Note: This task relates to configuring an OpenAPI 2.0 API definition. For details on how to configure an OpenAPI 3.0 API definition, see [Editing an OpenAPI 3.0 API definition](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

### Procedure

1. Open the required API for editing, as described in [Editing an OpenAPI 2.0 API definition](#).
2. Expand the General section then, if there are already one or more produces MIME types defined, expand Produces.
3. To specify a new MIME type, click the add icon  alongside Produces. To modify an existing MIME type, click the MIME type entry in the navigation pane.
4. Enter the required value in the Mime Type field; for example, `application/json` or `application/xml`. Then click Create.
5. Click Save when done.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Enforcing security requirements on an API

To enforce security requirements on an API, you apply previously created security schemes that specify various aspects of API security configuration.

### About this task

Note: This task relates to configuring an OpenAPI 2.0 API definition. For details on how to configure an OpenAPI 3.0 API definition, see [Editing an OpenAPI 3.0 API definition](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

For details on how to create and configure security scheme definitions, see [Defining security schemes](#).

The following restrictions exist when you apply security schemes to an API:

- You cannot apply more than two API key security schemes to an API.
- If you apply an API key security scheme for client secret, you must also apply an API key security scheme for client ID.
- If you require the application developer to supply both client ID and client secret, you must apply two separate API key security schemes.
- You can have at most one API key scheme of type client ID, regardless of whether the client ID is sent in the request header or as a query parameter.
- You can have at most one API key scheme of type client secret, regardless of whether the client secret is sent in the request header or as a query parameter.
- You cannot apply more than one basic security scheme to an API. If you apply a basic security scheme, you cannot also apply an OAuth security scheme.
- You can apply at most one OAuth security scheme to an API.

A security requirement specifies one or more security schemes whose conditions must all be satisfied for the API to be called successfully. You can define multiple security requirements; in this case, an application can call your API if it satisfies any of the security requirements you have defined.

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

## Procedure

1. Open the required API for editing, as described in [Editing an OpenAPI 2.0 API definition](#).
2. Expand General.
3. To create a new security requirement for the API, complete the following steps:
  - a. Click the add icon  alongside Security in the navigation pane.
  - b. Select the security schemes that you want to include in this security requirement. The security schemes listed are those that have been defined; see [Defining security schemes](#).

If a selected security scheme is of type OAuth2, select the required scopes; the scopes available for selection are those that were specified in the security scheme; for more information, see [Defining OAuth2 security schemes](#).

If you are applying the OAuth2 security scheme to an API that is enforced by the DataPower® API Gateway, you only need select any scopes if Advanced scope check after token generation is not enabled in the native OAuth provider associated with the security scheme. If a default scope has been set in the native OAuth provider and the API request doesn't contain any scope, the default scope is used; for more information, see [Configuring scopes for a native OAuth provider](#).

Note: The following additional requirement applies to security schemes that will be used with an OAuth third party provider. If you select an OAuth security scheme for protecting a consumer API, you must also include an API key security scheme, as the `X-IBM-Client-Id` or `client_id` must be included in the security credentials so that the correct Plan configuration settings can be enforced.

- c. Click Create. The security scheme selections are shown; you can change them again before saving.
  - d. Click Submit when done.
4. To modify an existing security requirement, complete the following steps:
    - a. Click Security in the navigation pane. All previously defined security requirements are listed; the security schemes included in each security requirement are shown.
    - b. To change the security schemes for a security requirement, click the edit icon  alongside the required security requirement, then change your security requirement selections as required.
    - c. Click Submit when done, then click Save.
    - d. To delete a security requirement, click the appropriate delete icon , click Delete to confirm, then click Save.
    - e. To disable security for the API, clear the Require one of the following Security Requirements check box, then click Save.

- [Defining security schemes](#)

A security scheme specifies all the settings for a particular aspect of API security; for example, the user registry that you use to authenticate access to the API.

- [Enabling CORS support for an API](#)

You can enable cross-origin resource sharing (CORS) support for your API. CORS allows embedded scripts in a web page to call the API across domain boundaries.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Defining security schemes

A security scheme specifies all the settings for a particular aspect of API security; for example, the user registry that you use to authenticate access to the API.

Note: This task relates to configuring an OpenAPI 2.0 API definition. For details on how to configure an OpenAPI 3.0 API definition, see [Editing an OpenAPI 3.0 API definition](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

You can create security definitions of the following types:

Type	Description
Basic authentication	Use a basic authentication security definition to specify a user registry or an authentication URL to be used to authenticate access to the API.
API key	Use an API key security definition to specify what application credentials are required to call an API.
OAuth2	Use an OAuth2 security definition to specify settings for OAuth token based authentication for your API.

- [Defining basic authentication security schemes](#)

A basic authentication security scheme is used when an application that calls the API is required to authenticate through a user registry.

- [Defining API key security schemes](#)

An API key security scheme is used to specify the credentials that an application must provide to identify itself when calling the API operations.

- [Defining OAuth2 security schemes](#)

An OAuth2 security scheme defines the settings for controlling access to the API operations through the OAuth authorization standard.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Defining basic authentication security schemes

A basic authentication security scheme is used when an application that calls the API is required to authenticate through a user registry.

### Before you begin

---

For authenticating access to the operations of APIs that are enforced on the API Connect gateway, the following user registry types are supported:

- Authentication URL
- LDAP

The following user registry types are **not** supported:

- OpenID Connect (OIDC)
- Local User Registry (LUR)
- A custom user registry

Before you can create a basic authentication security definition in an API, the user registry must exist. To create a user registry, you can use either API Manager or Cloud Manager. When you create a registry in API Manager, it is visible only to your provider organization. When you create a registry in Cloud Manager, you can make it visible to multiple provider organizations.

To create a user registry with API Manager, see [Working with user registries](#).

To create a user registry with Cloud Manager, see [User registries overview](#).

### About this task

---

Note: This task relates to configuring an OpenAPI 2.0 API definition. For details on how to configure an OpenAPI 3.0 API definition, see [Editing an OpenAPI 3.0 API definition](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

When you use basic authentication, you require API users to provide a valid user name and password to access selected operations. The application developer must also provide an HTTP authorization header in requests that are sent to operations that require basic authentication.

When you use an authentication URL, the user credentials that are provided in the authorization header are validated by the endpoint specified in the URL. If the user is authenticated, IBM® API Connect expects an authentication URL to return an HTTP 200 OK response status code. All other HTTP response status codes result in an authentication failure and access is denied.

For more information about using an LDAP user registry for authentication, see [LDAP authentication](#).

For information about using an Authentication URL, see [Authentication URL user registry](#).

To make use of a basic authentication security scheme, you must reference it from elsewhere in your API definition. For more information, see [Enforcing security requirements on an API](#) and [Enforcing security requirements on an operation](#).

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

### Procedure

---

1. Open the required API for editing, as described in [Editing an OpenAPI 2.0 API definition](#).
2. If there are already one or more security schemes defined, expand Security Schemes.
3. To create a basic authentication security scheme, click the add icon  alongside Security Schemes, then select basic for the Security Definition Type. To edit an existing basic authentication security scheme, click the security scheme name in the navigation pane.
4. Enter an identifying name of your choice in the Name field.
5. Select the user registry from the Authenticate using User Registry list.  
The user registries in the list are those that have been enabled in the Sandbox Catalog; for details, see [Creating and configuring Catalogs](#).
6. Optionally, provide a Description for the security scheme. You can use [CommonMark syntax](#) for rich text representation.
7. If you are creating a new basic authentication security scheme, click Create.  
The security scheme details are displayed for further editing.
8. Click Save when done.

### What to do next

---

Apply the security scheme to an API or operation. For more information, see [Enforcing security requirements on an API](#) and [Enforcing security requirements on an operation](#).

For more information on LDAP and Authentication URL, see [LDAP authentication](#) and [Authentication URL user registry](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Defining API key security schemes

An API key security scheme is used to specify the credentials that an application must provide to identify itself when calling the API operations.

### About this task

Note: This task relates to configuring an OpenAPI 2.0 API definition. For details on how to configure an OpenAPI 3.0 API definition, see [Editing an OpenAPI 3.0 API definition](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

You can require that, when calling an API operation, an application must provide either a client ID, or a client ID and client secret; you create an API key security scheme to specify a credentials requirement. If you require that an application must provide both a client ID and client secret, you must create two API key security schemes, one for each type of credentials.

To make use of an API key security scheme, you must reference it from elsewhere in your API definition. For more information, see [Enforcing security requirements on an API](#) and [Enforcing security requirements on an operation](#).

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

### Procedure

1. Open the required API for editing, as described in [Editing an OpenAPI 2.0 API definition](#).
2. If there are already one or more security schemes defined, expand Security Schemes.
3. To create an API key security scheme, click the add icon  alongside Security Schemes, then select apiKey for the Security Definition Type. To edit an API key existing security scheme, click the security scheme name in the navigation pane.
4. Enter an identifying name of your choice in the Security Scheme Name field.
5. Specify the parameter name in the Name field.

If your API is not enforced by the API Connect gateway, enter the parameter name required by your gateway.

If your API is enforced by the IBM® API Connect gateway, the required value depends on the gateway type setting for the API, as follows:

- DataPower® API Gateway: For a key of type client secret, you must include the string "secret", ignoring case, in the value you specify in the Name field; if the value does not contain the string "secret" then the key is assumed to be of type client ID.
- DataPower Gateway (v5 compatible): the value must be as specified in the following table, depending on where the client credentials are located, and the type of credentials.

Table 1. Client ID and Client secret parameter name values for the DataPower Gateway (v5 compatible)

Location of credentials	Type of credentials	Parameter name
Header	Client ID	X-IBM-Client-Id
Header	Client secret	X-IBM-Client-Secret
Query	Client ID	client_id
Query	Client secret	client_secret

When you first create an API, a default API key security definition, of type client ID, is provided.

For information about including API key parameters in an API call, see [Calling an API](#).

Note:

- You cannot apply more than two API key security definitions to an API.
- If you apply an API key security definition for client secret, you must also apply an API key security definition for client ID.
- If you require the application developer to supply both client ID and client secret, you must apply two separate API key security definitions.
- You can have at most one API key definition of type client ID, regardless of whether the client ID is sent in the request header or as a query parameter.
- You can have at most one API key definition of type client secret, regardless of whether the client secret is sent in the request header or as a query parameter.
- The client ID and client secret headers that are specified in the request when the API is called are **not** added automatically to the message context. If you need these headers in the message context for subsequent processing, include a **set-variable** policy in your API assembly that adds the headers to the message content, taking the values specified in the request; you can do this in either of the following ways:
  - In the Assemble tab, add a Set Variable policy to your API assembly that defines the appropriate actions; for example:

Table 2.

Action	Set	Type	Value
Set	message.headers.X-IBM-Client-Id	string	\$(request.headers.X-IBM-Client-Id)
Set	message.headers.X-IBM-Client-Secret	string	\$(request.headers.X-IBM-Client-Secret)

For more information on configuring a Set Variable policy, see [Set Variable](#).

- In the Source tab, add a **set-variable** policy directly to the assembly section in your OpenAPI source; for example:

```
assembly:
  execute:
    - set-variable:
      version: 2.0.0
      title: set-variable
      actions:
        - set: message.headers.X-IBM-Client-Id
          value: $(request.headers.X-IBM-Client-Id)
          type: string
```

```
- set: message.headers.X-IBM-Client-Secret
value: ${request.headers.X-IBM-Client-Secret}
type: string
```

For more information on defining a **set-variable** policy in your OpenAPI source, see [set-variable](#).

You should position the **set-variable** before any policy that needs to access the API key headers; for example, an invoke policy that calls a back-end service that is required to identify the application that made the initial request.

6. Select the Key Type: `client_id` or `client_secret`.

Important: The `client_id` is not confidential and functions as a "SecurityScheme" only in the meaning of the OpenAPI specification.

If you use only the `client_id` (without the `client_secret`) as your API Key, be aware that the `client_id` is not considered a confidential value in the API Manager UI; for example, it might be displayed to other authenticated members of the provider organization. The `client_id` is treated as a public identifier for apps and cannot be kept private.

If authentication of the identity of the app calling an API is needed, then the API Key should use both a `client_id` to identify the app, plus a `client_secret` to authenticate it. The `client_secret` is designed to be known only to the app and the authorization server, and it should be protected. IBM API Connect protects the `client_secret`: it is only available when first generated, it can be stored as a one-way hash to prevent retrieval or leaks, and it can be changed and reset without changing the corresponding `client_id`. When an API Key is not marked as a `client_secret`, it will not be protected in the API Manager UI.

7. Specify whether the credentials are sent in the request header, or as query parameters, by selecting one of the following Located In options:

header

The credentials are sent in the request header. This is the default setting.

query

The credentials are sent as query parameters. This method is less secure because the client secret could be exposed in a log file.

The selected option is enforced, and API calls fail if the credentials are included in the wrong location by the caller.

Note:

- You must specify the same location for the client ID and client secret, either header or query.
- If you migrated from API Connect V5, API key security definitions that contain multiple Client ID references, behave differently in Version 10 than in Version 5. For information about the differences, see [Client ID behavior in API key security definitions](#).

8. Optionally, provide a Description for the security scheme. You can use [CommonMark syntax](#) for rich text representation.

9. If you are creating a new API key security scheme, click Create.

The security scheme details are displayed for further editing.

10. Click Save when done.

## What to do next

Apply the security scheme to an API or operation. For more information, see [Enforcing security requirements on an API](#) and [Enforcing security requirements on an operation](#).

- [Client ID behavior in API key security definitions](#)

How the Client ID behaves in API key security definitions in IBM API Connect 10 compared to Version 5.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Client ID behavior in API key security definitions

How the Client ID behaves in API key security definitions in IBM® API Connect 10 compared to Version 5.

API key security definitions that contain multiple Client ID references, behave differently in Version 10 than in Version 5. Refer to the following table to understand the differences in Client ID behavior for different use cases.

Note: Although a `client_id` in the request body is supported, this data is not used during security requirement processing.

Table 1. Client ID behavior in V5 and V10

Use case	Description of security requirement	V5 behavior	V10 behavior
1	Allows <code>client_id</code> in the query, and the request contains multiple <code>client_ids</code> in the query.	Uses the first client ID in the request.	401 invalid client ID or secret.
2	Allows <code>client_id</code> in the header, and the request contains multiple <code>client_ids</code> in the header.	401 invalid client ID or secret.	401 invalid client ID or secret.
3	Allows <code>client_id</code> in the header, and the request contains multiple <code>client_ids</code> in the query and the header (1 in the query, 1 in the header).	401 client ID in wrong location.	Client ID in query is ignored.
4	Allows <code>client_id</code> in the query, and the request contains multiple <code>client_ids</code> in the query and the header.	Client ID in header is ignored.	Client ID in header is ignored.
5	Allows <code>client_id</code> in the query or header, and both the query and header contain multiple <code>client_ids</code> .	Header returns 401 client ID in wrong location. Query uses the first client ID in the request.	401 invalid client ID or secret.
6	Allows <code>client_id</code> in the header, and the request contains a valid <code>client_id</code> in the query, and an invalid <code>client_id</code> in the header.	401 client ID in wrong location.	401 invalid client ID or secret.
7	Allows <code>client_id</code> in the query, and the request contains a valid <code>client_id</code> in the header, and an invalid <code>client_id</code> in the query.	401 invalid client ID or secret.	401 invalid client ID or secret.
8	Allows <code>client_id</code> in the query or header, and both the query and header contain valid <code>client_ids</code> .	200 OK.	403 multiple client IDs.

Use case	Description of security requirement	V5 behavior	V10 behavior
9	Allows client_id in the query or header, and both the query and header contain invalid client_ids.	401 client ID in wrong location.	401 invalid client ID or secret.
10	Allows client_id in the query or header, and both the query and header contain a client_id, and the one in the query is valid.	200 OK.	Uses the valid one 200 OK.
11	Allows client_id in the query or header, and both the query and header contain a client_id, and the one in the header is valid.	401 client ID in wrong location.	Uses the valid one 200 OK.
12	Allows client_id in the query or header, and both the query and client_id is missing in the request (no security requirement, but client security is defined in the assembly).	401 invalid client ID or secret.	<ul style="list-style-type: none"> <li>When Return V5 Responses compatibility option is off: 401 client ID is missing.</li> <li>When Return V5 Responses compatibility option is on: 401 invalid client ID or secret.</li> </ul> <p>For information about setting compatibility options, see <a href="#">Configuring v5 compatibility options</a>.</p>

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Defining OAuth2 security schemes

An OAuth2 security scheme defines the settings for controlling access to the API operations through the OAuth authorization standard.

### Before you begin

Before you can create an OAuth2 security scheme, you must:

- Create an OAuth provider.
  - To use Cloud Manager, see [Configuring a native OAuth provider](#) or [Configuring a third-party OAuth provider](#).
  - To use API Manager, see [Configuring a native OAuth provider](#) or [Configuring a third-party OAuth provider](#).
- Add the OAuth provider to a catalog. If you have not created any catalogs, use the Sandbox Catalog. See the [OAuth instructions step](#) in [Creating and configuring Catalogs](#).

### About this task

Note: This task relates to configuring an OpenAPI 2.0 API definition. For details on how to configure an OpenAPI 3.0 API definition, see [Editing an OpenAPI 3.0 API definition](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

To make use of an OAuth2 security scheme, you must reference it from elsewhere in your API definition. For more information, see [Enforcing security requirements on an API](#) and [Enforcing security requirements on an operation](#).

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

### Procedure

- Open the required API for editing, as described in [Editing an OpenAPI 3.0 API definition](#).
- If there are already one or more security schemes defined, expand Security Schemes.
- To create an OAuth2 security scheme, click the add icon  alongside Security Schemes, then select oauth2. To edit an existing OAuth2 security scheme, click the security scheme name in the navigation pane.
- Enter an identifying name of your choice in the Security Scheme Name field.
- Provide the following information:
  - Security Scheme Name: An identifying name of your choice.
  - OAuth Provider: Select the OAuth provider to be used.
  - Flow: Select one of the following options:
    - Implicit
    - Resource Owner
    - Application
    - Access Code

Note: The flow options that are available for selection depend on which options are supported by the selected OAuth provider.

  - Description: An optional description of the OAuth2 security scheme. You can use [CommonMark syntax](#) for rich text representation.
  - The URL endpoints (the applicable endpoints depend on the flow type):
    - Authorization Url
    - Token Url

Note: The URL endpoint values supplied here are maintained only for informative purposes, no validation or other action is applied to them by API Connect. The OAuth security that is applied depends on the specified OAuth provider.

  - Scopes (available if you are editing an existing OAuth2 security scheme):
    - To add a new scope, click Add. To edit an existing scope, click the options icon  alongside the required scope, then click Edit.
    - Provide the following information:

- Scope: The scope identifier.
  - Description: An optional description of the scope. You can use [CommonMark syntax](#) for rich text representation.
  - If you are creating a new scope, click Create.
6. If you are creating a new OAuth2 security scheme, click Create.  
The security scheme details are displayed for further editing.
7. Click Save when done.

## What to do next

Apply the security scheme to an API or operation. For more information, see [Enforcing security requirements on an API](#) and [Enforcing security requirements on an operation](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Enabling CORS support for an API

You can enable cross-origin resource sharing (CORS) support for your API. CORS allows embedded scripts in a web page to call the API across domain boundaries.

### Before you begin

This task relates to configuring an OpenAPI 2.0 API definition. For details on how to configure an OpenAPI 3.0 API definition, see [Editing an OpenAPI 3.0 API definition](#).

### About this task

Note:

- When CORS is enabled, the API Gateway runs the `cors` preflow policy to handle all CORS requests that are made to the API.
- When CORS is enabled and a preflight request is received, only the following API actions are performed:
  - The `cors` preflow policy configures the appropriate response headers.
  - The response headers are set.
- When a preflight request is received, the `request.attributes.isCORSPreflight` flag is set to `true`.
- For all preflight requests, the `security` and `client-identification` preflow policies are always skipped, whether CORS is enabled or not enabled.

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

## Procedure

To enable CORS support for an API, complete the following steps:

1. Open the required API for editing, as described in [Editing an OpenAPI 2.0 API definition](#).
2. Select the Gateway tab, expand Gateway and portal settings, then click CORS.  
The CORS page opens.
3. Select Enabled.
4. Optional: Configure a CORS policy.  
Should you create a CORS policy? Review the following considerations:
  - A CORS policy is an optional part of an API definition. If an API definition has no CORS policy but CORS is enabled, then CORS requests will be accepted from all Origins.  
If you want to accept CORS requests from all Origins, then enable CORS but do not add a CORS policy to the API definition.
  - If you create a CORS policy, then CORS requests will only be accepted from Origins that are explicitly listed in the CORS rules contained in the CORS policy. CORS requests from any other Origins will be rejected.  
If you want to accept CORS requests from only a limited number of Origins (and might also want to configure the Access-Control-Allow-Credentials and Access-Control-Expose-Headers response headers), then you should enable CORS and create a CORS policy. Only those Origins explicitly listed in the allow-origin field of the CORS rules in the CORS policy will be accepted; CORS requests from any Origins not listed will be rejected.
  - To configure a new CORS policy, complete the following steps:
    - Alongside Policy, click Add.
    - To include the header `Access-Control-Allow-Credentials: true` in a response, select Allow Credentials. The `Access-Control-Allow-Credentials` response header tells browsers whether to expose the response to front-end JavaScript code when the request's credentials mode (`Request.credentials`) is set to `include`.
    - To append one or more of the following values to the `Access-Control-Expose-Headers` response header, select Expose headers, and select from the following options:
      - Predefined - The predefined value of the Gateway. This option is selected by default.
      - Backend - The value of `Access-Control-Expose-Headers` from the backend response.
      - Custom - A custom string.
    - Click Create.
    - Alongside Allowed Origins click Add.
    - Enter the origin URL, then click Create. This setting indicates that the response can be shared with requesting code from the specified origin.
  - To modify an existing CORS policy, click its entry on the CORS page. You can then modify individual origin URLs, add further origins, and change the Allow Credentials setting.

5. Click Save to save your changes.
6. Optional: To implement your own CORS solution using custom OPTIONS operations, complete the following steps:
  - a. Add the following headers to your HTTP responses:

```
Access-Control-Allow-Origin: https://<portalhostname>  
Access-Control-Allow-Headers: Origin, X-Requested-With, Content-Type, Accept
```

Where <portalhostname> is your Developer Portal host name.

- b. Optional: You can proxy your API through API Connect as an enforced invoke API so that CORS is handled automatically.

Important:

- If you implement your own CORS solution, you **must** disable the CORS option described in step 3
- CORS preflight requests are sent by using the HTTP **OPTIONS** method. Therefore, if you require these requests to be handled by the API Connect gateway then you must enable the **OPTIONS** method for all APIs that will handle preflight requests; see [Defining Paths for a REST API](#).
- **OPTIONS** requests are counted as API calls against any configured rate limit. Note that you can apply rate limits to individual operations; see [Defining rate limits for an API operation](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Specifying external documentation for an API

You can reference an external resource for extended documentation for an API.

### About this task

---

Note: This task relates to configuring an OpenAPI 2.0 API definition. For details on how to configure an OpenAPI 3.0 API definition, see [Editing an OpenAPI 3.0 API definition](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

### Procedure

---

1. Open the required API for editing, as described in [Editing an OpenAPI 2.0 API definition](#).
2. Expand the General section, then click External Documentation.
3. Provide the following information:
  - URL (required): The URL for the target documentation.
  - Description: An optional description of the target documentation. You can use [CommonMark syntax](#) for rich text representation.
4. Click Save when done.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Adding tags to an API

You can include tags in API definition. Such tags are added to the OpenAPI definition of the API but are not used by API Connect for any indexing.

### About this task

---

Note: This task relates to configuring an OpenAPI 2.0 API definition. For details on how to configure an OpenAPI 3.0 API definition, see [Editing an OpenAPI 3.0 API definition](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

### Procedure

---

1. Open the required API for editing, as described in [Editing an OpenAPI 2.0 API definition](#).
2. Expand the General then, if there already one or more tags defined, expand Tags.
3. To add a new tag, click the add icon  alongside Tags in the navigation pane. To edit an existing tag, click the tag name in the navigation pane.
4. Provide the following information:
  - Name (required): The name of the tag.
  - Description: An optional description of the tag. You can use [CommonMark syntax](#) for rich text representation.
  - External Documentation URL (available when editing an existing tag): The URL for target documentation that describes this tag.
  - External Documentation Description (available when editing an existing tag): An optional description of the target documentation.

5. If you are creating a new tag, click Create.
6. Click Save when done.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Defining Paths for an API

A Path is a unit of a REST API that you can call. A Path comprises an HTTP verb and a URL path. By configuring the Path, you define how the API is exposed to your developers.

### About this task

Note: This task relates to configuring an OpenAPI 2.0 API definition. For details on how to configure an OpenAPI 3.0 API definition, see [Editing an OpenAPI 3.0 API definition](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

### Procedure

1. Open the required API for editing, as described in [Editing an OpenAPI 2.0 API definition](#).
2. If there are already one or more Paths defined, expand Paths.
3. To create a new Path, click the add icon  alongside Paths in the navigation pane. To edit an existing Path, click the Path in the navigation pane.
4. Provide the following information:
  - Path: A relative path to an individual endpoint.

The path is appended to the base path to construct the full URI to access the APIs. The path must start, but not end, with the / character. A parameter at the end of the path can contain a qualifier to match one or more path levels.

If you specify just the name of the parameter, then one level of that path is matched. If you want to allow for multiple levels of the path, you can prefix the parameter with one of the following qualifiers:

- \* to indicate 0 or more occurrences
- + to indicate 1 or more occurrences

The + and \* qualifiers can only be used at the end of the path.

For example, the path:

```
/petstore/{type}/{*category}
```

matches the following paths, where only one type value is matched, but all (0 or more) categories are matched:

```
/petstore/cats
/petstore/cats/supplies
/petstore/cats/supplies/health
/petstore/cats/supplies/health/medicines
/petstore/cats/supplies/health/medicines/a/b/c
```

- \$ref (available when editing an existing Path): A reference to a Path that is defined elsewhere, either in this OpenAPI definition, or in an external file. A reference enables reuse of a set of operations already defined for a Path in this API, or in a file that is either a complete API definition or an OpenAPI fragment.

The reference uses JSON pointer notation. For example, a reference to a Path called `/mypath` in this API would have the following format:

```
#/paths/~mypath
```

The `~1` characters are used to escape the / character, which is being used literally in the path name rather than as a special character.

A reference to a path in an external file called `path_fragments.yaml` would have the following format:

```
file://path_fragments.yaml/paths/~1mypath
```

5. If you are creating a new Path, click Create.  
The Path details are displayed for further editing as described in [step 4](#).
6. Click Save when done.

- [Defining parameters for a path](#)  
Path parameters can specify variable elements of a URL path, query parameters, headers, or a request body. The parameters apply to all the operations defined under the path. A Path parameter can be overridden at the operation level but cannot be removed there.
- [Defining operations for a path](#)  
Operations on a Path defines the mechanisms available for interacting with the API when it is called using that Path. An operation can be of various pre-defined types; for example, a POST operation is most commonly used for creating new resources, while a GET operation is used to retrieve a resource.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Defining parameters for a path

Path parameters can specify variable elements of a URL path, query parameters, headers, or a request body. The parameters apply to all the operations defined under the path. A Path parameter can be overridden at the operation level but cannot be removed there.

### About this task

---

Note: This task relates to configuring an OpenAPI 2.0 API definition. For details on how to configure an OpenAPI 3.0 API definition, see [Editing an OpenAPI 3.0 API definition](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

### Procedure

---

1. Open the required API for editing, as described in [Editing an OpenAPI 2.0 API definition](#).
2. Expand Paths.
3. Expand the required Path, then, if there already one or more parameters defined, expand Path Parameters.
4. You can either create a new parameter, or edit any existing parameter.
  - To create a parameter, click the add icon  alongside Path Parameters, then refer to [Creating a parameter](#).
  - To edit an existing parameter, click the parameter name in the navigation pane, then refer to [Editing a parameter](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Defining operations for a path

Operations on a Path defines the mechanisms available for interacting with the API when it is called using that Path. An operation can be of various pre-defined types; for example, a POST operation is most commonly used for creating new resources, while a GET operation is used to retrieve a resource.

### About this task

---

Note: This task relates to configuring an OpenAPI 2.0 API definition. For details on how to configure an OpenAPI 3.0 API definition, see [Editing an OpenAPI 3.0 API definition](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

### Procedure

---

1. Open the required API for editing, as described in [Editing an OpenAPI 2.0 API definition](#).
2. Expand Paths, then expand the required path.
3. Click the add icon  alongside Operations under the Path in the navigation pane.
4. Provide the following information:
  - Verb: Select the operation type from the following options:
    - get
    - post
    - put
    - delete
    - options
    - head
    - patch
    - trace
  - Summary: A summary of what the operation does.
  - Description: A description of the operation behavior.
  - Operation: Unique string used to identify the operation. The id must be unique among all operations described in the API.
  - Deprecated: Declares this operation to be deprecated. Consumers should refrain from using the declared operation.
5. Click Create.
6. Click Save when done.

- **[Adding tags to an operation](#)**

You can include tags in API operation definition. Such tags are added to the OpenAPI definition of the API but are not used by API Connect for any indexing.

- **[Specifying external documentation for an operation](#)**

You can referencing an external resource for extended documentation for an API operation.

- **[Specifying the MIME types that an API operation produces](#)**

You can specify which types of media your API operation will return when calls are made to it. The API Connect gateway supports XML and JSON.

- [Specifying the MIME types that an API operation consumes](#)  
You can specify which types of media your API operation will accept when calls are made to it. The API Connect gateway supports XML and JSON.
- [Defining parameters for an operation](#)  
Responses define the HTTP status code and data returned in a response body and headers.
- [Defining responses for an operation](#)  
Responses define the HTTP status code and data returned in a response body and headers. A response defined for an operation is one that can returned by executing the operation.
- [Specifying schemes for an operation](#)  
The schemes settings define which transfer protocols you want your API operation to use.
- [Enforcing security requirements on an operation](#)  
To enforce security requirements on an API operation, you apply previously created security schemes that specify various aspects of API security configuration.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Adding tags to an operation

You can include tags in API operation definition. Such tags are added to the OpenAPI definition of the API but are not used by API Connect for any indexing.

### About this task

---

**Note:** This task relates to configuring an OpenAPI 2.0 API definition. For details on how to configure an OpenAPI 3.0 API definition, see [Editing an OpenAPI 3.0 API definition](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

### Procedure

---

1. Open the required API for editing, as described in [Editing an OpenAPI 2.0 API definition](#).
2. Expand Paths, then expand the required Path.
3. Expand Operations, then expand the required operation.
4. To add a new operation tag, click the add icon  alongside the Tags entry for the operation in the navigation pane. To edit an existing tag, expand Tags then click the tag name in the navigation pane.
5. Provide the following information:
  - Name (required): The name of the tag.
6. If you are creating a new operation tag, click Create.
7. Click Save when done.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Specifying external documentation for an operation

You can referencing an external resource for extended documentation for an API operation.

### About this task

---

**Note:** This task relates to configuring an OpenAPI 2.0 API definition. For details on how to configure an OpenAPI 3.0 API definition, see [Editing an OpenAPI 3.0 API definition](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

### Procedure

---

1. Open the required API for editing, as described in [Editing an OpenAPI 2.0 API definition](#).
2. Expand Paths, then expand the required Path.
3. Expand Operations, expand the required operation, then click External Documentation.
4. Provide the following information:
  - URL (required): The URL for the target documentation.
  - Description: An optional description of the target documentation. You can use [CommonMark syntax](#) for rich text representation.
5. Click Save when done.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Specifying the MIME types that an API operation produces

You can specify which types of media your API operation will return when calls are made to it. The API Connect gateway supports XML and JSON.

### About this task

---

Note: This task relates to configuring an OpenAPI 2.0 API definition. For details on how to configure an OpenAPI 3.0 API definition, see [Editing an OpenAPI 3.0 API definition](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

### Procedure

---

1. Open the required API for editing, as described in [Editing an OpenAPI 2.0 API definition](#).
2. Expand Paths, then expand the required Path.
3. Expand Operations, then expand the required operation.
4. To specify a new MIME type, click the add icon  alongside Produces. To modify an existing MIME type, click the MIME type entry in the navigation pane.
5. Enter the required value in the Mime Type field; for example `application/json` or `application/xml`. Then click Create.
6. Click Save when done.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Specifying the MIME types that an API operation consumes

You can specify which types of media your API operation will accept when calls are made to it. The API Connect gateway supports XML and JSON.

### About this task

---

Note: This task relates to configuring an OpenAPI 2.0 API definition. For details on how to configure an OpenAPI 3.0 API definition, see [Editing an OpenAPI 3.0 API definition](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

### Procedure

---

1. Open the required API for editing, as described in [Editing an OpenAPI 2.0 API definition](#).
2. Expand Paths, then expand the required Path.
3. Expand Operations, then expand the required operation.
4. To specify a new MIME type, click the add icon  alongside Consumes. To modify an existing MIME type, click the MIME type entry in the navigation pane.
5. Enter the required value in the Mime Type field; for example, `application/json` or `application/xml`. Then click Create.
6. Click Save when done.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Defining parameters for an operation

Responses define the HTTP status code and data returned in a response body and headers.

### About this task

---

Note: This task relates to configuring an OpenAPI 2.0 API definition. For details on how to configure an OpenAPI 3.0 API definition, see [Editing an OpenAPI 3.0 API definition](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

## Procedure

---

1. Open the required API for editing, as described in [Editing an OpenAPI 2.0 API definition](#).
2. Expand Paths, then expand the required Path.
3. Expand Operations, then expand the required operation.
4. You can either create a new operation parameter, or edit any existing parameter.
  - To create an operation parameter, click the add icon  alongside Path Parameters, then refer to [Creating a parameter](#).
  - To edit an existing operation parameter, click the parameter name in the navigation pane, then refer to [Editing a parameter](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Defining responses for an operation

Responses define the HTTP status code and data returned in a response body and headers. A response defined for an operation is one that can returned by executing the operation.

### About this task

---

Note: This task relates to configuring an OpenAPI 2.0 API definition. For details on how to configure an OpenAPI 3.0 API definition, see [Editing an OpenAPI 3.0 API definition](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

## Procedure

---

1. Open the required API for editing, as described in [Editing an OpenAPI 2.0 API definition](#).
2. Expand Paths, then expand the required Path.
3. Expand Operations, expand the required operation, then, if there are any existing responses, expand Responses.
4. You can either create a new response, or edit any existing response.
  - To create a response, click the add icon  alongside Responses, then refer to [Creating a response](#).
  - To edit an existing response, click the response name in the navigation pane, then refer to [Editing a response](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Specifying schemes for an operation

The schemes settings define which transfer protocols you want your API operation to use.

### About this task

---

Note: This task relates to configuring an OpenAPI 2.0 API definition. For details on how to configure an OpenAPI 3.0 API definition, see [Editing an OpenAPI 3.0 API definition](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

## Procedure

---

1. Open the required API for editing, as described in [Editing an OpenAPI 2.0 API definition](#).
2. Expand Paths, then expand the required Path.
3. Expand Operations, expand the required operation, then, if there are any existing schemes, expand Schemes List.
4. You can either add a new scheme, or edit any existing scheme.
  - To add a scheme, click the add icon  alongside Schemes List, select the required transfer protocol, then click Create.

Note: If your API is enforced by an API Connect gateway, only the HTTPS protocol is supported.

- To edit an existing scheme, click the scheme in the navigation pane, then change the transfer protocol as required.

5. Click Save when done.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Enforcing security requirements on an operation

To enforce security requirements on an API operation, you apply previously created security schemes that specify various aspects of API security configuration.

### About this task

Note: This task relates to configuring an OpenAPI 2.0 API definition. For details on how to configure an OpenAPI 3.0 API definition, see [Editing an OpenAPI 3.0 API definition](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

For details on how to create and configure security schemes, see [Defining security schemes](#).

A security requirement specifies one or more security scheme definitions whose conditions must all be satisfied for the API operation to be called successfully. You can define multiple security requirements; in this case, an application can call your API operation if it satisfies any of the security requirements you have defined.

Any security requirements that you define for an operation completely override any security requirements defined on the parent API. If you do not define any security requirements for an operation, or you delete all security requirements from an operation, the operation inherits the security requirements defined on the parent API. For more information, see [Enforcing security requirements on an API](#).

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

### Procedure

1. Open the required API for editing, as described in [Editing an OpenAPI 2.0 API definition](#).
2. Expand Paths, then expand the required Path.
3. Expand Operations, then expand the required operation.
4. To create a new security requirement for the operation, complete the following steps:
  - a. Click the add icon  alongside the Security entry for the operation in the navigation pane.
  - b. Select the security schemes that you want to include in this security requirement. The security schemes listed are those that have previously been defined; see [Defining security schemes](#).If a selected security scheme is of type OAuth2, select the required scopes; the scopes available for selection are those that were specified in the security scheme; for more information, see [Defining OAuth2 security schemes](#).

If you are applying the OAuth2 security scheme to an API that is enforced by the DataPower® API Gateway, you only need select any scopes if Advanced scope check after token generation is not enabled in the native OAuth provider associated with the security scheme. If a default scope has been set in the native OAuth provider and the API request doesn't contain any scope, the default scope is used; for more information, see [Configuring scopes for a native OAuth provider](#).

Note: The following additional requirement applies to security schemes that will be used with an OAuth third party provider. If you select an OAuth security scheme for protecting a consumer API, you must also include an API key security scheme, as the `x-IBM-Client-Id` or `client_id` must be included in the security credentials so that the correct Plan configuration settings can be enforced.

- c. Click Create. The security scheme selections are shown; you can change them again before saving.
  - d. Click Save when done.
5. To modify an existing security requirement, complete the following steps:
    - a. Click the Security entry for the operation in the navigation pane. All previously defined security requirements are listed; the security schemes included in each security requirement are shown.
    - b. To change the security schemes for a security requirement, click the edit icon  alongside the required security requirement, then change your security requirement selections as required.
    - c. Click Submit when done, then click Save.
    - d. To delete a security requirement, click the appropriate delete icon , click Delete to confirm, then click Save.
    - e. To disable security for the operation, clear the Require one of the following Security Requirements check box, then click Save.

Note: These settings completely override any security requirements defined on the parent API; see [Enforcing security requirements on an API](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Defining schemas for an API

Schema components define reusable schemas that provide developers with information about the request they should make, or the response they should expect to receive, when calling an API operation.

## About this task

---

Note: This task relates to configuring an OpenAPI 2.0 API definition. For details on how to configure an OpenAPI 3.0 API definition, see [Editing an OpenAPI 3.0 API definition](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

## Procedure

---

1. Open the required API for editing, as described in [Editing an OpenAPI 2.0 API definition](#).
2. If there are already one or more schemas defined, expand Definitions.
3. You can create a new schema, or edit any existing schema.
  - To create a schema, click the add icon  alongside Definitions, then refer to [Creating a schema](#).
  - To edit an existing schema, click the schema component name in the navigation pane, then refer to [Editing a schema](#).

- **Creating a schema**

Schemas provide developers with information about the request they should make, or the response they should expect to receive, when calling an API operation. You can create schemas in various places in your API definition.

- **Editing a schema**

Schemas provide developers with information about the request they should make, or the response they should expect to receive, when calling an API operation. You can edit schemas that have been previously created in various places in your API definition.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Creating a schema

Schemas provide developers with information about the request they should make, or the response they should expect to receive, when calling an API operation. You can create schemas in various places in your API definition.

## Before you begin

---

Note: Schemas are compiled before they are used for validation. Because the compilation process is longer than the validation process, the compiled schema artifacts are stored in a cache. The limited capacity of the cache can cause older entries to be evicted from the cache when newer entries are added. Schemas whose artifacts have been evicted from the cache must be recompiled, which can cause significant delays in validation.

Launch the schema creation window. For details of the areas in your API definition from where you can create a schema, see the following topics:

- [Defining schemas for an API](#)
- [Editing a response](#)

## About this task

---

Note: This task relates to configuring an OpenAPI 2.0 API definition. For details on how to configure an OpenAPI 3.0 API definition, see [Editing an OpenAPI 3.0 API definition](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

## Procedure

---

1. Provide the following information:
  - Schema Name: This name defines a key that enables this schema to be referenced from elsewhere in the API definition; the reference has the following format:  

```
#/definitions/Name
```
  - Title: The schema title.
  - Type: The schema data type; select one of the following:
    - array
    - boolean
    - integer
    - number
    - object
    - string
  - Description: An optional description of the schema. You can use [CommonMark syntax](#) for rich text representation.
  - Select the following options as required:
    - Nullable: Properties associated with this schema can be null.
    - Read Only: A property associated with this schema can be sent in a response but should not be sent in a request.
    - Write Only: A property associated with this schema can be sent in a request but should not be sent in a response.

- Deprecated: The schema is deprecated and should be transitioned out of usage.
2. Click Create.

The schema details are displayed for further editing; see [Editing a schema](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Editing a schema

Schemas provide developers with information about the request they should make, or the response they should expect to receive, when calling an API operation. You can edit schemas that have been previously created in various places in your API definition.

---

## Before you begin

Note: Schemas are compiled before they are used for validation. Because the compilation process is longer than the validation process, the compiled schema artifacts are stored in a cache. The limited capacity of the cache can cause older entries to be evicted from the cache when newer entries are added. Schemas whose artifacts have been evicted from the cache must be recompiled, which can cause significant delays in validation.

Open the details form for a schema. For details of the areas in your API definition from where you can edit a schema, see the following topics:

- [Defining schemas for an API](#)
- [Editing a response](#)

---

## About this task

Note: This task relates to configuring an OpenAPI 2.0 API definition. For details on how to configure an OpenAPI 3.0 API definition, see [Editing an OpenAPI 3.0 API definition](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

---

## Procedure

You can configure the following schema settings:

- Schema Name: This name defines a key that enables this schema to be referenced from elsewhere in the API definition; the reference has the following format:

`#/definitions/Name`

To change the name, click Update, change the value in the field, then click Save.

- Title: The schema title.
- Type: The schema data type; select one of the following:
  - array
  - boolean
  - integer
  - number
  - object
  - string

Note: If you change the type of an existing schema, any existing settings that are not relevant to the new type are still retained in the OpenAPI source even though they are no longer displayed in the user interface. You should therefore avoid porting a schema from one type to another but instead either create a new schema or modify the OpenAPI source directly; to open the source editor, click the Source icon .

- Additional schema settings dependent on the selected Type, as follows:
  - array:
    - Max Items: The maximum allowed number of items in an array instance.
    - Min Items: The minimum allowed number of items in an array instance.
    - Unique Items: If selected, all items in an array instance must be unique.
  - boolean: no type specific settings.
  - integer:
    - Format: An optional data type modifier. For more information, see [Data Types](#) in the [OpenAPI Specification](#).
    - Multiple Of: Division of an integer instance by this value must result in an integer.
    - Maximum: An integer instance must be less than or equal to this value.
    - Exclusive Maximum: An integer instance must be strictly less than this value.
    - Minimum: An integer instance must be greater than or equal to this value.
    - Exclusive Minimum: An integer instance must be strictly greater than this value.
  - number:
    - Format: An optional data type modifier. For more information, see [Data Types](#) in the [OpenAPI Specification](#).
    - Multiple Of: Division of a number instance by this value must result in an integer.
    - Maximum: A number instance must be less than or equal to this value.
    - Exclusive Maximum: A number instance must be strictly less than this value.
    - Minimum: A number instance must be greater than or equal to this value.
    - Exclusive Minimum: A number instance must be strictly greater than this value.
  - object

- Properties: To add properties to the schema, click Add alongside the Properties section heading. You configure a property by defining its schema with the schema editor.  
To create the property, refer to [Creating a schema](#).

To further configure the property, follow the steps on this page.

By defining properties, you can create more complex data structures. For example, you could define an "Address" schema that has the following properties:

PROPERTY NAME	PROPERTY TYPE
street1	string
street2	string
city	string
state	string
zip_code	string

and then define a "BankBranch" schema that has the following properties, one of which is a reference to the Address schema:

PROPERTY NAME	PROPERTY TYPE
address	address
type	string
id	string

- Max Properties: The number of properties in an object instance must be less than or equal to this value.
- Min Properties: The number of properties in an object instance must be greater than or equal to this value.
- Required Properties: An array of property names; every property name in the array must be the name of a property in an object instance. To add a required property name, click Add alongside the Required Properties section heading, enter the name, then click Create.
- string:
  - Format: An optional data type modifier. For more information, see [Data Types](#) in the [OpenAPI Specification](#).
  - Pattern: A regular expression; a string instance must successfully match the expression.
  - Max Length: The maximum allowed number of characters in a string instance.
  - Min Length: The minimum allowed number of characters in a string instance.
  - Enum: An array of string values; a string instance must match one of the array values. To add an enum value, click Add, enter the value, then click Create.
- Description: An optional description of the schema. You can use [CommonMark syntax](#) for rich text representation.
- General settings; select the required options:
  - Nullable: Properties associated with this schema can be null.
  - Read Only: A property associated with this schema can be returned in a response but should not be included in a request. For example, properties whose values are system generated identifiers will be defined as Read Only because application clients wouldn't be able to set these.
  - Write Only: A property associated with this schema can be included in a request but should not be returned in a response. For example, password properties are usually defined as Write Only because application clients would supply these when creating a user object but shouldn't be able see them when retrieving the object.
  - Deprecated: The schema is deprecated and should be transitioned out of usage.
- Example Value: An example value. Whatever you enter here is displayed as-is in the Developer Portal.
- External Documentation: An external resource for extended documentation; provide the following information:
  - URL (required): The URL for the target documentation.
  - Description: An optional description of the target documentation. You can use [CommonMark syntax](#) for rich text representation.
- Xml: Metadata that allows for more fine-tuned XML model definitions; provide the following information:
  - Name: Replaces the name of the element or attribute used for the described schema property.
  - Namespace: The URL of the namespace definition.
  - Prefix: The prefix to be used for the Name.
  - Attribute: Specifies whether the property definition translates to an attribute instead of an element.
  - Wrapped: For an array definition, Specifies whether the array is wrapped (for example, `<books><book/></books>`) or unwrapped (`<book/></book/>`).
- Click Save when done.

## What to do next

If required, use the breadcrumb trail to navigate to another location in the hierarchy of the object you are working on.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.

For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Defining parameters for an API

Parameters can specify variable elements of a URL path, query parameters, headers, or a request body.

### About this task

Note: This task relates to configuring an OpenAPI 2.0 API definition. For details on how to configure an OpenAPI 3.0 API definition, see [Editing an OpenAPI 3.0 API definition](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

## Procedure

1. Open the required API for editing, as described in [Editing an OpenAPI 2.0 API definition](#).
  2. If there already one or more parameters defined, expand Parameter Definitions.
  3. You can either create a new parameter, or edit any existing parameter.
    - To create a parameter, click the add icon  alongside Parameters, then refer to [Creating a parameter](#).
    - To edit an existing parameter, click the parameter name in the navigation pane, then refer to [Editing a parameter](#).
- **Creating a parameter**  
Parameters define variable elements of a URL path, query parameters, headers, or a request body. You can create parameters for Paths and Path operations in your API definition.
  - **Editing a parameter**  
Parameters define variable elements of a URL path, query parameters, headers, or a request body. You can edit parameters that have been previously created for the API, or for Paths and Path operations in your API definition.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Creating a parameter

Parameters define variable elements of a URL path, query parameters, headers, or a request body. You can create parameters for Paths and Path operations in your API definition.

### Before you begin

Launch the parameter creation window. For details of the areas in your API definition from where you can create a parameter, see the following topics:

- [Defining parameters for a path](#)
- [Defining parameters for an operation](#)
- [Defining parameters for an API](#)

### About this task

Note: This task relates to configuring an OpenAPI 2.0 API definition. For details on how to configure an OpenAPI 3.0 API definition, see [Editing an OpenAPI 3.0 API definition](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

A parameter is similar to a header, with the following differences:

- Parameters carry actual data and are available to end users, headers carry meta data associated with a request or response and are hidden from end users.
- A parameter can have various locations, the location of a header is always set to **header**.
- A parameter can have various format styles, the style of a header is always **simple**.

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

### Procedure

1. Provide the following information:
  - Parameter Name: The name of the parameter.
  - Located In: The location of the parameter. Select one of the following options:
    - query: Parameters that are appended to the URL. For example, `url_path?myparam=myvalue`.
    - header: Custom headers that are expected as part of the request.
    - path: The parameter value is part of the operation's URL, enclosed in {}.
    - body: Parameters that describe the body of POST, PUT and PATCH requests.
  - Description: A description of the parameter.
  - Type: The data type of the parameter.
  - Format: Select the data format; the available options depend on the selected Type.
  - Select the following option as required:
    - Required: Determines whether this parameter is mandatory. If the Located In property is set to path, this option must be selected.
    - Allow Empty Value: Allows sending a parameter with an empty value. This is valid only if the Located In property is set to query.
2. Click Create.  
The parameter details are displayed for further editing; see [Editing a parameter](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Editing a parameter

Parameters define variable elements of a URL path, query parameters, headers, or a request body. You can edit parameters that have been previously created for the API, or for Paths and Path operations in your API definition.

## Before you begin

---

Open the details form for a parameter. For details of the areas in your API definition from where you can edit a parameter, see the following topics:

- [Defining parameters for a path](#)
- [Defining parameters for an operation](#)
- [Defining parameters for an API](#)

## About this task

---

Note: This task relates to configuring an OpenAPI 2.0 API definition. For details on how to configure an OpenAPI 3.0 API definition, see [Editing an OpenAPI 3.0 API definition](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

A parameter is similar to a header, with the following differences:

- Parameters carry actual data and are available to end users, headers carry meta data associated with a request or response and are hidden from end users.
- A parameter can have various locations, the location of a header is always set to **header**.
- A parameter can have various format styles, the style of a header is always **simple**.

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

## Procedure

---

1. Provide the following information:
  - Description: A description of the parameter. You can use [CommonMark syntax](#) for rich text representation.
  - Type: The data type of the parameter.
  - Format: Select the data format; the available options depend on the selected Type.
  - Select the following options as required:
    - Required: Determines whether this parameter is mandatory. If the Located In property is set to path, this option must be selected.
    - Allow Empty Value: Allows sending a parameter with an empty value. This is valid only if the Located In property is set to query.
2. Click Save when done.

## What to do next

---

If required, use the breadcrumb trail to navigate to another location in the hierarchy of the object you are working on.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.

For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Defining responses for an API

---

Responses define the HTTP status code and data returned in a response body and headers. Responses defined for an API can be used across operations.

## About this task

---

Note: This task relates to configuring an OpenAPI 2.0 API definition. For details on how to configure an OpenAPI 3.0 API definition, see [Editing an OpenAPI 3.0 API definition](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

## Procedure

---

1. Open the required API for editing, as described in [Editing an OpenAPI 2.0 API definition](#).
2. If there already one or more responses defined, expand Response Definitions.
3. You can either create a new response, or edit any existing response.
  - To create a response, click the add icon  alongside Response Definitions, then refer to [Creating a response](#).
  - To edit an existing response, click the response name in the navigation pane, then refer to [Editing a response](#).
- [Creating a response](#)  
Responses define the HTTP status code and data returned in a response body and headers. You can create responses for the Path operations in your API definition.
- [Editing a response](#)  
Responses define the HTTP status code and data returned in a response body and headers. You can edit responses that have been previously created for Path operations in your API definition.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Creating a response

Responses define the HTTP status code and data returned in a response body and headers. You can create responses for the Path operations in your API definition.

### Before you begin

---

Launch the response creation window. For details of the areas in your API definition from where you can create a response, see the following topics:

- [Defining responses for an API](#)
- [Defining responses for an operation](#)

### About this task

---

**Note:** This task relates to configuring an OpenAPI 2.0 API definition. For details on how to configure an OpenAPI 3.0 API definition, see [Editing an OpenAPI 3.0 API definition](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

### Procedure

---

1. Provide the following information:
  - Name: The HTTP status code.
  - Description (required): A description of the response.
2. Click Create.

The response details are displayed for further editing; see [Editing a response](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Editing a response

Responses define the HTTP status code and data returned in a response body and headers. You can edit responses that have been previously created for Path operations in your API definition.

### Before you begin

---

Open the details form for a response. For details of the areas in your API definition from where you can edit a response, see the following topics:

- [Defining responses for an API](#)
- [Defining responses for an operation](#)

### About this task

---

**Note:** This task relates to configuring an OpenAPI 2.0 API definition. For details on how to configure an OpenAPI 3.0 API definition, see [Editing an OpenAPI 3.0 API definition](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

### Procedure

---

1. Provide the following information:
  - Name: The HTTP status code.
  - Description (required): A description of the response.
  - Schema: The schema defines the response structure.  
To define a schema for the response, click Create, then refer to [Creating a schema](#).

If the response already has a schema defined, click View to edit the schema.

For full details on editing a schema, see [Editing a schema](#).

2. Click Save when done.

## What to do next

---

If required, use the breadcrumb trail to navigate to another location in the hierarchy of the object you are working on.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Specifying gateway and portal settings

Define general configuration settings for your API.

### About this task

---

Note: This task relates to configuring an OpenAPI 2.0 API definition. For details on how to configure an OpenAPI 3.0 API definition, see [Editing an OpenAPI 3.0 API definition](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

### Procedure

---

1. Open the required API for editing, as described in [Editing an OpenAPI 2.0 API definition](#).
2. Select the Gateway tab, then click Gateway and portal settings.
3. Provide the following information:
  - Target Services: Define web services that you want to use in your API definition. For details, see [Defining target services for an API](#).
  - Enforced: Select this option to enforce the API by using the DataPower® API Gateway. Clear this option if you are managing the API on a gateway other than the DataPower API Gateway. Although not published to a gateway by API Connect, an unenforced API is still available in the Developer Portal for subscription by application developers.
  - Phase: The phase of the lifecycle that your API is in; select one of the following options:
    - Realized (default) - The API is in the implementation phase.
    - Identified - The API is in the early conceptual phase and is neither fully designed nor implemented.
    - Specified - The API has been fully designed and passed an internal milestone but has not yet been implemented.
  - Testable: Select this option to allow the API's operations to be tested using the test tool in the Developer Portal. Note: For the test tool to work, an API must be included in a Plan in a Product that is staged in a Catalog.
  - CORS: Enable and configure cross-origin resource sharing (CORS) support for your API. For details, see [Enabling CORS support for an API](#).
  - Properties: Add properties that can be referenced in your API definition. For details, see [Setting API properties](#).
  - Catalog Properties: Define property values that are specific to a particular Catalog. For details, see [Defining Catalog specific property values](#).
  - Gateway: For details, see [Specifying the gateway type for an API definition](#).
  - Application Authentication: Enable application authentication to protect your API with a certificate. For details, see [Configuring application authentication for an API](#).
  - Application Authentication Source: If application authentication is enabled, specify how the client certificate is sent to the gateway. For details, see [Configuring application authentication for an API](#).
  - Activity Log: Configure your logging preferences for the API activity that is stored in Analytics. For details, see [Configuring activity logging](#).
  - Compatibility: For details, see [Configuring v5 compatibility options](#).
  - Html Page: For a GraphQL API, the HTML page with which the API responds to an initial GraphQL editor request. Currently, the only option is `store:///graphql.html`. For more information, see [Enabling the GraphQL editor for a GraphQL API](#).
  - GraphQL Schema: For a GraphQL API, the name of the schema definition that references the imported GraphQL schema. For information on uploading a schema during GraphQL API creation, see [Creating a GraphQL proxy API](#). For information on replacing the schema for an existing GraphQL API, see [Using the GraphQL schema editor](#).
  - Extensions: Extensions added to the API to extend the OpenAPI specification. For details, see [Adding an OpenAPI extension to an API](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Defining target services for an API

A target service defines a web service that you want to use in your API definition.

### About this task

---

Note: This task relates to configuring an OpenAPI 2.0 API definition. For details on how to configure an OpenAPI 3.0 API definition, see [Editing an OpenAPI 3.0 API definition](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

## Procedure

1. Open the required API for editing, as described in [Editing an OpenAPI 2.0 API definition](#).
2. Select the Gateway tab, expand Gateway and portal settings then, if there are already one or more target services defined, expand Target Services.
3. To define a new API target service, complete the following steps:
  - a. Click the add icon  alongside Target Services in the navigation pane.
  - b. Upload the service information from a stand-alone .wsdl file, or a .zip file that contains a WSDL file and its dependent documents, by either dragging and dropping your file, or browsing and selecting the file that you want to use.  
If you upload a .zip file, you can include in the .zip file an options file to specify additional directives. For details, see [Using an options file when importing a WSDL service](#).

The target services that you add are now available in the palette on the Policies view for you to add to your API assembly flow; for more information, see [Including elements in your API assembly](#).

4. Select the service that you want to add.
5. Click Save to save your changes.
6. To view the source for an existing target service, click the target service name in the navigation pane.

## Results

The target services that you add are now available in the palette on the Policies view for you to add to your API assembly flow; for more information, see [Including elements in your API assembly](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Setting API properties

In addition to the pre-supplied API properties that you can use to control the behavior of API Connect policies, you can define your own API properties. The properties that you define can be referenced in your API definitions.

## About this task

Note: This task relates to configuring an OpenAPI 2.0 API definition. For details on how to configure an OpenAPI 3.0 API definition, see [Editing an OpenAPI 3.0 API definition](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

API properties include property name, value, and, optionally a specific Catalog to which a property value applies. For a list of pre-supplied API properties relating to various policies, see [API properties](#).

Note: Once defined, an API property is read only.

For information on how to reference a property in an API definition, see [Variable references in API Connect](#).

It is also possible to define properties that are specific to a Catalog and can be referenced by any of the APIs in that Catalog; for more information, see [Creating and configuring Catalogs](#). Note that if you define a Catalog property of the same name as an API property, the API property takes precedence over the Catalog property.

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

Tip: If you add or change an API property on an API that is already staged or published, you must re-stage or re-publish the Product that contains the updated API for the change to take effect.

## Procedure

1. Open the required API for editing, as described in [Editing an OpenAPI 2.0 API definition](#).
2. Select the Gateway tab, expand Gateway and portal settings then, if there are already one or more API properties defined, expand Properties.
3. Configure an API property.
  - To define a new API property, complete the following steps:
    - Click the add icon  alongside Properties in the navigation pane.
    - Provide the following information:
      - Property Name: Enter a name for the property; this name is used to reference the property. The following character set is supported for the name of an API property: `[A-Za-z0-9_-]+`. Spaces are allowed, but not two or more consecutive spaces.
      - Property Value: A default value for the property. Leave blank if the property is to have a null value by default.
      - Description: An optional description of the property. You can use [CommonMark syntax](#) for rich text representation.
      - Select Property Value is Base64 Encoded if you want to hide the property values, or protect user passwords from casual observance.  
Note: If you encode a property value, it is saved in Base64 encoded form; it is **not** encrypted. If you subsequently clear the Encoded check box, the original property value is restored in its unencoded form.
    - Click Create.
  - To modify an existing API property, click the property name in the navigation pane. You can then change any of the configuration settings.
4. Click Save to save your changes.

- [Defining Catalog specific property values](#)

For any API property, you can define a value that is specific to a particular Catalog. For any API published to that Catalog, the API property assumes the Catalog specific value, overriding any default property value.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Defining Catalog specific property values

For any API property, you can define a value that is specific to a particular Catalog. For any API published to that Catalog, the API property assumes the Catalog specific value, overriding any default property value.

---

### Before you begin

You must have previously created the API property that you now want to define a Catalog specific value for; see [Setting API properties](#).

---

### About this task

Note: This task relates to configuring an OpenAPI 2.0 API definition. For details on how to configure an OpenAPI 3.0 API definition, see [Editing an OpenAPI 3.0 API definition](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

Tip: If you add or change an API property on an API that is already staged or published, you must re-stage or re-publish the Product that contains the updated API for the change to take effect.

---

### Procedure

1. Open the required API for editing, as described in [Editing an OpenAPI 2.0 API definition](#).
2. Select the Gateway tab, expand Gateway and portal settings then, if there are already one or more Catalog specific property values defined, expand Catalog Properties.
3. Configure a Catalog specific property value.
  - To define a new Catalog specific property value, complete the following steps:
    - Click the add icon  alongside Catalog Properties in the navigation pane.
    - Enter the Catalog Name, or select it from the list. If you enter the name manually, it **must** match the value of the **name** field for the required Catalog.
    - Click Create. The Catalog properties details for the specified catalog are displayed for further editing.
    - Alongside Property Overrides, click Add.
    - Provide the following information:
      - Property Name to Override: Enter the name of the API property that you want to define a Catalog specific value for. The name **must** match the name of a previously defined API property; see [Setting API properties](#).
      - Property Value: The Catalog specific property value. Leave blank if the property is to have a null value by default.
    - Click Create.
  - To modify an existing Catalog specific property value, click the Catalog name in the navigation pane. You can then change the Catalog name, and add, modify, or delete property override settings.
4. Click Save to save your changes.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Configuring application authentication for an API

Application authentication settings allow you to protect your API with a certificate, for example, by using TLS mutual authentication. You can select whether a client certificate is sent as a TLS client certificate or in an HTTP header.

---

### About this task

Note: This task relates to configuring an OpenAPI 2.0 API definition. For details on how to configure an OpenAPI 3.0 API definition, see [Editing an OpenAPI 3.0 API definition](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

---

### Procedure

1. Open the required API for editing, as described in [Editing an OpenAPI 2.0 API definition](#).
2. Enable application authentication, as follows:
  - a. Select the Gateway tab, expand Gateway and portal settings, then click Application Authentication.
  - b. Select Certificate.
3. Specify how the client certificate is sent to the gateway, as follows:
  - a. In the navigation pane, click Application Authentication Source. Any existing application authentication source definitions are listed.
  - b. Alongside Application Authentication Source, click Add.
  - c. Select the required option, header or tls-cert. You can separately add one or both of the options. When the API is called, an X509 client certificate must be supplied, either in the specified HTTP header, or as a TLS client certificate from TLS mutual authentication. For any Developer Portal application that calls the API, the certificate must be entered in the Developer Portal user interface; for details, see [Registering an application](#).

The Gateway service to which the API is published can be configured to use TLS mutual authentication to secure API calls made to that Gateway service; for details, see [Configuring the initial Gateway service](#). If you select this option, continue to sub-step d.

If you are using a load balancer, configure the load balancer to use the specified HTTP header to relay the appropriate client certificate to the Gateway service after the load balancer terminates the TLS communication.

- d. If you select the tls-cert option, enable mTLS at the Gateway level. This can be done by enabling "Mutual authentication: Required" in the TLS Server Profile configured in the Gateway Service in the Cloud Manager Topology (requires cloud administrator permissions). For information, see [Registering a gateway service](#).

You can create a Truststore (with the root or intermediate CA certificate) for use with the TLS Server Profile.

The following example cURL command uses a client-cert during SSL:

```
**curl -X GET 'https://GW-Server:9443/test/sandbox/mtls-testing/callmtls-call' -H 'X-IBM-Client-Id: 1872xxxxxxxxxxxx' --cert my-leaf-cert.pem --key my-leaf-cert.key -k -v**
```

Note: This feature is intended for the scenario where different applications will be registered with different end certificates in the Developer Portal, which will have the same intermediate or root CA issuer. The certificate will pass Gateway-level mTLS if it matches the issuer available in the Truststore, but will only allow access to the API that matches the correct end certificate.

4. Click Create.
5. Click Save to save your changes.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Configuring activity logging

You can configure your logging preferences for the API activity that is stored in Analytics, overriding the default activity logging behavior.

### About this task

Note: This task relates to configuring an OpenAPI 2.0 API definition. For details on how to configure an OpenAPI 3.0 API definition, see [Editing an OpenAPI 3.0 API definition](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

An API event record exists for each API execution event in the Gateway server. By default, the content type that is collected and stored in API event records is activity for when API execution completes successfully, and payload for when API execution completes with an error code. When you compose your API definition, you can change the type of content to log in these API event records. During API execution, the activity data is stored in the `log` context variable, which populates the API event record on completion of the API execution; for more information, see [API activity logging context variables](#).

Note:

Activity logging that calls for logging of Analytics data upon success doesn't apply for the OAuth provider. The OAuth provider logs Analytics data for failure cases, but doesn't log successful cases.

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

### Procedure

1. Open the required API for editing, as described in [Editing an OpenAPI 2.0 API definition](#).
2. Select the Gateway tab, expand Gateway and portal settings, then click Activity Log.
3. Select Enabled, then select options for the Success Content and Error Content fields as follows:

Field label	Description
-------------	-------------

Field label	Description
Success Content	<p>Defines the type of content to be logged when the operation is successful.</p> <ul style="list-style-type: none"> <li>• none: Indicates that no logging occurs. Restriction: This option disables notifications for application developers who use your Developer Portal.</li> <li>• activity: Logs invocation only; only the resource URI will be recorded</li> <li>• header: Logs activity and header; the HTTP headers, in addition to the resource URI will be recorded</li> <li>• payload: Logs activity, header, and payload; all information, including the payload received in a request or returned in a response, will be recorded</li> </ul> <p>The default value is activity.</p>
Error Content	<p>Indicates what content to log when an error occurs.</p> <ul style="list-style-type: none"> <li>• none: Indicates that no logging occurs. Restriction: This option disables notifications for application developers who use your Developer Portal.</li> <li>• activity: Logs invocation only; only the resource URI will be recorded</li> <li>• header: Logs activity and header; the HTTP headers, in addition to the resource URI will be recorded</li> <li>• payload: Logs activity, header, and payload; all information, including the payload received in a request or returned in a response, will be recorded</li> </ul> <p>The default value is payload.</p>
Preserved request header	Click Add to specify customized request headers to preserve for logging to analytics.
Preserved response header	Click Add to specify customized response headers to preserve for logging to analytics.

4. Click Save to save your changes.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Configuring v5 compatibility options

You can configure settings to ensure compatibility with API Connect Version 5.0 compatible APIs that are converted for use with the DataPower® API Gateway.

### About this task

Note: This task relates to configuring an OpenAPI 2.0 API definition. For details on how to configure an OpenAPI 3.0 API definition, see [Editing an OpenAPI 3.0 API definition](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

### Procedure

1. Open the required API for editing, as described in [Editing an OpenAPI 2.0 API definition](#).
2. Select the Gateway tab, expand Gateway and portal settings, then click Compatibility.
3. Select from the following options as required:
  - Return V5 Responses: Return v5-compatible responses, such as OAuth and client security error responses.
  - Copy Id Headers to Message: Copy security headers to the message context for retrieval by the invoke back-end service.
  - Enforce Required Params: Check the request for required parameters during API routing. When enabled, a request that does not provide a required parameter is rejected.
  - Allow Chunked Uploads: Allow the assembly `invoke` policy to send documents to the server with **Transfer-Encoding: chunked**. This setting applies only to the `invoke` 1.5.0 wrapper policy deployed from API Connect using the migration utility. It does not apply to the native API Gateway assembly `invoke` policy.
4. Click Save to save your changes.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Including elements in your API assembly

An assembly is formed of elements that are applied to calls to and responses from operations in your API. Elements can be either policies or logic constructs.

### About this task

Note: This task relates to configuring an OpenAPI 2.0 API definition. For details on how to configure an OpenAPI 3.0 API definition, see [Editing an OpenAPI 3.0 API definition](#).

In the Policies view of IBM® API Connect, you can add and configure elements in your assembly. You can also directly add elements to the OpenAPI definition of your API.

- [The assembly editor](#)  
The API Manager of IBM API Connect features a graphical editor that you can use to create assemblies. With assemblies, you can readily tailor your APIs to include elements such as activity logging and redaction of specific fields.
- [Adding elements to your assembly](#)  
Create your API assembly by using the Assemble view in the API Manager.
- [Handling errors in the assembly](#)  
Use the catch section of the assembly to describe the handling of errors thrown during the assembly execution.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## The assembly editor

The API Manager of IBM® API Connect features a graphical editor that you can use to create assemblies. With assemblies, you can readily tailor your APIs to include elements such as activity logging and redaction of specific fields.

**Note:** This task relates to configuring an OpenAPI 2.0 API definition. For details on how to configure an OpenAPI 3.0 API definition, see [Editing an OpenAPI 3.0 API definition](#).

You can access the Assemble view by clicking the Gateway tab in the API editor. This tab includes a palette, which lists the available elements, a property sheet, which is used to configure an element, and a canvas, which is used to arrange and visualize the assembly's elements.

## The palette

The palette is a list of different elements that you can include in your assembly. The palette can be hidden by clicking the Show/hide policy palette icon .

## The canvas

You can use the canvas to create a graphical representation of the assembly flow. You can drag various elements from the palette to the appropriate location on the canvas. When you drag an element, valid positions are shown by dashed boxes.

**Note:** You must click Save in the Assemble view to save your assembly updates, and to make them appear in the Source view.

API calls are made at the initial, unfilled, circle, and returned at the final, filled, circle. You can insert elements between the two circles to modify the data received from the call, or returned by the response. To add an element, select it in the palette and drag it across to one of the dashed boxes that appear when you move the element over the canvas.

You can use the Show catches toggle to show and hide error catches in the palette. A catch is a section of the assembly that is applied when an API call results in the corresponding HTTP status code being returned. Click the catch section to open the property sheet for all your catches.

You can zoom the view of your canvas in and out by clicking the + and - icons. To fit the canvas to the screen size, click the Fit to screen icon .

You can filter the canvas to show only the parts of it that will apply to a specific operation by clicking the Filter by operation icon  and then selecting the operation from the drop-down list. Click the Clear operation filter icon  to remove the filter.

## The property sheet

When you select an element that is in the assembly by clicking it, details about the element are displayed in the property sheet. In this pane, you can configure the element's properties. The options available to you in the property sheet are specific to the type of element you are working with. For some elements, you can add and remove properties by clicking Object Properties and selecting the property from the drop-down menu.

You can release the property sheet by clicking the Close icon .

## The behavior of an assembly

The assembly runs policies in order and acts on different contexts of the API call. When an API call is made, security and rate limits are enforced before the assembly is executed. During the assembly, the flow can branch or be thrown and caught, according to the policies contained in it. The message context can be thought to flow through the assembly, being used and altered by various policies. In addition to the message, other contexts can be accessed and created.

### Security and rate limiting

Before the assembly is executed, security and then rate limits are enforced.

First, security definitions and CORS access control are used to authenticate an API call. Any API Key security definitions are used to identify applications that have subscriptions to a Product containing the API. If a security definition does not allow access, the API call is rejected.

If an application is identified by its client ID or client secret, a rate limit can be enforced based on the Plan or operation called.

### The assembly execution sequence

The assembly is executed in order from the initial, filled, circle to the final, unfilled, circle. However, there is room for branching, when if and operation-switch logic constructs are used, or for the remaining assembly to be ignored when a throw policy is executed.

The message is the context that is acted upon by any policy that isn't otherwise configured. At the beginning of the API call, the message is empty and, at the end of the API call, the message is used as the response.

The request context contains the information that is sent by the API caller and varies with the type of operation called and the configuration of that operation. For example, a GET operation can never have a populated `request.body`, and you can configure an operation to have `request.parameters` (query parameters). The first policy in an assembly acts on the request and produces the first instance of the message. If there are no policies, the request is returned to the caller.

## Managing contexts

Because the message can be overwritten, it can be useful to create and reference new contexts where possible so that they are saved and reusable during the API call.

- Use the map policy to overwrite the message context when you need to execute a policy that only acts on the message.
- Use the request context when you want to use the original request made to the API.
- Use the map, invoke, and proxy policies to create new contexts when you want to save your message.

Note: When you create a new context, unless you are also mapping to the message, the message is overwritten with an empty object.

For example, an invoke policy is the first policy in the assembly and its response overwrites the request as the message. The message is then acted upon by a validate policy, and a map policy then saves the message as a new context, ready for a second invoke policy to overwrite the message without losing the first invoke policy's output.

You can also access contexts outside of the message or your custom contexts, but these cannot be written to. For a list of contexts, see [API Connect context variables](#).

## Branches and catches

Using logic constructs, such as operation-switch or if, you can execute different sections of the assembly when certain conditions are fulfilled. When the assembly branches, the subsection of the assembly contained by the construct is executed in the same manner as a complete assembly. However, contexts are shared with the complete assembly.

When a catch is triggered, either by an error occurring during the execution of a policy, or because a throw policy is encountered, the rest of the assembly flow is ignored. All contexts are shared by the catch being executed and when the end of the catch is reached, the API call is completed. There is no way to return from a catch to the rest of the assembly.

# Adding elements to your assembly

Create your API assembly by using the Assemble view in the API Manager.

## About this task

---

Note: This task relates to configuring an OpenAPI 2.0 API definition. For details on how to configure an OpenAPI 3.0 API definition, see [Editing an OpenAPI 3.0 API definition](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

You can use the assembly tool in the UI to create assemblies that are used to manipulate requests made to or responses made by any of your API's operations.

Alternatively, you can use the Source view to edit the source of your API definition, in which case the syntax is as described in [execute OpenAPI extension](#).

For more information about the use of the assembly tool, see [The assembly editor](#).

## Procedure

---

To add elements to your assembly using the assembly tool, complete the following steps:

1. In the navigation pane, click  Develop, then select the APIs tab.  
The Develop page opens.
2. Click the title of the API definition that you want to work with.
3. Use the Policies view to add an element.
  - a. Select the Gateway tab, then click Policies in the navigation pane.
  - b. Find the element that you want to add in the palette.
  - c. Drag the element onto the canvas; dashed boxes are displayed. Drop the element in a dashed box to insert it into that position in the assembly.  
Note:
    - Elements are applied in order from the initial, unfilled, circle to the final, filled, circle.
    - Unless an Operation Switch element is used, the whole assembly applies to every operation in the API.
  - d. Add and edit properties of the element by clicking the element and using the property sheet.  
For some elements, you can add and remove properties by clicking Object Properties and selecting the property from the drop-down list. For information about the properties of policy elements, see [API policies and logic constructs](#). For information about the properties of logic constructs, see [Logic Constructs](#).
4. Optional: Repeat Steps [3.b](#) to [3.d](#) for any additional elements that you want to add.

5. Click Save to save your changes.

## Results

---

You have added one or more elements to your assembly.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Handling errors in the assembly

Use the catch section of the assembly to describe the handling of errors thrown during the assembly execution.

### About this task

---

Note: This task relates to configuring an OpenAPI 2.0 API definition. For details on how to configure an OpenAPI 3.0 API definition, see [Editing an OpenAPI 3.0 API definition](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

The catch section of the assembly is used to implement an assembly in the instance that an error is thrown during the assembly execution. For example, the assembly could contain a throw element, the API caller could fail to authenticate, or a policy could fail to execute correctly. Each error can be handled with a different catch and each catch can handle multiple status errors.

### Procedure

---

To create a catch and include elements in it, complete the following steps:

1. In the navigation pane, click  Develop, then select the APIs tab.  
The Develop page opens.
2. Click the title of the API definition that you want to apply a catch to.
3. Select the Gateway tab, then click Policies in the navigation pane.
4. Set the Show catches toggle in the menu bar of the canvas to the Show position.
5. Click Catches in the canvas, or a Catch icon  if one is displayed.  
The property sheet for the API's catches opens.
6. To add a default catch that is executed when an otherwise uncaught error is thrown, click Add default catch.  
Note: If you have a default catch before another catch in precedence, the default catch will activate even when the other catch's error is thrown.
7. To add a new catch, click Add catch.
8. To specify which errors the catch applies to, type the name of a custom error and press Enter, or use the Search errors field to search for the appropriate error.
9. Optional: To remove an error case from a catch, click the corresponding cross.
10. Optional: To change the precedence of your catches, use the Move up  or Move down  icons.  
If an error case is handled by multiple catches, the catch at the beginning of the list is applied.
11. To add an element to a catch, drag the element over the dashed, gray box that appears in the flow from the Catch icon  for the catch that you want to apply the element to.
12. Click Save to save your changes.

### What to do next

---

If you added a catch for ConnectionError, SOAPError, or OperationError, you must add the same error to the Stop on error setting for the Invoke policy in your assembly. Otherwise if the error occurs during the execution of the Invoke policy, it is not caught, the policy execution is allowed to complete, and the assembly flow continues. For details on configuring an Invoke policy, see [Invoke](#).

For details of all the errors that can be returned by the assembly and are available to the catch function, see [Error cases supported by assembly catches](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Specifying the gateway type for an API definition

An API definition is specific to one or other of the gateway types, DataPower® API Gateway or DataPower Gateway (v5 compatible). A default gateway type is set when you create an API definition, but you can edit the API configuration to specify a different gateway type.

### About this task

---

Note: This task relates only to an OpenAPI 2.0 API definition. An OpenAPI 3.0 API is supported only on the DataPower API Gateway.

DataPower Gateway (v5 compatible) has been available with IBM® API Connect for a number of years. The DataPower API Gateway is a new gateway that has been designed with APIs in mind, and with the same security focus as DataPower Gateway (v5 compatible).

For more information on how to choose which gateway type to use, see [API Connect gateway types](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

You must specify which type of gateway each API uses. APIs can use only one type of gateway.

When you create a new API definition, or import an API definition that has no gateway type configured, the gateway type defaults according to the gateway types of the gateway services that are enabled in your Sandbox Catalog, as indicated in the following table.

Table 1. Default gateway type for a new API definition

Gateway Service enablement in Sandbox Catalog	Default gateway type for new API definition
No gateway services enabled	DataPower API Gateway
At least one gateway service of each type enabled	DataPower API Gateway
One or more gateway services only of type DataPower API Gateway enabled	DataPower API Gateway
One or more gateway services only of type DataPower Gateway (v5 compatible) enabled	DataPower Gateway (v5 compatible)

If you import an API definition that already has a gateway type configured, that gateway type is retained.

Note that when you modify your API definitions to use a specific gateway type, you must ensure that each policy and policy version in the API are supported by the gateway type. DataPower Gateway (v5 compatible) and DataPower API Gateway each support policies that the other gateway type does not. In some cases, the same policy is supported by both gateway types, but with a different version number.

For example, DataPower Gateway (v5 compatible) supports version **1.0.0** of the **invoke** policy, but DataPower API Gateway requires version **2.0.0**.

For information on policies, see [execute](#).

For information on policy versions, see the documentation for each individual policy. For example, to review the **invoke** policy, see [invoke](#).

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

## Procedure

1. Open the required API for editing, as described in [Editing an OpenAPI 2.0 API definition](#).
2. Click the title of the API you want to update.
3. Select the Gateway tab, then click Gateway and portal settings.
4. Select the type:
  - datapower-gateway for the DataPower Gateway (v5 compatible)
  - datapower-api-gateway for the DataPower API Gateway.

Note: The Gateway Type selection is not applicable if the Enforced option is disabled, because an unenforced API is not managed on an API Connect gateway.

5. Click Save to retain the changes.

6. In the navigation pane, select Policies to ensure that your API uses policies that are supported by the gateway type you selected.

Policies in an existing API that are not supported by the new gateway type are grayed out and flagged with a red exclamation point: .

Some policies are supported by only one gateway type. Some policies are supported by both gateway types, but require a different version of the policy for each gateway type.

## Related tasks

- [Converting an API definition for deployment to the DataPower API Gateway](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Converting an API definition for deployment to the DataPower API Gateway

IBM® API Connect provides two gateway types, DataPower® Gateway (v5 compatible) and DataPower API Gateway. If you have an API definition that was developed for the DataPower Gateway (v5 compatible) and you want to port it to the DataPower API Gateway, you must make changes to convert it before deployment.

### About this task

Note: This task relates only to an OpenAPI 2.0 API definition. An OpenAPI 3.0 API is supported only on the DataPower API Gateway.

DataPower Gateway (v5 compatible) has been available with IBM API Connect for a number of years. The DataPower API Gateway is a new gateway that has been designed with APIs in mind, and with the same security focus as DataPower Gateway (v5 compatible).

To convert an API for deployment to the DataPower API Gateway, you must, as a minimum, change the gateway type setting on the API definition, and ensure that each policy and policy version in the API are supported by the DataPower API Gateway; DataPower Gateway (v5 compatible) and DataPower API Gateway each support policies that the other gateway type does not. In some cases, the same policy is supported by both gateway types, but with a different version number.

In addition, depending on the specific policies in your API assembly, some policies might require modification to adapt them for use with the DataPower API Gateway.

The following procedure provides instructions for converting your API definition:

## Procedure

1. Set the gateway type for the API to DataPower API Gateway, and ensure policy type and version compatibility. For details, see [Specifying the gateway type for an API definition](#).
2. Refer to the [DataPower API Gateway porting notes](#) for detailed instructions on how to convert your API definition.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Modifying a GraphQL schema

For a GraphQL API, an editor is provided for modifying the associated GraphQL schema.

### About this task

---

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

### Procedure

---

To open the GraphQL schema editor for a GraphQL API, complete the following steps:

1. Open the required API for editing, as described in [Editing an OpenAPI 2.0 API definition](#).
2. Select the GraphQL Schema tab.

### What to do next

---

For full details on how to use the editor, see [Using the GraphQL schema editor](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Editing an OpenAPI 3.0 API definition

IBM® API Connect provides a form based editor that enables you to configure APIs that conform to the OpenAPI 3.0 specification.

### About this task

---

Note:

- This task relates to configuring an OpenAPI 3.0 API definition. For details on how to configure an OpenAPI 2.0 API definition, see [Editing an OpenAPI 2.0 API definition](#).
- OpenAPI 3.0 APIs are supported only with the DataPower® API Gateway, not with the DataPower Gateway (v5 compatible).
- For details of current OpenAPI 3.0 support limitations, see [OpenAPI 3.0 support in IBM API Connect](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

### Procedure

---

You can open an API for editing in either of the following ways:

- During the initial creation of an API, the API wizard guides you to enter the minimum configuration settings; on completion of the initial configuration, click Edit API.
- To open an existing API for editing, complete the following steps:
  1. In the navigation pane, click  Develop, then select the APIs tab.
  2. Click the title of the API version that you want to work with.
- [OpenAPI 3.0 support in IBM API Connect](#)  
IBM API Connect supports the OpenAPI 3.0 specification, with some limitations. The current implementation includes complete support for the Berlin Group NextGen PSD2 requirements.
- [Specifying API metadata](#)  
API metadata provides summary information about the API. You enter API metadata in the Info section of the API definition.
- [Defining servers for an API](#)  
Server definitions in an API provide information for connecting to target servers.
- [Enforcing security requirements on an API](#)  
To enforce security requirements on an API, you apply previously created security scheme components that define various aspects of API security configuration.
- [Specifying external documentation for an API](#)  
You can reference an external resource for extended documentation for an API.
- [Adding tags to an API](#)  
You can include tags in API definition. Such tags are added to the OpenAPI definition of the API but are not used by API Connect for any indexing.

- [Defining Paths for an API](#)  
A Path is a unit of a REST API that you can call. A Path comprises an HTTP verb and a URL path. By configuring the Path, you define how the API is exposed to your developers.
- [Defining components for an API](#)  
Components are reusable objects relating to various aspects of your API definition. A component has no effect on the API unless it is explicitly referenced from elsewhere in your API definition.
- [Specifying gateway and portal settings](#)  
Define general configuration settings for your API.
- [Defining target services for an API](#)  
A target service defines a web service that you want to use in your API definition.
- [Setting API properties](#)  
In addition to the pre-supplied API properties that you can use to control the behavior of API Connect policies, you can define your own API properties. The properties that you define can be referenced in your API definitions.
- [Configuring activity logging](#)  
You can configure your logging preferences for the API activity that is stored in Analytics, overriding the default activity logging behavior.
- [Including elements in your API assembly](#)  
An assembly is formed of elements that are applied to calls to and responses from operations in your API. Elements can be either policies or logic constructs.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## OpenAPI 3.0 support in IBM API Connect

IBM® API Connect supports the OpenAPI 3.0 specification, with some limitations. The current implementation includes complete support for the Berlin Group NextGen PSD2 requirements.

### Overview

A Product can contain any combination of OpenAPI 2.0 and OpenAPI 3.0 APIs. When you publish a Product that contains an OpenAPI 3.0 API, that API is validated to ensure that it is syntactically correct, and that references to configuration resources and policies resolve correctly, in the same way that OpenAPI 2.0 APIs are validated.

You can also validate OpenAPI 3.0 APIs in your local file system by using the `apic validate` command provided by the developer toolkit CLI; for details, see [Validating the YAML or JSON definition of an API or Product](#).

If you retrieve an API object by using the developer toolkit CLI or the API Connect REST APIs, there is an `oai_version` property that defines which OpenAPI version the API represents.

There is no OpenAPI 3.0 API support with the DataPower® Gateway (v5 compatible); OpenAPI 3.0 API support is provided by the DataPower API Gateway **only**.

### Limitations

The limitations to the OpenAPI 3.0 support in IBM API Connect are as follows:

User interface limitations

- Some aspects of the OpenAPI 3.0 specification are not currently supported by the user interface. In such circumstances, use the OpenAPI source directly.
- Validation errors that are identified locally are reflected in the API editor header almost immediately. However, some validation errors can be identified only by the API Manager backend and are not reflected until the API is saved; this means that, on saving an API, some validation errors might appear or disappear.
- The user interface does not currently support referencing a request body component from the request body of an operation. If you want to reference a request body component, add the reference to the request body of the operation directly in the OpenAPI source:

```
requestBody:
  $ref: '#/components/requestBodies/request_body_component_name'
```

The reference **is** confirmed on the details page for the request body in the user interface however.

- If, in the API Designer user interface, you create and activate an API of the same name and version as one that has already been activated from the API Manager user interface, the Edit Rate Limit operation fails.

Limitations for APIs that are enforced by the DataPower API Gateway

- General limitations.
  - The `servers` array cannot contain more than one server.
  - The `url` entry in the `servers` array cannot contain **variables**.
  - `path` objects cannot contain server object overrides.
  - Wildcarding in response objects is not supported for error codes or success codes.
  - There is no support for converting a WSDL defined SOAP service into an OpenAPI 3.0 API.
- Assembly policies.
  - All policies are supported, except for the following:
    - The `validate` and `map` policies are not supported.
  - Schema support is limited to Draft 4 and earlier. Therefore, the following policies are limited to those drafts:
    - `gatewayscript`
    - `set-variable`
    - `switch`
    - `json-to-xml`
    - `xml-to-json`

- `parse`
- `xslt`
- Security.
  - The following security schemes are not supported:
    - OAuth2 with multiple flows (a single flow is supported).
    - OpenID Connect (OIDC).
  - The use of cookies in an API key is not supported.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Specifying API metadata

API metadata provides summary information about the API. You enter API metadata in the Info section of the API definition.

### About this task

Note:

- This task relates to configuring an OpenAPI 3.0 API definition. For details on how to configure an OpenAPI 2.0 API definition, see [Editing an OpenAPI 2.0 API definition](#).
- OpenAPI 3.0 APIs are supported only with the DataPower® API Gateway, not with the DataPower Gateway (v5 compatible).
- For details of current OpenAPI 3.0 support limitations, see [OpenAPI 3.0 support in IBM® API Connect](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

### Procedure

1. Open the required API for editing, as described in [Editing an OpenAPI 3.0 API definition](#).
2. Expand the General section, then click Info.
3. Provide the following information:
  - Title (required): The title of the API.
  - Name: The name was generated automatically when the API was created and cannot be changed. The value in the Name field is a single string that is used to identify the API in developer toolkit CLI commands. To view the CLI commands to manage draft APIs, see [apic draft-apis](#).
  - Version: The API version is specified when the API is initially created and cannot be changed thereafter. You can, however, create a new version of an existing API; see [Creating a new version of an API definition](#).
  - Description: An optional description of the API. You can use [CommonMark syntax](#) for rich text representation.
  - Terms of Service: A URL to the Terms of Service for the API.
  - Contact Name: The identifying name of the contact person/organization.
  - Contact URL: A URL pointing to the contact information.
  - Contact Email: The email address of the contact person/organization.
  - License Name: The license name used for the API.
  - License URL: A URL to the license used for the API.
4. Click Save when done.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Defining servers for an API

Server definitions in an API provide information for connecting to target servers.

### About this task

Note:

- This task relates to configuring an OpenAPI 3.0 API definition. For details on how to configure an OpenAPI 2.0 API definition, see [Editing an OpenAPI 2.0 API definition](#).
- OpenAPI 3.0 APIs are supported only with the DataPower® API Gateway, not with the DataPower Gateway (v5 compatible).
- For details of current OpenAPI 3.0 support limitations, see [OpenAPI 3.0 support in IBM® API Connect](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

You can define more than one server but only the first is used by API Connect.

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

## Procedure

---

1. Open the required API for editing, as described in [Editing an OpenAPI 3.0 API definition](#).
2. Expand General then, if there are already one or more servers defined, expand Servers.
3. To create a new server definition, click the add icon  alongside Servers in the navigation pane. To edit an existing server definition, click the server URL in the navigation pane.
4. Provide the following information:
  - Server URL (required): The specified URL is used to determine the full URL endpoint for the calling the API, taking into account any vanity endpoint configuration in the Catalog in which the API is published. For an API that is enforced by the DataPower API Gateway, the value entered here is interpreted as the basepath so you would typically provide only the basepath value; for example:  

```
/my_basepath
```

For full details on how the server URL is used to determine the full URL endpoint, see [Configuring vanity endpoints for a Catalog](#).
  - Server Description: An optional description of the host designated by the URL. You can use [CommonMark syntax](#) for rich text representation.
  - Server Variables (available when editing an existing server definition): A server variable defines a map between a variable name and its value. The value is used for substitution in the server's URL template.
    - To add a new server variable, click Add. To edit an existing server variable, click the variable name.
    - Provide the following information:
      - Server Variable Name (required).
      - Default value (required).
      - An optional rich text description. You can use [CommonMark syntax](#) for rich text representation.
      - One or more Enum Value entries (available when editing an existing server variable). Enum values specify an enumeration of string values to be used if the substitution options are from a limited set. To add a new Enum value, click Add, enter the value, then click Create. To edit an existing Enum value, click the Enum value.
    - If you are creating a new server variable, click Create. The server variable details are displayed for further editing.
    - If required, use the breadcrumb trail to return to your server definition for further editing.
5. If you are creating a new server definition, click Create.  
The server definition details are displayed for further editing as described in step 4.
6. Click Save when done.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Enforcing security requirements on an API

To enforce security requirements on an API, you apply previously created security scheme components that define various aspects of API security configuration.

### About this task

---

Note:

- This task relates to configuring an OpenAPI 3.0 API definition. For details on how to configure an OpenAPI 2.0 API definition, see [Editing an OpenAPI 2.0 API definition](#).
- OpenAPI 3.0 APIs are supported only with the DataPower® API Gateway, not with the DataPower Gateway (v5 compatible).
- For details of current OpenAPI 3.0 support limitations, see [OpenAPI 3.0 support in IBM® API Connect](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

For details on how to create and configure security scheme components, see [Defining security scheme components](#).

The following restrictions exist when you apply security schemes to an API:

- You cannot apply more than two API key security schemes to an API.
- If you apply an API key security scheme for client secret, you must also apply an API key security scheme for client ID.
- If you require the application developer to supply both client ID and client secret, you must apply two separate API key security schemes.
- You can have at most one API key scheme of type client ID, regardless of whether the client ID is sent in the request header or as a query parameter.
- You can have at most one API key scheme of type client secret, regardless of whether the client secret is sent in the request header or as a query parameter.
- You cannot apply more than one basic security scheme to an API. If you apply a basic security scheme, you cannot also apply an OAuth security scheme.
- You can apply at most one OAuth security scheme to an API.

A security requirement specifies one or more security scheme components whose conditions must all be satisfied for the API to be called successfully. You can define multiple security requirements; in this case, an application can call your API if it satisfies any of the security requirements you have defined.

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

## Procedure

---

1. Open the required API for editing, as described in [Editing an OpenAPI 3.0 API definition](#).
2. Expand General.

3. To create a new security requirement for the API, complete the following steps:
  - a. Click the add icon  alongside Security in the navigation pane.
  - b. Select the security schemes that you want to include in this security requirement. The security schemes listed are those that have been defined in security scheme components; see [Defining security scheme components](#).  
If a selected security scheme is of type OAuth2, select the required scopes; the scopes available for selection are those that were specified in the security scheme component; for more information, see [Defining OAuth2 security scheme components](#).  
  
If you are applying the OAuth2 security scheme to an API that is enforced by the DataPower API Gateway, you only need select any scopes if Advanced scope check after token generation is not enabled in the native OAuth provider associated with the security scheme. If a default scope has been set in the native OAuth provider and the API request doesn't contain any scope, the default scope is used; for more information, see [Configuring scopes for a native OAuth provider](#).

Note: The following additional requirement applies to security schemes that will be used with an OAuth third party provider. If you select an OAuth security scheme for protecting a consumer API, you must also include an API key security scheme, as the `X-IBM-Client-Id` or `client_id` must be included in the security credentials so that the correct Plan configuration settings can be enforced.

  - c. Click Create. The security scheme selections are shown; you can change them again before saving.
  - d. Click Submit when done.
4. To modify an existing security requirement, complete the following steps:
  - a. Click Security in the navigation pane. All previously defined security requirements are listed; the security schemes included in each security requirement are shown.
  - b. To change the security schemes for a security requirement, click the edit icon  alongside the required security requirement, then change your security requirement selections as required.
  - c. Click Submit when done, then click Save.
  - d. To delete a security requirement, click the appropriate delete icon , click Delete to confirm, then click Save.
  - e. To disable security for the API, clear the Require one of the following Security Requirements check box, then click Save.

## What to do next

---

For more information on LDAP and Authentication URL, see [LDAP authentication](#) and [Authentication URL user registry](#).

- [Enabling CORS support for an API](#)

You can enable cross-origin resource sharing (CORS) support for your API. CORS allows embedded scripts in a web page to call the API across domain boundaries.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.

For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Enabling CORS support for an API

You can enable cross-origin resource sharing (CORS) support for your API. CORS allows embedded scripts in a web page to call the API across domain boundaries.

## Before you begin

---

This task relates to configuring an OpenAPI 3.0 API definition. For details on how to configure an OpenAPI 2.0 API definition, see [Editing an OpenAPI 2.0 API definition](#).

## About this task

---

Note:

- When CORS is enabled, the API Gateway runs the `cors` preflow policy to handle all CORS requests that are made to the API.
- When CORS is enabled and a preflight request is received, only the following API actions are performed:
  - The `cors` preflow policy configures the appropriate response headers.
  - The response headers are set.
- When a preflight request is received, the `request.attributes.isCORSPreflight` flag is set to `true`.
- For all preflight requests, the `security` and `client-identification` preflow policies are always skipped, whether CORS is enabled or not enabled.

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

## Procedure

---

To enable CORS support for an API, complete the following steps:

1. Open the required API for editing, as described in [Editing an OpenAPI 3.0 API definition](#).
2. Select the Gateway tab, expand Gateway and portal settings, then click CORS.  
The CORS page opens.
3. Select Enable CORS.
4. Optional: Configure a CORS policy.  
Should you create a CORS policy? Review the following considerations:
  - A CORS policy is an optional part of an API definition. If an API definition has no CORS policy but CORS is enabled, then CORS requests will be accepted from all Origins.  
If you want to accept CORS requests from all Origins, then enable CORS but do not add a CORS policy to the API definition.

- If you create a CORS policy, then CORS requests will only be accepted from Origins that are explicitly listed in the CORS rules contained in the CORS policy. CORS requests from any other Origins will be rejected.  
If you want to accept CORS requests from only a limited number of Origins (and might also want to configure the Access-Control-Allow-Credentials and Access-Control-Expose-Headers response headers), then you should enable CORS and create a CORS policy. Only those Origins explicitly listed in the allow-origin field of the CORS rules in the CORS policy will be accepted; CORS requests from any Origins not listed will be rejected.

- To configure a new CORS policy, complete the following steps:
  - Alongside CORS Policy, click Add.
  - To include the header `Access-Control-Allow-Credentials: true` in a response, select Allow Credentials. The `Access-Control-Allow-Credentials` response header tells browsers whether to expose the response to frontend JavaScript code when the request's credentials mode (`Request.credentials`) is set to `include`.
  - To append one or more of the following values to the `Access-Control-Expose-Headers` response header, select Expose headers, and select from the following options:
    - Predefined - The predefined value of the Gateway. This option is selected by default.
    - Backend - The value of `Access-Control-Expose-Headers` from the backend response.
    - Custom - A custom string.
  - Click Create.
  - Alongside Allowed Origins click Add.
  - Enter the origin URL, then click Create. This setting indicates that the response can be shared with requesting code from the specified origin.
- To modify an existing CORS policy, click its Allowed Origins entry on the CORS page. You can then modify individual origin URLs, add further origins, and change the Allow Credentials setting.

5. Click Save to save your changes.

6. Optional: To implement your own CORS solution using custom OPTIONS operations, complete the following steps:

- a. Add the following headers to your HTTP responses:

```
Access-Control-Allow-Origin: https://<portalhostname>  
Access-Control-Allow-Headers: Origin, X-Requested-With, Content-Type, Accept
```

Where `<portalhostname>` is your Developer Portal host name.

- b. Optional: You can proxy your API through API Connect as an enforced invoke API so that CORS is handled automatically.

Important:

- If you implement your own CORS solution, you **must** disable the CORS option described in step 3
- CORS preflight requests are sent by using the HTTP `OPTIONS` method. Therefore, if you require these requests to be handled by the API Connect gateway then you must enable the `OPTIONS` method for all APIs that will handle preflight requests; see [Defining Paths for a REST API](#).
- `OPTIONS` requests are counted as API calls against any configured rate limit. Note that you can apply rate limits to individual operations; see [Defining rate limits for an API operation](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Specifying external documentation for an API

You can reference an external resource for extended documentation for an API.

### About this task

Note:

- This task relates to configuring an OpenAPI 3.0 API definition. For details on how to configure an OpenAPI 2.0 API definition, see [Editing an OpenAPI 2.0 API definition](#).
- OpenAPI 3.0 APIs are supported only with the DataPower® API Gateway, not with the DataPower Gateway (v5 compatible).
- For details of current OpenAPI 3.0 support limitations, see [OpenAPI 3.0 support in IBM® API Connect](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

### Procedure

1. Open the required API for editing, as described in [Editing an OpenAPI 3.0 API definition](#).
2. Expand the General section, then click External Documentation.
3. Provide the following information:
  - URL (required): The URL for the target documentation.
  - Description: An optional description of the target documentation. You can use [CommonMark syntax](#) for rich text representation.
4. Click Save when done.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Adding tags to an API

You can include tags in API definition. Such tags are added to the OpenAPI definition of the API but are not used by API Connect for any indexing.

### About this task

---

Note:

- This task relates to configuring an OpenAPI 3.0 API definition. For details on how to configure an OpenAPI 2.0 API definition, see [Editing an OpenAPI 2.0 API definition](#).
- OpenAPI 3.0 APIs are supported only with the DataPower® API Gateway, not with the DataPower Gateway (v5 compatible).
- For details of current OpenAPI 3.0 support limitations, see [OpenAPI 3.0 support in IBM® API Connect](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

### Procedure

---

1. Open the required API for editing, as described in [Editing an OpenAPI 3.0 API definition](#).
2. Expand the General then, if there already one or more tags defined, expand Tags.
3. To add a new tag, click the add icon  alongside Tags in the navigation pane. To edit an existing tag, click the tag name in the navigation pane.
4. Provide the following information:
  - Name (required): The name of the tag.
  - Description: An optional description of the tag. You can use [CommonMark syntax](#) for rich text representation.
  - External Documentation\_>\_URL (available when editing an existing tag): The URL for target documentation that describes this tag.
  - External Documentation\_>\_Description (available when editing an existing tag): An optional description of the target documentation.
5. If you are creating a new tag, click Create.  
The tag details are displayed for further editing as described in step 4.
6. Click Save when done.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Defining Paths for an API

A Path is a unit of a REST API that you can call. A Path comprises an HTTP verb and a URL path. By configuring the Path, you define how the API is exposed to your developers.

### About this task

---

Note:

- This task relates to configuring an OpenAPI 3.0 API definition. For details on how to configure an OpenAPI 2.0 API definition, see [Editing an OpenAPI 2.0 API definition](#).
- OpenAPI 3.0 APIs are supported only with the DataPower® API Gateway, not with the DataPower Gateway (v5 compatible).
- For details of current OpenAPI 3.0 support limitations, see [OpenAPI 3.0 support in IBM® API Connect](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

The Path is appended to the server URL to form the full URL. For details on configuring servers, see [Defining servers for an API](#).

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

### Procedure

---

1. Open the required API for editing, as described in [Editing an OpenAPI 3.0 API definition](#).
2. If there are already one or more Paths defined, expand Paths.
3. To create a new Path, click the add icon  alongside Paths in the navigation pane. To edit an existing Path, click the Path in the navigation pane.
4. Provide the following information:
  - Path: A relative path to an individual endpoint.  
The path is appended to the base path to construct the full URI to access the APIs. The path must start, but not end, with the / character. A parameter at the end of the path can contain a qualifier to match one or more path levels.

If you specify just the name of the parameter, then one level of that path is matched. If you want to allow for multiple levels of the path, you can prefix the parameter with one of the following qualifiers:

- \* to indicate 0 or more occurrences
- + to indicate 1 or more occurrences

The + and \* qualifiers can only be used at the end of the path.

For example, the path:

```
/petstore/{type}/{*category}
```

matches the following paths, where only one type value is matched, but all (0 or more) categories are matched:

```
/petstore/cats
/petstore/cats/supplies
/petstore/cats/supplies/health
/petstore/cats/supplies/health/medicines
/petstore/cats/supplies/health/medicines/a/b/c
```

- Ref (available when editing an existing Path): A reference to a Path that is defined elsewhere, either in this OpenAPI definition, or in an external file. A reference enables reuse of a set of operations already defined for a Path in this API, or in a file that is either a complete API definition or an OpenAPI fragment.

The reference uses JSON pointer notation. For example, a reference to a Path called `/mypath` in this API would have the following format:

```
#/paths/~1mypath
```

The `~1` characters are used to escape the `/` character, which is being used literally in the path name rather than as a special character.

A reference to a path in an external file called `path_fragments.yaml` would have the following format:

```
file://path_fragments.yaml/paths/~1mypath
```

- Summary: An optional summary, intended to apply to all operations in this path.
- Description: An optional description, intended to apply to all operations in this path. You can use [CommonMark syntax](#) for rich text representation.

5. If you are creating a new Path, click Create.

The Path details are displayed for further editing as described in step 4.

6. Click Save when done.

- [Defining servers for a Path](#)

Server definitions for a Path provide alternative target servers when calling the API at that Path.

- [Defining parameters for a Path](#)

Path parameters can specify variable elements of a URL path, query parameters, headers, or a request body. The parameters apply to all the operations defined under the path. A Path parameter can be overridden at the operation level but cannot be removed there.

- [Defining operations for a Path](#)

Operations on a Path defines the mechanisms available for interacting with the API when it is called using that Path. An operation can be of various pre-defined types; for example, a POST operation is most commonly used for creating new resources, while a GET operation is used to retrieve a resource.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.

For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Defining servers for a Path

Server definitions for a Path provide alternative target servers when calling the API at that Path.

---

### About this task

Note:

- This task relates to configuring an OpenAPI 3.0 API definition. For details on how to configure an OpenAPI 2.0 API definition, see [Editing an OpenAPI 2.0 API definition](#).
- OpenAPI 3.0 APIs are supported only with the DataPower® API Gateway, not with the DataPower Gateway (v5 compatible).
- For details of current OpenAPI 3.0 support limitations, see [OpenAPI 3.0 support in IBM® API Connect](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

Note: It is unlikely that you will need to define servers for a Path because it applies only if the API operations are distributed across different gateway endpoints, and such a configuration is possible only if you are hosting your API operations on your own runtime endpoints outside of API Connect. For an API that is published to the DataPower API Gateway, all API operations are invoked on the same gateway service.

A server defined for a Path overrides any server defined for the parent API. You can define more than one server but only the first is used by API Connect.

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

---

## Procedure

1. Open the required API for editing, as described in [Editing an OpenAPI 3.0 API definition](#).
2. Expand Paths.
3. Expand the required Path, then, if there already one or more servers defined for the Path, expand Servers.
4. To create a new server definition for the Path, click the add icon  alongside Servers under the Path in the navigation pane. To edit an existing server definition, click the server URL under the Path in the navigation pane.
5. Provide the following information:
  - Server URL (required): The specified URL is used to determine the full URL endpoint for the calling the API, taking into account any vanity endpoint configuration in the Catalog in which the API is published. For an API that is enforced by the DataPower API Gateway, the value entered here is interpreted as

the basepath so you would typically provide only the basepath value; for example:

```
/my_basepath
```

For full details on how the server URL is used to determine the full URL endpoint, see [Configuring vanity endpoints for a Catalog](#).

- Server Description: An optional description of the host designated by the URL. You can use [CommonMark syntax](#) for rich text representation.
  - Server Variables (available when editing an existing server definition): A server variable defines a map between a variable name and its value. The value is used for substitution in the server's URL template.
    - To add a new server variable, click Add. To edit an existing server variable, click the variable name.
    - Provide the following information:
      - Server Variable Name (required).
      - Default value (required).
      - An optional rich text description. You can use [CommonMark syntax](#) for rich text representation.
      - One or more Enum Value entries (available when editing an existing server variable). Enum values specify an enumeration of string values to be used if the substitution options are from a limited set. To add a new Enum value, click Add, enter the value, then click Create. To edit an existing Enum value, click the Enum value.
    - If you are creating a new server variable, click Create. The server variable details are displayed for further editing.
    - If required, use the breadcrumb trail to return to your server definition for further editing.
6. If you are creating a new server definition, click Create.  
The path details are displayed for further editing as described in [5](#).
7. Click Save when done.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Defining parameters for a Path

Path parameters can specify variable elements of a URL path, query parameters, headers, or a request body. The parameters apply to all the operations defined under the path. A Path parameter can be overridden at the operation level but cannot be removed there.

---

### About this task

Note:

- This task relates to configuring an OpenAPI 3.0 API definition. For details on how to configure an OpenAPI 2.0 API definition, see [Editing an OpenAPI 2.0 API definition](#).
- OpenAPI 3.0 APIs are supported only with the DataPower® API Gateway, not with the DataPower Gateway (v5 compatible).
- For details of current OpenAPI 3.0 support limitations, see [OpenAPI 3.0 support in IBM® API Connect](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

A parameter is similar to a header, with the following differences:

- Parameters carry actual data and are available to end users, headers carry meta data associated with a request or response and are hidden from end users.
- A parameter can have various locations, the location of a header is always set to **header**.
- A parameter can have various format styles, the style of a header is always **simple**.

For more information on headers, see [Creating a header](#).

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

---

## Procedure

1. Open the required API for editing, as described in [Editing an OpenAPI 3.0 API definition](#).
2. Expand Paths.
3. Expand the required Path, then, if there already one or more parameters defined, expand Parameters.
4. You can either create a new parameter, or edit any existing parameter.
  - To create a parameter, click the add icon  alongside Parameters, then refer to [Creating a parameter](#).
  - To edit an existing parameter, click the parameter name in the navigation pane, then refer to [Editing a parameter](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Defining operations for a Path

Operations on a Path defines the mechanisms available for interacting with the API when it is called using that Path. An operation can be of various pre-defined types; for example, a POST operation is most commonly used for creating new resources, while a GET operation is used to retrieve a resource.

## About this task

---

Note:

- This task relates to configuring an OpenAPI 3.0 API definition. For details on how to configure an OpenAPI 2.0 API definition, see [Editing an OpenAPI 2.0 API definition](#).
- OpenAPI 3.0 APIs are supported only with the DataPower® API Gateway, not with the DataPower Gateway (v5 compatible).
- For details of current OpenAPI 3.0 support limitations, see [OpenAPI 3.0 support in IBM® API Connect](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

## Procedure

---

1. Open the required API for editing, as described in [Editing an OpenAPI 3.0 API definition](#).
  2. Expand Paths.
  3. Expand the required Path, then, if there are one or more operations, expand Operations.
  4. To create an operation, click the add icon  alongside Operations under the Path in the navigation pane. To edit an existing operation, click the operation name under the Path in the navigation pane.
  5. Provide the following information:
    - Verb: Select the operation type from the following options:
      - get
      - post
      - put
      - delete
      - options
      - head
      - patch
      - trace
    - Summary: A summary of what the operation does.
    - Description: A description of the operation behavior. You can use [CommonMark syntax](#) for rich text representation.
    - Operation ID: Unique string used to identify the operation. The id must be unique among all operations described in the API.
    - Deprecated: Declares this operation to be deprecated. Consumers should refrain from using the declared operation.
  6. If you are creating a Path operation, click Create.
  7. Click Save when done.
- [Adding tags to an operation](#)  
You can include tags in API operation definition. Such tags are added to the OpenAPI definition of the API but are not used by API Connect for any indexing.
  - [Specifying external documentation for an operation](#)  
You can referencing an external resource for extended documentation for an API operation.
  - [Defining parameters for an operation](#)  
Operation parameters can, for the URL path associated with that specific operation, define variable elements of the URL path, query parameters, headers, or body parameters.
  - [Defining the request body for an operation](#)  
A request body defines the structure of the body of an API request.
  - [Defining responses for an operation](#)  
Responses define the HTTP status code and data returned in a response body and headers.
  - [Enforcing security requirements on an operation](#)  
To enforce security requirements on an API operation, you apply previously created security scheme components that define various aspects of API security configuration.
  - [Defining servers for an operation](#)  
Server definitions for an API operation provide alternative target servers when calling that operation.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Adding tags to an operation

You can include tags in API operation definition. Such tags are added to the OpenAPI definition of the API but are not used by API Connect for any indexing.

## About this task

---

Note:

- This task relates to configuring an OpenAPI 3.0 API definition. For details on how to configure an OpenAPI 2.0 API definition, see [Editing an OpenAPI 2.0 API definition](#).
- OpenAPI 3.0 APIs are supported only with the DataPower® API Gateway, not with the DataPower Gateway (v5 compatible).
- For details of current OpenAPI 3.0 support limitations, see [OpenAPI 3.0 support in IBM® API Connect](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

## Procedure

---

1. Open the required API for editing, as described in [Editing an OpenAPI 3.0 API definition](#).
2. Expand Paths, then expand the required Path.
3. Expand Operations, then expand the required operation.
4. To add a new operation tag, click the add icon  alongside the Tags entry for the operation in the navigation pane. To edit an existing tag, expand Tags then click the tag name in the navigation pane.
5. Provide the following information:
  - Name (required): The name of the tag.
6. If you are creating a new operation tag, click Create.  
The tag details are displayed for further editing as described in step 5.
7. Click Save when done.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Specifying external documentation for an operation

You can referencing an external resource for extended documentation for an API operation.

### About this task

---

Note:

- This task relates to configuring an OpenAPI 3.0 API definition. For details on how to configure an OpenAPI 2.0 API definition, see [Editing an OpenAPI 2.0 API definition](#).
- OpenAPI 3.0 APIs are supported only with the DataPower® API Gateway, not with the DataPower Gateway (v5 compatible).
- For details of current OpenAPI 3.0 support limitations, see [OpenAPI 3.0 support in IBM® API Connect](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

## Procedure

---

1. Open the required API for editing, as described in [Editing an OpenAPI 3.0 API definition](#).
2. Expand Paths, then expand the required Path.
3. Expand Operations, expand the required operation, then click External Documentation.
4. Provide the following information:
  - URL (required): The URL for the target documentation.
  - Description: An optional description of the target documentation. You can use [CommonMark syntax](#) for rich text representation.
5. Click Save when done.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Defining parameters for an operation

Operation parameters can, for the URL path associated with that specific operation, define variable elements of the URL path, query parameters, headers, or body parameters.

### About this task

---

Note:

- This task relates to configuring an OpenAPI 3.0 API definition. For details on how to configure an OpenAPI 2.0 API definition, see [Editing an OpenAPI 2.0 API definition](#).
- OpenAPI 3.0 APIs are supported only with the DataPower® API Gateway, not with the DataPower Gateway (v5 compatible).
- For details of current OpenAPI 3.0 support limitations, see [OpenAPI 3.0 support in IBM® API Connect](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

An operation parameter overrides a parameter of the same name defined on the parent Path; see [Defining parameters for a Path](#).

A parameter is similar to a header, with the following differences:

- Parameters carry actual data and are available to end users, headers carry meta data associated with a request or response and are hidden from end users.
- A parameter can have various locations, the location of a header is always set to **header**.
- A parameter can have various format styles, the style of a header is always **simple**.

For more information on headers, see [Creating a header](#).

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

## Procedure

1. Open the required API for editing, as described in [Editing an OpenAPI 3.0 API definition](#).
2. Expand Paths, then expand the required Path.
3. Expand Operations, then expand the required operation.
4. You can either create a new operation parameter, or edit any existing parameter.
  - To create an operation parameter, click the add icon  alongside Parameter, then refer to [Creating a parameter](#).
  - To edit an existing operation parameter, click the parameter name in the navigation pane, then refer to [Editing a parameter](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Defining the request body for an operation

A request body defines the structure of the body of an API request.

### About this task

Note:

- This task relates to configuring an OpenAPI 3.0 API definition. For details on how to configure an OpenAPI 2.0 API definition, see [Editing an OpenAPI 2.0 API definition](#).
- OpenAPI 3.0 APIs are supported only with the DataPower® API Gateway, not with the DataPower Gateway (v5 compatible).
- For details of current OpenAPI 3.0 support limitations, see [OpenAPI 3.0 support in IBM® API Connect](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

Note: The user interface doesn't currently support referencing a request body component from an operation. However, you can add the reference directly to the OpenAPI YAML source for your API definition, for example:

```
paths:
  /mypath:
    get:
      .
      .
      .
      requestBody:
        $ref: '#/components/requestBodies/my_requestbody_component'
      .
      .
      .
```

For information on request body components, see [Defining request body components](#).

## Procedure

1. Open the required API for editing, as described in [Editing an OpenAPI 3.0 API definition](#).
2. Expand Paths, then expand the required Path.
3. Expand Operations, expand the required operation, then click requestBody.
4. Provide the following information:
  - Description: An optional description of the request body. This could contain examples of use. You can use [CommonMark syntax](#) for rich text representation.
  - Content: A content definition describes the content of the request body.
    - To define a new content definition for the request body, click Add, then refer to [Creating a content definition](#).
    - To edit an existing content definition, click the content definition name, then refer to [Editing a content definition](#).
  - Required: Determines if the request body is required in the request.
5. Click Save when done.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Defining responses for an operation

Responses define the HTTP status code and data returned in a response body and headers.

### About this task

---

Note:

- This task relates to configuring an OpenAPI 3.0 API definition. For details on how to configure an OpenAPI 2.0 API definition, see [Editing an OpenAPI 2.0 API definition](#).
- OpenAPI 3.0 APIs are supported only with the DataPower® API Gateway, not with the DataPower Gateway (v5 compatible).
- For details of current OpenAPI 3.0 support limitations, see [OpenAPI 3.0 support in IBM® API Connect](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

### Procedure

---

1. Open the required API for editing, as described in [Editing an OpenAPI 3.0 API definition](#).
2. Expand Paths, then expand the required Path.
3. Expand Operations, expand the required operation, then, if there are any existing responses, expand Responses.
4. You can either create a new response, or edit any existing response.
  - To create a response, click the add icon  alongside Responses, then refer to [Creating a response](#).
  - To edit an existing response, click the response name in the navigation pane, then refer to [Editing a response](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Enforcing security requirements on an operation

To enforce security requirements on an API operation, you apply previously created security scheme components that define various aspects of API security configuration.

### About this task

---

Note:

- This task relates to configuring an OpenAPI 3.0 API definition. For details on how to configure an OpenAPI 2.0 API definition, see [Editing an OpenAPI 2.0 API definition](#).
- OpenAPI 3.0 APIs are supported only with the DataPower® API Gateway, not with the DataPower Gateway (v5 compatible).
- For details of current OpenAPI 3.0 support limitations, see [OpenAPI 3.0 support in IBM® API Connect](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

For details on how to create and configure security scheme components, see [Defining security scheme components](#).

A security requirement specifies one or more security scheme components whose conditions must all be satisfied for the API operation to be called successfully. You can define multiple security requirements; in this case, an application can call your API operation if it satisfies any of the security requirements you have defined.

Any security requirements that you define for an operation completely override any security requirements defined on the parent API. If you do not define any security requirements for an operation, or you delete all security requirements from an operation, the operation inherits the security requirements defined on the parent API. For more information, see [Enforcing security requirements on an API](#).

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

### Procedure

---

1. Open the required API for editing, as described in [Editing an OpenAPI 3.0 API definition](#).
2. Expand Paths, then expand the required Path.
3. Expand Operations, then expand the required operation.
4. To create a new security requirement for the operation, complete the following steps:
  - a. Click the add icon  alongside the Security Requirements entry for the operation in the navigation pane.
  - b. Select the security schemes that you want to include in this security requirement. The security schemes listed are those that have been defined in security scheme components; see [Defining security scheme components](#).

If a selected security scheme is of type OAuth2, select the required scopes; the scopes available for selection are those that were specified in the security scheme component; for more information, see [Defining OAuth2 security scheme components](#).

If you are applying the OAuth2 security scheme to an API that is enforced by the DataPower API Gateway, you only need select any scopes if Advanced scope check after token generation is not enabled in the native OAuth provider associated with the security scheme. If a default scope has been set in the native OAuth provider and the API request doesn't contain any scope, the default scope is used; for more information, see [Configuring scopes for a native OAuth provider](#).

Note: The following additional requirement applies to security schemes that will be used with an OAuth third party provider. If you select an OAuth security scheme for protecting a consumer API, you must also include an API key security scheme, as the `X-IBM-Client-Id` or `client_id` must be included in the security credentials so that the correct Plan configuration settings can be enforced.

- c. Click Create. The security scheme selections are shown; you can change them again before saving.
- d. Click Submit when done.
5. To modify an existing security requirement, complete the following steps:
  - a. Click the Security entry for the operation in the navigation pane. All previously defined security requirements are listed; the security schemes included in each security requirement are shown.
  - b. To change the security schemes for a security requirement, click the edit icon  alongside the required security requirement, then change your security requirement selections as required.
  - c. Click Submit when done, then click Save.
  - d. To delete a security requirement, click the appropriate delete icon , click Delete to confirm, then click Save.
  - e. To disable security for the operation, clear the Require one of the following Security Requirements check box, then click Save.

Note: These settings completely override any security requirements defined on the parent API; see [Enforcing security requirements on an API](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Defining servers for an operation

Server definitions for an API operation provide alternative target servers when calling that operation.

### About this task

---

Note:

- This task relates to configuring an OpenAPI 3.0 API definition. For details on how to configure an OpenAPI 2.0 API definition, see [Editing an OpenAPI 2.0 API definition](#).
- OpenAPI 3.0 APIs are supported only with the DataPower® API Gateway, not with the DataPower Gateway (v5 compatible).
- For details of current OpenAPI 3.0 support limitations, see [OpenAPI 3.0 support in IBM® API Connect](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

A server defined for an operation overrides any server defined for the parent API or Path. You can define more than one server but only the first is used by API Connect.

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

### Procedure

---

1. Open the required API for editing, as described in [Editing an OpenAPI 3.0 API definition](#).
2. Expand Paths, then expand the required Path.
3. Expand Operations, expand the required operation, then, if there already one or more servers defined for the operation, expand Servers.
4. To create a new server definition for the operation, click the add icon  alongside Servers under the operation in the navigation pane. To edit an existing server definition, click the server URL under the operation in the navigation pane.
5. Provide the following information:
  - Server URL (required): The specified URL is used to determine the full URL endpoint for the calling the API, taking into account any vanity endpoint configuration in the Catalog in which the API is published. For an API that is enforced by the DataPower API Gateway, the value entered here is interpreted as the basepath so you would typically provide only the basepath value; for example:

`/my_basepath`

For full details on how the server URL is used to determine the full URL endpoint, see [Configuring vanity endpoints for a Catalog](#).

- Server Description: An optional description of the host designated by the URL. You can use [CommonMark syntax](#) for rich text representation.
  - Server Variables (available when editing an existing server definition): A server variable defines a map between a variable name and its value. The value is used for substitution in the server's URL template.
    - To add a new server variable, click Add. To edit an existing server variable, click the variable name.
    - Provide the following information:
      - Server Variable Name (required).
      - Default value (required).
      - An optional rich text description. You can use [CommonMark syntax](#) for rich text representation.
      - One or more Enum Value entries (available when editing an existing server variable). Enum values specify an enumeration of string values to be used if the substitution options are from a limited set. To add a new Enum value, click Add, enter the value, then click Create. To edit an existing Enum value, click the Enum value.
    - If you are creating a new server variable, click Create. The server variable details are displayed for further editing.
    - If required, use the breadcrumb trail to return to your server definition for further editing.
6. If you are creating a new server definition, click Create.

- The path details are displayed for further editing as described in [5](#).
- Click Save when done.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Defining components for an API

Components are reusable objects relating to various aspects of your API definition. A component has no effect on the API unless it is explicitly referenced from elsewhere in your API definition.

Note:

- This task relates to configuring an OpenAPI 3.0 API definition. For details on how to configure an OpenAPI 2.0 API definition, see [Editing an OpenAPI 2.0 API definition](#).
- OpenAPI 3.0 APIs are supported only with the DataPower® API Gateway, not with the DataPower Gateway (v5 compatible).
- For details of current OpenAPI 3.0 support limitations, see [OpenAPI 3.0 support in IBM® API Connect](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

The following subtopics detail the various types of API component:

- Defining schema components**  
Schema components define reusable schemas that provide developers with information about the request they should make, or the response they should expect to receive, when calling an API operation.
- Defining response components**  
Response components define reusable response objects that specify the HTTP status code and data returned in a response body and headers.
- Defining parameter components**  
Parameter components define reusable parameters that can specify variable elements of a URL path, query parameters, headers, or a request body.
- Defining example components**  
An example component is a reusable example that you can add to an API to make the specification of your API clearer.
- Defining request body components**  
A request body component is a reusable definition of the structure of the body of an API request.
- Defining header components**  
A header component defines a reusable custom header that can be sent in an API request or returned in an API response.
- Defining security scheme components**  
A security scheme component specifies all the settings for a particular aspect of API security; for example, the user registry that you use to authenticate access to the API.
- Defining link components**  
A link component is a reusable link definition that can be used to describe how various values returned by one operation can be used as input for other operations. In this way, links provide a known relationship and traversal mechanism between the operations.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Defining schema components

Schema components define reusable schemas that provide developers with information about the request they should make, or the response they should expect to receive, when calling an API operation.

### About this task

---

Note:

- This task relates to configuring an OpenAPI 3.0 API definition. For details on how to configure an OpenAPI 2.0 API definition, see [Editing an OpenAPI 2.0 API definition](#).
- OpenAPI 3.0 APIs are supported only with the DataPower® API Gateway, not with the DataPower Gateway (v5 compatible).
- For details of current OpenAPI 3.0 support limitations, see [OpenAPI 3.0 support in IBM® API Connect](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

To make use of a schema component, you reference it from elsewhere in your API definition. You can reference a schema from the following locations:

- An API Path parameter; see [Defining parameters for a Path](#).
- An API operation parameter; see [Defining parameters for an operation](#).
- The request body of an API operation; see [Defining the request body for an operation](#).
- An API operation response; see [Defining responses for an operation](#).

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

## Procedure

---

1. Open the required API for editing, as described in [Editing an OpenAPI 3.0 API definition](#).
2. Expand Components then, if there are already one or more schemas components defined, expand Schemas.
3. You can create a new schema component, or edit any existing schema component.
  - To create a schema component, click the add icon  alongside Schemas, then refer to [Creating a schema](#).
  - To edit an existing schema component, click the schema component name in the navigation pane, then refer to [Editing a schema](#).
- **Creating a schema**  
Schemas provide developers with information about the request they should make, or the response they should expect to receive, when calling an API operation. You can create schemas in various places in your API definition.
- **Editing a schema**  
Schemas provide developers with information about the request they should make, or the response they should expect to receive, when calling an API operation. You can edit schemas that have been previously created in various places in your API definition.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Creating a schema

Schemas provide developers with information about the request they should make, or the response they should expect to receive, when calling an API operation. You can create schemas in various places in your API definition.

## Before you begin

---

Note: Schemas are compiled before they are used for validation. Because the compilation process is longer than the validation process, the compiled schema artifacts are stored in a cache. The limited capacity of the cache can cause older entries to be evicted from the cache when newer entries are added. Schemas whose artifacts have been evicted from the cache must be recompiled, which can cause significant delays in validation.

Launch the schema creation window. For details of the areas in your API definition from where you can create a schema, see the following topics:

- [Editing a content definition](#)
- [Editing a header](#)
- [Editing a parameter](#)
- [Defining schema components](#)

## About this task

---

Note:

- This task relates to configuring an OpenAPI 3.0 API definition. For details on how to configure an OpenAPI 2.0 API definition, see [Editing an OpenAPI 2.0 API definition](#).
- OpenAPI 3.0 APIs are supported only with the DataPower® API Gateway, not with the DataPower Gateway (v5 compatible).
- For details of current OpenAPI 3.0 support limitations, see [OpenAPI 3.0 support in IBM® API Connect](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

## Procedure

---

1. Create the schema; you can either create a schema from scratch, or you can reference a schema that is defined in a schema component.
  - To create the schema from scratch, provide the following information on the Definition tab:
    - Schema Name: If you are creating a schema component, this name defines a key that enables this schema to be referenced from elsewhere in the API definition; the reference has the following format:  
`#/components/schemas/Name`
    - Title: The schema title.
    - Type: The schema data type; select one of the following:
      - array
      - boolean
      - integer
      - number
      - object
      - string
    - Description: An optional description of the schema. You can use [CommonMark syntax](#) for rich text representation.
    - Select the following options as required:
      - Nullable: Properties associated with this schema can be null.
      - Read Only: A property associated with this schema can be sent in a response but should not be sent in a request.
      - Write Only: A property associated with this schema can be sent in a request but should not be sent in a response.
      - Deprecated: The schema is deprecated and should be transitioned out of usage.
  - To reference a schema that is defined in another schema component, provide the following information on the Reference tab:

- Schema Name: If you are creating a schema component, this name defines a key that enables this schema to be referenced from elsewhere in the API definition; the reference has the following format:

**#/components/schemas/Name**

- Reference from: Select a reference to a schema component.
2. Click Create.

The schema details are displayed for further editing; see [Editing a schema](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Editing a schema

Schemas provide developers with information about the request they should make, or the response they should expect to receive, when calling an API operation. You can edit schemas that have been previously created in various places in your API definition.

### Before you begin

Note: Schemas are compiled before they are used for validation. Because the compilation process is longer than the validation process, the compiled schema artifacts are stored in a cache. The limited capacity of the cache can cause older entries to be evicted from the cache when newer entries are added. Schemas whose artifacts have been evicted from the cache must be recompiled, which can cause significant delays in validation.

Open the details form for a schema. For details of the areas in your API definition from where you can edit a schema, see the following topics:

- [Editing a content definition](#)
- [Editing a header](#)
- [Editing a parameter](#)
- [Defining schema components](#)

### About this task

Note:

- This task relates to configuring an OpenAPI 3.0 API definition. For details on how to configure an OpenAPI 2.0 API definition, see [Editing an OpenAPI 2.0 API definition](#).
- OpenAPI 3.0 APIs are supported only with the DataPower® API Gateway, not with the DataPower Gateway (v5 compatible).
- For details of current OpenAPI 3.0 support limitations, see [OpenAPI 3.0 support in IBM® API Connect](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

### Procedure

You can configure the following schema settings:

- Schema Name: Available if you are editing a schema component, this name defines a key that enables this schema to be referenced from elsewhere in the API definition; the reference has the following format:

**#/components/schemas/Name**

To change the name, click Update, change the value in the field, then click Save.

- Title: The schema title.
- Type: The schema data type; select one of the following:
  - - array
    - boolean
    - integer
    - number
    - object
    - string

Note: If you change the type of an existing schema, any existing settings that are not relevant to the new type are still retained in the OpenAPI source even though they are no longer displayed in the user interface. You should therefore avoid porting a schema from one type to another but instead either create a new schema or modify the OpenAPI source directly; to open the source editor, click the Source icon .

- Additional schema settings dependent on the selected Type, as follows:
  - array:
    - Max Items: The maximum allowed number of items in an array instance.
    - Min Items: The minimum allowed number of items in an array instance.
    - Unique Items: If selected, all items in an array instance must be unique.
  - boolean: no type specific settings.
  - integer:
    - Format: An optional data type modifier. For more information, see [Data Types](#) in the [OpenAPI Specification](#).
    - Multiple Of: Division of an integer instance by this value must result in an integer.
    - Maximum: An integer instance must be less than or equal to this value.

- Exclusive Maximum: An integer instance must be strictly less than this value.
- Minimum: An integer instance must be greater than or equal to this value.
- Exclusive Minimum: An integer instance must be strictly greater than this value.
- number:
  - Format: An optional data type modifier. For more information, see [Data Types](#) in the [OpenAPI Specification](#).
  - Multiple Of: Division of a number instance by this value must result in an integer.
  - Maximum: A number instance must be less than or equal to this value.
  - Exclusive Maximum: A number instance must be strictly less than this value.
  - Minimum: A number instance must be greater than or equal to this value.
  - Exclusive Minimum: A number instance must be strictly greater than this value.
- object
  - Properties: To add properties to the schema, click Add alongside the Properties section heading. You configure a property by defining its schema with the schema editor.  
To create the property, refer to [Creating a schema](#).

To further configure the property, follow the steps on this page.

By defining properties, you can create more complex data structures. For example, you could define an "Address" schema that has the following properties:

PROPERTY NAME	PROPERTY TYPE
street1	string
street2	string
city	string
state	string
zip_code	string

and then define a "BankBranch" schema that has the following properties, one of which is a reference to the Address schema:

PROPERTY NAME	PROPERTY TYPE
address	address
type	string
id	string

  - Max Properties: The number of properties in an object instance must be less than or equal to this value.
  - Min Properties: The number of properties in an object instance must be greater than or equal to this value.
  - Required Properties: An array of property names; every property name in the array must be the name of a property in an object instance. To add a required property name, click Add alongside the Required Properties section heading, enter the name, then click Create.- string:
  - Format: An optional data type modifier. For more information, see [Data Types](#) in the [OpenAPI Specification](#).
  - Pattern: A regular expression; a string instance must successfully match the expression.
  - Max Length: The maximum allowed number of characters in a string instance.
  - Min Length: The minimum allowed number of characters in a string instance.
  - Enum: An array of string values; a string instance must match one of the array values. To add an enum value, click Add, enter the value, then click Create.
- Description: An optional description of the schema. You can use [CommonMark syntax](#) for rich text representation.
- General settings; select the required options:
  - Nullable: Properties associated with this schema can be null.
  - Read Only: A property associated with this schema can be returned in a response but should not be included in a request. For example, properties whose values are system generated identifiers will be defined as Read Only because application clients wouldn't be able to set these.
  - Write Only: A property associated with this schema can be included in a request but should not be returned in a response. For example, password properties are usually defined as Write Only because application clients would supply these when creating a user object but shouldn't be able see them when retrieving the object.
  - Deprecated: The schema is deprecated and should be transitioned out of usage.
- Example Value: An example value. Whatever you enter here is displayed as-is in the Developer Portal.
- External Documentation: An external resource for extended documentation; provide the following information:
  - URL (required): The URL for the target documentation.
  - Description: An optional description of the target documentation. You can use [CommonMark syntax](#) for rich text representation.
- Xml: Metadata that allows for more fine-tuned XML model definitions; provide the following information:
  - Name: Replaces the name of the element or attribute used for the described schema property.
  - Namespace: The URL of the namespace definition.
  - Prefix: The prefix to be used for the Name.
  - Attribute: Specifies whether the property definition translates to an attribute instead of an element.
  - Wrapped: For an array definition, Specifies whether the array is wrapped (for example, `<books><book/></books>`) or unwrapped (`<book/>`).
- Click Save when done.

## What to do next

If required, use the breadcrumb trail to navigate to another location in the hierarchy of the object you are working on.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.

For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Defining response components

Response components define reusable response objects that specify the HTTP status code and data returned in a response body and headers.

## About this task

---

Note:

- This task relates to configuring an OpenAPI 3.0 API definition. For details on how to configure an OpenAPI 2.0 API definition, see [Editing an OpenAPI 2.0 API definition](#).
- OpenAPI 3.0 APIs are supported only with the DataPower® API Gateway, not with the DataPower Gateway (v5 compatible).
- For details of current OpenAPI 3.0 support limitations, see [OpenAPI 3.0 support in IBM® API Connect](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

To make use of a response component, you must reference it from elsewhere in your API definition.

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

## Procedure

---

1. Open the required API for editing, as described in [Editing an OpenAPI 3.0 API definition](#).
  2. Expand Components then, if there are already one or more response components defined, expand Responses.
  3. You can create a new response component, or edit any existing response component.
    - To create a response component, click the add icon  alongside Responses, then refer to [Creating a response](#).
    - To edit an existing response component, click the response component name in the navigation pane, then refer to [Editing a response](#).
- **Creating a response**  
Responses define the HTTP status code and data returned in a response body and headers. You can create responses for the Path operations in your API definition.
  - **Editing a response**  
Responses define the HTTP status code and data returned in a response body and headers. You can edit responses that have been previously created for Path operations in your API definition.
  - **Creating a content definition**  
A content definition describes the content of an API request, response, or parameter. You can create content definitions in various places in your API definition.
  - **Editing a content definition**  
A content definition describes the content of an API request, response, or parameter. You can edit content definitions that have been previously created in various places in your API definition.
  - **Creating an encoding definition**  
An encoding definition defines a map between a specific schema property and its encoding information.
  - **Editing an encoding definition**  
An encoding definition defines a map between a specific schema property and its encoding information

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Creating a response

Responses define the HTTP status code and data returned in a response body and headers. You can create responses for the Path operations in your API definition.

## Before you begin

---

Launch the response creation window. For details of the areas in your API definition from where you can create a response, see the following topics:

- [Defining responses for an operation](#)
- [Defining response components](#)

## About this task

---

Note:

- This task relates to configuring an OpenAPI 3.0 API definition. For details on how to configure an OpenAPI 2.0 API definition, see [Editing an OpenAPI 2.0 API definition](#).
- OpenAPI 3.0 APIs are supported only with the DataPower® API Gateway, not with the DataPower Gateway (v5 compatible).
- For details of current OpenAPI 3.0 support limitations, see [OpenAPI 3.0 support in IBM® API Connect](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

## Procedure

---

1. Create the response; you can either create a response from scratch, or you can reference a response that is defined in a response component.
  - To create the response from scratch, provide the following information on the Definition tab:
    - Response name: A name for the response.
      - If you are creating an operation response, this name is the HTTP status code.

If you are creating a response component, this name defines a key that enables this response to be referenced from elsewhere in the API definition; the reference has the following format:

`#/components/responses/Name`

- Description (required): A description of the response. You can use [CommonMark syntax](#) for rich text representation.
- To reference a response that is defined in a response component, provide the following information on the Reference tab:
  - Response name: A name for the response.
  - If you are creating an operation response, this name is the HTTP status code.

If you are creating a response component, this name defines a key that enables this response to be referenced from elsewhere in the API definition; the reference has the following format:

`#/components/responses/Name`

- Reference from: Select a reference to a response component.

## 2. Click Create.

The response details are displayed for further editing; see [Editing a response](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Editing a response

Responses define the HTTP status code and data returned in a response body and headers. You can edit responses that have been previously created for Path operations in your API definition.

### Before you begin

Open the details form for a response. For details of the areas in your API definition from where you can edit a response, see the following topics:

- [Defining responses for an operation](#)
- [Defining response components](#)

### About this task

Note:

- This task relates to configuring an OpenAPI 3.0 API definition. For details on how to configure an OpenAPI 2.0 API definition, see [Editing an OpenAPI 2.0 API definition](#).
- OpenAPI 3.0 APIs are supported only with the DataPower® API Gateway, not with the DataPower Gateway (v5 compatible).
- For details of current OpenAPI 3.0 support limitations, see [OpenAPI 3.0 support in IBM® API Connect](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

## Procedure

### 1. Provide the following information:

- Response name: A name for the response.
  - If you are editing an operation response, this name is the HTTP status code.

If you are editing a response component, this name defines a key that enables this response to be referenced from elsewhere in the API definition; the reference has the following format:

`#/components/responses/Name`

To change the name, click Update, then click Save when done.

- Description: A description of the response. You can use [CommonMark syntax](#) for rich text representation.
- Headers: Headers define information that can be returned in the response.
  - To define a new header for the response, click Add, then refer to [Creating a header](#).
  - To edit an existing header, click the header name, then refer to [Editing a header](#).
- Content: A content definition describes the content of the response.
  - To define a new content definition for the response, click Add, then refer to [Creating a content definition](#).
  - To edit an existing content definition, click the content definition name, then refer to [Editing a content definition](#).
- Links: Links describe how various values returned by one operation can be used as input for other operations.
  - To define a new link for the response, click Add, then refer to [Creating a link](#).
  - To edit an existing link, click the link name, then refer to [Editing a link](#).

2. Click Save when done.

## What to do next

---

If required, use the breadcrumb trail to navigate to another location in the hierarchy of the object you are working on.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Creating a content definition

A content definition describes the content of an API request, response, or parameter. You can create content definitions in various places in your API definition.

### Before you begin

---

Launch the content definition creation window. For details of the areas in your API definition from where you can create a content definition, see the following topics:

- [Editing a header](#)
- [Editing a request body](#)
- [Defining the request body for an operation](#)
- [Editing a response](#)

### About this task

---

Note:

- This task relates to configuring an OpenAPI 3.0 API definition. For details on how to configure an OpenAPI 2.0 API definition, see [Editing an OpenAPI 2.0 API definition](#).
- OpenAPI 3.0 APIs are supported only with the DataPower® API Gateway, not with the DataPower Gateway (v5 compatible).
- For details of current OpenAPI 3.0 support limitations, see [OpenAPI 3.0 support in IBM® API Connect](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

### Procedure

---

1. Provide the following information:

- Content Type: Select the content type; for example, application/json.

Note: While the Content Type field in the editor provides a selection list of media types, by editing the OpenAPI source for the API directly you can specify a [media type range](#); for example, `text/*`, `*/*json`, or `*/*`. For requests or responses that match multiple types, only the most specific type is applicable; for example, `text/plain` overrides `text/*`.

2. Click Create.

The content definition details are displayed for further editing; see [Editing a content definition](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Editing a content definition

A content definition describes the content of an API request, response, or parameter. You can edit content definitions that have been previously created in various places in your API definition.

### Before you begin

---

Open the details form for a content definition. For details of the areas in your API definition from where you can edit a content definition, see the following topics:

- [Editing a header](#)
- [Editing a request body](#)
- [Defining the request body for an operation](#)
- [Editing a response](#)

### About this task

---

Note:

- This task relates to configuring an OpenAPI 3.0 API definition. For details on how to configure an OpenAPI 2.0 API definition, see [Editing an OpenAPI 2.0 API definition](#).
- OpenAPI 3.0 APIs are supported only with the DataPower® API Gateway, not with the DataPower Gateway (v5 compatible).
- For details of current OpenAPI 3.0 support limitations, see [OpenAPI 3.0 support in IBM® API Connect](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

## Procedure

---

1. Provide the following information:

- Content Type: Select the content type; for example, `application/json`.  
Note: While the Content Type field in the editor provides a selection list of media types, by editing the OpenAPI source for the API directly you can specify a [media type range](#); for example, `text/*, */json`, or `*/*`. For requests or responses that match multiple types, only the most specific type is applicable; for example, `text/plain` overrides `text/*`.

- Schema:

To define a schema for the content definition, click Create, then refer to [Creating a schema](#).

If the content definition already has a schema defined, click View to edit the schema.

For full details on editing a schema, see [Editing a schema](#).

Note: You cannot edit the schema if it references a schema component, the schema configuration is inherited from the schema component; for details on configuring a schema component, see [Defining schema components](#). You can, however, edit the referenced schema component but any changes will be reflected anywhere that the schema component is referenced.

- Example Value: An example of a parameter value. Whatever you enter here is displayed as-is in the Developer Portal.

- Examples:

To add an example of the content, click Add, then refer to [Creating an example](#).

To edit an existing example, click the example name, then refer to [Editing an example](#).

- Encoding: An encoding definition describes how a specific schema property is encoded.

To add an encoding definition, click Add, then refer to [Creating an encoding definition](#).

To edit an existing encoding definition, click the name, then refer to [Editing an encoding definition](#).

2. Click Save when done.

## What to do next

---

If required, use the breadcrumb trail to navigate to another location in the hierarchy of the object you are working on.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.

For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Creating an encoding definition

An encoding definition defines a map between a specific schema property and its encoding information.

## Before you begin

---

Launch the encoding definition creation window when configuring a content definition; see [Editing a content definition](#).

## About this task

---

Note:

- This task relates to configuring an OpenAPI 3.0 API definition. For details on how to configure an OpenAPI 2.0 API definition, see [Editing an OpenAPI 2.0 API definition](#).
- OpenAPI 3.0 APIs are supported only with the DataPower® API Gateway, not with the DataPower Gateway (v5 compatible).
- For details of current OpenAPI 3.0 support limitations, see [OpenAPI 3.0 support in IBM® API Connect](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

## Procedure

---

1. Provide the following information:

- Name: The name of the schema property.
- Content Type: The Content-Type for encoding the property; for example, `application/xml; charset=utf-8, image/png, image/jpeg`.
- Style: Describes how the property value will be serialized depending on the type of the property value. Select one of the following options:

- form: Form style properties defined by [RFC6570](#).
  - spaceDelimited: Space separated array values.
  - pipeDelimited: Pipe separated array values.
  - deepObject: Provides a simple way of rendering nested objects using form properties.
  - Explode: When selected, property values of type **array** or **object** generate separate properties for each value of the array or key-value pair of the map.
  - Allow Reserved: Determines whether the property value should allow reserved characters, as defined by [RFC3986](#) (:/?#[]@!\$&'()\*+,-;=) to be included without percent-encoding.
2. Click Create.
- The encoding definition details are displayed for further editing; see [Editing an encoding definition](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Editing an encoding definition

An encoding definition defines a map between a specific schema property and its encoding information

### Before you begin

Open the details form for an encoding definition when configuring a content definition; see [Editing a content definition](#).

### About this task

Note:

- This task relates to configuring an OpenAPI 3.0 API definition. For details on how to configure an OpenAPI 2.0 API definition, see [Editing an OpenAPI 2.0 API definition](#).
- OpenAPI 3.0 APIs are supported only with the DataPower® API Gateway, not with the DataPower Gateway (v5 compatible).
- For details of current OpenAPI 3.0 support limitations, see [OpenAPI 3.0 support in IBM® API Connect](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

### Procedure

1. Provide the following information:

- Name: The name of the schema property. To change the name, click Update, then click Save when done.
- Content Type: The Content-Type for encoding the property; for example:
  - `application/xml; charset=utf-8`
  - `image/png`, `image/jpeg`.
- Headers: A map allowing additional information to be provided as headers. To add a new header, click Add, then refer to [Creating a header](#).

To edit an existing header, click the header name, then refer to [Editing a header](#).

- Style: Describes how the property value will be serialized depending on the type of the property value. Select one of the following options:
  - form: Form style properties defined by [RFC6570](#).
  - spaceDelimited: Space separated array values.
  - pipeDelimited: Pipe separated array values.
  - deepObject: Provides a simple way of rendering nested objects using form properties.
- Explode: When selected, property values of type **array** or **object** generate separate properties for each value of the array or key-value pair of the map.
- Allow Reserved: Determines whether the property value should allow reserved characters, as defined by [RFC3986](#) (:/?#[]@!\$&'()\*+,-;=) to be included without percent-encoding.

2. Click Save when done.

### What to do next

If required, use the breadcrumb trail to navigate to another location in the hierarchy of the object you are working on.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Defining parameter components

Parameter components define reusable parameters that can specify variable elements of a URL path, query parameters, headers, or a request body.

## About this task

---

Note:

- This task relates to configuring an OpenAPI 3.0 API definition. For details on how to configure an OpenAPI 2.0 API definition, see [Editing an OpenAPI 2.0 API definition](#).
- OpenAPI 3.0 APIs are supported only with the DataPower® API Gateway, not with the DataPower Gateway (v5 compatible).
- For details of current OpenAPI 3.0 support limitations, see [OpenAPI 3.0 support in IBM® API Connect](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

To make use of a parameter component, you must reference it from elsewhere in your API definition.

A parameter is similar to a header, with the following differences:

- Parameters carry actual data and are available to end users, headers carry meta data associated with a request or response and are hidden from end users.
- A parameter can have various locations, the location of a header is always set to **header**.
- A parameter can have various format styles, the style of a header is always **simple**.

For more information on headers, see [Creating a header](#).

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

## Procedure

---

1. Open the required API for editing, as described in [Editing an OpenAPI 3.0 API definition](#).
  2. Expand Components then, if there are already one or more parameter components defined, expand Parameters.
  3. You can create a new parameter component, or edit any existing parameter component.
    - To create a parameter component, click the add icon  alongside Parameters, then refer to [Creating a parameter](#).
    - To edit an existing parameter component, click the parameter component name in the navigation pane, then refer to [Editing a parameter](#).
- **Creating a parameter**  
Parameters define variable elements of a URL path, query parameters, headers, or a request body. You can create parameters for Paths and Path operations in your API definition.
  - **Editing a parameter**  
Parameters define variable elements of a URL path, query parameters, headers, or a request body. You can edit parameters that have been previously created for Paths and Path operations in your API definition.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Creating a parameter

Parameters define variable elements of a URL path, query parameters, headers, or a request body. You can create parameters for Paths and Path operations in your API definition.

## Before you begin

---

Launch the parameter creation window. For details of the areas in your API definition from where you can create a parameter, see the following topics:

- [Defining parameters for a Path](#)
- [Defining parameters for an operation](#)
- [Defining parameter components](#)

## About this task

---

Note:

- This task relates to configuring an OpenAPI 3.0 API definition. For details on how to configure an OpenAPI 2.0 API definition, see [Editing an OpenAPI 2.0 API definition](#).
- OpenAPI 3.0 APIs are supported only with the DataPower® API Gateway, not with the DataPower Gateway (v5 compatible).
- For details of current OpenAPI 3.0 support limitations, see [OpenAPI 3.0 support in IBM® API Connect](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

A parameter is similar to a header, with the following differences:

- Parameters carry actual data and are available to end users, headers carry meta data associated with a request or response and are hidden from end users.
- A parameter can have various locations, the location of a header is always set to **header**.
- A parameter can have various format styles, the style of a header is always **simple**.

For more information on headers, see [Creating a header](#).

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

## Procedure

1. Create the parameter; you can either create a parameter from scratch, or you can reference a parameter that is defined in a parameter component.
  - To create the parameter from scratch, provide the following information on the Definition tab:
    - Name: Available if you are creating a parameter component, this name defines a key that enables this parameter to be referenced from elsewhere in the API definition; the reference has the following format:  

```
#/components/parameters/Name
```
    - Parameter name (required): The name of the parameter.
    - Located In (required): The location of the parameter. Select one of the following options:
      - query: Parameters that are appended to the URL. For example, `url_path?myparam=myvalue`.
      - header: Custom headers that are expected as part of the request.
      - path: The parameter value is part of the operation's URL, enclosed in {}.
      - cookie: Used to pass a specific cookie value to the API.
    - Description: A description of the parameter. You can use [CommonMark syntax](#) for rich text representation.
    - Style: Describes how the parameter value will be serialized depending on the type of the parameter value. Select one of the following options:
      - matrix: Path-style parameters defined by [RFC6570](#).
      - label: Label style parameters defined by [RFC6570](#).
      - simple: Simple style parameters defined by [RFC6570](#).
      - form: Form style parameters defined by [RFC6570](#).
      - spaceDelimited: Space separated array values.
      - pipeDelimited: Pipe separated array values.
      - deepObject: Provides a simple way of rendering nested objects using form parameters.
    - Select the following options as required:
      - Required: Determines whether this parameter is mandatory. If the Located In property is set to path, this option must be selected.
      - Deprecated: Specifies that a parameter is deprecated and should be transitioned out of usage.
      - Allows Empty Value: Allows sending a parameter with an empty value. This is valid only if the Located In property is set to query.
      - Explode: When selected, parameter values of type `array` or `object` generate separate parameters for each value of the array or key-value pair of the map.
      - Allow Reserved: Determines whether the parameter value should allow reserved characters, as defined by [RFC3986](#) (:/?#[ ]@!\$&'()\*+,-;=) to be included without percent-encoding. This property applies only if the Located In property is set to query.
    - To reference a parameter that is defined in a parameter component, provide the following information on the Reference tab:
      - Name: Available if you are creating a parameter component, this name defines a key that enables this parameter to be referenced from elsewhere in the API definition; the reference has the following format:  

```
#/components/parameters/Name
```
      - Parameter name (required, available if you are creating a path or operation parameter): The name of the parameter.
      - Reference from: Select a reference to a parameter component.
2. Click Create.

The parameter details are displayed for further editing; see [Editing a parameter](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#), for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Editing a parameter

Parameters define variable elements of a URL path, query parameters, headers, or a request body. You can edit parameters that have been previously created for Paths and Path operations in your API definition.

## Before you begin

Open the details form for a parameter. For details of the areas in your API definition from where you can edit a parameter, see the following topics:

- [Defining parameters for a Path](#)
- [Defining parameters for an operation](#)
- [Defining parameter components](#)

## About this task

Note:

- This task relates to configuring an OpenAPI 3.0 API definition. For details on how to configure an OpenAPI 2.0 API definition, see [Editing an OpenAPI 2.0 API definition](#).
- OpenAPI 3.0 APIs are supported only with the DataPower® API Gateway, not with the DataPower Gateway (v5 compatible).
- For details of current OpenAPI 3.0 support limitations, see [OpenAPI 3.0 support in IBM® API Connect](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

A parameter is similar to a header, with the following differences:

- Parameters carry actual data and are available to end users, headers carry meta data associated with a request or response and are hidden from end users.
- A parameter can have various locations, the location of a header is always set to `header`.
- A parameter can have various format styles, the style of a header is always `simple`.

For more information on headers, see [Creating a header](#).

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

## Procedure

1. Provide the following information:

- Name: Available if you are editing a parameter component, this name defines a key that enables this parameter to be referenced from elsewhere in the API definition; the reference has the following format:

```
#/components/parameters/Name
```

To change the name, click Update, then click Save when done.

- Parameter name (required): The name of the parameter.
- Located In (required): The location of the parameter. Select one of the following options:
  - query: Parameters that are appended to the URL. For example, `url_path?myparam=myvalue`.
  - header: Custom headers that are expected as part of the request.
  - path: The parameter value is part of the operation's URL, enclosed in {}.
  - cookie: Used to pass a specific cookie value to the API.
- Description: A description of the parameter. You can use [CommonMark syntax](#) for rich text representation.
- Style: Describes how the parameter value will be serialized depending on the type of the parameter value. Select one of the following options:
  - matrix: Path-style parameters defined by [RFC6570](#).
  - label: Label style parameters defined by [RFC6570](#).
  - simple: Simple style parameters defined by [RFC6570](#).
  - form: Form style parameters defined by [RFC6570](#).
  - spaceDelimited: Space separated array values.
  - pipeDelimited: Pipe separated array values.
  - deepObject: Provides a simple way of rendering nested objects using form parameters.
- Select the following options as required:
  - Required: Determines whether this parameter is mandatory. If the Located In property is set to path, this option must be selected.
  - Deprecated: Specifies that a parameter is deprecated and should be transitioned out of usage.
  - Allows Empty Value: Allows sending a parameter with an empty value. This is valid only if the Located In property is set to query.
  - Explode: When selected, parameter values of type `array` or `object` generate separate parameters for each value of the array or key-value pair of the map.
  - Allow Reserved: Determines whether the parameter value should allow reserved characters, as defined by [RFC3986](#) (`:/?#[ ]@!$&'()*+,-;=`) to be included without percent-encoding. This property applies only if the Located In property is set to query.
- Schema:

To define a schema for the parameter, click Create, then refer to [Creating a schema](#).

If the parameter already has a schema defined, click View to edit the schema.

For full details on editing a schema, see [Editing a schema](#).

Note: You cannot edit the schema if it references a schema component, the schema configuration is inherited from the schema component; for details on configuring a schema component, see [Defining schema components](#). You can, however, edit the referenced schema component but any changes will be reflected anywhere that the schema component is referenced.

- Example Value: An example of a parameter value. Whatever you enter here is displayed as-is in the Developer Portal.

2. Click Save when done.

## What to do next

If required, use the breadcrumb trail to navigate to another location in the hierarchy of the object you are working on.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.

For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Defining example components

An example component is a reusable example that you can add to an API to make the specification of your API clearer.

## About this task

Note:

- This task relates to configuring an OpenAPI 3.0 API definition. For details on how to configure an OpenAPI 2.0 API definition, see [Editing an OpenAPI 2.0 API definition](#).
- OpenAPI 3.0 APIs are supported only with the DataPower® API Gateway, not with the DataPower Gateway (v5 compatible).
- For details of current OpenAPI 3.0 support limitations, see [OpenAPI 3.0 support in IBM® API Connect](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

To make use of an example component, you must reference it from elsewhere in your API definition.

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

## Procedure

---

1. Open the required API for editing, as described in [Editing an OpenAPI 3.0 API definition](#).
  2. Expand Components then, if there are already one or more example components defined, expand Examples.
  3. You can create a new example component, or edit any existing example component.
    - To create an example component, click the add icon  alongside Examples, then refer to [Creating an example](#).
    - To edit an existing example component, click the example component name in the navigation pane, then refer to [Editing an example](#).
- **Creating an example**  
You add examples to an API to make the specification of your API clearer.
  - **Editing an example**  
You add examples to an API to make the specification of your API clearer.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Creating an example

You add examples to an API to make the specification of your API clearer.

## Before you begin

---

Launch the example creation window. For details of the areas in your API definition from where you can create an example, see the following topics:

- [Editing a content definition](#)
- [Defining example components](#)

## About this task

---

Note:

- This task relates to configuring an OpenAPI 3.0 API definition. For details on how to configure an OpenAPI 2.0 API definition, see [Editing an OpenAPI 2.0 API definition](#).
- OpenAPI 3.0 APIs are supported only with the DataPower® API Gateway, not with the DataPower Gateway (v5 compatible).
- For details of current OpenAPI 3.0 support limitations, see [OpenAPI 3.0 support in IBM® API Connect](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

## Procedure

---

1. Create the example; you can either create an example from scratch, or you can reference an example that is defined in an example component.
  - To create the example from scratch, provide the following information on the Definition tab:
    - Example Name: If you are creating an example component, this name defines a key that enables this example to be referenced from elsewhere in the API definition; the reference has the following format:  
**`#/components/examples/Name`**
    - Summary: A summary description of the example.
    - Description: A full description of the example. You can use [CommonMark syntax](#) for rich text representation.
    - External Value: A URL that points to a literal example. This provides the capability to reference examples that cannot easily be included in JSON or YAML documents. This could be a PDF, for example.
  - To reference an example that is defined in an example component, provide the following information on the Reference tab:
    - Example Name: If you are creating an example component, this name defines a key that enables this example to be referenced from elsewhere in the API definition; the reference has the following format:  
**`#/components/examples/Name`**
    - Reference from: Select a reference to an example component.
2. Click Create.  
The example details are displayed for further editing; see [Editing an example](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Editing an example

You add examples to an API to make the specification of your API clearer.

## Before you begin

---

Open the details form for an example. For details of the areas in your API definition from where you can edit an example, see the following topics:

- [Editing a content definition](#)
- [Defining example components](#)

## About this task

---

Note:

- This task relates to configuring an OpenAPI 3.0 API definition. For details on how to configure an OpenAPI 2.0 API definition, see [Editing an OpenAPI 2.0 API definition](#).
- OpenAPI 3.0 APIs are supported only with the DataPower® API Gateway, not with the DataPower Gateway (v5 compatible).
- For details of current OpenAPI 3.0 support limitations, see [OpenAPI 3.0 support in IBM® API Connect](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

## Procedure

---

1. Provide the following information:

- Example Name: If you are editing an example component, this name defines a key that enables this example to be referenced from elsewhere in the API definition; the reference has the following format:

**`#/components/examples/Name`**

To change the name, click Update, then click Save when done.

- Summary: A summary description of the example.
- Description: A full description of the example. You can use [CommonMark syntax](#) for rich text representation.
- Example Value: A literal example.
- External Value: A URL that points to a literal example. This provides the capability to reference examples that cannot easily be included in JSON or YAML documents. This could be a PDF, for example.

2. Click Save when done.

## What to do next

---

If required, use the breadcrumb trail to navigate to another location in the hierarchy of the object you are working on.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Defining request body components

A request body component is a reusable definition of the structure of the body of an API request.

## About this task

---

Note:

- This task relates to configuring an OpenAPI 3.0 API definition. For details on how to configure an OpenAPI 2.0 API definition, see [Editing an OpenAPI 2.0 API definition](#).
- OpenAPI 3.0 APIs are supported only with the DataPower® API Gateway, not with the DataPower Gateway (v5 compatible).
- For details of current OpenAPI 3.0 support limitations, see [OpenAPI 3.0 support in IBM® API Connect](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

## Procedure

---

1. Open the required API for editing, as described in [Editing an OpenAPI 3.0 API definition](#).
2. Expand Components then, if there are already one or more request body components defined, expand Request Bodies.
3. You can create a new request body component, or edit any existing request body component.
  - To create a request body component, click the add icon  alongside Request Bodies, then refer to [Creating a request body](#).
  - To edit an existing request body component, click the request body component name in the navigation pane, then refer to [Editing a request body](#).

- [Creating a request body](#)  
A request body defines the structure of the body of an API request.
- [Editing a request body](#)  
A request body defines the structure of the body of an API request.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Creating a request body

A request body defines the structure of the body of an API request.

### Before you begin

---

Launch the request body creation window; see [Defining request body components](#).

### About this task

---

Note:

- This task relates to configuring an OpenAPI 3.0 API definition. For details on how to configure an OpenAPI 2.0 API definition, see [Editing an OpenAPI 2.0 API definition](#).
- OpenAPI 3.0 APIs are supported only with the DataPower® API Gateway, not with the DataPower Gateway (v5 compatible).
- For details of current OpenAPI 3.0 support limitations, see [OpenAPI 3.0 support in IBM® API Connect](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

### Procedure

---

1. Create the request body; you can either create a request body from scratch, or you can reference a request body that is defined in a request body component.
  - To create the request body from scratch, provide the following information on the Definition tab:
    - Name: A name for the request body.  
If you are creating a request body component, this name defines a key that enables this request body to be referenced from elsewhere in the API definition; the reference has the following format:  
**`#/components/requestBodies/Name`**
    - Description: A description of the request body. You can use [CommonMark syntax](#) for rich text representation.
    - Required: Determines if the request body is required in the request.
  - To reference a request body that is defined in a request body component, provide the following information on the Reference tab:
    - Name: A name for the request body.  
If you are creating a request body component, this name defines a key that enables this request body to be referenced from elsewhere in the API definition; the reference has the following format:  
**`#/components/requestBodies/Name`**
    - Reference from: Select a reference to a request body component.
2. Click Create.  
The request body details are displayed for further editing; see [Editing a request body](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Editing a request body

A request body defines the structure of the body of an API request.

### Before you begin

---

Open the details form for a request body; see [Defining request body components](#).

### About this task

---

Note:

- This task relates to configuring an OpenAPI 3.0 API definition. For details on how to configure an OpenAPI 2.0 API definition, see [Editing an OpenAPI 2.0 API definition](#).
- OpenAPI 3.0 APIs are supported only with the DataPower® API Gateway, not with the DataPower Gateway (v5 compatible).
- For details of current OpenAPI 3.0 support limitations, see [OpenAPI 3.0 support in IBM® API Connect](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

## Procedure

1. Provide the following information:
  - Name: A name for the request body.  
Available if you are creating a request body component, this name defines a key that enables this request body to be referenced from elsewhere in the API definition; the reference has the following format:  
**#/components/requestBodies/Name**
  - Description: A description of the request body. You can use [CommonMark syntax](#) for rich text representation.
  - Content: A content definition describes the content of the request body.  
To define a new content definition for the request body, click Add, then refer to [Creating a content definition](#).  
  
To edit an existing content definition, click the content definition name, then refer to [Editing a content definition](#).
  - Required: Determines if the request body is required in the request.
2. Click Save when done.

## What to do next

If required, use the breadcrumb trail to navigate to another location in the hierarchy of the object you are working on.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Defining header components

A header component defines a reusable custom header that can be sent in an API request or returned in an API response.

## About this task

Note:

- This task relates to configuring an OpenAPI 3.0 API definition. For details on how to configure an OpenAPI 2.0 API definition, see [Editing an OpenAPI 2.0 API definition](#).
- OpenAPI 3.0 APIs are supported only with the DataPower® API Gateway, not with the DataPower Gateway (v5 compatible).
- For details of current OpenAPI 3.0 support limitations, see [OpenAPI 3.0 support in IBM® API Connect](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

To make use of a header component, you must reference it from elsewhere in your API definition.

A header is similar to a parameter, with the following differences:

- Parameters carry actual data and are available to end users, headers carry meta data associated with a request or response and are hidden from end users.
- A parameter can have various locations, the location of a header is always set to **header**.
- A parameter can have various format styles, the style of a header is always **simple**.

For more information on parameters, see [Creating a parameter](#).

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

## Procedure

1. Open the required API for editing, as described in [Editing an OpenAPI 3.0 API definition](#).
2. Expand Components then, if there are already one or more header components defined, expand Headers.
3. You can create a new header component, or edit any existing header component.
  - To create a header component, click the add icon  alongside Headers, then refer to [Creating a header](#).
  - To edit an existing header component, click the header component name in the navigation pane, then refer to [Editing a header](#).
- [Creating a header](#)  
A header defines information that can be sent in an API request or returned in an API response. You can create headers in various places in your API definition.
- [Editing a header](#)  
A header defines information that can be sent in an API request or returned in an API response. You can edit headers that have been previously created in various places in your API definition.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Creating a header

A header defines information that can be sent in an API request or returned in an API response. You can create headers in various places in your API definition.

### Before you begin

---

Launch the header creation window. For details of the areas in your API definition from where you can create a header, see the following topics:

- [Editing a response](#)
- [Editing an encoding definition](#)
- [Defining header components](#)

### About this task

---

Note:

- This task relates to configuring an OpenAPI 3.0 API definition. For details on how to configure an OpenAPI 2.0 API definition, see [Editing an OpenAPI 2.0 API definition](#).
- OpenAPI 3.0 APIs are supported only with the DataPower® API Gateway, not with the DataPower Gateway (v5 compatible).
- For details of current OpenAPI 3.0 support limitations, see [OpenAPI 3.0 support in IBM® API Connect](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

A header is similar to a parameter, with the following differences:

- Parameters carry actual data and are available to end users, headers carry meta data associated with a request or response and are hidden from end users.
- A parameter can have various locations, the location of a header is always set to **header**.
- A parameter can have various format styles, the style of a header is always **simple**.

For more information on parameters, see [Creating a parameter](#).

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

### Procedure

---

1. Create the header; you can either create a header from scratch, or you can reference a header that is defined in a header component.
  - To create the header from scratch, provide the following information on the Definition tab:
    - Header name: If you are creating a header component, this name defines a key that enables this header to be referenced from elsewhere in the API definition; the reference has the following format:  
**`#/components/headers/Name`**
    - Description: A description of the header. You can use [CommonMark syntax](#) for rich text representation.
    - Required: Determines whether this header is mandatory.
    - Deprecated: Specifies that this header is deprecated and should be transitioned out of usage.
    - Allow Empty Value: The header can be sent with an empty value.
    - Explode: When selected, header values of type **array** or **object** generate separate headers for each value of the array or key-value pair of the map.
    - Allow Reserved: Determines whether the header value should allow reserved characters, as defined by [RFC3986](#) (`:/?#[ ]@!$&'()*+,-;=`) to be included without percent-encoding.
  - To reference a header that is defined in a header component, provide the following information on the Reference tab:
    - Header name: If you are creating a header component, this name defines a key that enables this header to be referenced from elsewhere in the API definition; the reference has the following format:  
**`#/components/headers/Name`**
    - Reference from: Select a reference to a header component.
2. Click Create.  
The header details are displayed for further editing; see [Editing a header](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Editing a header

A header defines information that can be sent in an API request or returned in an API response. You can edit headers that have been previously created in various places in your API definition.

## Before you begin

- A parameter can have various locations, the location of a header is always set to **header**.
- A parameter can have various format styles, the style of a header is always **simple**.

For more information on parameters, see [Creating a parameter](#).

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

## Procedure

---

1. Provide the following information:

- Header name: If you are editing a header component, this name defines a key that enables this header to be referenced from elsewhere in the API definition; the reference has the following format:

**#/components/headers/Name**

To change the name, click Update, then click Save when done.

- Description: A description of the header. You can use [CommonMark syntax](#) for rich text representation.
- Required: Determines whether this header is mandatory.
- Deprecated: Specifies that this header is deprecated and should be transitioned out of usage.
- Allow Empty Value: The header can be sent with an empty value.
- Explode: When selected, header values of type **array** or **object** generate separate headers for each value of the array or key-value pair of the map.
- Allow Reserved: Determines whether the header value should allow reserved characters, as defined by [RFC3986](#) (:/?# [ ] @ ! \$ & ' ( ) \* + , ; =) to be included without percent-encoding.
- Schema:
  - To define a schema for the header, click Create, then refer to [Creating a schema](#).

If the header already has a schema defined, click View to edit the schema.

For full details on editing a schema, see [Editing a schema](#).

Note: You cannot edit the schema if it references a schema component, the schema configuration is inherited from the schema component; for details on configuring a schema component, see [Defining schema components](#). You can, however, edit the referenced schema component but any changes will be reflected anywhere that the schema component is referenced.

- Content: A content definition describes the content of the header.
  - To define a new content definition for the header, click Add, then refer to [Creating a content definition](#).

To edit an existing content definition, click the content definition name, then refer to [Editing a content definition](#).

2. Click Save when done.

## What to do next

---

If required, use the breadcrumb trail to navigate to another location in the hierarchy of the object you are working on.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.

For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Defining security scheme components

A security scheme component specifies all the settings for a particular aspect of API security; for example, the user registry that you use to authenticate access to the API.

Note:

- This task relates to configuring an OpenAPI 3.0 API definition. For details on how to configure an OpenAPI 2.0 API definition, see [Editing an OpenAPI 2.0 API definition](#).

- OpenAPI 3.0 APIs are supported only with the DataPower® API Gateway, not with the DataPower Gateway (v5 compatible).
- For details of current OpenAPI 3.0 support limitations, see [OpenAPI 3.0 support in IBM® API Connect](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

You can create security definitions of the following types:

Type	Description
Basic authentication	Use a basic authentication security definition to specify a user registry or an authentication URL to be used to authenticate access to the API.
API key	Use an API key security definition to specify what application credentials are required to call an API.
OAuth2	Use an OAuth2 security definition to specify settings for OAuth token based authentication for your API.

- [Defining basic authentication security scheme components](#)  
A basic authentication security scheme component is used when an application that calls the API is required to authenticate through a user registry.
- [Defining API key security scheme components](#)  
An API key security component is used to specify the credentials that an application must provide to identify itself when calling the API operations.
- [Defining OAuth2 security scheme components](#)  
An OAuth2 security scheme component defines the settings for controlling access to the API operations through the OAuth authorization standard.
- [Defining an HTTP bearer security scheme](#)  
An HTTP bearer security scheme is used to generate access tokens that are exchanged between the server and the client when calling the API operations.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Defining basic authentication security scheme components

A basic authentication security scheme component is used when an application that calls the API is required to authenticate through a user registry.

### Before you begin

For authenticating access to the operations of APIs that are enforced on the API Connect gateway, the following user registry types are supported:

- Authentication URL
- LDAP

The following user registry types are **not** supported:

- OpenID Connect (OIDC)
- Local User Registry (LUR)
- A custom user registry

Before you can create a basic authentication security definition in an API, the user registry must exist. To create a user registry, you can use either API Manager or Cloud Manager. When you create a registry in API Manager, it is visible only to your provider organization. When you create a registry in Cloud Manager, you can make it visible to multiple provider organizations.

To create a user registry with API Manager, see [Working with user registries](#).

To create a user registry with Cloud Manager, see [User registries overview](#).

### About this task

Note:

- This task relates to configuring an OpenAPI 3.0 API definition. For details on how to configure an OpenAPI 2.0 API definition, see [Editing an OpenAPI 2.0 API definition](#).
- OpenAPI 3.0 APIs are supported only with the DataPower® API Gateway, not with the DataPower Gateway (v5 compatible).
- For details of current OpenAPI 3.0 support limitations, see [OpenAPI 3.0 support in IBM® API Connect](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

When you use basic authentication, you require API users to provide a valid user name and password to access selected operations. The application developer must also provide an HTTP authorization header in requests that are sent to operations that require basic authentication.

When you use an authentication URL, the user credentials that are provided in the authorization header are validated by the endpoint specified in the URL. If the user is authenticated, IBM API Connect expects an authentication URL to return an HTTP 200 OK response status code. All other HTTP response status codes result in an authentication failure and access is denied.

For more information about using an LDAP user registry for authentication, see [LDAP authentication](#).

For information about using an Authentication URL, see [Authentication URL user registry](#).

To make use of a basic authentication security scheme component, you must reference it from elsewhere in your API definition. For more information, see [Enforcing security requirements on an API](#) and [Enforcing security requirements on an operation](#).

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

## Procedure

1. Open the required API for editing, as described in [Editing an OpenAPI 3.0 API definition](#).
2. Expand Components then, if there are already one or more security scheme components defined, expand Security Schemes.
3. To create a basic authentication security scheme component, click the add icon  alongside Security Schemes. To edit an existing basic authentication security scheme component, click the component name in the navigation pane.
4. If you are creating a new basic authentication security scheme component, you can either create it from scratch or you can reference another basic authentication security scheme component.

To create a basic authentication security scheme component from scratch, provide the following information on the Definition tab:

- Security Scheme Name (required): A key that enables this basic authentication security scheme component to be referenced from elsewhere in the API definition; the reference has the following format:

```
#/components/securitySchemes/Security_Scheme_Name
```

- Security Scheme Type (required): Select http.
- Scheme (required): The name of the HTTP Authorization scheme to be used in the Authorization header as defined in [RFC7235](#).
- Authenticate using User Registry: The name of the user registry to be used for authentication. This is the value of the **name** field that was auto-generated when the user registry was created.
- Bearer format: A hint to the client to identify how the bearer token is formatted. Bearer tokens are usually generated by an authorization server, so this information is primarily for documentation purposes.
- Description: An optional description of the basic authentication security scheme. You can use [CommonMark syntax](#) for rich text representation.

To reference another basic authentication security scheme component, provide the following information on the Reference tab:

- Security Scheme Name (required): A key that enables this basic authentication security scheme component to be referenced from elsewhere in the API definition; the reference has the following format:

```
#/components/securitySchemes/Security_Scheme_Name
```

- Reference from: Select a reference to another basic authentication security scheme component.

5. If you are creating a new basic authentication security scheme component, click Create.

The security scheme component details are displayed for further editing.

6. Click Save when done.

## What to do next

Apply the security scheme to an API or operation. For more information, see [Enforcing security requirements on an API](#) and [Enforcing security requirements on an operation](#).

For more information on LDAP and Authentication URL, see [LDAP authentication](#) and [Authentication URL user registry](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Defining API key security scheme components

An API key security component is used to specify the credentials that an application must provide to identify itself when calling the API operations.

### About this task

Note:

- This task relates to configuring an OpenAPI 3.0 API definition. For details on how to configure an OpenAPI 2.0 API definition, see [Editing an OpenAPI 2.0 API definition](#).
- OpenAPI 3.0 APIs are supported only with the DataPower® API Gateway, not with the DataPower Gateway (v5 compatible).
- For details of current OpenAPI 3.0 support limitations, see [OpenAPI 3.0 support in IBM® API Connect](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

You can require that, when calling an API operation, an application must provide either a client ID, or a client ID and client secret; you create an API key security scheme component to specify a credentials requirement. If you require that an application must provide both a client ID and client secret, you must create two API key security scheme components, one for each type of credentials.

To make use of an API key security scheme component, you must reference it from elsewhere in your API definition. For more information, see [Enforcing security requirements on an API](#) and [Enforcing security requirements on an operation](#).

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

## Procedure

1. Open the required API for editing, as described in [Editing an OpenAPI 3.0 API definition](#).
2. Expand Components then, if there are already one or more security scheme components defined, expand Security Schemes.
3. To create an API key security scheme component, click the add icon  alongside Security Schemes. To edit an API key existing security scheme component, click the component name in the navigation pane.

4. If you are creating a new API key security scheme component, you can either create it from scratch or you can reference another API key security scheme component.

To create an API key security scheme component from scratch, provide the following information on the Definition tab:

- Security Scheme Name: A key that enables this API key security scheme component to be referenced from elsewhere in the API definition; the reference has the following format:

```
#/components/securitySchemes/Security_Scheme_Name
```

- Security Scheme Type: Select apiKey.
- Name: The name of the header, query or cookie parameter to be used. For a key of type client secret you must include the string "secret", ignoring case, in the value you specify in the Name field; if the value does not contain the string "secret" then the key is assumed to be of type client ID.

Note: The client ID and client secret headers that are specified in the request when the API is called are **not** added automatically to the message context. If you need these headers in the message context for subsequent processing, include a **set-variable** policy in your API assembly that adds the headers to the message content, taking the values specified in the request; you can do this in either of the following ways:

- In the Assemble tab, add a Set Variable policy to your API assembly that defines the appropriate actions; for example:

Table 1.

Action	Set	Type	Value
Set	message.headers.X-IBM-Client-Id	string	\$(request.headers.X-IBM-Client-Id)
Set	message.headers.X-IBM-Client-Secret	string	\$(request.headers.X-IBM-Client-Secret)

For more information on configuring a Set Variable policy, see [Set Variable](#).

- In the Source tab, add a **set-variable** policy directly to the assembly section in your OpenAPI source; for example:

```
assembly:
  execute:
    - set-variable:
      version: 2.0.0
      title: set-variable
      actions:
        - set: message.headers.X-IBM-Client-Id
          value: $(request.headers.X-IBM-Client-Id)
          type: string
        - set: message.headers.X-IBM-Client-Secret
          value: $(request.headers.X-IBM-Client-Secret)
          type: string
```

For more information on defining a **set-variable** policy in your OpenAPI source, see [set-variable](#).

You should position the **set-variable** before any policy that needs to access the API key headers; for example, an invoke policy that calls a back-end service that is required to identify the application that made the initial request.

- Key Type: Select client\_id or client\_secret.  
Important: The client\_id is not confidential and functions as a "SecurityScheme" only in the meaning of the OpenAPI specification. If you use only the client\_id (without the client\_secret) as your API Key, be aware that the client\_id is not considered a confidential value in the API Manager UI; for example, it might be displayed to other authenticated members of the provider organization. The client\_id is treated as a public identifier for apps and cannot be kept private.

If authentication of the identity of the app calling an API is needed, then the API Key should use both a client\_id to identify the app, plus a client\_secret to authenticate it. The client\_secret is designed to be known only to the app and the authorization server, and it should be protected. IBM API Connect protects the client\_secret: it is only available when first generated, it can be stored as a one-way hash to prevent retrieval or leaks, and it can be changed and reset without changing the corresponding client\_id. When an API Key is not marked as a client\_secret, it will not be protected in the API Manager UI.

- Located In: Select one of the following options, to specify how the credentials are sent:
  - header: The credentials are sent in the request header.
  - query: The credentials are sent as query parameters. This method is less secure because the client secret could be exposed in a log file.

Note: If you migrated from API Connect V5, API key security definitions that contain multiple Client ID references, behave differently in Version 10 than in Version 5. For information about the differences, see [Client ID behavior in API key security definitions](#).

- Description: An optional description of the API key security scheme. You can use [CommonMark syntax](#) for rich text representation.

5. To reference another API key security scheme component, provide the following information on the Reference tab:

- Security Scheme Name: A key that enables this API key security scheme component to be referenced from elsewhere in the API definition; the reference has the following format:

```
#/components/securitySchemes/Security_Scheme_Name
```

- Reference from: Select a reference to another API key security scheme component.

6. If you are creating a new API key security scheme component, click Create.

The security scheme component details are displayed for further editing.

7. Click Save when done.

## What to do next

Apply the security scheme to an API or operation. For more information, see [Enforcing security requirements on an API](#) and [Enforcing security requirements on an operation](#).

- [Client ID behavior in API key security definitions](#)

How the Client ID behaves in API key security definitions in IBM API Connect 10 compared to Version 5.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.

For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Client ID behavior in API key security definitions

How the Client ID behaves in API key security definitions in IBM® API Connect 10 compared to Version 5.

API key security definitions that contain multiple Client ID references, behave differently in Version 10 than in Version 5. Refer to the following table to understand the differences in Client ID behavior for different use cases.

Note: Although a client\_id in the request body is supported, this data is not used during security requirement processing.

Table 1. Client ID behavior in V5 and V10

Use case	Description of security requirement	V5 behavior	V10 behavior
1	Allows client_id in the query, and the request contains multiple client_ids in the query.	Uses the first client ID in the request.	401 invalid client ID or secret.
2	Allows client_id in the header, and the request contains multiple client_ids in the header.	401 invalid client ID or secret.	401 invalid client ID or secret.
3	Allows client_id in the header, and the request contains multiple client_ids in the query and the header (1 in the query, 1 in the header).	401 client ID in wrong location.	Client ID in query is ignored.
4	Allows client_id in the query, and the request contains multiple client_ids in the query and the header.	Client ID in header is ignored.	Client ID in header is ignored.
5	Allows client_id in the query or header, and both the query and header contain multiple client_ids.	Header returns 401 client ID in wrong location. Query uses the first client ID in the request.	401 invalid client ID or secret.
6	Allows client_id in the header, and the request contains a valid client_id in the query, and an invalid client_id in the header.	401 client ID in wrong location.	401 invalid client ID or secret.
7	Allows client_id in the query, and the request contains a valid client_id in the header, and an invalid client_id in the query.	401 invalid client ID or secret.	401 invalid client ID or secret.
8	Allows client_id in the query or header, and both the query and header contain valid client_ids.	200 OK.	403 multiple client IDs.
9	Allows client_id in the query or header, and both the query and header contain invalid client_ids.	401 client ID in wrong location.	401 invalid client ID or secret.
10	Allows client_id in the query or header, and both the query and header contain a client_id, and the one in the query is valid.	200 OK.	Uses the valid one 200 OK.
11	Allows client_id in the query or header, and both the query and header contain a client_id, and the one in the header is valid.	401 client ID in wrong location.	Uses the valid one 200 OK.
12	Allows client_id in the query or header, and both the query and client_id is missing in the request (no security requirement, but client security is defined in the assembly).	401 invalid client ID or secret.	<ul style="list-style-type: none"><li>When Return V5 Responses compatibility option is off: 401 client ID is missing.</li><li>When Return V5 Responses compatibility option is on: 401 invalid client ID or secret.</li></ul> <p>For information about setting compatibility options, see <a href="#">Configuring v5 compatibility options</a>.</p>

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Defining OAuth2 security scheme components

An OAuth2 security scheme component defines the settings for controlling access to the API operations through the OAuth authorization standard.

### Before you begin

Before you can create an OAuth2 security scheme component, you must:

1. Create an OAuth provider.
  - To use Cloud Manager, see [Configuring a native OAuth provider](#) or [Configuring a third-party OAuth provider](#).
  - To use API Manager, see [Configuring a native OAuth provider](#) or [Configuring a third-party OAuth provider](#).
2. Add the OAuth provider to a catalog. If you have not created any catalogs, use the Sandbox Catalog. See the [OAuth instructions step](#) in [Creating and configuring Catalogs](#).

### About this task

Note:

- This task relates to configuring an OpenAPI 3.0 API definition. For details on how to configure an OpenAPI 2.0 API definition, see [Editing an OpenAPI 2.0 API definition](#).
- OpenAPI 3.0 APIs are supported only with the DataPower® API Gateway, not with the DataPower Gateway (v5 compatible).
- For details of current OpenAPI 3.0 support limitations, see [OpenAPI 3.0 support in IBM® API Connect](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

To make use of an OAuth2 security scheme component, you must reference it from elsewhere in your API definition. For more information, see [Enforcing security requirements on an API](#) and [Enforcing security requirements on an operation](#).

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

## Procedure

---

1. Open the required API for editing, as described in [Editing an OpenAPI 3.0 API definition](#).
2. Expand Components then, if there are already one or more security scheme components defined, expand Security Schemes.
3. To create an OAuth2 security scheme component, click the add icon  alongside Security Schemes. To edit an existing OAuth2 security scheme component, click the component name in the navigation pane.
4. If you are creating a new OAuth2 security scheme component, you can either create it from scratch or you can reference another OAuth2 security scheme component.

To create an OAuth2 security scheme component from scratch, provide the following information on the Definition tab:

- Security Scheme Name: A key that enables this OAuth2 security scheme component to be referenced from elsewhere in the API definition; the reference has the following format:

```
#/components/securitySchemes/Security_Scheme_Name
```

- Security Scheme Type: Select oauth2.
- Flow Type: Select one of the following options:
  - implicit
  - password
  - clientCredentials
  - authorizationCode
- OAuth Provider: The name of the OAuth provider to be used. This is the value of the **name** field that was auto-generated when the OAuth provider was created.
- Description: An optional description of the OAuth2 security scheme. You can use [CommonMark syntax](#) for rich text representation.

To reference another OAuth2 security scheme component, provide the following information on the Reference tab:

- Security Scheme Name: A key that enables this OAuth2 security scheme component to be referenced from elsewhere in the API definition; the reference has the following format:

```
#/components/securitySchemes/Security_Scheme_Name
```

- Reference from: Select a reference to another OAuth2 security scheme component.
5. If you are editing an existing OAuth2 security scheme component, provide the following information:

- The URL endpoints (the applicable endpoints depend on the flow type):
  - Authorization URL
  - Refresh URL
  - Token URL

Note: The URL endpoint values supplied here are maintained only for informative purposes, no validation or other action is applied to them by API Connect. The OAuth security that is applied depends on the specified OAuth provider.

- Scopes:
  - To add a new scope, click Add. To edit an existing scope, click the options icon  alongside the required scope, then click Edit.
  - Provide the following information:
    - Scope: The scope identifier.
    - Description: An optional description of the scope. You can use [CommonMark syntax](#) for rich text representation.

6. If you are creating a new OAuth2 security scheme component, click Create.

The security scheme component details are displayed for further editing.

7. Click Save when done.

## What to do next

---

Apply the security scheme to an API or operation. For more information, see [Enforcing security requirements on an API](#) and [Enforcing security requirements on an operation](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.

For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Defining an HTTP bearer security scheme

An HTTP bearer security scheme is used to generate access tokens that are exchanged between the server and the client when calling the API operations.

### About this task

---

For information on the use of bearer tokens with OpenAPI 3 APIs, see [Bearer Authentication](#) in the OpenAPI 3 specification.

If an HTTP bearer token is found in the request, its value is stored within the context as `api->security->bearer_token`. If an external URL validation is invoked, any response with a status code of 200 is stored within the context as `api->security->bearer_validation_response`.

Note:

- This task relates to configuring an OpenAPI 3.0 API definition. For details on how to configure an OpenAPI 2.0 API definition, see [Editing an OpenAPI 2.0 API definition](#).
- OpenAPI 3.0 APIs are supported only with the DataPower® API Gateway, not with the DataPower Gateway (v5 compatible).
- For details of current OpenAPI 3.0 support limitations, see [OpenAPI 3.0 support in IBM® API Connect](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

## Procedure

---

1. Open the required API for editing, as described in [Editing an OpenAPI 3.0 API definition](#).
2. Expand Components, Security Schemes.
3. Click Add.
4. In the Add Object dialog box, provide the following information:
  - Security Scheme Name (Key) - Provide a descriptive name for the new scheme.
  - Security Scheme Type - Select http.
  - Scheme - Select Bearer.
  - Bearer Format - Select JWT.
  - Validation Method - Select a method. If you select external-url, provide the following additional information:
    - Validation Endpoint - Provide the URL of the server used for validation. To ensure a secure connect, the URL should use the **https** protocol.
    - TLS Profile name - If the validation endpoint uses the **https** protocol, select the name of the TLS client profile to use for a secure connection.
  - Description - Provide a description of the JWT scheme.
5. Click Create to create the new scheme.
6. Click Save in the page header.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Defining link components

A link component is a reusable link definition that can be used to describe how various values returned by one operation can be used as input for other operations. In this way, links provide a known relationship and traversal mechanism between the operations.

## About this task

---

Note:

- This task relates to configuring an OpenAPI 3.0 API definition. For details on how to configure an OpenAPI 2.0 API definition, see [Editing an OpenAPI 2.0 API definition](#).
- OpenAPI 3.0 APIs are supported only with the DataPower® API Gateway, not with the DataPower Gateway (v5 compatible).
- For details of current OpenAPI 3.0 support limitations, see [OpenAPI 3.0 support in IBM® API Connect](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

To make use of a link component, you must reference it from elsewhere in your API definition.

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

## Procedure

---

1. Open the required API for editing, as described in [Editing an OpenAPI 3.0 API definition](#).
2. Expand Components then, if there are already one or more link components defined, expand Links.
3. You can create a new link component, or edit any existing link component.
  - To create a link component, click the add icon  alongside Links, then refer to [Creating a link](#).
  - To edit an existing link component, click the link component name in the navigation pane, then refer to [Editing a link](#).
- [Creating a link](#)  
Links describe how various values returned by one operation can be used as input for other operations, providing a known relationship and traversal mechanism between the operations.
- [Editing a link](#)  
Links describe how various values returned by one operation can be used as input for other operations, providing a known relationship and traversal mechanism between the operations.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Creating a link

Links describe how various values returned by one operation can be used as input for other operations, providing a known relationship and traversal mechanism between the operations.

---

### Before you begin

Launch the link creation window. For details of the areas in your API definition from where you can create a link, see the following topics:

- [Editing a response](#)
- [Defining link components](#)

---

### About this task

Note:

- This task relates to configuring an OpenAPI 3.0 API definition. For details on how to configure an OpenAPI 2.0 API definition, see [Editing an OpenAPI 2.0 API definition](#).
- OpenAPI 3.0 APIs are supported only with the DataPower® API Gateway, not with the DataPower Gateway (v5 compatible).
- For details of current OpenAPI 3.0 support limitations, see [OpenAPI 3.0 support in IBM® API Connect](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

---

### Procedure

1. Create the link; you can either create a link from scratch, or you can reference a link that is defined in a link component.
  - To create the link from scratch, provide the following information on the Definition tab:
    - Name: If you are creating a link component, this name defines a key that enables this link to be referenced from elsewhere in the API definition; the reference has the following format:  
**`#/components/links/Name`**
    - Operation ID: The ID of an existing operation; this field is mutually exclusive of the Operation Ref field. For details on defining operations, see [Defining operations for a Path](#).
    - Operation Ref: A relative or absolute URI reference to an existing operation; this field is mutually exclusive of the Operation ID field. For details on defining operations, see [Defining operations for a Path](#).
    - Description: A description of the link. You can use [CommonMark syntax](#) for rich text representation.
  - To reference a link that is defined in a link component, provide the following information on the Reference tab:
    - Name: If you are creating a link component, this name defines a key that enables this link to be referenced from elsewhere in the API definition; the reference has the following format:  
**`#/components/links/Name`**
    - Reference from: Select a reference to a link component.
2. Click Create.

The link details are displayed for further editing; see [Editing a link](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Editing a link

Links describe how various values returned by one operation can be used as input for other operations, providing a known relationship and traversal mechanism between the operations.

---

### Before you begin

Open the details form for a link. For details of the areas in your API definition from where you can edit a link, see the following topics:

- [Editing a response](#)
- [Defining link components](#)

---

### About this task

Note:

- This task relates to configuring an OpenAPI 3.0 API definition. For details on how to configure an OpenAPI 2.0 API definition, see [Editing an OpenAPI 2.0 API definition](#).

- OpenAPI 3.0 APIs are supported only with the DataPower® API Gateway, not with the DataPower Gateway (v5 compatible).
- For details of current OpenAPI 3.0 support limitations, see [OpenAPI 3.0 support in IBM® API Connect](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

## Procedure

1. Provide the following information:

- Name: If you are editing a link component, this name defines a key that enables this link to be referenced from elsewhere in the API definition; the reference has the following format:

```
#/components/links/Name
```

To change the name, click Update, then click Save when done.

- Operation ID: The ID of an existing operation; this field is mutually exclusive of the Operation Ref field. For details on defining operations, see [Defining operations for a Path](#).
- Operation Ref: A relative or absolute URI reference to an existing operation; this field is mutually exclusive of the Operation ID field. For details on defining operations, see [Defining operations for a Path](#).
- Parameters: A map representing parameters to pass to an operation as specified with Operation ID or identified via Operation Ref. The key is the parameter name to be used, whereas the value can be a constant or an expression to be evaluated and passed to the linked operation.
- Request Body: The request body to use when calling the target operation.
- Description: A description of the link. You can use [CommonMark syntax](#) for rich text representation.
- Server: A server to be used by the target operation. Provide the following information:
  - Server URL: The specified URL is used to determine the full URL endpoint for the calling the API, according to any vanity endpoint configuration in the Catalog in which the API is published. For full details, see [Configuring vanity endpoints for a Catalog](#).
  - Server Description: An optional description of the host designated by the URL. You can use [CommonMark syntax](#) for rich text representation.
  - Server Variables: A server variable defines a map between a variable name and its value. The value is used for substitution in the server's URL template.
    - To add a new server variable, click Add. To edit an existing server variable, click the variable name.

• Provide the following information:

- Server Variable Name (required).
- Default value (required).
- An optional rich text description. You can use [CommonMark syntax](#) for rich text representation.
- One or more Enum Value entries (available when editing an existing server variable). Enum values specify an enumeration of string values to be used if the substitution options are from a limited set. To add a new Enum value, click Add, enter the value, then click Create. To edit an existing Enum value, click the Enum value.

• If you are creating a new server variable, click Create. The server variable details are displayed for further editing.

2. Click Save when done.

## What to do next

If required, use the breadcrumb trail to navigate to another location in the hierarchy of the object you are working on.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.

For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Specifying gateway and portal settings

Define general configuration settings for your API.

### About this task

Note:

- This task relates to configuring an OpenAPI 3.0 API definition. For details on how to configure an OpenAPI 2.0 API definition, see [Editing an OpenAPI 2.0 API definition](#).
- OpenAPI 3.0 APIs are supported only with the DataPower® API Gateway, not with the DataPower Gateway (v5 compatible).
- For details of current OpenAPI 3.0 support limitations, see [OpenAPI 3.0 support in IBM® API Connect](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

## Procedure

1. Open the required API for editing, as described in [Editing an OpenAPI 3.0 API definition](#).

2. Select the Gateway tab, then click Gateway and portal settings.

3. Provide the following information:

- Phase: The phase of the lifecycle that your API is in; select one of the following options:
  - Realized (default) - The API is in the implementation phase.

- Identified - The API is in the early conceptual phase and is neither fully designed nor implemented.
- Specified - The API has been fully designed and passed an internal milestone but has not yet been implemented.
- Testable: Select this option to allow the API's operations to be tested using the test tool in the Developer Portal.  
Note: For the test tool to work, an API must be included in a Plan in a Product that is staged in a Catalog.
- CORS: Enable and configure cross-origin resource sharing (CORS) support for your API. For details, see [Enabling CORS support for an API](#).
- Target Services: Define web services that you want to use in your API definition. For details, see [Defining target services for an API](#).
- Enforced: Select this option to enforce the API by using the DataPower API Gateway. Clear this option if you are managing the API on a gateway other than the DataPower API Gateway. Although not published to a gateway by API Connect, an unenforced API is still available in the Developer Portal for subscription by application developers.
- Properties: Add properties that can be referenced in your API definition. For details, see [Setting API properties](#).
- Catalog Properties: Define property values that are specific to a particular Catalog. For details, see [Defining Catalog specific property values](#).
- Activity Log: Configure your logging preferences for the API activity that is stored in Analytics. For details, see [Configuring activity logging](#).
- Extensions: Extensions added to the API to extend the OpenAPI specification. For details, see [Adding an OpenAPI extension to an API](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Defining target services for an API

A target service defines a web service that you want to use in your API definition.

### About this task

Note:

- This task relates to configuring an OpenAPI 3.0 API definition. For details on how to configure an OpenAPI 2.0 API definition, see [Editing an OpenAPI 2.0 API definition](#).
- OpenAPI 3.0 APIs are supported only with the DataPower® API Gateway, not with the DataPower Gateway (v5 compatible).
- For details of current OpenAPI 3.0 support limitations, see [OpenAPI 3.0 support in IBM® API Connect](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

### Procedure

1. Open the required API for editing, as described in [Editing an OpenAPI 3.0 API definition](#).
2. Select the Gateway tab, expand Gateway and portal settings then, if there are already one or more target services defined, expand Target Services.
3. To define a new API target service, complete the following steps:
  - a. Click the add icon  alongside Target Services in the navigation pane.
  - b. Upload the service information from a stand-alone .wsdl file, or a .zip file that contains a WSDL file and its dependent documents, by either dragging and dropping your file, or browsing and selecting the file that you want to use.  
If you upload a .zip file, you can include in the .zip file an options file to specify additional directives. For details, see [Using an options file when importing a WSDL service](#).
4. Select the service that you want to add.
5. Click Save to save your changes.
6. To view the source for an existing target service, click the target service name in the navigation pane.

### Results

The target services that you add are now available in the palette on the Policies view for you to add to your API assembly flow; for more information, see [Including elements in your API assembly](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Setting API properties

In addition to the pre-supplied API properties that you can use to control the behavior of API Connect policies, you can define your own API properties. The properties that you define can be referenced in your API definitions.

### About this task

Note:

- This task relates to configuring an OpenAPI 3.0 API definition. For details on how to configure an OpenAPI 2.0 API definition, see [Editing an OpenAPI 2.0 API definition](#).
- OpenAPI 3.0 APIs are supported only with the DataPower® API Gateway, not with the DataPower Gateway (v5 compatible).
- For details of current OpenAPI 3.0 support limitations, see [OpenAPI 3.0 support in IBM® API Connect](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

API properties include property name, value, and, optionally a specific Catalog to which a property value applies. For a list of pre-supplied API properties relating to various policies, see [API properties](#).

Note: Once defined, an API property is read only.

For information on how to reference a property in an API definition, see [Variable references in API Connect](#).

It is also possible to define properties that are specific to a Catalog and can be referenced by any of the APIs in that Catalog; for more information, see [Creating and configuring Catalogs](#). Note that if you define a Catalog property of the same name as an API property, the API property takes precedence over the Catalog property.

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

Tip: If you add or change an API property on an API that is already staged or published, you must re-stage or re-publish the Product that contains the updated API for the change to take effect.

## Procedure

---

1. Open the required API for editing, as described in [Editing an OpenAPI 3.0 API definition](#).
2. Select the Gateway tab, expand Gateway and portal settings then, if there are already one or more API properties defined, expand Properties.
3. Configure an API property.
  - To define a new API property, complete the following steps:
    - Click the add icon  alongside Properties in the navigation pane.
    - Provide the following information:
      - Property Name: Enter a name for the property; this name is used to reference the property. The following character set is supported for the Name of an API property: `[A-Za-z0-9_-]+`. Spaces are allowed, but not two or more consecutive spaces.
      - Value: A default value for the property. Leave blank if the property is to have a null value by default.
      - Description: An optional description of the property. You can use [CommonMark syntax](#) for rich text representation.
      - Select Encoded if you want to hide the property values, or protect user passwords from casual observance.  
Note: If you encode a property value, it is saved in Base64 encoded form; it is **not** encrypted. If you subsequently clear the Encoded check box, the original property value is restored in its unencoded form.
    - Click Create.
  - To modify an existing API property, click the property name in the navigation pane. You can then change any of the configuration settings.
4. Click Save to save your changes.

## What to do next

---

Optionally, define a value for the property that is specific to a particular Catalog; see [Defining Catalog specific property values](#).

- [Defining Catalog specific property values](#)  
For any API property, you can define a value that is specific to a particular Catalog. For any API published to that Catalog, the API property assumes the Catalog specific value, overriding any default property value.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Defining Catalog specific property values

For any API property, you can define a value that is specific to a particular Catalog. For any API published to that Catalog, the API property assumes the Catalog specific value, overriding any default property value.

## Before you begin

---

You must have previously created the API property that you now want to define a Catalog specific value for; see [Setting API properties](#).

## About this task

---

Note:

- This task relates to configuring an OpenAPI 3.0 API definition. For details on how to configure an OpenAPI 2.0 API definition, see [Editing an OpenAPI 2.0 API definition](#).
- OpenAPI 3.0 APIs are supported only with the DataPower® API Gateway, not with the DataPower Gateway (v5 compatible).
- For details of current OpenAPI 3.0 support limitations, see [OpenAPI 3.0 support in IBM® API Connect](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

Tip: If you add or change an API property on an API that is already staged or published, you must re-stage or re-publish the Product that contains the updated API for the change to take effect.

## Procedure

1. Open the required API for editing, as described in [Editing an OpenAPI 3.0 API definition](#).
2. Select the Gateway tab, expand Gateway and portal settings then, if there are already one or more Catalog specific property values defined, expand Catalog Properties.
3. Configure a Catalog specific property value.
  - To define a new Catalog specific property value, complete the following steps:
    - Click the add icon  alongside Catalog Properties in the navigation pane.
    - Enter the Catalog Name. The name **must** match the value of the **name** field for the required Catalog.
    - Click Create. The Catalog properties details for the specified catalog are displayed for further editing.
    - Alongside Property Overrides, click Add.
    - Provide the following information:
      - Property Name: Enter the name of the API property that you want to define a Catalog specific value for. The name **must** match the name of a previously defined API property; see [Setting API properties](#).
      - Property Value: The Catalog specific property value. Leave blank if the property is to have a null value by default.
    - Click Create.
  - To modify an existing Catalog specific property value, click the Catalog name in the navigation pane. You can then change the Catalog name, and add, modify, or delete property override settings.
4. Click Save to save your changes.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Configuring activity logging

You can configure your logging preferences for the API activity that is stored in Analytics, overriding the default activity logging behavior.

### About this task

Note:

- This task relates to configuring an OpenAPI 3.0 API definition. For details on how to configure an OpenAPI 2.0 API definition, see [Editing an OpenAPI 2.0 API definition](#).
- OpenAPI 3.0 APIs are supported only with the DataPower® API Gateway, not with the DataPower Gateway (v5 compatible).
- For details of current OpenAPI 3.0 support limitations, see [OpenAPI 3.0 support in IBM® API Connect](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

An API event record exists for each API execution event in the Gateway server. By default, the content type that is collected and stored in API event records is activity for when API execution completes successfully, and payload for when API execution completes with an error code. When you compose your API definition, you can change the type of content to log in these API event records. During API execution, the activity data is stored in the `log` context variable, which populates the API event record on completion of the API execution; for more information, see [API activity logging context variables](#).

Note:

Activity logging that calls for logging of Analytics data upon success doesn't apply for the OAuth provider. The OAuth provider logs Analytics data for failure cases, but doesn't log successful cases.

At any time, you can switch directly to the underlying OpenAPI YAML source that corresponds to the design form in the user interface by clicking the Source icon . To return to the design form, click the Form icon .

## Procedure

1. Open the required API for editing, as described in [Editing an OpenAPI 3.0 API definition](#).
2. Select the Gateway tab, expand Gateway and portal settings, then click Activity Log.
3. Select Enabled, then select options for the Success Content and Error Content fields as follows:

Field label	Description
Success Content	<p>Defines the type of content to be logged when the operation is successful.</p> <ul style="list-style-type: none"><li>• none: Indicates that no logging occurs. Restriction: This option disables notifications for application developers who use your Developer Portal.</li><li>• activity: Logs invocation only; only the resource URI will be recorded</li><li>• header: Logs activity and header; the HTTP headers, in addition to the resource URI will be recorded</li><li>• payload: Logs activity, header, and payload; all information, including the payload received in a request or returned in a response, will be recorded</li></ul> <p>The default value is activity.</p>

Field label	Description
Error Content	<p>Indicates what content to log when an error occurs.</p> <ul style="list-style-type: none"> <li>• none: Indicates that no logging occurs. Restriction: This option disables notifications for application developers who use your Developer Portal.</li> <li>• activity: Logs invocation only; only the resource URI will be recorded</li> <li>• header: Logs activity and header; the HTTP headers, in addition to the resource URI will be recorded</li> <li>• payload: Logs activity, header, and payload; all information, including the payload received in a request or returned in a response, will be recorded</li> </ul> <p>The default value is payload.</p>

4. Click Save to save your changes.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Including elements in your API assembly

An assembly is formed of elements that are applied to calls to and responses from operations in your API. Elements can be either policies or logic constructs.

### About this task

Note:

- This task relates to configuring an OpenAPI 3.0 API definition. For details on how to configure an OpenAPI 2.0 API definition, see [Editing an OpenAPI 2.0 API definition](#).
- OpenAPI 3.0 APIs are supported only with the DataPower® API Gateway, not with the DataPower Gateway (v5 compatible).
- For details of current OpenAPI 3.0 support limitations, see [OpenAPI 3.0 support in IBM® API Connect](#).

In the Policies view of IBM API Connect, you can add and configure elements in your assembly. You can also directly add elements to the OpenAPI definition of your API.

- [The assembly editor](#)  
The API Manager of IBM API Connect features a graphical editor that you can use to create assemblies. With assemblies, you can readily tailor your APIs to include elements such as activity logging and redaction of specific fields.
- [Adding elements to your assembly](#)  
Create your API assembly by using the Assemble view in the API Manager.
- [Handling errors in the assembly](#)  
Use the catch section of the assembly to describe the handling of errors thrown during the assembly execution.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## The assembly editor

The API Manager of IBM® API Connect features a graphical editor that you can use to create assemblies. With assemblies, you can readily tailor your APIs to include elements such as activity logging and redaction of specific fields.

Note:

- This task relates to configuring an OpenAPI 3.0 API definition. For details on how to configure an OpenAPI 2.0 API definition, see [Editing an OpenAPI 2.0 API definition](#).
- OpenAPI 3.0 APIs are supported only with the DataPower® API Gateway, not with the DataPower Gateway (v5 compatible).
- For details of current OpenAPI 3.0 support limitations, see [OpenAPI 3.0 support in IBM API Connect](#).

You can access the Assemble view by clicking the Gateway view in the API editor. This view includes a palette, which lists the available elements, a property sheet, which is used to configure an element, and a canvas, which is used to arrange and visualize the assembly's elements.

### The palette

The palette is a list of different elements that you can include in your assembly. The palette can be hidden by clicking the Show/hide policy palette icon .

### The canvas

You can use the canvas to create a graphical representation of the assembly flow. You can drag various elements from the palette to the appropriate location on the canvas. When you drag an element, valid positions are shown by dashed boxes.

Note: You must click Save in the Assemble view to save your assembly updates, and to make them appear in the Source view. API calls are made at the initial, unfilled, circle, and returned at the final, filled, circle. You can insert elements between the two circles to modify the data received from the call, or returned by the response. To add an element, select it in the palette and drag it across to one of the dashed boxes that appear when you move the element over the canvas.

You can use the Show catches toggle to show and hide error catches in the palette. A catch is a section of the assembly that is applied when an API call results in the corresponding HTTP status code being returned. Click the catch section to open the property sheet for all your catches.

You can zoom the view of your canvas in and out by clicking the + and - icons. To fit the canvas to the screen size, click the Fit to screen icon .

You can filter the canvas to show only the parts of it that will apply to a specific operation by clicking the Filter by operation icon  and then selecting the operation from the drop-down list. Click the Clear operation filter icon  to remove the filter.

## The property sheet

---

When you select an element that is in the assembly by clicking it, details about the element are displayed in the property sheet. In this pane, you can configure the element's properties. The options available to you in the property sheet are specific to the type of element you are working with. For some elements, you can add and remove properties by clicking Object Properties and selecting the property from the drop-down menu.

You can release the property sheet by clicking the Close icon .

## The behavior of an assembly

---

The assembly runs policies in order and acts on different contexts of the API call. When an API call is made, security and rate limits are enforced before the assembly is executed. During the assembly, the flow can branch or be thrown and caught, according to the policies contained in it. The message context can be thought to flow through the assembly, being used and altered by various policies. In addition to the message, other contexts can be accessed and created.

### Security and rate limiting

Before the assembly is executed, security and then rate limits are enforced.

First, security definitions and CORS access control are used to authenticate an API call. Any API Key security definitions are used to identify applications that have subscriptions to a Product containing the API. If a security definition does not allow access, the API call is rejected.

If an application is identified by its client ID or client secret, a rate limit can be enforced based on the Plan or operation called.

### The assembly execution sequence

The assembly is executed in order from the initial, filled, circle to the final, unfilled, circle. However, there is room for branching, when if and operation-switch logic constructs are used, or for the remaining assembly to be ignored when a throw policy is executed.

The message is the context that is acted upon by any policy that isn't otherwise configured. At the beginning of the API call, the message is empty and, at the end of the API call, the message is used as the response.

The request context contains the information that is sent by the API caller and varies with the type of operation called and the configuration of that operation. For example, a GET operation can never have a populated `request.body`, and you can configure an operation to have `request.parameters` (query parameters). The first policy in an assembly acts on the request and produces the first instance of the message. If there are no policies, the request is returned to the caller.

### Managing contexts

Because the message can be overwritten, it can be useful to create and reference new contexts where possible so that they are saved and reusable during the API call.

- Use the map policy to overwrite the message context when you need to execute a policy that only acts on the message.
- Use the request context when you want to use the original request made to the API.
- Use the map, invoke, and proxy policies to create new contexts when you want to save your message.

Note: When you create a new context, unless you are also mapping to the message, the message is overwritten with an empty object.

For example, an invoke policy is the first policy in the assembly and its response overwrites the request as the message. The message is then acted upon by a validate policy, and a map policy then saves the message as a new context, ready for a second invoke policy to overwrite the message without losing the first invoke policy's output.

You can also access contexts outside of the message or your custom contexts, but these cannot be written to. For a list of contexts, see [API Connect context variables](#).

### Branches and catches

Using logic constructs, such as operation-switch or if, you can execute different sections of the assembly when certain conditions are fulfilled. When the assembly branches, the subsection of the assembly contained by the construct is executed in the same manner as a complete assembly. However, contexts are shared with the complete assembly.

When a catch is triggered, either by an error occurring during the execution of a policy, or because a throw policy is encountered, the rest of the assembly flow is ignored. All contexts are shared by the catch being executed and when the end of the catch is reached, the API call is completed. There is no way to return from a catch to the rest of the assembly.

## Related concepts

---

## Related reference

---

- [API Connect context variables](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Adding elements to your assembly

Create your API assembly by using the Assemble view in the API Manager.

### About this task

---

Note:

- This task relates to configuring an OpenAPI 3.0 API definition. For details on how to configure an OpenAPI 2.0 API definition, see [Editing an OpenAPI 2.0 API definition](#).
- OpenAPI 3.0 APIs are supported only with the DataPower® API Gateway, not with the DataPower Gateway (v5 compatible).
- For details of current OpenAPI 3.0 support limitations, see [OpenAPI 3.0 support in IBM® API Connect](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

You can use the assembly tool in the UI to create assemblies that are used to manipulate requests made to or responses made by any of your API's operations.

Alternatively, you can use the Source view to edit the source of your API definition, in which case the syntax is as described in [execute OpenAPI extension](#).

For more information about the use of the assembly tool, see [The assembly editor](#).

### Procedure

---

To add elements to your assembly using the assembly tool, complete the following steps:

1. In the navigation pane, click  Develop, then select the APIs tab.  
The Develop page opens.
2. Click the title of the API definition that you want to work with.
3. Use the Policies view to add an element.
  - a. Select the Gateway tab, then click Policies in the navigation pane.
  - b. Find the element that you want to add in the palette.
  - c. Drag the element onto the canvas; dashed boxes are displayed. Drop the element in a dashed box to insert it into that position in the assembly.  
Note:
    - Elements are applied in order from the initial, unfilled, circle to the final, filled, circle.
    - Unless an Operation Switch element is used, the whole assembly applies to every operation in the API.
  - d. Add and edit properties of the element by clicking the element and using the property sheet.  
For some elements, you can add and remove properties by clicking Object Properties and selecting the property from the drop-down list. For information about the properties of policy elements, see [API policies and logic constructs](#). For information about the properties of logic constructs, see [Logic Constructs](#).
4. Optional: Repeat Steps [3.b](#) to [3.d](#) for any additional elements that you want to add.
5. Click Save to save your changes.

### Results

---

You have added one or more elements to your assembly.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Handling errors in the assembly

Use the catch section of the assembly to describe the handling of errors thrown during the assembly execution.

### About this task

---

Note:

- This task relates to configuring an OpenAPI 3.0 API definition. For details on how to configure an OpenAPI 2.0 API definition, see [Editing an OpenAPI 2.0 API definition](#).
- OpenAPI 3.0 APIs are supported only with the DataPower® API Gateway, not with the DataPower Gateway (v5 compatible).
- For details of current OpenAPI 3.0 support limitations, see [OpenAPI 3.0 support in IBM® API Connect](#).

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

The catch section of the assembly is used to implement an assembly in the instance that an error is thrown during the assembly execution. For example, the assembly could contain a throw element, the API caller could fail to authenticate, or a policy could fail to execute correctly. Each error can be handled with a different catch and each catch can handle multiple status errors.

### Procedure

---

To create a catch and include elements in it, complete the following steps:

1. In the navigation pane, click  Develop, then select the APIs tab.  
The Develop page opens.
2. Click the title of the API definition that you want to apply a catch to.
3. Select the Gateway tab, then click Policies in the navigation pane.
4. Set the Show catches toggle in the menu bar of the canvas to the Show position.
5. Click Catches in the canvas, or a Catch icon  if one is displayed.  
The property sheet for the API's catches opens.
6. To add a default catch that is executed when an otherwise uncaught error is thrown, click Add default catch.  
Note: If you have a default catch before another catch in precedence, the default catch will activate even when the other catch's error is thrown.
7. To add a new catch, click Add catch.
8. To specify which errors the catch applies to, type the name of a custom error and press Enter, or use the Search errors field to search for the appropriate error.
9. Optional: To remove an error case from a catch, click the corresponding cross.
10. Optional: To change the precedence of your catches, use the Move up  or Move down  icons.  
If an error case is handled by multiple catches, the catch at the beginning of the list is applied.
11. To add an element to a catch, drag the element over the dashed, gray box that appears in the flow from the Catch icon  for the catch that you want to apply the element to.
12. Click Save to save your changes.

## What to do next

If you added a catch for `ConnectionError`, `SOAPError`, or `OperationError`, you must add the same error to the Stop on error setting for the Invoke policy in your assembly. Otherwise if the error occurs during the execution of the Invoke policy, it is not caught, the policy execution is allowed to complete, and the assembly flow continues. For details on configuring an Invoke policy, see [Invoke](#).

For details of all the errors that can be returned by the assembly and are available to the catch function, see [Error cases supported by assembly catches](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## LDAP authentication

The Lightweight Directory Access Protocol (LDAP) is an internet protocol for accessing and maintaining distributed directory information services over a network. If you rely on LDAP to authenticate users for web applications, take a minute to review the contents of this topic before beginning.

## Programming guidelines

When authenticating with LDAP, observe the following guidelines:

- Use only a LDAP interface -- Users can only be authenticated via a connection to an LDAP server.
- Active Directory -- Use of an Active Directory interface is prohibited, however, LDAP authentication with Active Directory is supported.
- Administrator properties -- The LDAP administrator must have access to all user's LDAP properties.

LDAP attributes read by IBM® API Connect are as follows:

Attribute	Definition
mail	User's SMTP email address.
cn	Used internally to determine user's common name.
sn	Used internally to determine user's last name or surname.
givenname	Used internally to determine user's first name.
Prefix from Search dn	Used as username.

## Using an LDAP Server for User Authentication

Every entry in an LDAP directory server has a distinguished name (DN). The DN is the name that uniquely identifies an entry in the directory. A DN is made up of **attribute=value** pairs, separated by commas. For example:

```
cn=Ben Gray,ou=editing,o=New York Times,c=US
cn=Lucille White,ou=editing,o=New York Times,c=US
cn=Tom Brown,ou=reporting,o=New York Times,c=US
```

Any of the attributes defined in the directory schema can be used to make up a DN. The order of the component attribute value pairs is important. The DN contains one component for each level of the directory hierarchy from the root down to the level where the entry resides. LDAP DNs begin with the most specific attribute (usually some sort of name) and continue with progressively broader attributes, often ending with a country attribute. The first component of the DN is referred to as the Relative Distinguished Name (RDN). It identifies an entry distinctly from any other entries that have the same parent. In the previous examples, the RDN "cn=Ben Gray" separates the first entry from the second entry, (with RDN "cn=Lucille White"). These two example DNs are otherwise equivalent. The attribute=value pair making up the RDN for an entry must also be present in the entry. (This is not true of the other components of the DN.)

## Examples

In the following examples, a user search is performed from Base DN. The search is done anonymously, or if authenticated bind is used, an authenticated user is used. Search DN appends the prefix, the given user name, and the suffix. If the prefix used is (**uid=** and the suffix used is **)** ", **uid** becomes the user name attribute. The default

search filter used is: `(| (cn={filter}*) (sn={filter}*) (mail={filter}*) (givenName={filter}*))` and attributes used for prefix are also added to the search filter. In this case, where 'uid=' is the prefix, when searching for users, the search filter becomes:

```
(| (cn={filter}*) (sn={filter}*) (mail={filter}*) (givenName={filter}*) (uid={filter}*))
```

where `{filter}` is replaced by actual text.

The authenticated bind DN is a user on the external LDAP server permitted to get base DN and search the LDAP directory within the defined search base. It should also be able to read other user properties and be used if anonymous access to LDAP to get base DN and to search and get access to user attributes is not allowed. When a search is performed for *Steve*, the LDAP query filter shown in the following example is used and search is done from base DN specified in UI. When the user's DN is returned, the DN and password are used to authenticate the user:

```
(| (cn=Steve*) (sn=Steve*) (mail=Steve*) (givenName=Steve*) (uid=Steve*)).
```

For bind during login calls, the search string used is the prefix. For example, if the prefix is 'uid=', the search string used to search for a user during log in becomes: `(uid=Steve)`.

Using the mail attribute as the user name

When you want to use an email address as the user name, (for example *steve@company.com*), you typically use the mail attribute as the prefix 'mail='. In this case, use the following search string to perform the search internally (assuming 'mail=' as prefix):

```
(| (cn=steve@company.com*) (sn=steve@company.com*) (mail=steve@company.com*) (givenName=steve@company.com*) (mail=steve@company.com*))
```

In the previous example, if DN is found, the password is used with the DN to perform a bind. The first result is taken, so be sure to use a unique attribute for username. Next, the LDAP properties for the user are read (`cn`, `sn`, `mail`, `givenName`). If LDAP properties cannot be read using the logged-in user, they are read from the user's DN using authenticated bind credentials. If the user name attribute differs, it is also queried for. For example, if the prefix is 'uid=', the `uid` attribute is also read from the user's DN object:

```
(| (cn={filter}*) (sn={filter}*) (mail={filter}*) (givenName={filter}*))
```

Note: The prefix and suffix cannot be used to get a user's DN directly. For example, the following attempt to directly get a user's DN fails:

```
Prefix: "uid=" home_markdown_jenkins_workspace_Transform_in_SSMNED_10.0.4_com.ibm.apic.toolkit.doc_con_ldap_requirements_
Suffix: ",ou=users,dc=company,dc=com"
```

## LDAP referrals

LDAP referrals allow a directory tree to be partitioned and distributed between multiple LDAP servers. An LDAP referral is a domain controller's way of indicating to a client application that it does not have a copy of a requested object, while giving the client a location that is more likely to hold the object. The client then uses the object as the basis for a DNS search for a domain controller.

API Connect support for LDAP referral includes:

- Searching for users that are part of multiple Active Directory trees and forests.
- Authenticating users in the Cloud Manager, API Manager and the Developer Portal.

Note: API Connect LDAP referral support is dependent on the following conditions:

- A single LDAP host/port is configured with administrator credentials and all users are referred to from the tree/server's base DN.
- As part of the user search following the LDAP referral, the same administrator credentials are used in the downstream trees/forests.
- LDAP API authentication does not support external LDAP referral. Internal LDAP referral is supported.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Authentication URL user registry

You can use an Authentication URL user registry to specify a REST authentication service to manage user authentication, and to optionally provide additional metadata to be embedded in the token.

This support can optionally enable any of the following:

- Providing the authenticated credential to IBM® API Connect. For example, the user logs-in with user name: `spoon`, and password: `fork`. When the user is authenticated, the credential becomes `cn=spoon,o=eatery`. The credential is kept in the OAuth `access_token` to represent the user.
- Providing metadata support. Allow extra metadata to be stored in the `access_token`.
- Overriding the `scope` that the application receives after a successful OAuth protocol processing. By responding with a specific header, the Authentication URL endpoint can replace the `scope` value that the application receives. For example, you can provide a specific resource owner an account number within the `scope` header response for use in future processing steps.

When you call the Authentication URL user registry, the API Connect gateway sends a GET request with HTTP headers and then processes any HTTP response from the URL. For authentication, a REST authentication service is expected at the Authentication URL.

The following response from the REST authentication service indicates that user authentication is successful and that API Connect will use `cn=spoon,o=eatery` as the user identity.

```
HTTP/1.1 200 OK
Server: example.org
X-API-Authenticated-Credential: cn=spoon,o=eatery
```

For information on how to configure a User Security policy in an API assembly for use with an Authentication URL user registry, see [User Security policy](#).

For an example of an OAuth provider configuration that uses an Authentication URL user registry, see [Example - using multiple OAuth policies in an OAuth provider assembly](#).

API Connect considers any non-200 HTTP response code a failed user authentication attempt.

When an Authentication URL user registry is invoked, two HTTP response headers are available that include metadata in the access token or the response payload that contains the access token. For more information, see [OAuth external URL and authentication URL](#). The two metadata response headers are:

**API-OAUTH-METADATA-FOR-ACCESSTOKEN**  
**API-OAUTH-METADATA-FOR-PAYLOAD**

When an Authentication URL is invoked, an HTTP response header is available to override the requested **scope** from the application. For more information, see [Scope](#). The response header is:

**x-selected-scope**

If you are using the DataPower® API Gateway rather than the DataPower Gateway (v5 compatible), this diagram is provided for guidance only and is not fully accurate for this release.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Activating an API

After you have created an API definition you can activate it to make it available for testing.

### About this task

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

When you activate an API, API Connect automatically completes the following actions:

- Creates a draft Product, adds the API to the Product, and publishes the Product to the Sandbox Catalog so that the API is available to be called. The Product has the title *api\_title* auto product. Note that if you later want to delete the draft Product, you cannot delete it directly; instead, delete the API and the draft Product is deleted together with the API; see [Deleting an API definition](#). If you want to remove the Product from any Catalogs to which it is published, you must do this separately; see [Removing a Product from a Catalog](#)
- Subscribes the Sandbox test application to the Product so that you can immediately test the API in the test environment. For information on testing an API, see [Testing an API](#).

To activate an API, you must be assigned a role that has the **Product:Manage** and **Subscription:Manage** permissions. The pre-supplied Developer role has these permissions by default; if you are assigned a custom role it must have these permissions. For more information, see [Creating custom roles](#).

Note:

- The API activation will not complete successfully if lifecycle approval is enabled in the Sandbox Catalog for the Stage, Publish, or Replace actions. If any such lifecycle approvals are enabled, then to be able to activate an API they must be disabled; for information on lifecycle approval settings, see [Creating and configuring Catalogs](#).
- To activate an API from the API Designer user interface, you must be connected to a Management server; API activation is not available with API Designer in offline mode. For more information, see [Logging in from API Designer](#).

- Products that contain an API with a Swagger property using **regex** that include lookahead assertions, such as "(?" cannot be validated or published. An error message is returned. For example:

```
Product has not been published!
The multipart 'openapi' field contains an OpenAPI definition with validation errors.
definitions.properties.pattern Does not match format 'regex' (context: (root).definitions.properties.pattern, line: 0,
col: 0)
400
```

## Procedure

To activate an API, complete the following steps:

1. In the navigation pane, click  Develop, then select the APIs tab.
2. Click the title of the API that you want to work with.
3. Move the activation slider control to the on position:

## Results

On successful completion, the API is shown as Online:

You can stop the API by moving the activation slider control to the off position:

If you stop an API, the application subscription is deleted, and the auto Product is removed from the Sandbox Catalog.

If you make a change to the API, it is republished automatically. You can also republish a running API manually by stopping it and then re-activating it.

The error indicator shows whether there are validation errors in the OpenAPI source for the API definition. If there are errors, click the icon for more details:

You can also activate an API during the creation process, and on the API test page; see [Creating an API definition](#) and [Testing an API](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Testing an API

Select a test tool and verify that your API works as you intended.

Before you publish an API where customers can access it, you need to test it and ensure that it is defined and implemented correctly. API Connect offers tools for running both simple and complex tests, in different environments. Use the following list of options to choose the test tool that best meets your needs:

- Execute and debug the API in the [Test tab](#)  
On the Test tab, you can quickly invoke your API from the API Connect UI with minimal preparation. The Test tab offers full control over the API call through a simple set of fields where you can define your request. The response includes both a visual flow diagram and a code trace that shows how the API's process flow is executed. Note: the Test tab tool is only available to APIs that use the DataPower API Gateway.
- Call the API externally from the Automated API behavior testing application as explained in [Testing an API with Automated API behavior testing](#)  
Automated API behavior testing provides a simple set of fields where you can quickly invoke your API. You can automate tests and define schedules for running them. You can even set up API monitoring and receive alerts on your API health before issues occur.
- Call the API from a [local test environment](#)  
The Local Test Environment is a lightweight API Manager, running on your computer, that allows you to rapidly test APIs without connecting to an API Connect management server.
- Run a simple test in the [Policies editor](#)  
Note: The Test panel is deprecated and might be removed without warning.
- Use the Try it tool in the [Explorer tab](#) to run simple tests  
You can use the Explorer tab in the API editor to see how your APIs look to a consumer in the Developer Portal. You can check the descriptions of the different artifacts, and review any schemas or examples, and you can also use the Try it tool to test the behavior of the API.
- [Locating API information on the Endpoints tab](#)  
The assembly tool's Endpoints tab opens a page that displays information for use when you call APIs externally. This tab displays only when an API's status is Online (the API was activated).
- [Using the Test tab to debug your API](#)  
Use the Test tab to execute calls and trace the API's actions in API Connect.

- [Testing an API with Automated API behavior testing](#)  
Use the IBM Automated API behavior testing application to invoke an API from outside of the API Connect Assembly page so that you can verify that it executes properly.
- [Testing an API with the Policies editor](#)  
IBM API Connect provides a basic test environment in the Policies editor so that you can ensure that your APIs are defined and implemented correctly.
- [Testing an API with the Local Test Environment](#)  
Use the Local Test Environment to test APIs on your local machine, without the need to connect to an API Connect management server. The Local Test Environment is a lightweight API Manager running on your local machine. It allows you to rapidly test APIs locally.
- [Testing an API with the Explorer tab](#)  
Use the Explorer tab in the API editor to see how your APIs look to a consumer in the Developer Portal. You can also use the Try it tool to test the behavior of the API.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Locating API information on the Endpoints tab

The assembly tool's Endpoints tab opens a page that displays information for use when you call APIs externally. This tab displays only when an API's status is Online (the API was activated).

Use the Endpoints tab to retrieve information that you can use when you call the API from an application.

**Note:** The fields in the Sandbox Sample Application Credentials section apply to the assembly tool's built-in client application and not to any application that you created. The credentials that display here are the default credentials that display in the assembly tool Test panel's "Identification" section.

To copy information from the Endpoints tab, click  next to a field.

The following values for the API are displayed in the Endpoints tab so that you can copy them and paste them into calls:

### Base API Endpoint

The URL representing the endpoint of the API that you are editing and testing. To invoke the API, append one of its supported queries (path and parameters) to this URL.

### Client ID and Client Secret

The values of the built-in test application's client ID and client secret. You can invoke APIs externally by providing the application's credentials in the request header.

### OAuth Token URL

If you specified an OAuth provider in the API's security definition, then this field displays the URL where you can obtain an access token for calling the API.

### OAuth Auth URL

If you specified an OAuth provider in the API's security definition, then this field displays the URL where you can submit an access token and receive an authorization token in exchange. You then use the authorization token when calling the API.

### Rate Limit

If you specified a rate limit on the Security panel when you created the API, the limit is displayed here for reference. If you did not specify a rate limit, the default rate limit displays.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Using the Test tab to debug your API

Use the Test tab to execute calls and trace the API's actions in API Connect.

The Test tab not only lets you quickly invoke an API with any needed headers and parameters, but lets you view the content of the response in both parsed and raw format. Additionally, you can view a trace of the actions execute as the API's process flow operates to complete the call. Viewing the trace can help you debug problems with the API's execution.

**Note:** The Test tab tool is only available to APIs that use the DataPower API Gateway.

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

Complete the following tasks to prepare your API for testing, execute requests, and debug responses.

1. [Preparing an API for debugging with the Test tab](#)  
Ensure that your API's definition meets the requirements for debugging it in the API Connect Test tab.
2. [Specifying the testing preferences for an API](#)  
By default, when you test an API with the Test tab, a range of test parameters are preconfigured. For example, a default Product is automatically generated, to which the API is added, and that Product is published to the Sandbox Catalog. However, you can configure testing preferences for each of your APIs, including the required Product and target Catalog.
3. [Sending the API request](#)  
Fill in fields to set up the request for an API that you want to debug on the Test tab.
4. [Reviewing the API response and trace](#)  
Review the response to an API that was invoked in the API Connect Test tab. You can use the included trace information to debug the API's execution.

## 5. [Testing a GraphQL API with the Test tab](#)

For a GraphQL API definition, the Test tab contains a GraphiQL editor. You can use the GraphiQL editor to help construct a GraphQL query. When you test your GraphQL API, the response is displayed in the GraphiQL editor.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Preparing an API for debugging with the Test tab

Ensure that your API's definition meets the requirements for debugging it in the API Connect Test tab.

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

To invoke your API in the Test tab, the following requirements must be satisfied:

The DataPower API Gateway is configured to support the API probe

To enable the Test tab's trace feature, the DataPower API Gateway must be configured to support gateway peering and the gateway probe. In a gateway service running in Kubernetes, the API probe is automatically enabled. In a gateway service running external to Kubernetes, the DataPower configuration must be added to the application domain supporting API Connect. Check with your administrator to confirm that gateway peering and the gateway probe are enabled as explained in [Configuring DataPower API Gateway](#).

The API uses the DataPower API Gateway

A gateway exposes APIs to calling applications, and provides processing actions that enable the APIs to integrate with various endpoints. API Connect supports two versions of the DataPower Gateway, but you can only debug APIs that use the DataPower API Gateway. The V5-compatible gateway is not supported. If your API definition has CORS enabled but you cannot see the Test tab, the API is probably configured to use the wrong version of the gateway.

You can determine which gateway your API uses by completing the following steps:

1. Log in to API Manager.
2. In the navigation list, click  Develop, then select the APIs tab.
3. Click the title of the API you want to test.
4. On the API's Design page, locate the Gateway field and note which option is selected.

You can change the gateway selection for an API on the Design page, but you must ensure that the policies used in the API's process flow are compatible with the new selection. For information on changing the gateway for an API, see [Specifying the gateway type for an API definition](#).

CORS is enabled in the API definition

Cross-Origin Resource Sharing support ensures that the API can be accessed from another domain. CORS support must be enabled for your API to be properly invoked and traced. If your API uses the API Gateway but you cannot open the Test tab, it's possible that CORS was not enabled in the API definition.

You can enable CORS for your API by completing the following steps:

1. Log in to API Manager.
2. In the navigation list, click  Develop.
3. On the Develop page, click the name of the API you want to test.
4. On the API's Design page, locate the CORS field and select it to enable support.
5. Click Save in the page header.

The API is published in the Sandbox catalog with the default Product/Plan, or a specified catalog and Product/Plan

By default, when you test an API with the Test tab, a default Product/Plan is generated for the API and published to the built-in Sandbox Catalog. However, you can optionally specify a range of API testing preferences including an alternative Product/Plan, and target Catalog; for more information, see [Specifying the testing preferences for an API](#). When you publish (activate) an API, the API is enabled online and becomes available for use. You cannot execute an offline API, even for testing purposes. You can set an API online by completing the following steps:

1. Log in to API Manager.
2. In the navigation list, click  Develop.
3. On the Develop page, click the name of the API you want to test.
4. In the Design page header, click Offline to toggle the API to its Online state.

**Next topic:** [Specifying the testing preferences for an API](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Specifying the testing preferences for an API

By default, when you test an API with the Test tab, a range of test parameters are preconfigured. For example, a default Product is automatically generated, to which the API is added, and that Product is published to the Sandbox Catalog. However, you can configure testing preferences for each of your APIs, including the required Product and target Catalog.

## About this task

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

Note: This feature is not available if you are using the [Local Test Environment](#).

## Procedure

---

1. Open the required API for editing, in either of the following ways:
  - During the initial creation of an API, the API wizard guides you to enter the minimum configuration settings; on completion of the initial configuration, click Edit API.
  - To open an existing API for editing, complete the following steps:
    - In the navigation pane, click  Develop, then select the APIs tab.
    - Click the title of the API version that you want to work with.

2. Click the settings icon  
The Preferences page opens.
3. Use the Edit links to configure the following testing preferences, as required:

### Target catalog

The Catalog to which you want to publish the Product that contains the API. The selected Catalog is used as the scope for the other preference settings. You can select a Catalog of your choice, or you can opt to use the Sandbox Catalog by selecting Use the default built-in Sandbox Catalog.

### Target Gateway service

The gateway service to which you want to publish the Product that contains the API.

### Target product

The Product that will contain the API; you can select any of the Products from the selected Target catalog, or you can opt to use an automatically generated Product by selecting Generate Product on Save. The auto-generated Product has the title *api\_title* auto product.

### Target product rate limit

If you opted to use an automatically generated Product, you can configure a rate limit to control calls to the API. If you selected your own Product, the Target product rate limit option is not available; instead, the rate limits that are configured in the selected Product and Plan are applied.

### Target Plan

The Plan in the selected Product that you want the test application to subscribe to. If you opted to use an automatically generated Product, the Target Plan option is not available; instead, the application is subscribed to the Default Plan in the automatically generated Product.

### Test application

The application that you want to subscribe to the selected Plan. You can select an application of your choice or, if you opted to use the Sandbox Catalog, you can instead use the pre-supplied test application by selecting Use the built-in Test Application.

### Test Consumer Org

The consumer organization that you want to subscribe to the selected Plan. If you selected your own application, the consumer organization is preset to that which contains the application, and cannot be changed. If you opted to use the pre-supplied test application you can, if required, select a consumer organization of your choice.

4. Click Save Preferences when done.

## Results

---

The next time you bring the API online, the API is published as specified by the preference settings, ready for testing.

Note: These settings are stored in your browser's local storage and will be used for your API testing in subsequent sessions. The following settings are specific to each individual API:

- Target product
- Target product rate limit
- Target Plan

The remaining settings will be applied to all your APIs.

**Previous topic:** [Preparing an API for debugging with the Test tab](#)

**Next topic:** [Sending the API request](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.

For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Sending the API request

Fill in fields to set up the request for an API that you want to debug on the Test tab.

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

## Open the Test tab

---

1. Log in to API Manager or API Designer.
2. In the navigation list, click  Develop, then select the APIs tab.
3. Click the title of the API you want to test.
4. On the API Design page, click the Test tab in the page header.

## Fill in the "Request" section

---

Use the Request section of the page to set up the request URL, the authentication mechanism, and the request parameters. Complete the following steps to fill in the fields needed for configuring the request.

1. Select an operation and request URL from the list provided.
2. On the Parameters tab, define header, query and path parameters.  
An empty row is provided for you to define parameters; enter the parameter name in the Key field, select query, header, or path in the Located in field as appropriate, and supply a string value in the Value field. As you begin to define a new parameter, a further empty row is added automatically.

Default header parameters and values are provided. For example, if the API has client ID or client secret definitions applied, the corresponding keys are added as header parameters, with the values preset; for details on configuring client ID and client security definitions, see [Creating an API key security definition](#).

The following table lists some common header definitions that are used in a request:

Table 1. Common request headers

Key	Value	Comments
Accepts	<i>media_type/sub type</i>	Specify the type of content that the response headers should use. The default is <b>application/json</b> .
X-IBM-Client-Id	<i>client_ID_val</i>	If you are using the built-in test application in the Sandbox catalog, the value is pre-populated automatically. If you are using your own client application, replace the value with the client ID of your application.
X-IBM-Client-Secret	<i>client_secret_val ue</i>	If you are using the built-in test application in the Sandbox catalog, the value is pre-populated automatically. If you are using your own client application, replace the value with the client secret of your application..
Authorization	Bearer <i>access_token</i>	Encode the token in base64. API Connect cannot encode the token for you.
Content-Type	<i>media_type/sub type</i>	Specify the type of content that the response body should use; for example, <b>application/json</b> or <b>image/png</b> .

If the API has path or query parameters defined, these are added to the parameters list, ready for you to supply values; for details on configuring path and query parameters, see [Defining Paths for a REST API](#) and [Configuring an operation](#).

3. If your API definition uses Basic authorization for the security setting, click the Authentication tab and provide the User name and Password needed for authenticating with the user registry.  
When you invoke the API, API Connect populates a header using the provided information.  
  
If you API definition does not use Basic authorization, the Authentication tab is not available.
4. If the operation is POST or PUT, set up the request body.
  - a. Click the Body tab.
  - b. Type the information for the body of the request.

## Send the request

When your API request is configured, click Send to execute the call.

If a message displays indicating "No Response", the API call cannot be completed. Possible causes of this problem are as follows::

- CORS is not enabled in the API's definition  
Edit the API's definition and enable CORS. Then, save the change and publish the API. If you are using your own client app, remember to subscribe it to the API again after publishing.
- The gateway service URL has an invalid certificate  
Follow the instructions to accept the certificate and continue testing.
- The browser cannot connect to the gateway service

**Previous topic:** [Specifying the testing preferences for an API](#)

**Next topic:** [Reviewing the API response and trace](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#), for details.  
For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Reviewing the API response and trace

Review the response to an API that was invoked in the API Connect Test tab. You can use the included trace information to debug the API's execution.

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

When the API request is invoked, the response displays in the "Response" section of the Test tab. The response always includes the HTTP status code the amount of time it took to receive a response. If the call completes (even if it returns an error), the response also includes headers and a body.

Click the Body tab to see the body of the response. When you review the body of the response, click the Parsed tab to view the response using the format that you specified in the "Accepts" request header. Click the Raw tab to view the unformatted response body.

Click the Headers tab to see the content of request headers and response headers.

Attention: If the assembly or back-end API returns a Cache-Control header, add the **Cache-Control: no-store** request header to prevent the browser from caching the request. Depending on your server, you might want to use the **Cache-Control: no-cache** header instead.

Click the Trace tab to display a record of the API execution so you can see what actions were triggered and the code that we executed for each action.

## Examine the trace

Use the Trace tab to see exactly how the API call was executed. This is helpful when the call returned an error and you don't know why. You can debug the API by reviewing the trace to see each step of the API's execution.

Note: The Trace works only with the default Gateway's URL. You cannot select a different Gateway for the trace. The Trace tab contains the following components to help you debug the API:

### Process flow diagram

In the diagram, the policies (actions) that were executed during the call are highlighted while the rest of the process flow is dimmed. The highlights make it easy to see where the executed actions occurred in the overall flow while clarifying the actual flow of execution for the call. For example, if the process flow includes a switch with three options, only the option that was selected during the call is highlighted.

### Policies list

A list of the highlighted policies lets you select a policy to examine its trace.

### Advanced toggle

The Advanced toggle that lets you control the level of detail in the trace. A basic trace shows the code for the input and output of the selected policy. An advanced trace shows the full code for the policy's execution.

### Code box

The selected level of code for the current policy displays in the code box, where you can review it in detail to see exactly how that policy was executed. By default, a minimal version of the response displays (the endpoint, the request, and the response, and the status message), with sections collapsed. You can expand individual sections by clicking the expand icon next to each. To see the complete response, click the Advanced toggle.

**Previous topic:** [Sending the API request](#)

**Next topic:** [Testing a GraphQL API with the Test tab](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Testing a GraphQL API with the Test tab

For a GraphQL API definition, the Test tab contains a GraphQL editor. You can use the GraphQL editor to help construct a GraphQL query. When you test your GraphQL API, the response is displayed in the GraphQL editor.

You can test a GraphQL query in either of the following ways:

- Use a **POST** operation, in which case the query is sent in the body of the operation request.
- Use a **GET** operation, in which case the query is sent as a query parameter.

For each operation type, you can test the query against either the GraphQL API endpoint itself, or against the cost endpoint that returns details of the cost of a request to the GraphQL API endpoint.

Whichever method and endpoint you use, you can either supply the query directly, or you can use the GraphQL editor to help construct the query; the editor provides type ahead assistance based on the schema that is defined for the API, and highlights errors along with correction suggestions. The schema was initially uploaded when the GraphQL API definition was created, but might have been modified subsequently. For details on creating a GraphQL API definition, see [Creating a GraphQL proxy API](#). For details on modifying the schema, see [Using the GraphQL schema editor](#).

## Before you begin

See [Preparing an API for debugging with the Test tab](#) for the requirements that your API definition must meet for you to test it with the Test tab.

## Procedure

1. In the Request section, select the required operation type and endpoint; for example:
  - **POST** `https://myserver.com/myorg/sandbox/mybasepath/graphql`
  - **GET** `https://myserver.com/myorg/sandbox/mybasepath/graphql/cost`
2. On the GraphQL tab, in the left hand pane of the editor, supply the query; for example:

```
{
  accounts(limit: 100) {
    name {
      first
      last
    }
  }
}
```

3. If required, you can supply additional request headers on the Parameters tab.
4. If your query includes variables, you can supply values for the variables in the Query Variables pane. For example, if the query is as follows:

```
query MyQuery($Query__accounts__limit: Int)
{
  accounts(limit: $Query__accounts__limit) {
    name {
      first
      last
    }
  }
}
```

you can set a value for the `Query__accounts__limit` by entering the following in the Query Variables pane:

```
{  
  "Query__accounts__limit": variable_value  
}
```

where *variable\_value* is the required value.

5. Click either Send, or the Execute Query icon  in the editor. The response is displayed in the GraphQL editor, and the Trace section shows you how the API call was executed. For details on the trace information, see [Examine the trace](#).

**Previous topic:** [Reviewing the API response and trace](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Testing an API with Automated API behavior testing

Use the IBM® Automated API behavior testing application to invoke an API from outside of the API Connect Assembly page so that you can verify that it executes properly.

Automated API behavior testing provides a simple set of fields where you can quickly invoke your API. You can automate tests and define schedules for running them.

Automated API behavior testing is an optional add-on to API Connect, and must be deployed by your administrator. If Automated API behavior testing is available in your deployment, a Test API displays on the Home page in API Manager.

Known limitations:

- AutoTest Assist is only available in Cloud Pak for Integration 2022.2.1 and later.
- Insights-Driven Test Generation is only available in Cloud Pak for Integration 2021.2.1 and later.

If you want to use Automated API behavior testing for validating an API, complete the following steps to get started:

1. Log in to API Manager.
2. Publish your API to make sure that it's available online.
3. Create a client application and copy its client ID and client secret.
4. Subscribe the client app to the API.
5. Open the Test application:
  - Cloud Pak for Integration only: Click Design in the page header, and then click Test APIs; or
  - All users: Click API Manager in the banner to return to the Home page, and then click the Test API tile.

Contribute in GitHub: [Edit online](#)

---

## Getting started

The Automated API behavior testing interface provides collaborative and powerful API testing capabilities.

- **Create automated and simple to use API tests quickly and easily.**
  - Produce high quality APIs consistently, with automated and simple to use API testing that you can rely on.
- **Intelligent validation of API payload accuracy.**
  - Add more intelligence to your tests to verify the accuracy of the payload. You can easily make logical assertions to create flexible and powerful conditions for validation, with no code necessary.
- **Collaborative testing.**
  - Accelerate your API development and testing, by sharing your tests and results through the intuitive visual composer.
- **Easily integrate into your CI/CD pipeline to execute tests as part of your deployment.**
  - Create [API Hooks](#) to allow your tests to be run via the command line and become part of your automated build processes.
- **No code necessary.**

---

## How to get started

- [Creating a test](#)
- [Modifying a test](#)
- [Running a test](#)
- [Publishing a test](#)
- [Variables](#)

Contribute in GitHub: [Edit online](#)

---

## Creating a test

Creating an API test involves the following three steps:

1. Creating a request.
2. Sending the request to an API endpoint.
3. Generating a test from the response that's returned from the endpoint.

The following instructions show you how to create a test by using the **HTTP Client**.

---

## What is the HTTP client?

After you log in to IBM API Connect Test APIs, you land on the HTTP Client.

To reach the HTTP Client from any other page, click **HTTP Client** in the menu bar.

## Step 1: Creating a request

The HTTP Client page contains the following three sections:

1. The initial section is where you specify the request type, the URL, and any other parameters that are needed. It's also where the **Send** and **Clear** buttons are located.
2. The central Headers and Body section is where you define the request headers and body.
3. The Response section is where the headers and body of the response appear after you've sent the request. You don't need to do anything in this section.

The following instructions use **GET https://us-east.apitest.apiconnect.ibmcloud.com/app/api/examples/retail/products** for illustration purposes, which is a built-in API endpoint example. This example requires no parameters to be added to the URL, and requires no request headers or body to be supplied.

## Set the request type

In the initial section of the HTTP Client, select the type of request that you want from the drop-down menu alongside the **Request url** field.

The following options are available:

- **GET**
- **POST**
- **PUT**
- **PATCH**
- **DELETE**

For our example, select **GET**.

## Set the API endpoint URL

In the initial section, complete the **Request url** field with the API endpoint URL. For our example, enter: **https://us-east.apitest.apiconnect.ibmcloud.com/app/api/examples/retail/products**.

## Add parameters to the URL

If you are using a different API endpoint from our example, and it requires one or more parameters, click **Params +** next to the **Request url** field. A parameter line is added after the URL, which you can edit.

Enter a parameter as a key-value pair.

To add more parameters, click the **add** icon  next to any defined parameter.

To remove a parameter, click the **delete** icon  next to the parameter.

## Configure the request headers

In the central Headers and Body section of the HTTP Client, select the **Headers** tab. If you're using our example, you don't need to supply any headers.

Define a header as key-value pair.

To add more headers, click the **add** icon  next to any defined header.

To remove a header, click the **delete** icon  next to the header.

## Configure the request body

In the central nHeaders and Body section of the HTTP Client, select the **Body** tab. This tab is not available if the request type is **GET**, so you don't need to complete this section if you're following our example.

Set the body type to either **URL Encoded** or **Raw**.

If you set the body type to **URL Encoded**, you must provide one or more key-value pairs.

- To add more key-value pairs to the body, click the **add** icon  next to any defined key-value pair.
- To remove a key-value pair, click the **delete** icon  next to the key-value pair.

If you set the body type to **Raw**, you must complete the following actions:

- Select the content type from the content type drop-down menu. The following options are available:
  - **application/x-www-form-urlencoded**
  - **application/json**
  - **text/xml**
  - **text/plain**
- Complete the request body in the text box under the body type selection.

## Step 2: Sending the request

Click **Send** in the initial section of the HTTP Client.

The screenshot displays the IBM API Connect interface for configuring an HTTP request. The top navigation bar includes 'IBM API Connect', 'Test APIs', and 'HTTP Client'. The main area shows a request configuration for a GET method to the URL `https://us-east.apitest.apiconnect.ibmcloud.com/app/api/examples/retail/products`. The 'Send' button is highlighted with a red box. Below the URL, there are sections for 'Params', 'Headers', and 'Body', each with a table for key-value pairs. The 'Response' section is currently empty, showing a message: 'You currently have no saved requests.'

The response from the endpoint is displayed in the Response section of the page. You can examine the returned headers and body by clicking the **Headers** and **Body** tabs in the response section.

IBM API Connect | Test APIs | <Your Test Organization> / Projects | Vault | HTTP Client >...

HTTP Client >... | Save | Generate Test | Import | Agent: Default >

Search ...

GET | https://us-east.apitest.apiconnect.ibmcloud.com/app/api/examples/retail/products | Params + | Send | Clear

Headers | Body

key | value | + | -

Response

Headers | Body | Raw | **Parsed**

● HTTP Code: 200 | Latency: 314 | Fetch: 106 | Total Time: 420

Date → Wed, 03 Jun 2020 15:27:44 GMT  
 Content-Type → application/json;charset=UTF-8  
 Transfer-Encoding → chunked  
 Connection → keep-alive  
 Set-Cookie → JSESSIONID=8AC4BEA4AD09DE362E8B0356D30E6D6A; Path=/app; Secure; HttpOnly  
 Cache-Control → no-store  
 Pragma → no-cache

 X-XSS-Protection → 1  
 Strict-Transport-Security → max-age=31536000

You currently have no saved requests.

### Step 3: Generating a test

Now that you've sent a request and received the response, you can generate the test.

Click **Generate Test** in the initial section of the HTTP Client.

IBM API Connect | Test APIs | <Your Test Organization> / Projects | Vault | HTTP Client >...

HTTP Client >... | Save | **Generate Test** | Import | Agent: Default >

Search ...

GET | https://service.io/api/random | Params + | Send | Clear

Headers | Body

- ✓ Global params added successfully.
- ✓ Input-set added successfully.

**Assertions**

- ✓ Request added successfully.
- ✓ Assertions added successfully.

**Close**

You are now in the test editor, called the Composer. In the Composer you can edit and run the test.

The screenshot displays the IBM API Connect interface for configuring a test. The top navigation bar includes 'IBM API Connect', 'Test APIs', and the current project path '<Your Test Organization> / my-project'. The main workspace is divided into a left sidebar with 'Data Sets', 'Vault Beta', and 'HTTP Client' sections, and a main area for the test configuration. The test configuration includes a GET request to 'https://service.io/api/' and five assertions: 'payload\_response.statusCode must be equal to 200', 'payload must match us\_zipcodes', 'payload must be boolean', 'payload must exist', and 'payload must contain id'. Each assertion is color-coded (Aeq, Am, Ai, Ae, Ac) and includes details like mode, type, level, and execution options. A '+ Add Request / Assertions' button is located at the bottom of the list.

## What to do next

- Next topic: [Modifying a test](#)

Contribute in GitHub: [Edit online](#)

---

## Modifying a test

Use the Composer to update and modify your test. The following sections provide information about the Composer, and how to use it.

[About the Composer](#)

[Using the editor](#)

[Adding a component](#)

[Editing a component](#)

[Moving components](#)

[Transforming a component](#)

[Deleting a component](#)

---

## About the Composer

If you are not on the Composer page, or you want to modify a different test, follow the instructions in [Opening a test in the Editor](#) to find the test that you want to modify, and open it in the Composer.

The Composer shows all of the components that make up the test. In our getting started example, the first component is the request to the API endpoint - which in this case is a **GET** to `$(endpointURL)`. When the test was generated, it extracted the URL that you provided into a variable. To see any variables that were generated, click

the **Data Sets** icon in the navigation pane.

After the request line, you will see the assertions and other components, for example **Aeq**, **Ai**, **Ae**, **for each in** and so on. For more information about assertion components, see [Assertion components](#).

## Using the editor

The test can be edited by using either the code (text) editor, or the visual (graphical) editor. Toggle between these two editors by clicking the **CODE** and **VISUAL** tabs. The visual editor is the default editor.

The following instructions describe how to make changes by using the visual editor.

## Adding a component

You can add a component by using one of the following options:

- By clicking the **add component** icon .
- By clicking a component at the location where you want to add a new component, then clicking the **menu** icon , and selecting **Add component before** or **Add component after**, depending on where you want the new component to be positioned.

A list of component types is displayed.

After you've chosen your component type, carry out the following steps to add the component to your test. Note that you can hover over each component to see a description of what that component does.

1. Click the component type that you want to add.
2. Configure the new component's parameters in the component dialogue box.
3. Click the **Confirm changes** icon  to apply the changes.
4. If your new component is in the wrong location, you can drag it to the correct location. Note that you can drag any component in your test.
5. Click **Save** to save your changes.

## Editing a component

You can edit a component in any one of the following ways:

1. Double-click the component to be edited.
2. Click the component, and then click the **Edit component** icon .
3. Click the component, then click the **menu** icon  and select **Edit component**.
4. Click the component, then click **Edit**.

The edit dialogue box is displayed. Each component dialogue box will look different, as they all have different sets of parameters.

In the edit dialogue box, you can make the following changes:

- Modify any of the component's parameters.
- Clone the component by clicking the **Clone component** icon .
- Delete the component by clicking the **Remove component** icon .
- Cancel changes by clicking the **Cancel changes** icon .
- Apply changes by clicking the **Confirm changes** icon .

Click **Save** to save your changes.

## Moving components

Simply drag-and-drop any component from one position within the test to another position in the visual editor.

Remember to click **Save** to save your changes.

## Transforming a component

You can transform a request component to be a different type of request, and an assertion component to be a different type of assertion.

1. Click the request or assertion component to be transformed, then click the **Transform component** icon  .
2. Select the type of request or assertion that you require.
3. Complete the edit dialogue box for the new type of component.
4. Apply the changes by clicking the **Confirm changes** icon  .
5. Click **Save** to save your changes.

---

## Deleting a component

You can delete a component in any one of the following ways:

- Click the component to be deleted, and click the **Remove selected component** icon  .
  - This technique can also be used to delete a block of components. Click the first component in the block, and press the shift key while clicking the last component in the block. Then click the **Remove selected component** icon  .
- Click the component to be deleted, then click the **menu** icon  , and select **Remove component**.
- Click the component to be deleted, then click **Edit** alongside the component pane, and then click the **Remove component** icon  .

Remember to click **Save** to save your changes.

---

## What to do next

- Next topic: [Running a test](#)
- Previous topic: [Creating a test](#)

Contribute in GitHub: [Edit online](#)

---

## Running a test

Tests are run from the Composer page of IBM API Connect Test APIs.

If you are not on the Composer page, or you want to run a different test, see [Opening a test in the Editor](#) for instructions.

---

## Before you begin

Ensure that your browser is set to allow pop-ups for this application.

---

## Running the test

1. From the Composer page for the test that you want to run, click **Run Test**.

2. Select a downloader from the drop-down list in the "Run Test" dialog box.
3. Click **Run Test**.
4. Your test results are displayed in a Test Report on a separate tab in your browser.

## <Test Organization Name>

## Troubleshooting

If an Internal Server Error message is displayed during the test, follow the instructions in [Opening a test in the Editor](#) to return to the Editor page, and run the test again.

## What to do next

- Next: [Publishing a test](#)
- Previous: [Modifying a test](#)

Contribute in GitHub: [Edit online](#)

---

## Publishing a test

After you have completed the configuration of your test, and run it manually to confirm that it works correctly, you can publish the test.

Following on from publishing a test, you can continue to work on the test in the Composer without affecting the published test, and then publish the test again later to update the published test.

To publish a test, complete the following steps:

1. Click your test suite name in the menu bar to get to the "Test Suites" page.

2. On the "Test Suites" page, click the **Tests** icon [Tests](#) for the test suite that contains the test that you want to publish. The list of tests is displayed.

3. From the list of tests double-click the test that you want to publish, or click the **edit** icon  for the test.

4. The status page for your test is displayed. If your test has not been published before, the status will show as **Not published**.

The screenshot shows the test status page for 'my-test' (no description). The test status is 'Draft'. A warning icon is displayed in a large circle. A progress indicator shows the test is not yet published. A red box highlights the 'Not published' status with the message: 'The working copy of the test has not yet been published.' Below this, there are two versions: 'Working Copy' (Author: User, Modified: 06/03/2020 4:18 PM) and 'Published Version' (Author: User, Modified: 06/03/2020 4:17 PM). A tooltip explains that the published version is the live version and cannot be undone. At the bottom, there are buttons for 'Compose', 'Publish', 'Clear Working Copy', 'Build from SPEC', and 'Delete Test'.

5. Click the **Publish** icon  to publish your test.

6. The test status page is updated with the following changes:

- The status of the test now shows as **Published**.
- The **Publish** icon is disabled.

The screenshot shows the test status page for 'my-test' (no description). The test status is 'Ready to be scheduled'. A calendar icon is displayed in a large circle. A progress indicator shows the test is published. A red box highlights the 'Published' status with the message: 'The test has been published.' Below this, there is one version: 'Published Version' (Author: User, Modified: 06/03/2020 4:19 PM). A tooltip explains that this is the live version and cannot be undone. At the bottom, there are buttons for 'Compose', 'Publish', 'Clear Working Copy', 'Build from SPEC', 'Copy To Clipboard', and 'Delete Test'. The 'Publish' button is now disabled.

## What to do next

- Next topic: [Tagging a test](#)
- Previous topic: [Running a test](#)

Contribute in GitHub: [Edit online](#)

---

## Tagging a Test

Adding tags to your tests is an easy way to keep them organized in your Test Suite. Furthermore, tags can be used as a way to selectively execute certain tests in your test suite when running them via an [API Hook](#) (see [Run Published Tests by Tag](#) for more information).

**Note:** To tag a test, you must have first [created a test](#).

---

## Adding a Tag to a Test

1. Click your test suite name in the menu bar to get to the "Test Suites" page.

2. On the "Test Suites" page, click the **Tests** icon  for the test suite that contains the test that you want to tag. The list of tests is displayed.

3. From the list of tests double-click the test that you want to tag, or click the **edit** icon  for the test.

4. The status page for your test is displayed. Click on the **edit** icon  alongside your test name.

IBM API Connect | Test APIs | <Test Organization Name> / Project 1 | Tests | Dashboard | API Quality | Vault | HTTP Client

← Tests List | Test 1 (no description) [edit icon]

Test status: Live

✓ Last Run  
This test never ran

This is a draft version of the test you are currently editing. This version is NOT live, and will not be invoked by API Hook. To push live click the Publish button.

**Working Copy**  
Author: User  
Modified: 06/03/2020 2:00 PM

**Published Version**  
Author: User  
Modified: 06/03/2020 2:00 PM

This is the live version of the test. It is executed either manually or via API Hook. To update the test, edit the Working Copy and Publish the Working Copy. Do so with caution, there is no undo button.

Show/hide test information (ProjectID, TestID)

Edit | Publish | Clear Working Copy | Build from API Specification | Copy To Clipboard | Delete Test

5. The Edit Details dialog box will open, allowing you to edit information about your test. To add Tags to your test, simply begin typing a name for a Tag into the Tags box within this dialog. You can assign multiple Tags to a test separating each Tag with a space. To remove a Tag from a test, click the **x** button alongside the Tag.

Edit Details: Test 1 in Project 1 [x] [checkmark]

Warning: saving the changes will also publish the current working copy.

Test name: Test 1

Description:

Tags: x production

6. Click the **confirm** icon  to confirm and save your edits.

7. Tags can be viewed any time in the Tests List. Click the **Tests List** button  to go back to the Tests List and see your tags alongside your tests.

The screenshot displays the IBM API Connect Tests List interface. At the top, there is a navigation bar with the following items: IBM API Connect, Test APIs, <Test Organization Name> / Project 1, Tests (with a dropdown arrow), Dashboard, API Quality, Vault, HTTP Client, and user profile, settings, and help icons. Below the navigation bar, the main content area is titled 'Tests' and includes a '+ New Test' button. The tests are listed in a table with columns for test name, author, and last modified date. Test 1 and Test 2 are visible. Test 1 has a 'production' tag highlighted with a red box. The interface also includes a 'Run All' button, an 'Agent: Default' dropdown, and an 'Environments' dropdown.

Test Name	Author	Last Modified	Tags
Test 1	User	2020/06/03 @ 02:23	production
Test 2	User	2020/06/03 @ 01:34

## Variables

Within API Testing there are multiple ways to define variables to address different requirements

### Defining variables

#### Global Variables

Global variables are ones that are common across the whole test and typically does not change between runs based on Input sets

#### Add a Global variable

To add a Global Variable within the Test Editor Select Data Sets Click **Add Global Variable** Provide Variable Name and value Click 

#### Edit A Global Variable

To edit an existing variable to change either the name or value For the given variable click

### Input Set Variables

The input set, is a group of input variables representing a scenario (e.g product id). Where the number of input sets determines how many times the test will be executed using those values.

If 3 input sets are defined, the test will run 3 times using the inputs defined within each of those sets on each run.

### Vault Variables

Variables can be defined within the vault which provides Test Suite scoped variables that can be used in all tests within that suite.

Vault variables can be defined as

- Variable - Visible
- Password - Hidden

### Hook Variables

When [Using API Hooks](#) it is possible to override Global defined variables within the request payload when running tests.

```
curl -X POST \  
-H X-API-Key:{API-Key} \  
-H X-API-Secret:{API-Secret} \  
-H Content-Type:application/json \  
-d \  
  {  
    "options": {  
      "allAssertions": boolean,  
      "JUnitFormat": boolean  
    },  
    "variables": {  
      "url": "https://www.ibm.com",  
      "username": "test",  
      "password": "passw0rd"  
    }  
  }  
  \  
  \  
<API-Hook-URL>/tests/{Test-ID}/run
```

### Variable Hierarchy

- If a variable is defined in Vault and either in Global or Input sets, Global or Input will take precedence
- If a variable is defined in both Global or Input set, Input set takes precedence
- If a variable is supplied as part of a Hook request and is defined in Vault, Global or Input set, the Hook will take precedence

## Referencing variables within a request

## Insights-Driven Test Generation

**Available only as part of Cloud Pak for Integration 2021.2.1**

Insights-driven test generation takes the OpenTelemetry data from a source deployment and compares the observed behaviors to your current set of API Management test cases to find untested and non-obvious behaviors inherent within API calls in a specific environment.

- [Enabling Insights for Test Suites](#)
- [Generating Test Cases from Insights](#)
- [Watson Insights](#)
- [Troubleshooting](#)

The insight generation process is made up of the following stages:

1. Training and testing
2. Scoring
3. New behaviour generation
4. Test template generation

During insight generation you'll be able to see the current stage of the generation process on the insights panel:

Tests	0	
Events	0	
Failures	0	
Insights  Processing	?	

<b>Dashboard</b>	<b>Tests</b>	<b>API Quality</b>	<b>Settings</b>

Restart analysis 
×

## Analyzing Data...

You can still create tests however their data might not contribute to insight generation.

- Training & testing
- Scoring
- Getting new behaviours
- Generating test template

### Known limitations

- API Management Spaces are not currently supported.
- The user currently has to manually refresh the tests page in order to obtain the most up-to-date insights status.

Contribute in GitHub: [Edit online](#)

---

## Enabling Insights for Test Suites

The following details are required in order to enable insights-driven test generation for a new or existing test suite:

### Jaeger

---

To configure the Jaeger connection details the following values are required:

*To obtain the service names used to identify the Jaeger traces from the API Gateway, review the options under the service dropdown on the Jaeger UI; the service name will be **apiconnect** by default.*

*The test service name is for the Jaeger instance deployed in the same environment as test APIs; source is the remote Jaeger instance.*

- **Service in test:** Test API Gateway Jaeger service name for the local system defined Jaeger instance
- **Service in production:** Source API Gateway Jaeger service name for the remote system defined in the Data service section
- **Time range:** Select the date range from which to obtain OpenTelemetry traces
- **Results limit:** Sets the number of OpenTelemetry traces that are to be retrieved from the source environment for use to build the training model

## Data Service Connection Details

---

Define the connection details of the remote data service to enable connection to the source environment to retrieve OpenTelemetry and analytics data:

- **Endpoint:** The route created for the insights data service
- **API key:** The key can be found in the `ai-data-service-api-key` secret mounted to the data service, this may need to be retrieved by your administrator
- **TLS certificate:** The certificate presented on the endpoint - if signed by an internal certificate authority or uses a self-signed certificate then please provide the full certificate

## API Management Connection Details

---

Provide the definitions for the source API Management deployment to enable the retrieval of analytics data.

- **Provider organization:** The name of your API Management organization
- **Catalog:** Name of the catalog in the above organization that you wish to use
- **Analytics service:** The name of the deployed analytics service that you wish to use
- **Username:** The username of the user created to retrieve analytics data from the source API Management instance
- **Password:** Password for the above user
- **Realm:** The user realm which the user authenticates against, should be in this format: `provider/idp`
- **OpenAPI document:** The OpenAPI spec document describing the set of APIs to be used for insights generation
- **Client ID:** The id of the application registered for use with the API Management REST API - No longer required as of CP4I 2021.3.1
- **Client secret:** The secret of the application registered for use with the API Management REST API - No longer required as of CP4I 2021.3.1

If a client application has not been created, then you may use a local user registry and create a new user for analytics.

## Generating Test Cases from Insights

To make use of the Insights feature, create a new Test Suite with the details described in [Enabling Insights for Test Suites](#), and follow the steps below once the insights generation process has successfully completed:

Step	Screenshot	Instruction
------	------------	-------------

Step	Screenshot	Instruction
1		<p>Click on the "Tests" button of the insights-enabled Test Suite to navigate to the tests dashboard</p>
2		<p>Click on the "Insights" button next to the "Create Test" button to bring the insights panel up</p>
3		<p>Click on the "Add test case" button on the desired insight</p>

Step	Screenshot	Instruction
		
4		Name the test case to be generated (and update its description and tags if desired) and click on the green tick to create the test case

Step	Screenshot	Instruction
5		<p>You should then edit the test case so that the <b>protocol</b>, <b>domain</b>, and <b>basePath</b> data set parameters match those of your deployment's</p>
6		<p>The insight-generated test case should now show up on the tests dashboard (with the insights icon next to the test name)</p>

Contribute in GitHub: [Edit online](#)

## Watson Insights

**Available as of APIC release 10.0.4**

As an enhancement to the AI Test Generation feature introduced in the 2021.2.1 release of CP4I, AI generated insights now take the form of *Watson Insights*. Up to three test cases with an impact score of at least 70% can be recommended, as denoted by the **Impact score nn%** annotation on each tile.

Panel breakdown:

1 - Test coverage improvement

- By analyzing the amount of occurrences covered by each of the highlighted test cases we can calculate a number for the total potential coverage improvement for your API provided by utilising all of the recommended cases.

2 - Impact score

- An impact score should be seen as a quick "overview" of how impactful a test case would be to add. The score is calculated by comparing the overall usefulness of all cases and calculating a relative score expressed as a percentage. These values are shown in the tooltip seen in point 3.

3 - Impact score tooltip

- The values used to calculate the impact score are shown here. *Data completeness* describes how *complete* the test case is based on the values that are pre-populated for you. *Occurrences covered* describes how many traces from this set of results were covered by this single test case. The final *Impact Score* is calculated by taking these two values, comparing them with the other generated insights, normalising the data and combining them to calculate a geometric mean between the two values which creates our final score\*.

*\*This value may change in future updates as more data is used to further enhance AI Test Generation.*

## AutoTest Assist

Available only as part of the following API Connect editions:

- **Cloud Pak for Integration 2022.2.1 and later (API Management capability)**
- **Enterprise as a Service (hosted on AWS)**

The AutoTest assistant (or, simply, the *auto-tester*) exercises your API by sending it a series of randomly-generated requests, guided by the API definition and any custom rules that you provide, and alerts you about any conformance errors and server-side errors that it observes.

You control the auto-tester by creating and running an AutoTest *profile*, and you can create multiple profiles against the same API to cover different use-cases. A profile specifies how the auto-tester should run, which endpoints it should test, and what kind of data it should send. A default profile is constructed so that you can get immediate feedback by providing no more than a target URL and credentials.

The AutoTest assistant is especially useful while an API is under development as it can quickly identify errors in an implementation without you having to write test cases. It is also valuable later in the cycle for spotting regressions, as the random nature of its requests can provide coverage that your existing test cases do not match. However, it is not meant as a replacement for other testing tools in API Connect, but is rather complementary, and the information it provides when it identifies an error is often a good starting point for creating a test case.

Follow these steps to create and run your first profile:

- [Creating a profile](#)
- [Running a profile](#)
- [Viewing the report](#)

Consult these additional guides for detailed instructions on how to configure the auto-tester to support your use case:

- [Profile Configuration](#)
- [Profile Security](#)
- [API Extensions](#)
- [Data Generation Rules](#)

## Known limitations

---

- The API definition must conform to OpenAPI 2.0 (Swagger 2.0)
- The API definition document must have a `.json` or `.yaml` extension (you cannot select a document with another extension)
- If there are errors in the API definition then you will see only a blank screen, and the errors are not reported
- You must provide either a username and password, or a bearer token, to authenticate against the target API; other authentication methods are not supported
- You can run only one profile at a time

Contribute in GitHub: [Edit online](#)

# Creating an AutoTest profile

An AutoTest profile exists within a test suite, alongside your test cases.

To add an AutoTest profile to a test suite: open the suite, select the **Tests** tab, and click on **AutoTest** profiles.

Click **Add**, and select the API you wish to target: choose either an existing API from the dropdown (from a definition you have uploaded previously) or upload a new definition by dragging and dropping an OpenAPI document in either JSON or YAML format. It doesn't matter if you upload the same document more than once as it will be recognized.

## Known limitations

- The API definition must conform to OpenAPI 2.0 (Swagger 2.0)
- The API definition document must have a `.json` or `.yaml` extension

Click **Next** and provide at least a name for your new profile. You can also add comments and tags.

[AutoTest profiles](#) /

## Profile info

### Info

---

Name

Description

Tags

This is a list of comma separated values

[Cancel](#) [Back](#) [Next](#)

Click **Next** and AutoTest scans the API document and extracts semantic information that will inform its generation of requests. You get a chance to review the information here, but if you need to change anything you must wait until the profile is complete. If this is your first time with AutoTest you can take the content on trust and move on, but read through [API Extensions](#) if you want to understand the detail.

### Known limitations

- If you see a blank screen at this point then there is most likely an error in your API definition, and you should validate it in the Swagger editor

[AutoTest profiles](#) /

## Review API Extension

**Info:** AutoTest has generated these extensions for the API you selected. You can edit the extensions once you have completed the profile.

```

1 properties:
2   - items:
3     - name: order_id
4       semantic: id
5       json_ptr: '#/definitions/Order'
6   - items:
7     - name: customer_id
8       semantic: id
9       json_ptr: '#/definitions/Customer'
10  - items:
11    - name: name
12      semantic: name
13      json_ptr: '#/definitions/ErrorTarget'
14  - items:
15    - name: message
16      semantic: sentence
17      json_ptr: '#/definitions/ErrorItem'
18  - items:
19    - name: phone
20      semantic: phone_number
21    - name: last_name
22      semantic: last_name
23    - name: first_name
24      semantic: first_name
25    - name: email
26      semantic: email
27    - name: username
28      semantic: username
    
```

Click **Create** and AutoTest will have created a profile with the default configuration.

[AutoTest profiles](#) /

## Summary

- ✔ Created AutoTest profile: movies - default.
- ✔ Generated associated API Extension.

Click **Close** and it takes you back to the starting page, but now showing your new profile.

## Running an AutoTest profile

To be able to run an AutoTest profile you will need to configure it first. Make sure to set the ServerURL parameter correctly otherwise all the generated API calls will fail. For more information please refer to [AutoTest Profile Configuration](#). At any point during this process you can click on the save button to maintain your progress.

Once you have made your changes in the configuration panel, go to the security panel to set your authentication.

## Design

## Report

Configuration

Info

Security

For more information read through [AutoTest Profile Security](#).

Once you have made all your changes to the configuration and security. You can either save, or click on the run button.

This will take you to the report page where the exerciser will generate calls to test the API.

## Design

## Report

Overview

API calls

 Generating calls

Calls made so far: 181

Items per page: 10 ▼
1-5 of 5 items
1 ▼ of 1 page ◀ ▶

The **API calls** tab contains a more detailed view of every API call made by the run. The left side contains the list of the calls and their respective response statuses; the search bar lets you filter on the HTTP method, the path, and the response code; this should make it relatively easy to find specific requests amongst the potentially large number of API calls.

You can also get to the details view by clicking on any of the non-zero numbers in the overview table; this will automatically filter the list of API calls by the appropriate class of responses (or just the path and verb if the total tally is clicked on), as shown below.

Contribute in GitHub: [Edit online](#)

---

## Profile Configuration

The configuration controls the execution of your profile; it determines for how long the test should run, and what kinds of requests it should generate. A newly-created profile includes a default configuration that you can run immediately to check that the auto-tester works with your API. The one thing you may have to set or change before you can run is the target [Server URL](#), which must point to your test deployment; the default value is copied from the API definition, where one is provided. You must also specify appropriate authentication settings on the separate **Security** tab (see [Profile Security](#)).

The configuration is in YAML format. The editor highlights syntactic errors as you type, and verifies the content for consistency with the API definition each time you press **Save**. If there is an error in the configuration, then the profile cannot run.

40 ErrorPercent: 1.5
41

```

Sections in the configuration:

- [The API](#)
- [Stopping Criteria](#)
- [Execution Control](#)
- [Resources](#)
- [Operations](#)
- [Datatypes](#)

## The API

### ServerURL

The server URL is the single endpoint to which all requests are sent. It must be a valid URL, reachable from your namespace, and include at least a scheme and a server address; it may also include a port number and a path prefix. It must not include a trailing slash. The server URL is prefixed to an operation path from the API definition to create the target of a request. For example, given this URL definition from the configuration:

**ServerURL:** `https://api-host:8000/apis`

And this operation path from the API definition:

```
paths:
  /movies:
    post:
```

The auto-tester will send `POST` requests to this target URL:

`https://api-host:8000/apis/movies`

## Stopping Criteria

The profile stops running as soon as any of these criteria are met.

### TimeToRun

The maximum length of time to run, in minutes: the auto-tester stops sending requests once this time period has elapsed. The overall running time will be longer because it includes additional time for setup and teardown.

For example, to set a maximum running time of ten minutes:

**TimeToRun:** `10`

## MaxRequests

The maximum number of requests to send: the auto-tester stops issuing requests once this number has been reached. The final total of requests may be greater if additional requests are needed for setup and teardown.

Set this to zero to disable the request limit, and then the auto-tester will issue as many requests as fit into the allotted time period.

For example, to set a maximum of two thousand requests:

```
MaxRequests: 2000
```

## MaxErrors

The maximum number of error responses to allow: the auto-tester stops issuing requests once this number has been reached.

An error in this context is not an API error indicated by a **4xx** (or even, sometimes, a **5xx**) response, which is to be expected if the profile exercises all execution paths through the implementation. An error here is one where the response to a request is inconsistent with the API definition, which is a defect. Common cases include:

- the status code is not documented
- the payload does not conform to the schema
- any 500 error

There should be no such errors in a mature implementation so the limit is typically set low, so that the profile can terminate early if they occur. You can set the limit to zero and disable this stopping condition, which might be appropriate for a development environment where you know that some operations have defects (or you can disable those operations from ever being called as described under [Operations](#)).

For example, to set the error limit to three:

```
MaxErrors: 3
```

## Execution Control

---

### ParallelRequests

If this is **true** then the auto-tester spawns threads to issue multiple requests concurrently, otherwise it issues just one request at a time. The concurrent option increases throughput and can be helpful in exposing synchronization issues in the API.

The number of concurrent threads is fixed and cannot be changed.

For example, to disable concurrent requests:

```
ParallelRequests: false
```

### ErrorInjection

If this is **true** then the auto-tester issues a certain percentage of malformed requests to further exercise the validation logic of the API, otherwise it only issues requests that are well-formed according to the API definition.

The percentage of requests is specified as **ErrorPercent**.

For example, to enable malformed requests:

```
ErrorInjection: true
```

### ErrorPercent

The percentage of malformed requests, when **ErrorInjection** is **true**.

For example, to include 2% of malformed requests:

```
ErrorPercent: 2.0
```

## Resources

---

The AutoTest execution model is based around the notion of "resources", where a resource has a schema (of object type) and a set of operations (or methods). Resources are defined in the [API extensions](#).

The auto-tester only exercises operations that belong to resources. To decide which operation to execute next, the auto-tester first picks a resource type at random, and then an operation from that type (again, at random).

You control the frequency with which resources are selected by assigning them weights. The selection frequency for a given resource is computed as the weight for that resource divided by the sum of all the weights.

A zero weight means that the resource will never be selected, and you can use this to exclude certain resources from testing; for example, when you know that they are not yet fully implemented. It is an error for all weights to be zero which would leave nothing to test.

Use the **Resources** key to assign weights to specific resources, and **ResourceDefault** to set the default weight for any resources not specified.

### Resources

The weights assigned to specific resource types. The value is an object, where the keys are resource names, and the values are non-negative integer weights. Resource names must be declared in the API extensions.

For example, to increase the test focus on **Customer** operations, and exclude **Order** operations entirely:

```
Resources:  
  Customer: 2  
  Order: 0
```

## ResourceDefault

The default weight for any resource type not mentioned explicitly under **Resources**. The weight can be any non-negative integer value, but there are two common use cases:

- if the weight is 1 then all resources are selected with equal frequency, except where specified otherwise under **Resources**
- if the weight is 0 then all resources are disabled, except for those specified otherwise under **Resources**

For example, to disable all resources by default:

```
ResourceDefault: 0
```

In this case there must be at least one non-zero weight under **Resources**.

## Instances

Upper and lower bounds on the number of resource instances that should exist at any time. The value is an object, where the keys are resource names, and the values specify lower and upper bounds for those resource types. Resource names must be declared in the API extensions, and the bounds must be non-negative integers that together define a non-empty range. The upper bound may also be **unlimited** in which case the number of instances depends upon the balance of create and delete requests issued for that type.

The auto-tester keeps track of the instances it creates for each resource type, in order to provide valid references and avoid too many 404 responses, and makes best efforts to keep the number of instances within any specified bounds.

For example, to place an upper bound on the number of **Customer** instances that should exist at any time:

```
Instances:
  Customer:
    maximum: 25
```

## InstanceDefault

The default instance bounds for any resource type not mentioned explicitly under **Instances**.

For example, to make the default unlimited:

```
InstanceDefault:
  minimum: 1
  maximum: unlimited
```

## Operations

---

Once the auto-tester has selected a resource type, it uses a similar weighting strategy to choose an operation from that type.

You control the frequency with which operations are selected by assigning them weights. Use the **Operations** key to assign weights to specific operations, and **OperationDefault** to set the default weight for any operations not specified.

A zero weight disables an operation entirely, and if all the operations are disabled for a resource then the resource itself is also disabled.

## Operations

The weights assigned to specific operations. The value is an object whose schema follows the pattern established by the **Paths** object in OpenAPI, but the values assigned to each operation are non-negative integer weights.

For example, to increase test focus on the **put\_customer** operation, and avoid **patch\_customer** completely:

```
Operations:
  /customers/{customer_id}:
    put: 10
    patch: 0
```

The special key **\_** can be used to match all methods defined on a path that are not called out explicitly. For example, to disable all but the **put\_customer** operation:

```
Operations:
  /customers/{customer_id}:
    put: 10
    _: 0
```

Remember that the weights are interpreted only across operations within the same resource type, and not across all operations in the API, so the overall distribution is determined by both the weight on the resource and the weight on the operation.

## OperationDefault

The default weight for any operations not mentioned explicitly under **Operations**. The value is an object where the keys are method names and the values are the default weights for those methods where they occur under any path. The special key **\_** matches all method names that are not listed separately.

For example, to disable all operations by default:

```
OperationDefault:
  _: 0
```

In this case there must be at least one non-zero weight under **Operations**.

## Datatypes

---

Place here any custom rules that guide the auto-tester in generating values for operation parameters and payloads. These rules override the default rules derived from the API definition and any semantic annotations in the API extensions.

Rule syntax is described in [Data Generation Rules](#).

## Schemas

Data generation rules for named schemas found under **definitions** (OpenAPI 2.0) or **components/schemas** (OpenAPI 3.0).

For example, given the schema definition:

```
Movie:
  type: object
  properties:
    title:
      type: string
    release_date:
      type: string
    format: date
    language:
      description: Two-letter ISO 639-1 language code
      type: string
      pattern: '[a-z]{2}'
```

The default generation rule for the **language** property, derived from this schema, will produce random string values that match the specified pattern (two lower-case alphabetic characters) but many of these will not be valid language codes, potentially giving rise to an excessive number of 400 responses.

To override the default generation rule and specify instead some particular language codes sufficient for testing:

```
Datatypes:
  schemas:
    Movie:
      properties:
        language:
          enum:
            - en
            - fr
            - de
```

To inject a small percentage of invalid values:

```
Datatypes:
  schemas:
    Movie:
      properties:
        language:
          choice:
            - enum:
                - en
                - fr
                - de
              weight: 98
            - const: xx
              weight: 2
```

## Operations

Data generation rules for operation parameters and payloads described by inline (or unnamed) schemas and types. The value is an object whose schema follows the pattern established by the **Paths** object in OpenAPI.

Note that the auto-tester only supports **path** and **query** parameters at present, and other parameter types are ignored.

For example, given these (abbreviated) operation definitions:

```
paths:
  /movies:
    get:
      parameters:
        - name: limit
          in: query
          description: Sets an upper bound on the number of movies returned
          schema:
            type: integer
    post:
      requestBody:
        content:
          application/json:
            schema:
              type: object
              allOf:
                - $ref: '#/definitions/Movie'
                - properties:
                    keywords:
                      type: array
                      items:
                        type: string
```

To set values for the **limit** query parameter, and the **keywords** property of the payload to **post**:

```
Datatypes:
  operations:
    /movies:
      get:
        parameters:
          - name: limit
            in: query
            data:
              # pick a random value between 0 and 500 (inclusive)
              minimum: 0
              maximum: 500
```

```
post:
  requestBody:
    content:
      application/json:
        data:
          properties:
            keywords:
              # pick up to 3 items from the following list
              items:
                enum:
                  - avant-garde
                  - dystopia
                  - epic
                  - postmodern
                  - remake
                  - shootout
                minItems: 0
                maxItems: 3
```

## Profile Security

Security is where you set credentials for the API under test. The auto-tester supports only **Basic** authentication (username and password) and **Bearer** (or **Token**) authentication; it does not support other authentication methods such as **OAuth**, or the use of custom headers.

Select your security type from the dropdown and enter the required information:

Security Type	Description	Credentials
None	Unsecured endpoint	n/a
Basic	Basic HTTP authentication	Username/Password
Basic-url	Same as <b>Basic</b> but omits the word <b>Basic</b> from the Authorization header	Username/Password
Bearer	Bearer (or Token) authentication	Token

If you provide incorrect credentials then they will not prevent the profile from running, but you can expect to see all requests fail, typically with the response **401 Unauthorized** or **403 Forbidden**.

If you provide a bearer token then be sure that it has a sufficient lifetime to cover the full period of the test, which is determined by the [stopping criteria](#) in the profile configuration. Otherwise, once the token expires, you can expect to see authentication failures as described earlier.

## Custom headers

You can also configure custom security headers should your APIs require them for authentication/authorization. Simply add the required header(s) and the appropriate value(s) under the custom headers section like so:

Name	Value
X-IBM-Client-Id	.....  

[Add new header](#)

---

## API Extensions

An **API Extension** augments an OpenAPI definition with semantic information designed to improve the automatic generation of test cases. Extensions are used primarily by the AutoTest assistant to refine its randomly-generated test cases, but have wider applicability.

An extension comes in two parts:

- [Resources](#) identify the key resource types managed by the API, and their methods
- [Properties](#) attach semantic categories to schema properties, to constrain the format of values suggested for those fields

An extension is associated with a specific OpenAPI document and uses [JSON Pointer](#) notation to locate terms in that document.

---

## Resources

The **resources** section contains a set of resource definitions, where each definition contains at least the following:

- a name for the resource
- a pointer to a schema of type **object** that models the resource
- a collection of methods that operate on the resource

Typically, a resource definition also identifies a field within the schema that stores a unique identifier for instances of that type.

For example, consider this extract from an API extension:

```
resources:
  Book:
    schemas:
      primary:
        json_ptr: '#/definitions/Book'
    properties:
      id_name: '$.book_id'
    operations:
      create:
        - json_ptr: '#/paths/~1books/post'
      retrieve:
        - json_ptr: '#/paths/~1books~1{book_id}/get'
        - json_ptr: '#/paths/~1books/get'
      update:
        - json_ptr: '#/paths/~1books~1{book_id}/put'
      delete:
        - json_ptr: '#/paths/~1books~1{book_id}/delete'
```

The `resources` section contains a single resource definition with the following properties:

- it defines a resource named `Book`
- a book is modeled by a schema of the same name located in the OpenAPI document under `definitions`
- each book has a property `book_id` that holds its unique ID
- there are operations defined in the OpenAPI document under `paths` that create, retrieve, update and delete books

The correspondence between the resource name and the schema name is common but not required: a resource name can be anything, as long as it is unique within the API.

The unique ID field for a book is identified by a simplified form of JSON Path expression that locates a property (`book_id`) within the primary schema.

Operations (or methods) on a resource are grouped by category:

- Create
- Retrieve
- Update
- Delete

There can be multiple operations in each. In this example there are two operations that retrieve books: one that returns a single book by ID, and another that returns a list of books, and this is common. A different definition might have `patch` as well as (or instead of) `put` under `update`.

JSON Pointer expressions in a resource definition all refer implicitly to the associated OpenAPI document, so the prefix `#` introduces a relative location within that document. JSON Pointer syntax uses the string `~1` to stand for a forward slash character (`/`) to prevent confusion with the same character used as a separator, so the operation defined in the OpenAPI document by the term:

```
paths:
  /books/{book_id}:
    get:
```

is identified here by the JSON Pointer:

```
#/paths/~1books~1{book_id}/get
```

## Dependencies

A resource definition may also describe a dependency from one resource type to another.

For example:

```
Order:
  schemas:
    primary:
      json_ptr: '#/definitions/Order'
  properties:
    id_name: '$.order_id'
  dependencies:
    - name: Book
      required: true
      references:
        - name: $.book_id
          in: body
      dependee_deletion: disabled
    - name: Customer
      required: true
      references:
        - name: customer_id
          in: path
      dependee_deletion: mutual
  operations:
    create:
      - json_ptr: '#/paths/~1customers~1{customer_id}~1orders~1{order_id}/post'
      # rest omitted for brevity
```

This definition says that the resource `Order` has dependencies on two other resources `Customer` and `Book` (which must be defined in the same extension).

Both dependencies are **required** in the sense that an order cannot exist unless there is a customer (to place the order) and at least one book (to buy).

An order refers to an existing book through the property `book_id` in the primary schema, and to a customer through the path parameter `customer_id`, as in the `create` method shown (and in other methods omitted).

A customer *owns* a set of orders; this is a hierarchical relationship implicit in the path:

```
/customer/{customer_id}/orders/{order_id}
```

When a customer is deleted, all their orders are also deleted, and this behavior is indicated by the `mutual` value of the deletion property.

A different relationship applies to books: a book cannot be deleted until all the orders which refer to it have been deleted, so deletion is indicated as `disabled` in that case.

There are three possible values for the `dependee_deletion` property:

- `enabled`: a referenced resource can be deleted even while dependent resources that refer to it still exist
- `disabled`: a referenced resource cannot be deleted until all dependent resources that refer to it have been deleted
- `mutual`: deleting a referenced resource deletes all the dependent resources that refer to it: this is typical where the dependent is owned by or contained in the referent

## Pure resources

A pure resource is one that has no instances, or at least no instances that can be tracked with unique IDs, and is used as a placeholder for operations that do not behave as resource methods.

A pure resource differs from a standard resource in the following ways:

- it has no ID field (because there are no instances)
- dependencies have no `dependee_deletion` (for the same reason)
- all operations are grouped under a single `pure` category

For example:

```
ServiceAvailability:
  schemas:
    primary:
      json_ptr: '#/definitions/ServiceAvailability'
  operations:
    pure:
      - json_ptr: '#/paths/~1service~1status/get'
```

`ServiceAvailability` is a type that is returned as the result of a service status request but has no unique, persistent state.

## Properties

The `properties` section assigns semantic categories to schema properties occurring in operation payloads, to constrain the range of values interpolated into generated request bodies.

For example:

```
properties:
  - json_ptr: '#/definitions/CardPayment'
    items:
      - name: card_number
        semantic: credit_card_number
      - name: expiry_date
        semantic: expiry
      - name: security_code
        semantic: cvv
```

The JSON Pointer expression locates a schema named `CardPayment` in the API document under `definitions`; the schema must have `object` type with at least the properties `card_number`, `expiry_date` and `security_code` which are specified here to have particular semantics that will guide the auto-generation of appropriate values wherever a `CardPayment` occurs in a request payload.

Semantic categories must be drawn from the following set:

address	cvv	latitude	state_code
age	date	longitude	street
area_code	domain	minutes	temperature
birthday	email	month	time
certificate	expiry	name	timestamp
charset	first_name	number	token
cidr	gender	paragraph	twitter
city	geo_location	percentage	url
color	hours	phone	user_agent
content_encoding	humidity	phone_number	username
content_type	iban	prefix	uuid
coordinates	id	pressure	version
country	identity_provider	price	year
country_code	ip_address	revision	zip_code
credit_card_number	language	sentence	
currency	language_code	social_security_number	
currency_code	last_name	state

## Data Generation Rules

Data generation rules guide the auto-tester in choosing values to populate the parameters and payloads of its requests.

There are default rules derived from the API definition and extensions, but sometimes you want to override these, either to improve the general accuracy of the auto-tester or to tailor its requests to a specific use case, and you do that by adding custom rules to the [Datatypes](#) section of the profile configuration.

A data generation rule binds a **data generator** to a schema or type in the API definition such that, when the auto-tester assembles the data for a request and encounters that schema or type, it uses the generator to provide an appropriate value at that point.

---

## Data generators

A **data generator** describes a never-ending sequence of values, and whenever the auto-tester calls on a generator it takes the next value from the sequence.

The syntax for generation rules reuses terms from JSON Schema where the implied constraints on a schema are sufficient to guide the auto-tester in generating conformant values. Such constraints occurring in the API definition help inform the default rules.

### Constant

The **constant** generator always returns the same value, which can be of any simple type.

```
const: 0
# ==> 0, 0, 0, ...

const: Thursday
# ==> "Thursday", "Thursday", "Thursday", ...
```

## Enumeration

The **enumeration** generator returns values selected at random from a given list, which can be of any simple type.

```
enum:
- 0
- 1
- 2
# ==> 1, 0, 2, 0, ...

enum:
- Thursday
- Friday
- Saturday
# ==> "Friday", "Saturday", "Saturday", ...
```

## Pattern

The **pattern** generator returns string values that match a given regular expression.

```
pattern: '[0-9]{3}'
# ==> "884", "924", "121", ...

pattern: '[a-z][a-z_]{0,15}'
# ==> "dbe", "kg_cfsv", "dhhfbgbjxavmsaxq", ...
```

## Range

The **range** generator returns numeric values uniformly distributed over a given range (inclusive).

```
minimum: 0
maximum: 10
# ==> 10, 6, 8, ...

If either endpoint is omitted then it defaults to the most negative or most positive value of the type:

minimum: 0
# ==> 10029625, 3162517758, 841054690, ...
```

## Semantic

The **semantic** generator returns values that conform to some pre-defined semantic category, covering names, addresses, credit card numbers, etc. The set of categories is the same as that allowed in the [API extensions](#).

```
semantic: email
# ==> "herbertschaden@fahey.net", "emmyfarrell@cruickshank.com", "vilmapprohaska@zboncak.org", ...

semantic: first_name
# ==> "Antwan", "Connie", "Modesto", ...
```

## Resource

The **resource** generator returns values that are unique identifiers of resource instances of a given type, selected at random from the pool of existing instances. The identifier of an instance is taken from the `id_name` property of the resource type defined in the [API extensions](#) and its type and format will vary accordingly.

```
resource: Customer
# ==> "e5537298-9041-47fc-b97e-c910d8f9d971", "f60521c8-2ccb-4036-a742-9f350271675f", "e5537298-9041-47fc-b97e-c910d8f9d971", ...
```

## Array

The **array** generator returns array values whose contents are populated from a data generator defined recursively. The length of the array is chosen at random between `minItems` and `maxItems` inclusive.

```
items:
  pattern: '[0-9]{3}'
minItems: 3
maxItems: 3
# ==> ["770", "496", "219"], ["431", "895", "331"], ["864", "130", "204"], ...

items:
  enum:
    - 0
    - 1
minItems: 0
```

```
maxItems: 5
```

```
# ==> [], [1, 0, 1, 1], [0], ...
```

## Object

The **object** generator returns object values whose properties are populated from named data generators, defined recursively.

```
properties:
```

```
  x:
    minimum: 0
    maximum: 100
  y:
    minimum: 0
    maximum: 100
```

```
# ==> {"x": 59, "y": 63}, {"x": 22, "y": 8}, {"x": 95, "y": 57}, ...
```

```
properties:
```

```
  code:
    pattern: '[0-9]{3}'
  language:
    enum:
      - en
      - fr
      - de
```

```
# ==> {"code": "452", "language": "fr"}, {"code": "504", "language": "en"}, {"code": "846", "language": "fr"}, ...
```

If a property is not required by the target schema then it may be marked with an **optional** attribute which specifies a frequency (between 0.0 and 1.0) that determines how often the property is included in the generated object (where 0 means never, and 1 means always).

```
properties:
```

```
  code:
    pattern: '[0-9]{3}'
  language:
    optional: 0.5
    enum:
      - en
      - fr
      - de
  tag:
    optional: 0.0
```

```
# ==> {"code": "452", "language": "fr"}, {"code": "504", "language": "en"}, {"code": "846"}, ...
```

## Choice

The **choice** generator returns values selected at random from a given list of data generators, using optional weights to bias the outcome. The alternatives must be simple generators, which excludes **array** and **object** generators.

```
choice:
```

```
  # bias the selection towards English
  - const: en
    weight: 5
  - const: fr
  - const: de
```

```
# ==> "en", "en", "en", ..., "de", "en", ...
```

```
choice:
```

```
  # normal values in the range 1-10
  - minimum: 1
    maximum: 10
    weight: 98
  # with a small percentage of outliers
  - const: 999
    weight: 2
```

```
# ==> 6, 3, 9, 1, ..., 999, 6, ...
```

## Data generation rules

A **data generation rule** binds a data generator to a schema occurring in the API definition so that the auto-tester knows how to generate values for that schema in an API call. Rules are specified in the [Datatypes](#) section of the profile configuration, and override the default rules derived from the API definition and extensions.

Schemas occur widely in the OpenAPI specification, but there are three key locations which have most relevance to the auto-tester where the profile allows override rules:

- Named schemas
- Parameters
- Inline request bodies

### Named schemas

A schema rule assigns a data generator to a named schema from the API definition, found either under **definitions** (OpenAPI 2.0) or **components/schema** (OpenAPI 3.0). The auto-tester will use the specified generator wherever the named schema occurs in a request.

Schema rules appear in the [schemas](#) section of the profile configuration, under **Datatypes**.

Because this is an *override*, the generator may be incomplete for the original schema, and the auto-tester will fall back to using the default rules to cover any gaps. In particular, if the schema describes an object type then the generator need only name a subset of the object properties, and the auto-tester will apply the override for those properties but use default rules for the rest.

For example, given this named schema in the API definition:

```
Movie:
  type: object
  properties:
    title:
      type: string
    release_date:
      type: string
      format: date
    language:
      description: Two-letter ISO 639-1 language code
      type: string
      pattern: '[a-z]{2}'
```

The default rule derived from the schema returns values such as:

```
{
  "title": "mkLHM22Ohabb6YG4-wdZFUwxQa7dn",
  "release_date": "2018-09-14",
  "language": "jq"
}
```

You can refine this by overriding the default rules for the `title` and `language` properties:

```
Datatypes:
  schemas:
    Movie:
      properties:
        title:
          semantic: sentence
        language:
          enum:
            - en
            - fr
            - de
```

This rule binds an object generator (introduced by the keyword `properties`) to the schema named `Movie` which -- combined with the default rule for `release_date` -- returns values such as:

```
{
  "title": "What dog everybody am myself hourly meeting how group over example her",
  "release_date": "2094-06-31",
  "language": "de"
}
```

## Parameters

A parameter rule binds a data generator to a named parameter within an operation found under `paths` in the API definition.

Parameter rules appear in the [operations](#) section of the profile configuration, under `Datatypes`.

For example, given this parameter definition on `GET /movies` in the API definition that restricts the number of movies returned in a single call:

```
paths:
  /movies:
    get:
      parameters:
        - name: limit
          in: query
          description: Sets an upper bound on the number of movies returned
          schema:
            type: integer
```

The default rule derived from this definition will return values from the full integer range, but you can override this with a rule in the profile configuration that specifies a more realistic range, with occasional outliers to check the validation logic:

```
Datatypes:
  operations:
    /movies:
      get:
        parameters:
          - name: limit
            data:
              choice:
                - minimum: 1
                  maximum: 500
                  weight: 95
                - const: 0
                  weight: 3
                - const: 8000000
                  weight: 2
```

The format of the rule follows the format of the original definition but with the keyword `data` in place of `schema` to introduce the data generator.

In OpenAPI, a parameter is uniquely identified by a name *and* a location (so the same name could be used in, say, both query and header) so the parameter rules allow the `in` property as optional where needed to disambiguate. It's not used in this example because the query parameter is the only one named `limit`.

The auto-tester only supports parameters of type `query` and `path` at present (and `body` in OpenAPI 2.0). Rules bound to other parameter types are ignored.

## Request body

A request body rule binds a data generator to the body of a request where the corresponding schema is specified directly as part of the operation in the API definition, rather than via a reference to a named schema.

Request body rules appear in the [operations](#) section of the profile configuration, under **Datatypes**.

For example, given this definition of the payload to a **POST** request:

```
paths:
  /movies:
    post:
      requestBody:
        content:
          application/json:
            schema:
              type: object
              allOf:
                - $ref: '#/components/schemas/Movie'
                - properties:
                    keywords:
                      type: array
                      items:
                        type: string
```

The following rule generates some appropriate keywords to attach to a new movie (where the movie itself is covered by the rules discussed earlier):

```
Datatypes:
  operations:
    /movies:
      post:
        requestBody:
          content:
            application/json:
              data:
                properties:
                  keywords:
                    # pick up to 3 items from the following list
                    items:
                      enum:
                        - avant-garde
                        - dystopia
                        - epic
                        - postmodern
                        - remake
                        - shootout
                    minItems: 0
                    maxItems: 3
```

As with the parameter rules, the format follows that of the original definition but with **data** in place of **schema**. The definition is in the style of OpenAPI 3.0, but the rule can work for OpenAPI 2.0 as well as long as the content type is consistent; alternatively, starting from an OpenAPI 2.0 definition, you can use a **body** parameter rule to specify the payload, but that does not work for 3.0.

---

## Assertion components

IBM API Connect Test APIs supports the following assertion types:

- [Assert Compares](#)  
Asserts that two elements are equivalent in some way.
- [Assert Contains](#)  
Asserts that the value of the element identified by a given expression contains a specific substring.
- [Assert Equals](#)  
Asserts that the value of the element identified by a given expression is equal to a specific value.
- [Assert Exists](#)  
Asserts that the value of the element identified by a given expression exists.
- [Assert Greater](#)  
Asserts that the value of the element identified by a given expression is greater than a specific value.

- [Assert In](#)  
Asserts that the element identified by a given expression matches at least one item from a given list.
- [Assert Is](#)  
Asserts that the value of the element identified by a given expression is of a specific type.
- [Assert Less](#)  
Asserts that the value of the element identified by a given expression is less than a specific value.
- [Assert Matches](#)  
Asserts that the value of the element identified by a given expression matches a knowledge base of some kind.
- [Set](#) Set a variable during test executions

Contribute in GitHub: [Edit online](#)

---

## Assert Compares

Asserts that two elements are equivalent in some way.

## Parameters

Name	Type	Required?	Description	Default value
Expression 1	Expression	Yes	Path to the first element for comparison; for example, <code>payload1.productId</code> .	
Expression 2	Expression	Yes	Path to the second element for comparison; for example, <code>payload2.productId</code> .	
Mode	Selection list	Yes	Select one of the following values: <ul style="list-style-type: none"><li>• <b>text</b>: compare the text of the two elements as plain text.</li><li>• <b>values</b>: compare the two elements regardless of their text layout.</li><li>• <b>structure</b>: compare only the structure of the two elements.</li></ul>	text
Level	Selection list	No	Select <b>error</b> or <b>warning</b> . Specifies whether, if the assertion fails, it should be considered an 'error' or just a 'warning.' A warning does not trigger alerts, such as email or text messages.	error
Stop test if fails	Selection list	No	Select <b>true</b> or <b>false</b> . If <b>true</b> , the test is immediately stopped if the assertion fails.	false
Assertion comment	String	No	An optional comment for information.	

Contribute in GitHub: [Edit online](#)

---

## Assert Contains

Asserts that the value of the element identified by a given expression contains a specific substring.

---

### Parameters

Name	Type	Required?	Description	Default value
Expression	Expression	Yes	Path to the element to be searched; for example, <code>payload.productId</code> .	
Value	String	Yes	Path to the second element for comparison; for example, <code>payload2.productId</code> .	
Mode	Selection list	No	Select one of the following values: <ul style="list-style-type: none"><li>• <b>all</b>: If the path expression matches multiple elements in the payload then they must all match the assertion.</li><li>• <b>one</b>: Only one of the matching elements in the payload needs to match the assertion.</li></ul>	all
Level	Selection list	No	Select <b>error</b> or <b>warning</b> . Specifies whether, if the assertion fails, it should be considered an 'error' or just a 'warning.' A warning does not trigger alerts, such as email or text messages.	error
Modifier	Selection list	No	Select <b>not</b> to negate the assertion; the assertion is considered verified if it does not pass.	None
Execute if item exists	Selection list	No	Select <b>true</b> or <b>false</b> . If <b>true</b> , the assertion is evaluated only if the element exists. This is useful when the element does not always exist.	false
Stop test if fails	Selection list	No	Select <b>true</b> or <b>false</b> . If <b>true</b> , the test is immediately stopped if the assertion fails.	false
Assertion comment	String	No	An optional comment for information.	

Contribute in GitHub: [Edit online](#)  
# Assert Equals

Asserts that the value of the element identified by a given expression is equal to a specific value.

---

## Parameters

Name	Type	Required?	Description	Default value
Expression	Expression	Yes	Path to the element to be compared with the specified value; for example, <code>payload.productId</code> .	
Value	String	Yes	The value that the element is to be compared with.	
Type	Selection list	No	The data type of the value. If you do not specify a data type, the values are compared as strings. Select one of the following values: <ul style="list-style-type: none"><li><b>integer</b>: the values are evaluated as whole numbers.</li><li><b>float</b>: the values are evaluated as decimal numbers.</li></ul>	

Name	Type	Required?	Description	Default value
Mode	Selection list	No	Select one of the following values: <ul style="list-style-type: none"> <li><b>all:</b> If the path expression matches multiple elements in the payload then they must all match the assertion.</li> <li><b>one:</b> Only one of the matching elements in the payload needs to match the assertion.</li> </ul>	all
Level	Selection list	No	Select <b>error</b> or <b>warning</b> . Specifies whether, if the assertion fails, it should be considered an 'error' or just a 'warning.' A warning does not trigger alerts, such as email or text messages.	error
Modifier	Selection list	No	Select <b>not</b> to negate the assertion; the assertion is considered verified if it does not pass.	None
Execute if item exists	Selection list	No	Select <b>true</b> or <b>false</b> . If <b>true</b> , the assertion is evaluated only if the element exists. This is useful when the element does not always exist.	false
Stop test if fails	Selection list	No	Select <b>true</b> or <b>false</b> . If <b>true</b> , the test is immediately stopped if the assertion fails.	false
Assertion comment	String	No	An optional comment for information.	

Contribute in GitHub: [Edit online](#)

---

## Assert Exists

Asserts that the value of the element identified by a given expression exists. The presence of the element, even if it is empty, is enough to consider it a valid assertion.

## Parameters

Name	Type	Required?	Description	Default value
Expression	Expression	Yes	Path to the element to be checked for existence; for example, <code>payload.productId</code> .	
Mode	Selection list	No	Select one of the following values: <ul style="list-style-type: none"><li>• <b>all</b>: If the path expression matches multiple elements in the payload then they must all match the assertion.</li><li>• <b>one</b>: Only one of the matching elements in the payload needs to match the assertion.</li></ul>	all
Level	Selection list	No	Select <b>error</b> or <b>warning</b> . Specifies whether, if the assertion fails, it should be considered an 'error' or just a 'warning.' A warning does not trigger alerts, such as email or text messages.	error
Modifier	Selection list	No	Select <b>not</b> to negate the assertion; the assertion is considered verified if it does not pass.	None
Stop test if fails	Selection list	No	Select <b>true</b> or <b>false</b> . If <b>true</b> , the test is immediately stopped if the assertion fails.	false
Assertion comment	String	No	An optional comment for information.	

Contribute in GitHub: [Edit online](#)

---

## Assert Greater

Asserts that the value of the element identified by a given expression is greater than a specific value.

---

### Parameters

Name	Type	Required?	Description	Default value
Expression	Expression	Yes	Path to the element to be compared with the specified value; for example, <code>payload.productId</code> .	
Value	String	Yes	The value that the element is to be compared with.	
Type	Selection list	No	The data type of the value. If you do not specify a data type, the values are compared as strings. Select one of the following values: <ul style="list-style-type: none"><li>• <b>integer</b>: the values are evaluated as whole numbers.</li><li>• <b>float</b>: the values are evaluated as decimal numbers.</li></ul>	
Mode	Selection list	No	Select one of the following values: <ul style="list-style-type: none"><li>• <b>all</b>: If the path expression matches multiple elements in the payload then they must all match the assertion.</li><li>• <b>one</b>: Only one of the matching elements in the payload needs to match the assertion.</li></ul>	all
Level	Selection list	No	Select <b>error</b> or <b>warning</b> . Specifies whether, if the assertion fails, it should be considered an 'error' or just a 'warning.' A warning does not trigger alerts, such as email or text messages.	error
Modifier	Selection list	No	Select <b>not</b> to negate the assertion; the assertion is considered verified if it does not pass.	None
Execute if item exists	Selection list	No	Select <b>true</b> or <b>false</b> . If <b>true</b> , the assertion is evaluated only if the element exists. This is useful when the element does not always exist.	false
Stop test if fails	Selection list	No	Select <b>true</b> or <b>false</b> . If <b>true</b> , the test is immediately stopped if the assertion fails.	false
Assertion comment	String	No	An optional comment for information.	

Contribute in GitHub: [Edit online](#)

# Assert In

Asserts that the element identified by a given expression matches at least one item from a given list.

---

## Parameters

Name	Type	Required?	Description	Default value
Expression	Expression	Yes	Path to the element to be compared with the items in the list; for example <code>payload.productId</code> .	
Value	String	Yes	The items that the specified element is to be compared with. Click anywhere in the field, enter the first item, then click the + icon to add further items. Alternatively, you can enter the items as a comma separated list.	
Type	Selection list	No	The data type of the value. If you do not specify a data type, the values are compared as strings. Select one of the following values: <ul style="list-style-type: none"><li><b>integer</b>: the values are evaluated as whole numbers.</li><li><b>float</b>: the values are evaluated as decimal numbers.</li></ul>	

Name	Type	Required?	Description	Default value
Mode	Selection list	No	Select one of the following values: <ul style="list-style-type: none"> <li><b>all:</b> If the path expression matches multiple elements in the payload then they must all match the assertion.</li> <li><b>one:</b> Only one of the matching elements in the payload needs to match the assertion.</li> </ul>	all
Level	Selection list	No	Select <b>error</b> or <b>warning</b> . Specifies whether, if the assertion fails, it should be considered an 'error' or just a 'warning.' A warning does not trigger alerts, such as email or text messages.	error
Modifier	Selection list	No	Select <b>not</b> to negate the assertion; the assertion is considered verified if it does not pass.	None
Execute if item exists	Selection list	No	Select <b>true</b> or <b>false</b> . If <b>true</b> , the assertion is evaluated only if the element exists. This is useful when the element does not always exist.	false
Stop test if fails	Selection list	No	Select <b>true</b> or <b>false</b> . If <b>true</b> , the test is immediately stopped if the assertion fails.	false
Assertion comment	String	No	An optional comment for information.	

Contribute in GitHub: [Edit online](#)

---

## Assert Is

Asserts that the value of the element identified by a given expression is of a specific type.

**1056** IBM API Connect 10.0.2.0 to 10.0.4.x

## Parameters

Name	Type	Required?	Description	Default value
Expression	Expression	Yes	Path to the element whose type is to be examined; for example, <code>payload.productId</code> .	
Type	Selection list	Yes	Select one of the following values: <ul style="list-style-type: none"> <li><b>integer</b>: Checks if the element is an integer value.</li> <li><b>float</b>: Checks if the element is a decimal value.</li> <li><b>url</b>: Checks if the element is a well-formatted URL.</li> <li><b>boolean</b>: Checks if the element is a boolean value.</li> <li><b>phone</b>: Checks if the element is a valid phone number format.</li> <li><b>email</b>: checks if the element is a valid email format.</li> <li><b>map</b>: Checks if the element is a map type.</li> <li><b>array</b>: Checks if the element is an array.</li> </ul>	
Mode	Selection list	No	Select one of the following values: <ul style="list-style-type: none"> <li><b>all</b>: If the path expression matches multiple elements in the payload then they must all match the assertion.</li> <li><b>one</b>: Only one of the matching elements in the payload needs to match the assertion.</li> </ul>	all
Level	Selection list	No	Select <b>error</b> or <b>warning</b> . Specifies whether, if the assertion fails, it should be considered an 'error' or just a 'warning.' A warning does not trigger alerts, such as email or text messages.	error
Modifier	Selection list	No	Select <b>not</b> to negate the assertion; the assertion is considered verified if it does not pass.	None
Execute if item exists	Selection list	No	Select <b>true</b> or <b>false</b> . If <b>true</b> , the assertion is evaluated only if the element exists. This is useful when the element does not always exist.	false
Stop test if fails	Selection list	No	Select <b>true</b> or <b>false</b> . If <b>true</b> , the test is immediately stopped if the assertion fails.	false
Assertion comment	String	No	An optional comment for information.	

Contribute in GitHub: [Edit online](#)  
# Assert Less

Asserts that the value of the element identified by a given expression is less than a specific value.

---

## Parameters

Name	Type	Required?	Description	Default value
Expression	Expression	Yes	Path to the element to be compared with the specified value; for example, <code>payload.productId</code> .	
Value	String	Yes	The value that the element is to be compared with.	
Type	Selection list	No	The data type of the value. If you do not specify a data type, the values are compared as strings. Select one of the following values: <ul style="list-style-type: none"><li>• <b>integer</b>: the values are evaluated as whole numbers.</li><li>• <b>float</b>: the values are evaluated as decimal numbers.</li></ul>	

Name	Type	Required?	Description	Default value
Mode	Selection list	No	Select one of the following values: <ul style="list-style-type: none"> <li><b>all:</b> If the path expression matches multiple elements in the payload then they must all match the assertion.</li> <li><b>one:</b> Only one of the matching elements in the payload needs to match the assertion.</li> </ul>	all
Level	Selection list	No	Select <b>error</b> or <b>warning</b> . Specifies whether, if the assertion fails, it should be considered an 'error' or just a 'warning.' A warning does not trigger alerts, such as email or text messages.	error
Modifier	Selection list	No	Select <b>not</b> to negate the assertion; the assertion is considered verified if it does not pass.	None
Execute if item exists	Selection list	No	Select <b>true</b> or <b>false</b> . If <b>true</b> , the assertion is evaluated only if the element exists. This is useful when the element does not always exist.	false
Stop test if fails	Selection list	No	Select <b>true</b> or <b>false</b> . If <b>true</b> , the test is immediately stopped if the assertion fails.	false
Assertion comment	String	No	An optional comment for information.	

Contribute in GitHub: [Edit online](#)

---

## Assert Matches

Asserts that the value of the element identified by a given expression matches a specified format.

## Parameters

Name	Type	Required?	Description	Default value
Expression	Expression	Yes	Path to the element that you want to examine; for example, <code>payload.productId</code> .	
Type	Selection list	Yes	<ul style="list-style-type: none"> <li><b>regex</b>: Evaluate the element value as a regular expression, as specified in the <b>Regex value</b> parameter.</li> <li><b>US states</b>: Check if the element value is a valid US State; for example, 'NY'.</li> <li><b>US zipcodes</b>: Check if the element value is a valid US Zipcode.</li> <li><b>credit card</b>: Check if the element value contains a valid credit card number from the most popular credit cards.</li> <li><b>country codes</b>: Checks if the element value contains a valid country code.</li> <li><b>currency codes</b>: Checks if the element value is a valid currency code.</li> </ul>	
Mode	Selection list	No	Select one of the following values: <ul style="list-style-type: none"> <li><b>all</b>: If the path expression matches multiple elements in the payload then they must all match the assertion.</li> <li><b>one</b>: Only one of the matching elements in the payload needs to match the assertion.</li> </ul>	all
Level	Selection list	No	Select <b>error</b> or <b>warning</b> . Specifies whether, if the assertion fails, it should be considered an 'error' or just a 'warning.' A warning does not trigger alerts, such as email or text messages.	error
Modifier	Selection list	No	Select <b>not</b> to negate the assertion; the assertion is considered verified if it does not pass.	None
Execute if item exists	Selection list	No	Select <b>true</b> or <b>false</b> . If <b>true</b> , the assertion is evaluated only if the element exists. This is useful when the element does not always exist.	false
Stop test if fails	Selection list	No	Select <b>true</b> or <b>false</b> . If <b>true</b> , the test is immediately stopped if the assertion fails.	false
Assertion comment	String	No	An optional comment for information.	

Contribute in GitHub: [Edit online](#)

---

## Set Variable

**Set Variable** is a component that can be added to the test to capture a particular value for later use or to perform computations to arrive at a given result.

---

## Parameters

Name	Type	Required?	Description	Default value
Variable Name	String	Yes	Name of variable to be used in subsequent components	
Mode	Selection List	Yes	Select one of the following values: <ul style="list-style-type: none"><li>• <b>String</b>: Provide a string for the value of the variable, this can be referencing a payload property</li><li>• <b>Object</b>: Interrogate the object being processed</li><li>• <b>Language</b>: Using Groovy script provide logic to determine a value for the variable</li></ul>	String
Value	String	No	Provide the Value of the variable if <b>String</b> was selected for <b>Mode</b>	

Name	Type	Required?	Description	Default value
Object	String	No	Provide the logic for use when <b>Mode</b> is set to <b>Object</b>	
Language	Selection List	No	The language you wish to script in, Groovy is the only option available	Groovy
Content	String	No	Your Groovy script logic	

## String

---

To set a variable from a requests response if one is given.

for example to set a variable to the **name** property Add **Set Variable Component from list** Provide the name of the variable Set the value to `${<request variable name>.name}`

If the variable being referenced is wihtin a loop the variable name will be `_1`

## Setting a Variable using Groovy script

---

To set variable to a value that requires a bit of additional logic, you can write a segment of groovy script to process inputs and provide an single output.

To write script, within **Set Variable** change the **Variable Mode** to **Language**

As an example if given a temperature I want to check if where it falls on a set of parameters using the tempature from a prior request

```
def temperature="Just Right"

if(payload.temperature>22){
    temperature='Its Warm'
} else if(payload.temperature<16){
    temperature='Its Cold'
}

return temperature
```

You much return a inner variable at the end to set the value of variable to be used later

NOTE: within Groovy script you do not need to wrap existing variables within `${ }`

## Object Mode

---

Object allows you to inspect the a larger object to find particular parts of a varialbe

```
payload.findAll {it.name == 'Douglas Adams' }
```

## Security

It is important to be aware of potential security implications when using IBM API Connect Test APIs.

- [Storing sensitive data](#)

Contribute in GitHub: [Edit online](#)

---

## Storing sensitive data

When using IBM API Connect Test APIs, it is always helpful to remember:

- Before making a request to any endpoint, it is important to pause and think about the data supplied in the request and the data expected in the response. If the data contains sensitive data such as authentication credentials or any form of personal data, then we **strongly** discourage you from making that request.
- Try to always use test accounts when monitoring production services.

---

## Template Test from Specification Document

As an alternative to making requests against an existing API deployment to create a test, instead you can create a test template from a document that specifies the APIs behavior, or use a Postman Collection.

The template will include parameterized requests with payloads if they can be determined and assertions based on the API document.

Once the template has been generated, you may need to make changes to the datasets to use the correct endpoint and complete any request payloads that have been partially generated.

---

## Supported document types

Test Templating supports generating test cases from the following document types

- Swagger 2.0 JSON
- Swagger 2.0 YAML
- SOAP WSDL (single wsdl file)
- Postman Collection

## Templating Options

---

Once the document has been uploaded, you will be presented with a list of requests based on Path and expected status code

### **From Scratch**

Generates a single request and any assertions that can be determined about that request

This replaces an existing test definition

### **Merge**

Generate additional request and adds to the end of the existing test case

Note: This does not include any assertions, it is recommended the core request to be tested is generated from scratch and then additional requests merged into it

### **Smart Generation**

Restrictions:

- OpenAPI 2.0/Swagger 2.0 only
- Enterprise as a Service and Cloud Pak for Integration only

Once you've enabled the insights-driven test generation feature you will be able to generate a test template which can contain multiple related requests that include setup and teardown operations for the targeted operation.

Smart Generation uses static analysis and natural language processing of the API document to determine links between API requests and data that can be shared between the requests

## Deleting a test suite

To delete a test suite, complete the following steps:

1. Click your test organization name in the menu bar to open your test organization test suite page.

2. On the test suites page, locate the test suite you want to delete and determine whether it contains any tests by observing the displayed **Tests** count.

**Note:** You can't delete a test suite that contains tests, so if your test suite does contain any tests you must delete them first; see [Deleting a test](#).

3. To delete the test suite, click its **Settings** icon [Settings](#), then click **Remove Test Suite**

**Note:** If the test suite contains tests, you will get an error when you click the **Settings** icon.

![Image of delete error](./dist/images/cant-delete-test suite.png)

If your test suite is deleted successfully, you are returned to your test organization test suite page, and your deleted test suite is no longer displayed.

Contribute in GitHub: [Edit online](#)

---

## Deleting a test

To delete a test, complete the following steps:

1. Click your test organization name in the menu bar to open your test organization test suite page.

2. On the test suites page, locate the test suite you want to work with and ensure that it contains tests by confirming that the displayed **Tests** count is not zero.

My-project

Tests	1	
Events	0	
Failures	0	

3. Click the test suite's **Tests** icon **Tests** . A list of the tests that have been created in the test suite are displayed.

4. Double-click the test you want to work with, or click its edit icon  .

5. On the test details page, click the **Delete Test** icon **Delete Test**, then click the tick icon to confirm. You are returned to the tests list and your deleted test is no longer displayed.

Contribute in GitHub: [Edit online](#)

# Opening a test in the Editor

To open a test in the Editor, complete the following steps:

1. Click your test organization name in the menu bar to open your test organization test suite page.

2. On the test suites page, locate the test suite you want to work with and ensure that it contains tests by confirming that the displayed **Tests** count is not zero.

3. Click the test suite's **Tests** icon . A list of the tests that have been created in the test suite are displayed.

4. Double-click the test you want to work with, or click its edit icon .

5. On the test details page, click the **Compose** icon . The Editor page opens for the selected test; for example:

## API Hooks

In addition to viewing and executing tests within the IBM API Connect Test interface, you may also perform these actions via an API. This allows tests to be executed via the command line, through third-party applications, or as part of a CI/CD pipeline. API hooks form the basis of this API, providing a base URL on which subsequent API operations can be performed. To start using an API Hook, see:

- [Creating An API Hook](#).

API Hooks require authentication to use in the form of an API Key and Secret. Once you have created your API Hook, view the following page to learn how to create an API Key and Secret for your Test Organization:

- [Creating API Keys and Secrets](#)

Once you've set up your API Hook, Key and Secret, see:

- [Using API Hooks](#)

Contribute in GitHub: [Edit online](#)

---

## Creating an API Hook

You can generate an API hook for each of the Test Suites within your Test Organization. API hooks are scoped to only one test suite and thus will only have access to operate on the data within that test suite; that is, if an API Hook is generated for **Test Suite 1**, it may only access the tests and test results associated with **Test Suite 1**. If you wish to interact with tests in multiple test suites, you will need to generate an API hook for each Test Suite.

API Hooks are protected and require an API Key and Secret to be used. You can find out how to create a API Key and Secret [here](#).

---

## Prerequisites

1. Your account must have administrators or Test Organization manager privileges.
2. You must have at least one Test Suite in your Test Organization.

To see a list of all the Test Suites in your Test Organization, navigate to the Main Dashboard by clicking on your Test Organization Name in the menu bar.

If there are no Test Suites here, you can create one by clicking the **Create Test Suite** button after the Test Status chart.

## How to create an API Hook

First navigate to the Test Organization settings page by clicking the **Cog** icon in the menu bar.

Within the Test Organization settings page, click the **Hooks** option under the API Hooks heading in the navigation menu.

Now click on the **+ API Hook** button to begin creating a new API Hook.

As API Hooks are scoped at a Test Suite level, you will need to select the test suite you wish to generate the hook for. Choose the appropriate test suite from the Test Suite dropdown and optionally add a description for the API Hook. Click the **confirm**  icon to generate and save the API Hook.

You've now created the API Hook URL for your Test Suite. Make a note of this URL as this will form the base path of all future API requests you make to this test suite.

Close the Hook URL dialog box. You can see that your new API Hook is now in the list of API Hooks. You can click on this at anytime to view the URL again in the future should you need. Note that this URL will remain active until it is deleted. To delete the API Hook, simply click on the **Delete** icon next to the API Hook you want to remove.

In order to use your new API Hook, you need to ensure you have an API Key and Secret for your Test Organization. Steps do do this can be found [here](#). Alternatively, if your Key and Secret is set up, see [Using API Hooks](#) for more information on how to use the API Hook.

## What to do next

- Next Topic: [Creating API Keys and Secrets](#)

Contribute in GitHub: [Edit online](#)

---

## Creating API Keys and Secrets

API Keys and Secrets are the credentials required to use an [API Hook](#). For a request to an API Hook to be authorised, both the **X-API-Key** and **X-API-Secret** headers must be provided. The values of the API Key and Secret represent the values of these headers respectively.

Unlike API Hooks which are scoped to a single Test Suite, API Keys and Secrets are scoped to a Test Organization. Therefore, any API Key and Secret pair which is generated within a Test Organization will have permission to authorise requests to all API Hooks within the same organization, regardless of the Test Suite the API Hook is associated with. API Keys and Secrets can only be generated by system administrators or test organization managers.

---

## Creating an API Key and Secret

First navigate to the Test Organization settings page by clicking the **Cog** icon in the menu bar. Note that you will only see this icon if you are a administrator or a test organization manager.

Within the Test Organization settings page, click the **KEYS** option under the API Hooks heading in the navigation menu.

Now click on the **+ API Key** button to create a new API Key.

You will then be shown the generated **Key** and **Secret**. Make a note of both of these, especially the **Secret** as this will be the only time this is visible. Give your new API Key a name and then click the **confirm**  icon to save it.

Your new API Key is now active and will now appear in the list of API Keys in the navigation menu. Clicking on the key will show you the API Key's value should you need to reference this again in the future. If you want to remove the API Key at any point, simply click on the **Delete** icon next to the API Key you want to remove. This will invalidate all future requests to API Hooks within you Test Organization using this Key and Secret combination.

## <Test Organization Name> Settings

All changes saved.

The screenshot displays the 'API Keys' management interface. On the left sidebar, 'API Hooks' and 'HOOKS' are visible, with 'KEYS' selected. The main area is titled 'API Keys' and includes a tip: 'Tip: Generate an API Key.' Below this is a '+ API Key' button. A list of API keys is shown, with one entry 'My API Key' highlighted by a red box. The key value is '30eb22de-03db-40d3-8b50-d218ef449f24'. To the right, the 'API key details' section shows the same key value in a text field with a 'Copy' button next to it.

## What to do next

- Next Topic: [Using API Hooks](#)

Contribute in GitHub: [Edit online](#)

---

## Using API Hooks

[API Hooks](#) provide a mechanism to interact with tests within a Test Suite via an API. Whilst the API Hook itself defines the basepath of this API, it also exposes a series of endpoints which, when appended onto this basepath, allow you to list and execute published tests within the API Hook's scope. The following pages detail these endpoints and subsequent parameters you can provide to either list, execute all, or execute only specific tests within a test suite.

---

## Endpoints

- [List All Tests](#)  
Lists all of the published tests within an API Hook's scope.
- [Run All Published Tests](#)  
Runs all of the published tests within an API Hook's scope.
- [Run Published Tests By Tag](#)  
Runs the published tests within an API Hook's scope that match the tags specified in the request body.

- [Run Published Test By ID](#)  
Run a specified test within an API Hook's scope.

---

## List All Tests

### Description

---

The List All Tests endpoint lists all of the published tests within an API Hook's scope.

### HTTP Request

---

```
GET <API-Hook-URL>/tests
```

## Sample Method Invocation

```
curl -X GET \  
-H X-API-Key:{API-Key} \  
-H X-API-Secret:{API-Secret} \  
<API-Hook-URL>/tests
```

<b>Parameters</b>	<b>Header Parameters</b> API-Key: A valid <a href="#">API Key</a> for the Test Organization this API Hook belongs to. API-Secret: A valid <a href="#">API Secret</a> for the Test Organization this API Hook belongs to.
<b>Response Content</b>	<b>MIME type: application/json</b> <pre>[   {     testId: string,     testName: string,     testDescription: string,     lastModified: string,     authorName: string,     tags: array[string]   } ]</pre> <b>Response Description</b> <ul style="list-style-type: none"><li>• <b>testId</b><ul style="list-style-type: none"><li>◦ ID of the test.</li></ul></li><li>• <b>testName</b><ul style="list-style-type: none"><li>◦ Name of the test.</li></ul></li><li>• <b>testDescription</b><ul style="list-style-type: none"><li>◦ Description of the test.</li></ul></li><li>• <b>lastModified</b><ul style="list-style-type: none"><li>◦ Date and time the test was last modified.</li></ul></li><li>• <b>authorName</b><ul style="list-style-type: none"><li>◦ User who composed the test.</li></ul></li><li>• <b>tags</b><ul style="list-style-type: none"><li>◦ Array of tags associated with the test.</li></ul></li></ul>
<b>Status Codes</b>	200: Success 400: Missing Authorization Headers 401: Invalid Authorization Headers

## Run All Published Tests

### Description

---

The Run All Tests endpoint executes all of the published tests within an API Hook's scope.

### HTTP Request

---

```
POST <API-Hook-URL>/tests/run
```

---

## Sample Method Invocation

**1082** IBM API Connect 10.0.2.0 to 10.0.4.x

```

curl -X POST \
-H X-API-Key:{API-Key} \
-H X-API-Secret:{API-Secret} \
-H Content-Type:application/json \
-d "
  {
    "options": {
      "allAssertions": boolean,
      "JUnitFormat": boolean
    },
    "variables": {
      string: string,
    }
  }
" \
<API-Hook-URL>/tests/run

```

<b>Parameters</b>	<b>Header Parameters</b>  API-Key: A valid <a href="#">API Key</a> for the Test Organization this API Hook belongs to. API-Secret: A valid <a href="#">API Secret</a> for the Test Organization this API Hook belongs to.
<b>Request Body</b>	<b>MIME type: application/json</b>  <pre> {   options: {     allAssertions: boolean,     JUnitFormat: boolean   },   variables: {     string: string,   } } </pre> <b>Body Parameters</b> <ul style="list-style-type: none"> <li>• <b>options</b> (Only required if providing a child element) <ul style="list-style-type: none"> <li>◦ A wrapper object for the containing options on how what data should be returned in the response, or how the response should be formatted.</li> <li>◦ Child Elements: <ul style="list-style-type: none"> <li>▪ <b>allAssertions</b> (Optional) <ul style="list-style-type: none"> <li>▪ When <b>false</b>, only the results of failing assertions in the test are returned. When <b>true</b>, all assertions in the test are returned. <b>allAssertions</b> is <b>false</b> by default.</li> </ul> </li> <li>▪ <b>JUnitFormat</b> (Optional) <ul style="list-style-type: none"> <li>▪ When <b>false</b>, <b>application/json</b> format is returned for the test results. When <b>true</b>, <b>text/xml</b> JUnit format is used for the test results (see <b>text/xml</b> response). <b>JUnitFormat</b> is <b>false</b> by default.</li> </ul> </li> </ul> </li> </ul> </li> <li>• <b>variables</b> (Optional) <ul style="list-style-type: none"> <li>◦ The variables section is used to pass a list of named variables and their values into the tests being run. It is only used by tests that have been written to make use of variables, and have values stored alongside them. Declaring the variable name as the object key, and its new value as the key's value (as type string), will overwrite the current value of the variable in the test which shares its name with the object key.</li> </ul> </li> </ul>
<b>Response Content</b>	<b>MIME type: application/json</b>  <b>application/json</b> is the default response from the endpoint.  <pre> [   {     testRunId: string,     testId: string,     testName: string,     location: string,     initiated: string,     duration: integer,     status: enum['passed' or 'failed'],     reportUrl: string,     results: {       warningsCount: integer,       failureCount: integer,       httpFailures: array[object],       criticalFailures: array[object],       assertions: array[object]     }   } ] </pre>

## Response Description

- **testRunID**
  - ID of the test run.
- **testId**
  - ID of the test which was executed.
- **testName**
  - Name of the test.
- **location**
  - Location of the agent which executed the test.
- **initiated**
  - Date and time when the test was initiated.
- **duration**
  - Total duration of the test run in seconds.
- **status**
  - Overall result of the test.
- **reportUrl**
  - URL to the test run report.
- **results**
  - A wrapper object containing the results of the test run.
  - Child Elements:
    - **warningsCount**
      - Count of the HTTP warnings returned by the test assertions.
    - **failureCount**
      - Count of the HTTP status code responses that are greater than 400.
    - **httpFailures**
      - Description of failures whose HTTP Status response code is greater than or equal to 400.
    - **criticalFailures**
      - Description of failures whose HTTP Status response code is greater than or equal to 500.
    - **assertions**
      - A description of the assertions executed in the test. By default, only failing assertions will be listed.

## MIME type: text/xml

To receive a **text/xml** response, the optional **JUnitFormat** variable in the request body must be set to **true**. JUnit responses can be useful when you wish to incorporate your test results with a build pipeline such as Jenkins, via the [JUnit plugin](#).

```
<?xml version="1.0" encoding="UTF-8"?>
<testSuite name="" tests="" disabled="" errors="" failures="" timestamp="" time="">
<testcase name="" classname="" time="">
<failure message="" type="" />
</testcase>
</testSuite>
```

## Response Description

- **<testSuite>**
  - Child Elements: **<testCase>**
  - Attributes:
    - **name**
      - Test Suite name.
    - **tests**
      - Number of published tests ran.
    - **disabled**
      - Number of disabled tests.
    - **errors**
      - Number of errors.
    - **failures**
      - Number of tests within the test suite that failed.
    - **timestamp**
      - Date and time the tests were ran.
    - **time**
      - Total duration of all test runs in seconds.
- **<testCase>**
  - Child Elements: **<failure>**
  - Attributes:
    - **name**
      - Test name.
    - **classname**
      - ID of the test which was executed.
    - **time**
      - Total duration of the test run in seconds.
- **<failure>**

	<ul style="list-style-type: none"> <li>◦ Attributes: <ul style="list-style-type: none"> <li>▪ <b>message</b> <ul style="list-style-type: none"> <li>▪ Failure message containing the expected and actual response.</li> </ul> </li> <li>▪ <b>type</b> <ul style="list-style-type: none"> <li>▪ Type of failure.</li> </ul> </li> </ul> </li> </ul>
<b>Status Codes</b>	200: Success 400: Missing Authorization Headers 401: Invalid Authorization Headers

## Run Published Tests By Tag

### Description

The Run Published Test By Tag endpoint executes all of the published tests within an API Hook's scope that match the tags specified in the request body. See [Tagging a Test](#) for more information on how to tag a test.

### HTTP Request

---

## Sample Method Invocation

```
curl -X POST \
-H X-API-Key:{API-Key} \
-H X-API-Secret:{API-Secret} \
-H Content-Type:application/json \
-d "
  {
    "options": {
      "allAssertions": boolean,
      "JUnitFormat": boolean
    },
    "variables": {
      string: string,
    },
    "tags": {
      "tagList": array[string],
      "operator": enum['not' or 'and' or 'or']
    }
  }
" \
<API-Hook-URL>/tests/run/tag
```

<b>Parameters</b>	<b>Header Parameters</b>  API-Key: A valid <a href="#">API Key</a> for the Test Organization this API Hook belongs to. API-Secret: A valid <a href="#">API Secret</a> for the Test Organization this API Hook belongs to.
<b>Request Body</b>	<p><b>MIME type: application/json</b></p> <pre>{   options: {     allAssertions: boolean,     JUnitFormat: boolean   },   variables: {     string: string,   },   tags: {     tagList: array[string],     operator: enum['not' or 'and' or 'or']   } }</pre> <p><b>Body Parameters</b></p> <ul style="list-style-type: none"> <li>• <b>options</b> (Only required if providing a child element)       <ul style="list-style-type: none"> <li>◦ A wrapper object for the containing options on how what data should be returned in the response, or how the response should be formatted.</li> <li>◦ Child Elements:           <ul style="list-style-type: none"> <li>▪ <b>allAssertions</b> (Optional)               <ul style="list-style-type: none"> <li>▪ When <b>false</b>, only the results of failing assertions in the test are returned. When <b>true</b>, all assertions in the test are returned. <b>allAssertions</b> is <b>false</b> by default.</li> </ul> </li> <li>▪ <b>JUnitFormat</b> (Optional)               <ul style="list-style-type: none"> <li>▪ When <b>false</b>, <b>application/json</b> format is returned for the test results. When <b>true</b>, <b>text/xml</b> JUnit format is used for the test results (see <b>text/xml</b> response). <b>JUnitFormat</b> is <b>false</b> by default.</li> </ul> </li> </ul> </li> </ul> </li> <li>• <b>variables</b> (Optional)       <ul style="list-style-type: none"> <li>◦ The variables section is used to pass a list of named variables and their values into the tests being run. It is only used by tests that have been written to make use of variables, and have values stored alongside them. Declaring the variable name as the object key, and its new value as the key's value (as type string), will overwrite the current value of the variable in the test which shares its name with the object key.</li> </ul> </li> <li>• <b>tags</b> (Required)       <ul style="list-style-type: none"> <li>◦ A wrapper object containing both the list of tags and the operator to use on them.</li> <li>◦ Child Elements:           <ul style="list-style-type: none"> <li>▪ <b>tagList</b> (Required)               <ul style="list-style-type: none"> <li>▪ The list of tags which correspond to the tests you want to execute or ignore (see <b>operator</b> element).</li> </ul> </li> <li>▪ <b>operator</b> (Required)               <ul style="list-style-type: none"> <li>▪ The operator indicates how to treat the list of tags and can be either one of three values: <b>not</b>, <b>and</b>, or <b>or</b>.                   <ul style="list-style-type: none"> <li>▪ The <b>not</b> operator will omit executing any test within the API Hook's scope that has been tagged with a tag listed in the <b>tagList</b>.</li> </ul> </li> </ul> </li> </ul> </li> </ul> </li> </ul>

- The **and** operator will include any test within the API Hook's scope that has been tagged with all the tags provided in the **tagList**.
- The **or** operator will include any test within the API Hook's scope that has been tagged with at least one of the tags provided in the **tagList**.

## Response Content

### MIME type: application/json

`application/json` is the default response from the endpoint.

```
[
  {
    testRunId: string,
    testId: string,
    testName: string,
    location: string,
    initiated: string,
    duration: integer,
    status: enum['passed' or 'failed'],
    reportUrl: string,
    results: {
      warningsCount: integer,
      failureCount: integer,
      httpFailures: array[object],
      criticalFailures: array[object],
      assertions: array[object]
    }
  }
]
```

### Response Description

- **testRunID**
  - ID of the test run.
- **testId**
  - ID of the test which was executed.
- **testName**
  - Name of the test.
- **location**
  - Location of the agent which executed the test.
- **initiated**
  - Date and time when the test was initiated.
- **duration**
  - Total duration of the test run in seconds.
- **status**
  - Overall result of the test.
- **reportUrl**
  - URL to the test run report.
- **results**
  - A wrapper object containing the results of the test run.
  - Child Elements:
    - **warningsCount**
      - Count of the HTTP warnings returned by the test assertions.
    - **failureCount**
      - Count of the HTTP status code responses that are greater than 400.
    - **httpFailures**
      - Description of failures whose HTTP Status response code is greater than or equal to 400.
    - **criticalFailures**
      - Description of failures whose HTTP Status response code is greater than or equal to 500.
    - **assertions**
      - A description of the assertions executed in the test. By default, only failing assertions will be listed.

### MIME type: text/xml

To receive a `text/xml` response, the optional `JUnitFormat` variable in the request body must be set to `true`. JUnit responses can be useful when you wish to incorporate your test results with a build pipeline such as Jenkins, via the [JUnit plugin](#).

```
<?xml version="1.0" encoding="UTF-8"?>
<testSuite name="" tests="" disabled="" errors="" failures="" timestamp="" time="">
<testcase name="" classname="" time="">
  <failure message="" type="" />
</testcase>
</testSuite>
```

## Response Description

- **<testSuite>**
  - Child Elements: **<testCase>**
  - Attributes:
    - **name**
      - Test Suite name.
    - **tests**
      - Number of published tests ran.
    - **disabled**
      - Number of disabled tests.
    - **errors**
      - Number of errors.
    - **failures**
      - Number of tests within the test suite that failed.
    - **timestamp**
      - Date and time the tests were ran.
    - **time**
      - Total duration of all test runs in seconds.
- **<testCase>**
  - Child Elements: **<failure>**
  - Attributes:
    - **name**
      - Test name.
    - **classname**
      - ID of the test which was executed.
    - **time**
      - Total duration of the test run in seconds.
- **<failure>**
  - Attributes:
    - **message**
      - Failure message containing the expected and actual response.
    - **type**
      - Type of failure.

<b>Status Codes</b>	200: Success 400: Missing Authorization Headers 401: Invalid Authorization Headers

## Run Published Test By ID

### Description

---

The Run Published Test By ID endpoint executes a single specified test within an API Hook's scope.

### HTTP Request

---

```
POST <API-Hook-URL>/tests/{Test-ID}/run
```

---

## Sample Method Invocation

```

curl -X POST \
-H X-API-Key:{API-Key} \
-H X-API-Secret:{API-Secret} \
-H Content-Type:application/json \
-d "
  {
    "options": {
      "allAssertions": boolean,
      "JUnitFormat": boolean
    },
    "variables": {
      string: string,
    }
  }
" \
<API-Hook-URL>/tests/{Test-ID}/run

```

<b>Parameters</b>	<b>Path Parameters</b>  Test-ID: The ID of the Test to execute.  <b>Header Parameters</b>  API-Key: A valid <a href="#">API Key</a> for the Test Organization this API Hook belongs to. API-Secret: A valid <a href="#">API Secret</a> for the Test Organization this API Hook belongs to.
<b>Request Body</b>	<b>MIME type: application/json</b>  <pre> {   options: {     allAssertions: boolean,     JUnitFormat: boolean   },   variables: {     string: string,   } } </pre> <b>Body Parameters</b> <ul style="list-style-type: none"> <li>• <b>options</b> (Only required if providing a child element) <ul style="list-style-type: none"> <li>◦ A wrapper object for the containing options on how what data should be returned in the response, or how the response should be formatted.</li> <li>◦ Child Elements: <ul style="list-style-type: none"> <li>▪ <b>allAssertions</b> (Optional) <ul style="list-style-type: none"> <li>▪ When <b>false</b>, only the results of failing assertions in the test are returned. ## Tutorial: Invoking test cases from Jenkins with JUnit result format

### Before you begin

---

You must have the Automated API behavior testing application enabled and have created and published at least one test. You must have a Jenkins instance that you can create a new build in with the [JUnit Plugin](#) installed

### About this tutorial

---

In this tutorial, you invoke a test case using injected variables from a Jenkins pipeline

This tutorial takes you through the following steps

1. Creating an API Hook
2. Creating an API Key and Secret

3. Creating a Jenkins build that invokes the API Hook
4. Executing the build and reviewing the test results

### Creating an API Hook

You can generate an API hook for each of the Test Suites within your Test Organization. API hooks are scoped to only one test suite and thus will only have access to operate on the data within that test suite; that is, if an API Hook is generated for **Test Suite 1**, it grants access only to the tests within **Test Suite 1**. If you wish to interact with tests in multiple test suites, you will need to generate an API hook for each Test Suite.

### How to create an API Hook

1. Navigate to the Test Organization settings page by clicking the **Cog** icon in the menu bar.

2. Within the Test Organization settings page, click the **Hooks** option under the API Hooks heading in the navigation menu.

<Test Organization Name> Settings

All changes saved.

3. Now click on the **+ API Hook** button to begin creating a new API Hook.

<Test Organization Name> Settings

All changes saved.

4. Because API Hooks are scoped at a Test Suite level, you will need to select the test suite you wish to generate the hook for. Choose the appropriate test suite from the dropdown and optionally add a description for the API Hook. Click the **confirm**  icon to generate and save the API Hook.

5. The API Hook URL has been created for your Test Suite. Make a note of this this URL as this will form the base path of all future API requests you make for the test suite.

## Creating an API Key and Secret

API Keys and Secrets are the credentials required to use an [API Hook](#). For a request to an API Hook to be authorised, both the **X-API-Key** and **X-API-Secret** headers must be provided. The values of the API Key and Secret represent the values of these headers respectively.

1. First navigate to the Test Organization settings page by clicking the **Cog** icon in the menu bar.

2. Within the Test Organization settings page, click the **KEYS** option under the API Hooks heading in the navigation menu.

### <Test Organization Name> Settings

All changes saved.

API Hooks

- HOOKS
- KEYS**

#### Test Organization

Test organization global settings. Hit "Save changes" to make your changes effective.

**Test Organization Name:**

**Time Zone:** ⓘ

UTC ▼

3. Now click on the **+ API Key** button to create a new API Key.

### <Test Organization Name> Settings

All changes saved.

API Hooks

- HOOKS
- KEYS**

#### API Keys

Tip: Generate an API Key.

**+ API Key**

4. You will then be shown the generated **Key** and **Secret**. Make a note of both of these, ensure the **Secret** is noted as it cannot be retrieved in the future. Give your new API Key a name and then click the **confirm**  icon to save it.

#### Add API Key

✖ ✔

**Name:**

**Key:**

**Secret:**

## Creating a Jenkins build that invokes the API Hook

1. Create a Jenkins Project or navigate to an existing one

2. Select **Configure** from the the options

**Jenkins**

Jenkins > Freestyle1 >

- Back to Dashboard
- Status
- Changes
- Workspace
- Build Now
- Delete Project
- Configure**
- Favorite
- Open Blue Ocean
- Rename

## Project Freestyle1

This is a test of CURL in Jenkins

- [Workspace](#)
- [Recent Changes](#)
- [Latest Test Result](#) (3 failures / ±0)

### Build History

find [x]

#30	09-Feb-2020 14:57
#29	07-Feb-2020 14:37

### Permalinks

- [Last build \(#30\), 1 day 1 hr ago](#)
- [Last stable build \(#16\), 5 days 23 hr ago](#)
- [Last successful build \(#30\), 1 day 1 hr ago](#)
- [Last failed build \(#5\), 6 days 23 hr ago](#)

3. Under **Build**, click **Add build step** dropdown and select **Execute Shell**

**Execute shell**

Command

See [the list of available environment variables](#)

Advanced...

Add build step ▾

4. Within the **Execute shell** block paste a **curl** command that will invoke the hook that was created in step 1

```
curl -XPOST
-H 'x-api-key: <API-KEY>'
-H 'x-api-secret: <API-SECRET>'
-H "Content-type: application/json"
-d '{ options: { JUnitFormat: true } }'
'<API-HOOK-URL>/tests/run'
>| testReports.xml
```

5. Under **Post-build Actions**, click **Add post-build action** and in the dropdown select **Publish JUnit test results report**.

1. For **Test report XMLs** provide the name of the report created from the curl, in this tutorial `testReports.xml`

The screenshot shows the 'Post-build Actions' configuration for a Jenkins job. The 'Publish JUnit test result report' action is selected. The 'Test report XMLs' field is empty. Below it, there is a link to the 'Fileset 'includes' setting' and a checkbox for 'Retain long standard output/error'. The 'Health report amplification factor' is set to '1.0'. Below that, there is a link to the '1% failing tests scores as 99% health. 5% failing tests scores as 95% health' setting and a checkbox for 'Do not fail the build on empty test results'. At the bottom, there is an 'Add post-build action' button.

6. Save the project

### Executing the build and reviewing the test results

1. Click **Build Now** on the project

The screenshot shows the Jenkins project page for 'Freestyle1'. The page has a dark header with the Jenkins logo and the word 'Jenkins' in white. Below the header, there is a breadcrumb trail: 'Jenkins > Freestyle1 >'. On the left side, there is a list of actions: 'Back to Dashboard', 'Status', 'Changes', 'Workspace', 'Build Now' (highlighted with a red box), 'Delete Project', 'Configure', 'Favorite', 'Open Blue Ocean', and 'Rename'. On the right side, there is a large heading 'Project' and a sub-heading 'This is a test ('. Below the heading, there are three icons: a folder icon labeled 'Wo', a notepad icon labeled 'Re', and a clipboard icon labeled 'Lat'. At the bottom, there is a 'Build History' button with a 'trend' dropdown menu and a 'Permalink' button.

2. Once the build has completed, you will now see a chart showing

**Project Freestyle1**  
This is a test of CURL in Jenkins

To expand upon this tutorial additional options and steps can be found under [Using API Hooks](#)

### What you did in this tutorial

In this tutorial you completed the following activities:

- Created a API Hook
- Created a Key and Secret used for authenticating with a hook
- Invoked the API Hook using the Key and Secret to start a test and process the results

Contribute in GitHub: [Edit online](#)

---

## Tutorial: Using variables within a test

### About this tutorial

---

In this tutorial, you will create a test case that uses both a variable defined in a dataset and define and use one within the test itself.

This tutorial will take you through the following testReports

1. Create a test using the HTTP Client
2. Modifying variables within data sets
3. Defining your own variable
4. Adding a new request to your test using the HTTP Client
5. Linking the requests with the variables

#### Creating a test with the HTTP Client

Using the HTTP Client it is possible to take the request and response and create a test case from these parts. The HTTP Client is accessible from either the top navigation bar or from inside a test case.

NOTE: test cases generated from the HTTP Client have no association with any specification document for the API that is being invoked, as such some details may be incorrect within the test case such as whether a given field is required or not.

### Making the request in the HTTP Client

1. Go to the HTTP client using the Link
2. For the URL enter `https://<API Test hostname>/apitest/api/exmaples/retail/products`, this is an unauthenticated **GET** request, as such no additional values are required
3. Click **Send**
4. Once the response has returned you should see this:

The screenshot shows the HTTP Client interface. At the top, there are buttons for 'Save', 'Generate Test', and 'Import'. Below that, the request method is 'GET' and the URL is 'https://hub.atm-test.ibm.com/apitest/api/examples/retail/products'. There are 'Params', 'Send', and 'Clear' buttons. The 'Response' section shows a JSON object with the following structure:

```
{
  "success": true,
  "status": 200,
  "content": {
    "act": "list",
    "products": [
      {
        "id": 1,
        "name": "Product 1"
      },
      {
        "id": 2,
        "name": "Product 2"
      }
    ]
  }
}
```

5. Click **Generate Test**

6. Provide a Test name and either add a new Test Suite or select an existing one

The 'Generate Test' dialog box is shown. It has a title bar with a red 'X' and a blue checkmark. The 'Name' field contains 'Retail Products'. The 'Save to Test Suite' dropdown is set to 'Create new test suite'. Below the dropdown, there is a list of existing test suites: 'Retail Examples'.

7. Click save

This will automatically generate a test case based on your request and you should have a **GET** request with a number of assertions

### Modifying variables within a Data sets

Having generated the test, you will see that the request will have a URL target of `/${endpointURL}` this is defined within the Global variables under Data Sets

In cases of tests generated tests, the value of `endpointURL` is the complete URL that we called, however if we want to call other paths on that endpoint we will need to modify it so we can reuse it in cases where call a different URL

This is what we will have from the generated test from the previous step:

The endpoint currently uses the full path of `https://<API Test hostname>/apitest/api/exmaples/retail/products`, but later I will make a call to a different resource to `products`, so I want to trim this to make it more reusable

1. Selecting Edit variable on `endpointURL`

2. Update the value to be `https://<API Test hostname>/apitest/api/exmaples/retail`
3. Click **Save**

As we have updated the value of the input, we now need to fix the request as it will be missing `/products` from the endpoint

1. Click **Edit** on the **GET** Request
2. Add `/products` after the `${endpointURL}`
3. Click save

Have made the updates we can check the test is still valid by clicking  image of Run Test

and we should get the payload of

```
{
  "success": true,
  "status": 200,
  "content": {
    "act": "list",
    "products": [
      511,
      611,
      711
    ]
  }
}
```

## Defining your own variable

The next step is to dig into the details of an individual product, based on one of the products ID we get back from `/products`

The IDs are process within the test case within the `For each loop` and accessible as `_1`, if we wanted to grab the `status` value we would to it in the way that assertion refers to it `payload.status`

1. Click **Add Components**

2. Click **Set (variable)**

**Set (variable)**

3. Provide the name of variables such as `productID`
4. Due to the processing the above values are treated as `floats`, but for the next call we need an integer a. Select **Language** for Mode b. Within **Content** provide the following groovy script `return Math.round(_1)` - this converts the float to an into
5. Move Set Variable to within the For Each loop

## Adding a New request to an existing test with the HTTP client

Once you are in the Test Editor there are two ways to add a new request, either adding one from the list of components or by making or loading a request within the client within the test Editor

for this tutorial we will perform the request in client inside the test

1. Click HTTP Client icon

**HTTP Client**

2. In the URL field enter `https://<API Test hostname>/apitest/api/exmaples/retail/product?id=711`
3. Click **Send**
4. Click **Generate Test**

5. Click **Continue** on each screen and finally **close** - generation of endpointURL variable will fail as it already exists, this is to be expected
6. Edit the URL value in the new request to be `${endpointURL}/product`
7. Edit the Query Parameters **ID** reference variable to be the one we created in the previous stage `productID`
8. Click  Image of completed GET request

You have now completed a linked set of requests, to check that this is running correctly you can now run the test and check the request to see what parameter value was used

The screenshot shows a GET request in progress. The URL is `get https://hub.atm-test-master.fyre.ibm.com/apitest/api/examples/retail/product?id=711`. Below the URL, there are performance metrics: **Latency: 25ms** and **Download: 24ms**. A progress bar is shown with a yellow segment and a blue segment. The **STATUS: 200** is displayed. A **See Request** link is visible in the bottom right corner.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Testing an API with the Policies editor

IBM® API Connect provides a basic test environment in the Policies editor so that you can ensure that your APIs are defined and implemented correctly.

## About this task

---

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

Note:

- If you are testing an OpenAPI 2.0 API, you can use either the Policies editor test tool described here, or you can use the Test tab. If you are testing an OpenAPI 3.0 API, only the Test tab is available; see [Using the Test tab to debug your API](#).
- If you are testing an API that contains references to API properties, only those references that are defined inside the API assembly are resolved and replaced with their corresponding values when you invoke the API in the assembly test tool; property references that are defined outside of the API assembly are not resolved. For more information on API properties, see [Setting API properties](#) (OpenAPI 2.0) or [Setting API properties](#) (OpenAPI 3.0).
- Due to Cross-Origin Resource Sharing (CORS) restrictions, the assembly test tool cannot be used with the Chrome or Safari browsers on the macOS Catalina platform.

## Procedure

---

To test an API, complete the following steps.

1. If you are using API Designer, set the mode to Online using the Options menu  on the main page.
  2. In the navigation pane, click  Develop, then select the APIs tab.
  3. Click the title of the API that you want to work with.
  4. Click the Gateway tab then, in the navigation pane, click Policies.
  5. If you are testing the API for the first time and, when you created the API definition, you selected the Activate API option, your test setup will already be configured and you can proceed immediately to the next step to test your API. Otherwise, click Offline to toggle the API to the Online state. If you are retesting your API after making changes, the modified API will have been republished automatically on saving.
  6. Click the Test icon .
- Note:
- The Test icon is active only if you have toggled your API to the Online state, as described in step 5.
  - The Catalog, Product, Plan, and application details displayed in the Setup pane reflect your configured API testing preferences; see [Specifying the testing preferences for an API](#).
7. In the Operation section, select the API operation that you want to test, then click Invoke.  
The API response is displayed in the Response section.
- Note: If you receive a message relating to an untrusted certificate, click the link provided, accept the certificate, then return to the test environment and click Invoke again. The message also mentions a lack of CORS support on the server, but this is just one possible cause for the connection failing.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Testing an API with the Local Test Environment

Use the Local Test Environment to test APIs on your local machine, without the need to connect to an API Connect management server. The Local Test Environment is a lightweight API Manager running on your local machine. It allows you to rapidly test APIs locally.

API Connect provides the following methods for testing an API on your local machine:

- Invoke the API from the API Designer UI application running in Online mode as described in [Testing an API](#).
- Call the API in the Local Test Environment with a cURL command, as described in the following sections.

## Prerequisites

---

- The API Connect developer toolkit, including the API Designer user interface, installed. For installation and running instructions, see [Installing the toolkit](#).
- The Local Test Environment and the API Designer must be from the same API Connect fix pack release in order for them to work together.
- Docker installed.

Note: The Local Test Environment is not supported with Docker Version 18.09.x.

- A minimum of 4 GB of RAM available to Docker if a single gateway type is used, or 6 GB if both the DataPower® API Gateway and DataPower Gateway (v5 compatible) are used.

Note: As you increase the number of APIs that are published to your gateways, you will need to allocate further memory to Docker. You will also need to start the Local Test Environment with a larger database; see [apic-lte start](#).

- If you are using Windows, ensure that your C: drive (or the drive on which your HOME directory is located, if different), is enabled as a shared drive so that the Local Test Environment files are accessible to the Docker containers.

## Installing the Local Test Environment

---

There are two options for installing the Local Test Environment:

- Each user downloads the Local Test Environment images to their local machine and installs the Local Test Environment from there.
- One user downloads the Local Test Environment images and uploads them to a private Docker registry, from where any user can install the Local Test Environment.

To install the Local Test Environment from your local machine, complete the following steps:

1. Open a browser and visit the [API Connect announcement page](#), search for your product version, and locate the "Downloads" table on the product announcement page. In the table, click the link to download each of the following files:
  - `apic-lte-images-version.tar.gz`, which contains all required Docker images.  
Example: `apic-lte-images-10.0.2.tar.gz`
  - `apic-lte-platform-version`, which are binary files for the Mac OS X, Linux®, and Windows platforms.  
Examples:
    - Mac OS X: `apic-lte-osx-10.0.2`
    - Linux: `apic-lte-linux-10.0.2`
    - Windows: `apic-lte-win-10.0.2`

2. On the Mac OS X or Linux platform, use the `chmod` command to make the binary file executable; for example:

```
chmod +x linux-apic-lte
```

3. Load the Docker images into your local Docker image repository by entering the following command:

```
docker load < apic-lte-images.tar.gz
```

Note: In all Local Test Environment commands that are used on the remainder of this page, replace `platform` with `osx`, `linux`, or `windows`, depending on your platform, as follows:

- Mac OS X: replace `platform-apic-lte` with `osx-apic-lte`
- Linux: replace `platform-apic-lte` with `linux-apic-lte`
- Windows: replace `platform-apic-lte` with `win-apic-lte`

To upload the Local Test Environment images to a private Docker registry, complete the following steps:

1. Download the `IBM_API_CONNECT_LOCAL_TEST_ENVIRO.zip` file as described in step 1.
2. Distribute the appropriate binary file to all users, according to the platform.
3. Upload the Local Test Environment to your private Docker registry; enter the following command:

```
platform-apic-lte registry-upload apic-lte-images.tar.gz registry_host
```

where `registry_host` is the host name or IP address of your private Docker registry. Now, any user can install and run the Local Test Environment as follows:

- a. If the private Docker registry requires authentication, log in by entering the following command:

```
docker login registry_host
```

- b. Load the Docker images into your local Docker image repository by entering the following command:

```
platform-apic-lte init registry_host
```

## Starting the Local Test Environment

1. Start the Docker images by entering the following command:

```
platform-apic-lte start
```

Note:

- By default, the `platform-apic-lte start` command starts only a DataPower API Gateway. To also start a DataPower Gateway (v5 compatible), enter the following command:

```
platform-apic-lte start --datapower-gateway-enabled --datapower-api-gateway-enabled
```

- The Local Test Environment might fail to start with an error message that includes the strings `Error: certificate is not yet valid` and `CERT_NOT_YET_VALID`. The most likely cause is that the date and time setting is incorrect on the machine that is the running the Local Test Environment. Ensure that the date and time setting is correct, before attempting the start command again. If you are using Docker for Windows, the clock in the Docker containers can become out of sync with the system clock, especially after a machine has been put in sleep mode. In this case, restarting Docker should fix the clock discrepancy; for more information, see <https://github.com/docker/for-win/issues/4526>.
- By default, the LTE starts with an empty backend database that does not contain the APIs and Products that might have been published during an earlier run of the LTE. To start the LTE with the backend database that was used during the previous run, use the flag `--keep-config`, for example, `platform-apic-lte start --keep-config`. When you use `--keep-config` any other flag that is specified for the start is ignored. Instead the same flags that were used during the earlier start are used, in particular the same gateways are enabled.

2. Verify that the Local Test Environment is installed and running correctly by entering the following commands:

- a. `platform-apic-lte status`

This output from this command shows the status of all components, and provides endpoint and authentication details, and should be similar to the following:

```
Container          Status
-----
apic-lte-apim      Up 3 minutes
apic-lte-datapower-gateway Not Running
apic-lte-datapower-api-gateway Up 2 minutes
apic-lte-db        Up 3 minutes
apic-lte-juhu     Up 3 minutes
apic-lte-lur      Up 3 minutes

- Platform API url: https://localhost:2000
- Admin user: username=admin, password=7iron-hide
- 'localtest' org owner: username=shavon, password=7iron-hide
- 'localtest' org sandbox test app credentials client id: 80963e74076afe50d346d76401c3c08a
- Datapower API Gateway API base url: https://localhost:9444/localtest/sandbox/
```

- b. `apic login --server localhost:2000 --username shavon --password 7iron-hide --realm provider/default-idp-2`

This command confirms that you can log in to the management server, and the response should be as follows:

Logged into localhost:2000 successfully

Note: If you have previously installed toolkit credentials, as detailed in [Installing the toolkit](#), attempting to log in to the Local Test Environment management server from the toolkit CLI will fail; you must first clear the credentials by using the following command:

```
apic client-creds:clear
```

The toolkit CLI will now use the default credentials for login to the toolkit Local Test Environment. If you subsequently log in to a management server in an API Connect cloud, the default toolkit credentials will also be used, rather than the credentials that are unique to that deployment. To use the unique credentials, re-install them by using the following command:

```
apic client-creds:set toolkit_credentials_file_path/credentials.json
```

where *credentials\_file\_path* is the location of the previously downloaded toolkit credentials JSON file. To determine whether you currently have any toolkit credentials installed, use the following command:

```
apic client-creds:list
```

## Preparing an API for testing in the Local Test Environment

To prepare an API for testing in the Local Test Environment, you must publish it to the Sandbox Catalog in the Local Test Environment. If you want to test an API that you already published, proceed to [Testing an API in the Local Test Environment](#), otherwise, complete the following steps:

1. Launch the API Designer user interface.
2. Open the required local directory; this is the directory in which your API and Product definition files will be stored.
3. Connect to the Local Test Environment. If you haven't previously connected to the Local Test Environment, click Add Another Cloud, then complete the following steps:
  - a. In the HOST URL field, enter `https://localhost:2000`, then click Next..
  - b. In the Username field, enter `shavon`, in the Password field enter `7iron-hide`, then click Sign in.

If you have previously connected to the Local Test Environment, click the existing tile to log in immediately.

The API Designer welcome page opens.

4. Click Develop APIs and Products, then click the API that you want to test. For details on how to configure an API definition, see [Developing your APIs and applications](#).
5. Move the activation slider control to the on position:

When the publish operation completes, your API is ready for testing.

Note: Whenever you make any changes to an API, you must republish it before retesting.

## Testing an API in the Local Test Environment.

To test an API in the Local Test Environment, issue a REST API call to the following URL:

```
https://localhost:9444/localtest/sandbox/basepath/operation_path?client_id=lte_client_id
```

where:

- *basepath* is the base path that is configured in the API definition.
- *operation\_path* is the path for the operation that you want to invoke, as configured in the API definition.
- *lte\_client\_id* is the client ID for the test application in the local test environment, as returned by the `platform-apic-lte status` command in step 2.

The following example show how to test the API that is created in the tutorial [Creating a proxy REST API definition](#), by using the `curl` utility; the API returns the details of bank branches:

```
curl -k https://localhost:9444/localtest/sandbox/branches/details?client_id=80963e74076afe50d346d76401c3c08a [{"id":"0b3a8cf0-7e78-11e5-8059-a1020f32cce5","type":"atm","address":{"street1":"600 Anton Blvd.,"street2":"Floor 5","city":"Costa Mesa","state":"CA","zip_code":"92626"}}, {"id":"9d72ece0-7e7b-11e5-9038-55f9f9c08c06","type":"atm","address":{"street1":"4660 La Jolla Village Drive","street2":"Suite 300","city":"San Diego","state":"CA","zip_code":"92122"}}, {"id":"ae648760-7e77-11e5-8059-a1020f32cce5","type":"atm","address":{"street1":"New Orchard Road","city":"Armonk","state":"NY","zip_code":"10504"}}, {"id":"c23397f0-7e76-11e5-8059-a1020f32cce5","type":"branch","phone":"512-286-5000","address":{"street1":"11400 Burnet Rd.,"city":"Austin","state":"TX","zip_code":"78758-3415"}}, {"id":"ca841550-7e77-11e5-8059-a1020f32cce5","type":"atm","address":{"street1":"334 Route 9W","city":"Palisades","state":"NY","zip_code":"10964"}}, {"id":"dc132eb0-7e7b-11e5-9038-55f9f9c08c06","type":"branch","phone":"978-899-3444","address":{"street1":"550 King St.,"city":"Littleton","state":"MA","zip_code":"01460-1250"}}, {"id":"e1161670-7e76-11e5-8059-a1020f32cce5","type":"branch","phone":"561-893-7700","address":{"street1":"5901 Broken Sound Pkwy. NW","city":"Boca Raton","state":"FL","zip_code":"33487-2773"}}, {"id":"f9ca9ab0-7e7b-11e5-9038-55f9f9c08c06","type":"atm","address":{"street1":"1 Rogers Street","city":"Cambridge","state":"MA","zip_code":"02142"}]}
```

## Local Test Environment commands

The following table summarizes the Local Test Environment commands; use the `help` command to get full usage details for any command.

Table 1. Local Test Environment command summary

Command	Description
<code>platform-apic-lte help command</code>	Display help information for any command.
<code>platform-apic-lte init</code>	Download the Local Test Environment Docker images.

Command	Description
<code>platform-apic-lte start</code>	<p>Start the Local Test Environment Docker images. Use the <code>--database-max-heap-size</code> parameter to set the size of the Local Test Environment database, in bytes; for example:</p> <pre>linux-apic-lte start --database-max-heap-size 4096M linux-apic-lte start --database-max-heap-size 1G linux-apic-lte start --database-max-heap-size 1048576K linux-apic-lte start --database-max-heap-size 1073741824</pre> <p>The default value is <b>1024M</b>.</p> <p>Tip: By default, the <code>platform-apic-lte start</code> command deletes all previous data and re-initializes the Local Test Environment configuration, so all your previous configuration, including published Products, is deleted. To retain the previous configuration, and to apply the same command parameters that were used in the previous <code>platform-apic-lte start</code> command, supply the <code>--keep-config</code> parameter.</p>
<code>platform-apic-lte status</code>	Display status information for the Local Test Environment components, and endpoint and authentication details.
<code>platform-apic-lte stop</code>	Stop the Local Test Environment Docker images.
<code>platform-apic-lte version</code>	Display Local Test Environment version information.

## Troubleshooting the Local Test Environment

You can consult the log file for each Local Test Environment microservice or database by using the following command:

```
docker logs container-name
```

where *container-name* is one of the following:

- `apic-lte-juhu`: the authentication gateway
- `apic-lte-apim`: the API Management service
- `apic-lte-lur`: the Local User Registry
- `apic-lte-db`: the Postgres database of the API Management service
- `apic-lte-datapower-api-gateway`: the DataPower API Gateway
- `apic-lte-datapower-gateway`: the DataPower Gateway (v5 compatible)

You can access the gateway logs in either of the following ways:

- Use the gateway administration web UI:
  1. Open the page `https://localhost:web_ui_port` in a browser; for details of the required port value, see [Local Test Environment port values](#).
  2. Select the apiconnect domain and the WebGUI interface, and log in with user name `admin` and password `admin`.
  3. Click View Logs.
- Use the gateway administration CLI:
  1. Open an SSH connection by using the following command:

```
ssh -p gateway-ssh-port localhost
```

For details of the required port value, see [Local Test Environment port values](#). The user name is `admin` and the password is `admin`.
  2. Enter the command `switch domain apiconnect`.
  3. To view the gateway log, enter the command `show log`.
  4. To view the log for the communication between the gateway and the API management system, enter the command `show logging gwd-log`.

## Local Test Environment port values

If any of the default port values for the Local Test Environment components conflict with ports already in use on your system, you can change them when you start the Local Test Environment by passing one or more `--component port_value` parameters to the `platform-apic-lte start` command, where:

- *component* is the Local Test Environment component whose port value you want to change.
- *port\_value* is the required value.

For example:

```
platform-apic-lte start --datapower-api-gateway-api-port 9445
```

The following table lists the components, together with the corresponding *component* parameters, and the default port values:

Component	component parameter	Default port value
DataPower API Gateway API port	<code>datapower-api-gateway-api-port</code>	9444
DataPower API Gateway API Connect service port	<code>datapower-api-gateway-apic-service-port</code>	3001
DataPower API Gateway REST management port	<code>datapower-api-gateway-rest-management-port</code>	5555
DataPower API Gateway SSH port	<code>datapower-api-gateway-ssh-port</code>	9023
DataPower API Gateway administration web UI	<code>datapower-api-gateway-web-gui-port</code>	9091
DataPower API Gateway XML management port	<code>datapower-api-gateway-xml-management-port</code>	5551
DataPower Gateway (v5 compatible) API port	<code>datapower-gateway-api-port</code>	9443
DataPower Gateway (v5 compatible) API Connect service port	<code>datapower-gateway-apic-service-port</code>	3000
DataPower Gateway (v5 compatible) REST management port	<code>datapower-gateway-rest-management-port</code>	5554
DataPower Gateway (v5 compatible) SSH port	<code>datapower-gateway-ssh-port</code>	9022
DataPower Gateway (v5 compatible) administration web UI	<code>datapower-gateway-web-gui-port</code>	9090
DataPower Gateway (v5 compatible) XML management port	<code>datapower-gateway-xml-management-port</code>	5550

Component	component parameter	Default port value
Platform API port	platform-api-port	2000

- 📄 [Creating TLS Client Profile in the Local Test Environment](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#), for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Testing an API with the Explorer tab

Use the Explorer tab in the API editor to see how your APIs look to a consumer in the Developer Portal. You can also use the Try it tool to test the behavior of the API.

### Before you begin

To test an API in the Try it test tool, the API must be auto-published. If the API is not auto-published, the Try it tool isn't enabled in the Explorer.

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

### About this task

The Explorer tab in the API editor of the API Designer UI and API Manager UI enables you to view how your APIs look to an API consumer in the Developer Portal. You can check the descriptions of the different artifacts, and as well as any schemas or examples, and you can also test the behavior of the API by using the Try it tool.

Note:

- You cannot use the Try it tool to test non-enforced APIs.

### Procedure

To test an API by using the Try it tool, complete the following steps.

- If you are using API Designer, set the mode to Online using the Options menu  on the main page.
- In the navigation pane, click  Develop, then select the APIs tab.
- Click the title of the API that you want to work with.  
The API editor is displayed.
- Click the Explorer tab.  
An Overview of the API is displayed.
- Click the API artifacts in the side menu bar to explore the operations and definitions that are available in the API, including reviewing any examples and schemas.
- To test API behavior, click an operation in the side menu bar, and click the Try it tab.  
The test pane for the operation is displayed, as shown in the following example:

- Provide any required API parameters, and click Send.  
The API response is displayed in the Response section.  
Note: If you receive a message relating to an untrusted certificate, click the link provided, accept the certificate, then return to the test environment and click Send again.

### What to do next

When you are happy with the look and behavior of your API, you can stage the API to a Product in a Catalog. For more information, see [Staging an API](#).  
**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.  
For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Staging an API

The graphical wizard provides an option that adds the API to a Product and stages the Product in a Catalog. When a Product is in the staged state, it is not yet visible to, or subscribable by, any developers. The syndication feature in IBM® API Connect means that if Spaces are enabled for a Catalog, Products can be staged only to a Space within that Catalog.

### Before you begin

Ensure that you have a Catalog to stage to in the API Manager or API Designer user interfaces (UI). For more information, see [Creating and configuring Catalogs](#).

Ensure that the Catalog has at least one gateway service configured.

Note: All references in this topic to a Catalog can also be applied to Spaces in a Catalog, unless specified otherwise. For more information about Spaces, see [Using syndication in IBM API Connect®](#).

To complete the Product management tasks that are described in this topic, you must either be the owner of the API provider organization, or be assigned Product > Stage permission for the target Catalog or Space. For information on configuring Product management permissions for a Catalog or Space, see [Creating and configuring Catalogs](#) or [Managing user access in a Space](#).

### About this task

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI. Staging is not available when working offline in API Designer.

A Catalog is a staging target, and behaves as a logical partition of the DataPower® Gateway, and the Developer Portal.

Validation of the API definition file occurs during the staging or publishing process. The following validation occurs:

- Validation against the OpenAPI schema by using the API Dev Tools Swagger Parser (<https://www.npmjs.com/package/@apidevtools/swagger-parser>).
- Validation against IBM extension properties.
- Semantic validation, which includes the following types of validation:
  - Ensuring that if an OpenAPI is enforced by an API Connect Gateway, then the scheme must be HTTPS, or the parameter name for an API key security scheme in the header must be either **X-IBM-Client-Id** or **X-IBM-Client-Secret**.
  - Ensuring that if the OpenAPI is not enforced by an API Connect Gateway, then a "host" must be provided.
  - De-referencing of local references in the definition file (that is, values of **\$ref** properties), and ensuring these are valid JSON Pointers within the file.

Note: If you are using Event Endpoint Management in Cloud Pak for Integration, similar validation is carried out for AsyncAPI documents. For more information, see the section about API document and enforcement in the [Cloud Pak for Integration documentation](#).

Note: If the OpenAPI file that defines your API uses a **\$ref** field to reference a fragment of OpenAPI code that is defined in a separate file, the **\$ref** field is replaced with the contents of the target file before the product that contains the API is staged or published (the **\$ref** field is supported only if you are using the API Connect for IBM Cloud developer toolkit). For more information, see [Using \\$ref to reuse code fragments in your OpenAPI files](#).

### Procedure

1. In the navigation pane, click  Develop, then select the APIs tab.  
The Develop page opens.
2. **Optional:** If you have accounts on multiple provider organizations, you can select a new provider organization for staging and publishing from the Organization menu.
3. You can stage an API either from the Develop listing page, or from within the API definition itself.
  - a. To stage an API from the Develop listing page, click the options menu icon  alongside the required API, and then select Stage.
  - b. To stage an API from within the API definition, complete the following steps:
    - i. Click the title of the API that you want to work with.
    - ii. Click the options menu icon:

- iii. Click Stage.
4. Choose one of the following actions:
    - To stage the API by adding it to a new Product:
      - Select New Product - Publish using a new product.
      - When prompted, enter a Title and Version.
      - The Product Name is automatically entered. The Name is the used to refer to the product in CLI commands. See [apic products](#).
      - Click Next.
    - To stage the API by adding it to an existing Product:
      - Select Existing Product - Publish using an existing product
      - Select the Product you want to use.
      - Click Next.
  5. On the Stage To page, select the Catalog to which you want to stage the Product.

Note: The Catalogs that you can select from are those that are defined for the management server and provider organization that you are connected to. If you are using the API Manager user interface, the connection details are determined by the API Manager URL that you open, and the user ID with which you log in. If you are using the API Designer user interface, you provide the management server details and user ID in the login window that opens when you first launch API Designer; see [Logging into API Connect Designer](#).

For details of how to create a Catalog in a provider organization, see [Creating and configuring Catalogs](#).

6. If, when the staged Product is subsequently published, you want it to be published only to selected gateway services, select Publish to specific gateway services, then select the required gateway services. Only the gateway services whose type matches the gateway type setting for the Product are listed. For information on gateway types, see [API Connect gateway types](#).
7. Click Stage.

## Results

Your Product is staged to a Catalog. You can view the state of the Product in the Catalog in API Manager. If you staged the product from API Designer, ensure you are logged into API Manager with the same user name and password that you used for API Designer. Click  Manage in the API Manager UI, then select the required Catalog. The Product is shown with a state of Staged.

For information about the lifecycle of a product, see [The Product lifecycle](#).

If approval is required to stage Products in the Catalog, an approval request is sent, and the Product moves to the Pending state; the Product is staged when the request is approved. If approval is not required, the Product is staged immediately.

For information on configuring Product lifecycle approvals for a Catalog, see [Creating and configuring Catalogs](#). For information on approving requests, see [Approving Product lifecycle and subscription requests](#).

If the Product contains no Plans, a Plan called Default Plan is added automatically to the Product in the Catalog.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Publishing an API

The user interface provides an option that adds an API to a Product and publishes the Product in a Catalog. Publishing a draft Product makes the APIs in that Product visible on the Developer Portal for use by application developers. The syndication feature in IBM® API Connect means that if Spaces are enabled for a Catalog, Products can be published only to a Space within that Catalog.

## Before you begin

Ensure that you have a Catalog to stage to in the API Manager or API Designer user interfaces (UI). For more information, see [Creating and configuring Catalogs](#).

Ensure that the Catalog has at least one gateway service configured.

Note: All references in this topic to a Catalog can also be applied to Spaces in a Catalog, unless specified otherwise. For more information about Spaces, see [Using syndication in IBM API Connect®](#).

To complete the Product management tasks that are described in this topic, you must either be the owner of the API provider organization, or be assigned Product<sub>z</sub> Manage permission for the target Catalog or Space. For information on configuring Product management permissions for a Catalog or Space, see [Creating and configuring Catalogs](#) or [Managing user access in a Space](#).

## About this task

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI. Publishing is not available when working offline in API Designer.

Validation of the API definition file occurs during the staging or publishing process. The following validation occurs:

- Validation against the OpenAPI schema by using the API Dev Tools Swagger Parser (<https://www.npmjs.com/package/@apidetools/swagger-parser>).
- Validation against IBM extension properties.
- Semantic validation, which includes the following types of validation:
  - Ensuring that if an OpenAPI is enforced by an API Connect Gateway, then the scheme must be HTTPS, or the parameter name for an API key security scheme in the header must be either **X-IBM-Client-Id** or **X-IBM-Client-Secret**.
  - Ensuring that if the OpenAPI is not enforced by an API Connect Gateway, then a "host" must be provided.
  - De-referencing of local references in the definition file (that is, values of **\$ref** properties), and ensuring these are valid JSON Pointers within the file.

Note: Products that contain an API with a Swagger property using **regex** that include lookahead assertions, such as "(?" cannot be validated or published. An error message is returned. For example:

```
Product has not been published!  
The multipart 'openapi' field contains an OpenAPI definition with validation errors.  
definitions.properties.pattern Does not match format 'regex' (context: (root).definitions.properties.pattern, line: 0, col:  
0)  
400
```

Note: If the OpenAPI file that defines your API uses a **\$ref** field to reference a fragment of OpenAPI code that is defined in a separate file, the **\$ref** field is replaced with the contents of the target file before the product that contains the API is staged or published (the **\$ref** field is supported only if you are using the API Connect for IBM Cloud developer toolkit). For more information, see [Using \\$ref to reuse code fragments in your OpenAPI files](#).

## Procedure

1. In the navigation pane, click  Develop, then select the APIs tab.  
The Develop page opens.
2. **Optional:** If you have accounts on multiple provider organizations, you can select a new provider organization for staging and publishing from the Organization menu.
3. You can publish an API either from the Develop listing page, or from within the API definition itself.
  - a. To publish an API from the Develop listing page, click the options menu icon  alongside the required API, and then select Publish.
  - b. To publish an API from within the API definition, complete the following steps:
    - i. Click the title of the API that you want to work with.
    - ii. Click the options menu icon:

- iii. Click Publish.
4. Choose one of the following actions:
    - To publish the API by adding it to a new Product:
      - Select New Product - Publish using a new product.
      - When prompted, enter a Title and Version.
      - The Product Name is automatically entered. The Name is used to refer to the product in CLI commands. See [apic products](#).
      - Click Next.
    - To publish the API by adding it to an existing Product:
      - Select Existing Product - Publish using an existing product
      - Select the Product you want to use.
      - Click Next.
  5. Select the Catalog to which you want to publish the Product.
  6. If Spaces have been enabled in the selected Catalog, select the Space that you require.  
Note: The Catalogs that you can select from are those that are defined for the management server and provider organization that you are connected to. If you are using the API Manager user interface, the connection details are determined by the API Manager URL that you open, and the user ID with which you log in. If you are using the API Designer user interface, you provide the management server details and user ID in the login window that opens when you first launch API Designer; see [Logging into API Connect Designer](#).  
  
For details of how to create a Catalog in a provider organization, see [Creating and configuring Catalogs](#).
  7. If you want to publish the Product only to selected gateway services, select Publish to specific gateway services, then select the required gateway services. Only the gateway services whose type matches the gateway type setting for the Product are listed. For information on gateway types, see [API Connect gateway types](#).
  8. Click Publish.

## Results

Your Product is published to a Catalog. You can view the state of the Product in the Catalog in API Manager. If you published the product from API Designer, ensure you are logged into API Manager with the same user name and password that you used for API Designer. Click  Manage in the API Manager UI, then select the required Catalog. The Product is shown with a state of Published.

For information about the lifecycle of a product, see [The Product lifecycle](#).

If approval is required to publish Products in the Catalog, a publish approval request is sent, and the Product moves to the Pending state; the Product is published in the Catalog when the request is approved. If approval is not required, the Product is published immediately.

Note: If approval is required to stage Products to the Catalog, a stage approval request is sent. When the request is approved, the Product moves to the staged state and must be separately published in the Catalog. For information on publishing a staged Product in a Catalog, see [Publishing a Product](#).

For information on configuring Product lifecycle approvals for a Catalog, see [Creating and configuring Catalogs](#). For information on approving requests, see [Approving Product lifecycle and subscription requests](#).

If the Product contains no Plans, a Plan called Default Plan is added automatically to the Product in the Catalog.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Creating a new version of an API definition

You can create multiple versions of an API definition and edit the versions independently by using IBM® API Connect.

### About this task

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

Note: If you want to publish a modified API to a production Catalog, you **must** create a new version of the API. You cannot publish an API to a production Catalog if there is already a published API with the same name and version.

## Procedure

---

To create a new version of an API definition, complete the following instructions:

1. In the navigation pane, click  Develop, then select the APIs tab.
2. You can create a new version of an API definition either from the Develop page, or from within the API definition itself.
  - a. To create a new version of an API definition from the Develop page, complete the following steps:
    - i. Alongside the API version that you want to work with, click the options icon , then click Save as a new version. The Save API as a new version window opens.
    - ii. Enter your new version number, then click Save.
  - b. To create a new version of an API definition from within the API definition itself, complete the following steps:
    - i. Click the title of the API definition that you want to create a new version of.
    - ii. Click the options menu icon:

- iii. Click New Version, enter your new version number, then click Submit.

Note: The version corresponds to the `info.version` property value of the API's OpenAPI definition. The `version.release.modification` version numbering scheme is recommended, for example 1.0.0.

## Results

---

You have created a new version of your API definition, which you can now edit independently of other versions. Each version of the API definition is listed separately on the APIs and Products page.

## Related tasks

---

- [Creating an API definition](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Updating an API definition from a file

---

You can update an API by uploading a .yaml or .json file that contains the OpenAPI definition for the revised API.

## About this task

---

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

The update operation completely replaces the previous API definition.

## Procedure

---

To update an API from a file, complete the following steps:

1. In the navigation pane, click  Develop, then select the APIs tab.
2. Click the title of the API that you want to update.
3. Click the options menu icon:

4. Click Update, then either drag and drop the file or click the link to select the file from your local file system.
5. Click Submit, then click Save.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Updating a SOAP API

---

You can update the configuration of an existing SOAP API either by uploading a WSDL file, or by uploading a .zip archive that contains a primary WSDL file together with other WSDL or XSD files that it references.

## About this task

You complete this task by using the browser based API Manager UI.

You can also use the API Connect developer toolkit CLI to update a SOAP API; for more information see [API development and management commands](#).

When you initiate the update action, the specified WSDL is parsed to find a service that matches the name of the API that you are updating. If a match is found, the WSDL service is converted into a YAML file that is used to update the API. If no match is found, an error message is displayed.

Only those sections of the API that are affected by the new WSDL are replaced, the other sections are unchanged.

## Procedure

To update a SOAP API from a WSDL file or a .zip archive, complete the following steps:

1. In the navigation pane, click  Develop, then select the APIs tab.
2. Click the title of the SOAP API that you want to update.
3. Click the options menu icon:

4. Then click Update WSDL, and either drag and drop the file or click the link to select the file from your local file system.  
The format of the WSDL file is validated. If the format is invalid, an error message is displayed.
5. Click Next.  
The services in the selected API are displayed. If no match is found, an error message is displayed.
6. Click Upload.  
The SOAP API is updated from the specified WSDL definition.
7. Click Save to save the updates.
8. If you updated a previously published API, you must publish it again for the change to take effect:
  - a. Click the Online/Offline toggle (shown in step 3) to set the API as Offline.
  - b. Click the toggle again to set the API back to Online, which publishes the API again.

## Related tasks

- [Creating an API definition](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Renaming an API definition

By renaming an API definition, you change the **name** property that, together with the version, is used to uniquely identify the API definition in API Connect. The **name** property is initially generated automatically when you first create the API definition, based on the title, but you can later change it if desired.

## About this task

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

**API Manager UI only:** To complete this task, you must be assigned a role that has the **Api-Drafts:Edit** permission. The pre-supplied Developer role has this permission by default; if you are assigned a custom role it must have this permission. For more information, see [Creating custom roles](#).

## Procedure

1. In the navigation pane, click  Develop, then select the APIs tab.
2. Click the title of the API that you want to work with.
3. Click the options menu icon:

4. To rename the API, select Rename.  
Only this version of the API is renamed.
5. Enter the new name, then click Submit.  
Note: If you previously added the API to a Product, it will no longer be recognized by that Product. You must open the Product and modify the **apis**: section on the Source tab as appropriate; for example:

```
apis:  
  newname1.0.0:  
    name: 'newname:1.0.0'
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Changing an API rate limit

When you activate an API to make it available for testing, as described in [Activating an API](#), no rate limit is applied to restrict calls to the API. However, if desired, you can apply a rate limit to the API, or modify a previously applied rate limit. The rate limit defines the maximum number of calls allowed in a specified time period.

### About this task

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

**API Manager UI only:** To complete this task, you must be assigned a role that has the `Api-Drafts:Edit` permission. The pre-supplied Developer role has this permission by default; if you are assigned a custom role it must have this permission. For more information, see [Creating custom roles](#).

Note: For information about rate limits and burst limits in API Connect, see [Understanding rate limits for APIs and Plans](#).

### Procedure

1. In the navigation pane, click  Develop, then select the APIs tab.
2. Click the title of the API that you want to work with.
3. Click the options menu icon:

4. Click Edit Rate Limit.
5. Select Unlimited to allow unrestricted calls to the API, or select Custom Rate Limit to define the required rate limit; use the supplied fields to define the maximum number of calls allowed in a specified time period; for example, 100 calls per 1 minute.
6. Click Submit when done.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Adding an OpenAPI extension to an API

You can extend the OpenAPI specification by adding either a JSON or YAML extension schema to an API. An OpenAPI extension is imported into a Catalog, or to a Space within a Catalog, and then added to the API schema.

### Before you begin

Import the OpenAPIextension into the Sandbox Catalog, or into any Catalog to which the API that you are adding the extension to will be published; see [Importing an OpenAPI extension into a Catalog](#).

### About this task

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

**API Manager UI only:** To complete this task, you must be assigned a role that has the `Api-Drafts:Edit` permission. The pre-supplied Developer role has this permission by default; if you are assigned a custom role it must have this permission. For more information, see [Creating custom roles](#).

### Procedure

1. In the navigation pane, click  Develop, then select the APIs tab.
2. Click the title of the API that you want to work with.
3. Select the Gateway tab, expand Gateway and portal settings, then click Extensions.
4. Select the OpenAPIextensions that you want to use with this API, then click Save.

Note: The OpenAPIextensions listed are those that have been imported into the Catalog and gateway service defined in the testing preferences for the API; see [Importing an OpenAPI extension into a Catalog](#) and [Specifying the testing preferences for an API](#). You will also need to import the OpenAPIextension into any Catalog to which the API will be published.

5. Update the OpenAPI source for the API definition with the values for the fields as defined in your selected OpenAPIextension schema files, as follows:
  - a. Click the Source icon .
  - b. Add a property whose name must begin with `x-` and references the name of the OpenAPIextension that you created. Specify the values of the properties that were defined in the OpenAPI extension YAML file.

For an example, see [Referring to an extension in an API definition](#)  
c. Click Save when done.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Downloading an API definition

You can download the details of your API definitions so that you can store them for later recovery.

### Before you begin

---

To complete this task, you must have created an API definition. For more information, see [Creating an API definition](#).

### About this task

---

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

**API Manager UI only:** To complete this task, you must be assigned a role that has the **Drafts:View** permission. The pre-supplied Developer role has this permission by default; if you are assigned a custom role it must have this permission. For more information, see [Creating custom roles](#).

You can download REST APIs that were created by using [Creating a REST proxy API from a target service](#) for example. This download creates a .yaml file that defines the API.

You can download SOAP APIs that were created by using [Creating a REST proxy API from an existing WSDL service](#), or [Creating a SOAP proxy API from an existing WSDL service](#) for example. This download creates a .zip file that contains the WSDL definition and the YAML file that defines the API.

You can use the downloaded .yaml and .zip files to re-create your API. For information about creating an API from a .yaml file, see [Adding a REST API by importing an OpenAPI definition file](#). For information about creating an API from a .zip file, see [Adding a SOAP API by importing a zip file](#).

### Procedure

---

To download a .yaml, or .zip file that contains the details of your API, complete the following steps:

1. In the navigation pane, click  Develop, then select the APIs tab.
2. Alongside the API version that you want to work with, click the options icon  and then click Download.
3. Save the file to the required location.

### Results

---

You downloaded a .yaml, or .zip file with a representation of your API.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Deleting an API definition

You can delete an API definition that is no longer required.

### About this task

---

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

**API Manager UI only:** To complete this task, you must be assigned a role that has the **Api-Drafts:Edit** permission. The pre-supplied Developer role has this permission by default; if you are assigned a custom role it must have this permission. For more information, see [Creating custom roles](#).

### Procedure

---

1. In the navigation pane, click  Develop, then select the APIs tab.
2. You can delete an API either from the Develop listing page, or from within the API definition itself.
  - a. To delete an API from the Develop listing page, click the options menu icon  alongside the required API, and then select Delete.
  - b. To delete an API from within the API definition, complete the following steps:
    - i. Click the title of the API definition that you want to work with.
    - ii. Click the options menu icon:

iii. To delete just this version of the API, select Delete. To delete all versions of this API, select Delete API.

Note: If a Product was previously generated automatically from the API, by using the Activate API option, that Product will be deleted together with the API; such Products have the title *api\_title* auto product.

3. Click Delete to confirm.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Using an options file when importing a WSDL service

When you create an API definition, or add a target WSDL service to an API definition, by importing a .zip file, you can specify additional directives by including an options file in the .zip file.

You can use an options file when importing a .zip file while performing any of the following tasks:

- Creating a REST proxy API; see [Creating a REST proxy API from an existing WSDL service](#).
- Creating a SOAP proxy API; see [Creating a SOAP proxy API from an existing WSDL service](#).
- Adding a target WSDL service to an API definition; see [Editing an API definition](#).

The options file is a YAML file, and must have the file name apiconnect.yaml.

You can include the following fields in the file:

Table 1. Fields that can be included in the apiconnect.yaml file

Field name	Value	Default	Description
<code>suppressExamples</code>	<code>true</code> or <code>false</code>	<code>false</code>	Suppress auto-generation of examples.
<code>wssecurity</code>	<code>true</code> or <code>false</code>	<code>true</code>	Enable generation of definitions for WS-Security headers.
<code>implicitHeaderFiles</code>	Array of XSD file locations		Additional schema files, not referenced in the WSDL, that are used to define additional SOAP headers.
<code>port</code>	The <code>name</code> attribute for a <code>wsdl:port</code> in a <code>wsdl:service</code> definition.		Create the API by using the information for the specified port. If the specified port does not exist, or refers to a REST/XML port rather than a SOAP port, the API creation fails.  If no <code>port</code> field is present in the options file, API Connect creates the API by using the first SOAP port that it finds in the <code>wsdl:service</code> definition.

## Example

```
suppressExamples: true
wssecurity: false
implicitHeaderFiles:
- xsdDir/schema1.xsd
- xsdDir/schema2.xsd
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Variable references in API Connect

In API Connect you can reference different variables in your API definition.

When defining an API, creating a custom policy, or configuring another policy or logic construct, you can include references to context variables and properties.

Variable references are resolved either when the API is staged in a Product, for static variables that are fixed upon staging, or when the API is called, for variables that can change with each API call.

## Types of variables

### Context variables

A context variable is a variable relevant during an API call, for example, the input of the call, the path of the call, or the message during the call. A context variable is one of the variables that makes up that particular context.

Context variables can consist of more than one part, for example, `request.headers`.

For a list of available context variables, see [API Connect context variables](#).

## API properties

An API property is a variable in an API where its value depends upon the Catalog in which the API is staged or published. By referencing an API property, you can use the same API definition in different Catalogs where there are small differences between the instances of the API between the Catalogs. For example, an assembly could contain an `if` construct that executes its case when a particular Catalog is used, determined from the value of the API property. API properties can also be used to hide a value such as a password by encoding the value.

API properties are referenced by name.

For a list of API properties, see [API properties](#)

For more information, see [Setting API properties](#) (OpenAPI 2.0) or [Setting API properties](#) (OpenAPI 3.0).

Note: Once defined, an API property is read only.

## Catalog properties

A Catalog property is specific to a Catalog, and can be referenced in any of the API definitions in that Catalog. For more information, see [Creating and configuring Catalogs](#).

Note:

- If you change the value of a Catalog property, any API that references that property must be republished for it use the new value.
- Catalog properties and API properties are not supported with global policies. Therefore, if you use such properties in a global policy, they are **not** replaced with the values specified in the Catalog or API property definitions.

## Methods of referencing variables

You can get or set the value for a referenced variable.

- Get the value for a variable in either of the following ways:
  - Through the [GatewayScript](#) policy, run the `apim.getvariable()` API.
  - API Gateway only Through the [GatewayScript](#) policy, use the `context.get()` function; for more information, see [Using context variables in GatewayScript and XSLT policies with the DataPower API Gateway](#).
  - Through the [XSLT](#) policy, run a stylesheet that uses the `apim:getVariable` extension function.
  - In an assembly policy field that supports variable references, use the following syntax:  
`$(variable)`
- Set the value for a variable in either of the following ways:
  - Through the [Set Variable](#) policy.
  - Through the [GatewayScript](#) policy, use the `apim.setvariable()` API.
  - API Gateway only Through the [GatewayScript](#) policy, use the `context.set()` function; for more information, see [Using context variables in GatewayScript and XSLT policies with the DataPower API Gateway](#).
  - Through the [XSLT](#) policy, run a stylesheet that uses the `apim:setVariable` extension element.

## GatewayScript references

When you want to reference a variable in a GatewayScript context, use one of the following methods:

```
apim.getvariable(variable)
```

where *variable* is the name of the context variable or API property that you want to reference.

```
apim.setvariable(variable, value, action)
```

where

- *variable* is the name of the context variable or API property that you want to reference.
- *value* is the string value that you want to set the variable to. This can be a literal value, or another variable. For example, to set your named variable to the value of the Content-Type header in a request, use the following code:

```
var contentType = apim.getvariable('request.headers.content-type');
apim.setvariable(variable, contentType, 'set');
```

This property is required only when `set` or `add` is specified as the action.

- *action* is the action that you want to apply to the variable. Valid options are:
  - `set`
  - `add`
  - `clear`

If no option is set, the default option of `set` is applied.

Use the `getvariable` method to retrieve the value of a context variable or API property, and the `setvariable` method to change one.

Some of the situations where you would use this type of reference are:

- GatewayScript policies. -For more information, see [GatewayScript](#).
- `if` logic constructs. For more information, see [if](#).
- User-defined policies. For more information, see [Authoring policies](#).

## Stylesheet references

You can reference a variable by using functions and elements in an XSLT policy with the following syntax:

```
<xsl:variable name="variable_name" select="apim:getVariable(variable)" />
```

where *variable* is a literal value, another variable, or a valid XSLT XPath statement.

```
<xsl:call-template name="apim:setVariable">
  <xsl:with-param name="varName" select="variable"/>
</xsl:call-template>
```

```
<xsl:with-param name="value" select="value"/>
<xsl:with-param name="action" select="action"/>
</xsl:call-template>
```

where

- *variable* is the name of the context variable or API property that you want to reference. This can be a literal value, another variable, or a valid XSLT XPath statement.
- *value* is the string value that you want to set the variable to. This can be a literal value, another variable, or a valid XSLT XPath statement. This property is required only when **set** or **add** is specified as the action.
- *action* is the action that you want to apply to the variable. This can be a literal value, another variable, or a valid XSLT XPath statement. Valid options are:
  - **set**
  - **add**
  - **clear**

If no option is set, the default option of **set** is applied.

The following example sets a named variable to the value of the Content-Type header in a request:

```
<xsl:variable name="contentType" select="apim:getVariable('request.headers.content-type') " />
<xsl:call-template name="apim:setVariable">
  <xsl:with-param name="varName" select="'variable'"/>
  <xsl:with-param name="value" select="$contentType"/>
  <xsl:with-param name="action" select="'set'"/>
</xsl:call-template>
```

Inline references

In many situations you can make a simpler reference, by using the following syntax:

```
$(variable)
```

where *variable* is the name of the context variable or API property that you want to reference.

Some of the situations where you would use this type of reference are:

- The URL called by an Invoke or Proxy policy. For more information about the policies, see [Invoke](#) or [Proxy](#).
- A Map policy. For more information, see [Map](#).

Note: The map policy can reference the following variables inline:

- Variables that are defined as inputs to the map policy and specified in the from field of a mapping.
- Context variable or API properties, provided that the **x-ibm-gateway-map-resolve-apic-variables** API property is not set to **false**. If an inline reference in a map policy resolves to a context variable or API property, it is immediately replaced by the corresponding value. For more information on the **x-ibm-gateway-map-resolve-apic-variables** API property, see [Properties controlling the map policy](#).

For more information on the use of inline references, and examples, see the following [About inline references](#) section.

## About inline references

When you use an inline reference for a property value in an assembly policy, the variable reference is replaced with the corresponding string value at run time, before the property is evaluated. For example, consider the following incoming request, which has two headers and two query parameters (a **curl** command is used to illustrate the request):

```
curl --data-binary @request.json \
  -H 'Content-Type: application/json' \
  -H 'X-Environment: test' \
  http://apiserver/org/catalog/petstore/getPetDetails?petid=285&storeid=z03
```

If an **invoke** policy is configured as follows:

```
invoke:
  target-url: https://backend/GetPetInfo/${request.parameters.storeid}/${request.parameters.petid}
```

then the value of the **target-url** property is evaluated as **https://backend/GetPetInfo/z03/285**, and this is therefore the URL to which the **invoke** policy sends its request.

DataPower Gateway (v5 compatible) only

You can also use an inline reference in the **condition** property of a **switch** policy. Consider the following example:

```
- switch:
  case:
    - condition: "${request.headers.X-Environment}" == "production"
      execute:
        - invoke:
            http://www.finance.com/base/stockquote
    - condition: "${request.headers.X-Environment}" == "test"
      execute:
        - invoke:
            http://testserver1.finance.com/stockquote
```

Using the incoming request referred to previously, the value of the **X-Environment** header is **"test"**. The inline references are first evaluated, then the conditions are evaluated as JavaScript. Therefore, the first condition is evaluated as **"test" == "production"**, returning **false**, and the second condition is evaluated as **"test" == "test"**, returning **true**, so the **invoke** policy sends its request to **http://testserver1.finance.com/stockquote**.

Important: This example, which encloses the inline references inside double quotes, assumes that the API is deployed to the DataPower API Gateway. If you deploy the API to the DataPower Gateway (v5 compatible), then the double quotes are added implicitly when the inline references are evaluated, and you must therefore omit them from the **condition** property; the two conditions in this example would therefore be

```
condition: ${request.headers.X-Environment} == "production"
```

and

```
condition: ${request.headers.X-Environment} == "test"
```

However, as an alternative to using an inline reference in a `condition`, you can instead use pure JavaScript, as follows:

```
- switch:
  case:
    - condition: request.headers["X-Environment"] == "production"
      execute:
        - invoke:
            http://www.finance.com/base/stockquote
    - condition: request.headers["X-Environment"] == "test"
      execute:
        - invoke:
            http://testserver1.finance.com/stockquote
```

in which case the policy configuration will work correctly as-is in both types of gateway. For more information on the types of gateway, see [API Connect gateway types](#).

In addition to single strings, you can use an inline reference for a complete object. Consider the following example, which uses an inline reference in a `set-variable` policy:

```
- set-variable:
  actions:
    - set: saved.reqHdrs
      value: $(request.headers)
      type: string
```

Here, the `request.headers` structured JSON object is substituted with its corresponding string representation, and a variable named `reqHdrs` is therefore created, under the `saved` object, with a string value of `{"Content-Type": "application/json", "X-Environment": "test", ...}`. However, if you are using the DataPower API Gateway, you can specify `type: any`, in which case the `set-variable` policy copies the value as-is, and `saved.reqHdrs` is created as a JSON object rather than a string:

```
- set-variable:
  actions:
    - set: saved.reqHdrs
      value: $(request.headers)
      type: any
```

You can reference a property in a JSON or XML request directly by name, by using the following syntax:

```
$(request.body.property_name)
```

For example, if the request contains `{ "account-number": 123 }` or `<account-number>123</account-number>` you can retrieve the value `123` by using the following inline reference:

```
$(request.body.account-number)
```

If the property value is within a nested property structure, you can reference it by concatenating the property names. For example, if the request contains `{ "account": { "balance": 123 } }` or `<account><balance>123</balance></account>` you can retrieve the value `123` by using the following inline reference:

```
$(request.body.account.balance)
```

Similarly, you can reference a property in a JSON or XML response by using the following syntax:

```
$(message.body.property_name)
```

Restriction: If you are using the DataPower API Gateway, you can reference properties in this way only if the format of the request or response is JSON; the mechanism is **not** supported with XML request or response formats. If you are using the DataPower Gateway (v5 compatible) the mechanism is supported with both JSON and XML formats.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## API properties

Properties are used by the gateway to control behavior of certain policies. Typically, you provide properties, but the policy can also provide properties settings.

In IBM® API Connect, you can create API properties that consist of Catalog-specific values to eliminate the need for source code modifications. You can then reference the properties elsewhere in your API definition.

Pre-supplied API properties for various policies are shown in the tables.

A list of invoke related API properties that control the behavior of the invoke policy.

Table 1. Properties controlling the invoke policy

Property	Required	Description	Data type
<a href="#">x-ibm-gateway-decode-request-params</a>	No	If set to a value of <code>true</code> , any request parameters that are referenced by a variable definition on an invoke target-url are URL-decoded. The default behavior is to not decode any parameters, thereby sending them to the target URL without alteration.	Boolean

Property	Required	Description	Data type
<small>DataPower Gateway (v5 compatible only)</small> x-ibm-gateway- invoke- suppress- clientid	No	When set with a value of <b>true</b> , or not specified, the X-IBM-Client-Id HTTP header (if specified on the API request) is suppressed from being sent to the invoke target URL. When set with a value of <b>false</b> , the X-IBM-Client-Id HTTP header is no longer suppressed from being sent to the invoke target URL. This property is supported only by the DataPower® Gateway (v5 compatible). If you are using the DataPower API Gateway then to achieve the same functionality add a <b>header-control</b> property to the <b>invoke</b> policy configuration in the OpenAPI definition for your API, as in the following examples.  Suppress the <b>X-Client-ID</b> header as follows: <pre>- invoke:   target-url: http://myhostname/mypath   header-control:     type: blacklist     values:       - ^X-Client-ID\$</pre> Suppress the <b>userId</b> query parameter as follows: <pre>- invoke:   target-url: http://myhostname/mypath   parameter-control:     type: blacklist     values:       - ^userId\$</pre>	Boolean
<small>DataPower Gateway (v5 compatible only)</small> x-ibm-gateway- optimize-invoke	No	If set to <b>false</b> , prevents the replacement of the last invoke in a policy with proxy. Any value other than <b>false</b> (case insensitive) will result in the last invoke in a policy possibly being replaced by proxy when the API is executed in the gateway.	Boolean
<small>DataPower Gateway (v5 compatible only)</small> x-ibm-gateway- queryparam- encode-plus- char	No	If set to a value of <b>true</b> , all "+" characters in the query parameter values of the target-url of the Invoke and Proxy policies are encoded to "%2F". The default value is <b>false</b> .	Boolean
<small>DataPower Gateway (v5 compatible only)</small> x-ibm-gateway- api-enforce- response-limits	No	If set to a value of <b>true</b> , allows the JSON parser to be enforced on the response rule. If the response body size is higher than the JSON parser limit set in the DataPower domain, a status code of 500 is returned. Note: The x-ibm-gateway-api-enforce-response-limits property is supported by the DataPower Gateway (v5 compatible) but not by the DataPower API Gateway. However, if you are using the DataPower API Gateway, consider using a <a href="#">Parse</a> policy in your API assembly to enforce these limits. For information on the different types of gateway, see <a href="#">API Connect gateway types</a> .	Boolean
<small>DataPower Gateway (v5 compatible only)</small> x-ibm-gateway- invoke-emulate- v4-soap-error	No	IBM API Management Version 4.0 initiates a DataPower error when a SOAP fault is returned from a web service. IBM API Connect provides a mechanism to catch SOAP errors and does not initiate a DataPower error. For compatibility with APIs developed in IBM API Management Version 4.0, set this property to <b>true</b> only in the case where a gateway extension is expecting to handle a SOAP error in a post error rule. The default value is <b>false</b> .  Note: This property is deprecated in favor of x-ibm-gateway-invoke-emulate-v4-invoke-error.	Boolean
<small>DataPower Gateway (v5 compatible only)</small> x-ibm-gateway- invoke-keep- payload	No	If set to a value of <b>true</b> , the invoke policy sends a payload on an HTTP DELETE method. This property is available for use with IBM DataPower Gateway version 7.7.1.1 and later. The default value is <b>false</b> .	Boolean
<small>DataPower Gateway (v5 compatible only)</small> x-ibm-gateway- invoke-emulate- v4-invoke-error	No	IBM API Management Version 4.0 initiates a DataPower error when a backend server error is returned, either a SOAP fault returned from a web service or a JSON or XML (non-SOAP) error from a restful service. IBM API Connect provides a mechanism to catch SOAP errors and operation errors and does not initiate a DataPower error when they occur. If no catch policy is configured, a generic error message is generated. For compatibility with APIs developed in IBM API Management Version 4.0, set this property to <b>true</b> only in the case where a gateway extension is expecting to handle a backend server error in a gateway extension post error rule or if the client of the API is expecting the backend server error to be returned. The default value is <b>false</b> .	Boolean

A list of map-related API properties that control the behavior of the map policy.

Table 2. Properties controlling the map policy

Property	Required	Description	Data type
<small>DataPower Gateway (v5 compatible only)</small> x-ibm-gateway- map-array-first- element-value	No	In IBM API Management Version 4.0, if a mapping source value is from an array then only the first value is output. In API Connect, the default behavior is to return an array of all array element values. To maintain compatibility with IBM API Management Version 4.0, set this API property to <b>true</b> to only return the first array element value.	Boolean
<small>DataPower Gateway (v5 compatible only)</small> x-ibm-gateway- map-resolve- apic-variables	No	By default, any API Connect variable that is found in the map configuration is resolved. For example, <b>\$(request.headers.content-type)</b> resolves to the request's content type header. Because searching for variables in every map property can be CPU intensive, you can choose not to resolve variables by setting this API property to <b>false</b> . If this property is not configured or is set to any other value, the existing behavior to search for these variables continues. Note that variable usage within a map value JavaScript snippet is not changed provided that the variables that are referenced come from a configured map input.	Boolean
<small>DataPower Gateway (v5 compatible only)</small> x-ibm-gateway- map-create- empty-array	No	This property controls how the map policy handles the output of an empty array; it can have the following values: <ul style="list-style-type: none"> <li><b>all</b>: Output all empty arrays, including empty children arrays. This is the default value if the property is not configured or has an invalid value.</li> <li><b>parent</b>: Output only the current property's empty array value. Children map actions of this property are not attempted.</li> <li><b>none</b>: Prevent any empty output array values from being produced.</li> </ul>	String

Property	Required	Description	Data type
<small>DataPower Gateway (S compat) only</small> x-ibm-gateway-optimize-schema-definition	No	Set the value of this property to <b>true</b> to provide a performance improvement to the map policy when a very complex schema definition is referenced by a policy output definition; for example, some very complex schemas that are generated by importing a very complex WSDL schema. The map policy builds a schema from an API definition when a referenced definition is provided as the value of the schema. If the schema does not have references that generate a circular reference, setting this property to <b>true</b> might provide a performance benefit while generating the same schema as would otherwise have been generated. However, in cases where the schema is very complex, with many potentially circular references, the generated schema could be different because the enhanced schema handling processes circular references differently. In such cases therefore, you should examine the resulting output to determine if the performance benefit gained is not at the expense of a change in the map policy output.  The default value of this property, is <b>false</b> , maintaining the existing behavior and performance.	Boolean
<small>DataPower Gateway (S compat) only</small> x-ibm-gateway-map-null-value	No	Set the value of this API property to <b>true</b> to allow a property from a map policy's input data with a value of <b>null</b> to be mapped to the output document. By default, a property from a map policy's input data with a value of <b>null</b> is not mapped to the output document.	Boolean
<small>DataPower Gateway (S compat) only</small> x-ibm-gateway-map-resolve-xmlinput-datatypes	No	XML input elements with numeric or boolean data have no metadata to indicate whether this data should be mapped as a string value or as the specific data type. If you set the value of this property to <b>false</b> , XML input elements are always mapped as a string. If you set the value to <b>true</b> , numeric or boolean XML input elements are mapped as the corresponding data type from the input schema. The default value is <b>false</b> .	Boolean
<small>DataPower Gateway (S compat) only</small> x-ibm-gateway-map-xml-empty-element	No	This property controls how the map policy handles XML input empty elements and impacts JSON output when the input document is XML; it can have the following values: <ul style="list-style-type: none"> <li><b>string</b>: The value for an empty XML element is considered to be an empty string. This is the default value if the property is not configured or has an invalid value.</li> <li><b>null</b>: The value for an empty XML element is considered to be null. A mapping of this element to a JSON output property does not occur unless the API property x-ibm-gateway-map-null-value is also specified with a value of <b>true</b>.</li> <li><b>none</b>: The empty XML element is ignored.</li> <li><b>string-badgerfish</b>: The value for an empty XML element is considered to be an empty string. The empty string value will be placed into a JSON badgerfish value property.</li> <li><b>null-badgerfish</b>: The value for an empty XML element is considered to be null. The null value will be placed into a JSON badgerfish value property. A mapping of this element to a JSON output property does not occur unless the API property x-ibm-gateway-map-null-value is also specified with a value of <b>true</b>.</li> </ul>	Boolean
<small>DataPower Gateway (S compat) only</small> x-ibm-gateway-schema-definition-reference-limit	No	Set the value of this property to an integer value that specifies the maximum allowed number of iterations of a circular schema definition. The default value is 1, which means that circular schema definitions are not followed. The maximum possible value is 5. If you specify a value greater than 5, a value of 5 is assumed. If you specify a non-numeric value, a value of 1 is assumed.	String

Property	Required	Description	Data type
<small>DataPower Gateway (v5 compatible) only</small> x-ibm-gateway-map-emulate-v4-default-required-properties	No	<p>Set this property to true to have default values generated in the output for required properties that are either not mapped, or for which there is no input data present, in the following specific cases:</p> <ul style="list-style-type: none"> <li>An array consists of objects that contain one or more required properties.</li> <li>An object which is optional has one or more child properties that are required.</li> </ul> <p>By default, these required properties are not present in the output. If you set the <code>x-ibm-gateway-map-emulate-v4-default-required-properties</code> API property to <code>true</code>, these required properties will be present in the output. If the output schema defines a <code>default</code> property for the output property then the specified default value is used, otherwise a default value is assigned dependent on the data type, as follows:</p> <ul style="list-style-type: none"> <li>String: empty string ("")</li> <li>Number: 0</li> <li>Boolean: false</li> <li>Object: empty object</li> <li>Array: empty array</li> </ul> <p>Example 1 The input data has the following array of objects:</p> <pre>[{"a": "value1"}, {"a": "value2", "b": "value3"}]</pre> <p>The output schema defines the output object as having two properties, <code>a</code> and <code>b</code>, of which <code>b</code> is required. The map policy defines the following mappings:</p> <ul style="list-style-type: none"> <li><code>input.array.a</code> to <code>output.array.a</code></li> <li><code>input.array.b</code> to <code>output.array.b</code></li> </ul> <p>If the <code>x-ibm-gateway-map-emulate-v4-default-required-properties</code> API property is set to <code>true</code>, and <code>b</code> is either not mapped or has no input data present, then <code>b</code> is assigned a default value of an empty string, and the output is as follows:</p> <pre>[{"a": "value1", "b": ""}, {"a": "value2", "b": "value3"}]</pre> <p>Example 2 The output schema defines the following structure:</p> <pre>{"a" : {"b" : {"c" : "value1", "d" : "value2"} } }</pre> <p>Property <code>b</code> is optional but property <code>d</code> within <code>b</code> is required.</p> <p>The map policy defines a mapping to <code>output.a.b.c</code>.</p> <p>If the <code>x-ibm-gateway-map-emulate-v4-default-required-properties</code> API property is set to <code>true</code>, and <code>d</code> is not mapped, then <code>d</code> is assigned a default value of an empty string, and the output is as follows:</p> <pre>{"a" : {"b" : {"c" : "value1", "d" : ""} } }</pre> <p>If the <code>x-ibm-gateway-map-emulate-v4-default-required-properties</code> API property is not specified or does not have a value of <code>true</code>, these required properties are <b>not</b> created in the output with their default values.</p>	Boolean
<small>DataPower Gateway (v5 compatible) only</small> ibm-gateway-map-post-process-json-output	No	<p>Set the value of this property to <code>true</code> to enable post processing of mapped JSON output. The post processing of JSON output will use the output schema to ensure that property values are of the same data type as that defined in the schema. It will also normalize output property values that have a Badgerfish JSON syntax due to object mapping of an XML input. Set the value to <code>false</code> for no post processing of mapped JSON output. The default value is <code>false</code>.</p>	Boolean
<small>DataPower Gateway (v5 compatible) only</small> x-ibm-gateway-map-emulate-v4-empty-json-object	No	<p>If a mapping fails because its input is not present and there is no default mapping configured, the default behavior is to not to make any change to the output mapping. Set the value of this property to <code>true</code> to create an empty object for the parent of the target mapping, emulating the behavior of IBM API Management Version 4.0.</p> <p>Example The map policy defines a mapping to <code>output.a.b.c</code>. If input data is present, the output is as follows:</p> <pre>{   "a": {     "b": {       "c": "inputvalue"     }   } }</pre> <p>If there is no input data, and the <code>x-ibm-gateway-map-emulate-v4-empty-json-object</code> API property is set to <code>true</code>, the output is as follows:</p> <pre>{   "a": {     "b": {     }   } }</pre> <p>Properties <code>a</code> and <code>b</code> are created but the value of <code>b</code> is an empty object. The default value is <code>false</code>.</p>	Boolean

DataPower Gateway (v5 compatible) only

A list of proxy-related API properties that control the behavior of the proxy policy.

Table 3. Properties controlling the proxy policy

Property	Required	Description	Data type
x-ibm-gateway-proxy-suppress-clientid	No	<p>A setting of <code>false</code> activates the injection of the X-IBM-Client-Id HTTP header (if it is specified on the API request), or the <code>client_id</code> query parameter in the request URL, to the proxy target-url. If not specified, or set with a value of <code>true</code>, suppresses the sending of this parameter to the proxy target-url.</p> <p>This property is supported only by the DataPower Gateway (v5 compatible). If you are using the DataPower API Gateway then to achieve the same functionality add a <code>header-control</code> property to the <code>invoke</code> policy configuration in the OpenAPI definition for your API, as in the following examples.</p> <p>Suppress the <code>X-Client-ID</code> header as follows:</p> <pre>- proxy:   target-url: http://myhostname/mypath   header-control:     type: blacklist     values:       - ^X-Client-ID\$</pre> <p>Suppress the <code>userId</code> query parameter as follows:</p> <pre>- proxy:   target-url: http://myhostname/mypath   parameter-control:     type: blacklist     values:       - ^userId\$</pre>	Boolean
x-ibm-gateway-optimize-invoke	No	If set to <code>false</code> , prevents the replacement of the last invoke in a policy with proxy. Any value other than <code>false</code> (case insensitive) will result in the last invoke in a policy possibly being replaced by proxy when the API is executed in the gateway.	Boolean
x-ibm-gateway-queryparam-encode-plus-char	No	If set to a value of <code>true</code> , all "+" characters in the query parameter values of the target-url of Invoke and Proxy policies are encoded to "%2F". The default value is <code>false</code> .	Boolean
x-ibm-gateway-api-enforce-response-limits	No	If set to a value of <code>true</code> , allows the JSON parser to be enforced on the response rule. If the response body size is higher than the JSON parser limit set in the DataPower domain, a status code of 500 is returned.	Boolean

A list of API properties that control the behavior of the rate limit policy.

Table 4. Properties controlling the rate limit policy

Property	Required	Description	Data type
x-ibm-gateway-emulate-v4-plan-rate-limit	No	By default in IBM API Connect Version 10, if you configure a rate limit only for a Plan and not for the API operations within the Plan then a single rate limit threshold is set for the API as a whole, regardless of which operation in the API is requested. This behavior differs from IBM API Management Version 4.0 where the rate limit is set <b>individually</b> for <b>each</b> operation in the API. To change the Version 10 behavior to emulate the Version 4.0 behavior, set this API property to a value of <code>true</code> .	Boolean

A list of API properties that control the behavior of multiple policies.

Table 5. Properties controlling multiple policies

Property	Required	Description	Data type
<small>DataPower Gateway (v5 compatible) only</small> x-ibm-gateway-sourcecode-resolve-apic-variables	No	<p>If set to <code>true</code>, API Connect variable references are resolved. Set to <code>false</code> if you want the policy to ignore API Connect variable references.</p> <p>The default value is <code>true</code>.</p> <p>This property applies to the following policies:</p> <ul style="list-style-type: none"> <li>Map</li> <li>GatewayScript</li> <li>XSLT</li> <li>if</li> <li>switch</li> </ul> <p>Note: This property setting is overridden by the x-ibm-gateway-map-resolve-apic-variables API property setting for the Map policy.</p>	Boolean
<small>DataPower Gateway (v5 compatible) only</small> x-ibm-gateway-api-json-parse-error-handling	No	If an API request or response payload includes valid JSON content that contains characters that cannot be represented in the JSON XML internal syntax that is used by the DataPower Gateway, set this property to <code>escape-unicode</code> to allow the payload to be accepted without parsing errors. If this property is not configured or is set to any other value, the payload is rejected as invalid JSON. This property applies to the API request payload, and to the API response payload when <code>x-ibm-gateway-api-enforce-response-limits</code> is enabled.	String
<small>DataPower Gateway (v5 compatible) only</small> x-ibm-gateway-framework-preserve-escaped-reverse-solidus	No	By default, the string <code>\\</code> in a policy property is converted to a single <code>\</code> character. Set this property to <code>true</code> to preserve the string <code>\\</code> .	Boolean

Property	Required	Description	Data type
<small>DataPower Gateway (v5 compatible) only</small> x-ibm-gateway-inspect-request-headers	No	<p>Causes an inspection of the HTTP headers in the API request to check for characters in the header values that are illegal XML characters; it can have the following values:</p> <ul style="list-style-type: none"> <li><b>default:</b> There is no inspection for these characters in the header values. If one is present, the API request fails with an HTTP 500 Internal Server Error.</li> <li><b>sanitize:</b> Any illegal XML characters in header values are replaced with a ? character. The API processing will continue. Any API that attempts to read <code>request.headers.&lt;headername&gt;</code> will see the ? character in the value. However, the original protocol headers representing <code>message.headers</code> will still have the original character, which will be sent to an invoke or proxy backend server.</li> <li><b>bad-request:</b> There will be an inspection for these characters in the header values. If one is present, the API request fails with an HTTP 400 Bad Request.</li> </ul> <p>The default value is <b>default</b>.</p>	Boolean

A list of API properties that control the behavior of custom policies.

Table 6. Properties controlling custom policies

Property	Required	Description	Data type
<small>DataPower Gateway (v5 compatible) only</small> x-ibm-gateway-custom-policy-with-gws-action	No	<p>If set to <b>true</b>, the <code>request.body</code> and <code>message.body</code> context variables will be populated for access by an <code>apim.getvariable('request.body')</code> or <code>apim.getvariable('message.body')</code> function call in a GatewayScript action of a custom policy. If the custom policy does not use a GatewayScript action that requires these variables to be populated, set this property to <b>false</b> or do not specify it.</p> <p>The default value is <b>false</b>.</p>	Boolean

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## API policies and logic constructs

Policies and logic constructs are pieces of configuration that control a specific aspect of processing in the Gateway server during the handling of an API invocation at run time.

Policies are the building blocks of assembly flows, and they provide the means to configure capability, such as security, logging, routing of requests to target services, and transformation of data from one format to another. Policies can be configured in the context of an API or in the context of a Plan.

Logic constructs behave in a similar way to policies, but they affect how and which parts of the assembly are implemented without modifying the data flow of the assembly.

IBM® API Connect provides the following ways that you can create, configure, and apply policies and logic constructs:

### Policies associated with a Plan

A Plan provides a mechanism for grouping API operations or subsets of operations from one or more APIs. You can set rate limiting policies on a Plan to specify how many requests an application is allowed to make during a specified time interval. You can also configure a policy for each operation that is included in a Plan. For more information, see [Working with Products](#).

### Built-in policies

A built-in policy enables you to apply a pre-configured policy statement to an assembly to control processing capabilities in the Gateway server. Built-in policies are applied by using the API Manager assembly editor to add a built-in policy to your assembly and to configure the properties for that policy. For more information, see [Built-in policies](#).

Note: You can also apply built-in policies to your APIs by adding an **assembly** extension to your OpenAPI definition file. For more information, see [IBM extensions to the OpenAPI specification](#).

### Logic constructs

A logic construct enables you to control the flow of data through your assembly during an API call. Like policies, logic constructs are applied to an API by using the API Manager assembly editor to add a logic construct to your assembly and to configure the behavior of the construct. For more information, see [Logic Constructs](#).

Note: You can also apply logic constructs to your APIs by adding an **assembly** extension to your OpenAPI definition file. For more information, see [IBM extensions to the OpenAPI specification](#).

### User-defined policies

A user-defined policy enables you to create your own policies to control extra processing features in the Gateway server, such as security, or routing of requests.

User-defined policies are created outside of API Connect and then imported into one or more Catalogs, so they can be applied to an operation in the same way as built-in policies. For more information, see [Authoring policies](#).

- [Built-in policies](#)

IBM API Connect includes a number of built-in policies that you can use to apply preconfigured policy statements to an operation to control an aspect of processing in the Gateway server when an API is invoked.

- [Logic Constructs](#)

IBM API Connect includes a number of logic constructs that you can use to apply preconfigured logic to an assembly to control the flow of data through your assembly when the API is called.

- [Using context variables in GatewayScript and XSLT policies with the DataPower API Gateway](#)

In the code for GatewayScript and XSLT policies in your API assemblies, you can use API context variables to work with the messages that are generated when an API is called.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Built-in policies

IBM® API Connect includes a number of built-in policies that you can use to apply preconfigured policy statements to an operation to control an aspect of processing in the Gateway server when an API is invoked.

Note: Although some built-in policies can be used with both the DataPower® Gateway (v5 compatible) and the DataPower API Gateway, some policies are restricted to a particular Gateway. The following icons indicate which Gateway each policy can be used with:

-  Indicates that the policy can be run on the DataPower Gateway (v5 compatible).
-  Indicates that the policy can be run on the DataPower API Gateway.

For details of the two types of gateway, see [API Connect gateway types](#).

Built-in policies are configured in the context of an API. You can use the API Manager assembly editor to add a built-in policy to an API and to configure the properties for that policy.

You can also add built-in policies to an API by creating an OpenAPI definition file. For more information, see [Creating an OpenAPI definition file](#).

The following table shows the list of built-in policies that are available. The table contains links to configuration information for both the built-in policy definitions, and the OpenAPI policy definitions. The policies are the same, but they are created in different ways.

Table 1. Built-in policies

Built-in policy	OpenAPI policy	Description		
<a href="#">Activity Log</a>	<a href="#">activity-log</a>	Use the Activity Log policy to configure your logging preferences for the API activity that is stored in IBM API Connect analytics. The preferences that you specify will override the default settings for collecting and storing details of the API activity. Note: The Activity Log policy is not supported in the assembly for an API whose gateway type is DataPower API Gateway. Instead, you configure activity logging in the API design settings. For details, see <a href="#">Configuring activity logging</a> (OpenAPI 2.0) or <a href="#">Configuring activity logging</a> (OpenAPI 3.0).	✓	✓ Functionality provided in the API design; see <a href="#">Configuring activity logging</a> (OpenAPI 2.0) or <a href="#">Configuring activity logging</a> (OpenAPI 3.0)
<a href="#">Client Security</a>	<a href="#">client-security</a>	Provides a range of options for authenticating client access to your APIs, extending the capabilities of the OpenAPI specification.	✗	✓
<a href="#">GatewayScript</a>	<a href="#">gatewayscript</a>	Use the gatewayscript policy to execute a specified DataPower GatewayScript program.	✓	✓
<a href="#">Generate JWT</a>	<a href="#">jwt-generate</a>	Use the Generate JWT security policy in IBM API Connect to generate a JSON Web Token (JWT).	✓	✓
<a href="#">Validate JWT</a>	<a href="#">jwt-validate</a>	Use the Validate JWT security policy to enable the validation of a JSON Web Token (JWT) in a request before allowing access to the APIs.	✓	✓
<a href="#">if</a>	<a href="#">if</a>	Use the if policy to apply a section of the assembly when a condition is fulfilled.	✓	✓ Functionality provided by <a href="#">switch</a>
<a href="#">GraphQL introspect</a>	<a href="#">graphql-introspect</a>	Use the GraphQL introspect policy to introspect a GraphQL schema.	✗	✓
<a href="#">Invoke</a>	<a href="#">invoke</a>	Apply the Invoke policy to call another service from within your assembly. The response from the backend is stored either in the variable <code>message.body</code> or in the response object variable if it is defined. The policy can be used with JSON or XML data, and can be applied multiple times within your assembly.	✓	✓
<a href="#">JSON to XML</a>	<a href="#">json-to-xml</a>	Use the JSON to XML policy to convert the context payload of your API from the JavaScript Object Notation (JSON) format to the extensible markup language (XML) format.	✓	✓
<a href="#">Log</a>	<a href="#">log</a>	Use the Log policy to customize or override the default activity logging configuration for an API.	✗	✓
<a href="#">Map</a>	<a href="#">map</a>	Use the Map policy to apply transformations to your assembly flow and specify relationships between variables.	✓	✓
<a href="#">operation-switch</a>	<a href="#">operation-switch</a>	Use the operation-switch policy to apply a section of the assembly to a specific operation.	✓	✓
<a href="#">OAuth</a>	<a href="#">oauth</a>	Use the OAuth policy to policy to perform OAuth processing based on defined OAuth provider settings.	✗	✓
<a href="#">Parse</a>	<a href="#">parse</a>	Use the Parse policy to control the parsing of an input document. When the input document is a JSON string, the string is parsed instead of copied over.	✗	✓
<a href="#">Proxy</a>	<a href="#">proxy</a>	Apply the Proxy policy to invoke another API within your assembly, particularly if the separate API contains a large payload. The response from the backend is stored in the <code>message.body</code> and in the response object variable if it is defined. Only one policy is permitted to be run per unique assembly flow.	✓	✓ Functionality provided by <a href="#">Invoke</a>
<a href="#">Rate Limit</a>	<a href="#">ratelimit</a>	Use the Rate Limit policy to apply one or more rate or burst limits at any point in your API assembly flow. Rate and burst limits restrict the number of calls that an application can make to an API in a specified time period.	✗	✓

Built-in policy	OpenAPI policy	Description	DataPower Gateway	API Gateway
Redaction <a href="#">Redaction - DataPower API Gateway</a> <a href="#">Redaction - DataPower Gateway (v5 compatible)</a>	<a href="#">redact - DataPower API Gateway</a> <a href="#">redact - DataPower Gateway (v5 compatible)</a>	Use the Redaction policy to completely remove or to redact specified fields from the Request body, the Response body, and the activity logs. You might find this policy useful for removing or blocking out sensitive data (for example, credit card details) for legal, security, or other reasons.	✓	✓
<a href="#">Set Variable</a>	<a href="#">set-variable</a>	Use the Set Variable policy to set the value of a runtime variable, or to clear a runtime variable, or to add a header variable.	✓	✓
<a href="#">switch</a>	<a href="#">switch</a>	Use the switch policy to execute one of a number of sections of the assembly based on which specified condition is fulfilled.	✓	✓
<a href="#">throw</a>	<a href="#">throw</a>	Use the throw policy to throw an error when it is reached during the execution of an assembly flow.	✓	✓
<a href="#">User Security</a>	<a href="#">user-security</a>	Use the user-security policy to extract a user's credentials, authenticate those credentials, and obtain authorization from the user.	✗	✓
Validate <a href="#">Validate - DataPower API Gateway</a> <a href="#">Validate - DataPower Gateway (v5 compatible)</a>	<a href="#">validate - DataPower API Gateway</a> <a href="#">validate - DataPower Gateway (v5 compatible)</a>	Use the Validate policy to validate the payload in an assembly flow against a JSON or an XML schema.	✓	✓
<a href="#">Validate Username Token</a>	<a href="#">validate-username-token</a>	Use the Validate Username Token policy to validate a Web Services Security (WS-Security) UsernameToken in a SOAP payload before allowing access to the protected resource.	✓	✗
<a href="#">XML to JSON</a>	<a href="#">xml-to-json</a>	Use the XML to JSON policy to convert the context payload of your API from the extensible markup language (XML) format to JavaScript Object Notation (JSON).	✓	✓
<a href="#">XSLT</a>	<a href="#">xslt</a>	Use the XSLT policy to apply an XSLT transform to the payload of the API definition.	✓	✓

- **Activity Log**  
Use the Activity Log policy to configure your logging preferences for the API activity that is stored in IBM API Connect analytics. The preferences that you specify will override the default settings for collecting and storing details of the API activity.
- **Client Security**  
The Client Security policy can be used to extend client authentication access for your APIs.
- **GatewayScript**  
Use the `gatewayscript` policy to execute a specified DataPower GatewayScript program.
- **Generate JWT**  
Use the Generate JWT security policy in IBM API Connect to generate a JSON Web Token (JWT).
- **Validate JWT**  
Use the Validate JWT security policy to enable the validation of a JSON Web Token (JWT) in a request before allowing access to the APIs.
- **GraphQL introspect**  
Use the GraphQL introspect policy to introspect a GraphQL schema.
- **Invoke**  
Apply the Invoke policy to call another service from within your assembly. The response from the backend is stored either in the variable `message.body` or in the response object variable if it is defined. The policy can be used with JSON or XML data, and can be applied multiple times within your assembly.
- **JSON to XML**  
Use the JSON to XML policy to convert the context payload of your API from the JavaScript Object Notation (JSON) format to the extensible markup language (XML) format.
- **Log**  
Use the Log policy to customize or override the default activity logging configuration for an API.
- **Map**  
Use the Map policy to apply transformations to your assembly flow and specify relationships between variables.
- **OAuth**  
An OAuth policy performs the requested OAuth processing based on the defined OAuth provider settings.
- **Parse**  
Use the Parse policy to control the parsing of an input document. When the input document is a JSON string, the string is parsed instead of copied over.
- **Proxy**  
Apply the Proxy policy to invoke another API within your assembly, particularly if the separate API contains a large payload. The response from the backend is stored in the `message.body` and in the response object variable if it is defined. Only one policy is permitted to be run per unique assembly flow.
- **Rate Limit**  
Use the Rate Limit policy to apply one or more rate, burst, or count limits at any point in your API assembly flow. Rate and burst limits restrict the number of calls made to an API in a specified time period, while count limits impose a strict limit on the total number of calls.
- **Redaction - DataPower API Gateway**  
Use the Redaction policy to completely remove or to redact specified fields from the Request body, the Response body, and the activity logs. You might find this policy useful for removing or blocking out sensitive data (for example, credit card details) for legal, security, or other reasons.
- **Redaction - DataPower Gateway (v5 compatible)**  
Use the Redaction policy to completely remove or to redact specified fields from the Request body, the Response body, and the activity logs. You might find this policy useful for removing or blocking out sensitive data (for example, credit card details) for legal, security, or other reasons.
- **Set Variable**  
Use the Set Variable policy to set the value of a runtime variable, or to clear a runtime variable, or to add a header variable.
- **User Security**  
Use the User Security policy to extract a user's credentials, authenticate those credentials, and obtain authorization from the user.

- [Validate - DataPower API Gateway](#)  
Use the Validate policy to validate the payload in an assembly flow against a schema.
- [Validate - DataPower Gateway \(v5 compatible\)](#)  
Use the Validate policy to validate the payload in an assembly flow against a JSON or an XML schema.
- [Validate Username Token](#)  
Use the Validate Username Token policy to validate a Web Services Security (WS-Security) UsernameToken in a SOAP payload before allowing access to the protected resource.
- [Websocket Upgrade](#)  
Use the Websocket Upgrade policy to process API requests and responses through a WebSocket connection.
- [XML to JSON](#)  
Use the XML to JSON policy to convert the context payload of your API from the extensible markup language (XML) format to JavaScript Object Notation (JSON).
- [XSLT](#)  
Use the XSLT policy to apply an XSLT transform to the payload of the API definition.

- [Including elements in your API assembly](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Activity Log

Use the Activity Log policy to configure your logging preferences for the API activity that is stored in IBM® API Connect analytics. The preferences that you specify will override the default settings for collecting and storing details of the API activity.

## Gateway support

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® Gateway (v5 compatible)	1.0.0

This topic describes how to configure the policy in the assembly user interface; for details on how to configure the policy in your OpenAPI source, see [activity-log](#).

Note that if you are using the DataPower API Gateway, you can configure your logging preferences by using the API design editor. For more information, see [Configuring activity logging](#) (OpenAPI 2.0) or [Configuring activity logging](#) (OpenAPI 3.0).

## About

An API event record exists for each API execution event in the Gateway server. By default, the content type that is collected and stored in API event records is **activity** for when API execution completes successfully, and **payload** for when API execution completes with an error code. Apply the Activity Log policy to your assembly to change the type of content to log in these API event records. For more information about API event records, see [API event record fields](#).

Note:

Activity log policies that call for logging of Analytics data upon success do not apply for the OAuth provider. The OAuth provider logs Analytics data for failure cases, but does not log successful cases.

## Properties

The following table lists the policy properties, indicates whether a property is required, specifies the valid and default values for input, and specifies the data type of the values.

Table 2. Activity Log policy properties

Property label	Required	Description	Data type
Title	Yes	A title for the policy is required, but a default value, <b>activity-log</b> is provided.	string
Description	No	A description of the policy.	string
Content	Yes	Defines the type of content to be logged when the operation is successful. Valid values: <ul style="list-style-type: none"> <li>• <b>none</b>: Indicates that no logging occurs. Restriction: This option disables notifications for application developers who use your Developer Portal.</li> <li>• <b>activity</b>: Logs invocation only (only the resource URI is recorded).</li> <li>• <b>header</b>: Logs activity and header.</li> <li>• <b>payload</b>: Logs activity, header, and payload (the original request, if any, and the final response).</li> </ul> The default value is <b>activity</b> .	string

Property label	Required	Description	Data type
Error content	No	<p>Indicates what content to log if an error occurs.</p> <p>Valid values:</p> <ul style="list-style-type: none"> <li><b>none</b>: Indicates that no logging occurs. Restriction: This option disables notifications for application developers who use your Developer Portal.</li> <li><b>activity</b>: Logs invocation only (only the resource URI is recorded).</li> <li><b>header</b>: Logs activity and header.</li> <li><b>payload</b>: Logs activity, header, and payload (the original request, if any, and the final response).</li> </ul> <p>The default value is <b>payload</b>.</p>	string

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Client Security

The Client Security policy can be used to extend client authentication access for your APIs.

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® API Gateway	2.0.0

This topic describes how to configure the policy in the assembly user interface; for details on how to configure the policy in your OpenAPI source, see [client-security](#).

## About

You use the Client Security policy to create an assembly action that's separate from the OpenAPI specification, to allow for more options to authenticate an application. Note that you cannot use the client-security policy to perform rate-limiting enforcement.

In a client security action, you define the following settings.

- Control whether to stop processing if client security fails. When client security fails, stops assembly processing and returns an error.
- Control whether to require the client secret. When required, the secret is compared to the registered secret on the application that is identified by the client ID.
- Define the method to extract client credentials from the request.
  - For all methods except HTTP, use the ID Name and the Secret Name properties to specify the location that contains the ID and the location that contains the secret.
    - When Cookie, specify which cookie.
    - When Context Variable, specify which runtime context variable.
    - When Form, specify the form data.
    - When Header, specify which header.
    - When Query, specify which query parameter.
  - For the HTTP method, use the HTTP Type property to specify the format of the authorization header, which expects the Basic form in the **basic base64\_id:secret** format.
- Define the method to authenticate the extracted client credentials. The supported methods are Native (this means by using IBM® API Connect), or by using a specified Third party user registry.
  - If Third party, use the User Registry Name property to specify the user-registry to authenticate the extracted client credentials. The supported registry types are LDAP and authentication URL.

## Properties

The following table lists the policy properties, indicates whether a property is required, specifies the valid and default values for input, and specifies the data type of the values.

Table 2. Client Security policy properties

Property label	Required	Description	Data type
Title	No	The title of the policy. The default value is <b>client-security</b> .	string
Description	No	A description of the policy.	string
Stop on Error	Yes	If this setting is enabled, assembly processing stops if client security fails, and an error is returned. The check box is selected by default.	boolean

Property label	Required	Description	Data type
Secret Required	Yes	If this setting is enabled, the client secret must be sent in the request. The secret is compared to the registered secret on the application that is identified by the client ID. The check box is selected by default.	boolean
Credential Extraction Method	Yes	Select one of the following options to define how the calling application authenticates: <ul style="list-style-type: none"> <li>Header: client ID and client secret credentials must be supplied in the request header.</li> <li>Query: client ID and client secret credentials must be supplied as query parameters in the request URL.</li> <li>Form: client ID and client secret credentials must be supplied as form data sent in a POST request.</li> <li>Cookie: client ID and client secret credentials must be supplied in a header called <b>Cookie</b>.</li> <li>HTTP: the calling application must authenticate by using basic authentication.</li> <li>Context Variable: the credentials that are used for authenticating the client are obtained from context variables that you set in the assembly flow prior to the Client Security policy, by using a <a href="#">GatewayScript</a> policy for example. The names of these context variables are determined by the values that you supply in the ID Name and Secret Name properties of the Client Security policy.</li> </ul> <p>The default value is Header.</p>	string
ID Name	Yes, unless the selected value of Credential Extraction Method is HTTP	The name of the parameter whose value specifies the client ID. For all Credential Extraction Method options other than Context Variable and HTTP, the calling application must supply a parameter with this name, in the location defined by the Credential Extraction Method option. For the Context Variable option, this property specifies the name of a context variable. This property does not apply if the Credential Extraction Method is HTTP.	string
Secret Name	Yes, if Secret Required is enabled and the selected value of Credential Extraction Method is other than HTTP	The name of the parameter whose value specifies the client secret. For all Credential Extraction Method options other than Context Variable and HTTP, the calling application must supply a parameter with this name, in the location defined by the Credential Extraction Method option. For the Context Variable option, this property specifies the name of a context variable. This property does not apply if the Credential Extraction Method is HTTP.	string
HTTP Type	Yes, if the selected value of Credential Extraction Method is HTTP	The authentication type. Currently, the only available option is Basic.	
Authenticate Client Method	Yes	Select one of the following options: <ul style="list-style-type: none"> <li>Native: only client ID and client secret are used to authenticate the client. If the selected value of Credential Extraction Method is HTTP then the calling application must supply the client ID for the user name, and the client secret for the password.</li> <li>Third party: a user registry is used to authenticate the client. If the selected value of Credential Extraction Method is other than HTTP then the calling application must supply the user name for the client ID, and the password for the client secret.</li> </ul> <p>The default value is Native.</p>	string
User Registry Name	Yes, if the selected value of Authenticate Client Method is Third party	Select the user registry that will be used to authenticate the client. The supported registry types are LDAP and authentication URL.	string

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## GatewayScript

Use the `gatewayscript` policy to execute a specified DataPower® GatewayScript program.

## Gateway support

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower Gateway (v5 compatible)	1.0.0
DataPower API Gateway	2.0.0

This topic describes how to configure the policy in the assembly user interface; for details on how to configure the policy in your OpenAPI source, see [gatewayscript](#).

## About

The `gatewayscript` policy gives you built-in access to the DataPower Gateway module via variable `apim`.

## Properties

The following table lists the policy properties, indicates whether a property is required, specifies the valid and default values for input, and specifies the data type of the values.

Table 2. gatewayscript policy properties

Property label	Required	Description	Data type
Title	No	The title of the policy. The default value is <code>gatewayscript</code> .	string
Description	No	A description of the policy.	string
Source	Yes	The GatewayScript source code to execute. For example: <pre>var message = [ 'Hello', 'World!' ]; console.debug(message.join(' '));</pre>	string

## Examples

The following examples show how the full OpenAPI for the policy looks in the source code.

Example one:

```
gatewayscript:
  title: writes message to DataPower log
  source: console.debug('Hello World!');
```

Example two:

```
gatewayscript:
  title: script written in multiple lines
  source: |
    var message = [ 'Hello', 'World!' ];
    console.debug(message.join(' '));
```

For more code examples, see [GatewayScript code examples](#) and, if you are using the DataPower API Gateway, [Using context variables in GatewayScript and XSLT policies with the DataPower API Gateway](#).

For general information on using GatewayScript, see the following topics in the DataPower product documentation:

- [GatewayScript APIs for API management](#)
- [Accessing and manipulating a variable in the API context](#)
- [OAuth context variables](#)

## Errors

The following error can be thrown while the policy is being executed:

- **JavaScriptError** - a generic error that captures all errors that occur during the execution of the policy.
- [GatewayScript code examples](#)  
Example GatewayScript code snippets to help the creation of a gatewayscript policy.

## Related tasks

- [Creating a new REST OpenAPI definition](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## GatewayScript code examples

Example GatewayScript code snippets to help the creation of a gatewayscript policy.

Attention:

- The mechanisms described here for interacting with the API Connect context are intended for v5-compatible gateways and also to provide v5 compatibility for APIs created for the API Gateway. However, if you are writing a GatewayScript policy or user-defined policy for a new API Gateway API, use the mechanisms described in [Using context variables in GatewayScript and XSLT policies with the DataPower API Gateway](#) for better performance and long-term support. For API Gateway APIs, the v5-compatibility functions listed here are to be used for v5 migration only.
- The GatewayScript functions that are listed here use the common name `apim` to call the methods. However, you can change the common name to one of your choice by using one or other of the following function calls depending on your gateway type:

```
DataPower Gateway (v5 compatible) var name = require('local:///isp/policy/apim.custom.js'); // v5-Compatible Gateway
API Gateway var name = require('apim'); // DataPower API Gateway
```

where `name` is your chosen name; for example:

```
var apim = require('apim');
```

## Access the assembly context

The following code snippets show examples of how to access the assembly context.

Example one returns the `request` context:

```
apim.getvariable('request');
```

Example two returns the header named `myheader`:

```
apim.getvariable('request.headers.myheader');
```

Example three shows how to set, add, or clear a context variable, in this case a message header:

```
apim.setvariable('message.headers.name', value, action)
```

where

- `name` is the name of the message header that you want to set, add, or clear.
- `value` is the string value that you want to set the variable to. This can be a literal value, or another variable. For example, to set your named variable to the value of the Content-Type header in a request, you would specify the `value` as `request.headers.content-type`. This property is only required when `set` or `add` is specified as the action.
- `action` is the action that you want to apply to the variable. Valid options are:
  - `set`
  - `add`
  - `clear`If no option is set, the default option of `set` is applied.

For a complete list of context variables, see [API Gateway context variables](#), and for more information about how to reference context variables in IBM API Connect see [Variable references in API Connect](#). If you are using the DataPower® API Gateway, see also [Using context variables in GatewayScript and XSLT policies with the DataPower API Gateway](#).

## Read input synchronously

The following code snippets show examples of how to read input synchronously by using the `apim.getvariable` function to read data direct from a context. JSON input is returned as a JavaScript object. XML data is returned as a NodeList object (DOM).

Example one returns a synchronous read of the original request body into the variable that is called `json`:

```
var json = apim.getvariable('request.body');
```

Example two returns a synchronous read of the current message into the variable that is called `xml`:

```
var xml = apim.getvariable('message.body');
```

Note: If the content type of the data is neither XML nor JSON, the `apim.getvariable()` function returns a NodeList object consisting of one binary node, which must be converted to a string. If the content really is XML or JSON, you must then parse this string, as illustrated in the following example:

```
var data = apim.getvariable('request.body');

// if a nodelist was returned and the type is 13 (BLOB/Binary Node), convert it
// to a Buffer, which can then be converted to a string
if ((data.item && data.length > 0 && data.item(0).nodeType === 13)) {
    data = data.item(0).toBuffer().toString();
}

// if the string really is XML or JSON, then now add code to parse it with
// the appropriate XML or JSON parse function
.
.
.
```

## Read input asynchronously

The following code snippets show the `apim.readInput()` calls that you can use to perform a JavaScript callback function to read input data asynchronously into a variable. JSON input is returned as a JavaScript object. XML data is returned as a NodeList object (DOM). Other types of input are returned as a Buffer object.

```
apim.readInput(callback(err, input) {});
apim.readInputAsJSON(callback(err, json) {});
apim.readInputAsXML(callback(err, nodelist) {});
apim.readInputAsBuffer(callback(err, buffer) {});
```

Note: The `apim.readInput()` function attempts to determine the input data type and call the appropriate `apim.readInputAsType()` function in order to return the data in the correct format. However, to ensure that the correct data type is returned, use the `apim.readInputAsType()` function.

The `apim.readInputAsType()` function reads the data from either the INPUT context (for example `session.INPUT`), or from a policy output context (for example `policy.output`), depending on whether a previous policy had been called that had written output to a policy output context. This function then calls the underlying IBM DataPower GatewayScript `readAsType` method on the relevant context to read the data, and then use JavaScript callbacks to return the data to a variable. For more information about DataPower methods, see [APIs for methods](#).

The following is an example of how to use the `apim.readInputAsJSON()` callback function to get data into a variable that is called `json`:

```
apim.readInputAsJSON(function (error, json) {
if (error)
{
// handle error
}
else
{
// the json parameter will contain the json data that has been read
// process the json object in some way and write to the output context
if (json.test==='true')
{

```

```
// if json data contains a variable called test that is set to true, then also add some test data
json.data = 'This is my test data'
}
session.output.write(json);
// write to the output context
}
});
```

## Configure error information

The following code block shows an example of how to configure the policy implementation to produce error information by using the `apim.error()` function. In this example, `MyError` is thrown to the assembly flow. If there is a catch handler it catches this error, otherwise the assembly skips the execution of the flow and sends a **500 Internal Error** response.

```
apim.error('MyError', 500, 'Internal Error', 'Some error message');
```

where:

- `MyError` is the name of the error.
- `500` is the HTTP code of the required error message.
- `Internal Error` is the HTTP reason phrase for the error.
- `Some error message` is the suggested action for the user.

## Accessing the caught exception in a catch block

The following example shows how, in the `catch` block of an API assembly, you can obtain the details of the current caught exception. A possible use would be to create a custom error response using the details of the caught exception.

```
let exception = apim.getError();
```

The function returns a JSON object; for example:

```
{
  "name": "OperationError",
  "message": "This is a thrown Operation Error",
  "policyTitle": "Throw Operation Error",
  "status": {
    "code": "500",
    "reason": "Internal Server Error"
  }
}
```

## Write output

The following example shows how to write data into the output, in this case the JSON data `{ "status": "created" }`, by using the `session.output.write` variable:

```
session.output.write('{ "status": "created" }');
```

The `session.output.write` variable is a standard GatewayScript method that writes data to the output context. For more information, see [Contexts and sessions](#). Use the following function to set the format of the content that is written to the `session.output` variable:

```
apim.output('application/type');
```

For example, if you were creating a policy that called:

```
session.output.write('<test>this is some xml data</test>');
```

the policy would write XML data to the output context. You would need to configure the policy to also call

```
apim.output('application/xml');
```

to tell the system that the output is XML. It can cause issues in the processing of the policy if the actual output context format, and the format that is specified in `apim.output`, are different.

Note: If you use `apim.setvariable` to manipulate `message.body`, you must immediately follow the `apim.setvariable` function call with an `apim.output` function call that specifies the content type of the payload that was written to `message.body` by `apim.setvariable`.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Generate JWT

Use the Generate JWT security policy in IBM® API Connect to generate a JSON Web Token (JWT).

## Gateway support

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® Gateway (v5 compatible)	1.0.0
DataPower API Gateway	2.0.0

This topic describes how to configure the policy in the assembly user interface; for details on how to configure the policy in your OpenAPI source, see [jwt-generate](#).

## About

JSON Web Token (JWT) is a compact, URL-safe way of representing claims that are to be transferred between two parties. The Generate JWT policy enables you to generate claims and configure whether they are to be used as the payload of a JSON Web Signature (JWS) structure, or as the plain text of a JSON Web Encryption (JWE) structure. Specifying the cryptographic material for both the JWS and the JWE produces a nested JWT that is both digitally signed and encrypted. The JWT is then assigned to the Authorization header as a Bearer token (the default option), or to the runtime variable in the JSON Web Token (JWT) property, if specified.

Note:

- For algorithm types HS256, HS384, and HS512 the cryptographic objects referenced must be a Shared Secret Key.
- For algorithm types RS256, RS384, RS512, ES256, ES384, ES512, PS256, PS384, PS512 the cryptographic objects referenced must be a Crypto Key (private key).
- The cryptographic material can be provided through a JSON Web Key (JWK).
- If both a cryptographic object and a JWK are specified, the cryptographic object is used to sign the JWT.

## Prerequisites

The following prerequisites apply:

- If you are using one or more cryptographic objects, they must be located in the API Connect domain on the DataPower appliance. The cryptographic objects must reference the Shared Secret Key or certificate that is needed to encrypt or sign the JWT contents.
- If a JSON Web Key (JWK) is being used, it must be referenced by a runtime variable.

## Properties

The following table lists the policy properties, indicates whether a property is required, specifies the valid and default values for input, and specifies the data type of the values.

Table 2. Generate JWT policy properties

Property label	Required	Description	Data type
Title	No	The title of the policy. The default value is <b>jwt-generate</b> .	string
Description	No	A description of the policy.	string
JSON Web Token (JWT)	No	Runtime variable in which to place the JWT that is generated. The default value is: <b>generated.jwt</b> . However, if not set, the JWT that is generated is written to the Authorization Header as a Bearer token.	string
JWT ID Claim	No	Indicates whether a JWT ID (jti) claim should be added to the JWT. If selected, the property is set to <b>true</b> , and a UUID is generated and set as the JTI claim value.	boolean
Issuer Claim	Yes	Runtime variable from which the Issuer (iss) claim string can be retrieved. This claim represents the Principal that issued the JWT. The default value is: <b>iss.claim</b>	string
Subject Claim	No	Runtime variable from which the Subject (sub) claim string can be retrieved.	string
Audience Claim	No	Runtime variable from which the Audience (aud) claim string can be retrieved. Multiple variables are set by using a comma-separated string.	string
Validity Period	Yes	The length of time (in seconds), that is added to the current date and time, in which the JWT is considered valid. The default value is <b>3600</b> .	integer
Private Claims	No	Runtime variable from which a valid set of JSON claims can be retrieved. These claims are added to any set of claims specified previously.	string
Sign JWK variable name	No	Runtime variable that contains the JWK that is used to sign the JWT. <sup>1</sup>	string
Cryptographic Algorithm	No	The cryptographic algorithm to use. Valid values are: <ul style="list-style-type: none"><li>• HS256</li><li>• HS384</li><li>• HS512</li><li>• RS256</li><li>• RS384</li><li>• RS512</li><li>• ES256</li><li>• ES384</li><li>• ES512</li><li>• PS256</li><li>• PS384</li><li>• PS512</li></ul>	string
Sign Crypto Object	No	The cryptographic object to use to sign the JWT. <sup>1</sup>	string

Property label	Required	Description	Data type
Encryption Algorithm	No	The encryption algorithm to use. Valid values are: <ul style="list-style-type: none"> <li>A128CBC-HS256</li> <li>A192CBC-HS384</li> <li>A256CBC-HS512</li> </ul>	string
Encrypt JWK variable name	No	Runtime variable that contains the JWK to use to encrypt the JWT.	string
Key Encryption Algorithm	No	The key encryption algorithm to use. Valid values are: <ul style="list-style-type: none"> <li>RSA1_5</li> <li>RSA-OAEP</li> <li>RSA-OAEP-256</li> <li>dir</li> <li>A128KW</li> <li>A192KW</li> <li>A256KW</li> </ul>	string
Encrypt Crypto Object	No	The cryptographic object to use to encrypt the claim.	string

## Example

```
- jwt-generate:
  version: 1.0.0
  title: jwt-generate
  iss-claim: iss.claim
  exp-claim: 3600
  jwt: generated.jwt
  jti-claim: true
  sub-claim: sub.claim
  aud-claim: aud.claim
  private-claims: private.claims
  jws-jwk: jws.jwk
  jws-alg: HS256
  jws-crypto: jwsCryptoObjectName
  jwe-enc: A128CBC-HS256
  jwe-jwk: jwe.jwk
  jwe-alg: A128KW
  jwe-crypto: jweCryptoObjectName
```

## Errors

The following error can be thrown while the policy is being executed:

- **RuntimeError** - a generic error that captures all errors that occur during the execution of the policy. Upon failure, the detailed error message that is received from the underlying JOSE module is written to the default system log as an error message. This detailed error message is also assigned to the runtime variable `jwt-generate.error-message`, so it can be retrieved via `catch`.

If a `catch` is not configured, in the case of a failure the Generate JWT policy returns an HTTP code 500 **Invalid-JWT-Generate** failure. The detailed error message from the underlying JOSE module can be found in the system log.

Attention: If you are an API developer who is troubleshooting a failure that one of your customers had with your API, consider the security risks before sending a customer the exact content of the log message. You can avoid the possibility of someone launching an attack based on the information that they receive from the log message by sending the customer only general information about the message.

## Related information

- [Introduction to JSON Web Tokens](#)

<sup>1</sup> A JWK and a Crypto Object are both valid ways of providing the cryptographic data necessary to sign the JWT. However, if both data types are specified, only the Crypto Object is used.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.

For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Validate JWT

Use the Validate JWT security policy to enable the validation of a JSON Web Token (JWT) in a request before allowing access to the APIs.

## Gateway support

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version

Gateway	Policy version
DataPower® Gateway (v5 compatible)	1.0.0
DataPower API Gateway	2.0.0

This topic describes how to configure the policy in the assembly user interface; for details on how to configure the policy in your OpenAPI source, see [jwt-validate](#).

## About

JSON Web Token (JWT) is a compact, URL-safe way of representing claims that are to be transferred between two parties. The Validate JWT policy enables you to secure access to your APIs by using JWT validation. For example, when an input request that contains a JWT in the header is received, the Validate JWT policy extracts the token, verifies, and decrypts (if appropriate) the signature, and validates the claim. If valid, the claim is put in a runtime variable (for subsequent use if required), and access is allowed to the API. If the claim is not valid, access is denied.

All claims that are specified in the Validate JWT policy are validated, but this is not necessarily all the claims that are contained in the JWT. Not all claims that are in the JWT must be validated, but if any one of the claims that are specified in the Validate JWT policy fail, the whole validation fails. If the validation succeeds, the full set of claims that are contained in the JWT are written to the runtime variable specified in the Output Claims property. Thereby allowing any subsequent action to use this runtime variable to further validate the full set of claims that were in the JWT, as necessary.

Note:

- If the original message was signed with a Shared Secret Key, the cryptographic object that is specified must also be a Shared Secret Key.
- If the original message was signed with a Private Key, the cryptographic object that is specified must be a Crypto Certificate (public certificate).
- The cryptographic material can be provided through a JSON Web Key (JWK).
- If a JWK header parameter is included in the header of the JWT, the parameter must match the JWK or cryptographic object that is specified in the policy, or the JWT validation will fail.
- If both a cryptographic object and a JWK are specified, the cryptographic object is used to decrypt or verify the JWT.

## Prerequisites

The following prerequisites apply:

- IBM® DataPower V7.5 with the Application Optimization (AO) option.
- If you are using one or more cryptographic objects, they must be located in the IBM API Connect domain on the DataPower appliance. The cryptographic objects must reference the Shared Secret Key or public certificate that is needed to decrypt the JWT contents or verify the signature.
- If a JSON Web Key (JWK) is being used, it must be referenced by a runtime variable.

## Properties

The following table lists the policy properties, indicates whether a property is required, specifies the valid and default values for input, and specifies the data type of the values.

Table 2. Validate JWT policy properties

Property label	Required	Description	Data type
Title	Yes	The title of the policy. The default value is <code>jwt-validate</code> .	string
Description	No	A description of the policy.	string
JSON Web Token (JWT)	Yes	Context or runtime variable that contains the JWT to be validated. The default value is: <code>request.headers.authorization</code> . However, if this property is not set, the policy looks for the JWT in the <code>request.headers.authorization</code> location by default.  Note: The format of the authorization header must be:  <code>"Authorization: Bearer <i>jwt-token</i>"</code>  where <i>jwt-token</i> is the encoded JWT.	string
Output Claims	Yes	Runtime variable to which the full set of claims that are contained in the JWT is assigned. The default value is: <code>decoded.claims</code> .	string
Issuer Claim	No	The Pearl Compatible Regular Expressions (PCRE) to use to validate the Issuer (iss) claim.	string
Audience Claim	No	The PCRE to use to validate the Audience (aud) claim.	string
Decrypt Crypto Object	No	The cryptographic object (a shared key or certificate) to use to decode the claim. <sup>1</sup>	string
Decrypt Crypto JWK variable name	No	Runtime variable that contains the JWK to use to decrypt the JWT. <sup>1</sup>	string
Verify Crypto Object	No	The cryptographic object (a shared key or certificate) to use to verify the signature. <sup>2</sup>	string
Verify Crypto JWK variable name	No	Runtime variable that contains the JWK to use to verify the signature. <sup>2</sup>	string

## Example

```
- jwt-validate:
  version: 1.0.0
  title: jwt-validate
  jwt: request.headers.authorization
  output-claims: decoded.claims
  iss-claim: "'^data.*'"
  aud-claim: "'^id.*'"
  jwe-crypto: jweCryptoObjectName
  jwe-jwk: jwe.jwk
```

```
jws-crypto: jwsCryptoObjectName
jws-jwk: jws.jwk
```

## Errors

The following error can be thrown while the policy is being executed:

- **RuntimeError** - a generic error that captures all errors that occur during the execution of the policy. Upon a validation failure, the detailed error message that is received from the underlying JOSE module is written to the default system log as an error message. This detailed error message is also assigned to the runtime variable `jwt-validate.error-message`, so it can be retrieved via `catch`.

If a `catch` is not configured, in the case of a validation failure the Validate JWT policy returns an HTTP code 500 **Invalid-JWT-Validate** failure. The detailed error message from the underlying JOSE module can be found in the system log.

Attention: If you are an API developer who is troubleshooting a failure that one of your customers had with your API, consider the security risks before sending a customer the exact content of the log message. You can avoid the possibility of someone launching an attack based on the information that they receive from the log message by sending the customer only general information about the message.

For examples, see [jwt-validate](#).

## Related information

- [Introduction to JSON Web Tokens](#)

<sup>1</sup> A JWK and a Crypto Object are both valid ways of providing the cryptographic data necessary to decrypt the JWT. However, if both data types are specified, only the Crypto Object is used.

<sup>2</sup> A JWK and a Crypto Object are both valid ways of providing the cryptographic data necessary to verify the JWT. However, if both data types are specified, only the Crypto Object is used.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.

## GraphQL introspect

Use the GraphQL introspect policy to introspect a GraphQL schema.

## Gateway support

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® API Gateway	2.0.0

This topic describes how to configure the policy in the assembly user interface; for details on how to configure the policy in your OpenAPI source, see [graphql-introspect](#).

## Properties

The following table lists the policy properties, indicates whether a property is required, specifies the valid and default values for input, and specifies the data type of the values.

Table 2. GraphQL introspect policy properties

Property label	Required	Description	Data type
Title	No	The title of the policy. The default value is <code>graphql-introspect</code> .	string
Description	No	A description of the policy.	string
Input	No	A variable in the API context that contains the input to introspect. The content of the <code>body</code> field of the variable is the input to introspect. By default, the variable name is <code>message</code> .	string
Output	No	A variable in the API context where the results of the introspection are stored. The content of the <code>body</code> field of the variable is the result of GraphQL introspection. The default variable name is the same as that of the variable specified in the Input field. Therefore, by default, the input of the introspection is overwritten by the output.	string

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.

For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Invoke

Apply the Invoke policy to call another service from within your assembly. The response from the backend is stored either in the variable `message.body` or in the response object variable if it is defined. The policy can be used with JSON or XML data, and can be applied multiple times within your assembly.

## Gateway support

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® Gateway (v5 compatible)	1.0.0
DataPower API Gateway	2.0.0 2.1.0 (DataPower API Gateway Version 10.0.1.1 or later) 2.2.0 (DataPower API Gateway Version 10.0.2.0 or later) 2.3.0 (DataPower API Gateway Version 10.0.3.0 or later)

This topic describes how to configure the policy in the assembly user interface; for details on how to configure the policy in your OpenAPI source, see [invoke](#).

## About

Users might notice that the last invoke in their policy is replaced by a proxy. The replacement is sometimes done automatically by the IBM® API Connect DataPower Gateway to improve performance. The proxy is functionally equivalent to the invoke, but the API caller might notice the following differences when proxy is used.

- If the HTTP request made by the invoke or proxy gets a redirect (3xx) response:
  - invoke returns the response from following the redirect response.
  - proxy does not follow 3xx responses, and the redirect response is returned.
- The IBM API Connect test tool shows that proxy was used, but invoke appears in the Analytics latency records.
- The response from the proxy can contain different whitespace or escaping than a response from invoke. Despite the differences in the response, it is still valid.

If you want to prevent replacement of the last invoke in the assembly with proxy, you can set the API property `api.properties.x-ibm-gateway-optimize-invoke` to `false`. For more information, see [API properties](#)

Note: The Invoke policy does not support responses with multipart form data, that is, when the response is set to `Content-Type: multipart/related`.

## Properties

The following table lists the policy properties, indicates whether a property is required, specifies the valid and default values for input, and specifies the data type of the values.

Table 2. Invoke policy properties

Property label	Required	Description	Data type
Title	Yes	The title of the policy. The default value is <code>invoke</code> .	string
Description	No	A description of the policy.	string
URL	Yes	Specifies a URL for the target service. For a SOAP API, a URL is added by default. Where possible, the Invoke URL value is pre-supplied from information that is defined in the imported WSDL.	string
<span style="border: 1px solid green; padding: 2px;">API Gateway only</span> Backend type	No	Select one of the following options to determine how the payload is sent to the backend: <ul style="list-style-type: none"> <li>• Detect: detect the message type and send the payload to the backend accordingly.</li> <li>• XML: package the payload as XML and send. If the message type is not XML, the operation fails.</li> <li>• JSON: package the payload as JSON and send. If the message type is not JSON, the operation fails.</li> <li>• Binary: package the payload the payload as binary and send, regardless of the message type.</li> <li>• GraphQL: package the payload as GraphQL and send. If the message type is not GraphQL, the operation fails.</li> </ul> The default value is Detect.	string
<span style="border: 1px solid green; padding: 2px;">API Gateway only</span> GraphQL send type(policy version 2.2.0 and later)	Yes, if Backend type is set to GraphQL or Detect, and HTTP Method is set to POST. or Keep	Select one of the following values to determine how the GraphQL payload is sent to the back end: <ul style="list-style-type: none"> <li>• Detect: detect the message type and send the payload to the back end accordingly.</li> <li>• GraphQL: package the payload as GraphQL and send. If the message type is not GraphQL, the operation fails.</li> <li>• JSON: package the payload as JSON and send. If the message type is not GraphQL, the operation fails.</li> </ul> Note: GraphQL send type is supported only if Backend type is set to GraphQL or Detect, and HTTP Method is set to POST or Keep.	string
TLS profile	No	Specifies a TLS profile to use for the secure transmission of data.	string
Timeout	Yes	The time to wait before a reply back from the endpoint (in seconds). The default value is 60.	integer
Follow redirects	No	Specifies the behavior if the back-end server returns the HTTP status code <b>301 Moved Permanently</b> . If you select this check box, the <code>invoke</code> policy follows the URL redirection by making a further call to the URL specified in the <code>Location</code> header in the response. If you clear this check box, the <code>invoke</code> saves the 301 status code and the API call is considered to be complete. Note: The <code>follow-redirect</code> property is supported only by the DataPower API Gateway. If you are using the DataPower Gateway (v5 compatible), the <code>invoke</code> always follows the URL redirection; the <code>proxy</code> policy (not supported by the DataPower API Gateway) saves the 301 status code and completes the API call without following the URL redirection.	boolean
Username	No	The username to use for HTTP Basic authentication.	string
Password	No	The password to use for HTTP Basic authentication.	string

Property label	Required	Description	Data type
HTTP Method	Yes	The HTTP method to use for the Invoke. Valid values are: <ul style="list-style-type: none"> <li>• Keep</li> <li>• GET</li> <li>• POST</li> <li>• PUT</li> <li>• DELETE</li> <li>• PATCH</li> <li>• HEAD</li> <li>• OPTIONS</li> </ul> <p>The default value is <b>GET</b>. However, if set to <b>Keep</b>, or the property is removed from the source, the HTTP method from the incoming request is used.</p>	string
<b>API Gateway only</b> HTTP Version (policy version 2.1.0 and later)	Yes	The HTTP version that will be used when connecting to the backend server. Select one of the following values: <ul style="list-style-type: none"> <li>• HTTP/1.0</li> <li>• HTTP/1.1</li> <li>• HTTP/2</li> </ul> <p>The default value is HTTP/1.1.</p>	string
<b>API Gateway only</b> HTTP/2 Required (policy version 2.1.0 and later)	No	Select this check box to require that the server selects HTTP/2 during a TLS connection, otherwise the DataPower API Gateway rejects the connection and fails the request. For a non TLS connection, a warning is logged stating that the requirement can't be enforced. This setting applies only if HTTP Version is set to HTTP/2.	boolean
Compression	No	Select this check box to enable Content-Encoding compression on upload. The check box is cleared by default.	boolean
Cache Type	No	The cache type determines whether to cache documents, honoring or overriding the HTTP Cache Control directives received in the response from the target URL. This property takes effect only when a response is received, otherwise the policy always returns the non-expired response that was previously saved in cache. Valid values are: <p>Protocol</p> <p>The cache behavior is determined by the Cache-Control headers on the response, in accordance with RFC 7234.</p> <p>To optimize performance, if the gateway receives more than one request for a resource that is not in the cache but could be cached when the response from the target URL is received, the gateway sends only one request to the target URL; the remaining requests are not processed until the response from the first request has been received and the cache behavior has been determined from this response. If the response indicates that caching is possible, the gateway responds to all waiting requests with the cached resource. If the response indicates that caching is not possible, the gateway sends all waiting requests to the target URL.</p> <p>Use this option only if you expect that responses from the target URL can be cached, in which case it should improve performance and limit the demand on the target URL. If, however, the target URL never indicates that the gateway should cache its response, performance might be impaired when compared to the No Cache option.</p> <p>No Cache</p> <p>Responses from the target URL are not cached on the gateway regardless of any caching headers returned. In this case, every request from the client is sent to the target URL.</p> <p>Use this option if you do not want to cache any of the backend responses on the gateway, or if it is unlikely that a response from the target URL will allow caching through the Cache-Control header settings.</p> <p>Time to Live</p> <p>This option is similar to the Protocol option except it allows you to specify the amount of time that you want the successful response from the invoke or proxy to remain in the cache. Use this option only if you expect that responses from the target URL can be cached.</p> <p>The default value is Protocol.</p>	string
Time to Live	No	Specifies the amount of time in seconds that the response stays in the cache. Applies only if the property Cache type is set to <b>Time to Live</b> . Enter a value in the range 5 - 31708800. The default value is <b>900</b> .	integer
Cache key	No	Specifies the unique identifier of the document cache entry. If omitted, the entire URL string is used as the key.	string
<b>API Gateway only</b> Allow WebSocket Upgrade (policy version 2.1.0 and later)	No	Select this check box to allow an HTTP or HTTPS connection to be upgraded to the WebSocket protocol if the request received by the corresponding HTTP or HTTPS handler on the DataPower API Gateway uses WebSocket (ws) or WebSocket Secure (wss). Note: <ul style="list-style-type: none"> <li>• This setting is available only for GraphQL APIs.</li> <li>• The Allow WebSocket Upgrade setting is deprecated. To allow WebSocket upgrade requests that can manage API processing data, define an assembly WebSocket upgrade policy. For more information, see <a href="#">WebSocket Upgrade</a>.</li> </ul>	boolean
<b>API Gateway only</b> Inject proxy headers	No	If you select this check box, the <b>invoke</b> policy injects the <b>X-Forwarded-For</b> , <b>X-Forwarded-To</b> , <b>X-Forwarded-Host</b> , and <b>X-Forwarded-Proto</b> headers to the request that is sent to the target URL. The check box is cleared by default.	boolean

Property label	Required	Description	Data type
 Decode Request Params	No	If you select this check box, any request parameters that are referenced by a variable definition on the target URL of the invoke policy are URL-decoded. The check box is cleared by default.	boolean
 Queryparam Encode	No	If you select this check box, all "+" characters in the query parameter values of the target URL are encoded to %2F. The check box is cleared by default.	boolean
 Keep Payload	No	If you select this check box, the invoke policy sends a payload on an <b>HTTP DELETE</b> method. The check box is cleared by default.	boolean
 Restrict to HTTP 1.0 (policy version 2.0.0 only)	No	If you select this check box, HTTP transactions are restricted to version 1.0. The check box is cleared by default.	boolean
 Allow chunked uploads	No	If you select this check box, chunked-encoded documents are sent to the server. When the HTTP 1.1 protocol is used, the body of the document can be delimited by either <b>Content-Length</b> or chunked encoding. While all servers can interpret <b>Content-Length</b> , many applications fail to understand chunked-encoded documents. For this reason, <b>Content-Length</b> is the standard method. The use of <b>Content-Length</b> interferes with the ability of the DataPower Gateway to fully stream. If you must stream full documents to the target server, enable this property.  When enabled, the server must be RFC 2616 compatible. Unlike all other HTTP 1.1 features that can be negotiated down at run time, you must know beforehand that the target server is RFC 2616 compatible.  The check box is selected by default.  Note: Chunked encoding is not supported by the HTTP 1.0 protocol.	boolean
 Persistent Connection (policy version 2.3.0 and later)	No	Select this check box to enable HTTP persistent connections, allowing connection re-use. The check box is selected by default.	boolean
 Header control	No	Specifies the headers in <b>message.headers</b> that you want to copy to the target URL. To prevent headers from being copied, complete the following steps:  <ol style="list-style-type: none"> <li>1. Select Blocklist.</li> <li>2. Click Add blocklist.</li> <li>3. In the empty field that is displayed, enter the header name.</li> <li>4. To add further headers, repeat the previous steps.</li> </ol> To specify headers that you want to be copied, complete the following steps:  <ol style="list-style-type: none"> <li>1. Select Allowlist.</li> <li>2. Click Add allowlist.</li> <li>3. In the empty field that is displayed, enter the header name.</li> <li>4. To add further headers, repeat the previous steps.</li> </ol> The values that you specify are in regular expression format. For example, to specify the Content-Type header, enter <b>^Content-Type\$</b>  By default, Blocklist is selected, with no blocklist entries, meaning that <b>all</b> headers are copied.	string
 Parameter control	No	Specifies the parameters in the incoming request that you want to be copied to the target URL. To prevent parameters from being copied, complete the following steps:  <ol style="list-style-type: none"> <li>1. Select Blocklist.</li> <li>2. Click Add blocklist.</li> <li>3. In the empty field that is displayed, enter the parameter name.</li> <li>4. To add further parameters, repeat the previous steps.</li> </ol> To specify parameters that you want to be copied, complete the following steps:  <ol style="list-style-type: none"> <li>1. Select Allowlist.</li> <li>2. Click Add allowlist.</li> <li>3. In the empty field that is displayed, enter the parameter name.</li> <li>4. To add further parameters, repeat the previous steps.</li> </ol> The values that you specify are in regular expression format.  For example, if the incoming request is  <b>http://apigw/org/sandbox/petstore/base?petid=100&amp;display=detailed</b>  and you specify a white list entry of <b>^petid\$</b> , the target URL at run time will be  <b>http://myhost/mypath?storeid=3&amp;petid=100</b>  By default, Allowlist is selected, with no allowlist entries, meaning that <b>no</b> parameters are copied.	string
Stop on error	No	Select the errors that, if thrown during the policy execution, cause the assembly flow to stop. If there is a <b>catch</b> flow configured for the error, it is triggered to handle the error thrown. If an error is thrown and there are no errors selected for the Stop on error setting, or if the error thrown is not one of the selected errors, the policy execution is allowed to complete, and the assembly flow continues.	string

Property label	Required	Description	Data type
Response object variable	No	The name of a variable that will be used to store the response data from the request. By default, the invoke response, that is the body, headers, statusCode and statusMessage, is saved in the variable <code>message</code> . Use this property to specify an alternate location to store the invoke response. This variable can then be referenced in other actions, such as <a href="#">Map</a> . Note: If you want the response to be saved in <code>message</code> , leave the Response object variable property blank, do <b>not</b> supply the value <code>message</code> .	string

## Example

```
- invoke:
  version: 2.0.0
  title: get the account status
  target-url: https://example.com/accounts/{id}?status={status}
  cache-response: time-to-live
  cache-putpost-response: true
  tls-profile: MyTLSProfile
  verb: POST
  timeout: 60
  compression: false
  username: MyUser
  password: MyPassword
  stop-on-error:
    - ConnectionError
    - OperationError
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## JSON to XML

Use the JSON to XML policy to convert the context payload of your API from the JavaScript Object Notation (JSON) format to the extensible markup language (XML) format.

## Gateway support

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® Gateway (v5 compatible)	1.0.0
DataPower API Gateway	2.0.0

This topic describes how to configure the policy in the assembly user interface; for details on how to configure the policy in your OpenAPI source, see [json-to-xml](#).

## About

The JSON to XML policy uses a simple convention, based on BadgerFish, to convert your API context payload from JSON to XML. The policy expects the JSON input to be in the same format as the BadgerFish convention, so the structure can be rebuilt in XML. No additional configuration is required. For more information about the BadgerFish convention, see [BadgerFish](#).

Note: The JSON to XML policy does convert the JSON structure { "a" : "hello" } (which is not BadgerFish convention) into `<a>hello</a>`.

Use the IBM® API Connect API Manager assembly view when you are creating your API definition to add a built-in policy to the flow.

The policy must be attached to the flow at the point at which you require the conversion to be performed. For example, if you need to convert a JSON-formatted request into an XML-formatted request, the policy must be attached to the request flow.

The policy reads input from the `message.body`, if that context exists, otherwise from the `request.body`, and then writes the output to the `message.body`.

Note: If you are using the DataPower API Gateway, the input to the JSON to XML policy must be parsed data. One way to produce parsed data is to use a [Parse](#) policy before a JSON to XML policy in your assembly flow, which provides explicit control of the parse action.

## Properties

The following table lists the policy properties, indicates whether a property is required, specifies the valid and default values for input, and specifies the data type of the values.

Table 2. Policy properties

Property label	Required	Description	Data type
Title	Yes	The title of the policy. The default value is <code>json-to-xml</code> .	string
Description	No	A description of the policy.	string
 Input	No	The input message to convert. Specify the name of a variable in the API context. <code>variableName.body</code> , the message payload, represents the JSON input to convert. The default value of the variable is <code>message</code> and <code>message.body</code> is the default input.	string
 Output	No	The output message to store the conversion result. Specify the name of a variable in the API context. <code>variableName.body</code> represents the result of conversion from JSON format to XML format. When the specified input message is the default message, the default output is <code>message.body</code> . Otherwise, when the input message is the variable <code>my-message-variable</code> , for example, the default output is <code>my-message-variable.body</code> . The variable cannot be any read-only in the API context.	string
 Conversion type	No	The conversion type that determines the target format of the output. The following options are available: <ul style="list-style-type: none"> <li>None: No conversion of the output takes place.</li> <li>badgerFish: BadgerFish convention is used to determine the target conversion format of the output.</li> </ul>	string
Root XML Element Name	Yes	The root element name of the resultant XML document. This property is used only if the input JSON document is not hierarchical and has more than one uppermost level property, or if the Always output the root element check box is selected. The default value is <code>json</code> .	string
Always output the root element	Yes	Select this check box if you always want the policy to output the root element, even if it is not required to make the XML document well formed. The default value is <code>false</code> .	boolean
Element name for JSON array elements	No	The XML element name to be used for JSON array elements.	string

## Examples

For example, the following simple JSON object

```
{ "a": { "$" : "hello" } }
```

becomes

```
<a>hello</a>
```

The following JSON object with an attribute

```
{ "a": { "$" : "hello", "@type" : "world" } }
```

becomes

```
<a type="world">hello</a>
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Log

Use the Log policy to customize or override the default activity logging configuration for an API.

## Gateway support

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® API Gateway	2.0.0 2.1.0 (DataPower API Gateway Version 10.0.3.0 or later)

This topic describes how to configure the policy in the assembly user interface; for details on how to configure the policy in your OpenAPI source, see [log](#).

## About

By default, the logging of activity when an API is called, and the sending of the log data to the analytics server, is determined by the settings in the API definition, as described in [Configuring activity logging](#) (OpenAPI 2.0) or [Configuring activity logging](#) (OpenAPI 3.0). However, you can customize activity logging by adding a Log policy to the API assembly flow.

The Log policy enables you to gather all API analytics data for processing in your assembly, and to control what activity log data is sent to the analytics server. Here are some examples of the ways in which you can use the Log policy to customize API activity logging:

- Gather activity log data, use a Redaction policy to redact sensitive fields in the data, then send to the analytics server.
- Send different levels of analytics data depending on certain conditions; for example, the API operation that was called.
- Configure custom activity logging in a global policy that is applied to every API in a Catalog. For more information on global policies, see [Working with global policies](#).

## Properties

The following table lists the policy properties, indicates whether a property is required, specifies the valid and default values for input, and specifies the data type of the values.

Table 2. Log policy properties

Property label	Required	Description	Data type
Title	No	The title of the policy. The default value is <b>log</b> .	string
Description	No	A description of the policy.	string
Mode	Yes	Select one of the following options: <ul style="list-style-type: none"> <li>• Gather-only: gather all analytics data and write it to the <b>log</b> context variable, which populates the API event record on completion of the API execution. For more information on the fields in the <b>log</b> context variable, and the consequent API event record, see <a href="#">API event record fields</a>.</li> <li>• Send-only: perform the following actions: <ul style="list-style-type: none"> <li>◦ Read the data from the <b>log</b> context variable.</li> <li>◦ Truncate all message payloads and convert to a textual representation.</li> <li>◦ Send the data to the analytics server.</li> </ul> </li> <li>• Gather-and-send: perform a <b>gather-only</b> operation, immediately followed by a <b>send-only</b> operation.</li> </ul> <p>If you use the Send-only or Gather-and-send option, data is buffered and sent to the analytics server in batches according to the time interval configured for the Analytics Endpoint on the DataPower API Gateway. For more information, see <a href="#">Configuring an analytics endpoint</a> in the DataPower knowledge center.</p> <p>Note: If you are offloading to a third party analytics server, you can redact any aspect of the event data. If you are using API Connect analytics, you can redact only request and response payloads.</p>	string
<span style="border: 1px solid green; padding: 2px;">API Gateway only</span> Log Level	No	The type of content to log. Enter one of the following values: <ul style="list-style-type: none"> <li>• none: Indicates no logging.</li> <li>• activity: Logs the invocation only, which is only the resource URI.</li> <li>• header: Logs activity and header.</li> <li>• payload: Logs activity, header, and payload.</li> <li>• default: Use the log level setting defined in the API definition; for more information, see <a href="#">Configuring activity logging</a> (OpenAPI 2.0) or <a href="#">Configuring activity logging</a> (OpenAPI 3.0). This is the default value.</li> <li>• \$(value): An inline parameter in the format \$(value) to retrieve a value from the API context.</li> </ul>	

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Map

Use the Map policy to apply transformations to your assembly flow and specify relationships between variables.

## Gateway Level support

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® Gateway (v5 compatible)	1.0.0
DataPower API Gateway	2.0.0

This topic describes how to configure the policy in the assembly user interface; for details on how to configure the policy in your OpenAPI source, see [map](#).

## About

Be aware that MAP decodes all parameter values to an ASCII character equivalent. If a MAP parameter contains entries such as %nn, the MAP output contains decoded values.

For information about the structure of a Map policy and its behavior, see [The Map policy structure](#).

For information about configuring a Map policy by using the user interface, see [Configuring the Map policy in the user interface](#).

For examples of YAML representations of different Map policy configurations, see [Map policy examples](#).

## Properties

The following table lists the policy properties, indicates whether a property is required, specifies the valid and default values for input, and specifies the data type of the values.

Table 2. Map policy properties

Property label	Required	Description	Data type
Title	No	The title of the policy. The field is visible when editing inputs. The default value is <b>map</b> .	string
Description	No	A description of the policy. The field is visible when editing inputs.	string
Inputs	Yes	A list of variables that are inputs of the policy.	array (string)
Outputs	Yes	A list of variables that are outputs of the policy.	array (string)
Value	Yes	A GatewayScript program to be performed by the policy in order to map its inputs to its outputs, or to set the value of outputs.	string

Note: The map policy has other properties that are not displayed in the user interface. For a complete list of properties, see [map](#).

- [The Map policy structure](#)  
The Map policy uses a structure within its OpenAPI definition to specify the behavior of the policy.
- [Configuring the Map policy in the user interface](#)  
The assemble view in API Manager provides a visual representation of the relations between the inputs and outputs of your Map policy.
- [Map policy examples](#)  
Examples of the OpenAPI definitions of Map policies.

## Related tasks

- [Creating a new REST OpenAPI definition](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## The Map policy structure

The Map policy uses a structure within its OpenAPI definition to specify the behavior of the policy.

This topic contains the following sections:

- [Structure](#)
- [Input and output definitions](#)
- [Actions](#)
- [Script](#)
- [Fields](#)
- [References to inputs and outputs](#)
- [Accessing other contexts](#)

For map policy examples, see [Map policy examples](#).

Note: If you deploy your API to the DataPower® Gateway (v5 compatible) then, with the exception of client ID and client secret, the passing of form input as a parameter into an API is not supported. This restriction does not apply if you deploy your API to the DataPower API Gateway.

## Structure

In addition to its title and description, a Map policy has the following four main sections:

### inputs

A list of variables that form the input of the Map policy. Each input has a context variable in which the input variable is found, the variable's name within the Map policy, the content type of the variable, and the definition of the variable or a schema defining its structure.

### outputs

A list of variables that form the output of the Map policy. These include a context variable where the output variable is found or should be created, the variable's name at output, and the definition of the variable or a schema defining its structure.

### action

An array containing details of the actions to be performed in order. Each entry includes either a **set** or **create** field, which specifies the output variable or variables that are part of the action. An action can also contain a **from** field, which specifies the input variable or variables that are part of the action.

Each action also contains either a **value** field, when the output is set or created, or a **foreach** field and a new **actions** section, when further actions are nested within the first to set or create elements in a nested array.

### options

The following property options are available for you to select:

- **Include empty.** If the check box is selected (the default option), empty XML elements are included in the output of the map policy. Clear the check box if you do not want empty XML elements to be included in the output of the map policy.
- **Namespace inheritance.** If the check box is selected (the default option), XML namespaces are inherited from the parent element. Clear the check box if you want the map policy to use explicit namespaces.
- **Namespace inlining.** If the check box is selected (the default option), XML namespaces will be inserted into the document where they are first used. Clear the check box if you want namespaces to all be defined on the root element.

- API Gateway only** Resolve XML input data type. If the check box is selected, XML elements whose schema is configured as type boolean or numeric will be converted to that data type. Clear the check box (the default option) if you want all XML element values to be returned as a string.
- API Gateway only** Parse XML output: If the check box is selected, the map policy will write XML output to `message.body` as a parsed XML document. By default, the XML will be output as an XML string. XML output to any other variable will always be written as an XML string.
- API Gateway only** Empty XML element handling. This property controls how the map policy handles the output of an empty XML element. The following choices are available:
  - String (the default option): An empty XML element is handled as an empty string.
  - Null: An empty XML element is handled as a null value.
  - None: The data is ignored.
  - API Gateway only** String Badgerfish: The value for an empty XML element is considered to be an empty string. The empty string value will be placed into a JSON badgerfish value property.
  - API Gateway only** Null Badgerfish: The value for an empty XML element is considered to be null. The null value will be placed into a JSON badgerfish value property. A mapping of this element to a JSON output property does not occur unless the Allow null value option is selected.
- API Gateway only** Use only first array element. If the check box is selected, if an array is encountered in the traversal of the input, only the first element is used. Clear the check box (the default option) if you want the map policy to use all array elements.
- API Gateway only** Resolve API Connect variable references. If the check box is cleared (the default option), the map policy ignores API Connect variable references in the map properties. Select the check box if you want API Connect variable references found in the map properties to be resolved.
- API Gateway only** Allow null value. If the check box is selected, an input property value with a null value is mapped to the output document. Clear this check box (the default option) if you want the map policy to ignore null input values.
- API Gateway only** Optimize schema definition. If the check box is selected, complex schema types evaluation handles circular type references in an optimized manner. Clear this check box (the default option) to evaluate these schema types in a standard manner.
- API Gateway only** Create required child properties for array objects and mapped optional objects. If the check box is selected, default values are generated in the output for required properties that are either not mapped, or for which there is no input data present, in the following specific cases:
  - An array consists of objects that contain one or more required properties.
  - An object which is optional has one or more child properties that are required.

By default, these required properties are not present in the output. If you select this option, these required properties will be present in the output. If the output schema defines a `default` property for the output property then the specified default value is used, otherwise a default value is assigned dependent on the data type, as follows:

- String: empty string ("")
- Number: 0
- Boolean: false
- Object: empty object
- Array: empty array

#### Example 1

The input data has the following array of objects:

```
[{"a": "value1"}, {"a": "value2", "b": "value3"}]
```

The output schema defines the output object as having two properties, `a` and `b`, of which `b` is required. The map policy defines the following mappings:

- `input.array.a` to `output.array.a`
- `input.array.b` to `output.array.b`

If the check box is selected, and `b` is either not mapped or has no input data present, then `b` is assigned a default value of an empty string, and the output is as follows:

```
[{"a": "value1", "b": ""}, {"a": "value2", "b": "value3"}]
```

#### Example 2

The output schema defines the following structure:

```
{"a" : {"b" : {"c" : "value1", "d" : "value2"} } }
```

Property `b` is optional but property `d` within `b` is required.

The map policy defines a mapping to `output.a.b.c`.

If the check box is selected, and `d` is not mapped, then `d` is assigned a default value of an empty string, and the output is as follows:

```
{"a" : {"b" : {"c" : "value1", "d" : ""} } }
```

If the check box is not selected, these required properties are **not** created in the output with their default values.

- API Gateway only** Empty JSON array handling. This property controls how the map policy handles the output of an empty array. The following choices are available:
  - All (The default value): Output all empty arrays, including empty children arrays.
  - Parent: Output only the current property's empty array value. Children map actions of this property are not attempted.
  - None: Prevent any empty output array values from being produced.
- API Gateway only** Enable JSON post processing. Select this check box to enable post processing of mapped JSON output. The post processing of JSON output will use the output schema to ensure that property values are of the same data type as that defined in the schema. It will also normalize output property values that have a Badgerfish JSON syntax due to object mapping of an XML input. The check box is cleared by default, meaning that there is no post processing of mapped JSON output.
- API Gateway only** Schema definition circular reference limit. Set the value of this property to an integer value that specifies the maximum allowed number of iterations of a circular schema definition. The default value is 1, which means that circular schema definitions are not followed. The maximum possible value is 5.

- Severity level for input data log messages; This property specifies the severity level for log messages that relate to input data. The following choices are available:
  - error
  - warn
  - info
- API Gateway only** Create empty parent object for failed mapping. If a mapping fails because its input is not present and there is no default mapping configured, the default behavior is to not to make any change to the output mapping. Select this check box to create an empty object for the parent of the target mapping, emulating the behavior of IBM® API Management Version 4.0.

#### Example

The map policy defines a mapping to `output.a.b.c`.  
If input data is present, the output is as follows:

```
{
  "a": {
    "b": {
      "c": "inputvalue"
    }
  }
}
```

If there is no input data, and the Create empty parent object for failed mapping option is selected, the output is as follows:

```
{
  "a": {
    "b": {
    }
  }
}
```

Properties `a` and `b` are created but the value of `b` is an empty object.  
The check box is cleared by default.

## Input and output definitions

You define the inputs and outputs of your Map policy in their own sections. Each input or output is an element in the array `inputs` or `outputs` and is defined by a name, a schema definition or reference, and a variable within the context from which it should be read or to which it should be written. After they have been defined, inputs and outputs are referenced by the name provided in the definition, not by the name of the variable.

The following example shows the inputs and outputs sections of a Map policy.

```
inputs:
  input_string:
    schema:
      type: string
      variable: request.parameters.name_in
  input_integer:
    schema:
      type: integer
      variable: request.parameters.age_in
outputs:
  output:
    schema:
      $ref: '#/definitions/output'
    variable: message.body
```

The `schema` field specifies the schema that describes the variable and can be a simple type, a reference to a definition, or an inline schema definition.

The `variable` field describes the variable and the context that should be assigned to the input or output variable during the execution of the map policy.

## Actions

The fields included in the `actions` section are used in the following ways:

#### set

Use the `set` field when you want to assign the result of the `value` field to the output variable specified in the `set` field, replacing the existing value of the output variable. You can specify only one output variable, although this variable can be an array or object.

#### create

Use the `create` field when you want to use the result of the `value` field to create a new entry for the output array specified in the `create` field, appending it to the array. You can specify only one output variable, although this variable can be an array or object.

#### from

Specify which variables are used in the action as either a single variable or an array of variables, where a variable can be an array or an object. The `from` field is not included if no inputs are used.

#### value

Use GatewayScript to provide a script that produces output variables. When a single input is mapped to a single output, the `value` field can be omitted and the variable in `from` is set or created as the variable in `set` or `create` respectively.

#### default

Provide a static value, or an inline variable reference, to be applied to the output when no input value is provided. For information on inline variable references, see [Inline references](#).

#### foreach

Specify a variable if you want to execute the associated `actions` field for each entry of the array. The variable can be from the input or output of the Map policy.

#### actions

Use the `actions` field to nest actions within an action. Because another action could achieve the same result if applied only once, it is primarily for use with the `foreach` field.

## Script

---

In a **value** or **default** field, use GatewayScript to write the behavior of the action to which the **value** field belongs.

Include the script in single quotation marks. For example: `'4 + 5'` or `'variable_1.toUpperCase()'`.

For information about GatewayScript, see [Gateway programming model and GatewayScript](#)

## Fields

---

### from, set, and create

Each action must have a single **set** or **create** field that specifies the output variable to which the action is applied. Each action can also have a **from** field containing one or more entries that are used to specify the input variable or variables that are used in the action.

The **set** and **create** fields are both used to assign values to the output variable.

- **set** replaces the current value of the output variable or creates the variable if it does not already exist.
- **create** appends a new array entry to the output variable.

For **set** and **create**, use `output_variable_name.variable_name` to specify which of your defined output variables to use, where `output_variable_name` is as defined in the outputs section of the Map policy and `variable_name` refers to an optional field that belongs to the output variable.

For **from**, use `input_variable_name.variable_name` to specify which of your defined output variables to use, where `input_variable_name` is as defined in the outputs section of the Map policy and `variable_name` refers to an optional field that belongs to the output variable.

### foreach

Use the **foreach** field to specify an input array for which the following **actions** or **value** field will be executed for each entry of the array.

For example:

```
foreach: input.in
actions:
  actions
```

where `input.in` is an input variable that is an array and `actions` is one or more actions in the same format as the parent section. In this example the instructions specified in `actions` are executed once for each array entry of `input.in`.

Referencing the input variable specified in the **foreach** field references the array entry that the current iteration corresponds to.

If a single variable is used in the **foreach** field instead of an array, the following **actions** or **value** field will be applied to or based upon the single variable once and then the loop will terminate.

## References to inputs and outputs

---

Reference variables from the **from** field either by name or by using a number preceded by a '\$' and enclosed in parentheses. The variables are numbered from 1, where 1 is the first variable in the array, or the only variable when the **from** field lists only a single variable. For example:

```
value: '$(1) + $(2)'
```

or

```
value: '$(variable_1) + $(variable_2)'
```

where each `variable` is a variable that is included in the **from** field.

During a **foreach** loop, you can reference `$(0)`. The `$(0)` variable begins a **foreach** loop empty but, after an iteration, becomes equivalent to the output of the iteration and can then be referenced again. In this manner, you can apply an array to a single value. For example:

```
- set: out.total
from: in.input
foreach: in.input
value: '$(0) + $(in.input)'
```

where `out.total` is referenced by `$(0)`. In each iteration, the current value of `out.total` and the current array entry of `in.input` are summed, and the value of `out.total` is set as this summation.

When using a **foreach** to operate on an array, if the elements of the array do not have named fields, you can use `$(this)` to reference the current level of nesting.

## Accessing other contexts

---

At any point within your Map policy's **value** or **default** fields, you can access the context of the API call using the syntax `$(context.variable)`.

Alternatively, you can include the variables from other contexts when you define an input to your map policy and then reference it as you would any other input variable.

For a list of available context variables, see [API Connect context variables](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.

For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Configuring the Map policy in the user interface

The assemble view in API Manager provides a visual representation of the relations between the inputs and outputs of your Map policy.

## Procedure

To configure your Map policy, complete the following steps:

1. Click the Map policy in the canvas of the Assemble view.  
The property sheet opens.
2. Click the Edit inputs icon  in the Input column.
3. Add an input variable.
  - a. Click + input.
  - b. In the Context variable field for an input, provide the location of your input variable in the context of the assembly. For a list of context variables, see [API Connect context variables](#).
  - c. In the Name field for an input, provide a name for your input for use within only the Map policy.  
Note:  
You must ensure that the name that you provide does not exactly match the value of the Context variable field, or the result might be unpredictable.
  - d. Optional: In the Content type field, specify the type of your input. If None is selected, the content type is treated as JSON.
  - e. In the Definition field for an input, provide the type of the variable.  
The type can be one from a standard set of types, a definition that you have created for your API, or you can select Inline schema to provide a schema as one of the following options:
    - YAML
    - JSON
    - Generate from sample JSON
    - Generate from sample XML  
If you select Object or Array, you can create a schema through the user interface after you have clicked Done and returned to the main view of the property sheet.
4. Optional: To remove a variable, click the corresponding Remove input icon .
5. After you have added all of your input variables, click Done.
6. Click the Edit outputs icon  in the Output column.
7. Add an output variable.
  - a. Click + output.
  - b. In the Context variable field for an output, provide the location of your output. This location can be a new context or one already established during the assembly. For a list of context variables, see [API Connect context variables](#).
  - c. In the Name field for an output, provide a name for your variable to use within the Map policy and when it is included in its context at output.  
Note:  
You must ensure that the name that you provide does not exactly match the value of the Context variable field, or the result might be unpredictable.
  - d. Optional: In the Content type field, specify the type of your input. If None is selected, the content type is treated as JSON.
  - e. In the Definition field for an output, provide the type of the variable.  
The type can be one from a standard set of types, a definition that you have created for your API, or you can select Inline schema to provide a schema as one of the following options:
    - YAML
    - JSON
    - Generate from sample JSON
    - Generate from sample XML  
If you select Object or Array, you can create a schema through the user interface after you have clicked Done and returned to the main view of the property sheet.
8. Optional: To remove a variable, click the corresponding Remove output icon .
9. After you have added all of your output variables, click Done.
10. Optional: If you selected Object or Array for the type of an input or output, create an inline schema definition through the user interface by completing the following steps:
  - a. For an Array, click add item. Provide a type for the item and then click the Add icon .
  - b. For an Object, click add property. Provide a name and type for the property and then click the Add icon .  
For objects and arrays created in this manner, you can continue to add items and properties, which can themselves be objects and arrays.
11. To connect an input variable to an output variable, click the circle that is directly before the input variable and then click the circle that is directly before the output variable.  
A green line is drawn, linking the two variables together. You can connect multiple inputs to a single output, and a single input can be connected to multiple outputs.
12. To configure an output, whether it has inputs connected to it or not, click the circle directly before the output variable without first clicking on a circle for an input variable.  
The Configure mapping window opens.
13. Optional: In the Mapped from section of the window, you can view which inputs are mapped to the output you are editing. To remove an input, click the Remove input icon  alongside the input.  
If the output is part of an array, further configuration options are available. The array, or levels of array in the case of a multidimensional array, can be created by iterating arrays on the input side of the mapping. For each level of your array, select which array on the input side is to be iterated. In the Value field, you can use `$(this)` to reference elements of an array that are not named within the array.
14. Optional: In the Value field, use GatewayScript to configure how any inputs are transformed to produce the output.  
For more information about valid code, see the [Script](#) section of the [The Map policy structure](#) topic.
15. Optional: In the Default field, provide a static value, or an inline variable reference, to be applied to the output when no input value is provided. For information on inline variable references, see [Inline references](#).
16. Optional: To delete all mappings to the output, click Delete.
17. When you have configured your outputs, click OK.
18. Optional: Click the Settings icon in the Map column.

- a. Optional: Provide a Title and Description for your Map policy.  
 b. To control the XML output of the map policy, select the following options as required:

Include empty

If the check box is selected (the default option), empty XML elements are included in the output of the map policy. Clear the check box if you do not want empty XML elements to be included in the output of the map policy.

Namespace inheritance

If the check box is selected (the default option), XML namespaces are inherited from the parent element. Clear the check box if you want the map policy to use explicit namespaces.

Namespace inlining

If the check box is selected (the default option), XML namespaces will be inserted into the document where they are first used. Clear the check box if you want namespaces to all be defined on the root element.

API Gateway only

Resolve XML input data type

If the check box is selected, XML elements whose schema is configured as type boolean or numeric will be converted to that data type. Clear the check box (the default option) if you want all XML element values to be returned as a string.

API Gateway only

Parse XML output

If the check box is selected, the map policy will write XML output to `message.body` as a parsed XML document. By default, the XML will be output as an XML string. XML output to any other variable will always be written as an XML string.

Note: These options effect the XML output only and have no effect on the JSON data.

API Gateway only

- c. From the Empty XML element handling list, select one of the following options to control how the map policy handles the output of an empty XML element:

- String (the default option): An empty XML element is handled as an empty string.
- Null: An empty XML element is handled as a null value.
- None: The data is ignored.
- API Gateway only String Badgerfish: The value for an empty XML element is considered to be an empty string. The empty string value will be placed into a JSON badgerfish value property.
- API Gateway only Null Badgerfish: The value for an empty XML element is considered to be null. The null value will be placed into a JSON badgerfish value property. A mapping of this element to a JSON output property does not occur unless the Allow null value option is selected.

API Gateway only

- d. Select the following general configuration options as required:

Use only first array element

If the check box is selected, then if an array is encountered in the traversal of the input, only the first element is used. Clear the check box (the default option) if you want the map policy to use all array elements.

Resolve API Connect variable references

If the check box is cleared (the default option), the map policy ignores API Connect variable references in the map policies. Select the check box if you want API Connect variable references found in the map properties to be resolved.

Allow null value

If the check box is selected (the default option), an input property value with a null value is mapped to the output document. Clear this check box (the default option) if you want the map policy to ignore null input values.

Optimize schema definition

If the check box is selected, complex schema types evaluation handles circular type references in an optimized manner. Clear this check box (the default option) to evaluate these schema types in a standard manner.

API Gateway only

Enable JSON post processing

If the check box is selected, post processing of mapped JSON output is enabled. The post processing of JSON output will use the output schema to ensure that property values are of the same data type as that defined in the schema. It will also normalize output property values that have a Badgerfish JSON syntax due to object mapping of an XML input. The check box is cleared by default, meaning that there is no post processing of mapped JSON output.

API Gateway only

Create empty parent object for failed mapping

API Gateway only

Use this setting to control the behavior if a mapping fails because its input is not present and there is no default mapping configured.

The default behavior is to make no change to the output, but if you select this check box an empty object is created for the parent of the target mapping, emulating the behavior of IBM API Management Version 4.0.

Example

The map policy defines a mapping to `output.a.b.c`.

If input data is present, the output is as follows:

```
{
  "a": {
    "b": {
      "c": "inputvalue"
    }
  }
}
```

If there is no input data, and the Create empty parent object for failed mapping option is selected, the output is as follows:

```
{
  "a": {
    "b": {
    }
  }
}
```

Properties `a` and `b` are created but the value of `b` is an empty object. The check box is cleared by default.

Create required child properties for array objects and mapped optional objects

If the check box is selected, default values are generated in the output for required properties that are either not mapped, or for which there is no input data present, in the following specific cases:

- An array consists of objects that contain one or more required properties.
- An object which is optional has one or more child properties that are required.

By default, these required properties are not present in the output. If you select this option, these required properties will be present in the output. If the output schema defines a **default** property for the output property then the specified default value is used, otherwise a default value is assigned dependent on the data type, as follows:

- String: empty string ("")
- Number: 0
- Boolean: false
- Object: empty object
- Array: empty array

#### Example 1

The input data has the following array of objects:

```
[{"a": "value1"}, {"a": "value2", "b": "value3"}]
```

The output schema defines the output object as having two properties, **a** and **b**, of which **b** is required. The map policy defines the following mappings:

- `input.array.a` to `output.array.a`
- `input.array.b` to `output.array.b`

If the check box is selected, and **b** is either not mapped or has no input data present, then **b** is assigned a default value of an empty string, and the output is as follows:

```
[{"a": "value1", "b": ""}, {"a": "value2", "b": "value3"}]
```

#### Example 2

The output schema defines the following structure:

```
{"a": {"b": {"c": "value1", "d": "value2"} } }
```

Property **b** is optional but property **d** within **b** is required.

The map policy defines a mapping to `output.a.b.c`.

If the check box is selected, and **d** is not mapped, then **d** is assigned a default value of an empty string, and the output is as follows:

```
{"a": {"b": {"c": "value1", "d": "" } } }
```

If the check box is not selected, these required properties are **not** created in the output with their default values.

- e. API Gateway only From the Empty JSON array handling list, select one of the following options to control how the map policy handles the output of an empty array:
- All (the default option): Output all empty arrays, including empty children arrays.
  - Parent: Output only the current property's empty array value. Children map actions of this property are not attempted.
  - None: Prevent any empty output array values from being produced.
- f. From the Severity level for input data log messages list, select one of the following options to specify the severity level for log messages that relate to input data:
- error
  - warn
  - info
- g. API Gateway only Set the Schema definition circular reference limit field to an integer value that specifies the maximum allowed number of iterations of a circular schema definition. The default value is 1, which means that circular schema definitions are not followed. The maximum possible value is 5.
- h. Click Save when done.

## Results

You have configured a Map policy to transform and map variables in your assembly flow.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.

For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Map policy examples

Examples of the OpenAPI definitions of Map policies.

- [One to one mapping](#)
- [Many to one mapping](#)
- [A simple transformation using the value field](#)
- [Mapping from multiple contexts into a new context](#)
- [Mapping to an inline schema definition](#)
- [Mapping with a default value](#)
- [Mapping an array into a single value](#)
- [Mapping array elements to an array](#)
- [Using the advanced XML options](#)

## One to one mapping

The following example:

- maps parameters from the request's query to an object in the message body.
- maps one strings directly to a single string.
- maps one integer directly to a single integer.

The referenced definition, `output`, defines an object containing a string, name, and an integer, age.

```
- map:
  title: 1-1 map
  inputs:
    input_string:
      schema:
        type: string
        variable: request.parameters.name_in # the location of the variable, named "name_in" and found in the query
parameters of the request
    input_integer:
      schema:
        type: integer
        variable: request.parameters.age_in # another variable in the query parameters of the request
  outputs:
    output:
      schema:
        $ref: '#/definitions/output' # a schema definition reference to use for the output. The schema is for the
whole of the message body.
        variable: message.body
  actions:
    - set: output.name_out # in the actions section, variables are referenced by their name within the map policy
      from: input_string # if a value field is not used, the mapping is direct with the input value used for the
output variable
    - set: output.age_out # because the 'output' variable is itself an object, further references are made to
variables that it contains
      from: input_integer
```

## Many to one mapping

The following example:

- maps parameters from the request's query to an object in the message body.
- maps two strings to a single string by concatenating them.
- maps two integers to a single integer by summing them.

The referenced definition, `output`, defines an object containing a string and an integer.

```
- map:
  title: many-1 map
  inputs:
    input_string_1:
      schema:
        type: string
        variable: request.parameters.first_name
    input_string_2:
      schema:
        type: string
        variable: request.parameters.last_name
    input_integer_1:
      schema:
        type: integer
        variable: request.parameters.balance_1
    input_integer_2:
      schema:
        type: integer
        variable: request.parameters.balance_2
  outputs:
    output:
      schema:
        $ref: '#/definitions/output'
        variable: message.body
  actions:
    - set: output.full_name
      from:
        - input_string_1
        - input_string_2
      value: |
        var retValue = undefined;
        if (($input_string_1) !== undefined && $(input_string_2) !== undefined) {
          retValue = $(input_string_1).toUpperCase() + ' ' + $(input_string_2).toUpperCase()
        }
        retValue;
    - set: output.total_balance
      from:
        - input_integer_1
        - input_integer_2
      value: |
        var i1 = 0;
        var i2 = 0;
        if (($input_integer_1) !== undefined) i1 = $(input_integer_1);
        if (($input_integer_2) !== undefined) i2 = $(input_integer_2);
        i1 + i2;
```

## A simple transformation using the value field

The following example:

- maps a parameter from the request's query to an object in the message body.
- maps one string featuring lowercase characters to a single string containing only uppercase characters.

The referenced definition, `output`, defines an object containing a single string.

```
- map:
  title: Uppercase map
  inputs:
    input_lowercase:
      schema:
        type: string
        variable: request.parameters.name_in
  outputs:
    output_uppercase:
      schema:
        $ref: '#/definitions/output'
        variable: message.body
  actions:
    - set: output_uppercase.name_out
      from: input_lowercase
      value: $(input_lowercase).toUpperCase() # the input variable is referenced and calls the toUpperCase method to
produce a value for the output variable
```

## Mapping from multiple contexts into a new context

The following example:

- maps an integer from the request's header to an integer in a new message body.
- maps a string from the message's body to the body of a new custom context, named `new_context`.

```
- map:
  title: Context map
  inputs:
    input_integer:
      schema:
        type: integer
        variable: request.headers.age_in # the 'age_in' header of the request is used as an input
    input_string:
      schema:
        type: string
        variable: message.body.name_in # as is the 'name_in' field of the request body
  outputs:
    output_integer:
      schema:
        type: integer
        variable: message.body.age_out
    output_string:
      schema:
        type: string
        variable: new_context.body.name_internal # the context named 'new_context' is created by the map policy and
exists only while the assembly is processed
  actions:
    - set: output_string
      from: input_string
    - set: output_integer
      from: input_integer
```

## Mapping to an inline schema definition

The following example:

- maps parameters from the request's headers to an object in the message body, which is defined within the map policy.
- maps one string directly to a single string.
- maps one integer directly to a single integer.

```
- map:
  title: Inline schema map
  inputs:
    input_integer:
      schema:
        type: integer
        variable: request.headers.age_in
    input_string:
      schema:
        type: string
        variable: request.headers.name_in
  outputs:
    output:
      schema: # instead of a simple type or a reference to a definition, an inline YAML definition
is used
        type: object
        properties:
          name_out:
            type: string
            name: name_out
          age_out:
```

```

        type: integer
        format: int32
        name: age_out
        title: output
        variable: message.body
    actions:
    - set: output.age_out
      from: input_integer
    - set: output.name_out
      from: input_string

```

## Mapping with a default value

The following example:

- maps one string directly to a single string.
- provides a default value for the output string if a valid input string is not provided.

```

- map:
  title: Default Map
  inputs:
    input_string:
      schema:
        type: string
        variable: request.headers.name_in
  outputs:
    output_string:
      schema:
        type: string
        variable: message.body.name_out
  actions:
  - set: output_string
    from: input_string
    default: John Smith # the default field is specified in the same way as a value, in this case
    providing a fixed value

```

## Mapping an array into a single value

The following map policy:

- maps a single array of integers into a single integer.
- sums the integers in the array.
- $\$(0)$  represents the accumulated output because map evaluates all array element values.

```

- map:
  title: Summation map
  inputs:
    input:
      schema:
        $ref: '#/definitions/balance_array_in'
        variable: request.body
  outputs:
    output:
      schema:
        type: integer
        variable: message.body.total_balance_out # instead of using a full schema definition of the message body, a
    single variable in the message body is specified
  actions:
  - set: output
    from: input
    foreach: input # the foreach field specifies that each value of the array 'input' is to be iterated over
    value: $\$(0)+$(input) # the $\$(0) reference is the accumulated value of the 'output' variable

```

## Mapping array elements to an array

The following map policy:

- maps an array, whose elements are objects containing two integers, to an array, whose entries contain a single integer field.
- maps an array to an array of the same length.
- takes the difference of the values of the integers in each array element to create a single integer in each array element.

```

- map:
  title: Array summation
  inputs:
    input:
      schema:
        $ref: '#/definitions/balance_and_credit_array'
        variable: request.body
  outputs:
    output_array:
      schema:
        type: array
        variable: message.body
  actions:
  - create: output_array
    from: input
    foreach: input
    actions:
    - set: total_balance_out
      from: # inside the actions section, variables inside the array elements being

```

```

iterated over are used
- integer_in_1
- integer_in_2
value: ${integer_in_1}-${integer_in_2} # the difference of the variables is taken for each array entry
of 'input'

```

## Using the advanced XML options

The following example:

- does not include empty elements in the output of the map policy.
- uses explicit name spaces rather than inheriting name spaces from the parent element
- indicates that all namespace declarations will be placed on the root XML element.
- uses all array elements rather than only the first
- ignores API Connect variable references
- maps input property values with a null value to the output document
- handles circular type references in an optimized manne

```

actions:
- set: output, two
  from: input, one
options:
  includeEmptyXMLElements: false
  namespaceInheritance: false
  inlineNamespaces: false
  mapArrayFirstElementValue: false
  mapResolveApicVariables: false
  mapNullValue: true
  mapOptimizeSchemaDefinition: true
  mapCreateEmptyArray: parent

```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## OAuth

An OAuth policy performs the requested OAuth processing based on the defined OAuth provider settings.

## Gateway support

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® API Gateway	2.0.0

This topic describes how to configure the policy in the assembly user interface; for details on how to configure the policy in your OpenAPI source, see [oauth](#).

## About

By adding an assembly OAuth policy, you specify the OAuth provider settings to use to perform the requested OAuth processing and the supported OAuth processing components.

Note: You add an OAuth policy to the assembly in a native OAuth provider. For more information, see the following topics:

- [Editing the native OAuth provider configuration using the API Editor](#) (Cloud Manager UI)
- [Editing the native OAuth provider configuration using the API Editor](#) (API Manager UI)

You can specify the settings through one or more of the following methods.

- URL reference
- Literal configuration
- Object reference

When you use more than one method to specify the same aspect of the OAuth provider settings, the following precedence rules apply to enforce the settings dynamically for the incoming transactions.

- URL reference takes precedence over any existing literal configuration or object reference.
- Literal configuration takes precedence over any existing object reference.

You can configure the policy to support one or more of the following processing components:

Validate request

Validates the authorization request from the client.

Generate authorization code

Generates the authorization code for the client, which represents the resource owner's authorization that grants access to the requested resource.

Verify authorization code

- Verifies the authorization code from the client.
- Verify refresh token
  - Verifies the refresh token that is presented by the client.
- Generate access token
  - Generates the access token to the client when the authorization code or refresh token is verified.
- Introspect token
  - Introspects the token to determine its state and, when active, its metadata.

When the policy does not support a processing component but that processing is requested, the unsupported component is not run.

You can include multiple OAuth policies in your OAuth provider assembly. For example, your assembly might include the following flow:

1. OAuth policy that validates the request.
2. GatewayScript policy.
3. OAuth policy that generates authorization code.

For more information, see [Example - using multiple OAuth policies in an OAuth provider assembly](#) and [OAuth context variables](#).

## Properties

The following table lists the policy properties, indicates whether a property is required, specifies the valid and default values for input, and specifies the data type of the values.

Table 2. OAuth policy properties

Property label	Required	Description	Data type
Title	No	The title of the policy. The default value is <code>oauth</code> .	string
Description	No	A description of the policy	string
Default OAuth Provider Settings Object	Yes	The name of an existing OAuth provider that defines the required settings.	string
Dynamic OAuth configuration from a URL	No	A URL to a document that contains serialized XML or JSON properties that defines OAuth token generate settings.	string
Dynamic OAuth configuration from a literal string	No	A literal string that contains serialized XML or JSON properties that defines OAuth token generate settings.	string
Supported OAuth components	No	Select the OAuth components that are supported by this policy.	string

## Overriding the default OAuth provider settings

You can use either the Dynamic OAuth configuration from a literal string property or the Dynamic OAuth configuration from a URL property to dynamically override any OAuth provider configuration settings defined by the Default OAuth Provider Settings Object property.

For example, to override the access token expiration time with a value of 200 seconds, include the following configuration in either the literal string or the document at the specified URL:

```
<OAuthProviderSettings><APICAccessTokenTTL>200</APICAccessTokenTTL></OAuthProviderSettings>
```

For a list of all OAuth provider settings, refer to the `OAuthProviderSettings` management schema, defined in the `xml-mgmt.xsd` file located in the store: directory on the DataPower API Gateway.

If you are using the API Manager user interface, the connection details are determined by the API Manager URL that you open, and the user ID with which you log in. If you are using the API Designer user interface, you provide the management server details and user ID in the login window that opens when you first launch API Designer; see [Logging into API Connect Designer](#).

- [Example - using multiple OAuth policies in an OAuth provider assembly](#)  
This example demonstrates the use of multiple OAuth policies in the assembly flow for a native OAuth provider.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Example - using multiple OAuth policies in an OAuth provider assembly

This example demonstrates the use of multiple OAuth policies in the assembly flow for a native OAuth provider.

The example is based on the default assembly that is generated when you create a native OAuth provider, and is customized with the addition of `gatewayscript` policies that use [OAuth context variables](#) to manipulate the OAuth flow. For details on creating a native OAuth provider, see [Configuring a native OAuth provider](#).

It has the following assembly flow:

The following sections describe the OpenAPI source code that underlies each of the policies in the assembly; for the complete assembly code, download [multiple\\_oauth\\_policies.txt](#).

## Sample policy to add a custom scope

The `add_scope` policy is a `gatewayscript` policy that adds a custom scope to the request.

The underlying OpenAPI source YAML is as follows:

```
- gatewayscript:
  version: 2.0.0
  title: add_scope
  source: |-
    // Add another custom scope to the request
    let scope = context.get("request.parameters.scope.values[0]");
    if (scope)
      context.set("oauth.processing.scope", scope + " custom");
```

## Validate the initial OAuth request

The first `process_request` policy is an `oauth` policy that processes the initial request and verifies that the request is valid. The result of the processing is stored automatically in the `oauth.processing` context variables for use, as required, by the next OAuth policy in the assembly flow.

The underlying OpenAPI source YAML is as follows:

```
- oauth:
  title: process_request
  version: 2.0.0
  description: >-
    This oauth policy performs all OAuth/OpenID Connect protocol steps
    that are needed for OAuth Validation by default. The inputs and
    outputs of each of the steps are driven by documented context
    variables. Add or remove the Supported OAuth Components as required.
  oauth-provider-settings-ref:
    default: custom-form
  supported-oauth-components:
    - OAuthValidateRequest
```

## Sample policy to modify the scope

The `modify_scope` policy is a `gatewayscript` policy that modifies the scope depending on the calling application.

The underlying OpenAPI source YAML is as follows:

```
- gatewayscript:
  version: 2.0.0
  title: modify_scope
  source: |-
    let admin_id = '1f1a2aa4-db9f-4423-b2f1-e2572b12123a';

    // Check application and modify the scope
    let app = context.get("oauth.processing.client_id");
    let scope = context.get("oauth.processing.scope");
    if (app === admin_id) {
      context.set("oauth.processing.scope", scope + " admin");
    } else {
      context.set("oauth.processing.scope", scope + " customer");
    }
  }
```

## Branch conditionally according to the OAuth path

The `path_branch` policy is a `switch` policy that branches according to the different OAuth paths to process the resource owner.

The underlying OpenAPI source YAML is as follows:

```

- switch:
  version: 2.0.0
  title: path_branch
  case:
    - condition: ($operationPath() = '/oauth2/token')
      execute:
        .
        .
        .
        definition of the user_security and other_grants policies
        .
        .
    - condition: ($operationPath() = '/oauth2/authorize')
      execute:
        .
        .
        .
        definition of the user_password and implicit_authcode policies
        .
        .
    - otherwise:
        .
        .
        .
        definition of the other_endpoints policy
        .
        .

```

## Process the user name and password, and enable grant type component

The following two policies operate on the token endpoint.

- The `user_password` policy for password grant type processes the user name and password from the `x-www-form-urlencoded` body. The authentication method is derived from the User Security settings in the OAuth provider; see [Configuring user security for a native OAuth provider](#).
- The `other_grants` policy is an `oauth` policy that enables the `OAuthGenerateAccessToken`, `OAuthVerifyAZCode`, `OAuthVerifyRefreshToken`, and `OAuthCollectMetadata` components to perform the operations for client credentials, authorization code, refresh token, and password grant types.

The underlying OpenAPI source YAML is as follows:

```

- user-security:
  title: user_password
  version: 2.0.0
  description: ''
  factor-id: default
  extract-identity-method: context-var
  user-context-var: request.parameters.username.values
  pass-context-var: request.parameters.password.values
  ei-stop-on-error: false
  user-auth-method: auth-url
  au-stop-on-error: false
  auth-url: 'http://httpbin.org/basic-auth/user/pass'
  user-az-method: authenticated
  az-stop-on-error: true
  auth-response-headers-pattern: (?)*x-api*
  auth-response-header-credential: X-API-Authenticated-Credential
- oauth:
  title: other_grants
  version: 2.0.0
  description: >-
    This oauth policy performs all OAuth/OpenID Connect
    protocol steps that are needed for token path by default.
    The inputs and outputs of each of the steps are driven by
    documented context variables. Add or remove the Supported
    OAuth Components as required.
  oauth-provider-settings-ref:
    default: custom-form
  supported-oauth-components:
    - OAuthGenerateAccessToken
    - OAuthVerifyAZCode
    - OAuthVerifyRefreshToken
    - OAuthCollectMetadata

```

## Perform authorization checks, and enable grant type components

These following two policies operate on the authorize endpoint.

- The `user_security` policy configuration is derived from the User Security settings in the OAuth provider; see [Configuring user security for a native OAuth provider](#).
- The `implicit_authcode` policy is an `oauth` policy that enables the `OAuthGenerateAZCode`, `OAuthGenerateAccessToken`, and `OAuthCollectMetadata` components to perform the operations for the implicit and authorization code grant types.

The underlying OpenAPI source YAML is as follows:

```

- user-security:
  title: user_security
  version: 2.0.0
  description: >-
    This user security policy performs EI(basic) and AU(auth

```

```

    url) check for oauth assembly. Change the security check
    method as required
    factor-id: default
    extract-identity-method: basic
    ei-stop-on-error: true
    user-auth-method: auth-url
    au-stop-on-error: true
    user-az-method: authenticated
    az-stop-on-error: true
    auth-response-headers-pattern: (?x-api*
    auth-response-header-credential: X-API-Authenticated-Credential
    auth-url: 'http://httpbin.org/basic-auth/user/pass'
- oauth:
  title: implicit_authcode
  version: 2.0.0
  description: >-
    This oauth policy performs all OAuth/OpenID Connect
    protocol steps that are needed for az code path by
    default. The inputs and outputs of each of the steps are
    driven by documented context variables. Add or remove the
    Supported OAuth Components as required.
  oauth-provider-settings-ref:
    default: custom-form
  supported-oauth-components:
    - OAuthGenerateAZCode
    - OAuthGenerateAccessToken
    - OAuthCollectMetadata

```

## Process all other endpoints

The `otherwise` condition catches all other endpoints such as the introspect and revoke endpoints. The `other_endpoints` policy in the `otherwise` condition is an `oauth` policy that enables the `OAuthIntrospectToken`, and `OAuthRevokeTokencomponents` components to perform the operations for introspect and revoke.

The underlying OpenAPI source YAML is as follows:

```

- oauth:
  title: other_endpoints
  version: 2.0.0
  description: >-
    This oauth policy performs all OAuth/OpenID Connect
    protocol steps that are needed for all other paths by
    default. The inputs and outputs of each of the steps are
    driven by documented context variables. Add or remove the
    Supported OAuth Components as required.
  oauth-provider-settings-ref:
    default: custom-form
  supported-oauth-components:
    - OAuthIntrospectToken
    - OAuthRevokeToken

```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Parse

Use the Parse policy to control the parsing of an input document. When the input document is a JSON string, the string is parsed instead of copied over.

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® API Gateway	2.0.0 2.1.0 (DataPower API Gateway Version 10.0.3.0 or later)

This topic describes how to configure the policy in the assembly user interface; for details on how to configure the policy in your OpenAPI source, see [parse](#).

## About

With the parse policy, you can retrieve parse settings by using the following methods in increasing order of precedence:

1. Specify a valid parse settings configuration from which to retrieve its properties as the default parse settings.  
Note: If you change the default name, you **must** separately configure a corresponding ParseSettings object on the DataPower API Gateway.
2. Specify a literal string as serialized XML or JSON properties as parse settings. These properties take precedence over any existing default properties. The literal string must be XML or JSON formatted.
  - The XML format is "`<ParseSettings><propertyName>propertyValue</propertyName></ParseSettings>`".
  - The JSON format is "`{ \"ParseSettings\" : { \"propertyName\" : propertyValue } }`".
3. A URL that represents a named context from which to retrieve the serialized XML or JSON properties as parse settings. These properties take precedence over any existing literal or default properties.

## Properties

The following table lists the policy properties, indicates whether a property is required, specifies the valid and default values for input, and specifies the data type of the values.

Table 2. Parse policy properties

Property label	Required	Description	Data type
Title	No	The title of the policy. The default value is <b>parse</b> .	string
Description	No	A description of the policy.	string
Use Content Type	No	If this setting is enabled and the parse setting is configured to detect the document type, the parse operation uses the <b>Content-Type</b> specified in the request headers. If this setting is enabled and the document type in the parse setting is configured for either JSON or XML, the parse operation uses the <b>Content-Type</b> specified in the request headers and fails if the <b>Content-Type</b> in the request headers does not match the parse setting.  Enabling this setting is applicable only when the expected <b>Content-Type</b> is either JSON or XML.  If this setting is not enabled, the parse operation uses either the document type that is specified in the parse setting, or the detected document type if the parse setting is configured to detect the document type.  The check box is cleared by default.	boolean
Parse settings object reference	No	An existing valid object from which to retrieve default property values for the dynamic object.	string
Document type	No	The type of document to parse. Select one of the following options: <ul style="list-style-type: none"> <li>• Detect: the document type is detected and the payload is parsed accordingly. This type is the default option.</li> <li>• JSON: the payload is parsed as JSON.</li> <li>• XML: the payload is parsed as XML.</li> <li>• GraphQL: parsing is performed in one of the following ways: <ul style="list-style-type: none"> <li>◦ As GraphQL in the body of a POST request. The GraphQL is in the following format: <pre>{   me {     name   } }</pre> </li> <li>◦ As a JSON string in the body of a POST request that contains a GraphQL query. The JSON object is in the following format: <pre>{   "query": "query MyData (\$idVar: Int!) { user (id: \$idVar) { name }}",   "operationName": "MyData",   "variables": {"idVar": 123} }</pre> </li> <li>◦ Through the URL query of a GET request. The URL is in the following format: <pre>https://myapi/graphql?query={me{name}}</pre> <p>The following example includes the <b>variables</b> and <b>operationName</b> properties, with URL encoding (line-breaks are for table formatting only, your value will not include line-breaks):</p> <pre>https://hostname/basepath/graphql?query=query%20fetchAccounts%20(\$limit:%20Int)%20{accounts(limit:%20\$limit)%20{name{first,last}}&amp;variables={"limit":100}&amp;operationName=fetchAccounts</pre> </li> </ul> </li> </ul> <p>Query variables in a GET request can be sent as a JSON string in a query parameter called <b>variables</b>. If the query contains several named operations, an <b>operationName</b> query parameter is required to determine which operation is to be executed.</p>	string
Maximum document size	No	Optionally, the maximum document size in bytes of a JSON, XML, or GraphQL input document that the parse operation accepts. This setting provides threat protection by enforcing the maximum document size. Enter a value in the range 0 - 5368709121. A document is rejected when its size exceeds the maximum size. A value of 0 indicates an unlimited document size. When set to 0, the operation result does not return the document size. The default value is 4194304.	integer

Property label	Required	Description	Data type
Maximum nesting depth	No	<p>Optionally, the maximum nesting depth of an XML, JSON, or GraphQL message that the parse operation accepts. This setting provides threat protection by enforcing limits in the message.</p> <ul style="list-style-type: none"> <li>When XML, it is the maximum level of element depth.</li> <li>When JSON, it is the maximum level of nested label-value pairs, the maximum number of nested arrays, or the maximum number of combination of label-value pairs and arrays.</li> <li>When GraphQL, it is the maximum level of nested selection sets.</li> </ul> <p>Enter a value in the range 0 - 4096. A document is rejected when its nesting depth exceeds the maximum depth. A value of 0 indicates unlimited nesting depth. When set to 0, the operation result does not return the nesting depth.</p> <p>The default value is 512.</p>	integer
Maximum width	No	<p>Optionally, the maximum width of the payload that the parse operation accepts.</p> <ul style="list-style-type: none"> <li>When the input document is XML, this property specifies the maximum number of attributes for an element or the maximum number of child elements for an element.</li> <li>When the input document is JSON, this property specifies the maximum number of properties on a JSON object or the maximum number of JSON items in a JSON array.</li> <li>When the input document is GraphQL, this property specifies the maximum number of selections in a selection set.</li> </ul> <p>Enter a value in the range 0 - 65535. The document is rejected when its width exceeds the maximum width. A value of 0 indicates unlimited width. When set to 0, the operation result does not return the width of the document.</p> <p>The default value is 4096.</p>	integer
Maximum name length	No	<p>Optionally, the maximum name length in bytes in a document that the parse operation accepts.</p> <ul style="list-style-type: none"> <li>For XML, it is the length of the name portion of a tag.</li> <li>For JSON, it is the length of the label portion of the JSON label-value pair.</li> <li>For GraphQL, it is the maximum length of the identifiers, including field names and directive names.</li> </ul> <p>The length includes any white space that is contained between tags in XML or quotation marks in JSON. Enter a value in the range 0 - 8192. A document is rejected when its name length exceeds the maximum length. A value of 0 indicates unlimited name length. When set to 0, the operation result does not return the name length of a document.</p> <p>The default value is 256.</p>	integer
Maximum value length	No	<p>Optionally, the maximum value length in bytes in a document that the parse operation accepts.</p> <ul style="list-style-type: none"> <li>For XML, it is the length of an attribute or the length of a text value.</li> <li>For JSON and GraphQL, it is the length of a string value.</li> </ul> <p>The length includes any white space that is contained between tags in XML or quotation marks in JSON. Enter a value in the range 0 - 5368709121. A document is rejected when its value length exceeds the maximum length. A value of 0 indicates unlimited value length. When set to 0, the operation result does not return the value length of a document.</p> <p>The default value is 8192.</p>	integer
Maximum number of unique names	No	<p>Optionally, the maximum number of unique names in a JSON or XML document that the parse operation accepts.</p> <ul style="list-style-type: none"> <li>For XML, it is the number of unique XML local names.</li> <li>For JSON, it is the number of unique JSON labels.</li> </ul> <p>Enter a value in the range 0 - 1048575. A document is rejected when the number of unique names in the document exceeds the maximum number. A value of 0 indicates an unlimited number of unique names. When set to 0, the operation result does not return the number of unique names in a document.</p> <p>The default value is 1024.</p>	integer
Maximum number of unique prefixes	No	<p>Optionally, the maximum number of unique XML namespace prefixes in a document that the parse operation accepts. This limit counts multiple prefixes defined for the same namespace, but does not count multiple namespaces defined in different parts of the input document under a single prefix. Enter a value in the range 0 - 262143. A document is rejected when the number of unique prefixes in the document exceeds the maximum number. A value of 0 indicates an unlimited number of unique prefixes. When set to 0, the operation result does not return the number of unique prefixes in a document.</p> <p>The default value is 1024.</p>	integer
Maximum number of unique namespaces	No	<p>Optionally, the maximum number of unique XML namespace URIs that the parse operation accepts. This limit counts all XML namespaces, regardless of how many prefixes are used to declare them. Enter a value in the range 0 - 65535. A document is rejected when the number of unique namespaces in the document exceeds the maximum number. A value of 0 indicates an unlimited number of unique namespaces. When set to 0, the operation result does not return the number of unique namespaces in a document.</p> <p>The default value is 1024.</p>	integer
Maximum number length	No	<p>Optionally, the maximum number of bytes in the value portion of a JSON label-value pair when the value is a number. The number must be a contiguous string of bytes that contain no white space. The number can include a minus sign and a positive or negative exponent. Enter a value in the range 0 - 256. A document is rejected when the number length in the document exceeds the maximum length. A value of 0 indicates unlimited number length. When set to 0, the operation result does not return the number length in a document.</p> <p>The default value is 128.</p>	integer

Property label	Required	Description	Data type
Parse settings literal configuration	No	A literal string as serialized XML or JSON properties that are merged into the dynamic object. These properties take preference over any existing default properties.	string
Parse settings URL reference	No	A URL that represents a named context from which to retrieve the serialized XML or JSON properties that are merged into the dynamic object. These properties take preference over any existing literal or default properties.	string
Message for parsing	No	The name of a variable in the API context. The content of the <b>body</b> field of the variable is the input to the policy. The default variable name is <b>message</b> .	string
Message for resulting parsed data	No	The name of a variable in the API context. The content of the body field of the variable is the output of the parse operation. The parse metrics of the parsed document can be stored in a different part of the message. The default variable name is the same as the input name, so by default the input message is overwritten by the output message.	string

For examples, see [parse](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.

For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Proxy

Apply the Proxy policy to invoke another API within your assembly, particularly if the separate API contains a large payload. The response from the backend is stored in the **message.body** and in the response object variable if it is defined. Only one policy is permitted to be run per unique assembly flow.

## Gateway support

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® Gateway (v5 compatible)	1.0.0
DataPower API Gateway, functionality provided by <a href="#">Invoke</a>	

This topic describes how to configure the policy in the assembly user interface; for details on how to configure the policy in your OpenAPI source, see [proxy](#).

## About

Only one Proxy policy is permitted to be run per unique flow of your assembly. More than one Proxy policy can be applied, if they are contained in mutually exclusive branches of the assembly.

You can use the Proxy policy to return multipart form data, that is, when the response is set to `Content-Type: multipart/related`. However, Proxy must be the last policy in the assembly, otherwise the response that is received can be manipulated during subsequent steps, thereby causing the multipart form data to be lost.

The proxy policy, if inside a conditional policy, must be the **final** policy to be executed in the API. If you need further processing afterward, use the [invoke](#) policy rather than the proxy policy.

## Properties

The following table lists the policy properties, indicates whether a property is required, specifies the valid and default values for input, and specifies the data type of the values.

Table 2. Proxy policy properties

Property label	Required	Description	Data type
Title	Yes	The title of the policy. The default value is <b>proxy</b> .	string
Description	No	A description of the policy.	string
Invoke URL	Yes	Specifies a URL for the target service. For a SOAP API, a URL is added by default. Where possible, the Proxy URL value is pre-supplied from information that is defined in the imported WSDL.	string
TLS profile	No	Specifies a TLS profile to use for the secure transmission of data.	string
Timeout	Yes	The time to wait before a reply back from the endpoint (in seconds). The default value is <b>60</b> .	integer
Username	No	The username to use for HTTP Basic authentication.	string
Password	No	The password to use for HTTP Basic authentication.	string

Property label	Required	Description	Data type
HTTP Method	Yes	<p>The HTTP method to use for the proxy. Valid values are:</p> <ul style="list-style-type: none"> <li>• Keep</li> <li>• GET</li> <li>• POST</li> <li>• PUT</li> <li>• DELETE</li> <li>• PATCH</li> <li>• HEAD</li> <li>• OPTIONS</li> </ul> <p>The default value is <b>Keep</b>. By using <b>Keep</b>, or removing the property from the source, the HTTP method from the incoming request is used.</p>	string
Compression	No	<p>Select this check box to enable Content-Encoding compression on upload. The check box is cleared by default.</p>	boolean
Cache Type	No	<p>The cache type determines whether to cache documents, honoring or overriding the HTTP Cache Control directives received in the response from the target URL. This property takes effect only when a response is received, otherwise the policy always returns the non-expired response that was previously saved in cache. Valid values are:</p> <p><b>Protocol</b> The cache behavior is determined by the Cache-Control headers on the response, in accordance with RFC 7234. To optimize performance, if the gateway receives more than one request for a resource that is not in the cache but could be cached when the response from the target URL is received, the gateway sends only one request to the target URL; the remaining requests are not processed until the response from the first request has been received and the cache behavior has been determined from this response. If the response indicates that caching is possible, the gateway responds to all waiting requests with the cached resource. If the response indicates that caching is not possible, the gateway sends all waiting requests to the target URL.</p> <p>Use this option only if you expect that responses from the target URL can be cached, in which case it should improve performance and limit the demand on the target URL. If, however, the target URL never indicates that the gateway should cache its response, performance might be impaired when compared to the No Cache option.</p> <p><b>No Cache</b> Responses from the target URL are not cached on the gateway regardless of any caching headers returned. In this case, every request from the client is sent to the target URL. Use this option if you do not want to cache any of the backend responses on the gateway, or if it is unlikely that a response from the target URL will allow caching through the Cache-Control header settings.</p> <p><b>Time to Live</b> This option is similar to the Protocol option except it allows you to specify the amount of time that you want the successful response from the invoke or proxy to remain in the cache. Use this option only if you expect that responses from the target URL can be cached.</p> <p>The default value is Protocol.</p>	string
Time to Live	No	<p>Specifies the amount of time in seconds that the response stays in the cache. Applies only if the property Cache type is set to <b>Time to Live</b>. Enter a value in the range 5 - 31708800. The default value is <b>900</b>.</p>	integer
Cache key	No	<p>Specifies the unique identifier of the document cache entry. If omitted, the entire URL string is used as the key.</p>	string
Stop on error	No	<p>Select the errors that, if thrown during the policy execution, cause the assembly flow to stop. If there is a <b>catch</b> flow configured for the error, it is triggered to handle the error thrown. If an error is thrown and there are no errors selected for the Stop on error setting, or if the error thrown is not one of the selected errors, the policy execution is allowed to complete, and the assembly flow continues.</p>	string
Response object variable	No	<p>The name of a variable that will be used to store the response data from the request. This variable can then be referenced in other actions, such as 'Map'.</p>	string

Property label	Required	Description	Data type
X-Forwarded header	No	<p>This header can be provided by</p> <ol style="list-style-type: none"> <li>If <b>X-Forwarded-Host</b> exists, processing continues. If it does not exist prior to calling the proxy policy, it is set with the value of the <b>Host</b> header.</li> <li>The <b>X-Forwarded-For</b> header is always set, in all cases. This header maintains breadcrumbs, showing a comma-separated list of IPs, from the client through any preceding proxy.</li> <li>If all three of <b>X-Forwarded-Host</b>, <b>X-Forwarded-Port</b>, and <b>X-Forwarded-Proto</b> headers are missing at the time of calling the proxy policy, they are set automatically. To prevent this, set <b>X-Forwarded-Host</b> header to some value before calling the proxy policy.</li> </ol>	string

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Rate Limit

Use the Rate Limit policy to apply one or more rate, burst, or count limits at any point in your API assembly flow. Rate and burst limits restrict the number of calls made to an API in a specified time period, while count limits impose a strict limit on the total number of calls.

## Gateway support

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® API Gateway	2.0.0
	2.1.0 (DataPower API Gateway Version 10.0.1.0 or later)
	2.2.0 (DataPower API Gateway Version 10.0.2.0 or later)

This topic describes how to configure the policy in the assembly user interface; for details on how to configure the policy in your OpenAPI source, see [ratelimit](#).

## About

The defined rate, burst, and count limits are applied to whatever follows in the assembly flow. For example, if a Rate Limit policy is placed before an Invoke policy, and the call made by the Invoke policy exceeds the limits defined by the Rate Limit policy, the API call itself fails.

Note: For information about rate limits and burst limits in API Connect, see [Understanding rate limits for APIs and Plans](#).

## Properties

The following table lists the policy properties, indicates whether a property is required, specifies the valid and default values for input, and specifies the data type of the values.

Table 2. Rate Limit policy properties

Property label	Required	Description	Data type
Title	No	The title of the policy. The default value is <b>ratelimit</b> .	string
Description	No	A description of the policy.	string
Source	Yes	The location of all the rate limit, burst limit, and count limit definitions that are included in this policy. Select one of the following options: <ul style="list-style-type: none"> <li>Catalog by Name: the limits to be applied are defined in the appropriate <b>api-collection</b> object on the DataPower API Gateway, which is the object that represents your API Connect Catalog in the gateway configuration. For details of how to configure a rate, burst, or count limit in the <b>api-collection</b> object, see <a href="#">Configuring a rate, burst, or count limit on the DataPower API Gateway</a>.</li> <li>Plan by Name: the limits to be applied are assembly burst limits or assembly count limits defined on the Plan to which the calling application is subscribed. For details on how to configure assembly burst limits and assembly count limits in a Plan, see <a href="#">Editing a draft Product</a>.</li> <li>Gateway by Name: the limits to be applied are defined in the <b>apigw</b> object, named <b>apiconnect</b>, on the DataPower API Gateway gateway. For details of how to configure a rate, burst, or count limit in the <b>apigw</b> object, see <a href="#">Configuring a rate, burst, or count limit on the DataPower API Gateway</a>.</li> <li>Plan Default: the rate and burst limits that are applied are the default ones configured in the Plan to which the calling application is subscribed. For details on how to configure default Plan rate and burst limits, see <a href="#">Editing a draft Product</a>.</li> </ul> <p>Note: The use of this option does not disable any automatic preflow rate limit policy that might be in place, and could result in the application of the rate limiting being repeated. For more information on preflow policies, see <a href="#">Customizing the preflow policies</a>.</p>	string
Rate Limit Name	Yes <sup>1</sup>	If Source property is set to Catalog by Name, the name of a rate limit as defined in the DataPower API Gateway configuration, To display the Rate Limit Name field, click Add Rate Limit; you can add as many rate limits as you want.  <sup>1</sup> You must provide at least one rate, burst, or count limit.	string
Burst Limit Name	Yes <sup>2</sup>	If Source property is set to Catalog by Name, the name of a burst limit as defined in the DataPower API Gateway configuration. If Source is set to Plan by Name, the name of an assembly burst limit in a Plan.  To display the Burst Limit Name field, click Add Burst Limit; you can add as many burst limits as you want.  <sup>2</sup> You must provide at least one rate, burst, or count limit.	string
Count Limit Name	Yes <sup>3</sup>	If Source property is set to Catalog by Name, the name of a count limit as defined in the DataPower API Gateway configuration. If Source is set to Plan by Name, the name of an assembly count limit in a Plan.  To display the Count Limit Name field, click Add Count Limit; you can add as many count limits as you want.  <sup>3</sup> You must provide at least one rate, burst, or count limit.	string

Property label	Required	Description	Data type
Operation	No	<p>For a rate limit, select one of the following options:</p> <ul style="list-style-type: none"> <li>Consume: the policy reduces the balance of available requests that remain in the interval defined by the rate limit specified in the Rate Limit Name field. The amount by which the remaining balance is reduced is the value that results from the weight expression defined in the specified rate limit.</li> <li>Replenish: the policy increases the balance of available requests that remain in the interval defined by the rate limit specified in the Rate Limit Name field. The amount by which the remaining balance is increased is the value that results from the weight expression defined in the specified rate limit.</li> </ul> <p>The purpose of the replenish operation is to restore an appropriate amount of remaining balance in cases where the amount calculated by an earlier consume operation turns out to be too high. For example, for an assembly rate limit with a limit of 100, a consume operation with a weight of 60 uses 60 requests, leaving 40 requests remaining for the interval. If the weight expression in the subsequent replenish operation computes to 15, meaning that the weight expression calculated that the actual request usage was only 45, the replenish operation increases the remaining requests by 15, to a remaining balance of 55.</p> <p>Note that the replenish operation cannot increase the remaining requests allowed beyond the original limit defined in the assembly rate limit scheme. In this example, a replenish operation cannot replenish requests beyond 100. A replenish operation is skipped if the weight expression evaluates to a value of less than 1.</p> <p>The default value is Consume.</p> <p>For a count limit, select one of the following options:</p> <ul style="list-style-type: none"> <li>Increment: the current count is incremented by the value that results from the weight expression defined in the count limit specified in the Count Limit Name field.</li> <li>Decrement: the current count is decremented by the value that results from the weight expression defined in the count limit specified in the Count Limit Name field.</li> </ul> <p>By default, the count limit is automatically decremented at the end of the API assembly by the total amount incremented during the assembly, minus any decrement operations that are defined in the assembly. You do not need to explicitly define decrement operations unless you want the decrements to occur at specific points in the assembly. However, if the auto decrement feature has been explicitly disabled in the count limit configuration, you must include a corresponding decrement operation, otherwise when the count limit is reached all future calls are blocked. For more information on configuring a count limit, see <a href="#">Configuring a rate, burst, or count limit on the DataPower API Gateway</a>.</p> <p>The default value is Increment.</p> <p>For a burst limit, the only option is Consume, meaning that the limit applied is that defined in the burst limit specified in the Burst Limit Name field.</p>	string

- [Configuring a rate, burst, or count limit on the DataPower API Gateway](#)

If you want to include a rate limiting policy in your API assembly flow, you must first configure the required rate, burst, and count limits on the Gateway. Rate and burst limits restrict the number of calls that an application can make to API in specified time period, while count limits impose a strict limit on the total number of calls.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Configuring a rate, burst, or count limit on the DataPower API Gateway

If you want to include a rate limiting policy in your API assembly flow, you must first configure the required rate, burst, and count limits on the Gateway. Rate and burst limits restrict the number of calls that an application can make to API in specified time period, while count limits impose a strict limit on the total number of calls.

### About this task

You configure rate, burst, and count limits on the DataPower® API Gateway by defining them in one or more configuration files that you package and then add to the Gateway as a Gateway extension.

You define *Catalog scoped* rate, burst, and count limits in the appropriate `api-collection` object on the DataPower API Gateway, which is the object that represents your API Connect Catalog in the gateway configuration. The defined rate, burst, and count limits will be available to be included in [Rate Limit](#) policies in the assembly flows of all the APIs that are published to that Catalog.

You define *Gateway scoped* rate, burst, and count limits in the appropriate `apigw` object on the DataPower API Gateway. The defined rate, burst, and count limits will be available to be included in [Rate Limit](#) policies in the assembly flows of all the APIs that are published to that Gateway.

Note:

- Only one Gateway extension can be in use at any one time, so you should package all required rate, burst, and count limits in a single Gateway extension.
- To apply a Catalog scoped or Gateway scoped rate, burst, or count limit, it must be referenced in a [Rate Limit](#) policy in an API assembly.

- You should ensure that all rate, burst, and count limit names are unique across all your Plans and Catalogs. When an API is called, information about any rate, burst, or count limits (such as name, limiting criteria, and remaining number of calls) is returned in the HTTP headers of the response. If two or more limit definitions with exactly the same name are applied during the invocation of an API, information about only **one** of them is returned. However, **all** limiting criteria are applied.

## Procedure

- Create a `.cfg` file that includes the DataPower API Gateway CLI commands that define the rate, burst, or count limit.

To define a rate limit, use the `assembly-rate-limit` command. To define a burst limit, use the `assembly-burst-limit` command. To define a count limit, use the `assembly-count-limit` command. For details of the command parameters, see [assembly-rate-limit](#), [assembly-burst-limit](#), and [assembly-count-limit](#) in the DataPower product documentation.

Example 1: Configuring a Catalog scoped rate limit

```
top; config;
switch apiconnect;

api-collection myorg_mycatalog_collection
  assembly-rate-limit 30perlmin 30 1 minute on off on on off off "" "my.vars.expected-amount - my.vars.actual-amount"
exit
```

In this example, the `assembly-rate-limit` command specifies a rate limit name, and the API call limits that you want to impose, 30 calls per minute in this case. The final, optional argument, `"my.vars.expected-amount - my.vars.actual-amount"`, is a weight expression. You use weight expressions in cases where you want to restore an appropriate amount of remaining rate limit balance when an earlier usage calculation in your assembly flow turns out to be too high. You define two rate limiting policies in your assembly flow, one with a `consume` operation, and a subsequent one with a `replenish` operation that restores some of the remaining rate limit balance if appropriate. The weight expression calculates the amounts to be consumed or replenished; for more information, see [Rate Limit](#).

The `api-collection` command specifies the `api-collection` object in which you want to configure the rate, burst, or count limits. The name of the `api-collection` object has the following format:

```
org_catalog_collection
```

where:

- `org` is the name of the provider organization that contains your Catalog.
- `catalog` is the name of the Catalog.

This `api-collection` object name is assigned automatically by the Gateway the first time that a Product is published to the Catalog.

Example 2: Configuring a Catalog scoped count limit

```
top; config;
switch apiconnect;

api-collection myorg_mycatalog_collection
  assembly-count-limit maxsixty 60 1 on on off off off off "" "1" off
exit
```

The final argument is the `autodecrement` property that controls whether the count limit is automatically decremented at the end of an API assembly. The default value is `on`, meaning that at the end of the assembly the count limit is automatically decremented by the total amount incremented during the assembly, minus any decrement operations that are defined in the assembly. You do not need to explicitly define decrement operations unless you want the decrements to occur at specific points in the assembly.

Example 3: Configuring a Gateway scoped rate limit

```
top; config;
switch apiconnect;

apigw apigw_object_name
  assembly-rate-limit 30perlmin 30 1 minute on off on on off off "" "my.vars.expected-amount - my.vars.actual-amount"
exit
```

The `apigw` command specifies the name of the `apigw` object in which you want to configure the rate, burst, or count limits; the `apigw` object name is the same as the name of the API Connect domain in your DataPower API Gateway configuration.

- Package the `.cfg` file in a `.zip` file.
  - You can package multiple `.cfg` files in a single `.zip` file if you want; the `.cfg` files must all be at the root of the `.zip` file.
- Add the `.zip` file to the DataPower API Gateway as a Gateway extension. For details, see [Configuring your Gateway server extensions](#).

## What to do next

Apply the rate, burst, or count limits to an API by adding a [Rate Limit](#) policy to the API assembly flow.

## Related information

- [Gateway extension guidelines - DataPower API Gateway](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

# Redaction - DataPower API Gateway

Use the Redaction policy to completely remove or to redact specified fields from the Request body, the Response body, and the activity logs. You might find this policy useful for removing or blocking out sensitive data (for example, credit card details) for legal, security, or other reasons.

## Gateway support

Note: This page describes the Redaction policy implementation in the DataPower® API Gateway. If you are using the DataPower Gateway (v5 compatible), see [Redaction - DataPower Gateway \(v5 compatible\)](#).

For information on the different types of gateway, see [API Connect gateway types](#).

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower API Gateway	2.0.0

This topic describes how to configure the policy in the assembly user interface; for details on how to configure the policy in your OpenAPI source, see [redact - DataPower API Gateway](#).

Note: With the DataPower API Gateway, the input to the Redaction policy must be parsed data. One way to produce parsed data is to use a [Parse](#) policy before a Redaction policy in your assembly flow, which provides explicit control of the parse action.

## Properties

The following table lists the policy properties, indicates whether a property is required, specifies the valid and default values for input, and specifies the data type of the values.

Table 2. Redaction policy properties

Property label	Required	Description	Data type
Title	No	The title of the policy. The default value is <b>redact</b> .	string
Description	No	A description of the policy.	string
Root	No	Specifies the data source that contains the content to redact or remove. If no value is entered in the Root field, the action is applied to the entire API context. You can use any supported JSONata path expression.  If you want to apply the action to either request or response data, specify a value of <code>message.body</code> . The actual content to which the action is applied then depends on the positioning of the Redaction policy in the overall assembly flow; for example: <ul style="list-style-type: none"><li>• If positioned at the beginning, the action is applied to the client request.</li><li>• If positioned after an Invoke policy, the action is applied to the response from the back end.</li><li>• If positioned at the end, the action is applied to the response that is returned to the client.</li></ul> If, in your assembly flow, the Redaction policy is used after a <a href="#">Log</a> policy that specifies Gather-only mode, specify a Root value of <code>log.request_body</code> for the logged request payload, or <code>log.response_body</code> for the logged response payload.	string
Path	Yes	Specifies a JSONata path expression that identifies the content to redact or remove from the source. For more information, see <a href="#">Constructing JSONata expressions to redact fields</a> .	string
Action	No	Specifies whether you want to remove or redact the content. Choose one of the following options: <ul style="list-style-type: none"><li>• Remove: Completely removes the specified fields.</li><li>• Redact: Redacts (obfuscates with "*"s) the fields to block out the data.</li></ul> The default value is Redact.  Note: If a numerical value is being redacted, the redacted value is depicted as <b>*****</b> and the type is changed to <b>string</b> .	string

Tip: You can optionally click Add action to specify JSONata expressions for additional fields that you want to remove or redact from the specified content source.

- [Constructing JSONata expressions to redact fields](#)

To define a field for redaction or removal when using the Redaction policy with the DataPower API Gateway, you supply a JSONata expression that defines the path to the field that you want to redact or remove.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.

For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Constructing JSONata expressions to redact fields

To define a field for redaction or removal when using the Redaction policy with the DataPower® API Gateway, you supply a JSONata expression that defines the path to the field that you want to redact or remove.

The following JSONata functions are supported:

- Aggregation functions:
  - `$average(array)`
  - `$max(array)`
  - `$min(array)`
  - `$sum(array)`
- Array functions:
  - `$append(array1, array2)`
  - `$count(array)`
  - `$reverse(array)`
  - `$sort(array [, function])`
  - `$zip(array1, ...)`
- Boolean functions:
  - `$boolean(arg)`
  - `$exists(arg)`
  - `$not(arg)`
- Numeric functions:
  - `$abs(number)`
  - `$ceil(number)`
  - `$floor(number)`
  - `$formatBase(number [, radix])`
  - `$number(arg)`
  - `$power(base, exponent)`
  - `$round(number [, precision])`
  - `$sqrt(number)`
- Object functions:
  - `$keys(object)`
  - `$lookup(object, key)`
  - `$merge(array<object>)`
  - `$spread(object)`
- String functions:
  - `$contains(str, pattern)`
  - `$join(array[, separator])`
  - `$length(str)`
  - `$lowercase(str)`
  - `$match(str, pattern [, limit])`
  - `$pad(str, width [, char])`
  - `$replace(str, pattern, replacement [, limit])`
  - `$split(str, separator [, limit])`
  - `$string(arg)`
  - `$substring(str, start[, length])`
  - `$substringAfter(str, chars)`
  - `$substringBefore(str, chars)`
  - `$trim(str)`
  - `$uppercase(str)`
- You can use the following functional extensions to standard JSONata notation. Each extension corresponds to a part of the API context.

Table 1. Functional extensions to JSONata

Extension	Variable	Description
<code>\$header(name)</code>	<code>message.headers.name</code>	Message header
<code>\$httpVerb()</code>	<code>request.verb</code>	HTTP method of the request
<code>\$operationID()</code>	<code>api.operation.id</code>	ID of the operation
<code>\$operationPath()</code>	<code>api.operation.path</code>	Path of the operation
<code>\$queryParameter('name')</code>	<ul style="list-style-type: none"> <li>◦ <code>request.parameters.name.locations</code> The supported keyword is <code>query</code>.</li> <li>◦ <code>request.parameters.name.values</code></li> </ul>	Searches for the index of <code>query</code> in <code>request.parameters.name.locations</code> and returns <code>request.parameters.name.values[index]</code> , where <code>[index]</code> is the value for <code>query</code> in locations. Parameter values are not URL decoded.
<code>\$statusCode()</code>	<code>message.status.code</code>	Status code
<code>\$storageType([arg])</code>	<p><code>variable.body</code></p> <p>You can specify any variable in the API context. When no variable is specified, the default variable <code>message.body</code> is used.</p>	Storage type of the message. The supported values are <code>binary</code> , <code>json</code> , <code>stream</code> , or <code>xml</code> .

Extension	Variable	Description
<code>\$urlParameter('name')</code>	<ul style="list-style-type: none"> <li><code>request.parameters.name.locations</code> The supported keywords are <code>path</code> and <code>query</code></li> <li><code>request.parameters.name.values</code></li> </ul>	<p>Searches for the index of <code>path</code> and <code>query</code> in <code>request.parameters.name.locations</code> and returns a single array that contains both <code>path</code> and <code>query</code> values from <code>request.parameters.name.values</code>. When the URL contains both path and query parameter values, the array includes the path values first followed by the query values. The values of each parameter type are added in the order that they are received. Parameter values are URL decoded.</p> <p>For example, the following URL contains both path and query parameter values.</p> <pre>http://example.com/petstore/cats/adopt?breed=Sphynx&amp;breed=Siamese</pre> <p>The <code>\$urlParameter('breed')</code> URL returns the following array of values.</p> <pre>[cats, adopt, Sphynx, Siamese]</pre> <p>In this example, the URL includes an API path that is configured as <code>/petstore/{breed}/{breed}</code>, where <code>breed</code> is configured to be a path parameter of the API path. As a result, <code>cats</code> and <code>adopt</code> are included in the output.</p>
<code>\$xpath(path, xpathExpression)</code>	You can specify any writable variable in the API context. The <code>xpathExpression</code> must be a literal string.	<p>Allows use of XPath expressions. The following example specifies all price elements in the source.</p> <pre>\$xpath(\$, '//price')</pre>

Table 2. Functional extensions to JSONata for GraphQL

Extension	Variable	Description
<code>\$gqlActiveOperation([graphql_message])</code>	<code>message.body</code>	Gets the active operation found in the specified GraphQL message. The <code>operationName</code> must be the same as the name of the active operation.
<code>\$gqlAlias(graphql_field_node)</code>	<code>message.body</code>	Gets the alias of a GraphQL field node.
<code>\$gqlFragments([graphql_message])</code>	<code>message.body</code>	Gets the fragments found in the specified GraphQL message.
<code>\$gqlName([graphql_node])</code>	<code>message.body</code>	Gets the node name. For operations, the node name is the <code>operationName</code> . For fields, fragment definitions, arguments, and other elements, the node name is the name of the element. By default, the <code>operationName</code> of <code>message.body</code> is retrieved.
<code>\$gqlOperations([graphql_message])</code>	<code>message.body</code>	Gets the operations found in the specified GraphQL message.
<code>\$gqlType([graphql_node])</code>	<code>message.body</code>	The operation type of the active operation is retrieved for Query, Mutation, and Subscription query types.

- You can use the `&` (concatenation) navigation operator.

You can use the following JSONata numeric operators:

- `+` (addition)
- `-` (subtraction)
- `*` (multiplication)
- `/` (division)
- `%` (modulo)

You can use the following JSONata comparison operators for number values or strings:

- `=`
- `!=`
- `<`
- `>`
- `<=`
- `>=`

You can also use the following operators and expressions.

- Parentheses to convert a sequence into an array, specify operator precedence, or compute complex expressions on a context value.
- Array ranges and predicate expressions.
- Single asterisk (`*`) and double asterisk (`**`) wildcard characters.

The following elements of a GraphQL query can be exposed in JSONata notation using the syntax shown.

- query**  
The entire GraphQL query including operations and fragments.
- operationName**  
For an anonymous operation, `operationName` can be empty.
- ~fragmentSpreadName**
- on~typeCondition**
- ~~fragmentDefinitionName**

You can define the path in either of the following ways:

- [Use a JSONata expression](#)
- [Use the `\$xpath\(\)` JSONata extension](#)

## Using a JSONata expression

The path specified by the JSONata expression is relative to any value specified for the `root` property of the Redaction policy. If the `root` property has no value or is absent, begin the expression with the absolute content path. If the `root` property has a value then you can either begin the expression with `$` to use the `root` path directly, or you can provide a sub-path relative to the `root` path.

JSONata expressions can be used with content that is in either JSON or XML format.

#### Example 1

If the `root` property of the Redaction policy has no value or is absent, use the following expression to redact or remove all occurrences of the `price` field in the request and response data:

```
message.body.**.price
```

#### Example 2

If the `root` property of the Redaction policy has the value `log.request_body`, use the following expression to redact or remove all occurrences of the `price` field, specifically within an `item` element, in the logged request payload:

```
$.item.price
```

#### Example 3

If the `root` property of the Redaction policy has the value `log`, use the following expression to redact or remove all occurrences of the `price` field in the logged response payload:

```
response_body.**.price
```

The `**` descendant wildcard traverses all descendants at all hierarchical levels.

## Using the `$xpath()` JSONata extension

---

The `$xpath()` function has the following format:

```
$xpath(content_path, xpath_expression)
```

where:

- `content_path` is the path to the content that contains the field that you want to redact or remove.
- `xpath_expression` is the XPath expression that defines the field that you want to redact or remove.

The `content_path` is relative to any value specified for the `root` property of the Redaction policy. If the `root` property has no value or is absent, provide the absolute content path. If the `root` property has a value then you can either provide the value `$` for the `content_path` parameter to use the `root` path directly, or you can provide a sub-path relative to the `root` path.

The `$xpath()` function can be used only with content that is in XML format.

#### Example 1

If the `root` property of the Redaction policy has no value or is absent, use the following expression to redact or remove all occurrences of the `price` field in the request and response data:

```
$xpath(message.body, '//price')
```

#### Example 2

If the `root` property of the Redaction policy has the value `log.request_body`, use the following expression to redact or remove all occurrences of the `price` field, specifically within an `item` element, in the logged request payload:

```
$xpath($, 'item/price')
```

#### Example 3

If the `root` property of the Redaction policy has the value `log`, use the following expression to redact or remove all occurrences of the `price` field in the logged response payload:

```
$xpath(response_body, '//price')
```

The `//` expression in the second parameter selects all occurrences anywhere in the content.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

DataPower Gateway (v5 compatible)

## Redaction - DataPower Gateway (v5 compatible)

Use the Redaction policy to completely remove or to redact specified fields from the Request body, the Response body, and the activity logs. You might find this policy useful for removing or blocking out sensitive data (for example, credit card details) for legal, security, or other reasons.

## Gateway support

---

Note: This topic describes the Redaction policy implementation in the DataPower® Gateway (v5 compatible). If you are using the DataPower API Gateway, see [Redaction - DataPower API Gateway](#).

For information on the different types of gateway, see [API Connect gateway types](#).

Table 1. Table showing which gateways

support this policy, and the corresponding policy version

Gateway	Policy version
DataPower Gateway (v5 compatible)	1.0.0

This topic describes how to configure the policy in the assembly user interface; for details on how to configure the policy in your OpenAPI source, see [redact - DataPower Gateway \(v5 compatible\)](#).

## About

## Properties

The following table lists the policy properties, indicates whether a property is required, specifies the valid and default values for input, and specifies the data type of the values.

Table 2. Redaction policy properties

Property label	Required	Description	Data type
Title	No	The title of the policy. The default value is <b>redact</b> .	string
Description	No	A description of the policy.	string
Path	Yes	Specifies an XPath expression that defines the field to remove or redact. You can construct an XPath expression that is based on JSON or XML depending on whether your API requests and responses use a JSON or an XML format. If the payload is JSON, use the DataPower XML representation of the JSON content (JSONx) to construct the expression.  Note: Use a JSONx representation only to identify the XPath expressions for the fields to remove or redact. Do not change the format of any response bodies in API Manager. To learn more about constructing XPath expressions that are based on JSON or XML, see <a href="#">Constructing XPath expressions to redact fields</a> .	string
Action	Yes	Specifies whether you want to remove or redact the field. Valid values: <ul style="list-style-type: none"><li><b>remove</b>: Completely removes the specified field.</li><li><b>redact</b>: Redacts (obfuscates with "*"s) the field to block out the data.</li></ul> The default value is <b>redact</b> .  Note: If a numerical value is being redacted, the redacted value is depicted as ***** and the type is changed to <b>string</b> .	string
From	Yes	Specifies where to remove or redact the specified field from. Valid values: <ul style="list-style-type: none"><li><b>all</b>: Removes or redacts the specified field from the Request body, the Response body, and the activity logs.</li><li><b>request</b>: Removes or redacts the specified field from the Request body.</li><li><b>response</b>: Removes or redacts the specified field from the Response body.</li><li><b>logs</b>: Removes or redacts the specified field from the activity logs.</li></ul> The default value is <b>all</b> .  Optionally click Add item to specify additional values.	string

Tip: You can optionally click Add item to specify XPath expressions for additional fields that you want to remove or redact from the Request body, Response body, and logs.

- [Constructing XPath expressions to redact fields](#)

To define a field for redaction when using the DataPower Gateway (v5 compatible), you supply an XPath expression that specifies the field that you want to redact. If your API requests and responses use XML format, you can base your XPath statements directly on the XML content. If your API requests and responses use JSON format, you must use the DataPower XML representation of the JSON content, JSONx, to construct your XPath expression.

## Related reference

- [API Connect context variables](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

DataPower Gateway (v5 compatible) only

## Constructing XPath expressions to redact fields

To define a field for redaction when using the DataPower® Gateway (v5 compatible), you supply an XPath expression that specifies the field that you want to redact. If your API requests and responses use XML format, you can base your XPath statements directly on the XML content. If your API requests and responses use JSON format, you must use the DataPower XML representation of the JSON content, JSONx, to construct your XPath expression.

## About this task

The following sections provide examples for constructing XPath expressions to redact a field; examples are provided for API responses in both XML and JSON format:

## XPaths for XML

Consider the following example of an XML response:

```
<xml>
  <primaryAddress>
    <streetAddress>21 2nd Street</streetAddress>
    <city>New York</city>
    <state>NY</state>
    <postalCode>10021</postalCode>
  </primaryAddress>
  <secondaryAddress>
    <streetAddress>412 Brooklyn Avenue</streetAddress>
    <city>New Jersey</city>
    <state>NJ</state>
    <postalCode>12302</postalCode>
  </secondaryAddress>
</xml>
```

To redact "streetAddress" in the preceding example the XPath expression would be: `//streetAddress` where the components of the expression have the following meaning:

Expression	Meaning
<code>//</code>	search anywhere in the XML structure
<code>//streetAddress</code>	search anywhere in the XML structure for an element of type "streetAddress"

The XML response that results from applying this XPath expression is as follows:

```
<?xml version="1.0" encoding="UTF-8"?>
<xml>
  <primaryAddress>
    <streetAddress>*****</streetAddress>
    <city>New York</city>
    <state>NY</state>
    <postalCode>10021</postalCode>
  </primaryAddress>
  <secondaryAddress>
    <streetAddress>*****</streetAddress>
    <city>New Jersey</city>
    <state>NJ</state>
    <postalCode>12302</postalCode>
  </secondaryAddress>
</xml>
```

Note: Both incidences of "streetAddress" have been redacted.

To redact one specific incidence of "streetAddress" in the initial example, the XPath expression would be: `//secondaryAddress/streetAddress` where the components of the expression have the following meaning:

Expression	Meaning
<code>//secondaryAddress</code>	search anywhere in the XML structure for an element of type "secondaryAddress"
<code>//secondaryAddress/streetAddress</code>	search under the preceding element for a child element of type "streetAddress"

The XML response that results from applying this XPath expression is as follows:

```
<?xml version="1.0" encoding="UTF-8"?>
<xml>
  <primaryAddress>
    <streetAddress>21 2nd Street</streetAddress>
    <city>New York</city>
    <state>NY</state>
    <postalCode>10021</postalCode>
  </primaryAddress>
  <secondaryAddress>
    <streetAddress>*****</streetAddress>
    <city>New Jersey</city>
    <state>NJ</state>
    <postalCode>12302</postalCode>
  </secondaryAddress>
</xml>
```

Note: Only the secondary address has been redacted.

### XPaths for JSON

Consider the following example of a JSON response:

```
{
  "primaryAddress": {
    "streetAddress": "21 2nd Street",
    "city": "New York",
    "state": "NY",
    "postalCode": 10021
  },
  "secondaryAddress": {
    "streetAddress": "412 Brooklyn Avenue",
```

```

"city": "New Jersey",
"state": "NJ",
"postalCode": 12302
}
}

```

Unlike the preceding XML example, to construct an XPath for this example you must use the corresponding DataPower XML representation, JSONx. The JSONx equivalent of this JSON response is as follows:

```

<json:object xsi:schemaLocation="http://www.datapower.com/schemas/json jsonx.xsd"
xmlns:json="http://www.ibm.com/xmlns/prod/2009/jsonx" xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
  <json:object name="primaryAddress">
    <json:string name="streetAddress">21 2nd Street</json:string>
    <json:string name="city">New York</json:string>
    <json:string name="state">NY</json:string>
    <json:number name="postalCode">10021</json:number>
  </json:object>
  <json:object name="secondaryAddress">
    <json:string name="streetAddress">412 Brooklyn Avenue</json:string>
    <json:string name="city">New York</json:string>
    <json:string name="state">NY</json:string>
    <json:number name="postalCode">10021</json:number>
  </json:object>
</json:object>

```

To redact the element "streetAddress" from the preceding JSONx structure, the XPath expression would be: `//*[ @name='streetAddress' ]` where the components of the expression have the following meaning:

Expression	Meaning
<code>//*[</code>	find any element anywhere in the structure
<code>[@name='streetAddress' ]</code>	this element has a 'name' property with value "streetAddress"

The JSON response that results from applying this XPath expression is as follows:

```

{
  "primaryAddress": {
    "streetAddress": "*****",
    "city": "New York",
    "state": "NY",
    "postalCode": 10021
  },
  "secondaryAddress": {
    "streetAddress": "*****",
    "city": "New York",
    "state": "NY",
    "postalCode": 10021
  }
}

```

Note: All incidences of "streetAddress" have been redacted in the preceding JSON structure.

To redact a specific occurrence of the "streetAddress" element, the XPath expression would be: `//*[ @name='secondaryAddress' ]/* [ @name='streetAddress' ]` where the components of the expression have the following meaning:

Expression	Meaning
<code>//*[</code>	find any element anywhere in the structure
<code>//*[ @name='secondaryAddress' ]</code>	find an element anywhere in the structure that is named "secondaryAddress"
<code>//*[ @name='secondaryAddress' ]/* [ @name='streetAddress' ]</code>	find a child element of any type (/*) where the child element has a name of "streetAddress"

The JSON response that results from applying this XPath expression is as follows:

```

{
  "primaryAddress": {
    "streetAddress": "21 2nd Street",
    "city": "New York",
    "state": "NY",
    "postalCode": 10021
  },
  "secondaryAddress": {
    "streetAddress": "*****",
    "city": "New York",
    "state": "NY",
    "postalCode": 10021
  }
}

```

Note: Only the street address for the secondary address has been redacted.

## What to do next

See [Including elements in your API assembly](#) to learn how to apply a redact policy using XPath.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Set Variable

Use the Set Variable policy to set the value of a runtime variable, or to clear a runtime variable, or to add a header variable.

## Gateway support

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® Gateway (v5 compatible)	1.0.0
DataPower API Gateway	2.0.0

This topic describes how to configure the policy in the assembly user interface; for details on how to configure the policy in your OpenAPI source, see [set-variable](#).

## About

## Properties

The following table lists the policy properties, indicates whether a property is required, specifies the valid and default values for input, and specifies the data type of the values.

Table 2. Set Variable policy properties

Property label	Required	Description	Data type
Title	No	The title of the policy. The default value is <b>set-variable</b> .	string
Description	No	A description of the policy.	string
Action	Yes	Defines what action to apply on a runtime variable. Choose one of the following values: <ul style="list-style-type: none"><li>Set: Indicates that you want to set a runtime variable to a string value. Can be used to set new headers or to override existing values.</li><li>Add: Indicates that you want to add a header variable. Can be used only to set new headers or to append a new entry of the same header name.</li><li>Clear: Indicates that you want to delete a runtime variable. Can be used to remove a header when the data is processed in the assembly flow.</li></ul> The default value is Set.	string
Set, Add, or Clear	Yes	Specifies the name of the variable that you want to set , add or clear, depending on the selected Action.	string
Type	Yes	Select the data type of the variable. Choose one of the following values: <ul style="list-style-type: none"><li><input checked="" type="checkbox"/> API Gateway only any</li><li>string</li><li>number</li><li>boolean</li></ul> If you are using the DataPower API Gateway then, for all values other than any, the value is validated against the specified data type.	string
Value	Yes*	Allocates this value to the specified variable. Can be a literal value, or another variable. * Value is required only when <b>Set</b> or <b>Add</b> is specified as the action.  For example, to set a named variable of <b>billing-hostname</b> to a literal value, you can specify the Value as <b>acme.com</b> .  As another example, to set a named variable to the value of the Content-Type header in a request, you can specify the Value entry as <b>\$(request.headers.content-type)</b> .  If the selected value of the Type field is boolean, select the Value check box to indicated a value of <b>true</b> .  Note: You can only set single string elements. Values are retrieved as strings and therefore you cannot clone a complete nodeset.	string

For examples, see [set-variable](#).

## Related tasks

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## User Security

Use the User Security policy to extract a user's credentials, authenticate those credentials, and obtain authorization from the user.

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® API Gateway	2.0.0

This topic describes how to configure the policy in the assembly user interface; for details on how to configure the policy in your OpenAPI source, see [user-security](#).

## About

When you define an assembly user security action, you can define the processing for identity-extraction, authentication, and authorization or you can selectively disable any of these this aspects of processing. When disabled, this processing aspect is skipped.

When identity-extraction is enabled, the following methods are supported.

- Use basic authentication, which requires no additional configuration.
- Use context variables. For this method, specify which variable contains the user name and password.
- Use a redirect. For this method, specify the URL fragment to redirect to, and the time allowed to process.
- Use an HTML login form. For this method, specify whether to use the default or custom form and the time allowed to submit the form. For a custom form, specify the location of the form and the TLS client profile to secure the connection to the remote server.

When authentication is enabled, the following methods are supported.

- Contact an LDAP server. For this method, specify which server to contact.
- Send a request to an authentication endpoint. For this method, specify the URL of the endpoint, the TLS client profile to secure the connection, the pattern to select which response header to add, and the response header that contains the authenticated credentials.

When authorization is enabled, the following methods are supported.

- Implicitly accept any previously authenticated users, which requires no additional configuration.
- Use an HTML authorization form. For this method, specify whether to use the default or custom form and the time allowed to submit the form. For a custom form, specify the location of the form and the TLS client profile to secure the connection to the remote server.

You can attach this policy to the REST API flow.

## Properties

The following table lists the policy properties, indicates whether a property is required, specifies the valid and default values for input, and specifies the data type of the values.

Table 2. User Security policy properties

Property label	Required	Description	Data type
Title	No	The title of the policy. The default value is <b>user-security</b> .	string
Description	No	A description of the policy.	string
Factor ID	No	The identity that identifies the results of factor-authentication in the API context.	string
Extract Identity Settings	Yes	Select the method that is used to extract the user credentials. The following options are available:  <b>Basic</b> Use basic authentication; no additional configuration is required.  <b>Context Variable</b> The credentials are provided by API Connect context variables; specify the following properties: <ul style="list-style-type: none"> <li>• Username content variable: the context variable that is used to obtain the user name.</li> <li>• password context variable: the context variable that is used to obtain the password.</li> </ul> <b>HTML Form</b> Use forms based identity-extraction. Select whether to use the default form or a custom form. For a custom form, specify the following properties: <ul style="list-style-type: none"> <li>• Custom form endpoint: the location of the form.</li> <li>• Custom form TLS profile: the TLS client profile that is used to secure the connection to the remote server.</li> </ul> In the HTML form time limit field, specify the time allowed to submit the form.  <b>Redirect</b> Use a redirect for identity-extraction; specify the following properties: <ul style="list-style-type: none"> <li>• Redirect URL: the URL fragment to which to redirect the request to obtain user credentials.</li> <li>• Redirect time limit: the time allowed for the transaction to complete.</li> </ul> <b>Disabled</b> Identity-extraction is disabled; this aspect of processing is skipped.  Select Stop on error to halt assembly processing in the event of identity-extraction failure.	string

Property label	Required	Description	Data type
Authenticate User Settings	Yes	<p>Select the authentication method. The following options are available:</p> <p>Authentication URL The credentials are authenticated by an external endpoint; specify the following properties:</p> <ul style="list-style-type: none"> <li>Authentication URL: the URL of the authentication endpoint.</li> <li>Authentication TLS profile: the TLS client profile that is used to secure the connection to the authentication endpoint.</li> <li>Authentication response header pattern: the pattern that is used to select which response headers to add to the API context.</li> <li>Authentication response header credential: the response header that contains the authenticated user credentials.</li> </ul> <p>LDAP The credentials are authenticated by an LDAP user registry; from the LDAP registry list, select the required registry.</p> <p>Disabled Authentication is disabled; this aspect of processing is skipped.</p> <p>Select <b>Stop on error</b> to halt assembly processing in the event of authentication failure.</p>	string
Authorize User Settings	Yes	<p>Select the authorization method. The following options are available:</p> <p>authenticated Implicitly accept any previously authenticated users; no additional configuration is required.</p> <p>HTML Form The user provides authorization through an HTML form. Select whether to use the default form or a custom form. For a custom form, specify the following properties:</p> <ul style="list-style-type: none"> <li>Custom form endpoint: the location of the form.</li> <li>Custom form TLS profile: the TLS client profile that is used to secure the connection to the remote server.</li> </ul> <p>In the Dynamic table entries field, enter the name of a context variable that specifies the scopes that are to be added automatically to the authorization consent form.</p> <p>In the HTML form time limit field, specify the time allowed to submit the form.</p> <p>Disabled Authorization is disabled; this aspect of processing is skipped.</p> <p>Select <b>Stop on error</b> to halt assembly processing in the event of authorization failure.</p>	string

## Related tasks

- [Creating a new REST OpenAPI definition](#)

## Related reference

- [API Connect context variables](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Validate - DataPower API Gateway

Use the Validate policy to validate the payload in an assembly flow against a schema.

## Gateway support

Note: This page describes the Validate policy implementation in the DataPower® API Gateway. If you are using the DataPower Gateway (v5 compatible), see [Validate - DataPower Gateway \(v5 compatible\)](#).

For information on the different types of gateway, see [API Connect gateway types](#).

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
---------	----------------

Gateway	Policy version
DataPower API Gateway	2.0.0 2.1.0 (DataPower API Gateway Version 10.0.1.0 or later) 2.2.0 (DataPower API Gateway Version 10.0.2.0 or later) 2.3.0 (DataPower API Gateway Version 10.0.2.0 or later) 2.4.0 (DataPower API Gateway Version 10.0.4.0 or later)

This topic describes how to configure the policy in the assembly user interface; for details on how to configure the policy in your OpenAPI source, see [validate - DataPower API Gateway](#).

## About

Position this policy where required in the assembly flow as follows:

- To validate the original input, position a Validate policy at the start of your flow.
- To validate an intermediate response that is returned from other invoke actions or tasks, position a Validate policy after those actions or tasks.
- To validate the response that is returned to the client application, position a Validate policy after the task that collates the response.

Note: With the DataPower API Gateway, the input to the Validate policy must be parsed data. One way to produce parsed data is to use a [Parse](#) policy before a Validate policy in your assembly flow, which provides explicit control of the parse action.

## Properties

The following table lists the policy properties, indicates whether a property is required, specifies the valid and default values for input, and specifies the data type of the values.

Table 2. Validate policy properties

Property label	Required	Description	Data type
Title	Yes	The title of the policy. The default value is <b>validate</b> .	string
Description	No	A description of the policy.	string
Input	No	Specifies the name of a variable in the API context. The content of the <b>body</b> field of the variable, which is represented by <b>variable_name.body</b> , is the input data to validate. By default, the variable name is <b>message</b> .	string
Output	No	Specifies the name of a variable in the API context. <ul style="list-style-type: none"> <li>• If the validation passes, the body field of the output variable, which is represented by <b>variable_name.body</b>, stores the output of the assembly validate action.</li> <li>• If the schema to validate is a JSON schema, the validation also adds any default values that are missing from the payload.</li> <li>• If the validation fails, no output is stored.</li> <li>• If an output variable is not specified, the results of the assembly validate action are not saved.</li> </ul>	string

Property label	Required	Description	Data type
Validate against	Yes	<p>Specifies the schema to be used for validating the payload. Select one of the following values:</p> <ul style="list-style-type: none"> <li> <b>definition:</b> Select this value if you want to use a previously defined schema to validate the payload that is returned from other invoke actions or tasks in the assembly flow. From the Definition Object list, select the required schema. For information on defining a schema for an API definition, see <a href="#">Editing an API definition</a>. </li> <li> <b>URL:</b> the schema is identified by a URL location. <ul style="list-style-type: none"> <li>In the JSON Schema URL field, enter the URL of the JSON schema to be used for validating a JSON payload.</li> <li>From the XML Validation Mode list, select how XML validation is to be performed: <ul style="list-style-type: none"> <li><b>None:</b> no XML payload validation is required.</li> <li><b>xsd:</b> an XML schema will be used to validate an XML payload. In the XML Schema URL field, enter the URL of the XML schema.</li> <li><b>wsdl:</b> a WSDL schema will be used to validate a SOAP payload. In the WSDL URL field, enter the URL of the WSDL schema.</li> <li><b>soap-body:</b> validate the body of a SOAP message against the XML schema only.</li> </ul> </li> </ul> <p>Note: The following limitations apply to schemas used for JSON validation, which include JSON schemas and OpenAPI documents that are used as schemas for validation. Exceeding these limits can impact compilation performance and is not supported.</p> <ul style="list-style-type: none"> <li>Maximum of 6,500 lines. Each key and each item in an array count as a line.</li> <li>Maximum recursion depth of 250.</li> <li>Maximum of 3,000 items in <b>enum</b> lists.</li> </ul> </li> <li> <b>WSDL:</b> (available with a SOAP service based API only) use the XML schema in the WSDL file associated with the API operation or the API path. </li> <li> <b>body-param:</b> validate the request input against the schema definition that is specified in the TYPE field for the request parameter for this operation. For information about how to create a request parameter, see <a href="#">Configuring an operation</a>. </li> <li> <b>response-param:</b> validate the response to be returned to the client application, against the schema definition that is specified in the SCHEMA field for the response parameter for this operation. For information about how to create a response parameter, see <a href="#">Configuring an operation</a>. </li> <li> <b>GraphQL:</b> (available for a GraphQL proxy API only) validate the payload against the GraphQL schema that has been imported into the GraphQL proxy API. In addition, either the GraphQL query or response, depending on the input, is analyzed against the GraphQL schema to calculate the cost, and the result is placed in the API context. For more information on GraphQL proxy APIs, see <a href="#">Creating a GraphQL proxy API</a> and <a href="#">GraphQL context variables</a>. </li> </ul>	string
XSLT version	No	The XSLT processor version. The default value is XSLT10.	string
Strict	No	Whether to enable strict XSLT error checking. Non-strict operations attempt to recover from certain errors, such as use of undeclared variables, calling undeclared templates, and so forth. By default, strict XSLT error checking is enabled.	boolean
Profile rule	No	Whether to enable stylesheet profiling. This option should not be used in production environments. By default, stylesheet profiling is disabled.	boolean
Debug rule	No	Whether to run the stylesheet, XQuery script, and JSONiq script in debug mode. When a stylesheet, XQuery script, or JSONiq script is run in debug mode, it generates a custom web page instead of displaying its normal output. The web page details exactly what occurred during execution, including the values of variables and where particular pieces of the output came from. This option should not be used in production environments. By default, debug mode is disabled.	boolean
Streaming rule	No	Whether the stylesheet must be run in streaming mode. Transformation of the document begins before the input is fully parsed. Not all stylesheets can be streamed. If the stylesheet cannot be streamed, an error is generated and the input is not processed. By default, streaming mode is disabled.	boolean
Attempt streaming rule	No	Whether to attempt to run the stylesheet in streaming mode. Transformation of the document begins before the input is fully parsed. Not all stylesheets can be streamed. If the stylesheet cannot be streamed, a warning is generated during compilation and the stylesheet is read in the entire input as normal at execution time. By default, attempting to run the stylesheet in streaming mode is disabled.	boolean
Minimum output escaping rule	No	Whether to escape output produced from the stylesheet during processing. Minimal escaping is particularly useful when handling non-English character sets. By default, minimum escaping is disabled.	boolean
Maximum stack size	No	The maximum number of bytes that the stack is allowed to use while executing a stylesheet or other compiled content. This setting is used to block infinite recursion. The minimum value is 10 kilobytes, or 10,240 bytes. The maximum value is 100 megabytes, or 104,857,600 bytes. The default value is 1 megabyte, or 1,048,576 bytes.	integer
WS-I Basic Profile validation	No	<p>The validation behavior to apply to WSDL files that are checked for conformance to section 5 of WS-I Basic Profile (version 1.0, April 2004). The default setting is Warn.</p> <p>Ignore Disables conformance checking.</p> <p>Warn Logs warnings for violations.</p> <p>Fail Forces conformance. Fails if the file contains any violation.</p>	string

Property label	Required	Description	Data type
Validate message body	No	The validation behavior for the <code>soap:Body</code> . The default setting is Strict.  Strict Validates this part of the message against the WSDL definition. Allows only messages that contain this part and that match the WSDL definition.  Lax Validates this part of the message against the WSDL definition. If the message contains this part and the WSDL definition does not define this part, allow the message. If the message contains this part and the WSDL definition defines this part, allow the message only when there is a match.  Skip Disables validation of this part of the message.	string
Validate message headers	No	The validation behavior for the <code>soap:Header</code> . The default setting is Lax.  Strict Validates this part of the message against the WSDL definition. Allows only messages that contain this part and that match the WSDL definition.  Lax Validates this part of the message against the WSDL definition. If the message contains this part and the WSDL definition does not define this part, allow the message. If the message contains this part and the WSDL definition defines this part, allow the message only when there is a match.  Skip Disables validation of this part of the message.	string
Validate message fault details	No	Specifies the validation behavior for the fault detail. The default setting is Strict.  Strict Validates this part of the message against the WSDL definition. Allows only messages that contain this part and that match the WSDL definition.  Lax Validates this part of the message against the WSDL definition. If the message contains this part and the WSDL definition does not define this part, allow the message. If the message contains this part and the WSDL definition defines this part, allow the message only when there is a match.  Skip Disables validation of this part of the message.	string
Require wrappers on fault details specified by type	No	Whether to require compatibility with RPC-style wrappers. By default, RPC-style wrappers are not required.	boolean
Specifically allow <code>xsi:type='SOAP-ENC:Array'</code> rule	No	Whether to allow the schema to accept most uses of elements with <code>xsi:type='SOAP-ENC:Array'</code> consistent with SOAP 1.1 Section 5, even when these attributes violate the XML Schema specification. Normally, the <code>xsi:type</code> attribute must name a type equal to or derived from the actual type of the element. For schemas compiled with this option, <code>xsi:type</code> is accepted specifically for the SOAP 1.1 Encoding 'Array' complex type if the element type is derived from <code>SOAP-ENC:Array</code> . The opposite is the normal allowable case. By default, elements with <code>xsi:type='SOAP-ENC:Array'</code> are not accepted.	boolean
Validate SOAP 1.1 encoding rule	No	Whether to perform extra schema validation following the encoding rules in SOAP 1.1 Section 5. When enabled, members of SOAP arrays are validated, attributes such as <code>@id</code> and <code>@href</code> are allowed even if they are not allowed by the schema, and <code>@href</code> values are checked to ensure that they have a corresponding <code>@id</code> element. By default, the extra validation is not performed.	boolean
Wildcards ignore <code>xsi:type</code> rule	No	Whether <code>xs:any</code> elements in the schema validate only child elements by name. The XML Schema specification requires that, if a wildcard matches an element but that element does not have an element declaration, the element is instead validated according to an <code>xsi:type</code> attribute on it. This option ignores those <code>xsi:type</code> attributes. It should be used for cases such as SOAP envelope validation where a further validation step will validate the contents matching the wildcard, possibly using the SOAP 1.1 encoding rules. By default, <code>xsi:type</code> attributes are not ignored.	boolean
Strict SOAP envelope version	No	Whether to strictly follow the SOAP binding in the WSDL. When enabled, only messages bound to SOAP 1.2 appear in SOAP 1.2 envelopes and only messages bound to SOAP 1.1 appear in SOAP 1.1 envelopes. By default, strict SOAP binding is disabled.	boolean
Debug XACML policy	No	Whether to compile XACML policies with debug information. Note that the XACML debugging messages are also controlled by the log event in the XACML category. Use the debug log level to view the full XACML debugging messages. By default, XACML policies are not compiled with debug information.	boolean
Accept MTOM/XOP optimized messages	No	Specifies whether the schema or WSDL document accepts messages where base64-encoded binary content was optimized according to the MTOM/XOP specifications. XOP binary-optimization replaces base64-encoded binary data with an <code>xop:Include</code> reference element that references the unencoded binary data located in an attachment. By default, MTOM/XOP optimized messages are disabled.  <ul style="list-style-type: none"> <li>When disabled, such optimized messages are rejected by validation of the optimized form. Rejection occurs because the schema specifies a simple type that accepts base64-encoded data, such as <code>xs:base64Binary</code> or <code>xs:string</code>, but the message contains an <code>xop:Include</code> element instead.</li> <li>When enabled, an <code>xop:Include</code> element can optionally appear in place of content for any XML Schema simple type that validates base64-encoded binary data. The <code>xop:Include</code> element itself will be validated according to the built-in schema in <code>store:///schemas/xop.xsd</code>.</li> </ul>	boolean

For examples, see [validate - DataPower API Gateway](#).

## Related tasks

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Validate - DataPower Gateway (v5 compatible)

Use the Validate policy to validate the payload in an assembly flow against a JSON or an XML schema.

### Gateway support

Note: This topic describes the Validate policy implementation in the DataPower® Gateway (v5 compatible). If you are using the DataPower API Gateway, see [Validate - DataPower API Gateway](#).

For information on the different types of gateway, see [API Connect gateway types](#).

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower Gateway (v5 compatible)	1.0.0

This topic describes how to configure the policy in the assembly user interface; for details on how to configure the policy in your OpenAPI source, see [validate - DataPower Gateway \(v5 compatible\)](#).

Restriction:

- The schema that represents the XML can reference only one XML namespace.
- The schema cannot reference polymorphic XML elements.
- The validation works on the `message.body` variable and not any other output/context variable. If the invoke policy contains a configured response object variable, then `message.body` is not set, and validate is not able to act.
- If you use the `multipleOf` keyword in a schema definition for the API then, due to rounding behavior, the specified value must satisfy the following conditions, otherwise the validation fails when the API is called:
  - The value must not be less than `0.0000009999999999999999848869`.
  - If the value is greater than 1, the amount before the decimal point must not be greater than `999999999999999934463`.

### About

You can attach this policy to the following API flow:

- REST

Position this policy where required in the assembly flow as follows:

- To validate the original input, position a Validate policy at the start of your flow.
- To validate an intermediate response that is returned from other invoke actions or tasks, position a Validate policy after those actions or tasks.
- To validate the response that is returned to the client application, position a Validate policy after the task that collates the response.

You can apply a different OpenAPI schema definition to each Validate policy either by choosing from the set of schema definitions that is specified at the API level, or the schema definition at the operation level.

### Properties

The following table lists the policy properties, indicates whether a property is required, specifies the valid and default values for input, and specifies the data type of the values.

Table 2. Validate policy properties

Property label	Required	Description	Data type
Title	Yes	The title of the policy. The default value is <code>validate</code> .	string
Description	No	A description of the policy.	string

Property label	Required	Description	Data type
Definition	Yes	Specifies the schema definition to be used for validating the payload. Valid values: <ul style="list-style-type: none"> <li><b>request</b>: Select this value to validate the request input against the schema definition that is specified in the TYPE field for the request parameter for this operation. For information about how to create a request parameter, see <a href="#">Configuring an operation</a>.</li> <li><b>response</b>: Select this value to validate the response to be returned to the client application, against the schema definition that is specified in the SCHEMA field for the response parameter for this operation. For information about how to create a response parameter, see <a href="#">Configuring an operation</a>.</li> <li><b>#/definitions/definition_name</b>: Select this value for a previously defined schema definition to be used to validate the payload that is returned from other invoke actions or tasks in the assembly flow. For information on defining a schema for an API definition, see <a href="#">Editing an API definition</a>.</li> </ul>	string

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Validate Username Token

Use the Validate Username Token policy to validate a Web Services Security (WS-Security) UsernameToken in a SOAP payload before allowing access to the protected resource.

## Gateway support

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® Gateway (v5 compatible)	1.0.0 1.1.0

This topic describes how to configure the policy in the assembly user interface; for details on how to configure the policy in your OpenAPI source, see [validate-username-token](#).

## About

A WS-Security UsernameToken enables a user identity to be passed securely over a multi-point message path. The Validate Username Token policy extracts the UsernameToken element from the request payload, authenticates the extracted username and password, and provides access to the protected resource based on the authentication result. The policy has two authentication methods: Lightweight Directory Access Protocol (LDAP) user registry, or Authentication URL.

The Validate Username Token policy supports both passwordText and passwordDigest types of password. When the authentication method is Authentication URL with a passwordDigest, a basic authentication header that contains a Base64 encoded username and passwordDigest is sent to the URL. In addition, a custom header named X-IBM-PasswordType is set with a value of digest. The following table shows the authentication process based on password type:

Table 2. Authentication URL process by password type

passwordText	passwordDigest
Authentication: Basic base64(username:password)	Authentication: Basic base64(username:passwordDigest) X-IBM-PasswordType: 'digest'

Position this policy where required in the assembly flow as follows:

- To validate the original input, position a Validate Username Token policy at the start of your flow.
- To validate an intermediate response that is returned from other invoke actions or tasks, position a Validate Username Token policy after those actions or tasks.
- To validate the response that is returned to the client application, position a Validate Username Token policy after the task that collates the response.

## Properties

The following table lists the policy properties, indicates whether a property is required, specifies the valid and default values for input, and specifies the data type of the values.

Table 3. Validate Username Token policy properties

Property label	Required	Description	Data type
Title	Yes	The title of the policy. The default value is <code>validate-username-token</code> .	string
Description	No	A description of the policy.	string

Property label	Required	Description	Data type
Authentication type (policy version 1.0.0 only)	Yes	The authentication type to use to validate the UsernameToken. Valid values: <ul style="list-style-type: none"> <li><b>Authentication URL:</b> Select this value to validate the user credentials against an authentication URL.</li> <li><b>LDAP registry:</b> Select this value to validate the user credentials against an LDAP user registry.</li> </ul> The default value is: <b>Authentication URL</b> .	string
Authentication URL (policy version 1.0.0 only)	Yes	The authentication URL to use to validate the UsernameToken user credentials against. Note: This property is required only if Authentication type is set to <b>Authentication URL</b> .	string
TLS profile (policy version 1.0.0 only)	No	The TLS profile to use for the secure transmission of data to the authentication URL. Note: This property is available only if Authentication type is set to <b>Authentication URL</b> .	string
LDAP registry name (policy version 1.0.0 only)	Yes	The name of the LDAP user registry to validate the UsernameToken user credentials against. You can select a name from the drop-down list, or type a name manually. Note: This property is required only if Authentication type is set to <b>LDAP registry</b> .	string
User Registry Name (policy version 1.1.0 and later)	Yes	Select the LDAP or Authentication URL registry to use to validate the UsernameToken.	string
LDAP search attribute <sup>1</sup>	Yes	The name of the LDAP user password attribute. Note: This property is required only for an LDAP user registry.	string

## Examples

The following example shows an LDAP user registry authentication:

```
- validate-username-token:
  version: 1.0.0
  title: "validate-username-token"
  auth-type: "LDAP Registry"
  ldap-registry: "wstest"
  ldap-search-attribute: "userPassword"
```

The following example shows an Authentication URL definition:

```
- validate-username-token:
  version: 1.0.0
  title: "validate-username-token"
  auth-type: "Authentication URL"
  auth-url: "https://www.google.com"
  tls-profile: "default-ssl-profile"
```

## Errors

The policy returns an HTTP 200 status code when successful, and the input payload is copied to the output flow. For all failure types the policy returns an HTTP 500 status code, and the output contains the SOAP fault.

Tip: If there are authentication failures, try verifying the LDAP user registry configuration as follows:

- Ensure Search (DN) is set as the communication method.
- Ensure Authenticated Bind is set so that specific permissions are required to search the registry.
- Ensure the Admin DN and Password fields are correctly completed for the Distinguished Name (DN) of a user authorized to carry out searches in the LDAP directory.
- Ensure that a combination of Base DN, Prefix, and Suffix are set, such that they fully describe the user DN. For example:
  - For a user named: **cn=alice, dc=ibm, dc=com**

```
BaseDN: dc=ibm
Prefix: cn=alice
Suffix: dc=com
```

where the user DN is calculated as: Prefix + BaseDN + Suffix.

## Related concepts

## Related tasks

- [Creating a new REST OpenAPI definition](#)

## Related information

- [Creating an LDAP registry](#)
- [Authenticating by using your enterprise user registry](#)

<sup>1</sup> When authenticating with LDAP and passwordText, the policy uses the username and password as LDAP bind credentials. However, when authenticating with LDAP and passwordDigest, the digest itself cannot be used for authentication. Instead, an LDAP search for the username is performed by using the administrator's distinguished name (DN) and password, and an attribute corresponding to the contents of the ldap-search-attribute is retrieved. A hash of the contents of this attribute (along with the Nonce and Created attributes, as in the WS-Security UsernameToken profile specification) is then compared to the passwordDigest.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

# Websocket Upgrade

Use the Websocket Upgrade policy to process API requests and responses through a WebSocket connection.

## Gateway support

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® API Gateway	2.0.0

This topic describes how to configure the policy in the assembly user interface; for details on how to configure the policy in your OpenAPI source, see [websocket-upgrade](#).

## Properties

The following table lists the policy properties, indicates whether a property is required, specifies the valid and default values for input, and specifies the data type of the values.

Table 2. Websocket Upgrade policy properties

Property label	Required	Description	Data type
Title	No	The title of the policy. The default value is <b>websocket-upgrade</b> .	string
Description	No	A description of the policy.	string
URL	Yes	Specify the URL to be invoked.	string
TLS Profile	No	Specifies a TLS profile to use for the secure transmission of data.	string
Timeout	No	The time to wait before a reply back from the endpoint (in seconds). The default value is <b>60</b> .	integer
Follow redirects	No	Specifies the behavior if the back-end server returns the HTTP status code <b>301 Moved Permanently</b> . If you select this check box, the <b>invoke</b> policy follows the URL redirection by making a further call to the URL specified in the <b>Location</b> header in the response. If you clear this check box, the <b>invoke</b> saves the <b>301</b> status code and the API call is considered to be complete. Note: The <b>follow-redirect</b> property is supported only by the DataPower API Gateway. If you are using the DataPower Gateway (v5 compatible), the <b>invoke</b> always follows the URL redirection; the <b>proxy</b> policy (not supported by the DataPower API Gateway) saves the <b>301</b> status code and completes the API call without following the URL redirection.	boolean
Username	No	The username to use for HTTP Basic authentication.	string
Password	No	The password to use for HTTP Basic authentication.	string
Inject proxy headers	No	If you select this check box, the <b>invoke</b> policy injects the <b>X-Forwarded-For</b> , <b>X-Forwarded-To</b> , <b>X-Forwarded-Host</b> , and <b>X-Forwarded-Proto</b> headers to the request that is sent to the target URL. The check box is cleared by default.	boolean
Decode Request Params	No	If you select this check box, any request parameters that are referenced by a variable definition on the target URL of the <b>invoke</b> policy are URL-decoded. The check box is cleared by default.	boolean
Queryparam encode	No	If you select this check box, all "+" characters in the query parameter values of the target URL are encoded to %2F. The check box is cleared by default.	boolean
<span style="border: 1px solid green; padding: 2px;">API Gateway only</span> Header control	No	Specifies the headers in <b>message.headers</b> that you want to copy to the target URL. To prevent headers from being copied, complete the following steps: <ol style="list-style-type: none"><li>1. Select Blocklist.</li><li>2. Click Add blocklist.</li><li>3. In the empty field that is displayed, enter the header name.</li><li>4. To add further headers, repeat the previous steps.</li></ol> To specify headers that you want to be copied, complete the following steps: <ol style="list-style-type: none"><li>1. Select Allowlist.</li><li>2. Click Add allowlist.</li><li>3. In the empty field that is displayed, enter the header name.</li><li>4. To add further headers, repeat the previous steps.</li></ol> The values that you specify are in regular expression format. For example, to specify the Content-Type header, enter <b>^Content-Type\$</b>  By default, Blocklist is selected, with no blocklist entries, meaning that <b>all</b> headers are copied.	string

Property label	Required	Description	Data type
<div style="border: 1px solid green; padding: 2px;">API Gateway only</div> Parameter control	No	<p>Specifies the parameters in the incoming request that you want to be copied to the target URL. To prevent parameters from being copied, complete the following steps:</p> <ol style="list-style-type: none"> <li>1. Select Blocklist.</li> <li>2. Click Add blocklist.</li> <li>3. In the empty field that is displayed, enter the parameter name.</li> <li>4. To add further parameters, repeat the previous steps.</li> </ol> <p>To specify parameters that you want to be copied, complete the following steps:</p> <ol style="list-style-type: none"> <li>1. Select Allowlist.</li> <li>2. Click Add allowlist.</li> <li>3. In the empty field that is displayed, enter the parameter name.</li> <li>4. To add further parameters, repeat the previous steps.</li> </ol> <p>The values that you specify are in regular expression format.</p> <p>For example, if the incoming request is</p> <pre>http://apigw/org/sandbox/petstore/base?petid=100&amp;display=detailed</pre> <p>and you specify a white list entry of <code>^petid\$</code>, the target URL at run time will be</p> <pre>http://myhost/mypath?storeid=3&amp;petid=100</pre> <p>By default, Allowlist is selected, with no allowlist entries, meaning that <b>no</b> parameters are copied.</p>	string
Request assembly	No	<p>The request processing assembly. For details on configuring an assembly in the <b>execute</b> section, see <a href="#">execute</a>. For example:</p> <pre>request-assembly:   execute   .   .   policy assembly   .   .</pre>	object
Response assembly	No	<p>The response processing assembly. For details on configuring an assembly in the <b>execute</b> section, see <a href="#">execute</a>. For example:</p> <pre>response-assembly:   execute   .   .   policy assembly   .   .</pre>	object

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## XML to JSON

Use the XML to JSON policy to convert the context payload of your API from the extensible markup language (XML) format to JavaScript Object Notation (JSON).

## Gateway support

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® Gateway (v5 compatible)	1.0.0
DataPower API Gateway	2.0.0

This topic describes how to configure the policy in the assembly user interface; for details on how to configure the policy in your OpenAPI source, see [xml-to-json](#).

## About

The XML to JSON policy uses a simple convention, based on BadgerFish, to convert your API context payload from XML to JSON. The XML content is preserved, including the attributes and namespaces. No additional configuration is required. For more information about the BadgerFish convention, including some examples, see [BadgerFish](#).

Use the API Manager assembly view when you are creating your API definition to add a built-in policy to the flow.

The policy must be attached to the flow at the point at which you require the conversion to be performed. For example, if you need to convert an XML-formatted request into a JSON-formatted request, the policy must be attached to the request flow.

The policy reads input from the `message.body`, if that context exists, otherwise from the `request.body`, and then writes the output to the `message.body`.

Note: If you are using the DataPower API Gateway, the input to the XML to JSON policy must be parsed data. One way to produce parsed data is to use a [Parse](#) policy before an XML to JSON policy in your assembly flow, which provides explicit control of the parse action.

## Properties

The following table lists the policy properties, indicates whether a property is required, specifies the valid and default values for input, and specifies the data type of the values.

Table 2. Policy properties

Property label	Required	Description	Data type
Title	Yes	The title of the policy. The default value is <code>xml-to-json</code> .	string
Description	No	A description of the policy.	string
<span style="border: 1px solid green; padding: 2px;">API Gateway only</span> Input	No	The input message to convert. Specify the name of a variable in the API context. <code>variableName.body</code> , the message payload, represents the XML input to convert. The default value of the variable is <code>message</code> and <code>message.body</code> is the default input.	string
<span style="border: 1px solid green; padding: 2px;">API Gateway only</span> Output	No	The output message to store the conversion result. Specify the name of a variable in the API context. <code>variableName.body</code> represents the result of conversion from XML format to JSON format. When the specified input message is the default message, the default output is <code>message.body</code> . Otherwise, when the input message is the variable <code>my-message-variable</code> , for example, the default output is <code>my-message-variable.body</code> . The variable cannot be any read-only in the API context.	string
<span style="border: 1px solid green; padding: 2px;">API Gateway only</span> Conversion type	No	The conversion type that determines the target format of the output. The following options are available: <ul style="list-style-type: none"> <li>badgerFish: BadgerFish convention is used to determine the target conversion format of the output.</li> <li>apicv5: apicv5 convention is used to determine the target conversion format of the output.</li> </ul>	string

## Examples

For example, the following simple XML object

```
<a>hello</a>
```

becomes

```
{ "a": { "$" : "hello" } }
```

The following XML object with an attribute

```
<a type="world">hello</a>
```

becomes

```
{ "a": { "$" : "hello", "@type" : "world" } }
```

For examples, see [xml-to-json](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.

For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## XSLT

Use the XSLT policy to apply an XSLT transform to the payload of the API definition.

## Gateway support

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® Gateway (v5 compatible)	1.0.0
DataPower API Gateway	2.0.0 2.1.0 (DataPower API Gateway Version 10.0.4.0 or later)

This topic describes how to configure the policy in the assembly user interface; for details on how to configure the policy in your OpenAPI source, see [xslt](#).

## About

Note: If you are using the DataPower API Gateway, the input to the XSLT policy must be parsed data. One way to produce parsed data is to use a [Parse](#) policy before an XSLT policy in your assembly flow, which provides explicit control of the parse action.

## Properties

The following table lists the policy properties, indicates whether a property is required, specifies the valid and default values for input, and specifies the data type of the values.

Table 2. XSLT policy properties

Property label	Required	Description	Data type
Title	Yes	The title of the policy. The default value is <b>xslt</b> .	string
Description	No	A description of the policy.	string
Use context current payload	No	Indicates whether this XSLT input document uses the context current payload, or if there is no input. The check box is cleared by default, which indicates that there is no input.	boolean
<span style="border: 1px solid green; padding: 2px;">API Gateway only</span> Serialize output	No	If you select this option, the output tree that is generated by the XSLT policy is serialized. The content of <b>message.body</b> is updated with the serialized binary data rather than the XML tree. The check box is cleared by default, which indicates that the output tree is not serialized.	boolean
Source	Yes	The XSLT transform source to execute.	string
<span style="border: 1px solid green; padding: 2px;">API Gateway only</span> XSLT version	No	The XSLT processor version. The default value is XSLT10.	string
<span style="border: 1px solid green; padding: 2px;">API Gateway only</span> Strict	No	Whether to enable strict XSLT error checking. Non-strict operations attempt to recover from certain errors, such as use of undeclared variables, calling undeclared templates, and so forth. By default, strict XSLT error checking is enabled.	boolean
<span style="border: 1px solid green; padding: 2px;">API Gateway only</span> Profile rule	No	Whether to enable stylesheet profiling. This option should not be used in production environments. By default, stylesheet profiling is disabled.	boolean
<span style="border: 1px solid green; padding: 2px;">API Gateway only</span> Debug rule	No	Whether to run the stylesheet, XQuery script, and JSONiq script in debug mode. When a stylesheet, XQuery script, or JSONiq script is run in debug mode, it generates a custom web page instead of displaying its normal output. The web page details exactly what occurred during execution, including the values of variables and where particular pieces of the output came from. This option should not be used in production environments. By default, debug mode is disabled.	boolean
<span style="border: 1px solid green; padding: 2px;">API Gateway only</span> Streaming rule	No	Whether the stylesheet must be run in streaming mode. Transformation of the document begins before the input is fully parsed. Not all stylesheets can be streamed. If the stylesheet cannot be streamed, an error is generated and the input is not processed. By default, streaming mode is disabled.	boolean
<span style="border: 1px solid green; padding: 2px;">API Gateway only</span> Attempt streaming rule	No	Whether to attempt to run the stylesheet in streaming mode. Transformation of the document begins before the input is fully parsed. Not all stylesheets can be streamed. If the stylesheet cannot be streamed, a warning is generated during compilation and the stylesheet is read in the entire input as normal at execution time. By default, attempting to run the stylesheet in streaming mode is disabled.	boolean
<span style="border: 1px solid green; padding: 2px;">API Gateway only</span> Minimum output escaping rule	No	Whether to escape output produced from the stylesheet during processing. Minimal escaping is particularly useful when handling non-English character sets. By default, minimum escaping is disabled.	boolean
<span style="border: 1px solid green; padding: 2px;">API Gateway only</span> Maximum stack size	No	The maximum number of bytes that the stack is allowed to use while executing a stylesheet or other compiled content. This setting is used to block infinite recursion. The minimum value is 10 kilobytes, or 10,240 bytes. The maximum value is 100 megabytes, or 104,857,600 bytes. The default value is 1 megabyte, or 1,048,576 bytes.	integer
<span style="border: 1px solid green; padding: 2px;">API Gateway only</span> WS-I Basic Profile validation	No	The validation behavior to apply to WSDL files that are checked for conformance to section 5 of WS-I Basic Profile (version 1.0, April 2004). The default setting is Warn.  Ignore Disables conformance checking.  Warn Logs warnings for violations.  Fail Forces conformance. Fails if the file contains any violation.	string
<span style="border: 1px solid green; padding: 2px;">API Gateway only</span> Validate message body	No	The validation behavior for the <b>soap:Body</b> . The default setting is Strict.  Strict Validates this part of the message against the WSDL definition. Allows only messages that contain this part and that match the WSDL definition.  Lax Validates this part of the message against the WSDL definition. If the message contains this part and the WSDL definition does not define this part, allow the message. If the message contains this part and the WSDL definition defines this part, allow the message only when there is a match.  Skip Disables validation of this part of the message.	string
<span style="border: 1px solid green; padding: 2px;">API Gateway only</span> Validate message headers	No	The validation behavior for the <b>soap:Header</b> . The default setting is Lax.  Strict Validates this part of the message against the WSDL definition. Allows only messages that contain this part and that match the WSDL definition.  Lax Validates this part of the message against the WSDL definition. If the message contains this part and the WSDL definition does not define this part, allow the message. If the message contains this part and the WSDL definition defines this part, allow the message only when there is a match.  Skip Disables validation of this part of the message.	string

Property label	Required	Description	Data type
<span style="border: 1px solid green; border-radius: 3px; padding: 2px;">API Gateway only</span> Validate message fault details	No	Specifies the validation behavior for the fault detail. The default setting is Strict.  Strict Validates this part of the message against the WSDL definition. Allows only messages that contain this part and that match the WSDL definition.  Lax Validates this part of the message against the WSDL definition. If the message contains this part and the WSDL definition does not define this part, allow the message. If the message contains this part and the WSDL definition defines this part, allow the message only when there is a match.  Skip Disables validation of this part of the message.	string
<span style="border: 1px solid green; border-radius: 3px; padding: 2px;">API Gateway only</span> Require wrappers on fault details specified by type	No	Whether to require compatibility with RPC-style wrappers. By default, RPC-style wrappers are not required.	boolean
<span style="border: 1px solid green; border-radius: 3px; padding: 2px;">API Gateway only</span> Specifically allow xsi:type='SOAP-ENC:Array' rule	No	Whether to allow the schema to accept most uses of elements with <code>xsi:type='SOAP-ENC:Array'</code> consistent with SOAP 1.1 Section 5, even when these attributes violate the XML Schema specification. Normally, the <code>xsi:type</code> attribute must name a type equal to or derived from the actual type of the element. For schemas compiled with this option, <code>xsi:type</code> is accepted specifically for the SOAP 1.1 Encoding 'Array' complex type if the element type is derived from <code>SOAP-ENC:Array</code> . The opposite is the normal allowable case. By default, elements with <code>xsi:type='SOAP-ENC:Array'</code> are not accepted.	boolean
<span style="border: 1px solid green; border-radius: 3px; padding: 2px;">API Gateway only</span> Validate SOAP 1.1 encoding rule	No	Whether to perform extra schema validation following the encoding rules in SOAP 1.1 Section 5. When enabled, members of SOAP arrays are validated, attributes such as @id and @href are allowed even if they are not allowed by the schema, and @href values are checked to ensure that they have a corresponding @id element. By default, the extra validation is not performed.	boolean
<span style="border: 1px solid green; border-radius: 3px; padding: 2px;">API Gateway only</span> Wildcards ignore xsi:type rule	No	Whether <code>xs:any</code> elements in the schema validate only child elements by name. The XML Schema specification requires that, if a wildcard matches an element but that element does not have an element declaration, the element is instead validated according to an <code>xsi:type</code> attribute on it. This option ignores those <code>xsi:type</code> attributes. It should be used for cases such as SOAP envelope validation where a further validation step will validate the contents matching the wildcard, possibly using the SOAP 1.1 encoding rules. By default, <code>xsi:type</code> attributes are not ignored.	boolean
<span style="border: 1px solid green; border-radius: 3px; padding: 2px;">API Gateway only</span> Strict SOAP envelope version	No	Whether to strictly follow the SOAP binding in the WSDL. When enabled, only messages bound to SOAP 1.2 appear in SOAP 1.2 envelopes and only messages bound to SOAP 1.1 appear in SOAP 1.1 envelopes. By default, strict SOAP binding is disabled.	boolean
<span style="border: 1px solid green; border-radius: 3px; padding: 2px;">API Gateway only</span> Debug XACML policy	No	Whether to compile XACML policies with debug information. Note that the XACML debugging messages are also controlled by the log event in the XACML category. Use the debug log level to view the full XACML debugging messages. By default, XACML policies are not compiled with debug information.	boolean
<span style="border: 1px solid green; border-radius: 3px; padding: 2px;">API Gateway only</span> Accept MTOM/XOP optimized messages	No	Specifies whether the schema or WSDL document accepts messages where base64-encoded binary content was optimized according to the MTOM/XOP specifications. XOP binary-optimization replaces base64-encoded binary data with an <code>xop:Include</code> reference element that references the unencoded binary data located in an attachment. By default, MTOM/XOP optimized messages are disabled. <ul style="list-style-type: none"> <li>When disabled, such optimized messages are rejected by validation of the optimized form. Rejection occurs because the schema specifies a simple type that accepts base64-encoded data, such as <code>xs:base64Binary</code> or <code>xs:string</code>, but the message contains an <code>xop:Include</code> element instead.</li> <li>When enabled, an <code>xop:Include</code> element can optionally appear in place of content for any XML Schema simple type that validates base64-encoded binary data. The <code>xop:Include</code> element itself will be validated according to the built-in schema in <code>store:///schemas/xop.xsd</code>.</li> </ul>	boolean

For examples of the OpenAPI definitions of XSLT policies, see [XSLT policy examples](#).

For more examples of how to use XSLT to access and modify properties and context, see [Implementation code examples](#) and, if you are using the DataPower API Gateway, [Using context variables in GatewayScript and XSLT policies with the DataPower API Gateway](#).

## Errors

The following error can be thrown while the policy is being executed:

- **TransformError** - a generic error that captures all errors that occur during the execution of the policy.
- [XSLT policy examples](#)  
Examples of the OpenAPI definitions of XSLT policies.
- [Implementation code examples](#)  
Example XSLT and GatewayScript code snippets.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## XSLT policy examples

Examples of the OpenAPI definitions of XSLT policies.

- [Simple example with no context current payload](#)
- [Concatenation and transformation](#)
- [Obtain query parameter values and refer to context variables](#)
- [Return DataPower object name associated with a client TLS profile](#)

Attention:

- The mechanisms described here for interacting with the API Connect context are intended for v5-compatible gateways and also to provide v5 compatibility for APIs created for the API Gateway. However, if you are writing an XSLT policy or user-defined policy for a new API Gateway API, use the mechanisms described in [Using context variables in GatewayScript and XSLT policies with the DataPower API Gateway](#) for better performance and long-term support. For API Gateway APIs, the v5-compatibility functions listed here are to be used for v5 migration only.
- The XML specification <https://www.w3.org/TR/xml/> does not specify a preferred order for XML namespace (XMLNS) attributes. Best practice is to not rely upon the sequence of XMLNS attributes if you write custom parsing code.

## Simple example with no context current payload

The following is an example of where the XSLT input document does not use the context current payload (there is no input):

```
- xslt:
  title: example xslt
  source: |
    <xsl:stylesheet version="1.0" xmlns:xsl="http://www.w3.org/1999/XSL/Transform">
      <xsl:template match="/">
        <Hello>World!</Hello>
      </xsl:template>
    </xsl:stylesheet>
```

## Concatenation and transformation

The following example shows a more complex XSLT transform source, where the stylesheet concatenates two input strings and transforms the third input string to the IP address of the client:

```
- xslt:
  title: xslt
  input: true
  source: |
    <?xml version="1.0" encoding="UTF-8"?>
    <xsl:stylesheet
      xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
      xmlns:xalan="http://xml.apache.org/xslt"
      xmlns:fn="http://www.w3.org/2005/xpath-functions"
      xmlns:dp="http://www.datapower.com/extensions"
      xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
      xmlns:xs4xs="http://www.w3.org/2001/XMLSchema"
      xmlns:io="http://xformMessage"
      xmlns:map="http://xformMessage/xform"
      xmlns:msl="http://www.ibm.com/xmlmap"
      exclude-result-prefixes="fn dp dp map xalan msl"
      version="1.0">
    <xsl:output method="xml" encoding="UTF-8" indent="no"/>

    <!-- root wrapper template -->
    <xsl:template match="/">
      <msl:datamap>
        <xsl:choose>
          <xsl:when test="not(msl:datamap/dataObject[1]/@xsi:nil)">
            <xsl:element name="dataObject">
              <xsl:attribute name="xsi:type">
                <xsl:value-of select="'io:data'"/>
              </xsl:attribute>
              <xsl:call-template name="map:xform">
                <xsl:with-param name="data" select="msl:datamap/dataObject[1]"/>
              </xsl:call-template>
            </xsl:element>
          </xsl:when>
          <xsl:otherwise>
            <xsl:element name="dataObject">

      <xsl:value-of select="concat($data/StringOne, $data/StringTwo)"/>
    </StringOne>
  </xsl:if>
  <!-- a simple mapping with no associated source: to "StringTwo" (string) -->
  <StringTwo>
    <xsl:value-of select="dp:client-ip-addr()"/>
  </StringTwo>
  <!-- a simple data mapping: "$data/NumberOne" (int) to "NumberOne" (int) -->
  <xsl:if test="$data/NumberOne">
    <NumberOne>
      <xsl:value-of select="$data/NumberOne"/>
    </NumberOne>
  </xsl:if>
  <!-- a simple data mapping: "$data/NumberTwo" (int) to "NumberTwo" (int) -->
  <xsl:if test="$data/NumberTwo">
    <NumberTwo>
      <xsl:value-of select="$data/NumberTwo"/>
    </NumberTwo>
  </xsl:if>
  <!-- a simple data mapping: "$data/NumberThree" (int) to "NumberThree" (int) -->
  <xsl:if test="$data/NumberThree">
    <NumberThree>
      <xsl:value-of select="$data/NumberThree"/>
    </NumberThree>
  </xsl:if>
</xsl:template>

<!-- ***** Utility Templates ***** -->
<!-- copy the namespace declarations from the source to the target -->
<xsl:template name="copyNamespaceDeclarations">
  <xsl:param name="root"/>
  <xsl:for-each select="$root/namespace::*[not(name() = '')]">
    <xsl:copy/>
  </xsl:for-each>
</xsl:template>
</xsl:stylesheet>

```

## Obtain query parameter values and refer to context variables

The following example shows a complete OpenAPI source file. The API includes an XSLT policy that obtains a query parameter value in XSLT, and also uses the `getvariable` method to retrieve the value of the context variable `request.headers.user-agent`.

```

```

```

<xsl:template match="/">
  <xsl:variable name="httpHeaders">
    <header name="Accept">application/xml</header>
  </xsl:variable>
  <!--
    For v5, the name returned is client:<orgname>-my-test
    For v5c, the name returned is client:<orgname>-my-testV1.0.0
    For API Gateway, the name returned is client:<orgname>_<catalogname>_tlsp-my-testV1.0.0
  -->
  <xsl:variable name="tlsClientProfile" select="apim:getTLSProfileObjName('my-test') " />
  <xsl:variable name="targetUrl" select="'https://127.0.0.1:6201/PingRequest'"/>
  <dp:url-open target="{targetUrl}" response="responsecode" timeout="20" http-headers="$httpHeaders" ssl-proxy="{
{tlsClientProfile}"/>
  </xsl:template>
</xsl:stylesheet>

```

For more examples of how to use XSLT to access and modify properties and context, see [Implementation code examples](#) and, if you are using the DataPower® API Gateway, [Using context variables in GatewayScript and XSLT policies with the DataPower API Gateway](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Implementation code examples

Example XSLT and GatewayScript code snippets.

Note: If you are using GatewayScript, you must include one or other of the following commands depending on your gateway type:

```

DataPower Gateway (v5 compatible) var apic = require('./apim.custom.js);
API Gateway var apim = require('apim');

```

where *apic* is the common name used for the GatewayScript examples in this topic. However, *apic* could be any given name of your choice, for example you could use:

```
var apim = require('./apim.custom.js);
```

and then you would start your calls with `apim`.

- [Access to input properties code snippet](#)
- [Access to runtime context code snippet](#)
- [Access to input payload code snippet](#)
- [Access to HTTP headers code snippet](#)
- [Modify the payload code snippet](#)
- [Configure error information code snippet](#)
- [Accessing the caught exception in a catch block](#)
- [Set variables code snippet](#)

## Access to input properties code snippet

The following code block shows an example of how to access the input properties by using the XSLT `policyProperties()` function. The example defines a property that is named `a_property`, which is declared as an integer value, but is retrieved in XSLT as text.

```

<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet version="1.0"
  xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:dp="http://www.datapower.com/extensions"
  xmlns:func="http://exslt.org/functions"
  xmlns:apim="http://www.ibm.com/apimanagement" extension-element-prefixes="dp func apim">

  <!-- Contains the APIM functions -->
  DataPower Gateway (v5 compatible) <xsl:import
href="#_home_markdown_jenkins_workspace_Transform_in_SSMNED_10.0.4_com.ibm.apic.toolkit.doc_local:isp_policy_apim.custom.xsl"
  />
  API Gateway <xsl:include
href="#_home_markdown_jenkins_workspace_Transform_in_SSMNED_10.0.4_com.ibm.apic.toolkit.doc_store:dp_apim.custom.xsl" />

  <xsl:template match="/">
    <xsl:variable name="p" select="apim:policyProperties()" />
    <xsl:message>
      The value of my input property is
      <xsl:value-of select="$p/a_property" />
    </xsl:message>
  </xsl:template>
</xsl:stylesheet>

```

If you are using GatewayScript, call the following function:

```
apic.getPolicyProperty(propertyName)
```

where *propertyName* is the name of the input property that you want to access. If the input property name is blank, the action will return all input properties.

## Access to runtime context code snippet

The following code block shows an example of how to access the runtime context by using the XSLT `getContext()` function.

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet version="1.0"
  xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:dp="http://www.datapower.com/extensions"
  xmlns:func="http://exslt.org/functions"
  xmlns:apim="http://www.ibm.com/apimanagement" extension-element-prefixes="dp func apim">

  <!-- Contains the APIM functions -->
  <xsl:import
    href="#_home_markdown_jenkins_workspace_Transform_in_SSMNED_10.0.4_com.ibm.apic.toolkit.doc_local:_isp_policy_apim.custom.xsl"
  />
  <xsl:include
    href="#_home_markdown_jenkins_workspace_Transform_in_SSMNED_10.0.4_com.ibm.apic.toolkit.doc_store:_dp_apim.custom.xsl" />

  <xsl:template match="/">
    <xsl:variable name="client-id" select="apim:getContext('client.app.id') " />
    <xsl:message>
      The calling application is
      <xsl:value-of select="$client-id" />
    </xsl:message>
  </xsl:template>
</xsl:stylesheet>
```

If you are using GatewayScript, call the following function:

```
apic.getContext(varName)
```

where `varName` is the name of the context variable that you want to access.

For a complete list of context variables, see [API Gateway context variables](#). If you are using the DataPower® API Gateway, see also [Using context variables in GatewayScript and XSLT policies with the DataPower API Gateway](#).

## Access to input payload code snippet

The following code block shows an example of how to access the input payload by using the XSLT `payloadRead()` function.

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet version="1.0"
  xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:dp="http://www.datapower.com/extensions"
  xmlns:func="http://exslt.org/functions"
  xmlns:apim="http://www.ibm.com/apimanagement" extension-element-prefixes="dp func apim">

  <!-- Contains the APIM functions -->
  <xsl:import
    href="#_home_markdown_jenkins_workspace_Transform_in_SSMNED_10.0.4_com.ibm.apic.toolkit.doc_local:_isp_policy_apim.custom.xsl"
  />
  <xsl:include
    href="#_home_markdown_jenkins_workspace_Transform_in_SSMNED_10.0.4_com.ibm.apic.toolkit.doc_store:_dp_apim.custom.xsl" />

  <xsl:template match="/">
    <xsl:variable name="input" select="apim:payloadRead() " />
    <xsl:message>
      The input payload is
      <xsl:copy-of select="$input" />
    </xsl:message>
  </xsl:template>
</xsl:stylesheet>
```

If you are using GatewayScript, call the following function:

```
apic.readInput(callback)
```

A callback is required because the actual payload read is asynchronous. The callback method is called when the payload is ready.

This function returns an XML node-set that contains the payload of the request. If the payload is in JSON format, a JSONx node-set is returned that can then be manipulated within an XSLT or GatewayScript stylesheet. If the payload is not in JSON or XML format, the node-set that is returned is empty.

The following example shows how to use the `payloadType()` function to determine what type of payload (XML or JSONx) will be returned by the XSLT `payloadRead()` function.

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet version="1.0"
  xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:dp="http://www.datapower.com/extensions"
  xmlns:func="http://exslt.org/functions"
  xmlns:apim="http://www.ibm.com/apimanagement" extension-element-prefixes="dp func apim">

  <!-- Contains the APIM functions -->
  <xsl:import
    href="#_home_markdown_jenkins_workspace_Transform_in_SSMNED_10.0.4_com.ibm.apic.toolkit.doc_local:_isp_policy_apim.custom.xsl"
  />
  <xsl:include
```

```
href="#_home_markdown_jenkins_workspace_Transform_in_SSMNED_10.0.4_com.ibm.apic.toolkit.doc_store:_dp_apim.custom.xsl" />
<xsl:template match="/">
  <xsl:variable name="payloadType" select="apim:payloadType()" />
  <xsl:message>
    <xsl:text>Payload type is [</xsl:text>
    <xsl:value-of select="$payloadType" />
    <xsl:text>]</xsl:text>
  </xsl:message>
</xsl:template>
</xsl:stylesheet>
```

## Access to HTTP headers code snippet

The following code block shows an example of how to access the HTTP headers in XSLT by using the `getContext()` function.

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet version="1.0"
  xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:dp="http://www.datapower.com/extensions"
  xmlns:func="http://exslt.org/functions"
  xmlns:apim="http://www.ibm.com/apimanagement" extension-element-prefixes="dp func apim">
  <!-- Contains the APIM functions -->
  <DataPower Gateway (v5 compatible) >xsl:import
href="#_home_markdown_jenkins_workspace_Transform_in_SSMNED_10.0.4_com.ibm.apic.toolkit.doc_local:isp_policy_apim.custom.xsl"
/>
  <API Gateway >xsl:include
href="#_home_markdown_jenkins_workspace_Transform_in_SSMNED_10.0.4_com.ibm.apic.toolkit.doc_store:dp_apim.custom.xsl" />
  <xsl:template match="/">
    <xsl:variable name="content-type" select="apim:getContext('request.headers.content-type')" />
    <xsl:message>
      The request content type is
      <xsl:value-of select="$content-type" />
    </xsl:message>
  </xsl:template>
</xsl:stylesheet>
```

If you are using GatewayScript, call the following function:

```
apic.getContext(request.headers.headerName)
```

where `headerName` maps to the name of the header you want to access.

Note: Access or modification of HTTP headers by using DataPower extensions, such as `dp:set-request-header`, is not advisable, as such actions might yield unexpected results when the policy is combined with other policies and assembly steps.

## Modify the payload code snippet

The output from a user-defined policy must be an XML node-set, which represents an XML or SOAP message, or a JSON message by using JSONx. The following code block shows an example of how to modify the payload in XSLT. To assist the API Gateway policy framework to accept the new or transformed message, call the `apim:output` template, as shown in the following example.

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet version="1.0"
  xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:apim="http://www.ibm.com/apimanagement"
  xmlns:jsonx="http://www.ibm.com/xmlns/prod/2009/jsonx">
  <!-- Contains the APIM functions -->
  <DataPower Gateway (v5 compatible) >xsl:import
href="#_home_markdown_jenkins_workspace_Transform_in_SSMNED_10.0.4_com.ibm.apic.toolkit.doc_local:isp_policy_apim.custom.xsl"
/>
  <API Gateway >xsl:include
href="#_home_markdown_jenkins_workspace_Transform_in_SSMNED_10.0.4_com.ibm.apic.toolkit.doc_store:dp_apim.custom.xsl" />
  <xsl:template match="/">
    <!-- Creates a JSON document (empty object is for simplicity) -->
    <jsonx:object>
    </jsonx:object>
  <!-- Indicates the media type of the output being produced -->
  <xsl:call-template name="apim:output">
    <xsl:with-param name="mediaType" select="'application/json'" />
  </xsl:call-template>
</xsl:template>
</xsl:stylesheet>
```

where `mediaType`:

- `'application/json'` is when the output is written in JSONx format.
- `'application/xml'` is when the output is written in XML format.

If you are using GatewayScript, call the following function:

```
apic.output(mediaType)
```

where `mediaType` is:

- `application/json` is when the output is written in JSONx format.
- `application/xml` is when the output is written in XML format.

Specifying the media type allows the next steps in the assembly flow to understand how to process the new payload.

Tip: The output from a user-defined policy must be XML or JSONx. JSONx is an IBM standard format to represent JSON as XML. One way to convert output GatewayScript JSON data into JSONx, is to add a **Convert Query Params to XML** action to follow the GatewayScript action within the same policy rule. The **Convert Query Params to**

**XML** action must have an **Input Conversion** with the **Default**

**Encoding** set to **JSON**. The output from the GatewayScript action must be the input for the **Convert Query Params to XML** action for JSONx to be produced.

## Configure error information code snippet

The following XSLT code block shows an example of how to configure the policy implementation to produce error information by calling the `apim-error` template.

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet version="1.0"
  xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:apim="http://www.ibm.com/apimanagement">

  <!-- Contains the APIM functions -->
  <xsl:import
    href="#_home_markdown_jenkins_workspace_Transform_in_SSMNED_10.0.4_com.ibm.apic.toolkit.doc_local:_isp_policy_apim.custom.xsl"
  />

  <xsl:include
    href="#_home_markdown_jenkins_workspace_Transform_in_SSMNED_10.0.4_com.ibm.apic.toolkit.doc_store:_dp_apim.custom.xsl" />

  <!-- Indicates this policy has a failure and provides
    additional information for the client application -->
  <xsl:template match="/">
    <xsl:call-template name="apim:error">
      <xsl:with-param name="httpCode" select="'401'" />
      <xsl:with-param name="httpReasonPhrase" select="'Unauthorized'" />
      <xsl:with-param name="errorMessage" select="'Please select a Plan'" />
    </xsl:call-template>
  </xsl:template>

</xsl:stylesheet>
```

where:

- `httpCode` is the code of the required error message.
- `httpReasonPhrase` is the reason for the error.
- `errorMessage` is the suggested action for the user.

If you are using GatewayScript, call the following function:

```
apic.error(name, httpCode, httpReasonPhrase, message)
```

where:

- `name` is the name of the error.
- `httpCode` is the code of the required error message.
- `httpReasonPhrase` is the reason for the error.
- `message` is the suggested action for the user.

## Accessing the caught exception in a catch block

The following XSLT code block shows an example of how, in the `catch` block of an API assembly, you can obtain the details of the current caught exception. A possible use would be to create a custom error response using the details of the caught exception.

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet version="1.0"
  xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:dp="http://www.datapower.com/extensions"
  xmlns:apim="http://www.ibm.com/apimanagement"
  xmlns:apigw="http://www.ibm.com/xmlns/datapower/2017/11/apigateway"
  extension-element-prefixes="dp"
  exclude-result-prefixes="dp apim">
  <xsl:include
    href="#_home_markdown_jenkins_workspace_Transform_in_SSMNED_10.0.4_com.ibm.apic.toolkit.doc_store:_dp_apim.custom.xsl" />
  <xsl:output method="xml" />

  <!-- Contains the APIM functions -->
  <xsl:import
    href="#_home_markdown_jenkins_workspace_Transform_in_SSMNED_10.0.4_com.ibm.apic.toolkit.doc_local:_isp_policy_apim.custom.xsl"
  />

  <xsl:include
    href="#_home_markdown_jenkins_workspace_Transform_in_SSMNED_10.0.4_com.ibm.apic.toolkit.doc_store:_dp_apim.custom.xsl" />
```

```

<xsl:template match="/">
  DataPower Gateway (v5 compatible) <xsl:variable name="exception" select="apim:getError()"/>
  API Gateway <xsl:variable name="exception" select="apigw:get-error()"/>
  <!-- output desired error message based on the exception -->
  <myError>
    <errorReason><xsl:value-of select="$exception/error/message" /></errorReason>
  </myError>

  <!-- Propagate the HTTP status code and reason phrase from the exception -->
  <xsl:call-template name="apim:setVariable">
    <xsl:with-param name="varName" select="'message.status.code'"/>
    <xsl:with-param name="value" select="$exception/error/status/code"/>
    <xsl:with-param name="action" select="'Set'"/>
  </xsl:call-template>

  <xsl:call-template name="apim:setVariable">
    <xsl:with-param name="varName" select="'message.status.reason'"/>
    <xsl:with-param name="value" select="$exception/error/status/reason"/>
    <xsl:with-param name="action" select="'Set'"/>
  </xsl:call-template>

</xsl:template>
</xsl:stylesheet>

```

The `apim:getError()` and `apigw:get-error()` functions return an XML node set; for example:

```

<?xml version="1.0" encoding="UTF-8"?>
<error>
  <name>RuntimeException</name>
  <message>This is a thrown Runtime Error</message>
  <policyTitle>Throw Runtime Error</policyTitle>
  <status>
    <code>500</code>
    <reason>Internal Server Error</reason>
  </status>
</error>

```

If you are using GatewayScript, call the following function:

```
apim.getError()
```

which returns a JSON object; for example:

```

{
  "name": "OperationError",
  "message": "This is a thrown Operation Error",
  "policyTitle": "Throw Operation Error",
  "status": {
    "code": "500",
    "reason": "Internal Server Error"
  }
}

```

## Set variables code snippet

The following XSLT code block shows an example of how to set a runtime variable to a specified string value by calling the `setVariable` template.

```

<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet version="1.0"
  xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:dp="http://www.datapower.com/extensions"
  xmlns:func="http://exslt.org/functions"
  xmlns:apim="http://www.ibm.com/apimanagement" extension-element-prefixes="dp func apim">
  <!-- Contains the APIM functions -->
  DataPower Gateway (v5 compatible) <xsl:import
href="#_home_markdown_jenkins_workspace_Transform_in_SSMNED_10.0.4_com.ibm.apic.toolkit.doc_local:_isp_policy_apim.custom.xsl"
/>
  API Gateway <xsl:include
href="#_home_markdown_jenkins_workspace_Transform_in_SSMNED_10.0.4_com.ibm.apic.toolkit.doc_store:_dp_apim.custom.xsl" />

  <xsl:template match="/">
    <xsl:call-template name="apim:setVariable">
      <xsl:with-param name="varName" select="'serviceEndpoint'"/>
      <xsl:with-param name="value" select="'https://endpoint.host.com/data'"/>
    </xsl:call-template>
    <xsl:message>
      <xsl:text>Variable [ </xsl:text>
      <xsl:value-of select="'serviceEndpoint'"/>
      <xsl:text>] set to [ </xsl:text>
      <xsl:value-of select="'https://endpoint.host.com/data'"/>
      <xsl:text>] </xsl:text>
    </xsl:message>
  </xsl:template>
</xsl:stylesheet>

```

where:

- **varName** is the name of the runtime variable that you want to set a value to.
- **value** is the string value that you want to set the variable to. This can be a literal value, or another variable. For example, to set your named variable to the value of the Content-Type header in a request, you would specify the **value** as `$(request.headers.content-type)`.

If you are using GatewayScript, call the following function:

```
apic.setvariable(varName, varValue, action)
```

where:

- **varName** is the name of the runtime variable that you want to set a value to, or that you want to add or clear.
- **varValue** is the string value that you want to set the variable to. This can be a literal value, or another variable. For example, to set your named variable to the value of the Content-Type header in a request, you would specify the **varValue** as `request.headers.content-type`. This property is only required when **set** or **add** is specified as the action.
- **action** is the action that you want to apply to the variable. Valid options are:
  - **set**
  - **add**
  - **clear**

If no option is set, the default option of **set** is applied.

The following XSLT example shows how to retrieve the value of a runtime variable by using the `getVariable()` function.

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet version="1.0"
  xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:dp="http://www.datapower.com/extensions"
  xmlns:func="http://exslt.org/functions"
  xmlns:apim="http://www.ibm.com/apimanagement" extension-element-prefixes="dp func apim">

  <!-- Contains the APIM functions -->
  <xsl:import
    href="#_home_markdown_jenkins_workspace_Transform_in_SSMNED_10.0.4_com.ibm.apic.toolkit.doc_local:_isp_policy_apim.custom.xsl"
  />
  <xsl:include
    href="#_home_markdown_jenkins_workspace_Transform_in_SSMNED_10.0.4_com.ibm.apic.toolkit.doc_store:_dp_apim.custom.xsl" />

  <xsl:template match="/">
    <xsl:variable name="varValue" select="apim:getVariable('serviceEndpoint')" />
    <xsl:message>
      <xsl:text>Variable [
    <xsl:value-of select="'serviceEndpoint'" />
    <xsl:text>] = [
    <xsl:value-of select="$varValue" />
    <xsl:text>]</xsl:text>
    </xsl:message>
  </xsl:template>
</xsl:stylesheet>
```

where

- **varValue** is the name of the runtime variable that you want to retrieve a value for.

If you are using GatewayScript, call the following function:

```
apic.getvariable(varName)
```

where **varName** is the name of the runtime variable that you want to retrieve a value for.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Logic Constructs

IBM® API Connect includes a number of logic constructs that you can use to apply preconfigured logic to an assembly to control the flow of data through your assembly when the API is called.

Logic constructs are configured in the context of an API. You can use the API Manager assembly editor to add a logic construct to an API and to configure the properties for that construct.

The logic constructs are described in the following subtopics:

- [if](#)  
Use the if construct to apply a section of the assembly when a condition is fulfilled.
- [operation-switch](#)  
Use the operation-switch component to apply a section of the assembly to a specific operation.
- [switch](#)  
Use the switch component to execute one of a number of sections of the assembly based on which specified condition is fulfilled.
- [throw](#)  
Use the throw policy to throw an error when it is reached during the execution of an assembly flow.

## Related concepts

- [The assembly editor](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## if

Use the if construct to apply a section of the assembly when a condition is fulfilled.

## Gateway support

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® Gateway (v5 compatible)	1.0.0
DataPower API Gateway, functionality provided by <a href="#">switch</a>	

This topic describes how to configure the policy in the assembly user interface; for details on how to configure the policy in your OpenAPI source, see [if](#).

An if construct provides a way to branch an API's assembly when a specified condition is fulfilled. Each if construct contains a section of the assembly that is only executed when the script within the construct returns a **true** value.

When using the assemble view's property sheet, use the Condition field to write your condition that returns **true** or **false**.

If you want one or more policies or constructs to be executed when the condition of the if construct is fulfilled, drag the new policy or construct onto one of the dashed boxes that are displayed within the if construct. Constructs and policies included in the if construct are part of the case that is executed when the condition of the if construct is returned as true.

For information about the OpenAPI implementation of an if construct, see [if](#).

In the Condition field, use the form `apim.getvariable('context.location.variable')` to reference your variables, where *context* is the context that you want to reference, *location* is the location of the variable within that context, and *variable* is the name of the variable.

## Construct property details

You can configure a construct's properties in the property sheet in the assemble view.

Table 2. The properties of an if construct

Property	Required	Description
Title	No	A custom title for your construct when it is displayed in the canvas. If a title is not specified, <b>if</b> is used by default.
Description	No	A description of your construct, it is not displayed on the canvas.
Condition	Yes	Use GatewayScript to provide conditions. A list of context variables that you can use to generate conditions can be found in <a href="#">API Connect context variables</a> .

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## operation-switch

Use the operation-switch component to apply a section of the assembly to a specific operation.

## Gateway support

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® Gateway (v5 compatible)	1.0.0
DataPower API Gateway	2.0.0

This topic describes how to configure the policy in the assembly user interface; for details on how to configure the policy in your OpenAPI source, see [operation-switch](#).

An operation-switch component provides a way to branch an API's assembly depending on the operation that is called. For each case, a separate piece of the assembly is applied to the operations that belong to the case.

When using the assemble view's property sheet, click the Case field to view suggested operations. Type in the Case field to refine the list of suggested operations.

Each case behaves as an assembly. To add components to a case, drag the component from the palette to the area included in the operation-switch component. Dashed boxes are displayed where the component can be included in the case.

For information about the OpenAPI implementation of an operation-switch component, see [operation-switch](#).

Restriction: Nesting an operation-switch component inside an if or switch construct, or another operation-switch component, is **not** supported.

## Component property details

You can configure a component's properties in the property sheet in the assemble view.

Table 2. The properties of an operation-switch component

Property	Required	Description
Title	No	A custom title for your component when it is displayed in the canvas. If a title is not specified, <code>operation-switch</code> is used by default.
Description	No	A description of your component, it is not displayed on the canvas.
Case	Yes	Each case includes one or more operations to which the branch provided by the operation switch applies.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## switch

Use the switch component to execute one of a number of sections of the assembly based on which specified condition is fulfilled.

## Gateway support

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® Gateway (v5 compatible)	1.0.0
DataPower API Gateway	2.0.0

This topic describes how to configure the policy in the assembly user interface; for details on how to configure the policy in your OpenAPI source, see [switch](#).

A switch construct provides a way to branch an assembly based on multiple conditions. Each switch component contains multiple cases, each corresponding to a section of the assembly that is only executed when the condition or operation specified by the case is met or used. Additionally, an otherwise case executes when no other case is fulfilled.

Add new cases by clicking + Case and add an "otherwise" case by clicking + Otherwise.

If multiple cases are fulfilled, the highest priority case will be executed. Change the priority of cases by clicking the Move up ↑ and Move down ↓ icons.

To configure a case to be executed if a specific operation is called, use the search operations field and select your operation from the list. You can refine the results of the search by typing in the search operations field.

To configure a case to be executed based on a GatewayScript condition, click edit condition and enter your script in the "Condition editor" window. When you have supplied a script, you can edit your script either in the Condition field or by clicking edit condition.

If you are using the DataPower Gateway (v5 compatible), you enter your condition as GatewayScript directly in a code area in the Condition editor. If you are using DataPower API Gateway, the Condition editor provides a script builder to help you construct your condition script; for more information, see [Using the switch policy condition editor](#).

To delete a case, click the Remove case icon .

If you want one or more policies or constructs to be executed when the condition of a case is fulfilled, drag the new policy or construct onto one of the dashed boxes that are displayed within the case's section of the switch construct.

Note: A switch case **must** contain at least one policy, otherwise the Gateway server returns an error.

## Construct property details

You can configure a construct's properties in the property sheet in the assemble view.

Table 2. The properties of a switch construct

Property	Required	Description
Title	No	A custom title for your construct when it is displayed in the canvas. If a title is not specified, <code>switch</code> is used by default.
Description	No	A description of your construct, it is not displayed on the canvas.

Property	Required	Description
case	Yes (one or more)	Specify one or more operations or write a script for a condition.  Use the Condition editor to construct your condition script. See <a href="#">Using the switch policy condition editor</a> .  Use GatewayScript to provide conditions. You can reference variables by using the form <code>apim.getvariable('context.location.variable')</code> , where <i>context</i> is the context that you want to reference, <i>location</i> is the location of the variable within that context, and <i>variable</i> is the name of the variable. A list of context variables that you can use to generate conditions can be found in <a href="#">API Connect context variables</a> .
otherwise	No	Add an otherwise case if you want to execute a section of the assembly when no other cases are fulfilled.

- [Using the switch policy condition editor](#)

The switch policy condition editor provides a user interface to help you build the conditions for the `case` clauses in a switch policy.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Using the switch policy condition editor

The switch policy condition editor provides a user interface to help you build the conditions for the `case` clauses in a switch policy.

You build a condition script by using the Add Group and Add Condition options, together with operator selections, and pre-supplied function selections. The Output field shows the resultant condition script, and updates dynamically as you build your condition.

## Adding conditions

When you open the policy condition editor, an initial condition is pre-supplied ready for you to configure.

Use the drop-down list to select the function that you want to begin your condition.

The following JSONata functions are supported:

- Aggregation functions:
  - `$average(array)`
  - `$max(array)`
  - `$min(array)`
  - `$sum(array)`
- Array functions:
  - `$append(array1, array2)`
  - `$count(array)`
  - `$reverse(array)`
  - `$sort(array [, function])`
  - `$zip(array1, ...)`
- Boolean functions:
  - `$boolean(arg)`
  - `$exists(arg)`
  - `$not(arg)`
- Numeric functions:
  - `$abs(number)`
  - `$ceil(number)`
  - `$floor(number)`
  - `$formatBase(number [, radix])`
  - `$number(arg)`
  - `$power(base, exponent)`
  - `$round(number [, precision])`
  - `$sqrt(number)`
- Object functions:
  - `$keys(object)`
  - `$lookup(object, key)`
  - `$merge(array<object>)`
  - `$spread(object)`
- String functions:
  - `$contains(str, pattern)`
  - `$join(array[, separator])`
  - `$length(str)`
  - `$lowercase(str)`
  - `$match(str, pattern [, limit])`
  - `$pad(str, width [, char])`
  - `$replace(str, pattern, replacement [, limit])`
  - `$split(str, separator [, limit])`
  - `$string(arg)`
  - `$substring(str, start[, length])`

- `$substringAfter(str, chars)`
- `$substringBefore(str, chars)`
- `$trim(str)`
- `$uppercase(str)`

- You can use the following functional extensions to standard JSONata notation. Each extension corresponds to a part of the API context.

Table 1. Functional extensions to JSONata

Extension	Variable	Description
<code>\$header(name)</code>	<code>message.headers.name</code>	Message header
<code>\$httpVerb()</code>	<code>request.verb</code>	HTTP method of the request
<code>\$operationID()</code>	<code>api.operation.id</code>	ID of the operation
<code>\$operationPath()</code>	<code>api.operation.path</code>	Path of the operation
<code>\$queryParameter('name')</code>	<ul style="list-style-type: none"> <li>◦ <code>request.parameters.name.locations</code> The supported keyword is <code>query</code>.</li> <li>◦ <code>request.parameters.name.values</code></li> </ul>	Searches for the index of <code>query</code> in <code>request.parameters.name.locations</code> and returns <code>request.parameters.name.values[index]</code> , where <code>[index]</code> is the value for <code>query</code> in locations. Parameter values are not URL decoded.
<code>\$statusCode()</code>	<code>message.status.code</code>	Status code
<code>\$storageType([arg])</code>	<code>variable.body</code> You can specify any variable in the API context. When no variable is specified, the default variable <code>message.body</code> is used.	Storage type of the message. The supported values are <code>binary</code> , <code>json</code> , <code>stream</code> , or <code>xml</code> .
<code>\$urlParameter('name')</code>	<ul style="list-style-type: none"> <li>◦ <code>request.parameters.name.locations</code> The supported keywords are <code>path</code> and <code>query</code></li> <li>◦ <code>request.parameters.name.values</code></li> </ul>	Searches for the index of <code>path</code> and <code>query</code> in <code>request.parameters.name.locations</code> and returns a single array that contains both <code>path</code> and <code>query</code> values from <code>request.parameters.name.values</code> . When the URL contains both path and query parameter values, the array includes the path values first followed by the query values. The values of each parameter type are added in the order that they are received. Parameter values are URL decoded. For example, the following URL contains both path and query parameter values. <code>http://example.com/petstore/cats/adopt?breed=Sphynx&amp;breed=Siamese</code> The <code>\$urlParameter('breed')</code> URL returns the following array of values. <code>[cats, adopt, Sphynx, Siamese]</code> In this example, the URL includes an API path that is configured as <code>/petstore/{breed}/{breed}</code> , where <code>breed</code> is configured to be a path parameter of the API path. As a result, <code>cats</code> and <code>adopt</code> are included in the output.
<code>\$xpath(path, xpathExpression)</code>	You can specify any writable variable in the API context. The <code>xpathExpression</code> must be a literal string.	Allows use of XPath expressions. The following example specifies all price elements in the source. <code>\$xpath(\$, '//price')</code>

Table 2. Functional extensions to JSONata for GraphQL

Extension	Variable	Description
<code>\$graphqlActiveOperation([graphql_message])</code>	<code>message.body</code>	Gets the active operation found in the specified GraphQL message. The <code>operationName</code> must be the same as the name of the active operation.
<code>\$graphqlAlias(graphql_field_node)</code>	<code>message.body</code>	Gets the alias of a GraphQL field node.
<code>\$graphqlFragments([graphql_message])</code>	<code>message.body</code>	Gets the fragments found in the specified GraphQL message.
<code>\$graphqlName([graphql_node])</code>	<code>message.body</code>	Gets the node name. For operations, the node name is the <code>operationName</code> . For fields, fragment definitions, arguments, and other elements, the node name is the name of the element. By default, the <code>operationName</code> of <code>message.body</code> is retrieved.
<code>\$graphqlOperations([graphql_message])</code>	<code>message.body</code>	Gets the operations found in the specified GraphQL message.
<code>\$graphqlType([graphql_node])</code>	<code>message.body</code>	The operation type of the active operation is retrieved for Query, Mutation, and Subscription query types.

- You can use the `&` (concatenation) navigation operator.

You can use the following JSONata numeric operators:

- `+` (addition)
- `-` (subtraction)
- `*` (multiplication)
- `/` (division)
- `%` (modulo)

You can use the following JSONata comparison operators for number values or strings:

- `=`
- `!=`
- `<`
- `>`

- <=
- >=

You can also use the following operators and expressions.

- Parentheses to convert a sequence into an array, specify operator precedence, or compute complex expressions on a context value.
- Array ranges and predicate expressions.
- Single asterisk (\*) and double asterisk (\*\*) wildcard characters.

The following elements of a GraphQL query can be exposed in JSONata notation using the syntax shown.

- **query**  
The entire GraphQL query including operations and fragments.
- **operationName**  
For an anonymous operation, **operationName** can be empty.
- **~fragmentSpreadName**
- **on~typeCondition**
- **~~fragmentDefinitionName**

You can also use the following functional extensions to standard JSONata notation. Each extension corresponds to a part of the API context.

Extension	Variable	Description
<b>\$header (name)</b>	<code>message.headers.name</code>	Message header
<b>\$httpVerb ()</b>	<code>request.verb</code>	HTTP method of the request
<b>\$operationID ()</b>	<code>api.operation.id</code>	ID of the operation
<b>\$operationPath ()</b>	<code>api.operation.path</code>	Path of the operation
<b>\$queryParameter ('name')</b>	<ul style="list-style-type: none"> <li>• <code>request.parameters.name.locations</code></li> <li>• <code>request.parameters.name.values</code></li> </ul>	Returns the value of a request query parameter given the parameter name. The function searches the <code>request.parameters.name.locations</code> array for the index position of the value <b>query</b> , and returns <code>request.parameters.name.values[index]</code> , where <b>index</b> is the index position. Parameter values are not URL decoded.
<b>\$statusCode ()</b>	<code>message.status.code</code>	Status code
<b>\$storageType ([arg])</b>	<b>variable.body</b> You can specify any variable in the API context. When no variable is specified, the default variable <code>message.body</code> is used.	Storage type of the message. The supported values are: <ul style="list-style-type: none"> <li>• <code>binary</code></li> <li>• <code>json</code></li> <li>• <code>stream</code></li> <li>• <code>xml</code></li> </ul>
<b>\$urlParameter ('name')</b>	<ul style="list-style-type: none"> <li>• <code>request.parameters.name.locations</code></li> <li>• <code>request.parameters.name.values</code></li> </ul>	Given a request parameter name, returns the parameter values for all occurrences of that parameter as a path parameter or query parameter. The function searches the <code>request.parameters.name.locations</code> array for the index positions of the values <b>path</b> and <b>query</b> , and returns, in a single array, the <code>request.parameters.name.values[index]</code> values for all identified index positions. When the URL contains both path and query parameter values, the array includes the path values first followed by the query values. The values of each parameter type are added in the order that they are received. Parameter values are URL decoded. <p>For example, the following URL contains both path and query parameter values:</p> <pre>http://example.com/petstore/cats/adopt?breed=Sphynx&amp;breed=Siamese</pre> <p>The function call <code>\$urlParameter('breed')</code> returns the following array of values:</p> <pre>[cats, adopt, Sphynx, Siamese]</pre> <p>In this example, the URL includes an API path that is configured as <code>/petstore/{breed}/{breed}</code>, where <b>breed</b> is configured to be a path parameter of the API path. As a result, <code>cats</code> and <code>adopt</code> are included in the output.</p>
<b>\$xpath (path, xpathExpression)</b>	You can specify any writable variable in the API context. The <b>xpathExpression</b> must be a literal string.	Allows use of XPath expressions

After you select the function, additional fields are displayed, depending on the selected function, so that you can complete the condition. For example, if you select the function `$httpVerb ()`, a comparison operator selection list is displayed (= or !=), together with a list of HTTP verbs to select on the right hand side of the expression (`GET`, `PUT`, `POST`, `DELETE`, `HEAD`, `OPTIONS`, or `PATCH`).

If you select NOT, your condition is negated with a `$not` function.

To add further conditions, click Add Condition; you then select whether to insert an **and** or an **or** operator between this condition and the preceding one.

To group two or more conditions inside parentheses, click Add Group, then add your conditions to the group; you then select whether to insert an **and** or an **or** operator between this group and the preceding condition or group.

To write your own condition from scratch, select Custom, then enter your script in the field provided.

## Example

To build the following condition:

```
($statusCode() != 200 and ($httpVerb() = 'GET' or $httpVerb() = 'PUT'))
```

complete these steps in the condition editor:

1. Select `$statusCode()`, select `!=` for the comparison operator, and enter `200` in the field on the right hand side of the condition.
2. Click Add Group.
3. In the new group sub pane that is displayed, click Add Condition.
4. Select `httpVerb()`, leave the comparison operator as `=`, and select `GET` on the right hand side of the condition.
5. Click Add Condition in the group sub pane again.
6. Select `httpVerb()`, leave the comparison operator as `=`, and select `PUT` on the right hand side of the condition.
7. For the comparison operator between the two conditions, select `or`.

## Simple condition statements

The following examples show conditions that use a single function.

This example uses the `$httpVerb()` extension to specify the HTTP method of the request.

```
$httpVerb()="GET"
```

This example uses the `$operationPath()` extension to specify the path of the operation.

```
$operationPath()="/base/path-2"
```

This example uses the `$operationID()` extension to specify the operation ID.

```
$operationID()="test-gatewayscript-GET"
```

This example uses the `$statusCode()` extension to specify the message status code.

```
$statusCode()=200
```

This example uses the `$header(name)` extension to specify the content type of the message header.

```
$header("Content-Type")="application/json"
```

## Combining conditions with logical operators

You can use `and` and `or` operators to combine multiple functions in a single condition.

This example specifies an HTTP GET request and an API operation path equal to `test-gatewayscript-GET`.

```
$httpVerb()="GET" and $operationPath()="test-gatewayscript-GET"
```

This example specifies either a `POST` or `PUT` request.

```
$httpVerb()="POST" or $httpVerb()="PUT"
```

This example specifies an API operation ID equal to `test-gatewayscript_POST` and a message status code equal to `200`, or an API operation ID equal to `test-gatewayscript-GET` and a message status code equal to `500`.

```
($operationID()="test-gatewayscript-POST" and $statusCode()=200) or ($operationID()="test-gatewayscript-GET" and $statusCode()=500)
```

This example specifies an API operation ID equal to `test-gatewayscript-POST` and a message status code equal to `200` with an API operation path equal to `/base/path-2`.

```
($operationID()="test-gatewayscript-POST" and $statusCode()=200) and $operationPath()="/base/path-2"
```

This example specifies a message header content type equal to `text/plain` and a message header length equal to `300`, or a message status code equal to `200`.

```
($header("Content-Type")="text/plain" and $header("Content-Length")=300) or $statusCode()= 200
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## throw

Use the throw policy to throw an error when it is reached during the execution of an assembly flow.

## Gateway support

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® Gateway (v5 compatible)	1.0.0
DataPower API Gateway	2.0.0 2.1.0 (DataPower API Gateway Version 10.0.3.0 or later)

This topic describes how to configure the policy in the assembly user interface; for details on how to configure the policy in your OpenAPI source, see [throw](#).

When the throw policy is encountered, the specified error and error message is produced.

If a catch has been configured that the error produced by the throw policy fulfills, the catch will be triggered.

If no catch is triggered by the thrown error, then a 500 `Internal Server Error` is returned to the API caller.

## Component property details

You can configure a component's properties in the property sheet in the assemble view.

Table 2. The properties of a throw component

Property	Required	Description
Title	No	A custom title for your component when it is displayed in the canvas. If a title is not specified, <code>throw</code> is used by default.
Error name	Yes	The error name that is thrown by the policy.
 Error status code (policy version 2.1.0 and later)	No	Specify the HTTP status code for the error. You can use the <code>\$(variable)</code> format to reference the <code>message.status.code</code> API context variable.
 Error status reason (policy version 2.1.0 and later)	No	Specify the HTTP reason phrase for the error. You can use the <code>\$(variable)</code> format to reference the <code>message.status.reason</code> API context variable.
Error message	No	The error message that is returned with the error name.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.

For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Using context variables in GatewayScript and XSLT policies with the DataPower API Gateway

In the code for GatewayScript and XSLT policies in your API assemblies, you can use API context variables to work with the messages that are generated when an API is called.

### Introduction

All API context variables are stored in a JSON-like tree; each context variable is a node in this tree. A non-leaf node can be either an object or an array, while a leaf node can be a number, string, boolean, or document; a document can contain an XML document, BLOB, Stream, or another JSON document.

Each context variable has a name and a value. You can access a context variable by name when using the GatewayScript and XSLT APIs. Dot notation is used to access a context variable, reflecting the position of the corresponding node in the JSON-like tree; for example, `request.headers.Host`. Where a node name contains special characters, bracket notation is supported; for example, `request.headers['Content-Type']`.

For the GatewayScript policy, all the APIs for the DataPower® API Gateway are in the `context` module, which is a global module. You can therefore access the `context` module directly, you do not need to use the `require()` function first.

For the XSLT policy, the APIs are in the `http://www.ibm.com/xmlns/datapower/2017/11/apigateway` namespace; to use these APIs you must declare this namespace.

Attention: The mechanisms described here for interacting with the API Connect context are preferred and provide the best performance if you are writing new GatewayScript or XSLT policies, or if you are authoring user-defined policies. However, for v5-compatible gateways and v5 compatibility for APIs created for the API Gateway, the preferred mechanisms are as described in [GatewayScript code examples](#) and [XSLT policy examples](#).

## Accessing context variables - examples

GatewayScript examples

To read the `client.app.id` context variable:

```
var clientID = context.get('client.app.id');
```

To set the value of a context variable:

```
context.set('my.vars.amount', 100);
```

The resulting tree has the following structure:

```
{ "my": { "vars": { "amount": 100 } } }
```

To delete the node `my.vars`, and all its child nodes:

```
context.clear('my.vars');
```

The resulting tree has the following structure:

```
{ "my": { } }
```

XSLT examples

To read the `client.app.id` context variable:

```
<xsl:variable name="clientID" select="apigw:get-variable('client.app.id')"/>
```

To set the value of a context variable:

```
<apigw:set-variable name="my.vars.amount" value="100"/>
```

The resulting tree has the following structure:

```
{ "my": { "vars": { "amount": 100 } } }
```

To delete the node `my.vars`, and all its child nodes:

```
<apigw:clear-variable name="my.vars"/>
```

The resulting tree has the following structure:

```
{ "my": { } }
```

## About payloads

When the assembly flow for an API call begins, the following two message objects are predefined in the API context tree:

- **request**: holds the information for the original payload; the **request** message is a read-only object.
- **message**: holds the information for the current payload.

Typically, a message object has **headers** and **body** properties. For the current payload, the **message** message object might have **variables** and **status** properties, and other properties created during the execution of the assembly.

The following example shows the general structure of a typical message:

```
{
  "headers": {
    "Content-Type": "application/xml",
    "X-Client-ID": "1234567890"
  },
  "variables": {
    "amount": 123,
    "name": "xyz"
  },
  "status": {
    "code": 200,
    "reason": "OK"
  },
  "body": <XML/Blob/Stream/JSON Document>
}
```

## Manipulating the message headers - examples

GatewayScript examples

To delete a header:

```
context.message.header.remove('X-My-Header');
```

To read a header:

```
var reqType = context.request.header.get('Content-Type');
var currType = context.message.header.get('Content-Type');
```

To set a header:

```
context.message.header.set('Content-Type', 'application/json');
```

To iterate through the headers:

```
var reqHdrs = context.request.headers;
for (var h in reqHdrs) {
  console.log('>>> Reading the request header: ', h, '=', reqHdrs[h]);
}

var currHdrs = context.message.headers;
for (var h in currHdrs) {
  console.log('>>> Reading the current header: ', h, '=', currHdrs[h]);
}
```

To create a message context called `headersContext`, if one doesn't already exist, and add to it a boolean context variable called `HelloWorld`, with the value `true`:

```
var ctx = context.getMessage("headersContext") || context.createMessage("headersContext");
ctx.setVariable('HelloWorld', true);
```

The `setVariable` call writes the variable into `headersContext.variables>HelloWorld`; therefore a condition statement in any subsequent `switch` policy should check for `headersContext.variables>HelloWorld` rather than `headersContext>HelloWorld`.

To read the context variable in any subsequent `gatewayscript` policy, use the following call:

```
ctx.getVariable("HelloWorld")
```

Note: If you are either migrating an API from IBM® API Connect Version 5.0, or from the DataPower Gateway (v5 compatible), to the DataPower API Gateway, or you are configuring a new API for the DataPower API Gateway, creating a message context, rather than using the context variable mechanism described in

[Accessing context variables - examples](#), is the preferred option. In the case of migration, it most closely matches the behavior of IBM API Connect Version 5.0, and `setVariable` and `getVariable` calls will continue to work without modification. Creating a message context is also the preferred option if you are creating a new API for the DataPower API Gateway because it most closely aligns the API context with the way that various native DataPower API Gateway policies process it.

XSLT examples

To delete a header:

```
<apigw:clear-header message='message' name='X-My-Header' />
```

To read a header:

```
<xsl:variable name='reqType' select='apigw:get-header('request', 'Content-Type')' />
<xsl:variable name='currType' select='apigw:get-header('message', 'Content-Type')' />
```

To set a header:

```
<apigw:set-header name='Content-Type' value='text/xml' />
```

To get all headers:

```
<xsl:variable name='allReqHdrs' select='apigw:all-headers('request')' />
<xsl:variable name='allCurrHdrs' select='apigw:all-headers('message')' />
```

## Manipulating the message status - examples

---

Note: Only the `message` object has the status property, not the `request` object.

GatewayScript examples

To read the status code and reason phrase:

```
var code = context.message.statusCode;
var reason = context.message.reasonPhrase;
```

To update the status code:

```
context.message.statusCode = 400; //integer, update the code, with default reason
```

To update the status code and reason phrase in a single operation:

```
context.message.statusCode = '200 Wonderful'; //string, update code along with customized reason
```

Note: The `context.message.reasonPhrase` context variable is read-only.

XSLT examples

To read the status code and reason phrase:

```
<xsl:variable name='code' select='apigw:get-variable('message.status.code')' />
<xsl:variable name='reason' select='apigw:get-variable('message.status.reason')' />

<apigw:set-variable name='message.status.code' value='200' />
<apigw:set-variable name='message.status.reason' value='OK' />
```

## Accessing the message body - examples

---

Note: The request body is read-only.

GatewayScript examples

To read the request body:

```
context.request.body.readAsJSON(function(error, json) {});
context.request.body.readAsXML(function(error, xml) {});
context.request.body.readAsBuffer(function(error, buffer) {});
```

To read the message body:

```
context.message.body.readAsJSON(function(error, json) {});
context.message.body.readAsXML(function(error, xml) {});
context.message.body.readAsBuffer(function(error, buffer) {});
```

To write the message body and update the content type accordingly:

```
// text response
context.message.body.write("Hello world.");
context.message.header.set('Content-Type', "text/plain");

// JSON response
var pet = { "kind": "dog", "age": 3, "color": "black" };
context.message.body.write(pet);
context.message.header.set('Content-Type', "application/json");

// XML response
var resp = "<order><id>100</id><timestamp>20181231</timestamp><status>fulfilled</status></order>";
context.message.body.write(resp);
context.message.header.set('Content-Type', "text/xml");
```

XSLT examples

Note:

- There is no XSLT API to write the message body; the output of the stylesheet transformation is used to update `message.body`.

- To read the request body or the message body, you must parse `message.body` with a [Parse](#) policy before the XSLT policy is executed. At the beginning of the assembly flow, `message.body` contains `request.body` so, after parsing `message.body`, you can then read the request from `message.body`.
- If the XSLT input document uses the context current payload, `message.body` is used for the input document `'/'` that can be accessed from the XSLT policy if `message.body` has been parsed as XML in advance; this is determined by the `input` property of the XSLT policy, see [xslt](#).

Read the message body:

```
<xsl:variable name="currentPayload" select="apigw:read-payload('message') " />
```

Read the message body when the `input` property of the XSLT policy is set to `true`:

```
<xsl:variable name="currentPayload" select="/" />
```

## Rejecting the session - examples

---

Note: After the session is rejected, the API assembly flow is stopped and a fault response is returned, unless a catch handler is defined.

GatewayScript example

To reject the session with an error name and message, and update the status reason and code:

```
context.reject('CustomError', 'You are not authorized to make this API call');
context.message.statusCode = '401 Unauthorized';
```

XSLT example

To reject the session with an error name and message, and update the status reason and code:

```
<apigw:reject identifier="CustomError" status-code="401" reason="Unauthorized">You are not authorized to make this API call</apigw:reject>
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.

For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Tags in API Connect

There are a number of forms of tagging in IBM® API Connect.

- You can create tags in an API that are visible in its OpenAPI definition and can be used to filter operations in the Developer Portal.
- You can tag items in the Developer Portal so that they can be searched for.

### Tags within an API

---

The OpenAPI specification allows the inclusion of tags in an API definition, and you can create these tags through the API Manager user interface. You can assign tags to an operation within an API.

Tags that are assigned to an operation can be used to group the operations of an API in the Developer Portal, by using the filter options for the API. These tags are visible to anyone who can view any of the Products to which the API belongs.

For more information, see [Editing an OpenAPI 2.0 API definition](#) and [Configuring an operation](#).

Note: Though you can tag the API itself in the API Setup section, by using this method the tag is not visible in the Developer Portal.

### Tags in the Developer Portal

---

An administrator can assign tags to items in the Developer Portal, which are then available through the API Products search function in the Developer Portal.

For more information, see [Editing tags for a specific item](#) and [Managing tags in the Developer Portal](#).

### Related concepts

## Working with Products

In IBM® API Connect, Plans and APIs are grouped together in Products, with which you can manage the availability and visibility of APIs and Plans.

The following diagram demonstrates how Products, Plans, and APIs relate to one another.

Note: Plans belong to only one Product, but they can possess different APIs to other Plans within the same Product, and they can share APIs with Plans from any Product.

Figure 1. The hierarchy of Products, Plans, and APIs.

Products provide a method by which you can group APIs into a package that is intended for a particular use. Additionally, they contain Plans, which can be used to differentiate between different offerings. Plans can share APIs, but whether subscription approval is required depends upon the Plan itself. Additionally, you can enforce rate limits through these Plans, or through operations within the APIs of a Plan that override the rate limit of the Plan. You can also assign different subscription costs to your Plans to differentiate the rates of API calls. For more information, see [Monetizing your Products](#).

To make an API available to an application developer, it must be included in a Plan. You can create Plans only within Products, and these Products are then published in a Catalog. A lifecycle manager can then control the availability and visibility of APIs and Plans through the API Manager. By using the API Manager, you can specify the Plans that an application developer is able to subscribe to through the Developer Portal. The application developer can only subscribe to one Plan from a specific Product. Multiple Plans within a single Product are useful in that they can fulfill similar purposes but with differing levels of performance and cost. For example, you can have a "Demo Plan", which makes a single API available free of charge, and a "Full Plan" which makes several APIs available with a monthly subscription cost.

As well as controlling which APIs an application developer can use, different Plans can be used to implement different rate limits. A rate limit can be implemented as a default rate that is shared across an entire Plan, or can be set for specific operations of an API within that Plan, exempting them from the shared Plan rate limit. Different Plans can have differing rate limits, both between operations and for the overall limit. This is useful for providing differing levels of service to customers. For example, a "Demo Plan" might enforce a rate limit of ten calls per minute, while a "Full Plan" might permit up to 1000 calls per second.

In addition, you can apply burst limits to your Plans, to prevent usage spikes that might damage infrastructure. Multiple burst limits can be set per Plan, at second and minute time intervals. You can also set multiple rate limits per Plan and per operation, at second, minute, hour, day, and week time intervals.

Note:

- Applying a rate limit at the Plan level creates a default rate limit that is shared across all the operations within the Plan. If you need to set specific rate limits for specific operations, you must set these within the operations themselves and these settings will override the setting at the Plan level.
- The test application that is used by the API Manager test tool is not subject to rate limits if you have enabled automatic subscriptions for the Catalog in which you are testing. For more information, see [Working with Catalogs](#)

API Connect also supports the implementation of multiple versions of Products. You can choose version numbers and use them to aid the development of your Products and Plans.

Note: The version for a Product is distinct from the version of any APIs that are contained in the associated Plans. Plans cannot themselves have their own version, they use the version of their parent Product.

- **[Creating a draft Product](#)**

Create a draft Product to collect a set of APIs and Plans into one offering that you make available to your developers. A Plan includes rate limit settings that can be applied to the Plan as a whole, or specified for each operation in an API. Through Products and Plans, you have greater control over what APIs your developers have access to, and the subscription terms.

- **[Downloading a draft Product](#)**

You can download the details of your draft Product so that you can store them for later recovery.

- [Importing a draft Product](#)  
You can create a Product by importing a Product definition in a .yaml file.
- [Searching for a draft Product](#)  
Quickly locate a draft API or Product by searching on the title and version.
- [Editing a draft Product](#)  
After initially creating a draft Product, you can continue to further configure the Product, or you can make configuration changes later.
- [Staging a draft Product](#)  
Stage a draft Product to a Catalog to create a specific version of that Product, before publishing. When a Product is in the staged state, it is not yet visible to, or subscribable by, any developers.. The syndication feature in IBM API Connect means that if Spaces are enabled for a Catalog, Products can be staged only to a Space within that Catalog.
- [Publishing a draft Product](#)  
Publish a draft Product to make the APIs in that Product visible on the Developer Portal for use by application developers. The syndication feature in IBM API Connect means that if Spaces are enabled for a Catalog, Products can be published only to a Space within that Catalog.
- [Creating a new version of your Product](#)  
You can have multiple versions of a Product in IBM API Connect. These versions can occupy any of the lifecycle stages, which facilitates development.
- [Specifying the gateway type for a Product](#)  
You can edit the Product configuration to specify a gateway type.
- [Deleting a draft Product](#)  
You can delete draft Products that are no longer required.
- [Organizing your Products into categories](#)  
You can organize your Products into categories. The Products that you categorize are displayed within the Developer Portal, in their defined categories.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Creating a draft Product

Create a draft Product to collect a set of APIs and Plans into one offering that you make available to your developers. A Plan includes rate limit settings that can be applied to the Plan as a whole, or specified for each operation in an API. Through Products and Plans, you have greater control over what APIs your developers have access to, and the subscription terms.

## Before you begin

---

Define your APIs. For more information, see [Creating an API definition](#).

Tip: As well as using the method described in this task, you can also create a Product when you create an API. If you create an API by using the developer toolkit command line editor, a Product is automatically created for you. You can then change any of the Product settings by opening your new Product in the Products page of the API Manager.

## About this task

---

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

When you first create your Product, it has *draft* status. When you have finished configuring your draft Product, you stage it to a Catalog so that the APIs in the Product can be made available to your application developers.

## Procedure

---

To create a Product, complete the following steps:

1. In the navigation pane, click  Develop, select the Products tab, then click Add Product.  
The Add Product page opens.
2. Select New Product, then click Next.
3. On the Info page, complete the following steps:
  - a. Enter the Title and Version of the Product and, optionally, a description. A Name is entered automatically.  
Note: The value in the Name field is a single string that is used to identify the Product in developer toolkit CLI commands. The Title is used for display. To view the CLI commands to manage draft Products, see [apic draft-products](#).
  - b. Click Next.
4. On the APIs page, select the APIs that you want to include in the Product. You can include only APIs whose gateway type matches the gateway type of the Product, or APIs for which the Enforced option is disabled, meaning that the API is not managed on an API Connect gateway. If you select an incompatible API whose gateway type does not match the gateway type of the Product, a warning message is displayed and you cannot save your changes until you clear the incompatible selection. For more information on gateway types, see [API Connect gateway types](#), [Specifying the gateway type for a Product](#), and [Specifying the gateway type for an API definition](#).
5. Click Next.
6. On the Plans page, complete the following steps:
  - a. Optional: Change the Title, Description, or Rate limit settings for the default Plan.
  - b. Optional: To add further Plans, click Add, then scroll down and modify the Plan settings as required.
  - c. Click Next.

7. To have the Product published to the Sandbox Catalog automatically after creation, select Publish product.  
Note: The publish option is not available in the API Designer UI.
8. If Publish product is selected, you can select which gateway service the Product is published to. By default, the Product is published to all relevant gateway services.
9. In the Visibility section, specify the users that you want the Product to be visible to. You can choose Public to make the Product visible to all users, Authenticated to make the Product available to users who have successfully authenticated, or Custom to specify the consumer organizations and consumer organization groups that you want the Product to be visible to.  
If you select Custom, use the Type to add organizations field to search for the consumer organizations and consumer organization groups that can subscribe to the Plans in the Product. For information about how to create and manage consumer organizations and consumer organization groups, see [Administering Consumer organizations](#).
10. In the Subscribability section, specify the users that can subscribe to the Plans in the Product. You can choose Authenticated to make the Plans in the Product subscribable by users who have successfully authenticated, or Custom to specify the consumer organizations and consumer organization groups that can subscribe to the Plans in the Product.  
If you select Custom, use the Type to add organizations field to search for the consumer organizations and consumer organization groups that can subscribe to the Plans in the Product. If you selected custom visibility, only the consumer organizations and consumer organization groups selected there are available for adding to the custom subscribability list. For information about how to create and manage consumer organizations and consumer organization groups, see [Administering Consumer organizations](#).  
Note: If you select custom visibility or subscribability, the consumer organizations and consumer organization groups that you can choose from are those in the Sandbox Catalog for the management server and provider organization that you are connected to. If you want to specify consumer organizations or groups that are in another Catalog, or in a Space, publish the Product to that Catalog or Space, then configure the visibility or subscribability there; for details, see [Changing the availability of a Product](#).  
If you are using the API Manager user interface, the connection details are determined by the API Manager URL that you open, and the user ID with which you log in. If you are using the API Designer user interface, you provide the management server details and user ID in the login window that opens when you first launch API Designer; see [Logging into API Connect Designer](#).  
  
If you are working offline in API Designer, you must type in the exact name of the organization or group.  
  
For more information about consumer organizations in a Catalog, see [Administering Consumer organizations](#).
11. Click Next to create your Product.
  - a. To further configure your Product, click Edit Product.  
For details, see [Editing a draft Product](#)
  - b. If you do not want to configure your Product further at this time, click the initial Develop link in the breadcrumb trail to return to the Develop page; you can then move on immediately to another task.  
For details on how to configure your Product later, see [Editing a draft Product](#).

---

## Results

You have created a draft Product, and specified a set of APIs and Plans into one offering that you can now make available to your developers.

---

## What to do next

Stage your Product to a Catalog. For more information, see [Staging a draft Product](#).

# Downloading a draft Product

You can download the details of your draft Product so that you can store them for later recovery.

---

## Before you begin

To complete this task, you must have created a draft Product. For more information, see [Creating a draft Product](#).

---

## About this task

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

**API Manager UI only:** To complete this task, you must be assigned a role that has the `Product-Drafts:Edit` permission. The pre-supplied Developer role has this permission by default; if you are assigned a custom role it must have this permission. For more information, see [Creating custom roles](#).

You can download the details of your Product as a .yaml file. This file can be used to re-create your Product, although it includes only references to APIs, not the API definitions themselves. This function does not provide a way to export an entire implementation. For information about creating a Product from a .yaml file, see [Importing a draft Product](#).

## Procedure

---

To download a .yaml file containing details of your Product, complete the following instructions:

1. In the navigation pane, click  Develop.
2. Select the Products tab.
3. Alongside the Product version that you want to work with, click the options icon  and then click Download.
4. Save the file to the required location.

## Results

---

You have downloaded a .yaml representation of your Product.

## Related tasks

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

# Importing a draft Product

You can create a Product by importing a Product definition in a .yaml file.

## Before you begin

---

To complete this task, you must have a .yaml representation of a Product. This can be created as described in the [Downloading a draft Product](#) task.

## About this task

---

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

You can import details of your Product as a .yaml file. This file can be used to re-create your Product, although it includes only references to APIs, not the API definitions themselves. This function does not provide a way to import an entire implementation.

You can import the file from your local file system.

## Procedure

---

To create a Product from a .yaml file, complete the following instructions:

1. In the navigation pane, click  Develop.
2. Select the Products tab.
3. Click Add  Product.
4. Select Existing Product, then click Next.
5. To import a file from your local file system, you can either drag and drop your files, or click Browse and select the file that you want to use. The wizard checks the validity of the YAML, and displays a message indicating successful validation.
6. Click Next.
7. To have the Product published to the Sandbox Catalog automatically after creation, select Publish product.
8. Click Next to create your Product.
  - a. To further configure your Product, click Edit Product. For details, see [Editing a draft Product](#)
  - b. If you do not want to configure your Product further at this time, click the initial Develop link in the breadcrumb trail to return to the Develop page; you can then move on immediately to another task. For details on how to configure your Product later, see [Editing a draft Product](#).

## Results

---

You have imported a Product from a .yaml file. If the same APIs and versions of APIs as referenced in the file are present, then they will be included in the Product.

Importing a Product in this way does not include the API definitions, only references to them.

## Related tasks

- [Downloading a draft Product](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Searching for a draft Product

Quickly locate a draft API or Product by searching on the title and version.

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

On the Develop page, type your search string into the search field and click  (or press Enter) to run the search.

The search returns a list of APIs (or Products) that most closely resemble your keywords, rather than limiting the results to identical matches. The following image shows a search string that includes "AccountServicing". The results include all draft APIs and Products with a title that is similar to the search text, with duplicates sorted by creation date.

Search text entered with no parameters

Title	Version	Type	Modified
<a href="#">AccountServicing</a>	1.0.0	API (SOAP)	a day ago
<a href="#">AccountServicing</a>	1.0.8	API (SOAP)	a day ago
<a href="#">AccountServicing</a>	2.0.0	API (SOAP)	a day ago
<a href="#">AccountServicing</a>	2.0.1	API (SOAP)	a day ago
<a href="#">AccountServicing</a>	999.99	API (SOAP)	a day ago

Items per page 10 1-10 of 10 search results 1 1 of 1 pages

Search results

Page controls

Resources with a name, title, or version that are not similar to the search text are not included in the results. If you select a resource type to search for but do not specify any keywords, the results are sorted by title and then by creation date. For example, if you search for Products but do not include any keywords, then all Products appear in the results table.

### Search text

The search is case insensitive. Trailing spaces and accents (for example: é, è, â) are ignored. For best results, provide as much of the title and version as possible in your search text. Detailed search strings return more accurate results. Results include all titles that are similar to your search string, and not just identical matches.

### What's included in the search?

The scope of the search includes the API or Product Title, Name and Version fields. The search applies only to the current provider organization (displayed in the product banner's Organization field).

You can optionally restrict your search to Products only, or to a specific type of API. Click in the search field and then in the "Types" list that displays, select Product or an API type (REST or SOAP).

### How are results displayed?

Search results display as a table, sorted by API or Product title and version. If the results overflow onto additional pages, navigate between pages using the standard page controls that follow the table. When you clear the search, APIs and Products are listed alphabetically by title and, within each title, by newest version first.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Editing a draft Product

After initially creating a draft Product, you can continue to further configure the Product, or you can make configuration changes later.

## About this task

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

During the initial creation of a Product, the Product creation wizard guides you to enter the minimum configuration settings, and then provides an Edit Product button. You have the option to specify additional configuration immediately, or to return to Product to edit it later. This topic describes how to specify additional configuration in either case.

## Procedure

To edit a draft Product, complete the following steps:

1. Access the Product Setup page in one of the following ways:
  - After completing the initial creation of the Product, click Edit Product.
  - In the navigation pane, click Develop, then select the Products tab.
  - Click the title of the Product that you want to edit.
2. On the Product Setup page, you can make the following configuration changes:
  - a. In the Info section, change the Title, Version, or Summary.
  - b. Use the Contact, Terms of Service, and License sections to enter the corresponding details as required.
  - c. Change the gateway type. For more information, see [API Connect gateway types](#) and [Specifying the gateway type for a Product](#).
  - d. Click Save to save your changes.
3. Optional: Specify Product metadata to be displayed with the Product in the Developer Portal:
  - a. Click the Source tab to see the OpenAPI source for the Product.
  - b. Add the custom attribute **x-name**:  
**value** into the **info** section. For example:

```
info:  
  version: 1.0.0  
  title: Multi Plans  
  name: multi-plans  
  x-customarg: This is the custom value  
  ...
```

Where **customarg** is the name of the custom metadata, and **This is the custom value** is the information content.

c. Click Save.

When the Product is published in the Developer Portal, the custom metadata is displayed with the Product. For example:

4. Click Visibility, then make the following changes as required:
  - a. In the Visibility section, specify the users that you want the Product to be visible to. You can choose Public to make the Product visible to all users, Authenticated to make the Product available to users who have successfully authenticated, or Custom to specify the consumer organizations and consumer organization groups that you want the Product to be visible to.  
If you select Custom, complete the following steps:
    - Select the Catalog for which you want to control visibility.
    - Use the Search organizations and groups field to search for the consumer organizations and consumer organization groups, in the selected Catalog, that you want the Product to be visible to. For information about how to create and manage consumer organizations and consumer organization groups, see [Administering Consumer organizations](#).
  - b. In the Subscribability section, specify the users that can subscribe to the Plans in the Product. You can choose Authenticated to make the Plans in the Product subscribable by users who have successfully authenticated, or Custom to specify the consumer organizations and consumer organization groups that can subscribe to the Plans in the Product.  
If you select Custom, complete the following steps:
    - Select the Catalog for which you want to control subscribability.
    - Use the Search organizations and groups field to search for the consumer organizations and consumer organization groups, in the selected Catalog, that you want the Product to be subscribable to. If you selected custom visibility, only the consumer organizations and consumer organization groups selected there are available for adding to the custom subscribability list. For information about how to create and manage consumer organizations and consumer organization groups, see [Administering Consumer organizations](#).

Note:

- If you select custom visibility or subscribability, only 10 search results are displayed in the selection list for the consumer organizations and consumer organization groups. If necessary, enter a more specific search string to refine the search.
  - Although the title of each organization or group is displayed, followed by the name in parentheses, in the table of selected organizations and groups only the name is displayed
- a. Click Save to save your changes.

Note: You can change the visibility and subscribability settings when you publish the Product; see [Publishing a draft Product](#). You can also change the settings in the Catalog to which the Product is published; see [Changing the availability of a Product](#).

5. To specify the APIs that you want to include in the Product, click APIs, then complete the following steps:

a. Click Edit.

All draft APIs are listed.

b. Select the APIs that you want to include. You can include only APIs whose gateway type matches the gateway type of the Product, or APIs for which the Enforced option is disabled, meaning that the API is not managed on an API Connect gateway. If you select an incompatible API whose gateway type does not match the gateway type of the Product, a warning message is displayed and you cannot save your changes until you clear the incompatible selection. For more information on gateway types, see [API Connect gateway types](#), [Specifying the gateway type for a Product](#), and [Specifying the gateway type for an API definition](#).

c. Click Save when done.

The selected APIs are listed.

Note: To make an API available to application developers, you must include it in a Plan.

6. Optional: Add billing integration to the Product. Click Plans, and in the Billing integration section, select the billing integration resource that you want to apply to the Product.

In the Plans section, you can then either edit the Default Plan to add pricing information, or create a new Plan with pricing information. For more information about billing integration, see [Monetizing your Products](#).

7. Optional: Add one or more Plans to the Product, or modify an existing Plan. Note that a default plan is automatically created for you, with a rate limit of 100 API calls per hour.

Note: If you enable event endpoints in Cloud Pak for Integration, rate limits do not apply to AsyncAPIs associated with a plan.

a. Click Plans.

b. To add a new Plan, click Add. To modify an existing Plan, click the options icon  alongside the required Plan, then click Edit.

c. Specify the Title of the Plan and, optionally, a description. A Name is entered automatically.

Note: The value in the Name field is a single string that is used to identify the Plan in developer toolkit CLI commands. The Title is used for display.

d. Specify whether your Plan requires subscription approval. If you want subscriptions by developers to require approval, select the Approval check box; otherwise, ensure the check box is cleared.

e. In the Plan pricing section, you can add pricing information by completing the following steps:

i. Change the toggle to On for Plan pricing. The Plan pricing definition section is displayed.

ii. If you want to include any free trial days in your Plan, select Include free trial days, and then enter the number of trial days that a subscriber can use the Plan without charge, after which their billing cycle begins.

iii. Select the Currency for the billing process use.

iv. Enter the Price per month to bill the subscriber for. If the selected currency supports fractional units, enter the price including any fractional units, such as cents.

For more information about Product billing integration, see [Defining a Product with billing integration](#).

f. In the Plan Rate Limits section, you can modify a rate limit, and click Add to add further rate limits. You can set multiple rate limits, at second, minute, hour, day, and week time intervals. To remove a rate limit, click the corresponding delete icon .

Note: For information about rate limits and burst limits in API Connect, see [Understanding rate limits for APIs and Plans](#).

g. In the Plan Burst Limits section, you can modify a burst limit, and click Add to add further burst limits. You use burst limits to prevent usage spikes that might

damage infrastructure. You can set multiple burst limits, at second and minute intervals. To remove a burst limit, click the corresponding delete icon .

Rate and burst limits work together to manage network traffic for the APIs covered under a Plan. A Plan can have multiple rate and burst limits, but it is recommended that each time interval be assigned only one set of limits. Adjust the rate and burst limits to allow for maximum traffic without overloading your network. The **rate limit** sets the maximum amount of sustainable, ongoing traffic for accessing the APIs on your network within a time interval (for example, one day). The **burst limit** sets the maximum short-term traffic volume for your network within a time interval (per second or minute).

The **burst limit** allows for short bursts of increased traffic. When the **burst limit** is exceeded, all subsequent API calls are rejected until the start of the next **burst limit interval**. The **burst limit counter** is reset to zero at the start of the next interval, which allows API calls to be accepted again. These API calls count toward the **rate limit counter**, but the resetting of the **burst limit counter** does not affect the **rate limit counter**.

The **rate limit** is the number of API calls allowed in a time interval, for example, 1000 calls per day. When the **rate limit** is exceeded, and Hard limit is enabled, all subsequent API calls will be rejected. The **rate limit counter** is reset to zero at the start of the next **rate limit interval**, which allows API calls to be accepted again. If Hard limit is disabled, all subsequent API calls are still accepted, and a message is logged stating that the **rate limit** has been exceeded. This is referred to as a "soft limit."

Hard limit affects only the **rate limit**, as illustrated by the following scenarios:

Scenario A

Table 1. Hard limit enabled

Hard limit	Burst limit	Rate limit
ON	100 calls/minute	1000 calls/day

- If a user calls an API 100 times in one minute, the **burst limit** is reached. The 101st call (and any subsequent calls) within the same minute will be rejected. Once the minute is up, the **burst limit counter** is reset. All API calls are tallied toward the **rate limit** of 1000 calls per day. The resetting of the **burst limit counter** does not affect the **rate limit counter**.
- If a user calls the API 99 times per minute, they will not hit the **burst limit**. They will eventually hit the 1000 calls per day rate limit, and the 1001st call will be rejected until the end of the same one day **rate limit interval**. During the period of time when API calls are rejected due to the daily **rate limit** being exceeded, the **burst limit** will not be activated since the calls are already rejected.
- Both **burst limits** and **rate limits** are applied per consumer.

Scenario B

Table 2. Hard limit disabled

Hard limit	Burst limit	Rate limit
OFF	100 calls/minute	1000 calls/day

- As in Scenario A, if a user calls the API 100 times in one minute, the 101st call within the same minute will be rejected, until that minute is up and the counter resets. These calls count toward the 1000 calls per day **rate limit** as well.
- If a user calls the API 99 times per minute, they will not hit the **burst limit**. They will eventually hit the 1000 calls per day **rate limit**, and the 1001st call will be accepted (since there is no hard limit). A message will be logged for each subsequent call until the time interval (one day) is up and the counter resets. During the remainder of the day, the **burst limit** will still be enforced, and calls will be rejected once the number of calls exceeds the 100 calls per minute within any given minute.
- Both burst limits and rate limits are applied per consumer.  
Note: When Hard limit is unchecked, the **rate limit** is considered a "soft limit." With a soft limit, calls are not rejected after the **rate limit** is reached. Instead, a message is recorded in the log file. With a soft limit, the **burst limit** still rejects API calls after it is exceeded.

- h. To include in the Plan all the APIs that were included in the Product in step 5, select Same as product in the Plan APIs section.
- i. In the GraphQL Rate Limits section you can configure rate limits that will be applied to any GraphQL proxy APIs that are added to the Product. The following rate limits are available:

**graphql-field-cost**

Applies a limit to the total calculated field cost of GraphQL query calls made to the GraphQL proxy APIs in this Plan.

**graphql-design-request**

Applies a limit to the total number of calls of any of the following types made to the GraphQL proxy APIs in this Plan:

- Requests sent to the **graphql/cost** endpoint for retrieving the cost of a GraphQL query. For more information, see [Enabling the cost endpoint for a GraphQL API](#).
- Standard introspection requests sent to the **/graphql** endpoint. For more information, see [Supporting default introspection for a GraphQL API](#).
- HTML web browser requests for a GraphQL editor sent to the **/graphql** endpoint. For more information, see [Enabling the GraphQL editor for a GraphQL API](#).

**graphql-input-type-cost**

Applies a limit to the total calculated input type cost of GraphQL query calls made to the GraphQL proxy APIs in this Plan.

**graphql-type-cost**

Applies a limit to the total calculated type cost of GraphQL query calls made to the GraphQL proxy APIs in this Plan.

The calculated costs depend on weighting factors applied to the types and fields in the GraphQL schema. For details on the GraphQL proxy API, and configuring type and field weights, see [Creating a GraphQL proxy API](#) and [Using the GraphQL schema editor](#).

- j. To define one or more assembly burst limits or assembly count limits, click Add in the Assembly Burst Limits or Assembly Count Limits section as appropriate. For a burst limit you specify the maximum number of calls allowed in a specified time period, for a count limit you specify a maximum call limit. The name that you supply is for use in a Rate Limit policy in an API assembly, enabling the policy to define the burst or count limit that is to be applied; for more information, see [Rate Limit](#).
- k. To select the APIs that you want to include in the Plan, select Customize the plan API list in the Plan APIs section, then click Edit. The Edit plan APIs window opens. The APIs that are available for selection are those that were included in the Product in step 5. Use the check boxes to specify the required APIs, then click Save when done.
- l. To select specific API operations to include in the Plan, click the options icon  alongside the required API, then click Edit operation list. The Select operations you want to include window opens. Use the check boxes to specify the required operations, then click Save when done.
- m. To remove an API from the Plan, click the options icon  alongside the required API in the Plan APIs section, then click Remove.
- n. For any GraphQL APIs in the Plan, if you want to prevent subscribers to this Plan from using certain types or fields, complete the following steps:
- Click the options icon  alongside the required GraphQL API in the Plan APIs section, then click Edit show/hide settings.
  - To prevent use of a GraphQL type, clear the check box selection alongside that type.
  - To prevent use of a field in a type, expand the type then clear the check box selection alongside that field.
  - When done, click Next. A summary window opens. If the operation is permitted, any related elements that will also be hidden are listed; for example, if you hide a type, and that type is referenced as the data type of a field on another type, that field is also hidden. If the operation is not permitted, an explanation is displayed.
  - If the operation is permitted, click Done to apply your changes. If the operation is not permitted, either click Cancel to close the window or click Back and amend your settings.

You can use the Edit show/hide settings option to change existing settings; you can hide additional types or fields, and you can show types or fields that were previously hidden.

- o. To define rate limits for specific API operations, select Override plan rate limits for individual operation in the Plan APIs section; for further details, see [Defining rate limits for an API operation](#)
- p. Click Save to save your changes.
8. Optional: Specify Plan metadata to be displayed with the Plan in the Developer Portal:
- Click the Source tab to see the OpenAPI source for the Plan.
  - Add the custom attribute **x-name**: **value** into the appropriate **plan** section. For example:

```
...
plans:
  default-plan:
    title: Default Plan
    description: Default Plan
    x-customarg: This is the custom value
    rate-limits:
      default:
        value: 100/1hour
        hard-limit: false
      minute:
        value: 20/1minute
        hard-limit: false
    apis:
      petstore-header-clientid1.0.0: {}
...
```

Where **customarg** is the name of the custom metadata, and **This is the custom value** is the information content.

- c. Click Save.
- When the Plan is published in the Developer Portal, the custom metadata is displayed with the Plan. For example:

## Plans

In order to subscribe, you must [create an account](#) or [sign in](#).

### Default Plan

#### 2 rate limits \*

Customarg: This is the custom value

Select

### Default Plan

✓ Petstore Header ClientID 1.0.0

[View details](#)

Note: After adding custom metadata to a Plan, if you need to edit the Plan details further, you must do this in the Source view, or the custom metadata will be deleted.

9. Optional: Click Categories, then define any categories that you want to organize your Product into. Click Save to save any updates.

By organizing your Products into categories, you can provide a hierarchical display for your Products in the Developer Portal. For more information, see [Organizing your Products into categories](#).

## What to do next

---

Stage your Product to a Catalog. For more information, see [Staging a draft Product](#).

- [Defining rate limits for an API operation](#)

For any Plan in a draft Product, you can apply one or more rate limits to a specific operation on any of the APIs in that Plan.

## Related tasks

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

# Defining rate limits for an API operation

For any Plan in a draft Product, you can apply one or more rate limits to a specific operation on any of the APIs in that Plan.

## About this task

---

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

During the initial creation of a Product, the Product creation wizard guides you to enter the minimum configuration settings, and then provides an Edit Product button. You have the option to specify additional configuration immediately, or to return to Product to edit it later. This topic describes how to specify additional configuration in either

case.

Note: For information about rate limits and burst limits in API Connect, see [Understanding rate limits for APIs and Plans](#).

## Procedure

---

1. Access the Product Setup page in one of the following ways:
  - After completing the initial creation of the Product, click Edit Product.
  - In the navigation pane, click Develop, then select the Products tab.
  - Click the title of the Product that you want to edit.
2. Click Plans.
3. Click the options icon  alongside the required Plan, then click Edit.
4. Scroll down to the Plan APIs section, then select Override plan rate limits for individual operation. The Override Rate Limits section is displayed.
5. Click Add. The Override plan rate limits window opens.
6. Select the API, and the specific operation in that API, to which you want to apply rate limits. By default, calls to the operation are unlimited.
7. To apply one or more rate limits to the operation, select Rate Limits.
8. To define a rate limit, click Add.
9. Supply a name for the rate limit, and define the maximum number of calls allowed in a specified time period; for example, 100 calls per 1 minute. If you select HARD LIMIT and the limit is exceeded, subsequent calls are rejected, otherwise calls are still accepted and a message is logged.
10. Click Save when done. An entry for the operation is listed in the Override Rate Limits section.
11. To modify the rate limiting definition for an operation, click the options icon  alongside the required operation, then click Edit Operation; to delete it, click Remove.
12. Click Save to save your changes.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#), for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Staging a draft Product

Stage a draft Product to a Catalog to create a specific version of that Product, before publishing. When a Product is in the staged state, it is not yet visible to, or subscribable by, any developers.. The syndication feature in IBM® API Connect means that if Spaces are enabled for a Catalog, Products can be staged only to a Space within that Catalog.

## Before you begin

---

Ensure that you have a Catalog to stage to in the API Manager or API Designer user interfaces (UI). For more information, see [Creating and configuring Catalogs](#).

Note: All references in this topic to a Catalog can also be applied to Spaces in a Catalog, unless specified otherwise. For more information about Spaces, see [Using syndication in IBM API Connect®](#).

To complete the Product management tasks that are described in this topic, you must either be the owner of the API provider organization, or be assigned Product > Stage permission for the target Catalog or Space. For information on configuring Product management permissions for a Catalog or Space, see [Creating and configuring Catalogs](#) or [Managing user access in a Space](#).

## About this task

---

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

Staging is not available when working offline in API Designer.

A Catalog is a staging target, and behaves as a logical partition of the DataPower® Gateway, and the Developer Portal.

You stage a Product so that the appropriate approvals, internally within the organization, can be given for it to then be published. For information on configuring Product lifecycle approvals for a Catalog, see [Creating and configuring Catalogs](#). For information on approving requests, see [Approving Product lifecycle and subscription requests](#). For information on publishing a Product, see [Publishing a Product](#).

You cannot re-stage an existing Product version to a production Catalog. If you update an API, you must create a new version of that API. Then, create a new version of the Product so that it includes the newer version of the API. For more information on creating new versions of APIs and Products, see [Creating a new version of an API definition](#) and [Creating a new version of your Product](#). If Spaces are enabled in a production Catalog, you cannot re-stage the same API or Product version to any Space in the Catalog.

You can, however, re-stage a Product version to the Sandbox Catalog, or other non-production Catalog, for ease of iterative testing. Note that when you re-stage a Product version to a non-production Catalog, any application subscriptions are deleted; this is done to facilitate scripted deployment in a continuous integration environment, where the re-creation of application subscriptions will be controlled by the scripts. If Spaces are enabled in a non-production Catalog and you re-stage a Product version to a different Space to the one in which it was previously staged, it is removed from the previous Space and staged to the newly specified Space. If billing integration is enabled in a Product, you cannot re-stage the same Product version into a non-production, or production, Catalog. For more information about billing integration, see [Monetizing your Products](#).

Validation of the API definition file occurs during the staging or publishing process. The following validation occurs:

- Validation against the OpenAPI schema by using the API Dev Tools Swagger Parser (<https://www.npmjs.com/package/@apidevtools/swagger-parser>).
- Validation against IBM extension properties.
- Semantic validation, which includes the following types of validation:

- Ensuring that if an OpenAPI is enforced by an API Connect Gateway, then the scheme must be HTTPS, or the parameter name for an API key security scheme in the header must be either `X-IBM-Client-Id` or `X-IBM-Client-Secret`.
- Ensuring that if the OpenAPI is not enforced by an API Connect Gateway, then a "host" must be provided.
- De-referencing of local references in the definition file (that is, values of `$ref` properties), and ensuring these are valid JSON Pointers within the file.

Note: If you are using Event Endpoint Management in Cloud Pak for Integration, similar validation is carried out for AsyncAPI documents. For more information, see the section about API document and enforcement in the [Cloud Pak for Integration documentation](#).

Note: If the OpenAPI file that defines your API uses a `$ref` field to reference a fragment of OpenAPI code that is defined in a separate file, the `$ref` field is replaced with the contents of the target file before the product that contains the API is staged or published (the `$ref` field is supported only if you are using the API Connect for IBM Cloud developer toolkit). For more information, see [Using \\$ref to reuse code fragments in your OpenAPI files](#).

## Procedure

To stage a Product, complete the following steps:

1. **Optional:** If you have accounts on multiple provider organizations, you can select a new provider organization for staging and publishing from the Organization menu.
2. In the navigation pane, click  Develop.
3. Select the Products tab.
4. You can stage a Product either from the Develop listing page, or from within the Product itself.
  - a. To stage a Product from the Develop listing page, click the options menu icon  alongside the required Product version, and then select Stage.
  - b. To stage a Product from within the Product itself, complete the following steps:
    - i. Click the Product version that you want to work with.
    - ii. Click the options menu icon:
 
    - iii. Select Stage.

ii. Click the options menu icon:

iii. Select Stage.

5. Select the Catalog to which you want to stage the Product.
6. If Spaces have been enabled in the selected Catalog, select the Space that you require.

Note: The Catalogs that you can select from are those that are defined for the management server and provider organization that you are connected to.

If you are using the API Manager user interface, the connection details are determined by the API Manager URL that you open, and the user ID with which you log in. If you are using the API Designer user interface, you provide the management server details and user ID in the login window that opens when you first launch API Designer; see [Logging into API Connect Designer](#).

For details of how to create a Catalog in a provider organization, see [Creating and configuring Catalogs](#).

7. If, when the staged Product is subsequently published, you want it to be published only to selected gateway services, select Publish to specific gateway services, then select the required gateway services. Only the gateway services whose type matches the gateway type setting for the Product are listed. For information on gateway types, see [API Connect gateway types](#).
8. Click Stage.

## Results

Your Product is staged to a Catalog. You can view the state of the Product in the Catalog in API Manager. If you staged the product from API Designer, ensure you are logged into API Manager with the same user name and password that you used for API Designer. Click  Manage in the API Manager UI, then select the required Catalog. The Product is shown with a state of Staged.

For information about the lifecycle of a product, see [The Product lifecycle](#).

If approval is required to stage Products in the Catalog, an approval request is sent, and the Product moves to the Pending state; the Product is staged when the request is approved. If approval is not required, the Product is staged immediately.

For information on configuring Product lifecycle approvals for a Catalog, see [Creating and configuring Catalogs](#). For information on approving requests, see [Approving Product lifecycle and subscription requests](#).

If the Product contains no Plans, a Plan called Default Plan is added automatically to the Product in the Catalog.

## What to do next

- Publish your Product for application developers to access it in the Developer Portal. For more information, see [Publishing a Product](#).

## Related information

- [Managing your Products](#)
- [Removing a Product from a Catalog](#)
- [Working with Products in the API Manager](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Publishing a draft Product

Publish a draft Product to make the APIs in that Product visible on the Developer Portal for use by application developers. The syndication feature in IBM® API Connect means that if Spaces are enabled for a Catalog, Products can be published only to a Space within that Catalog.

## Before you begin

Ensure that you have a Catalog to stage to in the API Manager or API Designer user interfaces (UI). For more information, see [Creating and configuring Catalogs](#).

Note: All references in this topic to a Catalog can also be applied to Spaces in a Catalog, unless specified otherwise. For more information about Spaces, see [Using syndication in IBM API Connect®](#).

To complete the Product management tasks that are described in this topic, you must either be the owner of the API provider organization, or be assigned Product Manage permission for the target Catalog or Space. For information on configuring Product management permissions for a Catalog or Space, see [Creating and configuring Catalogs](#) or [Managing user access in a Space](#).

## About this task

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI. Publishing is not available when working offline in API Designer.

You cannot re-publish a Product version to a production Catalog, you must create a new version of the Product for publication; see [Creating a new version of your Product](#). If Spaces are enabled in a production Catalog, you cannot re-publish the same Product version to any Space in the Catalog, neither the same Space nor a different Space.

You can, however, re-publish a Product version to the Sandbox Catalog, or other non-production Catalog, for ease of iterative testing. When you re-publish a Product version to a non-production Catalog, you can choose whether or not to preserve any application subscriptions; deleting subscriptions can facilitate scripted deployment in a continuous integration environment, where the re-creation of application subscriptions will be controlled by the scripts.

If Spaces are enabled in a non-production Catalog and you re-publish a Product version to a different Space to the one in which it was previously published, it is removed from the previous Space and published to the newly specified Space.

Validation of the API definition file occurs during the staging or publishing process. The following validation occurs:

- Validation against the OpenAPI schema by using the API Dev Tools Swagger Parser (<https://www.npmjs.com/package/@apidevtools/swagger-parser>).
- Validation against IBM extension properties.
- Semantic validation, which includes the following types of validation:
  - Ensuring that if an OpenAPI is enforced by an API Connect Gateway, then the scheme must be HTTPS, or the parameter name for an API key security scheme in the header must be either `X-IBM-Client-Id` or `X-IBM-Client-Secret`.
  - Ensuring that if the OpenAPI is not enforced by an API Connect Gateway, then a "host" must be provided.
  - De-referencing of local references in the definition file (that is, values of `$ref` properties), and ensuring these are valid JSON Pointers within the file.

Note: If you are using Event Endpoint Management in Cloud Pak for Integration, similar validation is carried out for AsyncAPI documents. For more information, see the section about API document and enforcement in the [Cloud Pak for Integration documentation](#).

Note: If the OpenAPI file that defines your API uses a `$ref` field to reference a fragment of OpenAPI code that is defined in a separate file, the `$ref` field is replaced with the contents of the target file before the product that contains the API is staged or published (the `$ref` field is supported only if you are using the API Connect for IBM Cloud developer toolkit). For more information, see [Using \\$ref to reuse code fragments in your OpenAPI files](#).

## Procedure

To publish a Product, complete the following steps:

1. **Optional:** If you have accounts on multiple provider organizations, you can select a new provider organization for staging and publishing from the Organization menu.
2. In the navigation pane, click  Develop.
3. Select the Products tab.
4. You can publish a Product either from the Develop listing page, or from within the Product itself.
  - a. To publish a Product from the Develop listing page, click the options menu icon  alongside the required Product version, and then select Publish. If you are re-publishing a Product to non-production Catalog, and the Product has application subscriptions, the Publish option deletes them. To preserve application subscriptions, click Publish (Preserve Subscriptions) instead.

Note: If there are any existing subscriptions to the Product, the Publish (Preserve Subscriptions) operation will fail if you remove any consumer organizations or consumer organization groups from the Product visibility or subscribability settings; you can, however, add further organizations or groups. For information on managing visibility and subscribability settings, see [Editing a draft Product](#).

For information on consumer organization groups, see [Working with consumer organization groups](#).

- b. To publish a Product from within the Product itself, complete the following steps:
  - i. Click the Product version that you want to work with.
  - ii. Click the options menu icon:

- iii. Select Publish.

5. Select the Catalog to which you want to publish the Product. You must have a compatible gateway type associated with the catalog to proceed, as described in [Creating and configuring Catalogs](#).
6. If Spaces have been enabled in the selected Catalog, select the Space that you require.

Note: The Catalogs that you can select from are those that are defined for the management server and provider organization that you are connected to. If you are using the API Manager user interface, the connection details are determined by the API Manager URL that you open, and the user ID with which you log in. If you are using the API Designer user interface, you provide the management server details and user ID in the login window that opens when you first launch API Designer; see [Logging into API Connect Designer](#).

For details of how to create a Catalog in a provider organization, see [Creating and configuring Catalogs](#).

7. If you want to publish the Product only to selected gateway services, select Publish to specific gateway services, then select the required gateway services. Only the gateway services whose type matches the gateway type setting for the Product are listed. For information on gateway types, see [API Connect gateway types](#).

8. The Visibility and Subscribability sections display the visibility and subscribability settings that have been configured for the draft Product, but you can modify these before publishing if required; proceed as follows:
- In the Visibility section, specify the users that you want the Product to be visible to. You can choose Public to make the Product visible to all users, Authenticated to make the Product available to users who have successfully authenticated, or Custom to specify the consumer organizations and consumer organization groups that you want the Product to be visible to. If you select Custom, use the Type to add organizations field to search for the consumer organizations and consumer organization groups, in the selected Catalog, that you want the Product to be visible to. For information about how to create and manage consumer organizations and consumer organization groups, see [Administering Consumer organizations](#).
  - In the Subscribability section, specify the users that can subscribe to the Plans in the Product. You can choose Authenticated to make the Plans in the Product subscribable by users who have successfully authenticated, or Custom to specify the consumer organizations and consumer organization groups that can subscribe to the Plans in the Product. If you select Custom, use the Search organizations and groups field to search for the consumer organizations and consumer organization groups, in the selected Catalog, that you want the Product to be subscribable to. If you selected custom visibility, only the consumer organizations and consumer organization groups selected there are available for adding to the custom subscribability list. For information about how to create and manage consumer organizations and consumer organization groups, see [Administering Consumer organizations](#).
- Note:
- If you select custom visibility or subscribability, only 10 search results are displayed in the selection list for the consumer organizations and consumer organization groups. If necessary, enter a more specific search string to refine the search.
  - If custom visibility or subscribability has already been configured in the draft Product, the titles that are displayed in the table of selected organizations and groups are derived by taking the names that are defined in the draft Product and finding the corresponding titles in the Catalog that has been selected as the publish target.
9. Click Publish.

## Results

---

Your Product is published to a Catalog. The state of the Product is shown as Published in the header of the Product itself, and you can click Published to see which Catalogs or Spaces the Product is published to.

You can also view the state of the Product in the Catalog in API Manager. If you published the product from API Designer, ensure you are logged into API Manager with the same user name and password that you used for API Designer. Click  Manage in the API Manager UI, then select the required Catalog. The Product is shown with a state of Published.

For information about the lifecycle of a product, see [The Product lifecycle](#).

If approval is required to publish Products in the Catalog, a publish approval request is sent, and the Product moves to the Pending state; the Product is published in the Catalog when the request is approved. If approval is not required, the Product is published immediately.

Note: If approval is required to stage Products to the Catalog, a stage approval request is sent. When the request is approved, the Product moves to the staged state and must be separately published in the Catalog. For information on publishing a staged Product in a Catalog, see [Publishing a Product](#).

For information on configuring Product lifecycle approvals for a Catalog, see [Creating and configuring Catalogs](#). For information on approving requests, see [Approving Product lifecycle and subscription requests](#).

If the Product contains no Plans, a Plan called Default Plan is added automatically to the Product in the Catalog.

## Creating a new version of your Product

You can have multiple versions of a Product in IBM® API Connect. These versions can occupy any of the lifecycle stages, which facilitates development.

### Before you begin

---

Create your Product and assign it a version. For more information, see [Creating a draft Product](#).

### About this task

---

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

You can create multiple versions of a Product, and these versions can be named according to your own preferences, and function as distinct Products when staged.

## Procedure

---

To create a new version of a Product, complete the following steps:

1. In the navigation pane, click  Develop.

2. Select the Products tab.
3. Alongside the Product version that you want to work with, click the options icon , then click Save as a new version. The Save Product as a new version window opens.
4. Enter your new version number, then click Save.

## Results

Your Product is saved as a new version.

## Related information

- [Managing your Products](#)
- [Working with Products in the API Manager](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Specifying the gateway type for a Product

You can edit the Product configuration to specify a gateway type.

### Before you begin

IBM® API Connect supports two gateway types: DataPower® Gateway (v5 compatible) and DataPower API Gateway.

DataPower Gateway (v5 compatible) has been available with IBM API Connect for a number of years. The DataPower API Gateway is a new gateway that has been designed with APIs in mind, and with the same security focus as DataPower Gateway (v5 compatible).

In addition, Event Endpoint Management in Cloud Pak for Integration provides the Event Gateway Service for handling incoming requests to consume from a stream of events.

For more information on how to choose which gateway type to use, see [API Connect gateway types](#).

### About this task

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

You can specify the gateway type for a Product.

Products can use only one type of gateway, and the APIs in the Product must use the same type of gateway. See [Specifying the gateway type for an API definition](#).

When you create a new Product, or import a Product definition that has no gateway type configured, the gateway type defaults according to the gateway types of the gateway services that are enabled in your Sandbox Catalog, as indicated in the following table.

Table 1. Default gateway type for a new Product

Gateway Service enablement in Sandbox Catalog	Default gateway type for new Product
No gateway services enabled	DataPower API Gateway
At least one gateway service of each type enabled	DataPower API Gateway
One or more gateway services only of type DataPower API Gateway enabled	DataPower API Gateway
One or more gateway services only of type DataPower Gateway (v5 compatible) enabled	DataPower Gateway (v5 compatible)

If you import a Product definition that already has a gateway type configured, that gateway type is retained.

For details of how to enable gateway services in a Catalog, see [Creating and configuring Catalogs](#).

## Procedure

To specify the gateway type for a Product, complete the following steps:

1. Ensure that you know the type of gateway that your APIs are configured to use.
2. In the navigation pane, click  Develop, then select the Products tab.
3. Click the title of the Product you want to update.
4. On the Product Setup page, go to the Gateway Type section. Select the gateway type for your Product:
  - DataPower Gateway (v5 compatible)
  - DataPower API Gateway
  - Event Gateway

Note:

You can only select the gateway type that satisfies the selected enforced APIs in your Product. To change the APIs included in your product, see [Editing a draft Product](#).

5. Click Save to retain your changes.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Deleting a draft Product

You can delete draft Products that are no longer required.

### About this task

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

**API Manager UI only:** To complete this task, you must be assigned a role that has the `Product-Drafts:Edit` permission. The pre-supplied Developer role has this permission by default; if you are assigned a custom role it must have this permission. For more information, see [Creating custom roles](#).

Note:

- Deleting a draft Product does not remove it from any Catalogs to which it has been published. For details on how to remove a Product from a Catalog, see [Removing a Product from a Catalog](#).
- You cannot directly delete a Product that was generated automatically from an API with the Activate API option; these Products have the title `api_title` auto product. To delete such Products, delete the API from which it was generated; the Product is deleted together with the API. For more information, see [Deleting an API definition](#).

### Procedure

1. In the navigation pane, click  Develop.
2. Select the Products tab.
3. Alongside the Product version that you want to delete, click the options icon  and then click Delete.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Organizing your Products into categories

You can organize your Products into categories. The Products that you categorize are displayed within the Developer Portal, in their defined categories.

### Before you begin

Your role must have the necessary permissions to stage and publish Products.

### About this task

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

By organizing your Products into categories, you can provide a hierarchical display for your Products in the Developer Portal.

Note: Organizing Products into a hierarchical view in the API Manager or API Manager UI is different to tagging in the Developer Portal.

### Procedure

1. In the navigation pane, click  Develop, then select the Products tab..
2. Click the title of the Product that you want to work with.
3. Click Categories.
4. In the Categories text box, enter the hierarchical taxonomy path that you want your Product to follow, in the following format:

```
top_level_element / next_level_element / x_level_element
```

For example:

```
Animals / Fluffy / Cat
```

5. After you have completed entering the category specifications for the Product, click Save.

### What to do next

- Publish the Product; see [Publishing a draft Product](#).
- After publishing the Product, you can, in the Developer Portal, display Products in the categories that you have defined. For more information, see [Displaying APIs and Products in categories](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Creating and validating API and Product definitions by using the CLI

The developer toolkit of IBM® API Connect provides a command line interface that you can use to create and publish API and Product definitions, and also to validate YAML or JSON definitions.

The following topics explain how to use the command line interface to create an OpenAPI definition file, create a Product definition file, and validate a YAML or JSON definition.

- [Creating an OpenAPI definition file](#)  
APIs are defined in OpenAPI definition files, in YAML format. You can create a default OpenAPI definition file by using the **create** command and then modify it by using an editor of your choice.
- [Specifying a gateway type for an API definition](#)  
An API definition is specific to one or other of the gateway types, DataPower® API Gateway or DataPower Gateway (v5 compatible). API definitions must specify which type of gateway the API uses.
- [Referring to an extension in an API definition](#)  
To refer to an OpenAPI extension in your API definition YAML (or JSON) file, add an **extensions** key under **x-ibm-configuration**.
- [Using \\$ref to reuse code fragments in your OpenAPI files](#)  
If you deploy an API to an IBM API Connect Management server by using the developer toolkit command line, you can use the **\$ref** field in your OpenAPI YAML and JSON API definition files to reference a fragment of OpenAPI code that is defined in a separate file. When API Connect processes the source API definition file, the **\$ref** field is replaced with the contents of the target file.
- [Creating a Product definition file](#)  
You define a Product by creating a Product definition file.
- [Using x-ibm-languages to create multilingual API and Product documentation](#)  
Create multilingual API and Product documentation by using the **x-ibm-languages** extension in your API and Product OpenAPI definitions.
- [Using x-example to control the examples displayed in the Developer Portal](#)  
OpenAPI does not support the use of **example** attributes on parameters, only on request and response objects and their properties. To allow API Developers to be able to control the examples displayed in the portal you can use **x-example** in OpenAPI parameters.
- [Using x-embedded-doc to add additional documentation to products and APIs](#)  
You can use **x-embedded-doc** to add additional documentation to a product or an API as part of their definition.
- [Using x-pathalias to give consistent URLs for products and APIs](#)  
You can use **x-pathalias** to assign a URL to a product or an API.
- [Validating the YAML or JSON definition of an API or Product](#)  
You can validate a YAML or JSON definition by using the IBM API Connect developer toolkit.
- [Creating and using API and Product definitions templates](#)  
You can use template files when creating OpenAPI 2.0 and OpenAPI 3.0 APIs, and when creating Product definitions. Template files are Handlebars templates containing variables of the form `{{variable-name}}` that are substituted with values when you create the API or Product definition.

- [API development and management commands](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Creating an OpenAPI definition file

APIs are defined in OpenAPI definition files, in YAML format. You can create a default OpenAPI definition file by using the **create** command and then modify it by using an editor of your choice.

You can stage or publish the API directly to a Catalog in API Manager by referencing the API in a Product definition file, and then using the **apic products:publish** command to publish the Product. You can also create a draft API in API Manager by using the **apic draft-apis:create** command.

You can create an API in the CLI by running **apic create:api**, and supplying additional arguments on the command line.

Another option is to create an API interactively in the command line by running **apic create:api** and following the prompts.

You can see further details and available options for the **apic create:api** command by running:

```
apic create:api --help
```

IBM provides an extension to the OpenAPI specification; this extension is described in [IBM extensions to the OpenAPI specification](#).

Note: Products that contain an API with a Swagger property using **regex** that include lookahead assertions, such as "(?" cannot be validated or published. An error message is returned. For example:

```
Product has not been published!  
The multipart 'openapi' field contains an OpenAPI definition with validation errors.  
definitions.properties.pattern Does not match format 'regex' (context: (root).definitions.properties.pattern, line: 0, col:  
0)  
400
```

## Creating an API definition from a template

You can use a custom Handlebars template to create an API by using the following command:

```
apic create:api --template template_filename --title api_title
```

where *template\_filename* is the name of the Handlebars template to use, and *api\_title* is the title of your API.

An API template file must have a .hbs file name extension. You can create a template from scratch, or start with the example (default) API template provided in [API and Product definition template examples](#).

You can create multilingual API and Product documentation by using an `x-ibm-languages` extension directly in the OpenAPI definition. For more information, see [Using x-ibm-languages to create multilingual API and Product documentation](#).

- [IBM extensions to the OpenAPI specification](#)

You use the `x-ibm-configuration` object in your OpenAPI definition file to add extensions that are specific to IBM API Connect.

## Related reference

- [API development and management commands](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## IBM extensions to the OpenAPI specification

You use the `x-ibm-configuration` object in your OpenAPI definition file to add extensions that are specific to IBM® API Connect.

The `x-ibm-configuration` extension has the following structure:

```
x-ibm-configuration:  
  enforced: enforced_boolean  
  phase: Phase  
  testable: test_boolean  
  cors:  
    enabled: cors_boolean  
  activity-log:  
    activity_logging_extension  
  assembly:  
    execute:  
      - assembly_component  
  gateway: gateway_type  
  type: api_type  
  properties:  
    properties_extension  
  catalogs:  
    catalogs_extension
```

The following table lists the various extensions used by API Connect, whether they are required, a description of their use and behavior, and their type.

Table 1. IBM extensions

Extension	Required	Description	Type
phase	Yes	Use the <code>phase</code> extension to describe the maturity of the API. It can take the following values: <ul style="list-style-type: none"><li>• <b>identified</b>: the API is in the early conceptual phase and is neither fully designed nor implemented.</li><li>• <b>specified</b>: the API has been fully designed and passed an internal milestone but has not yet been implemented.</li><li>• <b>realized</b>: the API is in the implementation phase.</li></ul>	String
testable	Yes	Use the <code>testable</code> extension to specify whether the API can be tested using the test tool in the Developer Portal.	Boolean
enforced	Yes	Use the <code>enforced</code> extension to specify if the API Connect gateway is used to enforce the API. <ul style="list-style-type: none"><li>• <b>true</b> indicates that the API Connect gateway is used to enforce the API.</li><li>• <b>false</b> indicates that the API Connect gateway is not used to enforce the API.</li></ul>	Boolean
cors	Yes	Use the <code>cors</code> extension to specify whether CORS access control is used for the API. The extension has an <code>enabled</code> field which is a Boolean.	Object (with a single Boolean field)
<span style="border: 1px solid green; padding: 2px;">API Gateway only</span> activity-log	No	Use the <code>activity-log</code> extension to configure your logging preferences for the API activity that is stored in Analytics. The preferences that you specify will override the default settings for collecting and storing details of the API activity.	Object
assembly	No	Use the <code>assembly</code> extension to describe the application of policies and logic to an API. It contains an <code>execute</code> field that contains an array of policies that are applied in order. It can contain a <code>catch</code> field that contains an array of error cases to be caught. For information about use of the <code>execute</code> field, see <a href="#">execute</a> . For information about use of the <code>catch</code> field, see <a href="#">catch</a> .	Object

Extension	Required	Description	Type
gateway	No	Use the <b>gateway</b> extension to specify which type of gateway you want to use. If you are using the DataPower® Gateway (v5 compatible) or DataPower API Gateway, it must be included and take one of the following values: <ul style="list-style-type: none"> <li>datapower-gateway (DataPower Gateway (v5 compatible))</li> <li>datapower-api-gateway (DataPower API Gateway)</li> </ul> For information about types of gateways, see <a href="#">API Connect gateway types</a> .	String
type	No	The <b>type</b> extension takes one of the following values: <ul style="list-style-type: none"> <li>rest</li> <li>wsdl</li> </ul>	
properties	No	Use the <b>properties</b> extension to define properties for use in an API.	Object ( <a href="#">properties</a> )
catalogs	No	Use the <b>catalogs</b> extension to define Catalog-specific values for properties defined in the <b>properties</b> extension.	Object ( <a href="#">catalogs</a> )

The following example shows the **x-ibm-configuration** section of an API that is enforced by API Connect, is in the realized state, is testable through the test tool in the Developer Portal, has CORS access control enabled, and has a simple assembly that invokes a URL and then redacts a field from the request or response.

```
x-ibm-configuration:
  enforced: true
  phase: realized
  testable: true
  cors:
    enabled: true
  assembly:
    execute:
      - invoke:
          title: Example Invoke
          target-url: 'https://example.com/api'
          description: Example description
      - redact:
          actions:
            - action: redact
              from:
                - request
                - response
              path: /**[@name='secondaryAddress']/**[@name='streetAddress']
  properties:
    ID:
      value: 1234
      description: An ID to be used for validating.
      encoded: false
  catalogs:
    Sandbox:
      properties:
        ID: 5678
```

- [catch](#)  
Use the **catch** extension to catch errors that occur during an API call.
- [properties](#)  
Use the **properties** extension to define properties for referencing in an API.
- [catalogs](#)  
Use the **catalogs** extension to assign catalog-specific values to properties defined in the **properties** section.
- [activity-log](#)  
If you're using the DataPower API Gateway, you can use the **activity-log** extension to configure your logging preferences for the API activity that is stored in Analytics. The preferences that you specify will override the default settings for collecting and storing details of the API activity.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## execute

The execute field of an assembly has the following structure:

```
execute:
- Policy_1
- Policy_2
```

Note: Although some built-in policies can be used with both the DataPower® Gateway (v5 compatible) and the DataPower API Gateway, some policies are restricted to a particular Gateway. The following icons indicate which Gateway each policy can be used with:

-  Indicates that the policy can be run on the DataPower Gateway (v5 compatible).
-  Indicates that the policy can be run on the DataPower API Gateway.

For details of the two types of gateway, see [API Connect gateway types](#).

The following table describes the possible policies and logic constructs that can be included in an execute field.

Table 1. execute properties

Property	Required	Description	Data Type	DataPower Gateway	API Gateway
activity-log	No	Use the activity-log policy to log information that relates to the calling of API operations.	object ( <a href="#">activity-log</a> )	✓	✓ Functionality provided by the <a href="#">activity-log</a> extension
client-security	No	Provides a range of options for authenticating client access to your APIs, extending the capabilities of the OpenAPI specification.	object ( <a href="#">client-security</a> )	✗	✓
gatewayscript	No	Include a GatewayScript program.	object ( <a href="#">gatewayscript</a> )	✓	✓
graphql-introspect	No	Use the graphql-introspect policy to introspect a GraphQL schema.	object ( <a href="#">graphql-introspect</a> )	✗	✓
if	No	Use the if policy to execute a section of the assembly only when a condition is fulfilled.	object ( <a href="#">if</a> )	✓	✓ Functionality provided by <a href="#">switch</a>
invoke	No	Use the invoke policy to call an API. The last invoke in your policy might be replaced by a proxy automatically to improve performance. To disable this, see: <a href="#">API properties</a> .	object ( <a href="#">invoke</a> )	✓	✓
json-to-xml	No	Convert payload from JSON to XML.	object ( <a href="#">json-to-xml</a> )	✓	✓
jwt-generate	No	Generate a JSON Web Token (JWT).	object ( <a href="#">jwt-generate</a> )	✓	✓
jwt-validate	No	Validate a JSON Web Token (JWT).	object ( <a href="#">jwt-validate</a> )	✓	✓
log	No	Use the log policy to customize or override the default activity logging configuration for an API.	object ( <a href="#">log</a> )	✗	✓
map	No	Use the map policy to transform variables.	object ( <a href="#">map</a> )	✓	✓
operation-switch	No	Use the operation-switch policy when you want to execute alternative policy assemblies, conditional on the operation that is being called.	object ( <a href="#">operation-switch</a> )	✓	✓
oauth	No	Use the oauth policy to policy to perform OAuth processing based on defined OAuth provider settings.	object ( <a href="#">oauth</a> )	✗	✓
parse	No	Use the parse policy to control the parsing of an input document. When the input document is a JSON string, the string is parsed instead of copied over.	object ( <a href="#">parse</a> )	✗	✓
proxy	No	Proxy a service.	object ( <a href="#">proxy</a> )	✓	✓ Functionality provided by <a href="#">invoke</a>
ratelimit	No	Use the ratelimit policy to apply one or more rate or burst limits at any point in your API assembly flow. Rate and burst limits restrict the number of calls that an application can make to an API in a specified time period.	object ( <a href="#">ratelimit</a> )	✗	✓
redact	No	Use the redact policy to completely remove or to redact specified fields from the request body, the response body, and the activity logs. You might find this policy useful for removing or blocking out sensitive data (for example, credit card details) for legal, security, or other reasons.	object ( <a href="#">redact - DataPower API Gatewayredact - DataPower Gateway (v5 compatible)</a> )	✓	✓
set-variable	No	Use the set-variable policy to set a runtime variable to a string value, or to add or clear a runtime variable.	object ( <a href="#">set-variable</a> )	✓	✓
switch	No	Use the switch policy to execute one of a number of sections of the assembly based on which specified condition is fulfilled.	object ( <a href="#">switch</a> )	✓	✓
throw	No	Use the throw policy to specify points at which an error should be thrown.	object ( <a href="#">throw</a> )	✓	✓
user-defined-policy	No	You can apply your own user-defined policies to your APIs.	object ( <a href="#">User-defined policies</a> )	✓	✓
user-security	No	Extract a user's credentials, authenticate those credentials, and obtain authorization from the user.	object ( <a href="#">user-security</a> )	✗	✓
validate	No	Use the Validate policy to validate the payload in an assembly flow against a JSON or an XML schema.	object ( <a href="#">validate - DataPower API Gateway, validate - DataPower Gateway (v5 compatible)</a> )	✓	✓
validate-usenametoken	No	Validate a WS-Security UsernameToken.	object ( <a href="#">validate-usenametoken</a> )	✓	✗
xml-to-json	No	Convert payload from XML to JSON.	object ( <a href="#">xml-to-json</a> )	✓	✓
xslt	No	Apply an XSLT transform to the payload.	object ( <a href="#">xslt</a> )	✓	✓

The following example shows an execute field for an assembly that invokes a URL and then redacts a field from the request or response.

```
execute:
- invoke:
  title: Example Invoke
  target-url: 'https://example.com/api'
  description: Example description
- redact:
  actions:
  - action: redact
    from:
    - request
```

```
- response
path: /**[@name='secondaryAddress']/**[@name='streetAddress']
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## activity-log

Use the Activity Log policy to configure your logging preferences for the API activity that is stored in IBM® API Connect analytics. The preferences that you specify will override the default settings for collecting and storing details of the API activity.

## Gateway support

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® Gateway (v5 compatible)	1.0.0

This topic describes how to configure the policy in your OpenAPI source; for details on how to configure the policy in the assembly user interface, see [Activity Log](#).

Note: If you are using the DataPower API Gateway, you configure your logging preferences by using the [activity-log](#) extension.

## About

The activity-log policy has the following format:

```
- activity-log:
  version: version
  title: title
  description: description
  content: activity_to_log_if_call_successful
  error-content: activity_to_log_if_call_unsuccessful
```

Apply this policy by adding an assembly extension with an execute field to your OpenAPI definition file.

You can also apply an activity-log policy by using the API Manager assembly editor to add a built-in policy to the API. For more information, see [Activity Log](#) in the built-in policies section.

## Properties

The following table describes the policy properties:

Table 2. Activity Log policy properties

Property	Required	Description	Data type
version	Yes	The policy version number	string
title	Yes	A title for the policy.	string
description	No	A description of the policy.	string
content	Yes	Defines the type of content to be logged when the operation is successful. Valid values: <ul style="list-style-type: none"><li><b>none:</b> Indicates that no logging occurs. Restriction: This option disables notifications for application developers who use your Developer Portal.</li><li><b>activity:</b> Logs invocation only (only the resource URI is recorded).</li><li><b>header:</b> Logs activity and header.</li><li><b>payload:</b> Logs activity, header, and payload (the original request, if any, and the final response).</li></ul> The default value is <b>activity</b> .	string
error-content	No	Indicates what content to log if an error occurs. Valid values: <ul style="list-style-type: none"><li><b>none:</b> Indicates that no logging occurs. Restriction: This option disables notifications for application developers who use your Developer Portal.</li><li><b>activity:</b> Logs invocation only (only the resource URI is recorded).</li><li><b>header:</b> Logs activity and header.</li><li><b>payload:</b> Logs activity, header, and payload (the original request, if any, and the final response).</li></ul> The default value is <b>payload</b> .	string

## Example 1

```
# use defaults
- activity-log:
  version: 1.0.0
  title: default activity logging
```

## Example 2

```
- activity-log:  
  version: 1.0.0  
  title: no logging for successful calls  
  content: none  
  error-content: activity
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## client-security

The client-security policy can be used to extend client authentication access for your APIs.

## Gateway support

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® API Gateway	2.0.0

This topic describes how to configure the policy in your OpenAPI source; for details on how to configure the policy in the assembly user interface, see [Client Security](#).

## About

You use the client-security policy to create an assembly action that's separate from the OpenAPI specification, to allow for more options to authenticate an application. Note that you cannot use the client-security policy to perform rate-limiting enforcement.

In a client security action, you define the following settings.

- Control whether to stop processing if client security fails. When client security fails, stops assembly processing and returns an error.
- Control whether to require the client secret. When required, the secret is compared to the registered secret on the application that is identified by the client ID.
- Define the method to extract client credentials from the request.
  - For all methods except **http**, use the **id-name** and the **secret-name** properties to specify the location that contains the ID and the location that contains the secret.
    - When **cookie**, specify which cookie.
    - When **context-var**, specify which runtime context variable.
    - When **form**, specify the form data.
    - When **header**, specify which header.
    - When **query**, specify which query parameter.
  - For the **http** method, use the **http-type** property to specify the format of the authorization header, which expects the **basic** form in the **basic base64\_id:secret** format.
- Define the method to authenticate the extracted client credentials. The supported methods are **native** (this means by using IBM® API Connect), or by using a specified **third-party** user registry.
  - If **third-party**, use the **user-registry** property to specify the user-registry to authenticate the extracted client credentials. The supported registry types are LDAP and authentication URL.

## Properties

The client-security policy has the following format:

```
- client-security:  
  version: version  
  title: title  
  description: description  
  stop-on-error: is_processing_stopped_on_client_security_failure  
  secret-required: is_client_secret_required_in_request  
  extract-credential-method: method_for_supplying_credentials  
  id-name: parameter_that_specifies_client_id  
  secret-name: parameter_that_specifies_client_secret  
  http-type: authentication_type  
  client-auth-method: method_for_client_authentication  
  user-registry: user_registry_for_client_authentication
```

Table 2. client-security policy properties

Property	Required	Description	Data type
version	Yes	The policy version number.	string
title	No	The title of the policy.	string
description	No	A description of the policy.	string
stop-on-error	Yes	If set to <b>true</b> , assembly processing stops if client security fails, and an error is returned.	boolean

Property	Required	Description	Data type
secret-required	Yes	If set to <b>true</b> , the client secret must be sent in the request. The secret is compared to the registered secret on the application that is identified by the client ID.	boolean
extract-credential-method	Yes	Specify one of the following values to define how the calling application authenticates: <ul style="list-style-type: none"> <li><b>header</b>: client ID and client secret credentials must be supplied in the request header.</li> <li><b>query</b>: client ID and client secret credentials must be supplied as query parameters in the request URL.</li> <li><b>form</b>: client ID and client secret credentials must be supplied as form data sent in a POST request.</li> <li><b>cookie</b>: client ID and client secret credentials must be supplied in a header called <b>Cookie</b>.</li> <li><b>http</b>: the calling application must authenticate by using basic authentication.</li> <li><b>context-var</b>: the credentials that are used for authenticating the client are obtained from context variables that you set in the assembly flow prior to the Client Security policy, by using a <a href="#">gatewayscript</a> policy for example. The names of these context variables are determined by the values that you supply in the id-name and secret-name properties of the client-security policy.</li> </ul>	string
id-name	Yes, unless extract-credential-method is set to <b>http</b>	The name of the parameter whose value specifies the client ID. For all values of extract-credential-method other than <b>context-var</b> and <b>http</b> , the calling application must supply a parameter with this name, in the location defined by the extract-credential-method setting. For <b>context-var</b> , this property specifies the name of a context variable. This option does not apply if the extract-credential-method property is set to <b>http</b> .	string
secret-name	Yes, if secret-required is set to <b>true</b> and extract-credential-method is other than <b>http</b>	The name of the parameter whose value specifies the client secret. For all values of extract-credential-method other than <b>context-var</b> and <b>http</b> , the calling application must supply a parameter with this name, in the location defined by the extract-credential-method setting. For <b>context-var</b> , this property specifies the name of a context variable. This option does not apply if the extract-credential-method property is set to <b>http</b> .	string
http-type	Yes, if extract-credential-method is set to <b>http</b>	The authentication type. Currently, this must be set to <b>basic</b> .	string
client-auth-method	Yes	Specify one of the following values: <ul style="list-style-type: none"> <li><b>native</b>: only client ID and client secret are used to authenticate the request. If extract-credential-method is set to <b>http</b> then the calling application must supply the client ID for the user name, and the client secret for the password.</li> <li><b>third-party</b>: a user registry is used to authenticate the client. If extract-credential-method is set to a value other than <b>http</b> then the calling application must supply the user name for the client ID, and the password for the client secret.</li> </ul>	string
user-registry	Yes, if the client-auth-method is set to <b>third-party</b>	Specify the value of the <b>name</b> property of the user registry that will be used to authenticate the client. The supported registry types are LDAP and authentication URL.	string

## client-security policy example

```
- client-security:
  version: 2.0.0
  title: client-security
  stop-on-error: true
  secret-required: true
  extract-credential-method: cookie
  id-name: my-client-id
  secret-name: my-client-secret
  client-auth-method: third-party
  user-registry: myauthurl
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## gatewayscript

Use the gatewayscript policy to execute a specified DataPower GatewayScript program.

## Gateway support

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® Gateway (v5 compatible)	1.0.0
DataPower API Gateway	2.0.0

This topic describes how to configure the policy in your OpenAPI source; for details on how to configure the policy in the assembly user interface, see [GatewayScript](#).

## About

The gatewayscript policy has the following structure:

```
- gatewayscript:  
  version: version  
  title: Title  
  description: Description  
  source: Script
```

## Properties

The following table describes the policy properties:

Table 2. gatewayscript policy properties

Property	Required	Description	Data type
version	Yes	The policy version number	string
title	No	The title of the policy.	string
description	No	A description of the policy.	string
source	Yes	The GatewayScript source code to execute.	string

## Example

The following is an example of a simple gatewayscript policy:

```
- gatewayscript:  
  version: 1.0.0  
  title: Example_GatewayScript  
  source: console.debug('Hello World!');  
  description: A simple GatewayScript policy.
```

For more information about how to use a gatewayscript policy, see [GatewayScript](#) in the built-in policies section.

For more code examples, see [GatewayScript code examples](#) and, if you are using the DataPower API Gateway, [Using context variables in GatewayScript and XSLT policies with the DataPower API Gateway](#).

For general information on using GatewayScript, see the following topics in the DataPower product documentation:

- [GatewayScript APIs for API management](#)
- [Accessing and manipulating a variable in the API context](#)
- [OAuth context variables](#)

- [GatewayScript code examples](#)
- [API Connect context variables](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## graphql-introspect

Use the graphql-introspect policy to introspect a GraphQL schema.

## Gateway support

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® API Gateway	2.0.0

This topic describes how to configure the policy in your OpenAPI source; for details on how to configure the policy in the assembly user interface, see [GraphQL introspect](#).

## Properties

Table 2. graphql-introspect policy properties

Property	Required	Description	Data type
version	Yes	The policy version number.	string
title	No	The title of the policy.	string

Property	Required	Description	Data type
description	No	A description of the policy.	string
input	No	A variable in the API context that contains the input to introspect. The content of the <b>body</b> field of the variable is the input to introspect. By default, the variable name is <b>message</b> .	string
output	No	A variable in the API context where the results of the introspection are stored. The content of the <b>body</b> field of the variable is the result of GraphQL introspection. The default variable name is the same as that of the variable specified for the <b>input</b> field. Therefore, by default, the input of the introspection is overwritten by the output.	string

## Example

```
- graphql-introspect:
  version: 2.0.0
  title: introspect the accounts graphql schema
  input: message
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## if

Use the if construct when you want to execute a portion of your assembly only when a specific condition is fulfilled.

## Gateway support

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® Gateway (v5 compatible)	1.0.0
DataPower API Gateway, functionality provided by <a href="#">switch</a>	

This topic describes how to configure the policy in your OpenAPI source; for details on how to configure the policy in the assembly user interface, see [if](#).

## About

The if policy has the following format:

```
- if:
  version: version
  title: title
  description: description
  condition: 'condition_1'
  execute:
    policy_assembly_1 ...
```

In the condition field, use the form `apim.getvariable('context.location.variable')` to reference your variables, where *context* is the context that you want to reference, *location* is the location of the variable within that context, and *variable* is the name of the variable.

The **execute**: section can define any policy assembly, including further if policies. For more information, see [execute](#).

## Properties

Table 2. if policy properties

Property	Required	Description	Data type
version	Yes	The policy version number	string
title	No	A title for the policy.	string
description	No	A policy description.	string
condition	Yes	A script that returns <b>true</b> or <b>false</b> . Use GatewayScript for a DataPower Gateway implementation. For information about the context variables you can use and how to reference them in your script, see <a href="#">API Connect context variables</a> .	string
execute	Yes	The policy assembly that you want to execute if the condition returns <b>true</b> . For more information, see <a href="#">execute</a> .	string

## Example

```
# carry out different redaction actions depending on the operation

- if:
  version: 1.0.0
  title: clear_region_and_set_body
  condition: 'apim.getvariable('request.body.secret') == true'
  execute:
    - redact:
      title: remove secret field
      actions:
```

```
- action: remove
  from: all
  path: /document/user/secret
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## invoke

Use the invoke policy to call an API.

## Gateway support

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® Gateway (v5 compatible)	1.0.0
DataPower API Gateway	2.0.0 2.1.0 (DataPower API Gateway Version 10.0.1.1 or later) 2.2.0 (DataPower API Gateway Version 10.0.2.0 or later)

This topic describes how to configure the policy in your OpenAPI source; for details on how to configure the policy in the assembly user interface, see [Invoke](#).

## About

The invoke policy does not support responses with multipart form data, that is, when the response is set to Content-Type: multipart/related.

The invoke policy has the following format:

```
- invoke:
  version: version
  title: title
  description: description
  target-url: URL_of_target_API
  backend-type: how_payload_is_sent_to_backend
  tls-profile: TLS_profile_to_be_used
  verb: method_type
  timeout: timeout_value_in_seconds
  compression: is_data_to_be_compressed
  username: username_if_authentication_required
  password: password_if_authentication_required
  output: location_of_the_invoke_result
  cache-key: unique_identifier_of_the_document_cache_entry
  cache-response: cache_behavior
  cache-putpost-response: response_caching_behavior
  cache-ttl: cache_time_to_live
  inject-proxy-headers: are_proxy_headers_sent_to_target_url
  decode-request-params: are_request_parameters_decoded
  encode-plus-char: are_plus_characters_encoded
  keep-payload: is_payload_sent_on_delete
  use-http-10: are_transactions_restricted_to_http_1.0
  chunked-uploads: are_chunked_encoded_documents_sent_to_the_server
  persistent-connection: are_persistent_connections_enabled
  header-control:
    .
    .
    .
    headers_to_copy_to_target_url
    .
    .
  parameter-control:
    .
    .
    .
    parameters_to_copy_to_target_url
    .
    .
  follow-redirects: url_redirection_behavior
  stop-on-error: errors_that_stop_the_flow
```

## Properties

The following table describes the properties of the invoke policy.

Table 2. Invoke policy properties

Property	Required	Description	Data type
version	Yes	The policy version number	string
title	No	A title for the policy.	string

Property	Required	Description	Data type
description	No	A policy description.	string
target-url	Yes	The URL of the target API.	string
<b>API Gateway only</b> backend-type	No	Specify one of the following values to determine how the payload is sent to the backend: <ul style="list-style-type: none"> <li>• <b>detect</b>: detect the message type and send the payload to the backend accordingly.</li> <li>• <b>xml</b>: package the payload as XML and send. If the message type is not XML, the operation fails.</li> <li>• <b>json</b>: package the payload as JSON and send. If the message type is not JSON, the operation fails.</li> <li>• <b>binary</b>: package the payload as binary and send, regardless of the message type.</li> <li>• <b>graphql</b>: package the payload as GraphQL and send. If the message type is not GraphQL, the operation fails.</li> </ul> <p>The default value is <b>detect</b>.</p>	string
<b>API Gateway only</b> graphql-send-type (policy version 2.2.0 and later)	Yes, if backend-type is set to <b>graphql</b> or <b>detect</b> , and verb is set to <b>POST</b> or <b>keep</b> .	Specify one of the following values to determine how the GraphQL payload is sent to the back end: <ul style="list-style-type: none"> <li>• <b>detect</b>: detect the message type and send the payload to the back end accordingly.</li> <li>• <b>graphql</b>: package the payload as GraphQL and send. If the message type is not GraphQL, the operation fails.</li> <li>• <b>json</b>: package the payload as JSON and send. If the message type is not GraphQL, the operation fails.</li> </ul> <p>Note: graphql-send-type is supported only if backend-type is set to <b>graphql</b> or <b>detect</b>, and verb is set to <b>POST</b> or <b>keep</b>.</p>	string
tls-profile	No	Specifies a TLS profile to use for the secure transmission of data.	string
verb	No	The operation method type. <p>Valid values:</p> <ul style="list-style-type: none"> <li>• GET</li> <li>• POST</li> <li>• PUT</li> <li>• DELETE</li> <li>• PATCH</li> <li>• HEAD</li> <li>• OPTIONS</li> </ul> <p>The default value is <b>GET</b>. However, if the property is omitted from the source, the HTTP method from the incoming request is used.</p>	string
timeout	No	The time to wait before a reply back from the endpoint (in seconds). The default value is <b>60</b> .	integer
<b>API Gateway only</b> http-version (policy version 2.1.0 and later)	Yes	The HTTP version that will be used when connecting to the backend server. Valid values: <ul style="list-style-type: none"> <li>• <b>HTTP/1.0</b></li> <li>• <b>HTTP/1.1</b></li> <li>• <b>HTTP/2</b></li> </ul>	string
<b>API Gateway only</b> http2-required (policy version 2.1.0 and later)	No	Set this property to <b>true</b> to require that the server selects HTTP/2 during a TLS connection, otherwise the DataPower API Gateway rejects the connection and fails the request. For a non TLS connection, a warning is logged stating that the requirement can't be enforced. This setting applies only if http-version is set to <b>HTTP/2</b> .	boolean
compression	No	Specifies whether data is to be compressed by using compress before it is uploaded. The default value is <b>false</b> .	boolean
username	No	The username to use for HTTP Basic authentication.	string
password	No	The password to use for HTTP Basic authentication.	string
output	No	The name of a variable that will be used to store the response data from the request. By default, the invoke response, that is the body, headers, statusCode and statusMessage, is saved in the variable <i>message</i> . Use this property to specify an alternate location to store the invoke response. This variable can then be referenced in other actions, such as <a href="#">map</a> . Note: If you want the response to be saved in <i>message</i> , leave the output property blank, do <b>not</b> supply the value <i>message</i> .	string
cache-key	No	Specifies the unique identifier of the document cache entry.	string
<b>API Gateway only</b> websocket-upgrade (policy version 2.1.0 and later)	No	Set this property to <b>true</b> to allow an HTTP or HTTPS connection to be upgraded to the WebSocket protocol if the request received by the corresponding HTTP or HTTPS handler on the DataPower API Gateway uses WebSocket (ws) or WebSocket Secure (wss). Note: <ul style="list-style-type: none"> <li>• This property is available only for GraphQL APIs.</li> <li>• The <b>websocket-upgrade</b> property is deprecated. To allow WebSocket upgrade requests that can manage API processing data, define an assembly WebSocket upgrade policy. For more information, see <a href="#">websocket-upgrade</a>.</li> </ul>	boolean

Property	Required	Description	Data type
cache-response	No	The cache response type. Valid values: <ul style="list-style-type: none"> <li><b>protocol</b>: The cache behavior is defined by the Cache-Control headers on the request and response.</li> <li><b>no-cache</b>: Specifies that there is no caching. However, if the document is already in the cache, the document is retrieved from the cache.</li> <li><b>time-to-live</b>: Specifies that the response stays in the cache for the specified time.</li> </ul> The default value is <b>protocol</b> .	string
cache-putpost-response	No	Specifies whether to cache the response from POST and PUT requests. Caching the response from POST and PUT requests can reduce server load and reduce latency in the response to the client request. The default value is <b>false</b> .	boolean
cache-ttl	No	Specifies the amount of time in seconds that the response stays in the cache. Applies only if the property cache-response is set to <b>time-to-live</b> . Enter a value in the range 5 - 31708800. The default value is <b>900</b> .	integer
<span style="border: 1px solid green; padding: 2px;">API Gateway only</span> inject-proxy-headers	No	When set to true, the <b>invoke</b> policy injects the <b>X-Forwarded-For</b> , <b>X-Forwarded-To</b> , <b>X-Forwarded-Host</b> , and <b>X-Forwarded-Proto</b> headers to the request that is sent to the <b>target-url</b> . The default value is <b>false</b> .	boolean
<span style="border: 1px solid green; padding: 2px;">API Gateway only</span> decode-request-params	No	When set to true, any request parameters that are referenced by a variable definition on the <b>target-url</b> of the invoke policy are URL-decoded. The default value is <b>false</b> .	boolean
<span style="border: 1px solid green; padding: 2px;">API Gateway only</span> encode-plus-char	No	When set to true, all "+" characters in the query parameter values of the <b>target-url</b> are encoded to %2F. The default value is <b>false</b> .	boolean
<span style="border: 1px solid green; padding: 2px;">API Gateway only</span> keep-payload	No	When set to true, the invoke policy sends a payload on an <b>HTTP DELETE</b> method. The default value is <b>false</b> .	boolean
<span style="border: 1px solid green; padding: 2px;">API Gateway only</span> use-http-10 (policy version 2.0.0 only)	No	When set to true, HTTP transactions are restricted to version 1.0. The default value is <b>false</b> .	boolean
<span style="border: 1px solid green; padding: 2px;">API Gateway only</span> chunked-uploads	No	If you set this property to <b>true</b> , chunked-encoded documents are sent to the server. When the HTTP 1.1 protocol is used, the body of the document can be delimited by either <b>Content-Length</b> or chunked encoding. While all servers can interpret <b>Content-Length</b> , many applications fail to understand chunked-encoded documents. For this reason, <b>Content-Length</b> is the standard method. The use of <b>Content-Length</b> interferes with the ability of the DataPower Gateway to fully stream. If you must stream full documents to the target server, enable this property.  When enabled, the server must be RFC 2616 compatible. Unlike all other HTTP 1.1 features that can be negotiated down at run time, you must know beforehand that the target server is RFC 2616 compatible.  The default value is <b>true</b> .  Note: Chunked encoding is not supported by the HTTP 1.0 protocol.	boolean
<span style="border: 1px solid green; padding: 2px;">API Gateway only</span> persistent-connection (policy version 2.3.0 and later)	No	Set this property to <b>true</b> to enable HTTP persistent connections, allowing connection re-use. The default value is <b>true</b> .	boolean
<span style="border: 1px solid green; padding: 2px;">API Gateway only</span> header-control: type values	No	Specifies the headers in <b>message.headers</b> that you want to copy to the target URL. If the <b>type</b> property is set to <b>blocklist</b> , the <b>values</b> property lists the headers that you don't want to be copied. If the <b>values</b> property is empty then all headers are copied.  If the <b>type</b> property is set to <b>allowlist</b> , the <b>values</b> property lists the headers that you want to be copied.  The items that are listed in the <b>values</b> property are in regular expression format. The values are not case-sensitive. The default value of the <b>header-control</b> property is  <b>header-control:</b> <b>type:</b> <b>blocklist</b> <b>values:</b> <b>[]</b>  See <a href="#">header-control examples</a>	object
<span style="border: 1px solid green; padding: 2px;">API Gateway only</span> parameter-control: type values	No	Specifies the parameters in the incoming request that you want to be copied to the target URL. If the <b>type</b> property is set to <b>blocklist</b> , the <b>values</b> property lists the parameters that you don't want to be copied.  If the <b>type</b> property is set to <b>allowlist</b> , the <b>values</b> property lists the parameters that you want to be copied. If the <b>values</b> property is empty then no parameters are copied.  The items that are listed in the <b>values</b> property are in regular expression format. The values are not case-sensitive. The default value of the <b>parameter-control</b> property is  <b>parameter-control:</b> <b>type:</b> <b>allowlist</b> <b>values:</b> <b>[]</b>  See <a href="#">parameter-control examples</a>	object

Property	Required	Description	Data type
<div style="border: 1px solid green; padding: 2px;">API Gateway only</div> follow-redirect	No	Specifies the behavior if the back-end server returns the HTTP status code <b>301 Moved Permanently</b> . If this property is set to <b>true</b> , the <b>invoke</b> policy follows the URL redirection by making a further call to the URL specified in the <b>Location</b> header in the response. If this property is set to <b>false</b> , the <b>invoke</b> saves the 301 status code and the API call is considered to be complete. Note: The <b>follow-redirect</b> property is supported only by the DataPower API Gateway. If you are using the DataPower Gateway (v5 compatible), the <b>invoke</b> always follows the URL redirection; the <b>proxy</b> policy (not supported by the DataPower API Gateway) saves the 301 status code and completes the API call without following the URL redirection.	boolean
stop-on-error	No	List the errors that, if thrown during the policy execution, cause the flow to stop. If there is a <b>catch</b> flow configured for the error, it is triggered to handle the error thrown. If an error is thrown and there are no errors specified for the Stop on error property, or if the error thrown is not one of the specified errors, the policy execution is allowed to complete, and the assembly flow continues.	string

## Example

```
- invoke:
  version: 2.0.0
  title: get the account status
  target-url: https://example.com/accounts/{id}?status={status}
  cache-response: time-to-live
  cache-putpost-response: true
  tls-profile: MyTLSProfile
  verb: POST
  timeout: 60
  compression: false
  username: MyUser
  password: MyPassword
  stop-on-error:
    - ConnectionError
    - OperationError
```

API Gateway only

## header-control examples

```
# copy all headers to the target URL

- invoke:
  target-url: http://myhost/mypath
  header-control:
    type: blocklist
    values: []

# copy all headers except X-Client-ID and Content-Type

- invoke:
  target-url: http://myhost/mypath
  header-control:
    type: blocklist
    values:
      - ^X-Client-ID$
      - ^Content-Type$

# copy no headers

- invoke:
  target-url: http://myhost/mypath
  header-control:
    type: allowlist
    values: []

# copy only the Content-Type header

- invoke:
  target-url: http://myhost/mypath
  header-control:
    type: allowlist
    values:
      - ^Content-Type$
```

API Gateway only

## parameter-control examples

```
# copy no request parameters to the target URL

- invoke:
  target-url: http://myhost/path?storeid=3
  parameter-control:
    type: allowlist
    values: []

# append the petid parameter to the target URL
# if the incoming request is http://apigw.org/sandbox/petstore/base?petid=100&display=detailed,
# the target URL at runtime will be http://myhost/mypath?storeid=3&petid=100

- invoke:
  target-url: http://myhost/path?storeid=3
  parameter-control:
    type: allowlist
```

```
values:
- ^petid$
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## json-to-xml

Use the json-to-xml policy to convert the context payload of your API from the JavaScript Object Notation (JSON) format to the extensible markup language (XML) format.

### Gateway support

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® Gateway (v5 compatible)	1.0.0
DataPower API Gateway	2.0.0

This topic describes how to configure the policy in your OpenAPI source; for details on how to configure the policy in the assembly user interface, see [JSON to XML](#).

### About

The json-to-xml policy has the following structure:

```
- json-to-xml:
  version: version
  title: Title
  description: Description
```

Note: If you are using the DataPower API Gateway, the input to the json-to-xml policy must be parsed data. One way to produce parsed data is to use a [parse](#) policy before a json-to-xml policy in your assembly flow, which provides explicit control of the parse action.

### Properties

The following table describes the policy properties:

Table 2. Policy properties

Property	Required	Description	Data type
version	Yes	The policy version number	string
title	Yes	The title of the policy.	string
description	No	A description of the policy.	string
<span>API Gateway only</span> input	No	The input message to convert. Specify the name of a variable in the API context. <b>variableName.body</b> , the message payload, represents the JSON input to convert. The default value of the variable is <b>message</b> and <b>message.body</b> is the default input.	string
<span>API Gateway only</span> output	No	The output message to store the conversion result. Specify the name of a variable in the API context. <b>variableName.body</b> represents the result of conversion from JSON format to XML format. When the specified input message is the default message, the default output is <b>message.body</b> . Otherwise, when the input message is the variable <b>my-message-variable</b> , for example, the default output is <b>my-message-variable.body</b> . The variable cannot be any read-only in the API context.	string
<span>API Gateway only</span> conversionType	No	The conversion type that determines the target format of the output. The following options are available: <ul style="list-style-type: none"><li>None: No conversion of the output takes place.</li><li>badgerFish: BadgerFish convention is used to determine the target conversion format of the output.</li></ul>	string
root-element-name	Yes	The root element name of the resultant XML document. This property is used only if the input JSON document is not hierarchical and has more than one uppermost level property, or if the always-output-root-element property is set to <b>true</b> .	
always-output-root-element	Yes	Select this property to <b>true</b> you always want the policy to output the root element, even if it is not required to make the XML document well formed.	boolean
unnamed-element-name	No	The XML element name to be used for JSON array elements.	string

### Example

The following is an example of a json-to-xml policy:

```
- json-to-xml:
  version: 1.0.0
  title: JSON to XML transform
  description: Transforms JSON message body to XML format
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## jwt-generate

Use the Generate JWT security policy in IBM® API Connect to generate a JSON Web Token (JWT).

### Gateway support

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® Gateway (v5 compatible)	1.0.0
DataPower API Gateway	2.0.0

This topic describes how to configure the policy in your OpenAPI source; for details on how to configure the policy in the assembly user interface, see [Generate JWT](#).

### About

The jwt-generate policy has the following structure:

```
- jwt-generate:  
  version: version  
  title: title  
  description: description  
  jwt: json_web_token  
  jti-claim: jwt_id_claim  
  iss-claim: issuer_claim  
  exp-claim: validity_period  
  sub-claim: subject_claim  
  aud-claim: audience_claim  
  jws-jwk: sign_jwk_variable_name  
  jws-alg: cryptographic_algorithm  
  jws-crypto: sign_crypto_object  
  jwe-enc: encryption_algorithm  
  jwe-jwk: encrypt_jwk_variable_name  
  jwe-alg: key_encryption_algorithm  
  jwe-crypto: encrypt_crypto_object
```

### Properties

The following table describes the policy properties:

Table 2. Generate JWT policy properties

Property	Required	Description	Data type
version	Yes	The policy version number	string
title	No	The title of the policy.	string
description	No	A description of the policy.	string
jwt	No	Runtime variable in which to place the JWT that is generated. The default value is: <b>generated.jwt</b> . However, if not set, the JWT that is generated is written to the Authorization Header as a Bearer token.	string
jti-claim	No	Indicates whether a JWT ID (jti) claim should be added to the JWT. If selected, the property is set to <b>true</b> , and a UUID is generated and set as the JTI claim value.	boolean
iss-claim	Yes	Runtime variable from which the Issuer (iss) claim string can be retrieved. This claim represents the Principal that issued the JWT. The default value is: <b>iss.claim</b>	string
sub-claim	No	Runtime variable from which the Subject (sub) claim string can be retrieved.	string
aud-claim	No	Runtime variable from which the Audience (aud) claim string can be retrieved. Multiple variables are set by using a comma-separated string.	string
exp-claim	Yes	The length of time (in seconds), that is added to the current date and time, in which the JWT is considered valid. The default value is <b>3600</b> .	integer
private-claims	No	Runtime variable from which a valid set of JSON claims can be retrieved. These claims are added to any set of claims specified previously.	string
jws-jwk	No	Runtime variable that contains the JWK that is used to sign the JWT. A JWK and a Crypto Object are both valid ways of providing the cryptographic data necessary to sign the JWT. However, if both data types are specified, only the Crypto Object is used.	string

Property	Required	Description	Data type
jws-alg	No	The cryptographic algorithm to use. Valid values are: <ul style="list-style-type: none"> <li>• HS256</li> <li>• HS384</li> <li>• HS512</li> <li>• RS256</li> <li>• RS384</li> <li>• RS512</li> <li>• ES256</li> <li>• ES384</li> <li>• ES512</li> <li>• PS256</li> <li>• PS384</li> <li>• PS512</li> </ul>	string
jws-crypto	No	The cryptographic object to use to sign the JWT. A JWK and a Crypto Object are both valid ways of providing the cryptographic data necessary to sign the JWT. However, if both data types are specified, only the Crypto Object is used.	string
jwe-enc	No	The encryption algorithm to use. Valid values are: <ul style="list-style-type: none"> <li>• A128CBC-HS256</li> <li>• A192CBC-HS384</li> <li>• A256CBC-HS512</li> </ul>	string
jwe-jwk	No	Runtime variable that contains the JWK to use to encrypt the JWT.	string
jwe-alg	No	The key encryption algorithm to use. Valid values are: <ul style="list-style-type: none"> <li>• RSA1_5</li> <li>• RSA-OAEP</li> <li>• RSA-OAEP-256</li> <li>• dir</li> <li>• A128KW</li> <li>• A192KW</li> <li>• A256KW</li> </ul>	string
jwe-crypto	No	The cryptographic object to use to encrypt the claim.	string

## Example

The following is an example of a jwt-generate policy:

```
- jwt-generate:
  version: 1.0.0
  title: jwt-generate
  iss-claim: iss.claim
  exp-claim: 3600
  jwt: generated.jwt
  jti-claim: true
  sub-claim: sub.claim
  aud-claim: aud.claim
  private-claims: private.claims
  jws-jwk: jws.jwk
  jws-alg: HS256
  jws-crypto: jwsCryptoObjectName
  jwe-enc: A128CBC-HS256
  jwe-jwk: jwe.jwk
  jwe-alg: A128KW
  jwe-crypto: jweCryptoObjectName
```

For more information about how to use a jwt-generate security policy, see [Generate JWT](#) in the built-in policies section.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## jwt-validate

Use the Validate JWT security policy to enable the validation of a JSON Web Token (JWT) in a request before allowing access to the APIs.

## Gateway support

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® Gateway (v5 compatible)	1.0.0
DataPower API Gateway	2.0.0

This topic describes how to configure the policy in your OpenAPI source; for details on how to configure the policy in the assembly user interface, see [Validate JWT](#).

## About

The jwt-validate policy has the following structure:

```
- jwt-validate:  
  version: version  
  title: title  
  description: description  
  jwt: json_web_token  
  output-claims: output_full_set_of_jwt_claims  
  iss-claim: issuer_claim  
  aud-claim: audience_claim  
  jwe-crypto: decrypt_crypto_object  
  jwe-jwk: decrypt_crypto_jwk_variable_name  
  jws-crypto: verify_crypto_object  
  jws-jwk: verify_crypto_jwk_variable_name
```

## Properties

The following table describes the policy properties:

Table 2. Validate JWT policy properties

Property	Required	Description	Data type
version	Yes	The policy version number	string
title	Yes	The title of the policy.	string
description	No	A description of the policy.	string
jwt	Yes	Context or runtime variable that contains the JWT to be validated. The default value is: <code>request.headers.authorization</code> . However, if this property is not set, the policy looks for the JWT in the <code>request.headers.authorization</code> location by default.  Note: The format of the authorization header must be:  <code>"Authorization: Bearer <i>jwt-token</i>"</code>  where <i>jwt-token</i> is the encoded JWT.	string
output-claims	Yes	Runtime variable to which the full set of claims that are contained in the JWT is assigned. The default value is: <code>decoded.claims</code> .	string
iss-claim	No	The Perl Compatible Regular Expressions (PCRE) to use to validate the Issuer (iss) claim.	string
aud-claim	No	The PCRE to use to validate the Audience (aud) claim.	string
jwe-crypto	No	The cryptographic object (a shared key or certificate) to use to decode the claim. A JWK and a Crypto Object are both valid ways of providing the cryptographic data necessary to decrypt the JWT. However, if both data types are specified, only the Crypto Object is used.	string
jwe-jwk	No	Runtime variable that contains the JWK to use to decrypt the JWT. A JWK and a Crypto Object are both valid ways of providing the cryptographic data necessary to decrypt the JWT. However, if both data types are specified, only the Crypto Object is used.	string
jws-crypto	No	The cryptographic object (a shared key or certificate) to use to verify the signature. A JWK and a Crypto Object are both valid ways of providing the cryptographic data necessary to verify the JWT. However, if both data types are specified, only the Crypto Object is used.	string
jws-jwk	No	Runtime variable that contains the JWK to use to verify the signature. A JWK and a Crypto Object are both valid ways of providing the cryptographic data necessary to verify the JWT. However, if both data types are specified, only the Crypto Object is used.	string

## Example

The following is an example of a jwt-validate policy:

```
- jwt-validate:  
  version: 1.0.0  
  title: jwt-validate  
  jwt: request.headers.authorization  
  output-claims: decoded.claims  
  iss-claim: ".*data.*"  
  aud-claim: ".*id.*"  
  jwe-crypto: jweCryptoObjectName  
  jwe-jwk: jwe.jwk  
  jws-crypto: jwsCryptoObjectName  
  jws-jwk: jws.jwk
```

For more information about how to use a jwt-validate security policy, see [Validate JWT](#) in the built-in policies section.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

Use the log policy to customize or override the default activity logging configuration for an API.

## Gateway support

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® API Gateway	2.0.0 2.1.0 (DataPower API Gateway Version 10.0.3.0 or later)

This topic describes how to configure the policy in your OpenAPI source; for details on how to configure the policy in the assembly user interface, see [Log](#).

## About

The log policy has the following format:

```
- log:  
  version: version  
  title: title  
  description: description  
  mode: activity_logging_actions  
  log-level: type_of_content_to_log
```

## Properties

The following table describes the properties of the log policy.

Table 2. log policy properties

Property	Required	Description	Data type
version	Yes	The policy version number	string
title	No	A title for the policy.	string
description	No	A policy description.	string
mode	Yes	<p>Specify one of the following values:</p> <ul style="list-style-type: none"><li><b>gather-only</b>: gather all analytics data and write it to the <code>log</code> context variable, which populates the API event record on completion of the API execution. For more information on the fields in the <code>log</code> context variable, and the consequent API event record, see <a href="#">API event record fields</a>.</li><li><b>send-only</b>: perform the following actions:<ul style="list-style-type: none"><li>Read the data from the <code>log</code> context variable.</li><li>Truncate all message payloads and convert to a textual representation.</li><li>Send the data to the analytics server.</li></ul></li><li><b>gather-and-send</b>: perform a <b>gather-only</b> operation, immediately followed by a <b>send-only</b> operation.</li></ul> <p>If you use the Send-only or Gather-and-send option, data is buffered and sent to the analytics server in batches according to the time interval configured for the Analytics Endpoint on the DataPower API Gateway. For more information, see <a href="#">Configuring an analytics endpoint</a> in the DataPower knowledge center.</p> <p>Note: If you are offloading to a third party analytics server, you can redact any aspect of the event data. If you are using API Connect analytics, you can redact only request and response payloads.</p>	string
log-level	No	<p>The type of content to log. Specify one of the following values:</p> <ul style="list-style-type: none"><li><b>none</b>: Indicates no logging.</li><li><b>activity</b>: Logs the invocation only, which is only the resource URI.</li><li><b>header</b>: Logs activity and header.</li><li><b>payload</b>: Logs activity, header, and payload.</li><li><b>default</b>: Use the log level setting defined in the API definition; for more information, see <a href="#">activity-log</a>. This is the default value.</li><li><b>\$(value)</b>: An inline parameter in the format <code>\$(value)</code> to retrieve a value from the API context.</li></ul>	string

## Example

```
- log:  
  version: 2.0.0  
  title: Gather activity log data for processing  
  mode: gather-only
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## map

Use the map policy to transform your assembly flow and specify relationships between variables.

## Gateway support

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® Gateway (v5 compatible)	1.0.0
DataPower API Gateway	2.0.0

This topic describes how to configure the policy in your OpenAPI source; for details on how to configure the policy in the assembly user interface, see [Map](#).

## About

For information about the use and structure of the map policy, see [The Map policy structure](#). For more information about API properties that affect the map policy, see [API properties](#).

The map policy has the following format:

```
- map
  version: version
  title: title
  description: description

  inputs:
  - input_1:
    variable: context_1
    $ref: '#/definitions/definition_1'
  - input_2
    variable: context_2
    type: type_2
    content: content_type

  outputs:
  - output_3
    variable: context_3
    type: type_3

  actions:
  - set: output_3.output_property_3
    from: input_1.input_property_1

  - set: output3.output_property_3
    from:
      - input1.input_property_1
      - input2.input_property_2
    value: 'script_A'
    default: 'default_A'

  - create: output3.output_property_3
    from: input1.input_property_1
    foreach: input1.input_property_1
    actions:
      - further_actions

  options:
    .
    .
    .
    advanced_XML_and_general_configuration_options
    .
    .
```

## Properties

Table 2.

Property	Required	Description	Data type	Belongs to
version	Yes	The policy version number	string	N/A
title	No	A title for the policy.	String	N/A
description	No	A policy description.	String	N/A
inputs	No	An array listing the inputs of the map policy.	Object	N/A
outputs	Yes	An array listing the outputs of the map policy.	Object	N/A
variable	Yes	A reference to the context variable that is the location of the input or output variable..	String	inputs or outputs
\$ref	Yes <sup>1</sup>	A reference to the definition of the type of the variable.	String	inputs or outputs
type	Yes <sup>1</sup>	The type of the variable.	String	inputs or outputs
content	No	The content type of the variable: <code>application/xml</code> or <code>application/json</code> . If <code>None</code> is selected, or the field is not included, then the type is treated as JSON.	String	inputs or outputs
actions	Yes	Lists actions to be performed by the map policy.	Object	N/A
set	Yes <sup>2</sup>	Specifies by name the output variable that is to be set to a value by the action.	String	actions
create	Yes <sup>2</sup>	Specifies by name the output variable that is to have a value appended to it by the action.	String	actions
from	No	Specifies by name any input variables used by the action.	String	actions

Property	Required	Description	Data type	Belongs to
value	No	Contains a script that maps and transforms input variables into output variables.	String	actions
default	No	Contains a static value, or an inline variable reference, to be applied to the output when no input value is provided. For information on inline variable references, see <a href="#">Inline references</a> .	String	actions
foreach	No	Specifies by name an array for which further actions should be performed for each element.	String	actions
includeEmptyXMLElements	No	If set to <b>true</b> , empty XML elements are included in the output of the map policy. Set to <b>false</b> if you do not want empty XML elements to be included in the output of the map policy. The default value is <b>true</b> .	Boolean	options
namespaceInheritance	No	If set to <b>true</b> , XML namespaces are inherited from the parent element. Set to <b>false</b> if you want the map policy to use explicit namespaces. The default value is <b>true</b> .	Boolean	options
inlineNamespaces	No	If set to <b>true</b> , XML namespaces will be inserted into the document where they are first used. Set to <b>false</b> if you want namespaces to all be defined on the root element. The default value is <b>true</b> .	Boolean	options
<b>API Gateway only</b> mapResolveXMLInputDataType	No	If set to <b>true</b> , XML elements whose schema is configured as type boolean or numeric will be converted to that data type. Set to <b>false</b> if you want all XML element values to be returned as a string.	Boolean	options
<b>API Gateway only</b> mapParseXMLOutput	No	If set to <b>true</b> , the map policy will write XML output to <b>message.body</b> as a parsed XML document. By default, the XML will be output as an XML string. XML output to any other variable will always be written as an XML string. The default value is <b>false</b> .	Boolean	options
<b>API Gateway only</b> mapXMLEmptyElement	No	This property controls how the map policy handles the output of an empty XML element. Specify one of the following values: <ul style="list-style-type: none"> <li><b>string</b> (the default option): An empty XML element is handled as an empty string.</li> <li><b>null</b>: An empty XML element is handled as a null value.</li> <li><b>none</b>: The data is ignored.</li> <li><b>API Gateway only string-badgerfish</b>: The value for an empty XML element is considered to be an empty string. The empty string value will be placed into a JSON badgerfish value property.</li> <li><b>API Gateway only null-badgerfish</b>: The value for an empty XML element is considered to be null. The null value will be placed into a JSON badgerfish value property. A mapping of this element to a JSON output property does not occur unless the <b>mapNullValue</b> property is set to <b>true</b>.</li> </ul>	String	options
<b>API Gateway only</b> mapArrayFirstElementValue	No	If set to <b>true</b> , then if an array is encountered in the traversal of the input, only the first element is used. Set to <b>false</b> if you want the map policy to use all array elements. The default value is <b>false</b> .	Boolean	options
<b>API Gateway only</b> mapResolveApiVariables	No	If set to <b>true</b> , API Connect variable references found in the map properties are resolved. Set to <b>false</b> if you want the map policy to ignore API Connect variable references in the map policies. The default value is <b>false</b> .	Boolean	options
<b>API Gateway only</b> mapNullValue	No	If set to <b>true</b> , an input property value with a null value is mapped to the output document. Set to <b>false</b> if you want the map policy to ignore null input values. The default value is <b>false</b> .	Boolean	options
<b>API Gateway only</b> mapOptimizeSchemaDefinition	No	If set to <b>true</b> , complex schema types evaluation handles circular type references in an optimized manner. Set to <b>false</b> to evaluate these schema types in a standard manner. The default value is <b>false</b> .	Boolean	options

Property	Required	Description	Data type	Belongs to
<div style="border: 1px solid green; padding: 2px; display: inline-block;">API Gateway only</div> mapEmulateV4DefaultRequiredProperties	No	<p>If set to <b>true</b>, default values are generated in the output for required properties that are either not mapped, or for which there is no input data present, in the following specific cases:</p> <ul style="list-style-type: none"> <li>• An array consists of objects that contain one or more required properties.</li> <li>• An object which is optional has one or more child properties that are required.</li> </ul> <p>By default, these required properties are not present in the output. If you set this property to <b>true</b>, these required properties will be present in the output. If the output schema defines a <b>default</b> property for the output property then the specified default value is used, otherwise a default value is assigned dependent on the data type, as follows:</p> <ul style="list-style-type: none"> <li>• String: empty string ("")</li> <li>• Number: 0</li> <li>• Boolean: false</li> <li>• Object: empty object</li> <li>• Array: empty array</li> </ul> <p>Example 1 The input data has the following array of objects:</p> <pre>[{"a": "value1"}, {"a": "value2", "b": "value3"}]</pre> <p>The output schema defines the output object as having two properties, <b>a</b> and <b>b</b>, of which <b>b</b> is required. The map policy defines the following mappings:</p> <ul style="list-style-type: none"> <li>• <b>input.array.a</b> to <b>output.array.a</b></li> <li>• <b>input.array.b</b> to <b>output.array.b</b></li> </ul> <p>If this property is set to <b>true</b>, and <b>b</b> is either not mapped or has no input data present, then <b>b</b> is assigned a default value of an empty string, and the output is as follows:</p> <pre>[{"a": "value1", "b": ""}, {"a": "value2", "b": "value3"}]</pre> <p>Example 2 The output schema defines the following structure:</p> <pre>{"a": {"b": {"c": "value1", "d": "value2"} } }</pre> <p>Property <b>b</b> is optional but property <b>d</b> within <b>b</b> is required.</p> <p>The map policy defines a mapping to <b>output.a.b.c</b>.</p> <p>If this property is set to <b>true</b>, and <b>d</b> is not mapped, then <b>d</b> is assigned a default value of an empty string, and the output is as follows:</p> <pre>{"a": {"b": {"c": "value1", "d": "" } } }</pre> <p>If this property is set to <b>false</b>, these required properties are <b>not</b> created in the output with their default values.</p> <p>The default value is <b>false</b>.</p>	Boolean	options
<div style="border: 1px solid green; padding: 2px; display: inline-block;">API Gateway only</div> mapEnablePostProcessingJSON	No	<p>If set to <b>true</b>, mapped JSON output is post processed. The post processing of JSON output will use the output schema to ensure that property values are of the same data type as that defined in the schema. It will also normalize output property values that have a Badgerfish JSON syntax due to object mapping of an XML input. Set to <b>false</b> if you want no post processing of mapped JSON output.</p> <p>The default value is <b>false</b>.</p>	Boolean	options
<div style="border: 1px solid green; padding: 2px; display: inline-block;">API Gateway only</div> mapCreateEmptyArray	No	<p>This property controls how the map policy handles the output of an empty array. Specify one of the following values:</p> <ul style="list-style-type: none"> <li>• <b>all</b>: Output all empty arrays, including empty children arrays.</li> <li>• <b>parent</b>: Output only the current property's empty array value. Children map actions of this property are not attempted.</li> <li>• <b>none</b>: Prevent any empty output array values from being produced.</li> </ul> <p>The default value is <b>all</b>.</p>	String	options
<div style="border: 1px solid green; padding: 2px; display: inline-block;">API Gateway only</div> mapReferenceLimit	No	<p>Set the value of this property to an integer value that specifies the maximum allowed number of iterations of a circular schema definition.</p> <p>The default value is 1, which means that circular schema definitions are not followed. The maximum possible value is 5. If you specify a value greater than 5, a value of 5 is assumed. If you specify a non-numeric value, a value of 1 is assumed.</p>	String	options
messagesInputData	No	<p>This property defines the severity level for log messages that relate to input data. Specify one of the following values:</p> <ul style="list-style-type: none"> <li>• <b>error</b></li> <li>• <b>warn</b></li> <li>• <b>info</b></li> </ul>	String	options

Property	Required	Description	Data type	Belongs to
<div style="border: 1px solid green; padding: 2px; display: inline-block;">API Gateway only</div> mapEmulateV4EmptyJSONObject	No	<p>If a mapping fails because its input is not present and there is no default mapping configured, the default behavior is to not to make any change to the output mapping. Set this property to <b>true</b> to create an empty object for the parent of the target mapping, emulating the behavior of IBM® API Management Version 4.0.</p> <p>Example</p> <p>The map policy defines a mapping to <b>output.a.b.c</b>. If input data is present, the output is as follows:</p> <pre style="background-color: #f0f0f0; padding: 5px;">{   "a": {     "b": {       "c": "inputvalue"     }   } }</pre> <p>If there is no input data, and the mapEmulateV4EmptyJSONObject option is set to <b>true</b>, the output is as follows:</p> <pre style="background-color: #f0f0f0; padding: 5px;">{   "a": {     "b": {     }   } }</pre> <p>Properties <b>a</b> and <b>b</b> are created but the value of <b>b</b> is an empty object. The default value is <b>false</b>.</p>	Boolean	options

<sup>1</sup> There must be one of \$ref or type in the description of a variable.

<sup>2</sup> There must be one of set or create in an actions field.

## Example

```

- map:
  version: 1.0.0
  title: Output mapping
  inputs:
    Monthly_cost:
      schema:
        type: double
        variable: loan_invoke.body.monthly_payment
        content: application/json
    Duration:
      schema:
        type: integer
        variable: request.parameters.duration
  outputs:
    Quote_Output:
      schema:
        $ref: '#/definitions/Quote_Output'
        variable: message.body
        content: application/json
  actions:
    - set: Quote_Output.monthly_repayment
      from: Monthly_cost
      value: ''
    - set: Quote_Output.total_cost
      from:
        - Duration
        - Monthly_cost
      value: '$(Duration)*$(Monthly_cost)'
  description: Maps and transforms contexts to the operation output.
  options:
    includeEmptyXMLElements: false
    namespaceInheritance: false
    inlineNamespaces: false
    

API Gateway only

 mapResolveXMLInputDataType: true
    

API Gateway only

 mapXMLEmptyElement: null
    

API Gateway only

 mapArrayFirstElementValue: false
    

API Gateway only

 mapResolveApicVariables: false
    

API Gateway only

 mapNullValue: true
    

API Gateway only

 mapOptimizeSchemaDefinition: true
    

API Gateway only

 mapCreateEmptyArray: parent
    

API Gateway only

 mapReferenceLimit: 5
    messagesInputData: warn
    mapEmulateV4EmptyJSONObject: true

```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## operation-switch

Use the operation-switch construct when you want to execute alternative policy assemblies, conditional on the operation that is being called.

### Gateway support

---

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® Gateway (v5 compatible)	1.0.0
DataPower API Gateway	2.0.0

This topic describes how to configure the policy in your OpenAPI source; for details on how to configure the policy in the assembly user interface, see [operation-switch](#).

### About

---

An operation can be described with a **verb/path** pair, or with an **operationId**. The **operationIds** are strings, or names, that are defined in the OpenAPI document.

The operation-switch policy has the following format:

```
- operation-switch:
  version: version
  title: title
  description: description
  case:
  - operations:
    - verb: operation_verb_1_1
      path: operation_path_1_1
    - verb: operation_verb_1_2
      path: operation_path_1_2
      .
      .
      .
      further verb/path combinations
      .
      .
      .
    execute:
      policy_assembly_1 ...
  - operations:
    - verb: operation_verb_2_1
      path: operation_path_2_1
    - verb: operation_verb_2_2
      path: operation_path_2_2
      .
      .
      .
      further verb/path combinations
      .
      .
      .
    execute:
      policy_assembly_2 ...
  - operations:
    - operationID_3_1
    - operationID_3_2
    - operationID_3_3
      .
      .
      .
      further operationIDs
      .
      .
      .
    execute:
      policy_assembly_3 ...
      .
      .
      .
      further operations sections
      .
      .
      .
```

For each **operations**: section, if the operation that is being called matches any of the **verb/path** combinations or **operationId** strings listed in that **operations**: section, then the policy assembly that is defined in the **execute**: section is executed. Therefore, each **operations**: section defines execution of a policy assembly conditional on the operation that is being called.

You can have as many **operations**: sections as you want, and each **operations**: section can have one or more **verb/path** combinations or **operationId** strings.

The **execute**: section can define any policy assembly, including further operation-switch policies.

## Properties

Table 2. operation-switch policy properties

Property	Required	Description	Data type	Contained in
version	Yes	The policy version number	string	N/A
title	No	A title for the policy.	string	N/A
description	No	A policy description.	string	N/A
case	Yes	An array containing different cases, each entry contains an operations and execute field.	array (object)	N/A
operations	Yes	The operations to which a case applies.	object	case
verb	No	An operation verb. Valid values: <ul style="list-style-type: none"><li>• GET</li><li>• POST</li><li>• PUT</li><li>• DELETE</li><li>• HEAD</li><li>• PATCH</li><li>• OPTIONS</li></ul>	string	operations
path	No	A relative path to an individual endpoint. For example, <code>/account_status</code> .	string	operations
operationID	No	The operation is defined in OpenAPI. The policy operation refers to the OpenAPI operation.	string	operations
execute	Yes	The policy assembly that you want to execute if the operation that is being called matches any one of the verb/path combinations. For more information, see <a href="#">execute</a> .	string	case

## Example

Example that defines match operations with **verb/path** combinations:

```
# carry out different redaction actions depending on the operation
```

```
- operation-switch:
  version: 1.0.0
  title: clear_region_and_set_body
  case:
    - operations:
      - verb: GET
        path: /account_details
      execute:
        - redact:
            title: remove secret field
            actions:
              - action: remove
                from: all
                path: /document/user/secret
    - operations:
      - verb: GET
        path: /account_status
      execute:
        - redact:
            title: redact address
            actions:
              - action: redact
                from: response
                path: /*[@name='secondaryAddress']/*[@name='streetAddress']
```

Example that defines match operation with **operationIDs**:

```
# match on operationIDs

- operation-switch:
  title: customer_actions
  case:
    - operations:
      - getCustomerByName
      - deleteCustomer
      - addACustomer
    execute:
      .
      .
      .
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

Use the oauth policy to policy to perform OAuth processing based on defined OAuth provider settings.

## Gateway support

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® API Gateway	2.0.0

This topic describes how to configure the policy in your OpenAPI source; for details on how to configure the policy in the assembly user interface, see [OAuth](#).

## About

The oauth policy has the following format:

```
- oauth:
  version: version
  title: title
  description: description
  oauth-provider-settings-ref:
    .
    .
    .
  references_to_oauth_settings
  .
  .
  supported-oauth-components:
  - oauth_component_1
  - oauth_component_2
  .
  .
```

Note: You add an oauth policy to the OpenAPI source in a native OAuth provider. For more information, see the following topics:

- [Editing the native OAuth provider configuration using the API Editor](#) (Cloud Manager UI)
- [Editing the native OAuth provider configuration using the API Editor](#) (API Manager UI)

## Properties

Table 2. oauth policy properties

Property	Required	Description	Data type
version	Yes	The policy version number	string
title	No	A title for the policy.	string
description	No	A description of the policy.	string
oauth-provider-settings-ref: default	Yes	The name of an existing OAuth provider that defines the required settings.	string
oauth-provider-settings-ref: url	No	A URL to a document that contains serialized XML or JSON properties that defines OAuth token generate settings. URL reference takes precedence over any existing literal configuration or object reference.	string
oauth-provider-settings-ref: literal	No	A literal string that contains serialized XML or JSON properties that defines OAuth token generate settings. Literal configuration takes precedence over any existing object reference.	string
supported-oauth-components: - oauth_component_1 - oauth_component_2 . . .	Yes	Specify the OAuth components that are supported by this policy, as follows:  - OAuthValidateRequest Validates the authorization request from the client.  - OAuthGenerateAZCode Generates the authorization code for the client, which represents the resource owner's authorization that grants access to the requested resource.  - OAuthVerifyAZCode Verifies the authorization code from the client.  - OAuthVerifyRefreshToken Verifies the refresh token that is presented by the client.  - OAuthCollectMetadata Collects metadata about a client for later user interaction  - OAuthGenerateAccessToken Generates the access token to the client when the authorization code or refresh token is verified.  - OAuthIntrospectToken Introspects the token to determine its state and, when active, its metadata.	string

## Overriding default OAuth provider settings

You can use either the `literal` property or the `url` property to dynamically override any OAuth provider configuration settings to dynamically override any OAuth provider configuration settings defined by the `default` property.

For example, to override the access token expiration time with a value of 200 seconds, include the following configuration in either the literal string or the document at the specified URL:

```
<OAuthProviderSettings><APICAccessTokenTTL>200</APICAccessTokenTTL></OAuthProviderSettings>
```

For a list of all OAuth provider settings, refer to the `OAuthProviderSettings` management schema, defined in the `xml-mgmt.xsd` file located in the store: directory on the DataPower API Gateway.

If you are using the API Manager user interface, the connection details are determined by the API Manager URL that you open, and the user ID with which you log in. If you are using the API Designer user interface, you provide the management server details and user ID in the login window that opens when you first launch API Designer; see [Logging into API Connect Designer](#).

## oauth policy example

```
- oauth:
  version: 2.0.0
  title: my-oauth-policy
  oauth-provider-settings-ref:
    default: my-oauth
  supported-oauth-components:
    - OAuthGenerateAZCode
    - OAuthGenerateAccessToken
    - OAuthIntrospectToken
    - OAuthVerifyAZCode
    - OAuthVerifyRefreshToken
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Example - using multiple OAuth policies in an OAuth provider assembly

This example demonstrates the use of multiple OAuth policies in the assembly flow for a native OAuth provider.

The example is based on the default assembly that is generated when you create a native OAuth provider, and is customized with the addition of `gatewayscript` policies that use [OAuth context variables](#) to manipulate the OAuth flow. For details on creating a native OAuth provider, see [Configuring a native OAuth provider](#).

It has the following assembly flow:

The following sections describe the OpenAPI source code that underlies each of the policies in the assembly; for the complete assembly code, download [multiple\\_oauth\\_policies.txt](#).

## Sample policy to add a custom scope

The `add_scope` policy is a `gatewayscript` policy that adds a custom scope to the request.

The underlying OpenAPI source YAML is as follows:

```
- gatewayscript:
  version: 2.0.0
  title: add_scope
  source: |-
    // Add another custom scope to the request
    let scope = context.get("request.parameters.scope.values[0]");
    if (scope)
      context.set("oauth.processing.scope", scope + " custom");
```

## Validate the initial OAuth request

The first `process_request` policy is an `oauth` policy that processes the initial request and verifies that the request is valid. The result of the processing is stored automatically in the `oauth.processing` context variables for use, as required, by the next OAuth policy in the assembly flow.

The underlying OpenAPI source YAML is as follows:

```
- oauth:
  title: process_request
  version: 2.0.0
  description: >-
    This oauth policy performs all OAuth/OpenID Connect protocol steps
    that are needed for OAuth Validation by default. The inputs and
    outputs of each of the steps are driven by documented context
    variables. Add or remove the Supported OAuth Components as required.
  oauth-provider-settings-ref:
    default: custom-form
  supported-oauth-components:
    - OAuthValidateRequest
```

## Sample policy to modify the scope

---

The `modify_scope` policy is a `gatewayscript` policy that modifies the scope depending on the calling application.

The underlying OpenAPI source YAML is as follows:

```
- gatewayscript:
  version: 2.0.0
  title: modify_scope
  source: |-
    let admin_id = '1f1a2aa4-db9f-4423-b2f1-e2572b12123a';

    // Check application and modify the scope
    let app = context.get("oauth.processing.client_id");
    let scope = context.get("oauth.processing.scope");
    if (app === admin_id) {
      context.set("oauth.processing.scope", scope + " admin");
    } else {
      context.set("oauth.processing.scope", scope + " customer");
    }
  }
```

## Branch conditionally according to the OAuth path

---

The `path_branch` policy is a `switch` policy that branches according to the different OAuth paths to process the resource owner.

The underlying OpenAPI source YAML is as follows:

```
- switch:
  version: 2.0.0
  title: path_branch
  case:
    - condition: ($operationPath() = '/oauth2/token')
      execute:
        .
        .
        .
        definition of the user_security and other_grants policies
        .
        .
    - condition: ($operationPath() = '/oauth2/authorize')
      execute:
        .
        .
        .
        definition of the user_password and implicit_authcode policies
        .
        .
    - otherwise:
        .
        .
        .
        definition of the other_endpoints policy
        .
        .
```

## Process the user name and password, and enable grant type component

---

The following two policies operate on the token endpoint.

- The `user_password` policy for password grant type processes the user name and password from the `x-www-form-urlencoded` body. The authentication method is derived from the User Security settings in the OAuth provider; see [Configuring user security for a native OAuth provider](#).
- The `other_grants` policy is an `oauth` policy that enables the `OAuthGenerateAccessToken`, `OAuthVerifyAZCode`, `OAuthVerifyRefreshToken`, and `OAuthCollectMetadata` components to perform the operations for client credentials, authorization code, refresh token, and password grant types.

The underlying OpenAPI source YAML is as follows:

```
- user-security:
  title: user_password
  version: 2.0.0
  description: ''
  factor-id: default
  extract-identity-method: context-var
```

```

user-context-var: request.parameters.username.values
pass-context-var: request.parameters.password.values
ei-stop-on-error: false
user-auth-method: auth-url
au-stop-on-error: false
auth-url: 'http://httpbin.org/basic-auth/user/pass'
user-az-method: authenticated
az-stop-on-error: true
auth-response-headers-pattern: (?x-api*
auth-response-header-credential: X-API-Authenticated-Credential
- oauth:
  title: other_grants
  version: 2.0.0
  description: >-
    This oauth policy performs all OAuth/OpenID Connect
    protocol steps that are needed for token path by default.
    The inputs and outputs of each of the steps are driven by
    documented context variables. Add or remove the Supported
    OAuth Components as required.
  oauth-provider-settings-ref:
    default: custom-form
  supported-oauth-components:
    - OAuthGenerateAccessToken
    - OAuthVerifyAZCode
    - OAuthVerifyRefreshToken
    - OAuthCollectMetadata

```

## Perform authorization checks, and enable grant type components

These following two policies operate on the authorize endpoint.

- The `user_security` policy configuration is derived from the User Security settings in the OAuth provider; see [Configuring user security for a native OAuth provider](#).
- The `implicit_authcode` policy is an `oauth` policy that enables the `OAuthGenerateAZCode`, `OAuthGenerateAccessToken`, and `OAuthCollectMetadata` components to perform the operations for the implicit and authorization code grant types.

The underlying OpenAPI source YAML is as follows:

```

- user-security:
  title: user_security
  version: 2.0.0
  description: >-
    This user security policy performs EI(basic) and AU(auth
    url) check for oauth assembly. Change the security check
    method as required
  factor-id: default
  extract-identity-method: basic
  ei-stop-on-error: true
  user-auth-method: auth-url
  au-stop-on-error: true
  user-az-method: authenticated
  az-stop-on-error: true
  auth-response-headers-pattern: (?x-api*
  auth-response-header-credential: X-API-Authenticated-Credential
  auth-url: 'http://httpbin.org/basic-auth/user/pass'
- oauth:
  title: implicit_authcode
  version: 2.0.0
  description: >-
    This oauth policy performs all OAuth/OpenID Connect
    protocol steps that are needed for az code path by
    default. The inputs and outputs of each of the steps are
    driven by documented context variables. Add or remove the
    Supported OAuth Components as required.
  oauth-provider-settings-ref:
    default: custom-form
  supported-oauth-components:
    - OAuthGenerateAZCode
    - OAuthGenerateAccessToken
    - OAuthCollectMetadata

```

## Process all other endpoints

The `otherwise` condition catches all other endpoints such as the introspect and revoke endpoints. The `other_endpoints` policy in the `otherwise` condition is an `oauth` policy that enables the `OAuthIntrospectToken`, and `OAuthRevokeTokencomponents` components to perform the operations for introspect and revoke.

The underlying OpenAPI source YAML is as follows:

```

- oauth:
  title: other_endpoints
  version: 2.0.0
  description: >-
    This oauth policy performs all OAuth/OpenID Connect
    protocol steps that are needed for all other paths by
    default. The inputs and outputs of each of the steps are
    driven by documented context variables. Add or remove the
    Supported OAuth Components as required.
  oauth-provider-settings-ref:
    default: custom-form
  supported-oauth-components:
    - OAuthIntrospectToken
    - OAuthRevokeToken

```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## parse

Use the parse policy to control the parsing of an input document. When the input document is a JSON string, the string is parsed instead of copied over.

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® API Gateway	2.0.0 2.1.0 ( DataPower API Gateway Version 10.0.3.0 or later)

This topic describes how to configure the policy in your OpenAPI source; for details on how to configure the policy in the assembly user interface, see [Parse](#).

## About

The parse policy has the following format:

```
- parse:
  version: version
  title: title
  description: description
  use-content-type: request_header_usage_setting
  parse-settings-reference:
    .
    .
    .
  references_to_parse_settings
    .
    .
    .
  input: input_message
  output: output_message
```

## Properties

Table 2. parse policy properties

Property	Required	Description	Data type
version	Yes	The policy version number.	string
title	No	The title of the policy.	string
description	No	A description of the policy.	string
use-content-type	No	If this setting is enabled and the parse setting is configured to detect the document type, the parse operation uses the <b>Content-Type</b> specified in the request headers. If this setting is enabled and the document type in the parse setting is configured for either JSON or XML, the parse operation uses the <b>Content-Type</b> specified in the request headers and fails if the <b>Content-Type</b> in the request headers does not match the parse setting.  Enabling this setting is applicable only when the expected <b>Content-Type</b> is either JSON or XML.  If this setting is not enabled, the parse operation uses either the document type specified in the parse setting, or the detected document type if the parse setting is configured to detect the document type.  The default value is <b>false</b> .	boolean
parse-settings-reference: default	No	An existing valid object from which to retrieve default property values for the dynamic object.	string

Property	Required	Description	Data type
document_type	No	<p>The type of document to parse. Specify one of the following values:</p> <ul style="list-style-type: none"> <li><b>detect</b>: the document type is detected and the payload is parsed accordingly. This type is the default option.</li> <li><b>JSON</b>: the payload is parsed as JSON.</li> <li><b>XML</b>: the payload is parsed as XML.</li> <li><b>graphql</b>: parsing is performed in one of the following ways: <ul style="list-style-type: none"> <li>As GraphQL in the body of a POST request. The GraphQL is in the following format: <pre> {   me {     name   } } </pre> </li> <li>As a JSON string in the body of a POST request that contains a GraphQL query. The JSON object is in the following format: <pre> {   "query": "query MyData (\$idVar: Int!) { user (id: \$idVar) { name }}",   "operationName": "MyData",   "variables": {"idVar": 123} } </pre> </li> <li>Through the URL query of a GET request. The URL is in the following format: <pre> https://myapi/graphql?query={me{name}} </pre> <p>The following example includes the <b>variables</b> and <b>operationName</b> properties, with URL encoding:</p> <pre> https://hostname/basepath/graphql? query=query%20fetchAccounts%20(\$limit:%20Int)%20{accounts(limit:%20\$limit)%20{name{first,last}}}&amp;variables={"limit":100}&amp;operationName=fetchAccounts </pre> </li> </ul> </li> </ul> <p>Query variables in a GET request can be sent as a JSON string in a query parameter called <b>variables</b>. If the query contains several named operations, an <b>operationName</b> query parameter is required to determine which operation is to be executed.</p>	string
max_doc_size	No	<p>Optionally, the maximum document size in bytes that the parse operation accepts. This setting provides threat protection by enforcing the maximum document size. Enter a value in the range 0 - 5368709121. A document is rejected when its size exceeds the maximum size. A value of 0 indicates an unlimited document size. When set to 0, the operation result does not return the document size. This setting is applicable to JSON, XML, or GraphQL input documents.</p> <p>The default value is 4194304.</p>	integer
max_nesting_depth	No	<p>Optionally, the maximum nesting depth of an XML, JSON, or GraphQL message that the parse operation accepts. This setting provides threat protection by enforcing limits in the message.</p> <ul style="list-style-type: none"> <li>When XML, it is the maximum level of element depth.</li> <li>When JSON, it is the maximum level of nested label-value pairs, the maximum number of nested arrays, or the maximum number of combination of label-value pairs and arrays.</li> <li>When GraphQL, it is the maximum level of nested selection sets.</li> </ul> <p>Enter a value in the range 0 - 4096. A document is rejected when its nesting depth exceeds the maximum depth. A value of 0 indicates unlimited nesting depth. When set to 0, the operation result does not return the nesting depth.</p> <p>The default value is 512.</p>	integer
max_width	No	<p>Optionally, the maximum width of the payload that the parse operation accepts.</p> <ul style="list-style-type: none"> <li>When the input document is XML, this property specifies the maximum number of attributes for an element or the maximum number of child elements for an element.</li> <li>When the input document is JSON, this property specifies the maximum number of properties on a JSON object or the maximum number of JSON items in a JSON array.</li> <li>When the input document is GraphQL, this property specifies the maximum number of selections in a selection set.</li> </ul> <p>Enter a value in the range 0 - 65535. The document is rejected when its width exceeds the maximum width. A value of 0 indicates unlimited width. When set to 0, the operation result does not return the width of the document.</p> <p>The default value is 4096.</p>	integer
max_name_length	No	<p>Optionally, the maximum name length in bytes in a document that the parse operation accepts.</p> <ul style="list-style-type: none"> <li>For XML, it is the length of the name portion of a tag.</li> <li>For JSON, it is the length of the label portion of the JSON label-value pair.</li> <li>For GraphQL, it is the maximum length of the identifiers, including field names and directive names.</li> </ul> <p>The length includes any white space that is contained between tags in XML or quotation marks in JSON. Enter a value in the range 0 - 8192. A document is rejected when its name length exceeds the maximum length. A value of 0 indicates unlimited name length. When set to 0, the operation result does not return the name length of a document.</p> <p>The default value is 256.</p>	integer

Property	Required	Description	Data type
max_value_length	No	<p>Optionally, the maximum value length in bytes in a document that the parse operation accepts.</p> <ul style="list-style-type: none"> <li>For XML, it is the length of an attribute or the length of a text value.</li> <li>For JSON and GraphQL, it is the length of a string value.</li> </ul> <p>The length includes any white space that is contained between tags in XML or quotation marks in JSON. Enter a value in the range 0 - 5368709121. A document is rejected when its value length exceeds the maximum length. A value of 0 indicates unlimited value length. When set to 0, the operation result does not return the value length of a document.</p> <p>The default value is 8192.</p>	integer
max_unique_names	No	<p>Optionally, the maximum number of unique names in a JSON or XML document that the parse operation accepts.</p> <ul style="list-style-type: none"> <li>For XML, it is the number of unique XML local names.</li> <li>For JSON, it is the number of unique JSON labels.</li> </ul> <p>Enter a value in the range 0 - 1048575. A document is rejected when the number of unique names in the document exceeds the maximum number. A value of 0 indicates an unlimited number of unique names. When set to 0, the operation result does not return the number of unique names in a document.</p> <p>The default value is 1024.</p>	integer
max_unique_prefixes	No	<p>Optionally, the maximum number of unique XML namespace prefixes in a document that the parse operation accepts. This limit counts multiple prefixes defined for the same namespace, but does not count multiple namespaces defined in different parts of the input document under a single prefix. Enter a value in the range 0 - 262143. A document is rejected when the number of unique prefixes in the document exceeds the maximum number. A value of 0 indicates an unlimited number of unique prefixes. When set to 0, the operation result does not return the number of unique prefixes in a document.</p> <p>The default value is 1024.</p>	integer
max_unique_namespaces	No	<p>Optionally, the maximum number of unique XML namespace URIs that the parse operation accepts. This limit counts all XML namespaces, regardless of how many prefixes are used to declare them. Enter a value in the range 0 - 65535. A document is rejected when the number of unique namespaces in the document exceeds the maximum number. A value of 0 indicates an unlimited number of unique namespaces. When set to 0, the operation result does not return the number of unique namespaces in a document.</p> <p>The default value is 1024.</p>	integer
max_number_length	No	<p>Optionally, the maximum number of bytes in the value portion of a JSON label-value pair when the value is a number. The number must be a contiguous string of bytes that contain no white space. The number can include a minus sign and a positive or negative exponent. Enter a value in the range 0 - 256. A document is rejected when the number length in the document exceeds the maximum length. A value of 0 indicates unlimited number length. When set to 0, the operation result does not return the number length in a document.</p> <p>The default value is 128.</p>	integer
parse-settings-reference: literal	No	A literal string as serialized XML or JSON properties that are merged into the dynamic object. These properties take preference over any existing default properties.	string
parse-settings-reference: url	No	A URL that represents a named context from which to retrieve the serialized XML or JSON properties that are merged into the dynamic object. These properties take preference over any existing literal or default properties.	string
input	No	The name of a variable in the API context. The content of the <b>body</b> field of the variable is the input to the policy. The default variable name is <b>message</b> .	string
output	No	The name of a variable in the API context. The content of the body field of the variable is the output of the parse operation. The parse metrics of the parsed document can be stored in a different part of the message. The default variable name is the same as the input name, so by default the input message is overwritten by the output message.	string

## parse policy example

```
- parse:
  version: 2.0.0
  title: my-parse-policy
  use-content-type: true
  parse-settings-reference:
    default: my-parse
  input: input-message
  output: output-message
```

## parse-settings-reference: literal example

In XML:

```
- parse:
  version: 2.0.0
  title: parse
  parse-settings-reference:
    default: apic-default-parsesettings
    literal: <ParseSettings><DocumentType>xml</DocumentType></ParseSettings>
```

In JSON:

```

- parse:
  version: 2.0.0
  title: parse
  parse-settings-reference:
  default: apic-default-parsesettings
  literal: { \"ParseSettings\" : { \"propertyName\" : propertyValue } }

```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## proxy

Apply the proxy policy to proxy another API within your operation, particularly if you need to call a large payload.

## Gateway support

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® Gateway (v5 compatible)	1.0.0
DataPower API Gateway, functionality provided by <a href="#">invoke</a>	

This topic describes how to configure the policy in your OpenAPI source; for details on how to configure the policy in the assembly user interface, see [Proxy](#).

## About

Keep the following considerations in mind regarding the proxy policy.

- Only one proxy policy is permitted to be called per assembly.
- More than one proxy policy can be applied, if they are contained in mutually exclusive branches of the assembly.
- You can use the proxy policy to return multipart form data, that is, when the response is set to `Content-Type: multipart/related`. However, proxy must be the final policy in the assembly, otherwise the response that is received is manipulated causing the multipart form data to be lost.
- The proxy policy, if inside a conditional policy, must be the **final** policy to be executed in the API. If you need further processing afterward, use the [invoke](#) policy rather than the proxy policy.
- The Proxy policy does not currently attempt to rewrite a Location header that is returned from the back end.

The proxy policy has the following structure:

```

- proxy:
  version: version
  title: title
  description: description
  target-url: URL_of_target_API
  tls-profile: TLS_profile_to_be_used
  verb: method_type
  http-version: HTTP_version
  timeout: timeout_value_in_seconds
  compression: is_data_to_be_compressed
  username: username_if_authentication_required
  password: password_if_authentication_required
  output: location_of_the_proxy_result
  cache-key: unique_identifier_of_the_document_cache_entry
  cache-response: cache_behavior
  cache-putpost-response: response_caching_behavior
  cache-ttl: cache_time_to_live
  stop-on-error: errors_that_stop_the_flow

```

## Properties

The table describes the properties of the proxy policy.

Table 2. Proxy policy properties

Property	Required	Description	Data type
version	Yes	The policy version number	string
title	No	A title for the policy.	string
description	No	A policy description.	string
target-url	Yes	The URL of the target API.	string
tls-profile	No	The TLS profile to be used.	string

Property	Required	Description	Data type
verb	No	The operation method type.  Valid values: <ul style="list-style-type: none"> <li>• Keep</li> <li>• GET</li> <li>• POST</li> <li>• PUT</li> <li>• DELETE</li> <li>• PATCH</li> <li>• HEAD</li> <li>• OPTIONS</li> </ul> The default value is <b>Keep</b> .	string
http-version	No	The HTTP version. The default value is <b>1.1</b> .	string
timeout	No	The timeout value in seconds. The default value is <b>60</b> .	integer
compression	No	Specifies whether data is to be compressed by using <b>gzip</b> before it is uploaded. The default value is <b>false</b> .	boolean
username	No	The user name, if authentication is required.	string
password	No	The password, if authentication is required.	string
output	No	Specifies the location of the proxy result. By default, the proxy result, that is the body, headers, statusCode and statusMessage, is saved in the variable <b>context.message</b> . The assembly developers can specify an additional location to store the proxy result with the output property.	string
cache-key	No	Specifies the unique identifier of the document cache entry.	string
cache-response	No	The cache response type. Valid values: <ul style="list-style-type: none"> <li>• protocol: The cache behavior is defined by the Cache-Control headers on the request and response.</li> <li>• no-cache: Specifies that there is no caching. However, if the document is already in the cache, the document is retrieved from the cache.</li> <li>• time-to-live: Specifies that the response stays in the cache for the specified time.</li> </ul> The default value is <b>protocol</b> .	string
cache-putpost-response	No	Specifies whether to cache the response from POST and PUT requests. Caching the response from POST and PUT requests can reduce server load and reduce latency in the response to the client request. The default value is <b>false</b> .	boolean
cache-ttl	No	Specifies the amount of time in seconds that the response stays in the cache. Applies only if the property cache-response is set to <b>time-to-live</b> . Enter a value in the range 5 - 31708800. The default value is <b>900</b> .	integer
stop-on-error	No	List the errors that, if thrown during the policy execution, cause the flow to stop. If there is a <b>catch</b> flow configured for the error, it is triggered to handle the error thrown. If an error is thrown and there are no errors specified for the Stop on error property, or if the error thrown is not one of the specified errors, the policy execution is allowed to complete, and the assembly flow continues.	string

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## ratelimit

Use the ratelimit policy to apply one or more rate, burst, or count limits at any point in your API assembly flow. Rate and burst limits restrict the number of calls made to an API in a specified time period, while count limits impose a strict limit on the total number of calls.

## Gateway support

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® API Gateway	2.0.0 2.1.0 (DataPower API Gateway Version 10.0.1.0 or later) 2.2.0 (DataPower API Gateway Version 10.0.2.0 or later)

This topic describes how to configure the policy in your OpenAPI source; for details on how to configure the policy in the assembly user interface, see [Rate Limit](#).

## About

The defined rate, burst, and count limits are applied to whatever follows in the assembly flow. For example, if a ratelimit policy is placed before an invoke policy, and the call made by the invoke policy exceeds the limits defined by the ratelimit policy, the API call itself fails.

The ratelimit policy has the following format:

```
- ratelimit:
  version: version
```

```

title: title
description: description
source: rate_and_burst_limit_location
rate-limit: rate_limits_to_apply
burst-limit: burst_limits_to_apply

```

## Properties

The following table describes the properties of the ratelimit policy.

Table 2. ratelimit policy properties

Property	Required	Description	Data type
version	Yes	The policy version number	string
title	No	A title for the policy.	string
description	No	A policy description.	string
source	Yes	<p>The location of all the rate limit, burst limit, and count limit definitions that are included in this policy. Specify one of the following values:</p> <ul style="list-style-type: none"> <li><b>catalog-named:</b> the rate or burst limits to be applied are defined in the appropriate <b>api-collection</b> object on the DataPower API Gateway, which is the object that represents your API Connect Catalog in the gateway configuration. For details of how to configure a rate, burst, or count limit in the <b>api-collection</b> object, see <a href="#">Configuring a rate, burst, or count limit on the DataPower API Gateway</a>.</li> <li><b>plan-named:</b> the limits to be applied are assembly burst limits or assembly count limits defined on the Plan to which the calling application is subscribed. For details on how to configure assembly burst limits and assembly count limits in a Plan, see <a href="#">Editing a draft Product</a>.</li> <li><b>gateway-named:</b> the limits to be applied are defined in the <b>apigw</b> object, named <b>apiconnect</b>, on the DataPower API Gateway gateway. For details of how to configure a rate, burst, or count limit in the <b>apigw</b> object, see <a href="#">Configuring a rate, burst, or count limit on the DataPower API Gateway</a>.</li> <li><b>plan-default:</b> the rate and burst limits that are applied are the default ones configured in the Plan to which the calling application is subscribed. For details on how to configure default Plan rate and burst limits, see <a href="#">Editing a draft Product</a>. Note: The use of this option does not disable any automatic preflow rate limit policy that might be in place, and could result in the application of the rate limiting being repeated. For more information on preflow policies, see <a href="#">Customizing the preflow policies</a>.</li> </ul>	string
rate-limit	Yes <sup>1</sup>	<p>If the <b>source</b> property is set to <b>catalog-named</b>, a list of rate limit names as defined in the DataPower API Gateway configuration, <sup>1</sup>You must provide at least one rate, burst, or count limit.</p>	string
burst-limit	Yes <sup>2</sup>	<p>If the <b>source</b> property is set to <b>catalog-named</b>, a list of a burst limit names as defined in the DataPower API Gateway configuration. If <b>source</b> is set to <b>plan-named</b>, a list of names of assembly burst limits defined in a Plan. <sup>2</sup>You must provide at least one rate, burst, or count limit.</p>	string
count-limit	Yes <sup>3</sup>	<p>If <b>source</b> property is set to <b>catalog-named</b>, a list of count limit names as defined in the DataPower API Gateway configuration. If <b>source</b> is set to <b>plan-named</b>, a list of names of assembly count limits defined in a Plan. <sup>3</sup>You must provide at least one rate, burst, or count limit..</p>	string

Property	Required	Description	Data type
operation	No	<p>For a rate limit, specify one of the following values:</p> <ul style="list-style-type: none"> <li><b>consume</b>: the policy reduces the balance of available requests that remain in the interval defined by the rate limit specified by the <code>rate-limit</code> property. The amount by which the remaining balance is reduced is the value that results from the weight expression defined in the specified rate limit.</li> <li><b>replenish</b>: the policy increases the balance of available requests that remain in the interval defined by the rate limit specified by the <code>rate-limit</code> property. The amount by which the remaining balance is increased is the value that results from the weight expression defined in the specified rate limit.</li> </ul> <p>The purpose of the replenish operation is to restore an appropriate amount of remaining balance in cases where the amount calculated by an earlier consume operation turns out to be too high. For example, for an assembly rate limit with a limit of 100, a consume operation with a weight of 60 uses 60 requests, leaving 40 requests remaining for the interval. If the weight expression in the subsequent replenish operation computes to 15, meaning that the weight expression calculated that the actual request usage was only 45, the replenish operation increases the remaining requests by 15, to a remaining balance of 55.</p> <p>Note that the replenish operation cannot increase the remaining requests allowed beyond the original limit defined in the assembly rate limit scheme. In this example, a replenish operation cannot replenish requests beyond 100. A replenish operation is skipped if the weight expression evaluates to a value of less than 1.</p> <p>The default value is <b>consume</b>.</p> <p>For a count limit, specify one of the following values:</p> <ul style="list-style-type: none"> <li><b>inc</b>: the current count is incremented by the value that results from the weight expression defined in the count limit specified by the <code>count-limit</code> property.</li> <li><b>dec</b>: the current count is decremented by the value that results from the weight expression defined in the count limit specified in the <code>count-limit</code> field.</li> </ul> <p>By default, the count limit is automatically decremented at the end of the API assembly by the total amount incremented during the assembly, minus any decrement operations that are defined in the assembly. You do not need to explicitly define decrement operations unless you want the decrements to occur at specific points in the assembly. However, if the auto decrement feature has been explicitly disabled in the count limit configuration, you must include a corresponding decrement operation, otherwise when the count limit is reached all future calls are blocked. For more information on configuring a count limit, see <a href="#">Configuring a rate, burst, or count limit on the DataPower API Gateway</a>.</p> <p>The default value is <b>inc</b>.</p> <p>For a burst limit, the only possible value is <b>consume</b>, meaning that the limit applied is that defined in the burst limit specified by the <code>burst-limit</code> field.</p>	string

## Example

```
- ratelimit:
  version: 2.0.0
  title: Apply rate and burst limits
  source: catalog-named
  rate-limit:
    - 30perMinute
    - 2000per3Hours
  burst-limit:
    - 5per10Seconds
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## redact - DataPower API Gateway

Use the redact policy to completely remove or to redact specified fields from the request body, the response body, and the activity logs. You might find this policy useful for removing or blocking out sensitive data (for example, credit card details) for legal, security, or other reasons.

## Gateway support

Note: This page describes the redact policy implementation in the DataPower® API Gateway. If you are using the DataPower Gateway (v5 compatible), see [redact - DataPower Gateway \(v5 compatible\)](#).

For information on the different types of gateway, see [API Connect gateway types](#).

Table 1. Table showing which

gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower API Gateway	2.0.0

This topic describes how to configure the policy in your OpenAPI source; for details on how to configure the policy in the assembly user interface, see [Redaction - DataPower API Gateway](#).

## About

The redact policy has the following format:

```
- redact:
  version: version
  title: title
  description: description
  redactions:
    - action: remove_or_redact
      path: JSONata_expression_for_field_to_remove_or_redact
      .
      .
      .
  root: content_source
```

Note: With the DataPower API Gateway, the input to the redact policy must be parsed data. One way to produce parsed data is to use a [parse](#) policy before a redact policy in your assembly flow, which provides explicit control of the parse action.

## Properties

The following table describes the properties of the redact policy.

Table 2. redact policy properties

Property	Required	Description	Data type
version	Yes	The policy version number	string
title	No	A title for the policy.	string
description	No	A policy description.	string
root	No	Specifies the data source that contains the content to which the redact or remove action applies. If the root property is omitted, the action is applied to the entire API context. You can use any supported JSONata path expression.  If you want to apply the action to either request or response data, specify a value of <code>message.body</code> . The actual content to which the action is applied then depends on the positioning of the redact policy in the overall assembly flow; for example: <ul style="list-style-type: none"> <li>If positioned at the beginning, the action is applied to the client request.</li> <li>If positioned after an invoke policy, the action is applied to the response from the back end.</li> <li>If positioned at the end, the action is applied to the response that is returned to the client.</li> </ul> If, in your assembly flow, the redact policy is used after a <a href="#">log</a> policy that specifies <code>gather-only</code> for the mode property, specify a root value of <code>log.request_body</code> for the logged request payload, or <code>log.response_body</code> for the logged response payload.	string
path	Yes	Specifies a JSONata path expression that identifies the fields to redact or remove from the source. For more information, see <a href="#">Constructing JSONata expressions to redact fields</a>	string
action	Yes	Specifies whether you want to remove or redact the content. Supply one of the following values: <ul style="list-style-type: none"> <li><code>remove</code>: Completely removes the specified fields.</li> <li><code>redact</code>: Redacts (obfuscates with <code>***</code>) the fields to block out the data.</li> </ul> The default value is <code>redact</code> .  Note: If a numerical value is being redacted, the redacted value is depicted as <code>*****</code> and the type is changed to <code>string</code> .	string

## Example

# Specify separate remove and redact actions

```
- redact:
  version: 2.0.0
  title: remove price, redact author
  redactions:
    - action: remove
      path: xpath($, '//price')
    - action: redact
      path: $.**.author"
  root: message.body
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## redact - DataPower Gateway (v5 compatible)

Use the redact policy to completely remove or to redact specified fields from the request body, the response body, and the activity logs. You might find this policy useful for removing or blocking out sensitive data (for example, credit card details) for legal, security, or other reasons.

### Gateway support

Note: This page describes the redact policy implementation in the DataPower® Gateway (v5 compatible). If you are using the DataPower API Gateway, see [redact - DataPower API Gateway](#).

For information on the different types of gateway, see [API Connect gateway types](#).

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower Gateway (v5 compatible)	1.0.0

This topic describes how to configure the policy in your OpenAPI source; for details on how to configure the policy in the assembly user interface, see [Redaction - DataPower Gateway \(v5 compatible\)](#).

### About

The redaction policy has the following format:

```
- redact:
  version: version
  title: title
  description: description
  actions:
    - action: remove_or_redact
      from:
        - where_the_redaction_is_to_be_applied
          path: XPath_expression_for_field_to_remove_or_redact
            .
            .
            .
            further action/from/path combinations
            .
            .
            .
```

You can specify as many `action/from/path` combinations as you want.

### Properties

The following table describes the policy properties:

Table 2. redact policy properties

Property	Required	Description	Data type
version	Yes	The policy version number	string
title	No	A title for the policy.	string
description	No	A policy description.	string
action	No	Specifies whether you want to remove or redact the fields. Valid values: <ul style="list-style-type: none"> <li><code>remove</code>: Completely removes the specified fields.</li> <li><code>redact</code>: Redacts (obfuscates with "*"s) the fields to block out the data.</li> </ul> The default value is <code>redact</code> .  Note: If a numerical value is being redacted, the redacted value is depicted as <code>*****</code> and the type is changed to <code>string</code> .	string
from	No	Determines where the redaction is to be applied. Valid values: <ul style="list-style-type: none"> <li><code>all</code>: Apply the redaction to the request body, the response body, and the activity logs.</li> <li><code>request</code>: Apply the redaction to the request body only.</li> <li><code>response</code>: Apply the redaction to the response body only.</li> <li><code>logs</code>: Apply the redaction to the activity logs only.</li> </ul> You can supply one or more values. The default value is <code>all</code> .	string

Property	Required	Description	Data type
path	Yes	Specifies an XPath expression that defines the fields to remove or redact. You can construct an XPath expression that is based on JSON or XML depending on whether your API requests and responses use a JSON or an XML format. If the payload is JSON, use the DataPower XML representation of the JSON content (JSONx) to construct the expression.  Note: Use a JSONx representation only to identify the XPath expressions for the fields to remove or redact. Do not change the format of any response bodies in API Manager. To learn more about constructing XPath expressions that are based on JSON or XML, see <a href="#">Constructing XPath expressions to redact fields</a> .	string

## Example

# Specify separate remove and redact actions

```
- redact:
  version: 1.0.0
  title: remove secret field, redact address
  actions:
    - action: remove
      from:
        - all
      path: /document/user/secret
    - action: redact
      from:
        - request
        - response
      path: /*[@name='secondaryAddress']/*[@name='streetAddress']
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## set-variable

Use the set-variable policy to set the value of a runtime variable, or to add or clear a runtime variable.

## Gateway support

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® Gateway (v5 compatible)	1.0.0
DataPower API Gateway	2.0.0

This topic describes how to configure the policy in your OpenAPI source; for details on how to configure the policy in the assembly user interface, see [Set Variable](#).

## About

The set-variable policy has the following format:

```
- set-variable:
  version: version
  title: title
  description: description
  actions:
    - action_type: variable_name
      value: value
      type: data_type
```

## Properties

Table 2. set-variable policy properties

Property	Required	Description	Data type
version	Yes	The policy version number	string
title	No	A title for the policy.	string
description	No	A policy description.	string
actions	Yes	Lists the actions to be performed by the set-variable policy.	array
set	Yes <sup>1</sup>	For setting a variable. specifies the name of the variable that you want to set. <sup>1</sup> One of the properties set, add, or clear is required.	string
add	Yes <sup>2</sup>	For adding a variable. specifies the name of the variable that you want to add. <sup>2</sup> One of the properties set, add, or clear is required.	string
clear	Yes <sup>3</sup>	For clearing a variable. specifies the name of the variable that you want to clear. <sup>3</sup> One of the properties set, add, or clear is required.	string

Property	Required	Description	Data type
value	Yes <sup>4</sup>	Allocates this value to the specified variable. Can be a literal value, or another variable. <sup>4</sup> value is required only when <b>set</b> or <b>add</b> is specified as the action.	string
<b>API Gateway only</b> type	Yes	Specifies the data type of the variable. Valid values: <ul style="list-style-type: none"> <li>• <b>any</b></li> <li>• <b>string</b></li> <li>• <b>number</b></li> <li>• <b>boolean</b></li> </ul> For all values other than <b>any</b> , the value is validated against the specified data type.  If the data type is specified as <b>boolean</b> , the value property must be set to <b>true</b> or <b>false</b> .	string

## Example 1

```
# clear a variable

set-variable:
  version: 1.0.0
  title: clear_region
  actions:
    - clear: message.headers.region
```

## Example 2

```
# set a variable to the value of an API Gateway context variable

set-variable:
  version: 2.0.0
  title: set content type
  actions:
    - set: message.headers.contenttype
      value: $(message.headers.content-type)
      type: string
```

## Example 3

```
# add a variable

assembly:
  execute:
    - set-variable:
        version: 2.0.0
        title: set-variable
        actions:
          - value: testing add
            add: message.headers.jja
            type: string
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## switch

Use the switch component to execute one of a number of sections of the assembly based on which specified condition is fulfilled.

## Gateway support

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® Gateway (v5 compatible)	1.0.0
DataPower API Gateway	2.0.0

This topic describes how to configure the policy in your OpenAPI source; for details on how to configure the policy in the assembly user interface, see [switch](#).

## About

The switch policy has the following format:

```
- switch:
  version: version
  title: switch
  description: 'Description'
```

```

case:
- condition: Script_1
  execute:
  Assembly_Section_1
- condition: Script_2
  execute:
  Assembly_Section_2
- otherwise:
  Assembly_Section_3

```

The **execute**: section can define any policy assembly, including further switch policies. For more information, see [execute](#).

## Properties

Table 2. switch policy properties

Property	Required	Description	Data type
version	Yes	The policy version number	string
title	No	A title for the policy.	string
description	No	A policy description.	string
case	Yes	Contains the condition and execute pairs of the switch policy.	string
condition	Yes (one or more)	A script that returns <b>true</b> or <b>false</b> . <div style="border: 1px solid green; padding: 2px; display: inline-block; margin-bottom: 5px;">API Gateway</div> Use the JSONata expression language to define your condition. See <a href="#">Writing switch condition scripts - DataPower API Gateway</a> . <div style="border: 1px solid blue; padding: 2px; display: inline-block; margin-top: 5px;">DataPower Gateway (v5 compatible)</div> Use GatewayScript to define your condition. See <a href="#">Writing switch condition scripts - DataPower Gateway (v5 compatible)</a> .	string
execute	Yes (one per condition)	The policy assembly that you want to execute if the condition returns <b>true</b> . For more information, see <a href="#">execute</a> .	string
otherwise	No	The case you want to execute if no other cases are fulfilled. It functions in the same manner as an execute property. For more information, see <a href="#">execute</a> .	string

For examples, see one or other of the following topics, depending on which gateway type you are using:

- [Writing switch condition scripts - DataPower API Gateway](#)
- [Writing switch condition scripts - DataPower Gateway \(v5 compatible\)](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Writing switch condition scripts - DataPower API Gateway

You write condition scripts for the switch policy in the DataPower® API Gateway by using the JSONata expression language.

The following JSONata functions are supported:

- Aggregation functions:
  - `$average(array)`
  - `$max(array)`
  - `$min(array)`
  - `$sum(array)`
- Array functions:
  - `$append(array1, array2)`
  - `$count(array)`
  - `$reverse(array)`
  - `$sort(array [, function])`
  - `$zip(array1, ...)`
- Boolean functions:
  - `$boolean(arg)`
  - `$exists(arg)`
  - `$not(arg)`
- Numeric functions:
  - `$abs(number)`
  - `$ceil(number)`
  - `$floor(number)`
  - `$formatBase(number [, radix])`
  - `$number(arg)`
  - `$power(base, exponent)`
  - `$round(number [, precision])`
  - `$sqrt(number)`
- Object functions:
  - `$keys(object)`
  - `$lookup(object, key)`
  - `$merge(array<object>)`

- `$spread(object)`
- String functions:
  - `$contains(str, pattern)`
  - `$join(array[, separator])`
  - `$length(str)`
  - `$lowercase(str)`
  - `$match(str, pattern [, limit])`
  - `$pad(str, width [, char])`
  - `$replace(str, pattern, replacement [, limit])`
  - `$split(str, separator [, limit])`
  - `$string(arg)`
  - `$substring(str, start[, length])`
  - `$substringAfter(str, chars)`
  - `$substringBefore(str, chars)`
  - `$trim(str)`
  - `$uppercase(str)`
- You can use the following functional extensions to standard JSONata notation. Each extension corresponds to a part of the API context.

Table 1. Functional extensions to JSONata

Extension	Variable	Description
<code>\$header(name)</code>	<code>message.headers.name</code>	Message header
<code>\$httpVerb()</code>	<code>request.verb</code>	HTTP method of the request
<code>\$operationID()</code>	<code>api.operation.id</code>	ID of the operation
<code>\$operationPath()</code>	<code>api.operation.path</code>	Path of the operation
<code>\$queryParameter('name')</code>	<ul style="list-style-type: none"> <li>◦ <code>request.parameters.name.locations</code> The supported keyword is <code>query</code>.</li> <li>◦ <code>request.parameters.name.values</code></li> </ul>	Searches for the index of <code>query</code> in <code>request.parameters.name.locations</code> and returns <code>request.parameters.name.values[index]</code> , where <code>[index]</code> is the value for <code>query</code> in locations. Parameter values are not URL decoded.
<code>\$statusCode()</code>	<code>message.status.code</code>	Status code
<code>\$storageType([arg])</code>	<code>variable.body</code> You can specify any variable in the API context. When no variable is specified, the default variable <code>message.body</code> is used.	Storage type of the message. The supported values are <code>binary</code> , <code>json</code> , <code>stream</code> , or <code>xml</code> .
<code>\$urlParameter('name')</code>	<ul style="list-style-type: none"> <li>◦ <code>request.parameters.name.locations</code> The supported keywords are <code>path</code> and <code>query</code></li> <li>◦ <code>request.parameters.name.values</code></li> </ul>	Searches for the index of <code>path</code> and <code>query</code> in <code>request.parameters.name.locations</code> and returns a single array that contains both <code>path</code> and <code>query</code> values from <code>request.parameters.name.values</code> . When the URL contains both path and query parameter values, the array includes the path values first followed by the query values. The values of each parameter type are added in the order that they are received. Parameter values are URL decoded. For example, the following URL contains both path and query parameter values. <code>http://example.com/petstore/cats/adopt?breed=Sphynx&amp;breed=Siamese</code> The <code>\$urlParameter('breed')</code> URL returns the following array of values. <code>[cats, adopt, Sphynx, Siamese]</code> In this example, the URL includes an API path that is configured as <code>/petstore/{breed}/{breed}</code> , where <code>breed</code> is configured to be a path parameter of the API path. As a result, <code>cats</code> and <code>adopt</code> are included in the output.
<code>\$xpath(path, xpathExpression)</code>	You can specify any writable variable in the API context. The <code>xpathExpression</code> must be a literal string.	Allows use of XPath expressions. The following example specifies all price elements in the source. <code>\$xpath(\$, '//price')</code>

Table 2. Functional extensions to JSONata for GraphQL

Extension	Variable	Description
<code>\$gqlActiveOperation([graphql_message])</code>	<code>message.body</code>	Gets the active operation found in the specified GraphQL message. The <code>operationName</code> must be the same as the name of the active operation.
<code>\$gqlAlias(graphql_field_node)</code>	<code>message.body</code>	Gets the alias of a GraphQL field node.
<code>\$gqlFragments([graphql_message])</code>	<code>message.body</code>	Gets the fragments found in the specified GraphQL message.
<code>\$gqlName([graphql_node])</code>	<code>message.body</code>	Gets the node name. For operations, the node name is the <code>operationName</code> . For fields, fragment definitions, arguments, and other elements, the node name is the name of the element. By default, the <code>operationName</code> of <code>message.body</code> is retrieved.
<code>\$gqlOperations([graphql_message])</code>	<code>message.body</code>	Gets the operations found in the specified GraphQL message.
<code>\$gqlType([graphql_node])</code>	<code>message.body</code>	The operation type of the active operation is retrieved for Query, Mutation, and Subscription query types.

- You can use the `&` (concatenation) navigation operator.

You can use the following JSONata numeric operators:

- + (addition)
- - (subtraction)
- \* (multiplication)
- / (division)
- % (modulo)

You can use the following JSONata comparison operators for number values or strings:

- =
- !=
- <
- >
- <=
- >=

You can also use the following operators and expressions.

- Parentheses to convert a sequence into an array, specify operator precedence, or compute complex expressions on a context value.
- Array ranges and predicate expressions.
- Single asterisk (\*) and double asterisk (\*\*) wildcard characters.

The following elements of a GraphQL query can be exposed in JSONata notation using the syntax shown.

- **query**  
The entire GraphQL query including operations and fragments.
- **operationName**  
For an anonymous operation, **operationName** can be empty.
- **~fragmentSpreadName**
- **on~typeCondition**
- **~~fragmentDefinitionName**

You can also use the following functional extensions to standard JSONata notation. Each extension corresponds to a part of the API context.

Extension	Variable	Description
<code>\$header (name)</code>	<code>message.headers.name</code>	Message header
<code>\$httpVerb ()</code>	<code>request.verb</code>	HTTP method of the request
<code>\$operationID ()</code>	<code>api.operation.id</code>	ID of the operation
<code>\$operationPath ()</code>	<code>api.operation.path</code>	Path of the operation
<code>\$queryParameter ('name')</code>	<ul style="list-style-type: none"> <li>• <code>request.parameters.name.locations</code></li> <li>• <code>request.parameters.name.values</code></li> </ul>	Returns the value of a request query parameter given the parameter name. The function searches the <code>request.parameters.name.locations</code> array for the index position of the value <code>query</code> , and returns <code>request.parameters.name.values[index]</code> , where <code>index</code> is the index position. Parameter values are not URL decoded.
<code>\$statusCode ()</code>	<code>message.status.code</code>	Status code
<code>\$storageType ([arg])</code>	<p><code>variable.body</code> You can specify any variable in the API context. When no variable is specified, the default variable <code>message.body</code> is used.</p> <ul style="list-style-type: none"> <li>• <code>binary</code></li> <li>• <code>json</code></li> <li>• <code>stream</code></li> <li>• <code>xml</code></li> </ul>	Storage type of the message. The supported values are:
<code>\$urlParameter ('name')</code>	<ul style="list-style-type: none"> <li>• <code>request.parameters.name.locations</code></li> <li>• <code>request.parameters.name.values</code></li> </ul>	<p>Given a request parameter name, returns the parameter values for all occurrences of that parameter as a path parameter or query parameter.</p> <p>The function searches the <code>request.parameters.name.locations</code> array for the index positions of the values <code>path</code> and <code>query</code>, and returns, in a single array, the <code>request.parameters.name.values[index]</code> values for all identified index positions. When the URL contains both path and query parameter values, the array includes the path values first followed by the query values. The values of each parameter type are added in the order that they are received. Parameter values are URL decoded.</p> <p>For example, the following URL contains both path and query parameter values:</p> <p><code>http://example.com/petstore/cats/adopt?breed=Sphynx&amp;breed=Siamese</code></p> <p>The function call <code>\$urlParameter ('breed')</code> returns the following array of values:</p> <p><code>[cats, adopt, Sphynx, Siamese]</code></p> <p>In this example, the URL includes an API path that is configured as <code>/petstore/{breed}/{breed}</code>, where <code>breed</code> is configured to be a path parameter of the API path. As a result, <code>cats</code> and <code>adopt</code> are included in the output.</p>
<code>\$xpath (path, xpathExpression)</code>	You can specify any writable variable in the API context. The <code>xpathExpression</code> must be a literal string.	Allows use of XPath expressions

## Simple condition statements

The following examples show conditions that use a single function.

This example uses the `$httpVerb()` extension to specify the HTTP method of the request.

```
$httpVerb()="GET"
```

This example uses the `$operationPath()` extension to specify the path of the operation.

```
$operationPath()="/base/path-2"
```

This example uses the `$operationID()` extension to specify the operation ID.

```
$operationID()="test-gatewayscript-GET"
```

This example uses the `$statusCode()` extension to specify the message status code.

```
$statusCode()=200
```

This example uses the `$header(name)` extension to specify the content type of the message header.

```
$header("Content-Type")="application/json"
```

## Combining conditions with logical operators

You can use `and` and `or` operators to combine multiple functions in a single condition.

This example specifies an HTTP GET request and an API operation path equal to `test-gatewayscript-GET`.

```
$httpVerb()="GET" and $operationPath()="test-gatewayscript-GET"
```

This example specifies either a `POST` or `PUT` request.

```
$httpVerb()="POST" or $httpVerb()="PUT"
```

This example specifies an API operation ID equal to `test-gatewayscript_POST` and a message status code equal to `200`, or an API operation ID equal to `test-gatewayscript-GET` and a message status code equal to `500`.

```
($operationID()="test-gatewayscript-POST" and $statusCode()=200) or ($operationID()="test-gatewayscript-GET" and $statusCode()=500)
```

This example specifies an API operation ID equal to `test-gatewayscript-POST` and a message status code equal to `200` with an API operation path equal to `/base/path-2`.

```
($operationID()="test-gatewayscript-POST" and $statusCode()=200) and $operationPath()="/base/path-2"
```

This example specifies a message header content type equal to `text/plain` and a message header length equal to `300`, or a message status code equal to `200`.

```
($header("Content-Type")="text/plain" and $header("Content-Length")=300) or $statusCode()= 200
```

## Example switch policy

```
- switch:
  version: 2.0.0
  title: switch
  case:
    - condition: ($statusCode() = 200)
      execute:
        - invoke:
            title: invoke
            timeout: 60
            verb: GET
            cache-response: protocol
            cache-ttl: 900
            target-url: 'https://example.com/1'
    - condition: ($statusCode() != 200 and ($httpVerb() = 'GET' or $httpVerb() = 'PUT'))
      execute:
        - invoke:
            title: invoke
            timeout: 60
            verb: GET
            cache-response: protocol
            cache-ttl: 900
            target-url: 'https://example.com/2'
    - otherwise:
        - set-variable:
            title: set-variable
            actions:
              - set: message.body
                value: Default result
                description: 'Set the default result for the otherwise case'
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

DataPower Gateway (v5 compatible) only

## Writing switch condition scripts - DataPower Gateway (v5 compatible)

You write condition scripts for the **switch** policy in the DataPower® Gateway (v5 compatible) by using GatewayScript.

To reference variables in your **switch** conditions, use the form `apim.getvariable('context.location.variable')`, where *context* is the context that you want to reference, *location* is the location of the variable within that context, and *variable* is the name of the variable.

to define a **switch** condition based on the operation called, use one of the following forms:

```
- condition: "((request.verb==='GET') && (api.operation.path===' /path-1'))"
- condition: "((api.operation.id===' Operation_ID'))"
```

where the context variables `request.verb` and `api.operation.path` retrieve the HTTP verb and the path segment of the API and operation that you want your case to apply to, while `api.operation.id` retrieves the operation ID of your operation, if one has been specified.

For information about the context variables you can use and how to reference them in your script, see [API Connect context variables](#).

## Example switch policy

```
- switch:
  version: 1.0.0
  title: switch
  case:
    - condition: message.status.code===200
      execute:
        - invoke:
            title: invoke
            timeout: 60
            verb: GET
            cache-response: protocol
            cache-ttl: 900
            target-url: 'https://example.com/1'
        - condition: ((request.verb==='GET') && (api.operation.path===' /path-2')) || ((request.verb==='GET') &&
(api.operation.path===' /path-1'))
          execute:
            - invoke:
                title: invoke
                timeout: 60
                verb: GET
                cache-response: protocol
                cache-ttl: 900
                target-url: 'https://example.com/2'
    - otherwise:
        - set-variable:
            title: set-variable
            actions:
              - set: message.body
                value: Default result
                description: Set the default result for the otherwise case
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## throw

Use the throw construct to throw an error when it is reached during an assembly flow, usually as a result of a condition being reached.

## Gateway support

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® Gateway (v5 compatible)	1.0.0
DataPower API Gateway	2.0.0
	2.1.0 (DataPower API Gateway Version 10.0.3.0 or later)

This topic describes how to configure the policy in your OpenAPI source; for details on how to configure the policy in the assembly user interface, see [throw](#).

## About

The throw policy has the following format:

```
- throw:
  title: title
  name: 'error_name'
  error-status-code: http_status_code_for_error
  error-status-reason: http_reason_phrase_for_error
  message: error_message
```

When the throw policy is encountered, the specified error and error message is returned. If a catch has been configured that the error produced by the throw policy fulfills, the catch will be triggered.

## Properties

Table 2. throw policy properties

Property	Required	Description	Data type
version	Yes	The policy version number	string
title	No	A title for the policy.	string
name	Yes	The name of the error to be thrown.	string
<b>API Gateway only</b> error-status-code (policy version 2.1.0 and later)	No	Specify the HTTP status code for the error. You can use the \$(variable) format to reference the <code>message.status.code</code> API context variable.	integer
<b>API Gateway only</b> error-status-reason (policy version 2.1.0 and later)	No	Specify the HTTP reason phrase for the error. You can use the \$(variable) format to reference the <code>message.status.reason</code> API context variable.	string
message	No	The message to accompany the error.	string

## Example

```
- throw:
  version: 1.0.0
  title: throw
  name: '404'
  message: Not found
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## User-defined policies

You can apply your own user-defined policies to your APIs.

The policy configuration that you add to the OpenAPI definition file must conform to the schema that you defined in the YAML file that describes the policy, and will have the following general format:

```
policy_name:
  property1: value1
  property2: value2
  .
  .
  .
```

For details on user-defined policies, and how to describe and implement them, see [Authoring policies](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## user-security

Use the user-security policy to extract a user's credentials, authenticate those credentials, and obtain authorization from the user.

## Gateway support

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® API Gateway	2.0.0

This topic describes how to configure the policy in your OpenAPI source; for details on how to configure the policy in the assembly user interface, see [User Security](#).

## About

The user-security policy has the following format:

```
- user-security:
  version: version
  title: title
```

```

description: description
factor-id: factor ID
extract-identity-method: method used to extract credentials
.
.
properties specific to the specified identity extraction method
.
.
user-auth-method: authentication method
.
.
properties specific to the specified authentication method
.
.
user-az-method: authorization method
.
.
properties specific to the specified authorization method
.
.

```

## Properties

Table 2. user-security policy properties

Property	Required	Description	Data type
version	Yes	The policy version number	string
title	No	The title of the policy.	string
description	No	A description of the policy.	string
factor-id	No	The identity that identifies the results of factor-authentication in the API context.	string
extract-identity-method	Yes	<p>Select the method that is used to extract the user credentials. The following options are available:</p> <p><b>basic</b> Use basic authentication; no additional configuration is required.</p> <p><b>context-var</b> The credentials are provided by API Connect context variables; specify the following properties:</p> <ul style="list-style-type: none"> <li>• user-context-var: the context variable that is used to obtain the user name.</li> <li>• pass-context-var: the context variable that is used to obtain the password.</li> </ul> <p><b>html-form</b> Use forms based identity-extraction. You can use the default form or a custom form. To use the default form, specify <b>ei-default-form: true</b>. To use a custom form, specify <b>ei-default-form: false</b> and supply the following properties:</p> <ul style="list-style-type: none"> <li>• ei-custom-form: the location of the form.</li> <li>• ei-custom-form-tls-client-profile: the TLS client profile that is used to secure the connection to the remote server.</li> </ul> <p>Use the ei-form-time-limit property to specify the time allowed to submit the form.</p> <p><b>redirect</b> Use a redirect for identity-extraction; specify the following properties:</p> <ul style="list-style-type: none"> <li>• redirect-url: the URL fragment to which to redirect the request to obtain user credentials.</li> <li>• redirect-time-limit: the time allowed for the transaction to complete.</li> </ul> <p><b>disabled</b> Identity-extraction is disabled; this aspect of processing is skipped.</p> <p>Specify <b>ei-stop-on-error: true</b> to halt assembly processing in the event of identity-extraction failure. This field is required if identity extraction is not disabled.</p>	string

Property	Required	Description	Data type
user-auth-method	Yes	<p>Select the authentication method. The following options are available:</p> <p>auth-url The credentials are authenticated by an external endpoint; specify the following properties:</p> <ul style="list-style-type: none"> <li>auth-url: the URL of the authentication endpoint.</li> <li>auth-tls-client-profile: the TLS client profile that is used to secure the connection to the authentication endpoint.</li> <li>auth-response-headers-pattern: the pattern that is used to select which response headers to add to the API context.</li> <li>auth-response-header-credential: the response header that contains the authenticated user credentials.</li> </ul> <p>ldap The credentials are authenticated by an LDAP user registry; use the ldap-registry property to specify the required registry.</p> <p>disabled Authentication is disabled; this aspect of processing is skipped.</p> <p>Specify <b>au-stop-on-error: true</b> to halt assembly processing in the event of user authentication failure. This field is required if authentication is not disabled.</p>	string
user-az-method	Yes	<p>Select the authorization method. The following options are available:</p> <p>authenticated Implicitly accept any previously authenticated users; no additional configuration is required.</p> <p>html-form The user provides authorization through an HTML form. You can use the default form or a custom form. To use the default form, specify <b>az-default-form: true</b>. To use a custom form, specify <b>az-default-form: false</b>.</p> <p>Supply the following properties:</p> <ul style="list-style-type: none"> <li>az-table-dynamic-entries: the name of a context variable that specifies the scopes that are to be added automatically to the authorization consent form.</li> <li>az-form-time-limit: the time allowed to submit the form.</li> </ul> <p>For a custom form, supply the following properties:</p> <ul style="list-style-type: none"> <li>az-custom-form: the location of the form.</li> <li>az-custom-form-tls-client-profile: the TLS client profile that is used to secure the connection to the remote server.</li> </ul> <p>disabled Authorization is disabled; this aspect of processing is skipped.</p> <p>Specify <b>az-stop-on-error: true</b> to halt assembly processing in the event of user authorization failure. This field is required if authorization is not disabled.</p>	string

## Example

```
# basic authentication with LDAP registry
```

```
- user-security:
  version: 2.0.0
  title: user-security
  factor-id: default
  extract-identity-method: basic
  ei-stop-on-error: true
  user-auth-method: ldap
  ldap-registry: corporate-ldap
  au-stop-on-error: true
  user-az-method: authenticated
  az-stop-on-error: true
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#), for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## validate - DataPower API Gateway

Use the validate policy to validate the payload in an assembly flow against a schema.

## Gateway support

1266 IBM API Connect 10.0.2.0 to 10.0.4.x

Note: This page describes the validate policy implementation in the DataPower® API Gateway. If you are using the DataPower Gateway (v5 compatible), see [validate - DataPower Gateway \(v5 compatible\)](#).  
 For information on the different types of gateway, see [API Connect gateway types](#).

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower API Gateway	2.0.0
	2.1.0 (DataPower API Gateway Version 10.0.1.0 or later)
	2.2.0 (DataPower API Gateway Version 10.0.2.0 or later)
	2.3.0 (DataPower API Gateway Version 10.0.2.0 or later)
	2.4.0 (DataPower API Gateway Version 10.0.4.0 or later)

This topic describes how to configure the policy in your OpenAPI source; for details on how to configure the policy in the assembly user interface, see [Validate - DataPower API Gateway](#).

## About

The validate policy has the following format:

```
- validate:
  version: version
  title: title
  description: description
  validate-against: validation_mechanism
  .
  .
  .
  properties_specific_to_the_specified_validation_mechanism
  .
  .
  .
```

Apply this policy by adding an assembly extension with an execute field to your OpenAPI definition file.

Note: With the DataPower API Gateway, the input to the validate policy must be parsed data. One way to produce parsed data is to use a [parse](#) policy before a validate policy in your assembly flow, which provides explicit control of the parse action.

## Properties

The following table describes the policy properties:

Table 2. validate policy properties

Property	Required	Description	Data type
version	Yes	The policy version number	string
title	No	A title for the policy.	string
description	No	A policy description.	string
input	No	Identifies a variable in the API context. The content of the <b>body</b> field of the variable, which is represented by <b>variable_name.body</b> , is the input data to validate. By default, the variable name is <b>message</b> .	string
output	No	Specifies the name of a variable in the API context. <ul style="list-style-type: none"> <li>If the validation passes, the body field of the output variable, which is represented by <b>variable_name.body</b>, stores the output of the assembly validate action.</li> <li>If the schema to validate is a JSON schema, the validation also adds any default values that are missing from the payload.</li> <li>If the validation fails, no output is stored.</li> <li>If an output variable is not specified, the results of the assembly validate action are not saved.</li> </ul>	string

Property	Required	Description	Data type
validate-against	Yes	<p>Specifies the schema to be used for validating the payload.</p> <p>Valid values:</p> <ul style="list-style-type: none"> <li><b>definition:</b> A previously defined schema will be used to validate the payload that is returned from other invoke actions or tasks in the assembly flow. In addition, supply a <b>definition</b> property to specify the required schema.</li> <li><b>url:</b> the schema is identified by a URL location. In addition, supply the following properties: <ul style="list-style-type: none"> <li><b>json-schema</b> field: the URL of the JSON schema to be used for validating a JSON payload.</li> <li><b>xml-validation-mode</b>, specify one of the following values to define how an XML payload is validated: <ul style="list-style-type: none"> <li><b>xsd:</b> use an XML schema; in addition, supply an <b>xml-schema</b> property that specifies the URL of the XML schema.</li> <li><b>wsdl:</b> use a WSDL schema; in addition, supply an <b>xml-schema</b> property that specifies the URL of the WSDL schema to be used for validating a SOAP payload..</li> <li><b>soap-body:</b> validate the body of a SOAP message against the XML schema only.</li> </ul> </li> </ul> </li> </ul> <p>Note: The following limitations apply to schemas used for JSON validation, which include JSON schemas and OpenAPI documents that are used as schemas for validation. Exceeding these limits can impact compilation performance and is not supported.</p> <ul style="list-style-type: none"> <li>Maximum of 6,500 lines. Each key and each item in an array count as a line.</li> <li>Maximum recursion depth of 250.</li> <li>Maximum of 3,000 items in <b>enum</b> lists.</li> </ul> <ul style="list-style-type: none"> <li><b>wsdl:</b> (use with a SOAP service based API only) use the XML schema in the WSDL file associated with the API operation or the API path.</li> <li><b>body-param:</b> validate the request input against the schema definition that is specified in the <b>schema</b> property for the request parameter for this operation.</li> <li><b>response-param:</b> validate the response to be returned to the client application, against the schema definition that is specified in the <b>schema</b> property for the response parameter for this operation.</li> <li><b>graphql:</b> (use with a GraphQL proxy API only) validate the payload against the GraphQL schema that has been imported into the GraphQL proxy API. In addition, either the GraphQL query or response, depending on the input, is analyzed against the GraphQL schema to calculate the cost, and the result is placed in the API context.</li> </ul> <p>For more information on GraphQL proxy APIs, see <a href="#">Creating a GraphQL proxy API</a> and <a href="#">GraphQL context variables</a>.</p>	string
xslt-version	No	The XSLT processor version. The default value is XSLT10.	string
strict	No	Whether to enable strict XSLT error checking. Non-strict operations attempt to recover from certain errors, such as use of undeclared variables, calling undeclared templates, and so forth. By default, strict XSLT error checking is enabled.	boolean
profile	No	Whether to enable stylesheet profiling. This option should not be used in production environments. By default, stylesheet profiling is disabled.	boolean
debug	No	Whether to run the stylesheet, XQuery script, and JSONiq script in debug mode. When a stylesheet, XQuery script, or JSONiq script is run in debug mode, it generates a custom web page instead of displaying its normal output. The web page details exactly what occurred during execution, including the values of variables and where particular pieces of the output came from. This option should not be used in production environments. By default, debug mode is disabled.	boolean
stream	No	Whether the stylesheet must be run in streaming mode. Transformation of the document begins before the input is fully parsed. Not all stylesheets can be streamed. If the stylesheet cannot be streamed, an error is generated and the input is not processed. By default, streaming mode is disabled.	boolean
try-stream	No	Whether to attempt to run the stylesheet in streaming mode. Transformation of the document begins before the input is fully parsed. Not all stylesheets can be streamed. If the stylesheet cannot be streamed, a warning is generated during compilation and the stylesheet is read in the entire input as normal at execution time. By default, attempting to run the stylesheet in streaming mode is disabled.	boolean
minimum-escaping	No	Whether to escape output produced from the stylesheet during processing. Minimal escaping is particularly useful when handling non-English character sets. By default, minimum escaping is disabled.	boolean
stack-size	No	The maximum number of bytes that the stack is allowed to use while executing a stylesheet or other compiled content. This setting is used to block infinite recursion. The minimum value is 10 kilobytes, or 10,240 bytes. The maximum value is 100 megabytes, or 104,857,600 bytes. The default value is 1 megabyte, or 1,048,576 bytes.	integer
ws-i-validation	No	<p>The validation behavior to apply to WSDL files that are checked for conformance to section 5 of WS-I Basic Profile (version 1.0, April 2004). The default setting is Warn.</p> <p>Ignore Disables conformance checking.</p> <p>Warn Logs warnings for violations.</p> <p>Fail Forces conformance. Fails if the file contains any violation.</p>	string

Property	Required	Description	Data type
wsdl-validate-body	No	The validation behavior for the <code>soap:Body</code> . The default setting is Strict.  Strict Validates this part of the message against the WSDL definition. Allows only messages that contain this part and that match the WSDL definition.  Lax Validates this part of the message against the WSDL definition. If the message contains this part and the WSDL definition does not define this part, allow the message. If the message contains this part and the WSDL definition defines this part, allow the message only when there is a match.  Skip Disables validation of this part of the message.	string
wsdl-validate-headers	No	The validation behavior for the <code>soap:Header</code> . The default setting is Lax.  Strict Validates this part of the message against the WSDL definition. Allows only messages that contain this part and that match the WSDL definition.  Lax Validates this part of the message against the WSDL definition. If the message contains this part and the WSDL definition does not define this part, allow the message. If the message contains this part and the WSDL definition defines this part, allow the message only when there is a match.  Skip Disables validation of this part of the message.	string
wsdl-validate-faults	No	Specifies the validation behavior for the fault detail. The default setting is Strict.  Strict Validates this part of the message against the WSDL definition. Allows only messages that contain this part and that match the WSDL definition.  Lax Validates this part of the message against the WSDL definition. If the message contains this part and the WSDL definition does not define this part, allow the message. If the message contains this part and the WSDL definition defines this part, allow the message only when there is a match.  Skip Disables validation of this part of the message.	string
wsdl-wrapped-faults	No	Whether to require compatibility with RPC-style wrappers. By default, RPC-style wrappers are not required.	boolean
allow-soap-enc-array	No	Whether to allow the schema to accept most uses of elements with <code>xsi:type='SOAP-ENC:Array'</code> consistent with SOAP 1.1 Section 5, even when these attributes violate the XML Schema specification. Normally, the <code>xsi:type</code> attribute must name a type equal to or derived from the actual type of the element. For schemas compiled with this option, <code>xsi:type</code> is accepted specifically for the SOAP 1.1 Encoding 'Array' complex type if the element type is derived from <code>SOAP-ENC:Array</code> . The opposite is the normal allowable case. By default, elements with <code>xsi:type='SOAP-ENC:Array'</code> are not accepted.	boolean
validate-soap-enc-array	No	Whether to perform extra schema validation following the encoding rules in SOAP 1.1 Section 5. When enabled, members of SOAP arrays are validated, attributes such as <code>@id</code> and <code>@href</code> are allowed even if they are not allowed by the schema, and <code>@href</code> values are checked to ensure that they have a corresponding <code>@id</code> element. By default, the extra validation is not performed.	boolean
wildcards-ignore-xsi-type	No	Whether <code>xs:any</code> elements in the schema validate only child elements by name. The XML Schema specification requires that, if a wildcard matches an element but that element does not have an element declaration, the element is instead validated according to an <code>xsi:type</code> attribute on it. This option ignores those <code>xsi:type</code> attributes. It should be used for cases such as SOAP envelope validation where a further validation step will validate the contents matching the wildcard, possibly using the SOAP 1.1 encoding rules. By default, <code>xsi:type</code> attributes are not ignored.	boolean
wsdl-strict-soap-version	No	Whether to strictly follow the SOAP binding in the WSDL. When enabled, only messages bound to SOAP 1.2 appear in SOAP 1.2 envelopes and only messages bound to SOAP 1.1 appear in SOAP 1.1 envelopes. By default, strict SOAP binding is disabled.	boolean
xacml-debug	No	Whether to compile XACML policies with debug information. Note that the XACML debugging messages are also controlled by the log event in the XACML category. Use the debug log level to view the full XACML debugging messages. By default, XACML policies are not compiled with debug information.	boolean
allow-xop-include	No	Specifies whether the schema or WSDL document accepts messages where base64-encoded binary content was optimized according to the MTOM/XOP specifications. XOP binary-optimization replaces base64-encoded binary data with an <code>xop:Include</code> reference element that references the unencoded binary data located in an attachment. By default, MTOM/XOP optimized messages are disabled.  <ul style="list-style-type: none"> <li>When disabled, such optimized messages are rejected by validation of the optimized form. Rejection occurs because the schema specifies a simple type that accepts base64-encoded data, such as <code>xs:base64Binary</code> or <code>xs:string</code>, but the message contains an <code>xop:Include</code> element instead.</li> <li>When enabled, an <code>xop:Include</code> element can optionally appear in place of content for any XML Schema simple type that validates base64-encoded binary data. The <code>xop:Include</code> element itself will be validated according to the built-in schema in <code>store:///schemas/xop.xsd</code>.</li> </ul>	boolean

You can also apply a validate policy by using the API Manager assembly editor to add a built-in policy to the API. For more information, see [Validate - DataPower API Gateway](#) in the built-in policies section.

## Example 1

```
- validate:
  version: 2.0.0
  title: 'validate, response parameter schema'
  validate-against: response-param
```

## Example 2

```
- validate:
  version: 2.0.0
  title: 'validate, predefined schema'
  validate-against: definition
  definition: '#/definitions/RouteOutput'
```

## Example 3

```
- validate:
  version: 2.0.0
  title: 'validate, JSON and XML schema URLs'
  validate-against: url
  json-schema: 'https://my.json.schema'
  xml-validation-mode: xsd
  xml-schema: 'https://my.xml.schema'
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## validate - DataPower Gateway (v5 compatible)

Use the validate policy to validate the payload in an assembly flow against a schema.

## Gateway support

Note: This page describes the validate policy implementation in the DataPower® Gateway (v5 compatible). If you are using the DataPower API Gateway, see [validate - DataPower API Gateway](#).

For information on the different types of gateway, see [API Connect gateway types](#).

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower Gateway (v5 compatible)	1.0.0

This topic describes how to configure the policy in your OpenAPI source; for details on how to configure the policy in the assembly user interface, see [Validate - DataPower Gateway \(v5 compatible\)](#).

Restriction:

- The schema that represents the XML can reference only one XML namespace.
- The schema cannot reference polymorphic XML elements.
- The validation works on the `message.body` variable and not any other output/context variable. If the invoke policy contains a configured response object variable, then `message.body` is not set, and validate is not able to act.
- If you use the `multipleOf` keyword in a schema definition for the API then, due to rounding behavior, the specified value must satisfy the following conditions, otherwise the validation fails when the API is called:
  - The value must not be less than `0.000009999999999999999848869`.
  - If the value is greater than 1, the amount before the decimal point must not be greater than `999999999999999934463`.

## About

The validate policy has the following format:

```
- validate:
  version: version
  title: title
  description: description
  definition: swagger_schema_definition_to_be_used
```

Apply this policy by adding an assembly extension with an execute field to your OpenAPI definition file.

## Properties

The following table describes the policy properties:

Table 2. validate policy properties

Property	Required	Description	Data type
version	Yes	The policy version number	string

Property	Required	Description	Data type
title	No	A title for the policy.	string
description	No	A policy description.	string
definition	Yes	<p>The schema to be used to validate the payload. Valid values:</p> <ul style="list-style-type: none"> <li><b>request</b>: Select this value to validate the request input against the schema definition that is specified in the Type field for the request parameter for this operation. For information about how to create a request parameter, see <a href="#">Configuring an operation</a>.</li> <li><b>response</b>: Select this value to validate the response to be returned to the client application, against the schema definition that is specified in the Schema field for the response parameter for this operation. For information about how to create a response parameter, see <a href="#">Configuring an operation</a>.</li> <li>The name of a schema definition, in the following format:   <pre>#/definitions/schema_name</pre> <p>The schema must be defined in the <b>definitions</b> section of your OpenAPI file.</p> </li> </ul>	string

You can also apply an validate policy by using the API Manager assembly editor to add a built-in policy to the API. For more information, see [Validate - DataPower Gateway \(v5 compatible\)](#) in the built-in policies section.

## Example 1

```
validate:
  version: 1.0.0
  title: validate the response
  definition: #/definitions/RouteOutput
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#), for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## validate-username token

Use the Validate Username Token policy to validate a Web Services Security (WS-Security) UsernameToken in a SOAP payload before allowing access to the protected resource.

## Gateway support

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® Gateway (v5 compatible)	1.0.0 1.1.0

This topic describes how to configure the policy in your OpenAPI source; for details on how to configure the policy in the assembly user interface, see [Validate Username Token](#).

## About

The validate-username token policy has the following format:

```
- validate-username token:
  version: version
  title: title
  description: description
  auth-type: Authentication URL or LDAP Registry (policy version 1.0.0 only)
  auth-url: authentication_url_to_use (policy version 1.0.0 only)
  tls-profile: tls_profile_to_use (policy version 1.0.0 only)
  ldap-registry: name_of_the_ldap_user_registry (policy version 1.0.0 only)
  registry: name_of_the_ldap_or_authurl_user_registry (policy version 1.1.0 and later)
  ldap-search-attribute: name_of_the_ldap_user_password_attribute
```

## Properties

The following table describes the policy properties:

Table 2. Validate Username Token policy properties

Property	Required	Description	Data type
version	Yes	The policy version number	string
title	Yes	The title of the policy.	string
description	No	A description of the policy.	string

Property	Required	Description	Data type
auth-type (policy version 1.0.0 only)	Yes	The authentication type to use to validate the UsernameToken. Valid values: <ul style="list-style-type: none"> <li><b>Authentication URL</b>: Specify this value to validate the user credentials against an authentication URL.</li> <li><b>LDAP registry</b>: Specify this value to validate the user credentials against an LDAP user registry.</li> </ul> The default value is: <b>Authentication URL</b> .	string
auth-url (policy version 1.0.0 only)	Yes	The authentication URL to use to validate the UsernameToken user credentials against. Note: This property is required only if Authentication type is set to <b>Authentication URL</b> .	string
tls-profile (policy version 1.0.0 only)	No	The TLS profile to use for the secure transmission of data to the authentication URL. Note: This property is available only if Authentication type is set to <b>Authentication URL</b> .	string
ldap-registry (policy version 1.0.0 only)	Yes	The name of the LDAP user registry to validate the UsernameToken user credentials against. Note: This property is required only if Authentication type is set to <b>LDAP registry</b> .	string
registry (policy version 1.1.0 and later)	Yes	The name of the LDAP or Authentication URL registry to use to validate the UsernameToken.	string
ldap-search-attribute	Yes	The name of the LDAP user password attribute. Note: This property is required only for an LDAP user registry.	string

## Examples

The following example shows an LDAP user registry authentication:

```
- validate-username-token:
  version: 1.0.0
  title: "validate-username-token"
  auth-type: "LDAP Registry"
  ldap-registry: "wstest"
  ldap-search-attribute: "userPassword"
```

The following example shows an Authentication URL definition:

```
- validate-username-token:
  version: 1.0.0
  title: "validate-username-token"
  auth-type: "Authentication URL"
  auth-url: "https://www.google.com"
  tls-profile: "default-ssl-profile"
```

For more information about how to use a validate-username-token security policy, see [Validate Username Token](#) in the built-in policies section.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## websocket-upgrade

Use the websocket-upgrade policy to process API requests and responses through a WebSocket connection.

## Gateway support

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® API Gateway	2.0.0

This topic describes how to configure the policy in your OpenAPI source; for details on how to configure the policy in the assembly user interface, see [Websocket Upgrade](#).

The websocket-upgrade policy has the following format:

```
- websocket-upgrade:
  version: version
  title: title
  description: description
  target-url: URL_of_target_API
  tls-profile: TLS_profile_to_be_used
  timeout: timeout_value_in_seconds
  follow-redirects: redirect_behavior_on_301_error
  username: username_if_authentication_required
  password: password_if_authentication_required
  inject-proxy-headers: are_proxy_headers_sent_to_target_url
  decode-request-params: are_request_parameters_decoded
  encode-plus-char: are_plus_characters_encoded
  header-control:
  .
  .
  .
```

```

headers_to_copy_to_target_url
.
.
parameter-control:
.
.
parameters_to_copy_to_target_url
.
.

```

## Properties

Table 2. websocket-upgrade policy properties

Property	Required	Description	Data type
version	Yes	The policy version number.	string
title	No	The title of the policy.	string
description	No	A description of the policy.	string
target-url	Yes	Specify the URL to be invoked.	string
tls-profile	No	Specifies a TLS profile to use for the secure transmission of data.	string
timeout	No	The time to wait before a reply back from the endpoint (in seconds). The default value is 60.	integer
follow-redirects	No	Specifies the behavior if the back-end server returns the HTTP status code <b>301 Moved Permanently</b> . If this property is set to <b>true</b> , the <b>invoke</b> policy follows the URL redirection by making a further call to the URL specified in the <b>Location</b> header in the response. If this property is set to <b>false</b> , the <b>invoke</b> saves the <b>301</b> status code and the API call is considered to be complete. Note: The <b>follow-redirect</b> property is supported only by the DataPower API Gateway. If you are using the DataPower Gateway (v5 compatible), the <b>invoke</b> always follows the URL redirection; the <b>proxy</b> policy (not supported by the DataPower API Gateway) saves the <b>301</b> status code and completes the API call without following the URL redirection.	boolean
username	No	The username to use for HTTP Basic authentication.	string
password	No	The password to use for HTTP Basic authentication.	string
inject-proxy-headers	No	When set to true, the <b>invoke</b> policy injects the <b>X-Forwarded-For</b> , <b>X-Forwarded-To</b> , <b>X-Forwarded-Host</b> , and <b>X-Forwarded-Proto</b> headers to the request that is sent to the <b>target-url</b> . The default value is <b>false</b> .	boolean
decode-request-params	No	When set to true, any request parameters that are referenced by a variable definition on the <b>target-url</b> of the <b>invoke</b> policy are URL-decoded. The default value is <b>false</b> .	boolean
encode-plus-char	No	When set to true, all "+" characters in the query parameter values of the <b>target-url</b> are encoded to %2F. The default value is <b>false</b> .	boolean
header-control: type values	No	Specifies the headers in <b>message.headers</b> that you want to copy to the target URL. If the <b>type</b> property is set to <b>blocklist</b> , the <b>values</b> property lists the headers that you don't want to be copied. If the <b>values</b> property is empty then all headers are copied.  If the <b>type</b> property is set to <b>allowlist</b> , the <b>values</b> property lists the headers that you want to be copied.  The items that are listed in the <b>values</b> property are in regular expression format. The values are not case-sensitive. The default value of the <b>header-control</b> property is  <b>header-control:</b> <b>type:</b> blocklist <b>values:</b> []  See <a href="#">header-control examples</a>	object
parameter-control: type values	No	Specifies the parameters in the incoming request that you want to be copied to the target URL. If the <b>type</b> property is set to <b>blocklist</b> , the <b>values</b> property lists the parameters that you don't want to be copied.  If the <b>type</b> property is set to <b>allowlist</b> , the <b>values</b> property lists the parameters that you want to be copied. If the <b>values</b> property is empty then no parameters are copied.  The items that are listed in the <b>values</b> property are in regular expression format. The values are not case-sensitive. The default value of the <b>parameter-control</b> property is  <b>parameter-control:</b> <b>type:</b> allowlist <b>values:</b> []  See <a href="#">parameter-control examples</a>	object
request-assembly: execute . . policy assembly . . .	No	The request processing assembly. For details on configuring an assembly in the <b>execute</b> section, see <a href="#">execute</a> .	object

Property	Required	Description	Data type
response-assembly: execute . . . policy assembly . . .	No	The response processing assembly. For details on configuring an assembly in the <code>execute</code> section, see <a href="#">execute</a> .	object

## Example

```
- websocket-upgrade:
  version: 2.0.0
  title: websocket-upgrade
  timeout: 60
  target-url: 'https://my.websocket.upgrade.com'
  secure-gateway: false
  follow-redirects: true
  inject-proxy-headers: true
  decode-request-params: false
  encode-plus-char: true
  response-assembly:
    execute:
      - parse:
          version: 2.0.0
          title: parse
          parse-settings-reference:
            default: apic-default-parsesettings
          description: Parse the response from the backend server
```

## header-control examples

```
# copy all headers to the target URL

- invoke:
  target-url: http://myhost/mypath
  header-control:
    type: blacklist
    values: []

# copy all headers except X-Client-ID and Content-Type

- invoke:
  target-url: http://myhost/mypath
  header-control:
    type: allowlist
    values:
      - ^X-Client-ID$
      - ^Content-Type$

# copy no headers

- invoke:
  target-url: http://myhost/mypath
  header-control:
    type: allowlist
    values: []

# copy only the Content-Type header

- invoke:
  target-url: http://myhost/mypath
  header-control:
    type: allowlist
    values:
      - ^Content-Type$
```

## parameter-control examples

```
# copy no request parameters to the target URL

- invoke:
  target-url: http://myhost/path?storeid=3
  parameter-control:
    type: allowlist
    values: []

# append the petid parameter to the target URL
# if the incoming request is http://apigw/org/sandbox/petstore/base?petid=100&display=detailed,
# the target URL at runtime will be http://myhost/mypath?storeid=3&petid=100

- invoke:
  target-url: http://myhost/path?storeid=3
  parameter-control:
    type: allowlist
    values:
      - ^petid$
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## xml-to-json

Use the xml-to-json policy to convert the context payload of your API from the extensible markup language (XML) format to JavaScript Object Notation (JSON).

### Gateway support

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® Gateway (v5 compatible)	1.0.0
DataPower API Gateway	2.0.0

This topic describes how to configure the policy in your OpenAPI source; for details on how to configure the policy in the assembly user interface, see [XML to JSON](#).

### About

The xml-to-json policy has the following structure:

```
- xml-to-json:  
  version: version  
  title: Title  
  description: Description
```

Note: If you are using the DataPower API Gateway, the input to the xml-to-json policy must be parsed data. One way to produce parsed data is to use a [parse](#) policy before an xml-to-json policy in your assembly flow, which provides explicit control of the parse action.

### Properties

The following table describes the policy properties:

Table 2. Policy properties

Property	Required	Description	Data type
version	Yes	The policy version number	string
title	Yes	The title of the policy.	string
description	No	A description of the policy.	string
<small>API Gateway only</small> input	No	The input message to convert. Specify the name of a variable in the API context. <b>variableName.body</b> , the message payload, represents the JSON input to convert. The default value of the variable is <b>message</b> and <b>message.body</b> is the default input.	string
<small>API Gateway only</small> output	No	The output message to store the conversion result. Specify the name of a variable in the API context. <b>variableName.body</b> represents the result of conversion from JSON format to XML format. When the specified input message is the default message, the default output is <b>message.body</b> . Otherwise, when the input message is the variable <b>my-message-variable</b> , for example, the default output is <b>my-message-variable.body</b> . The variable cannot be any read-only in the API context.	string
<small>API Gateway only</small> conversionType	No	The conversion type that determines the target format of the output. The following options are available: <ul style="list-style-type: none"><li>badgerFish: BadgerFish convention is used to determine the target conversion format of the output.</li><li>apicv5: apicv5 convention is used to determine the target conversion format of the output.</li></ul>	string

### Example

The following is an example of a xml-to-json policy:

```
- xml-to-json:  
  version: 1.0.0  
  title: XML to JSON transform  
  description: Transforms XML message body to JSON format
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## xslt

Use the xslt policy to apply an XSLT transform to the payload of the API definition.

## Gateway support

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® Gateway (v5 compatible)	1.0.0
DataPower API Gateway	2.0.0
	2.1.0 (DataPower API Gateway Version 10.0.4.0 or later)

This topic describes how to configure the policy in your OpenAPI source; for details on how to configure the policy in the assembly user interface, see [XSLT](#).

## About

The xslt policy has the following structure:

```
- xslt:
  version: version
  title: Title
  description: Description
  input: Input_True_False
  source: Transform
```

Note: If you are using the DataPower API Gateway, the input to the xslt policy must be parsed data. One way to produce parsed data is to use a [parse](#) policy before an xslt policy in your assembly flow, which provides explicit control of the parse action.

## Properties

The following table describes the policy properties:

Table 2. xslt policy properties

Property	Required	Description	Data type
version	Yes	The policy version number	string
title	Yes	The title of the policy.	string
description	No	A description of the policy.	string
input	No	Indicates whether this XSLT input document uses the context current payload, or if there is no input. The default value is <b>false</b> .	boolean
 API Gateway only serialize-output	No	If set to <b>true</b> , the output tree that is generated by the XSLT policy is serialized. The content of <code>message.body</code> is updated with the serialized binary data rather than the XML tree. The default value is <b>false</b> .	boolean
source	Yes	The XSLT transform source to execute.	string
 API Gateway only xslt-version	No	The XSLT processor version. The default value is XSLT10.	string
 API Gateway only strict	No	Whether to enable strict XSLT error checking. Non-strict operations attempt to recover from certain errors, such as use of undeclared variables, calling undeclared templates, and so forth. By default, strict XSLT error checking is enabled.	boolean
 API Gateway only profile	No	Whether to enable stylesheet profiling. This option should not be used in production environments. By default, stylesheet profiling is disabled.	boolean
 API Gateway only debug	No	Whether to run the stylesheet, XQuery script, and JSONiq script in debug mode. When a stylesheet, XQuery script, or JSONiq script is run in debug mode, it generates a custom web page instead of displaying its normal output. The web page details exactly what occurred during execution, including the values of variables and where particular pieces of the output came from. This option should not be used in production environments. By default, debug mode is disabled.	boolean
 API Gateway only stream	No	Whether the stylesheet must be run in streaming mode. Transformation of the document begins before the input is fully parsed. Not all stylesheets can be streamed. If the stylesheet cannot be streamed, an error is generated and the input is not processed. By default, streaming mode is disabled.	boolean
 API Gateway only try-stream	No	Whether to attempt to run the stylesheet in streaming mode. Transformation of the document begins before the input is fully parsed. Not all stylesheets can be streamed. If the stylesheet cannot be streamed, a warning is generated during compilation and the stylesheet is read in the entire input as normal at execution time. By default, attempting to run the stylesheet in streaming mode is disabled.	boolean
 API Gateway only minimum-escaping	No	Whether to escape output produced from the stylesheet during processing. Minimal escaping is particularly useful when handling non-English character sets. By default, minimum escaping is disabled.	boolean
 API Gateway only stack-size	No	The maximum number of bytes that the stack is allowed to use while executing a stylesheet or other compiled content. This setting is used to block infinite recursion. The minimum value is 10 kilobytes, or 10,240 bytes. The maximum value is 100 megabytes, or 104,857,600 bytes. The default value is 1 megabyte, or 1,048,576 bytes.	integer
 API Gateway only wsi-validation	No	The validation behavior to apply to WSDL files that are checked for conformance to section 5 of WS-I Basic Profile (version 1.0, April 2004). The default setting is Warn.  Ignore Disables conformance checking. Warn Logs warnings for violations. Fail Forces conformance. Fails if the file contains any violation.	string

Property	Required	Description	Data type
API Gateway only wsdl-validate-body	No	The validation behavior for the <code>soap:Body</code> . The default setting is Strict.  Strict Validates this part of the message against the WSDL definition. Allows only messages that contain this part and that match the WSDL definition.  Lax Validates this part of the message against the WSDL definition. If the message contains this part and the WSDL definition does not define this part, allow the message. If the message contains this part and the WSDL definition defines this part, allow the message only when there is a match.  Skip Disables validation of this part of the message.	string
API Gateway only wsdl-validate-headers	No	The validation behavior for the <code>soap:Header</code> . The default setting is Lax.  Strict Validates this part of the message against the WSDL definition. Allows only messages that contain this part and that match the WSDL definition.  Lax Validates this part of the message against the WSDL definition. If the message contains this part and the WSDL definition does not define this part, allow the message. If the message contains this part and the WSDL definition defines this part, allow the message only when there is a match.  Skip Disables validation of this part of the message.	string
API Gateway only wsdl-validate-faults	No	Specifies the validation behavior for the fault detail. The default setting is Strict.  Strict Validates this part of the message against the WSDL definition. Allows only messages that contain this part and that match the WSDL definition.  Lax Validates this part of the message against the WSDL definition. If the message contains this part and the WSDL definition does not define this part, allow the message. If the message contains this part and the WSDL definition defines this part, allow the message only when there is a match.  Skip Disables validation of this part of the message.	string
API Gateway only wsdl-wrapped-faults	No	Whether to require compatibility with RPC-style wrappers. By default, RPC-style wrappers are not required.	boolean
API Gateway only allow-soap-enc-array	No	Whether to allow the schema to accept most uses of elements with <code>xsi:type='SOAP-ENC:Array'</code> consistent with SOAP 1.1 Section 5, even when these attributes violate the XML Schema specification. Normally, the <code>xsi:type</code> attribute must name a type equal to or derived from the actual type of the element. For schemas compiled with this option, <code>xsi:type</code> is accepted specifically for the SOAP 1.1 Encoding 'Array' complex type if the element type is derived from <code>SOAP-ENC:Array</code> . The opposite is the normal allowable case. By default, elements with <code>xsi:type='SOAP-ENC:Array'</code> are not accepted.	boolean
API Gateway only validate-soap-enc-array	No	Whether to perform extra schema validation following the encoding rules in SOAP 1.1 Section 5. When enabled, members of SOAP arrays are validated, attributes such as <code>@id</code> and <code>@href</code> are allowed even if they are not allowed by the schema, and <code>@href</code> values are checked to ensure that they have a corresponding <code>@id</code> element. By default, the extra validation is not performed.	boolean
API Gateway only wildcards-ignore-xsi-type	No	Whether <code>xs:any</code> elements in the schema validate only child elements by name. The XML Schema specification requires that, if a wildcard matches an element but that element does not have an element declaration, the element is instead validated according to an <code>xsi:type</code> attribute on it. This option ignores those <code>xsi:type</code> attributes. It should be used for cases such as SOAP envelope validation where a further validation step will validate the contents matching the wildcard, possibly using the SOAP 1.1 encoding rules. By default, <code>xsi:type</code> attributes are not ignored.	boolean
API Gateway only wsdl-strict-soap-version	No	Whether to strictly follow the SOAP binding in the WSDL. When enabled, only messages bound to SOAP 1.2 appear in SOAP 1.2 envelopes and only messages bound to SOAP 1.1 appear in SOAP 1.1 envelopes. By default, strict SOAP binding is disabled.	boolean
API Gateway only xacml-debug	No	Whether to compile XACML policies with debug information. Note that the XACML debugging messages are also controlled by the log event in the XACML category. Use the debug log level to view the full XACML debugging messages. By default, XACML policies are not compiled with debug information.	boolean
API Gateway only allow-xop-include	No	Specifies whether the schema or WSDL document accepts messages where base64-encoded binary content was optimized according to the MTOM/XOP specifications. XOP binary-optimization replaces base64-encoded binary data with an <code>xop:Include</code> reference element that references the unencoded binary data located in an attachment. By default, MTOM/XOP optimized messages are disabled.  <ul style="list-style-type: none"> <li>When disabled, such optimized messages are rejected by validation of the optimized form. Rejection occurs because the schema specifies a simple type that accepts base64-encoded data, such as <code>xs:base64Binary</code> or <code>xs:string</code>, but the message contains an <code>xop:Include</code> element instead.</li> <li>When enabled, an <code>xop:Include</code> element can optionally appear in place of content for any XML Schema simple type that validates base64-encoded binary data. The <code>xop:Include</code> element itself will be validated according to the built-in schema in <code>store:///schemas/xop.xsd</code>.</li> </ul>	boolean

You can also apply an xslt policy by using the API Manager assembly editor to add a built-in policy to the API. For more information, see [XSLT](#) in the built-in policies section.

For examples of the OpenAPI definitions of xslt policies, see [XSLT policy examples](#) in the built-in policies section.

For more examples of how to use XSLT to access and modify properties and context, see [Implementation code examples](#) and, if you are using the DataPower API Gateway, [Using context variables in GatewayScript and XSLT policies with the DataPower API Gateway](#).

## Related concepts

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## catch

Use the catch extension to catch errors that occur during an API call.

The catch extension takes the following form:

```
catch:
- errors:
  - Error_1
  - Error_2
- execute:
  assembly_1
- errors:
  - Error_3
- execute:
  assembly_2
- default:
  assembly_3
```

The following table shows the properties of the `catch` extension:

Table 1. The properties of the catch extension

Property	Required	Description	Type
<code>errors</code>	Yes	The errors for which the catch will activate. For a list of errors, see <a href="#">Error cases supported by assembly catches</a> .	Array (String)
<code>execute</code>	Yes	The section of the assembly that will execute when the catch is activated.	Array (Object)
<code>default</code>	No	The section of the assembly that will execute when an error does not trigger other catches. It behaves in the same manner and has the same structure as <a href="#">execute</a>	Array (Object)

The following is an example of a `catch` extension:

```
catch:
- errors:
  - ConnectionError
  - JavaScriptError
- execute:
  - activity-log:
    title: activity-log
    content: activity
    error-content: payload
- default:
  - activity-log:
    title: activity-log
    content: activity
    error-content: payload
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## properties

Use the `properties` extension to define properties for referencing in an API.

The `properties` extension has the following structure:

```
properties:
  property_1:
    value: default_value_1
    description: description_1
    encoded: encoded_boolean_1
  property_2
```

```
value: default_value_2
description: description_2
encoded: encoded_boolean_2
```

The following table lists the fields found in the `properties` extension:

Table 1. The properties extension

Property	Required	Description	Data type
<code>property</code>	Yes	The name of the property. It is used when referencing the property. Note that this is the field name, not the contents of the field.	Object
<code>value</code>	No	The default value that the property takes. It can be empty.	String
<code>description</code>	No	The description of the property. It can be empty.	String
<code>encoded</code>	No	Specifies whether to encode the value of this property.	Boolean

The following example shows a sample `properties` field:

```
properties:
  ID:
    value: 1234
    description: An ID to be used for validating.
    encoded: false
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## catalogs

Use the `catalogs` extension to assign catalog-specific values to properties defined in the `properties` section.

The `catalogs` section has the following structure:

```
catalogs:
  catalog_name_1:
    properties:
      property_name_1: value_1
      property_name_2: value_2
  catalog_name_2:
    properties:
      property_name_1: value_3
```

The following table lists the fields found in the `catalogs` extension:

Table 1. Catalogs properties

Property	Required	Description	Data type
<code>catalog_name</code>	Yes	The name of the catalog. It must match a catalog in API Manager. Note that this is the field name, not the contents of the field.	Object
<code>properties</code>	Yes	This field contains any properties that are to be set.	Object
<code>property_name</code>	Yes	The field name is the property to be set and must match a property defined in the <code>properties</code> extension. It contains the value of the property for the catalog to which the field belongs. If, in the <code>properties</code> extension, it has been specified as encoded, this will be encoded when saved or staged by IBM® API Connect.	String

The following is an example of a `catalogs` extension:

```
catalogs:
  Sandbox:
    properties:
      ID: 5678
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## activity-log

If you're using the DataPower® API Gateway, you can use the `activity-log` extension to configure your logging preferences for the API activity that is stored in Analytics. The preferences that you specify will override the default settings for collecting and storing details of the API activity.

An API event record exists for each API execution event in the Gateway server. By default, the content type that is collected and stored in API event records is `activity` for when API execution completes successfully, and `payload` for when API execution completes with an error code. When you compose your API definition, you can change the type of content to log in these API event records. For more information about API event records, see [API event record fields](#).

Note that if you're using the DataPower Gateway (v5 compatible), you can configure your logging preferences by using an `activity-log` policy in your API assembly. For more information, see [activity-log](#).

The `activity-log` extension takes the following form:

```

activity-log:
  success-content: activity_to_log_if_call_successful
  error-content: activity_to_log_if_call_unsuccessful
  enabled: is_activity_logging_enabled

```

The following table shows the properties of the `activity-log` extension:

Table 1. The properties of the activity-log extension

Property	Required	Description	Type
<code>success-content</code>	No	Defines the type of content to be logged when the operation is successful. Valid values: <ul style="list-style-type: none"> <li><code>none</code>: Indicates that no logging occurs. Restriction: This option disables notifications for application developers who use your Developer Portal.</li> <li><code>activity</code>: Logs invocation only (only the resource URI is recorded).</li> <li><code>header</code>: Logs activity and header.</li> <li><code>payload</code>: Logs activity, header, and payload (the original request, if any, and the final response).</li> </ul> The default value is <code>activity</code> .	String
<code>error-content</code>	No	Indicates what content to log when an error occurs. Valid values: <ul style="list-style-type: none"> <li><code>none</code>: Indicates that no logging occurs. Restriction: This option disables notifications for application developers who use your Developer Portal.</li> <li><code>activity</code>: Logs invocation only (only the resource URI is recorded).</li> <li><code>header</code>: Logs activity and header.</li> <li><code>payload</code>: Logs activity, header, and payload (the original request, if any, and the final response).</li> </ul> The default value is <code>payload</code> .	String
<code>enabled</code>	No	Indicates whether activity logging is enabled or disabled.	Boolean

## Example 1

Override the default activity logging settings:

```

activity-log:
  success-content: none
  error-content: header
  enabled: true

```

## Example 2

Turn off activity logging:

```

activity-log:
  enabled: false

```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Specifying a gateway type for an API definition

An API definition is specific to one or other of the gateway types, DataPower® API Gateway or DataPower Gateway (v5 compatible). API definitions must specify which type of gateway the API uses.

### Before you begin

IBM® API Connect supports two gateway types: DataPower Gateway (v5 compatible) and DataPower API Gateway.

DataPower Gateway (v5 compatible) has been available with IBM API Connect for a number of years. The DataPower API Gateway is a new gateway that has been designed with APIs in mind, and with the same security focus as DataPower Gateway (v5 compatible).

For more information on how to choose which gateway type to use, see [API Connect gateway types](#).

### About this task

You must specify which type of gateway each API uses. APIs can use only one type of gateway.

When you modify your API definitions to use a specific gateway type, you must ensure that each policy and policy version in the API are supported by the gateway type. DataPower Gateway (v5 compatible) and DataPower API Gateway each support policies that the other gateway type does not. In some cases, the same policy is supported by both gateway types, but with a different version number.

For example, DataPower Gateway (v5 compatible) supports version **1.0.0** of the `invoke` policy, but DataPower API Gateway requires version **2.0.0**.

For information on policies, see [execute](#).

For information on policy versions, see the documentation for each individual policy. For example, to review the **invoke** policy, see [invoke](#).

## Procedure

1. Edit the API definition YAML file and add the gateway type. For example:

- DataPower Gateway (v5 compatible):

```
gateway: datapower-gateway
```

- DataPower API Gateway

```
gateway: datapower-api-gateway
```

Note: If your API YAML file includes the `gateway` property, the `enforced` property must be set to `true`

2. Ensure that the policies, including policy versions, in your APIs are supported by the gateway type. Review the list of policies on the [execute](#) page. If necessary, review the individual policy pages to determine the supported version number.
3. Ensure that any Product that uses this API is configured to use the same gateway type. See [Specifying a gateway type for your Product](#).

## Related information

- [DataPower API Gateway porting notes](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Referring to an extension in an API definition

To refer to an OpenAPI extension in your API definition YAML (or JSON) file, add an `extensions` key under `x-ibm-configuration`.

## Before you begin

Add the OpenAPI extension to any Catalogs that the API is to be published to, by importing its definition file; for details, see [Working with OpenAPI extensions](#). If the target Catalog does not contain the OpenAPI extension then attempts to publish the API to it will fail.

## About this task

The following example shows an extension definition file that defines a bank branch, in YAML format:

```
extension: '1.0.0'

info:
  title: Banking services
  name: banking
  version: 1.0.0
  description: Banking extensions
  contact:
    name: IBM API Connect
    url: https://apiconnect.ibm.com/
    email: myname@ibm.com

portal-visible: true

properties:
  title: "Branch"
  type: "object"
  properties:
    Branch type:
      type: "string"
      enum:
        - "ATM"
        - "Walk in"
    location:
      type: "object"
      title: "Location"
      properties:
        city:
          type: "string"
          default: "San Francisco"
        state:
          type: "string"
          default: "CA"
        citystate:
          type: "string"
          description: "This is generated automatically from the previous two fields"
          template: "{{city}}, {{state}}"
        watch:
          city: "location.city"
          state: "location.state"
  required:
    - Branch type
```

## Procedure

1. Edit the API definition YAML file and add the reference. For example:

```
x-ibm-configuration:
  .
  .
  .
  extensions:
    banking: 1.0.0
```

2. In your API definition file, add a property whose name must begin with **x-** and references the name of the extension you created. Specify the values of the properties that were defined in the OpenAPI extension YAML file. The following example uses the banking extension:

```
.
.
.
x-banking:
  Branch type: ATM
  location:
    city: San Francisco
    state: CA
    citystate: 'San Francisco, CA'
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Using \$ref to reuse code fragments in your OpenAPI files

If you deploy an API to an IBM® API Connect Management server by using the developer toolkit command line, you can use the **\$ref** field in your OpenAPI YAML and JSON API definition files to reference a fragment of OpenAPI code that is defined in a separate file. When API Connect processes the source API definition file, the **\$ref** field is replaced with the contents of the target file.

Use the following syntax in your source YAML file:

```
$ref: path_to_file_containing_code_fragment
```

Use the following syntax in your source JSON file:

```
{
  $ref: path_to_file_containing_code_fragment
}
```

For example:

```
$ref: ./code_fragments/my_fragment.yaml
```

```
{
  "$ref": "./code_fragments/my_fragment.json"
}
```

The replacement of the **\$ref** field with the target code fragment occurs when you perform any of the following actions on the API defined by the source API definition file:

- Stage or publish an API to an API Connect Management server by using the **apic publish** command. For more information, see [Publishing APIs and applications](#).
- Validate the API definition YAML file by using the **apic validate** command. For more information, see [Validating the YAML or JSON definition of an API or Product](#).

Important: You cannot insert a **\$ref** field at the root level of your OpenAPI file.

## Example

A source YAML file contains the following OpenAPI code:

```
swagger: '2.0'
info:
  version: 1.0.0
  title: Branches
  x-ibm-name: Branches
  description: Provides operations relating to BankA branch information.
basePath: /branches
paths:
  $ref: ./code_fragments/paths.yaml
  .
  .
  .
```

The file paths.yaml contains the following OpenAPI code fragment:

```
/details:
  get:
    responses:
      '200':
```

```
description: 200 OK defined in $ref file
schema:
  $ref: '#/definitions/branch'
summary: Branch details
description: Retrieve details of the current branches of BankA.
```

When API Connect processes the source YAML file, the `$ref` field is replaced with the target code fragment, yielding the following OpenAPI code:

```
swagger: '2.0'
info:
  version: 1.0.0
  title: Branches
  x-ibm-name: Branches
  description: Provides operations relating to BankA branch information.
basePath: /branches
paths:
  /details:
    get:
      responses:
        '200':
          description: 200 OK
          schema:
            $ref: '#/definitions/branch'
      summary: Branch details
      description: Retrieve details of the current branches of BankA.
  .
  .
  .
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Creating a Product definition file

You define a Product by creating a Product definition file.

### About this task

---

You can create a Product definition file in either of the following ways:

- Create the file in an editor of your choice.
- Create a Product definition file by using the `apic create:product` command and then modify it. You can base your Product definition file on the default Product template or on your own custom template.

This topic describes the syntax that is needed for both options and also the structure needed when the file is created in the editor. For details on what you can include in the product definition file, see [Product definition schema](#).

You can create a Product in the CLI by running `apic create:product` and supplying additional arguments on the command line. For example, you can enter the following text in a single command:

```
apic create:product --name product_name --title product_title --filename product_file_name.yaml
--apis "filename_of_api1.yaml filename_of_api2.yaml"
```

where:

- `product_name` is the name for your new Product.
- `product_title` is the title of your new Product.
- `product_file_name.yaml` is the name of the yaml file that is created for your new Product.
- `filename_of_api1.yaml` is the file name of one of the APIs that is used within the new Product.
- `filename_of_api2.yaml` is the file name of one of the APIs that is used within the new Product.

Another option is to create a Product interactively in the command line by running `apic create:product` and following the prompts.

You can see further details and available options for the `apic create:product` command by entering the command:

```
apic create:product --help
```

You can also create a Product from a custom Handlebars template by using the following command:

```
apic create:product --template template_filename --title product_title
```

where `template_filename` is the name of the Handlebars template to use, and `product_title` is the title of your Product. A Product template file must have a `.hbs` file name extension. You can create a template from scratch, or start with the example (default) Product template provided in [API and Product definition template examples](#).

A Product definition file contains the following sections:

- The specification version
- An information section
- A visibility section
- An APIs section
- A Plans section

In this topic, YAML is used, but the instructions can be adapted to use JSON. Both `.yaml` and `.yml` file extensions are supported, but the use of the `.yaml` file extension is recommended by [yaml.org](#).

Note: All keys and enumeration values that are specified in this topic are case-sensitive.

## Procedure

Structure your Product definition file by completing the following steps:

1. Set the specification version by adding the following line to the beginning of the file: `product: 1.0.0`.  
This line specifies the template version, and is always `product: 1.0.0`.  
Note: The specification version is distinct from your Product version. The specification version refers to this YAML file, while the Product version is by your discretion.
2. Include an information section with details about the Product, as described in [Completing the information section of your Product description](#).
3. Include a visibility section that specifies who can view and subscribe to the Product, as described in [Specifying the visibility of your Product](#).
4. Include an APIs section that references the APIs to be included in the Product, as described in [Referencing the APIs for your Product](#).
5. Include a Plans section that described the Plans you want include in your Product, as described in [Describing Plans in your Product](#).

## Results

You have completed a YAML representation of your Product. A complete example with full indentation can be found in [An example YAML representation of a Product](#).

You can create multilingual API and Product documentation by using an `x-ibm-languages` extension directly in the OpenAPI definition. For more information, see [Using x-ibm-languages to create multilingual API and Product documentation](#).

- [Product definition schema](#)  
The product definition schema defines the properties (and their data types) that you can include in a product definition file.
- [Converting a Product YAML file to use DataPower API Gateway](#)  
IBM API Connect now supports DataPower® API Gateway. You can optionally specify this gateway type in your Product YAML file.

## Related information

- [Changing the availability of a Product](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Product definition schema

The product definition schema defines the properties (and their data types) that you can include in a product definition file.

```
{
  "id": "https://api.ibm.com/product/schema.json#",
  "$schema": "http://json-schema.org/draft-06/schema#",
  "title": "A schema to represent the IBM specific API configuration",
  "type": "object",
  "additionalProperties": false,
  "required": [
    "product",
    "info"
  ],
  "patternProperties": {
    "^x-": {}
  },
  "properties": {
    "product": {
      "type": "string",
      "enum": [
        "1.0.0"
      ]
    },
    "info": {
      "$ref": "#/definitions/InfoSection"
    },
    "visibility": {
      "type": "object",
      "additionalProperties": false,
      "required": [
        "view",
        "subscribe"
      ]
    },
    "patternProperties": {
      "^x-": {}
    },
    "properties": {
      "view": {
        "type": "object",
        "additionalProperties": false,
        "required": [
          "type"
        ]
      },
      "properties": {
        "type": {
          "enum": [
```

```

        "public",

## Specifying a gateway type for your Product

Product definitions must specify which type of gateway the Product uses.

### Before you begin

---

IBM® API Connect supports two gateway types: DataPower® Gateway (v5 compatible) and DataPower API Gateway.

DataPower Gateway (v5 compatible) has been available with IBM API Connect for a number of years. The DataPower API Gateway is a new gateway that has been designed with APIs in mind, and with the same security focus as DataPower Gateway (v5 compatible).

For more information on how to choose which gateway type to use, see [API Connect gateway types](#).

### About this task

---

You can specify the gateway type for a Product.

Products can use only one type of gateway, and the APIs in the Product must use the same type of gateway. See [Specifying a gateway type for an API definition](#).

### Procedure

---

1. Determine the gateway type that is configured for the APIs in your Product. The Product gateway type must match the APIs gateway type. To review the APIs for your Product, see [Referencing the APIs for your Product](#).

2. Edit the Product definition file (YAML source) to add the gateway type you want to use:

- DataPower Gateway (v5 compatible):

```
gateways:
  datapower-gateway
```

- DataPower API Gateway

```
gateways:
  datapower-api-gateway
```

3. Ensure that the policies, including policy versions, in the APIs in your Product are supported by the gateway type. Review the list of policies on the [execute](#) page. If necessary, review the individual policy pages to determine the supported version number.

### Related information

---

## Converting a Product YAML file to use DataPower API Gateway

IBM® API Connect now supports DataPower® API Gateway. You can optionally specify this gateway type in your Product YAML file.

### Before you begin

---

IBM API Connect provides two gateway types, DataPower Gateway (v5 compatible) and DataPower API Gateway.

DataPower Gateway (v5 compatible) has been available with IBM API Connect for a number of years. The DataPower API Gateway is a new gateway that has been designed with APIs in mind, and with the same security focus as DataPower Gateway (v5 compatible).

For more information on how to choose which gateway type to use, see [API Connect gateway types](#).

## About this task

---

Product definitions can specify only one type of gateway. The type of gateway must match the gateway type that is used by the APIs that are included in the product. If you want to take advantage of the capabilities of DataPower API Gateway, you can easily modify your existing Product definitions to specify it as the gateway type.

## Procedure

---

1. Verify that the APIs in the product specify DataPower API Gateway as the gateway type, and that the APIs have been converted for use with the DataPower API Gateway.
2. Open the Product YAML file for editing.  
For example:

```
product: '1.0.0'
info:
  name: testprod
  title: testprod
  version: 1.0.0
  .
  .
  .
```

3. Add a `gateways` setting, and specify `datapower-api-gateway`.  
For example:

```
product: '1.0.0'
info:
  name: testprod
  title: testprod
  version: 1.0.0
  gateways:
  - datapower-api-gateway
  .
  .
  .
```

4. Save the modified YAML file.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Specifying the visibility of your Product

Detail who can view and subscribe to your Product.

### About this task

---

The visibility section of your Product's YAML representation determines who can view and subscribe to your Product in IBM® API Connect.

Note: All keys and enumeration values that are specified in this topic are case-sensitive.

An example visibility section of a YAML representation of a Product can be found at the end of this topic. An example of a complete YAML representation of a Product can be found in [An example YAML representation of a Product](#).

### Procedure

---

To complete the visibility section of your Product description, complete the following steps:

1. Title the section by adding `visibility`:
2. Under `visibility`, specify who can view the Product; use the following syntax:

```
view:
  enabled: View_Toggle
  type: View_Audience
  tags:
  - View_Tag_1
  - View_Tag_2
  orgs: View_Organizations
```

where

- `View_Toggle` determines whether the Product is visible to anybody or not. It must be `true` or `false`. If `false`, the Product will not be visible in the Developer Portal.

- `View_Audience` must be `public`, in which case the Product is visible to anybody who uses the Developer Portal, `authenticated`, in which case the Product is visible to anybody registered through the Developer Portal, or `custom`, in which case the Product is visible to a specified group of users.
- The `View_Tag` variables are strings that contains any tags that you want to attach to your Product's view status. Each tag must be on a new line and preceded with a dash. If you do not want to use any tags, do not include `tags:`.
- `View_Organizations` specifies the organizations that can view the Product if `View_Audience` is set to `custom`. If `View_Audience` is not set to `custom`, do not include `orgs:`. If `View_Audience` is `custom`, specify organizations in the following manner:

```
orgs:
  - Organization 1
  - Organization 2
```

where the `Organization` variables are the names of the organizations that are to be allowed to view the Product.

3. Under visibility, specify who can subscribe to your Product's Plans; use the following syntax:

```
subscribe:
  enabled: Subscribe_Toggle
  type: Subscribe_Audience
  tags:
    - Subscribe_Tag_1
    - Subscribe_Tag_2
  orgs: Subscribe_Organizations
```

where:

- `Subscribe_Toggle` must be `true` or `false`. If `false`, no developers will be able to subscribe to the Product.
- `Subscribe_Audience` must be `authenticated`, in which case the Product's Plans can be subscribed to by anybody who is registered through the Developer Portal, or `custom`, in which case the Product's Plans can be subscribed to by a specified group of users.
- The `Subscribe_Tag` variables are strings that contains any tags you want to attach to your Product. Each tag must be on a new line and preceded by a dash.
- `Subscribe_Organizations` specifies the organizations that can subscribe to the Product's Plans if `Subscribe_Audience` is set to `custom`. If `Subscribe_Audience` is not set to `custom`, omit it or set as `[]`. If `Subscribe_Audience` is `custom`, specify organizations in the following manner:

```
orgs:
  - Organization 1
  - Organization 2
```

where the `Organization` variables are the names of the organizations that are to be allowed to subscribe to the Product.

Note: If a Product is to be available for subscription, it must already be visible. As a result, for the subscription audience to be `authenticated`, the view audience cannot be `custom`.

## Results

You have completed the visibility section of your Product's YAML representation. It should have the following form:

```
visibility:
  view:
    enabled: View_Toggle
    type: View_Audience
    tags:
      - View_Tag_1
      - View_Tag_2
    orgs:
      - Organization_1
      - Organization_2

  subscribe:
    enabled: Subscribe_Toggle
    type: Subscribe_Audience
    tags:
      - Subscribe_Tag_1
      - Subscribe_Tag_2
    orgs:
      - Organization_1
      - Organization_2
```

where all variables are as described in previously in this topic. The indentation must be as in the example.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#), for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Referencing the APIs for your Product

Detail the file paths for the APIs you want to include in your Product in IBM® API Connect.

### About this task

Before an API can be included in a Plan, it must first be referenced in the APIs section of your Product description.

### Procedure

Begin the APIs section and reference the APIs you want to include in your Product. The syntax that you use depends on which user interface you are using, as follows:

- API Designer:

```
apis:
  API_1_NameAPI_1_Version
  $ref: API_1_File_Path
  API_2_NameAPI_2_Version
  $ref: API_2_File_Path
```

- API Manager:

```
apis:
  API_1_NameAPI_1_Version
  name: 'API_1_Name:API_1_Version'
  API_2_NameAPI_2_Version
  name: 'API_2_Name:API_2_Version'
```

where

- the *API\_n\_Name* variables are the case-sensitive names of your APIs.
- the *API\_n\_Version* variables are the versions of your APIs.
- the *API\_n\_File\_Path* variables are the file paths for the YAML files containing OpenAPI representations of your APIs.

The following example shows a complete sample APIs section:

```
apis:
  api11.0.0:
    name: 'api1:1.0.0'
  api21.0.0:
    name: 'api2:1.0.0'
  api31.0.0:
    name: 'api3:1.0.0'
```

For more information about creating OpenAPI definitions, see [Creating an OpenAPI definition file](#).

The indentation must be as in the examples and the APIs must have been created before they can be referenced.

## Results

You have referenced the APIs that are to be included in your Product. An example of a complete YAML representation of a Product can be found in [An example YAML representation of a Product](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.

For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Describing Plans in your Product

Describe the Plans that you want to include in your IBM® API Connect Product and which APIs they will contain, as well as any rate limits that apply.

### About this task

A Plan contains APIs and their operations. It can be used to implement rate limits and tailor visibility.

Note: If you are using more than one DataPower® server in a Gateway service, then to properly calculate API calls for rate limits the servers must be able to communicate with each other by using SLM peer groups, using either SLM unicast peering or SLM multicast peering depending on your network configuration. For more information, see [SLM peering](#).

In addition, you can apply burst limits to your Plans, to prevent usage spikes that might damage infrastructure. Multiple burst limits can be set per Plan, at second and minute time intervals. You can also set multiple rate limits per Plan and per operation, at second, minute, hour, day, and week time intervals.

Note: All keys and enumeration values that are specified in this topic are case-sensitive.

Two example Plan descriptions from a YAML representation of a Product can be found at the end of this topic. An example of a complete YAML representation of a Product can be found in [An example YAML representation of a Product](#).

### Procedure

To describe your Plans, include APIs in them, and set rate limits for Plans or specific operations, complete the following instructions:

1. Begin the Plans section with `plans`:
2. Under Plans, begin the description of your first Plan by providing a name, description, and specifying whether approval is required for subscription requests; use the following syntax:

```
plans:
  Plan_Name:
    title: Plan_Title
    description: Plan_Description
    approval: Approval_Toggle
```

where:

- *Plan\_Name* is the name of the Plan. It must be a single word and contain only alphanumeric characters, and the - (dash) and \_ (underscore) characters. The name is case-sensitive, and should be 20 characters or fewer so that it can be displayed in the API Manager user interface.
- *Plan\_Title* is the title of the Plan. Any string can be used, but the title should be kept short so that it can be displayed in the API Manager user interface.
- *Plan\_Description* is a description of your Plan.

- *Approval\_Toggle* must be either `true`, in which case approval is needed for subscription requests, or `false`, in which case subscriptions are automatically approved.

3. Optional: Under your Plan, add multiple burst and rate limits that will be shared across all the operations in the Plan; use the following syntax:

Note: For information about rate limits and burst limits in API Connect, see [Understanding rate limits for APIs and Plans](#).

```
rate-limits:
  Name:
    value: Rate_Limit
    hard-limit: Limit_Toggle
  Name:
    value: Rate_Limit
    hard-limit: Limit_Toggle
burst-limits:
  Name:
    value: Burst_Limit
```

where:

- *Name* is the name of the limit.
- *Rate\_Limit* is your rate limit. It can be for multiples of seconds, minutes, hours, days, or weeks, written as `second`, `minute`, `hour`, `day`, and `week` respectively; do not use the plural forms of the words. Use the syntax: `1/2minute`. If the time unit is singular, then it is not necessary to precede it with a number, for example, `1/minute`. If you do not want to apply a rate limit, set *Rate\_Limit* as `unlimited`.
- *Limit\_Toggle* must be `true` or `false`. If `true`, API calls by a developer will fail if the rate limit is exceeded. This step is not necessary if you have set *Rate\_Limit* to `unlimited`.
- *Burst\_Limit* is your burst limit. It can be for multiples of seconds or minutes, written as `second` or `minute`; do not use the plural forms of the words.

Note:

- Applying a rate limit at the Plan level creates a default rate limit that is shared across all the operations within the Plan. If you need to set specific rate limits for specific operations, you must set these within the operations themselves and these settings will override the setting at the Plan level.
- The test application that is used by the API Manager test tool is not subject to rate limits if you have enabled automatic subscriptions for the Catalog in which you are testing. For more information, see [Working with Catalogs](#)

4. Under your Plan, specify which APIs are to be included.

Reference APIs by name and version, as follows:

```
apis:
  API_1_nameAPI_1_version: {}
  API_2_nameAPI_2_version: {}
```

where

- the *API\_n\_name* variables are the case-sensitive names of your APIs.
- the *API\_n\_version* variables are the versions of your APIs.

5. Optional: If you want to include only a subset of an API's operations, list the operations that are to be included; use the following syntax:

```
apis:
  API_nameAPI_version:
    operations:
      - operation: Operation_1_Verb
        path: Operation_1_Path
      - operation: Operation_2_Verb
        path: Operation_2_Path
```

where

- the *Operation\_n\_Path* variables are the paths of operations that is to be included. The dash is required for each new operation.
- the *Operation\_n\_Verb* variables are the appropriate REST verbs for the operations.

6. Optional: If you want to specify multiple rate limits for a single operation; use the following syntax:

```
apis:
  API_nameAPI_version:
    operations:
      - operation: Operation_Verb
        path: Operation_Path
        rate-limits:
          Name:
            value: Operation_Limit
            hard-limit: Operation_Limit_Toggle
          Name:
            value: Operation_Limit
            hard-limit: Operation_Limit_Toggle
```

where:

- *Operation\_Limit* is the rate limit that you want to apply to your operation. It can be for multiples of seconds, minutes, hours, days, or weeks, written as `second`, `minute`, `hour`, `day`, and `week` respectively; do not use the plural forms of the words. Use the syntax: `1/2minute`. If the time unit is singular, then it is not necessary to precede it with a number, for example, `1/minute`. If you do not want to apply a rate limit, set *Operation\_Limit* as `unlimited`.
- *Operation\_Limit\_Toggle* must be `true` or `false`. If `true`, API calls by a developer will fail if the rate limit is exceeded. This step is not necessary if you have set *Operation\_Limit* to `unlimited`.

## Results

You have described the Plans that are to be included in your Product. Your Plans section should be similar to the following scenarios.

If you have enforced a rate limit for your Plan and not specified individual operations, your Plans section should have the following form:

```
plans:
  Plan Name:
    title: Plan Title
    description: Plan Description
    approval: Approval_Toggle
    rate-limits:
      Name:
        value: Limit
```

```

    hard-limit: Limit_Toggle
  apis:
    API_1_nameAPI_1_version: {}
    API_2_nameAPI_2_version: {}

```

If you have enforced rate limits at the Plan level and want to include two operations, with a separate rate limit one for one of the operations, your Plans section should have the following form:

```

plans:
  Plan_Name:
    title: Plan_Title
    description: Plan_Description
    approval: Approval_Toggle
    rate-limits:
      Name:
        value: API_Limit
        hard-limit: API_Limit_Toggle
    burst-limits:
      Name:
        value: Burst_limit
    apis:
      API_nameAPI_version:
        operations:
          - operation: Operation_1_Verb
            path: Operation_1_Path
            rate-limits:
              Name:
                value: Operation_Limit
                hard-limit: Operation_Limit_Toggle
          - operation: Operation_2_Verb
            path: Operation_2_Path

```

In both examples, variables are as in the previous steps and the indentation must be as presented.

The following example shows a complete sample Plans section:

```

plans:
  default:
    title: Default Plan
    description: Default Plan
    approval: false
    rate-limits:
      default:
        value: 100/hour
        hard-limit: false
  my-plan:
    title: my_plan
    rate-limits:
      Default rate-limit:
        value: 50/1hour
        hard-limit: false
    burst-limits:
      Default burst-limit:
        value: 10/1second
    apis:
      api21.0.0:
        operations:
          - operation: get
            path: /path2
      api31.0.0:
        operations:
          - operation: get
            path: /path3
            rate-limits:
              limit3:
                value: 10/1second
                hard-limit: true
              limit4:
                value: 100/1hour
                hard-limit: true
      api11.0.0: {}

```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## An example YAML representation of a Product

Products in IBM® API Connect can be represented by using a YAML file in a similar fashion to how APIs can be represented by using OpenAPI.

The following code describes a complete Product, with sample values.

```

info:
  version: 1.0.0
  title: SampleProduct
  name: SampleProduct
  summary: This is a sample product
gateways:
  - datapower-gateway

```

```

product: 1.0.0
visibility:
  view:
    enabled: true
    type: public
    tags: []
    orgs: []
  subscribe:
    enabled: true
    type: authenticated
    tags: []
    orgs: []
plans:
  default:
    title: Default Plan
    description: Default Plan
    approval: false
    rate-limits:
      default:
        value: 100/hour
        hard-limit: false
  newplan:
    title: NewPlan
    rate-limits:
      low:
        value: 10/1hour
        hard-limit: true
    burst-limits:
      Default burst-limit:
        value: 10/1second
apis:
  SampleAPI:
    name: 'Sampleapi:1.0.0'

```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Using `x-ibm-languages` to create multilingual API and Product documentation

Create multilingual API and Product documentation by using the `x-ibm-languages` extension in your API and Product OpenAPI definitions.

You can scale your API initiatives to a global user base, while still maintaining a single API definition. Translations are custom configured and controlled, so that they can be tailored to both your API documentation and the API consumer. The extensions that are used in API Connect are added directly to the YAML file as `x-ibm-languages`. These extensions are then used in the Developer Portal, so that whatever language the Developer Portal is set to reflects the translations that are contained in the API and Product definitions.

Add the following syntax into your API or Product YAML file at every point that you require some translated text:

```

x-ibm-languages:
  item_name:
    language_code: translated_text

```

Where:

- `item_name` is the name of the item that you want to translate, for example `summary`.
- `language_code` is the ISO code for the translation language. Supported languages with their ISO codes are listed in the following table.

Table 1. List of supported language codes

Language	Code
Chinese, simplified	zh_cn
Chinese, traditional	zh_tw
Dutch	nl
English	en
French	fr
German	de
Italian	it
Japanese	ja
Korean	ko
Portuguese	pt
Spanish	es
Turkish	tr

- `translated_text` is the translated text that you want to be displayed for the item in the Developer Portal.

Note: The Developer Portal automatically assumes that the default language in the OpenAPI definition is English. If you want to use a different default language in the definition, you must provide both the English translation and the default language text in the `x-ibm-languages` extension sections of your OpenAPI definition, by using the following syntax:

```

x-ibm-languages:
  item_name:

```

```
en: English translated text
default_language_code: default_language_text
```

For an example of how to write an OpenAPI YAML file with French as the default language, see the [Examples](#) section.

## Examples

An example API OpenAPI YAML file that contains the `fr` language extension, where English is the default language:

```
swagger: '2.0'
info:
  x-ibm-name: climbing-weather-api
  title: Climbing Weather API
  version: 1.0.0
  x-ibm-languages:
    title:
      fr: Climat d'escalade
schemes:
  - https
host: $(catalog.host)
consumes:
  - application/json
produces:
  - application/json
x-ibm-configuration:
  assembly:
    execute:
      - invoke:
          target-url: 'https://1234.com'
          title: 3 day forecast invocation
          cache-response: time-to-live
          cache-key: $(request.search)
  gateway: datapower-gateway
  enforced: true
  testable: true
  phase: realized
  cors:
    enabled: true
paths:
  /weather/forecast:
    get:
      summary: Retrieve the 3 day forecast for a location
      description: Retrieve the locations weather forecast descriptions for the next 3 days and nights
      operationId: getWeather
      x-ibm-languages:
        summary:
          fr: Récupérer la prévision de 3 jours pour un emplacement
        description:
          fr: Récupérer les descriptions des prévisions météo pour les 3 prochains jours et les nuits
      tags:
        - Weather
      parameters:
        - name: zip
          type: string
          in: query
          description: A 5 number zip code
          x-ibm-languages:
            description:
              fr: Un code postal à 5 numéros
        - name: country
          type: string
          in: query
          description: A 2 letter country code
          x-ibm-languages:
            description:
              fr: Un code de pays de 2 lettres
        - name: lat
          type: string
          in: query
          description: A latitude value between -90 and 90
          x-ibm-languages:
            description:
              fr: Une valeur de latitude entre -90 et 90
        - name: lon
          type: string
          in: query
          description: A longitude value between -180 and 180
          x-ibm-languages:
            description:
              fr: Une valeur de longitude entre -180 et 180
      responses:
        '200':
          description: Success
          x-ibm-languages:
            description:
              fr: Succès
        '400':
          description: Bad Request
          x-ibm-languages:
            description:
              fr: Mauvaise Demande
        '408':
          description: Request Timeout
          x-ibm-languages:
```

```

      description:
        fr: Délai de délai de demande
    '500':
      description: Internal Server Error
      x-ibm-languages:
        description:
          fr: Erreur Interne du Serveur
basePath: /
tags:
  - name: Weather
    description: Sample API to get weather forecast data
    x-ibm-languages:
      description:
        fr: Exemple d'API pour obtenir des données météorologiques
securityDefinitions:
  client-secret:
    type: apiKey
    description: ''
    in: header
    name: X-IBM-Client-Secret
  client-id:
    type: apiKey
    description: ''
    in: header
    name: X-IBM-Client-Id
security:
  - client-secret: []
    client-id: []

```

An example Product OpenAPI YAML file that contains the `fr` language extension, where English is the default language:

```

product: 1.0.0
info:
  name: climbing-weather
  title: Climbing Weather
  version: 1.0.0
  description: This is a product about weather.
  x-ibm-languages:
    title:
      fr: Météo traduite
    description:
      fr: C'est un produit sur la météo.
    termsOfService:
      fr: Quid ergo aliud intellegetur en francais.

```

An example of how to write an OpenAPI YAML file with French as the default language:

```

info:
  name: climat-d-escalade
  title: Climat d'escalade
  version: 1.0.0
  x-ibm-languages:
    title:
      en: Climbing Weather API
      fr: Climat d'escalade
...

```

This example shows that both the default French language, and the English language translation, must be provided in the `x-ibm-languages` section.

## Related information

- 📄 [Expand your API Initiatives Globally with Multi-Lingual Support of API and Product Definitions](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Using `x-example` to control the examples displayed in the Developer Portal

OpenAPI does not support the use of `example` attributes on parameters, only on request and response objects and their properties. To allow API Developers to be able to control the examples displayed in the portal you can use `x-example` in OpenAPI parameters.

In this example, you cannot use `example` as it isn't supported by the OpenAPI spec, but you can use `x-example`.

```

- name: city
  in: query
  required: false
  type: string
  maxLength: 50
  description: "Location"
  x-example: "New York"

```

An `example` attribute is honored where set and allowed by the spec. If `example` is not found, `default` is honored where set and allowed by the spec. An `x-example` attribute is honored if found, if not found, a random example to match the schema is generated.

If the spec allows you to use `example`, then you should use it in preference to `x-example`.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Using `x-embedded-doc` to add additional documentation to products and APIs

You can use `x-embedded-doc` to add additional documentation to a product or an API as part of their definition.

You can embed additional documentation pages within the api swagger documentation. These pages can be base64 encoded strings or markdown strings of the html content of the page. These pages show up in the navigation, on the left side, underneath the overview for that product or API, and above the paths. Any styling that is needed to theme the documentation can be included in the Developer Portal custom theme.

## Embedded docs for products and APIs

You can embed documentation for individual products and APIs by specifying an additional `x-embedded-doc` object in the product or API specification.

Field name	Type	Description
name	string	Required, the name of the embedded document
title	string	Required, The display title of the embedded document
format	string	Optional, the format of the embedded document content value. Values are <code>b64html</code> or <code>md</code> . Default value is <code>md</code> .
content	string	The base64 encoded html of page, or, the markdown string.
docs	x-embedded-doc	Additional embedded documentation. If no content is specified for parent, then the first child is the content that is shown.

Hierarchies of documents are supported by nesting of further doc properties. Language support is available by using `x-ibm-languages`.

## Examples

Documentation can be added to an api, by using the following JSON:

```
"x-embedded-doc": [
  {
    "name": "introduction",
    "title": "Introduction",
    "format": "md",
    "content": "# some markdown"
  },
  {
    "name": "concepts",
    "title": "Concepts",
    "format": "md",
    "content": "## more markdown"
  },
  {
    "name": "authentication",
    "title": "Authentication",
    "docs": [
      {
        "name": "auth_clientid_secret",
        "title": "Obtaining a Client ID and Secret",
        "format": "md",
        "content": "### even more markdown"
      },
      {
        "name": "auth_bearer_token",
        "title": "Getting and Using a Bearer Token",
        "format": "md",
        "content": "### yet more markdown"
      }
    ]
  }
]
```

Alternatively, by using base 64 encoded HTML:

```
"x-embedded-doc": [
  {
    "name": "introduction",
    "title": "Introduction",
    "format": "b64html",
    "content": "PGFydG1jbGUgaWQ9ImIudHJvZHVjdG1vbiIgY2xhc3M..."
  },
  {
    "name": "concepts",
    "title": "Concepts",
    "format": "b64html",
    "content": "PGFydG1jbGUgaWQ9ImNvbmlCHRzIiBjbGFzZzc0icGFnZSI..."
  },
  {
    "name": "authentication",
    "title": "Authentication",
    "docs": [
      {
        "name": "auth_clientid_secret",
        "title": "Obtaining a Client ID and Secret",
        "format": "b64html",
        "content": "PGFydG1jbGUgaWQ9ImNsaWVudC1pZC1zZWNYZX..."
      }
    ]
  }
]
```

```

    },
    {
      "name": "auth_bearertoken",
      "title": "Getting and Using a Bearer Token",
      "format": "b64html",
      "content": "ICA8YXJ0aWNsZSBpZD0iYmVhcmVvLXRva2VuIiBjbGFz...."
    }
  ]
}
]

```

Or mixed formats:

```

"x-embedded-doc": [
  {
    "name": "introduction",
    "title": "Introduction",
    "format": "b64html",
    "content": "PGFydGljbGUgaWQ9ImludHJvZHVjdGlvbiIqY2xhc3M...."
  },
  {
    "name": "concepts",
    "title": "Concepts",
    "format": "md",
    "content": "# some markdown"
  }
]

```

An example of some `x-embedded-doc` code and how it might render:

```

x-embedded-doc:
- name: document
  title: Interesting
  format: b64html
  content: >-
    PGFydGljbGUgaWQ9ImNsaWVudC1pZ...=
securityDefinitions:
  api_key:
    type: apiKey
    in: header
    name: api_key

```

## Obtaining a Client ID and Secret

---

Each client app that accesses the API Connect REST API must be registered that determine which operations the app may access.

To register a client app, use the `apic registrations:create` API Connect

**name**  
short name to identify the client

**title**  
display name of the client

**client\_id**  
a generated client ID value

**client\_secret**  
a generated client secret value

**client\_type**  
one of portal, gateway, toolkit, consumer\_toolkit, ui, consumer\_ui, ibm\_cloucd

An example of some `x-embedded-doc` code into a product and how it might render:

```

x-embedded-doc:
- name: introduction
  title: Introduction
  format: md
  content: >-
    ## Overview

    ### Philosophy

    Markdown is intended to be as easy-to-read and easy-to-write as is
    feasible. Compellingly facilitate 2.0 intellectual capital for
    cross-platform networks. Dynamically incubate ethical sources after
    optimal technologies. Phosfluorescently restore global users via excellent
    niche markets. Credibly impact cross-media mindshare through strategic
    best practices. Synergistically impact interdependent web services rather
    than unique interfaces.

    Continually reintermediate enabled sources rather than professional
    architectures. Appropriately embrace viral collaboration and idea-sharing
    whereas granular solutions. Energistically revolutionize competitive
    paradigms vis-a-vis highly efficient models. Objectively incentivize
    enterprise customer service through compelling e-markets. Competently grow
    multifunctional e-markets with business methods of empowerment.

    Dramatically iterate equity invested scenarios and focused data.
    Compellingly reconceptualize next-generation deliverables rather than
    out-of-the-box architectures. Competently foster cross-unit web services
    with interactive innovation. Quickly revolutionize enabled communities and
    alternative content. Globally administrate resource maximizing
    deliverables whereas corporate e-business.

    Progressively develop maintainable leadership.

---

## Using `x-pathalias` to give consistent URLs for products and APIs

You can use `x-pathalias` to assign a URL to a product or an API.

The information section of a YAML representation of a Product or API can include `x-pathalias`. This option can be useful as it allows the same URL to be used on different revisions of your product. It also allows the use of a vanity URL, which might better represent the branding of your site, or make the URL easier to pronounce.

In this example, you set an API called `Climbing weather API` in product `Weather watch` to have a URL of `portalURL/product/weather/api/climbing`.

Product information:

```
info:
  version: 1.0.0
  title: Weather watch
  name: weather-watch
  x-pathalias: weather
```

API information:

```
info:
  title: Climbing Weather API
  x-ibm-name: climbing-weather-api
  version: 1.0.0
  x-pathalias: climbing
```

---

## Validating the YAML or JSON definition of an API or Product

You can validate a YAML or JSON definition by using the IBM® API Connect developer toolkit.

## Before you begin

---

To complete the steps that are described in this topic, you must have installed the developer toolkit. For more information, see [Installing the toolkit](#).

## Procedure

---

To perform validation by using the developer toolkit, enter the following command:

```
apic validate filename
```

where *filename* is the file name of the API definition file you want to validate.

- Include `--product-only` to validate only a Product definition and not any APIs that it references.
- Include `--no-extensions` to validate only the default OpenAPI section of the API and none of its extensions.

Note:

- If the OpenAPI file that defines your API uses a `$ref` field to reference a fragment of OpenAPI code that is defined in a separate file, the `$ref` field is replaced with the contents of the target file before the draft API is created with the `apic drafts:validate` command. For more information, see [Using \\$ref to reuse code fragments in your OpenAPI files](#).
- Products that contain an API with a Swagger property using `regex` that include lookahead assertions, such as "(?)" cannot be validated or published. An error message is returned. For example:

```
Product has not been published!
The multipart 'openapi' field contains an OpenAPI definition with validation errors.
  definitions.properties.pattern Does not match format 'regex' (context: (root).definitions.properties.pattern, line: 0,
col: 0)
400
```

## Related concepts

---

- [Creating an OpenAPI definition file](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Creating and using API and Product definitions templates

You can use template files when creating OpenAPI 2.0 and OpenAPI 3.0 APIs, and when creating Product definitions. Template files are Handlebars templates containing variables of the form `{{variable-name}}` that are substituted with values when you create the API or Product definition.

### Before you begin

---

To complete the steps that are described in this topic, you must have installed the IBM® API Connect developer toolkit. For more information, see [Installing the toolkit](#).

### Procedure

---

1. Create a Product or API definition template, either from scratch, or by copying one of the examples provided in [API and Product definition template examples](#). The template file must have `.hbs` filename extension, and may contain any of the handlebars variables described in [Template variables for API and Product definitions](#).
2. To create a Product or API definition from a template, enter the following command:

```
apic create:[api | product] --template template_file --title [api_title | product_title] options
```

where *template\_file* is the template `.hbs` file to use, *api\_title* or *product\_title* is the title of the API or Product to create, and *options* is any additional command-line options. The path to the template file can be either an absolute path or relative to the location where the command is executed.

When the Product or API definition is created, the value of each command-line option is substituted for the corresponding handlebars template variable. For example, the value of the required `--title` option is substituted for the `info.title` field in the template file. The command creates an API or Product definition YAML file with the name specified in the `--name` option. If you don't supply the `--name` option, the command derives the name of the API or Product YAML file from the specified title by down-casing the title and replacing spaces with dashes.

---

## Working with global policies

Use global policies to configure policy assemblies that are called just before, or just after, each of your API assemblies is called, or when an error is thrown. You can upload global policies into each of the gateway services in your Catalogs, and then designate, for each gateway service, which global policy should be called before an API assembly is called, after an API assembly is called, or if an error occurs when an API assembly is called. The designated global policies are applied to all the APIs that are deployed to the associated gateway service.

### Prerequisites

---

IBM® DataPower® Gateway version that is compatible with your deployed version of API Connect.

To complete the global policy management tasks described in this topic, you must be the owner of the provider organization, or be assigned a role that has the **Settings:Manage** permission. The pre-supplied Administrator role has this permission by default; if you are assigned a custom role it must have this permission. For more information, see [Creating custom roles](#).

### Overview

---

For each of the gateway services in a Catalog, a global policy that you want to be called before any API assembly is called is designated as a *pre-request* global policy, and a global policy that you want to be called after any API assembly is called is designated as a *post-response* global policy. A policy that you want to be called when an error is thrown is called an *error* global policy. You can upload as many global policies into a gateway service as you want, but you can designate at most one global policy to be pre-request, one to be post-response, and one to be an error, at any one time.

Note:

- If you are using the DataPower Gateway (v5 compatible), there can be only one **proxy** policy across the combined pre-request, API, and post-response assembly flows.
- Catalog properties, as described in [Creating and configuring Catalogs](#), and API properties, as described in [Setting API properties](#), are not supported with global policies. Therefore, if you use such properties in a global policy, they are **not** replaced with the values specified in the API or Catalog property definitions.

A global policy is defined in a .yaml file. The global policy file specifies the policy assembly that you want to call. A global policy file has the following structure:

```
global-policy: 1.0.0

info:
  name: global_policy_name
  title: global_policy_title
  version: global_policy_version

gateways:
  - gateway_type

assembly:
  - policy_assembly_to_be_called
```

where *gateway\_type* has the value `datapower-gateway` if you want to use the global policy in a DataPower Gateway (v5 compatible), and `datapower-api-gateway` if you want to use the global policy in a DataPower API Gateway. For more information on the different types of gateway, see [API Connect gateway types](#).

Note: Error global policies are supported only by the DataPower API Gateway, not by the DataPower Gateway (v5 compatible).

The `assembly` section for a pre-request or post-response global policy can contain any valid API assembly flow. For more information, see the [execute](#) section.

The `assembly` section for an error global policy can only contain a `catch` extension in the assembly, an `execute` section is not valid. For details of the `catch` extension, see [catch](#).

## Sample global policy .yaml file for pre-request or post-reponse

---

```
global-policy: 1.0.0

info:
  name: sample-policy
  title: Sample Policy
  version: 2.0.0

gateways:
  - datapower-api-gateway

assembly:
  execute:
    - invoke:
        target-url: http://myhost.com/mytarget
        version: 2.0.0

  catch:
    - errors:
        - ConnectionError
      execute:
        - activity-log:
            title: activity-log
            content: activity
            error-content: payload
            version: 2.0.0
```

## Sample error global policy .yaml file

---

Note: An error global policy .yaml file can contain only a `catch` extension in the assembly.

```
global-policy: 1.0.0

info:
  name: sample-error-policy
  title: Sample Error Policy
  version: 2.0.0

gateways:
  - datapower-api-gateway

assembly:
  catch:
    - errors:
        - ConnectionError
      execute:
        - activity-log:
            title: activity-log
            content: activity
            error-content: payload
            version: 2.0.0
    - errors:
        - SOAPError
      execute:
        - xslt:
            version: 2.0.0
            title: xslt
            input: true
            source: |-
              <!-- Placeholder -->
              <xsl:stylesheet xmlns:xsl=''/>
```

## Logging in to the Management server

---

You work with global policies by using developer toolkit CLI commands. Before you can run the commands, you must log in to your management server from the CLI. Use the following command:

```
apic login --server mgmt_endpoint_url --username user_id --password password --realm provider/identity_provider
```

You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

```
apic identity-providers:list --scope provider --server mgmt_endpoint_url --fields title,realm
```

For example:

```
apic identity-providers:list --scope provider --server myserver.com --fields title,realm
total_results: 2
results:
- title: Cloud Manager User Registry
  realm: provider/default-ldap-2
- title: Corporate LDAP user registry
  realm: provider/corporate-ldap
```

The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default API Manager Local User Registry for login as a member of a provider organization is `default-ldap-2`. For full details of the `apic login` command, see [Logging in to a management server](#).

## Uploading a global policy to a gateway service

You upload a global policy to a gateway service by using the `apic global-policies:create` command. The command has the following format:

```
apic global-policies:create --catalog catalog_name --configured-gateway-service gateway_service_name --org organization_name --server mgmt_endpoint_url --scope scope [--space space] filename
```

where:

- `catalog_name` is the value of the `name` property of the Catalog that contains the gateway service to which you want to upload the global policy.
- `gateway_service_name` is the value of the `name` property of the gateway service.
- `organization_name` is the value of the `name` property of the provider organization that contains the Catalog.
- `mgmt_endpoint_url` is the platform API endpoint URL.
- `scope` has one of the following values:
  - `catalog` if the Catalog does not have Spaces enabled.
  - `space` if the Catalog has Spaces enabled. If you specify `space` for the `--scope` parameter you must also supply the `--space` parameter to specify the Space that contains the gateway service.
- (optional) `space` is the name of the Space that contains the gateway service. The `--space` parameter is required if the Catalog has Spaces enabled, in which case you must also include `--scope space` in the command.
- `filename` is the name of the global policy `.yaml` file that you want to upload.

Note: If Spaces are enabled in a Catalog, a global policy that you apply to one Space is applied to **all** Spaces; you cannot apply a global policy to an individual Space in the Catalog. Any subsequent updates are also applied to all Spaces.

You can confirm the global policies that have been uploaded by using the `apic global-policies:list-all` command, which has the following format:

```
apic global-policies:list-all --catalog catalog_name --configured-gateway-service gateway_service_name --org organization_name --server mgmt_endpoint_url --scope scope [--space space]
```

For reference details of the `apic global-policies` commands, see [apic global-policies](#).

## Designating the pre-request global policy

To designate the pre-request policy for a gateway service, complete the following steps:

1. Write the URL of the required global policy to a `.yaml` file by using the following command:

```
apic global-policies:get --catalog catalog_name --configured-gateway-service gateway_service_name --org organization_name --server mgmt_endpoint_url --scope scope [--space space] policy_name:policy_version --fields url
```

where `policy_name:policy_version` specifies the name and version number of the required global policy, as defined in the global policy `.yaml` file that was originally uploaded to the gateway service.

The value of the URL is written to a file called `GlobalPolicy.yaml`.

2. Edit the `GlobalPolicy.yaml` file and replace the string `url` with `global_policy_url`. The resulting file has the following format:

```
global_policy_url: >-
  https://server_host_name/api/catalogs/catalog_id/configured-gateway-services/gateway_service_id/global-policies/policy_id
```

3. Designate the global policy to be the pre-request policy by using the following command:

```
apic global-policy-prehooks:create --catalog catalog_name --configured-gateway-service gateway_service_name --org organization_name --server mgmt_endpoint_url --scope scope [--space space] GlobalPolicy.yaml
```

To replace the designated pre-request global policy with another policy, repeat steps [1](#) and [2](#), then use the `apic global-policy-prehooks:update` command. To remove the pre-request global policy designation, use the `apic global-policy-prehooks:delete` command. For reference details of the `apic global-policy-prehooks` commands, see [apic global-policy-prehooks](#).

By default, whenever an API is called, a series of policies, called the *preflow* policies, are invoked prior to the policy assembly configured in the API definition. However, by using a pre-request global policy you can, if required, fully customize the behavior of these policies, controlling if and when they are invoked, and with what customization. For more information, see [Customizing the preflow policies](#).

## Designating the post-response global policy

To designate the post-response policy for a gateway service, complete the following steps:

1. Write the URL of the required global policy to a .yaml file by using the following command:

```
apic global-policies:get --catalog catalog_name --configured-gateway-service gateway_service_name --org organization_name --server mgmt_endpoint_url --scope scope [--space space] policy_name:policy_version --fields url
```

where *policy\_name:policy\_version* specifies the name and version number of the required global policy, as defined in the global policy .yaml file that was originally uploaded to the gateway service.

The value of the URL is written to a file called GlobalPolicy.yaml.

2. Edit the GlobalPolicy.yaml file and replace the string `url` with `global_policy_url`. The resulting file has the following format:

```
global_policy_url: >-
  https://server_host_name/api/catalogs/catalog_id/configured-gateway-services/gateway_service_id/global-policies/policy_id
```

3. Designate the global policy to be the post-response policy by using the following command:

```
apic global-policy-posthooks:create --catalog catalog_name --configured-gateway-service gateway_service_name --org organization_name --server mgmt_endpoint_url --scope scope [--space space] GlobalPolicy.yaml
```

To replace the designated post-response global policy with another policy, repeat steps 1 and 2, then use the `apic global-policy-posthooks:update` command. To remove the post-response global policy designation, use the `apic global-policy-posthooks:delete` command.

For reference details of the `apic global-policy-posthooks` commands, see [apic global-policy-posthooks](#).

## Designating the error global policy

The error global policy is applied to an error caught in the API pre-request, assembly, and post-response stages unless any of those stages has its own error rule defined for the same error, in which case that error rule takes priority.

To designate the error global policy for a gateway service, complete the following steps:

1. Write the URL of the required global policy to a .yaml file by using the following command:

```
apic global-policies:get --catalog catalog_name --configured-gateway-service gateway_service_name --org organization_name --server mgmt_endpoint_url --scope scope [--space space] policy_name:policy_version --fields url
```

where *policy\_name:policy\_version* specifies the name and version number of the required global policy, as defined in the global policy .yaml file that was originally uploaded to the gateway service.

The value of the URL is written to a file called GlobalPolicy.yaml.

2. Edit the GlobalPolicy.yaml file and replace the string `url` with `global_policy_url`. The resulting file has the following format:

```
global_policy_url: >-
  https://server_host_name/api/catalogs/catalog_id/configured-gateway-services/gateway_service_id/global-policies/policy_id
```

3. Designate the global policy to be the error policy by using the following command:

```
apic global-policy-errors:create --catalog catalog_name --configured-gateway-service gateway_service_name --org organization_name --server mgmt_endpoint_url --scope scope [--space space] GlobalPolicy.yaml
```

To replace the designated error global policy with another policy, repeat steps 1 and 2, then use the `apic global-policy-errors:update` command. To remove the error global policy designation, use the `apic global-policy-errors:delete` command.

For reference details of the `apic global-policy-errors` commands, see [apic global-policy-errors](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Customizing the preflow policies

By default, whenever an API is called, a series of policies, called the *preflow* policies, are invoked prior to the policy assembly configured in the API definition. However, by using a global policy you can, if required, fully customize the behavior of these policies, controlling if and when they are invoked, and with what customization.

### Before you begin

- For details on how to configure and deploy a global policy, see [Working with global policies](#).
- For details on how to avoid authentication errors on a WSDL action, see the IBM troubleshooting tech note, [API Connect HTTP GET ?WSDL retrieval returns "401 - Unauthorized Invalid client id or secret"](#).

### Default preflow policies

The following preflow policies are invoked by default:

- `cors`: handles cross-origin resource sharing (CORS) requests for the API; invoked if CORS is enabled in the API definition settings.
- `html-page`: for a GraphQL API, if the GraphQL editor option is enabled, returns the GraphQL HTML page.

- **client-identification**: examines the API key credentials that are carried in the API request and matches the API Plan through which the target API is made available to the client.
- **ratelimit**: enforces the rate limit scheme that is configured for the matching API Plan. When the rate limit is reached, the request is rejected.
- **security**: performs the authentication and authorization checks that are required by the target API and operation. If the security requirement is not fulfilled, the request is rejected.

## Configuring a global policy to customize the preflow policies

To customize the preflow policies, complete the following steps:

1. add the following property to the **info**: section of your global policy .yaml file:

```
full-custom: true
```

The default value is **false**, meaning the default preflow policy behavior is applied.

Note: When **full-custom** is set to **true**, you must explicitly add the preflow policies to the assembly of your global policy. You can, however, remove, reposition, or replace any of the preflow policies as required.

2. Configure the policies in your global policy assembly as required; for example:

```
global-policy: 1.0.0

info:
  name: preflow-policy
  title: Preflow Policy
  version: 2.0.0
  full-custom: true

gateways:
  - datapower-api-gateway

assembly:
  execute:
    - cors:
        version: 2.0.0
        title: cors-in-preflow
    - client-identification:
        version: 2.0.0
        title: client-security-in-preflow
    - ratelimit:
        version: 2.0.0
        title: ratelimit-in-preflow
    - security:
        version: 2.0.0
        title: security-in-preflow
    - invoke:
        target-url: http://myhost.com/mytarget
        version: 2.0.0
    - set-variable:
        version: 2.0.0
        actions:
          - set: message.headers.flexible-preflow
            value: 'Preflow policies invoked in global policy'
            type: string
```

3. Deploy your global policy as a [pre-request global policy](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#), for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Reference

Reference information for developing your APIs in API Connect, including context variables, and template variables.

Note: For product-wide reference material, including command-line tool and REST APIs documentation, see [Reference information for IBM® API Connect](#).

- [API Connect context variables](#)  
List of IBM API Connect context variables that you can reference when defining default parameter values in an assembly operation, or by using the `getContext()` function when defining a policy.
- [OAuth context variables](#)  
You can customize the OAuth security flow in a native OAuth provider by adding multiple OAuth policies to the assembly. Each OAuth policy takes input from context variables and writes output to context variables. By using these OAuth context variables you can manipulate the original request, and process the output from an OAuth policy.
- [Error cases supported by assembly catches](#)  
Several error cases that can be returned by the assembly are available to the catch function.
- [API and Product definition template examples](#)  
You can use template files when creating API and Product definitions. Template files are Handlebars templates containing variables of the form `{{variable-name}}` that are substituted with values when you create the API or Product definition. This topic provides the default Handlebar templates used by `apic` to create Products and APIs as examples you can use to copy and customize for your own use.
- [Template variables for API and Product definitions](#)  
You can use template files when creating OpenAPI 2.0 and OpenAPI 3.0 APIs, and when creating Product definitions. Template files are Handlebars templates containing variables of the form `{{variable-name}}` that are substituted with values when you create the API or Product definition.

## Related information

- [IBM API Connect overview](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## API Connect context variables

List of IBM® API Connect context variables that you can reference when defining default parameter values in an assembly operation, or by using the `getContext ()` function when defining a policy.

The following tables are presented:

- [General context variables](#).
- [OAuth context variables - DataPower Gateway \(v5 compatible\)](#).
- [Application certificate context variables](#).
- [API activity logging context variables](#).
- [GraphQL context variables](#).

For more information about implementing an assembly component, see [Including elements in your API assembly](#), and for information about how to reference context variables in API Connect see [Variable references in API Connect](#) and [Using context variables in GatewayScript and XSLT policies with the DataPower API Gateway](#).

For more information about creating a user-defined policy, see [Authoring policies](#).

## General context variables

Note:

- For plan variables (such as `plan.name` or `plan.version`), plan information is available only when the requested operation requires identification and the client passes the authentication check.
- If you deploy your API to the DataPower® Gateway (v5 compatible) then, with the exception of client ID and client secret, the passing of form input as a parameter into an API is not supported. This restriction does not apply if you deploy your API to the DataPower API Gateway.

Table 1. API Connect context variables

Name	Description	Permission
<code>api.catalog.id</code>	The ID of the Catalog in which the API is published.	Read/write
<code>API Gateway only</code> <code>api.catalog.name</code>	The name of the Catalog in which the API is published.	Read/write
<code>API Gateway only</code> <code>api.catalog.path</code>	The path segment that represents this Catalog.	Read/write
<code>api.endpoint.address</code>	The address of the API Gateway endpoint.	Read/write
<code>api.endpoint.hostname</code>	The host name of the API Gateway endpoint, as requested by the application.	Read/write
<code>api.id</code>	The identifier of the API.	Read/write
<code>api.name</code>	The name of the API; this corresponds to the <code>x-ibm-name</code> field in the OpenAPI definition for the API.	Read/write
<code>api.operation.id</code>	The ID of the operation.	Read/write
<code>api.operation.path</code>	The path of the operation.	Read/write
<code>api.org.id</code>	The organization ID of the API provider.	Read/write
<code>api.org.name</code>	The organization short name of the API provider.	Read/write
<code>api.properties.propertyname</code>	The name of a custom API property. Property values are Catalog specific. Note: <ul style="list-style-type: none"> <li>• You have write permission to a custom property <b>only</b> from the user interface, <b>not</b> from GatewayScript.</li> <li>• To access a Catalog specific property value from GatewayScript, you must refer to the property by using the following syntax: <pre>apim-catalog-name</pre>           where <i>catalog</i> is the name of the Catalog, and <i>name</i> is the property name. For example: <pre>var mypropertyvalue = \$(apim-mycatalog-mypropertyname)</pre> </li> </ul>	Read/write
<code>api.root</code>	The API base path.	Read/write
<code>api.type</code>	The API type; REST or SOAP.	Read/write
<code>api.version</code>	The version string of the API.	Read/write
<code>client.app.id</code>	The client ID or application key that is received on the request.	Read/write
<code>client.app.lifecycle-state</code>	The lifecycle status of the calling client application. The possible values are as follows: <ul style="list-style-type: none"> <li>• <b>DEVELOPMENT</b></li> <li>• <b>PRODUCTION</b> (default)</li> </ul>	Read/write

Name	Description	Permission
<span style="border: 1px solid green; padding: 2px;">API Gateway only</span> <b>client.app.metadata.key</b>	<p>The string value of an application metadata key, where <i>key</i> is the name of the key.</p> <p>You can add metadata keys to an application by using either the <b>apic apps:create</b> or the <b>apic apps:update</b> command; you include the metadata keys in the configuration file parameter that is passed to the command.</p> <p>For example:</p> <pre>apic apps:create myapp.yaml --server myserver.com --org myorg --catalog mycatalog --consumer-org mycorg</pre> <p>where myapp.yaml contains the following:</p> <pre>name: myapp title: My test application metadata:   key1: value1   key2: value2   key3: value3   key4: value4   key5: value5</pre> <p>You can then retrieve the value of a metadata key in an API assembly policy by using a context variable such as the following:</p> <pre>client.app.metadata.key3</pre> <p>Note that adding application metadata might impact gateway trans performance.</p>	Read/write
<b>client.app.name</b>	The name of the application that is identified as having issued the request.	Read/write
<b>client.app.secret</b>	The client secret that is received in the request.	Read/write
<b>client.app.type</b>	The type of the client application that issued the request.	Read/write
<b>client.org.id</b>	The unique identification key of the organization that owns this application.	Read/write
<b>client.org.name</b>	The name of the organization that owns this application.	Read/write
<span style="border: 1px solid green; padding: 2px;">API Gateway only</span> <b>client.result</b>	The result of the client security policy, which is <b>SUCCESS</b> or <b>FAILURE</b> .	Read/write
<span style="border: 1px solid green; padding: 2px;">API Gateway only</span> <b>client.third_party.type</b>	The type of user registry used for third-party authentication of the extracted client credentials. The possible values are <b>LDAP</b> and <b>auth-url</b> .	Read/write
<span style="border: 1px solid green; padding: 2px;">API Gateway only</span> <b>client.third_party.headers</b>	The array of headers added to the request that was sent to that API authentication URL during third-party authentication.	Read/write
<span style="border: 1px solid green; padding: 2px;">API Gateway only</span> <b>client.third_party.response.authenticated</b>	The third-party authentication results. The possible values are as follows: <ul style="list-style-type: none"> <li><b>true</b>: the authentication was successful.</li> <li><b>false</b>: the authentication failed.</li> </ul>	Read/write
<span style="border: 1px solid green; padding: 2px;">API Gateway only</span> <b>client.third_party.response.user</b>	The user for third-party authentication.	Read/write
<span style="border: 1px solid green; padding: 2px;">API Gateway only</span> <b>client.title</b>	The title for the credentials that are received in the request.	Read/write
<span style="border: 1px solid blue; padding: 2px;">DataPower Gateway (v5 compatible) only</span> <b>env.name</b>	The name of the Catalog in which the API is published.	Read/write
<span style="border: 1px solid blue; padding: 2px;">DataPower Gateway (v5 compatible) only</span> <b>env.path</b>	The path segment that represents this Catalog.	Read/write
<b>error.message</b>	The message text for the error.	Read/write
<b>error.name</b>	The name of the error.	Read-only
<b>log</b>	The transaction data gathered in an assembly log action.	Read/write
<b>message.body</b>	The payload of the request or response message. Note: The <b>message.body</b> context variable is not supported with <b>getContext()</b> function. Use the <b>getvariable()</b> function instead.	Read/write
<b>message.headers.name</b>	The value of the current named header of the message or of the current named header of the root part of a multipart message. The <i>name</i> segment is case-insensitive.	Read/write
<b>message.original.headers.name</b>	The value of the original named header of the HTTP message. When the assembly contains an invoke action, the value is automatically populated by the original named header of the response message from the invoked URL. The <i>name</i> segment is case-insensitive.	Read-only
<span style="border: 1px solid green; padding: 2px;">API Gateway only</span> <b>message.package.headers.name</b>	The value of the current named header of the multipart message. The <i>name</i> segment is case-insensitive.	Read/write
<b>message.status.code</b>	The HTTP status code of the response.	Read/write
<b>message.status.reason</b>	The HTTP reason phrase of the response.	Read/write
<b>message.variables.name</b>	The value of a property in the message. For example, when <b>myvar</b> is the property in the message, you can retrieve the value of the <b>myvar</b> property by reading <b>message.variables.myvar</b> .	Read/write
<b>plan.name</b>	The name of the plan.	Read/write
<b>plan.id</b>	The unique identifier of the plan.	Read/write
<b>plan.rate-limit</b>	The rate limit of the plan, which is the number of API calls per time interval.	Read/write
<b>plan.rate-limit[index].hard-limit</b>	The hard limit setting for the rate limit scheme that is identified by <b>[index]</b> .	Read/write

Name	Description	Permission
<code>plan.rate-limit[index].value</code>	The value of the rate limit scheme that is identified by <code>[index]</code> . The syntax is <code>rate/interval</code> .	Read/write
<code>plan.spaceId</code>	The unique identifier of the space that the plan is contained within.	Read/write
<code>plan.spaceName</code>	The name of the space that the plan is contained within.	Read/write
<code>plan.version</code>	The version number of the plan.	Read/write
<code>request.authorization</code>	The parsed HTTP <code>authorization</code> header.	Read-only
<code>request.body</code>	The payload from the incoming request.	Read-only
<code>request.content-type</code>	Normalized content-type value.	Read-only
<code>request.date</code>	A date object that represents approximately when the request was received by the Gateway.	Read-only
<code>request.headers.name</code>	The value of the original named header of the HTTP request, or the value of the current named header of the root part of a multipart request. The <code>name</code> segment is case-insensitive.  The request header can be modified only in preflow policies. For more information, see <a href="#">Customizing the preflow policies</a> .	Read/write
<code>request.original.headers.name</code>	The value of the original named header of the HTTP request. This variable is created only when the request header is modified. The <code>name</code> segment is case-insensitive.	Read-only
<span style="border: 1px solid green; padding: 2px;">API Gateway only</span> <code>request.package.headers.name</code>	The value of the named header of the multipart request. The <code>name</code> segment is case-insensitive.	Read-only
<code>request.parameters</code>	You can obtain your incoming parameters from path and query parameters.	
<code>request.parameters.name.locations</code>	An array of strings that specify the parameter types associated with the parameter specified in name. The supported keywords for parameter types are as follows.  <b>formData</b> The parameter is in the body as form data <b>header</b> The parameter is in the request header <b>path</b> The parameter is in the path <b>query</b> The parameter is in the query	Read-only
<code>request.parameters.name.values</code>	An array containing values of the parameter types associated with the parameter specified in name. For example, when the first value is <code>path</code> in <code>request.parameters.myparam.locations []</code> , the first value in <code>request.parameters.myparam.values []</code> is the array of path values associated with <code>myparam</code> . Request parameters can be modified only in preflow policies. For more information, see <a href="#">Customizing the preflow policies</a> .	Read/write
<code>request.original.parameters.name.values</code>	An array containing the original values of the parameter types associated with the parameter specified in <code>name</code> . This variable is created only when a request parameter value is modified.	Read-only
<code>request.path</code>	The path section of the <code>request.uri</code> that starts with the base path of the API, including the <code>/'</code> character that begins the base path.	Read-only
<code>request.protocol</code>	The protocol that is used to receive the request: <code>http</code> or <code>https</code> .	Read-only
<code>request.querystring</code>	The request query string without the leading question mark.	Read-only
<code>request.search</code>	The request query string with the leading question mark.	Read-only
<code>request.uri</code>	The full HTTP request URI from the application.	Read-only
<code>request.verb</code>	The HTTP verb of this request.	Read-only
<code>session.apiGateway</code>	The gateway that receives the request.	Read-only
<code>session.apiGatewayName</code>	The name of the API gateway as defined in the API Manager.	Read-only
<code>session.clientAddress</code>	The address of the client that sent the request.	Read-only
<code>session.domainName</code>	The name of the domain that the gateway belongs to.	Read-only
<code>session.globalTransactionID</code>	The global transaction ID in the logs.	Read-only
<code>session.localAddress</code>	The address of the gateway on the DataPower® Gateway.	Read-only
<code>session.timeStarted</code>	The time that the gateway started to process the request.	Read-only
<code>session.transactionID</code>	The transaction ID of the gateway request.	Read-only
<code>system.datetime</code>	Returns a string that represents the current date and time in the system time zone of the gateway.	Read-only
<code>system.time</code>	Returns a string that represents the current time in the system time zone of the gateway.	Read-only
<code>system.time.hour</code>	Returns a number 0 - 23 inclusive, representing the hour of the current time in the system time zone of the gateway.	Read-only
<code>system.time.minute</code>	Returns a number 0 - 59 inclusive representing the minute of the current time in the system time zone of the gateway.	Read-only
<code>system.time.seconds</code>	Returns a number 0 - 59 inclusive representing the seconds of the current time in the system time zone of the gateway.	Read-only
<code>system.date</code>	Returns a string that represents the current date in the system time zone of the gateway.	Read-only
<code>system.date.day-of-week</code>	Returns a number 1 - 7 (Monday to Sunday) inclusive representing the day of the week in the system time zone of the gateway.	Read-only
<code>system.date.day-of-month</code>	Returns a number 1 - 31 representing the day of the month in the system time zone of the gateway.	Read-only
<code>system.date.month</code>	Returns a number 1 - 12 representing the month in the system time zone of the gateway.	Read-only
<code>system.date.year</code>	Returns a four-digit number that represents the year in the system time zone of the gateway.	Read-only
<code>system.timezone</code>	Returns a system time zone ISO 8601 identifier for the gateway, which might include a sign, a two-digit hour, and minutes. For example, <code>-04:00</code> .	Read-only

## OAuth context variables - DataPower Gateway (v5 compatible)

The OAuth context variables described in this section apply only to the DataPower Gateway (v5 compatible). For details of the OAuth context variables that apply to the DataPower API Gateway, see [OAuth context variables](#).

Table 2. OAuth context variables (DataPower Gateway (v5 compatible)).

Note: Most OAuth context variables are available only when IBM API Connect is acting as the OAuth resource server. However, the `oauth.introspect` variables are also available when integrating with third party providers.

Name	Description
<code>oauth.access-token</code>	If the request is authenticated with OAuth, this variable contains the access token string.
<code>oauth.miscinfo</code>	This variable contains information explicitly included in the Authentication URL and Metadata URL headers. For more information, see <a href="#">Authenticate URL</a> .
<code>oauth.not-after</code>	If the request is authenticated with OAuth, this variable contains the date when the token expires.
<code>oauth.not-before</code>	If the request is authenticated with OAuth, this variable contains the date when the token was issued.
<code>oauth.resource-owner</code>	If the request is authenticated with OAuth, this variable contains the name of the resource owner.
<code>oauth.scope</code>	If the request is authenticated with OAuth, this variable contains the scope of this access token.
<code>oauth.introspect.active</code>	Always available to introspection. Boolean value.
<code>oauth.introspect.response</code>	Always available to introspection. Shows the complete current response payload. Example payload value: <code>{"active":true, "client_id", "xxx-xxx", "token_type", "bearer", "scope":"neon"}</code>
Other variables might be available from the third party, in the form of: <code>oauth.introspect.&lt;variable&gt;</code>	Decoding the previous example payload, the following variables are made available for further processing.  <pre> oauth.introspect.client_id: xxx-xxx oauth.introspect.token_type: bearer oauth.introspect.scope: neon </pre>

## Application certificate context variables

The following table describes context variables that are available when a certificate is used to verify access to an API, although these will vary depending on the signature mechanism that is being used; for more information, see the [Internet X.509 Public Key Infrastructure Certificate and CRL Profile specification](#).

Table 3. Application certificate context variables

Name	Description
<code>application.certificate.Base64</code>	Base64 format.
<code>application.certificate.fingerprint</code>	Fingerprint
<code>application.certificate.Version</code>	Version
<code>application.certificate.SerialNumber</code>	Serial number
<code>application.certificate.SignatureAlgorithm</code>	Signing algorithm
<code>application.certificate.Issuer</code>	The issuer of the certificate
<code>application.certificate.Subject</code>	Subject
<code>application.certificate.NotBefore</code>	Not valid before this date
<code>application.certificate.NotAfter</code>	Not valid after this date
<code>application.certificate.SubjectPublicKeyAlgorithm</code>	Algorithm for the subject public key
<code>application.certificate.SubjectPublicKeyBitLength</code>	Length for the subject public key
<code>application.certificate.KeyValue.type</code>	Various context variables that depend on the algorithm and key. The following are possible context variables: <ul style="list-style-type: none"> <li><code>application.certificate.KeyValue.RSAKeyValue.Modulus</code></li> <li><code>application.certificate.KeyValue.RSAKeyValue.Exponent</code></li> </ul>

## API activity logging context variables

If activity logging is enabled for an API, a `log` context variable is created; the `log` context variable contains the data relating to an API execution event. On completion of API execution, the `log` context variable is written to an API event record that is stored for subsequent access by API analytics. For details of the fields contained in the `log` context variable, see [API event record fields](#).

The way in which you enable and configure activity logging depends on the type of gateway you are using, as follows:

- If you are using the DataPower API Gateway, you configure activity logging in the API configuration settings; see [Configuring activity logging](#) (OpenAPI 2.0) or [Configuring activity logging](#) (OpenAPI 3.0).
- If you are using the DataPower Gateway (v5 compatible), you configure activity logging by adding an [Activity Log](#) policy to the API assembly.

The activity logging configuration defines the default content of the `log` context variable, but you can modify it in an API assembly; for example:

- Add your own data values by using a [Set Variable](#) policy.
- Remove or redact data values by using a Redaction policy; see [Redaction - DataPower API Gateway](#) or [Redaction - DataPower Gateway \(v5 compatible\)](#).
-  Modify or replace the `log` context variable by using a [Log](#) policy.

## GraphQL context variables

The GraphQL query and response variables generated from API processing and assembly actions are stored in the API context in the `message.attributes.graphql` context variables.

Table 4. GraphQL context variables

Name	Description
<code>message.attributes.graphql</code>	The query and response attributes of the GraphQL message.
<code>message.attributes.graphql.query</code>	The attributes of a GraphQL query, including the query string, operation name, and variables.
<code>message.attributes.graphql.query.query</code>	The GraphQL query string.
<code>message.attributes.graphql.query.variables</code>	The map of GraphQL variables.
<code>message.attributes.graphql.query.operationName</code>	The name of the operation to execute.
<code>message.attributes.graphql.query.operationType</code>	The type of the operation to execute.
<code>message.attributes.graphql.request</code>	The attributes of the GraphQL request.
<code>message.attributes.graphql.request.fieldCost</code>	The weighted sum of the cost of all fields accessed in the query. The cost of each field access is configured in the schema. This count includes fields whose field costs are not set to 0.0.
<code>message.attributes.graphql.request.fieldCounts</code>	The maximum number of times that each field can be retrieved by the given query. This number is equal to the number of times that the resolver responsible for producing the value of the field is required to run. This count includes fields whose field costs are not set to 0.0.
<code>message.attributes.graphql.request.typeCost</code>	The weighted sum of the cost of all types retrieved in the query. The cost of each type is configured in the schema. This count includes types whose type costs are not set to 0.0.
<code>message.attributes.graphql.request.typeCounts</code>	The maximum number of times that a value of each type can be retrieved by the given query. This count includes types whose type costs are not set to 0.0.
<code>message.attributes.graphql.response.fieldCost</code>	The weighted sum of the cost of all fields in the response to the query. The cost of each field access is configured in the schema. If this sum cannot be calculated based on the analysis configuration in the request, the field cost is expressed as the maximum integer value that can be assigned.
<code>message.attributes.graphql.response.fieldCounts</code>	The number of times that each field was retrieved in the response to the query. This number is equal to the number of times that the resolver responsible for producing the value of the field is required to run. If this sum cannot be calculated based on the analysis configuration in the request, the field count is expressed as the maximum integer value that can be assigned.
<code>message.attributes.graphql.response.typeCost</code>	The weighted sum of the cost of all types in the response to the query. The cost of each type is configured in the schema. If this sum cannot be calculated based on the analysis configuration in the request, the type cost is expressed as the maximum integer value that can be assigned.
<code>message.attributes.graphql.response.typeCounts</code>	The number of times that a value of each type was contained in the response to the query. If this sum cannot be calculated based on the analysis configuration in the request, the type count is expressed as the maximum integer value that can be assigned.
<code>message.attributes.parse.GraphQLIntrospection</code>	The introspection type of the assembly GraphQL introspect action. When a GraphQL query is parsed, this context variable is populated with one of the following values: <ul style="list-style-type: none"> <li><code>not-introspection</code></li> <li><code>custom-introspection</code></li> <li><code>default-introspection</code></li> </ul>

## Related concepts

- [Variable references in API Connect](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## OAuth context variables

You can customize the OAuth security flow in a native OAuth provider by adding multiple OAuth policies to the assembly. Each OAuth policy takes input from context variables and writes output to context variables. By using these OAuth context variables you can manipulate the original request, and process the output from an OAuth policy.

Note: The OAuth context variables described here apply only to the DataPower® API Gateway. For details of the OAuth context variables that apply to the DataPower Gateway (v5 compatible), see [OAuth context variables - DataPower Gateway \(v5 compatible\)](#).

There are two main types of OAuth context variables:

- [Information variables](#), outputs of an OAuth policy.
- [Processing variables](#), processed during the execution of an OAuth policy.

## Information variables

These context variables are outputs of an OAuth policy. They are not used in the processing of the OAuth action.

#### `oauth.result`

The result of the latest action; returns **SUCCESS** or **FAILURE**.

#### `oauth.settings.variable_name`

Basic settings from the OAuth provider. The following context variables are available:

```
oauth.settings.allowed_scopes
oauth.settings.access_token_ttl
oauth.settings.authorization_code_ttl
oauth.settings.refresh_token_ttl
oauth.settings.refresh_token_limit
oauth.settings.maximum_consent_ttl
```

#### `oauth.executed_components[0].variable_name`

The components that have executed in this transaction, with their result. If a failure occurs then the error and error description will be added. The following context variables are available:

```
oauth.executed_components[0].result
oauth.executed_components[0].type
oauth.executed_components[0].error_description
oauth.executed_components[0].error
```

The possible values for the `type` variable are as follows:

```
ValidateRequestComponent
GenerateAZCodeComponent
VerifyAZCodeComponent
VerifyRefreshTokenComponent
GenerateAccessTokenComponent
IntrospectTokenComponent
RevokeTokenComponent
CollectMetaDataComponent
```

The following example shows a corresponding JSON extract from the OAuth context:

```
"executed_components": [
  {
    "type": "ValidateRequestComponent",
    "result": "SUCCESS"
  },
  {
    "type": "GenerateAccessTokenComponent",
    "result": "SUCCESS"
  }
]
```

#### `oauth.verified_access_token.variable_name`

The token that was verified in the security requirement for a native OAuth provider. The following context variables are available:

```
oauth.verified_access_token.access_token

oauth.verified_access_token.client_id
oauth.verified_access_token.consented_on
oauth.verified_access_token.consented_on_text
oauth.verified_access_token.grant_type
oauth.verified_access_token.misc_info
oauth.verified_access_token.not_after
oauth.verified_access_token.not_after_text
oauth.verified_access_token.not_before
oauth.verified_access_token.not_before_text
oauth.verified_access_token.one_time_use
oauth.verified_access_token.resource_owner
oauth.verified_access_token.scope
```

#### `oauth.third_party.variable_name`

The token that was verified in the security requirement for a third party OAuth provider. Provides the following information:

- The response headers from the external, third-party OAuth provider.
- The body of response from the external, third-party OAuth provider.
- Whether the response is cached. When cached, the value is **true**. When not cached, the value is **false**.

The following context variables are available:

```
oauth.third_party.headers
oauth.third_party.response
oauth.third_party.cached
```

#### `oauth.code.variable_name`

The code that was generated during the execution of a component of type `GenerateAZCodeComponent`. The following context variables are available:

```
oauth.code.client_id
oauth.code.code
oauth.code.redirect_uri
oauth.code.resource_owner
oauth.code.scope
```

#### `oauth.token.variable_name`

The token that was generated during the execution of a component of type `GenerateAccessTokenComponent`. The following context variables are available:

```
oauth.token.token_type
oauth.token.access_token
oauth.token.scope
oauth.token.expires_in
oauth.token.consented_on
oauth.token.redirect_uri
oauth.token.resource_owner
```

```
oauth.token.client_id
oauth.token.refresh_token
oauth.token.refresh_token_expires_in
oauth.token.refresh_token_count
```

#### `oauth.introspect.variable_name`

The token that was introspected during execution of a component of type `IntrospectTokenComponent`. The following context variables are available:

```
oauth.introspect.active
oauth.introspect.scope
oauth.introspect.client_id
oauth.introspect.resource_owner
oauth.introspect.token_type
oauth.introspect.grant_type
oauth.introspect.ttl
oauth.introspect.expires
oauth.introspect.expires_text
oauth.introspect.iat
oauth.introspect.not_before
oauth.introspect.not_before_text
oauth.introspect.consented_on
oauth.introspect.consented_on_text
oauth.introspect.one_time_use
```

#### `oauth.external_manager.variable_name`

Token management when using an external token manager. Provides the following information:

- The response headers from the external management server.
- The response JSON body from the external management server.
- When caching is enabled, whether the response is found in the cache or set in the cache. When caching is not enabled, that the response is not set in the cache.

The following context variables are available:

```
oauth.external_manager.headers
oauth.external_manager.response
oauth.external_manager.cached
```

## Processing variables

These context variables are processed during the execution of an OAuth policy in your API assembly. If they are set prior to any OAuth policy then the value overrides what was sent in the request. They can also be modified between OAuth policies to manipulate the next component that executes. The following context variables are available:

```
oauth.processing.assertion
oauth.processing.client_id
oauth.processing.client_secret
oauth.processing.grant_type
oauth.processing.redirect_uri
oauth.processing.scope
oauth.processing.response_type
oauth.processing.state
oauth.processing.resource_owner
oauth.processing.refresh_token
oauth.processing.code
oauth.processing.token
oauth.processing.token_type_hint
oauth.processing.nonce
oauth.processing.max_age
oauth.processing.oidc_values_requested
oauth.processing.id_token_requested
oauth.processing.oidc_signing_algorithm
oauth.processing.code_challenge
oauth.processing.code_challenge_method
oauth.processing.code_verifier

oauth.processing.metadata.access_token
oauth.processing.metadata.payload
oauth.processing.metadata.azcode_miscinfo

oauth.processing.verified_code.client_id
oauth.processing.verified_code.resource_owner
oauth.processing.verified_code.misc_info
oauth.processing.verified_code.scope
oauth.processing.verified_code.is_verified
oauth.processing.verified_code.nonce

oauth.processing.verified_refresh_token.client_id
oauth.processing.verified_refresh_token.resource_owner
oauth.processing.verified_refresh_token.misc_info
oauth.processing.verified_refresh_token.scope
oauth.processing.verified_refresh_token.refresh_token_count
oauth.processing.verified_refresh_token.is_verified
oauth.processing.verified_refresh_token.one_time_use
oauth.processing.verified_refresh_token.grant_type
```

The following example shows the OpenAPI source code for a `gateway-script` policy that executes before an OAuth policy in your API assembly and adds a custom scope to the request:

```
// Add another custom scope to the request
let scope = context.get("request.parameters.scope.values[0]");
if (scope)
    context.set("oauth.processing.scope", scope + " custom");
```

The following example shows the OpenAPI source code for a `gateway-script` policy that between OAuth policies in your assembly and modifies the scope depending on the resource owner:

```
// Check resource owner and modify the scope
let owner = context.get("oauth.processing.resource_owner");
let scope = context.get("oauth.processing.scope");

if (owner === 'admin') {
  context.set("oauth.processing.scope", scope + " admin");
} else {
  context.set("oauth.processing.scope", scope + " customer");
}
```

## Advanced scope context variables

The following context variables are used in OAuth advanced scope checking. They are populated by the values entered in the Endpoint and TLS Client Profile fields for the Application scope check and Owner scope check in the native OAuth provider configuration. Do not change these values as this might result in incorrect advanced scope operation.

For information on scope configuration, see [Configuring scopes for a native OAuth provider](#). For information on advanced scope checking, see [Scope](#).

```
oauth.advscope.app.url
oauth.advscope.app.tls-profile
oauth.advscope.own.url
oauth.advscope.own.tls-profile
```

## Custom error context variables

These context variables are used to stop OAuth processing and specify the respective error details. They can be used before OAuth processing takes place.

```
oauth.custom_error.status.code
oauth.custom_error.status.reason
oauth.custom_error.message
oauth.custom_error.description
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Error cases supported by assembly catches

Several error cases that can be returned by the assembly are available to the catch function.

ConnectionError

An error occurred while establishing a connection to another URL.

JavaScriptError

An error occurred while executing JavaScript or GatewayScript in a policy.

PropertyError

An error occurred due to an incorrect property during an invoke call or during the execution of a set-variable policy when an action was not set, add, or clear.

RedactionError

An error occurred during the redaction of a field as part of a redact policy.

TransformError

An error occurred during a transformation policy.

RuntimeError

An otherwise unspecified error occurred.

BadRequestError

An error occurred while trying to access the request. Beginning with Version 10, this is not supported by the default catch; to catch this condition, specify it in your catch definition.

SOAPError

A SOAP Fault response was received as the result of a web service invoke request.

OperationError

An invoke request received a response with an unsuccessful HTTP status code.

ValidateError

An error occurred while trying to schema validate a message payload.

**API Gateway only**

AssemblyRateLimitError

The request exceeds the transaction count threshold specified in the API's Plan.

**DataPower Gateway (v5 compatible) only**

UnauthorizedError

The API cannot be invoked based on the client ID and/or client secret provided, or id/secret were specified in the wrong location. Beginning with Version 10, this is not supported by the default catch; to catch this condition, specify it in your catch definition.

**DataPower Gateway (v5 compatible) only**

ForbiddenError

The application making the API request has been disabled or is not active. Beginning with Version 10, this is not supported by the default catch; to catch this condition, specify it in your catch definition.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## API and Product definition template examples

You can use template files when creating API and Product definitions. Template files are Handlebars templates containing variables of the form `{{variable-name}}` that are substituted with values when you create the API or Product definition. This topic provides the default Handlebar templates used by `apic` to create Products and APIs as examples you can use to copy and customize for your own use.

### Default API definition template (OpenAPI 2.0)

---

The following example template, which is for an OpenAPI 2.0 API definition, is the default template that developer toolkit uses when you create an API definition. Copy this example template into your own template file (which must have the `.hbs` extension), then edit it for your purposes. Template variables are enclosed by double curly braces, for example `{{name}}`. For information on template variables, see [Template variables for API and Product definitions](#). For more information on Handlebars, see <https://handlebarsjs.com/>.

  consumes:
  - application/x-www-form-urlencoded
  produces:
  - application/json
  summary: Request Access Tokens
  description: |
    This endpoint allows requesting an access token following one of the flows below:
    - Authorization Code (exchange code for access token)
    - Client Credentials (2-legged, there isnt resource owner information)
    - Resource Owner Password Credentials (2-legged, client provides resource owner name and password)
    - Refresh Token (exchange refresh token for a new access code)

```

The table below indicates the required parameters for each specific grant\_type options.  
Empty cells indicate a parameter is ignored for that specific grant type.

Client authentication:

- Confidential clients should authenticate using HTTP Basic Authentication. Alternatively, they may post their client\_id and client\_secret information as a formData parameter.
- Public clients should send their client\_id as formData parameter.

grant_type	code	client_credentials	password	refresh_token
client_id	required*	required*	required*	required*
client_secret	required*	required*	required*	required*
code	required			
redirect_uri	required			
username			required	
password			required	
scope		optional	optional	
refresh_token				required

The implicit grant requests, see /oauth2/authorize.

## Product definition template

The following example template is the default template that developer toolkit uses when you create a Product definition. Copy this example template into your own template file (which must have the `.hbs` extension), then edit it for your purposes. Template variables are enclosed by double curly braces, for example `{{name}}`. For information on template variables, see [Template variables for API and Product definitions](#). For more information on Handlebars, see <https://handlebarsjs.com/>.

```

# Template variables for API and Product definitions

You can use template files when creating OpenAPI 2.0 and OpenAPI 3.0 APIs, and when creating Product definitions. Template files are Handlebars templates containing variables of the form `{{variable-name}}` that are substituted with values when you create the API or Product definition.

## Product definition variables

The following table describes the Handlebars template variables that can be used in a product definition file. For more information on Handlebars, see <https://handlebarsjs.com/>. Product definition template files must have a `.hbs` filename extension.

Table 1. Product definition Handlebars template variables

Variable	Type	Description
<code>{{apis}}</code>	Array of string	The APIs to which the product definition refers. After substitution, the array values become the values of <code>apis.routes[n].\$ref</code> fields, for example: <pre>apis:   'routes':     \$ref: apidef.yaml     ...</pre>
<code>{{name}}</code>	String	Value of <code>info.x-ibm-name</code> field.
<code>{{title}}</code>	String	Value of <code>info.title</code> field.
<code>{{version}}</code>	String	Value of <code>info.version</code> field.

## API definition variables

The following table describes the Handlebars template variables that can be used in an API definition file. For more information on Handlebars, see <https://handlebarsjs.com/>. API definition template files must have a `.hbs` filename extension.

Table 2. API definition Handlebars template variables

Variable	Type	Description
<code>{{basepath}}</code>	String	Base path on which the API is served, which is relative to the <code>host</code> .
<code>{{definitions}}</code>	<a href="#">OpenAPI definitions object</a> converted to a YAML string ("stringified").	For a LoopBack API, contains data types that can be consumed and produced by operations. These data types can be primitives, arrays or models.
<code>{{definitionsObj}}</code>	<a href="#">OpenAPI definitions object</a> converted to a YAML string ("stringified").	For a LoopBack API, contains data types that can be consumed and produced by operations. These data types can be primitives, arrays or models.
<code>{{hostname}}</code>	String	Value of the <code>host</code> field.
<code>{{name}}</code>	String	Value of <code>info.x-ibm-name</code> field.
<code>{{paths}}</code>	<a href="#">OpenAPI paths object</a>	For a LoopBack API, contains the relative paths to the individual endpoints. The path is appended to <code>{{basePath}}</code> to construct the full URL.
<code>{{pathsObj}}</code>	<a href="#">OpenAPI paths object</a>	For a LoopBack API, contains the relative paths to the individual endpoints. The path is appended to <code>{{basePath}}</code> to construct the full URL.
<code>{{schemes}}</code>	Array of string	Transfer protocol of the API. Values must be one of: "http", "https", "ws", or "wss".
<code>{{targeturl}}</code>	String	Value of <code>x-ibm-configuration.assembly.execute[invoke]</code> . Default is <code>\$(runtime-url)\$(request.path)</code> .
<code>{{title}}</code>	String	Value of <code>info.title</code> field.
<code>{{version}}</code>	String	Value of <code>info.version</code> field.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Managing your APIs

You manage your APIs by using the API Manager user interface of IBM® API Connect. You can also analyze your API usage by using the analytics that are provided and socialize your APIs in a developer portal.

## Why use APIs?

Whether you are a business user, an IT user, or an application developer, APIs are increasingly important to your business. You can use an API to publicize your company. The assets, data, or services of your company can be provided to external application developers to expand your enterprise and open new markets.

The API Manager UI provides a solution for companies to manage APIs for private internal APIs, and public external APIs. This on-premises offering provides the capabilities that are required so that you can externalize and manage your services as REST or SOAP APIs.

## What do you need to know?

---

Depending on your role, you can complete different tasks relating to managing your API Catalogs and these are outlined in the documentation. Each task is covered in the order that they are executed.

Each task introduces new features of the API Manager UI as they become relevant to the Catalog that you are building.

For security reasons, your session times out after a period of inactivity.

Before you start, check that the browser you are using is supported and meets the required minimum levels; for details, open the [Detailed system requirements for a specific product](#) page, search for the IBM API Connect product, then select the required version.

The ways in which you can manage your APIs are described in the following subtopics:

- **[API management checklist](#)**  
A summary, with links, of the key tasks for managing APIs in IBM API Connect.
- **[Activating your API Manager user account](#)**  
Before you can access the API Manager user interface of IBM API Connect, you must activate the user account that your Cloud Manager administrator invited you to join.
- **[Accessing the API Manager user interface](#)**  
The IBM API Connect API Manager user interface provides a range of options for working with your APIs and Products, and managing security.
- **[Searching for items in API Manager](#)**  
Use the search feature in IBM API Connect API Manager to easily locate items such as APIs, Catalogs, Spaces, applications, and subscriptions.
- **[Working with Catalogs](#)**  
Products must be staged to a Catalog and then published; application developers are able to access the APIs in a Product by being members of consumer organizations to which the Product is made available. In IBM API Connect, you can create multiple Catalogs. Catalogs are useful for separating Products and APIs for testing before you make them available to consumer organizations. The syndication feature in API Connect means that you can also publish a Product to a Space in a Catalog.
- **[Using syndication in API Connect](#)**  
With the IBM API Connect syndication feature, you can partition your Catalogs into *Spaces*. Each Space is used by a different API provider development team and has its own set of management capabilities relating specifically to the APIs that the associated team publishes to that Space, enabling each team to manage their APIs independently.
- **[Working with Products](#)**  
In IBM API Connect, Plans and APIs are grouped together in Products.
- **[Working with APIs](#)**  
For a specific Product, you can work with the APIs that are contained in the Plans in that Product.
- **[Working with Plans](#)**  
After a Product has been published to a Catalog, you can work with the Plans in that Product.
- **[Working with consumer organizations](#)**  
Manage the consumer organizations that access your APIs and Plans when their users sign up to use the IBM API Connect Developer Portal.
- **[Working with developer applications](#)**  
You can work with the applications that have been registered in the Developer Portal associated with a Catalog.
- **[Working with application subscriptions](#)**  
You can work with the subscriptions to the Plans in all the Products in a specific Catalog. Plan subscriptions are created by application developers in the Developer Portal.
- **[Security and authentication](#)**  
In API Manager, you can use TLS profiles to secure the transmission of data between the management server and other API Connect subsystems and external services, and also configure user registries to securely authenticate your Catalogs and APIs.
- **[API Analytics](#)**  
You can use IBM API Connect to filter, sort, and aggregate your API event data. You can present the results within correlated charts, tables, and maps to help you manage service levels, set quotas, establish controls, set up security policies, manage communities, and analyze trends.
- **[Administering user access](#)**  
If you have permission to administer users in IBM API Connect, you can add and delete users. After users are removed from an organization through deletion, the user account remains in API Manager.
- **[Changing your API Manager password](#)**  
You can change your API Manager password in IBM API Connect.
- **[Resolving login problems by increasing HTTP header size](#)**  
You can resolve login problems for the API Manager UI by increasing the maximum HTTP client header size.
- **[Reviewing a gateway's processing status](#)**  
Review the processing status for the Gateway services that are enabled in your API Connect Catalogs and Spaces.
- **[Reference](#)**  
Reference information for the API Manager component in IBM API Connect.

## API management checklist

A summary, with links, of the key tasks for managing APIs in IBM® API Connect.

---

Task	Description
<a href="#">Activate your API Manager user account</a>	For you to be able to connect to a Management server by using the API Manager user interface, one or other of the following prerequisites must be satisfied: <ul style="list-style-type: none"> <li>Your administrator has created a provider organization, specifying you as the owner; see <a href="#">Creating a provider organization</a>.</li> <li>You have been added as a member of a provider organization; see <a href="#">Adding provider organization users and assigning roles</a>.</li> </ul>
<a href="#">Log in to the API Manager user interface</a>	After you have activated your account, you can log in to your Management server from the API Manager user interface.
<a href="#">Configure your Catalogs</a>	APIs are published to a Catalog to make them available to application developers. The URLs for API calls, and for the Developer Portal, are specific to a particular Catalog. By default, a <i>sandbox</i> Catalog is provided for API testing, but you can create your own Catalogs; for example, a production Catalog for hosting APIs that are ready for full use.
<a href="#">Manage the membership of your Catalogs</a>	You can add users to your Catalogs, and assign roles and permissions to control their level of access.
<a href="#">Configure API security</a>	You can configure user registries of various types for authenticating API access, TLS profiles for securing data transmission over HTTPS, and OAuth providers for securing third-party website or application access to APIs.
<a href="#">Manage your Products</a>	Move your Products through their lifecycle, from initially staging a Product to a Catalog, through to publishing to make the Product version available to your application developers, and to eventual retiring and archiving. You can also display analytics information, and control who can see or subscribe to your Products.
<a href="#">Analyze your API usage</a>	You can use IBM API Connect to filter, sort, and aggregate your API event data. You can present the results within correlated charts, tables, and maps to help you manage service levels, set quotas, establish controls, set up security policies, manage communities, and analyze trends.
<a href="#">Manage user access to your provider organization</a>	You can add users to your provider organization, remove users, and assign roles and permissions.
<a href="#">Partition your Catalogs into Spaces for syndication</a>	With the syndication feature, you can partition your Catalogs into <i>Spaces</i> . Each Space is used by a different API provider development team and has its own set of management capabilities relating specifically to the APIs that the associated team publishes to that Space, enabling each team to manage their APIs independently.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Activating your API Manager user account

Before you can access the API Manager user interface of IBM® API Connect, you must activate the user account that your Cloud Manager administrator invited you to join.

### Before you begin

The Cloud Manager administrator invited you to join API Connect .

### Procedure

1. Complete the following steps to create your API Manager account:

If the Identity Provider uses LDAP

An invitation email with an activation link is sent. Click the activation link, or paste it in a browser, to log in directly with your user credentials. Upon authentication, the API Connect user record is updated from the backend identity provider.

If the Identity Provider uses a local registry

An invitation email with an activation link is sent. Click the activation link or paste it in a browser. The activation link takes you to a sign up page where you enter your first name, last name and password. Passwords must have a minimum of 8 characters and contain characters from at least three of the four following categories:

- Uppercase letters
- Lowercase letters
- Numbers
- Special characters (for example: ! # \$ %)

Note:

- The email address that you enter on the sign up page must match the email address to which the invitation email was sent, otherwise the account activation fails.
- If you previously had an account that the administrator removed, and they are inviting you again, you must re-activate your account by using the Sign In option on the page, **not** by completing the registration form and using the Sign Up option; attempting to re-register will fail.

If the Identity Provider uses an authentication URL

An invitation email with an activation link is sent. Click the activation link or paste it in a browser. The activation link takes you to a sign up page where you enter your credentials, which then become your user name and password. Upon authentication, the API Connect user record is updated from the backend identity provider.

If multiple user registries are available for selection on the sign up page, then make sure that the correct registry for your API Manager account is selected. You might need to ask your administrator which user registry is appropriate for your account.

For information on configuring user registries and making them available for API Manager login, see [User registries overview](#) and [Selecting user registries for Cloud Manager and API Manager](#).

2. Click Sign up to complete your registration, then click Sign in to open the API Manager login page.

## Results

You have created your API Connect account.

## What to do next

Log in to the API Manager user interface and, depending on your role, start to work with Catalogs, consumer organizations, APIs and Products.  
To access the API Manager login page in the future, use the following URL:

`https://host/manager`

where *host* is the fully qualified host name or IP address of the Management server.

# Accessing the API Manager user interface

The IBM® API Connect API Manager user interface provides a range of options for working with your APIs and Products, and managing security.

To log in to the API Manager user interface, complete the following steps:

1. In a web browser, enter the following URL:

`https://host/manager`

where *host* is the fully qualified host name or IP address of the Management server.

2. If your cloud contains multiple user registries, then select the user registry that contains the login credentials for your API Manager account. You might need to ask your administrator which user registry is appropriate for your account.

For information on configuring user registries and making them available for API Manager login, see [User registries overview](#) and [Selecting user registries for Cloud Manager and API Manager](#).

3. Enter your user name and password, then click Sign in.

The API Manager user interface opens:

Depending on your role, you can now start to work with Catalogs, consumer organizations, APIs and Products.

---

## Searching for items in API Manager

Use the search feature in IBM® API Connect API Manager to easily locate items such as APIs, Catalogs, Spaces, applications, and subscriptions.

Search is available from any page in API Manager and can be accessed by typing in the search field in the page banner, or by clicking  Search in the navigation list.

## Using Search

---

The Search feature is available on all pages of the API Manager. To start searching, just type a string into the Search field and press Enter. Whenever you press Enter in the Search field, the Search page displays with results and additional options. If you press Enter in an empty Search field, or click  Search in the navigation list, then the Search page displays a list all items. If you type a string before pressing Enter, the page displays the results from the corresponding search.

Search results include all items that contain the search string in a text field. For example, suppose you searched for "Crafted". The results might look like the following image, with items that don't match the search string exactly, but do include the string in a text field such as a title or a name.

By default, the search returns all types of items that contain the string. Sort results on a particular column by clicking the column header.

When you find an item you want to work with, click the . . . actions menu next to the item's "Modified" date to see what you can do. The list of possible actions depends on the item's type.

You can limit the search results by selecting an item type from the list that displays before the results. Click More to view additional types. If you select a type from the More menu, it replaces a type in the list.

If you want to refine the search further, click Options. On the Options panel, click Catalogs to Search and select which catalogs to search (the default is all catalogs). You can select up to 5 catalogs for a limited search.

You can also choose whether only exact matches (the complete string) are included in results, or items containing similar strings are also included.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Working with Catalogs

Products must be staged to a Catalog and then published; application developers are able to access the APIs in a Product by being members of consumer organizations to which the Product is made available. In IBM API Connect, you can create multiple Catalogs. Catalogs are useful for separating Products and APIs for testing before you make them available to consumer organizations. The syndication feature in API Connect means that you can also publish a Product to a Space in a Catalog.

A Catalog is a staging target, and behaves as a logical partition of the gateway and the Developer Portal. The URL for API calls and the Developer Portal are specific to a particular Catalog. In a typical configuration, an API provider organization uses a development Catalog for testing APIs under development and a production Catalog for hosting APIs that are ready for full use. A common approach is to have a development cloud with a development Catalog, a few test Catalogs and a production cloud that might have its own test Catalog.

You can use a *Space* to partition a Catalog so multiple teams can manage Products and APIs independently in a single Catalog. A Space is conceptually like a sub-catalog, except that Products and APIs in all Spaces in a given Catalog are published to the same developer portal. For more information about Spaces, see [Using syndication in](#)

## [API Connect.](#)

### Note:

Every account in the Developer Portal, including across different user registries for the same site, must have a unique email address, including the site Admin account. For example, if you configure three different user registries for a particular Developer Portal site, the email address *alice@acme.com* can be used to log in to the site from only one of the user registries. The default email address for the Admin account is the email address of the Catalog owner. It is not possible to create a user account (and associated Consumer organization) with the same email address as the Admin account (or that of the Catalog owner if their email address is different). Any attempts to create an account with the same email address results in the new account not functioning correctly, and returning the following error message when trying to log in: **A user already exists with this email address.**

For more information on using the Developer Portal, see [Developer Portal: Socialize your APIs](#).

- [Creating and configuring Catalogs](#)  
These instructions describe how to create and configure Catalogs in IBM API Connect.
- [Configuring sub paths for Developer Portal sites](#)  
You can increase the specificity of a IBM API Connect Developer Portal site URL by using sub paths.
- [Managing Catalog membership](#)  
Manage Catalog membership by adding new users to the Catalog and assigning roles to the users.
- [Importing a user-defined policy into a Catalog](#)  
You can make your user-defined policy available to API developers by importing it into an IBM API Connect Catalog, or a Space in a Catalog.
- [Importing an OpenAPI extension into a Catalog](#)  
You can extend the OpenAPI specification by adding either a JSON or YAML extension schema to an API. An extension is imported into a Catalog, or a Space in a Catalog, then added to the API schema.
- [Retaining Version 5 vanity endpoint behavior in a Catalog](#)  
The behavior of vanity endpoints in a Catalog has changed in API Connect Version 10 compared with Version 5. However, you can modify your Catalog settings to retain the Version 5 behavior.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#), for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Creating and configuring Catalogs

These instructions describe how to create and configure Catalogs in IBM® API Connect.

### Before you begin

You must possess Catalog create permissions to complete this task. For more information about permissions, see [API Connect user roles](#).

#### Note:

- As the user who creates the Catalog, you are automatically the Catalog owner and have all Catalog permissions.
- If you configure a new user registry for authenticating users to the Developer Portal, you must also complete the onboarding section in the Catalog, to make the registry available to Developer Portal users. See [Step 13](#) for details.
- Every account in the Developer Portal, including across different user registries for the same site, must have a unique email address, including the site Admin account. For example, if you configure three different user registries for a particular Developer Portal site, the email address *alice@acme.com* can be used to log in to the site from only one of the user registries. The default email address for the Admin account is the email address of the Catalog owner. It is not possible to create a user account (and associated Consumer organization) with the same email address as the Admin account (or that of the Catalog owner if their email address is different). Any attempts to create an account with the same email address results in the new account not functioning correctly, and returning the following error message when trying to log in: **A user already exists with this email address.**

### Procedure

To create and configure your Catalog, complete the following steps:

1. In the navigation pane of the API Manager UI, click  Manage.
2. Create the Catalog. You can create the Catalog in either of the following ways:
  - Specify the owner, then configure the Catalog yourself.
  - Send an invitation email, with an activation link, to the intended Catalog owner. The Catalog owner configures the Catalog after activating it.To specify the owner and configure the Catalog yourself, complete the following steps:
  - a. Click **Add >> Create catalog**.
  - b. In the Catalog Owner field, select the owner of the Catalog; by default, you are the owner. You can specify any user who is a member of the provider organization.
  - c. Continue from [step 3](#) to configure the Catalog.To invite the Catalog owner, complete the following steps:
  - a. Click **Add >> Invite catalog owner**.
  - b. Enter the email address of the Catalog owner, then click **Invite**.On receipt of the invitation email, the Catalog owner should complete the following steps:
  - a. Open the activation link, complete the sign up form, and sign in to the API Manager UI.
  - b. Click **Manage Catalogs**, click the Catalog name that was provided on the sign up form, then click the **Catalog settings** tab.
  - c. Continue from [step 6](#) to configure the Catalog.
3. Enter the Catalog Title. A Name is entered automatically and cannot be changed.  
**Note:** The value in the Name field is a single string that is used to identify the Catalog in developer toolkit CLI commands. The Title is used for display; you can change the title subsequently but the name does not change.  
To view the CLI commands to manage Catalogs, see [apic catalogs](#).

4. Click Create.  
Your new Catalog is displayed on the Manage page.
5. To continue to configure your Catalog, select the Catalog on the Manage page, then click the Catalog settings tab.
6. To configure the general settings for the Catalog, click Overview, then proceed with the following steps:
  - a. By default, the new Catalog is a development Catalog. To use the Catalog in production, set the Production Mode slider control to the On position, then click Confirm.  
In a development Catalog, all publish operations are forced, and any conflicts are resolved automatically. If you republish a previously published Product version it is overwritten without warning, allowing you, for example, to repeatedly republish the same Product version during testing. If Spaces are enabled in a development Catalog and you republish a previously published Product version to a different Space, it is removed from the previous Space.  
  
A development Catalog behaves the same as any other Catalog with regard to requiring approval for staging and publishing actions, if the Catalog has been configured to require approval.  
  
Note: In a production Catalog, the following conditions apply:
    - You will be prevented from publishing a Product to the Catalog if there is already a Product in the Catalog with the same name and version, you must create a new version of the Product for publication; see [Creating a new version of your Product](#). If Spaces are enabled in a production Catalog, you cannot publish a Product with the same name and version to more than one Space in the Catalog.
    - If this new Product contains one or more modified APIs, you **must** create new versions of these APIs for inclusion in the Product; see [Creating a new version of an API definition](#). If the Product contains a modified API and there is already a published API of the same name and version, the changes will **not** be published.
  - b. To enable the partition of this Catalog into Spaces, set the Spaces slider control to the On position, then click Confirm.  
For more information, see [Using syndication in IBM API Connect](#).
  - c. If the Catalog is the default staging Catalog, move the Default slider control to the On position, then click Confirm. Then, calls to APIs that are published to the Catalog can use a shorter URL that does not include the Catalog name.  
Note: You can enable Default only for one Catalog. If another Catalog is already set as the default Catalog you will be unable to enable the setting on this Catalog without first disabling the setting on the other Catalog.
7. To transfer ownership of the Catalog to a different user, click Overview, then proceed with the following steps:
  - a. Click Edit.
  - b. From the Select owner user drop-down menu, select the user who will become the new owner.
  - c. If Spaces are enabled in the Catalog then to also have the ownership of all Spaces in the Catalog transferred to the new Catalog owner, select Also transfer ownership of owned Spaces.
  - d. Click Save when done.

Note:

  - To have permission to change the Catalog owner, you must be either the Catalog owner, or the owner of the provider organization that contains the Catalog.
  - When the ownership changes, the new owner is assigned administration privileges for the Catalog, and the previous owner has their administration privileges removed. If required, you can restore the privileges to the previous owner as described in [Managing Catalog membership](#).
  - The ownership can be transferred only to a user who is already a member of the Catalog. To transfer to a new user or another existing user, that user must previously have been added or invited to the Catalog, as described in [Managing Catalog membership](#).
8. To configure the gateway service settings for the Catalog, click Gateway Services, then proceed with the following steps:
 

Note: If Spaces are enabled in the Catalog then you configure the gateway settings for the Spaces, **not** for the Catalog as a whole.  
For more information about enabling and managing Spaces, see [Using syndication in API Connect](#).

  - a. Click Edit.
  - b. Select the gateway services that you want to use with this Catalog.  
Gateway services are configured by the using the Cloud Manager UI. For details, see [Registering a gateway service](#). If any Catalog default gateway services have been configured, they will already be selected when you create a new Catalog; see [Configuring default gateway services for Catalogs](#).  
The TYPE column indicates the gateway type for each gateway service listed, DataPower® Gateway (v5 compatible), DataPower API Gateway, or Event Gateway Service if you have Event Endpoint Management enabled in Cloud Pak for Integration. For more information, see [API Connect gateway types](#).
  - c. Click Save to save your changes.  
You publish APIs by adding them to a Product and then publishing the Product to a Catalog. To be able to publish Products to a Catalog, the Catalog must be assigned at least one gateway service so that the APIs in the Product are available to be called at a gateway service endpoint. You can assign more than one gateway service to a Catalog, and they can be of mixed types: DataPower API Gateway, DataPower Gateway (v5 compatible), and Event Gateway Service.  
  
A Product is gateway type specific: DataPower API Gateway, DataPower Gateway (v5 compatible), or Event Gateway Service. By default, when you publish a Product to a Catalog, it is published to all the assigned gateway services of the same gateway type as the Product, but you can choose to publish the Product only to selected gateway services, of that type, at publish time; see [Publishing a draft Product](#) for more information. The APIs in the Product will be available to be called at all the specified gateway service endpoints.  
  
If you select two or more Gateway services then, for analytics data to be available in the Developer Portal for this Catalog, the Gateway services must all be associated with the **same** analytics service. If the set of associated analytics services for the selected gateway services includes two or more different analytics services then the Developer Portal does **not** display analytics data. An analytics service is associated with a gateway service in the Cloud Manager user interface; see [Associating an analytics service with a gateway service](#).  
Note: You can also configure the gateway service settings for the Catalog by using the developer toolkit CLI; for details, see [apic configured-gateway-services](#).
9. To specify the Product lifecycle state changes for which you want to enforce approval, complete the following steps:
  - a. Click Lifecycle Approvals in the Catalog settings navigation pane, then click Edit.
  - b. Select the required state changes, then click Save when done.  
For example, if you select Publish and leave the other check boxes cleared, approval is required when anyone attempts to publish a Product, but no approval is required for any of the other lifecycle state changes.  
Note: Approval for Product lifecycle state changes in a Catalog is disabled by default. You must explicitly enable the Product lifecycle state changes that you want to enforce.
  - c. To allow the originator of a Product lifecycle change to approve it themselves, move the Task self approval slider control to the On position.  
Note: In a development Catalog, the originator of a Product lifecycle change can **always** approve it themselves.
10. Click Save when done.
11. To configure the permissions that each role in API Manager has, complete the following steps:
  - a. Click Roles in the Catalog settings navigation pane.  
To see the current permissions for a role, expand the role.
  - b. Click the options icon  alongside the role that you want to work with, then click Edit.
  - c. Select or clear the permissions check boxes as required.  
To ensure a role can manage user-defined policies, select Manage for the Settings permission.

To grant a role the permission to approve a specific lifecycle state change, select the state change in the Product-Approval section.

Note: You cannot remove a permission that has been assigned to the role at the provider organization level. However, you can add permissions that haven't been assigned at the provider organization level.

d. Click Save when done.

12. To configure the default role permissions for consumer organizations that are created in this Catalog, complete the following steps:

a. Click Role Defaults in the Catalog settings navigation pane.

To see the current default permissions for a role, expand the role.

b. Click the options icon  alongside the role that you want to work with, then click Edit.

c. Select or clear the permissions check boxes as required.

d. Click Save when done.

e. To create a new role and assign default permissions to it, click Add, name the role and assign permissions, then click Save.

13. To manage the onboarding of API consumers into this Catalog, complete the following steps:

a. Click Onboarding in the Catalog settings navigation pane.

b. To select the registries that are used to authenticate users of the Developer Portal associated with this Catalog, click Edit in the Catalog User Registries section, select the required registries, then click Save.

For details on how to configure a user registry, see [Authenticating by using your enterprise user registry](#).

Important: Do not share user registries between the API Manager and the Developer Portal, or between Developer Portal sites when self-service onboarding is enabled or account deletions in any of the sites are expected. You should create separate user registries for them, even if the separate registries point to the same backend authentication provider (for example, an LDAP server). This separation enables the Developer Portal to maintain unique email addresses across the Catalog, without API Manager needing the same requirement. It also avoids problems with users deleting their accounts from the Developer Portal that then affects their API Manager access.

c. To set a default registry, click the options icon  alongside the required registry, then select Set default.

When an API consumer signs up to the Developer Portal, the specified registry is used by default, with the option to select another registry.

d. To allow API consumers to complete their own sign-up process to the Developer Portal, move the Self service onboarding slider control to the On position. If this option is disabled, an API consumer cannot sign-up without an invitation from a consumer organization owner.

e. To require approval for all new self service onboarding to the Developer Portal, move the Self service onboarding approval slider control to the On position. If this option is enabled, then any attempt by an API consumer to sign-up to the Developer Portal results in an approval request being sent. This request is displayed in the Task tab in the Catalog for the associated Developer Portal, from where the request can be approved or declined.

Note: To enable self-service onboarding approval, you must also complete the following tasks:

- Configure the user registry to require the user's email address.
- Configure the OIDC apps to send the user's email address for approval.

f. To configure the ability for API consumers to invite collaborators and assign them to roles, click Edit in the Consumer invitation and roles section, select the options required, and click Save.

g. To configure the timeout for activation links that are sent in email invitations to application developers, click Edit in the Invitation Timeout section, specify the timeout length, then click Save.

h. To override the timeouts set by consumer organization invitations, enable the Override consumer organization's invitation timeout with catalog invitation timeout setting by moving the slider to the On position.

The catalog's own timeout setting will be used instead.

14. To specify the user registries that are used to secure access to APIs in this Catalog, and to add the user registry to the Sandbox Catalog, complete the following steps:

a. Click the Catalog settings tab, and then select API User Registries.

b. Click Edit and select the user registries you want to use.

For details on how to configure a user registry, see [Authenticating by using your enterprise user registry](#).

c. Click Save when done.

Note:

- Only LDAP and Authentication URL registries can be used to secure access to APIs; therefore, only registries of these types are listed and available for selection.
- If Spaces are enabled in the Catalog then you specify the user registries for the Spaces, **not** for the Catalog as a whole. If you specify a user registry in one Space in a Catalog, it is deployed to the gateway services across all Spaces in that Catalog. For more information about enabling and managing Spaces, see [Using syndication in API Connect](#).

15. To specify the OAuth Providers that can be used to secure access to APIs in this Catalog, complete the following steps:

Note:

- If you want to specify an OAuth provider for a Catalog, ensure that the Sandbox Catalog is configured to use the same OAuth provider
- Any resources that the OAuth provider references, such as API user registries or TLS client profiles, must also be enabled in the Catalog
- If Spaces are enabled in the Catalog then you specify the OAuth providers for the Spaces, **not** for the Catalog as a whole. If you specify an OAuth provider in one Space in a Catalog, it is deployed to the gateway services across all Spaces in that Catalog. For more information about enabling and managing Spaces, see [Using syndication in API Connect](#).

a. Click OAuth Providers in the Catalog settings navigation pane.

b. Click Edit, then select the OAuth providers that you want to use.

To configure an OAuth provider, see either [Configuring a native OAuth provider](#) using Cloud Manager or [Configuring a native OAuth provider](#) using API Manager.

c. Click Save when done.

16. Optional: Configure vanity API endpoints for your Catalog.

For any API, there are two possible endpoints to consider:

- The gateway endpoint at which the API is invoked.
- The endpoint that is visible to the consumer in the Developer Portal.

If you do not configure vanity endpoints, these two endpoints are the same, and point to the gateway endpoint at which an API is invoked.

To have an endpoint visible to the consumer that is different to the gateway endpoint, you configure a vanity endpoint. A vanity endpoint represents the endpoint by which an API is known externally; that is, the endpoint that is published to the Developer Portal and is used by an application developer to invoke the API. The way in which the gateway endpoints for an API are determined depends on the OpenAPI version of the API, as follows:

**(OpenAPI 2.0):** For any enforced API in API Connect, the gateway endpoint formats for the API are as follows:

- If the OpenAPI definition has no **host** field, the API endpoint has the following format:

`https://gateway_service_host/provider_organization/catalog/basepath`

- If the OpenAPI definition has a **host** field (for example, `petstore.com`), the host is appended to the path after the `provider_organization/catalog` segments, and the API endpoint has the following format:

`https://gateway_service_host/provider_organization/catalog/host_field_value/basepath`

Note: This is a change in behavior from IBM API Connect Version 5.0, where the **host** field is not included in the API endpoint.

In these endpoint URLs, the variables are as follows:

- `gateway_service_host` is the host name of the gateway service on which the API is running.
- `provider_organization` is the value of the **name** field of the provider organization that contains the Catalog in which the API is published.
- `catalog` is the value of the **name** field of the Catalog in which the API is published.
- `basepath` is the value of the **basepath** field in the OpenAPI definition for the API.
- `host_field_value` is the value of the host field in the OpenAPI definition for the API.

**API Gateway only**

**(OpenAPI 3.0):** If the API is enforced by the DataPower API Gateway, the value specified for the first **url** entry in the **servers** array in the OpenAPI definition of the API is used to determine the **basepath** element of the API endpoint, as follows:

- a. If a relative URL is specified for the server URL, that value is used as-is for the **basepath**, and the API endpoint has the following format:

`https://gateway_service_host/provider_organization/catalog/basepath`

- b. If a full URL is specified for the server URL, the scheme (`http://` or `https://`) is ignored by the DataPower API Gateway, and the remaining host name and **basepath** are used to form the API endpoint as follows:

`https://gateway_service_host/provider_organization/catalog/host_name/basepath`

In these endpoint URLs, the variables are as follows:

- `gateway_service_host` is the host name of the gateway service on which the API is running.
- `provider_organization` is the value of the **name** field of the provider organization that contains the Catalog in which the API is published.
- `catalog` is the value of the **name** field of the Catalog in which the API is published.
- `host_name` is the value of the host name in the server URL.
- `basepath` is the value of the **basepath** derived from the server URL.

For details on configuring the server URL in an OpenAPI 3.0 API definition, see [Defining servers for an API](#), [Defining servers for a Path](#), and [Defining servers for an operation](#).

Note: You can change your Catalog settings to use the IBM API Connect Version 5.0 endpoint behavior, including support for a feature known as *host to catalog mapping*, whereby an API can be invoked without having to include the provider organization or Catalog in the URL path; see [Retaining Version 5 vanity endpoint behavior in a Catalog](#).

To configure vanity API endpoints, so that you can publish endpoints that are different to these gateway endpoints, complete the following steps:

- a. Click API Endpoints in the Catalog settings navigation pane. The Vanity API Endpoint page opens.
  - b. Click Edit.
  - c. To display the current API base endpoint settings, select Display vanity endpoint.
  - d. Select the required Preference setting. Choose one of the following settings:
    - **Catalog priority:** Any host defined in the OpenAPI definition of the API is ignored and all API endpoints always point to the endpoints that you define here. For example, suppose you define a vanity API endpoint, with Catalog priority preference, to be `https://prod.acme.com/`. Then the API endpoint will be `https://prod.acme.com/basepath`.  
The way in which the **basepath** is determined depends on the OpenAPI version of the API, as follows:
      - **(OpenAPI 2.0):** The **basepath** is taken from the **basepath** field in the OpenAPI definition.
      - **API Gateway only (OpenAPI 3.0):** The **basepath** is taken from the first **url** entry in the **servers** array in the OpenAPI definition, ignoring any scheme (`http://` or `https://`) and host name.
    - **API priority:** The host defined in the OpenAPI definition for the API takes precedence. For example, suppose you define a vanity API endpoint, with API priority preference, to be `https://api.acme.com/`. Then the following rules determine the endpoint that is used when an API is called:
      - If the OpenAPI definition has a host defined, `test.acme.com` for example, then that value is used to determine the API endpoint. For example: `https://test.acme.com/basepath`.
      - If the OpenAPI definition has no host defined, the API endpoint will be `https://api.acme.com/basepath`, as determined by the vanity API endpoint setting.
- The way in which any defined host is determined depends on the OpenAPI version of the API, as follows:
- **(OpenAPI 2.0):** The host is taken from the **host** field in the OpenAPI definition.
  - **API Gateway only (OpenAPI 3.0):** The host is taken from the host name in the first **url** entry in the **servers** array in the OpenAPI definition.
- e. Supply one or more endpoints, as follows:
    - If you selected Catalog priority, click Add to enter one or more endpoints URLs, and an optional summary for each. Any of the endpoint URLs can be used to invoke an API.
    - If you selected API priority, enter the endpoint URL, and an optional summary.

Note: After configuring your Catalog to support your vanity URL, you must configure your external network to map the vanity endpoints to the corresponding gateway endpoints. This typically includes the following:

- A DNS mapping to ensure that the vanity host resolves to the gateway.
- Additional URL routing for the API as required.

For example, if your gateway has a default domain name of `apigw.dc.zone.mycompany.com` and an IP address of `29.12.141.150`, then the generic DNS configuration might look like:

```
api.acme.com. CNAME apigw.dc.zone.mycompany.com.
```

or

```
api.acme.com. A 29.12.141.150
```

Consult your network administrator and the DNS provider's documentation to do this configuration.

17. To configure the TLS client profiles that are used with this Catalog, complete the following steps:

Note: If Spaces are enabled in the Catalog then you configure the TLS client profiles for the Spaces, **not** for the Catalog as a whole. If you configure a TLS client profile in one Space in a Catalog, it is deployed to the gateway services across all Spaces in that Catalog.

For more information about enabling and managing Spaces, see [Using syndication in API Connect](#).

- a. Click TLS Client Profiles in the Catalog settings navigation pane.
  - b. Click Edit, then select the TLS client profiles that you want to use with this Catalog.  
For details on how to create a TLS client profile, see [Creating a TLS client profile](#).
  - c. Click Save when done.
18. To configure the Developer Portal, complete the following steps:
- a. Click Portal in the Catalog settings navigation pane, then click Create.
  - b. Select the portal service that you want to use with this Catalog.  
Portal services are configured by using the Cloud Manager UI. For details, see [Registering a portal service](#).
  - c. Optionally, override the default generated portal URL.  
The URL must have the following format:

```
https://host_name.portal.com
```

where *host\_name.portal.com* must resolve to the IP address of the Developer Portal machine.  
For example:

```
https://myhost.mydomain.com
```

Note:

- The URL must be unique across all Catalogs.

To implement sub paths into your site URL, see [Sub paths for Developer Portal sites](#).

- d. Select the portal service that you want to use with this Catalog.  
For more information on using the Developer Portal, see [Developer Portal: Socialize your APIs](#).
- e. Click Create to save your changes.

Note: The account profile for the owner of the Catalog must have an email address specified to receive the creation notification, otherwise the Developer Portal creation operation will fail. To check whether your account profile has an email address, and specify a value, complete the following steps:

- a. Click the User icon , and then select My Account.
- b. Check the contents of the Email field, and specify a value if necessary, then click Save.

19. To define Catalog properties, complete the following steps:
- a. Click Properties in the Catalog settings navigation pane, then click Create.
  - b. Enter the property Name and Value, then click Create.

The properties that you define can be referenced in any of the API definitions in this Catalog. It is also possible to define properties that are specific to an API definition; see [Setting API properties](#). For information on how to reference a property in an API definition, see [Variable references in API Connect](#).

Note:

- If you define a Catalog property of the same name as an API property, the API property takes precedence over the Catalog property.
- If you change the value of a Catalog property, any API that references that property must be republished for it use the new value.

---

## What to do next

Import your own policies into the Catalog. For details, see [Importing a user-defined policy into a Catalog](#).

Note: When you import a policy, its implementation is imported into all Gateway devices associated with the Gateway service that hosts the Catalog. Additionally, API Connect modifies some object names and file locations to mark them with the appropriate Catalog name and policy version.

# Configuring sub paths for Developer Portal sites

You can increase the specificity of a IBM® API Connect Developer Portal site URL by using sub paths.

By adding additional text to the URL of a Developer Portal site, you can create more site permutations for an organization. Developer Portal site URLs must be unique across all Catalogs.

Important:

- Sub paths are case-sensitive.
- The Developer Portal host name must contain only **lowercase** characters.

You can create a Developer Portal in the following format:

```
https://host_name.portal.com/sub_path_1/sub_path_2/.../sub_path_n
```

Where *sub\_path* can be any text that you want to implement to specify your site URL. There is no limit to the number of sub paths that you can have for the first site that you want to create.

However, you must not create overlaps in the naming of your URLs. A URL of one site must not be able to be confused with pages belonging to another site. For example, if you create the following site URL:

```
https://host_name.portal.com/bank/safe/dollar
```

Then, you cannot have the following site URL permutations:

```
https://host_name.portal.com/bank/safe
```

or

```
https://host_name.portal.com/bank/safe/dollar/cent
```

However, you can lengthen or shorten a site URL if you change a single sub path value, or the *host\_name.portal.com* value. For example, if you created the following site URL:

```
https://host_name.portal.com/bank/safe/dollar
```

Then, you can create the following site URL permutations:

```
https://host_name.portal.com/bank/euro
```

and

```
https://host_name.portal.com/bank/euro/vault/cent
```

Important: If you already have a site URL that ends in *sub\_path* texts, you cannot create a new site URL with the sub path text at the start.

For example, if you create the following site URL:

```
https://host_name.portal.com/bank
```

then, you cannot create the following site URL:

```
https://bank.host_name.portal.com
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Managing Catalog membership

Manage Catalog membership by adding new users to the Catalog and assigning roles to the users.

### Before you begin

To manage Catalog members in the API Manager, you must be assigned to a role that has the Member. Manage permission for that Catalog. For more information on assigning Catalog permissions to a role, see [Creating and configuring Catalogs](#).

### About this task

The Catalog owner can invite members of the provider organization work with the Catalog in the API Manager. The invited users are called "Catalog members" and are different from consumer users who are members of [consumer organizations](#).

### Procedure

1. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with.
2. Click the Members tab.
3. To add an existing user, click Add. Add member. To add a new user, click Add. Invite member.  
If you are using the Add member option, you can add any user who is already a member of another Catalog, or of a Space, in the provider organization, and is neither currently a member of this Catalog, nor the Catalog owner.
4. Enter the email address of a new user, or search for, and select, an existing user.
5. Select the roles that you want to assign to the user.  
For details of the roles and the default permissions assigned to them, see [API Connect user roles](#). For details on how to create your own roles, see [Creating custom roles](#).

If Spaces are enabled in the Catalog, any role that you assign to the user at the Catalog level is assigned automatically to the user in all Spaces in that Catalog. Furthermore, if a user had originally been assigned a role only in a specific Space in a Catalog and you subsequently assign the user that role at the Catalog level, the Space specific role assignment is lost and the user now has that role in all Spaces in the catalog.

Note: You can subsequently change the roles assigned to a user by selecting or clearing the appropriate check boxes alongside that user on the Members tab. If a user was originally added to the provider organization, rather than to the Catalog itself, the following conditions apply:

- Any role assigned to the user at the provider organization level is assigned automatically to the user in all Catalogs, and cannot be removed at the Catalog level.

For details on adding a user to a provider organization, see [Adding provider organization users and assigning roles](#).

- In the Catalog, the user has the permissions that are configured for the role at the Catalog level.
  - Any role that hasn't been assigned to the user at the provider organization level can be assigned to the user at the Catalog level.
6. If you are adding an existing user, click Add. If you are adding a new user, click Invite.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Importing a user-defined policy into a Catalog

You can make your user-defined policy available to API developers by importing it into an IBM® API Connect Catalog, or a Space in a Catalog.

### About this task

---

For instructions, see [Defining, packaging, and publishing a catalog-scoped policy for the API Gateway](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Importing an OpenAPI extension into a Catalog

You can extend the OpenAPI specification by adding either a JSON or YAML extension schema to an API. An extension is imported into a Catalog, or a Space in a Catalog, then added to the API schema.

### Before you begin

---

You must possess Catalog edit permissions to complete this task.

### About this task

---

This task describes how to import an OpenAPI extension into a Catalog by using the browser based API Manager user interface. Alternatively, you can use the developer toolkit CLI; see [Working with OpenAPI extensions](#).

For an example of an extension schema file, see [Referring to an extension in an API definition](#).

### Procedure

---

1. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with.
2. If Spaces are enabled in the Catalog, select the Space that you want to work with by completing the following steps:
  - a. Click the Spaces tab.
  - b. Select the Space that you want to work with.
3. Click the Catalog settings tab if you are working in a Catalog, or the Space settings tab if you are working in a Space.
4. Click Gateway services.
5. Alongside the Gateway service that you want to work with, click the options icon  and then click View extensions.
6. Click Upload then upload the extension file as indicated, either by dragging and dropping the file, or by browsing and selecting it. The extension schema file will be either a JSON or YAML file.
7. Click Upload when done.

### Results

---

The user-defined extension is now imported into a Catalog or Space, and can be used when developing an API by using the API editor in either the API Designer or the API Manager user interface.

### What to do next

---

Add the OpenAPI extension to your APIs as required; see [Adding an OpenAPI extension to an API](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Retaining Version 5 vanity endpoint behavior in a Catalog

The behavior of vanity endpoints in a Catalog has changed in API Connect Version 10 compared with Version 5. However, you can modify your Catalog settings to retain the Version 5 behavior.

## About this task

A vanity endpoint represents the endpoint by which an API is known externally; that is, the endpoint that is published to the Developer Portal and is used by an application developer to invoke the API.

You can modify your Catalog settings to define vanity endpoints that retain the API Connect Version 5 behavior.

You can modify the Catalog settings in either of the following ways:

- [Use the API Manager user interface.](#)
- [Use the developer toolkit CLI.](#)

You can also use the API Connect REST APIs; see the [API Connect REST API documentation](#).

## Procedure

- To modify the Catalog settings to retain Version 5 vanity endpoint behavior by using the API Manager user interface, complete the following steps:
  1. Click API Endpoints in the Catalog settings navigation pane. The Vanity API Endpoint page opens.
  2. Click Edit, then select v5 legacy behavior.
  3. To use the API Connect URLs, select Use gateway URLs. To configure a vanity endpoint, select Display vanity endpoint then provide the following information:
    - Endpoint: The URL of your vanity endpoint.
    - Gateway Uri: The URL of the gateway service that is enabled in the Catalog and is associated with the vanity endpoint; select from the list provided.
    - Summary: An optional description of the vanity endpoint.
- To modify the Catalog settings to retain Version 5 vanity endpoint behavior by using the developer toolkit CLI, complete the following steps:
  1. Log in to your API Connect Management server as a member of a provider organization, by using the following command:

```
apic login --server mgmt_endpoint_url --username user_id --password password --realm provider/identity_provider
```

where:

- `mgmt_endpoint_url` is the platform API endpoint URL.
- `user_id` is the user ID that you want to log in with. The user ID must be a member of a provider organization. This is an ID that you could also use to log in to the API Manager user interface.
- `password` is the password associated with the supplied user ID.
- `identity_provider` is the identity provider that is used to authenticate the supplied user ID.

For example:

```
apic login --server platform-api.myserver.com --username myuser --password mypassword --realm provider/myldap
```

You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

```
apic identity-providers:list --scope provider --server mgmt_endpoint_url --fields title,realm
```

For example:

```
apic identity-providers:list --scope provider --server myserver.com --fields title,realm
total results: 2
results:
- title: Cloud Manager User Registry
  realm: provider/default-idp-2
- title: Corporate LDAP user registry
  realm: provider/corporate-ldap
```

The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default API Manager Local User Registry for login as a member of a provider organization is `default-idp-2`. For full details on how to log in to your management server from the CLI, see [Logging in to the management server](#).

2. Define the configuration for your vanity endpoint by creating a YAML file with the following structure:

```
legacy_endpoint_behavior: enabled
v5_endpoint_substitution_behavior:
  base_endpoints:
    - endpoint: vanity_endpoint_url
      description: description
      gateway_service_url: gateway_service_url
unenforced_api_base_endpoint: unenforced_api_base_endpoint
```

where:

- the `legacy_endpoint_behavior: enabled` setting specifies that the Catalog retains API Connect Version 5 behavior. A Catalog can support either Version 5 behavior or Version 10 behavior but not both.
- `vanity_endpoint_url` is the URL of your vanity endpoint.  
Note: API Connect Version 5 supports only the host name in a vanity endpoint URL; a URL of the form `https://host_name/path` is not supported. Therefore the vanity endpoint URL that you supply here must contain only a host name; for example, `https://vanity.com`.
- `description` (optional) is a description of your vanity endpoint.
- `gateway_service_url` is the URL of the gateway service that is enabled in the Catalog and is associated with the vanity endpoint.  
Note: You can determine the gateway service URL by using the following command:

```
apic configured-gateway-services:list --scope catalog --catalog catalog_name --server mgmt_endpoint_url --org organization_name
```

where:

- `gateway_service_name` is the name of the gateway service.
- `catalog_name` is the name of the Catalog.
- `organization_name` is the name of the provider organization that contains the Catalog.

The command output lists all the gateway services that are enabled in the Catalog, together with their gateway service URLs.

- `unenforced_api_base_endpoint` (optional) is a custom API URL that specifies the URL for APIs that are deployed to a third party gateway.

Note: `base_endpoints`: is an array. You can configure multiple vanity endpoints by defining multiple `endpoint`: entries.

3. Modify your Catalog settings by using the following command:

```
apic catalog-settings:update --server mgmt_endpoint_url --catalog catalog_name --org organization_name filename
```

where `filename` is the name of the YAML file that you created in step 2.

4. Confirm your updated Catalog settings by using the following command:

```
apic catalog-settings:get --server mgmt_endpoint_url --catalog catalog_name --org organization_name --output -
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Using syndication in API Connect

With the IBM® API Connect syndication feature, you can partition your Catalogs into *Spaces*. Each Space is used by a different API provider development team and has its own set of management capabilities relating specifically to the APIs that the associated team publishes to that Space, enabling each team to manage their APIs independently.

When you stage or publish an API to a Catalog that has Spaces enabled, you specify the Space within that Catalog that you want to stage or publish to. However, application developers that access the Developer Portal for the Catalog are unaware of the Space partitioning of the Catalog and see the APIs as a coordinated offering.

Each Space has its own Product lifecycle management, subscription approvals, and analytics data. You use Space specific access control to restrict user access to each Space; for example, a developer in the Flights team is able to stage APIs only to the Flights Space.

### Example

A travel company, AcmeAir, has separate API provider development teams for each of the following areas of their business:

- Flights
- Hotels
- Payments
- User Profiles

They have an AcmeAir corporate Catalog, with its associated corporate Developer Portal. They partition their Catalog into separate Spaces, one for each development team.

Spaces are described in detail in the following sections:

- [Enabling Spaces in a Catalog](#)  
To use the syndication feature in IBM API Connect, you must enable Spaces in any Catalog in which you require syndication capabilities.
- [Creating, modifying, and deleting Spaces](#)  
You use the API Manager user interface to create a new Space in a Catalog, modify the configuration, and owner of a Space, and delete a Space from a Catalog.
- [Working with Spaces](#)  
If Spaces are enabled in an IBM API Connect Catalog, you can select a specific Space to work with in the API Manager user interface. This enables you to manage the Products and APIs that are specific to that Space, and control user access to the Space.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Enabling Spaces in a Catalog

To use the syndication feature in IBM® API Connect, you must enable Spaces in any Catalog in which you require syndication capabilities.

### Before you begin

---

If Spaces are enabled for a Catalog, Products (and their associated APIs) can be published only to a Space within that Catalog. For information about publishing, see [Staging a Product](#) for publishing by using the API Manager, and see [Publishing APIs](#) for publishing by using the developer toolkit.

Note: You cannot enable Spaces in a Catalog to which one or more Products have already been staged or published. If the Catalog does contain staged or published Products, first complete the following steps for each Product in the Catalog:

1. Remove all staged Products.
2. Retire, then remove, all published Products.

After enabling Spaces, re-stage or re-publish Products, and re-create application subscriptions, as required.

### About this task

---

By default, Spaces are disabled in a Catalog. You enable Spaces by modifying the Catalog settings. After Spaces are enabled for a Catalog, a default Space is automatically created that inherits all of the configuration settings from the Catalog.

Note: You can also enable Spaces by using the developer toolkit CLI; for details, see [apic spaces](#).

### Procedure

---

To enable Spaces in a Catalog, complete the following steps:

1. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with.
2. Click the Catalog settings tab.
3. Set the Spaces slider control to the On position.
4. In the Enable Spaces window, click Enable.

### Results

---

Spaces are enabled for your Catalog, and a default Space is created that automatically inherits all of the configuration settings from the Catalog. The Catalog owner is also the owner of the default Space.

### What to do next

---

You can modify Space settings, and create more Spaces; see [Creating, modifying, and deleting Spaces](#) and [Working with Spaces](#) for more information.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Creating, modifying, and deleting Spaces

You use the API Manager user interface to create a new Space in a Catalog, modify the configuration, and owner of a Space, and delete a Space from a Catalog.

### Before you begin

---

Navigate to the Spaces page of the Catalog containing the Space you want to work with, by completing the following steps:

1. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with.
2. Click the Spaces tab.

Note: You can also enable Spaces by using the developer toolkit CLI; for details, see [apic spaces](#).

### Procedure

---

- To create a new Space, complete the following steps:
  1. Click Add, Add a new Space.
  2. In the Space Details window, enter the Title of the Space and, optionally, a descriptive summary. A Name is entered automatically.  
Note: The value in the Name field is a single string that is used to identify the Space in developer toolkit CLI commands. The Title is used for display. To view the CLI commands to manage Spaces, see [apic spaces](#).
  3. Click Create to create the Space.

Note:

- As the user who creates the Space, you are automatically the Space owner and have all Space permissions.

- When you create a new Space, it does not automatically inherit all of the configuration settings from the Catalog. So you should check and modify the settings as necessary.
  - To modify the details of a Space, complete the following steps:
    1. On the Spaces page, select the Space whose details you want to modify, then click Space settings.
    2. Use the options in the navigation pane to modify the details as required.
 

The following types of resource can be enabled in a Space:

      - Gateway services
      - API user registries
      - OAuth providers
      - TLS client profiles
- Note:
- If you enable a resource of any of the following types in one Space in a Catalog, it is deployed to the gateway services across all Spaces in that Catalog:
    - API user registries
    - OAuth providers
    - TLS client profiles
  - If you deploy any of the following types of resource to a gateway in a Space, it is actually deployed to the gateway at Catalog scope:
    - Custom policy
    - Global policy
    - Global policy pre-hook
    - Global policy post-hook
    - Gateway extension
- To change the owner of a Space, complete the following steps:
    1. On the Spaces page, select the Space whose details you want to modify.
    2. Click the Space settings tab to open the Space details page, then click Edit.
    3. From the Select owner user drop-down menu, select the user who will become the new owner.
    4. Click Save when done.

Note:

- To have permission to change the Space owner, you must be either the Catalog owner, the Space owner, or the owner of the provider organization that contains the Space.
- When the ownership changes, the new owner is assigned administration privileges for the Space, and the previous owner has their administration privileges removed. If required, you can restore the privileges to the previous owner as described in [Managing Space membership](#).
- The ownership can be transferred only to a user who is already a member of the Space or Catalog. To transfer to a new user or another existing user, that user must previously have been added or invited to the Space, as described in [Managing Space membership](#), or to the Catalog, as described in [Managing Catalog membership](#).
- To delete a Space, complete the following steps:
  1. On the Spaces page, click the Manage icon  for the Space that you want to delete.
  2. Click Delete, then click Confirm to confirm deletion.

Note:

- You cannot delete a Space to which one or more Products have been staged or published.
- If there is only one Space in a Catalog, you cannot delete it, but you can disable Spaces for the Catalog. However, you cannot disable Spaces in a Catalog to which one or more Products have already been staged or published. If any of the Spaces in the Catalog do contain staged or published Products, first complete the following steps for the Products in each of the Spaces:

1. Remove all staged Products.
2. Retire, then remove, all published Products.

Then, to disable Spaces for the Catalog, complete the following steps:

1. Click the Catalog settings tab in the Catalog.
2. Set the Spaces slider control to the Off position.

After disabling Spaces, re-stage or re-publish Products, and re-create application subscriptions, as required.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Working with Spaces

If Spaces are enabled in an IBM® API Connect Catalog, you can select a specific Space to work with in the API Manager user interface. This enables you to manage the Products and APIs that are specific to that Space, and control user access to the Space.

### Procedure

To work with a Space, complete the following steps:

1. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with.
2. Click the Spaces tab.
3. Select the Space that you want to work with.

### What to do next

For details of the Space management tasks, see the following subtopics:

- [Managing Products in a Space](#)  
If Spaces are enabled in an IBM API Connect Catalog, you can use the API Manager user interface to separately manage the Products that are staged or published to each Space.

- [Managing subscription requests in a Space](#)  
If Spaces are enabled in an IBM API Connect Catalog, you can approve, or deny, individual requests to subscribe to Plans in Products that are published to the Space.
- [Managing application subscriptions in a Space](#)  
If Spaces are enabled in an IBM API Connect Catalog, you can use the API Manager user interface to separately manage the application subscriptions to Plans in the Products that are published to a Space.
- [Managing Space membership](#)  
If Spaces are enabled in an IBM API Connect Catalog, you can manage the members within the Space. You manage Space membership by adding new users to the Space and assigning roles to the users.
- [Managing user access in a Space](#)  
If Spaces are enabled in an IBM API Connect Catalog, you can manage the access that users have within the Space. You manage access by specifying the permissions that are assigned to user roles.
- [Managing Gateways in a Space](#)  
If Spaces are enabled in a Catalog, you can separately control which Gateway services are used by each of the Spaces in the IBM API Connect Catalog.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Managing Products in a Space

If Spaces are enabled in an IBM® API Connect Catalog, you can use the API Manager user interface to separately manage the Products that are staged or published to each Space.

### Before you begin

---

To manage Products in a Space in the API Manager UI, a user must be assigned a role that has the Products, Manage permission. For more information on assigning Space permissions to a role, see [Managing user access in a Space](#).

### Procedure

---

To manage the Products that are staged or published to a specific Space, complete the following steps:

1. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with.
2. Click the Spaces tab.
3. Select the Space that you want to work with.

### What to do next

---

For details of the management tasks that you can perform on the Products in the Space, see [Working with Products](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Managing subscription requests in a Space

If Spaces are enabled in an IBM® API Connect Catalog, you can approve, or deny, individual requests to subscribe to Plans in Products that are published to the Space.

### Before you begin

---

To manage Space subscription requests in the API Manager UI, a user must be assigned a role that has the Subscription Approvals, Manage permission. For more information on assigning Space permissions to a role, see [Managing user access in a Space](#).

### Procedure

---

To manage the subscription requests in a Space, complete the following steps:

1. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with.
2. Click the Spaces tab.
3. Select the Space that you want to work with.
4. Click the Tasks tab.

The Tasks page lists only the subscription requests for the selected Space.

### What to do next

---

For details on how to manage approvals, see [Approving Product lifecycle and subscription requests](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Managing application subscriptions in a Space

If Spaces are enabled in an IBM® API Connect Catalog, you can use the API Manager user interface to separately manage the application subscriptions to Plans in the Products that are published to a Space.

### Before you begin

---

To manage application subscriptions in the API Manager UI, a user must be assigned a role that has the Subscriptions, Manage permission. For more information on assigning Space permissions to a role, see [Managing user access in a Space](#).

### Procedure

---

1. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with.
2. Click the Spaces tab.
3. Select the Space that you want to work with.
4. In the navigation pane of the API Manager UI, click the Applications tab.  
All applications that have been registered in the Developer Portal associated with this Space are listed.
5. Click the options icon  alongside the application you want to work with, then click View Subscriptions.

### What to do next

---

For details of the management tasks that you can perform on application subscriptions in a Space, see [Working with application subscriptions](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Managing Space membership

If Spaces are enabled in an IBM® API Connect Catalog, you can manage the members within the Space. You manage Space membership by adding new users to the Space and assigning roles to the users.

### Before you begin

---

To manage Space members in the API Manager UI, a user must be assigned a role that has the Child, Manage permission for the Catalog that contains the Space. For more information on assigning Space permissions to a role, see [Managing user access in a Space](#).

### About this task

---

Note: You can add the same user to two or more Spaces and assign different roles in each, allowing a user to have differing levels of access in different Spaces.

### Procedure

---

1. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with.
2. Click the Spaces tab.
3. Select the Space that you want to work with.
4. Click the Members tab.
5. To add an existing user, click Add, Add member. To add a new user, click Add, Invite member.  
If you are using the Add member option, you can add any user who is already a member of another Space, or of a Catalog, in the provider organization, and is neither currently a member of this Space, nor the Space owner.
6. Enter the email address of a new user, or search for, and select, an existing user.
7. Select the roles that you want to assign to the user.  
For details of the roles and the default permissions assigned to them, see [API Connect user roles](#). For details on how to create your own roles, see [Creating custom roles](#).

If a user was originally added either to the provider organization, or to the Catalog that contains the Space, rather than to the Space itself, the following conditions apply:

- Any role assigned to the user at the provider organization or Catalog level is assigned automatically to the user in all Spaces, and cannot be removed at the Space level.

For details on adding a user to a provider organization, see [Adding provider organization users and assigning roles](#).

For details on adding a user to a Catalog, see [Managing Catalog membership](#).

- In the Space, the user has the permissions that are configured for the role at the Space level. For details on configuring role permissions for a Space, see [Managing user access in a Space](#).
  - Any role that hasn't been assigned to the user at the provider organization or Catalog level can be assigned at the Space level
- Note: You can subsequently change the roles assigned to a user by selecting or clearing the appropriate check boxes alongside that user on the Members page.
8. If you are adding an existing user, click Add. If you are adding a new user, click Invite.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Managing user access in a Space

If Spaces are enabled in an IBM® API Connect Catalog, you can manage the access that users have within the Space. You manage access by specifying the permissions that are assigned to user roles.

### Before you begin

---

To manage Space permissions in the API Manager UI, a user must be assigned a role that has the Child\_>.Manage permission for the Catalog that contains the Space. For information on adding users to a Space and assigning user roles, see [Managing Space membership](#).

### Procedure

---

1. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with.
2. Click the Spaces tab.
3. Select the Space that you want to work with.
4. Click the Space settings tab.
5. Click Roles, click the options icon  alongside the role whose permissions you want to modify, then click Edit.
6. Select the required permissions, then click Save.

### Related tasks

---

- [Creating custom roles](#)

### Related information

---

- [API Connect user roles](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Managing Gateways in a Space

If Spaces are enabled in a Catalog, you can separately control which Gateway services are used by each of the Spaces in the IBM® API Connect Catalog.

### Before you begin

---

To manage Space Gateway settings in the API Manager UI, a user must be assigned a role that has the Child\_>.Manage permission for the Catalog that contains the Space. For information on adding users to a Space and assigning user roles, see [Managing Space membership](#).

### About this task

---

Note: If Spaces are enabled in a Catalog then you configure the Gateway settings for each Space separately, **not** for the Catalog as a whole.

### Procedure

---

To manage the Gateway settings for a Space, complete the following steps:

1. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with.
2. Click the Spaces tab.
3. Select the Space that you want to work with.
4. Click the Space settings tab.
5. Click Gateway services.  
The Gateway services that are currently enabled for the Space are listed.
6. To change the Gateway service configuration for the Space, click Edit, then select which Gateway services you want the Space to use.

7. Click Save to save your changes.

## Related information

- [Configuring the initial Gateway service](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Working with Products

In IBM API Connect, Plans and APIs are grouped together in Products.

Information about managing Products in the API Manager UI can be found in the following topics.

- **The Product lifecycle**  
When you manage your Product versions, you move them through a series of lifecycle states. From initially staging a Product version to a Catalog, through to publishing to make the Product version available to your application developers, and to eventual retiring and archiving. The syndication feature in IBM API Connect means that Product lifecycle states can also be managed within Spaces in the associated Catalog.
- **Monetizing your Products**  
In addition to offering free Plans for your customers to use your Products, you can also define Plans that automatically bill your customers who are using your Products in IBM API Connect.
- **Managing your Products**  
You can manage your Products in API Manager by using the Products page of the associated Catalog. In this view, you can move the Products through their lifecycle, display analytics information, and control who can see or subscribe to the Products. The syndication feature in IBM API Connect means that Products can also be managed by using the Products tab of the associated Space.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## The Product lifecycle

When you manage your Product versions, you move them through a series of lifecycle states. From initially staging a Product version to a Catalog, through to publishing to make the Product version available to your application developers, and to eventual retiring and archiving. The syndication feature in IBM® API Connect means that Product lifecycle states can also be managed within Spaces in the associated Catalog.

## Product lifecycle state diagram

The following diagram shows the possible lifecycle states for a Product version, and the Product management operations that move a Product version from one lifecycle state to another. For example, the Retire operation moves a Product version from the Published to the Retired state.

Note: The same Product lifecycle states apply irrespective of whether your Product is managed within a Catalog, or within a Space in a Catalog. For more information about the syndication feature, see [Using syndication in API Connect](#).

If approval is required for a Product management operation, an approval request is sent and the Product version moves to the pending state. When the request is approved, the operation is completed and the Product version moves to the next lifecycle state. If approval is not required, the operation is completed immediately.

Note: Approval is not required for the following lifecycle state transitions:

- Retired to Staged.
- Deprecated to Published.

For information on configuring Product lifecycle approvals for a Catalog, see [Creating and configuring Catalogs](#). For information on approving requests, see [Approving Product lifecycle and subscription requests](#).

Note:

- Approval for Product lifecycle state changes in a Catalog is disabled by default. You must explicitly enable the Product lifecycle state changes that you want to enforce.
- Product lifecycle approvals can be configured only at the Catalog level. This feature is not available at the Space level.
- You can view the history of Product lifecycle requests and approvals, by clicking the options icon  alongside the Product that you want to work with, and selecting View Approval History.

The following sections describe the various lifecycle states for a Product version.

Note: All references in this topic to a Catalog, can also be applied to a Space in a Catalog, unless specified otherwise.

## Draft

---

The draft state for a Product or API is when a Product or API definition is not deployed and is not associated with any Catalog.

## Staged

---

When you stage a Product, a copy of the Product version is deployed to the target Catalog. Staged is the initial state when you publish a Product. When a Product is in the staged state, it is not yet visible to, or subscribable by, any developers. For more information about staging a Product, see [Staging a Product](#).

You stage a Product so that the appropriate approvals, internally within the organization, can be given for it to then be published. For information on configuring Product lifecycle approvals for a Catalog, see [Creating and configuring Catalogs](#). For information on approving requests, see [Approving Product lifecycle and subscription requests](#). For information on publishing a Product, see [Publishing a Product](#).

## Published

---

When you publish a Product, a fixed copy of the Product version is deployed to the target Catalog. The Product version is visible to, and subscribable by, the targeted developers or communities. When a Product is published in a Catalog, the visibility and subscription settings can be changed for the published version of that Product. Any further changes require a new version of the Product to be staged and published before they take effect.

If you replace a Published Product with a Staged or Deprecated Product, the replacement Product is published, and the replaced Product is retired.

If you supersede a Published Product with a Staged or Deprecated Product, the superseding Product is published, and the superseded Product is deprecated.

For more information about publishing a Product, see [Publishing a Product](#).

Note: If you want to update a Product, you must republish it. The `products:update` command only updates a Product's metadata.

## Deprecated

---

When you deprecate a Product, the Product version is visible only to developers whose applications are currently subscribed. No new subscriptions to the Plans in the Product are possible. For more information about deprecating Products, see [Deprecating a Product](#).

A Product is also deprecated if you supersede it with another Product. For more information, see [Superseding a Product with another Product](#).

## Retired

---

When you retire a Product, the Product version can neither be viewed nor can its Plans be subscribed to, and all of the associated APIs are taken offline. For more information about retiring Products, see [Retiring a Product](#).

A Product is also retired if you replace it with another Product. For more information, see [Replacing a Product with another Product](#).

## Monetizing your Products

In addition to offering free Plans for your customers to use your Products, you can also define Plans that automatically bill your customers who are using your Products in IBM® API Connect.

API Connect includes a subscription billing feature that allows API providers to define pricing Plans in their API Products, and monetize their API offerings. If a Product contains a pricing Plan, API consumers must enter their payment information into the Developer Portal before they can subscribe to that Plan.

API Connect supports integration with Stripe Subscription Billing, an independent cloud service that manages monetized product Plans, customers, their payment information, and their subscription history, in order to generate monthly invoices and charge customers automatically. With this integration, Stripe serves as both the subscription billing system and the payment processing system.

You can define both free Plans and paid Plans within the same Product. To charge your customers more for greater access to your APIs, you can create multiple Plans with different tiers of prices and rate-limits. For example, an introductory Plan might have a low monthly price and restrictive rate-limiting, while a higher tier Plan might couple a higher monthly price with less restrictive rate limiting controls. Your customers can then select the Plan that is appropriate for their usage rates. As your customers have different needs for the use of your Products, so you can offer different levels of service. For example, a smaller customer might need a rate of only 5 API calls per hour, whereas a larger company might need a rate of 1000 API calls per hour. You can create the Plans that are appropriate for your customers, and they can subscribe to the service and pricing Plan that is appropriate for them.

Restriction: The following limitations apply to the subscription billing feature:

- Billing and monetization requirements vary by country, where IBM and the independent cloud billing provider, Stripe, cannot guarantee every country requirement is supported. Country requirements change, and are out of scope for this document. Some limitations on storing and passing fields to the Stripe billing provider might exist, when fields are unique to a subset of countries. For example, the passing of a billing address from API Connect to Stripe, which is required by some EU countries due to GDPR and taxation laws, is not currently supported.
- High availability configurations including the optional billing microservice are not supported at this time.
- After a configured billing resource is in use by a Catalog, it might not be possible to remove it. Do not add your Stripe test keys to production Catalogs. If you want to prototype with your non-production Stripe keys, create a separate temporary Catalog.
- If an API consumer deletes their payment method, or their credit card expires, or their card is out of credit after they have initially subscribed and prepaid for their first month, there is no mechanism to alert the provider organization or suspend API access automatically in response. Provider organizations can monitor their Stripe dashboards for non-payment events and, if necessary, notify the consumer, suspend the application for that subscription, or cancel the API Connect subscription manually. The URL of the API Connect subscription is saved in the metadata of the Stripe subscription object, to assist in reverse lookups.
- Suspending an application does not automatically pause the billing cycles of the subscriptions for that application.

Though much of the procedure is the same for setting up a paid Plan and a free Plan, there are some extra actions that are needed before you can start defining paid Plans. See the following topics for more information:

1. First, you must configure a billing integration resource for your provider organization; see [Adding a billing integration resource](#).
2. Before you can publish a Product Plan with pricing to a Catalog, you must add your billing integration resource to that Catalog; see [Adding a billing integration resource to a Catalog](#).
3. Also before you can publish to a Catalog, an administrator must enable the Stripe payment method module in the Developer Portal for that Catalog; see [Configuring Stripe in the Developer Portal](#).
4. After the Catalog and Developer Portal are configured, you can create Products that include pricing Plans; see [Defining a Product with billing integration](#).

Note:

- Before you can create billing resources in provider organizations, the billing microservice must be enabled on your management system by your system administrator. See [Configuring monetization on VMware](#) and [Configuring monetization on Kubernetes](#) for more information.
- You can also create and manage billing integration resources by using the developer toolkit CLI. For more information, see [Command-line tool reference for the developer toolkit](#).

---

# Adding a billing integration resource

To enable the monetization of your Product Plans, you must add a billing integration resource in your IBM® API Connect provider organization that defines the configuration data needed to synchronize with an external subscription billing system.

---

## Before you begin

To use Stripe as your credit card processing vendor, you must have port 443 open to HTTPS communication between the Stripe API and your Developer Portal management and the Management cluster servers. See [Firewall requirements on Kubernetes](#) and [Firewall requirements on VMware](#) for more information about this requirement.

Before you can create billing resources in provider organizations, the billing microservice must be enabled on your management system by your system administrator. See [Configuring monetization on VMware](#) and [Configuring monetization on Kubernetes](#) for more information.

You must either be the provider organization owner, or have `Settings: Manage permissions`, to complete this task.

You must have an account with Stripe to be able to complete this task. If you do not already have a Stripe account, you can set one up at: [www.stripe.com](http://www.stripe.com).

## About this task

---

API Connect supports integration with Stripe Subscription Billing, an independent cloud service that manages monetized product Plans, customers, their payment information, and their subscription history, in order to generate monthly invoices and charge customers automatically. With this integration, Stripe serves as both the subscription billing system and the payment processing system. When API consumers subscribe to Product Plans with billing in the Developer Portal, they set up automatic payments through a credit card registered with Stripe. To enable this billing process, you must first specify your Stripe account information by creating a billing integration resource. The subscription payment amount is processed from the account that is provided by the API consumer, and credited to the account that you provide as the API provider.

Important: Each Stripe account comes with two sets of API keys, one for testing, and one for production. Each set of API keys has a distinct namespace for Stripe objects. Test API keys cannot see objects created by production API keys, and vice versa. You cannot switch the API keys of one of your billing integrations with the keys from another account, or swap your test and production keys over, as that would prevent API Connect from resolving the Stripe objects that were created by using the old keys. If you want to use your Stripe test keys, you must create a separate Catalog for testing, and not add your Stripe test keys to production Catalogs.

## Procedure

---

To create a billing integration resource, complete the following steps:

1. In the API Manager, click  Resources.
2. Ensure that you are in the provider organization to which you want to add the billing integration.
3. Select Billing, and then click Add.  
The Add billing integration page for Stripe integration is displayed.
4. Enter a Title for your billing integration.
5. The Name is auto-generated based on the Title that you enter, and is a single string that can be used in developer toolkit CLI commands.
6. Enter the Publishable key and Secret key for your Stripe account.  
Refer to your Stripe dashboard to get your publishable key and secret key; see <https://dashboard.stripe.com/apikeys>.
7. Click Add to create your billing integration resource.

## Results

---

Your new billing integration resource is listed in the table on the Billing dashboard. The table also displays the state of the job queue for the billing integration. Any issues with the job queue are displayed in this table. See [Billing integration resource job queues](#) for more information.

## What to do next

---

To be able to publish monetized Product Plans, you must add the billing integration resource to your Catalog, and to the Sandbox Catalog. See [Adding a billing integration resource to a Catalog](#) for details.

## Related tasks

---

---

## Billing integration resource job queues

Billing integration resources use job queues to manage the bulk Product lifecycle operations in IBM® API Connect.

Subscription billing systems such as Stripe, typically provide APIs that support updating a single resource at a time. However, IBM API Connect has Product lifecycle operations that can modify many resources in a single transaction, such as migrating a set of subscriptions from one Product to another Product. In order to bridge the mismatch between these two APIs, API Connect adds a job queue to each billing integration resource in your provider organization. Jobs on this queue are responsible for mapping bulk operations to a series of API calls against the subscription billing system. Jobs run one at a time, in the order that they were created. When a job completes it's deleted from the queue, and the next job runs. When all of the jobs in the queue complete running and the queue is empty, the data model of the subscription billing system should be up-to-date with the changes made in API Connect.

There are potential issues when moving this type of synchronization to background jobs. Network connectivity, outages at the billing provider, or rolling of the API keys of the billing system, could all cause the job queue to be blocked if the root issue does not resolve by itself in the span of an hour. If a job encounters an error, such as a network connectivity error, the job is retried up to five times over the course of 70 minutes, before changing the state of the job from Running to either Blocked or Failed. Only when the state of the head job is blocked or failed, will the Retry Blocked Jobs action appear in the options menu. So if an error is shown but the job is still attempting to run, you need to wait up to 70 minutes before the Retry Blocked Jobs action appears.

The job queue status can be viewed in the table on the Billing dashboard. The table lists any blocked jobs, and the error that is blocking them. If the error indicates that your API keys are no longer valid, you must update your billing resource to contain the correct values. After the root cause is resolved, you can click the  options menu on the row of the billing integration resource, and click Retry Blocked Jobs. This action retries the jobs on the job queue. After a few minutes the number of jobs should go down. Note that you can click the Refresh icon  to refresh the results from the server.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Adding a billing integration resource to a Catalog

To be able to publish monetized Product Plans, you must add a billing integration resource to your Catalogs.

### Before you begin

---

You must have created a billing integration resource. See [Adding a billing integration resource](#) for details.

You must either be the provider organization owner, or have `Settings: Manage` permissions, to complete this task.

### About this task

---

Before you can publish any Products that include pricing Plans, you must add the billing integration resource to the Sandbox Catalog, as well as to the Catalog where you will create the monetized Products. When API consumers subscribe to Product Plans with billing in the Developer Portal, they set up automatic payments through a credit card registered with Stripe. To enable this billing process, after you have specified your Stripe account in a billing integration resource, you must then apply that resource to your Catalogs, including the Sandbox Catalog. The subscription payment amount is processed from the account that is provided by the API consumer, and credited to the account that is provided in the billing integration resource.

Note:

- Before you can publish a monetized Product Plan to a Catalog, the Stripe payment method module in the Developer Portal must also be enabled; see [Configuring Stripe in the Developer Portal](#).
- Each Stripe account comes with two sets of API keys, one for testing, and one for production. Each set of API keys has a distinct namespace for Stripe objects. Test API keys cannot see objects created by production API keys, and vice versa. You cannot switch the API keys of one of your billing integrations with the keys from another account, or swap your test and production keys over, as that would prevent API Connect from resolving the Stripe objects that were created by using the old keys. If you want to use your Stripe test keys, you must create a separate Catalog for testing, and not add your Stripe test keys to production Catalogs.

### Procedure

---

To add a billing integration resource to a Catalog, complete the following steps:

1. In the API Manager, click  Manage.
2. Select the Catalog tile on the Manage page that you want to update, then click the Catalog settings tab.
3. Select Billing, and then click Edit.
4. Select the billing integration resource that you want to apply to the Catalog, and click Save. You should apply only one billing integration resource to each production Catalog.

The billing integration resource is now listed in the Billing section.

Remember: You must add the billing resource to the Sandbox Catalog, as well as to the Catalog that will contain your monetized Products, if different. More than one billing resource can be applied to the Sandbox Catalog.

### Results

---

The billing integration resource is added to the Catalog.

### What to do next

---

The Stripe payment method module must be enabled in the Developer Portal for that Catalog; see [Configuring Stripe in the Developer Portal](#) for details.

After both the Catalog and the Developer Portal are configured, you can create Products with pricing Plans. See [Defining a Product with billing integration](#) for more information.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Defining a Product with billing integration

To monetize your APIs, you must create Product Plans with pricing information that allow API consumers to subscribe to your Plans with integrated billing.

### Before you begin

You must have a billing integration resource, and this resource must be added to the Catalog that you want to publish your Product to, as well as to the Sandbox Catalog. See [Adding a billing integration resource](#), and [Adding a billing integration resource to a Catalog](#) for details.

Also, the Stripe payment method module must be enabled in the Developer Portal for the Catalog; see [Configuring Stripe in the Developer Portal](#) for details.

### About this task

When you decide to charge customers to use your API Products, your customers have different requirements for the number of API calls that they are willing to pay for. You can solve this issue by defining Plans at different levels of service, and at different costs.

Within your Product, you can define free Plans as well as Plans that contain billing integration. The following instructions guide you through defining a Plan with pricing information. For more detailed information about creating Products, see [Creating a draft Product](#) and [Editing a draft Product](#).

Important: Products that contain a billing integration cannot be re-staged into non-production Catalogs. To experiment with billing on the Sandbox Catalog, or any other non-production Catalogs, you must publish new versions of your monetized Product. This practice aligns with how you have to work with production Catalogs currently, as they also don't support the re-staging of existing versions of the same Product.

### Procedure

To add pricing information to a Product Plan, complete the following steps:

1. In the API Manager, click  Develop.
2. Select the Products tab.
3. Select the Product that you want to add billing integration to, or create a new draft Product by clicking Add > Product and following the wizard.
4. With the Product open and the Design tab selected, select Plans in the navigation menu.
5. In the Billing integration section, select the billing integration resource that you want to apply to the Product.  
In the Plans section, you can then either edit the Default Plan to add pricing information, or create a new Plan with pricing information.
6. If this is a new Plan, enter a Title, and if you require approval for someone to subscribe to this Plan also select the Approval checkbox.
7. In the Plan pricing section, complete the following steps to add the pricing information:
  - a. Change the toggle to On for Plan pricing.  
The Plan pricing definition section is displayed.
  - b. Optional: If you want to include any free trial days in your Plan, select Include free trial days, and then enter the number of trial days that a subscriber can use the Plan without charge, after which their billing cycle begins.
  - c. Select the Currency for the billing process use.
  - d. Enter the Price per month to bill the subscriber for.  
If the selected currency supports fractional units, enter the price including any fractional units, such as cents.
8. Optional: In the Plan rate limits section, set the rate limits by entering the number of calls that are allowed per unit of time.  
Remember that this rate limit applies only to this Plan. You can set multiple rate limits, at second, minute, hour, day, and week time intervals. You can override this Plan rate limit for specific endpoints if you prefer, adding a different rate limit or enabling unlimited calls to it. You can also create more Plans with different rate limits. For more information about rate limits, see [Understanding rate limits for APIs and Plans](#).
9. Optional: Select the Hard limit checkbox if you want the gateway to reject any calls beyond the specified rate, rather than adding them to a queue to be resolved when the limits reset.
10. Optional: Add more burst limits, GraphQL limits, and assembly limits, as appropriate for your APIs.
11. Complete the Plan APIs section if you want to customize the APIs and operations that are available in this Plan.
12. If you want to add more Plans to the Product, repeat the process from Step 6.
13. Click Save to save the Product.

### Results

Your Product with billing integration and a pricing Plan is listed in the Products dashboard of the Develop area. If your Product doesn't appear, click the Refresh icon  to refresh the results from the server.

### What to do next

Stage your Product to a Catalog. For more information, see [Staging a draft Product](#).

## Related reference

---

- [Troubleshooting your billing configuration](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Managing your Products

You can manage your Products in API Manager by using the Products page of the associated Catalog. In this view, you can move the Products through their lifecycle, display analytics information, and control who can see or subscribe to the Products. The syndication feature in IBM® API Connect means that Products can also be managed by using the Products tab of the associated Space.

### Before you begin

---

To complete the Product management tasks that are described in this topic, you must either be the owner of the API provider organization, or be assigned Manage permission for Products in the Catalog that contains the Product. If you have View permission for Products, you have read-only access to the Product management page. For information on configuring Product management permissions for a Catalog, see [Creating and configuring Catalogs](#).

The syndication feature in IBM API Connect means that Products can be contained within a Space in a Catalog. In this case, to complete the Product management tasks that are described in this topic, you must either be the owner of the API provider organization, or be assigned Manage permission for Products in the Space that contains the Product. For information on configuring Product management permissions for a Space, see [Managing user access in a Space](#).

### About this task

---

For more information about the Product lifecycle, see [The Product lifecycle](#).

For more information about the syndication feature, see [Using syndication in API Connect](#).

For information on viewing Analytics that can provide insight into Product and API usage and performance, see [API Analytics](#).

For information about Product billing, see [Monetizing your Products](#).

### Procedure

---

To manage your Product, complete the following steps.

1. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with. The Products page of the Catalog opens, and all of the Products available in that Catalog are displayed.
2. If the Product that you want to work with is contained within a Space, select the required Space by completing the following steps:
  - a. Click the Spaces tab.
  - b. Select the Space that you want to work with. The Products page of the Space opens, and all of the Products available in that Space are displayed.
3. Expand a Product to see details of the APIs and Plans in that Product. Manage options are also available, depending on the state of the Product. To view the manage options, click the options icon  and select the options that you require.
4. To manage the lifecycle of a version of a Product, click the options icon  alongside the Product version, and select the required lifecycle action.
5. To set the migration target of a version of a Product, click the options icon  alongside the Product version, and select Set migration target. In the Set migration target window, select the Product that you want to set as the migration target, and select Next. Then map the migration source Plans to the migration target Plans, and click OK. Restriction: If the Plan is part of a Product that is contained within a Space in the Catalog, and the migration action is being made at the Space level, the Plan that you are migrating subscriptions from must be located in the same Space as the Plan you are migrating to. If the migration action is being made at the Catalog level, subscriptions can be migrated across Spaces. For more information about the Space feature, see [Using syndication in API Connect](#).

### What to do next

---

For details of the ways in which you can manage your Products, see the following subtopics:

- [Considerations when changing a Product lifecycle with billing integration](#)  
There are special considerations for lifecycle operations for Products that contain a billing integration in IBM API Connect.
- [Publishing a Product](#)  
APIs become accessible when a Product is published and made visible on the IBM API Connect Developer Portal for use by application developers. A Product can be published to selected communities of application developer organizations, and the Plans within the Product can be used to tailor access and visibility further.
- [Migrating application subscriptions to another Product](#)  
By using the Products view within a Catalog in API Manager, you can migrate application subscriptions between Products. The syndication feature in IBM API Connect means that you can also use the Products view within a Space in a Catalog to migrate application subscriptions.
- [Migrating application subscribers to new Product versions](#)  
When new versions of Products are created in IBM API Connect, there are a number of ways that subscribers can be moved to the Plans of the new Product.
- [Changing the availability of a Product](#)  
You can change the availability of a Product and the associated Plans by using the Products view within a Catalog in API Manager. The syndication feature in IBM API Connect means that you can also use the Products view within a Space in a Catalog to change the availability of a Product.

- [Deprecating a Product](#)  
You can deprecate a published Product by using the Manage Products page within a Catalog in API Manager. When you deprecate a Product, application developers that are already subscribed to the Product can continue to use it, but no new developers can subscribe to the Product. The syndication feature in IBM API Connect means that you can also use the Manage Products page within a Space in a Catalog to deprecate a published Product.
- [Retiring a Product](#)  
You can retire a published or deprecated Product by using the Manage Products page within a Catalog in API Manager. When a Product is retired, all associated APIs are taken offline, and any subscriptions are deleted. The syndication feature in IBM API Connect means that you can also use the Manage Products page within a Space in a Catalog to retire a Product.
- [Re-staging a Product](#)  
If a Product in a Catalog has been retired, you can re-stage the Product so that it can re-enter the Product lifecycle. A re-staged Product moves to the Staged state, from where it can be published. The syndication feature in IBM API Connect means that you can also re-stage a Product within a Space in a Catalog.
- [Working with the subscriptions in a Product](#)  
You can work with the subscriptions to the Plans in a specific Product. Plan subscriptions are created by application developers in the Developer Portal.
- [Updating the gateway services for a Product](#)  
When you stage or publish a draft Product to a Catalog, you specify the gateway services at which the APIs in the Product are to be made available. However, you can later update the selected gateway services after a Product has been stage or published.
- [Removing a Product from a Catalog](#)  
You can remove a Product from a specific Catalog by using the Products view within a Catalog in API Manager. The syndication feature in IBM API Connect means that you can also use the Products view within a Space to remove a Product from a Catalog.
- [Approving Product lifecycle and subscription requests](#)  
To approve or decline requests to change the lifecycle state of a Product, and requests by application developers to subscribe to a Plan, use the Tasks page in the Catalog that contains the associated Product in API Manager. The syndication feature in IBM API Connect means that you can also use the Tasks page within a Space in a Catalog to approve or decline requests.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

# Considerations when changing a Product lifecycle with billing integration

There are special considerations for lifecycle operations for Products that contain a billing integration in IBM® API Connect.

For example, if you release new versions of your Product that contain pricing changes, you will need to define the upgrade pathways for your existing subscribers. The following scenarios detail the special considerations for Product lifecycle changes:

### Deprecating

Preparing an existing Product to be removed from production. You can define a replacement Product by using the Set Migration Target option in the Catalog. API consumers will then see a Migrate this subscription message in the Developer Portal that they can click to upgrade their subscription to the migration target. If the upgrade target is a paid Plan, they must enter a payment method before upgrading. Upgrades by API consumers from a free Plan to a paid Plan are supported. For more information about deprecating Products, see [Deprecating a Product](#).

### Migrating

Moving subscriptions from one Product to a different Product, and from a free Plan to a paid Plan, is not supported. Instead, see the superseding scenario.

### Replacing

Replacing a Product with a newer version of the same Product, and automatically upgrading all existing subscribers to the new Product. You must map which Plans from your new Product correspond to which Plans in your old Product. You cannot map a free Plan to a paid Plan in the replace operation. For more information about replacing Products, see [Replacing a Product with another Product](#).

### Retiring

Removing a Product or Plan from production, and canceling all of the existing subscriptions and their billing cycles. For more information about retiring Products, see [Retiring a Product](#).

### Superseding

Deprecating the old Product, and at the same time defining its migration target to a newer version of itself. Retaining the existing Product and Plan for subscribers who would like to keep it, but offering a different Product and Plan for the updated version of a Product. API consumers will then see a Migrate this subscription message in the Developer Portal that they can click to upgrade their subscription to the migration target. If the upgrade target is a paid Plan, they must enter a payment method before upgrading. Upgrades by API consumers from a free Plan to a paid Plan are supported. For more information about superseding Products, see [Superseding a Product with another Product](#).

Note: You can use the Set Migration Target option in the Catalog on a Product that isn't being deprecated. For example, if you wanted to give customers the option to move to a different Product without affecting the original Product.

While these follow the same basic procedures that are described in [Managing your Products](#) for Products and Plans without billing, there are some considerations that only apply to Products that contain paid Plans.

## You cannot migrate a customer directly from a free Plan to a Plan with billing

---

Customers who subscribe to Plans with billing must set up their billing information in the Developer Portal. If they subscribe only to free Plans, they don't have billing accounts.

There are two ways to migrate customers from a free Plan to a paid Plan:

- Supersede the free Product Plan and provide a migration target to a paid Product Plan. This deprecates the free Product Plan so no new users can subscribe to it, and gives the customer a Migrate this subscription message in the Developer Portal to move to the new Product Plan.
- Set a migration target to a paid Product Plan. In this case the free Product Plan is not deprecated, but it still gives the customer the Migrate this subscription message in the Developer Portal for moving to the new Product Plan. With this method, new customers can still subscribe to the free Product Plan.

Both of these methods require action from the customer before they move from the free Product Plan to the paid Product Plan.

Note: Free trial days do not apply to customers when they migrate. They are available only for new customers.

---

## You must map the existing Plans to the new Plans when you supersede or replace a Product

---

When you replace or supersede a Plan with billing with another Plan, you must map the Plans from the Product that is being removed to the Plans that are in the new Product. It is convenient if there are the same number of Plans for each, but you can map more than one Plan from the existing Product to one Plan in the new Product.

---

## Billing charges are prorated when subscriptions are migrated

---

When customers change their subscriptions to a Plan that has a different price, their next monthly invoice will contain prorated charges, depending on how long they spent on different billing Plans. For more information about how Stripe handles proration, see <https://stripe.com/docs/billing/subscriptions/prorations>.

---

## Publishing a Product

---

APIs become accessible when a Product is published and made visible on the IBM® API Connect Developer Portal for use by application developers. A Product can be published to selected communities of application developer organizations, and the Plans within the Product can be used to tailor access and visibility further.

---

## Before you begin

---

You must stage a Product before it can be published. For more information about staging Products, see [Staging a Product](#).

Note: If you want to publish a LoopBack project, you must publish both the APIs (by publishing the Products that contain the APIs) and the associated applications so the project can be run. For more information about publishing LoopBack applications, see [Publishing APIs and applications](#).

To complete the Product management tasks that are described in this topic, you must either be the owner of the API provider organization, or be assigned Manage permission for Products in the Catalog that contains the Product. If you have View permission for Products, you have read-only access to the Product management page. For information on configuring Product management permissions for a Catalog, see [Creating and configuring Catalogs](#).

The syndication feature in IBM API Connect means that Products can be contained within a Space in a Catalog. In this case, to complete the Product management tasks that are described in this topic, you must either be the owner of the API provider organization, or be assigned Manage permission for Products in the Space that contains the Product. For information on configuring Product management permissions for a Space, see [Managing user access in a Space](#).

---

## About this task

---

A community is a collection of consumer organizations, used to control which organizations have access to Products and Plans without having to assign access on an individual basis. A Product can be published to selected communities, which means that only application developers within those organizations contained within the community can see the Product on the Developer Portal and obtain application keys to access it. A Product can alternatively be published to all communities. Communities are used to restrict the visibility and accessibility of APIs, for example to particular business partners, internal organizations, or other groups of application developers.

Note: If you want to update a Product, you must republish it. The `products: update` command only updates a Product's metadata.

---

## Procedure

---

You can publish a product in any of the following ways:

- Publish a new Product.
- Replace a Product with another Product.
- Supersede a Product with another Product

For details of the ways in which you can publish a Product, see the following subtopics:

- [Publishing a new Product](#)

Publish a Product from within its containing Catalog in API Manager. The syndication feature in IBM API Connect means that you can also publish a Product from within its containing Space in a Catalog.

- [Replacing a Product with another Product](#)

You can replace a published Product in IBM API Connect with another Product, and automatically migrate subscribers to the new Product, by using the API Manager.

- [Superseding a Product with another Product](#)

You can supersede a published Product with another Product by using the API Manager.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Publishing a new Product

Publish a Product from within its containing Catalog in API Manager. The syndication feature in IBM® API Connect means that you can also publish a Product from within its containing Space in a Catalog.

### Before you begin

The Product that you are publishing must be in the Staged or Deprecated state.

To complete the Product management tasks that are described in this topic, you must either be the owner of the API provider organization, or be assigned Manage permission for Products in the Catalog that contains the Product. If you have View permission for Products, you have read-only access to the Product management page. For information on configuring Product management permissions for a Catalog, see [Creating and configuring Catalogs](#).

The syndication feature in IBM API Connect means that Products can be contained within a Space in a Catalog. In this case, to complete the Product management tasks that are described in this topic, you must either be the owner of the API provider organization, or be assigned Manage permission for Products in the Space that contains the Product. For information on configuring Product management permissions for a Space, see [Managing user access in a Space](#).

### About this task

You can complete this task either by using the API Designer UI application, or by using the browser based API Manager UI.

If you publish a Product to a non-development Catalog, the Product that is published is an independent and fixed copy of the version of the Product that you chose to stage. Editing the Product through the Products page will not affect the published Product. For this reason, it is recommended that when you stage a Product, you then create a new version of the Product to edit in future, so as to avoid confusion regarding the properties of the published Product. For more information on creating new versions of your Product, see [Creating a new version of your Product](#).

An exception is that if you publish a Product to a development Catalog, editing it through the Products page will enable you to re-stage and publish the same version of the Product. For information on how to create a development Catalog, see [Creating and configuring Catalogs](#).

Although you can publish to a development Catalog, the development Catalog should be used only for testing purposes. Similarly, a Developer Portal created from a development Catalog must be used for testing purposes only, and not for production use. For more information on Catalogs, see [Working with Catalogs](#).

Note: All references in this topic to a Catalog can also be applied to a Space in a Catalog, unless specified otherwise. For more information about Spaces, see [Using syndication in API Connect](#).

### Procedure

To publish a Product, complete the following steps:

1. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with. The Products page of the Catalog opens, and all of the Products available in that Catalog are displayed.
  2. If the Product that you want to work with is contained within a Space, select the required Space by completing the following steps:
    - a. Click the Spaces tab.
    - b. Select the Space that you want to work with. The Products page of the Space opens, and all of the Products available in that Space are displayed.
  3. Alongside the Product version that you want to work with, click the options icon  and then click Publish. The Confirm Visibility Settings page opens.
  4. Specify the following options:
    - The users that the Product is visible to  
You can choose Public users, Authenticated users, or Custom.
      - Custom - You can use the Type to add... field to search for organizations or communities that you want your Product to be visible to.
    - Who can subscribe to the Product  
You can add or remove one or more consumer organizations or communities.
      - Custom - You can use the Type to add... field to search for organizations or communities that you want to allow to subscribe to your Product.
  5. Click Publish, then click Confirm to proceed with the publish operation. If approval is required to publish Products in this Catalog, an approval request is sent, and the Product moves to the Pending state; the Product is published when the request is approved. If approval is not required, the Product version is published immediately, and moves to the Published state. For information on configuring Product lifecycle approvals for a Catalog, see [Creating and configuring Catalogs](#). For information on approving requests, see [Approving Product lifecycle and subscription requests](#).
- Note:
- Approval for Product lifecycle state changes in a Catalog is disabled by default. You must explicitly enable the Product lifecycle state changes that you want to enforce.
  - Product lifecycle approvals can be configured only at the Catalog level. This feature is not available at the Space level.
  - You can view the history of Product lifecycle requests and approvals, by clicking the options icon  alongside the Product that you want to work with, and selecting View Approval History.

## Results

---

Your Product is in the Published state.

Your Product is published to your Catalog and available to your specified organizations or communities. Application developers within the groups you selected can see and use the APIs within the Product.

Any application developer requests to use your Product are displayed on the Approvals tab in the containing Catalog, where you can decline or accept the request.

## Replacing a Product with another Product

You can replace a published Product in IBM® API Connect with another Product, and automatically migrate subscribers to the new Product, by using the API Manager.

## Before you begin

---

The Product to be replaced must be in the Published state, and the replacement Product must be in the Staged, Published, or Deprecated state.

To complete the Product management tasks that are described in this topic, you must either be the owner of the API provider organization, or be assigned Manage permission for Products in the Catalog that contains the Product. If you have View permission for Products, you have read-only access to the Product management page. For information on configuring Product management permissions for a Catalog, see [Creating and configuring Catalogs](#).

The syndication feature in IBM API Connect means that Products can be contained within a Space in a Catalog. In this case, to complete the Product management tasks that are described in this topic, you must either be the owner of the API provider organization, or be assigned Manage permission for Products in the Space that contains the Product. For information on configuring Product management permissions for a Space, see [Managing user access in a Space](#).

## About this task

---

When you replace a Product with another Product, the following actions are taken:

- The replacement Product is published.
- If the visibility and subscribability settings in the replacement Product are such that access is the same as, or less restrictive than, the original Product, the settings in the replacement Product are used. If the settings in the replacement Product are more restrictive, meaning that fewer consumer organizations can see or subscribe to the Product, the replace operation fails. For more information on visibility and subscribability settings, see [Changing the availability of a Product](#).
- The subscribers to the original Product are migrated to the replacement Product.  
Note: Customers cannot be migrated automatically from a free Plan to a paid Plan. To move your customers from a free Plan to a paid Plan, you can supersede the product with a new product and set a migration target to the paid Plan. The customers then select a button to migrate and must enter their credit card information before the process is complete. For more information, see [Considerations when changing a Product lifecycle with billing integration](#).
- The original Product is moved to the Retired state. Products in the Retired state are removed from the Developer Portal; they are no longer visible to the application developers, and any subscriptions to them are canceled. However, the Product can be staged again later if required.

Although you can publish to a development Catalog, the development Catalog should be used only for testing purposes. Similarly, a Developer Portal created from a development Catalog must be used for testing purposes only, and not for production use. For more information on Catalogs, see [Working with Catalogs](#).

Note: All references in this topic to a Catalog, can also be applied to a Space in a Catalog, unless specified otherwise.

## Procedure

---

To replace a Product, complete the following steps:

1. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with.  
The Products page of the Catalog opens, and all of the Products available in that Catalog are displayed.
2. If the Product that you want to work with is contained within a Space, select the required Space by completing the following steps:
  - a. Click the Spaces tab.
  - b. Select the Space that you want to work with.  
The Products page of the Space opens, and all of the Products available in that Space are displayed.
3. Alongside the Product version that you want to replace, click the options icon , then click Replace.  
The Replace window opens.
4. Select the replacement Product, then click Next.
5. From the drop-down list, select which Plans from your new Product correspond to Plans in your old Product.
6. Click Replace.

If approval is required to replace Products in this Catalog, an approval request is sent, and the Product moves to the Pending state; the Product is replaced when the request is approved. If approval is not required, the Product is replaced immediately. For information on configuring Product lifecycle approvals for a Catalog, see [Creating and configuring Catalogs](#). For information on approving requests, see [Approving Product lifecycle and subscription requests](#).

Note:

- Approval for Product lifecycle state changes in a Catalog is disabled by default. You must explicitly enable the Product lifecycle state changes that you want to enforce.
- Product lifecycle approvals can be configured only at the Catalog level. This feature is not available at the Space level.
- You can view the history of Product lifecycle requests and approvals, by clicking the options icon  alongside the Product that you want to work with, and selecting View Approval History.

## Results

---

Your new Product is in the Published state, and the original Product is in the Retired state.

Your new Product is published to your preferred organizations or communities. Application developers within the groups you selected can see and use the APIs within the Product.

Any application developer requests to use your Product are displayed on the Approvals tab in the containing Catalog, where you can decline or accept the request.

# Superseding a Product with another Product

You can supersede a published Product with another Product by using the API Manager.

## Before you begin

---

The Product to be superseded must be in the Published state. The superseding Product must be in the Staged, Published, or Deprecated state.

To complete the Product management tasks that are described in this topic, you must either be the owner of the API provider organization, or be assigned Manage permission for Products in the Catalog that contains the Product. If you have View permission for Products, you have read-only access to the Product management page. For information on configuring Product management permissions for a Catalog, see [Creating and configuring Catalogs](#).

The syndication feature in IBM® API Connect means that Products can be contained within a Space in a Catalog. In this case, to complete the Product management tasks that are described in this topic, you must either be the owner of the API provider organization, or be assigned Manage permission for Products in the Space that contains the Product. For information on configuring Product management permissions for a Space, see [Managing user access in a Space](#).

## About this task

---

When you supersede a Product with another Product, the following actions are taken:

- The superseding Product is published.
- If the visibility and subscribability settings in the superseding Product are such that access is the same as, or less restrictive than, the original Product, the settings in the superseding Product are used. If the settings in the superseding Product are such that access is more restrictive, meaning that fewer consumer organizations can see or subscribe to the Product, the supersede operation fails. For more information on visibility and subscribability settings, see [Changing the availability of a Product](#).
- The original Product is moved to the Deprecated state.
- The application developers that are already subscribed to the now deprecated Product can continue to use it, but no new developers can subscribe to the Product. In the Developer Portal the application developers will see a Migrate this subscription message, which they can click to upgrade their subscription to the migration target.
- The deprecated product can be published again if required.

Although you can publish to a development Catalog, the development Catalog should be used only for testing purposes. Similarly, a Developer Portal created from a development Catalog must be used for testing purposes only, and not for production use. For more information on Catalogs, see [Working with Catalogs](#).

Note: All references in this topic to a Catalog, can also be applied to a Space in a Catalog, unless specified otherwise.

## Procedure

---

To supersede a Product, complete the following steps:

1. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with. The Products page of the Catalog opens, and all of the Products available in that Catalog are displayed.

2. If the Product that you want to work with is contained within a Space, select the required Space by completing the following steps:
  - a. Click the Spaces tab.
  - b. Select the Space that you want to work with.

The Products page of the Space opens, and all of the Products available in that Space are displayed.

3. Alongside the Product version that you want to supersede, click the options icon  and then click Supersede.
4. Select the superseding Product and then click Next.
5. From the drop-down list, select which Plans from your new Product correspond to Plans in your old Product.
6. Click Supersede.

If approval is required to supersede Products in this Catalog, an approval request is sent, and the Product moves to the Pending state; the Product is superseded when the request is approved. If approval is not required, the Product is superseded immediately. For information on configuring Product lifecycle approvals for a Catalog, see [Creating and configuring Catalogs](#). For information on approving requests, see [Approving Product lifecycle and subscription requests](#).

Note:

- Approval for Product lifecycle state changes in a Catalog is disabled by default. You must explicitly enable the Product lifecycle state changes that you want to enforce.
- Product lifecycle approvals can be configured only at the Catalog level. This feature is not available at the Space level.
- You can view the history of Product lifecycle requests and approvals, by clicking the options icon  alongside the Product that you want to work with, and selecting View Approval History.

## Results

---

Your superseding Product is in the Published state.

The Product that was superseded is in the Deprecated state.

Your superseding Product is published to your preferred organizations or communities. Application developers within the groups you selected can see and use the APIs within the Product. The original Product is deprecated.

Any application developer requests to use your Product are displayed on the Approvals tab in the containing Catalog, where you can decline or accept the request.

Existing customers remain subscribed to the deprecated product, and any billing cycles for subscriptions to paid plans continue uninterrupted. For more information, see [Considerations when changing a Product lifecycle with billing integration](#).

# Migrating application subscriptions to another Product

By using the Products view within a Catalog in API Manager, you can migrate application subscriptions between Products. The syndication feature in IBM® API Connect means that you can also use the Products view within a Space in a Catalog to migrate application subscriptions.

## Before you begin

---

Your Product that you are migrating subscriptions from must be in one of the following states:

- Published
- Deprecated

To complete the Product management tasks that are described in this topic, you must either be the owner of the API provider organization, or be assigned Manage permission for Products in the Catalog that contains the Product. If you have View permission for Products in this Catalog, you will have read-only access to the Product management page. For information on configuring Product management permissions for a Catalog, see [Creating and configuring Catalogs](#).

The syndication feature in IBM API Connect means that Products can be contained within a Space in a Catalog. In this case, to complete the Product management tasks that are described in this topic, you must either be the owner of the API provider organization, or be assigned Manage permission for Products in the Space that contains the Product. For information on configuring Product management permissions for a Space, see [Managing user access in a Space](#).

## About this task

---

Application developers initially subscribe their applications to one or more Plans in Products by using the Developer Portal. For more information, see [Exploring APIs and Products in the Developer Portal](#). However, by using API Manager, for a chosen Product you can migrate one or more of its application subscriptions from one Plan to a Plan in another Product.

## Procedure

---

To migrate Product subscriptions, complete the following steps:

1. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with.  
The Products page of the Catalog opens, and all of the Products available in that Catalog are displayed.
2. If the Product that you want to work with is contained within a Space, select the required Space by completing the following steps:
  - a. Click the Spaces tab.
  - b. Select the Space that you want to work with.The Products page of the Space opens, and all of the Products available in that Space are displayed.
3. Alongside the Product version that you want to work with, click the options icon  and then click Migrate Subscriptions.
4. Select the Plan from which you want to migrate subscriptions, then click Next.
5. Select the subscriptions that you want to migrate, then click Next.
6. Select the Product that you want to migrate the subscriptions to, then click Next.
7. Select the Plan that you want to migrate the application subscriptions to, and then click Migrate.

## Results

---

The target Product has the migrated subscriptions, and those subscriptions are removed from the Product from which they were migrated.

## Related tasks

---

- [Working with Spaces](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Migrating application subscribers to new Product versions

When new versions of Products are created in IBM® API Connect, there are a number of ways that subscribers can be moved to the Plans of the new Product.

## About this task

---

You can move users to the new Plans in different ways, depending on your Product strategy, by using the options icon  alongside the Product in the associated Catalog in the API Manager UI.

## Procedure

---

To automatically migrate all existing subscribers to a new Product, for example, when you are applying fixes to a Product:

- You should Replace the original version of the Product with a new version of the Product.
    - The replacement Product is Published.
    - The original Product is Retired.
    - The subscribers to the original Product are automatically migrated to the replacement Product.  
Note: Customers cannot be migrated automatically from a free Plan to a paid Plan. To move your customers from a free Plan to a paid Plan, you can supersede the product with a new product and set a migration target to the paid Plan. The customers then select a button to migrate and must enter their credit card information before the process is complete. For more information, see [Considerations when changing a Product lifecycle with billing integration](#).
- For more information about replacing Products, see [Replacing a Product with another Product](#).

To encourage subscribers to move to a new Product, and stop new users from subscribing to the original Product, for example, if an enhancement or new feature is added:

- You should Supersede the original version of the Product with a new version of the Product.
    - The superseding Product is Published.
    - The original Product is Deprecated.
    - The application developers that are already subscribed to the now deprecated Product can continue to use it, but no new developers can subscribe to the Product. In the Developer Portal the subscribers will see a Migrate this subscription message, which they can click to upgrade their subscription to the migration target.
    - If the migration target is a paid Plan, subscribers must enter a payment method before they can upgrade. Upgrades by subscribers from a free Plan to a paid Plan are supported.
- For more information about superseding Products, see [Superseding a Product with another Product](#).

To prepare a Product to be removed from production, but leave the existing subscriptions as they are:

- You should Deprecate the original Product.
    - The Product is Deprecated.
    - The application developers that are already subscribed to the now deprecated Product can continue to use it, but no new developers can subscribe to the Product.
    - You can define a replacement Product by using the Set Migration Target option in the Catalog. Application developers will then see a Migrate this subscription message in the Developer Portal that they can click to upgrade their subscription to the migration target. If the upgrade target is a paid Plan, they must enter a payment method before upgrading. Upgrades by API consumers from a free Plan to a paid Plan are supported.
- For more information about deprecating Products, see [Deprecating a Product](#).

To give subscribers the option to move to a different Product, but without affecting the original Product:

- You can use the Set Migration Target option in the Catalog on a Product that isn't being deprecated or superseded. For more information, see [Managing your Products](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Changing the availability of a Product

You can change the availability of a Product and the associated Plans by using the Products view within a Catalog in API Manager. The syndication feature in IBM® API Connect means that you can also use the Products view within a Space in a Catalog to change the availability of a Product.

### Before you begin

To complete the Product management tasks that are described in this topic, you must either be the owner of the API provider organization, or be assigned Manage permission for Products in the Catalog that contains the Product. If you have View permission for Products, you have read-only access to the Product management page. For information on configuring Product management permissions for a Catalog, see [Creating and configuring Catalogs](#).

The syndication feature in IBM API Connect means that Products can be contained within a Space in a Catalog. In this case, to complete the Product management tasks that are described in this topic, you must either be the owner of the API provider organization, or be assigned Manage permission for Products in the Space that contains the Product. For information on configuring Product management permissions for a Space, see [Managing user access in a Space](#).

Note: All references in this topic to a Catalog can also be applied to a Space in a Catalog, unless specified otherwise. For more information about Spaces, see [Using syndication in API Connect](#).

### Procedure

To change the availability of a Product, complete the following steps:

1. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with.  
The Products page of the Catalog opens, and all of the Products available in that Catalog are displayed.
2. If the Product that you want to work with is contained within a Space, select the required Space by completing the following steps:
  - a. Click the Spaces tab.
  - b. Select the Space that you want to work with.The Products page of the Space opens, and all of the Products available in that Space are displayed.
3. Alongside the Product version that you want to work with, click the options icon , then click Edit visibility.  
The Visibility page opens.
4. In the Visibility section, specify the users that you want the Product to be visible to. You can choose Public to make the Product visible to all users, Authenticated to make the Product available to users who have successfully authenticated, or Custom to specify the consumer organizations and consumer organization groups that you want the Product to be visible to.  
If you select Custom, use the Type to add organizations field to search for the consumer organizations and consumer organization groups that you want the Product to be visible to. For information about how to create and manage consumer organizations and consumer organization groups, see [Working with consumer organizations](#).  
Use the Temporarily disable visibility check box to toggle whether the Product is or is not visible, without having to change other visibility settings.
5. In the Subscribability section, specify the users that can subscribe to the Plans in the Product. You can choose Authenticated to make the Plans in the Product subscribable by users who have successfully authenticated, or Custom to specify the consumer organizations and consumer organization groups that can subscribe to the Plans in the Product.  
If you select Custom, use the Type to add organizations field to search for the consumer organizations and consumer organization groups that can subscribe to the Plans in the Product. If you selected custom visibility, only the consumer organizations and consumer organization groups selected there are available for adding to the custom subscribability list. For information about how to create and manage consumer organizations and consumer organization groups, see [Working with consumer organizations](#).  
Use the Temporarily disable subscribability check box to toggle whether the Product can or cannot be subscribed to, without having to change other subscription settings.
6. Click Save when done.  
The Product version is configured with the modified availability settings.  
Note:
  - Changing who can view or subscribe to a Product does not affect the settings of the draft Product. The change applies only in the Catalog that was selected in Step 1.
  - Changing who can view or subscribe to a Product does not affect existing subscriptions.

### Results

Your Product remains in the same lifecycle state, now with new availability settings.

### Related tasks

- [Working with Spaces](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Deprecating a Product

You can deprecate a published Product by using the Manage Products page within a Catalog in API Manager. When you deprecate a Product, application developers that are already subscribed to the Product can continue to use it, but no new developers can subscribe to the Product. The syndication feature in IBM® API Connect means that you can also use the Manage Products page within a Space in a Catalog to deprecate a published Product.

### Before you begin

The Product that you are deprecating must be in the Published state.

To complete the Product management tasks that are described in this topic, you must either be the owner of the API provider organization, or be assigned Manage permission for Products in the Catalog that contains the Product. If you have View permission for Products, you have read-only access to the Product management page. For information on configuring Product management permissions for a Catalog, see [Creating and configuring Catalogs](#).

The syndication feature in IBM API Connect means that Products can be contained within a Space in a Catalog. In this case, to complete the Product management tasks that are described in this topic, you must either be the owner of the API provider organization, or be assigned Manage permission for Products in the Space that contains the Product. For information on configuring Product management permissions for a Space, see [Managing user access in a Space](#).

### Procedure

To deprecate a Product, complete the following steps:

1. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with. The Products page of the Catalog opens, and all of the Products available in that Catalog are displayed.
2. If the Product that you want to work with is contained within a Space, select the required Space by completing the following steps:
  - a. Click the Spaces tab.
  - b. Select the Space that you want to work with.The Products page of the Space opens, and all of the Products available in that Space are displayed.
3. Alongside the Product version that you want to work with, click the options icon , then click Deprecate. The Deprecate Product window opens.
4. Click Confirm to deprecate the Product. If approval is required to deprecate Products in this Catalog, an approval request is sent, and the Product moves to the Pending state; the Product is deprecated when the request is approved. If approval is not required, the Product is deprecated immediately. For information on configuring Product lifecycle approvals for a Catalog, see [Creating and configuring Catalogs](#). For information on approving requests, see [Approving Product lifecycle and subscription requests](#).

Note:

  - Approval for Product lifecycle state changes in a Catalog is disabled by default. You must explicitly enable the Product lifecycle state changes that you want to enforce.
  - Product lifecycle approvals can be configured only at the Catalog level. This feature is not available at the Space level.
  - You can view the history of Product lifecycle requests and approvals, by clicking the options icon  alongside the Product that you want to work with, and selecting View Approval History.

### Results

Your Product is in the Deprecated state.

## Retiring a Product

You can retire a published or deprecated Product by using the Manage Products page within a Catalog in API Manager. When a Product is retired, all associated APIs are taken offline, and any subscriptions are deleted. The syndication feature in IBM® API Connect means that you can also use the Manage Products page within a Space in a Catalog to retire a Product.

### Before you begin

The Product that you are retiring must be in the Published or Deprecated state.

To complete the Product management tasks that are described in this topic, you must either be the owner of the API provider organization, or be assigned Manage permission for Products in the Catalog that contains the Product. If you have View permission for Products, you have read-only access to the Product management page. For information on configuring Product management permissions for a Catalog, see [Creating and configuring Catalogs](#).

The syndication feature in IBM API Connect means that Products can be contained within a Space in a Catalog. In this case, to complete the Product management tasks that are described in this topic, you must either be the owner of the API provider organization, or be assigned Manage permission for Products in the Space that contains the Product. For information on configuring Product management permissions for a Space, see [Managing user access in a Space](#).

## Procedure

---

To retire a Product, complete the following steps.

1. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with.  
The Products page of the Catalog opens, and all of the Products available in that Catalog are displayed.
2. If the Product that you want to work with is contained within a Space, select the required Space by completing the following steps:
  - a. Click the Spaces tab.
  - b. Select the Space that you want to work with.The Products page of the Space opens, and all of the Products available in that Space are displayed.
3. Alongside the Product version that you want to work with, click the options icon  and then click Retire. The Retire Product window opens.
4. Click Confirm.

If approval is required to retire Products in this Catalog, an approval request is sent, and the Product moves to the Pending state; the Product is retired when the request is approved. If approval is not required, the Product is retired immediately. For information on configuring Product lifecycle approvals for a Catalog, see [Creating and configuring Catalogs](#). For information on approving requests, see [Approving Product lifecycle and subscription requests](#).

Note:

- Approval for Product lifecycle state changes in a Catalog is disabled by default. You must explicitly enable the Product lifecycle state changes that you want to enforce.
- Product lifecycle approvals can be configured only at the Catalog level. This feature is not available at the Space level.
- You can view the history of Product lifecycle requests and approvals, by clicking the options icon  alongside the Product that you want to work with, and selecting View Approval History.

## Results

---

Your Product is in the Retired state. It is also removed from the Developer Portal, is no longer visible to the application developers, and any subscriptions to it are deleted. You can stage the Product again later if required; for details, see [Staging a Product](#).

If the Product has any monetized Plans, the billing cycles for any subscriptions are canceled as well. For more information, see [Considerations when changing a Product lifecycle with billing integration](#).

## Re-staging a Product

---

If a Product in a Catalog has been retired, you can re-stage the Product so that it can re-enter the Product lifecycle. A re-staged Product moves to the Staged state, from where it can be published. The syndication feature in IBM® API Connect means that you can also re-stage a Product within a Space in a Catalog.

## Before you begin

---

The Product that you are re-staging must be in the Retired state.

To complete the Product management tasks that are described in this topic, you must either be the owner of the API provider organization, or be assigned Manage permission for Products in the Catalog that contains the Product. If you have View permission for Products, you have read-only access to the Product management page. For information on configuring Product management permissions for a Catalog, see [Creating and configuring Catalogs](#).

The syndication feature in IBM API Connect means that Products can be contained within a Space in a Catalog. In this case, to complete the Product management tasks that are described in this topic, you must either be the owner of the API provider organization, or be assigned Manage permission for Products in the Space that contains the Product. For information on configuring Product management permissions for a Space, see [Managing user access in a Space](#).

## About this task

---

You stage a Product so that the appropriate approvals, internally within the organization, can be given for it to then be published. For information on configuring Product lifecycle approvals for a Catalog, see [Creating and configuring Catalogs](#). For information on approving requests, see [Approving Product lifecycle and subscription requests](#). For information on publishing a Product, see [Publishing a Product](#).

## Procedure

---

To re-stage a Product, complete the following steps.

1. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with.  
The Products page of the Catalog opens, and all of the Products available in that Catalog are displayed.
  2. If the Product that you want to work with is contained within a Space, select the required Space by completing the following steps:
    - a. Click the Spaces tab.
    - b. Select the Space that you want to work with.The Products page of the Space opens, and all of the Products available in that Space are displayed.
  3. Alongside the Product version that you want to work with, click the options icon  and then click Re-stage. The Re-stage Product window opens.
  4. Click Confirm.  
If approval is required to stage Products in this Catalog, an approval request is sent, and the Product moves to the Pending state; the Product is re-staged when the request is approved. If approval is not required, the Product is re-staged immediately. For information on configuring Product lifecycle approvals for a Catalog, see [Creating and configuring Catalogs](#). For information on approving requests, see [Approving Product lifecycle and subscription requests](#).
- Note:
- Approval for Product lifecycle state changes in a Catalog is disabled by default. You must explicitly enable the Product lifecycle state changes that you want to enforce.
  - Product lifecycle approvals can be configured only at the Catalog level. This feature is not available at the Space level.
  - You can view the history of Product lifecycle requests and approvals, by clicking the options icon  alongside the Product that you want to work with, and selecting View Approval History.

## Results

---

Your Product is in the Staged state, from where it can be published; see [Publishing a new Product](#).

## Working with the subscriptions in a Product

You can work with the subscriptions to the Plans in a specific Product. Plan subscriptions are created by application developers in the Developer Portal.

## Procedure

---

To work with the Plan subscriptions in a Product, complete the following steps:

1. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with.  
The Products page of the Catalog opens, and all of the Products available in that Catalog are displayed.
2. Optional: If Spaces are enabled in the Catalog, select the Space that you want to work with by completing the following steps:
  - a. Click the Spaces tab.
  - b. Select the Space that you want to work with.For more information about enabling Spaces, see [Using syndication in API Connect](#).
3. Alongside the Product version that you want to work with, click the options icon  and then click View Subscriptions.  
A window opens listing all subscriptions to the Plans in the selected Product.
4. Alongside the subscription that you want to work with, click the options icon .  
You can then select from the following options:
  - View Consumer Organization: a window opens listing the consumer organization that the subscribing application belongs to. If required, you can click the options icon  to work with the consumer organization. For details of the available options, see [Working with consumer organizations](#).
  - View Application: a window opens listing the subscribing application. If required, you can click the options icon  to work with the application. For details of the available options, see [Working with developer applications](#).
  - View Plan: a window opens listing the Plan that the application is subscribed to. If required, you can click the options icon  to work with the Plan. For details of the available options, see [Working with Plans](#).

- View Product: a window opens listing the Product that contains the Plan that the application is subscribed to. If required, you can click the options icon  to work with the Product. For details of the available options, see [Managing your Products](#).

5. To display the Client ID's for a particular Product subscription, click the information icon  in the Application column for the subscription that you require.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Updating the gateway services for a Product

When you stage or publish a draft Product to a Catalog, you specify the gateway services at which the APIs in the Product are to be made available. However, you can later update the selected gateway services after a Product has been stage or published.

### Before you begin

To complete the Product management tasks that are described in this topic, you must either be the owner of the API provider organization, or be assigned Manage permission for Products in the Catalog that contains the Product. If you have View permission for Products, you have read-only access to the Product management page. For information on configuring Product management permissions for a Catalog, see [Creating and configuring Catalogs](#).

The syndication feature in IBM® API Connect means that Products can be contained within a Space in a Catalog. In this case, to complete the Product management tasks that are described in this topic, you must either be the owner of the API provider organization, or be assigned Manage permission for Products in the Space that contains the Product. For information on configuring Product management permissions for a Space, see [Managing user access in a Space](#).

### About this task

When you stage or publish a draft Product to a Catalog, you can either choose to make the APIs in the Product available at all the gateway services that match the gateway service type of the Product, either DataPower® API Gateway or DataPower Gateway (v5 compatible), or can you select specific gateway services of that type. The APIs in the Product can then be called at those gateway service endpoints.

However, after a Product has been staged or published you can later update the gateway services to change the selections.

For more information on staging and publishing a Product, see [Staging a draft Product](#) and [Publishing a draft Product](#).

For more information on the gateway service types, see [API Connect gateway types](#).

### Procedure

To update the gateway services for a Product, complete the following steps:

1. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with.  
The Products page of the Catalog opens, and all of the Products available in that Catalog are displayed.
2. If the Product that you want to work with is contained within a Space, select the required Space by completing the following steps:
  - a. Click the Spaces tab.
  - b. Select the Space that you want to work with.The Products page of the Space opens, and all of the Products available in that Space are displayed.
3. Alongside the Product version that you want to work with, click the options icon , then click Update gateway services.  
The Select Gateway Services window opens.
4. Select the required gateway services, then click Save.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Removing a Product from a Catalog

You can remove a Product from a specific Catalog by using the Products view within a Catalog in API Manager. The syndication feature in IBM® API Connect means that you can also use the Products view within a Space to remove a Product from a Catalog.

### Before you begin

The Product that you are removing from the Catalog must be in the Staged or Retired state. For more information, see [Staging a Product](#) or [Retiring a Product](#).

To complete the Product management tasks that are described in this topic, you must either be the owner of the API provider organization, or be assigned Manage permission for Products in the Catalog that contains the Product. If you have View permission for Products, you have read-only access to the Product management page. For information on configuring Product management permissions for a Catalog, see [Creating and configuring Catalogs](#).

The syndication feature in IBM API Connect means that Products can be contained within a Space in a Catalog. In this case, to complete the Product management tasks that are described in this topic, you must either be the owner of the API provider organization, or be assigned Manage permission for Products in the Space that contains

the Product. For information on configuring Product management permissions for a Space, see [Managing user access in a Space](#).

## Procedure

---

To remove a Product from a Catalog, complete the following steps.

1. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with.  
The Products page of the Catalog opens, and all of the Products available in that Catalog are displayed.
2. If the Product that you want to work with is contained within a Space, select the required Space by completing the following steps:
  - a. Click the Spaces tab.
  - b. Select the Space that you want to work with.The Products page of the Space opens, and all of the Products available in that Space are displayed.
3. Alongside the Product version that you want to work with, click the options icon , then click Delete.  
The Delete Product window opens.
4. Click Confirm to delete the Product.

## Results

---

Your Product is removed from the Catalog. You can stage the Product again if required; for details, see [Staging a Product](#).  
If your Product was contained within a Space in a Catalog, your Product is removed from both the Space and the Catalog.

## Related concepts

## Approving Product lifecycle and subscription requests

To approve or decline requests to change the lifecycle state of a Product, and requests by application developers to subscribe to a Plan, use the Tasks page in the Catalog that contains the associated Product in API Manager. The syndication feature in IBM® API Connect means that you can also use the Tasks page within a Space in a Catalog to approve or decline requests.

## Before you begin

---

To see lifecycle change requests for a Product, you must either be the owner of the API provider organization, or you must be assigned a user role that has permission to view or manage Products in the Catalog that contains the Product. For information on configuring Product management permissions for a Catalog, see [Creating and configuring Catalogs](#).

The syndication feature in API Connect means that Products can be contained within a Space in a Catalog. In this case, to see lifecycle change requests for a Product, you must either be the owner of the API provider organization, or you must be assigned a user role that has permission to view or manage Products in the Space that contains the Product. For information on configuring Product management permissions for a Space, see [Managing user access in a Space](#).

## About this task

---

If approvals for Product lifecycle changes are enabled for a Catalog, then an attempt to change the lifecycle state of a Product results in an approval request being sent. This request is displayed in the Tasks page in the Catalog, from where the request can be approved or declined. The authority to approve Product lifecycle state changes is restricted to users in specified roles. For information on configuring Product lifecycle approvals for a Catalog, see [Creating and configuring Catalogs](#).

Note:

- Approval for Product lifecycle state changes in a Catalog is disabled by default. You must explicitly enable the Product lifecycle state changes that you want to enforce.
- Product lifecycle approvals can be configured only at the Catalog level. This feature is not available at the Space level.
- You can view the history of Product lifecycle requests and approvals, by clicking the options icon  alongside the Product that you want to work with, and selecting View Approval History.

If a Product is set to require approval for subscription by application developers, then an attempt by an application developer to subscribe to the Product results in an approval request being sent. This request is displayed in the Approvals tab in the Catalog that contains the associated Product in API Manager, from where the request can be approved or declined.

## Procedure

---

To work with a Product lifecycle change request, complete the following steps.

1. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with.  
The Products page of the Catalog opens, and all of the Products available in that Catalog are displayed.
2. If the Product that you want to work with is contained within a Space, select the required Space by completing the following steps:
  - a. Click the Spaces tab.
  - b. Select the Space that you want to work with.The Products page of the Space opens, and all of the Products available in that Space are displayed.
3. Click the Tasks tab, then locate the Product lifecycle change request that you want to deal with.
4. Click the Approve or Decline as required.  
Note: You can approve or decline lifecycle change requests only if you have a user role that has permission to approve Product publish requests in the Catalog in which the changes will take place.  
For information on configuring Product management permissions for a Catalog, see [Creating and configuring Catalogs](#).

To work with a subscription request, complete the following steps.

5. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with.  
The Products page of the Catalog opens, and all of the Products available in that Catalog are displayed.
6. If the Product that you want to work with is contained within a Space, select the required Space by completing the following steps:
  - a. Click the Spaces tab.
  - b. Select the Space that you want to work with.The Products page of the Space opens, and all of the Products available in that Space are displayed.
7. Click the Tasks tab, then locate the subscription requests that you want to deal with.  
Note: To see subscription approvals, you must either be the owner of the API provider organization, or you must be assigned a user role that has permission to view or approve subscription requests. For information on creating and assigning user roles, see [Administering user access](#).
8. Click the Approve or Decline as required.  
Note: The options to approve or decline a subscription request are available only if you are assigned a user role that has permission to approve subscription requests. For information on configuring permissions for a Catalog, see [Creating and configuring Catalogs](#) For information on assigning user roles, see [Managing Catalog membership](#).

## Results

---

For a subscription request, an email is sent confirming whether you approved or declined the request. For a request to change the lifecycle state of a Product, no email is sent.

## Related concepts

---

- [Using syndication in API Connect](#)

## Related tasks

---

- [Working with Spaces](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.

# Working with APIs

For a specific Product, you can work with the APIs that are contained in the Plans in that Product.

## Procedure

---

To work with the APIs in a Product, complete the following steps:

1. List the Plans in the Product:
  - a. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with.
  - b. If Spaces are enabled in the Catalog, select the Space that you want to work with by completing the following steps:
    - i. Click the Spaces tab.
    - ii. Select the Space that you want to work with.
  - c. If the Products page is not already displayed, click the Products tab.
  - d. Alongside the Product version that you want to work with, click the options icon , then click View Plans.  
A window opens listing the Plans in the Product.
2. Alongside the required Plan, click View APIs.  
A window opens listing the APIs in the Plan.
3. Alongside the required API, click the options icon .  
You can then select from the following options:
  - Take Offline: if you take an API offline, the API is no longer available to be called. When required, you can make the API available again by selecting Online.
  - View Products: a window opens listing all the Products that contain the API. If required, you can click the options icon  alongside a Product to work with that Product. For details of the available options, see [Managing your Products](#).

- View Plans: a window opens listing all Plans, across all Products, that contain the API. If required, you can click the options icon  alongside a Plan to work with that Plan. For details of the available options, see [Working with Plans](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Working with Plans

After a Product has been published to a Catalog, you can work with the Plans in that Product.

### Before you begin

---

For details on configuring a Plan in a Product, see [Editing a draft Product](#).

For details on Publishing a Product to a Catalog, see [Publishing a Product](#).

To complete the tasks that are described in this topic, you must either be the owner of the API provider organization, or you must be assigned a role that has either the Product\_>Manage or the Product\_>View permission for the Catalog. For more information, see [Adding provider organization users and assigning roles](#) and [Managing Catalog membership](#). For information on configuring Product management permissions for a Catalog, see [Creating and configuring Catalogs](#).

### Procedure

---

To work with Plans in a Catalog, complete the following steps:

1. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with.  
The Products page of the Catalog opens, and all of the Products available in that Catalog are displayed.
2. If the Product that you want to work with is contained within a Space, select the required Space by completing the following steps:
  - a. Click the Spaces tab.
  - b. Select the Space that you want to work with.The Products page of the Space opens, and all of the Products available in that Space are displayed.
3. Alongside the Product version that you want to work with, click the options icon  and then click View Plans.  
A window opens listing all the Plans in the selected Product.
4. Alongside the Plan that you want to work with, click the options icon .  
You can then select from the following options:
  - View Product: a window opens listing the Product that contains the Plan. If required, you can click the options icon  to work with the Product. For details of the available options, see [Managing your Products](#).
  - View APIs: a window opens listing the APIs in the Plan. If required, you can click the options icon  alongside an API to work with that API. For details of the available options, see [Working with APIs](#).
  - View Subscriptions: a window opens listing the subscriptions to the Plan. If required, you can click the options icon  alongside a subscription to work with that subscriptions. For details of the available options, see [Working with application subscriptions](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Working with consumer organizations

Manage the consumer organizations that access your APIs and Plans when their users sign up to use the IBM® API Connect Developer Portal.

### About this task

---

Application developers in consumer organizations access the Developer Portal and sign up to use the Plans in the Products you create in the API Manager. You can create more than one consumer organization and each organization has one owner. Application developers are added through the Developer Portal UI.

You can also create groups of consumer organizations. A consumer organization group is an efficient way of grouping application developers together to publish Products to, making it easier to control who has access to the Plans in the Products.

Use the following tasks to administer your consumer organizations and consumer organization groups:

- [Creating a consumer organization](#)  
If you have permission to manage developers, you can create new consumer organizations in a Catalog. consumer organizations contain the application developers that subscribe to use the APIs that are published to the Catalog
- [Editing a consumer organization](#)  
You can change the title of an IBM API Connect consumer organization, and also transfer ownership to a new organization owner.

- [Deleting a consumer organization](#)  
When you delete a consumer organization, all of the resources in that organization are removed from the cloud. However, the account of the organization owner remains in IBM API Connect.
- [Working with the applications in a consumer organization](#)  
You can work with the developer applications that have been registered in a consumer organization.
- [Working with the subscriptions in a consumer organization](#)  
You can work with the Plan subscriptions that have been created by the developer applications registered in a consumer organization.
- [Working with consumer organization groups](#)  
A *consumer organization group* is a collection of consumer organizations, and provides an efficient way of controlling who can see, and subscribe to, the APIs in your Products. By using a consumer organization group, you can define this access for all the developers in the organizations in that group in a single operation, rather than having to define access for the organizations separately.
- [Sending messages to consumer organization owners](#)  
You can send email messages to the owners of consumer organizations. You can also style the email to match your business theme.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Creating a consumer organization

If you have permission to manage developers, you can create new consumer organizations in a Catalog. consumer organizations contain the application developers that subscribe to use the APIs that are published to the Catalog

### Before you begin

Your IBM® API Connect Developer Portal must be enabled to perform this task. For more information, see [Creating and configuring Catalogs](#). To complete this task, you must be defined as a member in a Catalog or Space (if Spaces are enabled), and you must be assigned a role that has the Consumer-Org\_ Manage permission. For more information, see [Adding provider organization users and assigning roles](#) and [Managing Catalog membership](#).

### About this task

You can create a consumer organization in either of the following ways:

- Invite a user to be a consumer organization owner, in which case they receive an invitation email with an activation link, and can complete the creation of the consumer organization and specify the title.
- Create the consumer organization yourself, specifying the owner and title. There are two ways you can specify the owner:
  - Specify the user ID of an existing user.
  - If you are using a Local User Registry, specify a new user ID; the user is added to the registry and becomes the owner of the consumer organization.

If Spaces are enabled in your Catalog, when you create a consumer organization, it is added to the Catalog and its Spaces. For more information about enabling Spaces, see [Using syndication in API Connect](#).

## Procedure

1. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with.
2. Optional: If Spaces are enabled in the Catalog, select the Space that you want to work with by completing the following steps:
  - a. Click the Spaces tab.
  - b. Select the Space that you want to work with.
 For more information about enabling Spaces, see [Using syndication in API Connect](#).
3. In the navigation pane of the API Manager UI, click the Consumers tab.
4. To invite a user to be a consumer organization owner, complete the following steps:
  - a. Click Add...Invite organization owner.
  - b. Enter the email address of the organization owner.
  - c. Click Invite.

The new consumer organization is added to the list, and an email invitation is sent to the owner; by using the activation link, the owner specifies the title of the organization. The status is shown as `Pending` until the recipient of the email clicks the link in the email to complete the creation of their Developer Portal account, after which the status changes to `Enabled`.

5. To create the consumer organization yourself, complete the following steps:
  - a. Click Add...Create organization.
  - b. Enter the organization Title. A Name is entered automatically.  
The value in the Name field is a single string that is used to identify the consumer organization in developer toolkit CLI commands. The title is used for display.  
To view the CLI commands to manage consumer organizations, see [apic consumer-orgs](#).
  - c. Select the required user registry.
  - d. Specify the organization owner; complete one or other of the following steps, either to specify an existing user, or to create a new user:
    - To specify the user ID of an existing API Connect user who is in the selected user registry, complete the following steps:
      - For the Type of user, select Existing.
      - In the Username field, enter the user ID of the organization owner  
After the consumer organization is created, the specified user can immediately log in to the Developer Portal associated with the Catalog.
    - If you selected a Local User Registry, then to specify a new user ID, complete the following steps:
      - For the Type of user, select New User.
      - In the Username field, enter the new user ID.

- Enter the Email, First Name, Last Name, and Password.  
After the consumer organization is created, the new user will have been added to the selected registry and can immediately log in to the Developer Portal associated with the Catalog, by using the specified user ID and password.

e. Click Create to complete the creation of the consumer organization.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Editing a consumer organization

You can change the title of an IBM® API Connect consumer organization, and also transfer ownership to a new organization owner.

### Before you begin

To complete this task, you must be defined as a member in a Catalog or Space (if Spaces are enabled), and you must be assigned a role that has the Consumer-Org\_ Manage permission. For more information, see [Adding provider organization users and assigning roles](#) and [Managing Catalog membership](#).

### About this task

If you transfer ownership, the new organization owner can be an existing user, or you can create a new user. When the ownership changes, the new owner is assigned administration privileges for the organization, and the previous owner has their administration privileges removed. If required, you can restore the privileges to the previous owner as described in [Administering members and roles](#).

If Spaces are enabled in your Catalog, when you edit the details of a consumer organization, the updates are applied to the Catalog and its Spaces. For more information about enabling Spaces, see [Using syndication in API Connect](#).

### Procedure

To change the title of a consumer organization, or to transfer ownership to a new organization owner, complete the following steps:

1. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with.
2. Optional: If Spaces are enabled in the Catalog, select the Space that you want to work with by completing the following steps:
  - a. Click the Spaces tab.
  - b. Select the Space that you want to work with.
3. In the navigation pane of the API Manager UI, click the Consumers tab.
4. Click the name of the consumer organization that you want to work with.
5. To change the title, enter a new title in the Title field, then click Save.
6. To transfer ownership, select the user registry for the consumer organization owner you want to transfer ownership to.

The remaining procedure varies according to the type of the selected user registry, as follows:

- Local User Registry
  - Select whether the user is an Existing user or a New User.
    - For an existing user, complete the following steps:
      - Enter the name of an existing API Connect user that has previously been invited to register and has activated their account.
      - Click Save.
    - For a new user, complete the following steps:
      - Enter a unique user name for the new user.
      - Supply an email address, name details, and a password.
      - Click Save.
- LDAP
  - Enter the name of a user that exists in the selected user registry.
  - Click Save.
- Authentication URL and OIDC
  - Enter the name of an existing API Connect user that has previously been invited to register and has activated their account. If the required organization owner has not previously been invited and activated their account, you must ensure they have been invited to the organization first.
  - Click Save.

### Results

If the title of the consumer organization is changed, all application developers that are members of that consumer organization will see the title change reflected in the Developer Portal user interface.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Deleting a consumer organization

When you delete a consumer organization, all of the resources in that organization are removed from the cloud. However, the account of the organization owner remains in IBM® API Connect.

### Before you begin

---

To complete this task, you must be defined as a member in a Catalog or Space (if Spaces are enabled), and you must be assigned a role that has the Consumer-Org. Manage permission. For more information, see [Adding provider organization users and assigning roles](#) and [Managing Catalog membership](#).

Important: If you delete a consumer organization, client IDs and secrets associated with applications that were registered by users in the consumer organization can no longer be used to call APIs. However, the account of the organization owner remains in API Connect.

### About this task

---

When you delete a consumer organization, it is removed permanently and users can no longer access that organization.

If Spaces are enabled in your Catalog, when you delete a consumer organization, it is deleted from the Catalog and its Spaces. For more information about enabling Spaces, see [Using syndication in API Connect](#).

### Procedure

---

To delete a consumer organization, complete the following steps:

1. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with.
2. Optional: If Spaces are enabled in the Catalog, select the Space that you want to work with by completing the following steps:
  - a. Click the Spaces tab.
  - b. Select the Space that you want to work with.For more information about enabling Spaces, see [Using syndication in API Connect](#).
3. In the navigation pane of the API Manager UI, click the Consumers tab.
4. Click the options icon  alongside the consumer organization you want to work with, then click Delete.
5. Click Confirm to delete the consumer organization.

Note: If the consumer organization is the only one specified in the custom visibility settings for a published Product, the deletion operation will fail. For more information, see [Changing the availability of a Product](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Working with the applications in a consumer organization

You can work with the developer applications that have been registered in a consumer organization.

### Procedure

---

To work with applications, complete the following steps:

1. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with.
2. Optional: If Spaces are enabled in the Catalog, select the Space that you want to work with by completing the following steps:
  - a. Click the Spaces tab.
  - b. Select the Space that you want to work with.For more information about enabling Spaces, see [Using syndication in API Connect](#).
3. In the navigation pane of the API Manager UI, click the Consumers tab.
4. Click the options icon  for the consumer organization that you want to work with, then click View Applications. A window opens listing all the developer applications that have been registered in the consumer organization.
5. To view and edit the details of an application, click the title of the application.
6. Further options are available by clicking the options icon  alongside the application you want to work with. For details, see [Working with developer applications](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Working with the subscriptions in a consumer organization

You can work with the Plan subscriptions that have been created by the developer applications registered in a consumer organization.

## Procedure

---

To work with Plan subscriptions, complete the following steps:

1. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with.
2. Optional: If Spaces are enabled in the Catalog, select the Space that you want to work with by completing the following steps:
  - a. Click the Spaces tab.
  - b. Select the Space that you want to work with.For more information about enabling Spaces, see [Using syndication in API Connect](#).
3. In the navigation pane of the API Manager UI, click the Consumers tab.
4. Click the options icon  for the consumer organization that you want to work with, then click View Subscriptions.  
A window opens listing all the Plan subscriptions that have been created by the developer applications registered in the consumer organization. If required, you can click the options icon  alongside a subscription to work with that subscription. For details of the available options, see [Working with application subscriptions](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Working with consumer organization groups

A *consumer organization group* is a collection of consumer organizations, and provides an efficient way of controlling who can see, and subscribe to, the APIs in your Products. By using a consumer organization group, you can define this access for all the developers in the organizations in that group in a single operation, rather than having to define access for the organizations separately.

### About this task

---

A consumer organization group might represent particular business partners, internal organizations, or other groups of application developers.

When you create a Product, you can define which application developers can access the APIs in that Product. You can configure the following types of access:

- Visibility, which specifies the application developers who can see the APIs in the Developer Portal.
- Subscribability, which specifies the application developers who can create subscribe to use the APIs.

You configure this access by selecting the required consumer organizations, and Consumer organization groups. You can also change the visibility and subscribability settings for a Product after it has been published. For more information, see [Creating a draft Product](#) and [Changing the availability of a Product](#).

## Procedure

---

To work with consumer organization groups, you first navigate to the Consumer organization groups page. You then create new groups, send an email to the owners of the consumer organizations in a group, and edit or delete existing groups.

- Navigating to the required consumer organization groups page.
  1. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with.
  2. If Spaces are enabled in the Catalog, select the Space that you want to work with by completing the following steps:
    - a. Click the Spaces tab.
    - b. Select the Space that you want to work with.
  3. Click the Consumers tab, then click Manage Groups.
- Creating a consumer organization group.
  1. Click Add.
  2. Enter a Title for the new group and, optionally, a Summary. A Name is entered automatically. The title is used for display.
  3. Use the Search orgs/groups field to search for, and select, the consumer organizations that you want to add to the group.  
**Note:** To prevent excessive search results lists, only the first 10 matches are displayed when you begin typing in the field; lengthen your search string to shorten the list for locating the required consumer organization.
  4. Click Save to create the group.
- Editing a consumer organization group.
  1. Click the options icon  for the consumer organization group that you want to work with, then click Edit.
  2. Make the required updates, then click Save.**Note:** If you remove a consumer organization from a group, and that group is specified in the custom visibility settings for a Product, applications in that consumer organization can no longer subscribe to the Product. However, any existing subscriptions are not affected. For information on managing visibility and subscribability settings, see [Editing a draft Product](#).
- Deleting a consumer organization group.
  1. Click the options icon  for the consumer organization group that you want to work with, then click Delete.
  2. Click Confirm to delete the group.
- Sending an email to the owners of the consumer organizations in a consumer group
  1. Click the options icon  for the consumer organization group that you want to work with, then click Message owners.  
The Send message window opens, and the email addresses of the consumer organization owners are displayed as the recipients.
  2. Enter the subject of the message in the Subject field.
  3. Enter the content of the message in the Message field, then click Send.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

# Sending messages to consumer organization owners

You can send email messages to the owners of consumer organizations. You can also style the email to match your business theme.

## Before you begin

To complete this task, you must be defined as a member in a Catalog or Space (if Spaces are enabled), and you must be assigned a role that has the Consumer-Org\_> Manage permission. For more information, see [Adding provider organization users and assigning roles](#) and [Managing Catalog membership](#).

Note: You can also send email messages by using the developer toolkit CLI, or by using the API Connect REST APIs. See [API development and management commands](#), or [API Connect REST APIs](#), for more information.

## Procedure

To send a message, complete the following steps:

1. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with.
2. Optional: If Spaces are enabled in the Catalog, select the Space that you want to work with by completing the following steps:
  - a. Click the Spaces tab.
  - b. Select the Space that you want to work with.For more information about enabling Spaces, see [Using syndication in API Connect](#).
3. In the navigation pane of the API Manager UI, click the Consumers tab.
4. You can either send a message to the owner of a specific consumer organization, or to the owners of multiple selected consumer organizations.
  - To send a message to the owner of a specific consumer organization, click the options icon  alongside the consumer organization you want to work with, then click Message owner. The Send Message window opens, and the email address of the consumer organization owner is displayed as the recipient.
  - To send a message to the owners of multiple selected consumer organizations, complete the following steps:
    - Click the options icon  alongside the Add button, then click Message owners.
    - Select the required consumer organizations, then click Next. The Send Message window opens, and the email addresses of the selected consumer organization owners are displayed as the recipients.
5. Enter the subject of the message in the Subject field.
6. Select the Content type that you want to use for the entering the content of the message, from HTML, PlainText, or Both. The default content type is PlainText. An edit window for the selected content type is displayed, or both edit windows are displayed if Both is selected. For HTML content, only the tags and their attributes that are shown in the following table are allowed.

Table 1. List of allowed HTML tags and their attributes

HTML tag	Attribute
<a>	"class", "href", "hreflang", "style"
<em>	"class", "style"
<strong>	"class", "style"
<cite>	"class", "style"
<blockquote>	"class", "cite", "style"
<code>	"class", "style"
<ul>	"class", "type", "style"
<ol>	"class", "start", "type", "style"
<li>	"class", "style"
<dl>	"class", "style"
<dt>	"class", "style"
<dd>	"class", "style"
<h1>	"class", "id", "style"
<h2>	"class", "id", "style"
<h3>	"class", "id", "style"
<h4>	"class", "id", "style"
<h5>	"class", "id", "style"
<h6>	"class", "id", "style"
<p>	"class", "style"
<div>	"class", "style"
 	"class", "style"
<span>	"class", "style"
<img>	"class", "src", "alt", "data-entity-type", "data-entity-uuid", "data-align", "data-caption", "width", "height", "style"
<table>	"class", "id", "style"
<tr>	"class", "id", "style"
<td>	"class", "id", "style"

If an HTML tag that is not allowed is used in a notification, the tag and its contents are displayed in the email as plain text.

Images can be used by adding a `<img`

`src="https://path/to/image.png"/>` tag in the template. The `src` attribute for the image must be a fully qualified web URL, and must be externally accessible so that the email recipients can access the image. It's not possible to reference local images, they must be fully qualified URLs. It's also not possible to embed or attach images or other files in the emails.

7. Enter the content of the message.
8. Click Send.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Working with developer applications

You can work with the applications that have been registered in the Developer Portal associated with a Catalog.

### Procedure

---

To work with developer applications, complete the following steps.

1. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with.
2. Optional: If Spaces are enabled in the Catalog, select the Space that you want to work with by completing the following steps:
  - a. Click the Spaces tab.
  - b. Select the Space that you want to work with.For more information about enabling Spaces, see [Using syndication in API Connect](#).
3. Click the Applications tab.

All applications that have been registered in the Developer Portal associated with this Catalog are listed.
4. To view and edit the details of an application, click the title of the application.
5. Further options are available by clicking the options icon  alongside the application you want to work with, as follows:
  - Client ID: lists the Client IDs for the application. You can add new client ID/client secret credentials; you can copy the client secret only at creation time. An option is provided for deleting any of the credentials from the application.
  - Create Subscription: subscribe the application to a Plan in a Product; select the required Plan and Product, then click Create Subscription.
  - View Subscriptions: a window opens listing summary details of all the Plan subscriptions for the application. If required, you can click the options icon  alongside a subscription to work with that subscriptions. For details of the available options, see [Working with application subscriptions](#).
  - View Consumer Organization: a window opens listing the consumer organization that the application belongs to. If required, you can click the options icon  to work with the consumer organization. For details of the available options, see [Working with consumer organizations](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Working with application subscriptions

You can work with the subscriptions to the Plans in all the Products in a specific Catalog. Plan subscriptions are created by application developers in the Developer Portal.

### Procedure

---

To work with application subscriptions, complete the following steps:

1. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with.

The Products page of the Catalog opens, and all of the Products available in that Catalog are displayed.
2. Optional: If Spaces are enabled in the Catalog, select the Space that you want to work with by completing the following steps:
  - a. Click the Spaces tab.
  - b. Select the Space that you want to work with.For more information about enabling Spaces, see [Using syndication in API Connect](#).
3. Click the Subscriptions tab.

A window opens listing all subscriptions to the Plans in all the Products in the Catalog.
4. Alongside the subscription that you want to work with, click the options icon .

You can then select from the following options:

  - View Consumer Organization: a window opens listing the consumer organization that the subscribing application belongs to. If required, you can click the options icon  to work with the consumer organization. For details of the available options, see [Working with consumer organizations](#).
  - View Application: a window opens listing the subscribing application. If required, you can click the options icon  to work with the application. For details of the available options, see [Working with developer applications](#).
  - View Plan: a window opens listing the Plan that the application is subscribed to. If required, you can click the options icon  to work with the Plan. For details of the available options, see [Working with Plans](#).
  - View Product: a window opens listing the Product that contains the Plan that the application is subscribed to. If required, you can click the options icon  to work with the Product. For details of the available options, see [Managing your Products](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Security and authentication

In API Manager, you can use TLS profiles to secure the transmission of data between the management server and other API Connect subsystems and external services, and also configure user registries to securely authenticate your Catalogs and APIs.

For details of authentication in IBM API Connect, see the following subtopics:

- [Creating a TLS client profile](#)  
In the IBM API Connect API Manager interface, TLS profiles are used to secure transmission of data between the management server and other API Connect subsystems and external services. TLS and SSL certificates guarantee that information you submit will not be stolen or tampered with. In this topic, you learn how to create a TLS profile in API Manager.
- [Authenticating by using your enterprise user registry](#)  
IBM API Connect supports a variety of user registry types for authenticating users and securing APIs.
- [Configuring a native OAuth provider](#)  
Native OAuth providers are configured and managed by you within your cloud.
- [Configuring a third-party OAuth provider](#)  
Enter the secure endpoints to provide OAuth authentication from a third party.
- [OAuth concepts for API Connect](#)  
OAuth is a token-based authorization protocol that allows third-party websites or applications to access user data without requiring the user to share personal information.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Creating a TLS client profile

In the IBM® API Connect API Manager interface, TLS profiles are used to secure transmission of data between the management server and other API Connect subsystems and external services. TLS and SSL certificates guarantee that information you submit will not be stolen or tampered with. In this topic, you learn how to create a TLS profile in API Manager.

---

### Before you begin

One of the following roles is required to configure TLS Profiles:

- Organization Administrator
- Owner
- Custom role with the `Settings: Manage permissions`

---

### About this task

API Connect supports the use of TLS and SSL certificates, but does not itself produce strong encryption keys or manage your encryption keys. Encryption keys should be created and managed according to your own procedures. For more information, see [Viewing certificate details and adding certificates to a keystore or truststore](#) and [Generating a PKCS#12 file for Certificate Authority](#).

Note: If you update a TLS profile that is associated with a Gateway service, the updates are not automatically propagated to Gateway servers. For instructions on how to configure the toolkit command-line tool to use TLS certificates when connecting to API Manager, see [Configuring the command-line tool to use TLS certificates](#).

---

## Procedure

To create a TLS profile, complete the following steps:

1. In the API Manager, click  Resources.
2. Select TLS.
3. Click Create in the TLS Client Profile table.
4. Enter the fields to configure the TLS Client Profile:

Field	Description
Title (required)	Enter a Title for the profile. The title is displayed on the screen.

Field	Description
Name (required)	<p>The Name is auto-generated. The value in the Name field is a single string that can be used in developer toolkit CLI commands. To view the CLI commands to manage a TLS Client Profile, see <a href="#">apic tls-client-profiles</a>.</p> <p>Important: The name of the TLS Client Profile as saved on the DataPower® Gateway, depending on the gateway type, is as follows:</p> <ul style="list-style-type: none"> <li>DataPower API Gateway: <pre>provider-org-name_catalog-name_tlsp-tls-profile-nameV1.0.0</pre> </li> <li>DataPower Gateway (v5 compatible): <pre>provider-org-name-tls-profile-nameV1.0.0</pre> </li> </ul> <p>where</p> <ul style="list-style-type: none"> <li><i>tls-profile-name</i> is the value of the auto-generated Name field for the TLS client profile in API Connect.</li> <li><i>provider-org-name</i> is the name of the provider organization containing the TLS client profile.</li> <li><i>catalog-name</i> is the name of the Catalog, in that provider organization, containing the TLS client profile.</li> </ul>
Version (required)	Assign a version number for the profile. Using version numbers allows you to create multiple server profiles with the same name and different configurations, for example, <i>MyProfile 1.0</i> and <i>MyProfile 1.1</i> .
Summary (optional)	Enter a description of the profile.
Protocols (required)	Select one or more supported TLS protocol versions. The default is 1.2.
Server Connection (optional)	<p>Specify whether to support weak or insecure credentials.</p> <ul style="list-style-type: none"> <li>Allow insecure server connections - Insecure server connections may result from self-signed certificates, expired or corrupted certificates, or certificates from an unknown or untrusted source. Check this box to allow the connection to proceed with an insecure connection. The default is to not allow insecure server connections.</li> <li>Support Server Name Indication (SNI) - Check this box to enable SNI. SNI allows support for multiple certificates presented on the same IP address using different host names. The client profile sends the name of a virtual domain as part of the TLS negotiation. The default is to enable SNI.</li> </ul>
Keystore (optional)	A Keystore is a repository containing public and private key pairs. Select the keystore where you will store the certificates for the profile. Default keystores are provided, and you can also create your own.
Truststore (optional)	A Truststore is a repository containing verified public keys, which are usually obtained from a third-party certificate authority. Truststores provide secure identification for peer systems. A truststore is usually used when mutual authentication is enabled. Select a truststore for the profile. Default truststores are provided, and you can also create your own.
Ciphers (required)	<p>Cipher suites are encryption/decryption algorithms used to secure HTTPs communication within the API Connect ecosystem. Select the ciphers that the profile supports.</p> <p>Note: The TLS 1.3 ciphers are clearly indicated. If you select TLS version 1.3 as one of the protocols for the profile but do not select any TLS 1.3 ciphers, <b>all</b> the TLS 1.3 ciphers are added to the list of ciphers supported by the profile. If you do not select TLS version 1.3 but select one or more TLS 1.3 ciphers, those ciphers are <b>not</b> added to the list of ciphers supported by the profile.</p>

5. Click Save.

- [Creating a Keystore](#)  
Keystores contain matched pairs of public certificates and private keys used to confirm identity and encrypt/decrypt data transmission over HTTPS.
- [Creating a Truststore](#)  
Truststores are repositories containing trusted certificates with verified public keys. The certificates in the truststore are usually obtained from a third-party certificate authority (CA).
- [Generating a PKCS#12 file for Certificate Authority](#)  
PKCS#12 (P12) files define an archive file format for storing cryptographic objects as a single file. API Connect supports the P12 file format for uploading a keystore and truststore. The keystore should contain both a private and public key along with intermediate CA certificates.
- [Generating a self-signed certificate using OpenSSL](#)  
OpenSSL is an open source implementation of the SSL and TLS protocols. It provides the transport layer security over the normal communications layer, allowing it to be intertwined with many network applications and services.
- [Viewing certificate details and adding certificates to a keystore or truststore](#)  
You can view details for the certificates in an existing keystore or truststore and add additional certificates. You might need add certificates when a certificate or PKCS #12 (P12) file expires.
- [Defining elliptic curve cryptographic schemes for a TLS client profile](#)  
You define the elliptic curve cryptographic schemes for a TLS client profile by using the developer toolkit CLI.

## Related tasks

- [Working with user registries](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Creating a Keystore

Keystores contain matched pairs of public certificates and private keys used to confirm identity and encrypt/decrypt data transmission over HTTPS.

## Before you begin

API Manager supports and uses TLS certificates, but does not produce strong encryption keys or manage your encryption keys. Encryption keys are generated and managed according to your own procedures. For more information, see [Generating a PKCS#12 file for Certificate Authority](#) and [Generating a self-signed certificate using OpenSSL](#).

One of the following roles is required to configure Keystores:

- Organization Administrator
- Owner
- Custom role with the `Settings: Manage permissions`

## About this task

API Connect includes pre-configured Keystores which may be used for testing purposes. For production environments, we suggest creating a new, secure Keystore.

## Procedure

Perform the following steps to create a TLS Client profile:

1. In the API Manager, click  Resources.
2. Select TLS.
3. Click Create in the Keystore table.

Field	Description
Title (required)	Enter a Title for the Keystore. The title is displayed on the screen.
Name (required)	The Name is auto-generated. The value in the Name field is a single string that can be used in developer toolkit CLI commands. To view the CLI commands to manage keystores, see <a href="#">apic keystores</a> .
Summary (optional)	Enter a brief description.
Private Key & Public Key: Step 1: Upload private key	Upload the file containing the private key certificate. If necessary, you can click Browse to locate the file. If the file contains both the private and public keys, upload it in Step 1. Private and public keys are always uploaded in pairs, either in a single file or separate files.
Private key password (optional)	Enter the password for the private key if it has a password.
Private Key & Public Key: Step 2: Upload public key	If the public key is contained in a separate file, upload it in Step 2. Private and Public keys are always uploaded in pairs, either in a single file or separate files.

4. Click Save.

Note: After they have been uploaded, private keys cannot be downloaded from API Connect.

## Related tasks

- [Creating a Truststore](#)
- [Generating a PKCS#12 file for Certificate Authority](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Creating a Truststore

Truststores are repositories containing trusted certificates with verified public keys. The certificates in the truststore are usually obtained from a third-party certificate authority (CA).

## Before you begin

One of the following roles is required to configure truststores:

- Organization Administrator
- Owner
- Custom role with the `Settings: Manage permissions`

## About this task

API Manager supports and uses TLS certificates, but does not produce strong encryption keys or manage your encryption keys. Encryption keys are generated and managed according to your own procedures. For more information, see [Generating a PKCS#12 file for Certificate Authority](#) and [Generating a self-signed certificate using OpenSSL](#).

API Connect includes pre-configured Truststores which may be used for testing purposes. For production environments, we suggest creating a new, secure Truststore.

## Procedure

1. In the API Manager, click  Resources.
2. Select TLS.

3. Click Create in the Truststore table.

Field	
Title (required)	Enter a Title for the Truststore. The title is displayed on the screen.
Name (required)	The Name is auto-generated. The value in the Name field is a single string that can be used in developer toolkit CLI commands. To view the CLI commands to manage truststores, see <a href="#">apic truststores</a> .
Summary (optional)	Enter a brief description.
Public Keys	Upload the file containing the public key certificate. If necessary you can click Browse to locate the file.

4. Click Save.

## Related tasks

- [Creating a TLS client profile](#)
- [Creating a Keystore](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Generating a PKCS#12 file for Certificate Authority

PKCS#12 (P12) files define an archive file format for storing cryptographic objects as a single file. API Connect supports the P12 file format for uploading a keystore and truststore. The keystore should contain both a private and public key along with intermediate CA certificates.

### Before you begin

One of the following roles is required to add a key to a keystore or truststore:

- Organization Administrator
- Owner
- Custom role with the `Settings: Manage permissions`

Before you can generate a P12 file, you must have a private key (for example: `key.pem`), a signed certificate by a Certificate Authority (for example `certificate.pem`) and one or more certificates from the CA authority (known as *intermediate CA certificates*).

Note: If your certificate file contains more than one certificate, you must manually split the file and create a single file for each entry. Each entry must be bound by the following markers:

```
-----BEGIN CERTIFICATE-----  
-----END CERTIFICATE-----
```

### Procedure

1. If you have intermediate certificates from your CA, concatenate them into a single `.pem` file to build your `caChain`. Be sure to enter a new line following each certificate's data.

```
cat ca1.pem ca2.pem ca3.pem > caChain.pem  
cat caChain.pem  
-----BEGIN CERTIFICATE-----  
MIIEPjCCA46gAwIBAgIQEod26KZabjd+BQMG1Dw16jANBgkqhkiG9w0BAQUFADC  
...  
lQX7CkTJn61AJUsyEa8H/gjVQnHp4VOLFR/dKgeVcCRvZF7Tt5AuiyHY  
-----END CERTIFICATE-----  
-----BEGIN CERTIFICATE-----  
MIIEPDCAySgAwIBAgIQSEus8arH1xND0aJ0NumXJTANBgkqhkiG9w0BAQUFADBv  
...  
-----END CERTIFICATE-----  
-----BEGIN CERTIFICATE-----  
MIIEENjCCA46gAwIBAgIBATANBgkqhkiG9w0BAQUFADBvMQswCQYDVQQGEwJTRTEU  
...  
-----END CERTIFICATE-----
```

2. Create the P12 file including the private key, the signed certificate and the CA file you created in step 1, if applicable. Omit the `-CAfile` option if you don't have CA certificates to include.

The following command uses OpenSSL, an open source implementation of the SSL and TLS protocols.

```
openssl pkcs12 -inkey key.pem -in certificate.pem -export -out certificate.p12 -CAfile caChain.pem -chain
```

Once the certificate file is created, it can be uploaded to a keystore.

3. Once the certificate file is created, it can be uploaded to a Truststore. In the API Manager, click .
4. Select TLS.
5. Click Create in the Keystore table.
6. Create a Keystore and upload the certificate file following the instructions at [Creating a Keystore](#).

Note:

- API Connect supports only the P12 (PKCS12) format file for the present certificate.
- Your P12 file must contain the private key, the public certificate from the Certificate Authority, and all intermediate certificates used for signing.
- Your P12 file can contain a maximum of 10 intermediate certificates.

7. Click Save.

## Results

---

Your P12 file is generated and ready to upload.

## What to do next

---

Upload your P12 file to IBM® API Connect. For more information, see [Creating a TLS client profile](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Generating a self-signed certificate using OpenSSL

OpenSSL is an open source implementation of the SSL and TLS protocols. It provides the transport layer security over the normal communications layer, allowing it to be intertwined with many network applications and services.

### Before you begin

---

One of the following roles is required to complete this task:

- Organization Administrator
- Owner
- Custom role with the `Settings: Manage permissions`

### About this task

---

This topic tells you how to generate a self-signed SSL certificate request using the OpenSSL toolkit to enable HTTPS connections.

### Procedure

---

To generate a self-signed SSL certificate using the OpenSSL, complete the following steps:

1. Write down the Common Name (CN) for your SSL Certificate. The CN is the fully qualified name for the system that uses the certificate. For static DNS, use the hostname or IP address set in your Gateway Cluster (for example, `192.16.183.131` or `dp1.acme.com`).
2. Run the following OpenSSL command to generate your private key and public certificate. Answer the questions and enter the Common Name when prompted.

```
openssl req -newkey rsa:2048 -nodes -keyout key.pem -x509 -days 365 -out certificate.pem
```

3. Review the created certificate:

```
openssl x509 -text -noout -in certificate.pem
```

4. Combine your key and certificate in a PKCS#12 (P12) bundle:

```
openssl pkcs12 -inkey key.pem -in certificate.pem -export -out certificate.p12
```

5. Validate your P2 file.

```
openssl pkcs12 -in certificate.p12 -noout -info
```

Once the certificate file is created, it can be uploaded to a keystore.

6. In the API Manager, click  Resources.
7. Select TLS.
8. Click Create in the Keystore table.
9. Create a Keystore and upload the certificate file following the instructions at [Creating a Keystore](#).

Note:

- API Connect supports only the P12 (PKCS12) format file for the present certificate.
- Your P12 file must contain the private key, the public certificate from the Certificate Authority, and all intermediate certificates used for signing.
- Your P12 file can contain a maximum of 10 intermediate certificates.

10. Click Save.

---

## Viewing certificate details and adding certificates to a keystore or truststore

You can view details for the certificates in an existing keystore or truststore and add additional certificates. You might need add certificates when a certificate or PKCS #12 (P12) file expires.

---

### Before you begin

One of the following roles is required to edit Keystores and Truststores:

- Organization Administrator
- Owner
- Custom role with the `Settings: Manage permissions`

---

### About this task

API Connect includes pre-configured Keystores and Truststores which can be used for testing purposes. For production environments, we suggest creating a new, secure Keystore or Truststore. From an existing Keystore or Truststore, you can edit the title, view the details of the certificates, and add new certificates.

---

### Procedure

To work with existing Keystores and Truststores:

1. In the API Manager, click  Resources.
2. Select TLS.
3. Click the name of the keystore or truststore.
4. Edit the name and summary if needed.
5. The Subject, Finger Print, and Expiration date is shown for each certificate in the keystore or truststore. Click > to view the certificate details.
6. Add additional private and/or public keys if needed.
7. Click Save.

Note: After they have been uploaded, private keys cannot be downloaded from API Connect.

---

## Defining elliptic curve cryptographic schemes for a TLS client profile

You define the elliptic curve cryptographic schemes for a TLS client profile by using the developer toolkit CLI.

---

### About this task

To define elliptic curve cryptographic schemes for a TLS client profile, you include `elliptic_curve_auto_negotiation` and `elliptic_curve` properties in a YAML file definition for the TLS client profile. The `elliptic_curve` property lists the required elliptic curve cryptographic schemes. For example:

```
elliptic_curve_auto_negotiation: false
elliptic_curve:
  - secp521r1
  - secp384r1
  - prime256v1
```

You then use the developer toolkit CLI to create the TLS client profile in API Connect.

When `elliptic_curve_auto_negotiation` is set to `true`, the system negotiates the Elliptic-curve Diffie-Hellman (ECDH) key agreement automatically with its peer, and any `elliptic_curve` property settings are ignored.

The following example shows a complete YAML file for a TLS client profile:

```
type: tls_client_profile
name: my-tls-client-profile
version: 1.0.0
title: My TLS client profile
protocols:
  - tls_v1.2
ciphers:
  - ECDHE_ECDSA_WITH_AES_256_GCM_SHA384
elliptic_curve_auto_negotiation: false
elliptic_curve:
```

```
- sect163k1
insecure_server_connections: false
server_name_indication: true
```

Note:

- The `elliptic_curve_auto_negotiation` option is not supported by any of the API Connect gateway types. If the TLS client profile is targeted for an API Connect gateway; this setting is ignored by the gateway.
- The elliptic curve cryptographic schemes shown in each row of the following table are equivalent. However, API Connect recognizes only one or the other depending on how the TLS profile is used, as indicated in the table.

Table 1.

API enforcement on the gateway	API Connect server access security
secp192r1	prime192v1
secp256r1	prime256v1

Therefore, if you want to use either of these schemes and are unsure whether you are targeting the TLS client profile to the API Connect gateway for API enforcement, whether you are using it to secure user access to the API Connect servers, or whether it will be used for both purposes, specify both equivalent schemes; API Connect will simply ignore the non-relevant scheme. For example:

```
elliptic_curve:
  .
  .
  .
- secp256r1
- prime256v1
  .
  .
```

## Procedure

To create a TLS client profile with elliptic curve cryptographic schemes defined, complete the following steps:

1. Create a YAML file definition for your TLS client profile, with the required `elliptic_curve` property.
2. Log in to the management server from the developer toolkit CLI. Log in either as a member of the cloud administration organization or as a member of a provider organization, depending on where you want to create the TLS client profile. For details, see [Logging in to a management server](#).
3. Create the TLS client profile by using the following command:

```
apic tls-client-profiles:create --server mgmt_endpoint_url --org organization_name tls_client_profile_yaml_file
```

where:

- `mgmt_endpoint_url` is the platform API endpoint URL, and is the same as that which was used when you logged in at step 2.
- `organization_name` is either `admin`, for the cloud administration organization, or the name of your provider organization, and is the same as that which was used when you logged in at step 2.
- `tls_client_profile_yaml_file` is the name of the YAML file that contains the definition for your TLS client profile.

Note: When you install IBM® API Connect, the API Connect gateway has a pre-supplied default TLS client profile that is used for API enforcement if you do not configure a TLS client profile; you cannot configure this default TLS client profile on the gateway.

For reference details of all the `apic tls-client-profiles` commands, see [apic tls-client-profiles](#).

You can also complete the operations described in this topic by using the API Connect REST APIs; see the [API Connect REST API documentation](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#), for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Authenticating by using your enterprise user registry

IBM® API Connect supports a variety of user registry types for authenticating users and securing APIs.

You can use your enterprise user registry for authentication in API Connect if it is of one of the following types:

LDAP directory

If your user registry uses Lightweight Directory Access Protocol (LDAP), you can use it in API Connect for both user authentication and API security.

Authentication URL User Registry

You can configure a non-LDAP user registry by using an authentication URL user registry. An authentication URL user registry enables integration with third-party authentication providers. You can use an authentication URL user registry in API Connect for both user authentication and API security.

Local User Registry

You can authenticate users with a local user registry. A local user registry is an internal registry stored within API Connect.

OpenID Connect

You can authenticate users through an identity provider that supports the OpenID Connect (OIDC) authentication protocol.

- [Working with user registries](#)  
To secure the APIs that are published to your IBM API Connect Catalogs, you authenticate with user registries.
- [Modifying the configuration details for a user registry](#)  
You modify the configuration details for a user registry by using the User Registries page in the API Manager user interface of IBM API Connect.
- [Password lockout criteria](#)  
You can be locked out of your account if you attempt to log in and fail consecutively.

## Related tasks

- [Working with user registries](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Working with user registries

To secure the APIs that are published to your IBM® API Connect Catalogs, you authenticate with user registries.

### About this task

---

Create user registry resources to secure your APIs, and authenticate with users.

### Procedure

---

To configure a user registry, complete the following steps:

1. In the API Manager user interface, select  Resources.
2. On the Resources page, select User Registries > Create.
3. Select the tile for the user registry type you want, and continue to the instructions for configuring user authentication for your selection.  
Important: Do not share user registries between the API Manager and the Developer Portal, or between Developer Portal sites when self-service onboarding is enabled or account deletions in any of the sites are expected. You should create separate user registries for them, even if the separate registries point to the same backend authentication provider (for example, an LDAP server). This separation enables the Developer Portal to maintain unique email addresses across the Catalog, without API Manager needing the same requirement. It also avoids problems with users deleting their accounts from the Developer Portal that then affects their API Manager access.

Authentication URL User Registry

For more information, see [Creating an Authentication URL user registry](#).

Custom user registry

For more information, see [Creating an organization-specific custom user registry](#).

LDAP User Registry

For more information, see [Creating an LDAP user registry in API Manager](#).

Local User Registry

For more information, see [Creating a Local User Registry](#).

OIDC User Registry

For more information, see [Creating an OIDC user registry](#).

### Results

---

The user registry information is added to API Manager.

### What to do next

---

You can now use API Manager to chart and manage your Catalogs.

- [Creating an Authentication URL user registry](#)  
An Authentication URL user registry provides a simple mechanism for authenticating users by referencing a custom identity provider.
- [Creating an organization-specific custom user registry](#)

# Creating an Authentication URL user registry

An Authentication URL user registry provides a simple mechanism for authenticating users by referencing a custom identity provider.

## About this task

This topic describes how to create a new Authentication URL user registry as a Resource in your organization. After the user registry is created, the user registry must be added to the Sandbox catalog.

One of the following roles is required to configure user registries:

- Administrator
- Organization Owner
- Custom role with the `Settings: Manage permissions`

Note:

API Connect issues an HTTP `GET` call to the Authentication URL endpoint, sending the user's credential. The following example shows a call made to an Authentication URL identity provider with an endpoint defined as `https://myauthurl.example.com/user/authenticate`:

```
GET /user/authenticate HTTP/1.1
Host: myauthurl.example.com
Authorization: Basic c3Bvb246Zm9yaw=
```

If the Authentication URL endpoint returns an HTTP status code of `200`, the user authenticates successfully. An HTTP status code other than `200` indicates a failed login attempt. API Connect forwards any HTTP Header starting with `x-` (with the exception of `x-Client-Certificate`), and `Cookie` to the Authentication URL identity provider, to aid the authentication decision; for example:

```
GET /user/authenticate HTTP/1.1
Host: myauthurl.example.com
Authorization: Basic c3Bvb246Zm9yaw=
X-Forwarded-For: 8.8.9.9
X-Custom-Header-From-Customer: special
Cookie: MyCookie=VGhpc0lzV21ja2VkQWlhempluZw==
```

When a user is presented with the form for completing their API Connect user registration, which fields are pre-populated depends on which fields are returned in the response from the Authentication URL identity provider. If any of the following fields are returned, they will be pre-populated in the registration form:

- `username`
- `email`
- `first_name`
- `last_name`

If the `username` field is not returned, the registration form displays the user name that was provided by the user. The pre-population capability requires that the response from the Authentication URL identity provider satisfies the following conditions:

- The `Content-Type` must be `application/json`.
- The response body format must be JSON.

A sample response is as follows:

```
HTTP/1.1 200 OK
Content-Type: application/json; charset=UTF-8
Cache-Control: no-store
Pragma: no-cache

{
  "username": "myuser",
  "email": "myuser@example.com",
  "first_name": "My",
  "last_name": "User"
}
```

## Procedure

1. In the API Manager, click  Resources.
2. Select User Registries to see the list of current user registries in your organization.
3. Click Create in the User Registries section.

Important: Do not share user registries between the API Manager and the Developer Portal, or between Developer Portal sites when self-service onboarding is enabled or account deletions in any of the sites are expected. You should create separate user registries for them, even if the separate registries point to the same backend authentication provider (for example, an LDAP server). This separation enables the Developer Portal to maintain unique email addresses across the Catalog, without API Manager needing the same requirement. It also avoids problems with users deleting their accounts from the Developer Portal that then affects their API Manager access.

4. Select Authentication URL User Registry and enter the following parameters:

Field	Description
Title (required)	Enter a descriptive name to use on the screen.
Name (required)	The name that is used in CLI commands. The name is auto-generated. For details of the CLI commands for managing user registries, see <a href="#">apic user-registries</a> .
Summary (optional)	Enter a brief description.

Field	Description
Display Name (required)	The name that is displayed for selection by the user when logging in to a user interface, or activating their API Manager account. For details of user interface log in, and account activation, see <a href="#">Accessing the Cloud Manager user interface</a> , <a href="#">Accessing the API Manager user interface</a> , and <a href="#">Activating your API Manager user account</a> . Note: The Developer Portal uses the <b>Title</b> of the User Registries when rendering them at the login page, rather than the <b>Display Name</b> .
URL (required)	Enter the URL for the authentication service. When establishing authentication, API Connect makes a GET call to the URL. The call includes the user name and password it has collected from the user in its authorization header. Either 200 OK or 401 Unauthorized will be returned.
TLS Client Profile (optional)	Select a TLS Client Profile to allow secure authentication with a specific web server.
Case sensitive	To ensure proper handling of user name capitalization, you <b>must</b> ensure that your case-sensitivity setting here matches the setting on your backend Authentication URL server: <ul style="list-style-type: none"> <li>• <b>Only</b> select Case sensitive if your backend server supports case-sensitivity.</li> <li>• Do <b>not</b> select Case sensitive if your backend server does not support case-sensitivity.</li> </ul> Note: The Developer Portal does not support case sensitive usernames. Note: After at least one user has been onboarded into the registry, you cannot change this setting.
Email required	Select this checkbox if an email address is required as part of the user onboarding process. If selected, the source identity provider must supply the email address as part of the authentication process during onboarding. Note: An email address is not required by default for onboarding to the Cloud Manager or the API Manager, but it is required for onboarding to the Developer Portal.
Unique email address	Select this checkbox if email addresses must be unique within the user registry. Note: Every account in the Developer Portal, including across different user registries for the same site, must have a unique email address, including the site Admin account.

5. Click Save.

6. Add the user registry to the Sandbox catalog. See [Creating and configuring Catalogs](#).

## Results

The user registry can be used for Basic Authentication in the Security Definition for an API. For more information, see [Creating a basic authentication security definition](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Creating an organization-specific custom user registry

You can configure an organization-specific custom user registry to provide user authentication for the Developer Portal.

### Before you begin

Custom user registries can be used for authenticating users to the Developer Portal, but cannot be used to secure APIs.

To configure a custom user registry as a resource in API Manager, the external user directory must be created and available to use with your API Connect ecosystem.

Also, a custom user registry definition for your external user registry must already have been created on the Cloud Manager, as you will need the information from this definition to set up the custom user registry. See [Configuring a shared custom user registry](#) for information.

One of the following roles is required to configure a custom user registry:

- Administrator
- Owner
- Topology Administrator
- Custom role with the `Settings: Manage permissions`

### About this task

You can create a custom user registry that is specific to a provider organization, or one that can be shared and available to all of the provider organizations in your API Connect environment. An organization-specific user registry can be used for authenticating Developer Portal users in a specific provider organization. While a shared user registry can be used for authenticating Cloud Manager, API Manager, and Developer Portal users.

This topic describes how to configure an organization-specific custom user registry. If you want to create a shared registry, see [Configuring a shared custom user registry](#) for more information.

Note:

- You can also create and manage custom user registries by using the API Connect REST APIs; see the [API Connect REST API documentation](#).

You can use the following instructions to create a writable or a read-only custom user registry.

API Connect provides two methods for creating a custom user registry in the API Manager, as described in the following sections:

- [Creating a custom user registry by using the API Manager UI](#)
- [Creating a custom user registry by using the developer toolkit CLI](#)

Important: Do not share user registries between the API Manager and the Developer Portal, or between Developer Portal sites when self-service onboarding is enabled or account deletions in any of the sites are expected. You should create separate user registries for them, even if the separate registries point to the same backend

authentication provider (for example, an LDAP server). This separation enables the Developer Portal to maintain unique email addresses across the Catalog, without API Manager needing the same requirement. It also avoids problems with users deleting their accounts from the Developer Portal that then affects their API Manager access.

## Creating a custom user registry by using the API Manager UI

You configure a custom user registry by creating a new custom user registry resource, which references the custom user registry type that is defined in the Cloud Manager. To make the custom user registry available to the Developer Portal for user authentication, you must enable the registry in the associated Catalog. When the custom user registry is used for authentication, API Connect makes a REST call to the endpoint of your external registry, as defined in the custom user registry type.

### Creating a custom user registry resource

Use the following instructions to create a new custom user registry resource in the API Manager UI.

1. Click Create in the User Registries section of Resources.
2. Click the Custom user registry tile.
3. Enter the following information:

Property	Description
Custom type	The name of the custom user registry type. For example, <i>my-custom-user-registry-type</i> . Use the drop-down arrow to select different custom user registry types. The custom user registry type is defined in the Cloud Manager.
Title	A descriptive name to display in the UI.
Name	The name of the custom user registry. This name is auto-generated, and is used in CLI commands.
Summary	A brief description of the custom user registry.
Endpoint	Optional endpoint information.
Case sensitive	To ensure proper handling of user name capitalization, you <b>must</b> ensure that your case-sensitivity setting here matches the setting on your backend server: <ul style="list-style-type: none"><li>• <b>Only</b> select Case sensitive if your backend server supports case-sensitivity.</li><li>• Do <b>not</b> select Case sensitive if your backend server does not support case-sensitivity.</li></ul> Note: <ul style="list-style-type: none"><li>• The Developer Portal does not support case sensitive usernames.</li><li>• After at least one user has been onboarded into the registry, you cannot change this setting.</li></ul>
User registry managed	Determines whether API Connect manages your user registry. Valid values are: <ul style="list-style-type: none"><li>• <b>true</b> - select the checkbox</li><li>• <b>false</b> - clear the checkbox</li></ul>
User managed	Determines whether your user registry is writable or not. Select the checkbox to set to <b>true</b> for writable. Clear the checkbox for the non-writable option.
Email required	Select this checkbox if an email address is required as part of the user onboarding process. If selected, the source identity provider must supply the email address as part of the authentication process during onboarding. Note: An email address is not required by default for onboarding to the Cloud Manager or the API Manager, but it is required for onboarding to the Developer Portal.
Unique email address	Select this checkbox if email addresses must be unique within the user registry. Note: Every account in the Developer Portal, including across different user registries for the same site, must have a unique email address, including the site Admin account.

4. Click Create. The new user registry is displayed in the User registries list.

### Adding your custom user registry to the Developer Portal login

To make the custom user registry available for authenticating Developer Portal users, you must enable it in the Catalog that is associated with that Developer Portal. In the API Manager UI, click Manage followed by the relevant Catalog, and then click Catalog settings > Onboarding. In the Catalog User Registries section, click Edit, select the custom user registry, and click Save. For more information, see [Creating and configuring Catalogs](#).

### Creating a custom user registry by using the developer toolkit CLI

You configure an organization-specific custom user registry by creating a new custom user registry resource that references the integration document that exists on the Cloud Manager. You use developer toolkit CLI commands to create the custom user registry, and to make the registry available to the Developer Portal, you must enable the registry in the associated Catalog. When the custom user registry is used for authentication, API Connect makes a REST call to the endpoint of your external registry, as defined in the integration document.

### Logging in to the management server CLI

Before you can define the custom user registry configuration, you must log in to your management server from the developer toolkit CLI as a member of a provider organization. Use the following command:

```
apic login --server mgmt_endpoint_url --username user_id --password password --realm provider/identity_provider
```

You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

```
apic identity-providers:list --scope provider --server mgmt_endpoint_url --fields title,realm
```

For example:

```
apic identity-providers:list --scope provider --server myserver.com --fields title,realm
total_results: 2
results:
- title: Cloud Manager User Registry
  realm: provider/default-idp-2
- title: Corporate LDAP user registry
  realm: provider/corporate-ldap
```

The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default API Manager Local User Registry for login as a member of a provider organization is `default-ldp-2`. For full details of the login command, see [Logging in to a management server](#).

For more information about how to use the CLI, see [Installing the toolkit](#), and [Overview of the command-line tool](#).

## Defining your custom user registry

You define the configuration of your custom user registry in a `custom_config_file.yaml` file, as shown in the following example.

```
name: 'custom_registry_name'
title: 'display_title'
registry_type: 'custom_user_registry'
integration_url: custom_integration_url
case_sensitive: true_or_false
user_managed: true_or_false
user_registry_managed: true_or_false
email_required: true_or_false
email_unique_if_exist: true_or_false
identity_providers:
- name: provider_name
  title: 'provider_title'
configuration:
  custom_config1: 'value1'
  customize: true
```

The registry properties that are common to each authentication method are described in the following table:

Property	Description
<code>name</code>	The name of the custom user registry. This name is used in the CLI commands.
<code>title</code>	A descriptive name to display in a graphical user interface.
<code>registry_type</code>	The registry type that is configured in the <code>name</code> property in the integration document, for example <code>custom_user_registry</code> .
<code>integration_url</code>	The custom integration URL in your API Connect configuration. You can determine the custom integration URL by using the following CLI command:  <code>apic integrations:list --server mgmt_endpoint_url --subcollection user-registry</code>
<code>case_sensitive</code>	Determines whether your user registry is case-sensitive. Valid values are: <ul style="list-style-type: none"> <li><code>true</code></li> <li><code>false</code></li> </ul> <p>To ensure proper handling of user name capitalization, you <b>must</b> ensure that your case-sensitivity setting here matches the setting on your backend LDAP server:</p> <ul style="list-style-type: none"> <li><b>Only</b> set <code>case_sensitive</code> to <code>true</code> if your backend LDAP server supports case-sensitivity.</li> <li>Set <code>case_sensitive</code> to <code>false</code> if your backend LDAP server does not support case-sensitivity.</li> </ul> <p>Note: After at least one user has been onboarded into the registry, you cannot change this setting.</p>
<code>user_managed</code>	Determines whether your user registry is writable or not. Must be set to <code>true</code> for writable. Set to <code>false</code> if you don't want the registry to be writable.
<code>user_registry_managed</code>	Determines whether API Connect manages your user registry. Valid values are: <ul style="list-style-type: none"> <li><code>true</code></li> <li><code>false</code></li> </ul>
<code>email_required</code>	Determines whether an email address is required as part of the user onboarding process. Valid values are: <ul style="list-style-type: none"> <li><code>true</code></li> <li><code>false</code></li> </ul> <p>If set to <code>true</code>, the source identity provider must supply the email address as part of the authentication process during onboarding.</p> <p>Note: An email address is not required by default for onboarding to the Cloud Manager or the API Manager, but it is required for onboarding to the Developer Portal.</p>
<code>email_unique_if_exist</code>	Determines whether email addresses must be unique within the user registry. Valid values are: <ul style="list-style-type: none"> <li><code>true</code></li> <li><code>false</code></li> </ul> <p>Note: Every account in the Developer Portal, including across different user registries for the same site, must have a unique email address, including the site Admin account.</p>
<code>identity_providers</code>	An array containing the details of your custom server, where: <ul style="list-style-type: none"> <li><code>name</code> - is the name of the custom server and is the name that is used in CLI commands</li> <li><code>title</code> - is the display name of the custom server</li> </ul>
<code>configuration</code>	The user-defined configuration based on the <code>configuration_schema</code> that is defined in the integration document.

Save your `custom_config_file.yaml` so it can be accessed by the `user-registries:create` command in the following section.

## Creating your custom user registry

To create your organization-specific custom user registry, run the following CLI command:

```
apic user-registries:create --server mgmt_endpoint_url --org organization_name custom_config_file.yaml
```

where:

- `mgmt_endpoint_url` is the platform API endpoint URL.
- `--org organization_name` means that the registry will be created in your provider organization.
- `custom_config_file` is the name of the YAML file that defines the configuration of your custom user registry.

On completion of the registry creation, the command displays the following summary details:

```
registry_name registry_url
```

The `registry_name` is derived from the `name` property in the custom user registry YAML file. The `registry_url` is the URL with which the custom registry resource can be accessed.

Your organization-specific user registry is now created; see the following section for instructions on how to make the registry available to users.

## Configuring your custom user registry in a Catalog

---

To make your custom user registry available for authenticating Developer Portal users, you must enable it in the Catalog that is associated with that Developer Portal. Complete the following steps:

1. Determine the URL of your custom user registry by using the following command (or you can copy and paste from the summary of the registry creation):

```
apic user-registries:list --server mgmt_endpoint_url --org organization_name
```

2. Enter the following command (the terminating hyphen character means that the command takes input from the command line):

```
apic configured-catalog-user-registries:create --server mgmt_endpoint_url --org organization_name --catalog catalog_name -
```

where `catalog_name` is the value of the `name` property of the required Catalog. The command returns

```
Reading CONFIGURED_CATALOG_USER_REGISTRY_FILE arg from stdin
```

3. Enter the following data, followed by a new line:

```
user_registry_url: custom_registry_url
```

where `custom_registry_url` is the URL of your custom user registry, obtained in step [1](#).

4. Press **CTRL D** to terminate the input.

## Creating an LDAP user registry in API Manager

You can use the API Manager UI to configure an organization-specific LDAP user registry to provide user authentication and onboarding for the Developer Portal. APIs can also be secured with an LDAP user registry.

### Before you begin

---

To configure an LDAP user registry as a resource in API Manager, the LDAP directory must be created and populated for use with your API Connect ecosystem.

LDAP registries can be used to secure APIs, or for securing a Catalog to authenticate Developer Portal users.

Important: If you are using an LDAP registry to secure APIs, the STARTTLS protocol, which upgrades an insecure protocol to a secure one by applying TLS security, is not supported.

One of the following roles is required to configure an LDAP user registry:

- Organization Administrator
- Owner
- Topology Administrator
- Custom role with the `Settings: Manage permissions`

### About this task

---

You can create an LDAP user registry that is specific to a provider organization, or one that can be shared and available to all of the provider organizations in your API Connect environment. An organization-specific LDAP user registry can be used for authenticating Developer Portal users in a specific provider organization. While a shared LDAP user registry can be used across the Cloud Manager, the API Manager, and the Developer Portal components in your environment.

This topic describes how to configure an organization-specific LDAP user registry. If you want to create a shared registry, see [Configuring an LDAP user registry in the Cloud Manager](#) for more information.

Note:

- You can also create and manage LDAP user registries by using the developer toolkit CLI. For more information, see [Using the CLI to create an organization-specific LDAP user registry](#).

- The API Connect REST APIs can also be used to create and manage LDAP user registries; see the [API Connect REST API documentation](#).
- If you are using the DataPower® API Gateway, LDAP group authentication is not supported.
- You can map external LDAP groups to API Connect user roles to enable greater control of user access, but this configuration can be done only by using the developer toolkit CLI; see [Using the CLI to create an organization-specific LDAP user registry](#) for details.

You create an LDAP user registry by configuring a set of properties in the API Manager UI. If you want to enable writable LDAP, you must complete the Attribute Mapping section by selecting the User Managed checkbox, and providing the mapping of your source LDAP attribute names to the target API Connect values. You can also change a registry to be read-only again by clearing the User Managed checkbox. To make the registry available to the Developer Portal, you must define the registry for consumer onboarding in the associated Catalog. To secure APIs with an LDAP registry, you must configure security definitions.

For general information about authenticating with LDAP, see [LDAP authentication](#).

## Procedure

Follow these steps to configure a new LDAP user registry as a Resource in the API Manager UI.

Note: If you are using an **Active Directory**, you must indicate this by using the property "**directory\_type**": "**ad**" in the LDAP config.

1. In the API Manager, click  Resources.
2. Click Create in the User Registries section.

Important: Do not share user registries between the API Manager and the Developer Portal, or between Developer Portal sites when self-service onboarding is enabled or account deletions in any of the sites are expected. You should create separate user registries for them, even if the separate registries point to the same backend authentication provider (for example, an LDAP server). This separation enables the Developer Portal to maintain unique email addresses across the Catalog, without API Manager needing the same requirement. It also avoids problems with users deleting their accounts from the Developer Portal that then affects their API Manager access.

3. Select LDAP User Registry for the user registry type, and enter the following information:

Field	Description
Title	Enter a descriptive name to display on the screen.
Name	The name that is used in CLI commands. The name is auto-generated. For details of the CLI commands for managing user registries, see <a href="#">apic user-registries</a> .
Display Name (required)	The name that is displayed for selection by the user when logging in to a user interface, or activating their API Manager account. For details of user interface log in, and account activation, see <a href="#">Accessing the Cloud Manager user interface</a> , <a href="#">Accessing the API Manager user interface</a> , and <a href="#">Activating your API Manager user account</a> . Note: The Developer Portal uses the <b>Title</b> of the User Registries when rendering them at the login page, rather than the <b>Display Name</b> .
Summary (optional)	Enter a brief description.
Address	Enter the IP address or host name of the LDAP server.
Port	Enter the Port number that API Connect can use to communicate with the LDAP registry. For example, 389.
Select a TLS Client Profile (optional)	Select the TLS Client Profile the LDAP server requires.
Select a protocol version	Select the version number for the LDAP protocol that you are using.
Case-sensitivity	To ensure proper handling of user name capitalization, you <b>must</b> ensure that your case-sensitivity setting here matches the setting on your backend LDAP server: <ul style="list-style-type: none"> <li>• <b>Only</b> select Case sensitive if your backend LDAP server supports case-sensitivity.</li> <li>• Do <b>not</b> select Case sensitive if your backend LDAP server does not support case-sensitivity.</li> </ul> Note: The Developer Portal does not support case sensitive usernames. Note: After at least one user has been onboarded into the registry, you cannot change this setting.
Email required	Select this checkbox if an email address is required as part of the user onboarding process. If selected, the source identity provider must supply the email address as part of the authentication process during onboarding. Note: An email address is not required by default for onboarding to the Cloud Manager or the API Manager, but it is required for onboarding to the Developer Portal.
Unique email address	Select this checkbox if email addresses must be unique within the user registry. Note: Every account in the Developer Portal, including across different user registries for the same site, must have a unique email address, including the site Admin account.

4. Click Next and enter the authentication information, which will vary depending on the selected Authentication Method. The choices are:
  - **Compose DN** - Select this format if you can compose the user LDAP Distinguished Name (DN) from the user name. For example, `uid=<username>,ou=People,dc=company,dc=com` is a DN format that can be composed from the user name. If you are unsure whether Compose (DN) is the correct option, contact your LDAP administrator. If you are using an LDAP registry to secure APIs, Compose DN is not supported with the DataPower API Gateway.
  - **Compose UPN** - Select this format if your LDAP directory supports binding with User Principal Names such as `john@acme.com`. The Microsoft Active Directory is an example of an LDAP directory that supports Compose UPN authentication. If you are unsure whether your LDAP directory supports binding with UPNs, contact your LDAP administrator.  
Note: The Admin Bind DN and Admin Bind Password are not used with this authentication method.
  - **Search DN** - Select this format if you cannot compose the user LDAP Distinguished Name from the user name; for example, if the base DNs of the users are different. This format might require an administrator DN and password to search for users in the LDAP directory. If your LDAP directory permits anonymous binds, you can omit the admin DN and password. If you are unsure if your LDAP directory permits anonymous binds, contact your LDAP administrator.

For all of the authentication methods:

If you are creating an LDAP registry to authenticate users of an API, you can specify an LDAP authorization group to restrict API access. To be able to call an API that is secured by the LDAP registry, a user must successfully authenticate with their LDAP user ID and password **and** they must be a member of the specified authorization group. The authorization group can be a Static Group or Dynamic Group. A static group is one in which the individual members of the group are explicitly listed. A dynamic group is one which is defined according to the set of attributes that the group members share in common.

5. For authentication method Compose DN, enter the following:

Field	Description
Bind Method	Anonymous or Authenticated. If specific permissions are not needed to search the registry, select Anonymous Bind. Or, if specific permissions are necessary, select Authenticated Bind.

Field	Description
Admin DN	For Authenticated Bind, enter the Distinguished Name of a user authorized to perform searches in the LDAP directory. For example <code>cn=admin,dc=company,dc=com</code> .
Admin Password	For Authenticated Bind, enter the user password for the Admin DN.
Prefix	Specify the prefix to the DN. For example <code>(uid=</code> .
Suffix	Specify the suffix to the DN. For example <code>)</code> .
Base DN (optional)	Enter a base DN in the Base DN field, or click Get Base DN to populate the field with a retrieved base DN.
Use group authentication (optional)	Static or Dynamic. For Static Group, enter the Group Based DN, Prefix, and Suffix. For Dynamic Group, enter the Filter condition for the group. Note: If you are using the DataPower API Gateway, LDAP group authentication is not supported.

6. For authentication method Compose UPN, enter the following:

Field	Description
Bind Method	Anonymous or Authenticated. If specific permissions are not needed to search the registry, select Anonymous Bind. Or, if specific permissions are necessary, select Authenticated Bind.
Admin DN	For Authenticated Bind, enter the Distinguished Name of a user authorized to perform searches in the LDAP directory. For example <code>cn=admin,dc=company,dc=com</code> .
Admin Password	For Authenticated Bind, enter the user password for the Admin DN.
Suffix	Enter the domain part of the user principal name. For example, <code>@acme.com</code> .
Use group authentication (optional)	Enter the Filter condition for the group. Note: If you are using the DataPower API Gateway, LDAP group authentication is not supported.

7. For authentication method Search DN, enter the following:

Field	Description
Bind Method	Anonymous or Authenticated. If specific permissions are not needed to search the registry, select Anonymous Bind. Or, if specific permissions are necessary, select Authenticated Bind.
Admin DN	For Authenticated Bind, enter the Distinguished Name of a user authorized to perform searches in the LDAP directory. For example <code>cn=admin,dc=company,dc=com</code> .
Admin Password	For Authenticated Bind, enter the user password for the Admin DN.
Prefix	Specify the prefix to the DN. For example <code>(uid=</code> .
Suffix	Specify the suffix to the DN. For example <code>)</code> .
Base DN (optional)	Enter a base DN in the Base DN field, or click Get Base DN to populate the field with a retrieved base DN.
Use group authentication (optional)	Static or Dynamic. For Static Group, enter the Group Based DN, Prefix, and Suffix. For Dynamic Group, enter the Filter condition for the group. Note: If you are using the DataPower API Gateway, LDAP group authentication is not supported.

8. Optional: Click Test configuration to test the settings for your LDAP user registry. Enter valid credentials to ensure that you can access the LDAP database.

9. Optional: If you want to make your LDAP user registry writable, select the User Managed checkbox in the Attribute Mapping section, and provide the mapping of your source LDAP attribute names to the target API Connect values. Click Add to add each name/value pair, specified as follows:

- LDAP ATTRIBUTE NAME - is the name of the source LDAP attribute.
- API CONNECT VALUE - is a string that represents the value that API Connect will populate the LDAP attribute with, by replacing the content contained in [ ] with the value that the user supplies when signing up.

The default user profile properties that API Connect requires during user registration are `username`, `first_name`, `last_name`, `email`, and `password`, as shown in the following example:

LDAP ATTRIBUTE NAME	API CONNECT VALUE
<code>dn</code>	<code>uid=[username],ou=users,dc=company,dc=com</code>
<code>cn</code>	<code>{first_name} {last_name}</code>
<code>sn</code>	<code>{last_name}</code>
<code>mail</code>	<code>{email}</code>
<code>userPassword</code>	<code>{password}</code>

You must ensure that you enter the correct attribute mapping values for your LDAP configuration, to enable API Connect to access the LDAP database. Note that a writable LDAP user registry cannot be used to authenticate Cloud Manager and API Manager users.

10. Click Create.

Your new LDAP registry is shown in the list of User Registries on the Resources page.

## What to do next

If you want to make the LDAP user registry available for authenticating Developer Portal users, you must enable it in the Catalog that is associated with that Developer Portal. Click the relevant Catalog, then click Settings > Onboarding. In the Catalog User Registries section, click Edit, select the user registry, and click Save. For more information, see [Creating and configuring Catalogs](#).

If you want to use the LDAP user registry to secure APIs, see the following information:

- To use for basic authentication in the security definition for an API, see [Creating a basic authentication security definition](#).
- To use for authentication in the User Security configuration for a native OAuth provider, see [Configuring user security for a native OAuth provider](#).
- Using the CLI to create an organization-specific LDAP user registry**

You can use the developer toolkit CLI to configure an organization-specific LDAP user registry to provide user authentication for the Developer Portal. APIs can also be secured with an LDAP user registry.

## Related information

- [Command-line tool reference for the developer toolkit](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Using the CLI to create an organization-specific LDAP user registry

You can use the developer toolkit CLI to configure an organization-specific LDAP user registry to provide user authentication for the Developer Portal. APIs can also be secured with an LDAP user registry.

### Before you begin

---

To configure an LDAP user registry as a resource in API Manager, the LDAP directory must be created and available to use with your API Connect ecosystem.

LDAP registries can be used to secure APIs, or for securing a Catalog to authenticate Developer Portal users.

Important: If you are using an LDAP registry to secure APIs, The STARTTLS protocol, which upgrades an insecure protocol to a secure one by applying TLS security, is not supported.

Note: If you are using an **Active Directory**, you must indicate this by using the property `"directory_type": "ad"` in the LDAP config.

One of the following roles is required to configure an LDAP user registry:

- Administrator
- Owner
- Topology Administrator
- Custom role with the `Settings: Manage permissions`

### About this task

---

You can create an LDAP user registry that is specific to a provider organization, or one that can be shared and available to all of the provider organizations in your API Connect environment. An organization-specific LDAP user registry can be used for onboarding and authenticating Developer Portal users in a specific provider organization. While a shared LDAP user registry can be used for authenticating Cloud Manager, API Manager, and Developer Portal users.

This topic describes how to configure an organization-specific LDAP user registry. If you want to create a shared registry, see [Using the CLI to configure a shared LDAP user registry](#) for more information.

Note:

- You can also create organization-specific LDAP user registries by using the API Manager UI; for more information see [Creating an LDAP user registry in API Manager](#).
- In addition, you can create and manage LDAP user registries by using the API Connect REST APIs; see the [API Connect REST API documentation](#).
- If you are using the DataPower® API Gateway, LDAP group authentication is not supported.
- You can map external LDAP groups to API Connect user roles to enable more control of user authorization by using the developer toolkit CLI. The following instructions explain how to set the `external_group_mapping_enabled` configuration on your LDAP user registry resource. For information about how to set external role mapping on your API Connect user roles, see [Configuring LDAP group mapping on Cloud Manager user roles](#).

You create an LDAP user registry by first defining the registry details in a configuration file. You then use a developer toolkit CLI command to create the registry, passing the configuration file as a parameter. To make the registry available to the Developer Portal, you must enable the registry in the associated Catalog. To secure APIs with an LDAP registry, you must configure security definitions. You can use the following instructions to create a writable or a read-only LDAP user registry.

For general information about authenticating with LDAP, see [LDAP authentication](#).

### Logging in to the management server CLI

---

Before you can define the LDAP user registry configuration, you must log in to your management server from the developer toolkit CLI as a member of a provider organization. Use the following command:

```
apic login --server mgmt_endpoint_url --username user_id --password password --realm provider/identity_provider
```

You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

```
apic identity-providers:list --scope provider --server mgmt_endpoint_url --fields title,realm
```

For example:

```
apic identity-providers:list --scope provider --server myserver.com --fields title,realm
total_results: 2
results:
- title: Cloud Manager User Registry
  realm: provider/default-idp-2
- title: Corporate LDAP user registry
  realm: provider/corporate-ldap
```

The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default API Manager Local User Registry for login as a member of a provider organization is `default-idp-2`.

For full details of the login command, see [Logging in to a management server](#).

For more information about how to use the CLI, see [Installing the toolkit](#), and [Overview of the command-line tool](#).

### Defining your LDAP configuration

---

You define the configuration of your LDAP user registry in an `ldap_config_file.yaml` file, as shown in the following example. Note that the actual contents of your YAML file will vary depending on the authentication method of your LDAP server, and this is explained in the following tables.

Important: Do not share user registries between the API Manager and the Developer Portal, or between Developer Portal sites when self-service onboarding is enabled or account deletions in any of the sites are expected. You should create separate user registries for them, even if the separate registries point to the same backend authentication provider (for example, an LDAP server). This separation enables the Developer Portal to maintain unique email addresses across the Catalog, without API Manager needing the same requirement. It also avoids problems with users deleting their accounts from the Developer Portal that then affects their API Manager access.

```

name: registry_name
title: "display_title"
integration_url: LDAP_integration_url
user_managed: true_or_false
user_registry_managed: false
external_group_mapping_enabled: true_or_false
case_sensitive: true_or_false
email_required: true_or_false
email_unique_if_exist: true_or_false
identity_providers:
- name: provider_name
  title: provider_title
endpoint:
  endpoint: "ldap_server_url_and_port"
configuration:
  authentication_method: authentication_method
  authenticated_bind: "true_or_false"
  admin_dn: "admin_dn"
  admin_password: admin_password
  search_dn_base: "search_dn_base"
  search_dn_scope: search_dn_scope
  search_dn_filter_prefix: prefix
  search_dn_filter_suffix: suffix
  attribute_mapping:
    dn: "distinguished_name"
    cn: "common_name"
    sn: "last_name"
    mail: "email_address"
    userPassword: "password"

```

The registry properties that are common to each authentication method are described in the following table:

Property	Description
<code>name</code>	The name of the registry. This name is used in CLI commands.
<code>title</code>	A descriptive name to display in a graphical user interface.
<code>integration_url</code>	The LDAP integration URL in your API Connect configuration. You can determine the LDAP integration URL by using the following CLI command: <code>apic integrations:list --server mgmt_endpoint_url --subcollection user-registry</code>
<code>user_managed</code>	Determines whether your user registry is writable or not. Must be set to <code>true</code> for writable LDAP. You can change this setting to <code>false</code> if you don't want the registry to be writable; see the Switching your LDAP registry between writable and read-only section at the end of this topic for details. Note that a writable LDAP user registry cannot be used to authenticate Cloud Manager and API Manager users.
<code>user_registry_managed</code>	Must be set to <code>false</code> for LDAP. Determines whether API Connect manages your user registry. Only LUR registries are managed by API Connect.
<code>external_group_mapping_enabled</code>	Determines whether your user registry supports LDAP group mapping. Valid values are: <ul style="list-style-type: none"> <li><code>true</code></li> <li><code>false</code></li> </ul> The default value is <code>false</code> .
<code>case_sensitive</code>	Determines whether your user registry is case-sensitive. Valid values are: <ul style="list-style-type: none"> <li><code>true</code></li> <li><code>false</code></li> </ul> To ensure proper handling of user name capitalization, you <b>must</b> ensure that your case-sensitivity setting here matches the setting on your backend LDAP server: <ul style="list-style-type: none"> <li><b>Only</b> set <code>case_sensitive</code> to <code>true</code> if your backend LDAP server supports case-sensitivity.</li> <li>Set <code>case_sensitive</code> to <code>false</code> if your backend LDAP server does not support case-sensitivity.</li> </ul> Note: After at least one user has been onboarded into the registry, you cannot change this setting.
<code>email_required</code>	Determines whether an email address is required as part of the user onboarding process. Valid values are: <ul style="list-style-type: none"> <li><code>true</code></li> <li><code>false</code></li> </ul> If set to <code>true</code> , the source identity provider must supply the email address as part of the authentication process during onboarding. Note: An email address is not required by default for onboarding to the Cloud Manager or the API Manager, but it is required for onboarding to the Developer Portal.
<code>email_unique_if_exist</code>	Determines whether email addresses must be unique within the user registry. Valid values are: <ul style="list-style-type: none"> <li><code>true</code></li> <li><code>false</code></li> </ul> Note: Every account in the Developer Portal, including across different user registries for the same site, must have a unique email address, including the site Admin account.
<code>identity_providers</code>	An array containing the details of your LDAP server, where: <ul style="list-style-type: none"> <li><code>name</code> - is the name of the LDAP server and is the name that is used in CLI commands</li> <li><code>title</code> - is the display name of the LDAP server</li> </ul>

Property	Description
<b>endpoint</b>	The endpoint of your LDAP server, made up of the url and port, for example:  "ldap://server.com:389"
<b>tls_profile</b>	Optionally set the TLS Client Profile that the LDAP server requires.
<b>protocol_version</b>	Optionally set the version number for the LDAP protocol that you are using. Valid values are: <ul style="list-style-type: none"> <li>• 2</li> <li>• 3</li> </ul> Defaults to 3 if not explicitly set.

The properties in the configuration section will vary depending on the selected authentication method. The three authentication methods are:

- **compose\_dn** - Set this format if you can compose the user LDAP Distinguished Name (DN) from the user name. For example, `uid=<username>,ou=People,dc=company,dc=com` is a DN format that can be composed from the user name. If you are unsure whether Compose (DN) is the correct option, contact your LDAP administrator. If you are using an LDAP registry to secure APIs, **compose\_dn** is not supported with the DataPower API Gateway.
- **compose\_upn** - Set this format if your LDAP directory supports binding with User Principal Names such as `john@acme.com`. The Microsoft Active Directory is an example of an LDAP directory that supports Compose UPN authentication. If you are unsure whether your LDAP directory supports binding with UPNs, contact your LDAP administrator.  
Note: The Admin Bind DN and Admin Bind Password are not used with this authentication method.
- **search\_dn** - Select this format if you cannot compose the user LDAP Distinguished Name from the user name; for example, if the base DNs of the users are different. This format might require an administrator DN and password to search for users in the LDAP directory. If your LDAP directory permits anonymous binds, you can omit the admin DN and password. If you are unsure if your LDAP directory permits anonymous binds, contact your LDAP administrator.

For authentication method **compose\_dn**, set the following configuration properties:

Properties	Description
<b>authentication_method</b>	<b>compose_dn</b>
<b>authenticated_bind</b>	The bind method. Valid values are: <ul style="list-style-type: none"> <li>• "true" - authenticated bind</li> <li>• "false" - anonymous bind</li> </ul> If specific permissions are not needed to search the registry, select "false". If specific permissions are necessary, select "true".
<b>admin_dn</b>	If <b>authenticated_bind</b> is set to "true", enter the Distinguished Name (DN) of a user authorized to perform searches in the LDAP directory. For example:  "cn=admin,dc=company,dc=com"
<b>admin_password</b>	If <b>authenticated_bind</b> is set to "true", enter the user password for the <b>admin_dn</b> .
<b>search_dn_base</b>	Optionally set a base DN, for example:  "dc=company,dc=com"
<b>bind_prefix</b>	Set the prefix to the DN, for example:  (uid=
<b>bind_suffix</b>	Set the suffix to the DN, for example:  )
<b>attribute_mapping</b>	If <b>user_managed</b> is set to <b>true</b> , provide the mapping of your source LDAP attribute names to the target API Connect values. This mapping is configured as a name/value pair, specified as follows:  <code>ldap_registry_attribute_name: "apic_ldap_attribute_value"</code>  Where: <ul style="list-style-type: none"> <li>• <code>ldap_registry_attribute_name</code> - is the name of the source LDAP attribute</li> <li>• <code>apic_ldap_attribute_value</code> - is a string that represents the value that API Connect will populate the LDAP attribute with, by replacing the content contained in [ ] with the value that the user supplies when signing up.</li> </ul> The user profile properties that API Connect requires during user registration are <b>username</b> , <b>first_name</b> , <b>last_name</b> , <b>email</b> , and <b>password</b> . The following extract shows an example of an attribute mapping:  <code>attribute_mapping: dn: "uid=[username],ou=users,dc=company,dc=com" cn: "[first_name] [last_name]" sn: "[last_name]" mail: "[email]" userPassword: "[password]"</code>

For authentication method **compose\_upn**, set the following configuration properties:

Properties	Description
<b>authentication_method</b>	<b>compose_upn</b>
<b>authenticated_bind</b>	The bind method. Valid values are: <ul style="list-style-type: none"> <li>• "true" - authenticated bind</li> <li>• "false" - anonymous bind</li> </ul> If specific permissions are not needed to search the registry, select "false". If specific permissions are necessary, select "true".
<b>admin_dn</b>	If <b>authenticated_bind</b> is set to "true", enter the Distinguished Name (DN) of a user authorized to perform searches in the LDAP directory. For example:  "cn=admin,dc=company,dc=com"

Properties	Description
<code>admin_password</code>	If <code>authenticated_bind</code> is set to <code>"true"</code> , enter the user password for the <code>admin_dn</code> .
<code>bind_suffix</code>	Enter the domain part of the user principal name. For example:  <code>@acme.com</code>
<code>attribute_mapping</code>	<p>If <code>user_managed</code> is set to <code>true</code>, provide the mapping of your source LDAP attribute names to the target API Connect values. This mapping is configured as a name/value pair, specified as follows:</p> <pre>ldap_registry_attribute_name: "apic_ldap_attribute_value"</pre> <p>Where:</p> <ul style="list-style-type: none"> <li><code>ldap_registry_attribute_name</code> - is the name of the source LDAP attribute</li> <li><code>apic_ldap_attribute_value</code> - is a string that represents the value that API Connect will populate the LDAP attribute with, by replacing the content contained in [ ] with the value that the user supplies when signing up.</li> </ul> <p>The user profile properties that API Connect requires during user registration are <code>username</code>, <code>first_name</code>, <code>last_name</code>, <code>email</code>, and <code>password</code>. The following extract shows an example of an attribute mapping:</p> <pre>attribute_mapping: dn: "uid=[username],ou=users,dc=company,dc=com" cn: "[first_name] [last_name]" sn: "[last_name]" mail: "[email]" userPassword: "[password]"</pre>

For authentication method `search_dn`, set the following configuration properties:

Property	Description
<code>authentication_method</code>	<code>search_dn</code>
<code>authenticated_bind</code>	<p>The bind method. Valid values are:</p> <ul style="list-style-type: none"> <li><code>"true"</code> - authenticated bind</li> <li><code>"false"</code> - anonymous bind</li> </ul> <p>If specific permissions are not needed to search the registry, select <code>"false"</code>. If specific permissions are necessary, select <code>"true"</code>.</p>
<code>admin_dn</code>	<p>If <code>authenticated_bind</code> is set to <code>"true"</code>, enter the Distinguished Name (DN) of a user authorized to perform searches in the LDAP directory. For example:</p> <pre>"cn=admin,dc=company,dc=com"</pre>
<code>admin_password</code>	If <code>authenticated_bind</code> is set to <code>"true"</code> , enter the user password for the <code>admin_dn</code> .
<code>search_dn_base</code>	<p>Optionally set a base DN, for example:</p> <pre>"dc=company,dc=com"</pre>
<code>search_dn_scope</code>	<p>Optionally set the search DN scope. The scope determines which part of the directory information tree is examined. Possible values are:</p> <ul style="list-style-type: none"> <li><code>base</code></li> <li><code>one</code></li> <li><code>sub</code></li> </ul>
<code>search_dn_filter_prefix</code>	<p>Set the prefix to the DN, for example:</p> <pre>(uid=</pre>
<code>search_dn_filter_suffix</code>	<p>Set the suffix to the DN, for example:</p> <pre>)</pre>
<code>attribute_mapping</code>	<p>If <code>user_managed</code> is set to <code>true</code>, provide the mapping of your source LDAP attribute names to the target API Connect values. This mapping is configured as a name/value pair, specified as follows:</p> <pre>ldap_registry_attribute_name: "apic_ldap_attribute_value"</pre> <p>Where:</p> <ul style="list-style-type: none"> <li><code>ldap_registry_attribute_name</code> - is the name of the source LDAP attribute</li> <li><code>apic_ldap_attribute_value</code> - is a string that represents the value that API Connect will populate the LDAP attribute with, by replacing the content contained in [ ] with the value that the user supplies when signing up.</li> </ul> <p>The user profile properties that API Connect requires during user registration are <code>username</code>, <code>first_name</code>, <code>last_name</code>, <code>email</code>, and <code>password</code>. The following extract shows an example of an attribute mapping:</p> <pre>attribute_mapping: dn: "uid=[username],ou=users,dc=company,dc=com" cn: "[first_name] [last_name]" sn: "[last_name]" mail: "[email]" userPassword: "[password]"</pre>

Save your `ldap_config_file.yaml` so it can be accessed by the `user-registries:create` command in the following section. See the [Example](#) section for an example configuration file.

## Creating your LDAP user registry

To create your organization-specific LDAP user registry, run the following CLI command:

```
apic user-registries:create --server mgmt_endpoint_url --org organization_name ldap_config_file.yaml
```

where:

- `mgmt_endpoint_url` is the platform API endpoint URL.
- `organization_name` is the value of the `name` property of your provider organization.
- `ldap_config_file` is the name of the YAML file that defines the configuration of your LDAP user registry.

On completion of the registry creation, the command displays the following summary details:

```
registry_name registry_url
```

The `registry_name` is derived from the `name` property in the configuration YAML file. The `registry_url` is the URL with which the registry resource can be accessed. Your LDAP user registry is now created; see the following section for instructions on how to make the registry available in the Developer Portal.

## Configuring your LDAP registry in a Catalog

If you want to make your LDAP registry available for authenticating Developer Portal users, you must enable it in the Catalog that is associated with that Developer Portal. Complete the following steps:

1. Determine the URL of your LDAP user registry by using the following command (or you can copy and paste from the summary of the registry creation):

```
apic user-registries:list --server mgmt_endpoint_url --org organization_name
```

2. Log in to the management server as a member of a provider organization; enter the following command:

```
apic login --server mgmt_endpoint_url --username user_id --password password --realm provider/identity_provider
```

You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

```
apic identity-providers:list --scope provider --server mgmt_endpoint_url --fields title,realm
```

For example:

```
apic identity-providers:list --scope provider --server myserver.com --fields title,realm
total_results: 2
results:
- title: Cloud Manager User Registry
  realm: provider/default-idp-2
- title: Corporate LDAP user registry
  realm: provider/corporate-ldap
```

The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default API Manager Local User Registry for login as a member of a provider organization is `default-idp-2`.

For full details of the `apic login` command, see [Logging in to a management server](#).

3. Enter the following command (the terminating hyphen character means that the command takes input from the command line):

```
apic configured-catalog-user-registries:create --server mgmt_endpoint_url --org organization_name --catalog catalog_name -
```

where `catalog_name` is the value of the `name` property of the required Catalog. The command returns

```
Reading CONFIGURED_CATALOG_USER_REGISTRY_FILE arg from stdin
```

4. Enter the following data, followed by a new line:

```
user_registry_url: ldap_registry_url
```

where `ldap_registry_url` is the URL of your LDAP registry, obtained in step 1.

5. Press **CTRL D** to terminate the input.

## Switching your LDAP registry between writable and read-only

After an LDAP user registry has been created, it can be switched between writable and read-only by updating the `user_managed` property in the registry configuration. Complete the following steps.

1. Determine the name or ID of the LDAP user registry that you want to update, by running the following command (or you can use the summary from the registry creation):

```
apic user-registries:list --server mgmt_endpoint_url --org organization_name
```

The command returns a list of all the user registries for that organization, shown by name followed by their registry URL. The registry ID is located at the end of the URL, for example `https://company.com/api/user-registries/x-x-x-x-x/registry_id`.

2. Enter the following command (the terminating hyphen character means that the command takes input from the command line):

```
apic user-registries:update --server mgmt_endpoint_url --org organization_name registry_name_or_id -
```

where `registry_name_or_id` is the name or ID of the LDAP user registry that you want to update (as determined in the previous step). The command returns:

```
Reading USER_REGISTRY_FILE arg from stdin
```

3. Enter the following data, followed by a new line:

```
user_managed: true_or_false
```

where `true` makes the registry writable, and `false` makes the registry read-only.

4. Press **CTRL D** to terminate the input.

Note that if you are changing your registry from read-only to writable, you must also set the `attribute_mapping` configuration, as described in the previous registry property tables.

## Using an LDAP user registry to secure APIs

---

If you want to use the LDAP user registry to secure APIs, see the following information:

- To use for basic authentication in the security definition for an API, see [Creating a basic authentication security definition](#).
- To use for authentication in the User Security configuration for a native OAuth provider, see [Configuring user security for a native OAuth provider](#).

For details of all the `apic user-registries` and `apic configured-catalog-user-registries` commands, see [apic user-registries](#) and [apic configured-catalog-user-registries](#).

## Example

---

The following example shows a configuration file that uses the Search DN authentication method for setting up writable LDAP:

```
name: sdn-ldap
title: "SDN LDAP User Registry"
integration_url: https://mycompany.com/api/cloud/integrations/user-registry/xxx-xxx-xxx
user_managed: true
user_registry_managed: false
case_sensitive: false
identity_providers:
- name: ldap
  title: "SDN LDAP Identity Provider"
endpoint:
  endpoint: "ldap://mycompany.com:389"
configuration:
  authentication_method: search_dn
  authenticated_bind: "true"
  admin_dn: "cn=admin,dc=company,dc=com"
  admin_password: xxxx
  search_dn_base: "dc=company,dc=com"
  search_dn_scope: sub
  search_dn_filter_prefix: (uid=
  search_dn_filter_suffix: )
  attribute_mapping:
    dn: "uid=[username],ou=users,dc=company,dc=com"
    cn: "[first_name] [last_name]"
    sn: "[last_name]"
    mail: "[email]"
    userPassword: "[password]"
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Creating a Local User Registry

---

A Local User Registry (LUR) can be created to provide user authentication for API Manager.

## About this task

---

Local User Registries (LURs) are the default user registries included in API Connect. LURs are local databases included with API Connect. Two default LURs are installed and configured during installation of API Connect. They cannot be deleted. The default Admin user account is stored in the Provider LUR.

You can use API Manager to create additional Local User Registries for use with your provider organization.

One of the following roles is required to configure user registries:

- Administrator
- Organization Owner
- Custom role with the `Settings: Manage permissions`

## Procedure

---

Follow these steps to configure a new LUR:

1. In the API Manager, click  Resources.
2. Select User Registries to see the list of current user registries in your organization.
3. Click Create in the User Registries section.

**Important:** Do not share user registries between the API Manager and the Developer Portal, or between Developer Portal sites when self-service onboarding is enabled or account deletions in any of the sites are expected. You should create separate user registries for them, even if the separate registries point to the same backend authentication provider (for example, an LDAP server). This separation enables the Developer Portal to maintain unique email addresses across the

Catalog, without API Manager needing the same requirement. It also avoids problems with users deleting their accounts from the Developer Portal that then affects their API Manager access.

- Select Local User Registry as the type for the user registry and enter the following information:

Field	Description
Title (required)	Enter a descriptive name for use on the screen.
Name (required)	The name that is used in CLI commands. The name is auto-generated. For details of the CLI commands for managing user registries, see <a href="#">apic user-registries</a> .
Display Name (required)	The name that is displayed for selection by the user when logging in to a user interface, or activating their API Manager account. For details of user interface log in, and account activation, see <a href="#">Accessing the Cloud Manager user interface</a> , <a href="#">Accessing the API Manager user interface</a> , and <a href="#">Activating your API Manager user account</a> .  Note: The Developer Portal uses the <b>Title</b> of the User Registries when rendering them at the login page, rather than the <b>Display Name</b> .
Summary (optional)	Enter a brief description.
Case sensitive	Select this setting if user names are case-sensitive. Note: The Developer Portal does not support case sensitive usernames. Note: After at least one user has been onboarded into the registry, you cannot change this setting.
Email required	Select this checkbox if an email address is required as part of the user onboarding process. If selected, the source identity provider must supply the email address as part of the authentication process during onboarding. Note: An email address is not required by default for onboarding to the Cloud Manager or the API Manager, but it is required for onboarding to the Developer Portal.
Unique email address	Select this checkbox if email addresses must be unique within the user registry. For new Local User Registries, this setting is always selected; so if email addresses are contained in the user record, they must be unique. However, for existing Local User Registries this setting can be edited. Note: Every account in the Developer Portal, including across different user registries for the same site, must have a unique email address, including the site Admin account.

- Click Save.

- Add the user registry to the Sandbox Catalog. See [Creating and configuring Catalogs](#).

## Results

The user registry can be used for Basic Authentication in the Security Definition for an API. For more information, see [Creating a basic authentication security definition](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.

For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Creating an OIDC user registry

Create an organization-specific OIDC user registry when multi-factor authentication (MFA) is required.

You can create an OIDC user registry that is specific to a provider organization, or that is shared and available to all the provider organizations in your API Connect environment. An organization-specific OIDC user registry is used for onboarding and authenticating Developer Portal users, while a shared OIDC user registry can be used for onboarding and authenticating Cloud Manager, API Manager, and Developer Portal users.

This topic describes how to create an organization-specific registry. For information on how to create a shared registry, see [Configuring an OIDC user registry](#).

API Connect provides two methods for creating an OIDC user registry in API Manager, as described in the following sections:

- [Using the UI to create an OIDC user registry](#)
- [Using the CLI to create an OIDC user registry](#)

## Using the UI to create an OIDC user registry

Use the API Manager user interface to create an organization-specific OIDC user registry when multi-factor authentication (MFA) is required.

- In the API Manager navigation pane, click  Resources.
- Click User Registries.
- Click Create and select OIDC User Registry.

**Important:** Do not share user registries between the API Manager and the Developer Portal, or between Developer Portal sites when self-service onboarding is enabled or account deletions in any of the sites are expected. You should create separate user registries for them, even if the separate registries point to the same backend authentication provider (for example, an LDAP server). This separation enables the Developer Portal to maintain unique email addresses across the Catalog, without API Manager needing the same requirement. It also avoids problems with users deleting their accounts from the Developer Portal that then affects their API Manager access.

- On the Create OIDC User Registry page, use the fields in each of the following sections to configure the registry settings, and then click Create. Many of the registry settings are preconfigured to simplify the configuration steps.

### Provider Type

Use the settings in Table 1 to define the provider type.

Table 1. Provider Type settings

Field	Description
-------	-------------

Field	Description
Provider Type	OIDC provider. Select one of the following supported OIDC providers: <ul style="list-style-type: none"> <li>• Facebook</li> <li>• GitHub</li> <li>• Google</li> <li>• LinkedIn</li> <li>• Slack</li> <li>• Twitter</li> <li>• Windows Live</li> <li>• Standard OIDC (default value allows you to specify another provider)</li> </ul>
Title	Provide a descriptive name for display purposes.
Name	Automatically generated. This name is used in CLI commands to reference the registry. For details of the CLI commands for managing user registries, see the <a href="#">apic user registries</a> topic in the Command Line tool reference section of this documentation.
Summary	Provide a brief description of the new registry.
Email required	Select this checkbox if an email address is required as part of the user onboarding process. If selected, the source identity provider must supply the email address as part of the authentication process during onboarding. Note: An email address is not required by default for onboarding to the Cloud Manager or the API Manager, but it is required for onboarding to the Developer Portal.
Unique email address	Select this checkbox if email addresses must be unique within the user registry. Note: Every account in the Developer Portal, including across different user registries for the same site, must have a unique email address, including the site Admin account.

#### Provider Endpoint

Automatically generated for most supported providers. In the Authorization Endpoint field, type the URL of the provider's authorization endpoint.

#### Token Endpoint

Fill in the settings as described in Table 2.

Table 2. Token Endpoint settings

Field	Description
URL	Preconfigured for most of the supported OIDC providers. Type the URL of the provider's token endpoint.
TLS	Select the TLS Client Profile for the token endpoint (OIDC must be configured to use TLS). Default is Default TLS Client Profile.

#### UserInfo Endpoint

Fill in the settings as described in Table 3.

Table 3. UserInfo Endpoint settings

Field	Description
URL	Preconfigured for most of the supported OIDC providers. Type the URL of the provider's userinfo endpoint.
TLS	Select the TLS Client Profile for the userinfo endpoint (OIDC must be configured to use TLS). Default is Default TLS Client Profile.

#### JWKS Endpoint

Fill in the settings as described in Table 4.

Table 4. JWKS Endpoint settings

Field	Description
URL	Type the URL of the read-only endpoint that contains the public keys' information in JWKS format.
TLS	Select the TLS Client Profile for the userinfo endpoint (OIDC must be configured to use TLS). Default is Default TLS Client Profile.

#### Logout

Fill in the settings as described in Table 5.

Table 5. Logout

Field	Description
Logout redirect	Optionally, give a logout redirect URL, allowing APIC to initiate an https 302 redirect to the configured endpoint. Note: When the Developer Portal uses this feature, it does not retain control afterwards. Instead, the content is presented from the redirected endpoint.

#### Client Information

Fill in the settings as described in Table 6.

Table 6. Client Information settings

Field	Description
Client ID	Provide the client ID of the application that is registered with the selected OIDC provider.
Client Secret	Provide the client secret of the application that is registered with the selected OIDC provider.
Response Type	Preconfigured for most of the supported OIDC providers. Specify the data type of the response that will be received from the OIDC provider.
Scopes	Preconfigured for most of the supported OIDC providers. Specify the access scope for the OIDC provider.
Client Authentication Method	Preconfigured for most of the supported OIDC providers. Select the authentication method to be used with the OIDC provider. Options are: <ul style="list-style-type: none"> <li>• Http basic authentication schema</li> <li>• Data encoded form body</li> </ul>

#### Additional Support

Optional. Select the additional security parameters described in Table 7.

Table 7. Additional security options

Security parameter	Description
NONCE	Enable the NONCE extension to prevent compromised requests from being used again (replayed).
Proof Key for Code Exchange (PKCE)	Enable the PKCE extension to allow public clients to mitigate the threat of having the authorization code intercepted.

#### Advanced Features

Optional. Select the advanced features described in Table 8.

Table 8. Advanced features

Feature	Description
Auto onboard	Allow users to execute calls to APIs without logging in first, provided they present a valid token issued by the OIDC provider.

Feature	Description
Always use the userinfo endpoint	Configures the OIDC user registry to always fetch user data from the userinfo endpoint, if populated.
Use Portal as Endpoint for external OIDC provider traffic	When authenticating users, redirect the external OIDC provider to communicate with the Developer Portal instead of API Manager.
Return third-party access token	Include the third-party OIDC access token in the response. Note: Enable this setting for debugging purposes only. This setting is not recommended for use in a production environment. When this setting is enabled, the token size will increase when a request is made to API Connect using the token. The larger token size might exceed the HTTP protocol limit, resulting in an <code>ERR_HTTP2_PROTOCOL_ERROR</code> or <code>ERR_CONNECTION_CLOSED</code> error.
Return third-party id_token	Include the third-party OIDC id_token in the response. Note: Enable this setting for debugging purposes only. This setting is not recommended for use in a production environment. When this setting is enabled, the token size will increase when a request is made to API Connect using the token. The larger token size might exceed the HTTP protocol limit, resulting in an <code>ERR_HTTP2_PROTOCOL_ERROR</code> or <code>ERR_CONNECTION_CLOSED</code> error.
Token Relay	Allow <code>access_token/refresh_token</code> to send in 302 redirect for logout
Userinfo POST	If supported by your OIDC provider, by using HTTP POST method when contacting userinfo endpoint. Note: Not all OIDC providers support POST. Ensure that your OIDC provider supports this before you enable the feature.

#### User Mapping

Fill in the settings as described in Table 9.

Note:

The User Mapping fields are preconfigured for most of the supported OIDC providers to minimize potential errors; use care when changing the settings. For the Standard OIDC option, contact your OIDC provider to obtain the details of the fields.

Table 9. User mapping settings

Field	Description
Username	The name of the field in the response token that contains the user's user name. Note: The username field must be unique for this OIDC registry, because it identifies the user in the system and cannot be changed.
Email	The name of the field in the response token that contains the user's email address.
First name	The name of the field in the response token that contains the user's given name.
Last name	The name of the field in the response token that contains the user's surname.

#### Redirect URI

The Redirect URI section lists the endpoints to which the OIDC authorization server will redirect the authorization code. There is one endpoint for each API Connect organization type: Cloud administration, Provider organization, and Consumer organization. The redirect endpoint is required when a user registers their application with the OIDC provider. For example, if this OIDC user registry is used by a provider organization, the user must register the provider organization's redirect endpoint with the OIDC provider. These read-only fields are provided for you to copy the endpoint values as required.

### Enabling the OIDC user registry

Complete the following steps to enable the new user registry for a specific catalog in the Developer Portal. Repeat this procedure for each catalog that will use the new registry.

1. On the navigation pane, click  Manage.
2. Select the catalog for which you will enable the new OIDC user registry.
3. On the navigation pane, click the Catalog settings tab.
4. On the Settings page, click Onboarding.
5. On the Onboarding page, click Edit in the Catalog User Registries section.
6. On the Edit User Registry page, select the new OIDC user registry to enable for your catalog.
7. Click Save.

## Using the CLI to create an OIDC user registry

Use the developer toolkit CLI to create an organization-specific OIDC user registry when multi-factor authentication (MFA) is required.

Important: Do not share user registries between the API Manager and the Developer Portal, or between Developer Portal sites when self-service onboarding is enabled or account deletions in any of the sites are expected. You should create separate user registries for them, even if the separate registries point to the same backend authentication provider (for example, an LDAP server). This separation enables the Developer Portal to maintain unique email addresses across the Catalog, without API Manager needing the same requirement. It also avoids problems with users deleting their accounts from the Developer Portal that then affects their API Manager access. You configure an OIDC user registry by first defining the registry details in a configuration file. You then use a CLI command to create the registry, passing the configuration file as parameter. To make the registry available to the Developer Portal, you must enable the registry in the associated Catalog.

Note:

- An OIDC registry, in common with a Local User Registry, cannot be used to secure APIs on the gateway.
- Because the interaction with the third party OIDC provider is handled by the Management server, the Management server is the application from the point of view of the third party OIDC provider. Your OIDC redirection endpoint, which is used by authorization server to send the token to the Management server, must be accessible to the OIDC provider through your firewall. When you register your application with the third party OIDC provider, you are required to supply the associated OIDC redirect URI, `https://consumer.mycompany.com/consumer-api/oauth2/redirect` for example. However, this information is not available until you have created your OIDC user registry in API Connect. You must therefore first register your application without this information, then update it later, as detailed in the instructions on this page.

### Logging in to the Management server

Before you can create an OIDC user registry, you must log in to your management server from the CLI. Use the following command:

```
apic login --server mgmt_endpoint_url --username user_id --password password --realm provider/identity_provider
```

You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

```
apic identity-providers:list --scope provider --server mgmt_endpoint_url --fields title,realm
```

For example:

```
apic identity-providers:list --scope provider --server myserver.com --fields title,realm
total_results: 2
results:
- title: Cloud Manager User Registry
  realm: provider/default-idp-2
- title: Corporate LDAP user registry
  realm: provider/corporate-ldap
```

The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default API Manager Local User Registry for login as a member of a provider organization is `default-idp-2`.

For full details of the `apic login` command, see [Logging in to a management server](#).

## Defining your OIDC registry configuration

You define the configuration of your OIDC user registry in a YAML file. As a minimum, the YAML file must have the following content:

```
title: registry_title
integration_url: oidc_integration_url
case_sensitive: case_sensitivity_setting
email_required: true_or_false
email_unique_if_exist: true_or_false
configuration:
  client_id: 'app_client_id'
  client_secret: 'my-client-secret'
  provider_type: oidc_provider_type
```

where:

- `registry_title` is your chosen descriptive title for the user registry.
- `oidc_integration_url` is the OIDC integration URL in your API Connect configuration. You can determine the OIDC integration URL by using the following CLI command:

```
apic integrations:list --server mgmt_endpoint_url --subcollection user-registry
```

- `case_sensitivity_setting` determines whether your user registry is case-sensitive. Valid values are:
  - `true`
  - `false`

To ensure proper handling of user name capitalization, you **must** ensure that your case-sensitivity setting here matches the setting on the backend OIDC provider:

- **Only** set `case_sensitive` to `true` if the backend OIDC provider supports case-sensitivity.
- Set `case_sensitive` to `false` if the backend OIDC provider does not support case-sensitivity.

Note: After at least one user has been onboarded into the registry, you cannot change this setting.

- `email_required` determines whether an email address is required as part of the user onboarding process. Valid values are:
  - `true`
  - `false`

If set to `true`, the source identity provider must supply the email address as part of the authentication process during onboarding.

Note: An email address is not required by default for onboarding to the Cloud Manager or the API Manager, but it is required for onboarding to the Developer Portal.

- `email_unique_if_exist` determines whether email addresses must be unique within the user registry. Valid values are:
  - `true`
  - `false`

Note: Every account in the Developer Portal, including across different user registries for the same site, must have a unique email address, including the site Admin account.

- `app_client_id` is the client ID of the application that is registered with the OIDC server, and must be in string format.
- `my-client-secret` is the client secret of the application that is registered with the OIDC server, and must be in string format.
- `oidc_provider_type` is the type of OIDC provider; specify one of the following values:

- `facebook`
- `github`
- `google`
- `linkedin`
- `slack`
- `twitter`
- `windows_live`
- `standard`

Use the `standard` provider type for any OIDC provider that is compliant with the OIDC standard.

Note: If the provider type is `standard`, you must include the following additional properties in the `configuration` section of your YAML file:

```
authorization_endpoint: 'oidc_auth_endpoint'
token_endpoint:
  endpoint: 'oidc_token_endpoint'
```

where:

- `oidc_auth_endpoint` is the authorization endpoint on the OIDC server, and must be in string format.
- `oidc_token_endpoint` is the token endpoint on the OIDC server, and must be in string format.

## Default OIDC configurations

For each OIDC provider type, API Connect assumes a default configuration, but you can override the default configuration properties in your YAML file. The default configurations are as follows:

- Facebook

```
authorization_endpoint: 'https://www.facebook.com/v3.1/dialog/oauth'
token_endpoint:
  endpoint: 'https://graph.facebook.com/v3.1/oauth/access_token'
```

```
userinfo_endpoint:
  endpoint: 'https://graph.facebook.com/me'
scope: email public_profile
field_mapping:
  username: email
  email: email
  last_name: last_name
  first_name: first_name
```

- Github

```
authorization_endpoint: 'https://github.com/login/oauth/authorize'
token_endpoint:
  endpoint: 'https://github.com/login/oauth/access_token'
userinfo_endpoint:
  endpoint: 'https://api.github.com/user'
scope: 'read:user user:email'
field_mapping:
  username: login
  email: email
  last_name: name
  first_name: name
```

- Google

```
authorization_endpoint: 'https://accounts.google.com/o/oauth2/v2/auth'
token_endpoint:
  endpoint: 'https://www.googleapis.com/oauth2/v4/token'
scope: openid profile email
field_mapping:
  username: email
  email: email
  last_name: family_name
  first_name: given_name
```

- LinkedIn

```
authorization_endpoint: 'https://www.linkedin.com/oauth/v2/authorization'
token_endpoint:
  endpoint: 'https://www.linkedin.com/oauth/v2/accessToken'
userinfo_endpoint:
  endpoint: 'https://api.linkedin.com/v1/people/~:(id,first-name,last-name,picture-url,public-profile-url,email-address)?
format=json'
scope: r_basicprofile r_emailaddress
field_mapping:
  username: emailAddress
  email: emailAddress
  last_name: lastName
  first_name: firstName
credential_location: form_body
```

- Slack

```
authorization_endpoint: 'https://slack.com/oauth/authorize'
token_endpoint:
  endpoint: 'https://slack.com/api/oauth.access'
userinfo_endpoint:
  endpoint: 'https://slack.com/api/users.identity'
scope: identity.basic identity.email
field_mapping:
  username: user.email
  email: user.email
  last_name: user.name
  first_name: user.name
```

- Twitter

```
request_endpoint: https://api.twitter.com/oauth/request_token'
authorization_endpoint: https://api.twitter.com/oauth/authenticate'
token_endpoint:
  endpoint: 'https://api.twitter.com/oauth/access_token'
userinfo_endpoint:
  endpoint: 'https://api.twitter.com/1.1/account/verify_credentials.json'
oauth_signature_method: 'HMAC-SHA1'
field_mapping:
  email: email
  first_name: name
  last_name: name
  username: screen_name
```

- Windows Live

```
authorization_endpoint: 'https://login.microsoftonline.com/common/oauth2/v2.0/authorize'
token_endpoint:
  endpoint: 'https://login.microsoftonline.com/common/oauth2/v2.0/token'
scope: openid offline_access profile email
field_mapping:
  email: email
  username: preferred_username
  first_name: name
  last_name: name
```

- Standard

```
response_type: code
```

```
scope: openid
field_mapping:
  username: sub
  email: email
  last_name: family_name
  first_name: given_name
credential_location: auth_header
```

Although this is the default configuration for the `standard` provider type, you should contact your OIDC provider to obtain the details of the fields that you need to define.

## Creating your OIDC user registry

To create your OIDC user registry, use the following CLI command:

```
apic user-registries:create --server mgmt_endpoint_url --org organization_name oidc_config_file
```

where:

- `mgmt_endpoint_url` is the platform API endpoint URL.
- `organization_name` is the value of the `name` property of your provider organization.
- `oidc_config_file` is the name of the YAML file that defines the configuration of your OIDC user registry.

On completion of the registry creation, the command displays the following summary details:

```
registry_name registry_url
```

By default, the `registry_name` is derived from the `title` property in the configuration YAML file but you can override this by including a `name` property in the file. The `registry_url` is an internal URL that API Connect assigns to the registry.

After you have created your OIDC user registry, you must update your application registration with the third party OIDC provider to include the OIDC redirect URI; you can obtain this information by using the following command, which displays the details of the registry in the command window:

```
apic user-registries:get --server mgmt_endpoint_url --org organization_name registry_name --output -
```

The required `oidc_redirect_uri` value is in the `consumer:` section; for example:

```
consumer:
  oidc_redirect_uri: https://consumer.mycompany.com/consumer-api/oauth2/redirect
```

## Enabling your OIDC registry in a Catalog

To make your OIDC registry available for onboarding and authenticating Developer Portal users, you must enable it in the Catalog that is associated with that Developer Portal. Complete the following steps:

1. Determine the URL of your OIDC user registry by using the following command:

```
apic user-registries:list --server mgmt_endpoint_url --org organization_name
```

2. Enter the following command (the terminating hyphen character means that the command takes input from the command line):

```
apic configured-catalog-user-registries:create --server mgmt_endpoint_url --org organization_name --catalog catalog_name -
```

where `catalog_name` is the value of the `name` property of the required Catalog. The command returns

```
Reading CONFIGURED_CATALOG_USER_REGISTRY_FILE arg from stdin
```

3. Enter the following data, followed by a new line:

```
user_registry_url: oidc_registry_url
```

where `oidc_registry_url` is the URL of your OIDC registry, obtained in step 1.

4. Press **CTRL D** to terminate the input.

For details of all the `apic user-registries` and `apic configured-catalog-user-registries` commands, see [apic user-registries](#) and [apic configured-catalog-user-registries](#).

You can also complete the operations described in this topic by using the API Connect REST APIs; see the [API Connect REST API documentation](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Modifying the configuration details for a user registry

You modify the configuration details for a user registry by using the User Registries page in the API Manager user interface of IBM® API Connect.

### About this task

If you want to authenticate an API Connect Catalog with a user registry that is not yet defined in API Connect, you define the registry when you configure the Catalog; for details, see [Working with user registries](#).

Note: User registries shared from the Cloud Manager cannot be edited.

To modify the configuration details for a user registry that is already defined, you use the User Registries page.

## Procedure

To modify the configuration details for a user registry, complete the following steps:

1. In the API Manager, click  Resources, and then select User Registries.
2. On the User Registries page, click the options icon  for the user registry that you want to edit, then click Edit. The details of the registry are displayed.
3. Modify the configuration details as required, then click Save to save your changes.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Password lockout criteria

You can be locked out of your account if you attempt to log in and fail consecutively.

**Note:** Account lock out applies only for local user registries.

The length of time that you are locked out of using the account is based on the number of consecutive attempts that you fail. The length of time increases as the number of consecutive failed attempts increases.

For example, you can be locked out for 15 seconds if you have five consecutive failed attempts, or 32 minutes for 12 consecutive failed attempts.

**Note:** External user registries, such as LDAP, might enforce their own lockout criteria.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Configuring a native OAuth provider

Native OAuth providers are configured and managed by you within your cloud.

### About this task

A native OAuth provider object provides settings for OAuth processing operations such as generating and validating OAuth tokens. An OAuth provider object is referenced by an OAuth security definition to protect an API. When a native OAuth provider is used, the OAuth operations are performed natively by API Connect.

Every OAuth provider object has a backing API. Your configuration here automatically updates the OpenAPI document of the API. You can edit the OpenAPI document directly by navigating to the  Resources > OAuth Providers page, selecting your OAuth provider, then clicking API Editor.

**Note:** Take care when modifying the code directly on the Source tab of the API Editor because validation is limited. For example:

- If you change the name of auto-generated assembly actions in the source code, the assembly will be prevented from updating dynamically when the OAuth provider settings are modified.
- You must ensure that the OAuth provider name matches the value specified in the `oauth-provider-settings-ref` field in each OAuth assembly action.

When a published API references an OAuth provider object, the backing API is automatically made available in the gateway.

One of the following roles is required to configure a native OAuth provider:

- Organization Administrator
- Owner
- Custom role with the Settings > Manage permissions

**Note:**

- The OAuth provider logs Analytics data for failure cases, but does not log successful cases. Activity log policies that call for logging of Analytics data upon success do not apply for the OAuth provider.
- You must ensure the OAuth Provider is configured in the Sandbox Catalog before using the OAuth Provider in a non-Sandbox Catalog.

## Procedure

1. In the API Manager, click  Resources.
2. Click OAuth Providers > Add > Native OAuth provider.
  - a. Complete the following parameters for the first screen, then click Next.

Field	Description
Title	Enter a title for the native OAuth provider.
Name	This field is auto-populated by the system.
Description (optional)	Enter a brief description.

Field	Description
Base path (optional)	The base path is the URL segment of the API that is shared by all operations in the API. It does not include the host name or any additional segments for paths or operations. The base path must be unique for a given catalog. The base path cannot include special characters and must begin with a "/" character even if it is otherwise empty.
Gateway Type	Select the gateway type, either DataPower® Gateway (v5 compatible) or DataPower API Gateway. For information about types of gateways, see <a href="#">API Connect gateway types</a> .  OAuth Providers apply to one gateway type.

b. In the next screen, enter the following additional configuration parameters, then click Next.

Field	Description
Authorize Path	/oauth2/authorize/ is the standard OAuth endpoint to login to account
Token Path	/oauth2/token/ is the standard OAuth endpoint to exchange code for access token.
Supported grant types	<ul style="list-style-type: none"> <li>Implicit - An access token is returned immediately without an extra authorization code exchange step.</li> <li>Application - Application to application. Corresponds to the OAuth grant type "Client Credentials." Does not require User Security.</li> <li>Access code - An authorization code is extracted from a URL and exchanged for an access code. Corresponds to the OAuth grant type "Authorization Code."</li> <li>Resource owner - Password - The user's username and password are exchanged directly for an access token, so can only be used by first-party clients.</li> <li><input type="checkbox"/> API Gateway only Resource owner - JWT - A verified signed JSON Web Token is exchanged directly for an access token.</li> </ul>
Supported client types	<ul style="list-style-type: none"> <li>Confidential - Client can maintain secure credentials on a secure server</li> <li>Public - Client credentials are not secure. (Public is not available for DataPower API Gateway at this time.)</li> </ul>

c. Enter the scopes in the next screen. A scope becomes an option in the request and response for an access token. Click Add to add additional fields for scopes. Click Next when done.

Field	Description
sample_scope_1	Scope for token
additional scopes	Scope for token

d. Enter the parameters for User Security in the next screen. Define the settings to use to extract the application users' credentials, authenticate their identities, and grant authorization. User Security is not required for the Application grant type. Click Next when done.

Field	Description
Identity Extraction	<p>Determines how the user credential is extracted:</p> <ul style="list-style-type: none"> <li>Basic Authentication - HTTP basic authentication (requires no additional configuration)</li> <li>Default HTML Form - Use default login form for user name and password</li> <li><input type="checkbox"/> API Gateway only Context variable - Specify which variable contains the user name and password. API Connect OAuth context variables as listed here <a href="#">API Connect context variables</a> Note: DataPower API Gateway only. Not available for DataPower Gateway (v5 compatible).</li> <li>Custom HTML Form - Enter the endpoint and select an optional TLS profile for a custom HTML form. For instructions on creating a custom form, see <a href="#">Creating a custom HTML login form for user security</a>.</li> <li>Redirect - Enter an endpoint to redirect to a third-party identity provider. For more information, see <a href="#">Authenticating and authorizing through a redirect URL</a>.</li> <li><input type="checkbox"/> API Gateway only Disabled - do not collect the user credential</li> </ul> <p>Note: If you use either the Default HTML Form or Redirect identity extraction methods, the response from the redirect endpoint <b>must</b> maintain the order of the query parameters before the <b>state_nonce</b> query parameter, otherwise the authorization fails.</p>
Authentication	Authenticate application users with a user registry. Select an LDAP or Authentication URL user registry or create the SampleAuthURL User Registry. For a DataPower API Gateway, you have the option to disable authentication with a user registry.
Authorization	<p>The following methods for extracting the user credential are available:</p> <ul style="list-style-type: none"> <li>Authenticated - Authorize authenticated users automatically.</li> <li>Default HTML Form - Use default HTML form to authorize.</li> <li>Custom HTML Form - Enter the endpoint and select an optional TLS profile for a custom HTML form. For instructions on creating a custom form, see <a href="#">Creating a custom HTML authorization form for user security</a>.</li> <li><input type="checkbox"/> API Gateway only Disabled - Disable authorization.</li> </ul>

3. Review the Summary for the native OAuth provider configuration.

4. Click Back to make changes.

5. Click Finish to save the basic configurations and to proceed to the Advanced Parameters for a native OAuth Provider.

## Results

You can use the OAuth Provider to secure the APIs in catalog.

- [Configuring basic settings for a native OAuth provider](#)

You can update the identification details and basic configuration settings for a native OAuth provider.

- [Configuring scopes for a native OAuth provider](#)

Access tokens contain authorization for specific scopes.

- [Configuring user security for a native OAuth provider](#)

Define the settings to use to extract the application users' credentials, authenticate their identities, and grant authorization.

- [Configuring tokens for a native OAuth provider](#)

Set time to live for access tokens and refresh tokens, and a time period for maximum consent for all tokens.

- [Configuring token management and revocation for a native OAuth provider](#)

Select whether to use a native gateway (DataPower) or third party endpoint for token revocation.

- [Configuring introspection for a native OAuth provider](#)

Define an introspection path to allow the metadata for an access token to be examined.

- [Configuring metadata for a native OAuth provider](#)

Use Authentication URL or External URL parameters to request user-defined content from a remote server and include it in the access token or in the response payload that contains the access token.

- [Configuring the OIDC parameters for a native OAuth provider](#)

Open ID Connect (OIDC) provides an additional authentication protocol based on OAuth 2.0. OIDC provides user information encoded in a JSON Web Token, or JWT.

- [Editing a native OAuth provider by using the API Editor](#)

You can edit the source and assembly policies for the Native OAuth Provider using the API editor.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Configuring basic settings for a native OAuth provider

You can update the identification details and basic configuration settings for a native OAuth provider.

### About this task

One of the following roles is required to configure the basic settings for a native OAuth Provider:

- Organization Administrator
- Owner
- Custom role with the Settings > Manage permissions

You can select the basis settings pages for a native OAuth provider immediately on completion of the creation operation detailed in [Configuring a native OAuth provider](#), or you can update the basic settings for an existing native OAuth provider. If you want to update the basic settings for an existing native OAuth provider, complete the following steps before following the procedure described in this topic:

1. Click  Resources > OAuth Providers.
2. Select the required native OAuth provider.

### Procedure

1. To modify the identification details, click Info in the sidebar menu, then update the following fields as required:

Field	Description
Title	Enter a title for the native OAuth provider.
Name	This field is auto-populated by the system.
Description (optional)	Enter a brief description.
Base path (optional)	The base path is the URL segment of the API that is shared by all operations in the API. It does not include the host name or any additional segments for paths or operations. The base path must be unique for a given catalog. The base path cannot include special characters and must begin with a "/" character even if it is otherwise empty.

2. To modify the basic configuration settings, click Configuration in the sidebar menu, then update the following fields as required:

Field	Description
Authorize Path	/oauth2/authorize/ is the standard OAuth endpoint to login to account
Token Path	/oauth2/token/ is the standard OAuth endpoint to exchange code for access token.
Supported grant types	<ul style="list-style-type: none"> <li>• Implicit - An access token is returned immediately without an extra authorization code exchange step.</li> <li>• Application - Application to application. Corresponds to the OAuth grant type "Client Credentials." Does not require User Security.</li> <li>• Access code - An authorization code is extracted from a URL and exchanged for an access code. Corresponds to the OAuth grant type "Authorization Code."</li> <li>• Resource owner - Password - The user's username and password are exchanged directly for an access token, so can only be used by first-party clients.</li> <li>• <span style="border: 1px solid green; padding: 2px;">API Gateway only</span> Resource owner - JWT - A verified signed JSON Web Token is exchanged directly for an access token. Tip: Selecting only the Resource owner - JWT grant type when defining a native OAuth provider in the user interface is not supported and results in an invalid configuration. To avoid this problem, additionally select either the Access code or the Resource owner - Password grant type.</li> </ul> <p>Note: If you plan to configure OpenID Connect (OIDC) for a native OAuth provider, you must include at least one of the following grant types: Implicit, Access code.</p>
Supported client types	<ul style="list-style-type: none"> <li>• Confidential - Client can maintain secure credentials on a secure server</li> <li>• Public - Client credentials are not secure.</li> </ul>

DataPower Gateway (v5 compatible) only Note: If the gateway type is DataPower® Gateway (v5 compatible) and, when the native OAuth provider was created, only the Application grant type was selected, you cannot add further grant types until you configure the user security settings. In particular, you must specify the user registry for authenticating application users. To configure the user security settings, complete the following steps:

- a. Click User Security in the sidebar menu, then click Edit.
  - b. Update the user security settings as required; for more details, see [Configuring user security for a native OAuth provider](#).
  - c. Click Save when done.
3. Click Save when done.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Configuring scopes for a native OAuth provider

Access tokens contain authorization for specific scopes.

### About this task

The client applications can request only the scopes or a subset of the scopes that you define here. The scopes are included in the access tokens that are generated from the provider. When an OAuth protected API is invoked, the gateway checks the scopes carried in the access tokens against the list of allowed scopes in the security definition for the API to determine whether to grant access.

In addition, you can enforce advanced scope checks. The advanced scope check URLs are invoked after application authentication or after user authentication based on which URLs are configured. The final scope permission that is granted by the access token is the result of all scope checks.

Per IETF RFC 6749, the value of the scope parameter is a list of space-delimited, case-sensitive strings. For more information, see [The OAuth 2.0 Authorization Framework](#).

One of the following roles is required to configure scopes for a native OAuth Provider:

- Organization Administrator
- Owner
- Custom role with the Settings\_>Manage permissions

You can select the scope settings page for a native OAuth provider immediately on completion of the creation operation detailed in [Configuring a native OAuth provider](#), or you can update the scope settings for an existing native OAuth provider. If you want to update the scope settings for an existing native OAuth provider, complete the following steps before following the procedure described in this topic:

1. Click  Resources\_>OAuth Providers.
2. Select the required native OAuth provider.

### Procedure

1. Click Scopes in the sidebar menu. The currently configured scopes are listed. Review and update the scopes as required.

Field	Description
sample_scope_1	Scope for token
additional scopes	Scope for token

In the Default scopes section, select the default scopes to be used if the API request doesn't contain any scopes.

If the user authorization method is set to Default HTML Form in the User Security settings, all scopes specified here are added automatically to the authorization consent form.

2. Advanced scope check before token generation. This setting specifies the scope check endpoint where additional scope verification is performed in addition to the basic scopes. The advanced scope check URLs are invoked after application authentication or after owner authentication based on which URLs are configured. The scopes are included in the token and will overwrite any previous scopes.

Field	Description
Application scope check	Allow extra verification by running a scope check from an endpoint. Enter the endpoint and an optional TLS Profile to use for an application scope check.
Owner scope check	Further refine the scope with an additional check. Enter the endpoint and an optional TLS Profile to use for an owner scope check.

For more information about scope, see [Scope](#)

3. Advanced scope check after token generation. This setting specifies an additional scope check at the API consumer level to verify compliance with the scope requirements of the API.

Field	Description
Enabled	Select the check box to enable the advanced scope check after token validation. Enter an optional default validator endpoint.
Use endpoint from API	Select the check box to use the endpoint from the API, or clear the check box to override the endpoint from the API.

For more information about scope, see [Scope](#)

4. Click Save when done.

### Results

You can use the OAuth Provider with these scopes to secure the APIs in catalog.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.

For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Configuring user security for a native OAuth provider

Define the settings to use to extract the application users' credentials, authenticate their identities, and grant authorization.

### About this task

User security authenticates the user. It is required for the Implicit, Access code, and Resource owner - Password grant types. It is not used for the Application or Resource owner - JWT grant types.

One of the following roles is required to configure user security for a native OAuth Provider:

- Organization Administrator
- Owner
- Custom role with the Settings > Manage permissions

You can select the user security settings page for a native OAuth provider immediately on completion of the creation operation detailed in [Configuring a native OAuth provider](#), or you can update the user security settings for an existing native OAuth provider. If you want to update the user security settings for an existing native OAuth provider, complete the following steps before following the procedure described in this topic:

1. Click  Resources > OAuth Providers.
2. Select the required native OAuth provider.

## Procedure

1. Click User Security in the sidebar menu.
2. Specify the following parameters for User Security. Define the settings to use to extract the application users' credentials, authenticate their identities, and grant authorization. User Security is not required for the Application or Resource owner - JWT grant types. Click Next when done.

Field	Description
Identity Extraction	<p>Determines how the user credential is extracted:</p> <ul style="list-style-type: none"><li>• Basic Authentication - HTTP basic authentication (requires no additional configuration)</li><li>• Default HTML Form - Use default login form for user name and password</li><li>•  Context variable - Specify which variable contains the user name and password. API Connect OAuth context variables as listed here <a href="#">API Connect context variables</a></li><li>• Custom HTML Form - Enter the endpoint and select an optional TLS profile for a custom HTML form. For instructions on creating a custom form, see <a href="#">Creating a custom HTML login form for user security</a>.</li><li>• Redirect - Enter an endpoint to redirect to a third-party identity provider. For more information, see <a href="#">Authenticating and authorizing through a redirect URL</a>.</li><li>•  Disabled - do not collect the user credential</li></ul> <p>Note: If you use either the Default HTML Form or Redirect identity extraction methods, the response from the redirect endpoint <b>must</b> maintain the order of the query parameters before the <b>state_nonce</b> query parameter, otherwise the authorization fails.</p>
Authentication	Authenticate application users with a user registry. Select an LDAP or Authentication URL user registry or create the SampleAuthURL User Registry.
Authorization	<p>Various methods may be used to authorize application users. For a DataPower® API Gateway, the following methods for extracting the user credential are available:</p> <ul style="list-style-type: none"><li>• Authenticated - Authorize authenticated users automatically.</li><li>• Default HTML Form - Use default HTML form to authorize. If you select the Default HTML Form method, all scopes that are specified in the Scopes settings are added automatically to the authorization consent form.</li><li>• Custom HTML Form - Enter the endpoint and select an optional TLS profile for a custom HTML form.</li><li>•  Disabled - Disable authorization.</li></ul>

3. Click Save when done.

## Results

You can use the OAuth Provider to secure the APIs in catalog.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Configuring tokens for a native OAuth provider

Set time to live for access tokens and refresh tokens, and a time period for maximum consent for all tokens.

### About this task

Access tokens are granted to the client application to allow the application to access resources on behalf of the application user. Refresh tokens are issued to the client to obtain a new access token when the current access token becomes invalid or expires, or to obtain additional access tokens with identical or more narrow scope. You can also specify how long the consent given by the combination of any number of access and refresh token remains valid.

One of the following roles is required to configure tokens for a native OAuth Provider:

- Organization Administrator
- Owner
- Custom role with the Settings > Manage permissions

You can select the token settings page for a native OAuth provider immediately on completion of the creation operation detailed in [Configuring a native OAuth provider](#), or you can update the token settings for an existing native OAuth provider. If you want to update the token settings for an existing native OAuth provider, complete the following steps before following the procedure described in this topic:

1. Click  Resources > OAuth Providers.

2. Select the required native OAuth provider.

## Procedure

1. Click Tokens in the sidebar menu.
2. Define the settings to configure tokens.

Field	Description
Access tokens time to live	Enter the expiration time period in seconds for access tokens.
<span style="border: 1px solid green; padding: 2px;">API Gateway only</span> One time use access token	Click the check box to enable one time use for the access token. Access tokens are multiple use by default which allows them to be used for multiple requests. When one time use is enabled, the access token will be consumed after one use. The OAuth flow will need to be repeated to obtain another access token. Note: If you select this option, you must also enable token management; see one of the following topics, depending on the user interface you are using: <ul style="list-style-type: none"> <li>• <a href="#">Configuring token management and revocation for a native OAuth provider</a> (Cloud Manager)</li> <li>• <a href="#">Configuring token management and revocation for a native OAuth provider</a> (API Manager)</li> </ul>
Refresh tokens	Click the check box to enable Refresh tokens. Set the Count to limit the number of times a refresh token can be issued. Set the Refresh Token Time to Live value to determine the time to live, or expiration time period, for each refresh token in seconds.
One time use refresh token	Clear the check box to disable one time use for the refresh tokens. Refresh tokens are one time use by default which allows them to be used one time only to generate an access token and a new refresh token. When refresh token one time use is disabled then the refresh token count is limited to one and the refresh token can be used multiple times to generate new access tokens, however, another refresh token will not be generated unless the initial OAuth flow (Authorization Code or Password) is repeated. Note: If you select this option, you must also enable token management; see one of the following topics, depending on the user interface you are using: <ul style="list-style-type: none"> <li>• <a href="#">Configuring token management and revocation for a native OAuth provider</a> (Cloud Manager)</li> <li>• <a href="#">Configuring token management and revocation for a native OAuth provider</a> (API Manager)</li> </ul>
Maximum consent	Click the check box to enable Maximum consent and enter the Maximum Consent Time to Live value in seconds. This is the time to live, or expiration time period, for all tokens, both access and refresh.
<span style="border: 1px solid green; padding: 2px;">API Gateway only</span> Token secret	Click the check box to select the Shared Secret which was configured for the gateway. If no Shared Secret was entered in the Gateway Configuration, then enter an key name and key value to use as the token secret.
<span style="border: 1px solid green; padding: 2px;">API Gateway only</span> Proof Key for Code Exchange	Proof Key for Code Exchange (PKCE) is a method to protect OAuth 2.0 public clients from an authorization code interception attack when they use Authorization Code grant requests. You can enable this extension when deploying with the DataPower® API Gateway.  For more information, see <a href="#">RFC 7636</a> .  Select the options for your OAuth Providers: <ul style="list-style-type: none"> <li>• Enable proof key for code exchange If selected, enforces PKCE when submitted in Authorization Code grant requests.</li> <li>• Always required If selected, requires PKCE in all Authorization Code grant requests.</li> <li>• Allow plain Select this check box to allow the plain challenge method in Authorization Code grant requests.</li> </ul>

3. Click Save when done.

## Results

You can use the OAuth Provider to secure the APIs in a catalog.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Configuring token management and revocation for a native OAuth provider

Select whether to use a native gateway (DataPower) or third party endpoint for token revocation.

### About this task

Token management enables you to prevent replay attacks by configuring token revocation. API Connect supports token revocation using a native gateway (DataPower) or a third party endpoint. For a native gateway, quota enforcement is used to manage tokens. For a third party endpoint, a URL to an external service is used to manage tokens.

For more information, see the IETF RFC 7009 [OAuth 2.0 Token Revocation](#).

One of the following roles is required to configure token management and revocation for a native OAuth Provider:

- Organization Administrator
- Owner
- Custom role with the Settings\_>\_Manage permissions

You can select the token management settings page for a native OAuth provider immediately on completion of the creation operation detailed in [Configuring a native OAuth provider](#), or you can update the token management settings for an existing native OAuth provider. If you want to update the token management settings for an existing native OAuth provider, complete the following steps before following the procedure described in this topic:

1. Click  Resources, OAuth Providers.
2. Select the required native OAuth provider.

## Procedure

---

1. Select Token Management in the sidebar menu.
2. Enable token management by selecting the check box.
3. From the Type list, select either Native or External. Native points to DataPower as the token storage location; External points to a revocation URL for token storage.  
Note: If you are using the API Manager user interface then, for the External option to be available, you must be using DataPower® API Gateway Version 10.0.1.0 or later, and the gateway service must be enabled in the Sandbox Catalog; for details on how to enable a gateway service in a Catalog, see [Creating and configuring Catalogs](#).
4. For Native, select one or both of the Resource owner revocation path and Client revocation path.
  - Resource owner revocation path - Uses the standard OAuth revocation path to allow the resource owner (end user) to revoke the application permission.
  - Client revocation path - Uses the standard OAuth revocation path to allow the client (application) to revoke a single token when the application closes.For more information about managing tokens with the Native DataPower Gateway, see [Token management with the native DataPower Gateway](#).
5. For External, the settings depend on the gateway type, as follows:  
DataPower API Gateway:
  - Endpoint - the URL of the external management endpoint.
  - TLS Client Profile (optional) - the TLS client profile to secure connections.
  - Security - how to secure connections. The only supported method is basic authentication.
  - Basic authentication username (optional) - the user name for authentication.
  - Basic authentication password (optional) - the password for authentication.
  - Basic authentication request header name (optional) - the request header that contains the authentication string; if you supply both a request header name and user name/password, the request header authentication method is used.
  - Custom header pattern (optional) - the name pattern of the headers to use for sending additional information to the external management service.
  - Cache type - the cache type to control whether and how to cache positive responses. If you select Time to live, specify how long to keep responses in the cache; the default value is 900 seconds.
  - Fail on error - if selected, processing is stopped if the connection to the external management service fails.Note: For details of the JSON format that is required when exchanging messages with the external management service, see [JSON format to exchange messages with the external management service](#).  
DataPower Gateway (v5 compatible):
  - Endpoint - Enter the URL to an external web server that contains information about access or refresh tokens. API Connect calls the URL to determine if the associated token can be trusted. The token server then checks a token *blocklist* (a data store of inactive tokens) to ensure that the token is still valid. If the token is still valid, API Connect continues the processing. For more information see [Token revocation](#).
  - TLS Client Profile - Select a TLS profile to verify the external endpoint.
6. Click Save when done.

## Results

---

You can use the OAuth Provider to secure the APIs in a catalog.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Configuring introspection for a native OAuth provider

Define an introspection path to allow the metadata for an access token to be examined.

### About this task

---

Token introspection allows an authorized holder of an access token to examine the contents of tokens using an introspection path. The access token to introspect must be obtained through the native OAuth provider. Introspection provides context for the token by allowing an authorized protected resource to query the authorization server to determine the set of metadata for a given token. The metadata includes whether or not the token is currently active, the scopes assigned to the token, and the authorization context in which the token was granted (including who authorized the token and which client it was issued to). API Connect token introspection conforms to IETF RFC 7662. See [OAuth 2.0 Token Introspection](#).

One of the following roles is required to enable introspection for a native OAuth Provider:

- Organization Administrator
- Owner
- Custom role with the Settings, Manage permissions

You can select the introspection settings page for a native OAuth provider immediately on completion of the creation operation detailed in [Configuring a native OAuth provider](#), or you can update the introspection settings for an existing native OAuth provider. If you want to update the introspection settings for an existing native OAuth provider, complete the following steps before following the procedure described in this topic:

1. Click  Resources, OAuth Providers.
2. Select the required native OAuth provider.

## Procedure

---

1. Click Introspection in the sidebar menu.

2. Select the check box to enable Introspection. The OAuth standard path for introspection, /oauth2/introspect is automatically entered. This path will be used when another entity inspects the token contents.
3. Click Save when done.

## Results

---

Tokens will be queried using the /oauth2/introspect path. You can use the OAuth Provider to secure the APIs in a catalog.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Configuring metadata for a native OAuth provider

Use Authentication URL or External URL parameters to request user-defined content from a remote server and include it in the access token or in the response payload that contains the access token.

### About this task

---

Configure an Authentication URL or an External URL from which custom metadata is collected for inclusion in the token. The metadata is either stored inside the access token or it is sent along with the access token to the client application. For more information about how the metadata is collected, see [OAuth external URL and authentication URL](#).

Following are examples of metadata that can be included with the access token:

- Metadata about the authenticated resource owner
- Grant type that was used to obtain the token
- A confirmation code to be provided to the client application

One of the following roles is required to configure metadata collection for a native OAuth Provider:

- Organization Administrator
- Owner
- Custom role with the Settings > Manage permissions

You can select the metadata settings page for a native OAuth provider immediately on completion of the creation operation detailed in [Configuring a native OAuth provider](#), or you can update the metadata settings for an existing native OAuth provider. If you want to update the metadata settings for an existing native OAuth provider, complete the following steps before following the procedure described in this topic:

1. Click  Resources > OAuth Providers.
2. Select the required native OAuth provider.

### Procedure

---

1. Click Metadata in the sidebar menu.
2. Select Collect metadata to enable metadata collection.
3. The Authentication URL user registry is selected by default and is required. For more information about the Authentication URL, see [Authentication URL user registry](#).
4. Select the External URL to collect metadata from an external URL. Enter the endpoint and an option TLS Client Profile.
5.  If required, override the default Header name token value. The value of this header, if returned in the response from the OAuth endpoint, is placed in the response payload and indicated as **metadata**.
6.  If required, override the default Header name payload value. If the value of this header, if returned in the response from the OAuth endpoint, is placed within the access token and indicated as **miscinfo**.
7. Save the OAuth Provider.
8. Click Save when done.

## Results

---

You can use the OAuth Provider to secure the APIs in a catalog.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Configuring the OIDC parameters for a native OAuth provider

Open ID Connect (OIDC) provides an additional authentication protocol based on OAuth 2.0. OIDC provides user information encoded in a JSON Web Token, or JWT.

### About this task

---

When you enable OpenID connect, a template is provided for generating ID tokens along with access tokens and the required assembly policies are automatically created. You can customize the policies to suit your needs in the API Editor. The sample key provided is for test purposes only and is used to sign the JWT token.

One of the following roles is required to configure an OIDC template for a native OAuth Provider:

- Organization Administrator
- Owner
- Custom role with the System, Manage permissions

Note: You can configure OIDC parameters only if the selected grant types for the native OAuth provider include at least one of the Implicit or Access code grant types; see [Configuring basic settings for a native OAuth provider](#).

You can select the OIDC settings page for a native OAuth provider immediately on completion of the creation operation detailed in [Configuring a native OAuth provider](#), or you can update the OIDC settings for an existing native OAuth provider. If you want to update the OIDC settings for an existing native OAuth provider, complete the following steps before following the procedure described in this topic:

1. Click  Resources, OAuth Providers.
2. Select the required native OAuth provider.

## Procedure

1. Click OpenID Connect in the sidebar menu.
2. Select the initial check box to configure an OIDC Template. Enter the following parameters:

Field	Description
<input checked="" type="checkbox"/> API Gateway only Support hybrid response types (optional)	Select the response types for the OpenID Connect hybrid flow to be supported by this OAuth provider.
<input checked="" type="checkbox"/> API Gateway only Auto Generate OIDC API Assembly	Select this option to generate the full OIDC assembly. Leave this option unselected to simply enable OIDC support in the OAuth provider and allow the developer to implement their own assembly.
<input type="text"/> DataPower Gateway (v5 compatible) only ID token issuer	Descriptive text to indicate the source of the key.
<input type="text"/> DataPower Gateway (v5 compatible) only ID token signing key	Specify the JSON Web Key (JWK) to be used to sign the ID token.
<input type="text"/> DataPower Gateway (v5 compatible) only ID token signing algorithm	Select the algorithm used to sign the token.

3. Click Save when done. You can edit the policies by using the API Editor.

## Results

You can use the OAuth Provider to secure the APIs in a catalog.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Editing a native OAuth provider by using the API Editor

You can edit the source and assembly policies for the Native OAuth Provider using the API editor.

### About this task

If you have configured an OIDC template, you can customize it in API Editor. In the API Editor, the Source tab allows you to edit the code for the configuration using a text editor. The API Assemble tab provides a graphical drag-and-drop editor (identical to the one in API Manager) that allows you to add additional elements to the assembly for the OAuth Provider.

Note: Take care when modifying the code directly on the Source tab of the API Editor because validation is limited. For example:

- If you change the name of auto generated assembly actions in the source code, the assembly will be prevented from updating dynamically when the OAuth provider settings are modified.
- You must ensure that the OAuth provider name matches the value specified in the `oauth-provider-settings-ref` field in each OAuth assembly action.

One of the following roles is required to configure tokens for a native OAuth Provider:

- Organization Administrator
- Owner
- Custom role with the Settings, Manage permissions

You can modify the native OAuth provider configuration by selecting the API Editor page immediately on completion of the creation operation detailed in [Configuring a native OAuth provider](#), or you can update the configuration for an existing native OAuth provider. If you want to update the configuration for an existing native OAuth provider, complete the following steps before following the procedure described in this topic:

1. Click  Resources, OAuth Providers.
2. Select the required native OAuth provider.

## Procedure

1. Click API Editor in the sidebar menu.
2. In the Source tab, view and edit the policies to customize the behavior for the OAuth provider.
3. In the API Assemble tab, use the drag and drop editor to add additional policies to the OIDC behavior.  
Note: If you add a policy that references a TLS profile, an **invoke** policy for example, then when you publish an API that uses this OAuth provider, you must ensure that the TLS profile is enabled for the Catalog to which you publish the API. For details on how to enable a TLS profile in a Catalog, see [Creating and configuring Catalogs](#).
4. Save the edits.
5. Click Save when done.

## Results

You can use the OAuth Provider to secure the APIs in a catalog.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.

For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Configuring a third-party OAuth provider

Enter the secure endpoints to provide OAuth authentication from a third party.

### About this task

One of the following roles is required to configure OAuth Providers:

- Organization Administrator
- Owner
- Custom role with the Settings > Manage permissions

## Procedure

1. In the API Manager, click  Resources.
2. Select OAuth Providers > Add > Third party OAuth Provider.
  - a. Complete the following parameters for the first screen and click Next.

Field	Description
Title	Enter a descriptive title for the gateway service. This title will be displayed on the screen.
Name	This field is auto-populated by the system and used as the internal field name.
Supported grant types	Select from the following options: <ul style="list-style-type: none"><li>• Implicit: An access token is returned immediately without an extra authorization code exchange step.</li><li>• Application: Application to application. Corresponds to the OAuth grant type Client Credentials. Does not require User Security.</li><li>• Access code: An authorization code is extracted from a URL and exchanged for an access code. Corresponds to the OAuth grant type Authorization Code.</li><li>• Resource owner - Password: The user's username and password are exchanged directly for an access token, so can only be used by first-party clients.</li><li>• <span style="border: 1px solid green; padding: 2px;">API Gateway only</span> Resource owner - JWT: a JSON Web Token (JWT) Bearer Token is used as a means for requesting an OAuth 2.0 access token, and for client authentication, as defined by the <a href="#">JSON Web Token (JWT) Profile for OAuth 2.0 Client Authentication and Authorization Grants</a>.</li></ul>
Gateway type	Select the gateway type, either DataPower® Gateway (v5 compatible) or DataPower API Gateway. For information about types of gateways, see <a href="#">API Connect gateway types</a> .  OAuth Providers apply to one gateway type.

- b. Specify configuration settings for the endpoints.

Field	Description
Authorization URL	An authorization URL where the resource owner grants authorization to the client application to access a protected resource. Example:  <code>https://example.com/oauth2/authorize</code>
Token URL	A token request URL where the client application exchanges an authorization grant for an access token. Example:  <code>https://example.com/oauth2/token</code>
Introspect URL	The introspection URL is where the API gateway validates the access tokens that are issued by the third party provider. Example:  <code>https://example.com/oauth2/introspect</code>  For more information on integrating third party OAuth providers for introspection, see <a href="#">OAuth introspection for third-party OAuth providers</a> .

Field	Description
<b>API Gateway only</b> Introspect cache type	The cache type determines how long responses from the third party provider are cached, if at all. Select one of the following options: <ul style="list-style-type: none"> <li>No cache (default): Responses are not cached.</li> <li>Protocol: Defined by the <code>cache-control</code> header in the provider response.</li> <li>Time to live: Defined by the provider.</li> </ul>
<b>API Gateway only</b> Cache Time to Live	The length of time, in seconds, for which provider responses are cached, if the Introspect cache type is set to Time to live. The default value is 900.
TLS Profile (optional)	Select an optional TLS profile for communicating with the third party provider.
Security	Default is Basic Authentication.
Basic authentication request header name	The <code>x-introspect-basic-authorization-header</code> is available to provide a user-configured HTTP Basic authorization header.
<b>API Gateway only</b> Basic authentication username (optional)	The default user name for HTTP Basic authentication.
<b>API Gateway only</b> Basic authentication password (optional)	The default password for HTTP Basic authentication.
<b>API Gateway only</b> Token validation	Specifies the method used to determine the success of the introspection request that is sent to the third party service to validate the provided token. Select one of the following options: <ul style="list-style-type: none"> <li>Connected: The query is successful if the status return code is 200.</li> <li>Active (default): The query is successful if the status return code is 200 and the response JSON body includes the property <code>active: true</code>.</li> </ul>
<b>API Gateway only</b> Custom header pattern (optional)	A regular expression for request headers that are to be passed to the third-party provider; for example, <code>x-Introspect-*</code> .
<b>API Gateway only</b> Authorization header pass through	Select this check box if you want to retain the <code>Authorization</code> header for a bearer token. The default behavior is to remove this header.

- c. Enter the scopes in the third screen. A scope becomes an option in the request and response for an access token. Click Add to add additional fields for scopes. Click Next when done.

Field	Description
sample_scope_1	Scope for token
sample_scope_2	Scope for token
additional scopes	Scope for token

- d. Review the settings on the Summary panel.

3. Click Save and Edit to complete the configuration.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## OAuth concepts for API Connect

OAuth is a token-based authorization protocol that allows third-party websites or applications to access user data without requiring the user to share personal information.

Note: In a multi-node cluster, OAuth operations will fail if quorum is lost. Quorum requires that the number of active nodes is greater than 50% of the total number of nodes in the cluster.

- OAuth user scenario**  
Potential users of OAuth with IBM® API Connect have a number of methods to secure their API. The following scenario provides an overview of the available options.
- OAuth introspection for third-party OAuth providers**  
OAuth token validation can be offloaded to the third-party Open Authorization (OAuth)/Open ID Connect (OIDC) provider by using the Introspection URL. Clients can use a third-party OAuth or OIDC provider to obtain a token that is protected by IBM API Connect. IBM API Connect can use this feature along with the mentioned provider to protect access to the API.
- OAuth external URL and authentication URL**  
You can use the Authentication URL or External URL parameters to request user-defined content from a remote server and include it in the access token or in the response payload that contains the access token.
- Scope**  
Per IETF RFC 6749, the value of the scope parameter is expressed as a list of space-delimited, case-sensitive strings.
- Tokens**  
Tokens can be managed using refresh tokens and revocation URLs. You can extend the life of tokens using refresh tokens. You can end the life of a token by specifying a revocation URL.
- Authentication URL user registry**  
You can use an Authentication URL user registry to specify a REST authentication service that manages user authentication, and optionally provides additional metadata to be embedded in the token.
- Custom forms for user security**  
You can create custom forms for the authorization and identity extraction phase of OAuth.
- Securing an API with a JSON Web Token**  
There are two methods to secure your API with a JSON Web Token. You can use the `jwt-generate` command, or you can use a token that has been generated external to IBM API Connect.

- [Troubleshooting OAuth](#)

You can find the answers to some common questions in the Developer Portal, or in support communities and forums in DeveloperWorks, on GitHub, or on Youtube.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## OAuth user scenario

Potential users of OAuth with IBM® API Connect have a number of methods to secure their API. The following scenario provides an overview of the available options.

### Scenario overview

---

In this scenario, Alice is a user of an application. Alice can grant permission for an application to access specific information about Alice in a third-party system that is using OAuth. Depending on the type of OAuth that is supported by the target service, Alice does not enter her user name and password into the application. Instead, the application receives an access token that represents her credentials (user name and password). The application can now access the information about Alice in the target system.

For example, Alice maintains a list of books that she reads on a service that is provided by mybooks.com. Following the purchase of a smartphone, Alice installs an application on her new phone to display the book details. The phone application wants to call an API provided by mybooks.com, which can access the information. The mybooks.com API is secured by using the OAuth protocol.

To access the book details, the application must complete a two-step process:

1. The application must first obtain permission from Alice.
2. The application then uses that permission to call the target service and obtain the list of books.

In the first step, the application typically directs Alice to the provider of the target service, mybooks.com. Alice provides her user name and password, and gives permission for the application to access her information. It is important that Alice trusts that she is providing her credentials to the provider of the target service and not to an untrusted proxy application. For example, by checking that the security certificate of the website where Alice enters her credentials matches what Alice expects from the provider of the target service.

The result of this step is the access token that the application can use to call the API. The application then generates the appropriately formatted OAuth request. For example, the Authorization header, or HTTP query parameters, which includes the access token, consumer key, and signature method that are required by OAuth. This OAuth request is used to invoke the API proxy operation.

### Scenario within API Connect

---

No changes to the definition of your API operation are required to support this scenario.

1. Alice grants permission for the application to access her information *before* the invocation of the API.
2. When the application provides the Authorization header, or query parameters, containing the OAuth details about the call to the operation endpoint, the header is automatically passed through to the target service without any additional configuration.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## OAuth introspection for third-party OAuth providers

OAuth token validation can be offloaded to the third-party Open Authorization (OAuth)/Open ID Connect (OIDC) provider by using the Introspection URL. Clients can use a third-party OAuth or OIDC provider to obtain a token that is protected by IBM API Connect. IBM® API Connect can use this feature along with the mentioned provider to protect access to the API.

You can use API Connect to protect an API that is secured by using the third-party OAuth access token in accordance with Introspection specification as defined in [RFC 7662](#). In addition to the specification, the `x-Introspect-` header is provided to pass other content to the third party as you require.

Authentication information can be carried in the request by configuring a basic authentication request header.

The following sequence diagram depicts the overall flow of request and response. The purpose of this diagram is only to provide a general visualization of the nature of the flow; for the precise details, refer to the explanatory information after the diagram.

The Introspect URL is configured in the Third Party OAuth provider configuration. See [Configuring a third-party OAuth provider](#).

When an API is protected by a third-party OAuth provider, API Connect will extract the bearer token and issue an HTTP POST request to the endpoint specified in the Introspect URL field.

The GET request is protected by API Connect with this feature.

You can use a header prefix to pass information to the third-party provider. The header prefix can include a regular expression and specifies the name pattern of the headers to use for sending additional information, such as **x-introspect-\***.

```
GET /petstore/pet/123 HTTP/1.1
Host: apiconnect.com
x-Introspect-type: dog
x-Introspect-name: simon
x-custom-apic: petstore123
Authorization: Bearer tGzv3JOkF0XG5Qx2T1KWIA
x-IBM-Client-Id: xxx-xxx
```

However, if you want to use a different header prefix, specify the required value in the Custom header pattern field in the third party OAuth provider configuration. For third-party OAuth provider configuration details, see [Configuring a third-party OAuth provider](#). The Custom header pattern feature is available only with the DataPower® API Gateway, if you are using the DataPower Gateway (v5 compatible) the header prefix must be **x-Introspect-**.

API Connect will issue this POST request to the introspection endpoint specified in **x-tokenIntrospect**, as illustrated in the code sample:

```
POST /oauth/introspectURL HTTP/1.1
Host: apiconnect.ibm.com
Content-Type: application/x-www-form-urlencoded
x-Introspect-type: dog
x-Introspect-name: simon
x-custom-apic: petstore123
token_type_hint=access_token&token=tGzv3JOkF0XG5Qx2T1KWIA
```

The third party OAuth/OIDC provider will respond with HTTP 200 indicating the request was successful and that payload contains the token information. API Connect honors the active claim as defined in the RFC specification.

If the value of the active claim is `true`, the token is treated as valid.

```
HTTP/1.1 200 OK
Content-Type: application/json; charset=UTF-8
Cache-Control: no-store
Pragma: no-cache

{
  "active": true,
  "token_type": "bearer",
  "client_id": "xxx-xxx",
  "username": "John Smith",
  ...
}
```

If the value of the active claim is `false`, the token is treated as invalid.

```
HTTP/1.1 200 OK
Content-Type: application/json; charset=UTF-8
Cache-Control: no-store
Pragma: no-cache

{
  "active": false
}
```

A response code other than **HTTP 200** indicates failure to process the request.

When the OAuth token is valid and active, context variables are populated with information from the introspect JSON response. For more information, see [API Connect context variables](#).

When contacting the introspection endpoint, API Connect uses `client_id/appId` and `client_secret/appSecret` to construct the HTTP Basic authorization header.

By default, if `x-introspect-basic-authorization-header` exists in the request, the value is used for the HTTP Basic authentication header when the introspection endpoint is contacted. API Connect verifies that the HTTP Basic authentication header value is Base64 encoded before it is sent, and encodes it if necessary as shown in the following example. If the header is already encoded, it is sent without modification.

```
GET /petstore/pet/123 HTTP/1.1
Host: apiconnect.com
x-introspect-basic-authorization-header: user:password
```

API Connect issues the following:

```
POST ..
Authorization: Basic M3JkLXBhcncR5LWNsaWVudF9pZDozcmQtcGFydH1fY2xpZW50X3N1Y3JldA==token_type_hint=access_token&token= ..
```

If you are using the DataPower API Gateway, you can specify your own value for the HTTP Basic authentication header by providing the required value in the Basic authentication request header name field in the third party OAuth provider configuration. The following rules determine what authentication data is passed to the introspection endpoint:

- If there is a basic authentication header in the request, the specified credentials are used. The value must be either a string in the format `user:password`, or the Base64 encoded equivalent; API Connect will Base64 encode the value if necessary before sending the request to the introspection endpoint.
- If there is no basic authentication header in the request but there are values specified in the Basic authentication username and Basic authentication password fields in the third party OAuth provider configuration, those values are used.
- If there is no basic authentication header in the request, and user name and password details are not supplied in the third party OAuth provider configuration, but `client_id` and `client_secret` values are supplied in the body of the request, these are used.
- Otherwise, an error is returned.

For third-party OAuth provider configuration details, see [Configuring a third-party OAuth provider](#).

If either, or both, of `scope` and `scope validate url` are configured, and if the response is an active token with a scope claim from the third-party OAuth Provider introspection endpoint, API Connect will further enforce the scope validation in the following order:

1. If `scope` is configured for the OAuth API protection, verify the third-party scope against the scope that is configured.
2. If `scope validation url` is configured, verify the third-party scope against the scope validation URL.
3. If the third-party OAuth provider introspection endpoint does not return a scope, the Gateway will not check the scope defined in the security definition of the API where the third-party OAuth provider resource is used. For details on configuring an OAuth security definition in an API, see [Creating an OAuth security definition](#).

For more information, see [Scope](#).

DataPower Gateway (v5 compatible) only By default the API Connect client ID and scope are sent to the third party OAuth provider. You can suppress this behavior in either of the following ways:

- Supply a `suppress-parameters` header as follows:

```
suppress-parameters: client_id
suppress-parameters: scope
```

or

```
suppress-parameters: client_id scope
```

depending on which parameters you want to suppress.

- Define an API property called `suppress-parameters` in the API definition itself, with one of the following string values:

```
client_id
```

```
scope
```

or

```
client_id scope
```

depending on which parameters you want to suppress. For information on how to define API properties, see [Setting API properties](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.

For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## OAuth external URL and authentication URL

You can use the Authentication URL or External URL parameters to request user-defined content from a remote server and include it in the access token or in the response payload that contains the access token.

---

## Including custom metadata in a token

In many scenarios, custom metadata needs to be included during the access token generation process. The metadata is either stored inside the access token or it is sent along with the access token to the client application. The client application can then send that access token, or the metadata in the payload, in a subsequent request to IBM® API Connect where the metadata is retrieved, validated, or sent to the downstream systems as required.

Examples include, but are not limited to:

- When resource owners are authenticated, metadata about the authenticated resource owner needs to be stored within the access token.
- The grant type that was used to obtain the token is another example of metadata stored within the access token.
- A confirmation code that needs to be sent to the client application along with access token is stored as metadata within the access token.

## Configuring External URL or Authentication URL in API Connect to obtain metadata

Metadata can be set by using either or both of the following URLs:

- External URL - When you call the External URL, an HTTP GET request is sent and API Connect expects an HTTP 200 OK along with an optional set of the specified response headers.
- Authentication URL - When you call the Authentication URL, the API Connect gateway sends a GET request with HTTP headers and then processes any HTTP response from the URL. For authentication, a REST authentication service is expected at the Authentication URL.  
See: [Authentication URL](#).

The External URL endpoint is entered in the Metadata section when you configure an OAuth Provider in the Cloud Manager or API Manager UI.

Use the following HTTP headers in the response, depending on the type of gateway you are using:

- DataPower® API Gateway:

**X-API-OAUTH-METADATA-FOR-PAYLOAD**

**X-API-OAUTH-METADATA-FOR-ACCESSTOKEN**

Note: These are the default header names for the DataPower API Gateway but you can override them; see [Configuring metadata for a native OAuth provider](#).

- DataPower Gateway (v5 compatible):

**API-OAUTH-METADATA-FOR-PAYLOAD**

**API-OAUTH-METADATA-FOR-ACCESSTOKEN**

The response header value from **X-API-OAUTH-METADATA-FOR-PAYLOAD** or **API-OAUTH-METADATA-FOR-PAYLOAD** is placed in the response payload and indicated as **metadata**.

The response header value from **X-API-OAUTH-METADATA-FOR-ACCESSTOKEN** or **API-OAUTH-METADATA-FOR-ACCESSTOKEN** is placed within the access token and indicated as **miscinfo**.

The two metadata response headers are case insensitive and you must escape any special characters in the string value content.

An example response payload that contains metadata along with the access token:

```
{
  "token_type": "bearer",
  "access_token": "AAEkNzhjDHYyyYy...cL0Mv6ct137w7ZU",
  "metadata": "m:metadata-for-payload_content"
  "expires_in": 3600,
  "scope": "read",
  "refresh_token": "AAEnj5SynCMYbF...oEZ6JjxYax_HdNg",
}
```

This example output from the token introspection endpoint shows the contents of the access token with **miscinfo** containing the metadata information.

```
{
  "active": true,
  "token_type": "bearer",
  "client_id": "78c2f10f-799a-4e1f-8e0a-098634997a35",
  "username": "Fred Smith",
  "sub": "fred",
  "exp": 1479850049,
  "expstr": "2016-11-22T21:27:29Z",
  "iat": 1479846449,
  "nbf": 1479846449,
  "nbfstr": "2016-11-22T20:27:29Z",
  "scope": "read",
  "miscinfo": "m:metadata-for-accesstoken_content",
  "client_name": "MobileApp"
}
```

## Input to the External URL

The following request headers are sent to the External URL.

Note: Any existing metadata values that were previously sent from the Authentication URL are also sent in the two request headers **x-existing-metadata-for-payload** and **x-existing-metadata-for-access-token**. The Metadata URL can make use of this information to create a new set of metadata values.

The two request headers that are sent to the Metadata URL are displayed in bold text.

```
X-existing-metadata-for-payload payload-from-auth-url
X-existing-metadata-for-access-token token-from-auth-url
X-URI-in /org/env/miscinfo/oauth2/token (the URL that was sent to APIConnect for this particular token request)
X-METHOD-in POST
X-POST-Body-in client_id=client_id&grant_type=password&scope=read&username=name&password=password
X-X-Client-IP IP_address
X-X-Global-Transaction-ID ID_number
...
```

Note: If you are using the DataPower API Gateway rather than the DataPower Gateway (v5 compatible), the **X-POST-Body-in** header is not supported.

## Retrieving Metadata in API Connect

As described in the previous example scenarios, the metadata can be retrieved from the access token in the Application API and sent to the downstream systems. Retrieval can be done in the API assembly, which is secured to accept tokens in the security definitions.

In the resource API that accepts an access token, the `miscinfo` field can be accessed in the Assembly with the `oauth.miscinfo` context variable, as in the example.

```
apim.setvariable('message.body', apim.getvariable('oauth.miscinfo'));
```

You can also use token introspection to look at the contents of the access token.

## Refresh tokens and metadata

The Authentication URL (if configured for authentication) is invoked first, during authentication of the resource owner. The External URL is invoked as the last step, just before the generation of the access token. The only exception is when access tokens are generated from a refresh token. In cases where refresh tokens are used to generate new access tokens, the External URL is not invoked. The metadata from the refresh token is retained and then copied into the newly generated access token.

## Identifying the source of the metadata

The metadata is prefixed with keywords to indicate whether it originated from the External URL or the Authentication URL.

- Metadata from the External URL is prefixed with `m`:
- Metadata from the Authentication URL is prefixed with `a`:

Note: When revocation is enabled, some internal details are also stored in the `miscinfo` field, in brackets within the access token as shown in the following example:

```
"miscinfo": "[tlsprofile@https://api-revoke-url:443/server/revocation-url]m:metadata-for-accesstoken_content"
```

## Maximum size of the metadata

Metadata for the access token cannot exceed 512 bytes.

Metadata for the payload does not have a specific size restriction, except for when you use the Authorization code grant type. These restrictions are described in following sections.

## Characters are not allowed in metadata in certain scenarios

When you use the Authorization code grant type, or when a consent form is used for implicit grant type, there is a temporary state or code where the metadata from the authentication URL is stored. API Connect internally uses two prefixes - `!ma` and `!mp` to differentiate between payload and token metadata received from the Authentication URL and store them internally in the temporary state/code. Hence these specific character sequences - `!ma` and `!mp` should not be used as the metadata itself.

## Grant types and metadata

The OAuth grant types described in the following sections include `authorization code` (access code), `implicit`, and `client credentials` (application).

Authorization code grant type

- When metadata is included from an Authentication URL for an Authorization code grant type, as it is a three legged flow, both the content and the payload are stored within the `dp-state` and carried on to the authorization code and to the access token. Note that around 10 characters are used internally to differentiate between the metadata for payload and metadata for the access token when stored in the `dp-state`. In addition, if revocation is enabled, that will also be part of the token metadata. Hence the combined size of the token metadata, the payload metadata (including the 10 characters of internal data), and internal revocation details, cannot exceed 512 bytes in total.

If the overall size of the metadata exceeds 512 bytes, then the access token generation succeeds, but the metadata fields contain an error message of "metadata too large" as shown in the example.

```
"metadata": "m:error: metadata too large for AZ code grant type[Authorization Code-metadata-url-payload]"
"miscinfo": "[r:gateway]m:error: metadata too large for AZ code grant type[Authorization Code-metadata-url-token]"
```

This size restriction can be overcome when the metadata is sent from the Metadata URL and not from the Authentication URL, because the metadata is not stored in `dp-state` or in the authorization code.

Example of the `authorization code` (access code) grant type:

```
$ curl -k -d
"grant_type=authorization_code&code=$mycode&client_id=$myid&scope=scope_introspect&redirect_uri="
https://9.70.153.90/fei/sb/introspectpl/oauth2/token
{ "token_type": "bearer",
"access_token": "AAEkOTh1ZDhhNjYtYTQ1ZS00YTmzLWE0N2QtZmE2OGZkMzQ0NzQ2OZn5Tl_TqYFeIfB7Bff6HFGibEoOjWXXEA84oFsWue4NY-
RRZVdnGSaXAIYJz7s5vczfk5EV-BIb_6P_1YKm3ahrfrhR5kI3sPO0uADEoseIP5-09anUpEM5yhsayXvZbJ_6VDYz-hyXSJHTNqVj-
PHBialoRkBD5qca6k00fV2M", "metadata": "a:[Authorization Code-Test-auth-url-payload]", "expires_in": 3600,
"scope": "scope_introspect", "refresh_token": "AAFAG1EVmbwicr_L0FTZ4q6HZ-
RcQygniXFC9zbSKO4wd3hcnic4KQX21X0fL2c8cnmzCZgws8xxLzNyfjQhUJNG15C1GbIe3dwhXJdiWA0Go-
dduhVtCbG26sJRRXyYrMeRkXWnJsyLBETPI8HQEN4a_D7fmxKcTVRZBvq86byg95qe1ZKyERi0Lhxdd_04Nvss" }
```

```
$ curl -k -H "X-IBM-Client-Id: $myid" -H "X-IBM-Client-Secret: $mysecret" -d
"token_type_hint=access_token&token=$mytoken" https://9.70.153.90/fei/sb/introspectpl/oauth2/introspect
{ "active": true, "token_type": "bearer", "client_id": "98ed8a66-a45e-4a33-a47d-fa68fd344746", "username": "anyuser",
"sub": "anyuser", "exp": 1484766368, "expstr": "2017-01-18T19:06:08Z", "iat": 1484762768, "nbf": 1484762768,
```

```
"nbfstr": "2017-01-18T18:06:08Z", "scope": "scope_introspect", "miscinfo": "[r:gateway]a:[Authorization Code-Test-auth-url-token]", "client_name": "oauth_app" }
```

#### Implicit grant type

- When implicit grant type is used, the access token and the metadata are returned in the `Location` header as a fragment, as you see in the example.

```
< Location:
https://localhost#access_token=AAEkOThlZDhhNjYtYTQ1ZS00YTMzLWE0N2QtZmE2OGZkMzQ0NzQ2buS2KfWdq-
nYBJSi4nmPxQBtLae17tKBPRMzwp5BC386nlxpoOTE1G748ZVH6Mq_TJL3GeV3PtXTVIkWOlBji_7t1jjiQfnpVfrNkovvZkhUexYmFkcDsmLSdaWxZ6Pc
IMPAC4ojT8qV1sYV-
ChTk36yqOx_NiKimZaDikDk7WTg&expires_in=3600&scope=scope_introspect&token_type=bearer&metadata=a%3A[Implicit-Test-
auth-url-payload]

$ curl -k -H "X-IBM-Client-Id: $myid" -H "X-IBM-Client-Secret: $mysecret" -d
"token_type_hint=access_token&token=$mytoken" https://9.70.153.90/fe1/sb/introspectp1/oauth2/introspect
{ "active": true, "token_type": "bearer", "client_id": "98ed8a66-a45e-4a33-a47d-fa68fd344746",
"username": "anyuser", "sub": "anyuser", "exp": 1484768365, "expstr": "2017-01-18T19:39:25Z", "iat": 1484764765,
"nbf": 1484764765, "nbfstr": "2017-01-18T18:39:25Z", "scope": "scope_introspect", "miscinfo": "[r:gateway]a:[Implicit-
Test-auth-url-token]", "client_name": "oauth_app" }
```

#### Client credentials grant type

Authentication URL will not be invoked when using client credentials grant type, as there is no resource owner. The metadata from Authentication URL is not available for this grant type. However, content returned from Metadata URL will be included as metadata.

## Behavior when retrieving metadata with both an External URL and an Authentication URL

If an External URL is configured and a connection to the external server is successful, the response headers overwrite any existing metadata obtained from the Authentication URL to become the final value. Therefore, you must carefully examine the incoming request headers and create appropriate response headers from the External URL.

If an External URL is configured, but the connection to the External URL fails, then a failure message of "error on metadata url" is written for metadata in both the payload and the access token.

If an External URL is configured and the connection is successful, but the remote server does not send any of the specified HTTP response headers, a blank value is written for metadata in both the payload and the access token.

Attention: An External URL overwrites existing values from Authentication URL. This includes blank values.

If no External URL is configured, the metadata that is obtained from the Authorization URL is retained as the final value.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.

For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Scope

Per IETF RFC 6749, the value of the scope parameter is expressed as a list of space-delimited, case-sensitive strings.

In IBM® API Connect, scopes have no inherent meaning. Instead, scopes are defined in the OAuth Provider so that an application can request an access token that is valid for one or more of the scopes. In the secured API, scopes are listed as requirements for an access token to be considered valid. All scopes that are listed by the security definition for the API must be granted by the access token.

## OAuth provider

To provide more refined support for the OAuth scope handling, API Connect allows the [Authentication URL user registry](#) extension to modify the scope value.

When you define an [OAuth provider](#), the Advanced scope check extensions provide the flexibility to check and override allowed scopes. The optional extensions are Application scope check and Owner scope check.

The scope that is eventually received by the application is determined by the interactions that are described in the three following paragraphs. Scope processing follows the sequence of items 1, 2, and 3 in the following list, offering three opportunities to override the scope value. Figure 1 provides an overview of the process.

- After the application successfully authenticates, and if OAuth Native provider `>Advanced scope check` `>Application scope check` is configured, API Connect makes a call to allow extra verification and uses the contents of `x-selected-scope` to override the scope value that was initially requested by the application. When Application scope check is enabled, the HTTP response header `x-selected-scope` must be present, or the call fails.
- If OAuth Native provider `>User Security` `>Authentication` is configured to authenticate application users using an Authentication URL, then API Connect makes a call, as documented in [Authentication URL user registry](#). When the response code is HTTP 200, and the response header `x-selected-scope` is present, the value that is configured in `x-selected-scope` is used as the new scope value, overriding both what the application already requested and what was provided in the Application scope check described in paragraph 1. In the response header, `x-selected-scope` is an optional element.
- After the user successfully authenticates, and if OAuth Native provider `>Advanced scope check` `>Owner scope check` is enabled and configured with a valid URL, API Connect makes a call to allow the content of `x-selected-scope` to refine the scope value. When Owner scope check is enabled, the HTTP response header `x-selected-scope` must be present, or the call fails.

Figure 1. OAuth advanced scope overview

The final scope permission that is granted by the access token is the result of the flow described in items 1, 2, and 3. [Figure 2](#) shows a more detailed view of the transaction flow with examples that show when `x-selected-scope` provides a new scope value.

Figure 2. OAuth advanced scope detail

```
HTTP/1.1 200 OK
Cache-Control: no-store
Pragma: no-cache
X-Custom-For-Assemble-Process: audit
```

Any HTTP response header that begins with "x-" is kept as the context variable `oauth.advanced-consent`. Based on the example successful response, `X-Custom-For-Assemble-Process: audit` becomes `oauth.advanced-consent.x-custom-for-assemble-process`, and can be accessed in the assemble step.

Additional validation options

You can optionally use additional fields for validation:

Request Header

Defines the regular expression to match against **request** headers. Matching headers are included in the request to the advanced scope validation endpoint.

Response Context Variable

Defines the regular expression to match against **response** headers. Matching headers are saved as context variables in the format `oauth.advanced-consent.*`.

## Related information

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Tokens

Tokens can be managed using refresh tokens and revocation URLs. You can extend the life of tokens using refresh tokens. You can end the life of a token by specifying a revocation URL.

This section contains information regarding token management, including refreshing and revoking tokens, redirecting, and managing tokens with the DataPower Gateway.

- [Refresh tokens](#)  
If you are using OAuth authentication, you can enable refresh tokens. Refresh tokens are issued to the client to obtain a new access token when the current access token becomes invalid or expires, or to obtain additional access tokens with identical or narrower scope.
- [Token revocation](#)  
In IBM® API Connect, you can revoke or refresh tokens. If necessary, you can also revoke all tokens that are issued to a specific client ID or a resource owner.
- [Authenticating and authorizing through a redirect URL](#)  
You can use a service that is hosted externally from IBM API Connect to collect authentication and authorization details from your user when an application requests access on that user's behalf.
- [Token management with the DataPower Gateway \(v5 compatible\)](#)  
API Connect can use the DataPower distributed cache to manage the token lifecycle that includes when to revoke access rights.
- [Token management with the DataPower API Gateway](#)  
API Connect can use the DataPower distributed cache to manage the token lifecycle that includes when to revoke access rights.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Refresh tokens

If you are using OAuth authentication, you can enable refresh tokens. Refresh tokens are issued to the client to obtain a new access token when the current access token becomes invalid or expires, or to obtain additional access tokens with identical or narrower scope.

When you are using OAuth authentication, API requests must include a valid access token, by using the Authorization HTTP header. Access tokens that are issued by the IBM® API Connect Token Endpoint are valid for 3600 seconds (1 hour) by default, as indicated by the `expires_in` property that is returned on the token request. The following code block shows an example API request with an Authorization header:

```
GET /bankingApi/accountSummary?client_id=32427ce5-bb7c-48a7-9de3-4bb629091103
HTTP/1.1
Accept: application/json
Host: api.ibm.com
Authorization: Bearer AAEFYy1hbGx1hdS5nVX4x6iTL2sb3ymBivQb...
```

After an access token expires, if the option is enabled in the OAuth provider configuration Tokens > Refresh tokens screen, the application uses refresh tokens. Each refresh token is valid for approximately 31 days after it is issued (or for the Time to Live time period specified) and can be used only once to request a new access token. Along with the new access token, a new refresh token is also returned. For details on how to enable refresh tokens, see [Configuring a native OAuth provider](#).

If the access token is expired and the application does not have a refresh token, it must restart the OAuth exchange by using the choice of Grant Type(s) allowed by the OAuth provider.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Token revocation

In IBM® API Connect, you can revoke or refresh tokens. If necessary, you can also revoke all tokens that are issued to a specific client ID or a resource owner.

### Token revocation using an external third party service

---

This topic describes token revocation using a third party, external service. This option is configured in the Native OAuth provider, using the Token Management Type = Third party screen. The revocation URL is an endpoint that links to an external service which contains information about access or refresh tokens. API Connect is involved in the initial creation and validation of tokens. When an OAuth revocation URL is present, API Connect calls the URL to determine if the associated token can be trusted. The token server then checks a token *blocklist* (a data store of inactive tokens) to ensure that the token is still valid. If the token is still valid, API Connect continues the processing.

### Examples

---

A number of revocation examples follow. The first shows a sample fetch request and the response from a remote revocation URL.

#### GET request and response

---

In this example, an API Gateway server issues a GET request to the Revocation URL and receives a result. It shows that different resource owners (Laura and Emily) can revoke all tokens when using the same application (client ID).

Request:

```
<?xml version="1.0" encoding="UTF-8"?>
GET <revocationURL> HTTP/1.1
User-Agent: IBM-APIManagement/4.0
Accept: application/xml; text/xml
```

Response:

```
<?xml version="1.0" encoding="UTF-8"?>
<oauth-revocation>

<!--
Access Tokens and/or Refresh Tokens that are revoked can be individually listed.
To keep this list small, please only include access tokens and refresh tokens that are valid.
For access tokens, any token older than 20 minutes is no longer valid.
For refresh tokens, any token older than 44700 minutes is no longer valid.
-->

<token type="access">AAETb2F1dGgtcmV2b2t1LWN1c3RvbfZaRlVbnPSc1..</token>
<token type="refresh">fZaRlVbnPSc1UGTjCRdq4mPbOosD2+aZIKbJ6bTeW...</token>

<!--
If a resource owner has revoked all tokens issued to a given application, please
list them as shown here.
-->

<resource-owner client-id="760d75a2-44b1-4485-8c6f-0d264fcf7398">laura</resource-owner>
<resource-owner client-id="760d75a2-44b1-4485-8c6f-0d264fcf7398">emily</resource-owner>

</oauth-revocation>
```

#### POST request and response

---

The next example shows a post request and response.

Request:

```
POST <revocationURL> HTTP/1.1
User-Agent: IBM-APIManagement/4.0
Content-Type: application/xml

<?xml version="1.0" encoding="UTF-8"?>
<token>
  <token_type>bearer</token_type>
  <access_token>AAENYy1hbGwtcmVmcVzaOfNeQKX8ZeojsBY9v0FI7/OerQvzKHq...</access_token>
  <expires_in>3600</expires_in>
  <scope>3600</scope>
  <resource-owner>alice</resource-owner>
  <client_id>83d9cdcd-ba72-4d00-abae-005da8da5fb1</client_id>
</token>
```

Response:

```
HTTP/1.1 200 OK
```

### Provide token information on revocation request

---

In this example, the application calls an API and passes a bearer token. In response, the Gateway fetches the revocation URL and provides information on the token being verified.

Gateway:

```
GET <revocationURL>HTTP/1.1
access-token: AAETb2F1dGgtcmV2b2t1LWN1c3RvbfZaRlVbnPSc1
client-id: 760d75a2-44b1-4485-8c6f-0d264fcf7398
resource-owner: alice
```

Alternatively, the same process occurs when using a refresh token to issue a new access token. The application sends a refresh request to the token service. The Gateway then fetches the revocation URL, providing information on the refresh token being verified.

Gateway:

```
GET <revocationURL>GET HTTP/1.1
refresh-token: AAETb2F1dGgtcmV2b2t1LWN1c3RvbfZaRlVbnPSc1
client-id: 760d75a2-44b1-4485-8c6f-0d264fcf7398
resource-owner: alice
```

Note: If you are using a third party OAuth provider then, for API Calls with bearer tokens, when Introspect URL is enabled on the API, the revocation URL is not applicable. Instead, the third party endpoint must validate the token and also check for revocation before returning a 200 OK response to the Gateway.

## Revoking tokens issued to Alice up to and including a specific date

On May 1st, Alice loses her phone and needs to reset her password. As a result, the token provider wants to revoke every token issued before Alice lost her phone. In this example, the Gateway sends a GET request to the revocation service. The revocation service replies confirming revocation of the specified tokens.

Gateway:

```
GET <revocationURL>HTTP/1.1
access-token: AAETb2F1dGgtcmV2b2t1LWN1c3RvbfZaRlVbnPSc1
client-id: 760d75a2-44b1-4485-8c6f-0d264fcf7398
resource-owner: alice
```

Revocation Service:

```
<?xml version="1.0" encoding="UTF-8"?>
<oauth-revocation>
  <resource-owner before="2015-05-01T09:30:10Z">alice</resource-owner>
</oauth-revocation>
```

## Revoking all tokens issued up to and including a specific date

Under certain catastrophic conditions, you may need to revoke all tokens issued up to and including a specific date, for example, May 1st. In this example, the Gateway sends a GET request to the revocation service. The revocation service replies confirming revocation of the specified tokens.

Gateway:

```
GET <revocationURL>HTTP/1.1
access-token: AAETb2F1dGgtcmV2b2t1LWN1c3RvbfZaRlVbnPSc1
client-id: 760d75a2-44b1-4485-8c6f-0d264fcf7398
resource-owner: alice
```

Revocation Service:

```
<?xml version="1.0" encoding="UTF-8"?>
<oauth-revocation>
  <everytoken before="2015-05-01T09:30:10Z" />
</oauth-revocation>
```

## Putting it all together

The following shows the examples contained in this topic executed in a single action:

Gateway:

```
GET <revocationURL>HTTP/1.1
access-token: AAETb2F1dGgtcmV2b2t1LWN1c3RvbfZaRlVbnPSc1
client-id: 760d75a2-44b1-4485-8c6f-0d264fcf7398
resource-owner: alice
```

Revocation Service:

```
HTTP/1.1 200 OK
Content-Type: application/xml
Cache-Control: public, max-age=120
Date: Fri, 08 May 2015 21:49:03 GMT
```

```
<?xml version="1.0" encoding="UTF-8"?>
<oauth-revocation>
  <resource-owner before="2015-04-08T09:30:10Z">mary</resource-owner>
  <resource-owner before="2015-04-12T09:30:10Z">john</resource-owner>
  <resource-owner before="2015-04-13T09:30:10Z">kevin</resource-owner>
  <resource-owner before="2015-04-01T09:30:10Z">alice</resource-owner>
</oauth-revocation>
```

Notes:

- In the previous example, there are no entries older than one month in the response (the maximum life of a refresh token).
- Each response is cached for up to two minutes according to response's directive.
- The **before** attribute uses the **xs:dateTime** syntax.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Authenticating and authorizing through a redirect URL

You can use a service that is hosted externally from IBM® API Connect to collect authentication and authorization details from your user when an application requests access on that user's behalf.

### Before you begin

To complete this task, you will need to either create or have created an OAuth security definition that uses Implicit grant type or Access Code (Authorization Code) grant type. For more information, see [Creating an OAuth security definition](#).

### About this task

If you use methods for authentication that are not supported by API Connect, you can redirect users to a suitable URL at which they can authenticate. The user is then returned to the OAuth process after authentication and authorization have been confirmed.

The following illustration indicates the transaction flow for third party authentication.

Figure 1. Third party authentication (AU) and authorization (AZ) transaction flow

1. The application initiates a request to access an API protected with a third-party entity. API Connect redirects the application with an **HTTP 302** redirect based on **identity extraction** -> **redirect** -> **redirect-url**, for user authentication (and optional authorization).
2. The application communicates directly with the third-party entity to gather user identity. API Connect is not involved in this communication. After the third-party entity finishes processing authentication (and optional authorization), it returns an **HTTP 302** redirect that uses the **original-uri** from the request, with the username and confirmation code appended.
3. API Connect receives the request that includes the username and confirmation code, and communicates with the authentication URL, based on **authentication** -> **x-ibm-authentication-url**, to confirm user identity before the request is completed.
4. An **HTTP 200** response from the third-party entity allows API Connect to continue the OAuth 2.0 request process as if the owner is authenticated. The request is then processed according to the **grants** type.
  - - **accessCode** returns a temporary code to the application.
  - - **implicit** returns the access token to the application.

For any response other than HTTP 200, the request fails with a statement added to the error log.

## Procedure

To create an external form, and to indicate the URL to which API Connect will redirect users, complete the following instructions:

1. Create your service for authentication and authorization. You will use the URL of the landing page of this service as your redirect URL.
  - a. To include elements in your form that are provided by API Connect, use the following query parameters from the URL that your user is redirected to. Note: With the exception of **original-url**, none of these parameters are included in the URL automatically; you must add them as required.

**app-name**  
The name of the application requesting access, as provided through the Developer Portal.

**appid**  
The id of the application requesting access.

**catalog**  
The name of the catalog where the product is being used by the application.

**catalogid**  
The id of the catalog where the product is being used by the application.

**catalogtitle**  
User-friendly display name for the catalog.

**org**  
The name of the consumer organization that hosts the application.

**orgid**  
The id of the consumer organization that hosts the application.

**orgtitle**  
User-friendly display name for the organization.

**original-url**  
The original URL that the user was directed to by the application, including query parameters from the original URL that are necessary for standard OAuth 2.0 requests. You can include these parameters in your service to provide information to the user. Additionally the `state_nonce` is appended. The `state_nonce` is a hash code generated by API Connect for verification purposes. The URL is URL-encoded and should be decoded before further use, the `state_nonce` should remain unchanged.

**provider**  
The name of the API provider organization.

**providerid**  
The id of the API provider organization.

**providertitle**  
User-friendly display name for the provider organization.

**requested-scope**  
[optional] If [Application Scope check](#) is enabled and replaces the `scope` from the initial application request, this field holds the `scope` value from the initial application request, and the new replacement scope value is put into **original-url**.

**transid**  
transaction id used in the GW for the transaction which trigger this call

The URL to which the user is sent to when they are redirected to your page has the following form:

**`Redirect_URL?original-url=Original_URL&state_nonce=R_State&app-name=Application_Name`**

where all variables are as described previously. The Redirect URL does not have a size limit enforced by API Connect.

- b. Create the stages of authentication, authorization, and any intermediate stages that you require to take place before you allow access to the application. Upon completion of these stages, redirect the user to the *Original\_URL* and append a user name, their confirmation code, and the application name to be evaluated for access grant or denial by API Connect. The confirmation code does not have a size limit enforced by API Connect. Original URL requires the following form:

**`Original_URL&username=User_Name&confirmation=Confirmation_Code`**

where all variables are as described previously.

For example:

**`https://your_gateway.com/your_org/your_catalog/your_api/oauth/authorize?response_type=code&redirect_uri=https://example.com/redirect&scope=/your_api&client_id=5af57a4a-6db9-4141-ad08-5709432af66e&state_nonce=HoIbRG+6bZtq1B7LDkq4gj1D3SHKq1CbnYdHs/bMz2Y=&username=spoon&confirmation=12345678`**

- c. To send your own error responses after the authentication and authorization service, redirect the user to the *Original\_URL* and append an error code. You can also append a user name. Use the following form:

**`Original_URL&username=User_Name&error=Error_Response`**

where *Error\_Response* is the message you wish to send and all other variables are described as previously.

For example:

**`https://your_gateway.com/your_org/your_catalog/your_api/oauth/authorize?response_type=code&redirect_uri=https://example.com/redirect&scope=/your_api&client_id=5af57a4a-6db9-4141-ad08-5709432af66e&state_nonce=HoIbRG+6bZtq1B7LDkq4gj1D3SHKq1CbnYdHs/bMz2Y=&username=User&error=access_denied`**

2. Create a service to validate the confirmation code and user name. API Connect makes a GET call to your authentication URL after the user is redirected back to the authorization URL. When the call is made, it includes in its authorization header the user name and confirmation code you supplied previously. Confirm that these are correct and respond with an HTTP success code such as 200 OK if you want to allow access, or non-200 HTTP response code, such as 401 Unauthorized to deny access.
3. In your OAuth provider configuration, supply the redirect URL that is used in Step 1 and the authentication URL that is used in Step 2. For more information on configuring an OAuth Provider, see [Configuring a native OAuth provider](#) when using API Manager or [Configuring a native OAuth provider](#) when using Cloud Manager.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Token management with the DataPower Gateway (v5 compatible)

API Connect can use the DataPower distributed cache to manage the token lifecycle that includes when to revoke access rights.

In order to manage tokens with the DataPower® Gateway (v5 compatible), you must set the Token Management Type to Native in your Native OAuth provider configuration. See [Configuring token management and revocation for a native OAuth provider](#) when using Cloud Manager or [Configuring token management and revocation for a native OAuth provider](#) when using API Manager.

Also, the DataPower quota enforcement server must be enabled on the DataPower Gateway to use the distributed cache to manage tokens. See [Quota enforcement](#).

When distributed cache support is enabled, replay protection is provided across the gateway cluster through the quota enforcement server. This support ensures that the same token cannot be reused across the members of the quota enforcement peer group.

Important:

If you have a cluster of DataPower Gateway servers, the OAuth data synchronization behavior across the servers depends on whether or not you enable revocation:

- If you enable revocation, API Connect uses the DataPower quota enforcement server, and OAuth data is synchronized across the servers. If an access token is obtained from one server, the OAuth data synchronization ensures that the same authorization code cannot be used to obtain an access code from another server. You must ensure that the DataPower quota enforcement server is configured.
- If you disable revocation, API Connect does **not** use the DataPower quota enforcement server and OAuth data does not synchronize across the cluster of DataPower Gateway servers. Therefore, to prevent the same authorization code being used to obtain an access code from more than one server you must configure DataPower to synchronize OAuth data across the servers, by using the DataPower Gateway console.

To configure DataPower to synchronize OAuth data, ensure that the DataPower quota enforcement server is configured. For more information, see [Configuring the quota enforcement server](#).

## Resource owner revocation

When Resource owner revocation path is selected in the Token Management screen, the configuration inserts two REST API calls to /oauth2/issued.

- An HTTP GET operation that retrieves a list of all granted permissions for a specific user.
- An HTTP DELETE operation that revokes an application for a specific user.

The setting inserts header-based security definitions of client ID and client secret as shown in the **View permissions example**. The API call to revoke a given application for a given user is shown in the **Revoke permissions example**.

View permissions example

To list all the applications granted by user `cn=spoon,o=ibm` with username `spoon` and password `spoon` using a registered administration application of `5287fe53-8747-438a-8262-681ec75b79c5`.

- Request:

```
GET /oauth2/issued
HTTP/1.1
Host: apic.ibm.com
x-ibm-client-id: 5287fe53-8747-438a-8262-681ec75b79c5
x-ibm-client-secret: E2qM6mG2bX2uClxT2iN1uU6bT5cV4dN7nW5kM5uP8vL3uF3cT7
Authorization: Basic c3Bvb246c3Bvb24=
```

- Response:

```
HTTP/1.1 200 OK
Content-Type: application/json;charset=UTF-8
Cache-Control: no-store
Pragma: no-cache
[
  {
    "clientId": "7369ad66-5674-b7d3-4567-de35283421aca",
    "owner": "cn=spoon,o=ibm",
    "clientName": "PetStore Application",
    "scope": "listpet",
    "issuedAt": 1503327054,
    "consentedOn": 1503327054,
    "expiredAt": 1503330654,
    "refreshTokenIssued": false,
    "appId": "d2031f0f27339315333734ab9",
    "org": "PetStoreOrg",
    "orgTitle": "Katie Pet Grooming Inc",
    "orgId": "5887803de4b06e6998c4b2c7",
    "provider": "SuperStore",
    "providerTitle": "Simon SuperStore",
    "providerId": "5887803de4b06e6998c4b2c7",
    "catalog": "publicapi",
    "catalogTitle": "For public",
    "catalogId": "5887803de4b06e6998c4b2d3"
  },
  {
    "clientId": "a8746323-9825-a842-8736-abd8202356ac8",
    "owner": "cn=spoon,o=ibm",
    ...
  }
]
```

Revoke permissions example

To revoke application `a8746323-9825-a842-8736-abd8202356ac8` by owner `cn=spoon,o=ibm`.

- Request

```
DELETE /oauth2/issued?client-id=a8746323-9825-a842-8736-abd8202356ac8
HTTP/1.1
Host: apic.ibm.com
x-ibm-client-id: 5287fe53-8747-438a-8262-681ec75b79c5
x-ibm-client-secret: E2qM6mG2bX2uClxT2iN1uU6bT5cV4dN7nW5kM5uP8vL3uF3cT7
Authorization: Basic c3Bvb246c3Bvb24=
```

- Response

```
HTTP/1.1 200 OK
Content-Type: application/json;charset=UTF-8
Cache-Control: private, no-store, no-cache, must-revalidate
Pragma: no-cache

{ "status": "success" }
```

## Client revocation

---

When Client revocation path is selected in the Token Management screen, the result is the following:

This option inserts one REST API call to /oauth2/ revoke, which supports OAuth 2.0 [IETF RFC 7009](#). An HTTP POST operation that an application can send to this API to revoke either an `access_token`, or `refresh_token` with `token_type_hint` as shown in the following examples:

Revoke `access_token`

- Request:

```
POST /oauth2/revoke
HTTP/1.1
Host: apic.ibm.com
x-ibm-client-id: 5287fe53-8747-438a-8262-681ec75b79c5
x-ibm-client-secret: E2qM6mG2bX2uClxT2iN1uU6bT5cV4dN7nW5kM5uP8vL3uF3cT7
Content-Type: application/x-www-form-urlencoded

token_type_hint=access_token&token=AAIHZGVmYXVsdD1-KqwD0Yc3EDn941SWX14xuR....
```

- Response:

```
HTTP/1.1 200 OK
Content-Type: application/json;charset=UTF-8
Cache-Control: private, no-store, no-cache, must-revalidate
Pragma: no-cache

{ "status": "success" }
```

Revoke `refresh_token`

- Request:

```
POST /oauth2/revoke
HTTP/1.1
Host: apic.ibm.com
x-ibm-client-id: 5287fe53-8747-438a-8262-681ec75b79c5
x-ibm-client-secret: E2qM6mG2bX2uClxT2iN1uU6bT5cV4dN7nW5kM5uP8vL3uF3cT7
Content-Type: application/x-www-form-urlencoded

token_type_hint=refresh_token&token=.....
```

- Response:

```
HTTP/1.1 200 OK
Content-Type: application/json;charset=UTF-8
Cache-Control: private, no-store, no-cache, must-revalidate
Pragma: no-cache

{ "status": "success" }
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Token management with the DataPower API Gateway

API Connect can use the DataPower distributed cache to manage the token lifecycle that includes when to revoke access rights.

Note: The steps described in this topic are required if you are using the DataPower® OVA or appliance version of the gateway. For the API Connect supplied Kubernetes deployment, the API Security Token Manager is preconfigured provided that, in the gateway service custom resource file, v5 compatibility mode is disabled and the token management service is enabled:

```
spec:
```

```
apicGatewayServiceV5CompatibilityMode: false
tokenManagementService:
  enabled: true
```

For more information, see [Installing the DataPower Gateway subsystem](#).

In order to manage tokens with the DataPower API Gateway, you must set the Token Management Type to Native in your Native OAuth provider configuration. See [Configuring token management and revocation for a native OAuth provider](#) when using Cloud Manager or [Configuring token management and revocation for a native OAuth provider](#) when using API Manager.

Note: This setting is also required when you use a third-party OAuth provider and **Introspect** **cache type** is set to **protocol** or **Time to live**.

For token management with the DataPower API Gateway, you must configure the API Security Token Manager on the gateway. Complete the following steps:

1. Log in to the DataPower administration console, selecting apiconnect for the domain, and WebGUI for the Graphical Interface.
2. In the search box, enter API Security Token Manager, then click on the API Security Token Manager link that displays in the search results.
3. For the Administrative state, select enabled.
4. Click the + icon alongside the Gateway Peering field to create a new gateway peering object.
5. Provide a Name and a Local address.
6. In the Local port and Monitor port fields, provide values that aren't already in use by services for the Local address.
7. Ensure that Peer group mode is selected.
8. Alongside the Peers field, use the add button and accompanying field to add at least two peers, to ensure that quorum is achieved.
9. If the Enable SSL option is selected, select a value for the Identification credentials.
10. For Persistence location, select a setting other than memory.
11. When done, click Apply.
12. Repeat steps 1 to 11 for each DataPower API Gateway in the peer group.
13. When done, click Apply, then click Save Configuration to save your changes.

For more information, see [Defining the API security token manager](#) and [Creating a gateway peering instance](#).

## Resource owner revocation

When Resource owner revocation path is selected in the Token Management screen, the configuration inserts two REST API calls to /oauth2/issued.

- An HTTP GET operation that retrieves a list of all granted permissions for a specific user.
- An HTTP DELETE operation that revokes an application for a specific user.

The setting inserts header-based security definitions of client ID and client secret as shown in the **View permissions example**. The API call to revoke a given application for a given user is shown in the **Revoke permissions example**.

View permissions example

To list all the applications granted by user `cn=spoon,o=ibm` with username `spoon` and password `spoon` using a registered administration application of `5287fe53-8747-438a-8262-681ec75b79c5`.

- Request:

```
GET /oauth2/issued
HTTP/1.1
Host: apic.ibm.com
x-ibm-client-id: 5287fe53-8747-438a-8262-681ec75b79c5
x-ibm-client-secret: E2qM6mG2bX2uClxT2iN1uU6bT5cV4dN7nW5kM5uP8vL3uF3cT7
Authorization: Basic c3Bvb246c3Bvb24=
```

- Response:

```
HTTP/1.1 200 OK
Content-Type: application/json;charset=UTF-8
Cache-Control: no-store
Pragma: no-cache
[
  {
    "clientId": "7369ad66-5674-b7d3-4567-de35283421aca",
    "owner": "cn=spoon,o=ibm",
    "clientName": "PetStore Application",
    "scope": "listpet",
    "issuedAt": 1503327054,
    "consentedOn": 1503327054,
    "expiredAt": 1503330654,
    "refreshTokenIssued": false,
    "appId": "d2031f0f27339315333734ab9",
    "org": "PetStoreOrg",
    "orgTitle": "Katie Pet Grooming Inc",
    "orgId": "5887803de4b06e6998c4b2c7",
    "provider": "SuperStore",
    "providerTitle": "Simon SuperStore",
    "providerId": "5887803de4b06e6998c4b2c7",
    "catalog": "publicapi",
    "catalogTitle": "For public",
    "catalogId": "5887803de4b06e6998c4b2d3"
  },
  {
    "clientId": "a8746323-9825-a842-8736-abd8202356ac8",
    "owner": "cn=spoon,o=ibm",
    ...
  }
]
```

```
}  
]
```

Revoke permissions example

To revoke application `a8746323-9825-a842-8736-abd8202356ac8` by owner `cn=spoon,o=ibm`.

- Request

```
DELETE /oauth2/issued?client-id=a8746323-9825-a842-8736-abd8202356ac8  
HTTP/1.1  
Host: apic.ibm.com  
x-ibm-client-id: 5287fe53-8747-438a-8262-681ec75b79c5  
x-ibm-client-secret: E2qM6mG2bX2uClxT2iN1uU6bT5cV4dN7nW5kM5uP8vL3uF3cT7  
Authorization: Basic c3Bvb246c3Bvb24=
```

- Response

```
HTTP/1.1 200 OK  
Content-Type: application/json;charset=UTF-8  
Cache-Control: private, no-store, no-cache, must-revalidate  
Pragma: no-cache
```

```
{ "status": "success" }
```

## Client revocation

---

When Client revocation path is selected in the Token Management screen, the result is the following:

This option inserts one REST API call to `/oauth2/revoke`, which supports OAuth 2.0 [IETF RFC 7009](#). An HTTP POST operation that an application can send to this API to revoke either an `access_token`, or `refresh_token` with `token_type_hint` as shown in the following examples:

Revoke `access_token`

- Request:

```
POST /oauth2/revoke  
HTTP/1.1  
  
Host: apic.ibm.com  
  
x-ibm-client-id: 5287fe53-8747-438a-8262-681ec75b79c5  
x-ibm-client-secret: E2qM6mG2bX2uClxT2iN1uU6bT5cV4dN7nW5kM5uP8vL3uF3cT7  
Content-Type: application/x-www-form-urlencoded  
  
token_type_hint=access_token&token=AAIHZGVmYXVsdD1-KqwD0Yc3EDn94lSWX14xuR....
```

- Response:

```
HTTP/1.1 200 OK  
Content-Type: application/json;charset=UTF-8  
Cache-Control: private, no-store, no-cache, must-revalidate  
Pragma: no-cache
```

```
{ "status": "success" }
```

Revoke `refresh_token`

- Request:

```
POST /oauth2/revoke  
HTTP/1.1  
  
Host: apic.ibm.com  
  
x-ibm-client-id: 5287fe53-8747-438a-8262-681ec75b79c5  
x-ibm-client-secret: E2qM6mG2bX2uClxT2iN1uU6bT5cV4dN7nW5kM5uP8vL3uF3cT7  
Content-Type: application/x-www-form-urlencoded  
  
token_type_hint=refresh_token&token=.....
```

- Response:

```
HTTP/1.1 200 OK  
Content-Type: application/json;charset=UTF-8  
Cache-Control: private, no-store, no-cache, must-revalidate  
Pragma: no-cache
```

```
{ "status": "success" }
```

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Authentication URL user registry

You can use an Authentication URL user registry to specify a REST authentication service that manages user authentication, and optionally provides additional metadata to be embedded in the token.

This support can optionally enable any of the following:

- Providing the authenticated credential to IBM® API Connect. For example, the user logs-in with user name: `spoon`, and password: `fork`. When the user is authenticated, the credential becomes `cn=spoon,o=eatery`. The credential is kept in the OAuth `access_token` to represent the user.
- Providing metadata support. Allow extra metadata to be stored in the `access_token`.
- Overriding the `scope` that the application receives after a successful OAuth protocol processing. By responding with a specific header, the Authentication URL endpoint can replace the `scope` value that the application receives. For example, you can provide a specific resource owner an account number within the `scope` header response for use in future processing steps.

When you call the Authentication URL user registry, the API Connect gateway sends a GET request with HTTP headers and then processes any HTTP response from the URL. For authentication, a REST authentication service is expected at the Authentication URL.

The following response from the REST authentication service indicates that user authentication is successful and that API Connect will use `cn=spoon,o=eatery` as the user identity.

```
HTTP/1.1 200 OK
Server: example.org
X-API-Authenticated-Credential: cn=spoon,o=eatery
```

For information on how to configure a User Security policy in an API assembly for use with an Authentication URL user registry, see [User Security policy](#).

For an example of an OAuth provider configuration that uses an Authentication URL user registry, see [Example - using multiple OAuth policies in an OAuth provider assembly](#).

API Connect considers any non-200 HTTP response code a failed user authentication attempt.

When an Authentication URL user registry is invoked, two HTTP response headers are available that include metadata in the access token or the response payload that contains the access token. For more information, see [OAuth external URL and authentication URL](#). The two metadata response headers are:

```
API-OAUTH-METADATA-FOR-ACCESSTOKEN
API-OAUTH-METADATA-FOR-PAYLOAD
```

When an Authentication URL is invoked, an HTTP response header is available to override the requested `scope` from the application. For more information, see [Scope](#). The response header is:

```
x-selected-scope
```

If you are using the DataPower® API Gateway rather than the DataPower Gateway (v5 compatible), this diagram is provided for guidance only and is not fully accurate for this release.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Custom forms for user security

You can create custom forms for the authorization and identity extraction phase of OAuth.

### About this task

The Native OAuth provider configuration provides the capability for requiring additional authentication and authorization steps for user security. Custom HTML forms may be created to extract the identity of the user and to authorize the user. This capability applies to Implicit, Resource owner password, and Access code grant types.

- [Creating a custom HTML login form for user security](#)  
Custom HTML forms can be created for user security during the identity extraction stage in OAuth.
- [Creating a custom HTML authorization form for user security](#)  
Custom HTML forms can be created for user security during the authorization stage in OAuth.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Creating a custom HTML login form for user security

Custom HTML forms can be created for user security during the identity extraction stage in OAuth.

### Before you begin

The Native OAuth provider configuration includes Identity Extraction when using the Implicit, Access code, or Resource owner password grant types. You have the option to select how to extract the user credential and one of the choices is Custom HTML Form. For more information, see [Configuring a native OAuth provider](#) when using API Manager or [Configuring a native OAuth provider](#) when using Cloud Manager. For more information, see [Configuring a native OAuth provider](#). This topic describes how to create the Custom HTML form for identity extraction.

### About this task

During three-legged OAuth definitions (Implicit flow, Resource owner password flow, and Access (Authorization) code flow, the user is presented with a form for signing in to the service provided by the API. You can present a custom form or a default form. Your custom form must fulfill certain requirements.

Important: The fields used by IBM® API Connect to inject information into your form have case-sensitive field names.

### Procedure

To create a custom sign-in form for your Native OAuth provider, complete the following steps:

1. Create a well formed XHTML document that will be parsed and transformed by API Connect to inject hidden fields.
2. For your XHTML form, set the method as `POST`, the encoding type as `application/x-www-form-urlencoded`, and the action as `authorize`. Add any other parameters that you require.  
For example:

```
<form method="POST" enctype="application/x-www-form-urlencoded" action="authorize">
```

3. Create a text input field that is named `username` and create a password input field named `password`.
4. Add the line `<EI-INJECT-HIDDEN-INPUT-FIELDS>`. This third element is a placeholder that API Connect replaces with input fields to complement the user-submitted data.
5. Create a button to initiate the sign-in process.  
For example:

```
<button  
id=" _home_markdown_jenkins_workspace_Transform_in_SSMNED_10.0.4_com.ibm.apic.apionprem.doc_oauth_custom_login_form_2_login  
_button" type="submit" name="login" value="true">Log in</button>
```

6. Optional: Add text that is displayed the first time that the user visits the sign-in page. Use the tag `<EI-LOGINFIRSTTIME>` for the text that you want to display.
7. Optional: Add text that appears when the user is returned to the sign-in page if they fail to authenticate. Use the tag `<EI-LOGINFAILED>` for the text that you want to display.
8. Optional: Have an error message displayed when an error in the custom form prevents it from being displayed to the user correctly. Use the tag `<EI-INTERNAL-CUSTOM-FORM-ERROR/>`; the message text is generated automatically. You should detect such errors during testing to prevent this error message being displayed to the end user.
9. Optional: You can add elements that are loaded from external sources, such as images or JavaScript.
10. Insert spacing and other features as you require. Completing Steps [1](#) through to [8](#) results in a form similar to the following example:

```
<html lang="en" xml:lang="en">  
<head><meta http-equiv="Content-Type" content="text/html; charset=UTF-8"/></head>  
<body>  
  <form method="POST" enctype="application/x-www-form-urlencoded" action="authorize">  
    <h1>Please sign in</h1>  
    <p>Username </p>  
    <p ><input type="text" name="username" required="required" /> </p>  
    <p>Password </p>  
    <p ><input type="password" name="password" required="required" /> </p>  
    <EI-INJECT-HIDDEN-INPUT-FIELDS/>  
    <p > <button  
id=" _home_markdown_jenkins_workspace_Transform_in_SSMNED_10.0.4_com.ibm.apic.apionprem.doc_oauth_custom_login_form_2_login  
_button" type="submit" name="login" value="true">Log in</button> </p>  
  
    <EI-LOGINFIRSTTIME>  
    <p>If you have forgotten your user name or password, contact your system administrator.</p>  
  </EI-LOGINFIRSTTIME>  
  
  <EI-LOGINFAILED>
```

```

    <p >At least one of your entries does not match our records.
      If you have forgotten your user name or password, contact your system administrator.</p>
  </EI-LOGINFAILED>

  <EI-INTERNAL-CUSTOM-FORM-ERROR/>

</form>
</body>
</html>

```

11. Make your form available at a URL of your choice.
12. If you have not already done so, configure your Native OAuth provider to use a Custom HTML form for identity extraction and provide the URL at which your form is available. For more information, see [Configuring a native OAuth provider](#) when using API Manager or [Configuring a native OAuth provider](#) when using Cloud Manager.

## Related tasks

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

# Creating a custom HTML authorization form for user security

Custom HTML forms can be created for user security during the authorization stage in OAuth.

## Before you begin

The Native OAuth provider configuration includes user authorization when using the Implicit, Access code, or Resource owner password grant types. You have the option to select how to authorize application users and one of the choices is Custom HTML Form. For more information, see [Configuring a native OAuth provider](#) when using API Manager or [Configuring a native OAuth provider](#) when using Cloud Manager. This topic describes how to create the Custom HTML form for authorization.

## About this task

During three-legged OAuth definitions (Implicit flow, Resource owner password flow, and Access (Authorization) code flow, the user is presented with a form through which they grant permission to an application to access their data through the API on their behalf. You can present a custom form or a default form. Your custom form must fulfill certain requirements.

Important: The fields used by IBM® API Connect to inject information into your form have case-sensitive field names.

## Procedure

To create a custom authorization form for your Native OAuth provider, complete the following steps:

1. Create a well-formed XHTML document. This will be parsed and transformed by API Connect to inject hidden fields.
2. For your XHTML form, set the method as POST, the encoding type as application/x-www-form-urlencoded, and the action as authorize. Add any other parameters that you require.

For example:

```
<form method="POST" enctype="application/x-www-form-urlencoded" action="authorize">
```

3. Add the line <AZ-INJECT-HIDDEN-INPUT-FIELDS/>. This line is a placeholder that API Connect will replace with input fields necessary for the completion of the OAuth process.
4. Create two buttons with the following code so that the user can grant or deny permission. Edit the text to suit your preferences.

```
<button class="cancel" type="submit" name="approve" value="false">No Thanks</button>
<button class="submit" type="submit" name="approve" value="true">Allow Access</button>
```

5. Optional: Display an error message when an error in the custom form prevents it from being displayed to the user correctly. Use the tag <AZ-INTERNAL-CUSTOM-FORM-ERROR/>; the message text is generated automatically. You should detect such errors during testing to prevent this error message being displayed to the end user.
6. Optional: You can add to the form HTML elements that will load features from external sources, such as images or JavaScript. For example, <script src="http://www.example.com/example.js" />
7. Insert spacing and additional elements as you require. Completing Steps 1 through to 6 results in a form similar to the following example:

```
<html lang="en" xml:lang="en">
  <head><title>Request for permission</title></head>
  <body class="customconsent">
    <div>
      <div>
        <form method="post" enctype="application/x-www-form-urlencoded" action="authorize">
          <AZ-INJECT-HIDDEN-INPUT-FIELDS/>
          <p>Greeting...</p><DISPLAY-RESOURCE-OWNER/>
        </form>
      </div>
    </div>
  </body>
</html>
```

```
<p>This app </p><OAUTH-APPLICATION-NAME/><p> would like to access your data.</p>
<div>
  <button class="cancel" type="submit" name="approve" value="false">No Thanks</button>
  <button class="submit" type="submit" name="approve" value="true">Allow Access</button>
</div>
</form>
</div>
<AZ-INTERNAL-CUSTOM-FORM-ERROR/>
</div>
</body>
</html>
```

8. Make your form available at a URL of your choice.
9. If you have not already done so, configure your Native OAuth provider to use a Custom HTML Form for authorization for User Security. Provide the URL as the endpoint at which your form is available. For more information, see [Configuring a native OAuth provider](#) when using API Manager or [Configuring a native OAuth provider](#) when using Cloud Manager.

# Securing an API with a JSON Web Token

There are two methods to secure your API with a JSON Web Token. You can use the **jwt-generate** command, or you can use a token that has been generated external to IBM® API Connect.

## About this task

---

JSON Web Token (JWT) is an OAuth 2.0 compliant method of authentication that can be useful to secure your API in API Connect.

You can secure your API with a JSON Web Token by using either of the following methods:

- Generate a token through the **jwt-generate** command, and then augment the response payload with your generated token replacing the **id** token.
- Use a token that was generated outside of API Connect and include it into the response payload, by using the metadata URL.

## Procedure

---

Create a **jwt-generate** policy in the assembly.

- a. In API Manager, open the Assembly tab.
- b. Add a **jwt-generate** policy to the assembly for the API.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

# Troubleshooting OAuth

You can find the answers to some common questions in the Developer Portal, or in support communities and forums in DeveloperWorks, on GitHub, or on Youtube.

You can use the following links to go to the topics:

- [Enable an extended error description](#)
- [OAuth 2.0 support in the developer portal test tool](#)
- [OAuth requires quorum in a multi-node cluster](#)

## Enable an extended error description

---

The [OAuth 2.0 Authorization Framework](#) governs how IBM® API Connect is defined. According to the specification, OAuth 2.0 error conditions trigger a payload with error, and an optional field `error_description`. To prevent information leakage, the IBM DataPower® Gateway default setting returns the error only. However, during the development and testing phase of an application, it is useful to find out why an OAuth 2.0 request is being rejected. To enable this behavior, the caller can pass an HTTP request header in the OAuth request:

```
APIm-Debug: true
```

The presence of the header enables the 'just-in-time' debugging for that OAuth transaction, and `error_description` is returned as part of the error condition. The output helps the caller to determine why an OAuth request is rejected by API Connect as shown in the examples. Example error output without 'just-in-time' debugging:

```
{ "error": "invalid_request" }
```

Example error output with 'just-in-time' debugging:

```
{ "error": "invalid_request", "error_description": "Multiple OAuth client credentials are provided" }
```

---

## OAuth 2.0 support in the developer portal test tool

OAuth 2.0 support is exposed as an API through the provider OpenAPI definition. You can use the test tool that is included with API Connect to test the OAuth 2.0 configuration. For more information, see [Testing an API using the Developer Portal test tool](#).

---

## OAuth requires quorum in a multi-node cluster

In a multi-node cluster, OAuth operations will fail if quorum is lost. Quorum requires that the number of active nodes is greater than 50% of the total number of nodes in the cluster.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## API Analytics

You can use IBM API Connect to filter, sort, and aggregate your API event data. You can present the results within correlated charts, tables, and maps to help you manage service levels, set quotas, establish controls, set up security policies, manage communities, and analyze trends.

API analytics is built on the Kibana open source analytics and visualization platform, which is designed to work with the Elasticsearch real-time distributed search and analytics engine.

Use the following tasks to configure and manage analytics:

- [Catalogs, Spaces, and Analytics](#)  
Understand how syndication and the use of Catalogs and Spaces affects the use of the features in IBM API Connect Analytics.
- [Accessing analytics](#)  
You can view predefined or customized analytics information for your IBM API Connect Catalogs within dashboards. If Spaces are enabled in your Catalogs, you can also view predefined or customized analytics information for your API Connect Spaces within dashboards.
- [The applications landing page](#)  
In IBM API Connect, each Catalog or Space has an applications landing page, which is a launching point for accessing the saved searches, dashboards, and visualizations that are available for that Catalog or Space. For more information about Catalogs and Spaces, see [Working with Catalogs](#) and [Using syndication in API Connect](#).
- [Dashboard application page](#)  
In IBM API Connect, each Catalog has its own default landing page, which lists the dashboards that are available for that Catalog.
- [Visualization application page](#)  
In IBM API Connect, you can use existing visualizations or create your own visualizations to organize the data on your dashboards.
- [Working with searches \(Discover\)](#)  
Use the IBM API Connect Analytics Discover tab to create and run searches against your analytics data.
- [Exporting API event data](#)  
You can obtain analytics and API event data from the API Manager user interface of IBM API Connect or by using REST API calls.

---

## Related information

- [Kibana](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Catalogs, Spaces, and Analytics

Understand how syndication and the use of Catalogs and Spaces affects the use of the features in IBM® API Connect Analytics.

The data for Analytics is collated from API events that are logged when API operations are invoked. Analytics data for an API is scoped to the Catalog or Space where that API resides, and is only included in search results (and thus, visualizations and dashboards) for the owning Catalog or Space. For example, you cannot create a single dashboard that includes data from multiple Catalogs.

Access to the analytics data, and to the analytics functions in the API Manager user interface, can be managed through the use of Catalogs and Spaces, and the roles and permissions that are assigned to the users (or *members*) of the provider organization.

## Catalogs, Spaces, and permissions

Catalogs act as deployment targets through which APIs (in their containing Plans and Products) are staged and published to consumer organizations. API Manager users in the provider organization can be assigned the following access to the Analytics component for a Catalog:

- A role that has the `Analytics.>.View` permission for a Catalog: These users can view the analytics data generated for the APIs in the Catalog within *dashboards*, export dashboard data in its raw format or as event records, and apply filters to the data shown within the dashboards.
- A role that has the `Analytics.>.Manage` permission for a Catalog: These users have an implicit View permission. They can additionally complete the following actions:
  - Create, edit, and delete dashboards.
  - Create, edit, delete, export, and import the charts, tables, and maps.

For more information about creating and configuring Catalogs, and assigning roles and permissions to a Catalog, see [Working with Catalogs](#).

The following diagram shows an example of a Catalog with its associated functions, from an analytics perspective.

The IBM API Connect syndication feature provides a way for you to partition a Catalog into multiple deployment targets (or *Spaces*) through which separate groupings of APIs (in their containing Plans and Products) can be staged and published. Each Space can be allocated to a separate group of users who need to manage their Products independently, and the analytics data in each Space is scoped to those Products only. API Manager users in the provider organization can be assigned the following access to the Analytics component for a Space:

- A role that has the `Analytics.>.View` permission for a Space: These users can view the analytics data generated for the APIs in the Space within dashboards, export dashboard data in its raw format, and apply filters to the data shown within the dashboards.
- A role that has the `Analytics.>.Manage` permission for a Space: These users have an implicit View permission. They can additionally complete the following actions:
  - Create, edit, and delete dashboards.
  - Create, edit, delete, export, and import the charts, tables, and maps.

For information about enabling Spaces in a Catalog, setting up Spaces, and assigning roles and permissions to a Space, see [Using syndication in API Connect](#).

Note: Users can also be assigned a role with Catalog permissions, which provides a view of all Spaces (including analytics) in a Catalog. The following diagram shows an example of a Catalog with its associated functions and Space partitions, from an analytics perspective.

For more information about assigning Catalog or Space permissions to a role, see [Managing Catalog membership](#) and [Managing Space membership](#).

For more information about the default API Manager roles and permissions, see [API Connect user roles](#).

## Dashboards and visualizations: Understanding the inheritance flow across Catalogs and Spaces

When you create a Catalog, a set of default API Manager dashboards, visualizations, and searches are added to the Catalog. If you enable Spaces in the Catalog, a similar set of default dashboards, visualizations, and searches are added to each Space. You can also create custom dashboards, visualizations, and searches in the Catalog and its Spaces, if you have the required permission.

A layered implementation is used to define an "inheritance" flow for dashboards, visualizations, and searches in a Catalog and its Spaces. This structure determines whether updates made to the dashboards, visualizations, and searches in a Catalog are reflected in a Space, and affects what you see when you attempt to edit, delete, or restore default dashboards, visualizations, or searches, or when you attempt to create, edit, or delete custom dashboards, visualizations, or searches.

To help you identify the state of a dashboard, visualization, or search as default, custom, or inherited, tags are applied to dashboards and visualizations within the API Manager user interface. These tags are visible on the main Discover, Visualize, and Dashboard pages, which list your saved searches, dashboards, and visualizations.

Searches, dashboards, and visualizations

For the searches, dashboards, and visualizations, the following principles apply for create, edit, or delete operations:

Create

- When you create a search, dashboard, or visualization in a Catalog, it is automatically added to the Spaces in that Catalog.
- When you create a search, dashboard, or visualization in a Space, the search, dashboard, or visualization is added to that Space only.

Edit

- You cannot edit a default search, dashboard, or visualization. You must clone it, and then edit the clone.
- Searches, dashboards, and visualizations that are created in the Catalog are propagated down to the Spaces in that Catalog.
- You cannot modify a Catalog search, dashboard, or visualization in the Space of the Catalog. You must clone it to modify it.
- Searches, dashboards, and visualizations that are created or cloned in a Space are not propagated up to the Catalog.

Delete

- You cannot delete a default search, dashboard, or visualization.

- When you delete a search, dashboard, or visualization from a Catalog, it is also deleted from the Spaces within that Catalog.
- When you delete a search, dashboard, or visualization from a Space, it is not deleted from the Catalog.
- If a search, dashboard, or visualization in a Space was inherited from a Catalog, and has not been edited in the Space, you cannot delete that search, dashboard, or visualization from the Space. You must delete it from the Catalog.

How tags are applied to searches, dashboards, and visualizations in the Discover, Dashboard, and Visualize pages

The Discover, Dashboard, and Visualize pages, display tags to highlight the state of a search, dashboard or visualization as admin, catalog, or space. At the Catalog level, the following tags are applied to searches, dashboards or visualizations in the list to indicate their state:

- Each default search, dashboard or visualization, which has not been customized, is tagged with a **admin** label.
- Each search, dashboard or visualization that was created or cloned in the Catalog is tagged with a **catalog** label.
- Each custom dashboard or visualization that was created in the Space is tagged with a **space** label.

For information about accessing the Manage Saved Objects page from the API Manager UI, see:

- [Editing visualizations](#)
- [Exporting visualizations](#)
- [Importing visualizations](#)
- [Deleting custom visualizations](#)
- [Editing dashboards](#)
- [Exporting dashboards](#)
- [Importing dashboards](#)
- [Deleting custom dashboards](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Accessing analytics

You can view predefined or customized analytics information for your IBM® API Connect Catalogs within dashboards. If Spaces are enabled in your Catalogs, you can also view predefined or customized analytics information for your API Connect Spaces within dashboards.

### About this task

The analytics capabilities and functions are identical across Catalogs and Spaces. However, the analytics data is scoped to a Catalog when dashboards are accessed at the Catalog level, and the data is scoped to a Space when dashboards are accessed at the Space level. The ability to access analytics data at a Catalog or Space level depends on your assigned roles and permissions. For more information about Catalogs and Spaces, see [Working with Catalogs](#) and [Using syndication in API Connect](#).

Restriction: If the visualizations in your dashboards display no data or show data only for a time period in the past, a possible reason might be that access to analytics data within API Connect is switched off. Contact your cloud administrator for confirmation. (For more information, see [Configuring analytics offload for API Connect](#).)

### Procedure

- To open the analytics dashboard for any Catalog, complete the following steps:
  1. Log on to the API Manager that contains the Catalog for which you want to view the analytics.
  2. Select Manage  in the navigation.
  3. From the list of available Catalogs in the API Manager Dashboard, select the required Catalog.
  4. Click the Analytics tab.  
The default analytics dashboard for the Catalog is displayed.
- To open the analytics dashboard for any Space, complete the following steps:
  1. Log on to the API Manager that contains the Catalog for which you want to view the analytics.
  2. Select Manage  in the navigation.
  3. From the list of available Catalogs in the API Manager Dashboard, select the required Catalog.
  4. Select Spaces  in the navigation.
  5. Select the Space that you want to view.
  6. Click the Analytics tab.  
The default analytics dashboard for the Space is displayed.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## The applications landing page

In IBM® API Connect, each Catalog or Space has an applications landing page, which is a launching point for accessing the saved searches, dashboards, and visualizations that are available for that Catalog or Space. For more information about Catalogs and Spaces, see [Working with Catalogs](#) and [Using syndication in API Connect](#). You can navigate to the different applications pages by using the Discover, Visualize, and Dashboard applications icons on the Applications landing page. You can return to this page when you are anywhere within the Analytics navigation by selecting Apps in the breadcrumb trail.

The applications landing page for Catalogs or Spaces displays a table with the following information:

**Name**

The names of the items in the last application that you viewed. For example, if you last viewed dashboards, then it lists the dashboard titles.

**Tags**

Tags that identify at what level the item was created, and the required access level that is required to change them. The following tags are supported:

**admin**

This item is provided with IBM API Connect. You cannot modify items with the **admin** tag. You must clone them if you want to customize them.

**catalog**

This item was created by someone with Catalog management permissions. You can only modify dashboards with the **catalog** tag if you have Catalog management permissions, or higher. If you only have space permissions, then you must clone it to modify it.

**space**

This dashboard was created by someone with space management permissions. You can only modify dashboards with the **space** tag if you have space management permissions, or higher.

## The screen elements of the applications landing page

The following image shows an example of the applications page of a Sandbox Catalog. While the screen elements of all of the application pages are similar, see the individual application page topics for specific information for each page:

- [Working with searches \(Discover\)](#)
- [Visualization application page](#)
- [Dashboard application page](#)

The screen elements are summarized in the following table.

Screen element	Description
1 Application selector	Indicates your selected application inside the analytics tab navigation. You can select a different application name to view the information for that application.
2 Breadcrumb trail	Indicates your location inside the analytics tab.
3 Instance information	Lists the instances of the last items that you viewed.

## Related tasks

- [Accessing analytics](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Dashboard application page

In IBM® API Connect, each Catalog has its own default landing page, which lists the dashboards that are available for that Catalog.

If Spaces are enabled in your Catalogs, each Space also has its own default landing page with the list of dashboards that are available for the space. For more information about Catalogs and Spaces, see [Working with Catalogs](#) and [Using syndication in API Connect](#).

Note: Either an incognito tab, a separate browser instance, or a full page refresh is required for viewing dashboards in multiple Analytics services simultaneously.

The dashboard landing page for Catalogs or Spaces displays a table with the following information:

**Name**

The name of the dashboard. The names of the default dashboards are based on the information that is contained within the dashboard.

**Description**

A brief description of the dashboard and its purpose.

**Tags**

Tags that identify at what level the dashboard was created, and the required access level that is required to change them. The following tags are supported:

**admin**

This dashboard is provided with IBM API Connect. You cannot modify dashboards with the **admin** tag. You must clone them if you want to customize them.

**catalog**

This dashboard was created by someone with catalog management permissions. You can only modify dashboards with the **catalog** tag if you have catalog management permissions. If you only have space permissions, then you must clone it to modify it.

**space**

This dashboard was created by someone with space management permissions. You can only modify dashboards with the **space** tag if you have space management permissions.

## The screen elements of the dashboard application page

The following image shows an example of the Overview dashboard for the Sandbox Catalog with sample data. Custom dashboards that you create for Catalogs or Spaces, and the Analytics dashboards for other entities such as Products, Plans, and APIs, have a similar layout.

The screen elements are summarized in the following table.

Screen element	Description
1 Catalog or Space name	Identifies the selected Catalog or Space.
2 Service identifier	Identifies the analytics service that you are viewing. If you only have one analytics service configured, there is only one possible value.
3 Application selector	Lists the applications that are available for this Catalog or Space. These are only displayed when Apps is selected in the breadcrumb trail.
4 Breadcrumb trail	Indicates your location inside the analytics tab navigation.
5 Search bar	Use this bar to filter the list of dashboards for the Catalog or Space.
6 Create a dashboard	Use this icon to create a customized dashboard. See <a href="#">Creating custom dashboards</a> .
7 Dashboard configuration icons	Use these icons to export dashboards that you want to reuse or back up, import previously exported dashboards to your available dashboards, or create dashboards.
8 Navigation icons	Use this icon to navigate through a large number of dashboards that require multiple screens. Each screen displays a maximum of 20 dashboards.
9 Dashboard information	Names and information about the dashboards for this Catalog or Space.

- **Default dashboards**  
IBM API Connect analytics provides some preconfigured dashboards for you to use to view common analytics data.
- **Cloning a dashboard**  
You can clone an existing dashboard to use it as a base for a customized dashboard.
- **Creating custom dashboards**  
You can use API Connect to create custom dashboards that group together a set of related visualizations.
- **Importing dashboards**  
You can import dashboards from other IBM API Connect users for use, or you can import dashboards from another Catalog on your system. If Spaces are enabled in a Catalog, you can also import dashboards from a Space.

- [Editing dashboards](#)  
You cannot edit the IBM API Connect preconfigured dashboards, but you can clone it to create a custom dashboard to add, edit, or remove visualizations, and to resize or rearrange visualizations. You can also use the Time Picker to change the time range of the data shown in the visualizations.
- [Exporting dashboards](#)  
You can export dashboards for backing up the configuration, or so they can be imported into other Catalogs on your IBM API Connect system. If Spaces are enabled in a Catalog, exported dashboards can also be imported into a Space.
- [Backing up and restoring dashboards](#)  
To ensure you can recreate your IBM API Connect analytics dashboards in the event of data loss, you should export them and save the files as a back-up. Then you can import the files later if needed.
- [Deleting custom dashboards](#)  
If a custom dashboard is no longer required, you can permanently delete it from IBM API Connect.

## Related tasks

---

- [Accessing analytics](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Default dashboards

IBM® API Connect analytics provides some preconfigured dashboards for you to use to view common analytics data.

A list of dashboards is displayed when you open the default dashboards page for the first time. These dashboards provide examples of the data that you can view by using the analytics dashboards. You can use these dashboards as they are, or clone them to customize them to your needs. You cannot modify the existing dashboards. After you have cloned or created some of your own dashboards, your dashboards also appear in this list. The following dashboards are provided with API Connect:

### API Default

Includes general information about your APIs. This is the equivalent dashboard that was provided as api\_default in API Connect Version 5. It includes the following visualizations:

- Status Codes (detailed)  
Lists the detailed status codes of the API requests.
- Errors  
Displays the number of errors in a bar graph.
- Minimum Response Time (ms)  
Lists the fastest response time of the APIs in milliseconds.
- Average response time (ms)  
Lists the average response time across all of the APIs in milliseconds.
- Maximum Response Time (ms)  
Lists the maximum response time of the APIs in milliseconds.
- Response Times (ms)  
Provides a complete list of the response times of the API calls in milliseconds.
- API calls  
Provides a list of the API calls.
- API Calls per day  
Provides a graphical representation of the number of API calls that occurred each day.

### Catalog Default

Includes general information about the most used Products in your Catalog. This is the equivalent dashboard for catalog\_default in API Connect Version 5. It includes the following visualizations:

- Top 5 Products Overall (Daily Usage)  
Displays a graph of your 5 Products that receive the most calls on a daily basis.
- Top 5 APIs Overall (Daily Usage)  
Displays a graph of your 5 APIs that receive the most calls on a daily basis.

### Monitoring Latency

Provides information about the amount of time that elapses after the API request is submitted and the transfer of data begins. It contains the following visualizations:

- Response Times (ms)  
Provides a complete list of the response times of the API calls in milliseconds.
- Response times (>1 sec)  
Displays the calls where the response times are greater than 1 second.  
Note: This visualization runs a search that limits the results to the last 500 calls.
- Average response time (ms)  
Lists the average response time across all of the APIs in milliseconds.
- Data Usage (bytes received)  
Lists the bytes of data that are received to complete your calls.
- Data Usage (bytes sent)  
Lists the bytes of data that are sent to complete your calls.
- Maximum Response Time (ms)  
Lists the maximum response time of the APIs in milliseconds.

## Monitoring Status

Provides information about monitoring the status of your API. This dashboard includes the following visualizations:

### Success Rate

Displays how many of your API calls were successful, compared to how many were submitted.

### Status Codes (simple)

Provides overview status codes for the API calls.

### API calls

Provides a list of the API calls.

### Errors

Displays the number of errors in a bar graph.

### Successes

Lists the successful API calls.

Note: This visualization runs a search that limits the results to the last 500 calls.

## Portal Default

Provides information about the API requests to APIs in the Developer Portal. This is a replication of the portal\_default dashboard in API Connect Version 5. This dashboard includes the following visualizations:

### Success Rate

Displays how many of your API calls were successful, compared to how many were submitted.

### Data Usage (bytes sent)

Lists the bytes of data that are sent to complete your calls.

### Response Times (ms)

Provides a complete list of the response times of the API calls in milliseconds.

## Product Default

Provides information about the Products. This is a replication of the product\_default dashboard in API Connect Version 5. This dashboard includes the following visualizations:

### Developer Organizations

Lists the numerical value of the number of existing developer organizations.

### Apps per Plan

Displays a pie chart with the number of subscriptions to each Plan.

### API Calls per day

Provides a graphical representation of the number of API calls that occurred each day.

### API calls

Provides a list of the API calls.

### API Calls per day

Provides a graphical representation of the number of API calls that occurred each day.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Cloning a dashboard

You can clone an existing dashboard to use it as a base for a customized dashboard.

### About this task

---

You might want to customize a dashboard that is already created. Because the default dashboards that are provided with IBM® API Connect are read-only, you must clone a default dashboard to change it. You can clone any dashboard that you want to make additional changes to it without changing the original dashboard. To clone a dashboard, complete the following steps:

### Procedure

---

1. If you are not already in the Dashboard application, select Dashboard to view the list of available dashboards.
2. Select the dashboard that you would like to clone to open it.  
The dashboard opens, and the visualizations for that dashboard are displayed.
3. Select Clone in the menu bar to make a copy of the dashboard.
4. Enter a unique name for the new dashboard.
5. Select Confirm Clone to create the clone.  
The clone is created, and your new dashboard is opened.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Creating custom dashboards

You can use API Connect to create custom dashboards that group together a set of related visualizations.

## Before you begin

---

To create dashboards, you must either be the owner of the API provider organization, or be assigned a role that has the Analytics\_>Manage permission for the selected Catalog or Space. For information about enabling Spaces in a new or existing Catalog, see [Creating and configuring Catalogs](#) and [Enabling Spaces in a Catalog](#). For more information about assigning Catalog or Space permissions to a role, see [Managing Catalog membership](#) and [Managing Space membership](#).

## About this task

---

If Spaces are enabled in the selected Catalog, dashboards created at the Catalog level are added to all Spaces in the Catalog. However, if you create a dashboard within a Space, the dashboard is added to that Space only. For more information, see the *Dashboards and visualizations: Understanding the inheritance flow across Catalogs and Spaces* section in [Catalogs, Spaces, and Analytics](#).

When you create a dashboard, you can add previously saved visualizations, and then arrange and resize them as required in the dashboard. If you want to add a new visualization that does not yet exist to the new dashboard, you must first create the visualization to make it available for selection from the list of saved visualizations. For more information, see [Creating visualizations](#).

## Procedure

---

To create a custom dashboard, complete the following steps:

1. If you are not already in the Dashboard application, select Dashboard to view the list of available dashboards.
2. Select the New Dashboard icon  to open an empty dashboard.
3. To add visualizations to this dashboard, complete the following steps:
  - a. Click Add on the dashboard to add a new visualization.  
The list of saved visualizations is displayed.
  - b. Add one or more saved visualizations to the dashboard as follows:
    - i. From the list of saved and default visualizations, select a visualization.  
Tip: If you have a large set of saved visualizations, you can either browse through the saved list or use the visualization filter.  
The visualization is displayed at the end of the dashboard. Depending on the number of visualizations that are already on the dashboard, you might not see the newly added visualization until you close the saved list as described in step 4.
    - ii. Select any other visualizations that you want to add.
4. Close the list of saved and default visualizations by clicking Add new Visualization.
5. Arrange the visualizations in the required order by using the move icon  to drag and drop the visualizations in the preferred location in the dashboard. You can see this icon when you hover over a visualization on the dashboard.
6. Resize the visualization containers by dragging from the lower right-hand corner.
7. Optional: Change the time period against which the data in the visualizations is scoped. By default, a Last 15 minutes filter is applied. You can specify a different filter by using the Time Picker icon .
8. To save the new dashboard, complete the following steps:
  - a. Click Save in the menu bar.
  - b. Specify a name for the dashboard in the Title text field.
  - c. Add a description of the dashboard in the Description field that helps you identify it.
  - d. If you want to save the dashboard with the time period that you specified in step 7, select the Store time with dashboard check box.
  - e. Click the Save button to exit edit mode and view the dashboard.

## Results

---

The dashboard is added to a list of saved dashboards and can be opened at any time if you want view, edit, or share it.

## Related tasks

---

- [Editing dashboards](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Importing dashboards

You can import dashboards from other IBM® API Connect users for use, or you can import dashboards from another Catalog on your system. If Spaces are enabled in a Catalog, you can also import dashboards from a Space.

Dashboards can be imported from .json files that contain one or more exported dashboard definitions.

Note: JSON files that contain a combination of exported visualizations and dashboards can also be imported as described in the following steps.

## Before you begin

---

To import dashboards, you must either be the owner of the API provider organization, or be assigned a role that has the Analytics\_>Manage permission for the selected Catalog or Space. If you import a dashboard into a Catalog, the analytics data is scoped at the Catalog level, and if imported into a Space, the data is scoped to that Space.

For information about enabling Spaces in a new or existing Catalog, see [Creating and configuring Catalogs](#) and [Enabling Spaces in a Catalog](#). For more information about assigning Catalog or Space permissions to a role, see [Managing Catalog membership](#) and [Managing Space membership](#).

## Procedure

---

To import one or more dashboards, complete the following steps:

1. If you are not already in the Dashboard application, select Dashboard to view the list of available dashboards.  
The list of saved dashboards is displayed.
2. Select Import.
3. Navigate to the location where the .json file is stored and select the file to import it. If the file contains any dashboards that will overwrite existing ones on your system, new dashboards will be created even if they are duplicates.  
Remember that you cannot overwrite a default dashboard. If an imported dashboard has the same name as a default dashboard, it is saved with the same name but identified with a tag based on the whether it is a Catalog or Space dashboard.  
All dashboards in the .json file are added as individual objects to the Dashboards tab.

## Related tasks

---

- [Exporting dashboards](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details.  
For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Editing dashboards

You cannot edit the IBM® API Connect preconfigured dashboards, but you can clone it to create a custom dashboard to add, edit, or remove visualizations, and to resize or rearrange visualizations. You can also use the Time Picker to change the time range of the data shown in the visualizations.

## Before you begin

---

To edit dashboards, you must either be the owner of the API provider organization, or be assigned a role that has the Analytics\_>Manage permission for the selected Catalog or Space. For information about enabling Spaces in a new or existing Catalog, see [Creating and configuring Catalogs](#) and [Enabling Spaces in a Catalog](#). For more information about assigning Catalog or Space permissions to a role, see [Managing Catalog membership](#) and [Managing Space membership](#).

## About this task

---

If Spaces are enabled in the selected Catalog, when you edit the dashboard at the Catalog level, your changes are reflected in the Catalog, and are also propagated to the corresponding inherited dashboard in each Space provided the dashboard has not been edited in the Space. However, changes that you make to a dashboard in a Space will apply only within that Space. For more information, see the *Dashboards and visualizations: Understanding the inheritance flow across Catalogs and Spaces* section in [Catalogs, Spaces, and Analytics](#).

Any visualizations that you want to add to the dashboard must already be in the list of saved visualizations. If you want to add a new visualization that does not yet exist, you must first create the visualization to make it available for selection from the list of saved visualizations. For more information, see [Creating visualizations](#).

## Procedure

---

To edit a dashboard, complete the following steps:

Remember: You cannot directly edit a default dashboard that is provided with IBM API Connect. See [Cloning a dashboard](#) for information about how to clone the dashboard and modify it.

1. Access the dashboard that you want to edit:
  - a. If you are not already in the Dashboard application, select Dashboard to view the list of available dashboards. The list of saved dashboards is displayed.
  - b. Select the dashboard that you want to edit to open it.  
If you have a large set of saved dashboards, you can either browse through the list or use the filter to locate the dashboard.
  - c. Select Edit in the menu bar of the dashboard. The dashboard opens in edit mode.
2. Modify the contents as required:
  - Add an existing visualization to the dashboard:
    - Select Add to add a visualization. The list of saved visualizations is displayed.
    - Select the visualization you want to add.  
Tip: If you have a large set of saved visualizations, you can either browse through the list or use the visualization filter to locate the visualization. The visualization is added to the dashboard, within a container (but might be obscured by the saved list). You can resize or reposition the visualization as described later.
    - Close the list of saved visualizations by clicking Save.
  - Edit a visualization in the dashboard.  
Important: When you edit a visualization in this way, you must overwrite the original visualization in the saved list when prompted, in order to have the changes reflected in the dashboard you are editing. Be aware however, that your changes will also be reflected in any other dashboards that contain this visualization. (This might be undesired.)
    - Hover over the visualization and then click the Edit icon  that is displayed in the upper right-hand corner of the visualization container. The visualization builder page opens.
    - Update and save the visualization configuration as described in [Configuring visualizations](#).

When you close the visualization builder page, you return to the dashboard being edited.

- Remove a visualization from the dashboard by hovering over the visualization and then clicking the Delete icon  that is displayed in the upper right-hand corner of the visualization container.  
The action only removes the visualization container from the dashboard; it does not delete the visualization itself from the saved list.
  - Resize a visualization container from its lower right-hand corner by dragging inwards or upwards to decrease the size, or dragging outwards or downwards to increase the size.
  - Rearrange the visualizations by using the move icon  to drag and drop the visualizations in the required location in the dashboard. You can see this icon in the upper right-hand corner when you hover over a container.
  - Change the time period against which the data in the visualizations is scoped. You can specify a different filter by using the Time Picker icon .
3. When your changes are complete, save the dashboard as follows:
    - a. Click Save in the menu bar.
    - b. If you specified a time period as described in step 2, and you want to save the dashboard with that time filter, select the Store time with dashboard check box.
    - c. Click the Save button and then confirm that you want to overwrite the current dashboard.  
Your changes are reflected in the saved dashboard.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Exporting dashboards

You can export dashboards for backing up the configuration, or so they can be imported into other Catalogs on your IBM® API Connect system. If Spaces are enabled in a Catalog, exported dashboards can also be imported into a Space.

Dashboards are exported as .json files, which can then be imported. When you export, the filters that are currently applied are preserved in the exported file.

---

## Before you begin

To export dashboards, you must either be the owner of the API provider organization, or be assigned a role that has the Analytics\_>Manage permission for the selected Catalog or Space. For information about enabling Spaces in a new or existing Catalog, see [Creating and configuring Catalogs](#) and [Enabling Spaces in a Catalog](#). For more information about assigning Catalog or Space permissions to a role, see [Managing Catalog membership](#) and [Managing Space membership](#).

---

## Procedure

To export one or more dashboards, complete the following steps:

1. If you are not already in the Dashboard application, select Dashboard to view the list of available dashboards.  
The list of saved dashboards is displayed.
2. From the Dashboards tab, export one, several, or all dashboards as follows:
  - To export a single dashboard, locate the dashboard, select its check box, and then select Export.
  - To export several dashboards, locate each dashboard and select its check box. Then select Export.
  - To export all dashboards, select the Select All check box at the beginning of the Name column. Then select Export.

Tip: If you have a large set of saved dashboards, you can either browse through the list or use the filter to locate the dashboards.
3. Choose to save the file, which is named export.json by default. The file is saved to the download location that is configured for your browser. If you intend to export more than once, and you are exporting to the same location each time, you might want to rename each file with a meaningful name to help you differentiate between them.

---

## Related tasks

- [Importing dashboards](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Backing up and restoring dashboards

To ensure you can recreate your IBM® API Connect analytics dashboards in the event of data loss, you should export them and save the files as a back-up. Then you can import the files later if needed.

---

## About this task

API Connect does not back up dashboards, so it is good practice to create your own backups by exporting all of your dashboards.

This task only operates on the dashboard metadata, not on the analytics data.

## Procedure

---

1. Export your dashboards as explained in the topic, [Exporting dashboards](#).
2. If you need to restore the dashboards, import them as explained in the topic, [Importing dashboards](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Deleting custom dashboards

If a custom dashboard is no longer required, you can permanently delete it from IBM® API Connect.

Note: You cannot delete the default dashboards.

## Before you begin

---

To delete custom dashboards, you must either be the owner of the API provider organization, or be assigned a role that has the Analytics\_>Manage permission for the selected Catalog or Space. For information about enabling Spaces in a new or existing Catalog, see [Creating and configuring Catalogs](#) and [Enabling Spaces in a Catalog](#). For more information about assigning Catalog or Space permissions to a role, see [Managing Catalog membership](#) and [Managing Space membership](#).

## About this task

---

If Spaces are enabled in the selected Catalog, when you delete the dashboard at the Catalog level, the corresponding inherited dashboard is also deleted from each Space if it has not been edited in the Space. If you delete a dashboard that was created in a Space and is unique to that Space, the dashboard is removed from that Space.

If a custom dashboard is inherited from a Catalog and has not been edited in a Space, you cannot delete that dashboard from the Space, and must delete it from the Catalog if necessary. Similarly, an inherited dashboard that has been updated in a Space also cannot be deleted from that Space, and must be deleted from the Catalog.

For more information, see the *Dashboards and visualizations: Understanding the inheritance flow across Catalogs and Spaces* section in [Catalogs, Spaces, and Analytics](#).

## Procedure

---

To delete one or more dashboards, complete the following steps:

1. If you are not already in the Dashboard application, select Dashboard to view the list of available dashboards.  
The list of saved dashboards is displayed.  
Tip: After the deletion, you are returned to the currently loaded dashboard, so it might be best to start this task from a dashboard that you do not intend to delete at the current time. If you delete the currently loaded dashboard, you are returned to the Overview dashboard by default, with the following error message displayed in the notification banner: Could not locate that dashboard (id: `dashboard_ID`). You can click OK to close the message.
2. From the Dashboards tab, delete one or several dashboards as follows:

- To delete a single dashboard, locate the dashboard, select its check box, and then click the Delete icon .

- To delete several dashboards, locate each dashboard and select its check box. Then click the Delete icon .

Tips:

- If you have a large set of saved dashboards, you can either browse through the list or use the filter to locate the dashboards.
- Each default dashboard is tagged with a **Admin** label. Default dashboards that have been customized are additionally tagged with either a **Catalog** or a **Space** label. Any dashboard that is tagged with a **Admin** label cannot be deleted.
- Any dashboard that is inherited from a **Catalog** must be deleted from the Catalog.

3. Confirm the deletion.

Note: If a default dashboard was selected for deletion, a message is displayed in the notification banner to indicate that default dashboards cannot be deleted.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Visualization application page

In IBM® API Connect, you can use existing visualizations or create your own visualizations to organize the data on your dashboards. You can access the visualizations application page by selecting Analytics in the navigation for a Catalog. Select Apps\_>Visualize to open the Visualization page.

The visualization landing page displays a table with the following information:

Name

The name of the visualization. The names of the default visualizations are based on the information that is contained within the visualization. This list contains both preconfigured visualizations and customized visualizations.

Type

The format of the data in the visualization.

## Tags

Tags that identify at what level the visualization was created, and the required access level that is required to change them. The following tags are supported:

### admin

This visualization is provided with IBM API Connect. You cannot modify visualizations with the `admin` tag. You must clone them if you want to customize them.

### catalog

This visualization was created by someone with catalog management permissions. You can only modify visualizations with the `catalog` tag if you have catalog management permissions. If you only have space permissions, then you must clone it to modify it.

### space

This visualization was created by someone with space management permissions. You can only modify visualizations with the `space` tag if you have space management permissions.

## The screen elements of the visualize application page

The following image shows an example of the visualizations for the Sandbox Catalog with sample data. Custom visualizations that you create for Catalogs or Spaces, and the Analytics visualizations for other entities such as Products, Plans, and APIs, have a similar layout.

The screen elements are summarized in the following table.

Screen element	Description
1 Catalog or Space name	Identifies the selected Catalog or Space.
2 Service identifier	Identifies the analytics service that you are viewing. If you only have one analytics service configured, there is only one possible value.
3 Application selector	Indicates your selected application inside the analytics tab navigation. You can select a different application name to view the information for that application.
4 Search bar	Use this bar to filter your visualizations for the Catalog or Space.
5 Create a visualization	Use this icon to create a customized visualization. See <a href="#">Creating visualizations</a> .
6 Visualization configuration icons	Import or export your visualization to integrate a visualization or share one.
7 Navigation icons	Use these icons to navigate through a large number of visualizations that require multiple screens. Each screen displays a maximum of 20 visualizations.
8 Visualization information	Names and information about the saved visualizations for this Catalog or Space.

- **Visualizations**

Visualizations provide a way for you to apply a series of search criteria to your indexed data, compute metrics, and then graphically present the results in a convenient format for analysis or review. IBM API Connect analytics provides some preconfigured visualizations for you to use to view common analytics data on your dashboards. You can also create your own visualizations.

- **Applying filters to change the sampling of data displayed in visualizations**

You can apply different types of filters to change your view of the data in your IBM API Connect visualizations.

- **Creating visualizations**

You can create visualizations from the Visualize application page or when modifying a custom dashboard in IBM API Connect. All visualizations that you create are added to a list of saved visualizations, and can be used in any dashboard.

- **Importing visualizations**

You can import visualizations from other IBM API Connect users for use in your dashboards, or you can import visualizations from another Catalog on your system. If Spaces are enabled in a Catalog, you can also import visualizations from a Space.

- **Exporting visualizations**

You can export visualizations so they can be imported by other IBM API Connect users, or into other Catalogs on your system. If Spaces are enabled in a Catalog, exported visualizations can also be imported into a Space.

- [Backing up and restoring visualizations](#)

To ensure you can recreate your IBM API Connect analytics visualizations in the event of data loss, you should export them and save the files as a back-up. Then you can import the files later if needed.

- [Deleting custom visualizations](#)

If no longer required for use in your IBM API Connect dashboards, you can permanently delete your custom visualizations.

## Related tasks

---

- [Accessing analytics](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Visualizations

Visualizations provide a way for you to apply a series of search criteria to your indexed data, compute metrics, and then graphically present the results in a convenient format for analysis or review. IBM® API Connect analytics provides some preconfigured visualizations for you to use to view common analytics data on your dashboards. You can also create your own visualizations.

## Default visualizations

---

A list of visualizations is displayed when you select Visualize in the application selector and open the visualization application page for the first time. These are preconfigured visualizations of some common ways to parse and view analytics data. You can use these visualizations as they are, or clone them to customize them to your needs. You cannot modify the existing visualizations. After you have cloned or created some of your own visualizations, your visualizations also appear in this list. The following default visualizations are provided with API Connect:

API calls

Provides a list of the API calls.

API Calls per day

Provides a graphical representation of the number of API calls that occurred each day.

Apps per Plan

Displays a pie chart with the number of subscriptions to each Plan.

Average response time (ms)

Lists the average response time across all of the APIs in milliseconds.

Data Usage (bytes received)

Lists the bytes of data that are received to complete your calls.

Data Usage (bytes sent)

Lists the bytes of data that are sent to complete your calls.

Developer Organizations

Lists the numerical value of the number of existing developer organizations.

Errors

Displays the number of errors in a bar graph.

Maximum Response Time (ms)

Lists the maximum response time of the APIs in milliseconds.

Minimum Response Time (ms)

Lists the fastest response time of the APIs in milliseconds.

Response Times (ms)

Provides a complete list of the response times of the API calls in milliseconds.

Response times (>1 sec)

Displays the calls where the response times are greater than 1 second.

Note: This visualization runs a search that limits the results to the last 500 calls.

Status Codes (detailed)

Lists the detailed status codes of the API requests.

Status Codes (simple)

Provides overview status codes for the API calls.

Subscribed Apps

Lists the number of subscribed apps.

Success Rate

Displays how many of your API calls were successful, compared to how many were submitted.

Successes

Lists the successful API calls.

Note: This visualization runs a search that limits the results to the last 500 calls.

Top 5 APIs Overall (Daily Usage)

Displays a graph of your 5 APIs that receive the most calls on a daily basis.

Top 5 APIs Overall (Overall Usage)

Displays a graph of your 5 APIs that receive the most calls..

Top 5 Products Overall (Daily Usage)

Displays a graph of your 5 Products that receive the most calls on a daily basis.

Top 5 Products Overall (Overall Usage)

Displays a graph of your 5 Products that receive the most calls.

## Created visualizations

---

You cannot directly modify the default visualizations. You can clone and modify them, or create your own from scratch. The visualizations that you clone or create are added to the list of default visualizations. The created visualizations are designated with a **Catalog** or a **Space** tag.

API Connect supports the following types of visualizations:

- Area chart
- Bar chart
- Coordinate map
- Data table
- Gauge
- Goal
- Heat map
- Line chart
- Markdown widget
- Metric
- Pie chart
- Region map
- Tag cloud
- Tile map
- Vertical bar chart

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Applying filters to change the sampling of data displayed in visualizations

You can apply different types of filters to change your view of the data in your IBM® API Connect visualizations.

- [Filtering API events in your visualizations](#)
- [Specifying a time period and auto-refresh rate for the data in your visualizations](#)
- [Drilling down into data in your time-based visualizations](#)
- [Applying a filter by using the legend in a visualization](#)

---

### Filtering API events in your visualizations

In a dashboard, the visualizations depict information that relates to all the API events that occur for the selected Catalog in the IBM API Connect organization, and which are scoped to a specified time range. You can further filter the API events by using a free text search or a Lucene search query.

#### Procedure

To filter the API events, complete the following steps:

1. To perform a free text search, delete the asterisk character (\*) if shown, and then enter a text string in the search bar. For example, to filter for an API called **accounts**, enter `accounts` in the search bar. Then, press Enter or click the Search icon . The visualizations are refreshed to show the results of your search query.
2. To use the Lucene query syntax, complete the following steps:
  - a. In the search bar, delete the asterisk character (\*) if shown, and then enter a search string. For basic search queries, use the following guidelines:

Guideline	Example
Construct searches on field names and their actual values by using this syntax: <code>field_name:value</code> . Field names and their values are case-sensitive.	<code>app_name:legacyquote</code>
Where required for numeric fields, use comparison operators such as greater than (>), less than (<), or equal to (=).	<code>rateLimit.count:&gt;10</code>
Use the logic operators AND, OR, and NOT to combine search terms.	<code>app_name:livequote OR app_name:legacyquote</code>

For detailed information about the Lucene query syntax, see [Apache Lucene - Query Parser Syntax](#). For information about the API event fields that you can specify in search queries, see [API event record fields](#).

Tip: Two quick ways to check for the field names on certain visualizations are to check the tooltip, or to click the caret icon  to display the raw data behind the visualization.

- b. Press Enter or click the Search icon . The visualizations are refreshed to show the results of your search query.
3. To revert to your previous view of the dashboard, delete the search query in the search bar and press Enter.

---

### Specifying a time period and auto-refresh rate for the data in your visualizations

You can change the time period to which your visualization data relates by using the Time Picker. The defined time filter will be applied to all relevant visualizations in the IBM API Connect dashboard.

#### Procedure

To apply a time filter and auto-refresh rate, complete the following steps:

1. From the dashboard, click the Time Picker icon .
2. From the Time Picker, use one of these options to set a time filter:

#### Quick

Select this option to choose a predefined value such as Today, Yesterday, This week, or Last *n* minutes.

#### Relative

Select this option to specify a start time that is relative to now; for example, 20 seconds, minutes, hours, days, weeks, or months ago, optionally rounded to the specified unit of time. The date and time that corresponds to your "relative" selection is displayed before the fields. Click Go.

#### Absolute

Select this option to specify a precise time range. Either use the calendars to select a From and To date, or enter the values directly into the fields by using the date and time format specified underneath the fields. Click Go.

3. If you want to additionally specify a frequency at which the data should automatically be refreshed in your visualizations, click Auto-refresh and then select a predefined refresh interval.
4. If you set an auto-refresh interval as described in the previous step, click the auto-refresh value, which is displayed next to the Time Picker icon , to confirm your settings and close the time selection panels. If you did not set an auto-refresh interval, close the Time Picker panel by clicking within the box where the Time Picker icon  is located. The search query is resubmitted as you make your selections and the visualizations in the dashboard are automatically refreshed to show the matching data. The specified quick, relative, or absolute filter setting is shown with the Time Picker icon . If set, the auto-refresh interval is shown with the Time Picker icon, together with a Pause icon that can be used to pause auto-refresh if required.  
Tip: To switch off the auto-refresh capability, click the auto-refresh value next to the Time Picker icon, and click Off. Then, close the Refresh Interval panel by clicking within the Auto-refresh box next to the Time Picker icon.

## Drilling down into data in your time-based visualizations

On time-based visualizations that display histograms, you can zoom in on a specific time range on the chart. This is equivalent to applying a filter for an "absolute" time period.

### Procedure

To zoom in on your data, complete one of the following steps:

- In the chart, move your cursor to the area that depicts the start time, and hover over the x-axis so that the cursor changes to a plus (+). Click and then drag the mouse to select a boxed area that depicts the time range you want to examine. Release the mouse button to zoom in on the area and view the data in greater detail.

The filter is applied to all time-based visualizations in the current dashboard, and the start and end time range is shown to the right-hand side of the Time Picker icon .

Tip: To remove the filter, click the browser Back button. Alternatively, use the Time Picker icon to select the previous, or a different time range.

- Bar charts only: To zoom in on a particular bar, click that bar in the chart, and then in the filter banner that is displayed underneath the search bar, click Apply Now.

## Applying a filter by using the legend in a visualization

For any chart that includes a legend, you can use the legend labels to apply inclusion (or *positive*) filters to that chart and other relevant charts on the dashboard. When you use the legend in this way to specify inclusion, data is displayed only for the selected item. You can alternatively apply exclusion (or *negative*) filters to exclude the data for a selected item. You can also apply other filter conditions in addition to inclusion and exclusion filters.

### Procedure

To apply a filter from the legend of a chart such as an area chart, line chart, pie chart, or bar chart, complete the following steps:

1. In the chart, click a legend label to apply a filter for that item.  
The color picker opens as displayed in the following example, which shows the label and color picker for a Product named **Clothing**. Notice that two icons are also shown above the colored dots.

Tip: You can change the color of the lines, slices, or bars on a chart by clicking the colored dots in the color picker to select a preferred color. To retain these colors, save the dashboard.

2. Apply an inclusion or exclusion filter as follows:
  - To apply an inclusion filter that shows data associated with that item only (for example, the **Clothing** Product), click the Positive Filter icon . A blue inclusion filter oval and an Actions twistie are displayed beneath the search bar of the dashboard, as shown in the following example. The filter condition (which in this case is `product_name: "Clothing"`) is also shown in the filter oval.

- To apply an exclusion filter that excludes data about that item from the chart, click the Negative Filter icon . A red exclusion filter oval and an Actions twistie are displayed beneath the search bar of the dashboard, as shown in the following example. The filter condition (for example, `product_name: "Clothing"`) is also shown in the filter oval.

- Highlight the filter oval to view the filter icons and use these icons to apply other filter conditions. The following image shows an example of the filter icons for an inclusion filter, and also shows the Actions twistie in an expanded state. The Actions twistie provides equivalent options for the icons. For an exclusion filter, similar icons are shown in a red oval.

Icon	Description	Equivalent Actions option
	Click this icon to temporarily disable the inclusion or exclusion filter that was set in step 2. When you disable an inclusion filter, the filter oval is shown in a blue striped color, and the chart displays all the data again. (For a disabled exclusion filter, the filter oval is shown in a red striped color.) To enable the filter again, click the icon again.	Disable Enable  Toggle is an alternative for Enable/Disable.
	Click this icon to pin the filter. A pin icon is shown to the left-hand side of the filter condition in the blue (or red) oval as an indication. Pinning a filter causes it to be applied to other dashboards that you open. To unpin the filter, highlight the oval and click the pin icon again.	Pin Unpin
	Click this icon to toggle the filter to instead show excluded items (that is, those items that do not match the filter condition). The toggle action switches between applying an inclusion filter and an exclusion filter to the data in the visualization. When the exclusion filter is applied, the filter oval switches from blue to red  .	Invert
	Click this icon to remove the filter and restore the chart to its original state.	Remove
	Click this icon to display the JSON representation of the filter. If required, you can directly modify the JSON code to change your filter query and then specify an alias that can be used as the filter name. To see an example of how to use this option, see the <a href="#">Edit Filter</a> section within the <i>Filtering by Field</i> topic in the Kibana documentation.	

Example of how an inclusion filter works when enabled: Suppose the filter condition `product_name: "Clothing"` is applied to the first visualization, which shows the five most active Products. A second visualization in the same dashboard, which shows the five most active APIs, would automatically be refreshed to display data only for those APIs in the Product named `Clothing`.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Creating visualizations

You can create visualizations from the Visualize application page or when modifying a custom dashboard in IBM® API Connect. All visualizations that you create are added to a list of saved visualizations, and can be used in any dashboard.

### Before you begin

To create visualizations, you must either be the owner of the API provider organization, or be assigned a role that has the `Analytics_manage` permission for the selected Catalog or Space. For information about enabling Spaces in a new or existing Catalog, see [Creating and configuring Catalogs](#) and [Enabling Spaces in a Catalog](#). For more information about assigning Catalog or Space permissions to a role, see [Managing Catalog membership](#) and [Managing Space membership](#).

### About this task

If Spaces are enabled in the selected Catalog, visualizations created at the Catalog level are added to all Spaces in the Catalog. However, if you create a visualization within a Space, the visualization is added to that Space only. For more information, see the *Dashboards and visualizations: Understanding the inheritance flow across Catalogs and Spaces* section in [Catalogs, Spaces, and Analytics](#).

To create a visualization from a new dashboard page, complete the following steps:

### Procedure

- Click the New Dashboard icon  to create a new dashboard.
- Select `Add > Add new Visualization`.
- From the Select visualization type page, choose a visualization type, and then configure and save it as described in [Configuring visualizations](#).

### Results

The new visualization is added to the list of saved visualizations and can be selected for use.

- [Configuring visualizations](#)  
Use this information either when creating a visualization or when editing an existing visualization.

- [Editing visualizations](#)

You can edit a visualization either from a dashboard that contains that visualization or by managing your saved objects.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Configuring visualizations

Use this information either when creating a visualization or when editing an existing visualization.

---

### Before you begin

As a starting point for this task, you must have completed one of the following actions:

- Clicked Add, and then Create new Visualization in a new dashboard page to open the Select visualization type page. (In this case, start from step [1](#) in the procedure that follows.)
- Clicked Edit from an existing dashboard, and then clicked Add to open the Create new Visualization page. (In this case, start from step [1](#) in the procedure that follows.)
- Clicked the Edit icon  on a visualization container on an existing dashboard, to open the visualization builder page. (In this case, start from step [2](#) in the procedure that follows.)
- Clicked the Edit icon  for a visualization to open the visualization builder page. (In this case, start from step [2](#) in the procedure that follows.)

To configure visualizations, you must either be the owner of the API provider organization, or be assigned a role that has the Analytics\_>\_Manage permission for the selected Catalog or Space. For information about enabling Spaces in a new or existing Catalog, see [Creating and configuring Catalogs](#) and [Enabling Spaces in a Catalog](#). For more information about assigning Catalog or Space permissions to a role, see [Managing Catalog membership](#) and [Managing Space membership](#).

---

### About this task

When you configure visualizations, you use the following Elasticsearch aggregations to define the type and level of information to be retrieved and displayed:

- metrics: You can configure one or more metric aggregations that will calculate metrics based on values extracted from the indexed data fields. (Indexed fields are searchable and are available for use in visualizations.)
- buckets: Buckets operate in a similar way to SQL GROUP BY statements and enable aggregate functions to be performed on a filtered data set. You can configure one or more bucket aggregations that will sort your data according to the criteria specified.

For detailed information about aggregations, see the [Elasticsearch aggregations reference](#). For information about the indexed data fields that can be specified while configuring visualizations, see [API event record fields](#).

You can also specify view options for each visualization type; for example, the capability to show or hide the tooltip and legend.

Note: The API Manager analytics component loads with a preselected default index pattern, which identifies the index against which search and analytics are run, and which scopes the Kibana queries to the default Catalog. To ensure tenant and Catalog isolation, this default index pattern cannot be customized by users.

---

### Procedure

To configure a visualization, complete the following steps:

1. From the Create New Visualization page, choose the type of visualization that you want to create:
  - Area chart
  - Bar chart
  - Coordinate map
  - Data table
  - Gauge
  - Goal
  - Heat map
  - Line chart
  - Markdown widget
  - Metric
  - Pie chart
  - Region map
  - Tag cloud
  - Tile map
  - Vertical bar chart

Tip: If necessary, review the guidance on the page to help you decide which type you need.

2. From the visualization builder page, define the content and layout for the visualization you are creating or editing.

You can configure your settings by using the visualization builder controls in the left-hand pane, and then view the results of your actions in the preview canvas.

  - a. From the Data tab in the visualization builder, configure the metric and bucket aggregations for the visualization.
  - b. From the Options tab in the visualization builder, specify view options for the visualization.

For full details about completing the visualization builder for your selected visualization, see the following information in the Kibana documentation:

- [Area Charts](#)
- [Bar Charts](#)
- [Coordinate Maps](#)
- [Data Table](#)

- [Gauge Chart](#)
- [Goal Charts](#)
- [Heat Map Chart](#)
- [Line Charts](#)
- [Markdown Widget](#)
- [Metric](#)
- [Pie Charts](#)
- [Region Maps](#)
- [Timelion](#)
- [Tag Clouds](#)
- [Vertical Bar Charts](#)

For additional information about visualizations and aggregations, see the [Creating a Visualization](#) section in the Kibana documentation.

As you configure each setting in the visualization builder, you can click Apply changes  to view the results of your action within the preview canvas, or click

Discard changes  to undo a change. You can also click the Refresh icon  to refresh the visualization preview. If you are creating a complex visualization, you might find it useful to save and name the visualization (as described in step 3) after the initial metric or bucket aggregations are configured, and then save in stages as you configure more aggregations for the visualization.

- When the configuration is complete, save the visualization:
  - Click Save.
  - Specify a name for the visualization in the text field (if not already specified).
  - Click the Save button. (If you have previously saved, confirm that you want to overwrite.)
- Select Analytics in the navigation to exit the visualization builder page.
 

You return to the previous dashboard.

  - If you created a visualization, it is added to the saved list.
  - If you edited an existing visualization, your changes are reflected in any dashboards that contain that visualization.

## Related tasks

- [Creating custom dashboards](#)
- [Creating visualizations](#)
- [Editing dashboards](#)
- [Editing visualizations](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Editing visualizations

You can edit a visualization either from a dashboard that contains that visualization or by managing your saved objects.

### Before you begin

To edit visualizations, you must either be the owner of the API provider organization, or be assigned a role that has the Analytics\_>Manage permission for the selected Catalog or Space. For information about enabling Spaces in a new or existing Catalog, see [Creating and configuring Catalogs](#) and [Enabling Spaces in a Catalog](#). For more information about assigning Catalog or Space permissions to a role, see [Managing Catalog membership](#) and [Managing Space membership](#).

### About this task

If Spaces are not enabled in the selected Catalog, all dashboards that contain the modified visualization are updated to reflect the changes made for that visualization. If Spaces are enabled in the selected Catalog, when you edit a visualization at the Catalog level, your changes are reflected in all dashboards (which contain that visualization) in the Catalog. Your changes are also reflected in the corresponding visualization in each Space if the visualization was inherited from the Catalog and has not been edited in the Space. However, changes that you make to a visualization in a Space will apply only within that Space. For more information, see the *Dashboards and visualizations: Understanding the inheritance flow across Catalogs and Spaces* section in [Catalogs, Spaces, and Analytics](#).

## Procedure

To edit a visualization, complete either of the following steps:

- Edit a visualization in a dashboard.
 

Important: When you edit a visualization in this way, you must overwrite the original visualization in the saved list when prompted, in order to have the changes reflected in the dashboard you are editing. Be aware however, that your changes will also be reflected in any other dashboards that contain this visualization. (This might be undesired.)

  - From a dashboard that contains the visualization you want to edit, highlight visualization and then click the Edit icon  that displays. The visualization builder page opens.
  - Update and save the visualization configuration as described in [Configuring visualizations](#).
 

When you close the visualization builder page, you return to the dashboard and can see the updated visualization.
- Edit a visualization by managing your saved objects.
  - From a dashboard, click Edit, then Add.
 

The list of saved visualizations is displayed.

2. Click Manage Visualizations to open the Manage Saved Objects page.  
This page contains separate tabs that show a listing of all your saved dashboards and visualizations, and the total counts.
3. From the Visualizations tab, locate the visualization you want to edit.  
Tip: If you have a large set of saved visualizations, you can either browse through the list or use the filter to locate the visualization.
4. Click the Edit button  for the visualization. The visualization builder page opens.
5. Update and save the visualization configuration as described in [Configuring visualizations](#).  
When you close the visualization builder page, you return to the previous dashboard. When you open any dashboard that contains the edited visualization, your changes will be reflected in that dashboard.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Importing visualizations

You can import visualizations from other IBM® API Connect users for use in your dashboards, or you can import visualizations from another Catalog on your system. If Spaces are enabled in a Catalog, you can also import visualizations from a Space.

Visualizations can be imported from .json files that contain one or more exported visualization definitions.

Note: JSON files that contain a combination of exported visualizations and dashboards can also be imported as described in the following steps.

## Before you begin

To import visualizations, you must either be the owner of the API provider organization, or be assigned a role that has the Analytics\_...\_Manage permission for the selected Catalog or Space. If you import a visualization into a Catalog, the analytics data is scoped at the Catalog level, and if imported into a Space, the data is scoped to that Space. For information about enabling Spaces in a new or existing Catalog, see [Creating and configuring Catalogs](#) and [Enabling Spaces in a Catalog](#). For more information about assigning Catalog or Space permissions to a role, see [Managing Catalog membership](#) and [Managing Space membership](#).

## Procedure

To import one or more visualizations, complete the following steps:

1. From a dashboard, click Edit, then Add.  
The list of saved visualizations is displayed.
2. Click Manage Visualizations to open the Manage Saved Objects page.  
This page contains separate tabs that show a listing of all your saved dashboards and visualizations, and the total counts. The Visualizations tab is displayed by default.
3. Click the Import button.
4. Navigate to the location where the .json file is stored and select the file to import it. If the file contains any visualizations that will overwrite existing ones on your system, new visualizations will be created even if they are duplicates.  
All visualizations in the .json file are added as individual objects to the Visualizations tab.
5. Click the Close button to close the page and return to the dashboard.

## Related tasks

- [Exporting visualizations](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Exporting visualizations

You can export visualizations so they can be imported by other IBM® API Connect users, or into other Catalogs on your system. If Spaces are enabled in a Catalog, exported visualizations can also be imported into a Space.

Visualizations are exported as .json files, which can then be imported.

## Before you begin

To export visualizations, you must either be the owner of the API provider organization, or be assigned a role that has the Analytics\_...\_Manage permission for the selected Catalog or Space. For information about enabling Spaces in a new or existing Catalog, see [Creating and configuring Catalogs](#) and [Enabling Spaces in a Catalog](#). For more information about assigning Catalog or Space permissions to a role, see [Managing Catalog membership](#) and [Managing Space membership](#).

## Procedure

To export one or more visualizations, complete the following steps:

1. From a dashboard, click Edit, then Add.  
Tip: You can also start from the Visualize application page by selecting Visualize.  
The list of saved visualizations is displayed.
2. From the Visualizations tab, export one, several, or all visualizations as follows:
  - To export a single visualization, locate the visualization, select its check box, and then click Export.
  - To export several visualizations, locate each visualization and select its check box. Then click Export.
  - To export all visualizations, select the Select All check box and then click Export.Tip: If you have a large set of saved visualizations, you can either browse through the list or use the filter to locate the visualizations.
3. Choose to save the file, which is named export.json by default. The file is saved to the download location that is configured for your browser. If you intend to export more than once, and you are exporting to the same location each time, you might want to rename each file with a meaningful name to help you differentiate between them.

---

## Related tasks

- [Importing visualizations](#)

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Backing up and restoring visualizations

To ensure you can recreate your IBM® API Connect analytics visualizations in the event of data loss, you should export them and save the files as a back-up. Then you can import the files later if needed.

---

## About this task

API Connect does not back up visualizations, so it is good practice to create your own backups by exporting all of your visualizations.

This task only operates on the visualization metadata, not on the analytics data.

---

## Procedure

1. Export your visualizations as explained in the topic, [Exporting visualizations](#).
2. If you need to restore the visualizations, import them as explained in the topic, [Importing visualizations](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

---

## Deleting custom visualizations

If no longer required for use in your IBM® API Connect dashboards, you can permanently delete your custom visualizations.

Note: You cannot delete the default visualizations.

---

## Before you begin

To delete custom visualizations, you must either be the owner of the API provider organization, or be assigned a role that has the Analytics<sub>z</sub> Manage permission for the selected Catalog or Space. For information about enabling Spaces in a new or existing Catalog, see [Creating and configuring Catalogs](#) and [Enabling Spaces in a Catalog](#). For more information about assigning Catalog or Space permissions to a role, see [Managing Catalog membership](#) and [Managing Space membership](#).

---

## About this task

If Spaces are enabled in the selected Catalog, when you delete a visualization at the Catalog level, the corresponding inherited visualization is also deleted from each Space if it has not been edited in the Space. If you delete a visualization that was created in a Space and is unique to that Space, the visualization is removed from that Space.

If a custom visualization is inherited from a Catalog and has not been edited in a Space, you cannot delete that visualization from the Space, and must delete it from the Catalog if necessary. Similarly, an inherited visualization that has been updated in a Space also cannot be deleted from that Space, and must be deleted from the Catalog.

For more information, see the *Dashboards and visualizations: Understanding the inheritance flow across Catalogs and Spaces* section in [Catalogs, Spaces, and Analytics](#).

---

## Procedure

To delete one or more visualizations, complete the following steps:

- From a dashboard, click Edit, then Add.  
Tip: You can also start from the Visualize application page by selecting Visualize.  
The list of saved visualizations is displayed.
- From the Visualizations tab, delete one or several visualizations as follows:

- To delete a single visualization, locate the visualization, select its check box, and then click the Delete icon

- To delete several visualizations, locate each visualization and select its check box. Then click the Delete icon

Tips:

- If you have a large set of saved visualizations, you can either browse through the list or use the filter to locate the visualizations.
- Each default visualization is tagged with a **Admin** label. Default visualizations that have been customized are tagged with a **Catalog** or **Space** tag. Any visualization that is tagged with an **Admin** tag cannot be deleted.
- Each custom visualization is tagged with a **Catalog** or **Space** tag. Any visualization that is at the Space level but inherited from the Catalog level cannot be deleted at the Space level. It must be deleted at the Catalog level.

- Confirm the deletion.

Note:

- If a default visualization was selected for deletion, a message is displayed in the notification banner to indicate that default visualizations cannot be deleted.
- If you delete a visualization that is currently inserted in one or more dashboards, the visualization container is retained in those dashboards and displays the following message: Could not locate that visualization (id: *visualization\_ID*). You will have to remove the visualization container from these dashboards.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Working with searches (Discover)

Use the IBM® API Connect Analytics Discover tab to create and run searches against your analytics data.

Each search is based on a query that is written using Lucene query syntax, which is described in the [Elasticsearch documentation](#).

Saved searches display a title and a tag that indicates the level of permissions needed to modify the query. For example, if a saved search is tagged with **catalog** then you must have Analytics Manage permissions at the Catalog scope to modify it; otherwise you must clone it and customize your own copy. Searches tagged with **admin** are predefined and cannot be modified but they can be cloned and then customized.

The following image shows the Discover page with the predefined searches.

Any user with Analytics View permissions can run a saved search and view the results, as well as export a saved search to JSON format by selecting the search and clicking Export. Users with Analytics Manage permissions can additionally create new searches by clicking  and defining a query, or by clicking Import and importing a JSON file that contains a query definition. The following image shows the results of the predefined "Successes" search.

The screenshot displays the IBM API Connect Analytics Discover interface. At the top, there are tabs for 'Discover', 'Visualize', and 'Dashboard'. The 'Discover' tab is active, showing a search query 'api\_name is findbranch' and a filter 'FindBranch stats'. A bar chart below the search shows a single bar at 16:00. Below the chart is a table with columns: Time, status\_code, url\_path, api\_name, product\_name, app\_name. The table contains 5 rows of data for February 7th, 2020, all with status 'OK'.

Annotations in the image point to various features:

- Add a filter to refine results:** Points to the 'Add filter' dialog box.
- Manage this search:** Points to the 'Save', 'Clone', and 'Export' buttons.
- Select a time period for inclusion in the search:** Points to the 'Today' button.
- Graph summarizes the result set:** Points to the bar chart.
- Select fields to include in the results table:** Points to the 'Available Fields' list on the left.

- **[Creating searches](#)**

Use the IBM API Connect Analytics Discover tab to create new searches by defining a search query, or to import a search query that is stored in a JSON format file. You can then use saved searches to create visualizations.

- **[Editing searches](#)**

Use the IBM API Connect Analytics Discover tab to modify searches.

- **[Exporting searches](#)**

You can export searches for backing up the definitions, or so they can be imported into other Catalogs on your IBM API Connect system. If Spaces are enabled in a Catalog, exported searches can also be imported into a Space.

- **[Importing searches](#)**

You can import searches from other IBM API Connect users for use, or you can import searches from another Catalog on your system. If Spaces are enabled in a Catalog, you can also import searches from a Space.

- **[Backing up and restoring searches](#)**

To ensure you can recreate your IBM API Connect searches in the event of data loss, you should export them and save the files as a back-up. Then you can import the search definitions later if needed.

- **[Deleting searches](#)**

Use the IBM API Connect Analytics Discover tab to delete searches.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Creating searches

Use the IBM® API Connect Analytics Discover tab to create new searches by defining a search query, or to import a search query that is stored in a JSON format file. You can then use saved searches to create visualizations.

## Before you begin

To create searches, you must either be the owner of the API provider organization, or be assigned a role that has the Analytics - Manage permission for the selected Catalog or Space.

## About this task

When you create a search at the Catalog level, the search is automatically added to all of the Spaces in that Catalog. When you create a search in a Space, the search is added only to the current Space.

## Procedure

1. [Navigate to the Analytics feature for the Catalog or Space where you want to create a search.](#)
2. Click Discover to open the Discover tab, where you can create and manage searches.
3. Click .

4. Use the Search field to define a query using [Lucene query syntax](#) as explained in the Elasticsearch documentation.

5. Click  and select a time range for the API events to be included in the search results.

6. Click  to run the search.

## Results

When your searches are saved, you can use them on the Visualize tab to display search results in graphical formats such as charts and maps.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Editing searches

Use the IBM® API Connect Analytics Discover tab to modify searches.

### Before you begin

---

To edit searches, you must either be the owner of the API provider organization, or be assigned a role that has the Analytics - Manage permission for the selected Catalog or Space.

### About this task

---

When you modify a search, you can run it immediately and see the new result set on the Discover tab. The new results might also appear in the visualizations and dashboards that use the search. Whether the visualizations and dashboards based on that search are updated to reflect the new result set depends on their scope and inheritance.

For example, if you select a Space and modify the search there, then the change only applies to the version of the search that runs within that Space. Versions of the search stored in other Spaces are not updated. If you modify the search at the Catalog scope, then the changes are applied across the entire Catalog and all Spaces within in it.

### Procedure

---

1. [Navigate to the Analytics feature for the Catalog or Space where you want to modify a search.](#)

2. Click Discover to open the Discover tab, where you can create and manage searches.

3. If you want to modify a search that you don't have permission to edit, clone it first by completing the following steps:

In addition to belonging to a role with Analytics - Manage permission, you must have access to the scope in which the search was created if you want to edit that search directly. If you do not have the correct permissions to edit the search, you can clone it and then edit the copy to customize it. The tag that displays next to the search name indicates the scope of permissions required to edit the search. A predefined search (displays the **Admin** tag) cannot be modified and must always be cloned. A search tagged with **Space** can only be modified by users who have access to the Space in which the search was created. A search tagged with **Catalog** can be modified by all users of the current Catalog.

- a. Click the name of the search that you want to clone.
- b. Click Clone.
- c. In the Clone Search dialog box, click Clone, provide a name for the copy (the name defaults to "Search-name Copy"), and then click Confirm Clone.

The image shows a dialog box titled "Clone Search". Inside the dialog, there is a text prompt: "Please enter a new name for your search." Below this prompt is a text input field containing the text "Successes Copy". At the bottom of the dialog, there are two buttons: "Cancel" and "Confirm Clone".

The new, editable copy of the search immediately appears in the list of saved searches.

Clone of "Successes" search

- In the list of searches, click the name of the search that you want to modify.
- Edit the search query and the time frame for the search as needed.
- Click Save to update the saved search or optionally store a new copy of the search.

A dialog box displays where you can optionally rename the search or save it as a new search. Complete the fields and click **Save**.

Name of search being edited      Name of new copy of search

Save copy as a new search

Note: If you provide a new name for the search, it is saved with that name and the search that you originally selected to modify is left unchanged. If you select Save as a new search then a new search is created with the specified name. If you save a new search but do not change the name, a message displays to confirm that you want to create a different search using the same name. Click Save search to confirm that you want to save it as a new search.

If you save the search with a duplicate name, the search list displays both versions of the search with the older search appearing first.

Newest copy of search

You can edit searches and save them with new names to remove duplication.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Exporting searches

You can export searches for backing up the definitions, or so they can be imported into other Catalogs on your IBM® API Connect system. If Spaces are enabled in a Catalog, exported searches can also be imported into a Space.

## Before you begin

To export searches, you must either be the owner of the API provider organization, or be assigned a role that has the Analytics - Manager permission for the selected Catalog or Space.

## About this task

Searches are exported as .json files, which can then be [imported](#).

## Procedure

1. [Navigate to the Analytics feature for the Catalog or Space where you want to create a search.](#)
2. Click Discover to open the Discover tab, where you can create and manage searches.
3. Select the searches that you want to export into a single JSON file.

Discover Visualize Dashboard

Discover

Search...

Export Import

Select all

Name	Tags
<input checked="" type="checkbox"/> All Events	ADMIN
<input checked="" type="checkbox"/> ApiName_FindBranch	CATALOG
<input type="checkbox"/> ApiName_FindBranch	CATALOG
<input type="checkbox"/> Errors	ADMIN
<input checked="" type="checkbox"/> Find Status 2xx	CATALOG

Export

4. Click
5. Choose whether to open the file now or save it as export.json to your local "downloads" location.

## Results

The selected searches are exported to a single file called export.json.

Tip: If you plan to export multiple files, rename them after each download to avoid confusion.

```

export.json
1  [
2  {
3    "_type": "search",
4    "_source": {
5      "title": "All Events",
6      "description": "",
7      "hits": 0,
8      "columns": [],
9      "sort": [
10     "datetime",
11     "desc"
12   ],
13   "version": 1,
14   "kibanaSavedObjectMeta": {
15     "searchSourceJSON":
16     "{\"index\":\"apic-api-r\",\"highlightAll\":true,\"version\":true,\"filter\":[]}"
17   },
18   "default": true
19 }
20 ]

```

You can import the searches in this file to another Space or Catalog.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Importing searches

You can import searches from other IBM® API Connect users for use, or you can import searches from another Catalog on your system. If Spaces are enabled in a Catalog, you can also import searches from a Space.

### Before you begin

To import searches, you must either be the owner of the API provider organization, or be assigned a role that has the Analytics - Manage permission for the selected Catalog or Space.

### About this task

Searches can be imported from .json files that contain one or more exported search definitions. When you import a search at the Catalog level, the search is automatically added to all of the Spaces in that Catalog. When you import a search into a Space, the search is added only to the current Space.

Your search query must be contained in a JSON format file. If the file contains multiple search definitions, they will all be imported. For each search definition, the value in the `title` field is used as the new search's name.

```
1  [
2  {
3      "_type": "search",
4      "_source": {
5          "title": "Find Status 2xx",
6          "description": "",
7          "hits": 0,
8          "columns": [
9              "status_code",
10             "uri_path",
11             "api_name",
12             "product_name",
13             "app_name"
14         ],
15         "sort": [
16             "datetime",
17             "desc"
18         ],
19         "version": 1,
20         "kibanaSavedObjectMeta": {
21             "searchSourceJSON":
22             "{\"index\":\"apic-api-r\",\"highlightAll\":true,\"version\":true,\"filter\":[],\"query\":{\"query_string\":{\"query\":\"status_code:2*\",\"analyze_wildcard\":true}}}"
23         },
24         "catalog_id": "dd010c40-8bd6-460d-a12ff-fbcd3635f13f",
25         "org_id": "3f535b9b-baef-39ab-8ffd-495839b32408"
26     }
27 ]
```

Search name

Query

### Procedure

1. [Navigate to the Analytics feature for the Catalog or Space where you want to create a search.](#)
2. Click Discover to open the Discover tab, where you can create and manage searches.
3. Click  Import .
4. Select the JSON file containing the search query and click Open.

### Results

The imported search is saved automatically and added to the displayed list of saved searches.

If the JSON file contains multiple search definitions, all of the searches in the file are imported added to the search list. If an imported search's title duplicates an existing search title, all of the searches are retained and display in the search list with duplicate names. You can edit searches and save them with new names to remove duplication.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Backing up and restoring searches

To ensure you can recreate your IBM® API Connect searches in the event of data loss, you should export them and save the files as a back-up. Then you can import the search definitions later if needed.

### About this task

API Connect does not back up searches, so it is good practice to create your own backups by exporting all of your saved searches.

This task only operates on the search definition, not on the analytics data that is returned in the results.

### Procedure

1. Export your search definitions to JSON format as explained in the topic, [Exporting searches](#).
2. If you need to restore the searches, import the definitions from the JSON files as explained in the topic, [Importing searches](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Deleting searches

Use the IBM® API Connect Analytics Discover tab to delete searches.

### Before you begin

To delete searches, you must either be the owner of the API provider organization, or be assigned a role that has the Analytics - Manage permission for the selected Catalog or Space.

Searches are used in visualizations. When you delete a search, it is removed from all visualizations where it was previously used. A user who views a visualization based on a search that was deleted sees the following error message: `Could not locate that search (id: search_ID)`. Before deleting a search, you should remove it from visualizations to ensure that users don't encounter the error.

## About this task

In addition to belonging to a role with Analytics - Manage permission, you must have access to the scope in which the search was created if you want to delete that search. The tag that displays next to the search name indicates the scope of permissions required to edit the search. A predefined search (displays the **Admin** tag) cannot be deleted. A search tagged with **Catalog** can be deleted by all users of the current Catalog. A search tagged with **Space** can only be deleted by users who have access to the Space in which the search was created. Deleting a search from a Space removes it only from the current space. Other versions of the search stored in different Spaces are not deleted.

## Procedure

1. [Navigate to the Analytics feature for the Catalog or Space where you want to modify a search.](#)
2. Click Discover to open the Discover tab, where you can create and manage searches.
3. Select the searches that you want to delete.

Tip: If you have a large set of saved searches, you can either browse through the list or use the filter to locate the searches.

4. Click  .

5. If you really want to delete the selected searches, click  to confirm.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Exporting API event data

You can obtain analytics and API event data from the API Manager user interface of IBM® API Connect or by using REST API calls.

## About this task

From the API Manager UI, you can view and export the raw analytics data that is returned in your configured visualizations. You can also view the individual API event records that are generated for the aggregated data sets in your visualizations, and you can collectively export all the API event records that relate to all visualizations in a dashboard. Any analytics or API event data that you export is saved to a comma-separated values (CSV) file.

You can alternatively obtain analytics data for a specific Catalog and API provider organization by using REST API calls to return JSON objects that contain the analytics data.

- [Using the UI to export API event data](#)  
Use the IBM API Connect Analytics interface to export API events data to CSV or JSON Lines format.
- [Using REST APIs to export events data to JSON or YAML](#)  
Use the IBM API Connect REST APIs to export API events data to JSON or YAML format.
- [API event record fields](#)

An API event is logged each time an API operation is invoked, and an event record is generated for each API event in the Gateway server. The API event record contains information about the API call and the content of the record depends on the logging policy that is set for the operation.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Using the UI to export API event data

Use the IBM® API Connect Analytics interface to export API events data to CSV or JSON Lines format.

### About this task

---

Use the Analytics Discover tab to search for event data and then export the *hits* (the records in the search results) to a file. Each hit represents one API invocation in the Gateway server. When you view the hits in the UI, the display is limited to 500 records. To view the entire set of hits, export the data to a CSV or JSON Lines file.

### Procedure

---

1. Navigate to the Analytics page and click Discover.
2. Run a search.

Select a predefined search to run, or click  to define your own search, and then run it. Optionally apply filters to refine the results. The export option is only available when a search returns at least one hit.

3. Click Export (this option displays before the search results).
4. In the "Export Hits" panel, select the Filetype for the exported data.

There are two options for the file's type:

- a. JSON Lines (.txt): Exports data to a .txt file that contains a complete JSON record for each hit.
- b. Comma-separated Values (.csv): Exports to a .csv file that can be viewed either in a text editor, a spreadsheet, or some other CSV viewer.  
If you intend to view the .csv file in a viewer that does not support special characters, select the following options as needed to ensure compatibility with your viewer:
  - i. Escape double quotes: Insert an additional quotation mark (") as an escape character before each " that is already included in the file.
  - ii. Escape special characters: Insert a quotation mark (") as an escape character before each of the following characters: = \_ + % @

The content of the API event records in the CSV file depends on the logging policy that is set for the operation. If the logging policy includes the HTTP headers and the payload, then these details are included in the API event record. Where the payload is large, it might take longer to complete the export of the analytics data. For more information, see [activity-log.policy](#). For information about the fields that are included in the CSV file, see [API event records](#).

5. In the panel, click Export to start the export operation.
6. When the "The export has completed successfully." message displays, click Download to save the file, or click Another one? to run a new export operation. (Remember to save the current export results before running a new export).

Attention:

- If your browser is configured to block pop-ups, the download might be blocked. The precise behavior varies across browsers, but if you see a notification about "blocked pop-ups", reconfigure the browser to always allow pop-ups for the API Manager host address. Then check the "Export Hits" panel for the Download option, which completes the operation. If you do not see a Download option, repeat the export operation.
  - If you navigate away from the Analytics interface before the exported file is downloaded, the download operation is suspended. If you return to Analytics before any other export operation begins and before the file expires, you might see a Download option that allows you to finish downloading the file. Otherwise, you must repeat the entire export operation.
  - Each downloaded file is saved to the download location that is configured for your browser, using a randomly generated file name. If you intend to export more than once, and you are exporting to the same location each time, you might want to rename each file with a meaningful name.
- [Exporting aggregated analytics data from a visualization](#)  
From a visualization, you can view the raw aggregated data from which the graphical representation is constructed, and then export that data to a CSV file.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

---

## Exporting aggregated analytics data from a visualization

From a visualization, you can view the raw aggregated data from which the graphical representation is constructed, and then export that data to a CSV file.

### Procedure

---

To export analytics data from a visualization, complete the following steps.

1. Navigate to the Analytics page and click Visualize.
2. Select a visualization by clicking it.  
For example, you might select the visualization called "Status Codes (Detailed)" as shown in the following image:

3. Display the data in grid format by clicking the  that displays after the visualization. In the resulting grid, a row is displayed for each aggregated data set that matches the search criteria configured in the visualization's aggregation builder. The raw data shown in the columns and rows depends on the type of visualization accessed and the aggregations configured for that visualization.

Visualize / Status Codes (Detailed) Refresh Clone < This week >

\* Uses lucene query syntax

Add a filter +

Table

filters	Count	status_code.keyword: Descending	Count
1xx	0		
2xx	20	200 OK	20
3xx	0		
4xx	2	401 Unauthorized	2
5xx	0		

Export: Raw Formatted

Page Size 10

Display in graph format Export options

4. Export a tabular format of the raw data that is displayed in the grid:
- To export the data as stored in Elasticsearch, click the Raw link.
  - To export Kibana formatted data that is similar to what you see in the grid, click the Formatted link.
5. When prompted, choose to save the file, which is named `visualization_name.csv` by default. The file is saved to the download location that is configured for your browser. If you intend to export more than once from the same or another visualization, and you are exporting to the same location each time, you might want to rename each file with a meaningful name.

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## Using REST APIs to export events data to JSON or YAML

Use the IBM® API Connect REST APIs to export API events data to JSON or YAML format.

The Analytics REST APIs let you create analytics objects and retrieve data. When you reference an API, use the API's own endpoint on your management server.

Note: To use the Analytics REST APIs you need to register as client type "toolkit".

For details on the APIs, browse to the **API Connect Analytics APIs 1.0.0** section of the [API Connect REST API documentation](#).

**Note:** No fixes or enhancements are being added to IBM API Connect 10.0.2.0 to 10.0.4.x, and it is EOS after 16 December 2023. See [support policy](#) for details. For a more recent version of CD documentation, see the [IBM API Connect 10.0.6.x and later product documentation](#).

## API event record fields

An API event is logged each time an API operation is invoked, and an event record is generated for each API event in the Gateway server. The API event record contains information about the API call and the content of the record depends on the logging policy that is set for the operation.

You can use the activity-log policy to configure your logging preferences for the API event details that are stored in the Analytics component. By default, invocation details are logged if an API call is successful, and invocation, header, and payload (message body) details are logged if an API call results in an error code. To override these default settings and change the level of detail that is included in the API event record, you can add the activity-log policy to your API assembly and then configure the policy's properties. For example:

- To include details about the request body or response body in the API event record for a successful API call, you can add an activity-log policy to the associated API operation and set the content type to **payload**.  
Restriction: The payload logging feature is disabled for IBM® Cloud instances that are hosted in the Frankfurt region. The requirements for storing Sensitive Personal Information (SPI) are more restrictive in that region, so the payload information cannot be saved.
- To include details about the HTTP request headers or HTTP response headers in the API event record for a successful API call, you can add an activity-log policy to the associated API operation and set the content type to either **header** or **payload**.
- To include **client\_geoip** and **gateway\_geoip** fields in the data, ask your Kubernetes administrator to configure the Kubernetes ingresses/cluster to include the **X-Forwarded-For** header in the data that is collected by the DataPower gateway and passed to APIC Analytics.  
For information on the configuration task, see the following Kubernetes documentation:
  - [NGINX Configuration "use-forwarded-headers"](#)
  - [Troubleshooting NGINX Ingress](#)

For more information about how to configure your logging preferences, see [activity-log policy](#) and [Including elements in your assembly](#).

Tip: A log policy field is included in the event record to identify the logging setting. To see examples of the invocation, header, and payload details that can be included in an API event record, see:

- [Example: Event record with invocation details \(activity logging setting\)](#)
- [Example: Event record with invocation and header details \(header logging setting\)](#)
- [Example: Event record with invocation, header, and payload details \(payload logging setting\)](#)

The following table lists the static set of fields that are displayed in an API event record. When creating visualizations, you can use these fields to configure aggregations that define the type and level of information to be retrieved and displayed. For more information, see [Configuring visualizations](#). If you have configured your logging preferences to include header and payload details, your header and payload fields will additionally be available for selection while configuring aggregations, enabling you to create visualizations based on header and payload data if required.

Table 1. API event record fields

Field name	Type	Description
@timestamp	Date	A time stamp that records when the record was written by the <a href="#">Logstash</a> data collection engine that feeds data into Elasticsearch.
api_id	String	The API identifier.
api_name	String	The name of the API.
api_version	String	The version number of the API.
app_id	String	The identifier for the registered application.
app_name	String	The name of the registered application. Note: The data indicates <b>N/A</b> when a client ID is not used or is invalid on the API. The gateway needs a client id to determine which app was invoking the API. From this app, the gateway can determine what plan the app is subscribed to on the product that contains the API. Without a client ID, the gateway is unable to determine what plan, product, or app was invoked because a single API can belong to multiple products (each of which have multiple plans and apps subscribed to those plans with client IDs).
app_type	String	The application type, with a value of <b>Production</b> or <b>Development</b> .
bytes_received	Number	The number of bytes received on the inbound request.
bytes_sent	Number	The number of bytes sent on the outbound request.
client_geoip.area_code	Number	The public switched telephone network (PSTN) area code of the client, as identified from its IP address.

Field name	Type	Description
client_geoop.city_name	String	The city name of the client, as identified from its IP address.
client_geoop.continent_code	String	The two-letter continent code of the client, as identified from its IP address.
client_geoop.country_code2	String	The two-letter country code of the client, as identified from its IP address.
client_geoop.country_code3	String	The three-letter country code of the client, as identified from its IP address.
client_geoop.country_name	String	The country name of the client, as identified from its IP address.
client_geoop.dma_code	Number	The Designated Market Area (DMA) code of the client, as identified from its IP address.
client_geoop.ip	String	The IP address of the client.
client_geoop.latitude	Number	The latitude of the client location, as identified from its IP address.
client_geoop.location	String	The longitude and latitude of the client location (separated by a comma), as identified from its IP address.
client_geoop.longitude	Number	The longitude of the client location, as identified from its IP address.
client_geoop.postal_code	String	The postal code of the client, as identified from its IP address.
client_geoop.real_region_name	String	The full name of the region that corresponds to the IP address of the client.
client_geoop.region_name	String	The abbreviated form of the region that corresponds to the IP address of the client.
client_geoop.timezone	String	The time zone of the client, as identified from its IP address.
client_id	String	The unique ID of the client that is attached to the API request.
client_ip	String	The original client IP address, as obtained from the <b>X-Forwarded-For</b> header.
datetime	Date	A time stamp that records when the API was executed. The time stamp is always shown in coordinated universal time UTC.
developer_org_id	String	The identifier for the consumer organization that owns the application.
endpoint_url	String	When the request failed, identifies the proxy or invoke target URL on which the request failed. It is not included with a successful request.
developer_org_name	String	The name of the consumer organization that owns the application.
env_id	String	The Catalog identifier.
env_name	String	The name of the Catalog.
gateway_geoop.area_code	Number	The public switched telephone network (PSTN) area code of the gateway, as identified from its IP address.
gateway_geoop.city_name	String	The city name of the gateway, as identified from its IP address.
gateway_geoop.continent_code	String	The two-letter continent code of the gateway, as identified from its IP address.
gateway_geoop.country_code2	String	The two-letter country code of the gateway, as identified from its IP address.
gateway_geoop.country_code3	String	The three-letter country code of the gateway, as identified from its IP address.
gateway_geoop.country_name	String	The country name of the gateway, as identified from its IP address.
gateway_geoop.dma_code	Number	The Designated Market Area (DMA) code of the gateway, as identified from its IP address.
gateway_geoop.ip	String	The IP address of the gateway.
gateway_geoop.latitude	Number	The latitude of the gateway location, as identified from its IP address.
gateway_geoop.location	String	The longitude and latitude of the gateway location (separated by a comma), as identified from its IP address.
gateway_geoop.longitude	Number	The longitude of the gateway location, as identified from its IP address.
gateway_geoop.postal_code	String	The postal code of the gateway, as identified from its IP address.
gateway_geoop.real_region_name	String	The full name of the region that corresponds to the IP address of the gateway.
gateway_geoop.region_name	String	The abbreviated form of the region that corresponds to the IP address of the gateway.
gateway_geoop.timezone	String	The time zone of the gateway, as identified from its IP address.
gateway_ip	String	The IP address of the gateway.
graphql_request_field_cost	Number	GraphQL APIs only. The maximum cost of all fields accessed in the query. The cost of each field access is configured in the schema.

Field name	Type	Description
graphql_request_type_cost	Number	GraphQL APIs only. The maximum cost of all types retrieved in the query. The cost of each type is configured in the schema.
graphql_request_max_nesting	Number	GraphQL APIs only. The maximum nesting depth found in the query by the assembly validate action. The schema configuration is used to determine which types are nested, so this value might be less than the nesting depth found by the assembly parse action.
graphql_response_field_cost	Number	GraphQL APIs only. The cost of all fields accessed in the query. The cost of each field access is configured in the schema.
graphql_response_type_cost	Number	GraphQL APIs only. The cost of all types that were retrieved in the query. The cost of each type is configured in the schema.
graphql_response_max_nesting	Number	GraphQL APIs only. The nesting depth found in the query by the assembly validate action. The schema configuration is used to determine which types are considered nested, so this value might be less than the nesting depth found by the assembly parse action.
graphql_request_top_field_counts	Object	GraphQL APIs only. The maximum number of times that each field can be retrieved by the given query. This number is equal to the number of times that the resolver is required to run. This field is stored in JSON format and is not indexed, so it is not available for visualizations. A limited number of query requests and responses are stored for each entry, based on the amount of data that each contains. The maximum amount of data that can be stored is subject to change.
graphql_request_top_type_counts	Object	GraphQL APIs only. The maximum number of times that an object of each type can be retrieved by the given query. This field is stored in JSON format and is not indexed, so it is not available for visualizations. A limited number of query requests and responses are stored for each entry, based on the amount of data that each contains. The maximum amount of data that can be stored is subject to change.
graphql_response_top_field_counts	Object	GraphQL APIs only. The number of times that each field was retrieved by the given query. This number is equal to the number of times that the resolver is required to run. This field is stored in JSON format and is not indexed, so it is not available for visualizations. A limited number of query requests and responses are stored for each entry, based on the amount of data that each contains. The maximum amount of data that can be stored is subject to change.
