

IBM API Connect 10.0.5.x LTS

Tables of Contents

API Connect overview	1
What's new in the latest release (Version 10.0.5.6)	2
What's new in Version 10.0.5.5	3
What's new in Version 10.0.5.4	6
What's new in Version 10.0.5.3	7
What's new in Version 10.0.5.2	10
What's new in Version 10.0.5.1	12
What's new in Version 10.0.5.0	13
Language versions offered by API Connect	15
Known limitations	15
API Connect concepts	23
Who does what in API Connect?	23
API Connect user roles	24
Packaging strategy and terminology in API Connect	29
Understanding rate limits for APIs and Plans	32
API Connect components	33
Gateway types	35
API Connect support	36
API Connect glossary	36
Accessibility features for IBM API Connect	39
Legal information	39
Tracking API volume for auditing and compliance	39
Notices	39
Terms and conditions for information centers	41
IBM API Connect Considerations for GDPR Readiness	41
Essential reading	44
Tutorials	45
Installing and maintaining IBM API Connect	45
Kubernetes, OpenShift, and Cloud Pak for Integration	46
Planning your deployment	46
Key concepts: Custom Resources, Operators, and Operands	46
Planning your deployment topology	47
API Connect deployment profiles for OpenShift and Cloud Pak for Integration	48
Component profiles, CPU limits, memory limits, and licensing	49
Management component deployment profile limits	49
Portal component deployment profile limits	55
Analytics component deployment profile limits	57
DataPower gateway deployment profile limits	59
Network requirements for inter-subsystem communication	59
Enable JWT security instead of mTLS	60
In-cluster service communication between subsystems	62
Kubernetes ingress controller prerequisites	62
Persistent Volume (PV) requirements	63
Load balancer configuration in a Kubernetes deployment	64
Firewall requirements on Kubernetes	66
Planning your analytics deployment	69
Planning the analytics profile, storage class, and storage type	69
Planning your topology	70
Analytics pods and PVCs	70
Planning to offload data to a third-party system	70
Planning to disable internal storage	71
Planning to modify your incoming analytics data	71
Estimating internal storage space	71
Two data center deployment strategy on Kubernetes and OpenShift	73
Key Concepts: Cert-manager, Issuers, and Secrets	75
Certificates in a Kubernetes environment	76
Custom certificates on Kubernetes	80
Custom certificates reference	80
Generating custom certificates	82
Generating custom certificates using cert-manager in a two data center deployment	85
Configuring custom certificates before installation	86
Converting to custom front-end/ingress certificates after deployment	88
Webhooks deployed and managed by the API Connect Operator	88
Installing API Connect	90
Deployment requirements	90
IBM API Connect Version 10 software product compatibility requirements	93
API Connect licenses	94
Deployment procedures	95
Deploying on Kubernetes	95
Obtaining product files	95

Signature verification by using PGP	97
Deploying operators and cert-manager	98
Deploying operators in a single-namespace API Connect cluster	98
Deploying operators in a multi-namespace API Connect cluster	101
Installing cert-manager and certificates in a two data center deployment	103
Installing the API Connect subsystems	104
Installing the Management subsystem cluster	105
Installing the DataPower Gateway subsystem	107
Installing the Developer Portal subsystem	111
Defining multiple portal endpoints for a Kubernetes environment	114
Installing the Analytics subsystem	114
Creating the analytics CR	115
Topology settings and additional analytics features	117
Analytics persistent queue	117
Offloading data to a third-party system	117
Sample output plugins for offloading data	118
Providing a custom certificate for Analytics offload	120
Disabling internal storage	121
Modifying incoming analytics data	121
Sample filters for modifying analytics data	122
Reference: Fields in the Analytics CR	124
Installing analytics	126
Installing a two data center deployment on Kubernetes	126
Converting a single data center to a two data center deployment on Kubernetes	130
Deploying on OpenShift and Cloud Pak for Integration	134
Preparing for installation	134
Operator, operand, and CASE versions	135
API Connect configuration settings	135
Basic configuration settings	136
Management subsystem settings	137
Gateway subsystem settings	139
Developer Portal subsystem settings	141
Analytics subsystem settings	142
Analytics subsystem CR configured settings	143
Dedicated storage instead of shared storage	143
Analytics persistent queue	144
Offloading data to a third-party system	144
Sample output plugins for offloading data	145
Providing a custom certificate for Analytics offload	146
Disabling internal storage	148
Modifying incoming analytics data	148
Sample filters for modifying analytics	149
Reference: Fields in the Analytics CR	151
Additional Kubernetes settings	152
Configuring timeouts for management endpoints	153
Installation procedures with IBM Cloud Pak for Integration	154
Installing with the top-level CR on OpenShift	154
Connected installation	155
Installing operators	155
Installing API Connect	157
Air-gapped installation	158
Installing with a bastion host	159
Installing with a portable computer or storage device	164
Enable additional features post-install	171
Enable management CA verification on REST API calls	171
Enable JWT security and disable mTLS between subsystems	172
Installing with subsystem CRs in a shared namespace on OpenShift	172
Installing operators	173
Setting up a certificate issuer	175
Installing the Management subsystem in a shared namespace	178
Installing the Gateway subsystem in a shared namespace	180
Installing the Portal subsystem in a shared namespace	183
Installing the Analytics subsystem in a shared namespace	186
Installing with subsystem CRs in different namespaces or environments on OpenShift	189
Installing operators	189
Installing the Management subsystem	191
Extracting the Management ingress-ca certificates	195
Installing the Gateway subsystem	195
Installing the Portal subsystem	200
Installing the Analytics subsystem	204
Installing a two data center deployment with Cloud Pak for Integration	207
Planning and initial preparation	207

Preparing your active data center	208
Preparing your warm-standby data center	211
Installing API Connect on the active data center	213
Installing API Connect on the warm-standby data center	215
Installing a two data center deployment on OpenShift	217
Planning and initial preparation	218
Preparing your active data center	218
Preparing your warm-standby data center	220
Installing API Connect on the active data center	225
Installing API Connect on the warm-standby data center	226
Troubleshooting installation on OpenShift	228
Upgrading API Connect	230
Upgrading on Kubernetes	230
Upgrade considerations on native Kubernetes	230
Additional considerations for upgrading analytics from a version prior to 10.0.5.0	232
Exporting analytics data from the UI	233
Exporting aggregated analytics data from a visualization	233
Exporting analytics data by using the REST API	235
Offloading analytics data	236
Remove template overrides from your analytics CR	236
Upgrading subsystems on native Kubernetes	237
Upgrading Management subsystem on native Kubernetes	241
Upgrading Portal subsystem on native Kubernetes	243
Upgrading Analytics subsystem on native Kubernetes	243
Upgrading Gateway subsystem on native Kubernetes	244
Enabling gateway peering and verifying cluster status	246
Enabling Analytics after upgrading	246
Optional post-upgrade steps for upgrade to 10.0.5.3 (or later) from earlier 10.0.5 release	247
Upgrading from 2018 to 10.0.5.4 on Kubernetes	249
Preparing the 2018 deployment for upgrade	250
Obtaining files for upgrade from 2018	250
Deploying operators in a single-namespace API Connect cluster	252
Deploying operators in a multi-namespace API Connect cluster	254
Upgrading the Management subsystem from 2018 to v10	256
Rolling back a management upgrade to v2018	259
Cleaning up a failed management upgrade	260
Stopping the v2018 to v10 management upgrade	261
Troubleshooting the management subsystem upgrade from v2018 to v10	262
Upgrading the Developer Portal subsystem from 2018 to v10	263
Rolling back Developer Portal to v2018	265
Troubleshooting Portal subsystem upgrade from v2018 to v10	266
Upgrading the Analytics subsystem from v2018 to v10	267
Upgrading the gateway subsystem from 2018 to v10	267
Rollback of gateway subsystem to v2018	269
Post-upgrade steps for upgrading to v10	270
Disaster recovery of a 2018 deployment	271
Troubleshooting upgrades on Kubernetes	272
Migrating API test data	274
Backing up API test data	274
Restoring API test data	275
Uninstalling Percona Server for MongoDB	276
Upgrading on OpenShift and Cloud Pak for Integration	277
Upgrading API Connect in Cloud Pak for Integration	277
Upgrade considerations on OpenShift	278
Additional considerations for upgrading to analytics from a version prior to 10.0.5.0	280
Exporting analytics data from the UI	280
Exporting aggregated analytics data from a visualization	281
Exporting analytics data by using the REST API	283
Offloading analytics data	283
Remove template overrides from your analytics CR	284
Preparing to upgrade on OpenShift	284
Upgrading on OpenShift in an online environment	285
Air-gapped upgrade	290
Upgrading with a bastion host	290
Upgrading with a portable computer or storage device	297
Upgrading from 2018 to 10.0.5.4 on OpenShift	305
OpenShift: Preparing the 2018 deployment for upgrade	305
OpenShift: Upgrading from 2018 to v10	307
OpenShift: Post-upgrade steps	310
OpenShift: Recovering the V2018 deployment	312
Optional post-upgrade steps for upgrade to 10.0.5.3 from earlier 10.0.5 release	313
Enabling Analytics after upgrading	315

Troubleshooting upgrade on OpenShift	316
Upgrading a two data center deployment on Kubernetes and OpenShift	320
Upgrading a two data center deployment on Cloud Pak for Integration	322
Maintaining API Connect	324
Advanced configuration	324
Installing License Service	324
Installing the Automated API behavior testing application	325
Installing the toolkit	326
Changing deployment profiles on Kubernetes	328
Changing deployment profiles on OpenShift	329
Replica override for microservices	330
Changing the deployment profile on Cloud Pak for Integration	331
Enabling Developer Portal feature flags on Kubernetes	331
Enabling Developer Portal feature flags on OpenShift and Cloud Pak for Integration	333
Enabling UI feature flags on Kubernetes	334
Enabling UI feature flags on OpenShift and Cloud Pak for Integration	335
Advanced configuration for the management subsystem	336
Configuring maximum size of client requests to the Management subsystem	336
Setting rate limits for public APIs on the management service for a Kubernetes environment	337
Configuring monetization on Kubernetes	338
Overriding resources for Postgres components on Kubernetes	339
Overriding resources for Postgres components on OpenShift	340
Advanced configuration for the analytics subsystem	342
Changing storage type between shared and dedicated	342
Horizontal scaling of analytics data storage pod replicas	342
Advanced configuration for the gateway subsystem	345
Customizing a DataPower deployment	346
Overriding the default DataPower image, version, and license	346
Enabling autoscaling of gateway pods	347
Dynamically re-registering and reconfiguring a Gateway service in a Kubernetes deployment	347
Backing up and restoring	348
Backups on Kubernetes	349
Backing up and restoring the management subsystem	349
Configuring backup settings for fresh install of the Management subsystem	349
Configuring S3 backup settings for fresh install of the Management subsystem	349
Configuring SFTP backup settings for fresh install of the Management subsystem	352
Configuring local backup settings for fresh install of the Management subsystem	353
Reconfiguring or adding backup settings after installation of the management subsystem	353
Generating a manual backup of the management subsystem	354
Restoring the management subsystem (v10.0.1.1 or later)	356
Troubleshooting management subsystem backups	357
Troubleshooting resiliency issues	357
Troubleshooting stanza-create job for S3 backup configuration	357
Restore failure with bootstrap pod error	358
Backing up and restoring the Developer Portal in a Kubernetes environment	359
Overview of the Developer Portal backup resources	365
Backing up and restoring the analytics database	366
Configuring backup settings for Analytics	366
Running a backup of the Analytics database	368
Restoring the Analytics database	369
Troubleshooting Analytics backup and restore	370
Backups on OpenShift	371
Backing up and restoring the management subsystem on OpenShift and Cloud Pak for Integration	371
Configuring backup settings for a fresh install of the Management subsystem on OpenShift or Cloud Pak for Integration	372
Configuring S3 backup settings for a fresh install of the Management subsystem on OpenShift or Cloud Pak for Integration	372
Configuring SFTP backup settings for fresh install of the Management subsystem on OpenShift and Cloud Pak for Integration	375
Configuring local backup settings for a fresh install of the Management subsystem on OpenShift or Cloud Pak for Integration	376
Reconfiguring or adding backup settings after installation of the management subsystem on OpenShift and Cloud Pak for Integration	377
Generating a manual backup of the management subsystem on OpenShift and Cloud Pak for Integration	378
Restoring the management subsystem on OpenShift and Cloud Pak for Integration	379
Troubleshooting management subsystem backups on OpenShift and Cloud Pak for Integration	381
Troubleshooting resiliency issues on OpenShift and Cloud Pak for Integration	381
Troubleshooting the stanza-create job for S3 backup configuration on OpenShift and Cloud Pak for Integration	381
Backing up and restoring Developer Portal on OpenShift and Cloud Pak for Integration	382
Configuring backups for Developer Portal on OpenShift and Cloud Pak for Integration	383
Overview of the Developer Portal backup resources	365
Backing up Developer Portal on OpenShift and Cloud Pak for Integration	385
Restoring Developer Portal on OpenShift and Cloud Pak for Integration	387
Troubleshooting Developer Portal backup and restore on OpenShift and Cloud Pak for Integration	390
Backing up and restoring the Analytics database on OpenShift and Cloud Pak for Integration	391
Configuring backup settings for Analytics on OpenShift and Cloud Pak for Integration	392
Running a backup of the Analytics database on OpenShift and Cloud Pak for Integration	393

Restoring the Analytics database on OpenShift and Cloud Pak for Integration	394
Disaster recovery	396
Disaster recovery on Kubernetes	396
Preparing for a disaster	396
Preparing the management subsystem for disaster recovery	397
Preparing the Developer Portal for disaster recovery	398
Preparing the Analytics subsystem for disaster recovery	400
Recovering from a disaster	400
Recovering the management subsystem on Kubernetes	400
Recovering the management subsystem from S3 backups	400
Recovering the management subsystem from SFTP backups	403
Recovering the Developer Portal after a disaster	405
Recovering the Analytics subsystem after a disaster	406
Disaster recovery on OpenShift and Cloud Pak for Integration	406
Preparing for disaster recovery on OpenShift	407
Preparing the Management subsystem for disaster recovery on OpenShift	407
Preparing the Portal subsystem for disaster recovery on OpenShift	408
Preparing the Analytics subsystem for disaster recovery on OpenShift	410
Recovering from a disaster on OpenShift	410
Configuring the OIDC credentials on OpenShift	414
Preparing for disaster recovery on Cloud Pak for Integration	415
Preparing the Management subsystem for disaster recovery on Cloud Pak for Integration	415
Preparing the Portal subsystem for disaster recovery on Cloud Pak for Integration	416
Preparing the Analytics subsystem for disaster recovery on Cloud Pak for Integration	418
Recovering from a disaster on Cloud Pak for Integration	418
Configuring the OIDC credentials on Cloud Pak for Integration	423
Disabling and re-enabling the Analytics subsystem on Kubernetes	423
Disabling and re-enabling the Analytics subsystem on OpenShift and Cloud Pak for Integration	425
Maintaining a two data center deployment	426
Key concepts of 2DCDR and failure scenarios	427
How to failover API Connect from the active to the warm-standby data center	428
Recovering from a failover of a two data center deployment	430
Backup and restore requirements for a two data center deployment	431
Removing a two data center deployment	431
Verifying replication between data centers	432
Troubleshooting a two data center deployment	433
Monitoring and health checks	435
Monitoring on Kubernetes	435
Monitoring subsystems on Kubernetes	436
Monitoring Postgres disk usage	436
Monitoring platform health using Kubernetes events	438
Monitoring on OpenShift	439
Monitoring the API Connect cluster on OpenShift	439
Monitoring Postgres disk usage on OpenShift	440
Monitoring platform health on Red Hat OpenShift using Kubernetes events	442
Monitoring on Cloud Pak for Integration	443
Monitoring the API Connect cluster on Cloud Pak for Integration	443
Monitoring Postgres disk usage on Cloud Pak for Integration	444
Obtaining simple health check data of Developer Portal sites by using a REST API call	447
Logging	447
Gathering post-mortem logs	448
Changing logging levels	448
Troubleshooting	449
Troubleshooting on Kubernetes	449
Troubleshooting the management subsystem	449
Troubleshooting the management database	450
Increasing the PostgreSQL archive_timeout on Kubernetes	450
Recovering when disks are filled by the management database	451
Resizing a PersistentVolumeClaim for Postgres by volume expansion	451
Resizing a PersistentVolumeClaim for Postgres by moving content to a new PVC	452
Troubleshooting Analytics on Kubernetes	454
Analytics offload issues on Kubernetes	454
Empty Analytics display on Kubernetes	455
Analytics running out of disk space on Kubernetes	455
Troubleshooting on OpenShift and Cloud Pak for Integration	456
Power-cycling check on OpenShift and Cloud Pak for Integration	456
Troubleshooting the Management subsystem on OpenShift and Cloud Pak for Integration	457
Troubleshooting the management database on OpenShift and Cloud Pak for Integration	457
Increasing the PostgreSQL archive_timeout on OpenShift and Cloud Pak for Integration	458
Recovering on OpenShift and Cloud Pak for Integration when disks are filled by the management database	458
Resizing a PVC for Postgres on OpenShift by using volume expansion	459
Resizing a PVC for Postgres on OpenShift by moving content	460

Troubleshooting Analytics on OpenShift and Cloud Pak for Integration	461
Analytics offload issues on OpenShift and Cloud Pak for Integration	462
Empty Analytics display on OpenShift and Cloud Pak for Integration	462
Analytics running out of disk space on OpenShift and Cloud Pak for Integration	463
Uninstalling API Connect	463
Uninstalling API Connect subsystems	464
Removing Management subsystem postgres resources on Kubernetes	466
Removing API Connect	467
Removing postgres resources on Kubernetes after removing API Connect	469
Removing API Connect on OpenShift or Cloud Pak for Integration	470
Removing postgres resources on OpenShift and Cloud Pak for Integration	471
VMware	472
Planning your deployment	473
Deployment overview for endpoints	473
Planning your deployment topology and profiles	474
Enable JWT instead of mTLS	475
Firewall requirements on VMware	475
Firewall enabled ports for clustered OVA deployments	478
Load balancer ports for clustered OVA deployments	479
Load balancer configuration in a VMware deployment	479
A two data center deployment strategy on VMware	482
Planning your Analytics deployment	483
Planning the Analytics deployment profile	484
Planning to offload data to a third-party system	484
Planning to disable internal storage	484
Planning to modify your analytics data	484
Estimating internal storage space	485
API Connect TLS certificate best practices	487
Customizing your user-facing certificates	487
Installing API Connect	488
IBM API Connect Version 10 software product compatibility requirements	489
Requirements for initial deployment on VMware	489
API Connect licenses	491
What's new for v10 installation	492
First steps for deploying in a VMware environment	492
Signature verification by using PGP	97
Deploying the Management virtual appliance	494
Configuring the Management subsystem	495
Deploying the Management subsystem OVA file	499
Verify installation of the Management subsystem	500
Deploying the Analytics virtual appliance	502
Creating the analytics-extra-values file	502
Reference: Fields in analytics-extra-values	502
Enabling additional analytics features	503
Analytics persistent queue	503
Offloading data to a third-party system	504
Sample output plugins for offloading data	505
Providing a custom certificate for Analytics offload	507
Disabling internal storage	508
Modifying your analytics data	509
Sample filters for modifying analytics data	509
Deploying the Analytics subsystem	510
Configuring the Analytics subsystem	511
Deploying the Analytics subsystem OVA file	514
Verifying deployment of the Analytics subsystem	515
Deploying the Developer Portal virtual appliance	516
Configuring the Developer Portal subsystem	517
Deploying the Developer Portal subsystem OVA file	521
Verifying deployment of the Developer Portal subsystem	522
Configuring two NICs on the Developer Portal	524
Specifying a range of allowable client IP addresses for Developer Portal	524
Defining multiple portal endpoints for a VMware environment	525
Deploying DataPower Gateway virtual appliance	527
Installing DataPower Gateway	527
Configuring DataPower Gateway for API Connect	528
Configuring DataPower API Gateway	528
Configuring DataPower Gateway (v5 compatible)	532
Sample configuration for multiple peering objects on gateway services external to Kubernetes	534
Post-deployment steps	538
Installing a two data center deployment on VMware	539
Upgrading API Connect	545
Upgrade considerations on VMware	545

Additional considerations for upgrading analytics from a version prior to v10.0.5.0	547
Exporting analytics data from the UI	547
Exporting analytics with the REST API	548
Offloading analytics data	549
Update the analytics extra-values file	549
Preparing to upgrade on VMware	549
Upgrading a two data center deployment	551
Management subsystem two data center upgrade to v10.0.5.5 and later	551
Management subsystem two data center upgrade to v10.0.5.4 and previous	553
Upgrading to the latest release on VMware	555
Control Plane files for earlier releases	561
Checksum values for earlier releases	566
Upgrading DataPower Gateway Service	566
Upgrading from 2018 to 10.0.5.4 on VMware	567
Upgrade from v2018: overview and considerations	567
Preparing the 2018 deployment for upgrade	569
Upgrading v2018 subsystems to v10	571
Upgrading Management subsystem from 2018 to v10	572
Upgrading Developer Portal from 2018 to v10	574
Upgrading Analytics from 2018 to v10	575
Enabling Analytics after upgrading	576
Troubleshooting upgrades on VMware	577
Maintaining API Connect	584
Advanced installation on VMware	585
Installing the IBM License Metric Tool on VMware	585
Installing the toolkit	326
Installing the Automated API behavior testing application	588
Advanced configuration on VMware	588
Adding a static route on a virtual machine	588
Adding disk space to a VMware appliance	589
Appliance boot mode configuration	590
Running commands at boot with iso-ignored boot mode	591
Changing deployment profiles on VMware	592
Changing the DNS server configuration on appliances	593
Configuring API Connect subsystems in a cluster	594
Configuring SSHD to limit access to your deployment	597
Enabling Developer Portal feature flags on VMware	598
Managing an appliance data disk	600
Replica override for microservices on VMware	600
Testing a new configuration against a current cluster	601
TLS certificate concepts and operations	601
Certificate reference VMware	602
Customizing user-facing certificates	607
Certificate expiry and renewal	607
Extracting and copying certificates	609
Apicup certs command reference	609
Certificate validation reference	610
Use JWT security instead of mTLS between subsystems	611
Credentials and encryption secrets reference	611
Advanced configuration for management subsystem	612
Setting rate limits for public APIs on the management service	612
Configuring maximum size of client requests to the Management subsystem on VMware	614
Configuring monetization on VMware	615
Configuring use of an external NTP server	616
Overriding resources for Postgres components on VMware	617
Enabling UI feature flags on VMware	618
Backing up and restoring on VMware	619
Backing up and restoring the Management subsystem	619
Configuring backup settings during initial installation of the management subsystem	619
Verify configuration for s3 backup	622
Reconfiguring backup settings for the management subsystem	623
Backing up the management subsystem	626
Restoring the management subsystem	626
Troubleshooting management subsystem backups on VMware	628
Troubleshooting resiliency issues	628
Troubleshooting stanza-create job for S3 backup configuration	628
Backing up and restoring the Developer Portal	629
Configuring backup settings for the Developer Portal subsystem	630
Overview of the Developer Portal backup resources	365
Backing up the Developer Portal subsystem	633
Restoring the Developer Portal subsystem	634
Backing up and restoring the Analytics database on VMware	635

Configuring backup settings for Analytics	636
Running a backup of the Analytics database	637
Restoring the Analytics database	638
Disaster recovery	639
Preparing for a disaster	639
Preparing the management subsystem for disaster recovery on VMware	640
Preparing the Developer Portal subsystem for disaster recovery on VMware	640
Preparing the Analytics subsystem for disaster recovery on VMware	641
Recovering from a disaster	641
Recovering the Management subsystem on VMware	641
Recovering the Developer Portal subsystem on VMware	643
Recovering the Analytics subsystem on VMware	644
Using VM snapshots for infrastructure backup and disaster recovery	644
Disabling and re-enabling the Analytics subsystem on VMware	646
Maintaining a two data center deployment	647
Backup and restore considerations for a two data center deployment	647
Failure handling of a two data center deployment	648
Recovering from a failover of a two data center deployment	652
Removing a two data center deployment	653
Monitoring and health checks	654
Checking cluster health on VMware	654
Monitoring Postgres disk usage on VMware	655
Obtaining simple health check data of Developer Portal sites by using a REST API call	657
Monitoring the network with SNMP	657
Logging	658
Configuring remote logging for a VMware deployment	659
Gathering logs for a VMware environment	662
Changing logging levels	663
Troubleshooting	664
Recreating a calico pod that is in the CrashLoopBackOff state	664
Running a filesystem check on a VMware root partition	664
Troubleshooting the management database	665
Increasing the PostgreSQL archive_timeout on VMware	665
Dynamically re-registering and reconfiguring a Gateway service in a VMware deployment	666
Troubleshooting Analytics on VMware	667
Analytics offload issues on VMware	667
Empty Analytics display on VMware	667
Analytics running out of disk space on VMware	668
Migrating from API Connect v5 Public Cloud	669
Migration considerations	670
Preparing to migrate from v5 Public Cloud	672
Migrating data and Portal Delegated User Registries	675
Mapping v5 resource names to v10	678
Mapping v5 PDUR registries to v10	679
Migrating OAuth providers and OAuth secured APIs	681
Migrating v5 APIs to v10 API Gateway format	682
Configuration parameters for migrating v5 APIs	682
Reviewing and correcting migrated v5 APIs	686
Messages generated during conversion of APIs to DataPower API Gateway	686
Parse actions added to the API assembly after migration	687
Fine-tuning APIs after migration	687
Frequently asked questions about migrating APIs to API Gateway	688
Logging in to a management server with an OIDC registry	689
Migration troubleshooting	690
Migrating a Version 5 deployment	696
Migration overview	696
Migration steps	697
Migration steps with PDUR	698
Migration steps without PDUR	708
Logging in to a management server with an OIDC registry	689
Converting APIs to DataPower API Gateway	716
Configuring migration options for DataPower API Gateway	717
Reviewing APIs converted to DataPower API Gateway	721
Messages generated during conversion of APIs to DataPower API Gateway	722
Parse actions added to the API assembly after migration	758
Fine-tuning APIs after migration	758
Frequently asked questions about migrating to API Gateway	688
Migration mapping files	760
Migrating OAuth providers and OAuth secured APIs	681
Migrating token revocation information to DataPower API Gateway	764
Token migration errors	766
Migrating custom policies	766
Migrating gateway extensions	767

Migration considerations	670
Migration troubleshooting	690
Migrating v5-compatible APIs to API Gateway	777
Preparing the environment	777
Planning your migration	778
Downloading and extracting the data to migrate	778
Converting v5-compatible API definitions	778
Pushing custom policies and gateway extensions to the DataPower API Gateway	784
Pushing provider organization data	786
Migrating from v10 to v10 on a different form factor	789
v10 migration overview	789
v10 migration requirements	792
v10 migration steps	794
Preparing the source system	794
Installing the target system	795
Restoring the target system	798
Verifying the target system	803
Migrating from OpenShift to Cloud Pak for Integration on the same cluster	804
v10 migration troubleshooting	805
Shutting down the Postgres database	806
Migrating from v2018 to v10 on a different form factor	808
Migration overview	808
Migration preparation	809
v2018 migration steps	812
Extracting the v2018 source data on Kubernetes and OpenShift	812
Extracting the v2018 source data on VMware	813
Installing the v10 target on Kubernetes	815
Installing the v10 target system on OpenShift and Cloud Pak for Integration	816
Installing the v10 target system on VMware	818
Restoring the v2018 data to the v10 target deployment	819
Verifying the v10 target deployment	823
Migrating additional v2018 subsystems: Staged migration	824
Troubleshooting the form-factor migration from v2018	824
Replacing passwords, keys, and certificates	825
Disabling backups before updating secrets and certificates	826
Management subsystem: updating the password, keys, and secrets	826
Changing the cloud administrator password	826
Changing the database encryption key	827
Changing the registration client_id and client_secret for applications	827
Gateway subsystem: updating the password and secret	830
Changing the Gateway administrator password	830
Changing the Gateway client_secret	831
Changing the secret for Gateway peering	831
Updating the TLS profile for Gateway	832
Portal subsystem: updating keys and secrets	832
Changing the secret for Portal data and system tools	832
Changing the Portal client_secret	833
Rotating the portal intra-subsystem certificates on VMware	834
Analytics subsystem: replacing the TLS profile and keys	834
Updating the TLS profile for Analytics	835
Updating the Analytics backup/restore secret	835
Renewing TLS certificates	835
Renewing certificates with cert-manager	836
Renewing the management CA with the ManagementSecretRotation CR	837
Renewing the portal CA with the PortalSecretRotation CR	838
Renewing the ingress-ca	838
Copying renewed ingress-ca to subsystems in different namespaces	839
Renewing the analytics CA	840
Renewing end-entity certificates	840
Monitoring cert-manager certificate renewal	841
Renewing custom certificates	841
List of Issuers, CA certificates, and secrets	842
List of ingress certificates	842
List of intra-subsystem certificates	844
V2018 upgrade: List of certificates to update manually	845
Renewing certificates in a two data center deployment on Kubernetes and OpenShift	846
Management subsystem: restarting pods	847
Gateway subsystem: restarting pods	848
Analytics subsystem: restarting endpoints and pods	849
Restarting the Analytics ingestion endpoint	849
Restarting Analytics pods and data collection	849
Re-enabling scheduled backups	850
[Technical Preview] Using Config Sync to replicate consumer-side catalog data	850
Downloading the API Connect Config Sync utility	852
Setting environment variables for Config Sync	852

Running Config Sync as a standalone binary	854
Running Config Sync as a cronjob on OpenShift	855
Running Config Sync as a cronjob on Kubernetes	856
Running Config Sync as a cronjob on VMware	857
The API Connect operations tool: apicops	858
Configuring and managing your server environment	858
Cloud Manager configuration checklist	859
Activating your Cloud Manager user account	859
Accessing the Cloud Manager user interface	860
Defining your Cloud Manager topology	861
Creating an availability zone	862
Registering a gateway service	863
Registering an analytics service	865
Registering a portal service	867
Associating an analytics service with a gateway service	868
Setting visibility for a service	869
Managing authentication and security	870
User registries overview	870
Configuring an Authentication URL user registry	871
Configuring a shared custom user registry	873
Configuring an LDAP user registry in the Cloud Manager	878
Using the CLI to configure a shared LDAP user registry	880
Configuring a Local User Registry	887
Configuring an OIDC user registry in Cloud Manager	888
Setting visibility for a user registry	894
Deleting a user registry	894
Removing a user from a user registry	894
Removing yourself from a user registry	895
Removing another user from a user registry	895
TLS profiles overview	896
Viewing TLS Profiles, Keystores, and Truststores	897
Creating a TLS Server Profile	898
Creating a TLS Client Profile	899
Setting visibility for a TLS Client Profile	900
Defining elliptic curve cryptographic schemes for a TLS client profile	900
Creating a Keystore	901
Creating a Truststore	902
Viewing certificate details and adding certificates to a keystore or truststore	903
Generating a self-signed certificate using OpenSSL	903
Generating a PKCS#12 file for Certificate Authority	904
Binding a TLS server profile to a gateway service	905
Updating the PKCS#12 certificate for a TLS server profile	905
OAuth Provider overview	906
Configuring a native OAuth provider	906
Configuring basic settings for a native OAuth provider	908
Configuring scopes for a native OAuth provider	909
Configuring user security for a native OAuth provider	910
Configuring tokens for a native OAuth provider	911
Configuring token management and revocation for a native OAuth provider	912
Configuring introspection for a native OAuth provider	913
Configuring metadata for a native OAuth provider	914
Configuring the OIDC parameters for a native OAuth provider	914
Editing a native OAuth provider by using the API Editor	915
Configuring a third-party OAuth provider	916
Setting the visibility for OAuth providers	917
OAuth concepts for API Connect	917
OAuth user scenario	918
OAuth introspection for third-party OAuth providers	918
OAuth metadata URL and authentication URL	920
Scope	923
Tokens	927
Refresh tokens	927
OAuth revocation URL	927
Authenticating and authorizing through a redirect URL	929
Token management with the DataPower Gateway (v5 compatible)	931
Token management with the DataPower API Gateway	933
Authentication URL	935
Custom forms for user security	936
Creating a custom HTML login form for user security	936
Creating a custom HTML authorization form for user security	937
Securing an API with a JSON Web Token	938
Troubleshooting OAuth	939
Configuring the cloud settings	939

Change the name of your cloud	940
Configuring an email server for notifications	940
Setting up notifications	941
Customizing email notification templates	942
Configuring invitation timeouts	944
Configuring API key settings	944
Using the CLI to modify cloud settings	944
Configuring Base64 encoding for temporary tokens	946
Configuring the password-reset notification and timeout	946
Selecting user registries for Cloud Manager and API Manager	947
Setting a default user registry for Cloud Manager and API Manager	947
Configuring timeouts for access tokens and refresh tokens	948
Viewing platform and UI endpoints	949
Configuring the default gateway services for Catalogs	949
Managing the public/private key pairs for signing tokens	950
Configuring public/private key pairs for tokens	951
Administering provider organizations	952
Creating a provider organization	952
Editing a provider organization	954
Deleting a provider organization	954
Viewing current provider organizations	955
Sending messages to provider organization owners	955
Administering members and roles	956
Creating roles in the admin organization	957
Editing roles in the admin organization	957
Configuring LDAP group mappings on Cloud Manager user roles	958
Deleting roles in the admin organization	960
Viewing members and roles	960
Adding members to the admin organization	961
Assigning roles to members	961
Deleting a member	962
Role Defaults overview	962
Managing role defaults for provider organizations	963
Managing role defaults for consumer organizations	963
Monitoring the cloud	964
Accessing and configuring analytics	964
Counting total API calls for your Analytics service	965
Viewing API event data in API Connect	965
Cloud Manager analytics view	966
Including geoIP fields in analytics data	968
Configuring data retention and index rollover time periods	968
Configuring the Logstash persistent queue	969
Offloading analytics to third-party systems	969
Troubleshooting your analytics offload	969
Applying filters to incoming analytics data	970
Configuring audit logging to monitor user operations	970
Configuring the audit settings	972
Reviewing a gateway's processing status	975
Changing your Cloud Manager password and profile information	978
Resolving login problems by increasing HTTP header size	979
Onboarding a new admin for Cloud Pak for Integration	979
Extending the Gateway server behavior	980
Gateway extension guidelines - DataPower Gateway (v5 compatible)	981
Gateway extension guidelines - DataPower API Gateway	982
Gateway extensions manifest	984

Managing platform REST API keys	1051
Searching for items in API Manager	1051
Working with API definitions	1052
Creating an API definition	1053
Creating a REST proxy API from a target service	1054
Creating a REST proxy API from an existing OpenAPI service	1055
Creating a REST proxy API from an existing WSDL service	1056
Creating a SOAP proxy API from an existing WSDL service	1058
Creating a new REST OpenAPI definition	1059
Adding a REST API by importing an OpenAPI definition file	1060
Adding a SOAP API by importing a zip file	1061
Creating a GraphQL proxy API	1063
Using the GraphQL schema editor	1064
Supporting introspection for a GraphQL API	1067
Enabling the GraphQL editor for a GraphQL API	1068
Enabling the cost endpoint for a GraphQL API	1068
Securing a GraphQL API by using a client ID	1069
Request mechanisms supported by GraphQL endpoints	1071
GraphQL custom schema directives and scalar types	1071
@remove directive	1071
GraphQL limitations	1072
Importing an API from the CP4I asset repository	1072
Editing an OpenAPI 2.0 API definition	1073
Specifying API metadata	1074
Specifying the host for an API	1074
Specifying the basepath for an API	1075
Specifying the schemes for an API	1075
Specifying the MIME types that an API consumes	1075
Specifying the MIME types that an API produces	1076
Enforcing security requirements on an API	1076
Defining security schemes	1077
Defining basic authentication security schemes	1077
Defining API key security schemes	1078
Client ID behavior in API key security definitions	1079
Defining OAuth2 security schemes	1080
Enabling CORS support for an API	1081
Specifying external documentation for an API	1082
Adding tags to an API	1082
Defining Paths for an API	1083
Defining parameters for a path	1084
Defining operations for a path	1084
Adding tags to an operation	1085
Specifying external documentation for an operation	1085
Specifying the MIME types that an API operation produces	1085
Specifying the MIME types that an API operation consumes	1086
Defining parameters for an operation	1086
Defining responses for an operation	1086
Specifying schemes for an operation	1087
Enforcing security requirements on an operation	1087
Defining schemas for an API	1088
Creating a schema	1088
Editing a schema	1089
Defining parameters for an API	1090

Creating a parameter	1091
Editing a parameter	1091
Defining responses for an API	1092
Creating a response	1092
Editing a response	1093
Specifying gateway and portal settings	1093
Defining target services for an API	1094
Setting API properties	1094
Defining Catalog specific property values	1095
Configuring application authentication for an API	1095
Configuring activity logging	1096
Configuring v5 compatibility options	1097
Including elements in your API assembly	1097
The assembly editor	1098
Adding elements to your assembly	1099
Handling errors in the assembly	1100
Specifying the gateway type for an API definition	1100
Converting an API definition for deployment to the DataPower API Gateway	1101
Modifying a GraphQL schema	1101
Validating the OpenAPI YAML source	1102
Editing an OpenAPI 3.0 API definition	1102
OpenAPI 3.0 support in IBM API Connect	1103
Specifying API metadata	1104
Defining servers for an API	1104
Enforcing security requirements on an API	1105

Testing an API with the Explorer tab	1223

Staging an API	1224
Publishing an API	1226
Creating a new version of an API definition	1227
Updating an API definition from a file	1228
Updating a SOAP API	1228
Renaming an API definition	1229
Changing an API rate limit	1229
Adding an OpenAPI extension to an API	1229
Downloading an API definition	1230
Deleting an API definition	1230
Using an options file when importing a WSDL service	1231
Variable references in API Connect	1231
API properties	1234
API policies and logic constructs	1239
Built-in policies	1239
Activity Log	1242
Client Security	1243
Extract	1244
Constructing JSONata expressions to extract and transform data	1245
GatewayScript	1247
GatewayScript code examples	1248
Generate JWT	1250
Validate JWT	1252
GraphQL introspect	1253
Invoke	1254
Configuring the Invoke policy for DataPower API Gateway	1254
Configuring the Invoke policy for DataPower Gateway (v5 compatible)	1257
JSON to XML	1259
Configuring the JSON to XML policy for DataPower API Gateway	1260
Configuring the JSON to XML policy for DataPower Gateway (v5 compatible)	1261
Log	1262
Map	1263
The Map policy structure	1264
Configuring the Map policy in the user interface	1267
Map policy examples	1270
OAuth	1274
Example - using multiple OAuth policies in an OAuth provider assembly	1275
Parse	1278
Proxy	1280
Rate Limit	1283
Configuring a rate, burst, or count limit on the DataPower API Gateway	1284
Redaction - DataPower API Gateway	1286
Constructing JSONata expressions to redact fields	1286
Redaction - DataPower Gateway (v5 compatible)	1289
Constructing XPath expressions to redact fields	1290
Set Variable	1292
Configuring the Set Variable policy for DataPower API Gateway	1293
Configuring the Set Variable policy for DataPower Gateway (v5 compatible)	1294
User Security	1295
Validate - DataPower API Gateway	1297
Validate - DataPower Gateway (v5 compatible)	1300
Validate Username Token	1301
Websocket Upgrade	1302
Configuring the Websocket Upgrade policy for DataPower API Gateway	1302
Configuring the Websocket Upgrade policy for DataPower Gateway (v5 compatible)	1304
XML to JSON	1305
Configuring the XML to JSON policy for DataPower API Gateway	1306
Configuring the XML to JSON policy for DataPower Gateway (v5 compatible)	1307
XSLT	1307
Configuring the XSLT policy for DataPower API Gateway	1308
Configuring the XSLT policy for DataPower Gateway (v5 compatible)	1310
XSLT policy examples	1311
Implementation code examples	1314
Logic Constructs	1319
if	1320
operation-switch	1320
switch	1321
Using the switch policy condition editor	1321
throw	1325

API Connect overview

IBM® API Connect is an integrated API management offering, with capabilities and tooling for all phases of the API lifecycle. IBM API Connect 10.0.5.6 is the latest 10.0.5.x Long Term Support (LTS) release, following the previous 10.0.5.5 release. If you're looking for a different version of API Connect, use the Change version list in the navigation pane to select the version that you require.

As enterprises continue their digital transformation agendas, IT leaders are looking to APIs as a means to interconnect digital solutions across their hybrid and multi-cloud landscape. This API-led innovation helps organizations accelerate the delivery of new business models and superior client experiences as they create, secure, manage, and socialize APIs across multi-cloud landscapes.

Key steps of the API lifecycle include create, secure, manage, socialize, monetize, and analyze. IBM API Connect Version 10 delivers enhanced capabilities for the market-leading IBM API management solution. In addition to the ability to deploy in complex, multi-cloud topologies, this version provides enhanced experiences for developers and cloud administrators in your organization.

IBM API Connect has two main focuses: the first is providing best in class API Management tooling, and the second is having a cloud native solution. This allows users to create, manage, and secure applications that are deployed across a variety of on-premises and cloud environments.

The following table explains the key phases in the API lifecycle in more detail.

Table 1. Key phases of the API lifecycle

Lifecycle Phase	Description
Create	Develop and write API definitions from an API development environment, eventually bundling these APIs into consumable products, and deploying them to production environments. For tutorials, walk-throughs, and in-depth guides for building, testing, and deploying APIs and Products in API Connect, see Tutorials , and Developing your APIs and applications .
Secure	Leverage the best-in-class API Gateway, gateway policies, and more, to manage access to your APIs and back-end systems. To learn more about adding security to your API, see <i>Enforcing security requirements on an API</i> for the OpenAPI version that you are working with: <ul style="list-style-type: none">OpenAPI 2.0: Enforcing security requirements on an APIOpenAPI 3.0: Enforcing security requirements on an API To learn more about how to add API Gateway policies to your API, see API policies and logic constructs .
Manage	Governance structures are built in to the entire API lifecycle, from managing the view/edit permissions of APIs and Products being deployed, to managing what application developers can view and subscribe to when APIs are deployed. To understand and leverage API Connect management and governance controls along the API lifecycle, see Managing your APIs .
Socialize	API Connect comes with an advanced Developer Portal that streamlines the onboarding process of application developers, and can be completely customized to an organization's marketing standards. To understand more about using the Developer Portal, see Developer Portal: Socialize your APIs .
Monetize	Bundle APIs into Products and Plans with monetization schemes that are built into those Plans, thereby opening up digital revenue streams. To understand more about how to leverage monetization strategies in API Connect, see Monetizing your Products .
Analyze	Developers and Product Managers alike are given the tooling in API Connect to understand their API traffic patterns, latency, consumption, and more to make data driven insights into their API initiatives. To learn more about how to leverage API Connect analytics tooling, see API Analytics .

API Connect has four major components: API Manager, Analytics, Developer Portal, and Gateway. These four components can be deployed in a variety of hybrid and multi-cloud topologies. The API Connect infrastructure can either be deployed and managed by an IBM team in an IBM Cloud environment, or it can be deployed and managed by the customers in their own dedicated environment or third-party cloud. There is also the option for having hybrid scenarios, for example, with the API Connect Reserved Instance Offering, users are able to have their API Manager and Developer Portal running in the IBM Cloud, but then place remote gateways next to their back-end services.

Configuration of customer deployed API Connect clouds is done through the Cloud Manager. For in-depth guides and instructions see [Configuring and managing your server environment](#).

For information about the API Connect components that provide these capabilities, and details about the strategy for packaging and publishing APIs for use by API consumers, see:

- [Packaging strategy and terminology in API Connect](#)
- [API Connect components](#)

Note: For a comprehensive technical guide to best practices, considerations, and deployment options for API Connect, see the [API Connect v10.x Whitepaper](#).

What's new in the latest release (Version 10.0.5.6)

Find out about the newest features and the latest updates in IBM® API Connect.

IBM API Connect 10.0.5.6 is the latest 10.0.5.x Long Term Support (LTS) release, following the previous 10.0.5.5 release. API Connect 10.0.5.6 includes the following enhancements.

Product files and release notes

- Access the latest files from [IBM Fix Central](#) by searching for the API Connect product and your installed version. Full installation files for IBM API Connect can be downloaded from [Passport Advantage](#).
- For details on the specific APARs that are included in this release, links to downloads, and additional blogs and conference notices, see the IBM API Connect 10.0.5.6 [Support Announcement](#) page.

What's new for Developer Portal site administrators

Updates to the `custom-module` and `custom-theme` Developer Portal commands

The `custom-module:create-import` and `custom-theme:create-import` commands now include a `--wait` flag to give you more control over the command completion time. Previously, the cache rebuild was automatically included as part of the task. Now, if you want to include the cache rebuild as part of the task, you must include the `--wait` flag. If you run the commands without the `--wait` flag, the cache is rebuilt in the background after the task is complete. For more information, see [Using the custom-module commands](#) and [Using the custom-theme commands](#).

New Developer Portal `sites` command

You can now use a `sites:reset-upgrade-attempts` command to reset the upgrade attempt counter within the Developer Portal, so that failed upgrades can be retried. For more information, see [Using the sites commands](#).

New Developer Portal `queue` commands

Use the `queue` commands to list the queued and locked platform tasks on your Developer Portal site. For more information, see [Using the queue commands](#).

New Developer Portal `user` commands

The following `user` commands can be used to complete some Drupal user management tasks on your Developer Portal:

- `apic user:add-role` - Add one or more roles to one or more specified user accounts.
- `apic user:block` - Block one or more users.
- `apic user:information` - Retrieve information about your users.
- `apic user:remove-role` - Remove one or more roles from one or more specified user accounts.
- `apic user:unblock` - Unblock one or more users.

For more information, see [Using the user commands](#).

New Developer Portal `maintenance` commands

The following `maintenance` commands can be used to manage the maintenance operations on your Developer Portal:

- `apic maintenance:disable` - Disable your maintenance operations.
- `apic maintenance:enable` - Enable your maintenance operations.
- `apic maintenance:rebuild_node_access` - Rebuild the node access table for your maintenance operations.
- `apic maintenance:search_api_index_rebuild` - Rebuild and re-index the search API index of your maintenance operations.
- `apic maintenance:search_api_index_status` - Print the search API index of your maintenance operations.
- `apic maintenance:status` - Get the current mode of your maintenance operations.

For more information, see [Using the maintenance commands](#).

New Developer Portal `memcache` commands

The following `memcache` commands can be used to manage the default caching store operations on your Developer Portal:

- `apic memcache:disable` - Disable your default caching store operations and set Drupal to use database as its cache.
- `apic memcache:enable` - Enable your default caching store operations and set Drupal to use RAM as its cache.
- `apic memcache:get` - Get the status of your `memcache enabled` operations.

For more information, see [Using the memcache commands](#).

New Developer Portal `role` commands

The following `role` commands can be used to complete some Drupal role management tasks on your Developer Portal:

- `apic role:create` - Create a new user role.
- `apic role:delete` - Delete an unwanted user role.
- `apic role:add-permission` - Add one or more permissions to a user role.
- `apic role:remove-permission` - Remove one or more permissions from a user role.
- `apic role:get` - Get the details of a specific user role as well as the permissions available.
- `apic role:list` - List the roles based on a specific role or permission.

For more information, see [Using the role commands](#).

What's new for DevOps

Cert-manager update required for Kubernetes deployments

API Connect 10.0.5.6 uses cert-manager 1.12.7. If you are upgrading a deployment on Kubernetes, be sure to update the cert-manager as explained in the procedure for [Upgrading subsystems on native Kubernetes](#).

Enhancements to the Developer Portal caching process

The Developer Portal now has enhanced in-memory caching, which increases the speed of the page accesses for the Developer Portal web sites. This improved site performance is particularly helpful for long running administrative tasks, such as enabling and disabling modules. However, it is possible to disable these enhancements if required; see [Enabling Developer Portal feature flags on Kubernetes](#), [Enabling Developer Portal feature flags on OpenShift and Cloud Pak for Integration](#), or [Enabling Developer Portal feature flags on VMware](#) for information.

Technical Preview: New API Connect Config Sync utility to replicate consumer-side catalog data

API Connect Config Sync is a utility that can be run either as a standalone binary, or as part of a Kubernetes cronjob to facilitate the unidirectional replication of consumer-side data (consumer organizations, members, apps, subscriptions, credentials) from a catalog in a source API Connect cluster to a corresponding catalog in a separate, target API Connect cluster.

For more information, see [Using Config Sync to replicate consumer-side catalog data](#).

Updated TLS certificate management documentation for VMware

Documentation for certificate management is updated and moved to [TLS certificate concepts and operations](#).

What's new for security practitioners

Support for new OIDC protocol in LinkedIn

If you create a user registry for API Connect using LinkedIn as your OIDC provider, note that LinkedIn updated their OIDC protocol. The changes affect how you configure the OIDC registry in API Connect, and are explained in [Creating an OIDC user registry in API Manager](#) and [Configuring an OIDC user registry in Cloud Manager](#).

- [What's new in Version 10.0.5.0](#)
This page details the enhancements in IBM API Connect Version 10.0.5.0.

What's new in Version 10.0.5.5

This page details the enhancements in IBM® API Connect Version 10.0.5.5 since the previous release.

For details on the specific APARs that are included in this release, links to downloads, and additional blogs and conference notices, see the IBM API Connect 10.0.5.5 [Support Announcement](#) page.

Key updates in 10.0.5.5:

- Direct upgrade from Version 2018 is no longer supported. To upgrade from 2018, upgrade to 10.0.5.4 (or another version of 10.0.5.x prior to 10.0.5.5), and then upgrade to 10.0.5.5 or later versions.
- Cert-manager update required for Kubernetes deployments. API Connect 10.0.5.5 uses cert-manager 1.11.5. If you are upgrading a deployment on Kubernetes, be sure to update the cert-manager as explained in the procedure for [Upgrading subsystems on native Kubernetes](#).
- The following Drupal modules are now unsupported and their installation is blocked in the Developer Portal:
 - All of the advanced aggregation modules; `advagg`, `advagg_mod`, `advagg_js_minify`, `advagg_css_minify`, `advagg_ext_minify`, `advagg_validator`, and `advagg_bundler`. These modules are blocked due to incompatibility with the current Drupal version.
 - `statistics` module. This module is being deprecated by Drupal.
 - `tfa` module. Two-factor authentication isn't available within the Developer Portal. If multi-factor authentication is required, it can be configured within an OpenID Connect (OIDC) user registry; see [Creating an OIDC user registry](#).

What's new for Developers

LDAP updates

- The UI for creating an LDAP registry now provides options for specifying the scope for "Search DN" (subtree, one level, and base) as you can in the CLI.
- You can now specify whether your LDAP is Microsoft Active Directory in the UI and with the CLI, to ensure that the directory is handled correctly in API Connect.

For more information, see [Creating an LDAP user registry](#) and [Using the CLI to create an LDAP user registry](#).

What's new for API product managers

Analytics Monitoring Data Dashboard

The Cloud Manager and API Manager analytics view have a new dashboard called Monitoring Data Dashboard. The new dashboard provides information on which applications, plans, consumer organizations, and APIs are sending and receiving the most data.

New analytics API event fields

From API Connect 10.0.5.5 and later, when using IBM DataPower® 10.5.0.8 or later with the DataPower API Gateway, two new fields are now included in the API event records:

- **api_resource_id**: String containing the resource ID for the API used by the gateway. Format is **api_name:api_version:method:path**.
- **gateway_service_name**: The name of the gateway service, as configured in the Cloud Manager UI.

Note that these updates don't apply to the DataPower Gateway (v5 compatible).

Analytics event **query_string** fields are now stored as text

API event **query_string** fields are now stored in Analytics as text for improved indexing.

Top 20 analytics charts

New analytics charts that show the top 20 APIs, applications, and consumer organizations.

Analytics scroll API responses sorted by datetime

Calls to the analytics REST API **events/scroll** operation return results sorted by datetime.

Analytics charts variable length time axis

The time axis on analytics charts is sized appropriate to the available data points and selected time period.

Analytics time range options in UI

New time range options for viewing API event data in the UI:

- Last minute of API event data.
- Last 5 minutes of API event data.

What's new for API consumers

Download your APIs in JSON format

You can now download your OpenAPI documents from the Developer Portal UI in JSON format, as well as YAML format. You can select your required download option from the Overview section of the API.

What's new for Developer Portal site administrators

Ability to configure the analytics chart views in the Developer Portal

You can now configure which analytics charts of API data are displayed to API consumers in the Developer Portal. Previously, if access to analytics data is granted, API consumers see all of the default charts of application and organization analytics data, including API statistics, response times, and error information. Now, you can configure which charts are displayed to your API consumers, by using the Configuration > System > IBM API Developer Portal Consumer Analytics menu in the Developer Portal UI.

Updates to the Developer Portal **content** commands

The **content** command now enables you to export and import your Developer Portal site content. The following **content** commands are added:

- **content:create-export**
Creates a task to export a .tgz file of your site content.
- **content:create-import**
Creates a task to import an archive of your site content.
- **content:delete-export**
Cancels any currently running **content:create-export** tasks, and deletes any related artifacts.
- **content:delete-import**
Cancels any currently running **content:create-import** tasks, and deletes any related artifacts.
- **content:get-export**
Streams the content of a specific completed export task to a .tgz file.
- **content:get-export-status**
Returns the status of a specific export task.
- **content:get-import-status**
Returns the status of a specific import task.

Also, the **content:list** entity type flag name is changed from **--content_type** to **--entity_type**. There is no change to the **content:list-types** command.

For more information about the **content** commands and how to use them, see [Using the content commands](#).

New Developer Portal **export-entity** commands

The following **export-entity** commands are added, which enable you to export assorted entity content from your Developer Portal site.

- **export-entity:create**
Creates a new export entity, which is the container for the entity content that you want to export.
- **export-entity:add-content**
Adds content to an existing export entity.
- **export-entity:get**
Returns a list of the content of a specific export entity.
- **export-entity:remove-content**
Removes certain content from a specific export entity.
- **export-entity:delete**
Deletes a specific export entity.

- **export-entity:launch**
Launches an export entity polling task that creates a .tgz file of all of the entities that are contained in a specific export entity. Can be run with a `--no-poll` option, in which case the task doesn't return a .tgz file, but just returns the task ID.
- **export-entity:get-launch-export**
Streams the content of a specific completed **export-entity:launch** task to a .tgz file.
- **export-entity:delete-launch-export**
Cancels a currently running **export-entity:launch** task, and deletes any related artifacts.
- **export-entity:get-launch-export-status**
Returns the status of a specific **export-entity:launch** task.
- **export-entity:list**
Returns a list of all of the export entities within a specific Developer Portal. Each export entity contains a defined list of all of the entity content that will be exported if **export-entity:launch** is run.

For more information about the **export-entity** commands and how to use them, see [Using the export-entity commands](#).

Note that you can now also export and import entities from the Developer Portal UI. When you're editing a content entity type in the UI, you can click Export in the side navigation bar. To create an export entity container and export that entity, including any required embedded entities, click Export entity. Or, if you have an existing export entity container, you can select the required container, and click Add to the export. You can also view and manage all of your export entities by clicking Content > Content synchronizer > Exports, and all of your import entities by clicking Content > Content synchronizer > Imports.

Updates to the Developer Portal **site** commands

The **site** command now enables you to export and import the entire configuration for a Developer Portal site, including custom modules, custom themes, site configuration, and site content. The added commands mean that you can easily replicate a Developer Portal site, for example replicating a test site into a production site. The following **site** commands are added:

- **site:create-export**
Creates a task to export a .tgz archive file of your entire site configuration. You can then use this archive to create an identical Developer Portal site.
- **site:create-import**
Creates a task to import an archive of your entire site configuration, completely overriding the original site configuration, including content, custom modules, and custom themes.
- **site:delete-export**
Cancels any currently running **site:create-export** tasks, and deletes any related artifacts.
- **site:delete-import**
Cancels any currently running **site:create-import** tasks, and deletes any related artifacts.
- **site:get-export-status**
Returns the status of a specific export task.
- **site:get-export**
Streams the content of a specific completed export task to a .tgz file.
- **site:get-import-status**
Returns the status of a specific import task.

Important: If you want to import a site export configuration file, the export file must have been created on the same version of API Connect as the version that you want to import to.

For more information about the **site** commands and how to use them, see [Using the site commands](#).

Updates to the list of blocked Drupal modules

The following Drupal modules are now unsupported and their installation is blocked in the Developer Portal:

- All of the advanced aggregation modules; **advagg**, **advagg_mod**, **advagg_js_minify**, **advagg_css_minify**, **advagg_ext_minify**, **advagg_validator**, and **advagg_bundler**. These modules are blocked due to incompatibility with the current Drupal version.
- **statistics** module. This module is being deprecated by Drupal.
- **tfa** module. Two-factor authentication isn't available within the Developer Portal. If multi-factor authentication is required, it can be configured within an OpenID Connect (OIDC) user registry; see [Creating an OIDC user registry](#).

For more information about custom modules, see [Installing custom modules](#).

Ability to identify the realm parameter when logging in as a consumer to the toolkit CLI

You can now find out which realm parameter you need to use when logging in to the Developer Portal with the toolkit CLI, by running the following command:

```
apic identity-providers:list --server consumer_endpoint_api --mode consumer --catalog catalog_name_or_id --org
<provider_org_name_or_id> --fields registry_type,realm
```

For more information, see [Logging in as a consumer to the Developer Portal by using the CLI](#).

What's new for DevOps

Migrate v5-compatible APIs to the DataPower API Gateway

If your deployment includes v5-compatible APIs, they can only be used with the DataPower v5-compatible Gateway (also known as the v5c gateway). To use the v5-compatible APIs with the DataPower API Gateway, you must migrate the APIs to the newer format. For more information, see [Migrating v5-compatible APIs to API Gateway](#).

Cert-manager update required for Kubernetes deployments

API Connect 10.0.5.5 uses cert-manager 1.11.5. If you are upgrading a deployment on Kubernetes, be sure to update the cert-manager as explained in the procedure for [Upgrading subsystems on native Kubernetes](#).

After upgrading on Kubernetes or OpenShift, optionally regenerate DataPowerService CRs to use random passwords for gateway-peering. Starting with API Connect 10.0.5.5, GatewayCluster pods are configured by default to secure the gateway-peering sessions with a unique, randomly generated password. However, GatewayCluster pods created prior to API Connect 10.0.5.5 are configured to use a single, hard-coded password and upgrading to 10.0.5.5 or later does not replace the hard-coded password.

After upgrading to API Connect 10.0.5.5 or later, you can choose to secure the gateway-peering sessions by running the following command to delete the DataPowerService CR that was created by the GatewayCluster:

- Kubernetes: `kubectl delete dp <gateway_cluster_name>`
- OpenShift: `oc delete dp <gateway_cluster_name>`

This action prompts the API Connect Operator to recreate the DataPowerService CR with the unique, randomly generated password. This is a one-time change and does not need to be repeated for subsequent upgrades.

Note: This operation results in an API outage until the new GatewayCluster pods start up and are configured by API Connect. If you do not regenerate the CRs during the upgrade procedure, you can schedule this task for planned downtime. There is no need for unscheduled downtime to regenerate the CRs because the gateway-peering sessions are also secured by mutual TLS, so there is very little risk of data exposure/corruption on the pre-10.0.5.5 GatewayClusters. Regenerating the DataPowerService CRs to use random passwords for gateway-peering is included as an optional step in the [Upgrading subsystems on Kubernetes](#), [Upgrading on OpenShift in an online environment](#), and the OpenShift [Air-gapped upgrade](#) topics.

New annotation suppresses Zen behavior in Cloud Pak for Integration

In previous releases of API Connect, you could only deploy it as the API Management capability in Cloud Pak for Integration by using a single, top-level CR, and the Cloud Pak for Integration Zen features were also installed.

Beginning with API Connect 10.0.5.3, you can install the API Management capability with a special annotation in the CR that suppresses the Zen features and allows you to deploy by using either the top-level CR or a set of subsystem-level CRs, even when your deployment includes the Automation UI. The new annotation is supported for all fresh installations of API Connect 10.0.5.3 and later (Cloud Pak for Integration 2022.2.1 and 2022.4.1), and for upgrades from 10.0.1.7-eus (Cloud Pak for Integration 2020.4). For more information, see the sections on [Deploying on OpenShift and Cloud Pak for Integration](#) and [Upgrading on OpenShift and Cloud Pak for Integration](#).

Analytics ingestion resiliency

Analytics persistent queue feature updated for better resiliency when both internal storage and offload is configured. The offload processes are now separated from the internal storage processes.

Direct upgrade from Version 2018 is no longer supported

Beginning with 10.0.5.5, a direct upgrade from version 2018 is no longer supported. To upgrade from 2018, upgrade to v10.0.5.4 (or another version of 10.0.5.x prior to 10.0.5.5), and then upgrade to 10.0.5.5 or later versions.

Updates to analytics deployment profile storage and ingestion pods

The memory requests and limits of the storage pods is reduced for the following profiles:

- `n1xc6.m48`: Reduced from 38 Gi to 37 Gi.
- `n3xc6.m48`: Reduced from 38 Gi to 37 Gi for shared storage, and from 36 Gi to 35 Gi for dedicated storage.
- `n3xc8.m64`: Reduced from 54 Gi to 53 Gi for shared storage, and from 50 Gi to 49 Gi for dedicated storage.

The default PVC size for the ingestion pod is increased from 5 Gi to 50 Gi in all profiles.

Upgrade improvements

Updates to the analytics microservices are redesigned, leading to reduced downtime during upgrades.

LDAP updates

- The UI for creating an LDAP registry now provides options for specifying the scope for "Search DN" (subtree, one level, and base) as you can in the CLI.
- You can now specify whether your LDAP is Microsoft Active Directory in the UI and with the CLI, to ensure that the directory is handled correctly in API Connect.

For more information, see [Configuring an LDAP user registry in the Cloud Manager](#) and [Using the CLI to configure a shared LDAP user registry](#).

API key now supports multiple uses

When defining the API key timeout in Cloud Manager, you can additionally choose whether to allow the an application to exchange the API key for an access token multiple times. For more information, see [Configuring API key timeouts](#).

What's new in Version 10.0.5.4

This page details the enhancements in IBM® API Connect Version **10.0.5.4** since the previous release.

What's new for Developer Portal site administrators

New Developer Portal CLI **product** commands

The new **product** commands allow you to update the images, attachments, tags and categories for products on your Developer Portal. The following **product** commands are added:

- `product:add-attachment`
- `product:set-icon`
- `product:add-tag`

For more information about the **product** commands and how to use them, see [Using the product commands](#).

New Developer Portal CLI **api** commands

The new **api** commands allow you to update the images, attachments, tags, and categories for products on your Developer Portal. The following **api** commands are added:

- `api:add-attachment`
- `api:set-icon`
- `api:add-tag`

For more information about the **api** commands and how to use them, see [Using the api commands](#).

New Developer Portal CLI **site** command

The new `site:login-link` command is now available for use through the IBM API Connect toolkit CLI. By running this command, you receive a one-time login link for the Developer Portal site admin account.

For more information about the **site** commands and how to use them, see [Using the site commands](#).

New flag for the modules and themes commands in Developer Portal CLI

The new `--custom` flag added to your `modules:list` and `themes:list` commands helps you find what modules and themes have been installed on your Developer Portal site after an install.

For more information about the `--custom` flag, see [Using the themes commands](#) and [Using the modules commands](#).

New Developer Portal **content** commands

The new **content** commands allow you to list and expand your Developer Portal site content. The following **content** commands are added:

- `content:list-types`
Lists allowed content types on your site.
- `content:list`
Lists all the entities in your Developer Portal site for the given content type and bundle.

For more information about the **content** commands and how to use them, see [Using the content commands](#).

New Developer Portal CLI **service** command

The new `service:list` command allow you to list the Developer Portal service currently installed.

For more information about the **service** command and how to use it, see [Using the service commands](#).

What's new for DevOps

New analytics deployment profile

A new analytics profile is available: [n3xc4.m32](#). Use this profile instead of the existing [n3xc4.m16](#) profile if you have a high analytics load, since the 16 Mi of memory in the [n3c4.m16](#) profile can be insufficient.

JWT security between gateway and analytics

Network communication between the gateway and analytics subsystems can now be secured with JWT instead of mTLS. For more information, see [Enable JWT security instead of mTLS](#).

Cert-manager upgraded to version 1.9.1

API Connect 10.0.5.4 uses cert-manager 1.9.1. If your environment requires a manual installation or upgrade of cert-manager, the instructions are included as part of the API Connect installation and upgrade procedures.

Updates in the API Connect Migration Utility (AMU)

The following updates are available in the AMU:

- A new `--drafts-only` option is added to the `archive:push` command that enables you to push only draft APIs and Products, and skip all published APIs and Products. For more information, see [Migration steps with PDUR](#) or [Migration steps without PDUR](#).
- A new `--allow-old-node` option is added to the `archive:port-to-apigw` command. This option allows you to use an older version of node 18 if required, but it is at your own risk. For more information, see [Migration troubleshooting](#).
- A new `--porting-suffix` option is added to the `archive:port-to-apigw` command that allows the overriding of the `-apigw` suffix for renamed artifacts. The porting suffix is now appended to the version of artifacts that have versions, such as APIs and Products. For more information, see [Configuring migration options for DataPower API Gateway](#).

What's new in Version 10.0.5.3

This page details the enhancements in IBM® API Connect Version 10.0.5.3 since the previous release.

Important: Note the following key changes in IBM API Connect Version 10.0.5.3:

- From API Connect 10.0.5.3, the Developer Portal, which is built on the open source Drupal content management system, will be upgraded from Drupal 9 to Drupal 10. This upgrade also requires PHP 8.1. The upgrade tooling will update your Developer Portal sites, however, if you have any custom modules or themes, it is your responsibility to ensure their compatibility with Drupal 10 and PHP 8.1 before the upgrade. For more information about the Drupal 10 upgrade and how to prepare for it, see [Guidelines on upgrading your Developer Portal from Drupal 9 to Drupal 10](#).
- Sender details for email notifications for `consumer:app-suspended` and `consumer:app-reinstated` are updated to be consistent with the notifications in the consumer space. See [What's new for API product managers](#) for more details.

What's new for Developers

Added APIs to manipulate attachments in a message object

The message object provides APIs and properties to manipulate message attachments. For more information, see [Manipulating attachments in a message object](#).

Added the **JSON** custom scalar type for GraphQL APIs

You can use the **JSON** custom scalar type in GraphQL APIs to specify JSON payloads. For more information, see [GraphQL custom schema directives and scalar types](#).

Added the ability to specify strict UTF-8 encoding for JSON documents

When you configure a Parse policy, you can specify whether to enforce strict UTF-8 encoding throughout the entire JSON document. For more information, see [Parse](#).

Client credentials are shown in response to the `apps:create` command

If you're using the toolkit CLI to create consumer applications, the `apic apps:create` command now returns the client credentials for the application. For example, running the following command:

```
apic apps:create -s my_mgt_endpoint -o my_org -c my_catalog --consumer-org my_consumer-org tests/fixtures/refs/testapp.json
```

with the following payload:

```
{"title":"Jessica's Store","name":"store","redirect_endpoints":[]}
```

returns the following response:

```
store [state: enabled] https://example.com/api/apps/e6a4d5f1-bec0-416b-b1b7-738cc854c5b5/463d84ea-e70a-4338-beed-f3c2fe2547c0/423e0d4d-ea7c-4512-a5f6-afbd60bc3920/dab4a161-fdcd-455a-b5e7-c8447cc52105 client_id:'12340747f8bed76c4807988603bffa1f' client_secret: 'f123d1098ace3aa02d35d3f0da65a9f3'
```

For more information about how to run toolkit CLI commands, see [API development and management commands](#).

Updates to Automated API behavior testing OpenAPI 3.0 support

You can use OpenAPI 3.0 APIs in Automated API behavior testing. For more information, see [Testing an API with Automated API behavior testing](#).

What's new for API product managers

Sender details for email notifications for `consumer:app-suspended` and `consumer:app-reinstated` are updated to be consistent with the notifications in the consumer space

The sender address details for the following two email templates are now consistent with the other email notifications:

- `consumer:app-suspended`
- `consumer:app-reinstated`

Previously, `app-suspended` and `app-reinstated` notifications were always sent from the Cloud level sender name and address that's configured in the Cloud Manager. However, this configuration does not follow the established pattern for notifications, as documented in [Configuring sender details for email notifications](#). These two templates are now sent from the sender address that's configured at the Catalog level, if provided, or the Provider Organization level, or, if neither of those sender details are provided, the Cloud Manager level, consistent with existing behavior for other templates.

Specify the fields that are returned from analytics REST API and toolkit CLI event queries.

You can specify the API event record fields that you want returned from REST API and toolkit CLI event queries. Use the `--fields` argument with the toolkit CLI, and the `fields` query parameter with the REST API, for example:

```
/events?fields=bytes_received,bytes_sent
```

Analytics discover view in context filtering

While you're viewing the analytics API event data in the discover view, you can now quickly add and remove filters to update the event data displayed. For more information about filtering analytics UI data, see [Filtering displayed data](#).

Analytics dashboards enhanced with new charts

Three new charts are added to the analytics dashboards.

- Usage Dashboard: Top APIs by request size.
- Usage Dashboard: Top APIs by response size.
- Monitoring Latency Dashboard: Top APIs by response time.

New analytics dashboard: Gateway Operations

A new analytics dashboard is provided, which shows the API usage and latency per gateway. For more information about the analytics dashboards, see [Analytics dashboards](#).

Ability to save and share analytics queries

You can now save and share analytics queries created in the Cloud Manager and API Manager UIs. For more information about saving and sharing queries, see [API Manager UI analytics view](#).

Geographic IP data included in analytics API event data

The API event data now includes geographic information of the client IP address that called the API, and of the gateway itself. The geoIP feature is disabled by default. To use this feature, see [Including geoIP fields in analytics data](#).

What's new for Developer Portal site administrators

Change to the behavior of the approval process for onboarding to the Developer Portal

The way that the approval process works for onboarding to the Developer Portal has changed. In earlier releases, if Self service onboarding approval is enabled, and a user was approved to access a Developer Portal with a specific consumer organization, that user would not need to go through the approval process again if they created more consumer organizations for the same Developer Portal.

Now, Self service onboarding approval is honored whenever a consumer organization is created. So, even if a user is approved to access a Developer Portal with one consumer organization, if they then try to create another consumer organization in the same Developer Portal, their request will still go through the approval process.

For more information, see [Creating and configuring Catalogs](#).

Developer Portal upgrade to Drupal 10

From API Connect 10.0.5.3, the Developer Portal, which is built on the open source Drupal content management system, will be upgraded from Drupal 9 to Drupal 10. This upgrade also requires PHP 8.1. As a result, all existing Developer Portal sites will be upgraded to Drupal 10, and all new sites will be based on Drupal 10 as well. Ensure that all modules and themes used on your Developer Portal site are compatible with Drupal 10 and PHP 8.1. While core modules and themes will be

automatically made compatible as part of the upgrade, any custom modules or themes, whether created in-house or contributed by the Drupal community, need to be verified for compatibility before the upgrade.

For more information about the Drupal 10 upgrade, and how to ensure compatibility, see [Guidelines on upgrading your Developer Portal from Drupal 9 to Drupal 10](#).

Dynamic translations for API Connect entities

The latest Developer Portal upgrade contains a dynamic translations feature for the API Connect entities, including Blocks, Nodes, and Menu Links. Now, when you update the existing translations for your API Connect entities, the changes are automatically reflected across your sites without the need of re-translation. The dynamic translations feature also includes adding new language codes and their accompanying translations. Note that the translation changes may take 5-10 minutes to appear on the site as the cache recycles.

What's new for DevOps

(Red Hat OpenShift) Change from cloudctl to ibm-pak for installing and upgrading air-gapped deployments

Previous versions of API Connect used IBM Cloud Pak CLI (cloudctl) as the mirroring tool for installing and upgrading in air-gapped environments. API Connect 10.0.5.3 uses IBM Catalog Management Plug-in for IBM Cloud Paks (ibm-pak) instead. The ibm-pak plug-in extends the Red Hat OpenShift CLI (oc command) capability and streamlines the process of delivering installation images to the IBM Cloud Pak in an air-gapped environment. For information on installing and upgrading API Connect on Red Hat OpenShift in an air-gapped environment, see the [air-gap installation instructions](#) and the [air-gap upgrade instructions](#).

Daily Management subsystem local backups are taken by default

The Management subsystem now takes local backups by default. On new installations or upgrades where the user does not specify backup settings, management backups are taken daily at 01:00 UTC, and retained for 14 days. Local backups are set by default to prevent the situation where no backup settings cause continuous accumulation of WAL archives to local PVC. Local backups are stored on the management subsystem, and so cannot be used for disaster recovery. Configure remote S3 or SFTP backups for disaster recovery.

For more information about management backups, see:

- [Configure local management backups on Kubernetes](#).
- [Configure local management backups on OpenShift](#).
- [Configure management backup settings on OVA](#).

(Kubernetes, Red Hat OpenShift) Improved platform health status monitoring using Kubernetes events

A new feature is enabled in the IBM **APICo**nnect operator on Kubernetes and Red Hat OpenShift to generate CR events whenever there is a change in the top-level CR (APICoCluster) or subsystem CRs (**ManagementCluster**, **GatewayCluster**, **AnalyticsCluster**, **PortalCluster**) status conditions. Along with CR status conditions, you can monitor these events by using any third-party alerting system. For more information, see [Monitoring platform health using Kubernetes events](#) or [Monitoring platform health on Red Hat OpenShift using Kubernetes events](#).

Red Hat OpenShift-based deployments now manage foundational services through the API Connect operands

In previous releases of API Connect, a deployment on Red Hat OpenShift (including as a capability in Cloud Pak for Integration) managed the use of IBM Cloud Pak foundational services through dependencies that are enforced by OLM at the operator level. Beginning with API Connect 10.0.5.3, the dependency on foundational services is no longer managed at the operator level by OLM, but is instead handled at the operand level by the API Connect operator. This change provides more flexibility going forward by allowing the APIC operator to enforce the dependency only on the operands that actually require it. This change applies to new installations only. For more information, see the appropriate [installation instructions for your Red Hat OpenShift environment](#).

Configure analytics retention and rollover settings in the Cloud Manager UI

In previous releases, the only way to modify the retention and rollover settings was by using the toolkit CLI. It is now possible to configure these settings in the Cloud Manager UI. For more information, see [Configure data retention and index rollover time periods](#).

New message column in management and top-level get CR output

A new **MESSAGE** column is added to the output of `kubect`l get <cr name> for the management CR. The **MESSAGE** column provides additional information on the state of the management subsystem. For example,

```
kubect
```

l get mgmt -n <namespace>

NAME	READY	STATUS	VERSION	RECONCILED	VERSION	MESSAGE	AGE
management	17/17	Running	10.0.5.3	10.0.5.3-0		Management is ready	2d22h

On Cloud Pak for Integration, and on Red Hat OpenShift, if you installed API Connect with the top-level CR, the new **MESSAGE** column is also shown for the top-level CR. For example,

```
oc get apiconnectcluster -n <namespace>
```

NAME	READY	STATUS	VERSION	RECONCILED	VERSION	MESSAGE	AGE
small	7/7	Ready	10.0.5.3	10.0.5.3-16		API Connect cluster is ready	2d5h

Automatic verification and reporting of two data center disaster recovery management database replication

In two data center disaster recovery deployments, the management subsystem automatically monitors the replication status of the management databases, and reports any failures in the management CR status output. For example,

NAME	READY	STATUS	VERSION	RECONCILED	VERSION	MESSAGE
management	18/18	Warning	10.0.5.3-0	10.0.5.3-0		Management is ready. HA Status Warning - see HAStatus in CR for details

```
status:
  haStatus
  {
    ssssss
    "lastTransitionTime": "2023-03-31T19:47:08Z",
    "message": "Replication not working, install or upgrade in progress.",
    "reason": "na",
    "status": "True",
    "type": "Pending"
  }
}
```

Gateway CR property `validateApimClient` renamed to `mtlsValidateClient`

The `validateApimClient` property is renamed to `mtlsValidateClient` to match what is used in the other subsystems. `validateApimClient` is deprecated. When you upgrade to 10.0.5.3, `validateApimClient` is automatically changed to `mtlsValidateClient` in the gateway CR.

Use JWT instead of mTLS for some inter-subsystem communications

Most of the network interactions between API Connect subsystems use mTLS. The use of mTLS requires that any load-balancers that are located between subsystems are configured for TLS pass-through. If you want to use TLS termination at your load-balancers instead of pass-through on certain routes, you can disable mTLS and enable JWT security instead. For more information, see [Enable JWT security instead of mTLS](#).

If you are upgrading from an earlier release, to enable this feature see the following topics:

1. [Red Hat OpenShift: Additional post-upgrade steps for upgrading to 10.0.5.3 from earlier 10.0.5 release.](#)
2. [Kubernetes: Additional post-upgrade steps for upgrading to 10.0.5.3 from earlier 10.0.5 release.](#)
3. [OVA: Enable JWT security between subsystems.](#)

Non-OVA only: Use service (in-cluster) communication between subsystems, instead of external ingress/route based communication

If your subsystems are installed in the same cluster, then Kubernetes services can be used for inter-subsystem communication, instead of the default ingress/route based communication that requires external exposure of HTTPS endpoints. For more information, see [In-cluster service communication between subsystems](#).

Non-OVA only: New analytics database deployment option: Dedicated storage

Analytics now supports the OpenSearch dedicated storage type. Dedicated storage allows the management of the OpenSearch cluster, and the storage of analytics data to be separated into different pods. Using dedicated storage provides greater stability and allows some configuration changes to be made without downtime. Dedicated storage is available on three replica deployments only.

New analytics dashboard: Gateway Operations

A new analytics dashboard is provided, which shows the API usage and latency per gateway. For more information about the analytics dashboards, see [Cloud Manager UI analytics view](#).

New `customPlatformApiHostname` field available for Developer Portal restore

A new `customPlatformApiHostname` field is available to use when restoring the Developer Portal. The field allows you to provide a custom platform API hostname override for the Developer Portal `restore system` or `restore all` commands. If the API hostname of your management subsystem platform has changed since taking the backup you are restoring, then update it to the new platform API hostname of the management subsystem by using this override. For more information about restoring the Developer Portal, see:

- [Backing up and restoring the Developer Portal in a Kubernetes environment](#)
- [Restoring Developer Portal on OpenShift and Cloud Pak for Integration](#)
- [Restoring the Developer Portal subsystem](#)

New `portalBackupRecordDays` field available for Developer Portal backup settings

The `portalBackupRecordDays` setting denotes the number of days that backup records (backups that exist on the remote backup server) are shown when you list your remote backups. It is defaulted to 30 days. For more information about Developer Portal, see [Backing up and restoring the Developer Portal in a Kubernetes environment](#).

What's new for security practitioners

The MD5 certificate fingerprint format is no longer displayed

API Connect no longer calculates and displays the certificate fingerprint format of MD5. However, the SHA1 and SHA256 certificate fingerprint formats are displayed.

Two additional claims added to the JWKS URL endpoint on the management platform REST API

The following two claims are added to the JSON Web Key Set (JWKS) URL (`/api/cloud/oauth2/certs`) endpoint that is hosted on the REST API of the management platform.

- `iss`: describes the issuer of the token, which is IBM API Connect.
- `purpose`: describes what kind of API Connect token the key can be used to verify.

What's new in Version 10.0.5.2

This page details the enhancements in IBM® API Connect Version **10.0.5.2** since the previous release.

What's new for Developers

Added the `Date` custom scalar type for GraphQL APIs

You can use the `Date` custom scalar type in GraphQL APIs to define custom scalars that specify dates. For more information, see [Extensions to GraphQL](#).

Ability to set the API Designer locale

You can set a different locale than your current operating system for the API Designer application, by using the `--lang` argument when you start the application. For example, by using the `--lang=es` argument when you start API Designer, the language is set to Spanish. For more information, see [Setting the locale for API Designer](#).

Ability to switch directories in API Designer

You can switch to a different directory after logging in to the API Designer application UI, by clicking Switch directory on the menu bar in the header. For more information, see [Logging in from API Designer](#).

OpenAPI validation

You can now click Validate in the API Manager and API Designer API editors to validate your OpenAPI YAML source. If validation errors are found, you can click each error to navigate directly to the section of the API form that contains the invalid YAML. For more information, see [Validating the OpenAPI YAML source](#).

Support for multiple OAuth2 flows in OpenAPI 3.0 APIs

If you're creating or editing OpenAPI 3.0 APIs, you can now select multiple flows (grant types) for your OAuth2 security schemes. For more information about how to create OAuth2 security schemes, see [Defining OAuth2 security scheme components](#).

Create and manage API keys for platform APIs

Create API keys associated with your user account, and then use them to authenticate when you call the APIs provided by API Connect. For more information, see [Managing API keys](#).

What's new for API product managers

Analytics UI enhancements

The analytics UI now includes the following enhancements:

- All analytics views can be switched between local time and Coordinated Universal Time.
- Analytics charts can be switched between linear and logarithmic axes, selectable from the chart options menu.
- Analytics data can be shown going back to the start of your data retention period, not just the last 30 days.
- When you create and edit queries, the custom time range option now provides precision to the second, rather than the minute.
- Up to 200 events per page now viewable in the discover view tables.
- Updated columns in the discover view, providing clearer and more useful information.
- New query fields for `gateway_ip`, `client_ip`, `immediate_client_ip`. Queries can use CIDR notation to search by subnet.
- New refresh button on dashboards to update the data that is displayed, without the need to reload the browser.
- Ability to save and load analytics queries. Saved queries are stored in the analytics backup.

Analytics CLI and REST API enhancements

New filter operators for use with the CLI and REST API: `startswith`, `endswith`, `regex`, `notoneof`. For more information, see [Example toolkit CLI operations](#).

Additional variables for customizing the email notification templates

More variables are available to add to the email notification templates, so that you can define custom templates with more flexibility when addressing the user that's receiving the email. The following user variables are now available:

- `originator`
- `originatorFirstName`
- `originatorLastName`
- `originatorEmail`
- `username`
- `email`
- `firstName`
- `lastName`

For more information, see [Configuring notifications](#) in the API Manager, and [Customizing email notification templates](#) in the Cloud Manager.

What's new for API consumers

Consumer analytics redesign

The analytics dashboards in the Developer Portal are redesigned and enhanced. As well as viewing the standard analytics metrics for APIs at the application and organization level, API consumers can now view additional information, including response time, status codes, number of errors, and API call history.

What's new for Developer Portal administrators

Use the toolkit CLI to enable and disable maintenance mode on your Developer Portal site

You can now enable and disable maintenance mode on your Developer Portal site, by using the Portal commands in the toolkit CLI. For more information, see [How to enable and disable maintenance mode on your Developer Portal](#).

New **drupal-state** commands available in the Developer Portal command-line tool

The **drupal-state** commands enable you to store and retrieve information about the state of your Developer Portal system. For more information, see [Using the drupal-state commands](#).

What's new for DevOps

New requirement when installing or upgrading Developer Portal subsystem on VMware

If there are multiple Management subsystems in the same project, you must set the Developer Portal subsystem's `platform-api` and `consumer-api` certificates to match those used by the appropriate Management subsystem to ensure that the Developer Portal subsystem is correctly associated with that Management subsystem.

Instructions are included in the following topics:

- Installation on VMware: [Configuring the Developer Portal subsystem](#)
- Upgrade on VMware: [Upgrading to the latest release on VMware](#)

New `dbClientPrimaryuser` certificate

The Management component has a new certificate and secret called `dbClientPrimaryuser`, see: [Internal certificates](#).

If your deployment is installed on Kubernetes, and you use customized internal certificates, see the additional upgrade step: [Add db primary certificate](#).

If your deployment is installed on OpenShift, Cloud Pak for Integration, or OVA then no action is required.

Additional requirement for disaster recovery when Management subsystem uses S3 backups

If you installed API Connect on Red Hat OpenShift or Cloud Pak for Integration by using the top-level `apiconnectcluster` CR, you must annotate the CR as part of the disaster recovery process. The instructions for recovering from a disaster include a new step to guide you through the annotation procedure.

New deployment profiles with new CPU licensing limits

New deployment profiles are available, and CPU licensing limits updated. The `spec.license.metric` now correctly maps to the `productMetric` annotation for the containers that require license entitlement. See [CPU limits, Memory limits, and licensing](#). Some existing profiles are deprecated, see [API Connect deployment profiles for OpenShift and Cloud Pak for Integration](#).

Portal CR status message field

A new message field has been added to the output of `kubect1|oc get PortalCluster`. This new field provides portal status information, for example:

NAME	READY	STATUS	VERSION	RECONCILED	VERSION	MESSAGE	AGE
portal	3/4	Pending	10	10.0.5.2-0		Mounted certificates are not valid	8d
portal	4/4	Running	10	10.0.5.2-0		1 site(s) are not in sync with API Manager	8d
portal	4/4	Running	10	10.0.5.2-0		Ready for service registration	8d
portal	3/3	Running	10	10.0.5.2-0		Ready to create sites	22h
portal	3/3	Running	10	10.0.5.2-0		1 site is installing	22h
portal	3/3	Running	10	10.0.5.2-0		Serving 2 sites	22h
portal	3/3	Warning	10	10.0.5.2-0		Preparing for site upgrade(s)	22h
portal	3/3	Warning	10	10.0.5.2-0		Site Upgrades Executing: (0) Queued(1) Failed(0) Success(0)	22h

Manual portal backup and restore supports multiple portal clusters

Kubernetes, Cloud Pak for Integration, and OpenShift only: The portal backup and restore CRs now have a `portalCluster` property that specifies which portal cluster to apply the backup or restore to. For more information, see: [Backing up and restoring](#).

New API consumption dashboard

Monitor total API calls in your cloud with the new consumption dashboard available in the Cloud Manager UI, see [Cloud Manager UI analytics view](#).

Compatibility matrix for Kubernetes and OpenShift versions included in documentation

Tables that show which versions of IBM API Connect are compatible with which Kubernetes and OpenShift releases are now provided as a quick reference in the software product compatibility requirements page: [IBM API Connect Version 10 software product compatibility requirements](#).

Managing Developer Portal backup resources

If you are using remote backups, and there are a large number of rows in your `portalbackup` list that have a `CR TYPE` of `record`, there might be a slow down in system performance, including during Developer Portal upgrades. Although there is no upper limit to how many portal backups you can have, it is recommended that you prune your remote backups so that the number of rows does not become excessively large. One `portalbackup` row of type `record`, corresponds to one backup file on the configured remote backup server. For more information, see [Overview of the Developer Portal backup resources](#).

What's new for security practitioners

Migrate token revocation information to DataPower® API Gateway

You can use the Token Migration Utility (TMU) to migrate token revocation information from a v5 quota enforcement server (QES) to a gateway-peering cache in v10 DataPower API Gateway. For more information, see [Migrating token revocation information to DataPower API Gateway](#).

What's new in Version 10.0.5.1

This page details the enhancements in IBM® API Connect Version **10.0.5.1** since the previous release.

Version 10.0.5.1 product release

The following sections detail the changes and additions in version 10.0.5.1.

Attention:

API Connect 10.0.5.1 is now supported to run on VMware. For information about installing and upgrading on VMware, see the [VMware](#) section.

What's new for Developers

The API policy version must match the gateway policy version

The way that API Connect validates the API policy version has changed. In earlier releases, API Connect published the API if its policy version was considered to be compatible with the gateway's version. If no version was specified, the policy version defaulted to 1.0.0. However, the published API might then fail at the gateway if the API policy version didn't match the gateway policy version.

Now, API Connect mitigates the problem by validating the API policy version prior to publishing the API. This new behavior means that API Connect only publishes an API to the gateway if the API policy version exactly matches the version that is present on the gateway. In addition, if a policy version isn't specified, it no longer defaults to 1.0.0. If the version is incompatible with the gateway, a validation error is thrown that specifies the available versions.

Note that this change in behavior does not affect APIs that are already published.

For more information about adding policies to your assembly, see [Adding OpenAPI 2.0 elements to your assembly](#) or [Adding OpenAPI 3.0 elements to your assembly](#).

More flexibility when customizing the preflow policies

You can now use the `mode` property to control how the preflow policies are applied. For more information, see [Customizing the preflow policies](#).

What's new for API product managers

Analytics latency charts now show percentile levels

To assist in the investigation of latency anomalies, the latency charts now include percentile lines.

Advanced options now available on analytics REST API and toolkit CLI

Advanced query filters are now available when querying analytics data. See [Example toolkit CLI operations](#) and [Analytics REST API](#).

Configure the visibility of Products at a Catalog or Space level

You can now modify your Catalog settings to define a visibility property at a Catalog or Space level. This setting then becomes the maximum level of visibility that is allowed for any Product that is published to that Catalog or Space. It can also be used as the default visibility setting for that Catalog or Space. For more information, see [Configuring Product visibility in a Catalog](#).

Note that this is an additional feature that is disabled by default, so current Product visibility behavior is not affected. The new feature also doesn't affect any Products that are already published.

What's new for Developer Portal administrators

New commands are available in the Developer Portal command-line tool

The following commands for managing forums are now available in the Developer Portal command-line tool:

- **forums:disable** - Deletes any existing forums taxonomy terms, and then disables the Forum module for a given site.
- **forums:enable** - Enables the Forum module for a given site.

For more information, see [Using the forums commands](#).

What's new for DevOps

Upgrade now available for API Connect version 2018.4.1.20 to version 10.0.5.1

You can upgrade directly to 10.0.5.1 from 2018 FP20 by following the appropriate instructions for your platform:

- [Upgrading from v2018 on Kubernetes](#)
- [Upgrading from v2018 on OpenShift](#)
- [Upgrading from v2018 on VMware](#)

API Connect version 2018.4.1.20 to version 10.0.5.1 form factor migration

You can now migrate from version 2018.4.1.20 or later to a different form factor on version 10.0.5.1 or later. For more information, see: [Migrating from v2018 to v10 on a different form factor](#).

API Connect 10.0.5.1 uses a new version of cert-manager

- Kubernetes, VMware: cert-manager 1.7.1
There is an additional step to upgrade cert-manager [Upgrading subsystems on native Kubernetes](#). When you refer to cert-manager in your CRs or commands, the following values must be updated to reflect the newer version of cert-manager: In VMware, references to cert-manager in CRs are updated during the upgrade.
 - `cert-manager-0.10.1.yaml` becomes: `cert-manager-1.7.1.yaml`
 - `ingress-issuer-v1-alpha1.yaml` becomes: `ingress-issuer-v1.yaml`
 - `certmanager.k8s.io` becomes: `cert-manager.io`
- OpenShift, Cloud Pak for Integration: cert-manager 3.21 (provided by Foundational Services)
Upgrade of cert-manager is done automatically during the API Connect upgrade. However, when you refer to cert-manager in your CRs or commands, the following values must be updated to reflect the newer version of cert-manager:
 - `cert-manager-0.10.1.yaml` becomes: `cert-manager-3.21.yaml`
 - `ingress-issuer-v1-alpha1.yaml` becomes: `ingress-issuer-v1.yaml`
 - `certmanager.k8s.io` becomes: `cert-manager.io`

New `apicup` commands for the rotation of secrets on the Developer Portal subsystem

The following commands are now available for the rotation of secrets on the Developer Portal subsystem on VMware:

- `list-rotate-secrets` - to obtain a list of any Developer Portal secret rotations that were created by using the `rotate-secrets` command.
- `delete-rotate-secret` - to delete any Developer Portal secret rotations that were created by using the `rotate-secrets` command.

Two site High Availability (HA) feature renamed to two site DR (2DCDR)

This feature has been renamed to avoid confusion with production HA deployment profiles, and to recognize the manual intervention required to failover to the passive data center. The passive data center in a 2DCDR configuration has also been renamed to the warm-standby datacenter. See [Two data center deployment strategy](#).

Note: The terms passive and multiSiteHA are still used in the CR YAML files. This is a documentation change only, and there is no change in the behavior of 2DCDR.

New installation instructions for 2DCDR on Cloud Pak for Integration

The steps for installing API Connect on Cloud Pak for Integration in a 2DCDR configuration are now documented. See [Installing a two data center deployment on Cloud Pak for Integration](#).

New installation instructions for 2DCDR on OpenShift

2DCDR installation on OpenShift is now documented in a dedicated topic, instead of sharing the topic with Kubernetes 2DCDR install. See [Installing a two data center deployment on OpenShift](#).

Reorganization of Kubernetes, OpenShift, and Cloud Pak for Integration installation documentation

The installation documents for these platforms have been reorganized to provide a more sequential flow for the reader, and reduce the amount of non-applicable information presented to them; see [Deploying on Kubernetes](#) and [Deploying on OpenShift and Cloud Pak for Integration](#).

Mutual TLS support for Management to Gateway communication

For individual subsystem installations on OpenShift and Kubernetes, mutual TLS can be enabled with a new `validateApimClient` setting. See [Installing Gateway on Kubernetes](#), [Installing Gateway on OpenShift in a dedicated namespace](#), or [Installing Gateway on OpenShift in a shared namespace](#) depending on your deployment platform and topology.

What's new in Version 10.0.5.0

This page details the enhancements in IBM® API Connect Version 10.0.5.0.

If you are moving to Version 10 from Version 5, also see the [What's new in Version 2018](#) page for the additional new features since Version 5.

Note: You can access the latest files from IBM Fix Central. Full installation files for IBM API Connect can be downloaded from [Passport Advantage](#).

Version 10.0.5.0 product release

The following sections detail the changes and additions in version 10.0.5.0.

Attention:

IBM API Connect Version 10.0.5.0 requires IBM DataPower® Gateway Version 10.5. However, the DataPower firmware for the 10.5 LTS stream is supported on only the 8496 appliance, and the IBM DataPower Gateway for Docker. Consequently, the DataPower container for API Connect 10.0.5.0 is supported to run on only Kubernetes, OpenShift, and IBM Cloud Pak for Integration.

Although API Connect 10.0.5.0 is not supported to run on VMware, support for VMware is available from API Connect 10.0.5.1 and later.

What's new for Developers

OpenAPI 3 APIs with a response wildcard can be published but are disabled on the Gateway.

If an OpenAPI 3 API contains a response wildcard (which is not supported), publishing is disabled for that API. You must correct the problem before you can publish the API.

Increased OpenAPI 3.0 support

The following updates have been made to the Open API 3.0 support for APIs that are enforced by the DataPower API Gateway:

- All assembly policies are now supported, including the **validate** and **map** policies.
- The OAuth2 with multiple flows security scheme is now supported.

For more information, see [OpenAPI 3.0 support in IBM API Connect](#).

Added the Extract policy to transform content from the API context

The Extract policy transforms content from fields in the API context. You use JSONata expressions to specify the fields and how to transform the content. For more information, see [Extract](#).

What's new for API product managers

New publish validation option when publishing your products

You can now select from the following publish validation options when configuring Catalogs in the API Manager UI:

- Publishing APIs with empty paths is not allowed
- Validate custom policy schema in an assembly
- Validate the references inside the API and perform additional OpenAPI validations
- Publishing APIs with duplicate base paths is not allowed

To configure these options, in the Catalog that you want to work with click the Catalog settings tab, and then click Publish validations. Edit. For more information about configuring Catalogs, see [Creating and configuring Catalogs](#).

Override the timeouts set by consumer organization invitations

You can now override the consumer organization timeout with the timeout that is set in the Catalog. For more information, see [Creating and configuring Catalogs](#).

New analytics dashboards and REST API

New analytics dashboards are implemented in the API Manager UI, replacing the use of Kibana. There's also a new analytics REST API for accessing your analytics data. For more information, see [Accessing analytics in the API Manager UI](#).

Mixed-case resource names now supported

You can now create resource names with mixed-case text, including names for users, APIs, Products, Catalogs, organizations, and so on. However, you cannot have duplicate names of resources where the only difference is the case. For example, while **MyAPI** and **myapi** are both supported names, they cannot both exist in the same namespace. Also, note that Developer Portal endpoints must be only lower-case.

What's new for DevOps

Redesigned Analytics subsystem

- The Analytics subsystem now uses Opensearch instead of Elasticsearch, resulting in a different set of microservices; for detailed installation information, see [Installing the Analytics subsystem](#).

Attention:

The upgrade to v10.0.5.0 or later will result in the deletion of all existing analytics data. If you want to retain your analytics data then you must export it before upgrade. For instructions on exporting, see [Additional considerations for upgrade to v10.0.5](#). It is not possible to import analytics data from earlier releases to v10.0.5.0 or later.

- Logstash persistent queues replace the message queue feature.
- New analytics toolkit CLI commands and REST API operations, covering many administration operations including those previously done by running `curl_es` commands inside storage containers. `Curl_es` operations are no longer supported.
- Minor changes to the backup and restore process, which requires the recreation of the S3 backup secret after upgrade.
- A new analytics dashboard has been added to the Cloud Manager UI, allowing the administrator to view analytics API events for each analytics service that is configured.

Pre-upgrade health-check script improved

The **apicops** pre-upgrade script has been expanded to include additional checks of your deployment's health. Before upgrading to this release of API Connect, you should run the script and check the results as explained in the upgrade instructions for each platform.

Support for migrating billing data from v5 to v10

The API Connect Migration Utility (AMU) now supports migrating your billing data from v5 to v10:

- All Stripe billing integrations in v5 are migrated to v10 and applied automatically to all Catalogs.
- All products that use paid plans will have the plans migrated.
- Consumer payment methods that exist in the v5 Portal will be automatically created in v10.

After the migration is complete, you must configure the Stripe integrations in the Developer Portal sites; see [Configuring Stripe in the Developer Portal](#) for detailed instructions. For more information about migrating, see [Migrating a Version 5 deployment](#).

Ability to disable the Portal web endpoint check

When you create or register a Developer Portal service, the Portal subsystem checks that the Portal web endpoint is accessible. However sometimes, for example due to the complexity of public and private networks, the endpoint cannot be reached. In this instance, you can disable the Portal web endpoint check so that the Developer Portal service can be created successfully.

To disable the endpoint check, complete one of the following updates depending on your platform:

On Kubernetes, OpenShift, and IBM Cloud Pak for Integration

Add the following section to the Portal custom resource (CR) template:

```
spec:
  template:
    - containers:
      - env:
        - name: PORTAL_SKIP_WEB_ENDPOINT_VALIDATION
          value: "true"
        name: admin
      name: www
```

On VMware

In your `apicup` project, create a file called `ptl-extra-values.yaml` (or edit the file if one already exists), and add the following section:

```
spec:
  template:
    - containers:
      - env:
        - name: PORTAL_SKIP_WEB_ENDPOINT_VALIDATION
          value: "true"
        name: admin
      name: www
```

For more information, see [Registering a Portal service](#).

What's new for security practitioners

Configure Base64 encoding for temporary tokens

You can now enable or disable Base64 encoding for the temporary tokens that are created for invitations, and password reset tokens. For more information, see [Configuring Base64 encoding for temporary tokens](#).

Language versions offered by API Connect

API Connect is offered in several languages, as enabled by the operating platform on which the product is installed.

Note: When API Connect is deployed as a Cloud Pak for Integration capability, it is translated to the same set of languages as the Cloud Pak for Integration product.

- Brazilian Portuguese
- Chinese (Simplified)
- Chinese (Traditional)
- Czech
- Dutch
- English
- French
- German
- Italian
- Japanese
- Korean
- Polish
- Spanish
- Turkish

Known limitations

This page describes the known limitations for API Connect 10.0.5.x.

Note: The limitations that are documented on this page will be removed as they are addressed in the IBM® API Connect product. For the most up-to-date list of product limitations, visit the English version of this page.

Attention: API Connect 10.0.5.0 is not supported to run on VMware. However, support for VMware is available in API Connect 10.0.5.1 and later.

Gateway services that span data centers

If you want to configure a gateway service that consists of gateways in different data centers, then note the following points:

- This configuration should be used only if [TMS](#) is required and an external OAuth provider cannot be used.
- Network latency between sites must be less than 30 ms.
- The analytics service cannot span data centers. If you want to associate an analytics service with your gateway service, you must choose one of the data centers to host the analytics service.

Possible upgrade failure on VMware

During an upgrade to API Connect 10.0.5.3 or later on VMware, it is possible to encounter an issue where stanza create pods will fail, which causes other management services to be in **CrashLoopBackOff** state because postgres is still not up. It is also possible that the postgres pod is up but is stuck in a **0/1 Running** state. When this failure occurs, you cannot **exec** into the postgres pod and its logs display a message ending like the following example:

```
2023-04-28 11:11:49,258 INFO: Reaped pid=435,
```

You can confirm the issue by completing the following steps:

1. Determine which node the postgres pod is running on:

```
kubectl get pods -owide
```

2. On the node hosting the postgres pod, run the following command:

```
ctr -n k8s.io tasks ls | grep UNKNOWN
```

The issue is confirmed when the command returns more than one match, with one of the results being matched to the postgres container. If you encounter this issue, contact IBM Support for assistance.

New ibm-apiconnect-operator pod fails to start due existing terminating ibm-apiconnect-operator pod holding lock

The IBM APIConnect operator uses leader election (leader-for-life) to ensure that only one operator/controller pod is running/active at a time. This relies on Kubernetes garbage collection to clean up the lock when the old operator pod is deleted. The new ibm-apiconnect operator pod fails to start if an existing terminating ibm-apiconnect operator pod is still holding the lock.

If you suspect you are encountering this issue, verify it by running the following command:

```
kubectl -n <namespace> logs <new-ibm-apiconnect-pod-name> | grep "LockOwner"
```

If the lock is the problem, the log contains a message similar to the following example:

```
existing lock", "LockOwner": "ibm-apiconnect-xxxxxx held by terminating pod
```

Resolve the issue by completing one of the following options:

- Force delete the terminating pod by running the following command:

```
kubectl -n <namespace> delete pod <terminating-ibm-apiconnect-pod-name> --force --grace-period=0
```

Kubernetes deletes the lock when the pod is deleted.

- Remove the lock manually by running the following command:

```
kubectl delete cm ibm-apiconnect-lock
```

API Designer might hang while activating a large imported API

When you import a large API using API Designer and attempt to activate the API in the import wizard, the process might hang. If you encounter this issue, you can work around the problem by completing the following steps:

1. On your local file system, locate the autoprodukt file called API-NAME-auto-product_API-VERSION.yaml.
2. Delete the file.
3. In API Designer, edit the newly imported API and activate it by clicking the Online toggle.

In general, it is best practice to activate an API using the Online toggle or by publishing the API with the Publish option.

API Designer on Windows: APIs that use WSDL might encounter errors, or fail to activate, publish, or update.

If you activate, publish, or update a REST or SOAP API that uses a WSDL file, the operation might fail and never complete. Work around the issue by using the autopublish API feature in the API editor.

Permission restrictions in the API Designer UI

The API Designer UI currently has the following permission restrictions:

- Developers that have been given only View permissions cannot see the Test tab in the API editor. For developers to be able to see the Test tab, they must be given a different permission level. For information about the default permission levels available, see [API Connect user roles](#).
- Users with API-Drafts permissions, but who don't have any Sandbox Catalog permissions, cannot see the Test preferences in the Sandbox Catalog. For these users to be able to see the Test preferences, they must be given the Developer or Administrator role on the Sandbox Catalog.

Deleted security requirements might remain in the API source

Security requirements that are deleted from APIs in the API Designer and API Manager UIs, might still remain in the source. To work around this issue, click the Source icon  in the API editor, and manually remove the security requirements.

Sometimes the completion of an SFTP restore on the Management subsystem does not restore the actual data.

There is a known issue where sometimes a restore from the Management subsystem's SFTP backup succeeds but the data is not restored. If this happens, run the restore again.

Customized application view is reset to the default after upgrade if forums are also disabled

When upgrading API Connect version 10.0.5.0 or earlier to version 10.0.5.1 or later, if you have disabled forums on your Developer Portal site, and you have customized the application view, the customized application view will be reset to the default after the upgrade. To work around this issue, you can save the customized application view before running the upgrade, and then import the view into the upgraded Developer Portal.

To save the customized application view, run the following commands:

```
mkdir /tmp/tmp_config_<site-alias>
drush @<site-alias> config-get views.view.applications > /tmp/tmp_config_<site-alias>/views.view.applications.yaml
```

Where **<site-alias>** is the alias of your Developer Portal site.

To import the saved view after the upgrade, put the views.view.applications.yaml file inside a directory where it's the only file, and then run the following command:

```
drush @<site-alias> config-import --partial --source=/tmp/tmp_config_<site-alias>/
```

Cannot add comments to APIs by using the Source view in the API Designer and API Manager UIs

Comments cannot be added to APIs in the API Designer and API Manager UIs by clicking the Source icon , and using the hashtag symbol.

Changing Product visibility from Custom to Public doesn't automatically remove the Consumer organizations and groups

In the API Designer and API Manager UIs, changing Product visibility from Custom to Public doesn't automatically remove the consumer organizations and groups, so the Product publish will fail. To work around this issue, manually remove all of the consumer organizations and groups.

Stale cache can result in unexpected behavior in the Cloud Manager and API Manager UI

Having a stale cache in your browser can result in unexpected behavior in the Cloud Manager and API Manager UI, such as fetch errors, incorrect data being displayed, and blank pages. To work around this issue, particularly if you have just upgraded your deployment, complete the following actions:

- Reload the browser window.
- If there is still an issue, clear the browser cache and then log back in to the UI.
- Try using a private browser window.
- If possible, try a different browser type.

If issues persist, contact IBM Support.

The "Select compatible gateway services" option in Test Preferences causes a "404 POST undefined" error while testing the API

In the Test Preferences, Target gateway services setting, selecting Select compatible gateway services and choosing a specific gateway results in a "404 POST undefined" error when you test the API in the API Explorer or the Test tab.

Workaround: To avoid this problem, select the Use all compatible gateway services target gateway option instead.

Analytics command restrictions

The following `--mode analytics` commands work only when the flag `--return_format` is set to either `json` or `yaml`:

- `clustermgmt:catAllocation`
- `clustermgmt:catIndices`
- `clustermgmt:catNodes`
- `clustermgmt:catRecovery`
- `clustermgmt:catShards`
- `clustermgmt:catAliases`

The following commands don't currently work on the Toolkit CLI, as they return only `text/plain`:

- `clustermgmt:getNodesHotThreads`
- `clustermgmt:getNodesHotThreadsById`

Scale limits are used by default for the plan, collection, and operation rate and burst limits

Scale limits are used by default for the plan, collection, and operation rate and burst limits. Therefore, the following burst limit response headers are not used for the converted burst limits:

- `"X-BurstLimit-Limit"`
- `"X-BurstLimit-Remaining"`

Instead, the former burst limits are reported as the following rate limits in the headers:

- `"X-RateLimit-Limit"`
- `"X-RateLimit-Remaining"`

Note that this limitation does not apply to assembly burst limits.

Options menus in the Catalog might be hidden

In a Catalog, in any of the different tabs such as Consumers, or Subscriptions, when clicking on the options icon  the menu items might be hidden. To work around the issue, reload the page and the menu items will appear.

Override plan rate limits are not displayed in the Endpoint tab

Any override plan rate limits that have been added to your API for individual operations are not displayed in the API Endpoint tab in the UI. Only the plan rate limit is displayed.

You cannot install a "standalone" API Connect deployment on an OpenShift cluster where Cloud Pak for Integration is present

If an OpenShift cluster has Cloud Pak for Integration installed, then all API Connect deployments on that cluster are considered to be part of the Cloud Pak for Integration deployment, which will attempt to integrate with the standalone API Connect deployments.

Consumer rate limit notifications are not available in Version 10

The ability to configure notifications for applications so that API consumers are alerted when the usage of an API is nearing its rate limit is not available.

Cannot log in to API Manager using a Twitter OIDC if email is required

When the Email required option is enabled in the Twitter user registry as explained in [Configuring an OIDC user registry](#), then invited pOrg members and owners are unable to log in. The workaround is to leave this optional setting unselected.

Configuration update mistakes cause admission webhook errors in OpenShift and Cloud Pak for Integration

In OpenShift and Cloud Pak for Integration, configuration update errors can cause the `APIConnectCluster` instance to go into the Pending state with an underlying component throwing an admission webhook error.

```
oc get apiconnectcluster -n APIC_namespace
```

```
NAME   READY STATUS      VERSION      RECONCILED VERSION  AGE
ml     admission webhook "vmanagementcluster.kb.io" denied the request:
ManagementCluster.management.apiconnect.example.com "ml-mgmt" is invalid: [spec.databaseBackup.restartDB.accept: Invalid value: false: databaseBackup protocol has changed (from '' to 'objstore') and requires database restart. accept restartDB to restart database, spec.databaseBackup.restartDB.accept: Invalid value: false: databaseBackup configuration has changed and requires database restart. accept restartDB to restart database] Pending 10.0.1.5-3388-eus 10.0.1.5-3388-eus
2d6h
```

The 'strict' SameSite cookie causes incorrect invitations to consumer organizations

Using the 'strict' SameSite cookie might cause invitation links from emails to send users to a registration page where they are asked to create a new consumer organization instead of joining the organization they were invited to.

The workaround is to using the 'Lax' SameSite Cookie attribute.

Performance impact when publishing products from API Designer

When you publish a product from API Designer and have 10 or more catalogs available, you might experience a performance degradation.

Limitations to the OpenAPI 3.0 support

IBM API Connect supports the OpenAPI 3.0 specification, with some limitations. For information about what is supported, see [OpenAPI 3.0 support](#).

A GraphQL API that contains a `graphql-input-type-cost` rate limit fails to publish

A GraphQL API created in releases earlier than IBM API Connect Version 10.0.3.0 might contain a `graphql-input-type-cost` rate limit, which is no longer supported. If you attempt to use the automatic activation mechanism to publish the API, or manually add the API to a Product and attempt to publish that Product, the publish operation will fail. You can resolve this problem in either of the following ways:

- Remove the rate limit definition from the OpenAPI source for the API. For example, if the source is in YAML format, remove the following lines:

```
- name: graphql-input-type-cost
  operation: consume
```

- Edit the source for the Product and define a `graphql-input-type-cost` rate limit in all of the Plans that include the API.
Note: You can edit only a manually created Product, not a Product that is generated by the automatic activation mechanism.

Analytics restore on OpenShift with `enableOverride: false` gets stuck in pending state

If you set `enableOverride: false` to avoid overwriting indices during a restore, the restore operation should fail when existing indices are encountered. However, the operation does not fail, it instead gets stuck in the pending state.

When you configure the restore operation, set `enableOverride: true` but be aware that existing indices will be overwritten.

If you attempted a restore using `enableOverride: false` and the operation is stuck, then remove that job and start a new restore operation.

Options menu is missing from items on the Product list pages

If, in the API Manager user interface, you open the Product list page in either a Catalog or a Space, the options menu icon  might be missing from alongside all of the listed Products. To resolve this problem, reload the page.

Testing an API with the Policies editor doesn't work in the API Designer UI

The API Designer UI doesn't support testing an API with the Policies editor in the Gateway tab. Instead, you can test your API by using the Test tab or the Explorer tab.

Update WSDL option is not supported in the API Designer UI

The Update WSDL option to update the configuration of an existing SOAP API from a WSDL file or a .zip archive, is supported only in the API Manager UI, or by using the developer toolkit. This option is not supported in the API Designer UI.

Upgrading a 3 node profile to IBM API Connect 10.0.3.0 might result in some `portal-db/www` pods being stuck in the `Pending` state

IBM API Connect 10.0.3.0 introduces the pod anti-affinity required rule, meaning that in a 3 node profile deployment, all 3 `db` and `www` pods can run only if there are at least 3 running worker nodes. This rule can cause some upgrades to version 10.0.3.0 to become stuck in the `Pending` state. To resolve this issue, see one of the following workarounds:

- On a Kubernetes deployment: [Troubleshooting upgrades on Kubernetes](#)
- On an OpenShift deployment: [Troubleshooting installation and upgrade on OpenShift](#)
- On a VMware deployment: [Troubleshooting upgrades on VMware](#)

A unique email address is required for all Developer Portal accounts

Remember that every account in the Developer Portal, including across different user registries for the same site, must have a unique email address, including the site Admin account. The default email address for the Admin account is the email address of the Catalog owner. It is not possible to create a Developer Portal user account (and associated consumer organization) with the same email address as the Admin account (or that of the Catalog owner if their email address is different). Any attempts to create an account with the same email address results in the new account not functioning correctly, and returning the following error message when trying to log in to the Developer Portal: **A user already exists with this email address.**

For example, if you configure three different user registries for a particular Developer Portal site, the email address `alice@acme.com` can be used to log in to the site from only one of the user registries.

Configured user registries incorrectly allow the unsupported `external_group_mapping_enabled: true` option

API Connect does not support a configured user registry that is based on a registry where `external_group_mapping_enabled` is set to `true`. Under certain conditions you can create a configured user registry based on a user registry with the unsupported option; if this happens you will encounter errors while onboarding users.

You can create and update user registries with the `apic user-registries:create` and `apic user-registries:update` commands. Both commands accept the `external_group_mapping_enabled` option. If you then create a configured user registry with the `configured_catalog_user-registries:create` command, the results depend on how you set the `external_group_mapping_enabled` option in the user registry.

Suppose you create a user registry (for example, call it UR) and you want to create a configured user registry (call it CUR) based on UR. Consider the following scenarios:

- You create UR with the `external_group_mapping_enabled: false`. In this case, you can create your CUR based on that registry.
- You create UR with `external_group_mapping_enabled: true`. In this case, you cannot base a configured user registry on it, so the creation of CUR fails.
- You create UR with `external_group_mapping_enabled: false` and create CUR based on it, as in scenario 1. However, you then update UR and set `external_group_mapping_enabled: true`. In this case, you have a problem.
The operation described in scenario 3 is not currently blocked, so you will successfully create an unsupported CUR and then run into errors when you attempt to onboard users. To resolve the issue, complete one of the following workarounds:
 - Update UR (the base user registry) and set `external_group_mapping_enabled: false`.
 - Leave UR with `external_group_mapping_enabled: true` but delete the configured registry (CUR) that is based on it.

A Product republish, with the Preserve Subscriptions option, fails after a consumer organization group has been removed from the visibility settings

If you remove a consumer organization group from the custom visibility settings for a Product, and that group contains a consumer organization with an application that is subscribed to the Product, an attempt to republish the Product with the Preserve Subscriptions option will fail even if that consumer organization is then

added to the custom visibility settings individually.

For a secured GraphQL API, GraphQL subscriptions cannot be tested by using the Test tab in the user interfaces

For a GraphQL API that is secured by client ID, GraphQL subscriptions cannot be tested by using the Test tab in the API Designer or API Manager user interfaces. The API can still be published and used in production.

You can test GraphQL subscriptions in either of the following alternative ways:

- Remove client ID security from the API, for testing purposes, then use the Test tab.
- Use an external test tool.

A published API whose assembly contains a catch block with an invalid policy will now correctly fail to republish

Previously, policies in an assembly catch block were not validated, so if an incorrect policy configuration was coded in the OpenAPI source for an API, within an assembly catch block, the API would still publish successfully. Now, policies in an assembly catch block are validated, so such an API will fail to republish and will first need to be corrected.

An existing user cannot be added to a Space

If you attempt to add an existing user to a Space, the operation cannot be completed because the Create button is not enabled. Instead, use the invitation mechanism. For details, see [Managing Space membership](#).

Note: The invited user must use the Sign in option on the activation form, rather than completing the registration details and using Sign up.

Adding an **operation-switch** policy to an API assembly produces an incorrect warning message

If you add a Version 2.0.0 **operation-switch** policy to an API whose gateway type is DataPower® API Gateway, the API Setup page on the Design tab displays an incorrect warning stating that the policy is not valid for the gateway type. This warning message can be ignored.

Simultaneous editing of the same API by multiple users might result in changes being overwritten

If one user saves changes to an OpenAPI 3.0 API, another user who has the same API open in the API editor might have their changes overwritten.

An API developed for IBM API Connect Version 2018.4.1 that uses an `apim.getvariable('message.body')` function call fails in IBM API Connect Version 10

With the DataPower API Gateway in IBM API Connect Version 2018.4.1, the type of object returned, for XML payloads, by an `apim.getvariable('context_name.body')` function call in a GatewayScript policy in an API assembly depends on how the variable is stored in the gateway context, as follows:

- If the variable is stored as a Buffer (because the variable data was written as an XML string), an XML Nodelist is returned provided that `contextname.headers.content-type` is an XML type.
- If the variable is stored as a parsed XML Document (because the variable data was written as parsed XML, either as an XML document or an XML Nodelist), an XML document is returned.

With the DataPower API Gateway in IBM API Connect Version 10 however, the same function call always returns an XML Nodelist provided that `contextname.headers.content-type` is an XML type. Therefore, such an API developed for Version 2018.4.1 will fail in Version 10 if it is configured to expect an XML document, and will need to be reconfigured appropriately.

The problem does not occur with such an API migrated from IBM API Connect Version 5 because, with that release, `apim.getvariable('context_name.body')` also returns an XML Nodelist for XML payloads, nor does it occur if you are using the DataPower Gateway (v5 compatible).

`context_name` could be `message`, `request`, or the name of the output from an `invoke` policy.

Validate policy limitations when GraphQL response contains a GraphQL server error

When a GraphQL response contains a GraphQL server error and no data, the assembly Validate policy generates an error on the missing data and overwrites the payload. When the response contains partial data and an error, the assembly Validate action validates the data and overwrites the payload. To work around this limitation, use the condition `$not($exists(message.body.errors))` in an assembly switch condition to skip the assembly Validate policy when the response contains errors.

S3 backup type must be specified when configuring S3 backups on CP4I Platform Navigator or OpenShift Form UI

When you configure S3 backups for the Management subsystem, you must specify an S3 backup type of `ibm` or `aws`. The graphical user interfaces for CloudPack for Integration and for OpenShift incorrectly state the specification of S3 backup type is optional. In the CP4I Platform Navigator, or the OpenShift Form UI, when you configure Management System > Database Backup, be sure to select the S3 provider type menu and specify a supported value. For more information see [Configuring backup settings for fresh install of the Management subsystem](#) and the Database Backup table in the Management subsystem section of [IBM Cloud Pak for Integration](#).

A management backup remains in a **Pending** state

A management backup might remain in a **Pending** state for a long period of time, particularly after having upgraded the management subsystem. To resolve this problem, you must remove the pending backup and operation lock, and then re-run the backup CR. To remove the pending backup and operation lock, complete the following steps:

1. Verify the names of the pending backup and operation lock by running the following commands:

```
kubectl -n get mgmtb | grep Pending
```

```
kubectl -n get cm | grep oplock
```

2. Delete the pending backup by running the following command:

```
kubectl -n <namespace> delete mgmtb <name-of-backup>
```

3. Delete the operation lock by running the following command:

```
kubectl -n <namespace> delete cm <name-of-lock>
```

GraphQL API test fails when the generated example query contains variable definitions

If, when testing a GraphQL API in the Test tab, you use the Example dropdown menu to generate a Small, Medium, or Large query, and the generated query contains variable definitions, those variables are not added to the HTTP request, which then fails with the following error:

```
Parser failed with error: syntax error, variables type is neither a JSON object nor null.
```

To resolve this problem, modify the query to remove the variable definitions before re-sending the HTTP request.

Changes to parameters in an API definition aren't reflected on the Test tab

If you add or remove parameters in an API definition on the Design tab and then open the Test tab, the changes might not be reflected immediately. If you are using the API Manager user interface, either restart the browser or clear the browser cache and cookies, if you are using the API Designer user interface, restart the application. Then reopen the Test tab in the API definition.

An OpenAPI definition that contains regular expression syntax fails validation

IBM API Connect supports the [GO regular expression syntax](#). When you import an OpenAPI definition into the API Designer or API Manager user interfaces, or validate one with the `apic validate`, the validation will fail if the OpenAPI source contains unsupported regular expression syntax, with errors that include `Does not match format 'regex'`; for example:

```
- Must validate at least one schema (anyOf) (context:
(root).paths./example/types.post.parameters.0.schema.properties.items, line: 0, col: 0)
- Must validate one and only one schema (oneOf) (context: (root).paths./example/types.post.parameters.0, line: 46164, col:
21)
- paths./example/types.post.parameters.0.schema.properties.items.properties.pattern Does not match format 'regex'
(context: (root).paths./example/types.post.parameters.0.schema.properties.items.properties.pattern, line: 0, col: 0)
```

During migration, the `archive:unpack` fails to find an OAuth provider

When migrating API Connect to Version 10, the `archive:unpack` command might generate a warning like the following:

```
WARN[2020-06-04T09:29:54-04:00] Leaving a placeholder OAuth Provider which must be replaced in draft API <api name>:
Unable to find an OAuth Provider to extract from Token URL or Authorization URL <api token/authorization URL> with
basePath /<base path> and scopes <scope list>.
```

A possible cause is that an OAuth provider matches the API path but is missing the necessary scopes. To resolve this problem, complete the following steps:

1. Update the API definition in the `cloud/provider-orgs/<provider_organization_name>/drafts` folder to replace the `x-ibm-oauth-provider` value 'placeholder' with `name://../<oauth_provider>`.
2. Update the API definition in the `cloud/provider-orgs/<provider_organization_name>/catalogs/<catalog_name>/products` folder to replace the `x-ibm-oauth-provider` value 'placeholder' with `name://../<oauth_provider>`.
3. Update the OAuth Provider definition in the `cloud/provider-orgs/<provider_organization_name>/oauth-providers` folder to add the extra scopes from the API definition.

In addition, if the OAuth Provider references a user-registry in a `user-security` section, and this user-registry is not specified in the `cloud/provider-orgs/<provider_organization_name>/catalogs/<catalog_name>/configured-api-user-registries` folder, then add an entry of the following form to ensure that the user-registry is pushed to the Catalog:

```
api_version: 2.0.0
name: name://../<user_registries/<user_registry_name>/user-registry.yml
type: configured_api_user_registry
user_registry_url: file://../<user_registries/<user_registry_name>/user-registry.yml
```

The migration of a user registry fails

When migrating API Connect to Version 10, a user registry might fail to be pushed to the API Manager with errors like the following:

```
ErrorLog2020-06-02T08:35:37-04:00.log:ERRO[2020-06-02T08:36:07-04:00] unable to create User registry <user registry name>
ErrorLog2020-06-02T08:35:37-04:00.log:ERRO[2020-06-02T08:36:07-04:00] orgldap: An error occurred communicating with the
ldap server at
'ldaps://<ldap-address>' (error: 'Error: self signed certificate in certificate chain').
```

To work around this problem, for any artifacts, such as APIs or OAuth providers, that reference this user registry in their User Security section, replace the user registry with one that has been successfully migrated.

The migration of an OAuth provider push fails due to a missing TLS client profile ID

When migrating API Connect to Version 10, an OAuth Provider might fail to be pushed to the API Manager with an error like the following:

```
unable to create Oauth provider <provider name>
<provider name>: The expected path parameter 'tls-client-profile-id' is missing from the request URL.
```

and subsequently an error like the following:

```
unable to create Configured oauth provider <provider name>
<provider name>: The 'oauth_provider_url' property value '/api/orgs/<org>/oauth-providers/<provider name>' does not refer
to a known Oauth Provider.
```

This is caused by an OAuth provider containing a custom HTML form in one or more User Security sections that specifies an `ei-custom-form-tls-client-profile` or an `az-custom-form-tls-client-profile`.

To resolve this problem, use the default TLS client profile by specifying a value of `''`.

When scaling down a Kubernetes cluster of DataPower gateways, the cluster might enter an unrecoverable state if the peering primary instance is lost

If you are scaling down a Kubernetes cluster of DataPower gateways, you must first complete the following steps to ensure that the peering primary instance is not lost:

1. List the pods in the cluster; for example:

```
$ kubectl get pods -n apiconnect --selector
app.kubernetes.io/component=datapower,crd.apiconnect.ibm.com/instance=gwv6
NAME      READY   STATUS    RESTARTS   AGE
gwv6-0    1/1     Running   0           3h31m
gwv6-1    1/1     Running   0           3h32m
gwv6-2    1/1     Running   0           3h34m
```

2. Enter the DataPower admin CLI for gateway 0, by entering the following command and logging in at the prompt; for example:

```
$ kubectl attach -n apiconnect -it gwv6-0
```

3. Switch to the API Connect domain and enter config mode:

```
idg# switch apiconnect
idg[apiconnect]# config
```

Global mode

4. Show the gateway peering status; for example:

```
idg[apiconnect] (config)# show gateway-peering-status
```

Address	Configuration name	Pending updates	Replication offset	Link status	Primary
1.2.3.1	gwd	0	18331896	ok	no
1.2.3.1	rate-limit	0	3091219	ok	no
1.2.3.1	subs	0	3150127	ok	no
1.2.3.1	tms	0	3063575	ok	no
1.2.3.2	gwd	0	18330948	ok	no
1.2.3.2	rate-limit	0	3091067	ok	no
1.2.3.2	subs	0	3149975	ok	no
1.2.3.2	tms	0	3063257	ok	no
1.2.3.3	gwd	0	18330948	ok	yes
1.2.3.3	rate-limit	0	3091067	ok	yes
1.2.3.3	subs	0	3149975	ok	yes
1.2.3.3	tms	0	3063257	ok	yes

5. For each of the configuration names, set gateway 0 to be the peering primary instance:

```
idg[apiconnect] (config)# gateway-peering-switch-primary gwd
The instance is now the primary in the peer group.
idg[apiconnect] (config)# gateway-peering-switch-primary rate-limit
The instance is now the primary in the peer group.
idg[apiconnect] (config)# gateway-peering-switch-primary subs
The instance is now the primary in the peer group.
idg[apiconnect] (config)# gateway-peering-switch-primary tms
The instance is now the primary in the peer group.
```

6. Show the gateway peering status to confirm the changes; for example:

```
idg[apiconnect] (config)# show gateway-peering-status
```

Address	Configuration name	Pending updates	Replication offset	Link status	Primary
1.2.3.1	gwd	0	19067953	ok	yes
1.2.3.1	rate-limit	0	3218172	ok	yes
1.2.3.1	subs	0	3277032	ok	yes
1.2.3.1	tms	0	3189160	ok	yes
1.2.3.2	gwd	0	19067953	ok	no
1.2.3.2	rate-limit	0	3218172	ok	no
1.2.3.2	subs	0	3277200	ok	no
1.2.3.2	tms	0	3189160	ok	no
1.2.3.3	gwd	0	19069241	ok	no
1.2.3.3	rate-limit	0	3218172	ok	no
1.2.3.3	subs	0	3277508	ok	no
1.2.3.3	tms	0	3189312	ok	no

Incorrect UI behavior if API changes are not saved before creating a new API version

If you make changes to an API definition and then attempt to create a new API version without first saving your changes, you are not prompted to save your changes until after you have completed the new version creation operation. If you click OK in the prompt, your new version is created but your original changes are lost; to create your new version and retain your original changes, you should click Cancel in the prompt, then click Save to save your original changes.

Truststore and keystore settings in a shared TLS client profile are not reflected in API Manager

If you create a shared TLS client profile in the Cloud Manager user interface and assign a truststore and a keystore, these truststore and keystore settings are not reflected in that TLS client profile in the API Manager user interface and cannot be set there. Furthermore, the TLS client profile list views display the value shared for the truststore and keystore rather than the correct values. To work around this problem, create the truststore, keystore, and TLS client profile separately for each provider organization in the API Manager user interface, then enable the TLS client profile in your Catalogs as required.

Login to the Cloud Manager or API Manager user interfaces might fail with error 431 if the browser has a large number of cookies

Attempts to login to the Cloud Manager or API Manager user interfaces might fail if the HTTP header or cookie size is larger than 16 KB, a limitation that is imposed for security reasons. To resolve this problem, either clear the browser cache and cookies, or open a private window, then retry.

The `apic cloud-settings:topology` command doesn't return a topology object

If you use the `apic cloud-settings:topology` command without a `--format` parameter, it returns only the string `CloudTopology` rather than the cloud topology. To retrieve the topology object, include the `--format` parameter, with a value of either `yaml` or `json` as required.

The `apic cloud-settings:mail-server-configured` command response is incorrect

If you use the `apic cloud-settings:mail-server-configured` without a `--format` parameter, it returns only the string `MailServerConfigured` rather than a boolean value to indicate whether an email server has been configured in the cloud settings. To retrieve the correct response, include the `--format` parameter, with a value of either `yaml` or `json` as required.

API Designer user interface might not open correctly if there are badly formed OpenAPI YAML files in the startup directory

If, when launching the API Designer user interface, the startup directory that you select contains one or more badly formed OpenAPI YAML files, the interface might fail to load correctly, with an error such as the following:

```
Cannot read property 'type' of null
```

To resolve this problem, remove any invalid OpenAPI YAML files from the startup directory, then restart the API Designer user interface.

Pagination setting is global across the API Connect user interfaces

If you set the Items per page value on any page in the Cloud Manager or API Manager user interface, that setting is then applied to all pages in both user interfaces in the same browser session. If you want to set the value separately for a specific page, open it in a private browser window. Such a setting in a private browser window is specific to that window and is lost when the window is closed.

Refresh tokens are not supported in the API Manager or API Designer user interfaces with an OIDC registry

The use of refresh tokens is supported in API Manager, API Designer, the Developer Portal, and the toolkit CLI, provided that the user logs in with a non-OIDC Provider user registry. If the registry type used for user login is OIDC, then refresh tokens are not supported in API Manager or API Designer. For more information, see [Specifying cloud settings for refresh tokens](#).

Setting resource limits in Kubernetes can cause containers to behave oddly at run time

In Kubernetes, you can set resource limits for each container. However, limiting CPU means that the container processes might slow down if they try to use too much. Limiting memory means that the Kubernetes code kills processes that try to allocate memory that would take the container over its limit. These limits can result in odd behavior such as the containers continually trying to start a daemon process, such as `nginx` or `node`, and exiting with success immediately.

Field validation for the Client security policy is incorrect

When configuring a Client Security policy in an API assembly in the API Designer or API Manager user interfaces, there is the following incorrect validation behavior:

- The ID Name field is required, but the API definition can be saved without entering a value in the field.
- The Secret Name field is required only when the Secret Required option is selected, but the user interface indicates that the Secret Name field is required regardless. Furthermore, when the field is required, the API definition can be save without entering a value.
- If the Authenticate Client Method is set to Third party, the User Registry Name field is required, but the API definition can be saved without entering a value in this field.

Requests that take longer than the value of the `nginx` timeout cause a 409 error

Requests that take longer than the value of the `nginx` timeout can cause a 409 error, such as:

```
Another request is operating on portal-subsystem-03729230-4df7-4419-94c9-e7691b616382 with the same name, please try again.
```

The error occurs because the ingress controller is sending a repeat request when the previous one timed out. Your request will still continue processing in the background.

Adding members to a provider organization might fail

When adding members to a provider organization, the Cloud Manager user interface lists the current owner and members as well. If existing members are selected, the add action will fail.

Upgrading with new certificates breaks analytics ingestion

If the analytics subsystem certificates are modified after installation (by using the `apicup certs set` command , followed by the `apicup install` command to deploy the change to the cluster), the analytics ingestion ingress will no longer be recognized by the Gateway. The analytics service must be re-registered in the Cloud Manager interface so that the new certificates are recognized.

Users are not logged out of the user interfaces after tokens expire

If an API Manager or Cloud Manager user interface session times out, the user does not get redirected to the login page and might see an error. To redirect to the login page, refresh the browser window.

User interfaces are not supported in Microsoft Edge

The API Manager and Cloud Manager user interfaces are not supported in the Microsoft Edge web browser. To work in the user interfaces, use a different browser.

New gateways cannot connect to existing gateways after the gateway peering certificates are changed

Changing the gateway peering SSL certificates after gateway installation causes new gateways to be unable to connect to existing gateways, resulting in an outage. A full restart of the gateway StatefulSet (by deleting all the StatefulSet pods) is required for the gateways to come back online.

Changes to an OAuth provider are not reflected in the consuming APIs

If you modify the endpoints, scopes, or grants for an OAuth provider, the APIs that consume that OAuth provider will be affected. You might need to update the consuming APIs accordingly.

No option to bulk delete APIs or Products

In the API Designer and API Manager user interfaces, there is currently no option to delete multiple APIs or Products in a single operation; in the user interfaces, APIs and Products must be deleted individually. However, you can bulk delete APIs and Products by using the REST API or CLI interfaces.

Cannot publish an imported API that was generated with IBM API Connect Version 5.0 LoopBack®

If you import an API YAML file that was generated with IBM API Connect Version 5.0 LoopBack, attempts to publish the API fail. Before publishing, remove the `catalogs` section, and the invoke policy named `tls-invoke-profile`, from the YAML source of the API definition; for example:

```
catalogs:
  apic-dev:
    properties:
      runtime-url: $(TARGET_URL)
  sb:
    properties:
      runtime-url: 'http://localhost:4001'
```

Cannot publish an API that has duplicate security definition entries

The API Designer and API Manager user interfaces allow you to add duplicate security definitions to an API. However, attempts to publish the API will fail with OpenAPI validation errors. Ensure that the security definitions in an API are unique.

Kubernetes might excessively evict pods

In Kubernetes, if insufficient memory, CPU, or storage resources are provided then pods are evicted randomly. To avoid this problem, allocate sufficient resources to the pods. In addition, there are known issues with log rotation in Kubernetes that are documented here:

<https://github.com/kubernetes/kubernetes/issues/59902>. The lack of log rotation can cause logs to grow, limited only by the amount of storage on the node, eventually causing pods to restart. Therefore ensure that appropriate log levels are configured for all API Connect components.

You may also follow the instructions described here <https://success.docker.com/article/how-to-setup-log-rotation-post-installation> to set the maximum size of the log before it is rolled (`max-size`) and the maximum number of log files that can be present (`max-files`). More information about the Docker JSON File logging driver is available here: <https://docs.docker.com/config/containers/logging/json-file/>.

Logging in to the API Connect user interfaces fails when using the Safari web browser

If you are using the Safari web browser and a Basic Authorization header exists for the same DNS domain in which API Connect is running, attempts to log in to the API Connect user interfaces, or to sign up by using an activation link, fail. To avoid this problem, use an alternative web browser.

Endpoints cannot be changed by using APICUP after they have been configured in Cloud Manager

The changing of endpoints with APICUP after they have been configured in Cloud Manager is not supported. Any such endpoint changes will not be propagated to a running deployment.

An OAuth provider fails if the resources that it references aren't enabled in the Catalog

If you enable an OAuth provider in a Catalog then any resources that it references, such as API user registries or TLS client profiles, must be enabled in the same Catalog; if not, then although the OAuth provider might publish successfully it will fail at run time. For information on enabling resources in a Catalog, see [Creating and configuring Catalogs](#).

Redact conditions within **switch**, **operation-switch**, or **if** policies might not execute after converting to DataPower API Gateway

If an API Connect v5-compatible **redact** policy is found within a **switch**, **operation-switch**, or **if** policy, the migration utility does not move the **redact** policy to the beginning or end of the assembly. The difference in the response between API Connect v5 and DataPower API Gateway may prevent data from being redacted in the DataPower API Gateway.

For example, if an assembly includes a **switch** policy containing four redact conditions followed by an **invoke** policy, each redact condition redacts the response data. After porting to the API Gateway, the redact conditions remain inside the **switch** policy and target the **message.body** property for redaction. These redactions fail to execute because the **message.body** property has not yet been retrieved by the **invoke** policy. To correct this problem, you must move the **invoke** policy before the **switch** policy in the assembly.

Redact on invalid XPath fails after converting to DataPower API Gateway

A **redact** policy containing an XPath with a trailing slash is converted by the migration utility `apicm archive:port-to-apigw` command without removing the slash. This path is invalid. When the API containing this policy is called, an **assembly redact** error is generated.

"Test" tab's Trace feature displays blank policies list in Firefox

When you create an API, you can invoke it and debug its execution using the Test tab. The Test tab shows the API's response and includes a subtab where you can run a trace on the API's translation flow. In Firefox, the Trace tab's list of policies is empty. Use Chrome to debug your API so you can see the policies list in the trace.

Analytics REST API support for multiple query parameters

It is not possible to use multiple query parameters for the same nested API event record field when making calls to the analytics REST API. For example:

```
/cloud/events?response_http_headers[X-Client-IP]=not:10.51.11.183&response_http_headers[X-Client-IP]=not:10.51.11.184
```

Limitations to support for JSONata

The DataPower API Gateway support for JSONata notation has the following limitations and restrictions.

- You cannot extract or redact content from the same source that is defined in the root. For example, if the root is defined as **message.body.a**, the action fails if the content to extract or redact is defined as the entire input.

As a workaround, remove the last element of the root and define that element as the content to extract or redact. For the previous example, define root as **message.body** and the content as **a**.
- New JSON objects cannot be constructed from the capture field that is specified in an Extract policy. As a workaround, use the transform expression `$merge ([])` to construct the empty object. You can then specify more extracts as needed for key-value pairs.
- If soft linked copies of a field exist in different locations, an Extract or Redaction policy can cause content from all of the linked fields to be extracted or redacted. As a workaround for the Extract policy, use the `$merge ($spread ($))` object function to construct new, unlinked objects and arrays. For example, the following transform expressions construct unlinked copies of the field **c**.

```
\ "a\" : $merge ($spread ($ . c )  
\ "b\" : $merge ($spread ($ . c )
```

API Connect concepts

To help you get started, read about the API Connect concepts and obtain a high level understanding of the API management solution.

- [Who does what in API Connect?](#)
Review the different functions that users can perform in API Connect, the typical set of tasks that is performed by each type of user, and the documentation most often used for each task.
- [Packaging strategy and terminology in API Connect](#)
API Connect uses a proprietary packaging strategy for creating and publishing collections of APIs.
- [API Connect components](#)
The API Connect components provide a unified user experience across the API lifecycle. Changes in one stage of the API lifecycle are automatically reflected in the other components of API Connect.
- [API Connect support](#)
If you experience a problem with IBM API Connect that you cannot resolve, you can check the IBM Support website for the most recent technical bulletins and fixes. Otherwise, you can contact IBM Support.

Who does what in API Connect?

Review the different functions that users can perform in API Connect, the typical set of tasks that is performed by each type of user, and the documentation most often used for each task.

Systems administrators

If you deploy API Connect on premises, then your company manages the systems. Because API Connect comprises multiple servers even in an on-premises deployment, the collection of servers and services is referred to as a (local) cloud. This is unrelated to any servers and systems that are deployed in IBM® Cloud.

In an on-premises deployment, there are two roles for managing your deployment:

- Cloud owner: There is one cloud owner for a deployment, and that person adds other people to the server management team.
- Cloud administrator: Your deployment needs at least one cloud administrator; your company will probably assign multiple people to perform this role. Cloud administrators manage the deployment and configuration of API Connect servers and software.

In the API Connect documentation, cloud owners and administrators are primarily interested in the following sections, which introduce [concepts](#) and explain how to [deploy, maintain](#), and [configure](#) the components of an on-premises deployment.

Users

At the highest level, API Connect users belong to organizations, which are groups of people. A *provider organization* (often shortened as *p-org*) is a group of people who create, publish, and maintain APIs that are then used by people in a *consumer organization*. Consumers develop their own applications that call the APIs created by providers. A single customer can create multiple provider organizations and consumer organizations. For example, different divisions within a large company might work with different technologies and create entirely different sets of APIs, so it makes sense to group them into different p-orgs. Each provider organization publishes their APIs to a Developer Portal that uses consumer organizations to manage the customers who use those APIs.

At a minimum, you need one provider organization if you want to publish and manage APIs with API Connect, and one consumer organization for each customer.

Provider organization

A provider organization performs many tasks during the lifecycle of an API, from developing, publishing, and maintaining APIs to managing the membership of the organization itself. Each p-org can be as large or as small as needed. A large company might create a p-org for each product team, or for each department but a small company might use a single p-org.

A person can be a member of multiple provider organizations and receive a different set of permissions for each. When the user logs in to API Connect, they select the organization whose resources they will use, and receive the appropriate permissions for that organization for the duration of the session.

The following roles are commonly associated with a provider organization but are not necessarily represented by different people. In a small company, one person might perform all of the API maintenance tasks while in a larger company, several people might take on separate roles.

- **Organization Owner:** Every provider organization requires one owner to ensure that a user account is associated with the organization. The organization owner has full access to all of the p-org's resources (APIs, Products, Catalogs, and so on) and role cannot be deleted. The organization owner can add people to the organization manager role.
- **Organization Manager:** Maintaining the organization account is the job of the organization manager. In a large company, several people might share this role. Organization managers add *members* to provider organizations and assign them the permissions needed to perform their jobs. Organization owners and managers typically use the docs on [administering provider orgs](#) and [administering members and roles](#).
- **API Developer:** In API Connect, an API developer creates new APIs and updates existing APIs as needed. The API developer can configure *policies* that define security restrictions, logging rules, and quotas that control access to your company's resources. The API developer might be assigned to work with a specific *Catalog* that manages a subset of APIs, or they might receive access to all of the p-org's Catalogs and the *Spaces* within each. API developers are usually most concerned with documentation related to [developing APIs](#), [managing API settings](#), and [authoring policies for APIs](#).
- **API Administrator:** After an API developer creates a set of APIs, the API administrator manages the distribution. The API administrator defines *Plans* that determine access to the APIs, collects related APIs into *Products*, and publishes them to the consumer Developer Portals. To complete these tasks, the API administrator uses documentation focused on [managing API syndication](#) and [working with Products](#).
- **Product Manager:** A product manager controls access to the Developer Portal where customers subscribe to APIs and then tracks API usage and performance. For each customer, the product manager creates a consumer organization, assigns a customer representative as the owner, and manages the relationship between the provider organization and each consumer organization. The product manager can customize the appearance of Developer Portal for their p-org as well as provide forums and blogs for their consumers. The product manager uses the API Connect Analytics service to track API usage and performance so that the p-org knows when APIs should be updated or retired. The product manager typically uses documentation on [administering consumer organizations, using the Developer Portal](#), and [reviewing API analytics](#).

Consumer organization

A consumer organization creates applications that use the APIs that are developed by provider organizations. Each provider's APIs are made available to each consumer organization in the API Connect Developer Portal. Members of a consumer organization typically perform two functions:

- **Consumer Organization Owner:** The consumer organization owner also manages the organization by inviting other members and assigning permissions to each. This role additionally has permissions to customize the Developer Portal where members access APIs that the organization is subscribed to.
- **Application Developer:** Create applications that invoke APIs shared through the Developer Portal.

The only API Connect feature that API consumers use is the Developer Portal, which is managed by the API provider. There is no need for consumers to read the API Connect documentation.

- [API Connect user roles](#)

The IBM API Connect solution provides an infrastructure, tools, and facilities that allows users to create, manage, and stage APIs. The ability to perform tasks in the API Connect user interfaces is controlled through user roles, and the permissions that are assigned to those roles.

API Connect user roles

The IBM® API Connect solution provides an infrastructure, tools, and facilities that allows users to create, manage, and stage APIs. The ability to perform tasks in the API Connect user interfaces is controlled through user roles, and the permissions that are assigned to those roles.

The roles described here are the default API Connect roles. In the API Manager user interface, you can create custom roles; for more information, see: [Creating custom roles](#). You can also create custom roles in the Developer Portal user interface.

The following sections describe the roles and permissions for each of the API Connect user interfaces:

- [User roles in the Cloud Manager UI](#).
- [User roles in the API Manager UI](#).
- [User roles in the Developer Portal UI](#).

User roles and permissions in the Cloud Manager UI

The following table describes the Cloud Manager UI user permissions as configured in the base product. Certain roles can be edited as indicated in Table 2, and custom roles can be created. For instructions on how to create custom roles for the Admin organization (Cloud Manager users), see [Creating roles in the admin organization](#).

Table 1. Cloud Manager UI permissions

Permission	Action	Meaning
------------	--------	---------

Permission	Action	Meaning
Cloud Settings	View	View all items on the Cloud Manager > Settings menu (except Roles)
	Manage	Add, update, and delete all items on the Cloud Manager > Settings menu (except Roles)
Member	View	View members on the members list located at Cloud Manager > Members
	Manage	Add and invite members from Cloud Manager > Members Note: By default, a user with Member > Manage permission can assign, to themselves or to another user, any role with any permission regardless of the permissions that they themselves have. However, you can apply a restriction such that, for a user to assign a role, they must themselves have at least all of the permissions that are applied to that role. To apply that restriction, complete the following steps: <ol style="list-style-type: none"> Log in to your management server from the toolkit CLI as a member of the cloud administration organization; for details, see Logging in to management server. Enter the following command (the terminating hyphen character means that the command takes input from the command line): <pre>apic cloud-settings:update --server mgmt_endpoint_url -</pre> where <i>mgmt_endpoint_url</i> is the platform API endpoint URL. Enter the following data, followed by a new line: <pre>restrict_member_manage_permission: true</pre> Press CTRL D to terminate the input.
Org	View	Org:View is a permission assigned to all Roles in Cloud Manager. It does not provide access to any functionality. It allows a user to activate their membership. It is the only permission in the Member role.
Provider-Org	View	View the list of provider organizations at Cloud Manager > Provider Organizations
	Manage	Add, edit, and delete provider organizations and invite owners from Cloud Manager > Provider Organizations
Settings	View	View the items on the Cloud Manager > Resources menu plus Roles located at Cloud Manager > Settings > Roles
	Manage	Add, edit, and delete the items on the Cloud Manager > Resources menu plus Roles located at Cloud Manager > Settings > Roles
Topology	View	View the items on the Cloud Manager > Topology menu
	Manage	Add, edit, and delete the items on the Cloud Manager > Topology menu
Analytics	View	View items on Cloud Manager > Analytics, and also create, update, duplicate, delete, share, and unshare saved queries.

The following table lists the various Cloud Manager UI roles and the permissions assigned to them.

Table 2. Cloud Manager UI roles

Role	Permissions	Actions	Default role provides access to	Notes
Owner	All permissions	All actions	All menus	Cannot be modified or deleted.
Administrator	All permissions	All actions	All menus	Includes analytics:view on new v10.0.5 installations, this permission must be manually added on installations upgraded from earlier releases.
Member	Org	View	Membership activation only	Cannot be modified or deleted. Member role is automatically assigned to all users when they activate their membership from the invitation. It allows them to activate but does not provide access to any menus.
Organization Manager	Org	View	N/A	Can be modified and deleted.
	Provider-Org	View, Manage	Provider Organizations menu	
Topology Administrator	Org	View	N/A	Can be modified and deleted.
	Topology	View, Manage	Topology Menu	
	Settings	View, Manage	Resources menu plus Settings > Roles	
Viewer	All permissions	View	All menus, view only	Cannot be modified or deleted.

User roles and permissions in the API Manager UI

The following tables describe the API Manager UI user permissions.

A user with Roles permission can change the permission assignments, and can create custom roles; for more information, see [Creating custom roles](#) in the section, [Managing your APIs](#).

Note: In API Manager, the Owner role has full access and cannot be edited or deleted. All other roles, including custom roles, can be deleted. If you delete a role, users lose that role. If a user loses that role, their account remains in API Manager, enabling you to add a role to the user at a future date.

Table 3. Organization permissions

Permissions	Action	Permits the member to
Member	View	View organization's members

Permissions	Action	Permits the member to
	Manage	<p>Manage organization's members</p> <p>Note: By default, a user with Member > Manage permission can assign, to themselves or to another user, any role with any permission regardless of the permissions that they themselves have. However, you can apply a restriction such that, for a user to assign a role, they must themselves have at least all of the permissions that are applied to that role. To apply that restriction, complete the following steps:</p> <ol style="list-style-type: none"> 1. Log in to your management server from the toolkit CLI as a member of the cloud administration organization; for details, see Logging in to management server. 2. Enter the following command (the terminating hyphen character means that the command takes input from the command line): <pre>apic cloud-settings:update --server mgmt_endpoint_url -</pre> <p>where <i>mgmt_endpoint_url</i> is the platform API endpoint URL.</p> 3. Enter the following data, followed by a new line: <pre>restrict_member_manage_permission: true</pre> 4. Press CTRL D to terminate the input.
Settings	View	View an organization's configuration settings, including roles, TLS profiles, and user registries. View configuration settings for a Catalog or Space, including policies and OpenAPI extensions.
	Manage	Manage an organization's configuration settings, including roles, TLS profiles, and user registries. Manage configuration settings for a Catalog or Space, including policies and OpenAPI extensions.
Topology	View	Same permissions as Settings: View .
	Manage	Same permissions as Settings: Manage .
Org	View	View an organization
Product-Drafts	View	View draft APIs and Products
	Edit	View draft APIs and edit draft Products
Api-Drafts	View	View draft APIs
	Edit	Edit draft APIs and view draft Products
Product	View	View Products
	Stage	Stage Product
	Manage	Manage Product
Product-Approval	View	View Product lifecycle changes
	Stage	Approve the staging of a Product
	Publish	Approve the publishing of a Product
	Supersede	Approve the superseding of a Product
	Replace	Approve the replacement a Product
	Deprecate	Approve the deprecation of a Product
	Retire	Approve the retiring of a Product
Consumer-Org	View	View consumer organization and developers
	Manage	Manage consumer organization and developers
App	View	View both production and development applications.
	Manage	Manage both production and development applications. A member with this permission can also request the promotion of a development app to a production app. This request triggers a task that needs approval by a member with the App-approval Manage permission.
App-Dev	Manage	Same permissions as Settings: Manage .
App-Approval	View	View application approvals, for requests to promote a development app to a production app.
	Manage	Manage (Approve or Decline) requests for approval to promote a development app to a production app.
Subscription	View	View application Plan subscriptions that have been created by application developers in the Developer Portal.
	Manage	Manage the application Plan subscriptions that have been created by application developers in the Developer Portal. The Manage permission includes ability to migrate a subscription to another plan.
Subscription-Approval	View	View application Plan subscription approvals.
	Manage	Manage (approve or decline) application Plan subscriptions.
Consumer-Onboard-Approval	View	View consumer onboard approvals.
	Manage	Manage (approve or decline) consumer onboard approvals.
Api-Analytics	View	View analytics data, as well as access and apply saved analytics queries.
	Manage	In addition to the view permissions, the user can create, update, duplicate, delete, share, and unshare saved analytics queries.
Child	View	At the provider organization level, view Catalogs in the provider organization. At the Catalog level, view Spaces in the Catalog.
	Create	At the provider organization level, create Catalogs in the provider organization. At the Catalog level, create Spaces in the Catalog.
	Manage	At the provider organization level, manage Catalogs in the provider organization. At the catalog level, manage Spaces in the Catalog. Management tasks including deleting a Catalog or Space, or transferring ownership of a Catalog or Space.

A user with Settings > Manage permission can change the permission assignments, and can create custom roles; for more information, see [Creating custom roles](#) in the section, [Managing your APIs](#).

Table 4. Default API Manager UI roles and the default permissions assigned to those roles.

Role	Role description	Permissions	Actions
------	------------------	-------------	---------

Role	Role description	Permissions	Actions
Organization Owner	A provider organization owner has the full set of access permissions to API Connect functions, and also commission APIs and tracks their business adoption.	All permissions	All actions.
Administrator	A provider organization administrator has, by default, the full set of access permissions to API Connect functions, and also commission APIs and tracks their business adoption.	All permissions	All actions.
API Administrator	API administrators manage the lifecycle of APIs and publish APIs for discovery and use.	All permissions	All actions except cannot manage the following permissions: Member, Settings, Topology, and Child.
Community Manager	A community manager manages the relationship between the provider organization and application developers, provides information about API usage, and provides support to application developers.	Member	View
		Settings	View
		Topology	View gateway services or portal services at the provider organization.
		Org	View
		Drafts	View, Edit
		Product	View
		Product-approval	View
		Consumer-org	View, Manage
		App	View, Manage
		App-dev	Manage
		App-approval	View, Manage
		Subscription	View, Manage
		Subscription-approval	View, Manage
		Consumer-onboard-approval	View, Manage
		Api-analytics	View, Manage
		Child	View
Developer	API developers design and develop APIs and applications for the provider organizations to which they belong. Note: The Developer role allows the creation of Products and APIs, and the staging and publishing of Products to a Catalog or Space, when assigned to a user at the provider organization level--but not when assigned to a user who is a member only of a Catalog or Space within a provider organization. A Developer in a Catalog or Space can manage Products that are staged or published to the Catalog or Space.	Member	View
		Settings	View
		Topology	View gateway services or portal services at the provider organization.
		Org	View
		Drafts	View, Edit
		Product	View, Stage, Manage
		Product-approval	View, Stage, Publish, Supersede, Replace, Deprecate, Retire
		Consumer-org	View
		App	View, Manage
		App-dev	Manage
		App-approval	View, Manage
		Subscription	View, Manage
		Subscription-approval	View, Manage
		Api-analytics	View, Manage
		Child	View, Create
Member	Member of a provider organization	Org	View
Viewer	Viewer of a provider organization	Member	View

Role	Role description	Permissions	Actions
		Topology	View gateway services or portal services at the provider organization.
		Org	View
		Drafts	View
		Product-approval	View
		Consumer-org	View
		App	View
		App-approval	View
		Subscription	View
		Subscription-approval	View
		Api-analytics	View
		Child	View

Note: In API Manager, the Organization Owner role has full access and cannot be edited or deleted. All other roles, including custom roles, can be deleted. If you delete a role, users lose that role. If a user loses that role, their account remains in API Manager, enabling you to add a role to the user at a future date.

User roles in the Developer Portal UI

The following table describes the various Developer Portal UI roles that relate to working with APIs and applications. In addition, you can create custom roles for the Developer Portal site itself.

Table 5. Developer Portal UI roles

Role	Role Description	Permission	Actions
Owner	Owns and administers the app developer organization	Organization member	View, Manage
		Organization settings	View, Manage
		Organization view	View
		Consumer product	View
		Consumer app	View or Manage production or development applications
		Consumer app-dev	Manage development applications
		Consumer subscription	View or Manage the application Plan subscriptions that have been created by application developers in the Developer Portal. The Manage permission includes ability to migrate a subscription to another plan.
		Consumer app-analytics	View application analytics
Administrator	Administers the app developer organization	Organization member	View, Manage
		Organization settings	View, Manage
		Organization	View
		Consumer product	View
		Consumer app	View, Manage production or development applications
		Consumer app-dev	Manage development applications
		Consumer subscription	View or Manage the application Plan subscriptions that have been created by application developers in the Developer Portal. The Manage permission includes ability to migrate a subscription to another plan.
		Consumer app-analytics	View application analytics
Developer	Builds and manages apps in the developer organization	Organization member	View
		Organization settings	View
		Organization	View
		Consumer product	View
		Consumer app	View, Manage production or development applications
		Consumer app-dev	Manage development applications
		Consumer subscription	View or Manage the application Plan subscriptions that have been created by application developers in the Developer Portal. The Manage permission includes ability to migrate a subscription to another plan.

Role	Role Description	Permission	Actions
		Consumer app-analytics	View
Member	Member of the app developer organization	Organization	View
Viewer	Viewer of the app developer organization	Organization member	View
		Organization settings	View
		Organization	View
		Consumer product	View
		Consumer app	View applications
		Consumer production-app	View production applications
		Consumer app-analytics	View application analytics

Note: A user called admin is created automatically, with full administrator access to the Developer Portal site. The admin user can view Products and APIs but has no access to use APIs. The admin user assumes the email address of the owner of the provider organization associated with the Developer Portal.

Packaging strategy and terminology in API Connect

API Connect uses a proprietary packaging strategy for creating and publishing collections of APIs.

The packaging strategy supports API providers in meeting the requirements of the API consumers. An understanding of the concepts and terminology behind the packaging strategy is required before developing and deploying APIs using IBM® API Connect.

The following sections describe the concepts and terminology behind the packaging strategy for IBM API Connect:

- [APIs](#)
- [Plans and Products](#)
- [Catalog and Spaces](#)
- [Organizations and users](#)
- [LoopBack® applications](#)
- [Sample provider organization with two Catalogs](#)

APIs

An Application Programming Interface (API) is an industry-standard software technology. An API is a set of routines, protocols, and tools for building software applications. An API specifies how software components interact and provides quick access to common assets and processes. APIs can be public (such as offered on GitHub), can require client credentials, or can be kept private within an application. Thus, APIs are classified as external (public), partner (protected), or internal (private), based on how they are consumed.

An API is composed of operations, called methods, which are offered in one of the following styles in API Connect:

- A REST API is structured according to the principles of Representational State Transfer. REST APIs use HTTP or HTTPS requests to PUT, GET, POST, and DELETE data (also referred to as CRUD operations). REST identifies resources using URIs. Data can be described in a variety of formats (XML, HTML, JSON, TXT, etc.), with JSON being the popular choice. REST APIs specify MIME (Multipurpose Internet Mail Extensions) types. REST is platform- and language-independent and works across firewalls using HTTPS. REST APIs leverage HTTP standards for security, caching, and status codes. HTTP clients and servers are available for all major programming languages and operating system/hardware platforms. REST implementations are easily scaled due to use of HTTP and browsers as a uniform interface.
- A SOAP (Simple Object Access Protocol) API is a web service that is exposed as an API. SOAP interfaces are described in WSDL (Web Services Description Language) format. The WSDL is an XML document describing the structure for headers, messages, URL endpoints, and datatypes used to access a web service. SOAP is considered more secure than REST as it supports WS-Security as well as SSL. SOAP also contains WS-Reliable Messaging for reliability, rather than relying on retrying the operation (as does REST). SOAP requires a client application and is better suited for enterprise applications that require secure transactions.

APIs can be versioned and packaged into multiple Products for distribution to API consumers on the Developer Portal. For information about creating and managing APIs, see [Developing your APIs and applications](#) and [Managing your APIs](#).

Plans and Products

Plans and Products are proprietary packaging constructs that are unique to API Connect. API providers use Products to offer one or more APIs to the application developers who will consume the APIs (API consumers). The providers use Plans to control access to APIs and to manage API usage. Products are packages that contain both the APIs and the accompanying Plans. See [Working with Products](#).

To make an API available to an application developer, it must be included in at least one Product and at least one Plan.

Plans perform the following functions:

- Control which APIs an application developer can use
- Make available a collection of operations from one or more APIs
- Apply rate limits to APIs to differentiate between offerings
- Implement different rate limits to specify how many requests a consuming application is allowed to make during a specified time interval

A rate limit can be implemented as a default rate that is shared across all operations in a Plan, or can be set for specific operations of an API. Plans can use differing rate limits to provide different levels of service to API consumers. For example, a "Demo Plan" might enforce a rate limit of ten calls per minute, while a "Full Plan" might

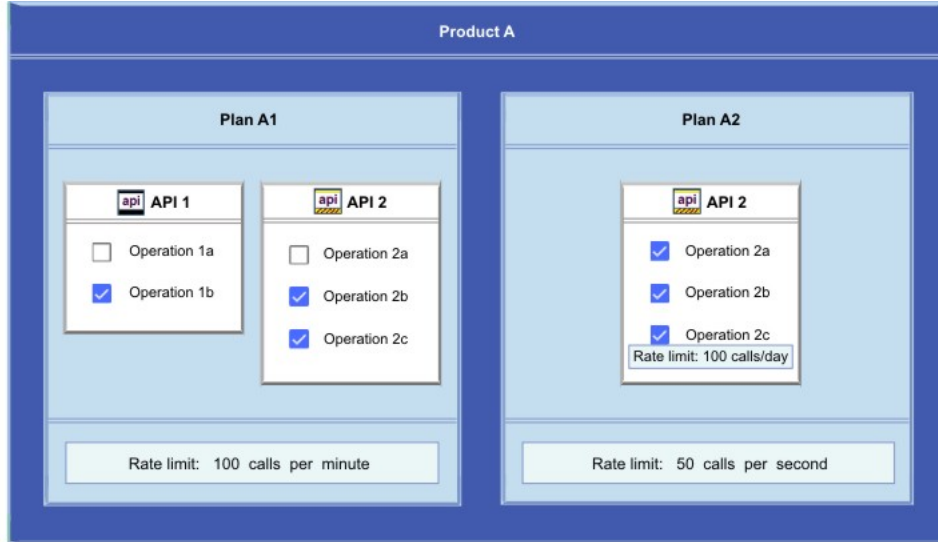

permit up to 1000 calls per second.

A Product in API Connect bundles a set of APIs and Plans into one offering that is intended for a particular use. You can create Plans only within Products, and these Products are then published in a Catalog. The following rules apply for the relationship between Products and Plans:

- A Plan can belong to only one Product.
- A Product can have multiple Plans that each contain a different set of APIs.
- A Plan in one Product can share APIs with Plans from any other Product.

Multiple Plans within a single Product provide different levels of performance for the same offering. For example, a Product can include a "Demo Plan" that makes a single API available, and a "Full Plan" that makes several APIs available.

The following diagram illustrates how Plans can be used to make operations from one or more APIs available, and to set rate limits on both Plans and individual operations:

The diagram illustrates the following concepts:

- Product A contains two APIs and two Plans.
- Both APIs are included in Plan A1.
- Plan A2 includes only API 2, which is also included in Plan A1. Operation 2a for API 2 is excluded from Plan A1. All operations in API 2 are included in Plan A2.
- Different rate limits are set for the two Plans at the Plan level. For API 2 in Plan A2, a rate limit is also set specifically for Operation 2c to override the rate limit set at the Plan level.

Products are used to manage the lifecycle of the APIs they contain. The states in the Product lifecycle include draft, staged, published, deprecated, and retired. A Product in draft state is moved to the staged state when it is staged to a *Catalog*. A Product moves to the published state when the Product is published. The APIs in a Product become accessible to API consumers when the Product is in the published state and they then become visible on a *Developer Portal*. After a Product is published, application developers can use the Developer Portal to gain access to its APIs by registering applications to one or more Plans in the Product.

The following diagram illustrates the hierarchy of Products, Plans, and APIs.

For more information about managing the lifecycle of Products, see [Working with Products in the API Manager](#).

Catalogs and Spaces

A Catalog contains a collection of Products. Catalogs are staging targets through which Products (together with the accompanying Plans and APIs) are published on a Developer Portal. Catalogs are used to separate Products and APIs for testing before publishing them on a Developer Portal. In a typical workflow, an API provider uses a development Catalog when developing and testing APIs, and uses a production Catalog for publishing APIs that are ready for external use. Each Catalog has an associated Developer Portal for exposing the published Products. A Catalog includes runtime capability through an associated gateway service that handles any API requests for the APIs in that Catalog.

API Connect includes a syndication feature that enables API providers to partition a Catalog into multiple staging targets (or *Spaces*) for API development purposes. Each API provider development team can use its own dedicated Space to manage its Products independently of other teams. A Space has its own set of capabilities relating specifically to the Products and APIs that are created and published to that Space. Products and APIs in all Spaces in a given Catalog are published to the same Developer

Portal. Spaces are not visible on the Developer Portal. Application developers who consume the APIs on the Developer Portal are unaware of the Space configuration used by the API Developers. On the Developer Portal, the APIs are seen as a coordinated offering within a Catalog.

For more information about Catalogs and Spaces, see [Working with Catalogs](#) and [Using syndication to partition Catalogs into Spaces](#).

Organizations and users

In the context of API Connect, there are two types of organizations: provider and consumer. An organization can encompass a project team, department, or division.

A provider organization owns APIs, and associated Plans and Products, and can additionally own *provider* applications that are called by APIs. To complete the various functions in the API lifecycle, a provider organization assigns responsibilities for certain tasks. Some standard responsibilities within a provider organization include:

- A provider organization owner who has the full set of access permissions to API Connect functions, and can also commission APIs and track their business adoption.
- API developers who design and develop APIs and applications for the provider organizations to which they belong.
- An administrator who manages the lifecycles of APIs and publishes APIs for discovery and use.
- A "community" manager who manages the relationship between the provider organization and application developers, provides information about API usage, and provides support to application developers.

A consumer organization owns only *developer* applications, and consumes the APIs and applications produced by the provider organization. Standard responsibilities within a consumer organization include:

- A consumer organization owner who adds application developers to the consumer organization, views the Products and APIs that the provider organization has made available on the Developer Portal, and subscribes to APIs to use them in applications.
- Application developers who view the Products and APIs that the provider organization has made available on the Developer Portal, and subscribe to use these APIs in applications.

The provider and consumer organization responsibilities map to *roles* within API Connect. Some roles are independent of an organization; for example, an administrator who manages the cloud infrastructure and keeps the system running. For information about the full set of defined roles and access permissions, see [API Connect user roles](#).

Users have an existence in the API Connect ecosystem that is independent of an organization. A user can be a member of more than one provider or consumer organization.

There can be multiple provider organizations in one API Connect cloud, to provide an API development environment for each line of business of an enterprise. The API Connect cloud is a collection of servers that comprise an API Connect installation, including the configuration information and metadata that they contain. The cloud infrastructure is shared by all organizations, and managed independently of them (by a cloud or system administrator). The following diagram shows the relationship between the provider organizations, consumer organizations, and users. The clusters shown are logical groupings of servers with the same capability.

For more information about organizations, see [Administering provider organizations](#) and [Administering consumer organizations](#).

LoopBack applications

In addition to APIs, provider organizations can also create applications (with associated APIs), which are built using Node.js and Java technology. When published, these APIs and applications are called by developer applications. The developer applications contain client code that accesses APIs to interact with a service, system, or content. The developer applications are typically mobile or web applications that use the HTTP protocol.

For information about creating LoopBack applications, see [Creating APIs and applications](#).

Sample provider organization with two Catalogs

The following diagram shows an example for how APIs, Plans, Products, Catalogs, and Spaces fit within provider and consumer organizations. In this example, two Catalogs are created in the provider organization to act as staging targets for different sets of requirements.

- Catalog 1 does not require separation of the Products for use by individual provider development teams, and so does not have Spaces enabled. API developers with access to this Catalog create draft APIs, and stage and publish them as Products to the Catalog. Several consumer organizations are granted permission to explore,

discover, and use the published Products and APIs. In each of the consumer organizations, the published Products and APIs from Catalog 1 are exposed on a single Developer Portal.

- Catalog 2 is partitioned into two Spaces (X and Y) so that two provider development teams can manage their Products independently. These teams stage and publish their APIs (as Products) separately to the individual Spaces, to make them accessible to application developers in multiple consumer organizations. In each of the developer organizations, the published Products and APIs from both Spaces are exposed in the same Developer Portal, and application developers who access this portal will see the APIs from both Spaces as a coordinated offering.

- [Understanding rate limits for APIs and Plans](#)
In API Connect, you can configure rate limiting on APIs and Plans to manage network traffic and API usage.

Understanding rate limits for APIs and Plans

In API Connect, you can configure rate limiting on APIs and Plans to manage network traffic and API usage.

What are rate limits and burst limits?

A rate limit is the maximum number of calls you want to allow in a particular time interval. Setting rate limits enables you to manage the network traffic for your APIs and for specific operations within your APIs. API Connect supports two types of rate limiting:

Rate limit

A specified number of calls to be accepted within a defined time period; for example, 100 calls per minute. In API Connect, rate limits can be defined as unlimited, or with a specified number of calls per second, minute, hour, day, or week.

Rate limits can be "hard" (enforced) or "soft". If the rate limit is hard and a call exceeds the limit, then the call is aborted and an error is returned. A soft rate limit allows the call to complete but logs a warning message. When a hard rate limit is reached, no more calls are accepted from that customer until the beginning of the next time period. For example, you might want to permit a total of 1000 calls per hour (rate limit). If a customer makes 1000 calls in the first 10 minutes, they cannot complete any more calls until the hour has expired.

Burst limit

A rate limit that is applied to a very small time period. In API Connect, burst limits are defined for multiples of seconds or minutes. Burst limits are always hard. When a burst limit is reached, calls are not accepted until the time period has expired. Once that pause is over, calls continue to be accepted until a hard rate limit is reached. Configuring a burst limit prevents usage spikes and ensures that the rate limit is evenly spread across its overall time period. For example, you might want to permit a total of 1000 calls per hour (rate limit) and a maximum spike of 50 calls per second (burst limit).

Where can you apply rate limits?

You can configure rate limiting at several levels of an API and the Plan containing it. Each of the rate limits is tracked separately and when a hard limit is exceeded, calls at that point are no longer accepted until the start of the next time period.

The following list explains where you can configure rate limits:

Plan: all APIs

You can define a general rate limit at the Plan level, and it affects all of the consumer orgs that use that Plan. When a rate limit is enforced for a Plan, the limit is checked before every call that involves any API contained in that Plan. If the rate limit is exceeded, APIs are not even called. For information on setting a rate limit for a Plan, see [Editing a draft Product](#).

Note: If the subscriber changes to a different Plan, only the Plan-level rates limit are reset. If there is a hard rate limit specified in the API's definition or assembly, that rate limit is still enforced under the new Plan.

Plan: API path and operation

You can define a rate limit for a specific path and operation of an API within a Plan; for example, you might allow unlimited calls to a GET operation but enforce a limit on PUT operations for the same API. You can even define multiple rate limits on the same path and operation. If the rate limit is enforced, then the limit is checked before every call that involves the API's path and operation. For more information on configuring rate limits on API paths and operations within a plan, see the following topics:

- [Defining rate limits for an API operation](#)
- [Describing Plans in your Product](#)

API definition

You can define a rate limit on an API in the API definition (the Design page in the user interface). This rate limit applies to all calls involving the API, from all consumer orgs. If the containing Plan allows the call but the API definition has a hard limit set, the call is aborted. For more information on setting a rate limit on an API definition, see [Changing an API rate limit](#).

API assembly

When you apply a rate limit to an API assembly, the limit only affects calls at that point in the assembly. This allows you to define a more granular rate limit than if you set it on the API definition. If the Plan and the API definition allow a call to proceed but a hard limit that is set on the assembly is exceeded, the call is aborted at the point in the process flow where the rate limit is set. Any actions that appear in the assembly's process flow before the rate limit policy are executed. Only the actions that appear in the flow after the rate limit policy are aborted. For more information on configuring assembly-level rate limits, see the following topics:

- [Rate Limit policy](#)
- [GatewayScript policy](#)
- [Using context variables in a GatewayScript policy](#)

How can you test rate limits?

When you're ready to test rate limits on an API or Plan, execute a larger number of calls than specified by your rate limit, within a shorter period of time. If you set soft rate limits, check for warning messages that indicate when each limit is exceeded. If you set hard limits, you can tell it was enforced when the API call fails. You can also check the error messages to verify which calls exceeded the limits.

For more information on creating and configuring Catalogs, see [Working with Catalogs](#).

API Connect components

The API Connect components provide a unified user experience across the API lifecycle. Changes in one stage of the API lifecycle are automatically reflected in the other components of API Connect.

- [Cloud Manager](#)
- [The developer toolkit](#)
- [API Manager](#)
- [API Gateways](#)
- [Runtime](#)
- [Developer Portal](#)
- [API Analytics](#)
- [Typical tasks per interface component](#)
- [API Connect server requirements](#)

Cloud Manager

The API Connect Cloud Manager component is used to manage the API Connect on-premises cloud. The Cloud Administrator uses this UI to:

- Define the cluster of *Management servers*, *Gateway servers*, and *containers* that are required in the cloud, and configure the topology. For information about Management servers and Gateway servers, see [API Connect server requirements](#). For information about containers, see [Runtime](#).
- Manage (modify, move, remove, restart, reboot) the servers in the cloud.
- Monitor the health of the cloud.
- Define and manage the provider organizations that develop APIs. (Assigned managers or owners of provider organizations can also complete this task.)
- Define additional cloud administrators, or set up users with roles that enable access to specific capabilities.
- Add user registries for authenticating users and securing APIs, and configure the secure transmission of data (for example, through websites).

For more information about the Cloud Manager, see [Managing your cloud](#).

The developer toolkit

The developer toolkit provides the tools for modeling, developing, and testing APIs and LoopBack® applications. The developer toolkit includes a command-line interface (CLI). It also incorporates LoopBack, an open source Node.js framework.

API developers use the API management functions in the API Designer or the CLI to create draft API definitions for REST and SOAP APIs, or for OAuth provider endpoints that are used for OAuth 2.0 authentication. The API definitions can be configured to add the API to a Product, add a policy assembly flow (to manipulate requests/responses), and to define security options and other settings. APIs can then be tested locally prior to publishing, to ensure they are defined and implemented correctly.

Using LoopBack, an API developer can create a Node.js application, connect to a data source such as a back-end database or a REST API to be consumed, and then expose the application as a REST API by creating a model definition. A LoopBack model defines the application data, validation rules, data access capabilities, and business logic for an API, and provides a REST API by default. This REST API can then be used by a REST API definition that was created using the API Designer or CLI and exposed to your users. The API and its associated application, which are implemented as a LoopBack project, must both be published to enable the project to be run. LoopBack projects can also be tested locally by creating a local runtime environment. The following diagram illustrates the LoopBack project architecture:

Draft APIs (in their containing Products) that are created by using the API Designer, CLI, or LoopBack are published to Catalogs. Applications created using LoopBack are published to containers, from where they run when called. (For information about containers, see [Runtime](#).)

The developer toolkit is installed locally, for offline API and application development. For more information about the developer toolkit, see [Developing your APIs and applications](#). For more information about LoopBack, see [LoopBack: The Node.js API Framework](#).

API Manager

The API Manager provides a user interface that facilitates promotion and tracking of APIs that are packaged within Products and Plans. API providers can move the Products through their lifecycle, and manage the availability and visibility of APIs and Plans.

Catalogs and Spaces are created in the API Manager to act as staging targets through which APIs, Plans, and Products are published to consumer organizations. API providers can stage their Products to Catalogs or Spaces, and then publish them to make the APIs in those Products visible on a *Developer Portal* for external discovery.

To control access to the available API management functions, users in the provider organization can be set up in the API Manager UI with assigned roles and permissions. API providers can also use the UI to manage the consumer organizations that sign up to access their APIs and Plans. Developer *communities* can additionally be created as a way of grouping together a collection of consumer organizations to whom a particular set of Products and Plans can be made available.

The API Manager UI also includes functions to manage the security of the API environment, and provides access to analytics information about API invocation metrics within customizable dashboard views.

For more information about the API Manager, see [Managing your APIs](#).

API Gateways

Gateways enforce runtime policies to secure and control API traffic, provide the endpoints that expose APIs to the calling applications, and provide assembly functions that enable APIs to integrate with various endpoints. They also log and report all API interactions to the API Connect analytics engine, for real-time and historical analytics and reporting. API Connect supports the following types of API gateways:

- DataPower Gateway (v5-compatible)

The DataPower® Gateway is an enterprise API Gateway that is built for departments and cross-enterprise usage. In V10 API Connect, the DataPower Gateway is compatible with the V5 DataPower Gateway, so it is referred to in documentation as the "v5-compatible" (or "v5c") gateway. The v5-compatible gateway provides a comprehensive set of API policies for security, traffic management, mediation, acceleration, and non-HTTP protocol support.

- DataPower API Gateway

The DataPower API Gateway was designed with the same security focus as the DataPower Gateway (v5-compatible). Where DataPower Gateway (v5 compatible) is built for flexibility, DataPower API Gateway is built specifically for the API use case, with resulting performance benefits. DataPower API Gateway is optimized for the cloud. Use this gateway if you are running applications in a public or private cloud and want to expose them as APIs.

Your API Connect deployment can include a virtual DataPower Gateway. Support for a physical DataPower Gateway is also available, subject to certain conditions.

For more information about the gateways, and a comparison of their features, see [Gateway types](#).

Runtime

You can run applications and API implementations in API Connect in a containerized runtime.

Containerized runtime

A containerized runtime environment provides a lightweight deployment location for APIs and applications. A container wraps an application in a complete file system that includes everything it needs to run, such as code, runtime, system tools, and system libraries. You can use Docker Swarm or Kubernetes containers to run your APIs and applications being managed by API Connect.

Developer Portal

The Developer Portal provides a customizable self-service web-based portal to application developers to explore, discover, and subscribe to APIs.

When API providers publish APIs in the API Manager, those APIs are exposed in the Developer Portal for discovery and usage by application developers in consumer organizations. Application developers can access the Developer Portal UI to register their applications, discover APIs, use the required APIs in their applications (with access approval where necessary), and subsequently deploy those applications.

The Developer Portal provides additional features, such as forums, blogs, comments, and ratings, for socialization and collaboration. API consumers can also view analytics information about the APIs that are used by an application, or used within a consumer organization. For more information, see [Developer Portal: Socialize your APIs](#).

API Analytics

API Connect provides the capability to filter, sort, and aggregate your API event data. This data is then presented within correlated charts, tables, and maps, to help you manage service levels, set quotas, establish controls, set up security policies, manage communities, and analyze trends. API analytics is built on the OpenSearch open source real-time distributed search and analytics engine.

API Connect server requirements

From an on-premises cloud, you can create, promote, use, and track APIs. An on-premises cloud is composed of various appliances, where each appliance is a server of a specific type. The collection of servers defines your cloud and determines how to distribute the work of managing, analyzing, routing, and storing data.

Your on-premises cloud can be a combination of new and existing physical appliances and virtual appliances, or can be entirely composed of virtual appliances. The type and quantity of servers in an API Connect environment are determined by the individual needs of each enterprise, but the minimum requirement is one Management server, one Analytics server, one Gateway server, and one server to host the Developer Portal.

The API Connect on-premises cloud includes the following server types:

- **Management server.** Stores all of the cloud configuration, and controls communication between the other servers within API Connect. Manages the operations of the various servers in the API Connect cloud and provides the tools to interface with the various servers. The Cloud Manager and API Manager user interfaces run on the Management server.
- **Analytics server.** Provides analytic functions that collect and store information about APIs and API users.
- **Gateway server.** Processes and manages security protocols and stores relevant user and appliance authentication data. The Gateway server also provides assembly functions that enable APIs to integrate with various endpoints, such as databases or HTTP-based endpoints.
- **Developer Portal server.** Provides a customizable social developer portal with a full-featured content management system, and includes clustering capability. Enables API providers to build portals for their application developers, and provides the interface for application developers to discover APIs and subscribe to usage Plans contained in the published Products for use in their applications.

Note: All Management appliances in an API Connect cloud must run at the same firmware level as each other. Gateway appliances can run on different firmware levels to each other, but it is recommended that all of the Gateway appliances run on the same level as each other.

Typical tasks per interface component

API Connect offers both command line and graphical user interfaces. Provider and consumer organizations use different interfaces for completing typical tasks. Refer to the following table to locate the interface that corresponds to a specific task.

Table 1. API Connect Tasks per interface component

Organization Type	Interface Component	Tasks
API Provider	Command Line Interface (CLI)	Create APIs, Plans, and Products
	API Designer UI	Create APIs, Plans, and Products
	API Manager UI	Create Catalogs and Spaces; Create Consumer Organizations
	Cloud Manager UI	Create Provider Organizations
API Consumer (application developer)	Developer Portal	Access APIs to create and run applications; Create Consumer Organizations

If self-service onboarding is enabled for a Catalog, a consumer organization is automatically created when an application developer signs up or is invited by the API provider to a Developer Portal, and the application developer then becomes the owner of that consumer organization.

- [Gateway types](#)
IBM API Connect provides the different types of gateways for use with your deployment.

Related concepts

- [Packaging strategy and terminology in API Connect](#)

Gateway types

IBM® API Connect provides the different types of gateways for use with your deployment.

Event Gateway Service

Event Endpoint Management in Cloud Pak for Integration provides an Event Gateway Service to control access from clients that consume AsyncAPI events from a Kafka cluster. For more information about event endpoints and the Event Gateway Service, see the [Cloud Pak for Integration documentation](#).

DataPower API Gateway

The DataPower® API Gateway has been designed with APIs in mind, and with the same security focus as DataPower Gateway (v5 compatible). Where DataPower Gateway (v5 compatible) was built for flexibility, DataPower API Gateway is built specifically for the API use case, with resulting performance benefits.

DataPower API Gateway was built and optimized for the cloud. Use this gateway if you are running applications in a public or private cloud and want to expose them as APIs.

DataPower Gateway (v5 compatible)

DataPower Gateway (v5 compatible) provides compatibility with the IBM DataPower Gateway that was provided with IBM API Connect Version 5 and earlier releases.

Consider using DataPower Gateway (v5 compatible) if you are an existing DataPower user and want to utilize your DataPower resources and knowledge.

Gateway comparison

The following table compares support for features between the gateway types. For v5-compatible features and policies that are not supported in DataPower API Gateway, you can use the API Connect Migration Utility (AMU) to migrate them to an API Gateway-compatible format. For more information, see [Migrating a Version 5 deployment](#).

Table 1. Comparison of the DataPower Gateway (v5 compatible) and DataPower API Gateway

Feature	DataPower Gateway (v5 compatible)	DataPower API Gateway
Native policies	No	Yes
OAuth provider	Full OAuth 2.0 Support	Full OAuth 2.0 Support
OAuth policy	No	Yes
OpenID Connect	Supported through a template	Supported natively
Invoke policy	Yes	Yes
Custom policies	Yes	Yes
Conditional policies	if, operation-switch, switch	switch
Activity logging	Implicitly executed at the end of API assembly	Configured in the API design, outside of the API assembly.
Parse policy (threat detection)	No	Yes
Gateway extensions	Yes	Yes
Support for mutual TLS (mTLS)	Yes	Yes

Attention: Version 5-compatible gateways and DataPower API Gateways have different mechanisms for interacting with the API context for GatewayScript and XSLT policies, or if you are authoring user-defined policies. Ensure that you are using the correct mechanisms for your gateway type:

- For v5-compatible gateways and v5 compatibility for APIs created for the API Gateway, see [GatewayScript code examples](#) and [XSLT policy examples](#).
- For DataPower API Gateway, see [Using context variables in GatewayScript and XSLT policies with the DataPower API Gateway](#).

API Connect support

If you experience a problem with IBM® API Connect that you cannot resolve, you can check the IBM Support website for the most recent technical bulletins and fixes. Otherwise, you can contact IBM Support.

For the most recent API Connect technical information, see the [IBM Support Community](#).

If you cannot find a resolution, before you contact IBM Support, you must gather information about the problem. For details of the information you must gather before contacting IBM Support, see [MustGather - Collecting data: API Connect problem determination](#).

Providing IBM Support with a good description of the problem together with the details of your API Connect configuration, helps to expedite the problem resolution.

API Connect glossary

The IBM® API Connect and Cloud Manager glossary of terms and definitions.

API Administrator (role)

Manages the API product lifecycle for the Provider Organizations for which they are a member.

API Event

An event captured for use by API Connect Analytics or third-party analytics, such as response time, HTTP response code, payload of the request and response body, and so on. An API event is logged each time an API operation is invoked via the Gateway server.

API Gateway

Service that acts as a single entry point or “front door” for provider APIs and back-end services. An API Gateway accepts and processes concurrent API calls, and performs traffic management, authorization and access control, monitoring, and API version management. See also [IBM DataPower Gateway](#).

API Manager

Graphical tool in API Connect that enables you to manage Catalogs, Spaces, and APIs, users and roles in the Provider organization, consumer organizations and communities, publish Products to the Developer Portal, and analyze API usage.

API Designer

Graphical tool that runs locally on a laptop or desktop system that enables you to create and modify APIs and LoopBack® apps, and publish them to IBM Cloud or container runtimes.

API operation

REST API call consisting of an HTTP verb and a URL path (endpoint). For example, `GET http://myserver.com/api/users` that returns a list of users.

Application

Software that consumes (calls) an API. One or more Applications are registered by a consumer organization to subscribe to APIs. The application is allocated client ID and client secret credentials that it supplies when invoking API calls.

assembly

Makes side calls to external services and then transforms and aggregates the response before a response is relayed to the calling application.

Availability zones

In API Connect these are logical groupings of API Connect services that will typically reflect the deployment environment. For example, you could have availability zones named **internal** and **external** to reflect the APIs published in each. Or they could be defined by the geographic location the services are running in.

Catalog

A staging target that behaves as a logical partition of the gateway and the Developer Portal. The URLs for API calls and for the Developer Portal are specific to a particular Catalog.

client ID
A piece of information that identifies an individual application. An application can invoke an API only if it passes an application key that is recognized by the IBM API Connect system and is granted access to the API. The application key is passed by the client by using an HTTP query parameter.

client secret
A piece of information used together with the application key to verify the identity of an application. An API can be configured to require that client applications supply their client secret with their client ID. The client secret functions effectively as a password known only to the application. The client secret is passed by the client by using an HTTP query parameter.

Cloud Manager (tool)
Graphical tool in API Connect on-premises installation that enables you to define servers, administer and scale system resources, monitor runtime health and create Provider organizations. The Cloud Administrator is the primary user of the Cloud Manager.

Cloud Administrator (role)
Manages the configuration of resources, regions, and availability zones for the Admin Organization of an on-premises installation.

cluster
A collection of one or more servers that provide a specific function.

Cold standby
A deployment configuration in which failover servers are in a stopped state until a failover is required, resulting in a longer time window to restore the normal operation of the solution.

community
A collection of consumer organizations. It is used as a grouping construct when publishing APIs. Communities are used to restrict the visibility and accessibility of APIs. An API can be published to selected communities, which means that only application developers within those organizations can see the API.

Community Manager (role)
Manages application developer communities for the Provider Organizations for which they are a member.

Consumer organization
Within a catalog, representation of a business entity that wishes to consume APIs exposed by the Catalog. For example, a third-party application development company would register themselves as a consumer organization (via the Developer Portal). Each developer in their company can then be registered as a user inside that consumer organization.

IBM DataPower® Gateway
API Gateway service component of API Connect that helps provide security, control, integration and optimized access to APIs. Due to its security and hardening, it is well-suited for a deployment in the demilitarized zone (DMZ) for externally-facing production scenarios. Available in physical, virtual, cloud, Linux and Docker form factors. There are two gateway types, DataPower Gateway (v5 compatible) and DataPower API Gateway; for details, see [Gateway types](#).

Developer (role)
Creates and configures APIs, Products, and policies for the Provider Organizations for which they are a member. An API Developer can be a member of one or more Provider Organizations. The API Developer focuses on the technical implementation of APIs more than they do on the business relationship with application developers.

Development Catalog
Catalog used for testing APIs that are under development and in which approvals are bypassed for publishing and lifecycle actions. Pending approvals are canceled when a non-Development Catalog is converted to a Development Catalog.

Developer Portal
Component of API Connect that provides a customizable graphical web portal for developers to discover APIs, register applications that consume APIs, subscribe to usage plans, and test and use APIs.

Developer Toolkit
Locally-installed package that includes API Designer and the `apic` command-line tool that enables you to create, edit, manage, and publish APIs and apps.

Gateway
See API Gateway.

Gateway service
API Connect service that provides API gateway functionality, such as microgateway or IBM DataPower.

Hot standby
A deployment configuration in which a set of servers are actively running ready to instantaneously take over in the event of a failure, but not actively serving traffic until that failover.

Identity provider
Provides identifiers for users looking to interact with a system, assert to such a system that such an identifier presented by a user is known to the provider, and possibly provide other information about the user that is known to the provider. API Connect supports LDAP, AuthURL, and Local User Registries.

Integrations
Third-party tools to build on and improve your API Connect workflow; for example, Slack, Auth0, etc.

Integration profile
Standard API that you can use to integrate with management services for things like identity, notifications, API analytics, and so on.

Keystore
A repository of security certificates, either authorization certificates or public key certificates, and corresponding private keys, used in SSL encryption. The Keystore file has a `.jks` extension.

LoopBack model
A JavaScript object that represents application data and includes validation rules, data access capabilities, and business logic. LoopBack models provide a REST API by default, and connect to data sources for access to back-end data

LoopBack data source
A JavaScript object that represents a back-end service such as a database, REST API (to be consumed), or SOAP web service. Data sources are backed by connectors that communicate directly with the database or other back-end service.

Management server
Stores all of the cloud configuration, and controls communication between the other servers within API Connect.

Management service
Consists of one or more Management servers.

Member (role)
The default role for all users in both the Admin and Provider Organization. All users are assigned the Member role in addition to other roles they may require.

microservice
Modular, independently-deployable application service that communicates with other microservices through a REST API. Microservices are typically organized around capabilities, for example, recommendation, inventory, shipping, or billing.

Mutual authentication
Process in which both entities on a network authenticate each other. In a network environment, the client authenticates the server and vice-versa. It is optional for TLS. Also called two-way authentication.

Notification settings

How you configure notifications for API Connect users (API providers and consumers).

Notification services

Integrations that provide notification capabilities, such as email.

Notification templates

The configuration of the message format and wording for a notification service.

OAuth provider

The OAuth provider supplies the OAuth authentication for logins. API Connect supports both Native and Third Party OAuth providers. Some common third-party OAuth providers are Google and Facebook.

OpenAPI Components

Part of API specification that contains a set of reusable objects for aspects of an API specification, such as schemas, responses, requestBodies, and headers. For more information, see [OpenAPI v3 specification](<https://github.com/OAI/OpenAPI-Specification/blob/OpenAPI.next/versions/3.0.md#components-object>).

organization

The entity that owns APIs or applications that use APIs. A provider organization owns APIs and associated Plans, and can additionally own applications. A consumer organization owns only applications. An organization has at least one owner. An organization can be a project team, department, or division.

Organization Manager (role)

The Organization Manager manages Provider Organizations for the Admin Organization.

Path

Defines the route through which users access REST APIs. A path consists of one or more HTTP operations such as GET or POST.

Plan

The packaging construct by which APIs are made available to developers. A Plan makes a collection of operations from one or more APIs available, and is published to communities of application developers. Application developers gain access to APIs by registering applications to access Plans. A Plan carries with it a collection of policy settings. In the simplest form, a Plan defines a single quota policy that applies to all the API operations that are accessed through the Plan. In more advanced cases, additional policies can be associated with a Plan.

policy

A configuration that controls a specific aspect of processing in the Gateway server during the handling of an API invocation at run time. Policies are the building blocks of assembly flows. Policies provide the means to configure capability, such as security, logging, routing of requests to target services, and transformation of data from one format to another. Policies can be configured in the context of an API or in the context of a Plan.

Product

Provide a method by which you can group APIs into a package that is intended for a particular use. Additionally, they contain Plans, which can be used to differentiate between different offerings. You can create Plans only within Products, and these Products are then published in a Catalog.

Provider Organization Owner

Owns and administers API provider organizations, manages application developer communities, authors APIs and defines products, manages the API product lifecycle. Owners are invited by the Cloud Administrator to join API Connect as an owner of a provider organization.

proxy

Application programming interface that forwards requests to a user-defined back-end resource and relays responses back to the calling application.

Region

A physical location (site or data center) hosting infrastructure isolated from other locations, with independent power and networking connectivity. A region may or may not have further sub-isolation characteristics such as semi-independent pods or availability zones.

Resources (User registries, TLS Profiles, Notifications)

Resources supply necessary functions for the API Connect cloud, such as user authentication, SSL security, and sending system-generated emails.

role

Defines permissions that can enable functionality for users. Each role has a different set of permissions.

security definition

Specifies all the settings for a particular aspect of API security; for example, the user registry that you use to authenticate access to the API.

server

A single appliance, such as an IBM WebSphere IBM DataPower appliance.

service

A user-configurable element implemented through one or more server processes in the API Connect runtime, such as microgateway, Analytics, IBM DataPower, and Developer Portal.

SNMP

Simple Network Management Protocol (SNMP) is a popular protocol for network management. It is used for collecting information from, and configuring, network devices, such as servers, printers, hubs, switches, and routers on an Internet Protocol (IP) network. The SNMP hosts are configured in the API Connect Cloud Manager.

Space

A subdivision of a Catalog. Each Space is used by a different API provider development team and has its own set of management capabilities relating specifically to the APIs that the associated team publishes to that Space, enabling each team to manage their APIs independently.

SSL (TLS) Profile

An SSL/TLS profile is used to secure the transmission of data through web sites. SSL certificates guarantee that information you submit to web sites will not be stolen or tampered with.

subscription

The means by which an application developer gains access to the resources provided by an API. An application developer uses the Developer Portal to subscribe to the plan in which the API is published.

TLS

Transport Layer Security - a cryptographic protocol that provides secure communication over a network to prevent eavesdropping and tampering. It is a successor to SSL and runs over TCP.

TLS Profiles

The Cloud Manager and API Manager use TLS profiles to secure transmission of data through web sites. TLS certificates guarantee that information you submit to web sites will not be stolen or tampered with. A TLS Profile consists of Server name, Protocol used (SSL or TLS), and whether Mutual Authentication is required.

Toolkit

See Developer Toolkit.

Topology administrator (role)

Configures gateway services for the Admin Organization.

Truststore

Stores certificates from trusted Certificate authorities(CA) which are used to verify certificate presented by Server in SSL/TSL Connection. While a keystore stores a server's credentials, the truststore stores certificates from a third-party CA.

User registry

A database or other collection containing credentials for users such as provider organization members, consumer organization members, and API Connect administrators. The users are authenticated by an identity provider such as LDAP. User registries authenticate users at login time when accessing the Cloud Manager or API Manager applications. User registries are also used to protect APIs so that user credentials must be supplied when an API is called.

vendor extension

An extension to OpenAPI (Swagger) specification required by a particular use case.

Visibility

Setting visibility determines whether a Provider Organization has access to an Availability Zone, or other service.

Accessibility features for IBM API Connect

Accessibility features help users who have a physical disability, such as restricted mobility or limited vision, to use information technology products successfully.

Accessibility features

The following list includes the major accessibility features in IBM® App Connect Enterprise. You can use screen-reader software to hear what is displayed on the screen.

- Supports keyboard-only operation.
- Supports interfaces commonly used by screen readers.

Tip: This product documentation, and its related publications, are accessibility-enabled for the IBM Home Page Reader. You can operate all features by using the keyboard instead of the mouse.

If you are reading a PDF file with a screen reader, the default reading option typically returns the best results. In some cases, how the PDF file is generated might require you to select one of the other reading options. For example, Use reading order in raw print stream.

Keyboard navigation

This product uses standard Linux® and Microsoft Windows navigation keys.

For more information about the commitments that IBM makes towards accessibility, see the [IBM Accessibility Center](#).

Legal information

Notices, and terms and conditions for information centers.

- [Tracking API volume for auditing and compliance](#)
For client security reasons, IBM entrusts its clients with monitoring their own API volume and ensuring that it is within the limits of the contract.
- [Notices](#)
This information was developed for products and services offered in the U.S.A.
- [Terms and conditions for information centers](#)
Permissions for the use of these publications are granted subject to the following terms and conditions.

Tracking API volume for auditing and compliance

For client security reasons, IBM entrusts its clients with monitoring their own API volume and ensuring that it is within the limits of the contract.

If you purchased IBM API Connect with a license metric of "API Calls", the count of total API Calls must be collected and archived by the client for audit and compliance. This includes, but is not limited to, licensed programs: "IBM API Connect Hybrid Entitlement" and "IBM Cloud Pak for Integration - API Calls".

Usage archiving

You are **required to regularly** record the number of your API calls from the Analytics **system** to maintain a record of **monthly** usage. To ensure the most accurate results, capture the counts of API Calls daily. For information about viewing API call counts and creating a query that counts API calls for **all** response status codes and for a specified time range, see [Counting total API calls for your Analytics service](#).

Overage charging

If you exceed your allotted usage, it is your responsibility to report this to IBM in the form of a CSV file so that the correct overage charge can be applied. IBM has the right to audit customer usage data at any time. If unreported overages are found, there are severe penalties.

Overage is based on the measurement period. For example, overage for a contract might be measured by the year. If your API volume exceeds the entitlement after 6 months, you must either pay overages for the remaining period or purchase additional volume.

Notices

This information was developed for products and services offered in the U.S.A.

IBM® may not offer the products, services, or features discussed in this document in other countries. Consult your local IBM representative for information on the products and services currently available in your area. Any reference to an IBM product, program, or service is not intended to state or imply that only that IBM product, program, or service may be used. Any functionally equivalent product, program, or service that does not infringe any IBM intellectual property right may be used instead. However, it is the user's responsibility to evaluate and verify the operation of any non-IBM product, program, or service.

IBM may have patents or pending patent applications covering subject matter described in this document. The furnishing of this document does not grant you any license to these patents. You can send license inquiries, in writing, to:

IBM Director of Licensing
IBM Corporation
North Castle Drive
Armonk, NY 10504-1785
U.S.A.

For license inquiries regarding double-byte character set (DBCS) information, contact the IBM Intellectual Property Department in your country or send inquiries, in writing, to:

Shimotsuruma,
Yamato-shi
Kanagawa
242-8502 Japan

The following paragraph does not apply to the United Kingdom or any other country where such provisions are inconsistent with local law: INTERNATIONAL BUSINESS MACHINES CORPORATION PROVIDES THIS PUBLICATION "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESS OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF NON-INFRINGEMENT, MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE. Some states do not allow disclaimer of express or implied warranties in certain transactions, therefore, this statement may not apply to you.

This information could include technical inaccuracies or typographical errors. Changes are periodically made to the information herein; these changes will be incorporated in new editions of the publication. IBM may make improvements and/or changes in the product(s) and/or the program(s) described in this publication at any time without notice.

Any references in this information to non-IBM Web sites are provided for convenience only and do not in any manner serve as an endorsement of those Web sites. The materials at those Web sites are not part of the materials for this IBM product and use of those Web sites is at your own risk.

IBM may use or distribute any of the information you supply in any way it believes appropriate without incurring any obligation to you.

Licensees of this program who wish to have information about it for the purpose of enabling: (i) the exchange of information between independently created programs and other programs (including this one) and (ii) the mutual use of the information which has been exchanged, should contact:

IBM United Kingdom Laboratories,
Mail Point 151,
Hursley Park,
Winchester,
Hampshire,
England
SO21 2JN

Such information may be available, subject to appropriate terms and conditions, including in some cases, payment of a fee.

The licensed program described in this information and all licensed material available for it are provided by IBM under terms of the IBM Customer Agreement, IBM International Program License Agreement, or any equivalent agreement between us.

Any performance data contained herein was determined in a controlled environment. Therefore, the results obtained in other operating environments may vary significantly. Some measurements may have been made on development-level systems and there is no guarantee that these measurements will be the same on generally available systems. Furthermore, some measurements may have been estimated through extrapolation. Actual results may vary. Users of this document should verify the applicable data for their specific environment.

Information concerning non-IBM products was obtained from the suppliers of those products, their published announcements or other publicly available sources. IBM has not tested those products and cannot confirm the accuracy of performance, compatibility or any other claims related to non-IBM products. Questions on the capabilities of non-IBM products should be addressed to the suppliers of those products.

All statements regarding IBM's future direction or intent are subject to change or withdrawal without notice, and represent goals and objectives only.

This information contains examples of data and reports used in daily business operations. To illustrate them as completely as possible, the examples include the names of individuals, companies, brands, and products. All of these names are fictitious and any similarity to the names and addresses used by an actual business enterprise is entirely coincidental.

COPYRIGHT LICENSE:

This information contains sample application programs in source language, which illustrate programming techniques on various operating platforms. You may copy, modify, and distribute these sample programs in any form without payment to IBM, for the purposes of developing, using, marketing or distributing application programs conforming to the application programming interface for the operating platform for which the sample programs are written. These examples have not been thoroughly tested under all conditions. IBM, therefore, cannot guarantee or imply reliability, serviceability, or function of these programs.

Each copy or any portion of these sample programs or any derivative work, must include a copyright notice as follows:

© (your company name) (year). Portions of this code are derived from IBM Corp. Sample Programs. © Copyright IBM Corp. _enter the year or years_. All rights reserved.

Trademarks

IBM, the IBM logo, and ibm.com[®] are trademarks or registered trademarks of International Business Machines Corp., registered in many jurisdictions worldwide. Other product and service names might be trademarks of IBM or other companies. A current list of IBM trademarks is available on the Copyright and trademark information page at <https://www.ibm.com/legal/copytrade.shtml>.

Java[™] and all Java-based trademarks and logos are trademarks or registered trademarks of Oracle and/or its affiliates.

Linux® is a registered trademark of Linus Torvalds in the United States, other countries, or both.

Kubernetes is a trademark of the Linux Foundation in the United States, other countries, or both.

Microsoft and Windows are trademarks of Microsoft Corporation in the United States, other countries, or both.

OpenShift® is a trademark of Red Hat®, Inc. in the United States, other countries, or both.

VMware is a registered trademark or trademark of VMware, Inc. in the United States and other jurisdictions.

Privacy Policy Considerations

IBM Software products, including software as a service solutions, (*Software Offerings*) may use cookies or other technologies to collect product usage information, to help improve the user experience, to tailor interactions with the user or for other purposes. In many cases no personally identifiable information is collected by the Software Offerings. Some of our Software Offerings can help enable you to collect personally identifiable information. If this Software Offering uses cookies to collect personally identifiable information, specific information about this offering's use of cookies is set forth in the following paragraphs.

Depending upon the configurations deployed, this Software Offering may use session and persistent cookies that collect each user's session ID for purposes of session management, or functional purposes. These cookies can be disabled, but disabling them will also eliminate the functionality they enable.

If the configurations deployed for this Software Offering provide you as customer the ability to collect personally identifiable information from users via cookies and other technologies, you should seek your own legal advice about any laws applicable to such data collection, including any requirements for notice and consent.

For more information about the use of various technologies, including cookies, for these purposes, See IBM's Privacy Policy at <https://www.ibm.com/privacy> and IBM's Online Privacy Statement at <https://www.ibm.com/privacy/details> the section entitled *Cookies, Web Beacons and Other Technologies* and the *IBM Software Products and Software-as-a-Service Privacy Statement* at <https://www.ibm.com/software/info/product-privacy>.

Terms and conditions for information centers

Permissions for the use of these publications are granted subject to the following terms and conditions.

Applicability

These terms and conditions are in addition to any terms of use for the IBM® website.

Personal use

You may reproduce these publications for your personal, noncommercial use provided that all proprietary notices are preserved. You may not distribute, display or make derivative work of these publications, or any portion thereof, without the express consent of IBM.

Commercial use

You may reproduce, distribute and display these publications solely within your enterprise provided that all proprietary notices are preserved. You may not make derivative works of these publications, or reproduce, distribute or display these publications or any portion thereof outside your enterprise, without the express consent of IBM.

Rights

Except as expressly granted in this permission, no other permissions, licenses or rights are granted, either express or implied, to the publications or any information, data, software or other intellectual property contained therein.

IBM reserves the right to withdraw the permissions granted herein whenever, in its discretion, the use of the publications is detrimental to its interest or, as determined by IBM, the aforementioned instructions are not being properly followed.

You may not download, export or re-export this information except in full compliance with all applicable laws and regulations, including all United States export laws and regulations.

IBM MAKES NO GUARANTEE ABOUT THE CONTENT OF THESE PUBLICATIONS. THE PUBLICATIONS ARE PROVIDED "AS-IS" AND WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING BUT NOT LIMITED TO IMPLIED WARRANTIES OF MERCHANTABILITY, NON-INFRINGEMENT, AND FITNESS FOR A PARTICULAR PURPOSE.

IBM API Connect Considerations for GDPR Readiness

Information about features of IBM® API Connect that you can configure, and aspects of the product's use, that you should consider to help your organization with GDPR readiness.

For PID(s): 5725-Z22 5725-Z63

Notice:

This document is intended to help you in your preparations for GDPR readiness. It provides information about features of API Connect that you can configure, and aspects of the product's use, that you should consider to help your organization with GDPR readiness. This information is not an exhaustive list, due to the many ways that clients can choose and configure features, and the large variety of ways that the product can be used in itself and with third-party applications and systems.

Clients are responsible for ensuring their own compliance with various laws and regulations, including the European Union General Data Protection Regulation. Clients are solely responsible for obtaining advice of competent legal counsel as to the identification and interpretation of any relevant laws and regulations that may affect the clients' business and any actions the clients may need to take to comply with such laws and regulations.

The products, services, and other capabilities described herein are not suitable for all client situations and may have restricted availability. IBM does not provide legal, accounting, or auditing advice or represent or warrant that its services or products will ensure that clients are in compliance with any law or regulation.

GDPR

General Data Protection Regulation (GDPR) has been adopted by the European Union ("EU") and applies from May 25, 2018.

Why is GDPR important?

GDPR establishes a stronger data protection regulatory framework for processing of personal data of individuals. GDPR brings:

- New and enhanced rights for individuals
- Widened definition of personal data
- New obligations for processors
- Potential for significant financial penalties for non-compliance
- Compulsory data breach notification

Read more about GDPR

- [Complete guide to GDPR compliance](#)
- [IBM GDPR website](#)

Product Configuration - considerations for GDPR Readiness

The following sections provide considerations for configuring API Connect to help your organization with GDPR readiness.

Configuration to support data handling requirements

The GDPR legislation requires that personal data is strictly controlled and that the integrity of the data is maintained. This requires the data to be secured against loss through system failure and also through unauthorized access or via theft of computer equipment or storage media.

IBM API Connect stores identity data in a local database. This encompasses both clients' employee identity data and end users' identity data. Direct access to this database is not available. Identity information collected is protected in transit; refer to [Creating a TLS Server Profile](#) for details on configuring TLS profiles.

API Connect supports a variety of user registry types for authenticating users. Refer to [Authenticating by using your enterprise user directory](#) for details. When using a local user registry, passwords are stored in encrypted form in the local API Connect database. If you want alternative password management, leverage a non-user registry option to manage passwords.

Administrators, that you define, can view identity information. Administrators can take backups that include identity information. It is your responsibility to protect these backups.

A core component for an API Connect deployment is the gateway. Refer to the section on [API Gateways](#) (in the *API Connect components* topic) for details about gateways. DataPower® Gateways are commonly leveraged; refer to the DataPower Gateway documentation for details. Refer to the DataPower Gateway deployment guidelines document for considerations for configuring DataPower Gateways to help your organization with GDPR readiness.

Configuration to support Data Privacy

For Developer Portal, you can customize the privacy policy statement. Refer to [Customizing the privacy policy statement](#) for details.

Configuration to support Data Security

To learn about securing your solution, use this API Connect product documentation and search for "security".

Data Life Cycle

GDPR requires that personal data is:

- Processed lawfully, fairly and in a transparent manner in relation to individuals.
- Collected for specified, explicit and legitimate purposes.
- Adequate, relevant and limited to what is necessary.
- Accurate and, where necessary, kept up to date. Every reasonable step must be taken to ensure that inaccurate personal data are erased or rectified without delay.
- Kept in a form which permits identification of the data subject for no longer than necessary.

API Connect manages the life cycle of user-related data in the following ways:

User account information

API Connect collects and stores identity information, including first and last name, and email address, for the purposes of user registration. Cloud Manager and API Manager accounts are for your employees (or designated actors). Developer Portal accounts are for your consumers of your APIs. Identity information can be collected directly from users or can be copied from LDAP registries. In situations where non-local user registries are used, only the email address is copied from the LDAP registry. Developer Portal user accounts can be deleted; refer to [Deleting your Developer account](#) for details. Cloud Manager and API Manager user accounts' identity information can be anonymized by users.

Users of the API Manager UI can publish Products and APIs to the Developer Portal for Application Developers to access and use. Refer to [Developer Portal: socialize your APIs](#) to learn about Developer Portal. Developer Portal accounts are for consumers of your APIs. You can define and customize a terms and conditions statement that your users must accept before they can register to use your Developer Portal; refer to [Customizing the terms of use statement](#) for details.

API analytics

API Connect optionally logs information related to API invocations. This capability in API Connect is known as API Analytics. Refer to [API Analytics](#) for details. The API Analytics log information can optionally include unknown / unclassified information such as query headers and request and response information related to API calls -- you control defining the APIs and data associated with API invocations.

The retention period for storing Analytics data in API Connect is configurable; refer to [Configuring data retention and index rollover time periods](#) for details. Backup capability for this information is not available.

To disable API Analytics, disassociate it from the gateway that collects event data. For information, refer to [Associating an analytics service with a gateway service](#).

System logs

Event-logging preferences can be configured at the API level, refer to [Activity Log](#) for details.

API Connect logs collect technical information related to service use including tracing of service execution and sequences of operation use. Other technical data related to service use includes data values that define the mechanisms used to connect to the service, for example, IP address. This data is collected for debugging and service improvement. Service diagnostics are collected during unexpected or error situations to allow the offering team to correct the situation and hopefully prevent it from occurring in the future. There is no direct access available to these logs. You can configure log settings and download the logs as explained in [Logging](#).

API Connect can generate audit events. An audit event is logged from each management node when there are changes to the API lifecycle or to the organization; for example, publishing a product or creating an organization triggers this event. Refer to [Configuring audit logging to monitor user operations](#) for details.

Data Collection

Developer Portal accounts are for consumers of your APIs. You can define and customize a terms and conditions statement that your users must accept before they can register to use your Developer Portal; refer to [Customizing the terms of use statement](#) for details. You can also customize the privacy policy statement for Developer Portal; refer to [Customizing the privacy policy statement](#) for details.

Types of Data Collected

API Connect collects and stores identity information (including first name, last name, and email address) for the purposes of user registration. Cloud Manager and API Manager accounts are for your employees (or designated actors). Developer Portal accounts are for your consumers of your APIs. Identity information can be collected directly from users or can be copied from LDAP registries. In situations where non-local user registries are used, only the email address is copied from LDAP registry. Developer Portal user accounts can be deleted; refer to [Deleting your Developer account](#) for details. Cloud Manager and API Manager user accounts' identity information can be anonymized by users.

Data Storage

Identity data is stored in API Connect local data store. There is no direct access available to this data store.

API Analytics leverages the OpenSearch real-time distributed search and analytics engine for storage of logged data. There is no direct access available to this data store.

Identity data is included in backups; refer to [Backing up and restoring](#) for details on taking backups. It is your responsibility to protect and discard backups.

Data Access

Identity information can be viewed by administrators that you define.

Analytics information can be accessed through a variety of means. Refer to [Exporting API event data](#) and [Analytics in the Developer Portal](#) for details.

Analytics information can be offloaded to third-party systems. Refer to [Offloading analytics to third-party systems](#) for details. It is your responsibility to protect off-loaded data.

API Connect can generate audit events. An audit event is logged from each management node when there are changes to the API lifecycle or to the organization; for example, publishing a product or creating an organization triggers this event. Refer to [Configuring audit logging to monitor user operations](#) for details.

API Connect logs collect technical information related to service use including tracing of service execution and sequences of operation use. Other technical data related to service use includes data values that define the mechanisms used to connect to the service, for example, IP address. This data is collected for debugging and service improvement. Service diagnostics are collected during unexpected or error situations to allow the offering team to correct the situation and hopefully prevent it from occurring in the future. There is no direct access available to these logs. You can configure log settings and download the logs as explained in [Logging](#).

Data Processing

Data collected by API Connect or to gateways via API invocations is protected by TLS in transit. Refer to [Creating a TLS Server Profile](#) for details.

Data is stored in API Connect local database on the API Connect appliances. There is no direct access available to this data.

Cloud Manager and API Manager administrators (defined by you) have read access to identity data.

Data Deletion

Right to Erasure

Article 17 of the GDPR states that data subjects have the right to have their personal data removed from the systems of controllers and processors -- without undue delay -- under a set of circumstances.

Data Deletion characteristics

Users can delete their own Developer Portal user accounts -- refer to [Deleting your Developer account](#) for details. Cloud Manager and API Manager user account identity data can be anonymized by the users to remove association with the account data.

Technical information related to service use collected in logs is rolled over based on size and time criteria.

To disable API Analytics, disassociate it from the gateway that collects event data. For information, refer to [Associating an analytics service with a gateway service](#).

The retention period for storing Analytics data in API Connect is configurable; refer to [Configuring data retention and index rollover time periods](#) for details. Backup capability for this information is not available.

Analytics information can be offloaded to third-party systems. Refer to [Offloading analytics to third-party systems](#) for details. You are responsible for the security of off-loaded data.

Identity information for accounts is included in system backups. You manage the deletion of system backups.

Data Monitoring

Customers should regularly test, assess, and evaluate the effectiveness of their technical and organizational measures to comply with GDPR. These measures should include ongoing privacy assessments, threat modeling, centralized security logging, and monitoring

API Connect can generate audit events. An audit event is logged from each management node when there are changes to the API lifecycle or to the organization; for example, publishing a product or creating an organization triggers this event. Refer to [Configuring audit logging to monitor user operations](#) for details.

Capability for Restricting Use of Personal Data

Users of the API Manager UI can publish Products and APIs to the Developer Portal for Application Developers to access and use. Refer to [Developer Portal: socialize your APIs](#) to learn about Developer Portal. Developer Portal accounts are for consumers of your APIs.

You can define and customize a terms and conditions statement that your users must accept before they can register to use your Developer Portal; refer to [Customizing the terms of use statement](#) for details. You can also customize the privacy policy statement for Developer Portal; refer to [Customizing the privacy policy statement](#) for details.

Developer Portal users can modify their own account information, and can delete their account.

Essential reading

These articles by IBM® API Connect product specialists provide a wealth of supporting information on APIs and the API economy.

[Why Become a Digital Business?](#)

Executing a Digital Transformation to become a Digital Business is among the hottest initiatives now – crossing both business and IT. But, is this just the latest buzzword or is there something to this that is different? Do you know **why** you should become a “Digital Business”?

[Creating A Digital Ecosystem – Past, Present, and Future](#)

The ability to create a digital ecosystem is critical to digital transformation success. Your success is your network reach.

[Agile integration](#)

Your business needs a modern, agile approach to integration. It should empower extended teams to create integrations, leverages a complete set of integration styles and capabilities, and increases overall productivity.

[What is an API? and What is the API Economy?](#)

Businesses start to consider APIs and the API Economy at various times. Many are long down their API journeys, while others are still considering whether to start. This article looks at some of the basics that companies considering APIs might want to know.

[What is API Management?](#)

APIs are not new. Software and hardware have had APIs (Application Programming Interfaces) for decades. However, *having* an API and *managing* an API are not the same thing.

[Providing APIs or Managing APIs – There is a Big Difference](#)

A discussion of the potential for confusion between APIs that are provided and APIs that are managed.

[Recommendations for an API Economy Center of Excellence](#)

What roles are required to drive a successful API initiative, how should this fit in the current organization, and how do these roles relate to existing roles in the company?

[Focus on the API Developer](#)

A productive developer is a happy developer. One of the most frequently discussed topics in the API economy is focusing on the needs of the Application developer – the consumer target for your APIs.

[Agile API development](#)

Agile API Development Customer expectations and behavior are continuously changing. To deliver exceptional customer experience, a business must be nimble to adapt to these changing needs.

[API Products – Who, What, Where, When, Why and How”](#)

An API Product is an API offering made available for consumer use that is offered to a target market to satisfy a customer’s needs.

[Changing Culture – How Committed Are You?](#)

How do we change the culture in our organization to create an API culture?

[Plan Ahead! Don’t Build an API Superhighway into a Cul-de-sac](#)

Without proper planning, a business can start their API initiatives, build incredible excitement quickly, but find that the path they have taken leads them into a cul-de-sac (or dead end) that cannot handle the demand they have created.

[IBM API Connect v10.x Deployment WhitePaper](#)

A technical deep dive on the deployment options for IBM API Connect.

[Principles for API Security - White Paper](#)

API security is of paramount importance in gaining the promised benefits without exposure to negative consequences.

[Can you trust your APIs?](#)

As enterprises are continuously expanding their digital footprint, they must ensure the API behavior is intact, as it has a far-reaching effect on an application's execution and end-user experience.

[Istio Service Mesh and APIConnect/DataPower Gateway integration](#)

What is Istio, and how can DataPower API Gateway integrate in an Istio Service Mesh.

[Best Practice – Monetizing API Products](#)

Ultimately the goal for almost all API initiatives is Monetization in the broad sense that crosses multiple modes from Free - to Indirect - to Direct. Most businesses using APIs successfully are monetizing APIs by speeding offerings to market, reaching new markets and new customers, innovating, and sharing assets better inside their enterprise.

Tutorials

These tutorials guide you through the steps typically required to set up, configure and run an API Connect cloud.

Introduction

These tutorials are arranged according to the desired goal, such as creating and publishing an API, or managing catalogs of products, or consuming published API products. These goals can be grouped into categories as follows.

Table 1. Tutorial Categories

Category	Description
Cloud Administration	Setting up and configuring the API Connect cloud, including the creation of Provider Organizations.
API Provider Administration	Setting up and managing catalogs, inviting organization members (such as developers), creating Developer Portals, managing resources.
API Product Promotion and Usage	Managing the Developer Portal presentation and user administration, as well as consuming published API products as an external developer.

Time required

Each tutorial should take approximately 20 - 30 minutes to finish. If you explore other concepts that are related to this tutorial, it might take longer.

Use the links in the following sections to access the tutorials that fit your goals.

Cloud Administration

Table 2. Cloud Administration Tasks. Setting up and configuring the API Connect cloud, including the creation of Provider Organizations.

Category	Tutorials
Initial Configuration	<ul style="list-style-type: none">Initial Cloud Configuration

Developer Portal Set Up	<ul style="list-style-type: none">Creating the PortalRegister a Consumer Application

API Product Promotion and Usage through the Developer Portal

There are many tutorials available for the Developer Portal from getting started to advanced customization. For more information, see [Developer Portal tutorials](#).

Prerequisites

- You must have a web browser available, whether you are working online or offline.
- When publishing Products in any of the tutorials you must have the permissions of an Organization Manager or Administrator. However, you can complete several of the tutorials with fewer permissions. For more information about user roles, see [Administering user access](#).

Installing and maintaining IBM API Connect

To ensure that your IBM® API Connect cloud functions, your cloud must have the necessary system requirements to support the installation. During the installation process, the components of IBM API Connect can be configured to satisfy your requirements.

Note: For a comprehensive technical guide to best practices, considerations, and deployment options for API Connect, see the [IBM API Connect v10.x Deployment WhitePaper](#).

- **[Kubernetes, OpenShift, and Cloud Pak for Integration](#)**
Use the instructions in this section to install, upgrade, and maintain API Connect on Kubernetes, OpenShift, and IBM Cloud Pak for Integration.
- **[VMware](#)**
Use the instructions in this section to install, upgrade, and maintain API Connect on VMware.
- **[Migrating from API Connect v5 Public Cloud](#)**
Prepare to move to API Connect v10 by migrating your existing data from API Connect v5 Public Cloud.
- **[Migrating a Version 5 deployment](#)**
Use the Migration Utility to automate the migration of a v5 deployment to a v10 deployment.
- **[Migrating v5-compatible APIs to API Gateway](#)**
Use the migration utility to automate the migration of v5-compatible APIs to DataPower API Gateway APIs.
- **[Migrating from v10 to v10 on a different form factor](#)**
Migrate an API Connect v10 deployment from one form factor to a different form factor.
- **[Migrating from v2018 to v10 on a different form factor](#)**
Migrate an API Connect v2018 deployment to a different form factor on v10. For example, migrate v2018 on Kubernetes to v10 on OpenShift.
- **[Replacing passwords, keys, and certificates](#)**
Ensure the security of your API Connect deployment by replacing compromised passwords, keys, and certificates.
- **[\[Technical Preview\] Using Config Sync to replicate consumer-side catalog data](#)**
Use the API Connect Config Sync utility to replicate consumer-side data from a source catalog in an API Connect cluster to a target catalog in a different API Connect cluster, so that API calls can be served by either API Connect cluster interchangeably to enable hybrid deployments and high-availability style scenarios.
- **[The API Connect operations tool: apicops](#)**
Use the apicops operations tool to check the health, troubleshoot, and run maintenance operations on your API Connect installation.

Kubernetes, OpenShift, and Cloud Pak for Integration

Use the instructions in this section to install, upgrade, and maintain API Connect on Kubernetes, OpenShift, and IBM Cloud Pak for Integration.

- **[Planning your deployment](#)**
Review the following topics to plan your API Connect deployment.
- **[Installing API Connect](#)**
Use these instructions to install a deployment of API Connect on Kubernetes, OpenShift, and IBM Cloud Pak for Integration.
- **[Upgrading API Connect](#)**
You can upgrade a v10 deployment of API Connect to a newer version.
- **[Maintaining API Connect](#)**
You can use utilities to complete maintenance tasks such as backup, restore, and certificate management on Kubernetes.
- **[Uninstalling API Connect](#)**
You can uninstall a Kubernetes deployment of API Connect.

Planning your deployment

Review the following topics to plan your API Connect deployment.

- **[Key concepts: Custom Resources, Operators, and Operands](#)**
API Connect uses Custom Resources (CRs) and the Kubernetes Operator pattern.
- **[Kubernetes ingress controller prerequisites](#)**
Describes the prerequisite settings for the ingress controller for a Kubernetes runtime environment.
- **[Persistent Volume \(PV\) requirements](#)**
Review the persistent volumes (PVs) required by your API Connect installation.
- **[Load balancer configuration in a Kubernetes deployment](#)**
When deploying API Connect for High Availability, it is recommended that you configure a cluster with at least three nodes and a load balancer. A sample configuration is provided for placing a load balancer in front of your API Connect Kubernetes deployment.
- **[Firewall requirements on Kubernetes](#)**
Diagram for port configuration, and list of active ports, for an IBM® API Connect deployment on Kubernetes.
- **[Planning your analytics deployment](#)**
Plan your IBM API Connect analytics deployment by reviewing options for topology, data modifications, and storage.
- **[Two data center deployment strategy on Kubernetes and OpenShift](#)**
An overview of the two data center disaster recovery deployment strategy in API Connect.
- **[Key Concepts: Cert-manager, Issuers, and Secrets](#)**
By default API Connect uses an open source product that is called [cert-manager](#) to handle the issuing and renewal of the certificates that are used by API Connect. The cert-manager has its own Kubernetes pods and runs in its own namespace. The cert-manager adds some additional resources to the Kubernetes environment. The API Connect administrator needs to be familiar with these additional resources:
- **[Certificates in a Kubernetes environment](#)**
Use of cert-manager is recommended for managing certificates in a Kubernetes environment.
- **[Webhooks deployed and managed by the API Connect Operator](#)**
The API Connect Operator deploys and manages various Kubernetes API webhooks in the cluster to assist in management of its custom resources.

Key concepts: Custom Resources, Operators, and Operands

API Connect uses Custom Resources (CRs) and the Kubernetes Operator pattern.

- Kubernetes: <https://kubernetes.io/docs/concepts/extend-kubernetes/operator/>
- OpenShift: <https://developers.redhat.com/articles/2021/06/11/kubernetes-operators-101-part-1-overview-and-key-features>.

Below are some key points to understand about how API Connect implements this pattern:

- An API Connect instance is composed of two main operators and the API Connect subsystems that they manage, which in Kubernetes terminology are known as the Operands.
- The operator is responsible for monitoring the API Connect operands, ensuring that they are running as expected.
- API Connect operands can continue running without their operator, in an unmanaged state. However, this is not a supported configuration.
- The API Connect operator manages the Management Server, Portal, and Analytics subsystems. On Kubernetes each of these subsystems has its own Custom Resource, so each of these is an Operand. On OpenShift and Cloud Pak for Integration there is also the option of having a top-level Custom Resource which manages all subsystems as a single Operand.
- The DataPower operator manages the Gateway operand.
- A single API Connect operator can manage multiple API Connect instances if the operator is installed globally and the API Connect operands are in individual namespaces. This is the recommended configuration where multiple API Connect instances are required, as opposed to a separate operator in each namespace.
- There can be only one instance of the API Connect operator in your Kubernetes or OpenShift environment. You cannot have multiple namespaces each with their own API Connect operator.
- In a single OpenShift/K8S environment all API Connect instances, operands, and operators, in all namespaces must be at the same version. The only exception is during upgrade where the operators are upgraded first.

Planning your deployment topology

On Kubernetes, OpenShift, and Cloud Pak for Integration, API Connect provides a choice of deployment options for capacity, High Availability (HA), and Disaster Recovery (DR).

High availability versus disaster recovery

High availability focuses on minimizing the loss of service that is experienced by users during a hardware or software failure. Disaster recovery (DR) focuses on the procedures for recovering a system after a catastrophic hardware, software, or operator failure. Consider the following two metrics:

Recovery Time Objective (RTO)

The RTO is the time that it is acceptable for a system to be unavailable after a disaster.

Recovery Point Objective (RPO)

DR solutions are usually based on restoring from a backup. This means that the system can only be recovered to the state it was in when the last backup was taken, and not to the state it was in at the instant the disaster occurred. The RPO measures how far back in time the recovery point is, and therefore how much new data is lost. An RPO of zero would assert that no data is lost, but such a solution is often a compromise against the cost and performance of the system.

To achieve high availability in your API Connect deployment, the three replica deployment profiles should be used, where each API Connect component consists of clusters of three replicas that are distributed across three worker nodes. However, this topology requires that all cluster members are running in the same Kubernetes environment, which requires a low network latency between worker nodes that is often unachievable between geographically separated data centers. To overcome this limitation, API Connect provides a two data center deployment solution that has both a low Recovery Time Objective (RTO), and a low Recovery Point Objective (RPO).

Deployment options

API Connect is composed of three components: Management, Portal, and Analytics, and a supporting program: the DataPower Gateway, see [API Connect components](#).

Note: Throughout this document, the DataPower Gateway supporting program is also referred to as a "component" or a "subsystem". The Management, Portal, and Analytics components are also referred to as "subsystems".

The Management, Portal, Analytics, and Gateway each have a set of capacity and HA profiles, called component profiles. OpenShift and Cloud Pak for Integration also have API Connect deployment profiles that define the component profiles that are used by each component of a complete API Connect deployment.

The naming convention of the profiles is **nAx_cB.mC** where:

- **nA** indicates the number (A) of replicas of each pod, where each replica must run on a different worker node.
- **cB** indicates the minimum number of virtual cores (B) required on the worker node to deploy the profile.
- **mC** indicates the minimum amount of memory (C) in GB required by the profile on the worker node.

Component profiles

Each API Connect component has a defined set of profiles that it can be deployed with. For information on the resource settings defined for each component profile, see [Component profiles, CPU limits, memory limits, and licensing](#).

Key points of component profiles:

- One replica profiles are denoted by **n1**, and provide a single replica of each pod. The one replica profiles can be deployed on a single worker node.
- Three replica profiles are denoted by **n3**, and provide three replicas of each pod. At least three worker nodes must be available to deploy a three replica profile. If one replica pod fails, then the other two replicas continue serving requests, providing high availability.
- Component profiles do not have to be the same for each component. For example, you can have a three replica deployment of the Management component that is configured with a one replica deployment of the Portal component.
- It is possible to change component profile after installation see [Advanced configuration](#).
- Multiple Portal, Analytics, and Gateway component instances can be added with either configuration. For example, you can have a three replica Management component that is configured with two Portal services: a one replica Portal component, and a three replica Portal component.

OpenShift and Cloud Pak for Integration API Connect deployment profiles

API Connect deployment profiles define a complete API Connect deployment, specifying the component profiles for the Management, Portal, Analytics, and Gateway components to be used in that deployment.

Key points of API Connect deployment profiles:

- The API Connect deployment profile is selected by the user in the installation steps on OpenShift and Cloud Pak for Integration.
- API Connect deployment profiles provide one instance of the Portal, Analytics, and Gateway components.
- For details of each API Connect deployment profile, see: [API Connect deployment profiles for OpenShift and Cloud Pak for Integration](#)

Two data center disaster recovery

API Connect deployments can operate across two data centers in an active/warm-standby configuration. Each data center has a complete API Connect installation. The active data center processes all user operations. The warm-standby data center does not process user operations but maintains its management and portal databases in synchronization with the active data center. If a failure occurs at the active data center, the warm-standby data center can become active with a manual failover operation. For more information on the two data center disaster recovery configuration, see: [Two data center deployment strategy on Kubernetes and OpenShift](#)

API Connect deployment profiles for OpenShift and Cloud Pak for Integration

Details of the API Connect deployment profiles that are provided for OpenShift and Cloud Pak for Integration.

API Connect provides various profiles to suit your capacity and availability requirements.

The API Connect deployment profiles provide one Management component instance, and one instance of the Portal, Analytics, and Gateway components.

On Cloud Pak for Integration:

- The available deployment profiles are presented as tiles in the Platform UI.
- The Portal, Analytics, and Gateway components are automatically registered with the Management component during installation.

n1xc7.m48: Small - Single replica

Best suited for light, noncritical workloads such as small team development and testing. Deploys 1 replica of the Management, Developer Portal, Analytics, and Gateway components with a minimal footprint.

Table 1. n1xc7.m48

Component name	Component profile
Management	n1xc2.m16
Portal	n1xc2.m8
Analytics	n1xc2.m16
Gateway	n1xc1.m8

n1xc16.m72: Medium - Single replica

Ideal for medium workloads such as organizational development, testing, and production when in alignment with business availability requirements. Deploys 1 replica of the Management, Developer Portal, Analytics, and Gateway components.

Table 2. n1xc16.m72

Component name	Component profile
APIM	n1xc4.m16
Portal	n1xc4.m16
Analytics	n1xc4.m32
Gateway	n1xc4.m8

n3xc16.m48: Large - Three replicas

Ideal for heavy workloads when business requires redundancy for greater availability & capacity. Deploys 3 replicas of the Management, Developer Portal, Analytics, and Gateway components.

Table 3. n3xc16.m48

Component name	Component profile
APIM	n3xc4.m16
Portal	n3xc4.m8
Analytics	n3xc4.m16
Gateway	n3xc4.m8

n1xc12.m64: Medium - Single replica - Remote Gateway

Ideal for medium workloads such as organizational development, testing, and production when in alignment with business availability requirements. Must be configured for use with existing or independently deployed Gateways. Deploys 1 replica of the Management, Developer Portal, and Analytics components.

Table 4. n1xc12.m64

Component name	Component profile
----------------	-------------------

Component name	Component profile
APIM	n1xc4.m16
Portal	n1xc4.m16
Analytics	n1xc4.m32

n3xc12.m40: Large - Three replicas - Remote Gateway

Ideal for heavy workloads when business requires redundancy for greater availability & capacity. Must be configured for use with existing or independently deployed Gateways. Deploys 3 replicas the Management, Developer Portal, and Analytics components.

Table 5. n3xc12.m40

Component name	Component profile
APIM	n3xc4.m16
Portal	n3xc4.m8
Analytics	n3xc4.m16

Deprecated profiles

The API Connect deployment profiles presented here existed in previous releases, but are now in a deprecated state and should not be used for new installations.

Table 6. n3xc11.m48

Component name	Component profile
APIM	n3xc2.m16
Portal	n3xc4.m8
Analytics	n3xc4.m16
Gateway	n3xc1.m8

Table 7. n3xc14.m48

Component name	Component profile
APIM	n3xc2.m16
Portal	n3xc4.m8
Analytics	n3xc4.m16
Gateway	n3xc4.m8

Table 8. n1xc10.m48

Component name	Component profile
APIM	n1xc2.m16
Portal	n1xc2.m8
Analytics	n1xc2.m16
Gateway	n1xc4.m8

Component profiles, CPU limits, memory limits, and licensing

Available component profiles, their CPU and memory limits, and how the CPU-based licensing works.

API Connect is licensed based on the CPU usage of your deployment. Each component profile sets specific CPU and memory limits on each of the containers that comprise API Connect.

API Connect operator

The API Connect operator container uses the same CPU and memory requests and limits for all profiles, and is not a container that requires license entitlement.

Table 1. Operator container CPU and memory requirements

Pod Name	Container Name	CPU Requests	CPU limits	Memory Requests	Memory Limits	PVC Size	Number of replicas	License entitlement required
ibm-apiconnect	ibm-apiconnect	75	1000	128	1Gi		1	No

The CPU and memory usage tables for each API Connect component profile are shown in the following pages.

- [Management component deployment profile limits](#)
The CPU, memory limits, and PVC space that are required for each Management profile.
- [Portal component deployment profile limits](#)
The CPU and memory limits that are defined for each Portal deployment profile.
- [Analytics component deployment profile limits](#)
The CPU and memory limits that are defined for each Analytics deployment profile.
- [DataPower gateway deployment profile limits](#)
The CPU and memory limits that are defined for each Gateway deployment profile.

Management component deployment profile limits

The CPU, memory limits, and PVC space that are required for each Management profile.

The tables in this topic also show which containers require license entitlement. The sum of the CPU limits of the licensed containers, multiplied by the number of replicas determine what you are charged. The formula is: **<total licensed CPU limit> = <total CPU limits of all licensed containers> * <number of replicas>**. For example, for the n3xc2.m16 profile:

- The three licensed containers are **apim**, **postgres**, and **taskmanager**.
- These three containers have CPU limits of 625, 750, and 625.
- This profile is a three replica (n3) profile.

The total CPU limit of the licensed containers then is: (625 + 750 + 625) * 3 = 6000

All Management component deployment profiles have job pods that complete tasks during startup, upgrade, backup, and restore operations. The job pods do not have any licensed containers, and their CPU/memory requests and limits are the same for all profiles.

Table 1. Management job pods CPU and memory requirements

Job Name	Pod Name	Container Name	CPU Requests	CPU limits	Memory Requests	Memory Limits
management-up-apim-schema	management-up-apim-schema-0-to-<nnn>-<xx>-<yy>	apim-schema	50m	500m	128Mi	256Mi
management-up-apim-data-populate	management-up-apim-data-populate-0-to-<nnn>-<xx>-<yy>	apim-data-populate	50m	600m	256Mi	4096Mi
management-up-lur-schema	management-up-lur-schema-0-to-<nnn>-<xx>-<yy>	lur-schema	50m	500m	128Mi	256Mi
management-up-lur-data-populate	management-up-lur-data-populate-0-to-<nnn>-<xx>-<yy>	lur-data-populate	50m	500m	128Mi	256Mi
backrest-backup-management-<xx>-postgres	backrest-backup-management-<xx>-postgres-<yy>	backrest	not set	not set	not set	not set
management-apim-restore-<xxx>	management-apim-restore-<xxx>-<yyy>	apim-restore	50m	500m	128Mi	256Mi
management-<xxx>-postgres-rmdata	management-<xxx>-postgres-rmdata-<yyy>	rmdata	not set	not set	not set	not set
management-<xxx>-postgres-bootstrap	management-<xxx>-postgres-bootstrap-<yyy>	database	600m	750m	512Mi	8192Mi
management-<xxx>-postgres-stanza-create	management-<xxx>-postgres-stanza-create-<yyy>	backrest	50m	500m	128Mi	256Mi

The following tables show the pod resource and license requirement for each Management component deployment profile. A separate table shows the requirements for optional features.

Important: The tables for the three replica profiles show the usage for a single replica in the three replica deployment. Except for containers that are indicated to be single replica, multiply by three to get the total usage.

n1xc2.m16

Table 2. n1xc2.m16 profile resource and licensing requirements

Pod Name	Container Name	CPU Requests	CPU limits	Memory Requests	Memory Limits	PVC Size	Number of replicas	License entitlement required
analytics-proxy	analytics-proxy	40m	800m	128Mi	512Mi		1

Portal component deployment profile limits

The CPU and memory limits that are defined for each Portal deployment profile.

The tables in this topic also show which containers require license entitlement. The sum of the CPU limits of the licensed containers, multiplied by the number of replicas determine what you are charged. The formula is: $\langle \text{total licensed CPU limit} \rangle = \langle \text{total CPU limits of all licensed containers} \rangle * \langle \text{number of replicas} \rangle$

All Portal component deployment profiles have a **sync-backup** job pod that completes tasks that are related to scheduled portal backups. The **sync-backup** job pod does not have any licensed containers, and its CPU/memory requests and limits are the same for all profiles.

Table 1. Portal job pods resource and licensing requirements

Job Name	Pod Name	Container Name	CPU Requests	CPU limits	Memory Requests	Memory Limits
<portal-instance-name>-sync-backup	<portal-instance-name>-sync-backup-<jobuid>	sync-ptl-backup-schedule	1m	1m	100Mi	100Mi

n1xc2.m8

Table 2. n1xc2.m8 profile resource and licensing requirements

Pod Name	Container Name	CPU Requests	CPU limits	Memory Requests	Memory Limits	PVC Size	Number of replicas	License entitlement required
db	db	200m	2000m	3Gi	8Gi	6Gi	1	
db	dbproxy	100m	1000m	128Mi	512Mi	15Gi	1	
www	web	150m	2000m	1Gi	5Gi	8Gi	1	Yes
www	admin	200m	2000m	1Gi	8Gi	6Gi + 15Gi	1	
nginx	nginx	20m	500m	512Mi	512Mi	1Gi	1	

Table 3. n1xc2.m8 Containers for optional features, resource and licensing requirements

Feature	Pod Name	Container Name	CPU Requests	CPU limits	Memory Requests	Memory Limits	PVC Size	Number of replicas	License entitlement required
2D CD R	db-remote	tunnel	75m	150m	160Mi	256Mi	1Gi	1

Note: For 2DCDR deployments, if the remote site is deployed with a one replica profile, the **db-remote** and **www-remote** pods have one replica, to match the remote site.

Analytics component deployment profile limits

The CPU and memory limits that are defined for each Analytics deployment profile.

The tables in this topic also show which containers require license entitlement. The sum of the CPU limits of the licensed containers, multiplied by the number of replicas determine what you are charged. The formula is: **<total licensed CPU limit> = <total CPU limits of all licensed containers> * <number of replicas>**

All Analytics component deployment profiles have an **osinit** job pod that is run on startup and completes tasks that are related to initialization. The **osinit** job pod does not have any licensed containers, and its CPU/memory requests and limits are the same for all profiles.

You can choose different storage types with the three replica profiles, and so the pods deployed differ depending on the storage option chosen: [OpenSearch storage type](#). If you choose storage type **shared**, then your analytics deployment has 1 storage pod, called **storage**. If you choose storage type **dedicated**, then your analytics deployment has 2 storage pods, called **storage** and **storage-os-master**. The tables for the three replica profiles indicate in parentheses after the pod name which storage type the pod applies to, for example "storage (shared)".

Table 1. Analytics job pods

Job Name	Pod Name	Container Name	CPU Requests	CPU limits	Memory Requests	Memory Limits
<analytics-instance-name>-osinit	<analytics-instance-name>-osinit-<podid>	osinit	8 m	100 m	128 Mi	256 Mi

The PVC sizes that are specified in the tables are the defaults. Review the planning and installation documentation to decide on the sizes to allocate for your deployment: [Planning your analytics deployment](#).

mtls-gw	mtls-gw	100 m	1000 m	256 Mi	512 Mi		3	
ingestion	ingestion	3000 m	4200 m	8 Gi	8 Gi	50 Gi	3	Yes
director	director	50 m	200 m	256 Mi	512 Mi		3	
storage (shared)	storage	2800 m	3800 m	53 Gi	53 Gi	50 Gi	3	Yes
storage (dedicated)	storage	2400 m	2800 m	49 Gi	49 Gi	50 Gi	3	Yes
storage-os-master (dedicated)	storage-os-master (dedicated)	400 m	1000 m	4 Gi	4 Gi	5 Gi	3	Yes

DataPower gateway deployment profile limits

The CPU and memory limits that are defined for each Gateway deployment profile.

The tables in this topic also show which containers require license entitlement. The sum of the CPU limits of the licensed containers, multiplied by the number of replicas determine what you are charged. The formula is: $\langle \text{total licensed CPU limit} \rangle = \langle \text{total CPU limits of all licensed containers} \rangle * \langle \text{number of replicas} \rangle$.

Note: All profiles show PVC size as 30Gi, this is only required if the Token Management Service (TMS) is enabled. If TMS is not enabled, there is no PVC requirement.

n1xc1.m8

Table 1. n1xc1.m8 profile resource and licensing requirements

Pod Name	Container Name	CPU Requests	CPU limits	Memory Requests	Memory Limits	PVC Size	Number of replicas	License entitlement required
gateway	datapower	1000m	1000m	8Gi	8Gi	30Gi	1	Yes

n1xc4.m8

gateway	datapower	4000m	4000m	8Gi	8Gi	30Gi	3	Yes

Network requirements for inter-subsystem communication

Plan how to secure the network communications between your API Connect subsystems.

API Connect provides various configuration options that are related to inter-subsystem communication.

Support load-balancer TLS termination by disabling mTLS and enabling JWT security

If your network infrastructure requires that load-balancers implement TLS termination, then mTLS between API Connect subsystems can be disabled and JSON Web Token (JWT) security can be used instead.

Note: Although mTLS is disabled, the network communication is still secured with standard TLS, which does not require passthrough to be enabled on the load-balancers. The following communication flows can be secured with JWT:

- Management initiated communication to portal, analytics, and gateway subsystems. From v10.0.5.3 and later.
- Analytics ingestion: The flow of API event records from the gateway to the analytics subsystem. From v10.0.5.4 and later.

Note: If the gateway is under a high transaction load and sending many API events to the analytics subsystem, the enablement of JWT might impact the performance of your analytics subsystem. It is recommended to run performance tests under your expected analytics load before you decide to use JWT for the analytics ingestion path.

With JWT enabled, the portal, gateway, and analytics subsystems verify the JSON Web Token (JWT) sent from the management subsystem when it initiates communication with them. The analytics subsystem verifies the JWT sent from the gateway with incoming API event data. The subsystems that receive the token contact a JSON Web Key Set (JWKS) URL to verify it. The JWKS URL is hosted by the management subsystem, in a subpath of the management subsystem's platform REST API. For more information about this feature, see [Enable JWT security instead of mTLS](#).

Use services instead of routes (OpenShift) or ingresses (Kubernetes)

Note: This feature is available on Kubernetes and OpenShift deployments where the API Connect subsystems are within the same cluster. It is not available on two data center disaster recovery deployments: [Two data center deployment strategy on Kubernetes and OpenShift](#).

For inter-subsystem communication, API Connect uses routes on OpenShift and Ingresses on Kubernetes. Both routes and ingresses require the exposure of external HTTPS endpoints. On API Connect deployments where all subsystems are in the same cluster, you can use services instead of routes or ingresses for inter-subsystem communication. When API Connect is configured to use services, all inter-subsystem communications are kept within the cluster, providing greater security and reduced load on external network infrastructure such as load-balancers.

In the context of inter-subsystem communication, the use of routes or ingresses is referred to as **external** communication, and the use of services is referred to as **in-cluster** communication.

You select whether to use **external** or **in-cluster** communication when you register your portal, gateway, or analytics subsystems with the management subsystem.

For more information about this feature, see [In-cluster service communication between subsystems](#).

Enabling mTLS on management to gateway communication

On Kubernetes and on OpenShift installations where the top-level CR is not used, mTLS can be enabled for management to gateway communication. To enable mutual TLS between the Management client and the Gateway service's manager endpoint, add `mTlsValidateClient` to the `spec` section:

```
spec:
  mTlsValidateClient: true
```

This ensures that the gateway service authenticates incoming requests from the API Manager, such as gateway service registration, and publishing APIs to the gateway service. Specifically, the gateway service requires that incoming requests present a certificate that was signed by the same CA that was used to sign the gateway service management endpoint. The gateway service management endpoint secret is specified under `gatewayManagerEndpoint.hosts.secretName`. The API Manager's gateway client's TLS credentials are specified in the ManagementCluster CR under `gateway.client.secretName`.

Note: In releases previous to 10.0.5.3, this property is called `validateApimClient`.

Note: On Cloud Pak for Integration and OpenShift where the top-level CR is used, mTLS enablement for management to gateway communication is not supported.

Management REST API CA certificate validation

The portal, gateway, and analytics subsystems make requests to the management subsystem through the REST API that is hosted by the management subsystem. This communication is standard TLS, where each REST API endpoint has a server certificate that is presented to the client during TLS handshaking. For extra security, validation of the management server certificate CA is enabled on all subsystems for new installations of API Connect v10.0.5.3 and later. If you are upgrading from an earlier release, the steps to enable this feature are

Certificates used to secure inter-subsystem communication

For information about the management of the certificates that are used in the TLS and mTLS communications between subsystems, see [Key Concepts: Cert-manager, Issuers, and Secrets](#).

Enable JWT security instead of mTLS

When and how to use JWT security instead of mTLS.

Most of the network interactions between API Connect subsystems use mTLS. The communication flows in API Connect that are secured with mTLS are as follows:

- Management to portal. mTLS set by default.
- Management to analytics. mTLS set by default.
- Management to API gateway. TLS set by default, mTLS can be enabled following [Enabling mTLS on management to gateway communication](#).
- Management to v5 compatible gateway. TLS set by default, mTLS can be enabled following [Enabling mTLS on management to gateway communication](#).
- Management to Event gateway. mTLS set by default. Cloud Pak for Integration only.
- API gateway to analytics. mTLS set by default.

- V5 compatible gateway to analytics. mTLS is set and cannot be disabled.
- Event gateway to analytics. mTLS set and cannot be disabled. Cloud Pak for Integration only.

All other inter-subsystem communication uses TLS. For the communication routes that use mTLS, it is a requirement that all network infrastructure such as load-balancers that are located between API Connect subsystems implement TLS passthrough (and not TLS termination).

Use of JSON Web Token (JWT) security instead of mTLS allows for the deployment of API Connect in network infrastructures where TLS termination is enabled on load-balancers that are located between subsystems. JWT provides application layer security between API Connect subsystems. The typical use-case for this feature is when payload inspection of all network communications is required at network boundaries. The communication flows that support JWT security are:

- Management to portal.
- Management to analytics.
- Management to API gateway.
- Management to v5 compatible gateway.
- API gateway to analytics. From v10.0.5.4 and later.

Note: It is not possible to use JWT and disable mTLS on the V5 compatible gateway to analytics message flow.

The management subsystem always sends a JWT when it initiates communication with the other subsystems, but by default the subsystems do not verify this JWT. When JWT security is enabled, the subsystems verify the JWT by making a REST call to the JSON Web Key Set (JWKS) URL. The JWKS URL is hosted on the management subsystem's platform REST API.

To enable JWT verification, you update the subsystem CRs to specify the JWKS URL. To disable JWT verification, you update the subsystem CRs and delete the value of the JWKS URL (leave it unset).

Note: For OpenShift users: The example steps in this topic use the Kubernetes `kubectl` command. On OpenShift, use the equivalent `oc` command in its place. If you are using a top-level CR you must edit the API Connect cluster CR (the top-level CR), instead of directly in the subsystem CRs. If the subsystem section is not included in the top-level CR, copy and paste the section from the subsystem CR to the top-level CR.

Disabling mTLS and enabling JSON Web Token (JWT) security

If you disable mTLS, you must enable JWT. It is not possible to configure API Connect with both mTLS and JWT disabled.

You disable mTLS on the portal, gateway, and analytics subsystems by setting the `mtlsValidateClient` property to false in the Custom Resources (CRs) of each subsystem.

Note: By default, `mtlsValidateClient` is set to false on the gateway subsystem.

When `mtlsValidateClient` is set to false, the subsystem does not verify the client's TLS credentials, but it does check for a valid JWT configuration. For example, to disable mTLS and enable JWT for management to portal communication, edit the portal CR and set:

```
spec:
  mtlsValidateClient: false
  jwksUrl: <JWKS URL>
```

where `<JWKS URL>` is the `jwksUrl` specified in the management subsystem CR `status.endpoints` section.

Using registration of the portal service in the Cloud Manager UI as an example, JWT works as follows:

1. Management subsystem establishes a TLS connection to the portal subsystem on the portal director admin endpoint, and sends a JWT to the portal.
2. Before the portal trusts the management subsystem, it first verifies the JWT it received. The JWT is verified by a call to a JSON Web Key Set (JWKS) URL.
3. The management subsystem receives the JWT verification request from the portal on its platform REST API, and responds that the JWT is valid.
4. The portal receives confirmation that the JWT is valid, and so it can trust the management subsystem and continue the registration process.

Note:

Datapower version 10.5.0.4 only: To enable JWT on the gateway to analytics communications flow, you also must add a `dataPowerOverride` section to the gateway CR:

```
spec:
  jwksUrl: <JWKS URL>
  dataPowerOverride:
    image: customregistry.com/custom-image-datapower:10.5.0.5
    version: 10.5.0.5
    license: X-XXXX-XXXXXX
```

To disable JWT security, either remove the `jwksUrl` property from the CR (and the `dataPowerOverride` if using gateway v10.5.0.4), or leave its value empty. If you disable JWT, you must enable mTLS by setting `mtlsValidateClient` to true.

Configuring the JWKS URL

The JWKS URL is defined as the platform API hostname with the following subpath appended: `api/cloud/oauth2/certs`. You can see what the JWKS URL is from the `status.endpoints` section of the management CR, for example:

```
status:
  ...
  endpoints:
  ...
  - name: jwksUrl
    secretName: api-endpoint
    type: API
    uri: https://api.apic.acme.com/api/cloud/oauth2/certs
```

Note: The JWT feature is intended for environments where there are load-balancers located between subsystems. If you are using the in-cluster communications feature [Use services instead of routes \(OpenShift\) or ingresses \(Kubernetes\)](#), then you cannot have load-balancers between subsystems, and so disabling mTLS and enabling JWT is not necessary. However, if you do want to use the JWT feature with in-cluster communications then the JWKS URL can be obtained following these steps:

1. Describe any API Connect pod:

```
kubectl describe pod <apic-pod>
```

2. In the pod describe output, search for `APIC_PLATFORM_API_SVC_ENDPOINT`:

```
Containers:
  apim:
    Environment:
      APIC_PLATFORM_API_SVC_ENDPOINT: https://management-juhu.acme-v1005-020323.svc:2000/api
```

3. The JWKS URL is the value of `APIC_PLATFORM_API_SVC_ENDPOINT` with `/cloud/oauth2/certs` appended to it. If the `APIC_PLATFORM_API_SVC_ENDPOINT` is missing the `/api` at the end, add `api/cloud/oauth2/certs` instead. The path of the JWKS URL must always be `api/cloud/oauth2/certs`.

Key points and limitations of JWT security

- For API Connect deployments upgraded from a pre-v10.0.5.3 release, the behavior of each subsystem remains the same as it was before upgrade.
- Changing the JWKS URL on portal, and analytics subsystems causes pods to restart, and so a short subsystem outage. The gateway pod does not restart when the JWKS URL is changed.
- On new installs of Cloud Pak for Integration and top-level CR OpenShift deployments, the JWKS URL is set automatically for the portal, gateway, and analytics subsystems.
- You can have both mTLS and JWT enabled, although the analytics subsystem does not verify the JWT if mTLS is enabled.
- The v5c gateway does not send a JWT to the analytics subsystem. This flow is secured by mTLS, which cannot be disabled.
- If you enable JWT for gateway to analytics communication, the ingestion of analytics data becomes dependent on the availability of the management subsystem (so that the JWT can be verified). For more information about this limitation, see: [JWT usage between gateway and analytics subsystems](#).
- Under high analytics ingestion loads, JWT enablement might impact the performance of the analytics subsystem. It is recommended to complete a performance test under your expected analytics load before you decide to use JWT for gateway to analytics communication.

JWT usage between gateway and analytics subsystems

Because the analytics subsystem makes a REST call to the management subsystems to verify the JWT it receives from the gateway, analytics ingestion depends on the management subsystem when JWT is enabled. The analytics subsystem caches the response from the JWKS URL so that it does not need to make a REST call to the management subsystem every time API event data is received from the gateway. But the JWT verification cache does expire after 24 hours, and a new REST call to the management subsystem is made to refresh the cache. The JWT dependency on the platform REST API means that an outage of the management subsystem does eventually prevent the analytics subsystem from accepting new analytics API event records.

In-cluster service communication between subsystems

Key points and limitations of `in-cluster` inter-subsystem communication.

- In-cluster communication is only possible between subsystems that are in the same cluster.
- In-cluster communication cannot be used in two data center disaster recovery deployments, [Two data center deployment strategy on Kubernetes and OpenShift](#).
- If you are upgrading from a pre-10.0.5.3 release, all existing subsystems continue to use `external` communication. If you want to change upgraded subsystems to use `in-cluster`, then you must reregister them.
- If you are adding new subsystems to an upgraded deployment you can set the subsystems to use `in-cluster` communication, but you must use different certificates and secrets for the subsystem endpoints. The default certificate and secret names for the subsystem endpoints are:
 - Analytics: `ai-endpoint`.
 - Portal: `portal-admin`.
 - Gateway: `gmv6-manager-endpoint` or `gw-gateway-manager`

Do not use these same certificate and secret names if your additional subsystems are in the same namespace.

- After a portal, gateway, or analytics subsystem is registered with the management subsystem, to change the communication mechanism you must reregister the subsystem. For more information on this procedure, see:
 - [Kubernetes: Change inter-subsystem communication type](#).
 - [OpenShift: Change inter-subsystem communication type](#).

Important: Backups of the management subsystem cannot be restored if the communication type of any registered subsystem is changed after the backup was taken. Do not change the communication type of any of your subsystems if you might want to restore your management subsystem from a previous backup.

- If you customize any TLS certificates used for inter-subsystem communication, then to use `in-cluster` communication the TLS certificates must include the service hostname in the DNS section of the SAN, for example:

```
X509v3 Subject Alternative Name: critical
DNS: ptladmin.mydomain.com, DNS: portal.apic.svc, DNS: portal.apic.svc.cluster.local
```

- On Cloud Pak for Integration, all subsystems are registered automatically during deployment with `external` communication specified.

Kubernetes ingress controller prerequisites

Describes the prerequisite settings for the ingress controller for a Kubernetes runtime environment.

Before you begin

Note: This article refers to third-party software that IBM does not control. As such, the software may change and this information may become outdated.

These instructions assume you have a working Kubernetes environment and understand how to manage Kubernetes. Kubernetes is a platform for automated deployment, scaling, and operation of application containers across clusters of hosts, providing container-centric infrastructure. For more information, see <https://kubernetes.io>.

Kubernetes/ingress-nginx ingress controller `ingress-config.yml` settings

A Kubernetes deployment for IBM® API Connect requires the `kubernetes/ingress-nginx` ingress controller implementation (see <https://github.com/kubernetes/ingress-nginx>) with SSL passthrough enabled.

API Connect v10 does not require Helm, so it is recommended to use Helm3 for the installation of the ingress controller. Follow these steps:

1. Create a file `ingress-config.yaml` where the following values are required:
Specify at least one SSL protocol; separate multiple protocols with a comma as shown in the example.

```
controller:
  watchIngressWithoutClass: true
  admissionWebhooks:
    enabled: false
  config:
    ssl-protocols: "TLSv1.2 TLSv1.3"
  extraArgs:
    annotations-prefix: ingress.kubernetes.io
    enable-ssl-passthrough: true
```

You may use the following sample `ingress-config.yml` file to configure the ingress controller:

```
controller:
  watchIngressWithoutClass: true
  admissionWebhooks:
    enabled: false
  config:
    hsts-max-age: "31536000"
    keepalive: "32"
    log-format: '{ "@timestamp": "$time_iso8601", "@version": "1", "clientip": "$remote_addr",
      "tag": "ingress", "remote user": "$remote_user", "bytes": $bytes_sent, "duration":
      $request_time, "status": $status, "request": "$request_uri", "urlpath": "$uri",
      "urlquery": "$args", "method": "$request_method", "referer": "$http_referer",
      "useragent": "$http_user_agent", "software": "nginx", "version": "$nginx_version",
      "host": "$host", "upstream": "$upstream_addr", "upstream-status": "$upstream_status"
    }'
    main-snippets: load_module "modules/nginx_stream_module.so"
    proxy-body-size: "0"
    proxy-buffering: "off"
    server-name-hash-bucket-size: "128"
    server-name-hash-max-size: "1024"
    server-tokens: "False"
    ssl-ciphers: HIGH:!aNULL!MD5
    ssl-prefer-server-ciphers: "True"
    ssl-protocols: "TLSv1.2 TLSv1.3"
    use-http2: "true"
    worker-connections: "10240"
    worker-cpu-affinity: auto
    worker-processes: "1"
    worker-rlimit-nofile: "65536"
    worker-shutdown-timeout: 5m
  daemonset:
    useHostPort: false
  extraArgs:
    annotations-prefix: ingress.kubernetes.io
    enable-ssl-passthrough: true
  hostNetwork: true
  kind: DaemonSet
  name: controller
rbac:
  create: "true"
```

2. Run the commands:

```
helm3 repo add ingress-nginx https://kubernetes.github.io/ingress-nginx
helm3 repo update
helm3 install ingress-controller ingress-nginx/ingress-nginx --namespace kube-system --values ingress-config.yaml
```

Kubernetes/ingress-nginx ingress controller `config.map` settings

To ensure that the IBM API Connect services have time to start, increase the `proxy-read-timeout` and `proxy-send-timeout` values, which are in seconds, in the `kubernetes/ingress-nginx` ingress controller `config.map` to at least the following:

- `proxy-read-timeout: "240"`
- `proxy-send-timeout: "240"`

Depending on your environment, you might need to increase these further if the IBM API Connect services do not start. If there is a load balancer in front of the worker nodes, then the load balancer configuration might also need to have extended timeouts.

System and Software Requirements

The system and software requirements are described in the Software Product Compatibility Reports. See [Detailed system requirements for a specific product](#)

Persistent Volume (PV) requirements

Review the persistent volumes (PVs) required by your API Connect installation.

The PV requirements for API Connect subsystems vary according to the number of subsystem nodes that are deployed, whether you are using two datacenter disaster recovery (2DCDR) [Two data center deployment strategy on Kubernetes and OpenShift](#), and other subsystem specific options.

Management subsystem

Table 1. Management PV requirements

Deployment profile	Number of PVs required
Single node (n1)	3
Three node (n3)	7

Note: An additional 2 PVs are required for upgrade of the n3 deployment profile. Replaced PVs can be deleted after successful upgrade.

Gateway subsystem

Only required where `tokenManagementService` is enabled:

```
tokenManagementService:  
  enabled: true  
  storage:  
    storageClassName: $STORAGE_CLASS  
    volumeSize: 30Gi
```

Portal subsystem

Table 2. Portal PV requirements

Deployment profile	Number of PVs required
Single node (n1), one datacenter	6
Three nodes (n3), one datacenter	18
Single node (n1), two datacenter	9 per datacenter
Three nodes (n3), two datacenter	27 per datacenter
Single node (n1), two datacenter, where other datacenter is three node (n3)	13 in n1 datacenter, 23 in n3 datacenter
Three node (n3), two datacenter, where other datacenter is single node (n1)	30 in n3 datacenter, 15 in n1 datacenter

Analytics subsystem

The number of PVs needed varies according to whether the [persistent queue](#) feature is used, and if internal storage is enabled [Planning to disable internal storage](#).

Table 3. Analytics PV requirements

Deployment profile	Storage enabled	Storage disabled (ingestion only)	Extra PVs if persistent queue enabled
Single node (n1)	1	0	1
Three node (n3)	3	0	3

Note: The last column shows the PVs that must be added to those specified in the storage columns. For example, if you have an n1 profile with storage and persistent queue enabled, then you need 2 PVs.

Load balancer configuration in a Kubernetes deployment

When deploying API Connect for High Availability, it is recommended that you configure a cluster with at least three nodes and a load balancer. A sample configuration is provided for placing a load balancer in front of your API Connect Kubernetes deployment.

Before you begin

Note:

- This article does not apply to the IBM® DataPower® Gateway component that is a part of the IBM API Connect solution.
- This article applies to third-party software that IBM does not control. As such, the software may change and this information may become outdated.

About this task

API Connect can be deployed on a single node cluster. In this case the ingress endpoints are host names for which the DNS resolution points to the single IP address of the corresponding node hosting a particular subsystem, and no load balancer is required. For high availability, it is recommended to have at least a three node cluster. With three nodes, the ingress endpoints cannot resolve to a single IP address. A load balancer should be placed in front of an API Connect subsystem to route traffic.

Because it is difficult to add nodes once endpoints are configured, a good practice is to configure a load balancer even for single node deployments. With the load balancer in place, you can easily add nodes when needed. Add the node to the list of servers pointed to by the load balancer and the ingress endpoints defined during installation of API Connect can remain unchanged.

To support Mutual TLS communication between the API Connect subsystems, configure the load balancer with **SSL Passthrough** and **Layer 4** load balancing. In order for Mutual TLS to be performed directly by the API Connect subsystems, the load balancer should leave the packets unmodified, as is accomplished by Layer 4. Following is a description of the communication between the endpoints that are configured with Mutual TLS:

- API Manager (with the client certificate portal-client) communicates with the Portal Admin endpoint portal-admin (with the server certificate portal-admin-ingress)
- API Manager (with the client certificate analytics-ingestion-client) communicates with the Analytics Ingestion endpoint analytics-ingestion (with the server certificate analytics-ingestion-ingress)

Note: From v10.0.5.3, it is possible to disable mTLS and use JWT instead, which allows the load-balancers to do TLS termination. For more information, see [Enable JWT security instead of mTLS](#).

Set endpoints to resolve to the load balancer

When configuring a load balancer in front of the API Connect subsystems, the ingress endpoints are set to host names that resolve to a load balancer, rather than to the host name of any specific node. For an overview of endpoints, see [Deployment overview for endpoints and certificates](#).

Use these example topologies as a guideline to determine the best way to configure the load balancer for your deployment.

Procedure

- **Kubernetes cluster with wildcard DNS**

In this example, API Connect is deployed to a Kubernetes cluster with three master and six worker nodes. The master nodes have the Kubernetes API server listening on port 6443. The Kubernetes API Server is used for communicating with the kubectl command line interface. Note that it is generally not necessary for the Kubernetes API server (on port 6443 in this example) to be exposed outside the cluster through the load balancer, this is just one possible setup shown here.

The kubernetes/ingress-nginx ingress controller is deployed as a daemonset, so that every worker node in the cluster has an ingress controller pod listening on port 443. The API Connect subsystems (API Manager, Developer Portal, Analytics and Gateway) are all deployed on this same cluster.

Note:

- When you configure a load balancer in front of a Management subsystem, specify timeouts of at least 240 seconds. Note that large deployments might need larger values.

The default timeout is typically 50 or 60 seconds, which is not long enough to avoid **409 Conflict** or **504 Gateway Timeout** errors. The **409 Conflict** error can occur when the time needed to complete an operation is sufficiently long that a second request gets issued.

For example, to specify 240 seconds when using HAProxy as a load balancer, set `timeout client` and `timeout server` to `240000`.

Best practice is to ensure that the same values are specified for the timeout settings for the load balancer and for the Kubernetes ingress controller. The ingress controller timeout settings are set in the ingress controller config.map. For more information, see the `proxy-read-timeout` and `proxy-send-timeout` settings in [Kubernetes ingress controller prerequisites](#).

- Ensure that the load balancer is configured to support the cipher `TLS_ECDHE_RSA_WITH_AES256_GCM_SHA384 (0xc030)`. When the Developer Portal, as a client, calls back to platform-api-endpoint or consumer-api-endpoint of the management subsystem, it sends only a single cipher in the Client Hello. The cipher is `TLS_ECDHE_RSA_WITH_AES256_GCM_SHA384 (0xc030)`. The SSL Handshake will fail if this cipher is not configured (supported) on the client's load balancer.

A host running HAProxy acts as the load balancer, with a configuration for proxies in the HAProxy configuration file such as:

```
defaults
    log          global
    mode        http
    option      httplog
    option      dontlognull
    timeout    connect 5000
    timeout    client 240000
    timeout    server 240000
    errorfile  400 /etc/haproxy/errors/400.http
    errorfile  403 /etc/haproxy/errors/403.http
    errorfile  408 /etc/haproxy/errors/408.http
    errorfile  500 /etc/haproxy/errors/500.http
    errorfile  502 /etc/haproxy/errors/502.http
    errorfile  503 /etc/haproxy/errors/503.http
    errorfile  504 /etc/haproxy/errors/504.http

frontend apiservers
    bind *:6443
    mode tcp
    option tcplog

    server cluster1-worker-4 10.169.241.196:443 check
    server cluster1-worker-5 10.169.241.168:443 check
    server cluster1-worker-6 10.169.241.156:443 check
```

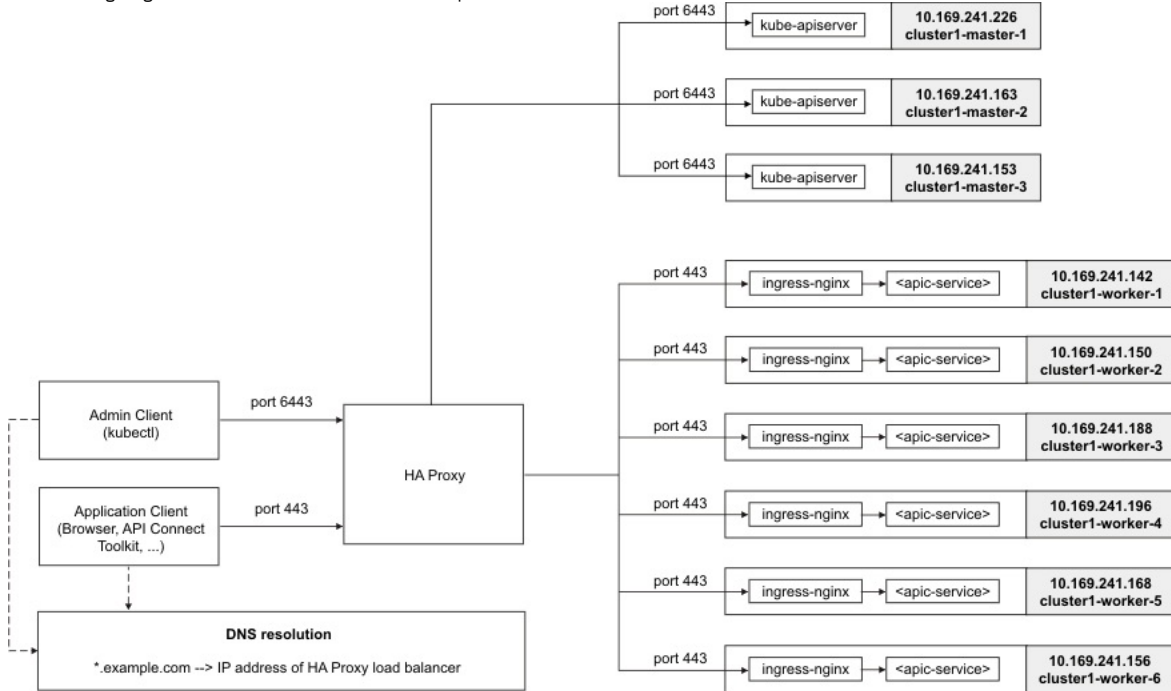

A wildcard DNS record allows the resolution of `*.example.com` to the IP address of the HAProxy host.

The ingress endpoints are defined in the CRs (custom resources) for each API Connect subsystem. During configuration of each subsystem, you define the endpoint by specifying a host name `STACK_HOST` in the CR. For configuration instructions, see [Installing the API Connect subsystems](#).

You can view the endpoint definitions in sample CRs:

- [Installing the Management subsystem cluster](#)
- [Installing the Developer Portal subsystem](#)
- [Installing the Analytics subsystem](#)
- [Installing the DataPower Gateway subsystem](#)

The following diagram illustrates the wildcard DNS example:

- **Kubernetes cluster without wildcard DNS**

This example uses the same topology as the previous one, except that there is no wildcard DNS resolution. Instead, individual DNS records are added, all pointing to the IP address of the load balancer. For example: `portal.example.com` and `admin.portal.example.com` resolve to the IP address of the load balancer.

- **Kubernetes cluster with `xip.io` or `nip.io`**

This example uses the same topology as the first one, except that there is no specific DNS resolution configured and instead a service such as `xip.io` or `nip.io` provides wildcard DNS resolution. It is not recommended to use this approach for a production setup, as the ingress endpoints configured during installation of API Connect would be tied to the IP address of the load balancer. This approach can be useful when configuring a test deployment in situations where access to DNS records is not practical or would introduce delay in the deployment.

Firewall requirements on Kubernetes

Diagram for port configuration, and list of active ports, for an IBM® API Connect deployment on Kubernetes.

Required Ports between zones

The following network diagram example helps to explain which ports must be configured in an API Connect network. Specific ports must be configured to enable the communication between the various zones, both public and private, in a network.

The ports specified in the diagram are default ports. Check your deployment to understand which communication, if any, is configured to use non-default ports.

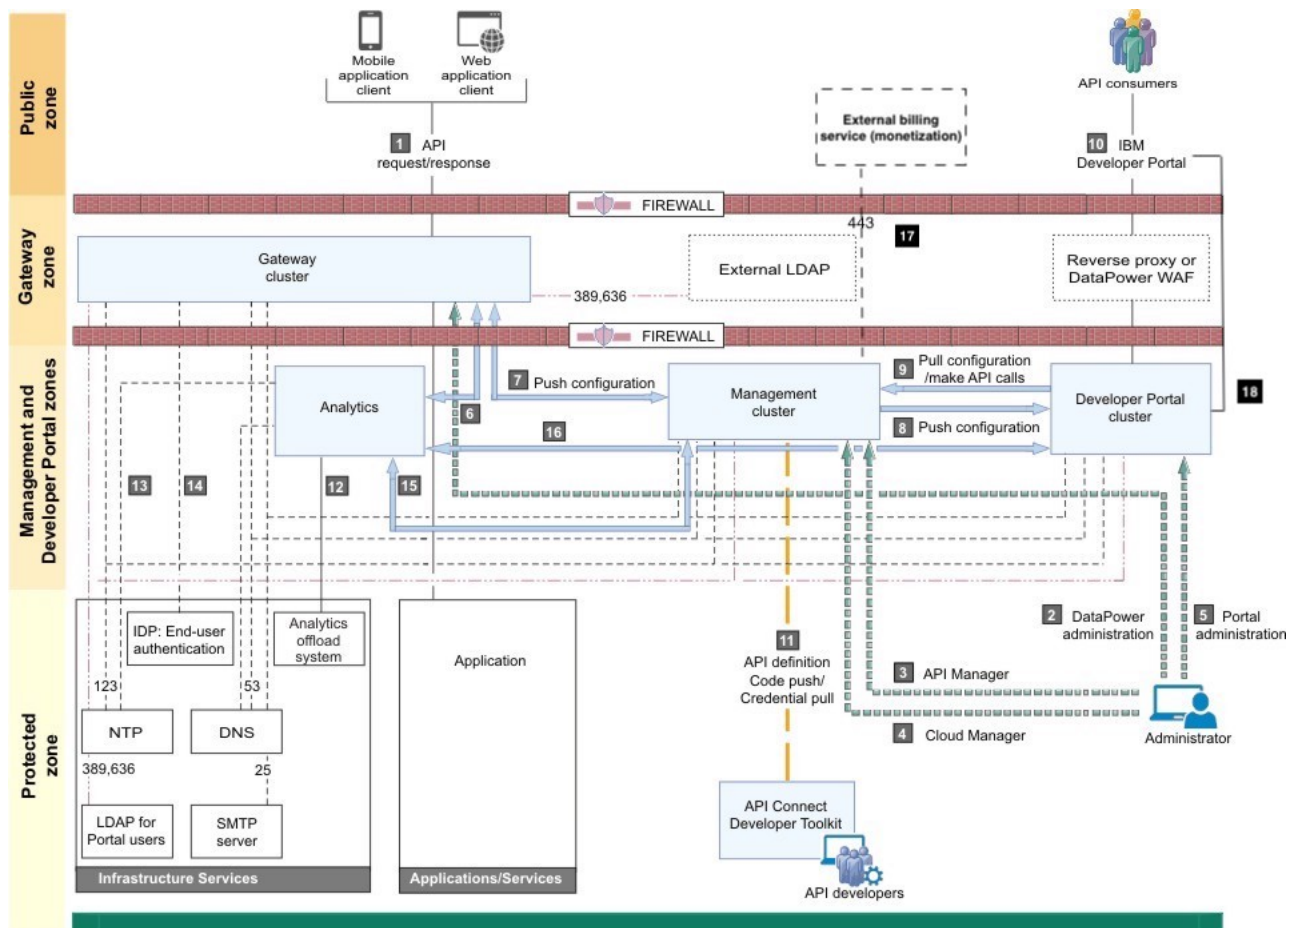

Table 1. Key for the network diagram example.
The following table lists the port numbers with a usage description.

	Usage description	Default port number
1	API request/response – Users invoking the provided APIs.	443 HTTPS from Public zone to Gateway zone
2	DataPower® administration – Internal operators who are managing the Gateway servers.	22 SSH, 9090 HTTPS from Protected zone to Gateway zone
3	API Manager – Internal business users who are defining and monitoring APIs.	443 HTTPS from Protected zone to Management zone
4	Cloud Manager – Internal operators who are administering the Cloud.	22 SSH, 443 HTTPS from Protected zone to Management zone
5	Developer Portal administration – Internal operators who are managing the Portal servers.	22 SSH, 443 HTTPS from Protected zone to Management zone
6	Gateway servers post traffic to Analytics service.	443 HTTPS from Gateway servers to Analytics service
7	Push configuration – Management servers communicate bi-directionally with Gateway servers.	3000 and 443 HTTPS Management servers to and from Gateway servers for webhook delivery. Port 3000 is the default port for apic-gw-service, and this is the port Management uses to communicate with Gateway. Port 443 is the default port for the platform-api endpoint, which apic-gw-service uses to communicate with Management.
8	Push configuration/webhooks – Management servers push configuration and webhooks to the Developer Portal.	443 HTTPS Management servers to Developer Portal servers for webhook delivery
9	Pull configuration/make API calls – Developer Portal servers pull configuration and call REST APIs.	443 HTTPS from Developer Portal servers to Management servers within Management zone
10	Developer Portal – External developers who are accessing the Developer Portal.	443 HTTPS from Public zone to Developer Portal management zone. The reverse proxy/DataPower WAF for incoming web traffic to the Developer Portal cluster must be a transparent proxy - no modification of the portal URL, port, host name or path is allowed.
11	Push API definition to Management server. Pick up credential for microservice code push.	443 HTTPS from Protected zone to Management zone

	Usage description	Default port number
12	Analytics offload	Port will depend on type of plugin and protocol used for the offload. Some possible protocols are: HTTP, HTTPS, TCP, UDP, KAFKA
13	Analytics accesses NTP	Standard NTP
14	Analytics access DNS	Standard DNS
15	Management service queries Analytics service	443 HTTPS within Management zone
16	The Portal service invokes an API (GET) on the Analytics service to retrieve data.	443 HTTPS within Management zone
17	External billing service – Management cluster connecting to external billing service (when configured for billing). If you are using Stripe as your external billing service, you must enable connections with the Stripe API at: https://stripe.com/files/jps/jps_api.json . You can also view the Stripe IP addresses at the following URL: https://stripe.com/docs/jps .	443 HTTPS from Management zone to Public zone
18	Developer Portal cluster must be able to access its own site endpoints.	443 HTTPS from Portal zone to Public zone

Firewall port requirements on Kubernetes

The following tables lists ports that must be open in both cluster and non-clustered deployments.

Table 2. Firewall port requirements common to all subsystems

Subsystem	Ports and description
Ports that must be open on all API Connect subsystems	<p>The following ports must be open on the Management Server, Analytics, and Developer Portal subsystems, whether in a cluster or not.</p> <ul style="list-style-type: none"> • 22 (outbound) Used for SFTP backups on Management and Portal subsystems • 53 (outbound) DNS • 123 (outbound) NTP • 443 (inbound and outbound) Used by all subsystems for communication with other subsystems • 44135 (inbound and outbound)

Each subsystem uses ports in addition to the ports in [Table 2](#). See the following table.

Table 3. Additional firewall port requirements for each subsystem

Subsystem	Ports and description
Management Service	<p>Management Service uses the ports in Table 2 plus:</p> <ul style="list-style-type: none"> • 22 remote backup server port (configurable) If backups are configured to use another port, ensure that the port is open. • 161 (inbound) SNMP • LDAP server port (if using LDAP user registry), typically 389 (outbound) • 3007 (outbound) LDAP <p>The Automated test behavior application must be able to invoke (outbound) any port that a test system might present an API on. It can be bound to a particular port (if it is the same in all environments) or to a range of ports (to cover all of the ports it might invoke).</p>
Developer Portal	<p>The Developer Portal uses the ports listed in Table 2, plus:</p> <ul style="list-style-type: none"> • 22 - A remote backup server port (configurable) If backups are configured to use another port, ensure that the port is open. See Backing up and restoring the Developer Portal in a Kubernetes environment.
Analytics	<p>The Analytics subsystem uses the ports listed in Table 2.</p> <p>Analytics port usage considerations:</p> <ul style="list-style-type: none"> • 161 for SNMP is required for both non-clustered and clustered deployments • In a non-clustered deployment, no additional ports are required. • Analytics supports an optional configuration for offload of data. This configuration might require additional outbound ports to be open.
Gateway Server	<p>The Gateway Server uses these ports in both non-clustered and clustered deployments:</p> <ul style="list-style-type: none"> • 161 (inbound and outbound) SNMP • 162 (outbound) SNMP traps • 3000 (inbound) Gateway Service local port (configurable) • 5550 (inbound) XML management port (configurable) • 5554 (inbound) REST management port (if enabled; configurable) • 9022 (inbound) Gateway SSH (if enabled; configurable) • 9090 (inbound) Web GUI console (if enabled; configurable) • 9443 (inbound) Gateway local port (configurable)

Communications inside the Gateway cluster

There are a number of important points to note regarding the communications within the Gateway cluster.

- We advise that you use the same port for all Gateway servers within a cluster.
- Gateway servers communicate with each other to synchronize invocation counts.
- All Gateway servers in a Gateway cluster must be able to reach all of the other Gateway servers in the same Gateway cluster.
- Gateway servers in a Gateway cluster do not directly communicate with Gateway servers in a different Gateway cluster.

- All Gateway servers must be able to reach the management subsystem platform API endpoint, which was configured during the installation of your API Connect environment.

Ethernet interface usage

To separate network traffic, you can use two or more Ethernet interfaces on the DataPower appliance on which a Gateway server is installed. For example, you can use one interface for internal IBM API Connect communications, and another for processing incoming API calls.

Port requirement for Stripe billing service

All Management servers and Developer Portal servers must be able to communicate HTTPS content with the external billing service when billing is configured. If you are using Stripe as your external billing service, you must enable HTTPS communication on port 443 with the Stripe API: https://stripe.com/files/ips/ips_api.json.

Note: API Connect does not support using webhooks with Stripe. You can see a list of the Stripe IP addresses at: <https://stripe.com/docs/ips>.

Planning your analytics deployment

Plan your IBM® API Connect analytics deployment by reviewing options for topology, data modifications, and storage.

Planning your Analytics topology is an important step in ensuring a successful and scalable solution. After you plan your overall API Connect topology, plan the analytics subsystem deployment by:

- [Planning the analytics profile, storage class, and storage type](#)
Begin planning your IBM API Connect analytics deployment by choosing a deployment profile, a Kubernetes storage class, and an OpenSearch storage type.
- [Planning to modify your incoming analytics data](#)
Review how you can optionally customize the analytics data in your IBM API Connect analytics deployment before storing it.
- [Estimating internal storage space](#)
If you plan to store data locally in your IBM API Connect analytics deployment, estimate disk space requirements.

Planning the analytics profile, storage class, and storage type

Begin planning your IBM® API Connect analytics deployment by choosing a deployment profile, a Kubernetes storage class, and an OpenSearch storage type.

Deployment profile

Decide which deployment **profile** you want to use, the available profiles are listed on [Analytics component deployment profile limits](#).

Kubernetes storage class

Before you install analytics, you must choose a storage class. **Ceph**, **Block**, and **Local Volume** are all supported; however, **Local Volume** is most suitable for analytics. The analytics subsystem provides internal data replication and HA support, so the additional HA capabilities that **Ceph** or **Block** storage might give you are not needed. In addition, analytics requires a high throughput of disk I/O operations to successfully handle the analytics data load from the gateway. **Local Volume** is the best-performing option in this area.

Note: **GlusterFS** storage is not supported for analytics. If you use this option, you might encounter severe performance degradation, and possibly loss of data.

OpenSearch storage type

Note: Storage type selection is available on three replica deployments only. On a one replica deployment, only shared storage is available. API Connect provides two OpenSearch storage types:

- **Shared storage**
A single pod provides data storage and OpenSearch cluster management. Shared storage is the default option, and the only option on a one replica deployment.
- **Dedicated storage**
OpenSearch data storage and cluster management functions are split, and run in separate pods on each worker node:
 - **storage-os-master** - Runs an OpenSearch "manager eligible" node that manages the OpenSearch cluster, but does not store any API event data.
 - **storage** - Runs an OpenSearch "data" node that stores API event data.

Dedicated storage facilitates horizontal scaling to support greater analytics data storage and throughput. Add worker nodes and increase the number of **storage** pod replicas in order to scale horizontally (you do not need to increase the number of **storage-os-master** replicas). Dedicated storage also provides greater stability and allows some OpenSearch configuration changes to be made without downtime.

You can change storage type after installation, see [Changing storage type between shared and dedicated](#).

Planning your topology

Determine the topology of your IBM® API Connect analytics deployment according to your needs.

Default topology

The default topology for analytics is useful for many organizations. It provides you with business analytics and metrics in the API Manager UI, and consumer analytics in portal UI. It is suitable for production environments and is easily scalable.

The default topology contains the following microservices:

- **osinit**: OpenSearch initialization job.
- **director**: NodeJS microservice handling inbound communication, service registration, proxies calls to storage and ingestion services.
- **ingestion**: Logstash-based data pipeline for receiving and routing data to internal or external storage.
- **mtls-gw**: OpenResty-based service for routing ingress traffic to director or ingestion.
- **storage**: OpenSearch-based service for writing, reading, and storing the data.
- **storage-os-master**: If dedicated storage type is selected, **storage-os-master** manages the OpenSearch cluster, allowing the **storage** service to be dedicated to analytics data storage.

For the complete list of available microservices, see [Analytics pods and PVCs](#).

Offload topology

The offload topology disables local storage of API Connect analytics data. Instead, the data is sent to a third-party system, and it is not viewable in the API Connect UIs.

The offload topology contains the following microservices:

- **director**: NodeJS microservice handling inbound communication, service registration, proxies calls to storage and ingestion services.
- **ingestion**: Logstash-based data pipeline for receiving and routing data to internal or external storage.
- **mtls-gw**: OpenResty-based service for routing ingress traffic to director or ingestion.

For information about configuring offload settings, see [Planning to offload data to a third-party system](#).

Internal and external storage topology

You can also have both internal storage and offload enabled, so that you can view your analytics data in the API Connect UIs, and store the data externally. This topology has the same set of microservices as the default topology.

For more information about disabling internal storage, see [Planning to disable internal storage](#).

Analytics pods and PVCs

See the complete list of pods and physical volume claims that comprise an API Connect analytics deployment.

Table 1 provides the name and a brief description of each microservice.

Table 1. Analytics microservices

Name	Description
osinit	OpenSearch initialization job.
director	NodeJS microservice handling inbound communication, service registration, proxies calls to storage and ingestion.
ingestion	Logstash-based data pipeline for receiving and routing data to internal or external storage.
mtls-gw	OpenResty-based service for routing ingress traffic to client or ingestion.
storage	If the shared storage type is selected, the storage pods contain both your analytics data and the OpenSearch cluster management processes. If the dedicated storage type is selected, the storage pods contain just the analytics data.
storage-os-master	If the dedicated storage topology is selected, the storage-os-master pods are created and manage the OpenSearch cluster in your deployment.

Table 2. Analytics PVCs

Name	Description
data-analytics-storage- <integer>	A PVC is created for each analytics storage pod. <integer> is the replica number, starting from 0.
data-analytics-storage-os- master- <integer>	If dedicated storage type is selected, then the storage-os-master PVCs are created for the storage-os-master pods.
data-analytics-ingestion- <integer>	If the persistent queue feature is enabled, a PVC is created for each ingestion pod. <integer> is the replica number, starting from 0. See Configuring the persistent queue .

Planning to offload data to a third-party system

Considerations for offloading data from your IBM® API Connect analytics deployment to a third-party system.

The analytics event data that sent from the gateway to analytics can be offloaded to a third-party service in real-time. The third-party service can provide enhanced monitoring, alerting, storage, and analysis, in addition to what the built-in analytics subsystem provides. Multiple target systems are supported, and the data can be

modified before offloading.

APIC supports offloading analytics data to the following third-party systems:

- HTTPs endpoints
- OpenSearch
- Elasticsearch
- Apache Kafka
- Syslog servers

For instructions on configuring your offload settings, see [Kubernetes - Offloading data to a third-party system](#), [OpenShift - Offloading data to a third-party system](#).

If you do not need internal storage and want to use only the third-party system for working with your analytics data, consider disabling internal storage entirely as explained in [Planning to disable internal storage](#).

Planning to disable internal storage

Review considerations for disabling local storage and offloading all data in your IBM® API Connect Analytics deployment.

The Analytics subsystem provides a complete solution for routing, storing, and viewing the analytics data. However, you might not need the internal storage and viewing solution, especially if you are primarily using a third-party system for data offloading. In this scenario, you can greatly reduce your CPU and memory costs by disabling the internal storage and viewing components.

With this approach, data that is offloaded is not viewable in the API Manager and Developer Portal UIs.

When you disable internal storage for analytics data, the following microservices are disabled:

- `osinit`
- `storage`

Important: The disablement of internal storage must be set in the analytics CR yaml file before installation. It is not possible to disable or re-enable internal storage after installation.

For the steps to disable internal storage, see [Kubernetes - Disabling internal storage](#), [OpenShift - Disabling internal storage](#).

Planning to modify your incoming analytics data

Review how you can optionally customize the analytics data in your IBM® API Connect analytics deployment before storing it.

You can create filters to customize the analytics API event data before it is sent to internal storage or offloaded to a third-party system. Filters allow you to add new fields, modify existing fields, or remove fields from the data. You can do this globally for the entire analytics subsystem, or you can do it conditionally for a specific API. By default, filters are defined at the global level, so unless you include conditionals, changes are applied to every piece of data flowing through the pipeline.

For information on adding filters to the analytics CR to modify your data, see [Kubernetes - Modify incoming analytics data](#), [OpenShift - Modify incoming analytics data](#).

What fields can you modify?

The fields that are available for you to interact with are described in [API event record fields](#). Each API defined in the Management subsystem and published to your Gateway has its own success and error log policies. The log policy settings determine what data is available for customization. Be sure to verify the existence of a field before trying to modify it; otherwise your pipeline might fail.

Modifying fields is a complex operation and can cause problems with your data. It is highly recommended that you remove fields entirely (instead of modifying them) if you need to sanitize data. If you want to change the format of an existing field, you should create a new, unique field.

Important: Do not change the data type of existing fields or modify fields critical to the analytics subsystem's operations and access control. Doing so can cause problems with retrieving or storing data. The following fields are restricted (note that there might be other fields that are not included in this list):

- `org_id`
- `catalog_id`
- `space_id`
- `developer_org_id`
- `datetime`
- `@timestamp`

The service for the data pipeline is based on Elastic Logstash, which provides [a set of predefined filter plugins](#) that you can use for modifying data. However, the plugins are third-party software that IBM does not control, so IBM cannot guarantee support for them.

Estimating internal storage space

If you plan to store data locally in your IBM® API Connect analytics deployment, estimate disk space requirements.

This information applies only to data that is stored in API Connect analytics and not to data that is offloaded to a third-party system. The formula and guidelines are based on known information about how the analytics service stores data, and cannot be directly applied to any other storage system.

Use the following guidelines to calculate a rough estimate of the amount disk space you need for storing stateful data in the API Connect analytics microservices.

Data storage: calculate how much data you want to store

The amount of disk space needed for storing analytics data is determined by the following factors:

Number of copies of the analytics data

Each copy of the analytics data must live on a separate node. The number of nodes in your deployment (based on your chosen profile in [Planning the analytics profile, storage class, and storage type](#)) determines the number of copies of analytics data that is stored in your deployment. With the three replica deployment profile, analytics data is replicated to three nodes (two replicas and one primary copy of the data) for storage. In the one replica profile, you only need to store one copy of the data.

Number of copies of data:

```
Copies of data = [1 | 3]
```

Number of days that data is retained

By default, analytics data is retained for 90 days, but you can [modify the retention setting](#) as needed. Make sure you know how long you want to store the data before attempting to calculate required disk space.

Number of days that data is retained:

```
Data retention = [90 days | preferred length]
```

Amount of each type of data stored

The required storage space for each type of logging is highly dependent on your APIs and usage. For each API, you can [configure activity logging](#) for the API activity, header, and payload. You can also [customize the data](#) to add, redact, or remove fields, which also impacts the amount of data that you store.

To estimate storage needs, calculate the average size of each type of log. When calculating your estimates, remember that the header logging size is the sum of activity logging size and the average size of your headers. The payload logging size is the sum of the header logging size and the average size of your payloads. Typically the average size of an activity logged event is 600-1000 bytes depending on the uniqueness and complexity of your analytics data. This number is highly dependent on your APIs and your implementations. For a rough estimate, you can use an average of 800 bytes per activity logged event.

If you choose to add fields, calculate the average size of the new fields as well, and add that number to all types of log policies. If you choose to remove fields, you should not subtract this size from the log policies unless you are also removing headers and/or payloads.

Amount of each type of data that is stored:

```
Activity log bytes per call = [600-1000 bytes]
Header log bytes per call = Activity log bytes per call + Average size of headers
Payload log bytes per call = Header log bytes per call + Average size of payloads
```

Percentage of each type of data

Estimate the percentage of each type of log (activity, header, payload) for all API calls.

If you follow best practices of using only activity logging for production environments and using only payload logging for test environments, this number is easy to determine. If you use different log policies per API, and they depend on "success" or "error" factors, the percentage is more difficult to determine. Typically, if you do not use an all-or-nothing method for logging, error rates range from 3% to 25% with subsequent payload logging in test and production environments. However, this is entirely dependent on your use case and your APIs.

Percentage of each type of data that is stored:

```
% of Activity log = [0, 100 or other estimate]
% of Header log = [0, 100 or other estimate]
% of Payload log = [0, 100 or other estimate]
```

Estimated number of API calls per month

When planning your API Connect deployment, this number is helpful. When estimating analytics storage, this number is vital because it is directly correlated to how much storage you need for your deployment.

If you do not know the number of calls per month, but you do know the number of calls per second, use the following formula to convert it to calls per month:

```
Calls per month = Calls per second * 86400 seconds per day * 30 days per month
```

Number of API calls per month:

```
Calls per month = [any estimate]
```

Calculating your disk space requirement

Estimate the disk space requirement for each storage node by completing following calculations.

Formula

```
Bytes per call = (% of Activity Log * Activity Log bytes per call) + (% of Header Log * Header Log bytes per call) + (% of Payload Log * Payload Log bytes per call)
Calls per retention period = Calls per month * (Number of days retained / 30 days per month)
Storage for API calls = Calls per retention period * Bytes per call * Copies of data
Total storage = Storage for API calls + Overhead
Storage per node = Total storage / Nodes
```

Details

1. Bytes per call:

Estimate the number of bytes that are logged for a single copy of each API call. This can be calculated from the prerequisites of the percentage of each data type and the amount of each data type stored.

```
Bytes per call = (% of Activity Log * Activity Log bytes per call) + (% of Header Log * Header Log bytes per call) + (% of Payload Log * Payload Log bytes per call)
```

2. Calls per retention period:

Calculate the anticipated number of API calls per retention period. This can be calculated from the prerequisites of the estimated calls per month and your desired data retention.

Calls per retention period = Calls per month * (Number of days retained / 30 days per month)

3. Storage for API Calls:

Calculate the storage needed for all copies of your api calls for your retention period. This can be calculated from steps 1 and 2, as well as the prerequisite of your total copies of your data.

Storage for API calls = Calls per retention period * Bytes per call * Copies of data

4. Total Storage:

Calculate the total storage you need by adding buffer space to the value from step 3. The analytics service requires some overhead space to complete its operations; for example, to contain system data and temporary debug header or payload logging. In addition, allowing extra space provides a buffer in case you underestimated the number of calls, or experience an unexpected increase.

There is no specific value for the buffer because it's based on your own situation. One approach is to use a value that rounds the Storage for API calls result from step 3 to the next whole number. Make sure the rounding leaves you with a comfortable amount of additional space. For example, if the result from step 3 is 380 GB, then adding 20 GB to reach 400 GB is probably not sufficient and you should consider rounding to a larger value such as 500 GB.

Total storage = Storage for API calls + Buffer

5. Storage per node:

Calculate the total storage amount required per storage node. The number of storage nodes is dependent on your deployment profile. For the one replica profile, use 1. For the three replica profile, it defaults to 3. If you manually scaled the storage microservices to be greater than 3, use your actual values.

Storage per node = Total storage / Nodes

Remember: This result is only an estimate. You should monitor the use of space over time and adjust storage as needed.

Save this information for when you are updating the analytics CR for your installation. [Kubernetes - Creating the analytics CR](#), [OpenShift - Analytics CR settings](#)

Example

Deployment information:

Copies of data = 3
Data retention = 90 days
Activity log bytes per call = 850 bytes
Header log bytes per call = 15k bytes
Payload log bytes per call = 30.5k bytes
% of Activity log = 100%
% of Header log = 0%
% of Payload log = 0%
Calls per month = 64 million

Formula:

Bytes per call = (% of Activity Log * Activity Log bytes per call) + (% of Header Log * Header Log bytes per call) + (% of Payload Log * Payload Log bytes per call)
Calls per retention period = Calls per month * (Number of days retained / 30 days per month)
Storage for API calls = Calls per retention period * Bytes per call * Copies of data
Total storage = Storage for API calls + Overhead
Storage per node = Total storage / Nodes

Details:

1. Bytes per call = 850 bytes

(100% of Activity Log * 850 bytes) + (0% of Header Log * 15k bytes) + (0% of Payload Log * 30.5 bytes)

2. Calls per retention period = 192 million calls

64 million calls per month * (90 days retained / 30 days per month)

3. Storage for API calls = 489.6 GB

192 million calls per period * 850 bytes per call * 3 copies of data

4. Total storage = 600 GB

489.6GB storage + Buffer

Since rounding to 500 GB only provides 10.4 GB of extra space, consider rounding to 600 GB instead.

5. Storage per node = 200 GB

600GB Total storage / 3 nodes

In this example, the estimated disk needed on each node for storage microservices is 200GB.

Two data center deployment strategy on Kubernetes and OpenShift

An overview of the two data center disaster recovery deployment strategy in API Connect.

The two data center disaster recovery (2DCDR) deployment configuration provides continuous replication of the management and portal subsystem databases to a warm-standby deployment in another data center.

Important: The 2DCDR deployment adds complexity to the API Connect installation procedures, and all subsequent maintenance procedures such as backup, restore, and upgrade.

2DCDR is only recommended if you are concerned about a complete site outage, and want to be able to switch to standby management and portal subsystems in a different data center as quickly as possible.

The following list covers some scenarios where 2DCDR might appear to be the best strategy, but simpler alternatives are available:

- If you are concerned about a gateway outage due to data center failure.
In this case, you can create a gateway service in a different data center and register it with the management subsystem in your main data center. If your main data center fails, your remote gateway continues to process calls to your published APIs.
- If you are concerned about a management or portal subsystem failure (rather than a complete data center failure).
In this case, you can use the disaster recovery procedures to restore the management and portal subsystems.
- If you are concerned about your users not being able to access the management and portal subsystems during a data center outage.
In this case, you can maintain another data center as a cold-standby, where you have the API Connect CR YAML files, custom secrets, and database backups ready for deployment and restoration.

The cold-standby data center must have the same network configuration as your main data center so that all the endpoints in your management and portal subsystem backups are valid there.

Copy your management and portal CRs, custom secrets, and database backups to your cold-standby data center as regularly as you take these backups.

Key points of the two data center disaster recovery (DR) solution

- Two data center DR is an active/warm-standby deployment for the API Manager and Developer Portal services, and must use manual failover.
- Two DataPower® Gateway subsystems must be deployed to provide high availability for the gateway service. However, this scenario doesn't provide high availability for the analytics service.
- If high availability is required for the analytics service, two analytics subsystems must be configured, one per gateway subsystem, but with this configuration Developer Portal analytics isn't possible.
- Data consistency is prioritized over data availability.
- Each data center must be setup within its own Kubernetes or OpenShift cluster.
- Latency between the two data centers must be less than 80 ms.
- Replication of the API Manager is asynchronous, so it is possible that the most recent updates do not transfer to the warm-standby data center if there is an active data center failure.
- Replication of the Developer Portal is synchronous, and therefore the latency is limited to 80 ms or less.
- The API Manager and the Developer Portal services in the two data centers must use the same deployment profile.
- The deployment in each data center is effectively an instance of the same API Connect deployment - therefore, the endpoints, certificates, and Kubernetes secrets must all be the same.
- It is not possible to use the Automated API behavior testing application ([Installing the Automated API behavior testing application](#)) in a two data center disaster recovery configuration.

Deployment architecture

A two data center deployment model is optimized for data consistency ahead of data availability, and must use manual failover when a fault occurs. For high availability of Management and Portal subsystems ensure that you use a three replica deployment profile. For more information on deployment profiles, see: [Planning your deployment topology](#).

For a single Kubernetes cluster to span multiple data centers the network latency must be no more than a few milliseconds, typically less than 10 ms. This low latency is often unachievable between geographically separated data centers. For this reason, the two data center disaster recovery solution requires that each data center is set up with its own Kubernetes cluster. The Management and Portal subsystem databases are continually replicated from the active datacenter to the warm-standby datacenter, this requires a network latency between the two data centers of less than 80 ms.

To achieve high availability for the DataPower Gateway, you must deploy two gateway subsystems. One subsystem in the active data center, and a separate subsystem in the warm-standby data center. Publish all Products and APIs to both gateway subsystems. The gateway subsystems are independent, and so are insulated if an issue occurs in one of them. A global dynamic router can then be used to route traffic to one gateway subsystem or the other. If high availability is also required for the analytics service, two analytics subsystems must be configured, one per gateway subsystem, but with this configuration Developer Portal analytics isn't possible.

There can be multiple Developer Portal services in an API Connect deployment (although still only one Developer Portal site per Catalog).

The deployment in each data center is effectively an instance of the same API Connect deployment – as the database is replicated, all of the configuration is also shared. Therefore, the endpoints, certificates, and Kubernetes secrets all need to be the same.

Dynamic routing

Note: A dynamic routing device, such as a load balancer, is required to route traffic to either data center. However, neither this device nor its configuration is part of the API Connect offering. Contact IBM Services if you require assistance with configuring a dynamic router.

The dynamic router configuration must handle the traffic between the subsystems and between the data centers. For example, the consumer API calls from the Developer Portal to API Manager must transfer through a dynamic router so that the Developer Portal can use a single endpoint regardless of which data center API Manager is active in. The same is needed for calls to the Platform and Admin APIs from the other subsystems, as well as for incoming UI traffic for the Developer Portal UI, Cloud Manager UI, and API Manager UI.

The dynamic router must support SSL passthrough, so that it routes the Mutual TLS (mTLS) connections between API Manager and the Developer Portal, and between API Manager and the DataPower Gateway. The router should not do TLS termination, it should do layer 4 based routing by using SNI.

Note: From v10.0.5.3, it is possible to disable mTLS and use JWT instead, which allows the load-balancers to do TLS termination. For more information, see [Enable JWT security instead of mTLS](#).

Service status

When a failure occurs, it is common practice to display an interstitial system outage web page. The dynamic router can be configured to display this web page when there is a failure, while the manual failover to the warm-standby data center is taking place.

Deployment-profiles

Both one replica and three replica deployment profiles can be used with two data center DR, but they must be the same at each data center. For more information about the deployment-profiles, see [Planning your deployment topology](#) on Kubernetes, and [Requirements for initial deployment on VMware](#).

For more information about a two data center DR deployment, see the following topics:

Key Concepts: Cert-manager, Issuers, and Secrets

By default API Connect uses an open source product that is called [cert-manager](#) to handle the issuing and renewal of the certificates that are used by API Connect. The cert-manager has its own Kubernetes pods and runs in its own namespace. The cert-manager adds some additional resources to the Kubernetes environment. The API Connect administrator needs to be familiar with these additional resources:

Issuers

Issuers play the part of certificate authorities (CAs) in the local environment and issue the certificates. Issuers reside in the API Connect namespace. There are two types of Issuers:

- Self-Signed - This issuer provides the self-signed certificates, for example a root CA.
- CA - This issuer can be either the root certificate authority or an intermediate certificate authority.

Here is an example of the issuers that can be found on the management subsystem:

```
kubectl get issuers -n <management namespace>
NAME                READY   AGE
abc-management-ca   True    96d
selfsigning-issuer  True    96d
```

- **selfsigning-issuer** This is a SelfSigned Issuer that provides the root certificate for all default certificates that are used in API Connect.
- **abc-management-ca** This is a CA Issuer that signs all the end-entity certificates that are used for communication between the management subsystem pods. It is in effect an intermediate CA between the root (**selfsigning-issuer**) and the end-entity certificates.

Certificates

A certificate is a Kubernetes resource that contains a pointer to a Kubernetes secret. The Kubernetes secret contains the actual TLS certificate. Certificate objects contain other information such as the issuer, expiry date, and status. Run `kubectl get certificate` to see the certificates on an API Connect subsystem:

```
kubectl get certificate -n <management namespace>
NAME                READY   SECRET                AGE
abc-management-ca   True    abc-management-ca     96d
abc-management-client True    abc-management-client 96d
abc-management-natscluster-mgmt True    abc-management-natscluster-mgmt 96d
abc-management-server True    abc-management-server  96d
...
```

The first certificate in the list **abc-management-ca** is the intermediate CA certificate that is used for signing the other certificates that are shown in the output. If you describe this certificate you can see that the **selfsigning-issuer** is its issuer:

```
kubectl describe certificate abc-management-ca -n <management namespace>
...
Spec:
...
  Issuer Ref:
    Kind: Issuer
    Name:  selfsigning-issuer
```

Describing the other management subsystem certificates, observe that the **abc-management-ca** certificate is the issuer:

```
kubectl describe certificates abc-management-client -n <management namespace>
...
Spec:
...
  Issuer Ref:
    Kind: Issuer
    Name:  abc-management-ca
```

Key points:

- The certificates with '-ca' on the end are all CA Certificates, and they sign all the other subsystem certificates whose names do not end with '-ca'.
- The CA certificates are also known as Issuer certificates.
- Certificates that CA certificates sign are known as end-entity certificates.
- When a CA certificate is updated, all end-entity certificates that it signs must also be updated.

For a complete list of the certificates in an API Connect installation, see [API Connect certificates reference](#).

Secrets

Secrets are the Kubernetes resource for storing credentials. In API Connect, secrets are where the TLS certificates are stored. Every Kubernetes certificate object has a corresponding secret of the same name. The Kubernetes certificate contains a property that refers to its corresponding secret:

```
kubectl describe certificates abc-management-client -n <management namespace>
...
Spec:
  ...
  Secret Name:      abc-management-client
```

The default output of `kubectl get certificate` includes a column that is labeled `SECRET`, which shows the secret name.

```
kubectl get certificate -n <management namespace>
NAME                                READY  SECRET  AGE
abc-management-ca                    True    abc-management-ca    96d
abc-management-client                 True    abc-management-client 96d
abc-management-natscluster-mgmt       True    abc-management-natscluster-mgmt 96d
abc-management-server                 True    abc-management-server 96d
...
```

The `kubectl describe` output of a secret shows that it contains the TLS certificates:

```
kubectl describe secret abc-management-client -n <management namespace>
...
Name:      abc-management-client
Namespace: default
Labels:    app.kubernetes.io/instance=abc-management
           app.kubernetes.io/managed-by=ibm-apiconnect
           app.kubernetes.io/name=abc-management-client
Annotations: cert-manager.io/alt-names:
              cert-manager.io/certificate-name: abc-management-client
              cert-manager.io/common-name: abc-management-client
              cert-manager.io/ip-sans:
              cert-manager.io/issuer-group:
              cert-manager.io/issuer-kind: Issuer
              cert-manager.io/issuer-name: abc-management-ca
              cert-manager.io/uri-sans:

Type:      kubernetes.io/tls

Data
====
ca.crt:    1107 bytes
tls.crt:   1139 bytes
tls.key:   1675 bytes
```

The full TLS certificate strings can be seen with:

```
kubectl get -o yaml secret <secret name> -n <namespace>
```

For more details about cert-manager, and a full list of all the certificates that are created and used in an API Connect deployment, see [API Connect certificate reference](#).

Certificates in a Kubernetes environment

Use of cert-manager is recommended for managing certificates in a Kubernetes environment.

When deploying on Kubernetes, choose one of the following methods for creating internal certificates:

- Do not specify any internal certificates. In this case, the operator generates all of the internal certificates without using a certificate manager. The CR definition to enable this option is:

```
microServiceSecurity: custom
```

- Specify some, or all, of the internal certificates yourself without using a certificate manager. In this case, any certificates that you do not create are created by the operator. You retain control over the certificates that you create. The CR definition to enable this option is:

```
microServiceSecurity: custom
```

- Configure cert-manager to generate the internal certificates. In this case, cert-manager creates and manages the certificates. The CR definition to enable this option is:

```
microServiceSecurity: certManager
```

To use cert-manager for generating the certificates, download and install cert-manager v1.12.7 from <https://github.com/cert-manager/cert-manager/releases/tag/v1.12.7> and create an Issuer CR in the same namespace where you will install API Connect; for example:

```
apiVersion: cert-manager.io/v1
kind: Issuer
metadata:
  name: selfsigning-issuer
spec:
  selfSigned: {}
```

In the CR for the API Connect Management subsystem, specify a `certManagerIssuer`. The `certManagerIssuer` can be configured to be a self-signing issuer, as in the following example:

```
microServiceSecurity: certManager
certManagerIssuer:
  name: selfsigning-issuer
  kind: Issuer
```

API Connect supports any other kind of Issuer supported by cert-manager, in addition to the self signed type.

In all the CRs, certs are expected at the level of any endpoint. For example, for the cloud admin endpoint of the Management subsystem you could have:

```
cloudManagerEndpoint:
  annotations:
    cert-manager.io/issuer: ingress-issuer
  hosts:
  - name: admin.example.com
    secretName: cm-endpoint
```

The previous entry lets cert-manager automatically generate a `cm-endpoint` TLS secret using the `ingress-issuer`. One way to define the `ingress-issuer` is as follows:

```
---
apiVersion: cert-manager.io/v1
kind: Issuer
metadata:
  name: selfsigning-issuer
spec:
  selfSigned: {}
---
apiVersion: cert-manager.io/v1
kind: Certificate
metadata:
  name: ingress-ca
spec:
  secretName: ingress-ca
  commonName: "ingress-ca"
  usages:
  - digital signature
  - key encipherment
  - cert sign
  isCA: true
  duration: 87600h # 10 years
  renewBefore: 720h # 30 days
  privateKey:
    rotationPolicy: Always
  issuerRef:
    name: selfsigning-issuer
    kind: Issuer
---
apiVersion: cert-manager.io/v1
kind: Issuer
metadata:
  name: ingress-issuer
spec:
  ca:
    secretName: ingress-ca
```

Another way to configure the cloud admin endpoint would be with:

```
cloudManagerEndpoint:
  hosts:
  - name: admin.example.com
    secretName: my-cm-endpoint
```

Where `my-cm-endpoint` is the name of a secret that you previously created, and is present in the same namespace as the subsystem, and contains TLS certificate files for termination of the endpoint.

Creating secrets and generating certificates

There is a number of "secrets" for which you can provide a name in the CRs:

- Portal admin secret.

```
portal:
  admin:
    secretName:
```

- Analytics ingestion secret.

```
analytics:
  ingestion:
    secretName: analytics-ingestion-client
```

- APIC Gateway Service TLS secret. Template entry from `gateway_cr_v6.yaml` (in the file name, "v6" refers to the API Gateway service):

```
apicGatewayServiceTLS:
  secretName:
```

- APIC Gateway Peering TLS secret. Template entry from `gateway_cr_v6.yaml` (in the file name, "v6" refers to the API Gateway service):

```
apicGatewayPeeringTLS:
  secretName:
```

You can manually create secrets that contain the `tls.crt`, `tls.key`, and `tls.ca` files for a certificate. You can then refer to them by name in their subsystem CR. However, a simpler way to have those secrets created is by using cert-manager. The following example shows how to generate those certificates with cert-manager:

```
---
apiVersion: cert-manager.io/v1
kind: Issuer
```

```

metadata:
  name: selfsigning-issuer
spec:
  selfSigned: {}
---
apiVersion: cert-manager.io/v1
kind: Certificate
metadata:
  name: ingress-ca
spec:
  secretName: ingress-ca
  commonName: "ingress-ca"
  usages:
  - digital signature
  - key encipherment
  - cert sign
  isCA: true
  duration: 87600h # 10 years
  renewBefore: 720h # 30 days
  privateKey:
    rotationPolicy: Always
  issuerRef:
    name: selfsigning-issuer
    kind: Issuer
---
apiVersion: cert-manager.io/v1
kind: Issuer
metadata:
  name: ingress-issuer
spec:
  ca:
    secretName: ingress-ca
---
apiVersion: cert-manager.io/v1
kind: Certificate
metadata:
  name: portal-admin-client
spec:
  commonName: portal-admin-client
  secretName: portal-admin-client
  issuerRef:
    name: ingress-issuer
  usages:
  - "client auth"
  - "signing"
  - "key encipherment"
  duration: 17520h # 2 years
  renewBefore: 720h # 30 days
  privateKey:
    rotationPolicy: Always
---
apiVersion: cert-manager.io/v1
kind: Certificate
metadata:
  name: analytics-ingestion-client
spec:
  commonName: analytics-ingestion-client
  secretName: analytics-ingestion-client
  issuerRef:
    name: ingress-issuer
  usages:
  - "client auth"
  - "signing"
  - "key encipherment"
  duration: 17520h # 2 years
  renewBefore: 720h # 30 days
  privateKey:
    rotationPolicy: Always
---
apiVersion: cert-manager.io/v1
kind: Certificate
metadata:
  name: gateway-service
spec:
  commonName: gateway-service
  secretName: gateway-service
  issuerRef:
    name: ingress-issuer
  usages:
  - "client auth"
  - "signing"
  - "key encipherment"
  duration: 17520h # 2 years
  renewBefore: 720h # 30 days
  privateKey:
    rotationPolicy: Always
---
apiVersion: cert-manager.io/v1
kind: Certificate
metadata:
  name: gateway-peering
spec:
  commonName: gateway-peering
  secretName: gateway-peering
  issuerRef:
    name: ingress-issuer

```

```

usages:
- "client auth"
- "signing"
- "key encipherment"
duration: 17520h # 2 years
renewBefore: 720h # 30 days
privateKey:
  rotationPolicy: Always

```

So with the previous example, in the subsystem CRs (for Management and Gateway) the following values could be set:

- `portal:`
 - `admin:`
 - `secretName: portal-admin-client`
- `analytics:`
 - `ingestion:`
 - `secretName: analytics-ingestion-client`
- `apicGatewayServiceTLS:`
 - `secretName: gateway-service`
- `apicGatewayPeeringTLS:`
 - `secretName: gateway-peering`

Also, the Client certificate should be signed by same CA as the one for the endpoint certificates, and the server side should be configured with the expected Subject DN for the client. For example:

- The `portalAdminSecret` certificate and the certificate used to terminate `portalAdminEndpoint` must have the same CA (in the example the CA is `ingress-ca` for both). Also, the `adminClientSubjectDN` in the Portal subsystem CR should be set to the Subject DN of `portal.admin.secretName`. For example:

```
adminClientSubjectDN: CN=portal-admin-client,O=cert-manager
```
- Similarly, the `analyticsIngestionSecret` and the Analytics ingestion endpoint certificate should share the same CA. The `ingestion.clientSubjectDN` should be set to the Subject DN of the `analytics.ingestion.secretName` certificate.

```

ingestion:
  endpoint:
    annotations:
      cert-manager.io/issuer: ingress-issuer
    hosts:
      - name: ai.example.com
        secretName: analytics-ai-endpoint
      clientSubjectDN: CN=analytics-ingestion-client,O=cert-manager

```

Important: When installing more than one Analytics subsystem in the same Kubernetes namespace, all secret names must be unique.

Creating TLS secret using openssl

Use of the cert-manager is recommended for managing certificates. However, you can choose not to use cert-manager, and instead create certificates manually. Requirements for manually created certificates:

- Extended Key Usage (EKU), either `serverAuth` or `clientAuth` depending upon the type of certificate. Certificates of type *Server* must have an Extended Key Usage with `serverAuth` purpose. Certificates of type *Client* must have an Extended Key Usage with `clientAuth` purpose.
- Subject Alternative Name (SAN) for the required hosts
- If a certificate is signed by an internal or custom CA, include the full chain in the end certificate. If you omit the full chain, then a user who uses openssl to access the endpoint will see the following error: `error:num=20:unable to get local issuer certificate`. The following example shows the full chain for an end certificate (signed by a custom CA):

```

-----BEGIN CERTIFICATE -----
Cert contents for end-cert
-----END CERTIFICATE -----
-----BEGIN CERTIFICATE -----
Cert contents for Intermediate-CA
-----END CERTIFICATE -----
-----BEGIN CERTIFICATE -----
Cert contents for Root CA
-----END CERTIFICATE -----

```

The following steps can be used as an alternative to using cert-manager. If you choose to create your certificates this way, you lose some of the management features of cert-manager. For example, you must manually update your certificates when their expiration date gets near.

1. Generate the custom certificate with the appropriate EKU and SAN. You will need to obtain the private key, public certificate, and CA certificates in non-password-protected PEM format for the custom certificate. Following is an example for how to generate a certificate (platform-api-example) with an EKU `serverAuth` and SAN using openssl:

```

openssl x509 -req -days 360 -in platform-api-example.csr -CA root-ca.pem -CAkey root-ca-key.pem -CAcreateserial -out
platform-api-cert -sha256
-extfile <(cat /etc/ssl/openssl.cnf <(printf
"\n[SAN]\nsubjectAltName=DNS:fqdn.myserver.com\nextendedKeyUsage=serverAuth"))
-extentions SAN

```

where

- `DNS:fqdn.myserver.com` is the fully qualified domain name of the endpoint the certificate applies to.
- `platform-api-example.csr` is the file name for the certificate signing request

Following is an example for how to generate a certificate (portal-client) with an EKU `clientAuth` and SAN using openssl:

```

openssl x509 -req -days 360 -in portal-client-example.csr -CA root-ca.pem -CAkey root-ca-key.pem -CAcreateserial -out
portal-client-cert

```

```
-sha256 -extfile <(cat /etc/ssl/openssl.cnf <(printf "\n[SAN]\nkeyUsage=critical,
digitalSignature,keyEncipherment\nextendedKeyUsage = clientAuth\nbasicConstraints=critical,
CA:FALSE\nsubjectKeyIdentifier=hash\n") -extensions SAN
```

2. Create a Kubernetes secret containing `tls.cert`, `tls.key`, and `ca.cert`.

Setting an encryption-secret for the management database using openssl

You can optionally set the encryption-secret for the management database. If you do not set one, one is automatically generated for you.

1. The encryption-secret is a secure random bytes password used for field level encryption in the management database. You can generate 128 random bytes using the following command in openssl:

```
openssl rand -out /path/to/secret/encryption-secret.bin 128
```

2. Use `kubectl` to put the generated secret into `management-encryption-key`:

```
kubectl create secret generic management-encryption-key -n <namespace>
--from-file=/path/to/secret/encryption_secret.bin
```

where `<namespace>` is the namespace where the Management CR is going to be created)

3. Make sure that in `management_cr.yaml`, `encryptionSecret.secretName` points to the name of the secret created in the previous step.

Important: Back up the `encryption-secret.bin` file to a safe location. If this file lost it will not be possible to access the management database or its backups.

- [Custom certificates on Kubernetes](#)

You can use custom certificates in your Kubernetes deployment. You can optionally generate your own custom certificates.

Custom certificates on Kubernetes

You can use custom certificates in your Kubernetes deployment. You can optionally generate your own custom certificates.

To deploy API Connect with Custom Certificates, some additional preparation and steps are required before any subsystem CRs are applied into the Cluster.

You can provide existing custom certificates that you already own, for example DigiCert certificates, or generate new custom certificates using a package such as Cert-Manager.

- If you have your own custom certificates, see [Configuring custom certificates before installation](#).
- If you do not already have your own custom certificates, and would like to use Cert-Manager to generate custom certificates, see [Generating custom certificates](#)
- To view a list of certificates used by API Connect, see [Custom certificates reference](#)

- [Custom certificates reference](#)

API Connect supports custom certificates for each subsystem, and for internal communications.

- [Generating custom certificates](#)

You can generate custom certificates.

- [Generating custom certificates using cert-manager in a two data center deployment](#)

You can generate custom certificates in a two data center disaster recovery deployment on Kubernetes.

- [Configuring custom certificates before installation](#)

Configure custom certificates for your API Connect deployment before you begin the installation procedures.

- [Converting to custom front-end/ingress certificates after deployment](#)

Convert a front-end certificate generated by cert-manager to a custom certificate for an existing IBM® API Connect deployment.

Custom certificates reference

API Connect supports custom certificates for each subsystem, and for internal communications.

Table 1. Certificates for Management Subsystem:

Certificate	Type	Notes
<code>analytics-ingestion-client</code>	Common Subsystem Communication	Must be signed by the same CA as <code>analytics-ai-endpoint</code> Certificate of Analytics Subsystem. For a two data center deployment, both data centers must have an identical subject name. For example, both data centers subject name could be <code>CN=a7s-ingestion-client</code> , or they could both be <code>CN=a7s-ingestion-client, O=cert-manager</code> , but they must be identical.
<code>portal-admin-client</code>	Common Subsystem Communication	Must be signed by the same CA as <code>portal-admin</code> Certificate of Portal Subsystem. For a two data center deployment, both data centers must have an identical subject name. For example, both data centers subject name could be <code>CN=portal-admin-client</code> , or they could both be <code>CN=ptl-adm-client, O=cert-manager</code> , but they must be identical.
<code>gateway-client-client</code>	Common Subsystem Communication	Must be signed by the same CA as <code>gww5-management-endpoint</code> and/or <code>gww6-management-endpoint</code> of Gateway Subsystem
<code>cm-endpoint</code>	External Frontend/Ingress	
<code>apim-endpoint</code>	External Frontend/Ingress	

Certificate	Type	Notes
api-endpoint	External Frontend/Ingress	
consumer-endpoint	External Frontend/Ingress	
hub-endpoint	External Frontend/Ingress	
turnstile-endpoint	External Frontend/Ingress	

Note:

To generate the certificates for the endpoints used by the Automated testing behavior endpoints (**hub-endpoint** and **turnstile-endpoint**), add the following statements to the **custom-certs-external.yaml**:

```

apiVersion: cert-manager.io/v1alpha2
kind: Certificate
metadata:
  name: hub-endpoint
  labels: {
    app.kubernetes.io/instance: "management",
    app.kubernetes.io/managed-by: "ibm-apiconnect",
    app.kubernetes.io/name: "hub-endpoint"
  }
spec:
  commonName: hub-endpoint
  secretName: hub-endpoint
  dnsNames:
  - hub.example.com
  issuerRef:
    name: ingress-issuer
  usages:
  - "server auth"
  - "signing"
  - "key encipherment"
  duration: 17520h # 2 years
  renewBefore: 720h # 30 days
  privateKey:
    rotationPolicy: Always
---
apiVersion: cert-manager.io/v1alpha2
kind: Certificate
metadata:
  name: turnstile-endpoint
  labels: {
    app.kubernetes.io/instance: "management",
    app.kubernetes.io/managed-by: "ibm-apiconnect",
    app.kubernetes.io/name: "turnstile-endpoint"
  }
spec:
  commonName: turnstile-endpoint
  secretName: turnstile-endpoint
  dnsNames:
  - turnstile.example.com
  issuerRef:
    name: ingress-issuer
  usages:
  - "server auth"
  - "signing"
  - "key encipherment"
  duration: 17520h # 2 years
  renewBefore: 720h # 30 days
  privateKey:
    rotationPolicy: Always

```

Table 2. Certificates for Analytics Subsystem

Certificate	Type	Notes
analytics-ai-endpoint	External Frontend/Ingress	Must be signed by the same CA as analytics-ingestion-client Certificate of Management Subsystem

Table 3. Certificates for Gateway Subsystem

Certificate	Type	Notes
gww5-endpoint	External Frontend/Ingress	
gww5-management-endpoint	External Frontend/Ingress	Must be signed by the same CA as gateway-client-client Certificate of Management Subsystem
gww6-endpoint	External Frontend/Ingress	
gww6-management-endpoint	External Frontend/Ingress	Must be signed by the same CA as gateway-client-client Certificate of Management Subsystem

Table 4. Certificates for Portal Subsystem

Certificate	Type	Notes
portal-admin	External Frontend/Ingress	Must be signed by the same CA as portal-admin-client Certificate of Management Subsystem
portal-web	External Frontend/Ingress	

Table 5. Internal Certificates

Certificate	Type (CA/Server/Client)	Subsystem	Notes
-------------	-------------------------	-----------	-------

Certificate	Type (CA/Server/Client)	Subsystem	Notes
caCertificate	CA	Management, Analytics, Portal	
clientCertificate	Client	Management, Analytics, Portal	
serverCertificate	Server	Management, Analytics, Portal	Portal DNS names required <pre> * <namespace> * <namespace>.svc * <instance name>-server.<namespace>.svc <instance name>-server * <instance name>-<site name>-db-all.<namespace>.svc * <instance name>-<site name>-www-all.<namespace>.svc * <instance name>-<site name>-db-all. <namespace>.svc.cluster.local * <instance name>-<site name>-www-all. <namespace>.svc.cluster.local * <namespace>.svc.cluster.local <instance name>-db </pre>
dbServerCertificate	Server	Management	
pgBouncerServerCertificate	Server	Management	
PGOTLSCertificate	Server	Management	
NATSTLSCertificate	Server	Management	
dbClientPostgres	Client	Management	
dbClientReplicator	Client	Management	
dbClientPgbouncer	Client	Management	
dbClientApicuser	Client	Management	
dbClientPrimaryuser	Client	Management	

Several certificates as noted above are required to be signed by the same CA as another certificate. For example, `portal-admin-client`, and `portal-admin`. This means that if the `portal-admin-client` certificate were to be customized, then the `portal-admin` certificate must also be customized, and signed by the same CA as `portal-admin-client`. To ensure that pairs of certificates like these are signed by the same CA, the Issuer for each certificate must be the same.

Generating custom certificates

You can generate custom certificates.

About this task

If you do not already have your own custom certificates that you can provide for the installation, you can manually prepare Certificate definitions for Cert-Manager to generate the required Certificates for you.

Note: If a certificate is signed by an internal or custom CA, include the full chain in the end certificate. If you omit the full chain, then a user who uses openssl to access the endpoint will see the following error: `error:num=20:unable to get local issuer certificate`

The following example shows the full chain for an end certificate (signed by a custom CA):

```

-----BEGIN CERTIFICATE -----
Cert contents for end-cert
-----END CERTIFICATE -----
-----BEGIN CERTIFICATE -----
Cert contents for Intermediate-CA
-----END CERTIFICATE -----
-----BEGIN CERTIFICATE -----
Cert contents for Root CA
-----END CERTIFICATE -----

```

Procedure

1. Create a Certificate Authority (CA) and an Issuer for Signing
 - a. Use the following YAML definition to generate a CA named `ingress-ca`, and an Issuer named `ingress-issuer` using that CA. Place the following definition into a file such as `ingress-ca.yaml`:

```

---
apiVersion: cert-manager.io/v1
kind: Certificate
metadata:
  name: ingress-ca
spec:
  secretName: ingress-ca
  commonName: "ingress-ca"
  usages:
  - digital signature
  - key encipherment
  - cert sign
  isCA: true
  issuerRef:
    name: selfsigning-issuer
    kind: Issuer
  duration: 87600h # 10 years

```

```

    renewBefore: 720h # 30 days
    privateKey:
      rotationPolicy: Always
---
apiVersion: cert-manager.io/v1
kind: Issuer
metadata:
  name: ingress-issuer
spec:
  ca:
    secretName: ingress-ca

```

b. Apply this file into the cluster:

```
kubectl apply -f ingress-ca.yaml -n <namespace>
```

This will create a CA Certificate named `ingress-ca`, and also a Secret named `ingress-ca`. This CA will be used to sign the rest of the custom certificates.

c. Verify the presence of both:

```
kubectl get certificate -n <namespace>
kubectl get secret -n <namespace>
```

2. Generating common subsystem communication certificates with Cert-Manager for management CR.

a. Use the following YAML definition to generate the following Common Certificates and Secrets: `analytics-ingestion-client`, and `portal-admin-client`. Place it into a file, for example, `common-certs.yaml`:

```

apiVersion: cert-manager.io/v1
kind: Certificate
metadata:
  name: analytics-ingestion-client
spec:
  commonName: analytics-ingestion-client
  secretName: analytics-ingestion-client
  issuerRef:
    name: ingress-issuer
  usages:
    - "client auth"
    - "signing"
    - "key encipherment"
  duration: 17520h # 2 years
  renewBefore: 720h # 30 days
  privateKey:
    rotationPolicy: Always
---
apiVersion: cert-manager.io/v1
kind: Certificate
metadata:
  name: portal-admin-client
spec:
  commonName: portal-admin-client
  secretName: portal-admin-client
  issuerRef:
    name: ingress-issuer
  usages:
    - "client auth"
    - "signing"
    - "key encipherment"
  duration: 17520h # 2 years
  renewBefore: 720h # 30 days
  privateKey:
    rotationPolicy: Always
---

```

Note that the `issuerRef` uses the Issuer created in Step 1. These certificates must be signed by the CA associated with that Issuer, `ingress-ca`.

b. Apply `common-certs.yaml` into the cluster:

```
kubectl apply -f common-certs.yaml -n <namespace>
```

This will create Client Certificates and Secrets named `analytics-ingestion-client`, and `portal-admin-client`.

c. Verify the presence of all of these certificates and secrets:

```
kubectl get certificate -n <namespace>
kubectl get secret -n <namespace>
```

3. Generating Front-end/Endpoint Certificates with Cert-Manager

a. Generate server certificates.

For each Endpoint in a subsystem CR, you can use the following YAML definition to generate a Server Certificate:

```

apiVersion: cert-manager.io/v1
kind: Certificate
metadata:
  name: <endpoint-host.secretName>
spec:
  commonName: <endpoint.host.secretName>
  secretName: <endpoint.host.secretName>
  dnsNames:
    - <endpoint.host.Name>
  issuerRef:
    name: ingress-issuer
  usages:
    - "server auth"

```

```

- "signing"
- "key encipherment"
duration: 17520h # 2 years
renewBefore: 720h # 30 days
privateKey:
  rotationPolicy: Always

```

Replace `<endpoint.host.secretName>` with the `secretName` in the `host` block of the `Endpoint` in the CR. For example, if the `Endpoint` in the CR is:

```

cloudManagerEndpoint:
  hosts:
  - name: admin.example.com
    secretName: cm-endpoint

```

The Certificate YAML should be updated as follows:

```

---
apiVersion: cert-manager.io/v1
kind: Certificate
metadata:
  name: cm-endpoint
spec:
  commonName: cm-endpoint
  secretName: cm-endpoint
  dnsNames:
  - admin.example.com
  issuerRef:
    name: ingress-issuer
  usages:
  - "server auth"
  - "signing"
  - "key encipherment"
  duration: 17520h # 2 years
  renewBefore: 720h # 30 days
  privateKey:
    rotationPolicy: Always

```

Note that the `issuerRef` uses the Issuer created in Step 1. This certificate will be signed by the CA associated with that Issuer, `ingress-ca`.

Place the edited yml into a file, e.g. `<subsystem>-server.yaml`.

b. Apply this file into the cluster:

```
kubectl apply -f <subsystem>-server.yaml.
```

This will create a Server Certificate named `<subsystem>-server`, and also a Secret named `<subsystem>-server`.

c. Check for the presence of both with:

```
kubectl get certificate -n <namespace>
kubectl get secret -n <namespace>
```

d. Repeat Step 3.a, step 3.b and step 3.c for each subsystem.

In each case, the Certificates must use the same Issuer created in Step 1. This ensures that all custom certificates are signed by the same CA Certificate.

Note that the `issuerRef` uses the Issuer created in Step 1. These certificates must be signed by the CA associated with that Issuer, `ingress-ca`.

e. Place the YAML definitions for each Certificate into a YAML file, for example, `endpoint-certs.yaml`. Apply this file into the cluster:

```
kubectl apply -f endpoint-certs.yaml -n <namespace>
```

This will create Client Certificates and Secrets for each Endpoint named `<endpoint.host.secretName>`.

f. Check for the presence of all of these with:

```
kubectl get certificate -n <namespace>
kubectl get secret -n <namespace>
```

4. Choose one of the following actions, based on whether or not you are customizing internal API certificates:

- If you do not plan to customize internal certificates, continue with [Configuring custom certificates before installation](#).
- If you want to generate some, or all, of the internal certificates, continue with the next step.

Note: It is not recommended to customize Internal certificates unless you have a specific requirement to do so.

5. Generate custom internal certificates using `custom-certs-internal.yaml`.

Each of the Internal certificates listed in [Custom certificates reference](#) have differing strict requirements for Common Names and DNS Names (i.e. Subject Alternative Names).

To generate custom certificates that meet these requirements, use the provided `custom-certs-internal.yaml` file, which can be found in the `helper_files` installation archive. For more information, see [Obtaining product files](#).

This file contains Certificate YAML definitions for all Internal certificates, CA, and Issuer that can be customized for each subsystem of IBM API Connect. The Certificate definitions file is already populated with the recommended default values.

a. When using custom internal certificates, you are required to specify a site name. The site name is used as the identifier for the PostgreSQL database Cluster used by API Connect. The site name chosen is added to the Management Subsystem CR YAML file before installing the Management Subsystem. In addition, this name is also required for use with the custom internal certificates, so a site name should be chosen now before proceeding.

b. Open `custom-certs-internal.yaml` in a text-editor, and make the following changes:

i. Search for the `pg-bouncer-server-certificate` certificate definition. Replace `commonName` and `dns-names` with the following values:

- `commonName: management-pgo_cluster_id-postgres-pgbouncer`

- `dnsNames:`
 - `"*.<namespace>"`
 - `"*.<namespace>.svc"`
 - `"management-pgo_cluster_id-postgres-pgbouncer.<namespace>.svc"`
 - `"management-pgo_cluster_id-postgres-pgbouncer"`

- Find and replace each occurrence of `<namespace>` with the desired namespace for the deployment. This must be done even if the `default` namespace is to be used.
 - Also in `custom-certs-internal.yaml`, replace each occurrence of `pgo_cluster_id` with the chosen site name described in Step 5.a.
- c. Apply the file to the Cluster:

```
kubectl apply -f custom-certs-internal.yaml -n <namespace>
```

- When all desired custom certificates are created and applied into the Kubernetes Cluster as **Certificates** and **Secrets**, update the Subsystem CR YAML files to use the custom certificates. See [Configuring custom certificates before installation](#).

Generating custom certificates using cert-manager in a two data center deployment

You can generate custom certificates in a two data center disaster recovery deployment on Kubernetes.

About this task

You can provide your own custom certificates when you deploy IBM API Connect, if required, instead of having the application generate and manage them for you. In most deployment cases to use the built in default Cert-Manager integration is the preferred method.

When you use the custom option, the use of Cert-Manager is the recommended method for generating custom certificates if that fits your business needs. However, use of Cert-Manager is not required, and custom certificates can be generated in any way that suit your needs.

The following example of providing custom certificates uses Cert-Manager as a model for generating them. For generating custom certificates, the minimum supported version of cert-manager is v1.5.1.

Procedure

- Set `KUBECONFIG` for the target cluster:

```
export KUBECONFIG=<path_to_cluster_config_YAML_file>
```

Example path:

```
/Users/user/.kube/clusters/<cluster_name>/kube-config-<cluster_name>.yaml
```

- Install cert-manager version 1.5.1 or later :
 - Download v1.12.7 from <https://github.com/cert-manager/cert-manager/releases/tag/v1.12.7>.
 - Install cert-manager. Do not specify a namespace:

```
kubectl apply -f cert-manager.yaml
```

- Check the status of the `cert-manager` pods:

```
kubectl -n cert-manager get po
```

Wait for `cert-manager` pods to enter `Running 1/1` status before proceeding. There are 3 `cert-manager` pods in total.

- Set up the customized external certificates:
For quick setup, you can use the provided yaml files that are included in the `helper_files` that you expanded in [Deploying operators and cert-manager](#). The yaml for the active data center (DC1) is called `custom-certs-external-dc1.yaml` and the yaml for the warm-standby data center (DC2) is called `custom-certs-external-dc2.yaml`.

- Open `custom-certs-external-dc1.yaml` and `custom-certs-external-dc2.yaml` in a text-editor. Find and replace each occurrence of `example.com` with the desired ingress subdomain for the API Connect stack.
- Ensure that the management CR for DC1 is ready for applying but not yet applied, make a note of the `hostname` of the site.
- In `custom-certs-external-dc1.yaml` find `spec.dnsNames`
For example, in DC1:

```
apiVersion: cert-manager.io/v1
kind: Certificate
metadata:
  name: dc1-mgmt-replication
spec:
  commonName: dc1-mgmt-replication
  secretName: dc1-mgmt-replication
  dnsNames:
  - <INSERT SITE HOSTNAME HERE. THIS WILL BE THE SAME VALUE AS IN THE MANAGEMENT CR spec.multiSiteHA.hosts.name for
site 1>
  issuerRef:
    name: ingress-issuer
  usages:
  - "signing"
  - "key encipherment"
  duration: 17520h # 2 years
  renewBefore: 720h # 30 days
  privateKey:
    rotationPolicy: Always
```

- Replace the line that begins `- <INSERT SITE HOSTNAME HERE` with `- hostname of the site`.

- e. Ensure that the management CR for DC2 is ready for applying but not yet applied, make a note of the `hostname` of the site.
- f. In `custom-certs-external-dc2.yaml` find `spec.dnsNames` and replace the line that begins - `<INSERT SITE HOSTNAME HERE` with - `hostname of the site`.
- g. Ensure that the portal CR for DC1 is ready for applying but not yet applied, make a note of the `hostname` of the site.
- h. In `custom-certs-external-dc1.yaml` find `spec.dnsNames`
For example, in DC1:

```
apiVersion: cert-manager.io/v1
kind: Certificate
metadata:
  name: dc1-ptl-replication
spec:
  commonName: dc1-ptl-replication
  secretName: dc1-ptl-replication
  dnsNames:
  - <INSERT SITE HOSTNAME HERE. THIS WILL BE THE SAME VALUE AS IN THE PORTAL CR spec.multiSiteHA.hosts.name for site
1>
  issuerRef:
    name: ingress-issuer
  usages:
  - "signing"
  - "key encipherment"
  duration: 17520h # 2 years
  renewBefore: 720h # 30 days
  privateKey:
    rotationPolicy: Always
```

- i. Replace the line that begins - `<INSERT SITE HOSTNAME HERE` with - `hostname of the site`.
 - j. Ensure that the portal CR for DC2 is ready for applying but not yet applied, make a note of the `hostname` of the site.
 - k. In `custom-certs-external-dc2.yaml` find `spec.dnsNames` and replace the line that begins - `<INSERT SITE HOSTNAME HERE` with - `hostname of the site`.
4. Use the following steps to allow `ingress-ca` secrets to be the same on both data centers.
- a. On DC1 apply the file `custom-certs-external-dc1.yaml`:

```
kubectl -n <namespace> apply -f custom-certs-external-dc1.yaml
```

- b. Validate that the command succeeded:

```
kubectl get certificates -n <namespace>
```

- c. Export `ingress-ca` secret as a yaml from DC1:

```
kubectl -n <namespace> get secret ingress-ca -o yaml > ingress-ca.yaml
```

- d. Edit the `ingress-ca.yaml` file to remove all labels, annotations, `creationTimestamp`, `resourceVersion`, `uid`, and `selfLink`.
- e. Copy the `ingress-ca.yaml` from DC1 to DC2 and apply that file on DC2:

```
kubectl -n <namespace> apply -f ingress-ca.yaml
```

- f. On DC2 apply the file `custom-certs-external-dc2.yaml`:

```
kubectl -n <namespace> apply -f custom-certs-external-dc2.yaml
```

- g. Use the following commands to test that they are the same, on DC1 run:

```
kubectl -n <namespace> get secrets ingress-ca -o yaml | grep tls.crt | awk '{print $2}' | base64 -d > /tmp/ingress.pem.dc1
```

- h. On DC2 run:

```
kubectl -n <namespace> get secrets ingress-ca -o yaml | grep tls.crt | awk '{print $2}' | base64 -d > /tmp/ingress.pem.dc2
```

- i. To see the differences run:

```
diff /tmp/ingress.pem.dc1 /tmp/ingress.pem.dc2
```

The files should be the same.

- j. To ensure that the certificates are working correctly and that they are using the `ingress-ca` secret. First, get the `portal-admin-client crt` file:

```
kubectl -n <namespace> get secrets portal-admin-client -o yaml | grep tls.crt | awk '{print $2}' | base64 -d > /tmp/admin-client.crt
```

- k. Test that it is working by using OpenSSL:

```
openssl verify -verbose -CAfile /tmp/ingress.pem.dc1 /tmp/admin-client.crt
```

If it is working, you should see:

```
/tmp/admin-client.crt: OK
```

5. Update the API Connect subsystem CR .yaml files to use the custom certificates. To do this, continue with [Configuring custom certificates before installation](#).

Configuring custom certificates before installation

Configure custom certificates for your API Connect deployment before you begin the installation procedures.

About this task

To deploy API Connect with custom certificates, complete the following steps to configure your custom certificates before applying any subsystem installation CRs to the cluster.

Procedure

1. Determine which certificates you want to customize.

For a list of certificates that can be customized, see [Custom certificates reference](#).

You can customize the following types of certificates:

- Endpoint (External Frontend/Ingress) certificates:
These are the certificates for external, public-facing endpoints where users interact with API Connect. You can customize none, some, or all of the endpoint certificates.

If you initially deploy APIC using default certificates for endpoints, you can convert them to custom certificates later as explained in [Converting to custom front-end/ingress certificates after deployment](#).

- Internal (CA, Client, Server, and Common Subsystem Communication) certificates:
These are the certificates used within API Connect, so that subsystems can communicate. If you want to customize any of the internal certificates, then you must customize all of them; however you don't have to create them all yourself. Any custom certs that are not specifically named in your deployment CR will be generated automatically during installation.

If you initially deploy API Connect using default certificates for internal certificates, you cannot convert them to custom certificates later.

2. Prepare your custom certificates.

If you don't have a set of custom certificates already, you can use Kubernetes Cert-manager to generate them as explained in [Generating custom certificates](#).

When preparing your custom certificates, remember that certain pairs of certificates must be signed by the same Certificate Authority, as noted in [Custom certificates reference](#).

If you're installing a two data center disaster recovery configuration, and are using custom certificates, then the subject names of any client certificates must be the same in both data centers, as noted in [Custom certificates reference](#). For example, both data centers subject name could be `CN=portal-admin-client`, or they could both be `CN=pt1-adm-client, O=cert-manager`, but they must be identical.

3. If needed, create a Kubernetes secret for each custom certificate.

Each custom certificate that you use must be captured in a TLS secret. To create a secret, use the following command:

```
kubectl create secret generic my-tls-secret --from-file=tls.crt=<path_to_cert_file> --from-file=tls.key=<path_to_key_file> --from-file=ca.crt=<path_to_cacert_file>
```

When you create each secret, it's helpful to reference its purpose or its corresponding certificate in the secret name, to ensure you specify the correct secret for each custom certificate.

4. Edit the `ingress-issuer-v1.yaml` file and delete the default definitions for the certificates that you will customize.

The `ingress-issuer-v1.yaml` file is provided as part of the installation `helper_files` archive.

This file is used for generating the default certificates. To use a custom certificate, you must delete the default definition to ensure that API Connect uses your certificate instead of the default certificate. If you customize all of the default certificates and delete those definitions from the file, then you don't need to use the file during installation.

5. Customize endpoint (External Frontend/Ingress) certificates in the corresponding subsystem CRs.

For each custom endpoint certificate, delete the annotation that specifies the default issuer, and replace the secret name with your own custom secret name.

- a. Open the subsystem CR for editing and locate the endpoint definition.

For example, the following snippet shows the definition for the `cloudManagerEndpoint` in the Management CR:

```
cloudManagerEndpoint:  
  annotations:  
    cert-manager.io/issuer: ingress-issuer  
  hosts:  
  - name: admin.example.com  
  secretName: cm-endpoint
```

- b. Delete the annotation for the `cert-manager.io/issuer`.

Delete the field name as well as the value; you can leave the `annotations:` label in place.

- c. Replace the default secret name with the name of the Kubernetes secret that you created for that endpoint's custom certificate.

In the following example, `cm-endpoint` is the default secret name, which must be replaced. Make sure to reference the correct secret for the custom certificate.

```
cloudManagerEndpoint:  
  annotations:  
  hosts:  
  - name: admin.example.com  
  secretName: my_cm-endpoint
```

6. Customize internal (CA, Client, Server, and Common Subsystem Communication) certificates.

- a. Open the subsystem CR for editing.

- b. Set the `microServiceSecurity` setting to `custom`.

By default, the setting is configured for `certManager` as shown in the following example:

```
microServiceSecurity: certManager  
certManagerIssuer:  
  name: selfsigning-issuer  
  kind: Issuer
```

- c. Delete (or comment-out) the `certManagerIssuer` block.

In the following example, `microServiceSecurity` is set to `custom` and the `certManagerIssuer` block is commented out:

```
microServiceSecurity: custom
#certManagerIssuer:
#  name: selfsigning-issuer
#  kind: Issuer
```

7. Add the `customCertificates` block and list the secret name for each internal custom certificate that you created for the subsystem. Each subsystem supports a different set of Common Subsystem Communication and External Frontend/Ingress certificates. You do not have to provide a custom version of every certificate supported by the subsystem. Just list the custom certificates that you created; any certificates that you omit from the list will be generated automatically during installation.

For example, your `customCertificates` list for the Management subsystem might look like the following example:

```
customCertificates:
- name: caCertificate
  secretName: my_ingress-ca
- name: clientCertificate
  secretName: my_management-client
- name: serverCertificate
  secretName: my_management-server
- name: dbServerCertificate
  secretName: my_db-server-certificate
- name: pgBouncerServerCertificate
  secretName: my_pg-bouncer-server-certificate
- name: PGOTLSCertificate
  secretName: my_pgo.tls
- name: NATSTLSCertificate
  secretName: my_management-natscluster-mgmt
- name: dbClientPostgres
  secretName: my_db-client-postgres
- name: dbClientReplicator
  secretName: my_db-client-replicator
- name: dbClientPgbouncer
  secretName: my_db-client-pgbouncer
- name: dbClientApicuser
  secretName: my_db-client-apicuser
- name: dbClientPrimaryuser
  secretName: my_db-client-primaryuser
```

What to do next

Deploy API Connect:

- If you did not deploy the API Connect operator yet, proceed to [Deploying operators in a single-namespace API Connect cluster](#) or [Deploying operators in a multi-namespace API Connect cluster](#).
- If you already deployed the operator, proceed to [Installing the API Connect subsystems](#).

Converting to custom front-end/ingress certificates after deployment

Convert a front-end certificate generated by cert-manager to a custom certificate for an existing IBM® API Connect deployment.

About this task

If you deploy IBM API Connect using certificates that were generated by cert-manager, you can later convert front-end (ingress) certificates to use custom certificates instead. For a list of the certificates that are generated and managed by cert-manager, see [Custom certificates reference](#).

Restriction: This task applies only to front-end certificates and is not supported for the "Common Subsystem Communication" and "Internal" type certificates.

Procedure

1. Create the secrets you want to use with the `kubectl create secret` command.
2. Edit the subsystem CR, and make the following changes for the endpoint secret you want to change:

- In the `annotations` section, remove the following line:

```
cert-manager.io/issuer: ingress-issuer
```

- In the `hosts` section, update the `secretName` to the new secret that you created in step 1.

The following example shows where the updates should be made:

```
spec:
  <endpoint>
    annotations:
      cert-manager.io/issuer: ingress-issuer REMOVE THIS LINE
    hosts:
      - name: <api endpoint hostname>
        secretName: CHANGE THIS TO THE NEW SECRET
```

Webhooks deployed and managed by the API Connect Operator

The API Connect Operator deploys and manages various Kubernetes API webhooks in the cluster to assist in management of its custom resources.

The webhooks included admission controllers and conversion webhooks.

Defaulting webhook

- Purpose
The defaulting webhook is a type of [Mutating Admission Webhook](#) which runs against Custom Resources (CRs) at **CREATE** or **UPDATE** time to populate default values in the CR's **spec**.
- Creation
Currently the defaulting webhook runtime is part of the API Connect Operator runtime, that is it exists within the API Connect Operator pod and container. When the operator boots, it creates **MutatingWebhookConfiguration** resources for each CRD (listed below). This **MutatingWebhookConfiguration** is a cluster-scope resource, but the configuration within will be specific to the namespace and operator instance which created it. If more than one instance of the API Connect Operator is deployed across a cluster (in different namespaces) there will be a set of webhook configurations for each API Connect Operator instance and namespace.

The name for the **MutatingWebhookConfiguration** resource for each CRD will take the following form:

```
<namespace>.<crd-name>.<defaulter [.<component>]>.<apiconnect.ibm.com>
```

The following CustomResourceDefinitions utilize a defaulting webhook:

```
AnalyticsCluster
ApiconnectCluster
GatewayCluster
ManagementBackup
ManagementCluster
ManagementDBUpgrade
ManagementRestore
PortalCluster
```

- Lifecycle
While the defaulting webhook runtime itself lives within the API Connect Operator pod, the **MutatingWebhookConfiguration** is a cluster-scope resource and is stand-alone. When it is created, an **ownerReference** is set on it that references the API Connect Operator's **ClusterRole**. Thus, the lifecycle of the **MutatingWebhookConfiguration** resources will be linked with the **ClusterRole**, which is linked with the installation of the operator itself.

When the operator is uninstalled, the **MutatingWebhookConfiguration** resources for that operator instance are also removed.

- Example
The below output shows the defaulting webhook configurations created for an operator deployed in the **apiconnect-operator** namespace. One can be seen for each CRD.

```
$ oc get mutatingwebhookconfiguration
NAME
apiconnect-operator.analyticsclusters.defaulter.analytics.apiconnect.ibm.com    1    4d4h
apiconnect-operator.apiconnectclusters.defaulter.apiconnect.ibm.com            1    4d4h
apiconnect-operator.gatewayclusters.defaulter.gateway.apiconnect.ibm.com      1    4d4h
apiconnect-operator.managementbackups.defaulter.management.apiconnect.ibm.com  1    4d4h
apiconnect-operator.managementclusters.defaulter.management.apiconnect.ibm.com 1    4d4h
apiconnect-operator.managementdbupgrades.defaulter.management.apiconnect.ibm.com 1    4d4h
apiconnect-operator.managementrestores.defaulter.management.apiconnect.ibm.com 1    4d4h
apiconnect-operator.portalclusters.defaulter.portal.apiconnect.ibm.com          1    4d4h
```

Validating webhook

- Purpose
The validating webhook is a type of [Validating Admission Webhook](#) which runs against Custom Resources (CRs) at **CREATE** or **UPDATE** time to validate the CR contains a configuration which will yield an operable cluster. The CustomResourceDefinitions use OpenAPI schema validation for basic property checks (such as integer bounds and non-empty strings), but more complex validation of the configuration is done via the webhook.
- Creation
Currently the validating webhook runtime is part of the API Connect Operator runtime, i.e. it exists within the API Connect Operator pod and container. When the operator boots, it creates **ValidatingWebhookConfiguration** resources for each CRD (listed below). This **ValidatingWebhookConfiguration** is a cluster-scope resource, but the configuration within will be specific to the namespace and operator instance which created it. If more than one instance of the API Connect Operator is deployed across a cluster (in different namespaces) there will be a set of webhook configurations for each API Connect Operator instance and namespace.

The name for the **ValidatingWebhookConfiguration** resource for each CRD will take the following form:

```
<namespace>.<crd-name>.<validator [.<component>]>.<apiconnect.ibm.com>
```

The following CustomResourceDefinitions utilize a validating webhook:

```
AnalyticsCluster
ApiconnectCluster
GatewayCluster
ManagementBackup
ManagementCluster
ManagementDBUpgrade
ManagementRestore
PortalCluster
```

- Lifecycle
While the validating webhook runtime itself lives within the API Connect Operator pod, the **ValidatingWebhookConfiguration** is a cluster-scope resource and is stand-alone. When it is created, an **ownerReference** is set on it that references the API Connect Operator's **ClusterRole**. Thus, the lifecycle of the **ValidatingWebhookConfiguration** resources will be linked with the **ClusterRole**, which is linked with the installation of the operator itself.

When the operator is uninstalled, the **ValidatingWebhookConfiguration** resources for that operator instance are also removed.

- Example
The below output shows the validating webhook configurations created for an operator deployed in the `apiconnect-operator` namespace. One can be seen for each CRD.

```
validatingwebhookconfiguration
```

NAME	WEBHOOKS	AGE
apiconnect-operator.analyticsclusters.validator.analytics.apiconnect.ibm.com	1	4d4h
apiconnect-operator.apiconnectclusters.validator.apiconnect.ibm.com	1	4d4h
apiconnect-operator.gatewayclusters.validator.gateway.apiconnect.ibm.com	1	4d4h
apiconnect-operator.managementbackups.validator.management.apiconnect.ibm.com	1	4d4h
apiconnect-operator.managementclusters.validator.management.apiconnect.ibm.com	1	4d4h
apiconnect-operator.managementdbupgrades.validator.management.apiconnect.ibm.com	1	4d4h
apiconnect-operator.managementrestores.validator.management.apiconnect.ibm.com	1	4d4h
apiconnect-operator.portalclusters.validator.portal.apiconnect.ibm.com	1	4d4h

Installing API Connect

Use these instructions to install a deployment of API Connect on Kubernetes, OpenShift, and IBM Cloud Pak for Integration.

To deploy API Connect, complete the tasks in the order below.

- [Deployment requirements](#)
Describes the system requirements for deploying into the Kubernetes, OpenShift, and Cloud Pak for Integration runtime environments.
- [Deployment procedures](#)
You can use these procedures to deploy API Connect on either native Kubernetes or OpenShift.

Deployment requirements

Describes the system requirements for deploying into the Kubernetes, OpenShift, and Cloud Pak for Integration runtime environments.

Before you begin

Note: This article refers to third-party software that IBM does not control. As such, the software might change and this information might become outdated. Kubernetes is a platform for automated deployment, scaling, and operation of application containers across clusters of hosts, providing container-centric infrastructure. For more information, see <https://kubernetes.io>.

These instructions assume you have a working Kubernetes environment and understand how to manage Kubernetes.

About this task

Review all the requirements listed in the following steps before starting your API Connect deployment.

Note: If you plan to install the Automated API behavior testing application, review the *Before you begin* section in [Installing the Automated API behavior testing application](#) because the requirements might have an impact on your deployment choices for API Connect.

Procedure

1. Verify that you have supported software.
 - Refer to the IBM Software Product Compatibility Reports site for detailed requirements for operating systems, supporting software, and other prerequisites. See [Detailed system requirements for a specific product](#)
 - For new installations, the API Connect operators and operands must be from the same version of API Connect. This requirement applies to native Kubernetes and OpenShift installations.
 - Note that the API Connect operator version *number* does not match the API Connect release version *number*. You can view a mapping of API Connect release number to API Connect operator version numbers in [Deploying operators and cert-manager](#).
 - For API Connect operands (Management, Portal, Analytics, and Gateway subsystems), the version number matches the API Connect release version number.
2. Verify that your Kubernetes environment is running and meets the configuration requirements for API Connect:
 - When using IBM Cloud Kubernetes Service, ingress-nginx is required.
 - Specify settings for the ingress controller for a Kubernetes runtime environment. See [Kubernetes ingress controller prerequisites](#).
 - The timezone for API Connect pods is set to UTC. Do not change the timezone for the pods.
 - To ensure the API Connect services have time to start, we recommend increasing the *proxy-read-timeout* and *proxy-send-timeout* values in the *config.map* used to configure the `kubernetes/ingress-nginx` ingress controller. The following settings should be increased:
 - `proxy-read-timeout: "240"`
 - `proxy-send-timeout: "240"`

240 seconds (4 minutes) is a recommended minimum; actual value will vary depending upon your environment. If there is a load balancer in front of the worker node(s), then the load balancer configuration may also need to have extended timeouts.
 - Storage type:
When selecting storage type, review the following considerations:
 - Management subsystem requires block storage.
 - Developer Portal subsystem supports block storage or local volume storage.
 - Analytics subsystem supports block storage or local volume storage.

Supported storage types

- Block storage

Select a block storage format of your choosing in order for API Connect components to be supported. Supported block storage types include, but are not limited to:

- Rook Ceph
Note: cephrrbd (RADOS Block Device) is recommended over cephfs file system
- OpenShift Container Storage
- Portworx
- IBM Cloud Block Storage
- AWS: the gp2, gp3, io1, and io2 types of Elastic Block Storage (EBS) are supported.
- IBM Spectrum Scale with Block Storage
- Azure Premium Storage
- GCE Persistent Disk

See also the **API Connect v10 WhitePaper 1.5** for information on limitations observed with other block storage solutions:

<https://community.ibm.com/community/user/integration/viewdocument/api-connect-deployment-whitepaper-v?CommunityKey=2106cca0-a9f9-45c6-9b28-01a28f4ce947&tab=librarydocuments&LibraryFolderKey=&DefaultView=folder>

- Local volume storage

Management subsystem and Developer Portal subsystem

All subsystems will run on local volume storage but it is not recommended for the Management subsystem and Developer Portal subsystem because it has severe performance impacts for high availability deployments, and for pod allocation.

Note also that local volume storage is not available in most cloud environments, and might incur limitations in disaster recovery scenarios, since it is tied to the node on which the pod is run. This means that use of LVS might be adequate for deployments with a one replicaprofile, but inadequate for deployments with a three replica profile.

Analytics subsystem

For Analytics subsystems, transactions per second (TPS) is three times faster with local volume storage than with Ceph block storage. In a production scenario, you will have multiple analytics-storage (OpenSearch) nodes forming a storage cluster. OpenSearch will manage data replication across its cluster and ensure high availability, thus mitigating possible local volume storage drawbacks with disaster recovery.

Non-supported storage

- NFS
API Connect v10 cannot be deployed on NFS.
- GlusterFS
GlusterFS is not recommended as a storage option due to severe performance degradation and in some cases, loss of data. There are known GlusterFS issues that affect OpenSearch (which is used in the API Connect analytics service), the Developer Portal and the Management subsystem

- Storage class configuration:

In your Kubernetes cluster configuration, you must create storage classes with the setting:

```
volumeBindingMode: WaitForFirstConsumer
```

This setting is needed to avoid volume node **affinity** conflicts, such as those caused by **requiredPodAntiAffinity** restrictions. If **WaitForFirstConsumer** is the binding mode, PVCs (PersistentVolumeClaims) are only bound once the pod is actually created.

By contrast, when the binding mode is immediate (**volumeBindingMode: Immediate**), the PVCs are bound to PVs (PersistentVolumes) as soon as the PV is created.

- Example:
The Postgres operator creates the PVC first and then deploys the deployments. In immediate mode, PVCs are bound to PVs as soon as the PV is created. The **pgbackrest** pod starts successfully, but because **requiredPodAntiAffinity** restrictions are set, and the **postgres** pod is **NOT ALLOWED** to schedule on the same node as **pgbackrest** pod, Kubernetes cannot schedule the pod in node **eu-west-1c**. Also, because the volume attached to the pod is at **eu-west-1c**, Kubernetes cannot move the pod to any other node, thus causing **volume node affinity** conflict.
- Example:
When deploying to a multi-zone cluster, you must use StorageClass with **WaitForFirstConsumer** because when binding mode is immediate, successful deployment is indeterminate because of interactions between pod/node affinity and the Kubernetes provisioning of the PV on the right node where the pod is being provisioned.

For more information, see "Volume Binding Mode" on <https://kubernetes.io/docs/concepts/storage/storage-classes/>.

Note: During deployment, you are required to specify the name of the storage class you created. You can either use the setting **storageClassName: \$STORAGE_CLASS** in the applicable CR (such as apiconnect top-level CR or an individual subsystem CR), or you can use a configuration UI such as Platform Navigator UI or OpenShift Container Platform (OCP) UI.

- When the Analytics service is configured to store data, (that is, it is not configured for ingestion-only), the service depends on OpenSearch, which requires map counts higher than the operating system defaults. See: [Installing the Analytics subsystem](#).
If you are deploying on OpenShift, the map count is preconfigured (**vm.max_map_count = 1027580**) with a value that is sufficiently large for OpenSearch so you do not need to modify this setting.
- Ensure that your Kubernetes deployment addresses known security vulnerabilities with SSH to prevent the use of weak SSH Message Authentication Code (MAC) and Key exchange algorithms (KexAlgorithms) with TCP over port 22. Use of weak algorithms can allow an attacker to recover the plain text message from the encrypted text. If you have not yet addressed the security vulnerabilities with weak MACs and KexAlgorithms, update your configuration manually by adding the following lines to `/etc/ssh/sshd_config`:

```
KexAlgorithms curve25519-sha256@libssh.org,diffie-hellman-group-exchange-sha256  
MACs hmac-sha2-512-etm@openssh.com,hmac-sha2-256-etm@openssh.com,umac-128-etm@openssh.com,hmac-sha2-512,hmac-sha2-256,umac-128@openssh.com
```
- IBM API Connect requires a number of container registry repositories to be added to your container registry service if automatic repository creation is not supported. Follow the procedure in Step 4 of [Obtaining product files](#).

- Logging:
 - Configure a remote server for logging. See [Logging](#). Pods are terminated during an upgrade, and the logs will be lost if not stored remotely.
 - Configure the log rotation by setting the **max-size** and **max-files** values to a setting appropriate for your deployment. In a Kubernetes deployment, insufficient values for max-size and max-files can cause logs to grow too large and eventually force pods to restart. For more information, visit the Docker documentation and search for "JSON File logging driver".
3. Ensure your deployment meets the DNS requirements for API Connect domain names, host names, and endpoints.
You specify endpoints when you edit the custom resource templates for each subsystem, and when you use the Cloud Manager UI to configure the services for your cloud. The domain names you use for the endpoints must be recognized by your DNS configuration. DNS entries must meet these requirements:

Important: For API Connect on native Kubernetes and OpenShift, do not use coredns 1.8.1 through 1.8.3. These releases have a defect that can prevent pods for Developer Portal from starting. See <https://coredns.io/>.

- Endpoints cannot contain the underscore character "_" or uppercase characters.
- Host names that are used to create endpoints cannot contain the underscore character "_" or uppercase letters.
- DNS must be configured with domain names that correspond to the endpoints configured at installation time for each subsystem.
- Host names and DNS entries may not be changed on a cluster after the initial installation.
- Kubernetes ingress limits the character set for DNS names to not support the underscore character "_". This means you cannot specify underscores in domain names that are used as endpoints. For example, `my_domain.abc.com` and `my.domain_abc.com` are not supported for `<xxx>.<hostname>.<domainname>`, and will cause an error:

```
Invalid value: "my_domain.abc.com": a DNS-1123 subdomain must consist of lowercase alphanumeric characters, '-' or '.', and must start and end with an alphanumeric character (e.g. 'example.com', regex used for validation is '[a-z0-9]([-a-z0-9]*[a-z0-9])?(\.[a-z0-9]([-a-z0-9]*[a-z0-9])?)*')
```

- We recommend that you keep a record of the DNS entries and endpoint names, as you will need to map the DNS entries and use the same endpoints when restoring a backup of the management database. Note that endpoints are FQDNs, entered in all lowercase. For an overview on endpoints, review [Deployment overview for endpoints and certificates](#)
- Specifying domain names when deploying CRs (custom resources) for each subsystem:
The custom resource templates provide endpoint settings that consist of a default endpoint prefix and a variable `$STACK_HOST` that you set to specify your domain name, as part of [Installing the API Connect subsystems](#).

Table 1. Endpoints with domain names that must be configured in DNS

Default endpoint name	Description
<code>admin.\$STACK_HOST</code>	Cloud Manager URL endpoint for the Management subsystem
<code>manager.\$STACK_HOST</code>	API Manager URL endpoint for the Management subsystem
<code>api.\$STACK_HOST</code>	Platform REST API Endpoint for admin and provider APIs
<code>consumer.\$STACK_HOST</code>	Platform REST API Endpoint for consumer APIs for the Management subsystem.
<code>rgw.\$STACK_HOST</code>	Gateway Endpoint for API invocation for DataPower API Gateway
<code>rgwd.\$STACK_HOST</code>	Gateway Management Endpoint for DataPower API Gateway
<code>gw.\$STACK_HOST</code>	Gateway Endpoint for API invocation for DataPower Multi-Protocol Gateway (v5-compatible)
<code>gwd.\$STACK_HOST</code>	Gateway Management Endpoint for DataPower Multi-Protocol Gateway (v5-compatible)
<code>ai.\$STACK_HOST</code>	Analytics ingestion endpoint for the Analytics subsystem
<code>api.portal.\$STACK_HOST</code>	Developer Portal admin endpoint
<code>portal.\$STACK_HOST</code>	Developer Portal UI endpoint

- Specifying endpoints using the Cloud Manager interface
After initial deployment of the Kubernetes custom resource for each subsystem, you will also enter the endpoints in the Cloud Manager user interface when defining each service as part of [Defining your topology](#).
4. The Cloud Provider for the target Kubernetes platform must provide Ingress Controller support for SSL Passthrough.
For example, if the Cloud Provider uses or suggests the use of the NGINX Community Ingress, then the `--enable-ssl-passthrough` flag would need to be provided at runtime, as described at <https://kubernetes.github.io/ingress-nginx/user-guide/tls/#ssl-passthrough>. For IBM Cloud Kubernetes Service, see https://cloud.ibm.com/docs/containers?topic=containers-ingress-user_managed.
5. Determine your strategy for using certificates and cert-manager with API Connect.
If you haven't already, review the topics in the section [Certificates in a Kubernetes environment](#).
- Consider the following:
- Will you use a cert-manager (recommended) or manually manage your certificates?
API Connect provides a cert-manager and default certificates. If you use these, you can follow default configuration steps. See [Deploying operators and cert-manager](#).
 - Will you use custom certificates rather than default certificates? See [Custom certificates on Kubernetes](#).
6. If you plan to deploy API Connect on Kubernetes with DataPower Gateway in a *non-Kubernetes* environment, such as a DataPower appliance, review the API Connect requirements for operation with DataPower Gateway:
- When deploying with a DataPower appliance, configure a Gateway Service Management Endpoint and API invocation Endpoint in DataPower. See [Configuring the API Connect Gateway Service](#) in the appropriate version of the [DataPower documentation](#).
 - Ensure that DataPower Gateway firmware version you plan to install is compatible with the API Connect Management server version.
- Note:
You can use any combination of API Connect 10.0.5.x with DataPower Gateway 10.5.0.x or DataPower API Gateway 10.5.0.x.
- Before you install, best practice is to review the latest compatibility support for your version of API Connect. To view compatibility support, follow the instructions in [IBM API Connect Version 10 software product compatibility requirements](#) to access API Connect information on the Software Product Compatibility Reports website. Once you access information for your version of API Connect, select Supported Software, Integration Middleware, and view the list of compatible DataPower Gateway versions.
7. If you plan to deploy the API Connect management subsystem and the DataPower Gateway subsystem on a Kubernetes deployment, managed by the DataPower and API Connect Operators, you can use any combination of API Connect 10.0.5.x with DataPower Gateway 10.5.0.x or DataPower API Gateway 10.5.0.x.
8. Observe namespace restrictions:
- OpenShift

Only one top level CR (APICoordinateCluster) can be deployed in each namespace.

- Cloud Pak for Integration
In the Platform Navigator UI, only one APICoordinate capability can be deployed in each namespace.

- Native Kubernetes
Only one instance of a subsystem can be deployed in each namespace. Deploying multiple similar subsystems in a single namespace is not supported. For example, there is no support for deploying two management subsystems, `mgmt1`, `mgmt2` in a single namespace where apicconnect operator is installed.

9. The following kernel or Kubernetes node limits for the Developer Portal subsystem must be set correctly:

- Ensure that your kernel or Kubernetes node has the value of its `inotify` watches set high enough so that the Developer Portal can monitor and maintain the files for each Developer Portal site. If set too low, the Developer Portal containers might fail to start or go into a `non-ready` state when this limit is reached. If you have many Developer Portal sites, or if your sites contain a lot of content, for example, many custom modules and themes, then a larger number of `inotify` watches are required. You can start with a value of 65,000, but for large deployments, this value might need to go up as high as 1,000,000. The Developer Portal containers take `inotify` watches only when they need them. The full number is not reserved or held, so it is acceptable to set this value high.
- Ensure that your kernel or Kubernetes node has a value of `nproc` (maximum number of processes) that applies to the user ID of the Portal pods that have been assigned, and that it is high enough to allow all of the Portal processes to execute. For smaller installations this might be as low as 16384, but for larger installations that have more concurrent web calls, you might need as many as 125205. If the number is too low, you will see errors like `"fork: retry: Resource temporarily unavailable"` in the Portal logs. Note that this value might need to be even higher if other, non-Portal, pods are sharing the same user ID.
- Ensure that your kernel or Kubernetes node has a value of `nofiles` (maximum number of open file descriptors) that applies to the user ID of the Portal pods that have been assigned, and that it is high enough to allow the Portal to open all of the files that it requires. For smaller installations this might be as low as 16384, but for larger installations that have more concurrent web calls and Portal web sites, you might need as many as 1048576. If the number is too low, you will see errors like `"too many open files"` in the Portal logs. Note that this value might need to be even higher if other, non-Portal, pods are sharing the same user ID.

- [IBM API Connect Version 10 software product compatibility requirements](#)

Ensure that you install the minimum API Connect operating system requirements. Use the IBM Software Product Compatibility Reports site to generate a requirements report appropriate for your API Connect version and environment.

- [API Connect licenses](#)

When you install a new version of API Connect, you must accept a license for the API Connect program that you purchased.

IBM API Connect Version 10 software product compatibility requirements

Ensure that you install the minimum API Connect operating system requirements. Use the IBM® Software Product Compatibility Reports site to generate a requirements report appropriate for your API Connect version and environment.

- [Generating a Software Product Compatibility Report](#)
- [Supported versions of Kubernetes](#)
- [Upgrading to an API Connect release that uses a newer version of Kubernetes](#)
- [Supported versions of OpenShift](#)
- [Upgrading to an API Connect release that uses a newer version of OpenShift](#)

Generating a Software Product Compatibility Report

To generate an API Connect requirements report, complete the following steps:

1. Open the [Detailed system requirements for a specific product](#) page on the IBM Software Product Compatibility Reports site.
2. Search for the IBM API Connect product.
3. In the Search results list, select IBM API Connect.
4. From the Version list, select the required version.
5. Use the Filters to refine the contents of the requirements report.
6. Click Submit to generate your requirements report.

Supported versions of Kubernetes

Table 1 provides a quick reference of the supported Kubernetes versions for each API Connect release:

Any upgrade can only progress from older versions of Kubernetes and API Connect to newer versions, and each stage must involve a combination that is represented with a check mark in the table.

Table 1. API Connect and Kubernetes (K8S) compatibility matrix

API Connect version	K8S 1.22	K8S 1.23	K8S 1.24	K8S 1.25	K8S 1.26	K8S 1.27	K8S 1.28	K8S 1.29
10.0.1.7	✓	✓						
10.0.1.8	✓	✓						
10.0.1.9		✓	✓	✓				
10.0.1.11		✓	✓	✓				
10.0.1.12			✓	✓	✓			
10.0.1.15				✓	✓	✓		
10.0.4.0-ifix2 or later	✓							
10.0.5.0	✓	✓						
10.0.5.1	✓	✓						
10.0.5.2		✓	✓	✓				
10.0.5.3			✓	✓	✓			

API Connect version	K8S 1.22	K8S 1.23	K8S 1.24	K8S 1.25	K8S 1.26	K8S 1.27	K8S 1.28	K8S 1.29
10.0.5.4			✓	✓	✓	✓		
10.0.5.5					✓	✓	✓	
10.0.5.6						✓	✓	✓

Upgrading to an API Connect release that uses a newer version of Kubernetes

When you upgrade API Connect, both your current deployment and your target release must support the same version of Kubernetes. After the API Connect upgrade, you can optionally update Kubernetes to the highest version supported by the new release of API Connect.

It is possible you will need to upgrade both Kubernetes and API Connect more than once to complete the process. For example, suppose that your current deployment is running API Connect 10.0.1.12 on Kubernetes v1.24 and you want to upgrade to API Connect 10.0.5.6. The highest version of Kubernetes supported with API Connect 10.0.1.12 is v1.26, but the lowest version of Kubernetes supported by API Connect 10.0.5.6 is v1.27, so a direct upgrade of API Connect is not possible.

In this scenario, you must make multiple upgrades of both Kubernetes and API Connect. For example, one option is to use API Connect 10.0.1.15 on Kubernetes v1.27 as your interim release by completing the following upgrades:

1. On your API Connect 10.0.1.12 deployment, upgrade Kubernetes from v1.24 to v1.25, and then v1.26.
2. Upgrade API Connect to 10.0.1.15 on Kubernetes v1.26.
3. On the API Connect 10.0.1.15 deployment, upgrade Kubernetes to v1.27.
4. Upgrade API Connect to 10.0.5.6 on Kubernetes v1.27.
5. On the API Connect 10.0.5.6 deployment, optionally upgrade Kubernetes to v1.28, and then to v1.29.

Supported versions of OpenShift

Table 2 provides a quick reference of the supported OpenShift versions for each API Connect release.

Any upgrade can only progress from older versions of OpenShift and API Connect to newer versions, and each stage must involve a combination that is represented with a check mark in the table.

Note: In the table, OpenShift 4.7, 4.8, and 4.9 are marked with * to indicate that they are available only as interim solutions to enable your upgrade from API Connect 10.0.1.7, 10.0.1.8, and 10.0.4-ifix2 on OpenShift 4.6.

Table 2. API Connect and OpenShift Container Platform (OCP) compatibility matrix

API Connect version	OCP 4.6	OCP 4.7	OCP 4.8	OCP 4.9	OCP 4.10	OCP 4.12	OCP 4.14
10.0.1.7	✓	✓*	✓*	✓*	✓		
10.0.1.8	✓	✓*	✓*	✓*	✓		
10.0.1.9					✓		
10.0.1.11					✓		
10.0.1.12					✓	✓	
10.0.1.15					✓	✓	
10.0.4.0-ifix2 or later	✓	✓*	✓*	✓*	✓		
10.0.5.0					✓		
10.0.5.1					✓		
10.0.5.2					✓	✓	
10.0.5.3					✓	✓	
10.0.5.4					✓	✓	
10.0.5.5					✓	✓	✓
10.0.5.6					✓	✓	✓

Upgrading to an API Connect release that uses a newer version of OpenShift

When you upgrade API Connect, both your current deployment and your target release must support the same version of OpenShift. After the API Connect upgrade, you can optionally update OpenShift to the highest version supported by the new release of API Connect.

Note: When you upgrade OpenShift, you must progress through every interim version; for example, to upgrade from 4.10 to 4.14, complete the following upgrades: 4.10, ≥ 4.11, ≥ 4.12, ≥ 4.13, ≥ 4.14.

Suppose you want to upgrade to API Connect 10.0.5.6:

- If you are using API Connect 10.0.1.11 or earlier running on OpenShift 4.10:
 1. Upgrade API Connect to a newer version that supports both OpenShift 4.10 and OpenShift 4.12 (for example, to 10.0.1.12 or 10.0.1.15, or to 10.0.5.2, 10.0.5.3, 10.0.5.4, or 10.0.5.5).
 2. Upgrade OpenShift to 4.12.
 3. Upgrade API Connect to 10.0.5.6 (supported on OpenShift 4.12).
 4. Optionally upgrade OpenShift to 4.14 (the highest version supported by API Connect 10.0.5.6).
- If you using API Connect 10.0.4.0-ifix2 running on OpenShift 4.6, then you must first upgrade to OpenShift 4.10 before you can upgrade to API Connect to 10.0.5.0 or later:
 1. Upgrade OpenShift to 4.10.
 2. Upgrade API Connect to a newer version that supports both OpenShift 4.10 and OpenShift 4.12 (10.0.5.2, 10.0.5.3, 10.0.5.4, or 10.0.5.5).
 3. Upgrade API Connect to 10.0.5.6 (supported on OpenShift 4.12).
 4. Optionally upgrade OpenShift to 4.14 (the highest version supported by API Connect 10.0.5.6).

API Connect licenses

When you install a new version of API Connect, you must accept a license for the API Connect program that you purchased.

See also: [API Connect licenses for the 10.0.6 and 10.0.7 releases](#).

When you install or upgrade API Connect, the procedures include instructions for specifying your license. Be sure to specify a License ID from the version of API Connect that your installing, or are upgrading to.

API Connect 10.0.5.x licenses

For API Connect 10.0.5.3 and later, the licenses in Table 1 will be used as the master mod-level license for all Fix Pack and security roll-up releases in this stream. There are no changes to license terms, only updates to open-source notices documented in the notes for each.

Table 1. API Connect 10.0.5.3 and later licenses

License ID	Program Name	URL
L-VQYA-YNM22H	IBM API Connect Enterprise V10.0.5.3 If you are upgrading from 10.0.5.0 or 10.0.5.1, this ID replaces the ID for "IBM API Connect Enterprise PVU V10.0.5"	https://ibm.biz/BdPGTL
L-SLCD-D9MBTA	IBM API Connect Enterprise Add-on for IBM Products V10.0.5.3	https://ibm.biz/BdPGTQ
L-XSJQ-UMJP6P	IBM API Connect Professional V10.0.5.3	https://ibm.biz/BdPGTC

Table 2. API Connect 10.0.5.2 licenses

License ID	Program Name	URL
L-GVEN-GFUPVE	IBM API Connect Enterprise V10.0.5.2 If you are upgrading from 10.0.5.0 or 10.0.5.1, this ID replaces the ID for "IBM API Connect Enterprise PVU V10.0.5"	https://ibm.biz/BdPPmt
L-BYRR-EEASJ3	IBM API Connect Enterprise Add-on for IBM Products V10.0.5.2	https://ibm.biz/BdPPm6
L-EMZJ-MQ4M24	IBM API Connect Professional V10.0.5.2	https://ibm.biz/BdPPmU
L-RJON-CJR3A7	IBM Cloud Pak for Integration - API Calls 2022.4.1	https://ibm.biz/BdPP5e

Table 3. API Connect 10.0.5.0 and 10.0.5.1 licenses

License ID	Program Name	URL
L-RJON-CEBLEH	IBM API Connect Enterprise PVU V10.0.5 If you purchased Cloud Pak for Integration, accept the API Connect Enterprise license when you purchase your Virtual Processor Cores.	https://ibm.biz/BdPFpN
L-RJON-CD3JHD	IBM Cloud Pak for Integration - API Calls 2022.2.1 If you purchased Cloud Pak for Integration - API Calls (which is an add-on product), select this license to track usage by the monthly number of API calls instead of the number of installed Virtual Processor Cores.	https://ibm.biz/BdPEBb
L-RJON-CEBLCF	IBM API Connect Enterprise PVU Add-on for IBM Products V10.0.5	https://ibm.biz/BdPFpW
L-RJON-CEBL97	IBM API Connect Professional PVU V10.0.5	https://ibm.biz/BdPF8B

Deployment procedures

You can use these procedures to deploy API Connect on either native Kubernetes or OpenShift.

- [Deploying on Kubernetes](#)
Use the procedures in this section to install API Connect on native Kubernetes distributions.
- [Deploying on OpenShift and Cloud Pak for Integration](#)
You can install API Connect in an OpenShift environment or as the API Management capability in IBM Cloud Pak for Integration.

Deploying on Kubernetes

Use the procedures in this section to install API Connect on native Kubernetes distributions.

- [Obtaining product files](#)
Obtain the product files, upload the images to a Docker registry, and decompress the operators and templates.
- [Deploying operators and cert-manager](#)
Deploy the Kubernetes operator files and install cert-manager.
- [Installing the API Connect subsystems](#)
Deploy the API Connect subsystem custom resources.
- [Installing a two data center deployment on Kubernetes](#)
Additional installation instructions for a two data center disaster recovery (2DCDR) deployment on Kubernetes.

Obtaining product files

Obtain the product files, upload the images to a Docker registry, and decompress the operators and templates.

Before you begin

- Ensure you have supported hardware and software. See [IBM API Connect Version 10 software product compatibility requirements](#).
- Complete the [Deployment requirements](#)
- Install and run Docker on the local machine being used for API Connect installation. Log in to your image registry.

About this task

From the [IBM Fix Central](#) site, download the Docker image-tool file of the API Connect subsystems. Next, you will upload the image-tool file to your Docker local registry. If necessary, you can populate a remote container registry with repositories. Then you can push the images from the local registry to the remote registry.

You will also download the Kubernetes operators, API Connect Custom Resource (CR) templates, and Certificate Manager, for use during deployment configuration.

Note:

- If you plan to migrate from Version 5 to Version 10, review [Migrating a Version 5 deployment](#) before you start the installation process.
- If you have API Connect installed and want to upgrade your release version, follow the upgrade instructions: [Upgrading API Connect in a Kubernetes runtime environment](#)

Procedure

1. Obtain the API Connect files:
 - a. Go to the [What's New in the latest version](#) information page.
 - b. Locate the Note: *You can access the latest files from <URL link>*. Select the <URL link> to go directly to the Announce page on Fix Central, where you can download files for the *latest version* of API Connect.

The following files are used for initial deployment on native Kubernetes:

IBM® API Connect <version> for Containers

Docker images for all API Connect subsystems

IBM® API Connect <version> Operator Release Files for Containers

Kubernetes operators and API Connect Custom Resource (CR) templates

IBM® API Connect <version> Toolkit for <operating_system_type>

Toolkit command line utility. Packaged standalone, or with API Designer or Loopback:

- IBM® API Connect <version> Toolkit for <operating_system_type>
- IBM® API Connect <version> Toolkit with Loopback for <operating_system_type>
- IBM® API Connect <version> Toolkit Designer with Loopback for <operating_system_type>

Not required during initial installation. After installation, you can download directly from the Cloud Manager UI and API Manager UI. See [Installing the toolkit](#).

IBM® API Connect <version> Local Test Environment

Optional test environment. See [Testing an API with the Local Test Environment](#)

IBM® API Connect <version> Security Signature Bundle File

Checksum files that you can use to verify the integrity of your downloads.

2. Optionally, you can verify the integrity of the downloaded files to ensure that they originated from IBM and are not modified. See [Signature verification by using PGP](#).
3. Load the image-tool image in your Docker local registry. The image is contained in the IBM® API Connect <version> for Containers download file. For example:

```
docker load < apiconnect-image-tool-<version>.tar.gz
```

Ensure that the registry has sufficient disk space for the files.

4. If your Docker registry requires repositories to be created before images can be pushed, create the repositories for each of the images listed by the image tool. (If your Docker registry does not require creation of repositories, skip this step and go to Step 5.)
 - a. Run the following command to get a list of the images from image-tool:

```
docker run --rm apiconnect-image-tool-<version> version --images
```

- b. From the output of each entry of the form <image-name>:<image-tag>, use your Docker registry repository creation command to create a repository for <image-name>.

For example in the case of AWS ECR the command would be for each <image-name>:

```
aws ecr create-repository --repository-name <image-name>
```

5. Upload the image:

- If you do not need to authenticate with the docker registry, use:

```
docker run --rm apiconnect-image-tool-<version> upload <registry-url>
```

- Otherwise, if your docker registry accepts authentication with username and password arguments, use:

```
docker run --rm apiconnect-image-tool-<version> upload <registry-url> --username <username> --password <password>
```

- Otherwise, such as with IBM Container Registry, if you need the image-tool to use your local Docker credentials, first authenticate with your Docker registry, then upload images with the command:

```
docker run --rm -v ~/.docker:/root/.docker --user 0 apiconnect-image-tool-<version> upload <registry-url>
```

Note: The previous command does not work on macOS if Docker is configured to use the `osxkeychain` credential store. In this case, complete the following steps:

- Disable **Docker > Preferences... > Securely store Docker logins in the macOS keychain**.
- Inspect `~/.docker/config.json` to make sure that it does not contain `"credStore": "osxkeychain"`, as some versions of Docker-for-mac may handle the setting correctly per <https://github.com/docker/for-mac/issues/4192>.
- Authenticate with the Docker registry you intend to upload to.
- Run the command:

```
docker run --rm -v ~/.docker:/root/.docker --user 0 apiconnect-image-tool-<version> upload <registry-url>
```

- Once the upload of images is successful you may enable **Docker > Preferences... > Securely store Docker logins in the macOS keychain**.

Docker authentication notes:

- Both HTTPS and HTTP are supported. Best practice for Docker registry security is to use HTTPS by utilizing standard Docker load tools, to ensure your images and platform are protected. However, when necessary you can use HTTP by specifying the `--tls-verify=false` flag.
- When using a Docker registry on `localhost`, you might encounter that the image-tool Docker container is on the Docker network and typically without access to `localhost`. You can workaround this issue by using the `--network host` argument to the Docker command. Note that `--network host` is a Docker argument, not an image-tool argument.
- Example of using `--network host` and `--tls-verify=false`:

```
$ docker run -d -p 5000:5000 --name registry registry:2
...
$ docker run --rm --network host apiconnect-image-tool-<version> upload localhost:5000 --tls-verify=false
...
```

Providing a certificate for verification, or disabling TLS verification

See the sample output of the tool usage for options to provide a certificate for verification or to disable TLS verification:

```
$ docker run --rm apiconnect-image-tool-<version> upload --help
upload docker images

Usage:
  image-tool upload REGISTRY [flags]

Flags:
  --cert-dir string  Directory with destination registry certificate tls.crt file
  --username string  User name
  -h, --help         help for upload
  --password         password for <username>
  --tls-verify       Verify TLS on destination registry (default true)

Global Flags:
  --accept-license  Accept the license for API Connect
  --debug           Enable debug logging
```

Notes:

- `--username=<username>` and `--password=<password>` can be used to specify credentials for authentication with the destination Docker registry.
- `--tls-verify=false` can be used to disable verification of the destination Docker registry certificate
- `--cert-dir <path>` can be used to provide a `tls.crt` file to be used for validation of the destination Docker registry certificate. For example:

```
docker run --rm -v <path-to-folder-with-tls.crt-file>:/cert apiconnect-image-tool-<version> upload <registry> --cert-dir /cert
```

6. Download the file IBM® API Connect <version> Operator Release Files for Containers

a. Decompress the downloaded Operator Release Files for Containers

Contents:

- API Connect Operator operator custom resource definition (CRDs).
- API Connect Operator Deployment and required resources CRDs.
- API Connect Operator Deployment and required resources CRDs, for multiple-namespace installations.
- DataPower Gateway Operator operator custom CRDs.
- API Connect custom resource templates, and Certificate Manager

The Operator Release Files for Containers files will be used later in deployment instructions.

Note: The Operator Release files may include catalog and operator source for OpenShift. These files are not used when deploying on native Kubernetes.

b. To access the API Connect custom resource templates and Certificate Manager, decompress the archive `helper_files.zip`.

The zip file contains custom resource templates for:

- Deployment of each subsystem.
- Backup and restore of each subsystem
- Custom certificates, both external and internal, for either standard deployments or 2-site HA deployments
- Certificate support for multi-namespace deployments
- Multi-site secret generation in a two data center deployment on Kubernetes.
- Ingress Issuer and Subsystem Certificates Resources, for either standard deployments or 2-site HA deployments
- Setting an administrator secret for DataPower Gateway

The templates will be used later in deployment instructions.

What to do next

Continue with [Deploying operators and cert-manager](#).

- [Signature verification by using PGP](#)

You can verify the integrity of files to ensure that they originated from IBM and are not modified.

Signature verification by using PGP

You can verify the integrity of files to ensure that they originated from IBM and are not modified.

About this task

You can use code signatures to verify that a downloaded file was created by IBM and that no bits in the file were changed. The signature files that are used are `*.asc`. The key/cert file is `PRD0003216key.pub.pgp`.

Procedure

1. Import the public key.

```
$ gpg --import PRD0003216key.pub.gpg
gpg: key 020ED6B5DBE65F3B: public key "APIConnect <psirt@us.ibm.com>" imported
gpg: Total number processed: 1
gpg:          imported: 1

$ gpg --list-key --fingerprint APIConnect
pub   rsa4096 2023-02-28 [SCE]
      39ED 1634 5FCD EDB5 D6ED  E860 020E D6B5 DBE6 5F3B
uid          [ unknown] APIConnect <psirt@us.ibm.com>
```

When the key is imported, it does not need to be imported again. It is not signed, but you should make a note of the fingerprint so you can compare to make sure that the key is IBM's:

```
39ED 1634 5FCD EDB5 D6ED  E860 020E D6B5 DBE6 5F3B
```

2. Verify the files.

```
$ $ gpg --verify helper_files.zip.asc
gpg: assuming signed data in 'helper_files.zip'
gpg: Signature made Mon 28 Sep 17:35:17 2020 PDT
gpg:          using RSA key 39ED16345FCDEDB5D6EDE860020ED6B5DBE65F3B
gpg: Good signature from "APIConnect <psirt@us.ibm.com>" [unknown]
gpg: WARNING: This key is not certified with a trusted signature!
gpg:          There is no indication that the signature belongs to the owner.
Primary key fingerprint: 39ED 1634 5FCD EDB5 D6ED  E860 020E D6B5 DBE6 5F3B
```

The verification shows that the key matches the signature and that shows the fingerprint of the key, which should match the import:

```
39ED 1634 5FCD EDB5 D6ED  E860 020E D6B5 DBE6 5F3B
```

Deploying operators and cert-manager

Deploy the Kubernetes operator files and install cert-manager.

Before you begin

You must have completed the following installation tasks before you deploy the operators:

1. Review the installation requirements. See [Deployment requirements](#).
2. Obtain the API Connect product files. See [Obtaining product files](#).

About this task

Table 1 lists the operator that applies to each release of API Connect.

Table 1. Operators and operands for API Connect

API Connect release	API Connect Operator version	DataPower Operator version
10.0.5.6	3.6.0	1.6.12
10.0.5.5	3.5.0	1.6.10
10.0.5.4	3.4.0	1.6.8
10.0.5.3	3.3.0	1.6.6
10.0.5.2	3.2.0	1.6.3
10.0.5.1	3.1.0	1.6.2
10.0.5.0	3.0.0	1.6.0

The deployment procedures differ depending on whether your deployment cluster uses a single namespace or multiple namespaces. Follow the instructions that apply to your deployment cluster:

- [Deploying operators in a single-namespace API Connect cluster](#)
Deploy the Kubernetes operator files in a single namespace cluster.
- [Deploying operators in a multi-namespace API Connect cluster](#)
Deploy the Kubernetes operator files in multi-namespace cluster.
- [Installing cert-manager and certificates in a two data center deployment](#)
Additional instructions explaining how to install a cert-manager and certificates in a two data center disaster recovery deployment on Kubernetes.

Deploying operators in a single-namespace API Connect cluster

Deploy the Kubernetes operator files in a single namespace cluster.

Before you begin

- Ensure you completed the prerequisite tasks for installing operators. See [Deploying operators and cert-manager](#).
- Be sure to review your strategy for using certificates with API Connect. See [Deployment requirements](#).

Note: If you are deploying a multi-namespace API Connect cluster, do not use these instructions. Instead, go to [Deploying operators in a multi-namespace API Connect cluster](#).

Procedure

1. Ensure `KUBECONFIG` is set for the target cluster:

```
export KUBECONFIG=<path_to_cluster_config_YAML_file>
```

An example path is `/Users/user/.kube/clusters/<cluster_name>/kube-config-<cluster_name>.yaml`

2. Decide on a namespace to be used for installation.

If not using the default namespace, create the namespace in the Kubernetes cluster where the API Connect deployment will take place. Use the following command, replacing `<namespace>` with the namespace for the deployment:

```
kubectl create ns <namespace>
```

3. Install a cert-manager.

Use of a certificate manager adds convenience to the generation and management of certificate, but is not required. Whenever a custom resource (CR) takes a certificate secret name as input, you can point to any secret name, as long as the secret exists before deploying the CR, and the secret contains relevant certificate data. Typically, this is `tls.crt`, `tls.key`, and `ca.crt` files. See [Certificates in a Kubernetes environment](#).

Note:

Do not use this step to install a cert-manager if:

- You want to use custom certificates. See [Custom certificates on Kubernetes](#)
- You are deploying a two data center disaster recovery deployment on Kubernetes, see [Installing cert-manager and certificates in a two data center deployment](#).

After you complete one of the alternate sets of instructions in the links in this Note, continue with Step 4.

- a. Obtain the certificate manager.

API Connect v10 uses cert-manager v1.12.7 of cert-manager, which is a native [Kubernetes](#) certificate management controller.

You can obtain cert-manager v1.12.7 from the API Connect v10 distribution `helper_files.zip` archive, or download it from <https://github.com/cert-manager/cert-manager/releases/tag/v1.12.7>

Note: cert-manager is bundled as a common service in IBM CloudPak for Integration.

- b. Apply the CR:

```
kubectl apply -f cert-manager-1.12.7.yaml
```

Do not specify a custom namespace.

See <https://cert-manager.io/docs/release-notes/release-notes-1.12/>.

- c. Wait for `cert-manager` pods to enter `Running 1/1` status before proceeding. To check the status:

```
kubectl get po -n cert-manager
```

There are 3 `cert-manager` pods in total.

4. Create a registry secret with credentials to be used to pull down product images.

Use the following command, replacing `<namespace>` with the namespace for your deployment, and replacing `<registry_server>` with the location of the Docker Registry where the installation product images were pushed:

```
kubectl create secret docker-registry apic-registry-secret
--docker-server=<registry_server>
--docker-username=<username@example.com> --docker-password=<password> --docker-email=<username@example.com> -n <namespace>
```

5. Create a registry secret for the DataPower registry with the credentials to be used to pull down product images.

Use the following command, replacing `<namespace>` with the desired namespace for the deployment:

```
kubectl create secret docker-registry datapower-docker-local-cred
--docker-server=<docker_server> --docker-username=<username@example.com> --docker-password=<password> --docker-email=
<username@example.com> -n <namespace>
```

6. Create a DataPower admin secret.

Use the following command, replacing `<namespace>` with the desired namespace for the deployment:

```
kubectl create secret generic datapower-admin-credentials --from-literal=password=admin -n <namespace>
```

The admin secret will be used for `$ADMIN_USER_SECRET` when deploying the gateway CR.

7. If you are using a namespace other than `default`, open `ibm-apiconnect.yaml` in a text editor. Replace each occurrence of `default` with the namespace for your deployment.

8. Open `ibm-apiconnect.yaml` in a text editor. Replace the value of each `image:` key with the location of the apiconnect operator images (from the `ibm-apiconnect` container and the `ibm-apiconnect-init` container), either uploaded to your own registry or pulled from a public registry.

```
serviceAccountName: ibm-apiconnect
imagePullSecrets:
- name: apic-registry-secret
initContainers:
- name: ibm-apiconnect-init
  image: <My_registry_or_public_registry>/ibm-apiconnect-operator-
init@sha256:0d3bbac7c67372ad013407a8049c69dbd08b1559b59a7606fcd87eb0f4519ce1
...
containers:
```

```
- name: ibm-apiconnect
image: <My_registry_or_public_registry>/ibm-apiconnect-
operator@sha256:a7473ee26c252fca4931b682cd95d73b4149e4b5b773834408f9f22d0246a76c
```

- If DataPower Gateway is desired in this installation, and if you are using a namespace other than `default`, open `ibm-datapower.yaml` in a text editor. Replace each occurrence of `default` with the namespace for your deployment.
- Open `ibm-datapower.yaml` in a text editor.
 - Locate the `image`: key in the containers section of the deployment yml immediately after `imagePullSecrets`:. Replace the value of the `image`: key with the location of the `datapower` operator image, either uploaded to your own registry or pulled from a public registry.
 - Update the `IBM_DOCKER_HUB` and `IBM_ENTITLED_REGISTRY` value in the `env` section with the registry address where the images were uploaded with the `image-tool` in [Obtaining product files](#).
For example, the default entries are:

```
- name: IBM_ENTITLED_REGISTRY
  value: "cp.icr.io/cp/datapower"
- name: IBM_DOCKER_HUB
  value: "cp.icr.io/cp/datapower"
```

- Install the `ibm-apiconnect` CRDs.

```
kubectl apply -f ibm-apiconnect-crds.yaml
```

- Install the `ibm-apiconnect` Kubernetes deployment.

```
kubectl apply -f ibm-apiconnect.yaml
```

- If DataPower Gateway is desired in this installation, install the `ibm-datapower` Kubernetes deployment for DataPower Gateway, with the following command, replacing `<namespace>` with the desired namespace for the deployment (`-n <namespace>` can be omitted if default namespace is being used for installation):

```
kubectl apply -f ibm-datapower.yaml -n <namespace>
```

Note: There is a known issue on Kubernetes version 1.19.4 or higher that can cause the DataPower operator to fail to start. In this case, the DataPower Operator pods can fail to schedule, and will display the status message: `no nodes match pod topology spread constraints (missing required label)`. For example:

```
0/15 nodes are available: 12 node(s) didn't match pod topology spread constraints (missing required label),
3 node(s) had taint {node-role.kubernetes.io/master: }, that the pod didn't tolerate.
```

You can workaround the issue by editing the DataPower operator deployment and re-applying it, as follows:

- Delete the DataPower operator deployment, if deployed already:

```
kubectl delete -f ibm-datapower.yaml -n <namespace>
```

- Open `ibm-datapower.yaml`, and locate the `topologySpreadConstraints`: section. For example:

```
topologySpreadConstraints:
- maxSkew: 1
  topologyKey: zone
  whenUnsatisfiable: DoNotSchedule
```

- Replace the values for `topologyKey`: and `whenUnsatisfiable`: with the corrected values shown in the example below:

```
topologySpreadConstraints:
- maxSkew: 1
  topologyKey: topology.kubernetes.io/zone
  whenUnsatisfiable: ScheduleAnyway
```

- Save `ibm-datapower.yaml` and deploy the file to the cluster:

```
kubectl apply -f ibm-datapower.yaml -n <namespace>
```

- Install the `ingress-ca` Issuer to be used by `cert-manager`.

Note:

If you are installing a two data center disaster recovery deployment, skip this step, and follow the steps in: [Installing cert-manager and certificates in a two data center deployment](#).

- Use the following command, replacing `<namespace>` with the desired namespace for the deployment:

```
kubectl apply -f ingress-issuer-v1.yaml -n <namespace>
```

The file `ingress-issuer-v1.yaml` is included in the release files contained in `helper_files.zip`

- Validate that the command succeeded:

```
kubectl get certificates -n <namespace>
```

Example output indicating success:

NAME	READY	SECRET	AGE
analytics-ingestion-client	True	analytics-ingestion-client	70s
gateway-peering	True	gateway-peering	69s
gateway-service	True	gateway-service	69s
ingress-ca	True	ingress-ca	71s
portal-admin-client	True	portal-admin-client	71s
portal-tunnel-client	True	portal-tunnel-client	70s

The list of certificates might vary based on your deployment.

- Continue with [Installing the API Connect subsystems](#).

Deploying operators in a multi-namespace API Connect cluster

Deploy the Kubernetes operator files in multi-namespace cluster.

Before you begin

- Ensure you completed the prerequisite tasks for installing operators. See [Deploying operators and cert-manager](#).
- Be sure to review your strategy for using certificates with API Connect. See [Deployment requirements](#).

About this task

Note: If you are deploying a single-namespace API Connect cluster, do not use these instructions. Instead, go to [Deploying operators in a single-namespace API Connect cluster](#).

- These instructions apply only to native k8s deployments. They do not apply to OpenShift deployments.
- The apiconnect operator is deployed as a cluster-scoped operator which watches every namespace in the cluster. The apiconnect operator can be installed in any namespace, although it is recommended that the API Connect operator is installed in its own dedicated namespace.
- The DataPower operator must be deployed in a namespace where gateway subsystem install is planned.
- Single ingress-ca certificate must be installed and used across the various namespaces where subsystems will be installed.

Procedure

1. Prepare your environment:

a. Ensure **KUBECONFIG** is set for the target cluster:

```
export KUBECONFIG=<path_to_cluster_config_YAML_file>
```

An example path is `/Users/user/.kube/clusters/<cluster_name>/kube-config-<cluster_name>.yaml`

b. Create namespaces on which subsystems are planned to be installed.

The required namespaces are:

- Apiconnect operator namespace
- Gateway subsystem namespace
- Management subsystem namespace
- Portal subsystem namespace
- Analytics subsystem namespace

The following example values and deployment are used throughout these instructions:

- An apiconnect operator is installed in **operator** namespace
- A DataPower operator and gateway subsystem is installed in **gtw** namespace
- The Management subsystem is installed in **mgmt** namespace
- The Portal subsystem is installed in **portal** namespace
- The Analytics subsystem is installed in **a7s** namespace

c. Multi-namespace templates are provided in **helper_files.zip**, inside the **release_files.zip** you downloaded in [Obtaining product files](#):

```
helper_files_unpack/multi-ns-support/
```

2. Install cert-manager and configure certificates:

Use of a certificate manager adds convenience to the generation and management of certificate, but is not required. Whenever a custom resource (CR) takes a certificate secret name as input, you can point to any secret name, as long as the secret exists before deploying the CR, and the secret contains relevant certificate data. Typically, this is `tls.crt`, `tls.key`, and `ca.crt` files. See [Certificates in a Kubernetes environment](#).

You can obtain cert-manager v1.12.7 from the API Connect v10 distribution **helper_files.zip** archive, or download it from <https://github.com/cert-manager/cert-manager/releases/tag/v1.12.7>.

a. Install cert-manager v1.12.7, do not specify a custom namespace as cert manager will be installed in its own namespace.

Note:

Do not use Step [2.a](#) to install a cert-manager if:

- You want to use custom certificates. See [Custom certificates on Kubernetes](#)
- You are deploying a two data center disaster recovery deployment on Kubernetes, see [Installing cert-manager and certificates in a two data center deployment](#)

i. **kubectl apply -f cert-manager-1.12.7.yaml**

ii. Wait for cert-manager pods to enter **Running 1/1** status before proceeding. Use the following command to check:

```
kubectl -n cert-manager get po
```

There are 3 cert-manager pods in total.

b. Install **ingress-ca** certificate:

- Locate **ingress-ca** certificate at **helper_files/multi-ns-support/ingress-ca-cert.yaml**
- Create **ingress-ca** certificate in one of the subsystems. For example, if we choose **mgmt** namespace:

```
kubectl -n mgmt apply -f ingress-ca-cert.yaml
```

c. Install common issuers on all the namespaces:

- Locate **common-issuer.yaml** in **helper_files/multi-ns-support/**
- Create **common-issuer.yaml** in all namespaces:

```
kubectl create -f common-issuer.yaml -n mgmt
kubectl create -f common-issuer.yaml -n gtw
kubectl create -f common-issuer.yaml -n ptl
kubectl create -f common-issuer.yaml -n a7s
```

- d. Obtain the ingress-ca secret created by cert manager and create the secret on all namespaces:

Note:

The instructions in this step result in having a **selfsigning-issuer** in every namespace. This issuer is typically referenced by an API Connect CR in the namespace with:

```
...
microServiceSecurity: certManager
certManagerIssuer:
  name: selfsigning-issuer
  kind: Issuer
...
```

This issuer (and associated root certificate) does not need to be the same in every namespace, nor does it need to be the same for 2 CRs in the same namespace. Each subsystem can use its own **selfsigning-issuer**, because it is only used for certificates that are internal to the subsystem.

To ensure that the ingress-issuer is in sync across namespaces, it should be backed by the same **ingress-ca** certificate. This enables, for example, APIM to use a client certificate that matches the CA of the portal-admin ingress endpoint. The sync is achieved by copying around the **ingress-ca** certificate in each namespace, as shown in the following steps. It does not matter that it is the same issuer, or whether it has a different name. However it is important is that the **ingress-ca** is the same for all the "ingress-issuer" that are going to be used by the subsystems.

- i. Make sure ingress-ca certificate READY status is set to true:

```
kubectl get certificate ingress-ca -n mgmt
NAME          READY  SECRET  AGE
ingress-ca    True   ingress-ca  9m24s
```

- ii. Cert-manager creates a secret called **ingress-ca** in **mgmt** namespace which represents the certificate we created in Step [2.c](#).
iii. Use the following command to obtain the yaml format of the secret:

```
kubectl get secret ingress-ca -n <namespace-where-ingress-ca-cert-is-created> -o yaml > ingress-ca-secret-in-cluster.yaml
```

- iv. Remove unwanted content from the secret yaml:

```
cat ingress-ca-secret-in-cluster.yaml | grep -v 'creationTimestamp' | grep -v 'namespace' | grep -v 'uid' | grep -v 'resourceVersion' > ingress-ca-secret.yaml
```

- v. Create the secret using the yaml we prepared in previous step on rest of the subsystem namespaces. In this example, in the **gtw**, **a7s** and **ptl** namespaces.

```
kubectl create -f ingress-ca-secret.yaml -n gtw
kubectl create -f ingress-ca-secret.yaml -n ptl
kubectl create -f ingress-ca-secret.yaml -n a7s
```

- e. Install management certs in management namespace:

- i. Locate **management-certs.yaml** in **helper_files/multi-ns-support/**
ii. Create **management-certs.yaml** in the **mgmt** namespace:

```
kubectl create -f management-certs.yaml -n mgmt
```

- f. Install gateway certs in the gateway namespace:

- i. Locate **gateway-certs.yaml** in **helper_files/multi-ns-support/**
ii. Create **gateway-certs.yaml** in the **gtw** namespace:

```
kubectl create -f gateway-certs.yaml -n gtw
```

3. Install the apiconnect operator:

- a. Install the **ibm-apiconnect** CRDs with the following command. Do not specify a namespace:

```
kubectl apply -f ibm-apiconnect-crds.yaml
```

- b. Create a registry secret with the credentials to be used to pull down product images with the following command, replacing **<namespace>** with the desired namespace for the apiconnect operator deployment.

```
kubectl -n <namespace> create secret docker-registry apic-registry-secret
--docker-server=<registry_server>
--docker-username=<username@example.com> --docker-password=<password>
--docker-email=<username@example.com>
```

- For example, replace **<namespace>** with **operator**.
- **docker-password** can be your artifactory API key.
- **-n <namespace>** can be omitted if **default** namespace is being used for installation

- c. Locate and open **ibm-apiconnect-distributed.yaml** in a text editor of choice. Then, find and replace each occurrence of **\$OPERATOR_NAMESPACE** with **<namespace>**, replacing **<namespace>** with the desired namespace for the deployment. In this example, the namespace is **operator**.

- d. Also in **ibm-apiconnect-distributed.yaml**, locate the **image:** keys in the containers sections of the deployment yaml right below **imagePullSecrets:**. Replace the placeholder values **REPLACE-DOCKER-REGISTRY** of the **image:** keys with the docker registry host location of the apiconnect operator image (either uploaded to own registry or pulled from public registry).

- e. Install **ibm-apiconnect-distributed.yaml** with the following command

```
kubectl apply -f ibm-apiconnect-distributed.yaml
```

4. Install DataPower operator:

Deployment of the DataPower operator is only needed if you have at least one API Connect v10 Gateway subsystem (whether v5 compatible or not) to upgrade. If you are using DataPower in a different form factor such as an Appliance, you will not have an API Connect v10 Gateway subsystem to upgrade, and will not need the DataPower operator for your upgrade.

Note: The DataPower Operator supports multiple instances of DataPower in the same cluster, separated by namespace. When deploying into multiple namespaces, ensure that any cluster-scoped resources are created with unique names for separate installations, such that they are not overwritten by subsequent installations. For example, DataPower cluster-scoped resources include `ClusterRoleBindings`.

- a. Create a registry secret for the DataPower registry with the credentials to be used to pull down product images with the following command, replacing `<namespace>` with the desired namespace for the deployment. (In this case `gtw`):

```
kubectl -n <namespace> create secret docker-registry datapower-docker-local-cred
--docker-server=<registry_server>
--docker-username=<username@example.com> --docker-password=<password>
--docker-email=<username@example.com>
```

- For example, replace `<namespace>` with `gtw`.
- `docker-password` can be your artifactory API key.
- `-n <namespace>` can be omitted if `default` namespace is being used for installation

- b. Create a DataPower admin secret, replacing `<namespace>` with the desired namespace for the deployment. For example, `gtw`. This secret will be used for `$ADMIN_USER_SECRET` later in the Gateway CR:

```
kubectl -n <namespace> create secret generic datapower-admin-credentials --from-literal=password=admin
-n
<namespace>
```

`<namespace>` can be omitted if `default` namespace is being used for installation.

- c. Locate and open `ibm-datapower.yaml` in a text editor of choice. Then, find and replace each occurrence of `default` with `<namespace>`, replacing `<namespace>` with the desired namespace for the deployment. For example, `gtw`.

- d. Install `ibm-datapower.yaml` with the following command:

```
kubectl -n <namespace> apply -f ibm-datapower.yaml
```

Note: There is a known issue on Kubernetes version 1.19.4 or higher that can cause the DataPower operator to fail to start. In this case, the DataPower Operator pods can fail to schedule, and will display the status message: `no nodes match pod topology spread constraints (missing required label)`. For example:

```
0/15 nodes are available: 12 node(s) didn't match pod topology spread constraints (missing required label),
3 node(s) had taint {node-role.kubernetes.io/master: }, that the pod didn't tolerate.
```

You can work around the issue by editing the DataPower operator deployment and re-applying it, as follows:

- i. Delete the DataPower operator deployment, if deployed already:

```
kubectl delete -f ibm-datapower.yaml -n <namespace>
```

- ii. Open `ibm-datapower.yaml`, and locate the `topologySpreadConstraints` section. For example:

```
topologySpreadConstraints:
- maxSkew: 1
  topologyKey: zone
  whenUnsatisfiable: DoNotSchedule
```

- iii. Replace the values for `topologyKey` and `whenUnsatisfiable` with the corrected values shown in the example below:

```
topologySpreadConstraints:
- maxSkew: 1
  topologyKey: topology.kubernetes.io/zone
  whenUnsatisfiable: ScheduleAnyway
```

- iv. Save `ibm-datapower.yaml` and deploy the file to the cluster:

```
kubectl apply -f ibm-datapower.yaml -n <namespace>
```

5. Next, install the subsystems. Continue with [Installing the API Connect subsystems](#).

Note: Unless otherwise stated, when performing the individual subsystem upgrades the `<namespace>` value of example `kubectl` commands for a given subsystem should be set to the namespace for the particular subsystem component they are acting on.

Installing cert-manager and certificates in a two data center deployment

Additional instructions explaining how to install a cert-manager and certificates in a two data center disaster recovery deployment on Kubernetes.

Before you begin

Before you install a cert-manager, you should know your strategy for using certificates with API Connect. Review the certificate requirements in [Deployment requirements](#).

You should also have already completed [Obtaining product files](#).

About this task

You must create certificates and keys for API Manager and the Developer Portal on both data centers, dc1 and dc2, and ensure that they match on both.

Use these instructions to install the supplied cert-manager and `ingress-issuer-v1.yaml`. Use these instructions if you are *not* using custom certificates.

Note that `ingress-issuer-v1.yaml` is supplied by cert-manager.

Note:

Do not use these instructions if you want to use custom certificates. See [Custom certificates on Kubernetes](#).

Procedure

1. Install a cert-manager.

Use of a certificate manager adds convenience to the generation and management of certificate, but is not required. Whenever a custom resource (CR) takes a certificate secret name as input, you can point to any secret name, on condition that the secret exists before you deploy the CR, and that the secret contains relevant certificate data. Typically, this is `tls.crt`, `tls.key`, and `ca.crt` files. See [Certificates in a Kubernetes environment](#).

a. Obtain the certificate manager.

API Connect v10 uses cert-manager v1.12.7 of cert-manager, which is a native [Kubernetes](#) certificate management controller.

You can obtain cert-manager v1.12.7 from the API Connect v10 distribution `helper_files.zip` archive, or download it from <https://github.com/cert-manager/cert-manager/releases/tag/v1.12.7>

Note: cert-manager is bundled as a common service in IBM Cloud Pak for Integration.

b. Apply the CR:

```
kubectl apply -f cert-manager-1.12.7.yaml
```

Do not specify a custom namespace.

See <https://cert-manager.io/docs/release-notes/release-notes-1.11/>.

c. Wait for `cert-manager` pods to enter `Running 1/1` status before proceeding. To check the status:

```
kubectl get po -n cert-manager
```

There are 3 `cert-manager` pods in total.

2. Use the following steps to allow `ingress-ca` secrets to be the same on both data centers.

a. On DC1 apply the file `ingress-issuer-v1-dc1.yaml`:

```
kubectl -n <namespace> apply -f ingress-issuer-v1-dc1.yaml
```

b. Validate that the command succeeded:

```
kubectl get certificates -n <namespace>
```

c. Export `ingress-ca` secret as a yaml from DC1:

```
kubectl -n <namespace> get secret ingress-ca -o yaml > ingress-ca.yaml
```

d. Edit the `ingress-ca.yaml` file to remove all `annotations`, `labels`, `creationTimestamp`, `managedFields`, `manager`, `operation`, `time`, `resourceVersion`, `selfLink`, and `uid`. Also, if you are using a different `namespace` in DC2, then update the `namespace` field.

e. Copy the `ingress-ca.yaml` from DC1 to DC2 and apply that file on DC2:

```
kubectl -n <namespace> apply -f ingress-ca.yaml
```

f. On DC2 apply the file `ingress-issuer-v1-dc2.yaml`:

```
kubectl -n <namespace> apply -f ingress-issuer-v1-dc2.yaml
```

g. Use the following commands to test that they are the same, on DC1 run:

```
kubectl -n <namespace> get secrets ingress-ca -o yaml | grep tls.crt | grep -v 'f:tls' | awk '{print $2}' | base64 -d > /tmp/ingress.pem.dc1
```

h. On DC2 run:

```
kubectl -n <namespace> get secrets ingress-ca -o yaml | grep tls.crt | grep -v 'f:tls' | awk '{print $2}' | base64 -d > /tmp/ingress.pem.dc2
```

i. To see the differences run:

```
diff /tmp/ingress.pem.dc1 /tmp/ingress.pem.dc2
```

The files should be the same.

j. On DC2, to ensure that the certificates are working correctly and that they are using the `ingress-ca` secret. First, get the `portal-admin-client.crt` file:

```
kubectl -n <namespace> get secrets portal-admin-client -o yaml | grep tls.crt | awk '{print $2}' | base64 -d > /tmp/admin-client.crt
```

k. Test that it is working by using OpenSSL:

```
openssl verify -verbose -CAfile /tmp/ingress.pem.dc1 /tmp/admin-client.crt
```

If it is working, you should see:

```
/tmp/admin-client.crt: OK
```

3. Continue with [Deploying operators and cert-manager](#).

Installing the API Connect subsystems

Deploy the API Connect subsystem custom resources.

Before you begin

Attention: API Connect is not supported on a FIPS-enabled environment.
Before you install the subsystems, verify that you completed the following prerequisite tasks:

1. [Obtaining product files](#)
2. [Deploying operators and cert-manager](#)

About this task

Use the CR (custom resource) files to install the Management, Gateway, Analytics, and Portal subsystems for your API Connect cloud. CRs are extensions of the Kubernetes API. API Connect installs its subsystems using individual CRs. One CR is deployed per one managed subsystem. The API Connect operator manages the lifecycle of the subsystem CRs and deploys and manages the microservice for each one.

CR templates are provided in the **helper_files** archive to install each API Connect subsystem. You extracted these files into an installation folder of your choosing in [Obtaining product files](#).

- The API Connect operators and operands must be from the same version of API Connect. For example, the API Connect operator 10.0.4.0 does not successfully deploy the API Connect management subsystem (operand) from Version 10.0.3.0.
- You can deploy multiple instances of API Connect into the same cluster by using different namespaces.
- Deploying multiple similar subsystems in a single namespace is not supported. For example, deploying two management subsystems, `mgmt1`, `mgmt2` in a single namespace where apiconnect operator is installed.
- For more information on Custom Resources in Kubernetes see <https://kubernetes.io/docs/concepts/extend-kubernetes/api-extension/custom-resources/>.
- For details on how the API Connect operator manages the CRs using the Kubernetes operator pattern, see <https://kubernetes.io/docs/concepts/extend-kubernetes/operator/>.
- For guidance on choosing object names and IDs in Kubernetes, see <https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names>.

Procedure

Complete each of the following instructions:

1. [Installing the Management subsystem cluster](#).
2. [Installing the DataPower Gateway subsystem](#).
3. [Installing the Developer Portal subsystem](#).
4. [Installing the Analytics subsystem](#).
5. When all subsystems are running, verify you can access the API Connect Cloud Manager. Enter the Cloud Manager endpoint URL in your browser.

Tip:

You can find your Cloud Manager endpoint URL as follows:

The property `cloudManagerEndpoint` is specified in the management CR (`management_cr.yaml`). When you edited the template, you specified a value for `$STACK_HOST`:

```
cloudManagerEndpoint:
  annotations:
    cert-manager.io/issuer: ingress-issuer
  hosts:
  - name: admin.$STACK_HOST
    secret: cm-endpoint
```

The template URL is `https://admin.<STACK_HOST>/admin`. The `/admin` suffix at the end is the name of the Cloud Manager administrator.

For example, if `$STACK_HOST` is `myhost.subnet.example.com`, the Cloud Manager endpoint URL is:

```
https://admin.myhost.subnet.example.com/admin
```

The first time that you access the Cloud Manager user interface, you enter `admin` for the user name and `7iron-hide` for the password. You will be prompted to change the Cloud Administrator password and email address. See [Accessing the Cloud Manager user interface](#).

What to do next

When you have completed the installation of all required API Connect subsystems, you can proceed to defining your API Connect configuration by using the API Connect Cloud Manager; refer to the [Cloud Manager configuration checklist](#).

- [Installing the Management subsystem cluster](#)
Install the Management subsystem cluster
- [Installing the DataPower Gateway subsystem](#)
Install the DataPower Gateway subsystem
- [Installing the Developer Portal subsystem](#)
Install the Developer Portal subsystem.
- [Installing the Analytics subsystem](#)
Install the IBM API Connect analytics subsystem.

Installing the Management subsystem cluster

Install the Management subsystem cluster

Before you begin

Before you start this task, you should have already:

- Reviewed the Kubernetes requirements in [Pre-installation requirements](#)
- Completed [Deploying operators and cert-manager](#)

About this task

Edit the custom resource template for the Management system, apply the resource, verify that the pods are up and running, and verify that you can connect to the API Connect Cloud Manager.

Procedure

1. Edit the `management_cr` template CR, to replace the placeholders with values for your deployment.

`$APP_PRODUCT_VERSION`

API Connect application version for the subsystems.

```
version: <version_number>
```

Example version number: 10.0.5.6

`$SECRET_NAME`

Use for image pull.

```
imagePullSecrets:  
- apic-registry-secret
```

`$PROFILE`

Specify your Management subsystem profile, where `n` indicates number of replicas, `c` number of cores, and `m` is the minimum memory allocation in GB. For more information on profiles, see [Planning your deployment topology](#).

`$DOCKER_REGISTRY`

The host name of the Docker Registry to which you uploaded the installation images. For example:

```
my.docker.registry.domain.example.com.
```

`$INGRESS_CLASS`

The ingress class that you want the endpoint to use. This is an optional property and if not specified, the ingress class with annotation

```
ingressclass.kubernetes.io/is-default-class:
```

`true` is used. If such an ingress class does not exist in the Kubernetes environment, then `nginx` is used. If you do set this value, it must refer to a valid ingress class configured in your Kubernetes system.

Note: This property is commented out in the template CR file. If you set this value, make sure to also uncomment it.

`$STACK_HOST`

The desired ingress subdomain for the API Connect stack. Used when specifying endpoints. Domain names that are used for endpoints cannot contain the underscore "_" character. You can do one of the following:

- Subdomain customization only

Accept the prefixes predefined for the ingress hostnames to use and just replace all instances of `STACK_HOST` to be the desired ingress subdomain for the API Connect stack. For example, if your host is `myhost.subnet.example.com`:

```
cloudManagerEndpoint:  
  < ... >  
  hosts:  
  - name: admin.myhost.subnet.example.com  
    secret: cm-endpoint  
  
apiManagerEndpoint:  
  < ... >  
  hosts:  
  - name: manager.myhost.subnet.example.com  
    secret: apim-endpoint  
  
platformAPIEndpoint:  
  < ... >  
  hosts:  
  - name: api.myhost.subnet.example.com  
    secret: api-endpoint  
  
consumerAPIEndpoint:  
  < ... >  
  hosts:  
  - name: consumer.myhost.subnet.example.com  
    secret: consumer-endpoint
```

- Complete hostname customization

Change both the predefined prefixes and the `STACK_HOST` subdomain to match your desired hostnames.

For example, for `cloudManagerEndpoint`, you can replace `admin.$STACK_HOST` with `my.cloudmgr.myhost.subnet.example.com`, where `my.cloudmgr` replaces `admin`, and `myhost.subnet.example.com` replaces `STACK_HOST`. For example:

```
cloudManagerEndpoint:  
  < ... >  
  hosts:  
  - name: my.cloudmgr.myhost.subnet.example.com  
    secret: cm-endpoint
```

You can do this for some or all of the hostnames, depending on your customization requirements.

`$STORAGE_CLASS`

The Kubernetes storage class to be used for Persistent Volume Claims. Find the available storage classes in the target cluster by running the following command: `kubectl get sc`.

```
storageClassName: local-storage
```

2. Edit the `license` setting:

- Set `accept`: to `true` to accept the license. Note that the default value is `false`. If you do not accept the license, the Operator will not install the subsystem.
- Set `metric`: to track your product usage. Enter the unit of measure that is used for your program license:
 - `PROCESSOR_VALUE_UNIT` - Default value. If you leave the field blank, this value is used.
 - `MONTHLY_API_CALL` - Applies only to the IBM API Connect Hybrid Entitlement program.

For information on tracking monthly call volume, see [Tracking API volume for auditing and compliance](#).

- Set `use`: to either `production` or `nonproduction`, to match the license you purchased.
- Set `license`: to the License ID for the version of API Connect that you purchased. See [API Connect licenses](#).

Example entry to accept the license for a production system:

```
license:
  accept: true
  metric: PROCESSOR_VALUE_UNIT
  use: production
  license: L-RJON-BZ5LSE
```

3. If installing with custom internal certificates, specify a site name.

- The site name is used as the identifier for the PostgreSQL database cluster used by API Connect. This name should already have been decided upon and used to update the `custom-certs-internal.yaml` file as described in [Generating custom certificates](#).
- You must now add your chosen site name to `management_cr.yaml`, by creating a `siteName` property anywhere inside the `spec` block, set to the chosen site name:

```
siteName: <site_name>
```

Replace `<site_name>` with your chosen site name.

4. It is recommended to allocate 100Gi for write-ahead logging (WAL) storage.

The default storage is:

- One replica profile - 30Gi
- Three replica profile - 47Gi

For best performance, edit the CR to add the following entries, and set `volumeSize`: to 100Gi:

```
spec:
  dbArchiveVolumeClaimTemplate:
    storageClassName: <storage-class>
    volumeSize: <volume-size>
```

5. Configure backups for the management subsystem.

Important: Note that in order to restore your deployment in the event of a disaster where you must redeploy a new cluster, you must take specific configuration actions **before** installing the Management subsystem. See [Preparing the management subsystem for disaster recovery](#).

You can review the backup and restore features here: [Configuring backup settings for fresh install of the Management subsystem](#)

6. Optional: If you are installing as part of a two data center disaster recovery set up, complete the steps in [Installing a two data center deployment on Kubernetes](#) before you apply the edited file.

7. Install the management Custom Resource, replacing `<namespace>` with the target installation namespace in the Kubernetes cluster.

```
kubectl apply -f management_cr.yaml -n <namespace>
```

8. Verify that the Management subsystem is fully installed:

```
kubectl get ManagementCluster -n <namespace>
```

The installation has completed when the `READY` status is `True`, and the `SUMMARY` reports that all services are online (e.g. 9/9). For example:

NAME	READY	SUMMARY	VERSION	RECONCILED	VERSION	AGE
management	True	16/16	<version>	<version-build>		7m17s

9. Retain the encryption secret and database credential secrets in a safe location, in case you need to restore during a disaster recovery scenario. Complete the steps in [Preparing the management subsystem for disaster recovery](#).

Important: If you do not complete the steps in [Preparing the management subsystem for disaster recovery](#), you will not be able to restore your management subsystem to a new cluster during a disaster recovery scenario.

10. Check your connection to the Cloud Manager user interface on the Management subsystem on your Cloud Manager endpoint.

For example, if you accepted the default prefix of `admin`, and you set `STACK_HOST` to `myhost.subnet.example.com`, the Cloud Manager endpoint URL is:

```
https://admin.myhost.subnet.example.com/admin
```

The first time that you access the Cloud Manager user interface, you enter `admin` for the user name and `7iron-hide` for the password. You will be prompted to change the Cloud Administrator password and email address. For further details, see [Accessing the Cloud Manager user interface](#).

What to do next

If you are creating a new deployment of API Connect, install other subsystems as needed.

When you have completed the installation of all required API Connect subsystems, you can proceed to defining your API Connect configuration by using the API Connect Cloud Manager; refer to the [Cloud Manager configuration checklist](#).

Installing the DataPower Gateway subsystem

Before you begin

If you plan to install the Gateway subsystem in a remote cluster, be sure to satisfy the following requirements:

- Install both the API Connect and the DataPower operators.
The versions of the operators on the remote cluster and the version of the Gateway operand must exactly match the versions used in the main cluster.
- Make sure the remote cluster has the certificates:
 - If you are using certificate manager, ensure that the ingress-ca is synced between sites.
 - If you are not using certificate manager, copy the client gateway certificates to the remote cluster and reference them in the Gateway CR.

About this task

Note: An alternate deployment scenario is to use a physical DataPower appliance for the gateway. If you are using an appliance for the gateway, do not install using API Connect Kubernetes CRs, since you do not need to configure a gateway subsystem in your Kubernetes cluster when using an appliance. For an appliance-based gateway, you must configure two endpoints in DataPower to be used as the Gateway Service Management Endpoint and the API invocation Endpoint. Enter these endpoints in the Configure Gateway Service screen in Cloud Manager. See [Configuring DataPower Gateway for API Connect](#) for instructions for configuring a DataPower appliance. The installation folder where the `helper_files.zip` was extracted contains two templates for Gateway service. The `v5cgateway_cr.yaml` template is for the v5 compatible Gateway, and the `apigateway_cr.yaml` template is for the API Gateway.

Procedure

1. Edit the template CR, either `apigateway_cr.yaml` or `v5cgateway_cr.yaml`, to replace the placeholders with values for your deployment.

`$APP_PRODUCT_VERSION`

API Connect application version for the subsystems.

```
version: <version_number>
```

Example version number: 10.0.5.6

`$PROFILE`

Specify your gateway profile, where **n** indicates number of replicas, **c** number of cores, and **m** is the minimum memory allocation in GB. For more information on profiles, see [Planning your deployment topology](#).

`$SECRET_NAME`

Use for image pull.

```
imagePullSecrets:
- apic-registry-secret
```

`$DOCKER_REGISTRY`

The host name of the Docker Registry to which you uploaded the installation images. For example:

```
my.docker.registry.domain.example.com
```

`$INGRESS_CLASS`

The ingress class that you want the endpoint to use. This is an optional property and if not specified, the ingress class with annotation `ingressclass.kubernetes.io/is-default-class: true` is used. If such an ingress class does not exist in the Kubernetes environment, then `nginx` is used. If you do set this value, it must refer to a valid ingress class configured in your Kubernetes system.

Note: This property is commented out in the template CR file. If you set this value, make sure to also uncomment it.

`$STACK_HOST`

The desired ingress subdomain for the API Connect stack. Used when specifying endpoints. Domain names that are used for endpoints cannot contain the underscore "_" character. You can do one of the following:

- Subdomain customization only
Accept the prefixes predefined for the ingress hostnames to use and just replace all instances of `STACK_HOST` to be the desired ingress subdomain for the API Connect stack. For example, if your host is `myhost.subnet.example.com`:

```
gatewayEndpoint:
  < ... >
  hosts:
  - name: rgw.myhost.subnet.example.com
    secret: gwv6-endpoint

gatewayManagerEndpoint:
  < ... >
  hosts:
  - name: rgwd.myhost.subnet.example.com
    secret: gwv6-manager-endpoint
```

- Complete hostname customization
Change both the predefined prefixes and the `STACK_HOST` subdomain to match your desired hostnames.

For example, for `gatewayEndpoint`, you can replace `rgw.$STACK_HOST` with `my.gateway.endpoint.myhost.subnet.example.com`, where `my.gateway.endpoint` replaces `rgw`, and `myhost.subnet.example.com` replaces `$STACK_HOST`:

```
gatewayEndpoint:
  < ... >
  hosts:
  - name: my.gateway.endpoint.myhost.subnet.example.com
    secret: gwv6-endpoint
```

You can do this for some or all of the hostnames, depending on your customization requirements.

`$STORAGE_CLASS`

The Kubernetes storage class to be used for Persistent Volume Claims. Find the available storage classes in the target cluster by running the following command: `kubectl get sc`.

```
storageClassName: local-storage
```

`$ADMIN_USER_SECRET`

Edit `$ADMIN_USER_SECRET` to set the value you created in [Deploying operators and cert-manager](#).

```
adminUserSecret: $ADMIN_USER_SECRET
```

`$PLATFORM_CA_SECRET`

Set to `ingress-ca`. The `$PLATFORM_CA_SECRET` contains the CA certificate for the platform REST API endpoint. The gateway makes calls to the platform REST API and this property must be set so that the gateway can verify the server certificate.

```
mgmtPlatformEndpointCASecret:  
secretName: $PLATFORM_CA_SECRET
```

2. Edit the `license` setting:

- Set `accept` to `true` to accept the license. Note that the default value is `false`. If you do not accept the license, the Operator will not install the subsystem.
- Set `metric` to track your product usage. Enter the unit of measure that is used for your program license:
 - `PROCESSOR_VALUE_UNIT` - Default value. If you leave the field blank, this value is used.
 - `MONTHLY_API_CALL` - Applies only to the IBM API Connect Hybrid Entitlement program.For information on tracking monthly call volume, see [Tracking API volume for auditing and compliance](#).
- Set `use` to either `production` or `nonproduction`, to match the license you purchased.
- Set `license` to the License ID for the version of API Connect that you purchased. See [API Connect licenses](#).

Example entry to accept the license for a production system:

```
license:  
accept: true  
metric: PROCESSOR_VALUE_UNIT  
use: production  
license: L-RJON-BZ5LSE
```

3. Optional: If applicable to your deployment, you can override the resource settings for CPU and memory.

- CPU override

When you specify `spec.license.use: nonproduction` and a one replica profile `profile:`

`n1xc4.m8`, the default CPU request for the gateway pod is 1 CPU. You can manually override this setting. For example, to request 2 CPUs:

```
template:  
- name: datapower  
  containers:  
  - name: gateway  
    resources:  
      requests:  
        cpu: 2
```

- When you specify `spec.license.use: production` and a one replica profile `profile: n1xc4.m8`, the default CPU request for the gateway pod is 4 CPUs.
- The CPU limit cannot be specified separately from the CPU request. The value for the CPU request is used as both CPU request and CPU limit in the Gateway CR.

- Memory override

The default memory limit and request is 8Gi. The memory limit should always be greater than or equal to the memory request.

For example, to request 10Gi and set a limit of 12Gi:

```
template:  
- name: datapower  
  containers:  
  - name: gateway  
    resources:  
      limits:  
        memory: 12Gi  
      requests:  
        cpu: 2  
        memory: 10Gi
```

Note: The override mechanism is specific only to the CPU and memory values, and cannot be used for other resource requests in the DataPower Gateway CR.

4. For `apigateway_cr.yaml` only, you can optionally enable `openTracing`.

- Edit the CR to add the following properties, and supply values for each:

```
openTracing:  
  enabled: false # if true provide below details  
  odTracingRegistrationHostname: $OD_TRACING_REGISTRATION_HOSTNAME  
  odTracingDataHostname: $OD_TRACING_HOSTNAME  
  imageAgent: $AGENT_IMAGE  
  imageCollector: $COLLECTOR_IMAGE
```

Where:

enabled

```
enabled: true
```

`$OD_TRACING_REGISTRATION_HOSTNAME`

```
odTracingRegistrationHostname: icp4i-od.tracing.svc
```

The hostname of the registration server for OpenTracing.

```
$OD_TRACING_HOSTNAME
odTracingDataHostname: od-store-od.tracing.svc
The hostname of the data server for OpenTracing.
```

```
$AGENT_IMAGE
imageAgent: icp4i_od_agent:1.0.0-amd64
Image will be pulled from the imageRegistry of this CR.
```

```
$COLLECTOR_IMAGE
imageCollector: icp4i_od_collector:1.0.0-amd64
Image will be pulled from the imageRegistry of this CR.
```

b. During the OpenTracing registration process, name the secret that stores credentials `icp4i-od-store-cred`, and add it to the cluster and into the installation namespace.

5. Enable or disable `syslogConfig`.

```
syslogConfig:
  enabled: false # if true, provide below details
  # remoteHost: $DATAPOWER_SYSLOG_TCP_REMOTE_HOST # must be a string
  # remotePort: $DATAPOWER_SYSLOG_TCP_REMOTE_PORT # must be an int
  # secretName: $DATAPOWER_SYSLOG_TCP_TLS_SECRET # must be a string
```

- To disable syslog, remove the `syslogConfig` block from `apigateway_cr.yaml` and `v5cgateway_cr.yaml`. Alternatively, you can set `syslogConfig.enabled` to `false`.
- To enable `syslogConfig` in the Gateways, set the following values in `apigateway_cr.yaml` and `v5cgateway_cr.yaml`:

```
enabled
  enabled: true
$DATAPOWER_SYSLOG_TCP_REMOTE_HOST
  remoteHost: <remote.host>
String. The hostname of the server for syslogConfig.

$DATAPOWER_SYSLOG_TCP_REMOTE_PORT
  remotePort: <remote.port.number>
Integer. The port number of the server for syslogConfig.

$DATAPOWER_SYSLOG_TCP_TLS_SECRET
  secretName: <secret>
String. The TLS secret name of the server for syslogConfig.
```

6. Optional: If applicable to your deployment, update the GatewayCluster CR to configure `DataPowerService` APIs to customize your DataPower deployment. See [Customizing a DataPower deployment](#).

7. To enable mutual TLS between the Management client and the Gateway service's manager endpoint, add `mtlsValidateClient` to the `spec` section:

```
spec:
  mtlsValidateClient: true
```

This ensures that the gateway service authenticates incoming requests from the API Manager, such as gateway service registration, and publishing APIs to the gateway service. Specifically, the gateway service requires that incoming requests present a certificate that was signed by the same CA that was used to sign the gateway service management endpoint. The gateway service management endpoint secret is specified under `gatewayManagerEndpoint.hosts.secretName`. The API Manager's gateway client's TLS credentials are specified in the ManagementCluster CR under `gateway.client.secretName`.

Note: In releases previous to 10.0.5.3, this property is called `validateApimClient`.

8. Optional: If you want to enable JWT security for communications between the management and gateway, add and set the property `jwtksUrl`.

```
spec:
  ...
  jwtksUrl: <JWTKS URL>
```

where `<JWTKS URL>` is the URL of the JWKS endpoint hosted on the management subsystems. To find out the `jwtksUrl`, describe the management CR and check the `status` section:

```
kubectl describe mgmt -n <namespace>
...
status:
- name: jwtksUrl
  secretName: api-endpoint
  type: API
  uri: https://api.apic.acme.com/api/cloud/oauth2/certs
```

For more information on JWT security, see [Enable JWT security instead of mTLS](#).

DataPower version 10.5.0.4 only: To enable JWT on the gateway to analytics communications flow, you also must add a `dataPowerOverride` section to the gateway CR:

```
spec:
  jwtksUrl: <JWTKS URL>
  dataPowerOverride:
    image: customregistry.com/custom-image-datapower:10.5.0.5
    version: 10.5.0.5
    license: X-XXXX-XXXXXX
```

9. Optional: If you want to use the [In-cluster](#) inter-subsystem communication feature, then uncomment the `mgmtPlatformEndpointSvcCASecret` section, and set the `secretName`:

```
mgmtPlatformEndpointSvcCASecret:
  secretName: management-ca # Usually management-ca
```

Unless you customized your internal certificates, this is always `management-ca`.

10. Optional: Enable autoscaling of gateway pods to ensure high availability of DataPower pods. See [Enabling autoscaling of gateway pods](#).

11. Install the Gateway Custom Resource by applying the Gateway template file:

For a DataPower API Gateway, run the following command:

```
kubectl apply -f apigateway_cr.yaml -n <namespace>
```

For a DataPower Gateway (v5 compatible), run the following command:

```
kubectl apply -f v5cgateway_cr.yaml -n <namespace>
```

12. To verify that the Gateway subsystem(s) are fully installed, run the following command:

```
kubectl get GatewayCluster -n <namespace>
```

The installation has completed when the **READY** status is **True**, and the **SUMMARY** reports that all services are online (2/2) for all the Gateway subsystems that were installed. Example:

NAME	READY	SUMMARY	VERSION	RECONCILED VERSION	AGE
gww5	True	2/2	<version>	<version-build>	7m31s
gww6	True	2/2	<version>	<version-build>	7m32s

There is no need to wait for the **READY** status to be **True** before moving on to the next Subsystem installation.

What to do next

If you are creating a new deployment of API Connect, install other subsystems as needed.

When you have completed the installation of all required API Connect subsystems, you can proceed to defining your API Connect configuration by using the API Connect Cloud Manager; refer to the [Cloud Manager configuration checklist](#).

Installing the Developer Portal subsystem

Install the Developer Portal subsystem.

About this task

Important:

- To enable effective high availability for your Portal service, you need a latency that is less than 50 ms between all portal-db pods to avoid the risk of performance degradation. Servers with uniform specifications are required, as any write actions occur at the speed of the slowest portal-db pod, as the write actions are synchronous across the cluster of portal-db pods. It is recommended that there are three servers in each cluster of portal-db pods for the high availability configuration. The three servers can be situated in the same availability zone, or across three availability zones to ensure the best availability. However, you can configure high availability with two availability zones.
- The Portal does not do certain operations if the free space on certain volumes falls beneath predefined limits. In particular:
 - The **databaseVolumeClaimTemplate** needs at least 4GB of free space to create new sites, restore site backups, or upgrade or change the URL of existing sites.
 - The **webVolumeClaimTemplate** needs at least 256MB free space to create new sites, restore site backups, or upgrade or change the URL of existing sites.
- Ensure that your kernel or Kubernetes node has the value of its **inotify** watches set high enough so that the Developer Portal can monitor and maintain the files for each Developer Portal site. If set too low, the Developer Portal containers might fail to start or go into a **non-ready** state when this limit is reached. If you have many Developer Portal sites, or if your sites contain a lot of content, for example, many custom modules and themes, then a larger number of **inotify** watches are required. You can start with a value of 65,000, but for large deployments, this value might need to go up as high as 1,000,000. The Developer Portal containers take **inotify** watches only when they need them. The full number is not reserved or held, so it is acceptable to set this value high.
- Ensure that your kernel or Kubernetes node has a value of **nproc** (maximum number of processes) that applies to the user ID of the Portal pods that have been assigned, and that it is high enough to allow all of the Portal processes to execute. For smaller installations this might be as low as 16384, but for larger installations that have more concurrent web calls, you might need as many as 125205. If the number is too low, you will see errors like **"fork: retry: Resource temporarily unavailable"** in the Portal logs. Note that this value might need to be even higher if other, non-Portal, pods are sharing the same user ID.
- Ensure that your kernel or Kubernetes node has a value of **nofiles** (maximum number of open file descriptors) that applies to the user ID of the Portal pods that have been assigned, and that it is high enough to allow the Portal to open all of the files that it requires. For smaller installations this might be as low as 16384, but for larger installations that have more concurrent web calls and Portal web sites, you might need as many as 1048576. If the number is too low, you will see errors like **"too many open files"** in the Portal logs. Note that this value might need to be even higher if other, non-Portal, pods are sharing the same user ID.

The Portal endpoints values are used when you configure a Portal service in the Cloud Manager. See [Registering a Portal service](#).

- portalAdminEndpoint** - This is the Management Endpoint that is defined in Cloud Manager, which is used for communicating with API Manager.
- portalUIEndpoint** - This is the Portal website URL defined in Cloud Manager. It determines the URL for the site that is created for each catalog. It is used for public access to the Portal from a browser.

Important: The endpoints defined here must be the ones used by the Management subsystem when registering the portal, and portal users when accessing portal sites. Do not attempt to proxy these endpoints. You will not be able to register the portal service nor access portal sites using any other endpoint URLs than those defined here.

Procedure

1. Edit the **portal_cr** template CR to replace the placeholders with values for your deployment.

```
$APP_PRODUCT_VERSION
API Connect application version for the subsystems.

version: <version_number>
```

Example version number: 10.0.5.6

\$PROFILE

Specify your portal subsystem profile, where **n** indicates number of replicas, **c** number of cores, and **m** is the minimum memory allocation in GB. For more information on profiles, see [Planning your deployment topology](#).

\$SECRET_NAME

Use for image pull.

```
imagePullSecrets:
- apic-registry-secret
```

\$DOCKER_REGISTRY

The host name of the Docker Registry to which you uploaded the installation images. For example:

```
my.docker.registry.domain.example.com.
```

\$INGRESS_CLASS

The ingress class that you want the endpoint to use. This is an optional property and if not specified, the ingress class with annotation `ingressclass.kubernetes.io/is-default-class: true` is used. If such an ingress class does not exist in the Kubernetes environment, then `nginx` is used. If you do set this value, it must refer to a valid ingress class configured in your Kubernetes system.

Note: This property is commented out in the template CR file. If you set this value, make sure to also uncomment it.

\$STACK_HOST

The desired ingress subdomain for the API Connect stack. Used when you specify endpoints. Domain names that are used for endpoints cannot contain the underscore "_" character. You can do one of the following:

- Subdomain customization only
Accept the prefixes predefined for the ingress hostnames to use and replace all instances of `$STACK_HOST` to be the desired ingress subdomain for the API Connect stack. For example, for a subdomain of `myhost.subnet.example.com`:

```
portalAdminEndpoint:
  < ... >
  hosts:
  - name: api.portal.myhost.subnet.example.com
    secret: portal-admin

portalUIEndpoint:
  < ... >
  hosts:
  - name: portal.myhost.subnet.example.com
    secret: portal-web
```

- Complete hostname customization
Change both the predefined prefixes and the `$STACK_HOST` subdomain to match your desired hostnames.

For example, for `portalAdminEndpoint`, you can replace `api.portal.$STACK_HOST` with `my.api.portal.myhost.subnet.example.com`, where `my.api.portal` replaces `api.portal`, and `myhost.subnet.example.com` replaces `$STACK_HOST`:

```
portalAdminEndpoint:
  < ... >
  hosts:
  - name: my.api.portal.myhost.subnet.example.com
    secret: cm-endpoint
```

You can do this for some or all of the hostnames, depending on your customization requirements.

\$STORAGE_CLASS

The Kubernetes storage class to be used for Persistent Volume Claims. Find the available storage classes in the target cluster by running the following command: `kubect1 get sc`. For example, for local storage:

```
databaseVolumeClaimTemplate:
  storageClassName: $STORAGE_CLASS
  volumeSize: 120Gi
databaseLogsVolumeClaimTemplate:
  storageClassName: $STORAGE_CLASS
  volumeSize: 12Gi
webVolumeClaimTemplate:
  storageClassName: $STORAGE_CLASS
  volumeSize: 200Gi
backupVolumeClaimTemplate:
  storageClassName: $STORAGE_CLASS
  volumeSize: 300Gi
adminVolumeClaimTemplate:
  storageClassName: $STORAGE_CLASS
  volumeSize: 20Gi
certVolumeClaimTemplate:
  storageClassName: $STORAGE_CLASS
  volumeSize: 4Gi
```

\$PLATFORM_CA_SECRET

Set to `ingress-ca`. The `$PLATFORM_CA_SECRET` contains the CA certificate for the platform REST API endpoint. The portal makes calls to the platform REST API and this property must be set so that the portal can verify the server certificate.

```
mgmtPlatformEndpointCASecret:
  secretName: $PLATFORM_CA_SECRET
```

\$CONSUMER_CA_SECRET

Set to `ingress-ca`. The `$CONSUMER_CA_SECRET` contains the CA certificate for the consumer REST API endpoint. The portal makes calls to the consumer REST API and this property must be set so that the portal can verify the server certificate.

```
mgmtConsumerEndpointCASecret:
  secretName: $CONSUMER_CA_SECRET
```

Note:

- The `databaseVolumeClaimTemplate` has a minimum value of 30Gi. The `webVolumeClaimTemplate` has a minimum value of 20Gi. The `backupVolumeClaimTemplate` has a minimum value of 30Gi. However, all three need to be sized according to the installation.
- The `adminVolumeClaimTemplate` and `databaseLogsVolumeClaimTemplate` in this example have their minimum values and you do not need to change them.
- The `certVolumeClaimTemplate` is used by the nginx pod and in 2dcha (two data center high availability) mode it is also by the tunnel, db-remote and www-remote pods. It can be sized small, just like the `adminVolumeClaimTemplate`, and does not need to be increased based on the number of sites.

2. Edit the `license` setting:

- Set `accept`: to `true` to accept the license. Note that the default value is `false`. If you do not accept the license, the Operator will not install the subsystem.
- Set `metric`: to track your product usage. Enter the unit of measure that is used for your program license:
 - `PROCESSOR_VALUE_UNIT` - Default value. If you leave the field blank, this value is used.
 - `MONTHLY_API_CALL` - Applies only to the IBM API Connect Hybrid Entitlement program.For information on tracking monthly call volume, see [Tracking API volume for auditing and compliance](#).
- Set `use`: to either `production` or `nonproduction`, to match the license you purchased.
- Set `license`: to the License ID for the version of API Connect that you purchased. See [API Connect licenses](#).

Example entry to accept the license for a production system:

```
license:
  accept: true
  metric: PROCESSOR_VALUE_UNIT
  use: production
  license: L-RJON-BZ5LSE
```

3. Optional: If you want to disable mTLS for communications between the management and portal, and enable JWT instead, then add and set the properties `mtlsValidateClient` and `jwtksUrl`.

```
spec:
  ...
  mtlsValidateClient: false
  jwtksUrl: <JWTKS URL>
```

where `<JWTKS URL>` is the URL of the JWKS endpoint hosted on the management subsystems. To find out the `jwtksUrl`, describe the management CR and check the `status` section:

```
kubectl describe mgmt -n <namespace>
...
status:
- name: jwtksUrl
  secretName: api-endpoint
  type: API
  uri: https://api.apic.acme.com/api/cloud/oauth2/certs
```

For more information on JWT security, see [Enable JWT security instead of mTLS](#).

4. Optional: If you want to use the [In-cluster](#) inter-subsystem communication feature, then uncomment the `mgmtPlatformEndpointSvcCASecret` and the `mgmtConsumerEndpointSvcCASecret` sections, and set the `secretName` for both:

```
mgmtPlatformEndpointSvcCASecret:
  secretName: management-ca # Usually management-ca
mgmtConsumerEndpointSvcCASecret:
  secretName: management-ca # Usually management-ca
```

Unless you customized your internal certificates, these secrets are always `management-ca`.

5. Optional: If you are installing as part of a two data center disaster recovery set up, complete the steps in [Installing a two data center deployment on Kubernetes](#) before you apply the edited file.

6. Install the Portal Custom Resource, replacing `<namespace>` with the target installation namespace in the Kubernetes cluster:

```
kubectl apply -f portal_cr.yaml -n <namespace>
```

7. Verify that the Portal subsystem is fully installed:

```
kubectl get PortalCluster -n <namespace>
```

The installation is complete when `STATUS` reports `Running`, `Ready` reports that all services are online (3/3), and `MESSAGE` reports "Ready for API Cloud Manager service registration", for example:

NAME	READY	STATUS	VERSION	RECONCILED	VERSION	MESSAGE	AGE
portal	3/3	Running	<version>	<version>		Ready for API Cloud Manager service registration	2h

You do not need to wait for the portal installation to complete before you move on to the next subsystem installation.

8. We highly recommend that you retain the Portal subsystem encryption secret in a safe location, in case you need to restore the Portal subsystem during a disaster recovery scenario.

The encryption secret is created when the Portal subsystem is initially deployed. You can obtain the name of the encryption secret from the Portal subsystem custom resource once the installation is complete. For example:

a. Obtain the name of the encryptionSecret:

```
kubectl get ptl portal -o yaml | grep encryptionSecret
encryptionSecret: portal-enc-key
```

The name of encryption secret is `portal-enc-key`.

b. Save the secret yaml in a safe location:

```
kubectl get secret portal-enc-key -o yaml > portal-enc-key.yaml
```

9. Backup the Portal installation. See [Backing up and restoring the Developer Portal in a Kubernetes environment](#).

Note:

When you create or register a Developer Portal service, the Portal subsystem checks that the Portal web endpoint is accessible. However sometimes, for example due to the complexity of public and private networks, the endpoint cannot be reached. The following example shows the errors that you might see in the `portal-www` pod, admin container logs, if the endpoint cannot be reached:

```
An error occurred contacting the provided portal web endpoint: example.com
The provided Portal web endpoint example.com returned HTTP status code 504
```

In this instance, you can disable the Portal web endpoint check so that the Developer Portal service can be created successfully. To disable the endpoint check, complete the following update:

On Kubernetes, OpenShift, and IBM® Cloud Pak for Integration
Add the following section to the Portal custom resource (CR) template:

```
spec:
  template:
    - containers:
      - env:
        - name: PORTAL_SKIP_WEB_ENDPOINT_VALIDATION
          value: "true"
        name: admin
      name: www
```

What to do next

If you are creating a new deployment of API Connect, install other subsystems as needed.

When you completed the installation of all the required API Connect subsystems, you can proceed to defining your API Connect configuration by using the API Connect Cloud Manager; refer to the [Cloud Manager configuration checklist](#).

- [Defining multiple portal endpoints for a Kubernetes environment](#)
Multiple public facing endpoints (portal-www) can be defined for the Developer Portal.

Defining multiple portal endpoints for a Kubernetes environment

Multiple public facing endpoints (portal-www) can be defined for the Developer Portal.

About this task

You can override the single endpoint definition for portal-WWW, and the associated portal-www-ingress TLS certificate, to support multiple portal-www endpoints.

For information about the endpoints for the Developer Portal, see [Installing the Developer Portal subsystem](#).

Following are the example endpoints for configuring different sites served by the same Developer Portal service, as configured in this task:

- `https://banking.example.com/loans`
- `https://insurance.example.com/vehicle`

These unique endpoints allow Developer Portal sites to be defined on the Developer Portal service with different host names and domains. They replace endpoints that distinguish different sites by sub paths, as shown in the following examples:

- `https://www.example.com/banking/loans`
- `https://www.example.com/insurance/vehicle`

Procedure

Edit your `portal_cr` template. You can add multiple entries for your endpoints in the `hosts` element:

For example:

```
spec:
  portalUIEndpoint:
    annotations:
      cert-manager.io/issuer: ingress-issuer
    hosts:
      - name: pt1.host1.example.com
        secretName: portal-web-host1
      - name: pt1.host2.example.com
        secretName: portal-web-host2
      - name: pt1.host3.example.com
        secretName: portal-web-host3
```

Installing the Analytics subsystem

Install the IBM® API Connect analytics subsystem.

Review the section on [Planning your analytics deployment](#) to ensure that you understand the choices for configuring the topology, disk space, and other elements of the analytics subsystem.

Note: When the analytics service is configured to store data, it uses OpenSearch, which requires map counts higher than the operating system defaults. The minimum recommended value is **262144**. If you plan to store analytics data locally (that is, do you not intend to disable local storage and offload all data), increase the default map count on every Kubernetes node:

1. To change the map counts on the live system, run the following command on every Kubernetes node:

```
sudo sysctl -w vm.max_map_count=262144
```

2. To persist this change when node restarts occur, add the following setting to the `/etc/sysctl.conf` file:

```
vm.max_map_count = 262144
```

For more information, see [Important settings](#) in the OpenSearch documentation.

- [Creating the analytics CR](#)
Create the installation CR for IBM API Connect analytics so that you can deploy the analytics subsystem.
- [Topology settings and additional analytics features](#)
Update the Kubernetes analytics CR to configure additional analytics features.
- [Installing analytics](#)
Deploy the analytics CR to install the analytics subsystem in your IBM API Connect deployment.

Creating the analytics CR

Create the installation CR for IBM® API Connect analytics so that you can deploy the analytics subsystem.

About this task

To install the analytics subsystem, create a Custom Resource (CR) in a `.yaml` file. The file contains all of your configuration settings for the analytics deployment. Use the file to install, upgrade, and update the configuration of your analytics subsystem.

Note: The `analytics_cr.yaml` and `analytics_dedicated_cr.yaml` template files are stored in the directory where you extracted `helper_files.zip`.

Procedure

1. Create or copy the appropriate analytics CR file from the `helper_files`, depending on which deployment storage type you want, see: [Planning the analytics profile, storage class, and storage type](#).

- If you want to use shared storage, use `analytics_cr.yaml`.
- If you want to use dedicated storage use `analytics_dedicated_cr.yaml`. Dedicated storage is only supported on three replica deployments.

2. Edit the CR file and update the following settings:

You cannot install the analytics subsystem until the placeholders are replaced with real values for your environment.

\$APP_PRODUCT_VERSION

API Connect application version for the subsystems.

```
version: <version_number>
```

Example version number: 10.0.5.6

\$PROFILE

Specify your analytics subsystem profile, where **n** indicates number of replicas, **c** number of cores, and **m** is the minimum memory allocation in GB. For more information on profiles, see [Planning your deployment topology](#).

\$SECRET_NAME

The name of the secret used to pull images from the Docker registry.

```
imagePullSecrets:  
- apic-registry-secret
```

\$DOCKER_REGISTRY

The host name of the Docker Registry to which you uploaded the installation images. For example:

```
my.docker.registry.domain.example.com.
```

\$INGRESS_CLASS

The ingress class that you want the endpoint to use. This is an optional property and if not specified, the ingress class with annotation `ingressclass.kubernetes.io/is-default-class:`

`true` is used. If such an ingress class does not exist in the Kubernetes environment, then `nginx` is used. If you do set this value, it must refer to a valid ingress class configured in your Kubernetes system.

Note: This property is commented out in the template CR file. If you set this value, make sure to also uncomment it.

\$STACK_HOST

The desired ingress subdomain for the API Connect stack. Used when specifying the ingestion endpoint. Domain names that are used for endpoints cannot contain the underscore "_" character. You can customize the subdomain or the complete host name:

- Subdomain customization only
Accept the prefixes predefined for the ingress host names to use and replace all instances of `$STACK_HOST` with the desired ingress subdomain for the API Connect stack. For example, if your host is `myhost.subnet.example.com`:

```
ingestion:  
  endpoint:  
    < ... >  
  hosts:  
    - name: ai.myhost.subnet.example.com  
      secretName: analytics-ai-endpoint  
    < ... >
```

`$$STORAGE_CLASS`

The Kubernetes storage class to be used for persistent volume claims (for more information, see [Planning the analytics profile, storage class, and storage type](#)). Find the available storage classes in the target cluster by running the following command: `kubect1 get sc`.

- For shared storage deployments:

```
storage:
  type: shared
  shared:
    volumeClaimTemplate:
      storageClassName: local_storage
```

- For dedicated storage deployments, set `$$STORAGE_CLASS` in two places:

```
storage:
  type: dedicated
  shared:
    volumeClaimTemplate:
      storageClassName: local_storage
  ...
  master:
    volumeClaimTemplate:
      storageClassName: local_storage
  ...
```

`$$DATA_VOLUME_SIZE`

Replace `$$DATA_VOLUME_SIZE` with the value that you calculated in [Data storage: calculate how much data you want to store](#). If not specified it defaults to 50Gi

```
storage:
  ...
  shared:
    volumeClaimTemplate:
      ...
      volumeSize: 50Gi
```

3. Edit the `license` setting:

- Set `accept`: to `true` to accept the license. Note that the default value is `false`. If you do not accept the license, the Operator will not install the subsystem.
- Set `metric`: to track your product usage. Enter the unit of measure that is used for your program license:
 - `PROCESSOR_VALUE_UNIT` - Default value. If you leave the field blank, this value is used.
 - `MONTHLY_API_CALL` - Applies only to the IBM API Connect Hybrid Entitlement program.

For information on tracking monthly call volume, see [Tracking API volume for auditing and compliance](#).

- Set `use`: to either `production` or `nonproduction`, to match the license you purchased.
- Set `license`: to the License ID for the version of API Connect that you purchased. See [API Connect licenses](#).

Example entry to accept the license for a production system:

```
license:
  accept: true
  metric: PROCESSOR_VALUE_UNIT
  use: production
  license: L-RJON-CEBL97
```

4. Optional: If you want to disable mTLS for communications between the management and analytics subsystem, and between the gateway and analytics subsystem, and enable JWT instead, then add and set the properties `mtlsValidateClient` and `jwtksUrl`.

```
spec:
  ...
  mtlsValidateClient: false
  jwtksUrl: <JWTKS URL>
```

where `<JWTKS URL>` is the URL of the JWKS endpoint hosted on the management subsystems. To find out the `jwtksUrl`, describe the management CR and check the `status`: section:

```
kubect1 describe mgmt -n <namespace>
...
status:
- name: jwtksUrl
  secretName: api-endpoint
  type: API
  uri: https://api.apic.acme.com/api/cloud/oauth2/certs
```

For more information on JWT security, see [Enable JWT security instead of mTLS](#).

Note: It is not possible to use JWT on the V5 compatible gateway to analytics message flow.

5. Save the file.

Results

You now have an analytics CR that is configured with the default analytics topology described in [Planning your topology](#).

What to do next

If you do not want to add any more configuration options, skip to the topic [Installing analytics](#).

Important: All additional analytics configuration options can be added, changed, or removed after installation **except** for disablement or enablement of internal storage. If you want to disable internal storage you must configure this in the analytics CR before installation: [Disabling internal storage](#)

Otherwise, add configuration options to the CR as explained in [Topology settings and additional analytics features](#)

Topology settings and additional analytics features

Update the Kubernetes analytics CR to configure additional analytics features.

About this task

Based on the decisions you made while [defining your topology](#), configure your deployment options by completing the steps in the following topics to enable the persistent queue, configure data offloading, use dedicated storage, and disable internal storage.

Important: All additional analytics configuration options can be added, changed, or removed after installation **except** for disablement or enablement of internal storage. If you want to disable internal storage you must configure this in the analytics CR before installation: [Disabling internal storage](#)

- **[Analytics persistent queue](#)**
For enhanced reliability in your analytics data pipeline, enable the persistent queue feature by updating your Kubernetes analytics CR.
- **[Offloading data to a third-party system](#)**
Update the Analytics CR to configure data offloading from your IBM API Connect Analytics deployment to a third-party system.
- **[Disabling internal storage](#)**
Update the Kubernetes analytics CR to disable local storage in your IBM API Connect analytics deployment.
- **[Modifying incoming analytics data](#)**
Update the analytics CR to customize data in your analytics deployment.
- **[Reference: Fields in the Analytics CR](#)**
Use the table of Analytics-specific fields to configure the CR for installing your IBM API Connect Analytics subsystem.

Analytics persistent queue

For enhanced reliability in your analytics data pipeline, enable the persistent queue feature by updating your Kubernetes analytics CR.

The Logstash persistent queue is an optional feature that provides enhanced reliability in the data pipeline. With the persistent queue enabled, the ingestion pod buffers incoming API event data to persistent storage so that no events are lost if the downstream API Connect services become unavailable.

For example, if the analytics storage service is restarted, any incoming API events are kept in persistent storage and sent on to the storage service when it is available again. If the persistent queue is not enabled, then the ingestion pod rejects further API event data coming from the gateway.

The persistent queue feature does not replay previously sent API events (if you change offload settings for example).

Another benefit of this feature is better handling of unexpected traffic spikes. The only disadvantages are higher CPU and persistent storage requirements.

To enable the persistent queue feature:

1. Edit your analytics_cr.yaml and add the following to the ingestion section.

```
2. ingestion:
  queue:
    type: persisted
    volumeClaimTemplate:
      storageClassName: <storage-class-name>
      volumeSize: <storage size>
```

Where:

- `<storage-class-name>` is the Kubernetes storage class defined for persistent volumes. For example `local-storage`
 - `<storage size>` is the maximum size for your persistent queue. The minimum value is 30Gi.
3. Save the file. If updating these settings after installation, confirm that the analytics ingestion pod restarts.

Offloading data to a third-party system

Update the Analytics CR to configure data offloading from your IBM® API Connect Analytics deployment to a third-party system.

About this task

For information about offloading data from your Analytics deployment, see [Planning to offload data to a third-party system](#).

Procedure

1. Open the analytics_cr.yaml file for editing.
2. Add the following section to the `spec` section of the CR:

```
external:
  offload:
    enabled: true
    output: |
      $EXTERNAL_OFFLOAD_OUTPUT
```

where `$EXTERNAL_OFFLOAD_OUTPUT` is the plugin output for the target third-party system.

The following example enables offloading to HTTP:

```

external:
  offload:
    enabled: true
    output: |
      http {
        url => "example.com"
        http_method => "post"
        codec => "json"
        content_type => "application/json"
        id => "offload_http"
      }

```

For examples of output plugins, see [Sample output plugins for offloading data](#).

- Optional: Modify the output plugin to include certificates for connecting to a secure endpoint.

If your third-party endpoint requires a particular certificate, you can configure the certificate and then reference it in the offload plugin. Include the `secretName` as well as the `cacert`, `client_cert`, and `client_key` settings.

For example, the following output plugin enables offloading to HTTP, and provides information on the certificate that is needed for authenticating with the endpoint:

```

external:
  offload:
    secretName: offload-certificates
    enabled: true
    output: |
      http {
        url => "https://example.com:443"
        http_method => "post"
        codec => "json"
        content_type => "application/json"
        id => "offload_http"
        cacert => "/etc/velox/external_certs/offload/cacert.pem"
        client_cert => "/etc/velox/external_certs/offload/client.pem"
        client_key => "/etc/velox/external_certs/offload/client.key"
      }

```

The secret and its defined files are mounted to the `/etc/velox/external_certs/offload` directory in the ingestion pod container.

For information on creating a secret to store the certificates, see [Providing a custom certificate for Analytics offload](#).

- Optional: Add a `filter` after the output plugin to modify data prior to offloading it.

The following example filter removes the `query_string` field:

```

external:
  offload:
    enabled: true
    output: |
      http {
        url => "example.com"
        http_method => "post"
        codec => "json"
        content_type => "application/json"
        id => "offload_http"
      }
    filter: |
      ruby {
        remove_field => ["query_string"]
      }

```

For information about modifying offloaded data, see [Planning to modify your incoming analytics data](#).

- Save the file. If updating these settings after installation, confirm that the analytics ingestion pod restarts.

- [Sample output plugins for offloading data](#)
Review sample output plugins to see how to code your own plugins for offloading data from IBM API Connect Analytics.
- [Providing a custom certificate for Analytics offload](#)
Prepare a private or self-signed certificate for offloading data and then add it to the IBM API Connect Analytics deployment on Kubernetes.

Sample output plugins for offloading data

Review sample output plugins to see how to code your own plugins for offloading data from IBM® API Connect Analytics.

Configure output plugins that direct analytics data to your third-party systems. An output plugin specifies where analytics data is offloaded, plus any information required to access that system, such as certificate information. The output plugin for displaying analytics data in the Analytics user interface is configured by default.

Note: If your third-party system requires a private or self-signed certificate, configure it as explained in [Providing a custom certificate for Analytics offload](#) and include a reference to the certificate in your output plugin. See the second HTTP output plugin for an example of how to reference the certificate.

HTTP

To configure data offload to an HTTP server, you must provide the server URL. You can optionally add standardized or custom HTTP headers to define additional operating parameters.

The following example configures an HTTP output plugin.

```

http {
  url => "example.com"
  http_method => "post"
  codec => "json"
  content_type => "application/json"
  headers => {
    "x-acme-index" => "8"
    "x-acme-key" => "0d5d259f-b8c5-4398-9e58-77b05be67037"
  }
  id => "offload_http"
}

```

The following example configures an HTTP output plugin that references a custom certificate for accessing the third-party endpoint.

```

http {
  url => "https://example.com:443"
  http_method => "post"
  codec => "json"
  content_type => "application/json"
  headers => {
    "x-acme-index" => "8"
    "x-acme-key" => "0d5d259f-b8c5-4398-9e58-77b05be67037"
  }
  id => "offload_http"
  cacert => "/etc/velox/external_certs/offload/cacert.pem"
  client_cert => "/etc/velox/external_certs/offload/client.pem"
  client_key => "/etc/velox/external_certs/offload/client.key"
}

```

For more information on offloading to HTTP, refer to the Logstash documentation on configuring the [HTTP output plugin](#).

Elasticsearch

To configure data offload to an Elasticsearch cluster, you must provide one or more server URLs, define how indices should be created by specifying a dynamically configured name, specify the number of primary shards for storing the indexed documents, and specify a number of replica shards for redundancy. You can optionally specify server authentication credentials.

The naming syntax that you specify for your indices determines how many indices are created and how they are characterized. For example, you can define indices that are created based on a date pattern (for example, daily or weekly), or indices that are created to store data by provider organization or by API name.

The following example configures an Elasticsearch output plugin.

```

elasticsearch {
  hosts => "https://example.com:443"
  index => "apiconnect"
  ssl => true
  cacert => "/etc/pki/tls/cert.pem"
}

```

For more information on offloading to Elasticsearch, refer to the Elasticsearch documentation on the [Elasticsearch output plugin](#).

Apache Kafka

To configure data offload to a Kafka cluster, you must provide host and port connection details for one or more servers, and the name of the Kafka topic to which you want to publish the offloaded data. For logging and monitoring purposes within Kafka, you can optionally specify a string identifier by which API Connect can be uniquely identified.

The following example configures a Kafka output plugin.

```

kafka {
  topic_id => "test"
  bootstrap_servers => "example.com:9093"
  codec => "json"
  id => "kafka_offload"
  ssl_truststore_location => "/usr/share/logstash/jdk/lib/security/cacerts"
  ssl_truststore_password => "changeit"
  ssl_truststore_type => "JKS"
  security_protocol => SSL
}

```

For more information on offloading to Apache Kafka, refer to the Logstash documentation on the [Kafka output plugin](#).

Syslog

To configure data offload to Syslog, you must provide host and port connection details for the server.

Restriction: Syslog does not support the use of chained client certificates for TLS profiles.

The following example configures a Syslog output plugin.

```

syslog {
  host => "example.com"
  port => 601
  protocol => "ssl-tcp"
  id => "offload_syslog"
  appname => "apiconnect"
  msgid => "%{org_id}"
  facility => "log audit"
  severity => "informational"
  codec => "json"
}

```

```
ssl_cacert => "/etc/pki/tls/cert.pem"
}
```

Attention: Due to a third-party issue with Logstash, most of the facility values are not set correctly on the offload server. As a temporary workaround, set the facility to "user-level" to ensure that the corresponding value is correctly sent to the offload server. When Logstash corrects this problem, you must update the offload configuration to change the value to a more appropriate setting.

For more information on offloading to Syslog, refer to the Logstash documentation on the [Syslog output plugin](#).

OpenSearch

To configure data offload to OpenSearch: <https://opensearch.org/docs/latest/clients/logstash/ship-to-opensearch/>

Providing a custom certificate for Analytics offload

Prepare a private or self-signed certificate for offloading data and then add it to the IBM® API Connect Analytics deployment on Kubernetes.

Procedure

1. Log in to a server that has kubectl access to the Kubernetes cluster where the API Connect Analytics subsystem is deployed.

2. Encode the certificate file contents in base64.

You can use either JKS files or text-based files such as PEM files:

- If you use a JKS file for the certificate, you must encode it.
- If you use a text-based file such as PEM, then you can either encode it, or paste its contents directly.

There are various tools for base64 encoding. If the `cat` and `base64` commands are available you can run the following command to encode the file contents:

```
cat keystore.jks | base64
```

Copy the output so that you can paste it into the secret in the next step.

3. Create a secret to contain the certificate.

a. Create a file called `analytics_certs.yaml` to contain the secret.

The secret's name that you specify in the file does not have to match the file name. In the examples, the secret's name is `offload-certificates`. Do not use the underscore character (`_`) in the secret name.

The method for adding the certificate to the secret depends on whether you encoded the file contents in the previous step:

- Base64-encoded file: In the `data` section of the secret, type a name for the field (you can choose the name). Paste the encoded output from the previous step (enclosed in `" "`) as the value.

```
apiVersion: v1
kind: Secret
metadata:
  # Change value of name to be whatever you wish secret to be called
  name: offload-certificates
  # Only base64 encoded data should be placed in data section; JKS keys would go here
data:
  keystore.jks: "output_of_base64_encoded_jks"
```

- Plain text file: In the `stringData` section of the secret, type a name for the key or certificate (you can choose the name), and paste the value.

```
apiVersion: v1
kind: Secret
metadata:
  # Change value of name to be whatever you wish secret to be called
  name: offload-certificates
stringData:
  cacert.pem: |-
    -----BEGIN CERTIFICATE-----
    MIIDIDCCAomgAwIBAgIEND70zzANBqkqhkiG9w0BAQUFADBOMQswCQYDVQQGEwJVUzEQMA4GA1UE

    BIZCe/zuf6IWURVnZ9NA2zsmWLIodz2uFHdh1voqZiegdFqnc1zqcPGUIWVEX/z87yloqaKHee95
    70+sB3c4
    -----END CERTIFICATE-----
```

You can add multiple keys/certificates, setting the field names for each as desired. For each key, a file based on the corresponding field name is created in the ingestion pod container at `/etc/velox/external_certs/offload`. The examples here would result in the files `keystore.jks` and `cacert.pem`.

b. Save the file.

4. Optional: Create an additional secret.

If you have sensitive data such as a certificate password that must be available in text format, you can store it in another secret.

If your password is not sensitive (such as the JKS default password), then you can supply it directly in the Logstash configuration, and skip this step.

- a. Create the file `offload_env_var.yaml`. The secret's name that you specify in the file does not have to match the file name. In this example, the secret's name is `offload-jks-password`.
- b. In the `stringData` section, set the property `jks_password.txt` to your password (in plain text):

```
apiVersion: v1
kind: Secret
metadata:
  name: offload-jks-password
stringData:
  jks_password.txt: <password>
```

- c. Run the following command to update the cluster:

```
kubectl apply -f offload_env_var.yaml -n your_namespace
```

Where `offload_env_var.yaml` is the secret's file name.

5. Apply the secret to the cluster where the Analytics subsystem is installed. Run the following command to update the cluster:

```
kubectl apply -f file_name_of_secret.yaml -n namespace
```

Where:

- `file_name_of_secret.yaml` is the secret's file name.
- `namespace` is your analytics namespace.

6. Edit the Analytics CR and add a reference to the secret and passwordSecret in the `offload` section:

```
offload:
  enabled: true
  output: |
    kafka {
      ...
    }
  secretName: offload-certificates
  passwordSecretName: offload-jks-password
```

7. If you want to reference the certificate in an [offload plugin](#), configure the plug-in now. Step 3 of that procedure shows how you can include the certificate information in the plug-in.

Disabling internal storage

Update the Kubernetes analytics CR to disable local storage in your IBM® API Connect analytics deployment.

About this task

The Analytics subsystem provides a complete solution for routing, storing, and viewing the analytics data. However, you might not need the internal storage and viewing solution, especially if you are primarily using a third-party system for data offloading. In this scenario, you can greatly reduce your CPU and memory costs by disabling the internal storage and viewing components.

With this approach, data that is offloaded is not viewable in the API Manager and Developer Portal UIs.

When you disable internal storage for analytics data, the following microservices are disabled:

- `osinit`
- `storage`

Important: The disablement of internal storage must be set in the analytics CR yaml file before installation. It is not possible to disable or re-enable internal storage after installation.

Procedure

1. Required: Configure data offloading as explained in [Offloading data to a third-party system](#). If you do not have offloading configured and also disable internal storage, you will have no analytics data.
2. Open the `analytics_cr.yaml` file for editing.
3. Locate the `storage` section and set `enabled` to `false`:

```
storage:
  enabled: false
```

4. Save the file.

Modifying incoming analytics data

Update the analytics CR to customize data in your analytics deployment.

Before you begin

Review the use of filters for modifying analytics data, and make sure that you understand the restrictions. For information about customizing data, see [Planning to modify your incoming analytics data](#).

About this task

You can define filters that add, modify, or remove fields from the incoming API event records, before they are stored in API Connect or offloaded to a third-party system.

Procedure

1. Open the `analytics_cr.yaml` file for editing.
2. Filters for API events that are offloaded to an external system are defined in the `external.offload` section. Filters for API events that are stored in the API Connect OpenSearch database are defined in the `ingestion` section.

Ingestion filters - for API event data stored by API Connect
Add the filter definition to the `ingestion` section:

```
spec:
  ingestion:
    ...
    filter: |
      mutate {
        remove_field => ["query_string"]
      }
```

Offload filters - for API event data that is sent to a third-party system.
Add the filter definition to the `external.offload` section:

```
spec:
  external:
    offload:
      filter: |
        mutate {
          remove_field => ["query_string"]
        }
```

For more examples, see [Sample filters for modifying analytics data](#).

3. Optional: Include geoIP fields in your analytics data, for both stored and offloaded data, by inserting `geoIPEnabled: true` in the ingestion section:

```
ingestion:
  ...
  geoIPEnabled: true
```

By default the `client_geoip` and `gateway_geoip` fields are not included in the analytics data. You do not need to add `geoIPEnabled` to the `external.offload` section. Enabling geoIP in the `ingestion` section enables it for both data routes.

Note: To ensure the value in the `client_geoip` field is accurate, the gateway must receive the `X-Forwarded-For` header in all API calls. Check with the administrator of your deployment environment to ensure that the `X-Forwarded-For` header is passed to your gateways. For example, in a Kubernetes environment where NINGX ingresses are used, configure the NGINX ingress that is used by your gateway to use the `X-Forwarded-For` header: [NGINX Configuration "use-forwarded-headers"](#).

4. Save the file. Changes to filters take effect after approximately 30 seconds.

- [Sample filters for modifying analytics data](#)

Review sample filters to see how to code your own filters for refining IBM API Connect Analytics data by adding fields, removing fields, or modifying field contents.

Sample filters for modifying analytics data

Review sample filters to see how to code your own filters for refining IBM® API Connect Analytics data by adding fields, removing fields, or modifying field contents.

You can use these sample filters in the `ingestion.filter` and the `external.offload.filter` configurations.

Adding a new field

You can add custom data to API event data by adding a field to the logging document. For example, if you want to search or visualize data that is stored in request and response headers, you can add fields to a filter to include that information.

To avoid naming conflicts with future or current analytics fields, include a prefix that ensures your new field name is unique. For example, instead of naming the field `employee_num` you might name it `x_mycompany_employee_num`.

The following example copies the contents of the `X-Employee-Num` field from the request header and adds it to the `x_mycompany_employee_num` field in the event data. Adding the field to the event data enables you to use the information in visualizations.

```
if [request_http_headers] {
  ruby {
    code => "event.get(['request_http_headers']).collect {|i| event.set(['x_mycompany_employee_num'], i['X-Employee-Num']) if
i.has_key?('X-Employee-Num')}"
  }
}
```

Modifying an existing field

Sometimes you don't want to remove a field entirely from your data, you just want to redact sensitive information such as IDs to prevent them from being exposed in visualizations. You can modify the contents of a field and replace information with a symbols or a message.

Remember: The following fields should not be modified if the data is being written to internal analytics storage: `org_id`, `catalog_id`, `space_id`, `developer_org_id`, `datetime`, and `@timestamp`.

The following example replaces sensitive information in the `X-Employee-Name` and `X-Employee-ID` request headers with the string: `*****sanitized*****`.

```
if [request_http_headers] {
  ruby {
    code => "headers=['X-Employee-Name','X-Employee-ID']; newHeaders = event.get(['request_http_headers']).collect {|i|
headers.each {|header| i[header] = '*****sanitized*****' if i.has_key?(header)}; i}; event.set(['request_http_headers'],
newHeaders)"
  }
}
```

Removing an existing field

Use the mutate `remove_field` operation to delete a field from the Analytics data. To remove multiple fields, delimit the field names with commas.

The following example removes multiple fields (`request_http_headers`, `response_http_headers`, `request_body`, `response_body`, and `query_string`) from the Analytics data:

```
mutate {
  remove_field => ["request_http_headers", "response_http_headers", "request_body", "response_body", "query_string"]
}
```

Combining filters with offload and ingestion configuration

Offload events from `catalog1` only:

```
offload:
  enabled: true
  if [catalog_name] == "offload1" {
    http {
      url => "http://offloadhost.example.com/offload"
      http_method => "post"
      codec => "json"
      content_type => "application/json"
      id => "offload_http"
    }
  }
}
```

Offload to different locations based on catalog name:

```
offload:
  enabled: true
  output: |
    if [catalog_name] == "offload1" {
      http {
        url => "http://offloadhost.example.com /offload1"
        http_method => "post"
        codec => "json"
        content_type => "application/json"
        id => "offload1_http"
      }
    }
    else if [catalog_name] == "offload2" {
      http {
        url => "http://offloadhost2.example.com /offload2"
        http_method => "post"
        codec => "json"
        content_type => "application/json"
        id => "offload2_http"
      }
    }
  }
}
```

Use the catalog name as a variable in the offload location:

```
offload:
  enabled: true
  http {
    url => "http://offloadhost.example.com /%{[catalog_name]}"
    http_method => "post"
    codec => "json"
    content_type => "application/json"
    id => "offload_http"
  }
}
```

Do not offload events from `apic` and `sandbox` catalogs:

```
offload:
  enabled: true
  if [catalog_name] !~ /sandbox|apic/ {
    http {
      url => "http://offloadhost.example.com /%{[catalog_name]}"
      http_method => "post"
      codec => "json"
      content_type => "application/json"
      id => "offload_http"
    }
  }
}
```

Do not store events from `apic` and `sandbox` catalogs:

```
ingestion:
  filter: |
    if [catalog_name] =~ /sandbox|apic/ {
      drop { }
    }
}
```

Filter and output plugin for splunk

When you create a filter for use with splunk, you must also create an output plugin for it.

Filter:

```
if "apicapievent" in [tags] {
  ruby {
    code => "event.set('@metadata[newevent]', event.to_json)"
  }
}
```

Output plugin:

```
http {
  url => "http://your-domain/services/collector/event"
  http_method => "post"
  codec => "json"
  content_type => "application/json"
  id => "offload http"
  format => "message"
  message => '{"event": "%{[@metadata][newevent]}", "index": "applications-int-ms", "sourcetype": "json:apimlogs"}'
  headers => ["Authorization", "Splunk XXXX"]
}
```

Reference: Fields in the Analytics CR

Use the table of Analytics-specific fields to configure the CR for installing your IBM® API Connect Analytics subsystem.

The two fields that must be in Analytics CR are `ingestion.endpoint` and `ingestion.clientSubjectDN`. The other fields are optional depending on the analytics features you want to configure.

Table 1. Configurable settings in the Analytics subsystem CR.

Field	Type	Default value	Description	Comments
<code>allowUpgrade</code>	Boolean	no	Set to true to allow analytics upgrade to v10.0 5.	See Additional considerations upgrading to analytics v10.0.5 - Kubernetes , Additional considerations upgrading to analytics v10.0.5 - OpenShift .
<code>databaseBackup.up.host</code>	String		The URL to your S3 storage.	See Configuring backup settings for Analytics , Configuring backup settings for Analytics on OpenShift and Cloud Pak for Integration .
<code>databaseBackup.up.path</code>	String		The path to your S3 storage at the URL specified by <code>databaseBackup.host</code> .	See Configuring backup settings for Analytics , Configuring backup settings for Analytics on OpenShift and Cloud Pak for Integration .
<code>databaseBackup.up.schedule</code>	String		Specifies the frequency of automatic backups. Use any valid <code>cron</code> string.	See Configuring backup settings for Analytics , Configuring backup settings for Analytics on OpenShift and Cloud Pak for Integration .
<code>databaseBackup.up.enableCompression</code>	Boolean	true	Specifies whether to compress the backups.	See Configuring backup settings for Analytics , Configuring backup settings for Analytics on OpenShift and Cloud Pak for Integration .
<code>databaseBackup.up.credentials</code>	String		The name of your S3 storage authentication secret.	See Configuring backup settings for Analytics , Configuring backup settings for Analytics on OpenShift and Cloud Pak for Integration .
<code>databaseBackup.up.chunkSize</code>	String	1Gi		See Configuring backup settings for Analytics , Configuring backup settings for Analytics on OpenShift and Cloud Pak for Integration .
<code>databaseBackup.up.enableServerSideEncryption</code>	Boolean			See Configuring backup settings for Analytics , Configuring backup settings for Analytics on OpenShift and Cloud Pak for Integration .
<code>external.offload.filter</code>	String		Filter configuration for external offload.	See Offloading data to a third-party system - Kubernetes , Offloading data to a third-party system - OpenShift .
<code>external.offload.enabled</code>	Boolean	false	Enables analytics offload feature.	See Offloading data to a third-party system - Kubernetes , Offloading data to a third-party system - OpenShift .
<code>external.offload.output</code>	String		Output configuration for external offload.	See Offloading data to a third-party system - Kubernetes , Offloading data to a third-party system - OpenShift .

Field	Type	Default value	Description	Comments
<code>external: offload: passwordSecretName</code>	String		The name of the secret that has the password to access the certificate keystore.	For where you are using a password protected key/truststore. See Offloading data to a third-party system - Kubernetes , Offloading data to a third-party system - OpenShift .
<code>external: offload: secretName</code>	String		The name of the secret that contains the certificates used for connecting to the offload target.	See Offloading data to a third-party system - Kubernetes , Offloading data to a third-party system - OpenShift .
<code>ingestion: endpoint</code>	Object		FQDN and TLS Secrets for client endpoint.	Identifies the endpoint that enables the Gateway to push your analytics data.
<code>ingestion: clientSubjectDN</code>	String		Subject DN (distinguished name) for authenticating with ingestion endpoint (RFC 2253).	
<code>ingestion: filter</code>	String		Filter to modify API event data that is stored internally (not offloaded).	See Configuring ingestion filters on Kubernetes Configuring ingestion filters on OpenShift .
<code>ingestion: queue</code>	Object		Persistent queue settings. Must be set to persisted if present.	See Configuring persistent queue on Kubernetes , Configuring persistent queue on OpenShift .
<code>ingestion: queue: type</code>	String		Defines the storage type for the persistent storage feature. Options are 'persisted' or 'memory'	See Configuring persistent queue on Kubernetes , Configuring persistent queue on OpenShift .
<code>ingestion: queue: volumeClaimTemplate: volumeSize</code>	String		Storage size for your persistent queue.	See Configuring persistent queue on Kubernetes , Configuring persistent queue on OpenShift .
<code>ingestion: queue: volumeClaimTemplate: storageClassName</code>	String		Storage class name for your persistent storage.	See Configuring persistent queue on Kubernetes , Configuring persistent queue on OpenShift .
<code>ingestion: pipelineWorkers</code>	4 <= integer <= 128	24	Number of pipeline workers.	More workers mean more CPU and memory requirements, but gives you the benefit of extra threads to pull data off the ingestion http interface and process it for storage. This has diminishing returns as the size increases, and should usually be multiple of the number of cores on your hardware. Adjust with caution.
<code>ingestion: pipelineBatchSize</code>	10 <= integer <= 10000	250	Batch size of a pipeline worker.	Pulling more or less data off the http interface per worker can have benefits. Recommended values are 125, 250, and 500. Increasing the value requires more memory.
<code>ingestion: pipelineBatchDelay</code>	10 <= integer <= 5000	50	Batch delay of a pipeline worker.	How long to wait for the batch size to fill before leaving the http interface to process for storage. Having threads wait too long causes idle threads in your system; however, setting this value too low decreases performance. Adjust with caution.
<code>ingestion: configReloadAutomatic</code>	Boolean	true	Whether to automatically reload the pipeline on configuration changes.	Typically, when the underlying files for the pipeline are modified, the pipeline process automatically reloads and picks up the changes. However, in Kubernetes environments where the pipeline is mapped to configmaps, this is unreliable. Ingestion microservice restarts are usually required.
<code>ingestion: pipelineUnsafeShutdown</code>	Boolean	false	Whether to allow unsafe shutdown of the pipeline.	Typically, the pipeline attempts to empty all workers' batches before shutdown to prevent data loss. You might need to enable this setting if the pipeline is badly configured and refuses to respond to shut down requests (uncommon). Adjust with caution.
<code>standaloneCluster</code>	Boolean			
<code>storage: type</code>	String	shared	Type of storage deployment.	Shared is the only available option.
<code>storage: shared: volumeClaimTemplate: storageClassName</code>	String	cluster default	Storage class name.	Name of the storage class configured to use for creating the microservice persistent volume.
<code>storage: shared: volumeClaimTemplate: volumeSize</code>	String	50Gi	Volume size.	Size of the volume used for data storage. See Estimating internal storage space for more information.

Installing analytics

Deploy the analytics CR to install the analytics subsystem in your IBM® API Connect deployment.

Before you begin

Now that you have a complete analytics custom resource file, you should double-check it for accuracy. In particular, verify that:

- No placeholder values remain in the analytics_cr.yaml file.
- You configured all the topology options that you plan to deploy.
- You configured appropriate volume size for storage.

Procedure

1. Run the following command to apply the analytics_cr.yaml:

```
kubectl apply -f path/to/analytics-cr -n namespace
```

where:

- `path/to/analytics-cr` is the path to your saved analytics_cr.yaml file
- `namespace` is the name of your namespace

2. Verify that the analytics subsystem is fully installed by running the following command:

```
kubectl get AnalyticsCluster -n namespace
```

where `namespace` is the name of your namespace.

The installation is complete when the **READY** status is **True** and the **SUMMARY** reports that all services are online. Example:

NAME	READY	SUMMARY	VERSION	RECONCILED	VERSION	AGE
analytics	True	5/5	<version>	<version-build>		7m39s

The **SUMMARY** total count is based on your configured topology. Both numbers are be equal when the installation is complete.

Results

Table 1 lists the number of microservices that should deploy, along with notes on which topologies might not include each microservice.

Table 1. Number of microservices deployed in typical Analytics subsystems

Expected	Microservice	Note
3	director	Always expected
3	ingestion	Always expected
3	mtls-gw	Always expected
3	storage	Not expected if you disabled internal storage
3	storage-os-master	Not expected if you disabled internal storage. Not expected if using shared storage.
3	osinit	Expected to be in Completed state

The one replica profile only expects 1 (instead of 3) of each microservice.

Installing a two data center deployment on Kubernetes

Additional installation instructions for a two data center disaster recovery (2DCDR) deployment on Kubernetes.

Before you begin

Ensure that you understand the concepts of 2DCDR in API Connect. For more information, see [Two data center deployment strategy on Kubernetes and OpenShift](#).

Download the operator files and custom resource definitions for use during installation onto both of your data centers. Ensure that you complete the instructions for [Deploying operators and cert-manager](#), and set the same ingress-ca certificate in both data centers: [Installing cert-manager and certificates in a two data center deployment](#).

Familiarize yourself with the instructions in [Installing the API Connect subsystems](#). Follow these instructions along with the 2DCDR specific steps in this topic.

Important: Each data center must use a different backup path for your Management backups. For portal backups each data center must use the same backup path. For more information, see [Backup and restore requirements for a two data center deployment](#).

Restrictions:

- API Connect is not supported on a FIPS-enabled environment.
- It is not possible to use the Automated API behavior testing application ([Installing the Automated API behavior testing application](#)) in a 2DCDR configuration ([Two data center deployment strategy on Kubernetes and OpenShift](#)).

The following endpoints must be the same on both data centers:

Management subsystem endpoints

- `cloudManagerEndpoint`

- `apiManagerEndpoint`
- `platformAPIEndpoint`
- `consumerAPIEndpoint`

Portal subsystem endpoints

- `portalAdminEndpoint`
- `portalUIEndpoint`

For more information about how to set the endpoints, see [Installing the Management subsystem cluster](#) on Kubernetes, [Installing the Developer Portal subsystem](#) on Kubernetes.

About this task

A 2DCDR deployment differs from a standard API Connect deployment in that the custom resources (CRs) for both the management and portal in each data center include a `multiSiteHA` configuration section. The `multiSiteHA` section is used to define which data center is the active and which is the warm-standby.

The following examples show `multiSiteHA` sections in the `PortalCluster` CRs for the active and warm-standby data centers.

<pre>siteName: dallas multiSiteHA: mode: active replicationEndpoint: annotations: cert-manager.io/issuer: ingress-issuer hosts: - name: ptlreplicationdallas.cluster1.example.com secretName: dallas-ptl-replication-worker-1 replicationPeerFQDN: ptlreplicationraleigh.cluster2.example.com tlsClient: secretName: ptl-replication-client ... </pre>	<pre>siteName: raleigh multiSiteHA: mode: passive replicationEndpoint: annotations: cert-manager.io/issuer: ingress-issuer hosts: - name: ptlreplicationraleigh.cluster2.example.com secretName: raleigh-ptl-replication-worker-1 replicationPeerFQDN: ptlreplicationdallas.cluster1.example.com tlsClient: secretName: ptl-replication-client ... </pre>
--	---

Table 1. `multiSiteHA` configuration properties

Configuration property	Description
<code>mode</code>	The state of the data center in the context of the 2DCDR deployment. Valid values are: <ul style="list-style-type: none"> • <code>active</code> - indicates the active data center. • <code>passive</code> - indicates the warm-standby data center.
<code>replicationEndpoint</code> <code>annotations:</code> <code>cert-manager.io/issuer:</code> <code>ingress-issuer</code> <code>hosts:</code> <code>- name:</code> <code>secretName:</code>	Contains details of the external ingress name for the subsystem in the current data center in the 2DCDR deployment. The <code>hosts name</code> is a unique fully qualified hostname that the other data center uses to communicate with the current data center.
<code>replicationPeerFQDN</code>	The ingress hostname for the other data center in the 2DCDR deployment. This information is required so that the two data centers can communicate with each other.
<code>tlsClient:</code> <code>secretName</code>	The TLS client secret for the subsystem.

The `siteName` property is a unique descriptive name for the portal and management subsystems, in each data center. For example, `dallas` in data center 1 (DC1), and `raleigh` in data center 2 (DC2).

- Set a different `siteName` on the active to the one set on the warm-standby data center.
- `siteName` is used in the hostnames, and so can contain only `a-z` and `0-9` characters.
- You can set a `siteName` in the `ManagementCluster` or `PortalCluster` CRs only on installation. You cannot change the name after deployment. If you don't set a `siteName` at first deployment, an automated `siteName` is created for you.

To install a 2DCDR deployment:

1. Set the placeholder properties in the CR file for management and portal subsystems as detailed in [Installing the API Connect subsystems](#), but do not run the final `kubectl apply` operation. Complete the additional 2DCDR configuration steps before you run `kubectl apply`.
2. Set the properties in the `multiSiteHA` section, and synchronize encryption secrets between the data centers as described in the procedure below:

Procedure

• Installing to an active data center

The following example shows how to set the multi-site HA CR values for deploying to the active data center. In this example, the initial active data center is called `dallas` (DC1) and the warm-standby data center is called `raleigh` (DC2).

1. Set Dallas to be active for the API Manager service on DC1.

Edit the `ManagementCluster` CR file `management_cr` for DC1, and set the `multiSiteHA` properties as shown:

```
siteName: dallas
multiSiteHA:
  mode: active
  replicationEndpoint:
    annotations:
      cert-manager.io/issuer: ingress-issuer
  hosts:
    - name: mgrreplicationdallas.cluster1.example.com
      secretName: dcl-mgmt-replication
  replicationPeerFQDN: mgrreplicationraleigh.cluster2.example.com

```

```

tlsClient:
  secretName: dcl-mgmt-replication-client

```

- Set Dallas to be active for the Developer Portal service on DC1.
Edit the `PortalCluster` CR file `portal_cr` for DC1, and set the `multiSiteHA` properties as shown:

```

multiSiteHA:
  mode: active
  replicationEndpoint:
    annotations:
      cert-manager.io/issuer: ingress-issuer
    hosts:
      - name: ptlreplicationdallas.cluster1.example.com
        secretName: dallas-ptl-replication-worker-1
      replicationPeerFQDN: ptlreplicationraleigh.cluster2.example.com
    tlsClient:
      secretName: ptl-replication-client
  ...
siteName: dallas

```

- Create a secret called `ptl-encryption-key` on the active and warm-standby data centers.
The secret must use the same random string in both data centers. Run the following command:

```
kubectl create secret generic ptl-encryption-key --from-literal=encryption_secret=<RANDOM STRING> -n <namespace>
```

The string can consist of uppercase letters, lowercase letters, and numbers, and must be at least 64 characters and no more than 100 characters.

- When the secrets are created on both DC1 and DC2, update the portal CR on DC1 and DC2 and add the following under the `spec` section:

```

encryptionSecret:
  secretName: ptl-encryption-key

```

Warning: Ensure that you add the secret directly under the `spec` section and not inside the `multiSiteHA` section.

- Create a secret called `mgmt-encryption-key` on the active and warm-standby data centers.
The secret must use the same random string in both data centers. Run the following command:

Note: Do not use the same random string that you used to create the secret for `ptl-encryption-key`.

```
kubectl create secret generic mgmt-encryption-key --from-literal=encryption_secret.bin=<RANDOM STRING> -n <namespace>
```

The string can consist of uppercase letters, lowercase letters, and numbers, and must be at least 64 characters and no more than 100 characters.

- When the secrets are created on both DC1 and DC2, update the portal CR on DC1 and DC2 and add the following under the `spec` section:

```

encryptionSecret:
  secretName: mgmt-encryption-key

```

Warning: Ensure that you add the secret directly under the `spec` section and not inside the `multiSiteHA` section.

- Apply the CR files to the subsystems in DC1.

For example, to apply the `ManagementCluster` CR file to the DC1 cluster, run the following command:

```
kubectl apply -f management_cr.yaml -n <namespace>
```

Where `<namespace>` is the target installation namespace in the Kubernetes cluster for DC1. Repeat this process to apply the updated `PortalCluster` CR file to DC1.

You can verify that the installation process is running with the following command:

```
kubectl get ManagementCluster -n <namespace>
```

Change `ManagementCluster` to `PortalCluster` to verify the Developer Portal installation. For more information, see [Installing the API Connect subsystems](#).

- Set your dynamic router to direct all traffic to DC1. The endpoints that must be directed to DC1 are:

Management subsystem endpoints

- `cloudManagerEndpoint`
- `apiManagerEndpoint`
- `platformAPIEndpoint`
- `consumerAPIEndpoint`

Portal subsystem endpoints

- `portalAdminEndpoint`
- `portalUIEndpoint`

• Installing the warm-standby data center

The following example shows how to set the multi-site HA CR values for the remote data center called `raleigh` (DC2) to be the warm-standby. Use the same encryption key on both sites.

Ensure that the installation of the active data center is complete before you start the installation of the warm-standby data center.

- Set Raleigh to be warm-standby for the API Manager service on DC2.
Edit the `ManagementCluster` CR file `management_cr` for DC2, and set the `multiSiteHA` properties as shown:

```

multiSiteHA:
  mode: passive
  replicationEndpoint:
    annotations:
      cert-manager.io/issuer: ingress-issuer
    hosts:
      - name: mgrreplicationraleigh.cluster2.example.com
        secretName: raleigh-mgr-replication-worker-1
      replicationPeerFQDN: mgrreplicationdallas.cluster1.example.com
    tlsClient:
      secretName: mgr-replication-client

```

```
...
siteName: raleigh
```

2. Set Raleigh to be warm-standby for the Developer Portal service on DC2. Edit the `PortalCluster` CR file `portal_cr` for DC2, and set the `multiSiteHA` properties as shown:

```
multiSiteHA:
  mode: passive
  replicationEndpoint:
    annotations:
      cert-manager.io/issuer: ingress-issuer
    hosts:
      - name: ptlreplicationraleigh.cluster2.example.com
        secretName: raleigh-ptl-replication-worker-1
  replicationPeerFQDN: ptlreplicationdallas.cluster1.example.com
  tlsClient:
    secretName: ptl-replication-client
...
siteName: raleigh
```

3. Apply the CR files to the subsystems in DC2. For example, to apply the `ManagementCluster` CR file to the DC2 cluster, run the following command:

```
kubectl apply -f management_cr.yaml -n <namespace>
```

Where `<namespace>` is the target installation namespace in the Kubernetes cluster for DC2. Repeat this process to apply the updated `PortalCluster` CR file to DC2.

You can verify that the installation process is running with the following command:

```
kubectl get ManagementCluster -n <namespace>
```

Change `ManagementCluster` to `PortalCluster` to verify the Developer Portal installation. For more information, see [Installing the API Connect subsystems](#).

- **Validating your two data center deployment**

While the management subsystems on the warm-standby and active data centers are synchronizing their databases, the management status reports **Warning**, and the `haStatus` reports **pending**:

```
kubectl get mgmt -n <namespace>
```

NAME	READY	STATUS	VERSION	RECONCILED	VERSION	MESSAGE
management	n/n	Warning	10.0.5.3-0	10.0.5.3-0		Management is ready. HA Status Warning - see HAStatus in CR for details
AGE		8m59s				

```
status:
  haStatus:
    {
      "lastTransitionTime": "2023-03-31T19:47:08Z",
      "message": "Replication not working, install or upgrade in progress.",
      "reason": "na",
      "status": "True",
      "type": "Pending"
    }
}
```

When the management database replication between sites is complete, the management status reports **Running**, and `status.haStatus` reports **Ready**:

NAME	READY	STATUS	VERSION	RECONCILED	VERSION	MESSAGE
management	n/n	Running	10.0.5.3-0	10.0.5.3-0		Management is ready.
AGE						8m59s

```
status:
  haStatus:
    {
      "lastTransitionTime": "2023-03-31T19:47:08Z",
      "message": "Replication is working",
      "reason": "na",
      "status": "True",
      "type": "Ready"
    }
}
```

If the management database replication between sites fails for any reason other than because an install or upgrade is in progress, the `haStatus` output shows:

NAME	READY	STATUS	VERSION	RECONCILED	VERSION	MESSAGE
management	n/n	Warning	10.0.5.3-0	10.0.5.3-0		Management is ready. HA Status Warning - see HAStatus in CR for details
AGE		8m59s				

```
status:
  haStatus:
    {
      "lastTransitionTime": "2023-03-31T19:47:08Z",
      "message": "Replication not working",
      "reason": "na",
      "status": "True",
      "type": "Warning"
    }
}
```

If the warning persists, see [Troubleshooting a two data center deployment](#).

You can validate that your portal deployments are synchronizing by running `kubectl get pods` on both the active and warm-standby data centers, and confirming that the number and names of the pods all match (the UUIDs in the names might be different on each site), and that all are in the **Ready** state.

For additional replication verification checks, see [Verifying replication between data centers](#). It is recommended to run a test failover, and confirm that all of the expected data is present and correct on the newly active site. See [How to failover API Connect from the active to the warm-standby data center](#) for details.

Converting a single data center to a two data center deployment on Kubernetes

Instructions on how to convert a single data center to a two data center disaster recovery (2DCDR) deployment on Kubernetes.

Before you begin

Ensure that you understand the concepts of 2DCDR in API Connect. For more information, see [Two data center deployment strategy on Kubernetes and OpenShift](#).

Download the operator files and custom resource definitions for use during installation onto both of your data centers. Ensure that you complete the instructions for [Deploying operators and cert-manager](#), and set the same ingress-ca certificate in both data centers: [Installing cert-manager and certificates in a two data center deployment](#).

Familiarize yourself with the instructions in [Installing the API Connect subsystems](#). Follow these instructions along with the 2DCDR specific steps in this topic.

Important: Each data center must use a different backup path for your Management backups. For portal backups each data center must use the same backup path. For more information, see [Backup and restore requirements for a two data center deployment](#).

Restrictions:

- API Connect is not supported on a FIPS-enabled environment.
- It is not possible to use the Automated API behavior testing application ([Installing the Automated API behavior testing application](#)) in a 2DCDR configuration ([Two data center deployment strategy on Kubernetes and OpenShift](#)).

About this task

You can convert a single data center API Connect to a two data center disaster recovery deployment. Both data centers must have the same `portal-admin` and `portal-ww` endpoints. The main difference is that the custom resource (CR) files for both the Management subsystem and the Developer Portal subsystem on each data center must include a `multiSiteHA` configuration section, and it's this section that determines the two data center DR deployment. It's also this section that's used to control the deployment in the future, for example in failover and recovery situations.

The following codeblocks show examples of completed `multiSiteHA` sections in the `PortalCluster` CR files for two data centers, one active and one warm-standby. Both the `ManagementCluster` and the `PortalCluster` CR templates have a `multiSiteHA` section containing the placeholder `$MULTI_SITE_HA`, and it is this placeholder that must be replaced with the values for your deployment.

<pre>siteName: dallas multiSiteHA: mode: active replicationEndpoint: annotations: cert-manager.io/issuer: ingress-issuer hosts: - name: ptlreplicationdallas.cluster1.example.com secretName: dallas-ptl-replication-worker-1 replicationPeerFQDN: ptlreplicationraleigh.cluster2.example.com tlsClient: secretName: ptl-replication-client ...</pre>	<pre>siteName: raleigh multiSiteHA: mode: passive replicationEndpoint: annotations: cert-manager.io/issuer: ingress-issuer hosts: - name: ptlreplicationraleigh.cluster2.example.com secretName: raleigh-ptl-replication-worker-1 replicationPeerFQDN: ptlreplicationdallas.cluster1.example.com tlsClient: secretName: ptl-replication-client ...</pre>
---	--

The configuration properties are described in the following table.

Table 1. The configuration properties of the multi-site HA section in the CR file

Configuration property	Description
<code>mode</code>	The state of the data center in the context of the two data center deployment. Valid values are: <ul style="list-style-type: none"> • <code>active</code> - indicates the primary data center • <code>passive</code> - indicates the warm-standby data center

Configuration property	Description
<code>replicationEndpoint</code> <code>annotations:</code> <code>cert-manager.io/issuer</code> <code>hosts:</code> <code>- name:</code> <code>secretName:</code>	Contains details of the external ingress name for the subsystem in the current data center in the two data center deployment. The hosts <code>name</code> is a unique fully qualified hostname that the other data center uses to communicate with the current data center.
<code>replicationPeerFQDN</code>	The ingress hostname for the other data center in the two data center deployment. This information is required so that the two data centers can communicate with each other.
<code>tlsClientSecretName</code>	The TLS client secret for the subsystem.
<code>siteName</code>	A descriptive name for the Portal subsystem, and the Management subsystem, in the current data center, for example <code>dallas</code> . This name is used in the hostnames, and so can contain only <code>a-z</code> and <code>0-9</code> characters. Note that you can set a <code>siteName</code> in the <code>ManagementCluster</code> or <code>PortalCluster</code> CR only when the subsystems are first deployed, and you cannot change the name after deployment. If you don't set a <code>siteName</code> at first deployment, an automated <code>siteName</code> is created for you. For example, if you are converting an existing single Management cluster to a two data center Management cluster by adding the multi-site HA values, you will not be able to configure a <code>siteName</code> for the existing Management cluster.

To install a two data center disaster recovery deployment, you must set all of the placeholder properties in the CR file for both the Management and the Developer Portal subsystems as detailed in the relevant topics in the [Installing the API Connect subsystems](#) section, as well as the properties in the multi-site HA section that are detailed here. Some examples of complete CR files are shown in the [Example](#) section.

Procedure

- **Converting a single data center deployment to two data centers**

When converting a single data center deployment into a two data center deployment, it is best practice to use the existing data center as the active one, and add a new warm-standby data center elsewhere. This practice ensures that the data is retained.

Remember:

- Both data centers must have the same `portal-admin` and `portal-www` endpoints.
- You cannot configure a `siteName` for the existing Management or Portal cluster because the `siteName` property can be configured only at first deployment.

The following example shows how to update the multi-site HA CR values for making the local data center called `dallas` (DC1) active, and for setting the new remote data center called `raleigh` (DC2) as warm-standby.

- **Install a cert-manager.**

Use of a certificate manager adds convenience to the generation and management of certificate, but is not required. Whenever a custom resource (CR) takes a certificate secret name as input, you can point to any secret name, on condition that the secret exists before you deploy the CR, and that the secret contains relevant certificate data. Typically, this is `tls.crt`, `tls.key`, and `ca.crt` files. See [Certificates in a Kubernetes environment](#).

Note: Run these steps on DC1 only if you don't already have cert-manager running.

1. Obtain the certificate manager.

API Connect v10 uses cert-manager v1.12.7 of cert-manager, which is a native [Kubernetes](#) certificate management controller.

You can obtain cert-manager v1.12.7 from the API Connect v10 distribution `helper_files.zip` archive, or from <https://github.com/cert-manager/cert-manager/releases/tag/v1.12.7>.

Note: Cert-manager is bundled as a common service in IBM CloudPack for Integration.

2. Apply the CR:

```
kubectl apply -f cert-manager-1.12.7.yaml
```

Do not specify a custom namespace.

See <https://docs.cert-manager.io/en/release-0.10/getting-started/install/kubernetes.html>.

3. Wait for `cert-manager` pods to enter `Running 1/1` status before proceeding. To check the status:

```
kubectl get po -n cert-manager
```

There are 3 `cert-manager` pods in total.

- Use the following steps to allow `ingress-ca` secrets to be the same on both data centers.

1. On DC1 apply the file `ingress-issuer-v1-dc1.yaml`:

```
kubectl -n <namespace> apply -f ingress-issuer-v1-dc1.yaml
```

2. Validate that the command succeeded:

```
kubectl get certificates -n <namespace>
```

3. Export `ingress-ca` secret as a yaml from DC1:

```
kubectl -n <namespace> get secret ingress-ca -o yaml > ingress-ca.yaml
```

4. Edit the `ingress-ca.yaml` file to remove all labels, annotations, `creationTimestamp`, `resourceVersion`, `uid`, and `selfLink`.

5. Copy the `ingress-ca.yaml` from DC1 to DC2 and apply that file on DC2:

```
kubectl -n <namespace> apply -f ingress-ca.yaml
```

6. On DC2 apply the file `ingress-issuer-v1-dc2.yaml`:

```
kubectl -n <namespace> apply -f ingress-issuer-v1-dc2.yaml
```

7. Use the following commands to test that they are the same, on DC1 run:

```
kubectl -n <namespace> get secrets ingress-ca -o yaml | grep tls.crt | awk '{print $2}' | base64 -d > /tmp/ingress.pem.dc1
```

8. On DC2 run:

```
kubectl -n <namespace> get secrets ingress-ca -o yaml | grep tls.crt | awk '{print $2}' | base64 -d > /tmp/ingress.pem.dc2
```

9. To see the differences run:

```
diff /tmp/ingress.pem.dc1 /tmp/ingress.pem.dc2
```

The files should be the same.

10. To ensure that the certificates are working correctly and that they are using the `ingress-ca` secret. First, get the `portal-admin-client` crt file:

```
kubectl -n <namespace> get secrets portal-admin-client -o yaml | grep tls.crt | awk '{print $2}' | base64 -d > /tmp/admin-client.crt
```

11. Test that it is working by using OpenSSL:

```
openssl verify -verbose -CAfile /tmp/ingress.pem.dc1 /tmp/admin-client.crt
```

If it is working, you should see:

```
/tmp/admin-client.crt: OK
```

- **Installing to an active data center**

The following example shows how to set the multi-site HA CR values for deploying to an active data center (DC). In this instance, we are deploying to a local data center called `dallas` (DC1) that has a remote data center called `raleigh` (DC2).

1. Set Dallas to be active for the API Manager service on DC1.

As the API Manager service already exists, you cannot set the `siteName` property. Add the multi-site HA section properties to the existing `ManagementCluster` CR file for DC1. For example:

```
multiSiteHA:
  mode: active
  replicationEndpoint:
    annotations:
      cert-manager.io/issuer: ingress-issuer
    hosts:
      - name: mgrreplicationdallas.cluster1.example.com
        secretName: dc1-mgmt-replication
  replicationPeerFQDN: mgrreplicationraleigh.cluster2.example.com
  tlsClient:
    secretName: dc1-mgmt-replication-client
```

2. Set Dallas to be active for the Developer Portal service on DC1.

As the Developer Portal service already exists, you cannot set the `siteName` property. Add the multi-site HA section properties to the existing `PortalCluster` CR file for DC1. For example:

```
multiSiteHA:
  mode: active
  replicationEndpoint:
    annotations:
      cert-manage.io/issuer: ingress-issuer
    hosts:
      - name: ptlreplicationdallas.cluster1.example.com
        secretName: dallas-ptl-replication-worker-1
  replicationPeerFQDN: ptlreplicationraleigh.cluster2.example.com
  tlsClient:
    secretName: ptl-replication-client
```

3. Create a secret called `ptl-encryption-key` on the active and warm-standby data centers.

You must create a secret on the active and warm-standby sites that use the same random string, run the following command:

```
kubectl create secret generic ptl-encryption-key --from-literal=encryption_secret=<RANDOM STRING> -n <namespace>
```

The string can consist of uppercase letters, lowercase letters, and numbers, and must be at least 64 characters and no more than 100 characters.

4. When the secrets are created on both DC1 and DC2, update the Portal CR on DC1 and DC2 to include in the `spec` object:

```
encryptionSecret:
  secretName: ptl-encryption-key
```

Warning: Ensure that you add the secret to the `spec` object and not to the `multiSiteHA` object.

5. Apply the CR files to the subsystems in DC1.

For example, to apply the `ManagementCluster` CR file to the DC1 cluster, run the following command:

```
kubectl apply -f management_cr.yaml -n <namespace>
```

Where `<namespace>` is the target installation namespace in the Kubernetes cluster for DC1. Repeat this process to apply the updated `PortalCluster` CR file to DC1.

You can verify that the updated CR files have been applied by running the following command:

```
kubectl get ManagementCluster -n <namespace>
```

Change `ManagementCluster` to `PortalCluster` to verify the Developer Portal installation. For more information, see [Installing the API Connect subsystems](#).

6. Set your dynamic router to direct all traffic to DC1.

This includes setting the four endpoints for the API Manager cluster, and the two endpoints for the Developer Portal cluster.

- **Installing to a warm-standby data center**

The following example shows how to set the multi-site HA CR values for the remote data center called **raleigh** (DC2), which is being installed as the warm-standby, standby location. You must use the same encryption key on both sites.

1. Get the encryption key from Dallas the **active** (DC1) site:
 - a. Run the command `kubectl get mgmt -o yaml | grep enc` to get the db encryption key on the **active** site, for example:

```
$ kubectl -n <namespace> get mgmt -o yaml | grep enc
```

An example of possible output:

```
encryptionSecret: dallas-enc-key
```

Make a note of the secret name. In this case, it's **dallas-enc-key**.

- b. Run `kubectl get secret dallas-enc-key -o yaml`, an example of possible output:

```
apiVersion: v1
data:
  encryption_secret.bin:
VKBNFj7sAOizxvE1H6i+9P31oJHvWwsO+x*****EGe/K+x6b3D7FEWGgoyG1WBUJKB4+T21My2iR5rBTov
pyLiY5g*****tSiRcQKegMPNBPg1829SVBCxuv3I=
kind: Secret
metadata:
  creationTimestamp: "2020-08-28T12:53:41Z"
  labels:
    app.kubernetes.io/instance: m1
    app.kubernetes.io/managed-by: ibm-apiconnect
    app.kubernetes.io/name: dallas-enc-key
  name: dallas-enc-key
  namespace: default
  resourceVersion: "43039"
  selfLink: /api/v1/namespaces/default/secrets/m1-enc-key
  uid: 46c92395-9cc2-4421-b2c4-48e472c0cbb1
type: Opaque
```

- c. Copy the output that you got and put it into a new file. Delete the contents of **metadata:** and add back in a **name:** attribute, in this case **dc1-enc-key**. An example of the format is here:

```
apiVersion: v1
data:
  encryption_secret.bin:
VKBNFj7sAOizxvE1H6i+9P31oJHvWwsO+x*****EGe/K+x6b3D7FEWGgoyG1WBUJKB4+T21My2iR5rBTov
pyLiY5g*****tSiRcQKegMPNBPg1829SVBCxuv3I=
kind: Secret
metadata:
  name: dc1-enc-key
type: Opaque
```

- d. Save the file. In this example, it's called **dc1-enc-key.yaml**.

2. On Raleigh the (DC2) site:
 - a. Copy the yaml file that you just saved that contains the **encryption_secret.bin** from Dallas the **active** (DC1) site.
 - b. Run `kubectl create -f dc1-enc-key.yaml` to create the same secret with the same key on the Raleigh (DC2) site. For example:

```
$ kubectl -n <namespace> create -f /tmp/dc1-enc-key.yaml
```

An example of possible output:

```
secret/dc1-enc-key created
```

- c. In the management CR for Raleigh the (DC2) site, add the following entry to the **spec**.

```
encryptionSecret:
  secretName: dc1-enc-key
```

3. Set Raleigh to be warm-standby for the API Manager service on DC2.

Edit the **ManagementCluster** CR file `management_cr` for DC2, and set the multi-site HA section properties, for example:

```
multiSiteHA:
  mode: passive
  replicationEndpoint:
  annotations:
    cert-manager.io/issuer: ingress-issuer
  hosts:
  - name: mgrreplicationraleigh.cluster2.example.com
    secretName: raleigh-mgr-replication-worker-1
  replicationPeerFQDN: mgrreplicationdallas.cluster1.example.com
  tlsClient:
    secretName: mgr-replication-client
  ...
siteName: raleigh
```

4. Set Raleigh to be warm-standby for the Developer Portal service on DC2.

Edit the **PortalCluster** CR file `portal_cr` for DC2, and set the multi-site HA section properties, for example:

```
multiSiteHA:
  mode: passive
  replicationEndpoint:
  annotations:
    cert-manage.io/issuer: ingress-issuer
  hosts:
  - name: ptlreplicationraleigh.cluster2.example.com
    secretName: raleigh-ptl-replication-worker-1
  replicationPeerFQDN: ptlreplicationdallas.cluster1.example.com
  tlsClient:
    secretName: ptl-replication-client
```

```
...
siteName: raleigh
```

5. Ensure that you completed the steps that are in the **Installing to an active data center** section to create a secret called `pt1-encryption-key` on DC1 and DC2, and to update the Portal CR on DC1 and DC2 to include the `pt1-encryption-key` in the `spec` object.
6. Apply the CR files to the subsystems in DC2.

For example, to apply the `ManagementCluster` CR file to the DC2 cluster, run the following command:

```
kubectl apply -f management_cr.yaml -n <namespace>
```

Where `<namespace>` is the target installation namespace in the Kubernetes cluster for DC2. Repeat this process to apply the updated `PortalCluster` CR file to DC2.

You can verify that the updated CR files are applied by running the following command:

```
kubectl get ManagementCluster -n <namespace>
```

Change `ManagementCluster` to `PortalCluster` to verify the Developer Portal installation. For more information, see [Installing the API Connect subsystems](#).

Deploying on OpenShift and Cloud Pak for Integration

You can install API Connect in an OpenShift environment or as the API Management capability in IBM Cloud Pak for Integration.

If you are deploying multiple API Connect instances in the same OpenShift cluster, all of them should be at the same version. The recommended configuration is to have a single operator in the global namespace, managing multiple API Connect instances in separate namespaces.

- [Preparing for installation](#)
Set up your OpenShift environment in preparation for deploying API Connect.
- [Installation procedures with IBM Cloud Pak for Integration](#)
The API Management capability of IBM Cloud Pak for Integration uses IBM API Connect.
- [Installing with the top-level CR on OpenShift](#)
Use the single, top-level `APIConnectCluster` CR to deploy API Connect on OpenShift.
- [Installing with subsystem CRs in a shared namespace on OpenShift](#)
Use the individual subsystem CRs to install API Connect subsystems in a shared namespace on OpenShift.
- [Installing with subsystem CRs in different namespaces or environments on OpenShift](#)
Install API Connect subsystems in different namespaces, for example Management subsystem in a namespace that is called `apicmgmt`, Gateway in a namespace called `apicgw`. These same steps can also be used for installing subsystems in different environments.
- [Installing a two data center deployment with Cloud Pak for Integration](#)
How to deploy a two data center disaster recovery (2DCDR) deployment on OpenShift with Cloud Pak for Integration.
- [Installing a two data center deployment on OpenShift](#)
How to deploy a two data center disaster recovery (2DCDR) deployment on OpenShift.
- [Troubleshooting installation on OpenShift](#)
Review the following troubleshooting tips if you encounter a problem while installing or upgrading API Connect on OpenShift, including as a component of IBM Cloud Pak for Integration (CP4I).

Preparing for installation

Set up your OpenShift environment in preparation for deploying API Connect.

About this task

Ensure that your environment meets all prerequisites, plan your deployment, and download files for installation.

Procedure

1. Ensure that your environment meets the following prerequisites:
 - [IBM API Connect Version 10 software product compatibility requirements](#)
Attention: API Connect is not supported on a FIPS-enabled environment.
 - [Deployment requirements](#)
 - If you want to use the OpenShift web console, Cluster admin access is required.
 - API Connect requires `block storage` as the storage class for all subsystems.

- Set the default SCC (security context constraint) to **restricted**. API Connect supports only the **restricted** SCC on OpenShift.
 - If your Openshift deployment uses a [LimitRange](#) and a CPU maxLimitRequestRatio is set, then its value must be at least 25; otherwise some API Connect pods might fail to start.
2. Plan your deployment as explained in [Planning your deployment](#).
 3. Review [Operator, operand, and CASE versions](#) to determine the operator, operand, and CASE versions that you need for your deployment.
 4. Optional: Specify additional settings in each subsystem CR to define the deployment's configuration before beginning the installation. In particular, consider increasing the timeout value for Management endpoints as explained in [Configuring timeouts for management endpoints](#).

For information on other configuration settings, see [API Connect configuration settings](#).

Tip: If you choose not to specify configuration settings now, you can modify the installation CRs later and then re-apply them to update the deployment.

- [Operator, operand, and CASE versions](#)
When you install API Connect on OpenShift, each release of API Connect supports a new combination of operator and operand, as well as a new CASE version for air-gapped installations.
- [API Connect configuration settings](#)
Specify configuration settings for API Connect in the CR, or the Platform UI in Cloud Pak for Integration.
- [Configuring timeouts for management endpoints](#)
Adjust the timeout settings for management endpoints by updating the CR.

Operator, operand, and CASE versions

When you install API Connect on OpenShift, each release of API Connect supports a new combination of operator and operand, as well as a new CASE version for air-gapped installations.

Table 1 lists the operator, operand, and CASE information that applies to each release of API Connect.

Table 1. Operators and operands for recent versions of API Connect

API Connect release	API Connect operator version (channel)	CASE version	DataPower operator version (channel)	Foundational services operator version (channel)
10.0.5.6	3.6.0 (v3.6)	4.0.7	1.6.12 (v1.6)	<ul style="list-style-type: none"> • 3.23 (v3.23) • 3.22 (v3.22) • 3.21 (v3.21) • 3.20 (v3.20) • 3.19 (v3)
10.0.5.5	3.5.0 (v3.5)	4.0.6	1.6.10 (v1.6)	<ul style="list-style-type: none"> • 3.23 (v3.23) • 3.22 (v3.22) • 3.21 (v3.21) • 3.20 (v3.20) • 3.19 (v3)
10.0.5.4	3.4.0 (v3.4)	4.0.5	1.6.8 (v1.6)	<ul style="list-style-type: none"> • 3.23 (v3.23) • 3.22 (v3.22) • 3.21 (v3.21) • 3.20 (v3.20) • 3.19 (v3)
10.0.5.3	3.3.0 (v3.3)	4.0.4	1.6.6 (v1.6)	<ul style="list-style-type: none"> • 3.23 (v3.23) • 3.22 (v3.22) • 3.21 (v3.21) • 3.20 (v3.20) • 3.19 (v3)
10.0.5.2	3.2.0 (v3.2)	4.0.2	1.6.3 (v1.6)	<ul style="list-style-type: none"> • 3.23 (v3.23) • 3.22 (v3.22) • 3.21 (v3.21) • 3.20 (v3.20) • 3.19 (v3)
10.0.5.1	3.1.0 (v3.1)	4.0.1	1.6.2 (v1.6)	3.19 (v3)
10.0.5.0	3.0.0 (v3.0)	4.0.0	1.6.0 (v1.6)	3.19 (v3)

API Connect configuration settings

Specify configuration settings for API Connect in the CR, or the Platform UI in Cloud Pak for Integration.

You can use the Platform UI on Cloud Pak for Integration, the OpenShift web console, or direct editing of the top-level or subsystem CR YAML files to specify advanced configuration options for API Connect. The following topics describe the available configuration options.

Attention: A mistake in a configuration update can result in an admission webhook error when **APIConnectCluster** is updated, or the **APIConnectCluster** can get stuck in a pending state with a webhook error message.

- Example of an admission webhook error when the **APIConnectCluster** update is rejected:

In this example, the user attempted to change the deployment profile to `n12xc4.m12-incorrect` and the result looked like the following example:

```
oc edit apiconnectcluster

error: apiconnectclusters.apiconnect.ibm.com "production" could not be patched: admission webhook
"vapiconnectcluster.kb.io" denied the request: APICoconnectCluster.apiconnect.ibm.com "production" is invalid: spec.Profile:
Invalid value: "n12xc4.m12-incorrect": invalid profile. Options are: [n3xc4.m16 n12xc4.m12]
```

- Example of when the `APICoconnectCluster` update is allowed, but is the state changes pending due to an underlying webhook error:

```
oc get apiconnectcluster -n apic

NAME      READY STATUS      VERSION      RECONCILED VERSION  AGE
m1        admission webhook "vmanagementcluster.kb.io" denied the request: ManagementCluster.management.apiconnect.ibm.com
"m1-mgmt" is invalid: [spec.databaseBackup.restartDB.accept: Invalid value: false: databaseBackup protocol has changed
(from '' to 'objstore') and requires database restart. accept restartDB to restart database,
spec.databaseBackup.restartDB.accept: Invalid value: false: databaseBackup configuration has changed and requires database
restart. accept restartDB to restart database] Pending 10.0.1.5-3388-eus 10.0.1.5-3388-eus 2d6h
```

Basic configuration

- [Basic configuration settings](#)

Advanced configuration

To enable access to the advanced configuration settings with Platform UI, toggle the Advanced Options slider.

- [Analytics subsystem settings](#)
- [Gateway subsystem settings](#)
- [Management subsystem settings](#)
- [Developer Portal subsystem settings](#)
- [Additional Kubernetes settings](#)

Additional configuration

You must edit the yaml file to set additional properties.

- [Basic configuration settings](#)
You can specify the API Connect basic configuration settings directly in the CR or with the Platform UI in Cloud Pak for Integration.
- [Management subsystem settings](#)
You can specify advanced configuration settings for the Management subsystem directly in the CR or with the Platform UI in Cloud Pak for Integration.
- [Gateway subsystem settings](#)
You can specify advanced configuration settings for the Gateway subsystem directly in the CR or with the Platform UI in Cloud Pak for Integration.
- [Developer Portal subsystem settings](#)
You can specify advanced configuration options for the Developer Portal subsystem directly in the CR or with the Platform UI in Cloud Pak for Integration.
- [Analytics subsystem settings](#)
Specify advanced configuration settings for the analytics subsystem directly in the analytics CR. If you are using Cloud Pak for Integration, you can configure many of the analytics setting in Platform UI.
- [Additional Kubernetes settings](#)
For each API Connect subsystem, you can specify additional settings for annotations and pod management.

Basic configuration settings

You can specify the API Connect basic configuration settings directly in the CR or with the Platform UI in Cloud Pak for Integration.

Review the tables for information on configuration settings for the following areas:

- [Details](#)
- [License](#)
- [Deployment profiles for installing with a single, top-level CR](#)
- [Product version](#)
- [Storage class](#)

Details

Table 1. Details

Field	Type	Required	Description
Name	String	Yes	Name this instance using only lowercase alphanumeric characters plus the underscore "-". Maximum of 54 characters. Default: none

License

Table 2. License

Field	Type	Required	Description
License acceptance	Boolean	Yes	The license agreement https://ibm.biz/apictoolkitlic must be accepted before you can install the API Connect capability. Default value: <code>false</code> (off). In the UI, click the License acceptance toggle to enable it. In the CR, set the <code>accept</code> : field to <code>true</code> to accept the license.
License use	String	Yes	Select <code>production</code> or <code>nonproduction</code> , to match the license you purchased. Default: <code>nonproduction</code>

Field	Type	Required	Description
License metric	Enumerated	No	Enter the unit of measure that is used for your program license: OpenShift <ul style="list-style-type: none"> PROCESSOR_VALUE_UNIT - Default value. If you leave the field blank, this value is used. MONTHLY_API_CALL - Applies only to the IBM API Connect Hybrid Entitlement program. Cloud Pak for Integration <ul style="list-style-type: none"> VIRTUAL_PROCESSOR_CORE - Default value. If you leave the field blank, this value is used. MONTHLY_API_CALL - Applies only to the IBM Cloud Pak for Integration - API Calls add-on program. For information on tracking monthly call volume, see Tracking API volume for auditing and compliance .
License ID	String	Yes	Select the license that you purchased for this instance of API Connect. Valid licenses are based on the selected value in the Product version field (see Table 4). When deploying the standalone IBM API Connect product, you must select the License ID for the API Connect program that you purchased. To view all License IDs, see API Connect licenses .

Deployment profiles for installing with a single, top-level CR

Select a deployment profile for the new installation. See [API Connect deployment profiles for OpenShift and Cloud Pak for Integration](#) for more information on the available profiles.

For information on switching to a different deployment profile after installation, see the following topics:

- [Changing the deployment profile on Cloud Pak for Integration](#)
- [Changing deployment profiles on OpenShift](#)

Product version

Table 3. Product version

Field	Type	Required	Description
Product version	Enumerated	No	Select the product version to be installed in the system. Warning: Do not select a channel here instead of the API Connect version. Selecting a channel will result in any API Connect interim fix updates being applied automatically and without warning.

Storage class

Table 4. Storage class

Field	Type	Required	Description
Default Storage Class	Enumerated	No	Specify the RWO block storage class to use for persistence storage. This will be used when creating a PVC. Specification of the storage class is optional, but is highly recommended. If not specified the default cluster storage class is used. See the IBM Cloud Pak documentation for guidance for Storage class selection. Go to the following page and select your Cloud Pak release level: https://www.ibm.com/support/knowledgecenter/SSGT7J . In the navigation panel, select System Requirements, > Storage. To review API Connect storage support, see Storage classes .

Management subsystem settings

You can specify advanced configuration settings for the Management subsystem directly in the CR or with the Platform UI in Cloud Pak for Integration.

The IBM Cloud Pak Platform UI enables you to specify settings for the following areas:

- [Database backup](#)
- [Database persistence](#)
- [Site name](#)
- [Test and Monitor](#)
- [Billing](#)

For annotations, labels, node selectors, and tolerations, see [Additional Kubernetes settings](#)

Note: Optionally, you might want to increase the timeout settings for management endpoints, particularly for large deployments. See [Configuring timeouts for management endpoints](#).

Database backup

Table 1. Database backup

Field	Type	Required	Description
-------	------	----------	-------------

Field	Type	Required	Description
Credentials	Drop down menu	No. Optional	<ul style="list-style-type: none"> For objstore type backups, the name of the Kubernetes secret containing your S3 Access Key / Key Secret For SFTP type backups, the name of the Kubernetes secret containing your SFTP Username/password <p>Default: (Generated Value)</p> <p>See Configuring backup settings for fresh install of the Management subsystem.</p>
Server hostname	String	No. Optional	<p>The backups host:</p> <ul style="list-style-type: none"> For objstore type backup, specify S3 endpoint with the corresponding S3 region in the format <S3endpoint>/<S3region>. For example: s3.eu-gb.cloud-object-storage.appdomain.cloud/eu-standard For sftp type, the SFTP server hostname. For example: 203.0.113.0 or example.com Not required for local storage backups <p>Default: none</p> <p>See Configuring backup settings for fresh install of the Management subsystem.</p>
Path	String	No. Optional	<p>The path to the location of the backup:</p> <ul style="list-style-type: none"> For objstore backups, the name of your S3 bucket to store backup data. For example, bucket-name/folder. The use of subdirectories in the bucket name is not supported. Ensure that bucket-name/folder is empty. If the folder was previously used for backups, the folder will not be empty, and stanza create might encounter an error. For sftp type, the folder name on the SFTP server. For example: mgmt_backup. Not required for local storage backups <p>Default: none</p> <p>See Configuring backup settings for fresh install of the Management subsystem.</p>
Server port	String	No. Optional	<p>Backup server port</p> <p>The port for the protocol to connect to the host. The backup port is not required for object storage. Default: 22</p> <p>See Configuring backup settings for fresh install of the Management subsystem.</p>
Protocol	String	No	<p>The type of the backup. Supported types:</p> <ul style="list-style-type: none"> objstore sftp The default value is sftp. Local storage backups For local backups, do not specify this parameter. When the parameter is set to "", the backup type is set to local storage backup. <p>See Configuring backup settings for fresh install of the Management subsystem.</p>
Restart database	Toggle Switch	No. Optional	<p>Flag to accept database reconfiguration. Restarting the database is required when changing the backup configuration. When marked true and the new backup configuration differs, the operator will stop the database and any dependent services, apply the change, and restart the stopped components. Defaults to Off.</p> <p>For more information on restarting the database, see Reconfiguring or adding backup settings after installation of the management subsystem</p>
Retries	String	No. Optional	<p>For sftp type backups only, the number of times the ibm-apiconnect Operator attempts backups in the event of a failed SFTP backup. Not used for objstore or local storage backup.</p> <p>Default value: 0.</p> <p>See Configuring backup settings for fresh install of the Management subsystem.</p>
S3 provider type	Drop down menu	Required when using s3 provider.	<p>Name of the S3 provider to use. Not required for local backups or SFTP backups. If you are configuring backups with an s3provider, you must specify one of the supported values of aws or ibm.</p> <p>See Configuring backup settings for fresh install of the Management subsystem.</p>

Field	Type	Required	Description
Schedule	String	No. Optional	<p>Cron like schedule for performing automatic backups. The format for the schedule is:</p> <ul style="list-style-type: none"> • * * * * * • - - - - - • • +----- day of week (0 - 6) (Sunday=0) • +----- month (1 - 12) • +----- day of month (1 - 31) • +----- hour (0 - 23) • +----- min (0 - 59) <p>The backup schedule defaults to <code>0 0 * * *</code>. This means a backup is run every day at midnight and minute zero UTC.</p> <p>When you configure a host, if you do not specify a value for <code>schedule</code>, the default backup schedule is automatically set. Note that the default backup schedule is not set, and scheduled backups not enabled, until host configuration is completed.</p> <p>See Configuring backup settings for fresh install of the Management subsystem.</p>

Database persistence

Table 2. Database persistence

Field	Type	Required	Description
Storage Class	Drop down menu	No. Optional	<p>Specify the RWO block storage class to use for persistence storage. This will be used when creating a PVC. Specification of the storage class is highly recommended. If not specified the default cluster storage class is used.</p> <p>See the IBM Cloud Pak documentation for guidance for Storage class selection. Go to the following page and select your Cloud Pak release level: https://www.ibm.com/support/knowledgecenter/SSGT7J. In the navigation panel of the KC, select System Requirements > Storage.</p> <p>To review API Connect storage support, see Storage classes.</p>
Volume size	Integer	No. Optional	<p>Represents the size of the Database volume. Defaults to 120G for <code>n1xc4.m16</code> installation profile, 180G for <code>n3xc4.m16</code> installation profile.</p>

Site name

Table 3. Site Name

Field	Type	Required	Description
Site name	string	No. Optional	<p>Site name is the logical name of this failure domain. Typically site name is the name of your data center, such as Amazon AZ.</p> <p>Default: randomly generated name.</p> <p>This will be the site name of the management deployment. For example, given the site name of <code>test</code> your management deployment will look like <code>management-test-postgres</code>.</p>

Test and Monitor

Table 4. Test and Monitor

Field	Type	Required	Description
Enable Test and Monitor	Boolean. Toggle off/on	No. Optional	<p>Test and Monitor automatically generates API test assertions. It contains dashboards for monitoring API test assertions and getting alerts on the health of your APIs.</p> <p>Default: off</p> <p>See Installing the Automated API behavior testing application.</p>

Billing

Table 5. Billing

Field	Type	Required	Description
Enable Billing	Boolean. Toggle off/on	No. Optional	<p>To enable the monetization of your Product Plans, you must add a billing integration resource in your API Connect provider organization that defines the configuration data needed to synchronize with an external subscription billing system.</p> <p>Default: off</p> <p>See Adding a billing integration resource.</p>

Gateway subsystem settings

You can specify advanced configuration settings for the Gateway subsystem directly in the CR or with the Platform UI in Cloud Pak for Integration.

The IBM Cloud Pak Platform UI enables you to specify settings for the following areas:

- [v5 compatibility mode](#)
- [Operations Dashboard](#)
- [Token management service](#)
- [Autoscaling gateway pods](#)

For annotations, labels, node selectors, and tolerances, see [Additional Kubernetes settings](#)

v5 compatibility mode

Table 1. v5 compatibility mode

Field	Type	Required	Description
V5 comparability mode	Toggle Switch off/on	No. Optional	Enabling this provides v5 compatibility (trading off some performance) with the IBM DataPower Gateway that was provided with IBM API Connect Version 5 and earlier releases. Consider using this DataPower Gateway (v5 compatible) if you are an existing DataPower user and want to utilize your DataPower resources and knowledge. Default: off To review v5 compatibility, see API Connect gateway types .

Operations Dashboard

Table 2. Operations Dashboard

Field	Type	Required	Description
Enable Operations Dashboard tracing	Toggle Switch off/on	No. Optional	Enable or disable cross-component transaction tracing to allow troubleshooting and investigating errors and latency issues. Default: disabled (off) To review the Operations Dashboard, see https://www.ibm.com/support/knowledgecenter/SSGT7J_20.3/tracing/operations_dashboard.html For information on configuring the Operations Dashboard, see https://ibm.github.io/datapower-operator-doc/apis/datapowerservice/v1beta2/#odtracing .
Operations Dashboard namespace	string	No. Optional	Namespace where the IBM Cloud Pak for Integration Operations Dashboard has been deployed. Default: none
Replica count	string	No. Optional	Specify the number of instances of the Gateway that should be deployed. For high-availability, a minimum of 3 replicas (one per node) is recommended. Default: none

Token management service

Table 3. Token management service

Field	Type	Required	Description
Advanced: Enable TMS	Toggle Switch	No. Optional	Enable or disable token management service (TMS) to use the DataPower to manage the token lifecycle.. Default: disabled (off) The Token Management Service uses the DataPower distributed cache to manage the token lifecycle which includes when to revoke access rights. For more information, see Token management with DataPower API Gateway .
Advanced: Storage Class	string	No. Optional	Specify the RWO block storage class to use for persistence storage. This will be used when creating a PVC. Specification of the storage class is highly recommended. If not specified the default cluster storage class is used. See the IBM Cloud Pak documentation for guidance for Storage class selection. Go to the following page and select your Cloud Pak release level: https://www.ibm.com/support/knowledgecenter/SSGT7J . In the navigation panel of the KC, select System Requirements > Storage. To review DataPower storage configuration, see https://ibm.github.io/datapower-operator-doc/apis/datapowerservice/v1beta2/#storage .
Advanced: Volume size	string	No. Optional	Resources represents the minimum resources the volume should have. For example, 10Gi. Default: none To review DataPower storage configuration, see storage API . in the DataPower documentation.

Autoscaling gateway pods

Autoscaling enables the gateway deployment to scale dynamically, either vertically or horizontally. It is not possible to use both horizontal and vertical pod scaling simultaneously. You must configure either **HPA** (for horizontal scaling) or **VPA** (for vertical scaling) as the scaling method.

Note: DataPower Gateway supports long-lived connections such as GraphQL subscriptions or other websockets connections. These long-lived connections might not be preserved when pods are scaled down based on defined CPU or memory thresholds. Workloads with long-lived connections are more vulnerable to failed API transactions when auto-scaling is occurring.

To learn more about HPA and VPA autoscaling, see the following topics in the DataPower documentation:

- [Autoscaling DataPower Pods](#)
- [podAutoScaling API](#)

You can configure autoscaling for Gateway pods by inserting a new subsection in the **spec gateway** section of the top-level CR, or by filling in the corresponding fields in the OpenShift or IBM Cloud Pak Platform UI. Settings are described in Table 4.

The following example configures HPA autoscaling in the gateway section of the top-level API Connect CR:

```
spec:
  gateway:
    podAutoScaling:
      hpa:
        maxReplicas: 5
        minReplicas: 3
        targetCPUUtilizationPercentage: 90
        targetMemoryUtilizationPercentage: 80
      method: HPA
```

Table 4. Autoscaling configuration settings

UI Field name / CR Setting	Autoscaling method	Required	Description
<ul style="list-style-type: none"> Scaling method <code>method</code> 	All	Yes	Select the autoscaling method to be used: either HPA (Horizontal Pod Autoscaling) or VPA (Vertical Pod Autoscaling). To disable autoscaling, leave <code>method</code> blank, or omit the <code>podAutoScaling</code> section from the CR.
<ul style="list-style-type: none"> Minimum pods <code>minReplicas</code> 	HPA	Yes	Minimum number of pods that can be scaled down to by the horizontal pod autoscaler.
<ul style="list-style-type: none"> Maximum pods <code>maxReplicas</code> 	HPA	Yes	Maximum number of pods that can be scaled up to by the horizontal pod autoscaler. Must be a value greater than <code>minReplicas</code> .
<ul style="list-style-type: none"> Target CPU Utilization Percentage <code>targetCPUUtilizationPercentage</code> 	HPA	No	Percent threshold on average CPU usage by pods for triggering horizontal scaling.
<ul style="list-style-type: none"> Target Memory Utilization Percentage <code>targetMemoryUtilizationPercentage</code> 	HPA	No	Percent threshold on average memory usage by pods for triggering horizontal scaling.
<ul style="list-style-type: none"> Maximum CPU <code>maxAllowedCPU</code> 	VPA	No	Maximum value for CPU resource that can be assigned to a DataPower container when scaling vertically. Minimum value is set from <code>DataPowerRequestsSpec.ResourceCPU</code>
<ul style="list-style-type: none"> Maximum Memory <code>maxAllowedMemory</code> 	VPA	No	Maximum amount of memory that can be assigned to a DataPower container when scaling vertically. Minimum value is set from <code>DataPowerRequestsSpec.ResourceMemory</code>

Developer Portal subsystem settings

You can specify advanced configuration options for the Developer Portal subsystem directly in the CR or with the Platform UI in Cloud Pak for Integration.

The IBM Cloud Pak Platform UI enables you to specify settings for the following areas:

- [Database backups](#)
- [Site name](#)

For annotations, labels, node selectors, and tolerations, see [Additional Kubernetes settings](#)

Known limitation: When deployed on OpenShift or Cloud Pak for Integration, the API Connect Developer Portal subsystem does not support multiple hosts for the `portalUIEndpoint` endpoint, due to a limitation of Routes in OCP.

Database backups

Table 1. Database backup settings

Field	Type	Description
Credentials	String	For <code>objstore</code> , this is the name of your Kubernetes secret that was generated with your username and password for your backup database. For <code>sftp</code> , this is the secret that contains the credentials for your <code>sftp</code> username and password. Required if configuring backups. See also Backing up and restoring the Developer Portal in a Kubernetes environment .
Backup host	String	The S3 endpoint with the corresponding S3 region in the format <code><S3endpoint>/<S3region></code> . For example: <code>s3.eu-gb.cloud-object-storage.appdomain.cloud/eu-standard</code> For <code>sftp</code> , this is the <code>sftp</code> server host name. Required if configuring backups. See also Backing up and restoring the Developer Portal in a Kubernetes environment .
Backup path	String	For <code>objstore</code> , the name of your S3 bucket to store backup data. For example: <code>test-bucket/restore-test</code> . For <code>sftp</code> , this is the path to the folder on the <code>sftp</code> server. Required if configuring backups. See also Backing up and restoring the Developer Portal in a Kubernetes environment .
Backup port	Integer	This is the port for the protocol to connect to the host. There is no default. See also Backing up and restoring the Developer Portal in a Kubernetes environment .

Field	Type	Description
Backup protocol	String	Choose the protocol (sftp or objstore) you wish to use to communicate with your remote backup endpoint. Objstore is recommended for most reliability. There is no default. This field must be set to either <code>sftp</code> or <code>objstore</code> to configure backups. See also Backing up and restoring the Developer Portal in a Kubernetes environment .
Backup schedule	String	This is the schedule in cron string format for how often automatic Developer Portal backups are run. For example: <code>0 /3 * * *</code> means at minute 0 past every 3rd hour. There is no default. Required if configuring backups. See also Backing up and restoring the Developer Portal in a Kubernetes environment .

Site name

Table 2. Site name

Field	Type	Description
Site name	string	Site name is the logical name of the failure domain of this portal subsystem. Typically site name is the name of your data center, such as Amazon AZ. The default is a randomly generated name.

Analytics subsystem settings

Specify advanced configuration settings for the analytics subsystem directly in the analytics CR. If you are using Cloud Pak for Integration, you can configure many of the analytics setting in Platform UI.

In the Cloud Pak for Integration Platform UI you can specify settings for the following areas:

- [Backups](#)
- [Storage type, class, and size](#)

For annotations, labels, node selectors, and tolerations, see [Additional Kubernetes settings](#)

Analytics features such as offloading, filtering, and disabling ingestion, must be configured directly in the analytics CR YAML file: [Analytics subsystem CR configured settings](#).

Backups

Table 1. Database backup

Field	Type	Required	Description
Backup chunk size in GB	Integer	No. Optional	<code>chunkSize</code> specifies how large files are stored. Large files can be stored as chunks when the snapshot is created. This setting specifies the size of the chunks as GB, MB, or KB. Default value is 1 GB. See Configuring backup settings for Analytics .
Credentials	String	No. Optional	The backup credential is the name of the Kubernetes secret that you created for accessing your S3-compatible storage. No default. See Configuring backup settings for Analytics .
Compress	Boolean: off or on	No. Optional	Determines whether metadata files are stored in compressed format. Default value is false (off). See Configuring backup settings for Analytics .
Enable server-side encryption	Boolean: off or on	No. Optional	Determines whether files are encrypted. When set to true (on), files are encrypted on the server side by using AES256. Default is false (off). See Configuring backup settings for Analytics .
Analytics server hostname	String	No. Optional	The URL to your S3 storage. No default. See Configuring backup settings for Analytics .
Backup Path	String	No. Optional	The path to your S3 storage at the URL specified by Analytics server hostname.host. No default. See Configuring backup settings for Analytics .
Schedule cron expression	String	No. Optional	The schedule that determines how often backups are run automatically. The format for the schedule is any valid <code>cron</code> string. Default: <code>"*/20 * * * *"</code> See Configuring backup settings for Analytics .

Storage type, class, and size

Table 2. Storage type, class, and size settings

Field	Type	Required	Description
Master storage class	String	Yes	If you specified dedicated storage, the master storage class is the storage class that is used by your <code>storage-os-master</code> pods. Select from the drop down. Local-volume storage is recommended for best performance. If none selected, the default storage class of your cluster is used. See Planning the analytics profile, storage class, and storage type .

Field	Type	Required	Description
Shared storage class	String	Yes	The storage class used by your analytics <code>storage</code> pods. Select from the drop down. Local-volume storage is recommended for best performance. If none selected, the default storage class of your cluster is used. See Planning the analytics profile, storage class, and storage type .
Master volume size	Integer > 0	No	If you specified dedicated storage, then master volume size specifies the disk storage that is allocated to your <code>storage-os-master</code> pods. The <code>storage-os-master</code> pods do not store your analytics data, and if left unset the value defaults to 5Gi.
Shared volume size	Integer > 0	Yes	How much persistent disk storage is allocated for analytics data (in Gi). The default is 50Gi, but it is HIGHLY recommended that you calculate how much storage you need. See Estimating internal storage space
Type	Boolean: dedicated or shared	Yes	OpenSearch storage type to use for your analytics data. For more information about storage types, see Dedicated storage instead of shared storage . The default storage type is shared.

- [Analytics subsystem CR configured settings](#)
Update the OpenShift analytics or top-level CR to configure additional analytics features.

Analytics subsystem CR configured settings

Update the OpenShift analytics or top-level CR to configure additional analytics features.

About this task

Based on the decisions you made while [defining your topology](#), configure your deployment options by completing the steps in the following topics to enable the persistent queue, configure data offloading, use dedicated storage, and disable internal storage.

Important: All additional analytics configuration options can be added, changed, or removed after installation **except** for disablement or enablement of internal storage. If you want to disable internal storage you must configure this in the analytics CR before installation: [Disabling internal storage](#)

- [Dedicated storage instead of shared storage](#)
Use dedicated storage instead of shared storage for your analytics data.
- [Analytics persistent queue](#)
For enhanced reliability in your analytics data pipeline, enable the persistent queue feature by updating your OpenShift analytics or top-level CR.
- [Offloading data to a third-party system](#)
Update the OpenShift analytics or top-level CR to configure data offloading from your IBM API Connect analytics deployment to a third-party system.
- [Disabling internal storage](#)
Update the OpenShift top-level or analytics CR to disable local storage in your IBM API Connect analytics deployment.
- [Modifying incoming analytics data](#)
Update the OpenShift top-level or analytics CR to customize data in your analytics deployment.
- [Reference: Fields in the Analytics CR](#)
Use the table of analytics-specific fields to configure the top-level or analytics CR for installing your API Connect analytics subsystem.

Dedicated storage instead of shared storage

Use dedicated storage instead of shared storage for your analytics data.

API Connect provides two OpenSearch storage types:

- **Shared storage**
A single pod provides data storage and OpenSearch cluster management. Shared storage is the default option, and the only option on a one replica deployment.
- **Dedicated storage**
OpenSearch data storage and cluster management functions are split, and run in separate pods on each worker node:
 - `storage-os-master` - Runs an OpenSearch "manager eligible" node that manages the OpenSearch cluster, but does not store any API event data.
 - `storage` - Runs an OpenSearch "data" node that stores API event data.

Dedicated storage facilitates horizontal scaling to support greater analytics data storage and throughput. Add worker nodes and increase the number of `storage` pod replicas in order to scale horizontally (you do not need to increase the number of `storage-os-master` replicas). Dedicated storage also provides greater stability and allows some OpenSearch configuration changes to be made without downtime.

The storage type is defined in the analytics CR, in the `spec.storage.type` section as follows:

- Shared storage:

```
storage:
  type: shared
  shared:
    volumeClaimTemplate:
      storageClassName: $STORAGE_CLASS
      volumeSize: $DATA_VOLUME_SIZE
```

- Dedicated storage:

```
storage:
  type: dedicated
  shared:
    volumeClaimTemplate:
      storageClassName: $STORAGE_CLASS
      volumeSize: $DATA_VOLUME_SIZE
  master:
```

```
volumeClaimTemplate:
  storageClassName: $STORAGE_CLASS
```

Analytics persistent queue

For enhanced reliability in your analytics data pipeline, enable the persistent queue feature by updating your OpenShift analytics or top-level CR.

The Logstash persistent queue is an optional feature that provides enhanced reliability in the data pipeline. With the persistent queue enabled, the ingestion pod buffers incoming API event data to persistent storage so that no events are lost if the downstream API Connect services become unavailable.

For example, if the analytics storage service is restarted, any incoming API events are kept in persistent storage and sent on to the storage service when it is available again. If the persistent queue is not enabled, then the ingestion pod rejects further API event data coming from the gateway.

Another benefit of this feature is better handling of unexpected traffic spikes. The only disadvantages are higher CPU and persistent storage requirements.

To enable the persistent queue feature:

1. If using a top-level CR edit your **APIConnectCluster** CR file. Otherwise edit your `analytics_cr.yaml` file and add the following to the ingestion section

```
2. ingestion:
  queue:
    type: persisted
    volumeClaimTemplate:
      storageClassName: <storage-class-name>
      volumeSize: <storage size>
```

Where

- `<storage-class-name>` is the OpenShift storage class defined for persistent volumes. For example `local-storage`
 - `<storage size>` is the maximum size for your persistent queue. For example `8Gi`.
3. Save the file. If updating these settings after installation, confirm that the analytics ingestion pod restarts.

Offloading data to a third-party system

Update the OpenShift analytics or top-level CR to configure data offloading from your IBM® API Connect analytics deployment to a third-party system.

About this task

For information about offloading data from your Analytics deployment, see [Planning to offload data to a third-party system](#).

Procedure

1. If using a top-level CR edit your **APIConnectCluster** CR file and make the changes in the `spec.analytics` section. Otherwise edit your `analytics_cr.yaml` file and make changes in the `spec` section.
- 2.

```
external:
  offload:
    enabled: true
    output: |
      $EXTERNAL_OFFLOAD_OUTPUT
```

where `$EXTERNAL_OFFLOAD_OUTPUT` is the plugin output for the target third-party system.

The following example enables offloading to HTTP:

```
external:
  offload:
    enabled: true
    output: |
      http {
        url => "example.com"
        http_method => "post"
        codec => "json"
        content_type => "application/json"
        id => "offload_http"
      }
```

For examples of output plugins, see: [Sample output plugins for offloading data](#).

3. Optional: Modify the output plugin to include certificates for connecting to a secure endpoint. If your third-party endpoint requires a particular certificate, you can configure the certificate and then reference it in the offload plugin. Include the `secretName` as well as the `cacert`, `client_cert`, and `client_key` settings.

```
external:
  offload:
    secretName: offload-certificates
    enabled: true
    output: |
      http {
        url => "https://example.com:443"
```

```

http_method => "post"
codec => "json"
content_type => "application/json"
id => "offload_http"
cacert => "/etc/velox/external_certs/offload/cacert.pem"
client_cert => "/etc/velox/external_certs/offload/client.pem"
client_key => "/etc/velox/external_certs/offload/client.key"
}

```

The secret and its defined files are mounted to the `/etc/velox/external_certs/offload` directory in the ingestion pod container.

For example, the following output plugin enables offloading to HTTP, and provides information on the certificate that is needed for authenticating with the endpoint:

For information on creating a secret to store the certificates, see [Providing a custom certificate for Analytics offload](#).

- Optional: Add a **filter** after the output plugin to modify data prior to offloading it.

The following example filter removes the `query_string` field:

```

external:
  offload:
    enabled: true
    output: |
      http {
        url => "example.com"
        http_method => "post"
        codec => "json"
        content_type => "application/json"
        id => "offload_http"
      }
    filter: |
      ruby {
        remove_field => ["query_string"]
      }
}

```

For information about modifying offloaded data, see [Planning to modify your incoming analytics data](#).

- Save the file. If updating these settings after installation, confirm that the analytics ingestion pod restarts.

- [Sample output plugins for offloading data](#)

Review sample output plugins to see how to code your own plugins for offloading data from IBM API Connect Analytics.

- [Providing a custom certificate for Analytics offload](#)

Prepare a private or self-signed certificate for offloading data and then add it to the IBM API Connect Analytics deployment on OpenShift.

Sample output plugins for offloading data

Review sample output plugins to see how to code your own plugins for offloading data from IBM® API Connect Analytics.

Configure output plugins that direct analytics data to your third-party systems. An output plugin specifies where analytics data is offloaded, plus any information required to access that system, such as certificate information. The output plugin for displaying analytics data in the Analytics user interface is configured by default.

Note: If your third-party system requires a private or self-signed certificate, configure it as explained in [Providing a custom certificate for Analytics offload](#) and include a reference to the certificate in your output plugin. See the second HTTP output plugin for an example of how to reference the certificate.

HTTP

To configure data offload to an HTTP server, you must provide the server URL. You can optionally add standardized or custom HTTP headers to define additional operating parameters.

The following example configures an HTTP output plugin.

```

http {
  url => "example.com"
  http_method => "post"
  codec => "json"
  content_type => "application/json"
  headers => {
    "x-acme-index" => "8"
    "x-acme-key" => "0d5d259f-b8c5-4398-9e58-77b05be67037"
  }
  id => "offload_http"
}

```

The following example configures an HTTP output plugin that references a custom certificate for accessing the third-party endpoint.

```

http {
  url => "https://example.com:443"
  http_method => "post"
  codec => "json"
  content_type => "application/json"
  headers => {
    "x-acme-index" => "8"
    "x-acme-key" => "0d5d259f-b8c5-4398-9e58-77b05be67037"
  }
  id => "offload_http"
  cacert => "/etc/velox/external_certs/offload/cacert.pem"
  client_cert => "/etc/velox/external_certs/offload/client.pem"
  client_key => "/etc/velox/external_certs/offload/client.key"
}

```

For more information on offloading to HTTP, refer to the Logstash documentation on configuring the [HTTP output plugin](#).

Elasticsearch

To configure data offload to an Elasticsearch cluster, you must provide one or more server URLs, define how indices should be created by specifying a dynamically configured name, specify the number of primary shards for storing the indexed documents, and specify a number of replica shards for redundancy. You can optionally specify server authentication credentials.

The naming syntax that you specify for your indices determines how many indices are created and how they are characterized. For example, you can define indices that are created based on a date pattern (for example, daily or weekly), or indices that are created to store data by provider organization or by API name.

The following example configures an Elasticsearch output plugin.

```
elasticsearch {
  hosts => "https://example.com:443"
  index => "apiconnect"
  ssl => true
  cacert => "/etc/pki/tls/cert.pem"
}
```

For more information on offloading to Elasticsearch, refer to the Elasticsearch documentation on the [Elasticsearch output plugin](#).

Apache Kafka

To configure data offload to a Kafka cluster, you must provide host and port connection details for one or more servers, and the name of the Kafka topic to which you want to publish the offloaded data. For logging and monitoring purposes within Kafka, you can optionally specify a string identifier by which API Connect can be uniquely identified.

The following example configures a Kafka output plugin.

```
kafka {
  topic_id => "test"
  bootstrap_servers => "example.com:9093"
  codec => "json"
  id => "kafka_offload"
  ssl_truststore_location => "/usr/share/logstash/jdk/lib/security/cacerts"
  ssl_truststore_password => "changeit"
  ssl_truststore_type => "JKS"
  security_protocol => SSL
}
```

For more information on offloading to Apache Kafka, refer to the Logstash documentation on the [Kafka output plugin](#).

Syslog

To configure data offload to Syslog, you must provide host and port connection details for the server.

Restriction: Syslog does not support the use of chained client certificates for TLS profiles.

The following example configures a Syslog output plugin.

```
syslog {
  host => "example.com"
  port => 601
  protocol => "ssl-tcp"
  id => "offload_syslog"
  appname => "apiconnect"
  msgid => "%{org_id}"
  facility => "log audit"
  severity => "informational"
  codec => "json"
  ssl_cacert => "/etc/pki/tls/cert.pem"
}
```

Attention: Due to a third-party issue with Logstash, most of the facility values are not set correctly on the offload server. As a temporary workaround, set the facility to "user-level" to ensure that the corresponding value is correctly sent to the offload server. When Logstash corrects this problem, you must update the offload configuration to change the value to a more appropriate setting.

For more information on offloading to Syslog, refer to the Logstash documentation on the [Syslog output plugin](#).

OpenSearch

To configure data offload to OpenSearch: <https://opensearch.org/docs/latest/clients/logstash/ship-to-opensearch/>

Providing a custom certificate for Analytics offload

Prepare a private or self-signed certificate for offloading data and then add it to the IBM® API Connect Analytics deployment on OpenShift.

Procedure

1. Log in to a server where you can run `oc` commands against the OpenShift environment where your analytics subsystem is installed.
2. Encode the certificate file contents in base64.
You can use either JKS files or text-based files such as PEM files:

- If you use a JKS file for the certificate, you must encode it.
- If you use a text-based file such as PEM, then you can either encode it, or paste its contents directly.

There are various tools for base64 encoding. If the `cat` and `base64` commands are available you can run the following command to encode the file contents:

```
cat keystore.jks | base64
```

Copy the output so that you can paste it into the secret in the next step.

3. Create a secret to contain the certificate.

- Create a file called `analytics_certs.yaml` to contain the secret.

The secret's name that you specify in the file does not have to match the file name. In the examples, the secret's name is `offload-certificates`. Do not use the underscore character (`_`) in the secret name.

The method for adding the certificate to the secret depends on whether you encoded the file contents in the previous step:

- Base64-encoded file: In the `data` section of the secret, type a name for the field (you can choose the name). Paste the encoded output from the previous step (enclosed in `" "`) as the value.

```
apiVersion: v1
kind: Secret
metadata:
  # Change value of name to be whatever you wish secret to be called
  name: offload-certificates
  # Only base64 encoded data should be placed in data section; JKS keys would go here
data:
  keystore.jks: "output_of_base64_encoded_jks"
```

- Plain text file: In the `stringData` section of the secret, type a name for the key or certificate (you can choose the name), and paste the value.

```
apiVersion: v1
kind: Secret
metadata:
  # Change value of name to be whatever you wish secret to be called
  name: offload-certificates
stringData:
  cacert.pem: |-
-----BEGIN CERTIFICATE-----
MIIDIDCCAomgAwIBAgIEND70zzANBqkqhkiG9w0BAQUFADBOMQswCQYDVQGEwJVUzEQMA4GA1UE

BIZCe/zuf6IWURVnZ9NA2zsmWLIodz2uFHdh1voqZiegDfqc1zqcPGUIWVEX/r87yloqaKHee95
70+sB3c4
-----END CERTIFICATE-----
```

You can add multiple keys/certificates, setting the field names for each as desired. For each key, a file based on the corresponding field name is created in the ingestion pod container at `/etc/velox/external_certs/offload`. The examples here would result in the files `keystore.jks` and `cacert.pem`.

- Save the file.

4. Optional: Create an additional secret.

If you have sensitive data such as a certificate passphrase that must be available in text format, you can store it in another secret.

If your passphrase is not sensitive (such as the JKS default passphrase), then you can supply it directly in the Logstash configuration, and skip this step.

- Create the file `offload_env_var.yaml`. The secret's name that you specify in the file does not have to match the file name. In this example, the secret's name is `offload-jks-passphrase`.
- In the `stringData` section, set the property `jks_password.txt` to your passphrase (in plain text):

```
apiVersion: v1
kind: Secret
metadata:
  name: offload-jks-passphrase
stringData:
  jks_password.txt: <passphrase>
```

- Run the following command to update the cluster:

```
oc apply -f offload_env_var.yaml -n your_namespace
```

Where `offload_env_var.yaml` is the secret's file name.

- Apply the secret to the cluster where the Analytics subsystem is installed. Run the following command to update the cluster:

```
kubectl apply -f file_name_of_secret.yaml -n namespace
```

Where:

- `file_name_of_secret.yaml` is the secret's file name.
- `namespace` is your analytics namespace.

- If using a top-level CR edit your `APICoconnectCluster` CR file. Otherwise edit your `analytics_cr.yaml` file and add a reference to the secret and passwordSecret in the `offload` section; for example:

```
offload:
  enabled: true
  output: |
    kafka {
      ...
    }
  secretName: offload-certificates
  passwordSecretName: offload-jks-password
```

7. If you want to reference the certificate in [Offloading data to a third-party system](#), configure the plugin now. Step 3 of that procedure shows how you can include the certificate information in the plugin.

Disabling internal storage

Update the OpenShift top-level or analytics CR to disable local storage in your IBM® API Connect analytics deployment.

About this task

The Analytics subsystem provides a complete solution for routing, storing, and viewing the analytics data. However, you might not need the internal storage and viewing solution, especially if you are primarily using a third-party system for data offloading. In this scenario, you can greatly reduce your CPU and memory costs by disabling the internal storage and viewing components.

With this approach, data that is offloaded is not viewable in the API Manager and Developer Portal UIs.

When you disable internal storage for analytics data, the following microservices are disabled:

- `osinit`
- `storage`

Important: The disablement of internal storage must be set in the analytics CR yml file before installation. It is not possible to disable or re-enable internal storage after installation.

Procedure

1. Required: Configure data offloading as explained in [Offloading data to a third-party system](#). If you do not have offloading configured and also disable internal storage, you will have no analytics data.
2. If using a top-level CR edit your `APIConnectCluster` CR file and find the `spec.analytics` section. Otherwise edit your `analytics_cr.yml` file and find the `spec` section.
3. Locate the `storage` section and set `enabled` to `false`:

```
storage:
  enabled: false
```

4. Save the file.

Modifying incoming analytics data

Update the OpenShift top-level or analytics CR to customize data in your analytics deployment.

Before you begin

Review the use of filters for modifying analytics data, and make sure that you understand the restrictions. For information about customizing data, see [Planning to modify your incoming analytics data](#).

About this task

You can define filters that add, modify, or remove fields from the incoming API event records, before they are stored in API Connect or offloaded to a third-party system.

Procedure

1. If you are using a top-level CR, edit your `APIConnectCluster` CR file and find the `spec.analytics` section. Otherwise, edit your `analytics_cr.yml` file and find the `spec` section.
2. Filters for API events that are offloaded to an external system are defined in the `external.offload` section. Filters for API events that are stored in the API Connect OpenSearch database are defined in the `ingestion` section.

Ingestion filters - for API event data stored by API Connect
Add the filter definition to the `ingestion` section:

```
spec:
  ingestion:
    ...
    filter: |
      mutate {
        remove_field => ["query_string"]
      }
  }
```

Offload filters - for API event data that is sent to a third-party system.
Add the filter definition to the `external.offload` section:

```
spec:
  external:
    offload:
      filter: |
        mutate {
          remove_field => ["query_string"]
        }
      }
```

For more examples, see [Sample filters for modifying analytics data](#).

3. Optional: Include geoIP fields in your analytics data, for both stored and offloaded data, by inserting `geoIPEnabled: true` in the ingestion section:

```
ingestion:
  ...
  geoIPEnabled: true
```

By default the `client_geoip` and `gateway_geoip` fields are not included in the analytics data. You do not need to add `geoIPEnabled` to the `external.offload` section. Enabling geoIP in the `ingestion` section enables it for both data routes.

Note: To ensure the value in the `client_geoip` field is accurate, the gateway must receive the `X-Forwarded-For` header in all API calls. Check with the administrator of your deployment environment to ensure that the `X-Forwarded-For` header is passed to your gateways. For example, in a Kubernetes environment where NINGX ingresses are used, configure the NGINX ingress that is used by your gateway to use the `X-Forwarded-For` header: [NGINX Configuration "use-forwarded-headers"](#).

4. Save the file. Changes to filters take effect after approximately 30 seconds.

- [Sample filters for modifying analytics](#)

Review sample filters to see how to code your own filters for refining IBM API Connect Analytics data by adding fields, removing fields, or modifying field contents.

Sample filters for modifying analytics

Review sample filters to see how to code your own filters for refining IBM® API Connect Analytics data by adding fields, removing fields, or modifying field contents.

You can use these sample filters in the `ingestion.filter` and the `external.offload.filter` configurations.

Adding a new field

You can add custom data to API event data by adding a field to the logging document. For example, if you want to search or visualize data that is stored in request and response headers, you can add fields to a filter to include that information.

To avoid naming conflicts with future or current analytics fields, include a prefix that ensures your new field name is unique. For example, instead of naming the field `employee_num` you might name it `x_mycompany_employee_num`.

The following example copies the contents of the `X-Employee-Num` field from the request header and adds it to the `x_mycompany_employee_num` field in the event data. Adding the field to the event data enables you to use the information in visualizations.

```
if [request_http_headers] {
  ruby {
    code => "event.get(['request_http_headers']).collect {|i| event.set(['x_mycompany_employee_num'], i['X-Employee-Num']) if
i.has_key?('X-Employee-Num')}"
  }
}
```

Modifying an existing field

Sometimes you don't want to remove a field entirely from your data, you just want to redact sensitive information such as IDs to prevent them from being exposed in visualizations. You can modify the contents of a field and replace information with a symbols or a message.

Remember: The following fields should not be modified if the data is being written to internal analytics storage: `org_id`, `catalog_id`, `space_id`, `developer_org_id`, `datetime`, and `@timestamp`.

The following example replaces sensitive information in the `X-Employee-Name` and `X-Employee-ID` request headers with the string: `*****sanitized*****`.

```
if [request_http_headers] {
  ruby {
    code => "headers=['X-Employee-Name','X-Employee-ID']; newHeaders = event.get(['request_http_headers']).collect {|i|
headers.each {|header| i[header] = '*****sanitized*****' if i.has_key?(header)}; i}; event.set(['request_http_headers'],
newHeaders)"
  }
}
```

Removing an existing field

Use the mutate `remove_field` operation to delete a field from the Analytics data. To remove multiple fields, delimit the field names with commas.

The following example removes multiple fields (`request_http_headers`, `response_http_headers`, `request_body`, `response_body`, and `query_string`) from the Analytics data:

```
mutate {
  remove_field => ["request_http_headers", "response_http_headers", "request_body", "response_body", "query_string"]
}
```

Combining filters with offload and ingestion configuration

Offload events from `catalog1` only:

```
offload:
  enabled: true
  if [catalog_name] == "offload1" {
    http {
      url => "http://offloadhost.example.com/offload"
      http_method => "post"
      codec => "json"
      content_type => "application/json"
      id => "offload_http"
    }
  }
}
```

Offload to different locations based on catalog name:

```
offload:
  enabled: true
  output: |
    if [catalog_name] == "offload1" {
      http {
        url => "http://offloadhost.example.com /offload1"
        http_method => "post"
        codec => "json"
        content_type => "application/json"
        id => "offload1_http"
      }
    }
    else if [catalog_name] == "offload2" {
      http {
        url => "http://offloadhost2.example.com /offload2"
        http_method => "post"
        codec => "json"
        content_type => "application/json"
        id => "offload2_http"
      }
    }
  }
}
```

Use the catalog name as a variable in the offload location:

```
offload:
  enabled: true
  http {
    url => "http://offloadhost.example.com /%{[catalog_name]}"
    http_method => "post"
    codec => "json"
    content_type => "application/json"
    id => "offload_http"
  }
}
```

Do not offload events from `apic` and `sandbox` catalogs:

```
offload:
  enabled: true
  if [catalog_name] !~ /sandbox|apic/ {
    http {
      url => "http://offloadhost.example.com /%{[catalog_name]}"
      http_method => "post"
      codec => "json"
      content_type => "application/json"
      id => "offload_http"
    }
  }
}
```

Do not store events from `apic` and `sandbox` catalogs:

```
ingestion:
  filter: |
    if [catalog_name] =~ /sandbox|apic/ {
      drop { }
    }
}
```

Filter and output plugin for splunk

When you create a filter for use with splunk, you must also create an output plugin for it.

Filter:

```
if "apicapievent" in [tags] {
  ruby {
    code => "event.set('@metadata[newevent]', event.to_json)"
  }
}
```

Output plugin:

```
http {
  url => "http://your-domain/services/collector/event"
  http_method => "post"
  codec => "json"
}
```

```

content_type => "application/json"
id => "offload_http"
format => "message"
message => '{"event": "%{[@metadata] newevent}","index": "applications-int-ms","sourcetype": "json:apimlogs"}'
headers => ["Authorization", "Splunk XXXX"]
}

```

Reference: Fields in the Analytics CR

Use the table of analytics-specific fields to configure the top-level or analytics CR for installing your API Connect analytics subsystem.

If using a top-level CR, make changes there. If you make changes directly to the analytics CR, they will be overwritten by the contents of the top-level CR the next time the API Connect operator reconciliation loop runs.

The two fields that must be in Analytics CR are `ingestion.endpoint` and `ingestion.clientSubjectDN`. The other fields are optional depending on the analytics features you want to configure.

Table 1. Configurable settings in the Analytics subsystem CR.

Field	Type	Default value	Description	Comments
<code>allowUpgrade</code>	Boolean	no	Set to true to allow analytics upgrade to v10.0.5.	See Additional considerations upgrading to analytics v10.0.5 - Kubernetes , Additional considerations upgrading to analytics v10.0.5 - OpenShift .
<code>databaseBackup: host</code>	String		The URL to your S3 storage.	See Configuring backup settings for Analytics , Configuring backup settings for Analytics on OpenShift and Cloud Pak for Integration .
<code>databaseBackup: path</code>	String		The path to your S3 storage at the URL specified by <code>databaseBackup.host</code> .	See Configuring backup settings for Analytics , Configuring backup settings for Analytics on OpenShift and Cloud Pak for Integration .
<code>databaseBackup: schedule</code>	String		Specifies the frequency of automatic backups. Use any valid <code>cron</code> string.	See Configuring backup settings for Analytics , Configuring backup settings for Analytics on OpenShift and Cloud Pak for Integration .
<code>databaseBackup: enableCompression</code>	Boolean	true	Specifies whether to compress the backups.	See Configuring backup settings for Analytics , Configuring backup settings for Analytics on OpenShift and Cloud Pak for Integration .
<code>databaseBackup: credentials</code>	String		The name of your S3 storage authentication secret.	See Configuring backup settings for Analytics , Configuring backup settings for Analytics on OpenShift and Cloud Pak for Integration .
<code>databaseBackup: chunkSize</code>	String	1Gi		See Configuring backup settings for Analytics , Configuring backup settings for Analytics on OpenShift and Cloud Pak for Integration .
<code>databaseBackup: enableServerSideEncryption</code>	Boolean			See Configuring backup settings for Analytics , Configuring backup settings for Analytics on OpenShift and Cloud Pak for Integration .
<code>external: offload: filter</code>	String		Filter configuration for external offload.	See Offloading data to a third-party system - Kubernetes , Offloading data to a third-party system - OpenShift .
<code>external: offload: enabled</code>	Boolean	false	Enables analytics offload feature.	See Offloading data to a third-party system - Kubernetes , Offloading data to a third-party system - OpenShift .
<code>external: offload: output</code>	String		Output configuration for external offload.	See Offloading data to a third-party system - Kubernetes , Offloading data to a third-party system - OpenShift .
<code>external: offload: passwordSecretName</code>	String		The name of the secret that has the password to access the certificate keystore.	For where you are using a password protected key/truststore. See Offloading data to a third-party system - Kubernetes , Offloading data to a third-party system - OpenShift .
<code>external: offload: secretName</code>	String		The name of the secret that contains the certificates used for connecting to the offload target.	See Offloading data to a third-party system - Kubernetes , Offloading data to a third-party system - OpenShift .
<code>ingestion: endpoint</code>	Object		FQDN and TLS Secrets for client endpoint.	Identifies the endpoint that enables the Gateway to push your analytics data.
<code>ingestion: clientSubjectDN</code>	String		Subject DN (distinguished name) for authenticating with ingestion endpoint (RFC 2253).	

Field	Type	Default value	Description	Comments
<code>ingestion:filter</code>	String		Filter to modify API event data that is stored internally (not offloaded).	See Configuring ingestion filters on Kubernetes Configuring ingestion filters on OpenShift .
<code>ingestion:queue</code>	Object		Persistent queue settings. Must be set to persisted if present.	See Configuring persistent queue on Kubernetes , Configuring persistent queue on OpenShift .
<code>ingestion:queue:type</code>	String		Defines the storage type for the persistent storage feature. Options are 'persisted' or 'memory'	See Configuring persistent queue on Kubernetes , Configuring persistent queue on OpenShift .
<code>ingestion:queue:volumeClaimTemplate:volumeSize</code>	String		Storage size for your persistent queue.	See Configuring persistent queue on Kubernetes , Configuring persistent queue on OpenShift .
<code>ingestion:queue:volumeClaimTemplate:storageClassName</code>	String		Storage class name for your persistent storage.	See Configuring persistent queue on Kubernetes , Configuring persistent queue on OpenShift .
<code>ingestion:pipelineWorkers</code>	4 <= integer <= 128	24	Number of pipeline workers.	More workers mean more CPU and memory requirements, but gives you the benefit of extra threads to pull data off the ingestion http interface and process it for storage. This has diminishing returns as the size increases, and should usually be multiple of the number of cores on your hardware. Adjust with caution.
<code>ingestion:pipelineBatchSize</code>	10 <= integer <= 10000	250	Batch size of a pipeline worker.	Pulling more or less data off the http interface per worker can have benefits. Recommended values are 125 , 250 , and 500 . Increasing the value requires more memory.
<code>ingestion:pipelineBatchDelay</code>	10 <= integer <= 5000	50	Batch delay of a pipeline worker.	How long to wait for the batch size to fill before leaving the http interface to process for storage. Having threads wait too long causes idle threads in your system; however, setting this value too low decreases performance. Adjust with caution.
<code>ingestion:configReloadAutomatic</code>	Boolean	true	Whether to automatically reload the pipeline on configuration changes.	Typically, when the underlying files for the pipeline are modified, the pipeline process automatically reloads and picks up the changes. However, in Kubernetes environments where the pipeline is mapped to configmaps, this is unreliable. Ingestion microservice restarts are usually required.
<code>ingestion:pipelineUnsafeShutdown</code>	Boolean	false	Whether to allow unsafe shutdown of the pipeline.	Typically, the pipeline attempts to empty all workers' batches before shutdown to prevent data loss. You might need to enable this setting if the pipeline is badly configured and refuses to respond to shut down requests (uncommon). Adjust with caution.
<code>standaloneCluster</code>	Boolean			
<code>storage:type</code>	String	shared	Type of storage deployment.	Shared is the only available option.
<code>storage:shared:volumeClaimTemplate:storageClassName</code>	String	cluster default	Storage class name.	Name of the storage class configured to use for creating the microservice persistent volume.
<code>storage:shared:volumeClaimTemplate:volumeSize</code>	String	50Gi	Volume size.	Size of the volume used for data storage. See Estimating internal storage space for more information.

Additional Kubernetes settings

For each API Connect subsystem, you can specify additional settings for annotations and pod management.

The additional settings are generic Kubernetes configuration settings. The Platform UI advanced configuration option for API Connect enables you to set them specifically for each subsystem.

Annotations

The annotations field serves as a pass-through for all the resources managed by the CR. You can add any annotation to this field. The annotations here overwrite the default annotations.

See <https://kubernetes.io/docs/concepts/overview/working-with-objects/annotations/>.

Labels

The labels field serves as a pass-through for Pod labels. You can add any label to this field and have it apply to the pod. The labels here overwrite the default labels provided. For example, if the label 'mylabel=1' was provided, it would apply to all Kubernetes resources managed by this CR.

See <https://kubernetes.io/docs/concepts/overview/working-with-objects/labels/>.

Node Selector

This field allows you to specify a set of key value pair that must be matched against the node labels to decide which API Connect pods can be scheduled on that node. Only nodes matching all of these key value pairs in their labels will be selected for scheduling API Connect pods.

See <https://kubernetes.io/docs/concepts/scheduling-eviction/assign-pod-node/>.

Tolerations

This field allows you to select which nodes API Connect pods can be scheduled or not scheduled. By specifying a set of matching tolerations, you can control whether specific nodes can be used for scheduling API Connect Pods.

Effect (optional)

Effect indicates the taint effect to match. Empty means match all taint effects. When specified, allowed values are NoSchedule, PreferNoSchedule and NoExecute.

Key (optional)

Key is the taint key that the toleration applies to. Empty means match all taint keys. If the key is empty, operator must be Exists; this combination means to match all values and all keys.

Operator represents a key's relationship to the value. Valid operators are Exists and Equal. Defaults to Equal. Exists is equivalent to wildcard for value, so that a pod can tolerate all taints of a particular category.

Operator (optional)

Operator represents a key's relationship to the value. Valid operators are Exists and Equal. Defaults to Equal. Exists is equivalent to wildcard for value, so that a pod can tolerate all taints of a particular category.

Toleration seconds (optional)

TolerationSeconds represents the period of time the toleration (which must be of effect NoExecute, otherwise this field is ignored) tolerates the taint. By default, it is not set, which means tolerate the taint forever (do not evict). Zero and negative values will be treated as 0 (evict immediately) by the system.

Value (optional)

Value is the taint value the toleration matches to. If the operator is Exists, the value should be empty, otherwise just a regular string.

See <https://kubernetes.io/docs/concepts/scheduling-eviction/taint-and-toleration/>.

Configuring timeouts for management endpoints

Adjust the timeout settings for management endpoints by updating the CR.

About this task

On large deployments, or with large API usage, you might encounter timeout issues when deployed with the default timeout setting of 30 seconds. To avoid timeout issues, increase the setting for the management endpoints used in routing.

You do not have to set these values on initial installation. You can set them or change them after installation and reapply the CR YAML files.

Procedure

Edit the CR to set the timeout to 240 seconds.

The instructions for editing depend on whether you install API Connect using subsystem CRs or a single top-level CR:

- If you are installing API Connect using subsystem CRs, edit `management_CR.yaml`:

```
cloudManagerEndpoint:
  annotations:
    haproxy.router.openshift.io/timeout: 240s
  hosts:
  - name: admin.example.com
    secretName: cm-endpoint
apiManagerEndpoint:
  annotations:
    haproxy.router.openshift.io/timeout: 240s
  hosts:
  - name: manager.example.com
    secretName: apim-endpoint
platformAPIEndpoint:
  annotations:
    haproxy.router.openshift.io/timeout: 240s
  hosts:
  - name: api.example.com
    secretName: api-endpoint
consumerAPIEndpoint:
  annotations:
```

```
haproxy.router.openshift.io/timeout: 240s
hosts:
- name: consumer.example.com
  secretName: consumer-endpoint
```

- If you are installing API Connect using a top-level CR, the management subsystem settings are embedded in the top-level APIConnectCluster CR. Edit the endpoint settings under `spec:management:` as follows:

```
apiVersion: apiconnect.ibm.com/v1beta1
kind: APIConnectCluster
metadata:
  labels:
    app.kubernetes.io/instance: apiconnect
    app.kubernetes.io/managed-by: ibm-apiconnect
    app.kubernetes.io/name: apiconnect-minimum
  name: <name_of_your_instance>
  namespace: ${NAMESPACE}
spec:
  ...
  management:
    cloudManagerEndpoint:
      annotations:
        haproxy.router.openshift.io/timeout: 240s
      hosts:
        - name: admin.example.com
          secretName: cm-endpoint
    apiManagerEndpoint:
      annotations:
        haproxy.router.openshift.io/timeout: 240s
      hosts:
        - name: manager.example.com
          secretName: apim-endpoint
    platformAPIEndpoint:
      annotations:
        haproxy.router.openshift.io/timeout: 240s
      hosts:
        - name: api.example.com
          secretName: api-endpoint
    consumerAPIEndpoint:
      annotations:
        haproxy.router.openshift.io/timeout: 240s
      hosts:
        - name: consumer.example.com
          secretName: consumer-endpoint
  ...
```

Installation procedures with IBM Cloud Pak for Integration

The API Management capability of IBM Cloud Pak for Integration uses IBM API Connect.

There are several methods for installing API Connect with Cloud Pak for Integration:

- Use the Cloud Pak for Integration Platform UI to install API Connect with a top-level CR. The steps are documented in the installation section of the Cloud Pak for Integration documentation: <https://www.ibm.com/docs/en/cloud-paks/cp-integration>.
- Install API Connect as individual subsystems: Install Cloud Pak for Integration first, then install API Connect following the OpenShift instructions: [Installing with subsystem CRs in a shared namespace on OpenShift](#) or [Installing with subsystem CRs in different namespaces or environments on OpenShift](#). Cloud Pak for Integration detects and incorporates the API Connect installation.
- If API Connect is already installed with the top-level CR and you want to migrate it to Cloud Pak for Integration, see [Migrating from OpenShift to Cloud Pak for Integration on the same cluster](#).
- If you want to install API Connect in the two data center disaster recovery configuration, see [Installing a two data center deployment with Cloud Pak for Integration](#).

Installing with the top-level CR on OpenShift

Use the single, top-level `APIConnectCluster` CR to deploy API Connect on OpenShift.

About this task

When you deploy API Connect with a top-level CR, all of the subsystems are deployed in the same namespace. The CR contains a section for each subsystem; configure deployment settings in the appropriate section for each subsystem.

If you want to install multiple API Connect instances, for example dev, uat, and prod, the recommended configuration is to have single API Connect and Datapower operators installed globally in the `openshift-operators` namespace and each API Connect instance installed in its own namespace using a top-level CR.

- [Connected installation](#)
Install API Connect on OpenShift using a single, top-level Custom Resource while connected to the internet.
- [Air-gapped installation](#)
In a disconnected environment using Red Hat OpenShift Container Platform (OCP), install API Connect by mirroring product images to a bastion host or a portable device and then completing the installation.
- [Enable additional features post-install](#)
After installing API Connect, you can enable additional features that are related to inter-subsystem communication.

Connected installation

Install API Connect on OpenShift using a single, top-level Custom Resource while connected to the internet.

About this task

Complete the following tasks in the sequence shown:

1. [Installing operators](#)
Install operators for API Connect, DataPower, and common services so that you can deploy API Connect.
2. [Installing API Connect](#)
Use the top-level `APICConnectCluster` CR to install all of the API Connect subsystems into a shared namespace on OpenShift while connected to the internet.

Installing operators

Install operators for API Connect, DataPower, and common services so that you can deploy API Connect.

Before you begin

The API Connect operator and operand must be from the same release and fix pack level. Table 1 lists the current version of the operator and operand for API Connect.

Table 1. API Connect operator and operand versions

API Connect (operand)	Operator channel version	Highest operator version
10.0.5.6	v3.6	3.6.0

You can use any combination of API Connect 10.0.5.x with DataPower Gateway 10.5.0.x or DataPower API Gateway 10.5.0.x.

Procedure

1. Obtain an entitlement key for the Entitled Registry:
 - a. Log in to the [IBM Container Library](#).
 - b. In the Container software library, select Get entitlement key.
 - c. After the Access your container software heading, click Copy key.
 - d. Copy the key to a safe location.
2. Create the namespace where API Connect will be installed, either by selecting Home->Projects->Create Project in the UI, or with the command:

```
oc create ns <APIC-namespace>
```

The namespace where you install API Connect must meet the following requirements:

- OpenShift restricts the use of default namespaces for installing non-cluster services. The following namespaces cannot be used to install API Connect: **default, kube-system, kube-public, openshift-node, openshift-infra, openshift.**
 - OpenShift: Only one top-level CR (APICConnectCluster) can be deployed in each namespace.
 - Cloud Pak for Integration: Only one API Connect capability can be deployed in each namespace.
3. If you are installing the operator into a single namespace, create an OperatorGroup object specifying that namespace.

Attention: If you are installing the operator into all namespaces, skip this step because the `openshift-operators` namespace already has an appropriate Operator group in place.

- a. Create the `apiconnect-operator-group.yaml` file with an OperatorGroup object that identifies the namespace in which RBAC permissions for the IBM API Connect Operator will be generated, and where the CSV will be available:

```
apiVersion: operators.coreos.com/v1
kind: OperatorGroup
metadata:
  name: <operator-group-name>
  namespace: <APIC-namespace>
spec:
  targetNamespaces:
  - <APIC-namespace>
```

- b. Apply the OperatorGroup object with the following command:

```
oc apply -f apiconnect-operator-group.yaml
```

4. Create the image pull secret in the namespace where you want to install API Connect:
 - a. Open the OpenShift web console, click Workloads, > Secrets.
 - b. Ensure that the Project is set to the namespace where you intend to install API Connect.
 - c. Click Create and select Image pull secret.
 - d. Set the following parameters for the secret:
 - Set Secret name to `ibm-entitlement-key`.
 - Set Authentication type to `Image registry credentials`.
 - Set Registry server address to `cp.icr.io`.
 - Set Username to `cp`.
 - Set Password to the entitlement key generated in Step 1.
 - Click Create to create the secret.

Note: If your OpenShift platform is Red Hat OpenShift on IBM Cloud (ROKS), you might need to reload your worker nodes after the image pull secret is created. You can reload the worker nodes either from the OpenShift web console or from the command line with: `oc worker reload`.

5. Add the IBM Operator Catalog source:

- a. In the OpenShift web console, and click + (in the page banner) to open the Import YAML dialog box.
- b. Paste the following resource definition into the dialog box:

```
apiVersion: operators.coreos.com/v1alpha1
kind: CatalogSource
metadata:
  name: ibm-operator-catalog
  namespace: openshift-marketplace
spec:
  displayName: "IBM Operator Catalog"
  publisher: IBM
  sourceType: grpc
  image: icr.io/cpopen/ibm-operator-catalog
  updateStrategy:
    registryPoll:
      interval: 45m
```

- c. Click Create.

6. Create the `apiconnect` subscription.

- a. Create the `apiconnect` subscription with the appropriate channel by creating a file called `apic-sub.yaml` and pasting in the following contents, updating the namespace as required:

```
apiVersion: operators.coreos.com/v1alpha1
kind: Subscription
metadata:
  name: ibm-apiconnect
  namespace: <namespace>
spec:
  channel: v3.6
  name: ibm-apiconnect
  source: ibm-operator-catalog
  sourceNamespace: openshift-marketplace
```

Where:

- `<namespace>` is set to `openshift-operators` if you are installing the API Connect operator in all namespaces. Otherwise set this to the namespace created in [step 2](#).

- b. Apply the subscription with the following command:

```
oc apply -f apic-sub.yaml
```

- c. Select Operators > Installed Operators, and ensure that Project: All Projects is selected.

If any operators such as `ibm-apiconnect` or `ibm-cert-manager-operator` show the status of "Upgrade available", approve the upgrade by completing the following steps:

- i. Click Upgrade available.
- ii. Click Preview InstallPlan.
- iii. Click Approve.
- iv. Wait for the **IBM API Connect** and **IBM DataPower Gateway** operators to install.

The **IBM DataPower Gateway** operator is a prerequisite to API Connect and must not be removed.

7. (10.0.5.3 and later) Create the `ibm-common-services-operator` subscription, if it does not already exist.

This step only applies when you install version 10.0.5.3 or later. If you are installing an older version of API Connect, skip this step.

- a. Create a file called `common-services-sub.yaml` and paste in the following contents:

```
apiVersion: operators.coreos.com/v1alpha1
kind: Subscription
metadata:
  name: ibm-common-service-operator
  namespace: <namespace>
spec:
  channel: <channel>
  name: ibm-common-service-operator
  source: ibm-operator-catalog
  sourceNamespace: openshift-marketplace
```

Where:

- `<namespace>` is one of the following values:
 - `openshift-operators` if you are installing the API Connect operator in all namespaces
 - The namespace created in [step 2](#) if you are installing the API Connect operator in a single namespace
- `<channel>` is one of the following values:
 - `v3.23` if you are using IBM Cloud Pak foundational services for CD (continuous delivery)
 - `v3` if you are using IBM Cloud Pak foundational services for LTSR (long term service release)

- b. Apply the subscription with the following command:

```
oc apply -f common-services-sub.yaml
```

- c. Select Operators > Installed Operators, and ensure that Project: All Projects is selected.

If any operators such as `ibm-apiconnect` or `ibm-cert-manager-operator` show the status of "Upgrade available", approve the upgrade by completing the following steps:

- i. Click Upgrade available.
- ii. Click Preview InstallPlan.
- iii. Click Approve.
- iv. Check the `ibm-common-services` namespace and ensure that all operators with a status of "Upgrade available" are approved.
- v. Wait for the **IBM Cloud Pak foundational services**, **IBM NamespaceScope**, and **Operand Deployment Lifecycle Manager** operators to install.

8. (10.0.5.3 and later) Install cert manager:

This step only applies when you install version 10.0.5.3 or later. If you are installing an older version of API Connect, skip this step.

- a. Create a file called cert-manager-operand-request.yaml and paste in the following content:

```
apiVersion: operator.ibm.com/v1alpha1
kind: OperandRequest
metadata:
  name: ibm-apiconnect-cert-manager
  namespace: <namespace>
spec:
  requests:
  - operands:
    - name: ibm-cert-manager-operator
      registry: common-service
      registryNamespace: ibm-common-services
```

- b. Create the operandRequest for cert-manager by running the following command:

```
oc apply -f cert-manager-operand-request.yaml
```

- c. Select Operators > Installed Operators, and ensure that Project: All Projects is selected.

Wait for the **ibm-cert-manager-operator** to display and if it shows the status of "Upgrade available", approve the upgrade by completing the following steps:

- i. Click Upgrade available.
ii. Click Preview InstallPlan.
iii. Click Approve.
iv. Wait for the **IBM Cert Manager** operator to install.

Next topic: [Installing API Connect](#)

Installing API Connect

Use the top-level **APIConnectCluster** CR to install all of the API Connect subsystems into a shared namespace on OpenShift while connected to the internet.

Before you begin

Review installation considerations and complete and prerequisite tasks as explained in:

- 1. [Preparing for installation](#)
2. [Installing operators](#)

Procedure

- 1. Install the subsystems by using the OpenShift web console.

API Connect uses a single top-level **apiconnectcluster** CR to quickly deploy all of the subsystems. With the top-level CR, you provide values for a small number of properties, and then the install logic chooses sensible defaults for you while deploying all of the subsystems.

- a. Select Operators->Installed Operators
b. Click on the IBM API Connect operator.
c. Click Create Instance on the API Connect cluster tile to install the top level Custom Resource.
Selecting API Connect cluster installs all the API Connect subsystems with the default configuration. The API Connect subsystems are Management, Developer Portal, Gateway, and Analytics.
d. Provide values for the following fields.

Table 1. Properties for the API Connect top-level CR

Input	Value
Name	The name to be used when deploying the API Connect cluster Custom Resource
License acceptance	Required. Click to accept the license. You must accept the license to install API Connect.
License use	Required. Select production or nonproduction to match the type of license that you purchased.
License metric	Optional. Enter the unit of measurement that is used for your program license: <ul style="list-style-type: none">PROCESSOR_VALUE_UNIT - Default value. If you leave the field blank, this value is used.MONTHLY_API_CALL - Applies only to the IBM API Connect Hybrid Entitlement program.
License ID	Required. Select the license ID for the API Connect program that you purchased. To view all license IDs, see API Connect licenses .
Deployment profile	The deployment profile defines the number of worker nodes, CPU, and memory that is available for API Connect. The available profiles are listed in API Connect deployment profiles for OpenShift and Cloud Pak for Integration .
Product version	Optional. The API Connect application version. Defaults to the latest version available.
Default storage class name	The name of the Storage class to be used You can set a default to appear here with the command: <pre>oc patch storageclass <storage class name> -p '{"metadata": {"annotations": {"storageclass.kubernetes.io/is-default-class": "true"}}}'</pre>

- e. Optional: If you are installing Cloud Pak for Integration 2022.2.1 or 2022.4.1 and don't want to use Cloud Pak endpoints, click the YAML tab and manually add the following annotation to the **metadata** section of your CR:

```
metadata:
  annotations:
    apiconnect-operator/cp4i: "false"
```

f. If you want to configure additional settings, click Advanced and see [API Connect configuration settings](#) for information on the advanced settings.

Notes:

- Before you install API Connect, you can customize the configuration of the analytics subsystem. Review the information in [Planning your analytics deployment](#) to choose configuration options, and then configure the settings as explained in [Analytics subsystem CR configured settings](#). The OpenShift web console deploys API Connect with a single, top-level CR, so add your configuration settings to the `spec.analytics` section of the CR.
- When setting additional values, you cannot specify more than one host for the `portalUIEndpoint` endpoint, due to a limitation of the Routes in OCP. If you require multiple `portalUIEndpoint` hosts to provide public access to multiple catalogs, deploy a new Portal service for each host name.

2. To verify your API Connect cluster is successfully installed, run `oc get apic -n <APIC-namespace>`.

3. Verify that you can log in to the API Connect Cloud Manager UI:

- To determine the location for logging in, view all the endpoints:

```
oc get routes -n <APIC-namespace>
```

- Locate the `mgmt-admin-apic` endpoint, and access the Cloud Manager UI
- Login as `admin`. When you install with the top-level CR, the password is auto-generated. To get the password:

```
oc get secret -n <APIC-namespace> | grep mgmt-admin-pass
```

```
oc get secret -n <APIC-namespace> <secret_name_from_previous_command> -o jsonpath="{.data.password}" | base64 -d && echo ""
```

4. Optional: Configure additional features related to inter-subsystem communication security, such as CA verification and JWT security: [Enable additional features post-install](#).

5. Optional: Increase the timeout settings for management endpoints, particularly for large deployments. See [Configuring timeouts for management endpoints](#).

6. Optional tasks:

- Toolkit
You can optionally download the API Connect toolkit from the Cloud Manager UI or API Manager UI after installation is completed. See [Installing the toolkit](#).
- Local Test Environment
You can install this optional test environment after initial installation. See [Testing an API with the Local Test Environment](#).

Note: You can also install the Toolkit and Local Test Environment from IBM Fix Central. For a link to the latest files on Fix Central, see [What's new in the latest release](#).

What to do next

When you finish installing API Connect, [prepare your deployment for disaster recovery](#) so that your data can be restored in the event of an emergency.

Previous topic: [Installing operators](#)

Air-gapped installation

In a disconnected environment using Red Hat OpenShift Container Platform (OCP), install API Connect by mirroring product images to a bastion host or a portable device and then completing the installation.

Before you begin

- Mirroring API Connect product images requires the use of IBM Catalog Management Plug-in for IBM Cloud Paks.
- An air-gapped installation is not possible in the following environments:
 - Red Hat OpenShift Service on AWS (ROSA)
 - Red Hat OpenShift Service Kubernetes Service on IBM Cloud (ROKS)

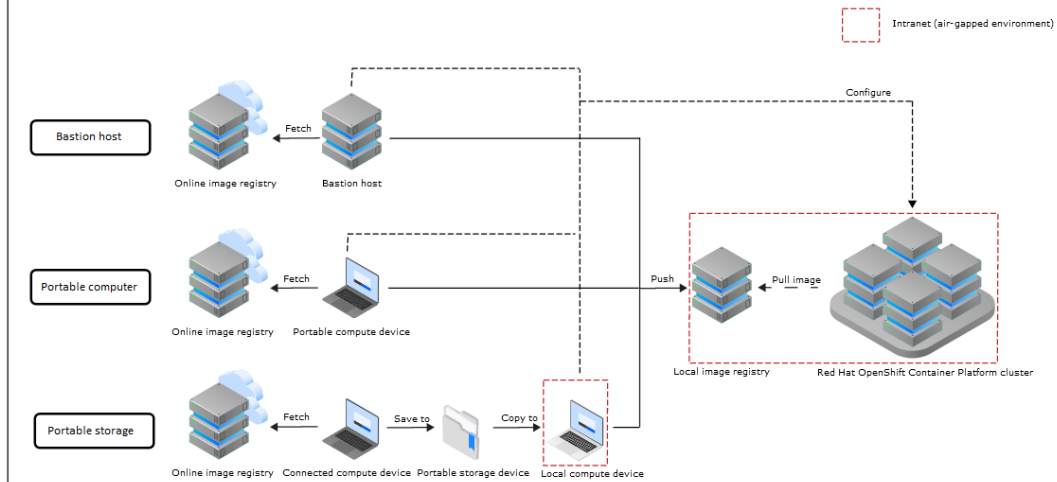

About this task

If your cluster is not connected to the internet (it is network-restricted, or air-gapped), you can install API Connect in your cluster by using either a bastion host, a portable computer, or a portable storage device.

The following diagram illustrates how you can mirror product images for an air-gapped installation with a bastion host, a portable computer, or a portable storage device.

Air-gapped installation scenarios

Mirroring product images for installation using a bastion host, a portable computer, or a portable storage device

All of the scenarios use Container Application Software for Enterprises (CASE) files to mirror content from a source (on the internet) to an intermediary target (a bastion host, a portable computer, or a portable storage device) before pushing them to a local server or device.

Then, you can transfer the files to the local air-gapped network and run the installation.

- [Installing with a bastion host](#)
You can use a bastion host to perform an air-gapped installation of API Connect on Red Hat OpenShift Container Platform (OCP) when your cluster has no internet connectivity.
- [Installing with a portable computer or storage device](#)
You can use a portable device, such as a portable computer or a USB storage device, to perform an air-gapped installation of API Connect on Red Hat OpenShift Container Platform (OCP) when your cluster has no internet connectivity.

Installing with a bastion host

You can use a bastion host to perform an air-gapped installation of API Connect on Red Hat OpenShift Container Platform (OCP) when your cluster has no internet connectivity.

Before you begin

This task must be performed by a Red Hat OpenShift administrator.

About this task

If your cluster is not connected to the internet, you can mirror product images to a registry in your network-restricted environment by using a bastion host. A bastion host has access to both the public internet and the network-restricted environment where the target clusters reside. You can fetch product images from the internet and push them to a local registry; then you can pull the images from the local registry to the target cluster for installation.

Procedure

1. Set up the mirroring environment.
 - a. Prepare the target cluster:
 - Deploy a supported version of Red Hat OpenShift Container Platform (OCP) as a cluster. For information, see Table 2 "API Connect and OpenShift Container Platform (OCP) compatibility matrix" in [IBM API Connect Version 10 software product compatibility requirements](#).
 - Configure storage on the cluster and make sure that it is available.
 - b. Prepare the bastion host:

You must be able to connect your bastion host to the internet and to the restricted network environment (with access to the Red Hat OpenShift Container Platform (OCP) cluster and the local registry) at the same time. Your host must be on a Linux x86_64 or Mac platform with any operating system that the Red Hat OpenShift Client supports (in Windows, execute the actions in a Linux x86_64 VM or from a Windows Subsystem for Linux terminal).

- i. Ensure that the sites and ports listed in Table 1 can be reached from the bastion host:

Table 1. Sites that must be reached from the bastion host

Site	Description
icr.io:443	IBM entitled registry
quay.io:443	Local API Connect image repository
github.com	CASE files and tools
redhat.com	Red Hat OpenShift Container Platform (OCP) upgrades

- ii. On the bastion host, install either Docker or Podman (not both).

Docker and Podman are used for managing containers; you only need to install one of these applications.

- To install Docker (for example, on Red Hat Enterprise Linux), run the following commands:

```
yum check-update
yum install docker
```

- To install Podman, see the [Podman installation instructions](#). For example, on Red Hat Enterprise Linux 9, install Podman with the following command:

```
yum install podman
```

- iii. Install the Red Hat OpenShift Client tool (`oc`) as explained in [Getting started with the OpenShift CLI](#). The `oc` tool is used for managing Red Hat OpenShift resources in the cluster.

- iv. Download the IBM Catalog Management Plug-in for IBM Cloud Paks version 1.1.0 or later from [GitHub](#). The `ibm-pak` plug-in enables you to access hosted product images, and to run `oc ibm-pak` commands against the cluster. To confirm that `ibm-pak` is installed, run the following command and verify that the response lists the command usage:

```
oc ibm-pak --help
```

- c. Set up a local image registry and credentials.

The local Docker registry stores the mirrored images in your network-restricted environment.

- i. Install a registry, or get access to an existing registry.

You might already have access to one or more centralized, corporate registry servers to store the API Connect images. If not, then you must install and configure a production-grade registry before proceeding.

The registry product that you use must meet the following requirements:

- Supports multi-architecture images through Docker Manifest V2, Schema 2
For details, see [Docker Manifest V2, Schema 2](#).
- Is accessible from the Red Hat OpenShift Container Platform cluster nodes
- Allows path separators in the image name

Note: Do not use the Red Hat OpenShift image registry as your local registry because it does not support multi-architecture images or path separators in the image name.

- ii. Configure the registry to meet the following requirements:

- Supports auto-repository creation
- Has sufficient storage to hold all of the software that is to be transferred
- Has the credentials of a user who can create and write to repositories (the mirroring process uses these credentials)
- Has the credentials of a user who can read all repositories (the Red Hat OpenShift Container Platform cluster uses these credentials)

To access your registries during an air-gapped installation, use an account that can write to the target local registry. To access your registries during runtime, use an account that can read from the target local registry.

2. Set environment variables and download CASE files.

Because you will use values from two different CASE files, you must create environment variables for both; notice that the variables for the foundational services (common services) CASE file are prefixed with "CS_" to differentiate them.

- a. Create the following environment variables with the installer image name and the image inventory on your host:

```
export CASE_NAME=ibm-apiconnect
export CASE_VERSION=4.0.7
export ARCH=amd64
```

For information on API Connect CASE versions and their corresponding operators and operands, see [Operator, operand, and CASE versions](#).

```
export CS_CASE_NAME=ibm-cp-common-services
export CS_CASE_VERSION=1.15.10
export CS_ARCH=amd64
```

For example, for IBM Cloud Pak foundational services 3.19.X (Long Term Service Release), use version 1.15.10; for foundational services 3.23.X (Continuous Delivery), use version 1.19.2.

For information on IBM Cloud Pak foundational services (common services) CASE versions, see "Table 1. Image versions for offline installation" in [Installing IBM Cloud Pak foundational services in an air-gapped environment](#) in the IBM Cloud Pak foundational services documentation.

- b. Connect your host to the internet (it does not need to be connected to the network-restricted environment at this time).

- c. Download the CASE file to your host:

Be sure to download both CASE files as shown in the example:

```
oc ibm-pak get $CASE_NAME --version $CASE_VERSION

oc ibm-pak get $CS_CASE_NAME --version $CS_CASE_VERSION
```

If you omit the `--version` parameter, the command downloads the latest version.

3. Mirror the images.

The process of mirroring images pulls the images from the internet and pushes them to your local registry. After mirroring your images, you can configure your cluster and pull the images to it before installing API Connect.

- a. Generate mirror manifests.

- i. Define the environment variable `$TARGET_REGISTRY` by running the following command:

```
export TARGET_REGISTRY=<target-registry>
```

Replace `<target-registry>` with the IP address (or host name) and port of the local registry; for example: `172.16.0.10:5000`. If you want the images to use a specific namespace within the target registry, you can specify it here; for example: `172.16.0.10:5000/registry_ns`.

- ii. Generate mirror manifests by running the following command:

```
oc ibm-pak generate mirror-manifests $CASE_NAME --version $CASE_VERSION $TARGET_REGISTRY
oc ibm-pak generate mirror-manifests $CS_CASE_NAME --version $CS_CASE_VERSION $TARGET_REGISTRY
```

If you need to filter for a specific image group, add the parameter `--filter <image_group>` to the command.

The `generate` command creates the following files at `~/ibm-pak/data/mirror/$CASE_NAME/$CASE_VERSION` and `~/ibm-pak/data/mirror/$CS_CASE_NAME/$CS_CASE_VERSION`:

- `catalog-sources.yaml`
- `catalog-sources-linux-<arch>.yaml` (if there are architecture-specific catalog sources)
- `image-content-source-policy.yaml`
- `images-mapping.txt`

The files are used when mirroring the images to the `TARGET_REGISTRY`.

- b. Obtain an entitlement key for the entitled registry where the images are hosted:

- Log in to the [IBM Container Library](#).
- In the Container software library, select Get entitlement key.
- In the "Access your container software" section, click Copy key.
- Copy the key to a safe location; you will use it to log in to `cp.icr.io` in the next step.

- c. Authenticate with the entitled registry where the images are hosted.

The image pull secret allows you to authenticate with the entitled registry and access product images.

- Run the following command to export the path to the file that will store the authentication credentials that are generated on a Podman or Docker login:

```
export REGISTRY_AUTH_FILE=$HOME/.docker/config.json
```

The authentication file is typically located at `$HOME/.docker/config.json` on Linux or `%USERPROFILE%\.docker/config.json` on Windows.

- Log in to the `cp.icr.io` registry with Podman or Docker; for example:

```
podman login cp.icr.io
```

Use `cp` as the username and your entitlement key as the password.

- d. Authenticate with the local registry.

Log in to the local registry using an account that can write images to that registry; for example:

```
podman login $TARGET_REGISTRY
```

If the registry is insecure, add the following flag to the command: `--tls-verify=false`.

- e. Update the CASE manifest to correctly reference the DataPower Operator image.

Files for the DataPower Operator are now hosted on `icr.io`; however, the CASE manifest still refers to `docker.io` as the image host. To work around this issue, visit [Airgap install failure due to 'unable to retrieve source image docker.io'](#) in the DataPower documentation and update the manifest as instructed. After the manifest is updated, continue to the next step in this procedure.

- f. Mirror the product images.

- Connect the bastion host to both the internet and the restricted-network environment that contains the local registry.
- Run the following command to copy the images to the local registry:

```
oc image mirror \
-f ~/.ibm-pak/data/mirror/$CASE_NAME/$CASE_VERSION/images-mapping.txt \
-a $REGISTRY_AUTH_FILE \
--filter-by-os '*' \
--skip-multiple-scopes \
--max-per-registry=1

oc image mirror \
-f ~/.ibm-pak/data/mirror/$CS_CASE_NAME/$CS_CASE_VERSION/images-mapping.txt \
-a $REGISTRY_AUTH_FILE \
--filter-by-os '*' \
--skip-multiple-scopes \
--max-per-registry=1
```

Note: If the local registry is not secured by TLS, or the certificate presented by the local registry is not trusted by your device, add the `--insecure` option to the command.

There might be a slight delay before you see a response to the command.

- g. Configure the target cluster.

Now that images have been mirrored to the local registry, the target cluster must be configured to pull the images from it. Complete the following steps to configure the cluster's global pull secret with the local registry's credentials and then instruct the cluster to pull the images from the local registry.

- Log in to your Red Hat OpenShift Container Platform cluster:

```
oc login <openshift_url> -u <username> -p <password> -n <namespace>
```

- [Update the global image pull secret](#) for the cluster as explained in the Red Hat OpenShift Container Platform documentation.

Note: If you have an insecure registry, add the registry to the cluster's `insecureRegistries` list by running the following command:

```
oc edit image.config.openshift.io/cluster -o yaml
```

and add the `TARGET_REGISTRY` to `spec.registrySources.insecureRegistries` as shown in the following example:

```
spec:
  registrySources:
    insecureRegistries:
      - insecure0.svc:5001
      - <TARGET_REGISTRY>
```

If the `insecureRegistries` field does not exist, you can add it.

- iii. Create the `ImageContentSourcePolicy`, which instructs the cluster to pull the images from your local registry (run both commands):

```
oc apply -f ~/.ibm-pak/data/mirror/${CASE_NAME}/${CASE_VERSION}/image-content-source-policy.yaml
```

```
oc apply -f ~/.ibm-pak/data/mirror/${CS_CASE_NAME}/${CS_CASE_VERSION}/image-content-source-policy.yaml
```

- iv. Verify that the `ImageContentSourcePolicy` resource was created:

```
oc get imageContentSourcePolicy
```

- v. Verify your cluster node status:

```
oc get MachineConfigPool -w
```

Wait for all nodes to be updated before proceeding to the next step.

4. Apply the catalog sources.

Now that you have mirrored images to the target cluster, apply the catalog sources.

In the following steps, replace `<Architecture>` with either `amd64`, `s390x` or `ppc64le` as appropriate for your environment.

- a. Export the variables for the command line to use:

```
export CASE_NAME=ibm-apiconnect
export CASE_VERSION=4.0.7
export ARCH=amd64
```

```
export CS_CASE_NAME=ibm-cp-common-services
export CS_CASE_VERSION=1.15.10
export CS_ARCH=amd64
```

- b. Generate the catalog sources and save them in another directory in case you need to replicate this installation in the future.

- i. Get the catalog sources:

```
cat ~/.ibm-pak/data/mirror/${CASE_NAME}/${CASE_VERSION}/catalog-sources.yaml
```

```
cat ~/.ibm-pak/data/mirror/${CS_CASE_NAME}/${CS_CASE_VERSION}/catalog-sources.yaml
```

- ii. Get any architecture-specific catalog sources that you need to back up as well:

```
cat ~/.ibm-pak/data/mirror/${CASE_NAME}/${CASE_VERSION}/catalog-sources-linux-${ARCH}.yaml
```

You can also navigate to the directory in your file browser to copy these artifacts into files that you can keep for re-use or for pipelines.

- c. Apply the catalog sources to the cluster.

- i. Apply the universal catalog sources:

```
oc apply -f ~/.ibm-pak/data/mirror/${CASE_NAME}/${CASE_VERSION}/catalog-sources.yaml
```

```
oc apply -f ~/.ibm-pak/data/mirror/${CS_CASE_NAME}/${CS_CASE_VERSION}/catalog-sources.yaml
```

- ii. Apply any architecture-specific catalog sources:

```
oc apply -f ~/.ibm-pak/data/mirror/${CASE_NAME}/${CASE_VERSION}/catalog-sources-linux-${ARCH}.yaml
```

- iii. Confirm that the catalog sources were created in the `openshift-marketplace` namespace:

```
oc get catalogsource -n openshift-marketplace
```

5. Create the namespace where you will install API Connect.

- a. Specify the namespace where you want to install the operator:

```
export NAMESPACE=<APIC-namespace>
```

The namespace where you install API Connect must meet the following requirements:

- Red Hat OpenShift Container Platform (OCP): Only one top-level CR (`APICConnectCluster`) can be deployed in each namespace.
- Cloud Pak for Integration: Only one API Connect capability can be deployed in each namespace.
- The following namespaces cannot be used to install API Connect because Red Hat OpenShift Container Platform (OCP) restricts the use of default namespaces for installing non-cluster services:

- `default`
- `kube-system`
- `kube-public`
- `openshift-node`
- `openshift-infra`
- `openshift`

- b. Create a new namespace for installing the operator:

```
oc new-project $NAMESPACE
```

- c. Create an `OperatorGroup`:

- i. Create a YAML file called `apiconnect-operator-group.yaml` similar to the following example, replacing `<APIC-namespace>` with your new namespace:

```
apiVersion: operators.coreos.com/v1
kind: OperatorGroup
metadata:
  name: ibm-apiconnect-operatorgroup
spec:
  targetNamespaces:
  - <APIC-namespace>
```

- ii. Add the new operator group to your namespace:

```
oc apply -f apiconnect-operator-group.yaml -n ${NAMESPACE}
```

6. (10.0.5.3 and later) Create the `ibm-common-services-operator` subscription, if it does not already exist. This step only applies when you install version 10.0.5.3 or later. If you are installing an older version of API Connect, skip this step.

The `ibm-common-services-operator` is provided by IBM Cloud Pak foundational services.

- a. Create a file called `common-services-sub.yaml` and paste in the following contents:

```
apiVersion: operators.coreos.com/v1alpha1
kind: Subscription
metadata:
  name: ibm-common-service-operator
  namespace: <APIC-namespace>
spec:
  channel: <channel>
  installPlanApproval: Automatic
  name: ibm-common-service-operator
  source: opencloud-operators
  sourceNamespace: openshift-marketplace
```

Where:

- `<APIC-namespace>` the namespace where you will install API Connect.
- `<channel>` is one of the following values:
 - `v3.23` if you are using IBM Cloud Pak foundational services for Continuous Delivery
 - `v3` if you are using IBM Cloud Pak foundational services for Long Term Service Release

- b. Apply the subscription with the following command:

```
oc apply -f common-services-sub.yaml
```

- c. Select `Operators`, `Installed Operators`, and ensure that `Project: All Projects` is selected.

If any operators such as `ibm-apiconnect` or `ibm-cert-manager-operator` show the status of "Upgrade available", approve the upgrade by completing the following steps:

- i. Click Upgrade available.
- ii. Click Preview InstallPlan.
- iii. Click Approve.
- iv. Check the `ibm-common-services` namespace and ensure that all operators with a status of "Upgrade available" are approved.
- v. Wait for the `IBM Cloud Pak foundational services, IBM NamespaceScope`, and `Operand Deployment Lifecycle Manager` operators to install.

7. (10.0.5.3 and later) Install cert manager:

This step only applies when you install version 10.0.5.3 or later. If you are installing an older version of API Connect, skip this step.

- a. Create a file called `cert-manager-operand-request.yaml` and paste in the following content:

```
apiVersion: operator.ibm.com/v1alpha1
kind: OperandRequest
metadata:
  name: ibm-apiconnect-cert-manager
  namespace: <APIC-namespace>
spec:
  requests:
  - operands:
    - name: ibm-cert-manager-operator
      registry: common-service
      registryNamespace: ibm-common-services
```

- b. Create the `operandRequest` for cert-manager by running the following command:

```
oc apply -f cert-manager-operand-request.yaml
```

- c. Select `Operators`, `Installed Operators`, and ensure that `Project: All Projects` is selected.

Wait for the `ibm-cert-manager-operator` to display and if it shows the status of "Upgrade available", approve the upgrade by completing the following steps:

- i. Click Upgrade available.
- ii. Click Preview InstallPlan.
- iii. Click Approve.
- iv. Wait for the `IBM Cert Manager` operator to install.

8. Create a `Subscription` for the `IBM APICConnect` operator.

- a. Create a YAML file called `apic-sub.yaml` similar to the following example:

```
apiVersion: operators.coreos.com/v1alpha1
kind: Subscription
metadata:
  name: ibm-apiconnect
spec:
  channel: v3.6
  name: ibm-apiconnect
  source: ibm-apiconnect-catalog
  sourceNamespace: openshift-marketplace
```

- b. Apply the new subscription to your namespace:

```
oc apply -f apic-sub.yaml -n ${NAMESPACE}
```

9. Install API Connect (the operand).

API Connect provides one top-level CR that includes all of the API Connect subsystems (Management, Developer Portal, Analytics, and Gateway).

Tip: Before you install API Connect, you can customize the configuration of the analytics subsystem. Review the information in [Planning your analytics deployment](#) to choose configuration options, and then configure the settings as explained in [Analytics subsystem CR configured settings](#). If you are installing with the top-level `APIConnectCluster` CR, add your configuration settings to the `spec.analytics` section of the CR; if you are installing the subsystems individually, make your changes to the `AnalyticsCluster` CR.

- a. Create a YAML file to use for deploying the top-level `APIConnectCluster` CR. Use the template that applies to your deployment (non-production or production).

Note: The values shown in the following examples might not be suitable for your deployment. For information on the license, profile, and version settings, as well as additional configuration settings, see [API Connect configuration settings](#).

- Example CR settings for a one replica deployment:

```
apiVersion: apiconnect.ibm.com/v1beta1
kind: APIConnectCluster
metadata:
  labels:
    app.kubernetes.io/instance: apiconnect
    app.kubernetes.io/managed-by: ibm-apiconnect
    app.kubernetes.io/name: apiconnect-minimum
  name: <name_of_your_instance>
  namespace: <APIC-namespace>
spec:
  license:
    accept: true
    license: L-VQYA-YNM22H
    metric: PROCESSOR_VALUE_UNIT
    use: nonproduction
  profile: n1xc17.m48
  version: 10.0.5.6
  storageClassName: <default-storage-class>
```

- Example CR settings for a three replica deployment:

```
apiVersion: apiconnect.ibm.com/v1beta1
kind: APIConnectCluster
metadata:
  labels:
    app.kubernetes.io/instance: apiconnect
    app.kubernetes.io/managed-by: ibm-apiconnect
    app.kubernetes.io/name: apiconnect-production
  name: <name_of_your_instance>
  namespace: <APIC-namespace>
spec:
  license:
    accept: true
    license: L-VQYA-YNM22H
    metric: PROCESSOR_VALUE_UNIT
    use: production
  profile: n3xc16.m48
  version: 10.0.5.6
  storageClassName: <default-storage-class>
```

- b. Optional: If you don't want to use Cloud Pak endpoints in Cloud Pak for Integration 2022.2.1 or 2022.4.1, add the following annotation to the `metadata` section of your CR:

```
metadata:
  annotations:
    apiconnect-operator/cp4i: "false"
```

- c. Apply the YAML file:

```
oc apply -f <your_yaml_file>
```

- d. To verify your API Connect cluster is successfully installed, run the following command:

```
oc get apic -n <APIC-namespace>
```

- e. Verify that you can log in to the API Connect Cloud Manager UI:

To determine the location for logging in, view all the endpoints:

```
oc get routes -n <APIC-namespace>
```

- f. Locate the `mgmt-admin-apic` endpoint, and access the Cloud Manager UI.

- g. Login as the API Connect administrator.

When you install with the top-level CR, the password is auto-generated. To get the password:

```
oc get secret -n <APIC-namespace> | grep mgmt-admin-pass
oc get secret -n <APIC-namespace> <secret_name_from_previous_command> -o jsonpath="{.data.password}" | base64 -d &&
echo
```

10. Optional: Increase the timeout settings for the API Connect management endpoints, particularly for large deployments. See [Configuring timeouts for management endpoints](#).

What to do next

When you finish installing API Connect, [prepare your deployment for disaster recovery](#) so that your data can be restored in the event of an emergency.

Installing with a portable computer or storage device

You can use a portable device, such as a portal computer or a USB storage device, to perform an air-gapped installation of API Connect on Red Hat OpenShift Container Platform (OCP) when your cluster has no internet connectivity.

Before you begin

This task must be performed by a Red Hat OpenShift administrator.

About this task

If your cluster is not connected to the internet, you can mirror product images to a registry in your network-restricted environment by using a portable device. You can download images from the public registries on the internet to the portable device; then you can bring that portable device into the network-restricted environment (or transfer the files to a different device within the network-restricted environment) and mirror the images to the local registry. You can pull the images from the local registry to the target cluster for installation.

Procedure

1. Set up the mirroring environment.

a. Prepare the target cluster:

- Deploy a supported version of Red Hat OpenShift Container Platform (OCP) as a cluster.
For information, see Table 2 "API Connect and OpenShift Container Platform (OCP) compatibility matrix" in [IBM API Connect Version 10 software product compatibility requirements](#).
- Configure storage on the cluster and make sure that it is available.

b. Prepare the portable device:

You must be able to connect your portable device to the internet and to the restricted network environment (with access to the Red Hat OpenShift Container Platform (OCP) cluster and the local registry). The portable device must be on a Linux x86_64 or Mac platform with any operating system that the Red Hat OpenShift Client supports (in Windows, execute the actions in a Linux x86_64 VM or from a Windows Subsystem for Linux terminal).

- i. Ensure that the portable device has sufficient storage to hold all of the software that is to be transferred to the local registry.
- ii. On the portable device, install either Docker or Podman (not both).

Docker and Podman are used for managing containers; you only need to install one of these applications.

- To install Docker (for example, on Red Hat Enterprise Linux), run the following commands:

```
yum check-update
yum install docker
```

- To install Podman, see the [Podman installation instructions](#).
For example, on Red Hat Enterprise Linux 9, install Podman with the following command:

```
yum install podman
```

- iii. Install the Red Hat OpenShift Client tool (`oc`) as explained in [Getting started with the OpenShift CLI](#).
The `oc` tool is used for managing Red Hat OpenShift resources in the cluster.

- iv. Download the IBM Catalog Management Plug-in for IBM Cloud Paks version 1.1.0 or later from [GitHub](#).

The `ibm-pak` plug-in enables you to access hosted product images, and to run `oc ibm-pak` commands against the cluster. To confirm that `ibm-pak` is installed, run the following command and verify that the response lists the command usage:

```
oc ibm-pak --help
```

c. Set up a local image registry and credentials.

The local Docker registry stores the mirrored images in your network-restricted environment.

- i. Install a registry, or get access to an existing registry.

You might already have access to one or more centralized, corporate registry servers to store the API Connect images. If not, then you must install and configure a production-grade registry before proceeding.

The registry product that you use must meet the following requirements:

- Supports multi-architecture images through Docker Manifest V2, Schema 2
For details, see [Docker Manifest V2, Schema 2](#).
- Is accessible from the Red Hat OpenShift Container Platform cluster nodes
- Allows path separators in the image name

Note: Do not use the Red Hat OpenShift image registry as your local registry because it does not support multi-architecture images or path separators in the image name.

- ii. Configure the registry to meet the following requirements:

- Supports auto-repository creation
- Has sufficient storage to hold all of the software that is to be transferred
- Has the credentials of a user who can create and write to repositories (the mirroring process uses these credentials)
- Has the credentials of a user who can read all repositories (the Red Hat OpenShift Container Platform cluster uses these credentials)

To access your registries during an air-gapped installation, use an account that can write to the target local registry. To access your registries during runtime, use an account that can read from the target local registry.

2. Set environment variables and download CASE files.

Create environment variables to use while mirroring images, connect to the internet, and download the API Connect CASE files.

- a. Create the following environment variables with the installer image name and the image inventory on your portable device:

Because you will use values from two different CASE files, you must create environment variables for both; notice that the variables for the foundational services (common services) CASE file are prefixed with "CS_" to differentiate them.

```
export CASE_NAME=ibm-apiconnect
export CASE_VERSION=4.0.7
```

```
export ARCH=amd64
```

For information on API Connect CASE versions and their corresponding operators and operands, see [Operator, operand, and CASE versions](#).

```
export CS_CASE_NAME=ibm-cp-common-services
export CS_CASE_VERSION=1.15.10
export CS_ARCH=amd64
```

For example, for IBM Cloud Pak foundational services 3.19.X (Long Term Service Release), use version 1.15.10; for foundational services 3.23.X (Continuous Delivery), use version 1.19.2.

For information on IBM Cloud Pak foundational services (common services) CASE versions, see "Table 1. Image versions for offline installation" in [Installing IBM Cloud Pak foundational services in an air-gapped environment](#) in the IBM Cloud Pak foundational services documentation.

- b. Connect your portable device to the internet (it does not need to be connected to the network-restricted environment at this time).
- c. Download the CASE files to your portable device:
Be sure to download both CASE files as shown in the example:

```
oc ibm-pak get $CASE_NAME --version $CASE_VERSION
oc ibm-pak get $CS_CASE_NAME --version $CS_CASE_VERSION
```

If you omit the `--version` parameter, the command downloads the latest version.

3. Mirror the images.

The process of mirroring images pulls the images from the internet and pushes them to your local registry. After mirroring your images, you can configure your cluster and pull the images to it before installing API Connect.

- a. Generate mirror manifests.
 - i. Define the environment variable `$TARGET_REGISTRY` by running the following command:

```
export TARGET_REGISTRY=<target-registry>
```

Replace `<target-registry>` with the IP address (or host name) and port of the local registry; for example: `172.16.0.10:5000`. If you want the images to use a specific namespace within the target registry, you can specify it here; for example: `172.16.0.10:5000/registry_ns`.

- ii. Generate mirror manifests by running the following command:

```
oc ibm-pak generate mirror-manifests $CASE_NAME file://integration --version $CASE_VERSION --final-registry $TARGET_REGISTRY
```

```
oc ibm-pak generate mirror-manifests $CS_CASE_NAME file://integration --version $CS_CASE_VERSION --final-registry $TARGET_REGISTRY
```

If you need to filter for a specific image group, add the parameter `--filter <image_group>` to the command.

The `generate` command creates the following files at `~/ibm-pak/data/mirror/$CASE_NAME/$CASE_VERSION` and `~/ibm-pak/data/mirror/$CS_CASE_NAME/$CS_CASE_VERSION`:

- `catalog-sources.yaml`
- `catalog-sources-linux-<arch>.yaml` (if there are architecture-specific catalog sources)
- `image-content-source-policy.yaml`
- `images-mapping-to-filesystem.txt`
- `images-mapping-from-filesystem.txt`

The files are used when mirroring the images to the `TARGET_REGISTRY`.

- b. Obtain an entitlement key for the entitled registry where the images are hosted:
 - i. Log in to the [IBM Container Library](#).
 - ii. In the Container software library, select Get entitlement key.
 - iii. In the "Access your container software" section, click Copy key.
 - iv. Copy the key to a safe location; you will use it to log in to `cp.icr.io` in the next step.
- c. Authenticate with the entitled registry where the images are hosted.

The image pull secret allows you to authenticate with the entitled registry and access product images.

- i. Run the following command to export the path to the file that will store the authentication credentials that are generated on a Podman or Docker login:

```
export REGISTRY_AUTH_FILE=$HOME/.docker/config.json
```

The authentication file is typically located at `$HOME/.docker/config.json` on Linux or `%USERPROFILE%/.docker/config.json` on Windows.

- ii. Log in to the `cp.icr.io` registry with Podman or Docker; for example:

```
podman login cp.icr.io
```

Use `cp` as the username and your entitlement key as the password.

- d. Update the API Connect CASE manifest to correctly reference the DataPower Operator image.
Files for the DataPower Operator are now hosted on `icr.io`; however, the CASE manifest still refers to `docker.io` as the image host. To work around this issue, visit [Airgap install failure due to 'unable to retrieve source image docker.io'](#) in the DataPower documentation and update the manifest as instructed. The manifest for API Connect (which uses the DataPower Operator) is stored in `~/ibm-pak/data/mirror/$CASE_NAME/$CASE_VERSION`.

After the manifest is updated, continue to the next step in this procedure.

- e. Mirror the images from the internet to the portable device.
 - i. Define the environment variable `$IMAGE_PATH` by running the following command:

```
export IMAGE_PATH=<image-path>
```

where `<image-path>` indicates where the files will be stored on the portable device's file system.

- ii. Mirror the images to the portable device:

```

oc image mirror \
-f ~/.ibm-pak/data/mirror/$CASE_NAME/$CASE_VERSION/images-mapping-to-filesystem.txt \
--filter-by-os '*' \
-a $REGISTRY_AUTH_FILE \
--skip-multiple-scopes \
--max-per-registry=1 \
--dir "$IMAGE_PATH"

oc image mirror \
-f ~/.ibm-pak/data/mirror/$CS_CASE_NAME/$CS_CASE_VERSION/images-mapping-to-filesystem.txt \
--filter-by-os '*' \
-a $REGISTRY_AUTH_FILE \
--skip-multiple-scopes \
--max-per-registry=1 \
--dir "$IMAGE_PATH"

```

There might be a slight delay before you see a response to the command.

- f. Move the portable device to the restricted-network environment.

The procedure depends on the type of device that you are using:

If you are using a portable computer, disconnect the device from the internet and connect it to the restricted-network environment. The same environment variables can be used.

If you are using portable storage, complete the following steps:

- i. Transfer the following files to a device in the restricted-network environment:
 - The `~/.ibm-pak` directory.
 - The contents of the `<image-path>` that you specified in the previous step.
- ii. Create the same environment variables as on the original device; for example:

```

export CASE_NAME=ibm-apiconnect
export CASE_VERSION=4.0.7
export ARCH=amd64

export CS_CASE_NAME=ibm-cp-common-services
export CS_CASE_VERSION=1.15.10
export CS_ARCH=amd64

export REGISTRY_AUTH_FILE=$HOME/.docker/config.json

export IMAGE_PATH=<image-path>

```

- g. Authenticate with the local registry.

Log in to the local registry using an account that can write images to that registry; for example:

```
podman login $TARGET_REGISTRY
```

If the registry is insecure, add the following flag to the command: `--tls-verify=false`.

- h. Mirror the product images to the target registry.

- i. If you are using a portable computer, connect it to the restricted-network environment that contains the local registry. If you are using portable storage, you already transferred files to a device within the restricted-network environment.
- ii. Run the following command to copy the images to the local registry:

```

oc image mirror \
-f ~/.ibm-pak/data/mirror/$CASE_NAME/$CASE_VERSION/images-mapping-from-filesystem.txt \
-a $REGISTRY_AUTH_FILE \
--filter-by-os '*' \
--skip-multiple-scopes \
--max-per-registry=1 \
--from-dir "$IMAGE_PATH"

oc image mirror \
-f ~/.ibm-pak/data/mirror/$CS_CASE_NAME/$CS_CASE_VERSION/images-mapping-from-filesystem.txt \
-a $REGISTRY_AUTH_FILE \
--filter-by-os '*' \
--skip-multiple-scopes \
--max-per-registry=1 \
--from-dir "$IMAGE_PATH"

```

Note: If the local registry is not secured by TLS, or the certificate presented by the local registry is not trusted by your device, add the `--insecure` option to the command.

There might be a slight delay before you see a response to the command.

- i. Configure the target cluster.

Now that images have been mirrored to the local registry, the target cluster must be configured to pull the images from it. Complete the following steps to configure the cluster's global pull secret with the local registry's credentials and then instruct the cluster to pull the images from the local registry.

- i. Log in to your Red Hat OpenShift Container Platform cluster:

```
oc login <openshift_url> -u <username> -p <password> -n <namespace>
```

- ii. [Update the global image pull secret](#) for the cluster as explained in the Red Hat OpenShift Container Platform documentation.

Note: If you have an insecure registry, add the registry to the cluster's `insecureRegistries` list by running the following command:

```
oc edit image.config.openshift.io/cluster -o yaml
```

and add the `TARGET_REGISTRY` to `spec.registrySources.insecureRegistries` as shown in the following example:

```

spec:
  registrySources:
    insecureRegistries:

```

```
- insecure0.svc:5001
- <TARGET_REGISTRY>
```

If the `insecureRegistries` field does not exist, you can add it.

- iii. Create the `ImageContentSourcePolicy`, which instructs the cluster to pull the images from your local registry (run both commands):

```
oc apply -f ~/.ibm-pak/data/mirror/${CASE_NAME}/${CASE_VERSION}/image-content-source-policy.yaml
oc apply -f ~/.ibm-pak/data/mirror/${CS_CASE_NAME}/${CS_CASE_VERSION}/image-content-source-policy.yaml
```

- iv. Verify that each `ImageContentSourcePolicy` resource was created:

```
oc get imageContentSourcePolicy
```

- v. Verify your cluster node status:

```
oc get MachineConfigPool -w
```

Wait for all nodes to be updated before proceeding to the next step.

4. Apply the catalog sources.

Now that you have mirrored images to the target cluster, apply the catalog sources.

In the following steps, replace `<Architecture>` with either `amd64`, `s390x` or `ppc64le` as appropriate for your environment.

- a. Export the variables for the command line to use:

```
export CASE_NAME=ibm-apiconnect
export CASE_VERSION=4.0.7
export ARCH=amd64

export CS_CASE_NAME=ibm-cp-common-services
export CS_CASE_VERSION=1.15.10
export CS_ARCH=amd64
```

- b. Generate the catalog sources and save them in another directory in case you need to replicate this installation in the future.

- i. Get the catalog sources:

```
cat ~/.ibm-pak/data/mirror/${CASE_NAME}/${CASE_VERSION}/catalog-sources.yaml
cat ~/.ibm-pak/data/mirror/${CS_CASE_NAME}/${CS_CASE_VERSION}/catalog-sources.yaml
```

- ii. Get any architecture-specific catalog sources that you need to back up as well:

```
cat ~/.ibm-pak/data/mirror/${CASE_NAME}/${CASE_VERSION}/catalog-sources-linux-${ARCH}.yaml
```

You can also navigate to the directory in your file browser to copy these artifacts into files that you can keep for re-use or for pipelines.

- c. Apply the catalog sources to the cluster.

- i. Apply the universal catalog sources:

```
oc apply -f ~/.ibm-pak/data/mirror/${CASE_NAME}/${CASE_VERSION}/catalog-sources.yaml
oc apply -f ~/.ibm-pak/data/mirror/${CS_CASE_NAME}/${CS_CASE_VERSION}/catalog-sources.yaml
```

- ii. Apply any architecture-specific catalog sources:

```
oc apply -f ~/.ibm-pak/data/mirror/${CASE_NAME}/${CASE_VERSION}/catalog-sources-linux-${ARCH}.yaml
```

- iii. Confirm that the catalog sources were created in the `openshift-marketplace` namespace:

```
oc get catalogsource -n openshift-marketplace
```

5. Create the namespace where you will install API Connect.

- a. Specify the namespace where you want to install the operator:

```
export NAMESPACE=<APIC-namespace>
```

The namespace where you install API Connect must meet the following requirements:

- Red Hat OpenShift Container Platform (OCP): Only one top-level CR (`APIConnectCluster`) can be deployed in each namespace.
- Cloud Pak for Integration: Only one API Connect capability can be deployed in each namespace.
- The following namespaces cannot be used to install API Connect because Red Hat OpenShift Container Platform (OCP) restricts the use of default namespaces for installing non-cluster services:
 - `default`
 - `kube-system`
 - `kube-public`
 - `openshift-node`
 - `openshift-infra`
 - `openshift`

- b. Create a new namespace for installing the operator:

```
oc new-project $NAMESPACE
```

- c. Create an `OperatorGroup`:

- i. Create a YAML file called `apiconnect-operator-group.yaml` similar to the following example, replacing `<APIC-namespace>` with your new namespace:

```
apiVersion: operators.coreos.com/v1
kind: OperatorGroup
metadata:
  name: ibm-apiconnect-operatorgroup
spec:
```

```
targetNamespaces:
- <APIC-namespace>
```

ii. Add the new operator group to your namespace:

```
oc apply -f apiconnect-operator-group.yaml -n ${NAMESPACE}
```

6. (10.0.5.3 and later) Create the `ibm-common-services-operator` subscription, if it does not already exist.

This step only applies when you install version 10.0.5.3 or later. If you are installing an older version of API Connect, skip this step.

The `ibm-common-services-operator` is provided by IBM Cloud Pak foundational services.

a. Create a file called `common-services-sub.yaml` and paste in the following contents:

```
apiVersion: operators.coreos.com/v1alpha1
kind: Subscription
metadata:
  name: ibm-common-service-operator
  namespace: <APIC-namespace>
spec:
  channel: <channel>
  installPlanApproval: Automatic
  name: ibm-common-service-operator
  source: opencloud-operators
  sourceNamespace: openshift-marketplace
```

Where:

- `<APIC-namespace>` the namespace where you will install API Connect.
- `<channel>` is one of the following values:
 - `v3.23` if you are using IBM Cloud Pak foundational services for Continuous Delivery
 - `v3` if you are using IBM Cloud Pak foundational services for Long Term Service Release

b. Apply the subscription with the following command:

```
oc apply -f common-services-sub.yaml
```

c. Select `Operators`, `Installed Operators`, and ensure that `Project: All Projects` is selected.

If any operators such as `ibm-apiconnect` or `ibm-cert-manager-operator` show the status of "Upgrade available", approve the upgrade by completing the following steps:

- Click Upgrade available.
- Click Preview InstallPlan.
- Click Approve.
- Check the `ibm-common-services` namespace and ensure that all operators with a status of "Upgrade available" are approved.
- Wait for the `IBM Cloud Pak foundational services, IBM NamespaceScope`, and `Operand Deployment Lifecycle Manager` operators to install.

7. (10.0.5.3 and later) Install cert manager:

This step only applies when you install version 10.0.5.3 or later. If you are installing an older version of API Connect, skip this step.

a. Create a file called `cert-manager-operand-request.yaml` and paste in the following content:

```
apiVersion: operator.ibm.com/v1alpha1
kind: OperandRequest
metadata:
  name: ibm-apiconnect-cert-manager
  namespace: <APIC-namespace>
spec:
  requests:
  - operands:
    - name: ibm-cert-manager-operator
      registry: common-service
      registryNamespace: ibm-common-services
```

b. Create the `operandRequest` for cert-manager by running the following command:

```
oc apply -f cert-manager-operand-request.yaml
```

c. Select `Operators`, `Installed Operators`, and ensure that `Project: All Projects` is selected.

Wait for the `ibm-cert-manager-operator` to display and if it shows the status of "Upgrade available", approve the upgrade by completing the following steps:

- Click Upgrade available.
- Click Preview InstallPlan.
- Click Approve.
- Wait for the `IBM Cert Manager` operator to install.

8. Create a `Subscription` for the `IBM`

`APIConnect` operator.

a. Create a YAML file called `apic-sub.yaml` similar to the following example:

```
apiVersion: operators.coreos.com/v1alpha1
kind: Subscription
metadata:
  name: ibm-apiconnect
spec:
  channel: v3.6
  name: ibm-apiconnect
  source: ibm-apiconnect-catalog
  sourceNamespace: openshift-marketplace
```

b. Apply the new subscription to your namespace:

```
oc apply -f apic-sub.yaml -n ${NAMESPACE}
```

9. Install API Connect (the operand).

API Connect provides one top-level CR that includes all of the API Connect subsystems (Management, Developer Portal, Analytics, and Gateway).

Tip: Before you install API Connect, you can customize the configuration of the analytics subsystem. Review the information in [Planning your analytics deployment](#) to choose configuration options, and then configure the settings as explained in [Analytics subsystem CR configured settings](#). If you are installing with the top-level **APIConnectCluster** CR, add your configuration settings to the **spec.analytics** section of the CR; if you are installing the subsystems individually, make your changes to the **AnalyticsCluster** CR.

- a. Create a YAML file to use for deploying the top-level **APIConnectCluster** CR. Use the template that applies to your deployment (non-production or production).

Note: The values shown in the following examples might not be suitable for your deployment. For information on the license, profile, and version settings, as well as additional configuration settings, see [API Connect configuration settings](#).

- Example CR settings for a one replica deployment:

```
apiVersion: apiconnect.ibm.com/v1beta1
kind: APIConnectCluster
metadata:
  labels:
    app.kubernetes.io/instance: apiconnect
    app.kubernetes.io/managed-by: ibm-apiconnect
    app.kubernetes.io/name: apiconnect-minimum
  name: <name_of_your_instance>
  namespace: <APIC-namespace>
spec:
  license:
    accept: true
    license: L-VQYA-YNM22H
    metric: PROCESSOR_VALUE_UNIT
    use: nonproduction
  profile: n1xc17.m48
  version: 10.0.5.6
  storageClassName: <default-storage-class>
```

- Example CR settings for a three replica deployment:

```
apiVersion: apiconnect.ibm.com/v1beta1
kind: APIConnectCluster
metadata:
  labels:
    app.kubernetes.io/instance: apiconnect
    app.kubernetes.io/managed-by: ibm-apiconnect
    app.kubernetes.io/name: apiconnect-production
  name: <name_of_your_instance>
  namespace: <APIC-namespace>
spec:
  license:
    accept: true
    license: L-VQYA-YNM22H
    metric: PROCESSOR_VALUE_UNIT
    use: production
  profile: n3xc16.m48
  version: 10.0.5.6
  storageClassName: <default-storage-class>
```

- b. Optional: If you don't want to use Cloud Pak endpoints in Cloud Pak for Integration 2022.2.1 or 2022.4.1, add the following annotation to the **metadata** section of your CR:

```
metadata:
  annotations:
    apiconnect-operator/cp4i: "false"
```

- c. Apply the YAML file:

```
oc apply -f <your_yaml_file>
```

- d. To verify your API Connect cluster is successfully installed, run the following command:

```
oc get apic -n <APIC-namespace>
```

- e. Verify that you can log in to the API Connect Cloud Manager UI:

To determine the location for logging in, view all the endpoints:

```
oc get routes -n <APIC-namespace>
```

- f. Locate the **mgmt-admin-apic** endpoint, and access the Cloud Manager UI.

- g. Log in as the API Connect administrator.

When you install with the top-level CR, the password is auto-generated. To get the password:

```
oc get secret -n <APIC-namespace> | grep mgmt-admin-pass
oc get secret -n <APIC-namespace> <secret_name_from_previous_command> -o jsonpath="{.data.password}" | base64 -d &&
echo
```

10. Optional: Increase the timeout settings for the API Connect management endpoints, particularly for large deployments. See [Configuring timeouts for management endpoints](#).

What to do next

When you finish installing API Connect, [prepare your deployment for disaster recovery](#) so that your data can be restored in the event of an emergency.

Enable additional features post-install

After installing API Connect, you can enable additional features that are related to inter-subsystem communication.

- [Enable management CA verification on REST API calls](#)
Enable the portal and gateway to validate the management subsystem's REST API server certificates.
- [Enable JWT security and disable mTLS between subsystems](#)
Postinstallation steps to enable JWT security and disable mTLS between subsystems.

Enable management CA verification on REST API calls

Enable the portal and gateway to validate the management subsystem's REST API server certificates.

About this task

After you install API Connect, you can enable the portal and gateway to verify the REST API server certificate when they make calls to the REST API. The gateway and portal subsystems make calls to the management subsystem REST API during their normal operations. The gateway makes calls to the platform REST API, and the portal makes calls to the platform REST API and the consumer REST API. To verify the CA certificates of the REST API endpoints, enter the secret names of the CA certificates into the portal and gateway subsystem sections of the top-level CR.

Note:

If you are not sure of the secret names, follow these steps to determine their names:

1. Check the management subsystem CR with `oc describe mgmt`, and identify the issuer of the platform and consumer API endpoints:

```
oc describe mgmt -n <namespace>
...
Platform API Endpoint:
Annotations:
  cert-manager.io/issuer: <instance name>-ingress-issuer
...
Consumer API Endpoint:
Annotations:
  cert-manager.io/issuer: <instance name>-ingress-issuer
```

2. Describe the issuer with `oc describe issuer`, and identify the secret name:

```
oc describe issuer <instance name>-ingress-issuer -n <namespace>
...
Spec:
Ca:
  Secret Name: <instance name>-ingress-ca
...
```

Note: If you are using `in-cluster` communication (see [In-cluster service communication between subsystems](#)), then the portal and gateway make REST calls on the service endpoints, instead of the `external` endpoints. In the steps documented in this topic, replace `mgmtPlatformEndpointCASecret` with `mgmtPlatformEndpointSvcCASecret`, and `mgmtConsumerEndpointCASecret` with `mgmtConsumerEndpointSvcCASecret`. For `secretName`, the default for the service endpoints is `mgmt-ca` or `<apic instance name>-mgmt-ca`.

Procedure

1. Edit the top-level CR, `apiconnectcluster`:

```
oc edit apiconnectcluster -n <namespace>
```

2. In the `spec` section, insert a portal section with the CA secret names for the platform and consumer REST APIs:

```
spec:
...
portal:
  mgmtPlatformEndpointCASecret:
    secretName: <instance name>-ingress-ca
  mgmtConsumerEndpointCASecret:
    secretName: <instance name>-ingress-ca
```

Note: If the portal section already exists, insert the `mgmtPlatformEndpointCASecret` and `mgmtConsumerEndpointCASecret` sections inside it.

3. In the `spec` section, insert a gateway section with the CA secret name for the platform REST API:

```
spec:
...
gateway:
  mgmtPlatformEndpointCASecret:
    secretName: <instance name>-ingress-ca
```

Note: If the gateway section already exists, insert the `mgmtPlatformEndpointCASecret` section inside it.

4. Check the contents of the `ptl` and `gw` CRs to confirm that the change is applied.

```
oc get ptl -o yaml -n <namespace>
...
  mgmtPlatformEndpointCASecret:
```

```

    secretName: <instance name>-ingress-ca
  mgmtConsumerEndpointCASecret:
    secretName: <instance name>-ingress-ca
  ...
oc get gw -o yaml -n <namespace>
...
  mgmtPlatformEndpointCASecret:
    secretName: <instance name>-ingress-ca
  ...

```

Enable JWT security and disable mTLS between subsystems

Postinstallation steps to enable JWT security and disable mTLS between subsystems.

About this task

JWT security is an alternative to using mTLS to secure inter-subsystem communication. For more information on JWT security and when to use it, see: [Enable JWT security instead of mTLS](#).

If you disable mTLS then you must enable JWT.

Note: It is not possible to use JWT on the V5 compatible gateway to analytics message flow. This flow is secured by mTLS, which cannot be disabled.

Procedure

1. Describe the `apiconnectcluster` CR to get the JWKS URL:

```

oc describe apiconnectcluster -n <namespace>

status:
- name: jwksUrl
  secretName: api-endpoint
  type: API
  uri: https://api.apic.acme.com/api/cloud/oauth2/certs

```

2. For each portal, gateway, and analytics subsystem where you want to use JWT security, edit the section of the top-level CR corresponding to that subsystem, and add the following:

```

spec:
  <subsystem>
    mtlsValidateClient: false
    jwksUrl: <JWKS URL>

```

where

- `<subsystem>` is either `portal`, `analytics`, or `gateway`, depending on which subsystem you want to use JWT security with. If this subsystem section does not already exist in the top-level CR, then add it as shown above.
- `<JWKS URL>` is the URL identified in step 1.

3. **v10.0.5.4 and later:** Enable JWT on the gateway to analytics communications flow. Enable the Use JWT switch for the registered gateway in the Topology page of the Cloud Manager UI.

DataPower version 10.5.0.4 only: To enable JWT on the gateway to analytics communications flow, you also must add a `dataPowerOverride` section to the gateway CR:

```

spec:
  jwksUrl: <JWKS URL>
  dataPowerOverride:
    image: customregistry.com/custom-image-datapower:10.5.0.5
    version: 10.5.0.5
    license: X-XXXX-XXXXXX

```

Installing with subsystem CRs in a shared namespace on OpenShift

Use the individual subsystem CRs to install API Connect subsystems in a shared namespace on OpenShift.

About this task

API Connect subsystems can be installed by creating individual subsystem CRs in the same shared namespace, instead of using a top-level CR. If you want to install your API Connect subsystems in different namespaces, for example Management server in a namespace that is called `mgmt`, and gateway in a namespace that is called `gway`, then see: [Installing with subsystem CRs in different namespaces or environments on OpenShift](#).

1. [Installing operators](#)
Install operators for API Connect, DataPower, and common services so that you can deploy the API Connect subsystems in a shared namespace on OpenShift.
2. [Setting up a certificate issuer](#)
Create the cert-manager issuer for generating the certificates and secrets for use with API Connect.
3. [Installing the Management subsystem in a shared namespace](#)
Install the Management subsystem by creating and applying the `mgmt_cr.yaml` file.
4. [Installing the Gateway subsystem in a shared namespace](#)
Install the Gateway subsystem by creating and applying the `apigateway_cr.yaml` file.

5. [Installing the Portal subsystem in a shared namespace](#)
Install the Portal subsystem by creating and applying the portal_cr.yaml file.
6. [Installing the Analytics subsystem in a shared namespace](#)
Install the analytics subsystem by creating and applying the analytics_cr.yaml file.

Installing operators

Install operators for API Connect, DataPower, and common services so that you can deploy the API Connect subsystems in a shared namespace on OpenShift.

Before you begin

The API Connect operator and operand must be from the same release and fix pack level. Table 1 lists the current version of the operator and operand for API Connect.

Table 1. API Connect operator and operand versions

API Connect (operand)	Operator channel version	Highest operator version
10.0.5.6	v3.6	3.6.0

You can use any combination of API Connect 10.0.5.x with DataPower Gateway 10.5.0.x or DataPower API Gateway 10.5.0.x.

Procedure

1. Obtain an entitlement key for the Entitled Registry:
 - a. Log in to the [IBM Container Library](#).
 - b. In the Container software library, select Get entitlement key.
 - c. After the Access your container software heading, click Copy key.
 - d. Copy the key to a safe location.
2. Create the namespace where API Connect will be installed, either by selecting Home->Projects->Create Project in the UI, or with the command:

```
oc create ns <APIC-namespace>
```

The namespace where you install API Connect must meet the following requirements:

- OpenShift restricts the use of default namespaces for installing non-cluster services. The following namespaces cannot be used to install API Connect: **default, kube-system, kube-public, openshift-node, openshift-infra, openshift.**
 - OpenShift: Only one top-level CR (APIConnectCluster) can be deployed in each namespace.
 - Cloud Pak for Integration: Only one API Connect capability can be deployed in each namespace.
3. If you are installing the operator into a single namespace, create an OperatorGroup object specifying that namespace.

Attention: If you are installing the operator into all namespaces, skip this step because the **openshift-operators** namespace already has an appropriate Operator group in place.

- a. Create the apiconnect-operator-group.yaml file with an OperatorGroup object that identifies the namespace in which RBAC permissions for the IBM API Connect Operator will be generated, and where the CSV will be available:

```
apiVersion: operators.coreos.com/v1
kind: OperatorGroup
metadata:
  name: <operator-group-name>
  namespace: <APIC-namespace>
spec:
  targetNamespaces:
  - <APIC-namespace>
```

- b. Apply the OperatorGroup object with the following command:

```
oc apply -f apiconnect-operator-group.yaml
```

4. Create the image pull secret in the namespace where you want to install API Connect:
 - a. Open the OpenShift web console, click Workloads, > Secrets.
 - b. Ensure that the Project is set to the namespace where you intend to install API Connect.
 - c. Click Create and select Image pull secret.
 - d. Set the following parameters for the secret:
 - Set Secret name to **ibm-entitlement-key**.
 - Set Authentication type to **Image registry credentials**.
 - Set Registry server address to **cp.icr.io**.
 - Set Username to **cp**.
 - Set Password to the entitlement key generated in Step 1.
 - Click Create to create the secret.

Note: If your OpenShift platform is Red Hat OpenShift on IBM Cloud (ROKS), you might need to reload your worker nodes after the image pull secret is created. You can reload the worker nodes either from the OpenShift web console or from the command line with: **oc worker reload**.

5. Add the IBM Operator Catalog source:
 - a. In the OpenShift web console, and click + (in the page banner) to open the Import YAML dialog box.
 - b. Paste the following resource definition into the dialog box:

```
apiVersion: operators.coreos.com/v1alpha1
kind: CatalogSource
metadata:
  name: ibm-operator-catalog
  namespace: openshift-marketplace
spec:
  displayName: "IBM Operator Catalog"
  publisher: IBM
```

```

sourceType: grpc
image: icr.io/cpopen/ibm-operator-catalog
updateStrategy:
  registryPoll:
    interval: 45m

```

c. Click Create.

6. Create the **apiconnect** subscription.

a. Create the **apiconnect** subscription with the appropriate channel by creating a file called **apic-sub.yaml** and pasting in the following contents, updating the namespace as required:

```

apiVersion: operators.coreos.com/v1alpha1
kind: Subscription
metadata:
  name: ibm-apiconnect
  namespace: <namespace>
spec:
  channel: v3.6
  name: ibm-apiconnect
  source: ibm-operator-catalog
  sourceNamespace: openshift-marketplace

```

Where:

- **<namespace>** is set to **openshift-operators** if you are installing the API Connect operator in all namespaces. Otherwise set this to the namespace created in [step 2](#).

b. Apply the subscription with the following command:

```
oc apply -f apic-sub.yaml
```

c. Select Operators, Installed Operators, and ensure that Project: All Projects is selected.

If any operators such as **ibm-apiconnect** or **ibm-cert-manager-operator** show the status of "Upgrade available", approve the upgrade by completing the following steps:

- Click Upgrade available.
- Click Preview InstallPlan.
- Click Approve.
- Wait for the **IBM API Connect** and **IBM DataPower Gateway** operators to install.

The **IBM DataPower Gateway** operator is a prerequisite to API Connect and must not be removed.

7. (10.0.5.3 and later) Create the **ibm-common-services-operator** subscription, if it does not already exist.

This step only applies when you install version 10.0.5.3 or later. If you are installing an older version of API Connect, skip this step.

a. Create a file called **common-services-sub.yaml** and paste in the following contents:

```

apiVersion: operators.coreos.com/v1alpha1
kind: Subscription
metadata:
  name: ibm-common-service-operator
  namespace: <namespace>
spec:
  channel: <channel>
  name: ibm-common-service-operator
  source: ibm-operator-catalog
  sourceNamespace: openshift-marketplace

```

Where:

- **<namespace>** is one of the following values:
 - **openshift-operators** if you are installing the API Connect operator in all namespaces
 - The namespace created in [step 2](#) if you are installing the API Connect operator in a single namespace
- **<channel>** is one of the following values:
 - **v3.23** if you are using IBM Cloud Pak foundational services for CD (continuous delivery)
 - **v3** if you are using IBM Cloud Pak foundational services for LTSR (long term service release)

b. Apply the subscription with the following command:

```
oc apply -f common-services-sub.yaml
```

c. Select Operators, Installed Operators, and ensure that Project: All Projects is selected.

If any operators such as **ibm-apiconnect** or **ibm-cert-manager-operator** show the status of "Upgrade available", approve the upgrade by completing the following steps:

- Click Upgrade available.
- Click Preview InstallPlan.
- Click Approve.
- Check the **ibm-common-services** namespace and ensure that all operators with a status of "Upgrade available" are approved.
- Wait for the **IBM Cloud Pak foundational services**, **IBM NamespaceScope**, and **Operand Deployment Lifecycle Manager** operators to install.

8. (10.0.5.3 and later) Install cert manager:

This step only applies when you install version 10.0.5.3 or later. If you are installing an older version of API Connect, skip this step.

a. Create a file called **cert-manager-operand-request.yaml** and paste in the following content:

```

apiVersion: operator.ibm.com/v1alpha1
kind: OperandRequest
metadata:
  name: ibm-apiconnect-cert-manager
  namespace: <namespace>
spec:
  requests:

```

```
- operands:
  - name: ibm-cert-manager-operator
    registry: common-service
    registryNamespace: ibm-common-services
```

b. Create the `operandRequest` for cert-manager by running the following command:

```
oc apply -f cert-manager-operand-request.yaml
```

c. Select Operators, Installed Operators, and ensure that Project: All Projects is selected.

Wait for the `ibm-cert-manager-operator` to display and if it shows the status of "Upgrade available", approve the upgrade by completing the following steps:

- i. Click Upgrade available.
- ii. Click Preview InstallPlan.
- iii. Click Approve.
- iv. Wait for the **IBM Cert Manager** operator to install.

Next topic: [Setting up a certificate issuer](#)

Setting up a certificate issuer

Create the cert-manager issuer for generating the certificates and secrets for use with API Connect.

Before you begin

To deploy API Connect, you must first create the cert-manager issuers and certificates that API Connect uses. On OpenShift cert-manager is bundled as a foundational service, so you do not need to install cert-manager itself. For more information on cert-manager: [Key Concepts: Cert-manager, Issuers, and Secrets](#)

Procedure

1. Create a file that is called `ingress-issuer-v1.yaml` and paste in the following contents:

```
#
# Licensed under the Apache License, Version 2.0 (the "License");
# you may not use this file except in compliance with the License.
# You may obtain a copy of the License at

      app.kubernetes.io/name: "gateway-peering"

```

2. Apply the file to your namespace with `oc apply -f ingress-issuer-v1.yaml -n <apic_namespace>`
3. Verify that the command installation succeeded by running the following command:

```
oc get certificates -n <apic_namespace>
```

All certificates created successfully:

NAME	READY	SECRET	AGE
analytics-ingestion-client	True	analytics-ingestion-client	70s
gateway-peering	True	gateway-peering	69s
gateway-service	True	gateway-service	69s
ingress-ca	True	ingress-ca	71s
portal-admin-client	True	portal-admin-client	71s

Previous topic: [Installing operators](#)

Next topic: [Installing the Management subsystem in a shared namespace](#)

Installing the Management subsystem in a shared namespace

Install the Management subsystem by creating and applying the `mgmt_cr.yaml` file.

Before you begin

Complete the following tasks to prepare for deploying API Connect:

1. [Preparing for installation](#)
2. [Installing operators](#)
3. [Setting up a certificate issuer](#)

About this task

Use the OpenShift CLI to edit the custom resource template for the Management subsystem then apply the resource. Verify that the pods are up and running, and validate that you can connect to the API Connect Cloud Manager.

Procedure

1. Create a file called `mgmt_cr.yaml` and paste in the following content:

```
#
# Licensed under the Apache License, Version 2.0 (the "License");
# you may not use this file except in compliance with the License.
# You may obtain a copy of the License at
#
#     http://www.apache.org/licenses/LICENSE-2.0
#
# Unless required by applicable law or agreed to in writing, software
# distributed under the License is distributed on an "AS IS" BASIS,
# WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied.
# See the License for the specific language governing permissions and
# limitations under the License.
#

apiVersion: management.apiconnect.ibm.com/v1beta1
kind: ManagementCluster
metadata:
  name: management
  labels: {
    app.kubernetes.io/instance: "management",
    app.kubernetes.io/managed-by: "ibm-apiconnect",
    app.kubernetes.io/name: "management"
  }
spec:
  version: $APP_PRODUCT_VERSION
  profile: $PROFILE
  portal:
    admin:
      secretName: portal-admin-client
  analytics:
    ingestion:
      secretName: analytics-ingestion-client
  gateway:
    client:
      secretName: gateway-client-client
  cloudManagerEndpoint:
    annotations:
      cert-manager.io/issuer: ingress-issuer
    hosts:
      - name: admin.$STACK_HOST
        secretName: cm-endpoint
  apiManagerEndpoint:
    annotations:
      cert-manager.io/issuer: ingress-issuer
    hosts:
      - name: manager.$STACK_HOST
        secretName: apim-endpoint
  platformAPIEndpoint:
    annotations:
      cert-manager.io/issuer: ingress-issuer
    hosts:
      - name: api.$STACK_HOST
        secretName: api-endpoint
  consumerAPIEndpoint:
    annotations:
      cert-manager.io/issuer: ingress-issuer
    hosts:
      - name: consumer.$STACK_HOST
        secretName: consumer-endpoint
  databaseVolumeClaimTemplate:
    storageClassName: $STORAGE_CLASS
  microServiceSecurity: certManager
  certManagerIssuer:
    name: selfsigning-issuer
    kind: Issuer
```

```

license:
  accept: $LICENSE_ACCEPTANCE
  use: $LICENSE_USE
  license: '$LICENSE_ID'

```

2. Edit the YAML file and replace the variables:

\$APP_PRODUCT_VERSION

API Connect application version for the subsystems.

```
version: <version_number>
```

Example version number: 10.0.5.6

\$PROFILE

Specify your Management subsystem profile, where **n** indicates number of replicas, **c** number of cores, and **m** is the minimum memory allocation in GB. For more information on profiles, see [Planning your deployment topology](#).

\$STACK_HOST

The desired ingress subdomain for the API Connect stack. Used when specifying endpoints. Domain names that are used for endpoints cannot contain the underscore " " character. You can do one of the following:

- Subdomain customization only
Accept the prefixes predefined for the ingress host names to use and replace all instances of **STACK_HOST** to be the desired ingress subdomain for the API Connect stack. For example, if your host is `myhost.subnet.example.com`:

```

cloudManagerEndpoint:
  < ... >
  hosts:
    - name: admin.myhost.subnet.example.com
      secret: cm-endpoint

apiManagerEndpoint:
  < ... >
  hosts:
    - name: manager.myhost.subnet.example.com
      secret: apim-endpoint

platformAPIEndpoint:
  < ... >
  hosts:
    - name: api.myhost.subnet.example.com
      secret: api-endpoint

consumerAPIEndpoint:
  < ... >
  hosts:
    - name: consumer.myhost.subnet.example.com
      secret: consumer-endpoint

```

- Complete hostname customization
Change both the predefined prefixes and the **STACK_HOST** subdomain to match your desired hostnames.

For example, for `cloudManagerEndpoint`, you can replace `admin.$STACK_HOST` with `my.cloudmgr.myhost.subnet.example.com`, where `my.cloudmgr` replaces `admin`, and `myhost.subnet.example.com` replaces `STACK_HOST`. For example:

```

cloudManagerEndpoint:
  < ... >
  hosts:
    - name: my.cloudmgr.myhost.subnet.example.com
      secret: cm-endpoint

```

You can do this for some or all of the hostnames, depending on your customization requirements.

\$STORAGE_CLASS

The OCP storage class to be used for Persistent Volume Claims. Find the available storage classes in the target cluster by running the following command: `oc get sc`.

```
storageClassName: local-storage
```

\$LICENSE_ACCEPTANCE

Set `accept` to `true`. You must accept the license to successfully deploy API Connect.

\$LICENSE_USE

Set `use` to either `production` or `nonproduction` to match the license that you purchased.

\$LICENSE_ID

Set `license` to the license ID for the version of API Connect that you purchased. See [API Connect licenses](#).

3. Optional: If you are installing Cloud Pak for Integration 2022.2.1 or 2022.4.1 and don't want to use Cloud Pak endpoints, add the following annotation to the `metadata` section of the Management CR:

Note: Beginning with API Connect 10.0.5.6, this annotation is added automatically to the stand-alone Management CR. You must still add it manually if you are installing an older version of 10.0.5.x.

```

metadata:
  annotations:
    apiconnect-operator/cp4i: "false"

```

4. Configure database backups for the Management subsystem.

To successfully restore API Connect in the event of a disaster where you must redeploy a new cluster, you must configure the database backup settings before the initial installation of the Management subsystem. For instructions on configuring backup settings, see [Configuring backup settings for a fresh install of the Management subsystem on OpenShift or Cloud Pak for Integration](#).

5. Install the Management subsystem by applying the modified CR with the following command:

```
oc apply -f mgmt_cr.yaml -n <management_namespace>
```

6. Verify that the Management subsystem is fully installed by running the following command:

```
oc get ManagementCluster -n <management_namespace>
```

The installation is complete when the **READY** status is **True**, and the **SUMMARY** reports that all services are online:

NAME	READY	SUMMARY	VERSION	RECONCILED	VERSION	AGE
management	True	16/16	<version>	<version-build>		7m17s

7. Verify that you can log in to the API Connect Cloud Manager UI:

a. Determine the URL for the Cloud Manager UI by running the following command to view the API Connect endpoints:

```
oc get routes -n <management_namespace>
```

b. Locate the **management-admin** endpoint, and note it down.

c. Determine the Cloud Manager administrator password by running the following commands:

```
oc get secret -n <management-namespace> | grep management-admin-secret
```

```
oc get secret -n <management-namespace> <secret_name_from_previous_command> -o jsonpath="{.data.password}" | base64 -d && echo ""
```

d. Open a browser and go to the **management-admin-apic** endpoint.

e. Log in to the Cloud Manager as **admin** with the administrator password.

8. Store all secrets and passwords in a safe place.

9. Prepare the Management subsystem for disaster recovery.

Follow the appropriate instructions for your environment:

- [Preparing the Management subsystem for disaster recovery on OpenShift](#)
- [Preparing the Management subsystem for disaster recovery on Cloud Pak for Integration](#)

What to do next

If you are creating a new deployment of API Connect, install other subsystems as needed.

When you have completed the installation of all required API Connect subsystems, you can proceed to defining your API Connect configuration by using the API Connect Cloud Manager; refer to the [Cloud Manager configuration checklist](#).

Previous topic: [Setting up a certificate issuer](#)

Next topic: [Installing the Gateway subsystem in a shared namespace](#)

Installing the Gateway subsystem in a shared namespace

Install the Gateway subsystem by creating and applying the `apigateway_cr.yaml` file.

Before you begin

Complete the following tasks to prepare for deploying API Connect:

1. [Preparing for installation](#)
2. [Installing operators](#)
3. [Setting up a certificate issuer](#)

About this task

Use the OpenShift CLI to edit the custom resource template for the Gateway, apply the resource, verify that the pods are up and running.

Procedure

1. Create the gateway admin secret with: `oc -n <gateway namespace> create secret generic admin-secret --from-literal=password=admin`
2. If you are installing the API Gateway (v6), create a yaml file that is called `apigateway_cr.yaml` and paste in these contents:

```
#
# Licensed under the Apache License, Version 2.0 (the "License");
# you may not use this file except in compliance with the License.
# You may obtain a copy of the License at
#
# http://www.apache.org/licenses/LICENSE-2.0
#
# Unless required by applicable law or agreed to in writing, software
# distributed under the License is distributed on an "AS IS" BASIS,
# WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied.
# See the License for the specific language governing permissions and
# limitations under the License.
#

apiVersion: gateway.apiconnect.ibm.com/v1beta1
kind: GatewayCluster
```

```

metadata:
  name: gwv6
  labels: {
    app.kubernetes.io/instance: "gateway",
    app.kubernetes.io/managed-by: "ibm-apiconnect",
    app.kubernetes.io/name: "gwv6"
  }
spec:

  license: '$LICENSE_ID'
adminUser:
  secretName: admin-secret
# syslogConfig:
# enabled: false # if true, provide below details
# remoteHost: $DATAPOWER_SYSLOG_TCP_REMOTE_HOST # must be a string
# remotePort: $DATAPOWER_SYSLOG_TCP_REMOTE_PORT # must be an int
# secretName: $DATAPOWER_SYSLOG_TCP_TLS_SECRET # must be a string

```

3. Edit the YAML file and set the variables:

```

$APP_PRODUCT_VERSION
  API Connect application version for the subsystems.

  version: <version_number>

  Example version number: 10.0.5.6

```

\$PROFILE
Specify your Gateway subsystem profile, where **n** indicates number of replicas, **c** number of cores, and **m** is the minimum memory allocation in GB. For more information on profiles, see [Planning your deployment topology](#).

\$STACK_HOST
The desired ingress subdomain for the API Connect stack. Used when specifying endpoints. Domain names that are used for endpoints cannot contain the underscore "_" character. You can do one of the following:

- Subdomain customization only
Accept the prefixes predefined for the ingress host names to use and replace all instances of **STACK_HOST** to be the desired ingress subdomain for the API Connect stack. For example, if your host is **myhost.subnet.example.com**:

```

gatewayEndpoint:
  < ... >
  hosts:
    - name: rgw.myhost.subnet.example.com
      secret: gwv6-endpoint

gatewayManagerEndpoint:
  < ... >
  hosts:
    - name: rgwd.myhost.subnet.example.com
      secret: gwv6-manager-endpoint

```

- Complete hostname customization
Change both the predefined prefixes and the **STACK_HOST** subdomain to match your desired hostnames.

For example, for **gatewayEndpoint**, you can replace **rgw.\$STACK_HOST** with **my.gateway.endpoint.myhost.subnet.example.com**, where **my.gateway.endpoint** replaces **rgw**, and **myhost.subnet.example.com** replaces **\$STACK_HOST**:

```

gatewayEndpoint:
  < ... >
  hosts:
    - name: my.gateway.endpoint.myhost.subnet.example.com
      secret: gwv6-endpoint

```

You can do this for some or all of the hostnames, depending on your customization requirements.

\$STORAGE_CLASS
The OCP storage class to be used for Persistent Volume Claims. Find the available storage classes in the target cluster by running the following command: **oc get sc**.

```

storageClassName: local-storage

```

\$LICENSE_ACCEPTANCE
Set **accept** to **true**. You must accept the license to successfully deploy API Connect.

\$LICENSE_USE
Set **use** to either **production** or **nonproduction** to match the license that you purchased.

\$LICENSE_ID
Set **license**: to the license ID for the version of API Connect that you purchased. See [API Connect licenses](#).

syslogConfig
To enable this feature uncomment this section, set **enabled**: **true**, and set the properties:

```

$DATAPOWER_SYSLOG_TCP_REMOTE_HOST
  remoteHost: <remote_host>
  String. The hostname of the server for syslogConfig.

```

```

$DATAPOWER_SYSLOG_TCP_REMOTE_PORT
  remotePort: <remote_port_number>
  Integer. The port number of the server for syslogConfig.

```

```

$DATAPOWER_SYSLOG_TCP_TLS_SECRET
  secretName: <secret>
  String. The TLS secret name of the server for syslogConfig.

```

4. Optional: If you are installing Cloud Pak for Integration 2022.2.1 or 2022.4.1 and don't want to have Zen endpoints, add the following annotation to the **metadata** section of the CR:

```

metadata:
  annotations:
    apiconnect-operator/cp4i: "false"

```

- Optional: If applicable to your deployment, update the gateway CR file to configure `DataPowerService` APIs to customize your DataPower deployment. See [Customizing a DataPower deployment](#).
- To enable mutual TLS between the Management client and the Gateway service's manager endpoint, add `mtlsValidateClient` to the `spec` section:

```

spec:
  mtlsValidateClient: true

```

This ensures that the gateway service authenticates incoming requests from the API Manager, such as gateway service registration, and publishing APIs to the gateway service. Specifically, the gateway service requires that incoming requests present a certificate that was signed by the same CA that was used to sign the gateway service management endpoint. The gateway service management endpoint secret is specified under `gatewayManagerEndpoint.hosts.secretName`. The API Manager's gateway client's TLS credentials are specified in the ManagementCluster CR under `gateway.client.secretName`.

Note: In releases previous to 10.0.5.3, this property is called `validateApimClient`.

- Optional: If you want to enable JWT security for communications between the management and gateway, add and set the property `jwtksUrl`.

```

spec:
  ...
  jwtksUrl: <JWTKS URL>

```

where `<JWTKS URL>` is the URL of the JWKS endpoint hosted on the management subsystems. To find out the `jwtksUrl`, describe the management CR and check the `status` section:

```

kubectl describe mgmt -n <namespace>
...
status:
- name: jwtksUrl
  secretName: api-endpoint
  type: API
  uri: https://api.apic.acme.com/api/cloud/oauth2/certs

```

For more information on JWT security, see [Enable JWT security instead of mTLS](#).

Datapower version 10.5.0.4 only: To enable JWT on the gateway to analytics communications flow, you also must add a `dataPowerOverride` section to the gateway CR:

```

spec:
  jwtksUrl: <JWTKS URL>
  dataPowerOverride:
    image: customregistry.com/custom-image-datapower:10.5.0.5
    version: 10.5.0.5
    license: X-XXXX-XXXXXX

```

- Optional: Update the gateway CR file to enable autoscaling of gateway pods to ensure high availability of DataPower pods. See [Enabling autoscaling of gateway pods](#).
- Install the Gateway Custom Resource by applying the yaml file:
For a DataPower® API Gateway, run the following command:

```
oc apply -f apigateway_cr.yaml -n <namespace>
```

For a DataPower Gateway (v5 compatible), run the following command:

```
oc apply -f v5cgateway_cr.yaml -n <namespace>
```

- To verify that the Gateway subsystem is fully installed, run the following command:

```
oc get GatewayCluster -n <namespace>
```

The installation is complete when the `READY` status is `True`, and the `SUMMARY` reports that all services are online (2/2) for all the Gateway subsystems that were installed. Example:

NAME	READY	SUMMARY	VERSION	RECONCILED VERSION	AGE
gww6	True	2/2	<version>	<version-build>	7m32s

There is no need to wait for the `READY` status to be `True` before moving on to next subsystem installation.

- Verify that the gateway is ready to be registered with the Management subsystem by calling the `health` api on the `gatewayManagerEndpoint.hosts.name` defined in your YAML file: `https://gwd.$STACK_HOST/health`.

```

curl -k https://gwd.example.com/health
{"status": "ok"}

```

What to do next

If you are creating a new deployment of API Connect, install other subsystems as needed.

When you have completed the installation of all required API Connect subsystems, you can proceed to defining your API Connect configuration by using the API Connect Cloud Manager; refer to the [Cloud Manager configuration checklist](#).

Previous topic: [Installing the Management subsystem in a shared namespace](#)

Next topic: [Installing the Portal subsystem in a shared namespace](#)

Installing the Portal subsystem in a shared namespace

Install the Portal subsystem by creating and applying the `portal_cr.yaml` file.

Before you begin

Complete the following tasks to prepare for deploying API Connect:

1. [Preparing for installation](#)
2. [Installing operators](#)
3. [Setting up a certificate issuer](#)

About this task

Use the OpenShift CLI to edit the custom resource template for the Portal subsystem, apply the resource, verify that the pods are up and running.

Procedure

1. Create a file that is called `portal_cr.yaml` and paste in these contents:

```
#
# Licensed under the Apache License, Version 2.0 (the "License");
# you may not use this file except in compliance with the License.
# You may obtain a copy of the License at
#
# http://www.apache.org/licenses/LICENSE-2.0
#
# Unless required by applicable law or agreed to in writing, software
# distributed under the License is distributed on an "AS IS" BASIS,
# WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied.
# See the License for the specific language governing permissions and
# limitations under the License.
#

apiVersion: portal.apiconnect.ibm.com/v1beta1

metadata:
  name: portal
  labels: {
    app.kubernetes.io/instance: "portal",
    app.kubernetes.io/managed-by: "ibm-apiconnect",
    app.kubernetes.io/name: "portal"
  }
spec:
  version: $APP_PRODUCT_VERSION
  profile: $PROFILE
  mgmtPlatformEndpointCASecret:
    secretName: ingress-ca
  mgmtConsumerEndpointCASecret:
    secretName: ingress-ca
  mgmtPlatformEndpointSvcCASecret:
    secretName: management-ca
  mgmtConsumerEndpointSvcCASecret:
    secretName: management-ca
  portalAdminEndpoint:
    annotations:
      cert-manager.io/issuer: ingress-issuer
    hosts:
      - name: api.portal.$STACK_HOST
        secretName: portal-admin
  portalUIEndpoint:
    annotations:
      cert-manager.io/issuer: ingress-issuer
    hosts:
      - name: portal.$STACK_HOST
        secretName: portal-web
  databaseVolumeClaimTemplate:
    storageClassName: $STORAGE_CLASS
    volumeSize: 15Gi
  databaseLogsVolumeClaimTemplate:
    storageClassName: $STORAGE_CLASS
    volumeSize: 6Gi
  webVolumeClaimTemplate:
    storageClassName: $STORAGE_CLASS
    volumeSize: 8Gi
  backupVolumeClaimTemplate:
    storageClassName: $STORAGE_CLASS
    volumeSize: 15Gi
  adminVolumeClaimTemplate:
    storageClassName: $STORAGE_CLASS
    volumeSize: 6Gi
  certVolumeClaimTemplate:
    storageClassName: $STORAGE_CLASS
    volumeSize: 4Gi
  adminClientSubjectDN: CN=portal-admin-client,O=cert-manager
  microServiceSecurity: certManager
  certManagerIssuer:
    name: selfsigning-issuer
    kind: Issuer
  license:
    accept: $LICENSE_ACCEPTANCE
    use: $LICENSE_USE
    license: '$LICENSE_ID'
```

2. Edit the YAML file and set the variables:

\$APP_PRODUCT_VERSION

API Connect application version for the subsystems.

```
version: <version_number>
```

Example version number: 10.0.5.6

\$PROFILE

Specify your portal subsystem profile, where **n** indicates number of replicas, **c** number of cores, and **m** is the minimum memory allocation in GB. For more information on profiles, see [Planning your deployment topology](#).

\$STACK_HOST

The desired ingress subdomain for the API Connect stack. Used when you specify endpoints. Domain names that are used for endpoints cannot contain the underscore " _ " character. You can do one of the following:

- Subdomain customization only
Accept the prefixes predefined for the ingress host names to use and replace all instances of **\$STACK_HOST** to be the desired ingress subdomain for the API Connect stack. For example, for a subdomain of **myhost.subnet.example.com**:

```
portalAdminEndpoint:
  < ... >
  hosts:
  - name: api.portal.myhost.subnet.example.com
    secret: portal-admin

portalUIEndpoint:
  < ... >
  hosts:
  - name: portal.myhost.subnet.example.com
    secret: portal-web
```

- Complete hostname customization
Change both the predefined prefixes and the **\$STACK_HOST** subdomain to match your desired hostnames.

For example, for **portalAdminEndpoint**, you can replace **api.portal.\$STACK_HOST** with **my.api.portal.myhost.subnet.example.com**, where **my.api.portal** replaces **api.portal**, and **myhost.subnet.example.com** replaces **\$STACK_HOST**:

```
portalAdminEndpoint:
  < ... >
  hosts:
  - name: my.api.portal.myhost.subnet.example.com
    secret: cm-endpoint
```

You can do this for some or all of the hostnames, depending on your customization requirements.

\$STORAGE_CLASS

The Kubernetes storage class to be used for Persistent Volume Claims. Find the available storage classes in the target cluster by running the following command: **oc get sc**. For example, for local storage:

```
databaseVolumeClaimTemplate:
  storageClassName: $STORAGE_CLASS
  volumeSize: 120Gi
databaseLogsVolumeClaimTemplate:
  storageClassName: $STORAGE_CLASS
  volumeSize: 12Gi
webVolumeClaimTemplate:
  storageClassName: $STORAGE_CLASS
  volumeSize: 200Gi
backupVolumeClaimTemplate:
  storageClassName: $STORAGE_CLASS
  volumeSize: 300Gi
adminVolumeClaimTemplate:
  storageClassName: $STORAGE_CLASS
  volumeSize: 20Gi
certVolumeClaimTemplate:
  storageClassName: $STORAGE_CLASS
  volumeSize: 4Gi
```

Note:

- The **databaseVolumeClaimTemplate** has a minimum value of 30Gi. The **webVolumeClaimTemplate** has a minimum value of 20Gi. The **backupVolumeClaimTemplate** has a minimum value of 30Gi. However, all three need to be sized according to the installation.
- The **adminVolumeClaimTemplate** and **databaseLogsVolumeClaimTemplate** in this example have their minimum values and you do not need to change them.
- The **certVolumeClaimTemplate** is used by the nginx pod and in 2dcdr (two data center disaster recovery) mode it is also used by the tunnel, db-remote and www-remote pods. It can be sized small, just like the **adminVolumeClaimTemplate**, and does not need to be increased based on the number of sites.

\$LICENSE_ACCEPTANCE

Set **accept** to **true**. You must accept the license to successfully deploy API Connect.

\$LICENSE_USE

Set **use** to either **production** or **nonproduction** to match the license that you purchased.

\$LICENSE_ID

Set **license**: to the license ID for the version of API Connect that you purchased. See [API Connect licenses](#).

3. Optional: If you are installing Cloud Pak for Integration 2022.2.1 or 2022.4.1 and don't want to have Zen endpoints, add the following annotation to the **metadata** section of the CR:

```
metadata:
  annotations:
    apiconnect-operator/cp4i: "false"
```

- Optional: If you want to disable mTLS for communications between the management and portal, and enable JWT instead, then add and set the properties `mtlsValidateClient` and `jwtksUrl`.

```
spec:
  ...
  mtlsValidateClient: false
  jwtksUrl: <JWTKS URL>
```

where `<JWTKS URL>` is the URL of the JWKS endpoint hosted on the management subsystems. To find out the `jwtksUrl`, describe the management CR and check the `status` section:

```
kubectl describe mgmt -n <namespace>
...
status:
- name: jwtksUrl
  secretName: api-endpoint
  type: API
  uri: https://api.apic.acme.com/api/cloud/oauth2/certs
```

For more information on JWT security, see [Enable JWT security instead of mTLS](#).

- Install the Portal subsystem by applying the modified CR with the following command:

```
oc apply -f portal_cr.yaml -n <namespace>
```

- Verify that the Portal subsystem is fully installed:

```
oc get PortalCluster -n <namespace>
```

The installation is complete when `STATUS` reports `Running`, `Ready` reports that all services are online (3/3), and `MESSAGE` reports "Ready for API Cloud Manager service registration", for example:

NAME	READY	STATUS	VERSION	RECONCILED	VERSION	MESSAGE	AGE
portal	3/3	Running	<version>	<version>		Ready for API Cloud Manager service registration	2h

You do not need to wait for the portal installation to complete before you move on to the next subsystem installation.

- Verify that you can access the portal web endpoint by browsing to the `portalUIEndpoint.hosts.name` as configured in your yaml file:

```
curl -k https://portal.$STACK_HOST
<!DOCTYPE html>
<html>
<head>
<title>Developer Portal is ready to create sites!</title>
<style>
  body {
    width: 35em;
    margin: 0 auto;
    font-family: Tahoma, Verdana, Arial, sans-serif;
  }
</style>
</head>
<body>Developer Portal is ready to create sites!</h1>
<p>If you see this page, the web server is successfully installed and
working. Further configuration is required.</p>
</body>
</html>
```

- It is highly recommend that you retain the Portal subsystem encryption secret in a safe location, in case you need to restore the Portal subsystem during a disaster recovery scenario.

The encryption secret is created when the Portal subsystem is initially deployed. You can obtain the name of the encryption secret from the Portal subsystem custom resource after the installation is complete:

- Obtain the name of the encryptionSecret:

```
oc get ptl portal -o yaml -n <namespace> | grep encryptionSecret
encryptionSecret: portal-enc-key
```

The name of encryption secret is `portal-enc-key`.

- Save the secret yaml in a safe location:

```
oc get secret portal-enc-key -o yaml -n <namespace> > portal-enc-key.yaml
```

- Backup the Portal installation. See [Backing up and restoring Developer Portal on OpenShift and Cloud Pak for Integration](#).

What to do next

If you are creating a new deployment of API Connect, install other subsystems as needed.

When you have completed the installation of all required API Connect subsystems, you can proceed to defining your API Connect configuration by using the API Connect Cloud Manager; refer to the [Cloud Manager configuration checklist](#).

Previous topic: [Installing the Gateway subsystem in a shared namespace](#)

Next topic: [Installing the Analytics subsystem in a shared namespace](#)

Installing the Analytics subsystem in a shared namespace

Install the analytics subsystem by creating and applying the `analytics_cr.yaml` file.

Before you begin

Complete the following tasks to prepare for deploying API Connect:

1. [Preparing for installation](#)
2. [Installing operators](#)
3. [Setting up a certificate issuer](#)

About this task

Use the OpenShift CLI to edit the custom resource template for the analytics subsystem, apply the resource, verify that the pods are up and running.

Procedure

1. Create a file that is called `analytics_cr.yaml` and paste in these contents:

```
#
# Licensed under the Apache License, Version 2.0 (the "License");
# you may not use this file except in compliance with the License.
# You may obtain a copy of the License at
#
# http://www.apache.org/licenses/LICENSE-2.0
#
# Unless required by applicable law or agreed to in writing, software
# distributed under the License is distributed on an "AS IS" BASIS,
# WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied.
# See the License for the specific language governing permissions and
# limitations under the License.
#

apiVersion: analytics.apiconnect.ibm.com/v1beta1
kind: AnalyticsCluster
metadata:
  name: analytics
  labels: {
    app.kubernetes.io/instance: "analytics",
    app.kubernetes.io/managed-by: "ibm-apiconnect",
    app.kubernetes.io/name: "analytics"
  }
spec:
  version: $APP_PRODUCT_VERSION
  license:
    accept: $LICENSE_ACCEPTANCE
    use: $LICENSE_USE
    license: '$LICENSE_ID'
  profile: $PROFILE
  microServiceSecurity: certManager
  certManagerIssuer:
    name: selfsigning-issuer
    kind: Issuer
  ingestion:
    endpoint:
      annotations:
        cert-manager.io/issuer: ingress-issuer
      hosts:
        - name: ai.$STACK_HOST
          secretName: analytics-ai-endpoint
    clientSubjectDN: CN=analytics-ingestion-client,O=cert-manager
  storage:
    type: shared # change to 'dedicated' if you want separate master and storage pods. Three-replica deployments only.
  shared:
    volumeClaimTemplate:
      storageClassName: $STORAGE_CLASS
      volumeSize: $DATA_VOLUME_SIZE
  # master: # uncomment this section if you set storage.type = dedicated.
  # volumeClaimTemplate:
  #   storageClassName: $STORAGE_CLASS
```

2. Edit the YAML file and set the variables:

\$APP_PRODUCT_VERSION
API Connect application version for the subsystems.

version: <version_number>

Example version number: 10.0.5.6

\$PROFILE

Specify your analytics subsystem profile, where **n** indicates number of replicas, **c** number of cores, and **m** is the minimum memory allocation in GB. For more information on profiles, see [Planning your deployment topology](#).

\$STACK_HOST

The desired ingress subdomain for the API Connect stack. Used when specifying endpoints. Domain names that are used for endpoints cannot contain the underscore "-" character. You can customize the subdomain or the complete hostname:

- Subdomain customization only
Accept the prefixes predefined for the ingress hostnames to use and replace all instances of `$STACK_HOST` with the desired ingress subdomain for the API Connect stack. For example, if your host is `myhost.subnet.example.com`:

```

ingestion:
  endpoint:
    < ... >
  hosts:
    - name: ai.myhost.subnet.example.com
      secret: analytics-ai-endpoint
    < ... >

```

- Complete hostname customization
Change both the predefined prefixes and the `$STACK_HOST` subdomain to match your desired hostnames.

For example, you can replace `$STACK_HOST` with `my.analytics.ingestion.myhost.subnet.example.com`, where `my.analytics.ingestion` replaces `ai`, and `myhost.subnet.example.com` replaces `STACK_HOST`.

```

ingestion:
  endpoint:
    < ... >
  hosts:
    - name: my.analytics.ingestion.myhost.subnet.example.com
      secret: analytics-ai-endpoint
    < ... >

```

`$STORAGE_CLASS`

The Kubernetes storage class to be used for persistent volume claims (for more information, see [Planning the analytics profile, storage class, and storage type](#)). Find the available storage classes in the target cluster by running the following command: `oc get sc`. Example:

```

storage:
  type: shared
  shared:
    volumeClaimTemplate:
      storageClassName: ceph-block

```

`$DATA_VOLUME_SIZE`

Size of storage allocated for data. To estimate the storage space you require, see [Estimating internal storage space](#). If `$DATA_VOLUME_SIZE` is not specified, it defaults to 50Gi. See [Reference: Fields in the Analytics CR](#). Example:

```

storage:
  type: shared
  shared:
    volumeClaimTemplate:
      storageClassName: ceph-block
      volumeSize: 100Gi

```

`$LICENSE_ACCEPTANCE`

Set `accept` to `true`. You must accept the license to successfully deploy API Connect.

`$LICENSE_USE`

Set `use` to either `production` or `nonproduction` to match the license that you purchased.

`$LICENSE_ID`

Set `license` to the license ID for the version of API Connect that you purchased. See [API Connect licenses](#).

- Optional: If you are installing Cloud Pak for Integration 2022.2.1 or 2022.4.1 and don't want to have Zen endpoints, add the following annotation to the `metadata` section of the CR:

```

metadata:
  annotations:
    apiconnect-operator/cp4i: "false"

```

- Optional: Three replica deployments only: Enable dedicated storage.
If you want to use dedicated storage, update the `spec.storage` section of the yaml file as follows:

```

storage:
  type: dedicated
  shared:
    volumeClaimTemplate:
      storageClassName: $STORAGE_CLASS
      volumeSize: $DATA_VOLUME_SIZE
  master:
    volumeClaimTemplate:
      storageClassName: $STORAGE_CLASS

```

For more information about dedicated storage, see [Dedicated storage instead of shared storage](#).

- Optional: If you want to disable mTLS for communications between the management and analytics subsystem, and between the gateway and analytics subsystem, and enable JWT instead, then add and set the properties `mtlsValidateClient` and `jwtksUrl`.

```

spec:
  ...
  mtlsValidateClient: false
  jwtksUrl: <JWTKS URL>

```

where `<JWTKS URL>` is the URL of the JWKS endpoint hosted on the management subsystems. To find out the `jwtksUrl`, describe the management CR and check the `status` section:

```

kubectl describe mgmt -n <namespace>
...
status:
- name: jwtksUrl
  secretName: api-endpoint
  type: API
  uri: https://api.apic.acme.com/api/cloud/oauth2/certs

```

For more information on JWT security, see [Enable JWT security instead of mTLS](#).

Note: It is not possible to use JWT on the V5 compatible gateway to analytics message flow.

- If you want to enable additional analytics features, you can set them in the `analytics_cr.yaml` file as described here: [Analytics subsystem CR configured settings](#)
- Install the analytics subsystem by applying the modified CR with the following command:

```
oc apply -f analytics_cr.yaml -n <namespace>
```

- Verify that the analytics subsystem is fully installed:

```
oc get AnalyticsCluster -n <namespace>
```

The installation is complete when **READY** shows all pods running (n/n), and the **STATUS** reports **Running**. Example:

NAME	READY	STATUS	VERSION	RECONCILED	VERSION	AGE
analytics	n/n	Running	10.0.5.3	10.0.5.3-1281	86m	

It is not necessary to wait for analytics installation to complete before you move on to the next subsystem installation.

What to do next

If you are creating a new deployment of API Connect, install other subsystems as needed.

When you have completed the installation of all required API Connect subsystems, you can proceed to defining your API Connect configuration by using the API Connect Cloud Manager; refer to the [Cloud Manager configuration checklist](#).

Previous topic: [Installing the Portal subsystem in a shared namespace](#)

Installing with subsystem CRs in different namespaces or environments on OpenShift

Install API Connect subsystems in different namespaces, for example Management subsystem in a namespace that is called `apicmgmt`, Gateway in a namespace called `apicgway`. These same steps can also be used for installing subsystems in different environments.

About this task

Install API Connect subsystems where you have separate namespaces for each subsystem.

- [Installing operators](#)
Install operators for API Connect, DataPower, and common services so that you can deploy API Connect subsystems across multiple namespaces on OpenShift. If deploying subsystems in different environments then the corresponding operator will need to be installed in each environment, for example the DataPower operator in your Gateway environment, and the API Connect operator in your Portal environment.
- [Installing the Management subsystem](#)
Install the Management subsystem by creating and applying the ingress-issuer and mgmt_cr yaml files.
- [Extracting the Management ingress-ca certificates](#)
In order for the Management subsystem to be able to communicate with subsystems in different namespaces, these subsystems need to have the same ingress-ca certificates as the Management subsystem.
- [Installing the Gateway subsystem](#)
Install the Gateway subsystem by creating and applying the ingress-ca, common-issuer, gateway-certs and gateway_cr yaml files.
- [Installing the Portal subsystem](#)
Install the Portal subsystem by creating and applying the ingress-ca, common-issuer, and portal_cr yaml files.
- [Installing the Analytics subsystem](#)
Install the Analytics subsystem by creating and applying the ingress-ca, common-issuer, and analytics_cr yaml files.

Installing operators

Install operators for API Connect, DataPower, and common services so that you can deploy API Connect subsystems across multiple namespaces on OpenShift. If deploying subsystems in different environments then the corresponding operator will need to be installed in each environment, for example the DataPower operator in your Gateway environment, and the API Connect operator in your Portal environment.

Before you begin

The API Connect operator and operand must be from the same release and fix pack level. Table 1 lists the current version of the operator and operand for API Connect.

Table 1. API Connect operator and operand versions

API Connect (operand)	Operator channel version	Highest operator version
10.0.5.6	v3.6	3.6.0

You can use any combination of API Connect 10.0.5.x with DataPower Gateway 10.5.0.x or DataPower API Gateway 10.5.0.x.

Procedure

- Obtain an entitlement key for the Entitled Registry:
 - Log in to the [IBM Container Library](#).
 - In the Container software library, select Get entitlement key.

- c. After the Access your container software heading, click Copy key.
- d. Copy the key to a safe location.
2. Create a global pull secret:
 - a. Open the OpenShift web console, click Workloads, > Secrets.
 - b. Select the project `openshift-config`.
 - c. Select `pull-secret` from the secret list.
 - d. Select Actions, > Edit Secret, > Add Credentials.
 - e. Set Registry Server Address to `cp.icr.io`.
 - f. Set Username to `cp`.
 - g. Set Password to the entitlement key generated in Step 1.
 - h. Click Save.
3. Add the IBM Operator Catalog source:
 - a. In the OpenShift web console, and click + (in the page banner) to open the Import YAML dialog box.
 - b. Paste the following resource definition into the dialog box:

```
apiVersion: operators.coreos.com/v1alpha1
kind: CatalogSource
metadata:
  name: ibm-operator-catalog
  namespace: openshift-marketplace
spec:
  displayName: "IBM Operator Catalog"
  publisher: IBM
  sourceType: grpc
  image: icr.io/cpopen/ibm-operator-catalog
  updateStrategy:
    registryPoll:
      interval: 45m
```

- c. Click Create.
4. Create the `apiconnect` subscription.
 - a. Create the `apiconnect` subscription with the appropriate channel by creating a file called `apic-sub.yaml` and pasting in the following contents:

```
apiVersion: operators.coreos.com/v1alpha1
kind: Subscription
metadata:
  name: ibm-apiconnect
  namespace: openshift-operators
spec:
  channel: v3.6
  name: ibm-apiconnect
  source: ibm-operator-catalog
  sourceNamespace: openshift-marketplace
```

- b. Apply the subscription with the following command:

```
oc apply -f apic-sub.yaml
```

- c. Select Operators, > Installed Operators, and ensure that Project: All Projects is selected. If any operators such as `ibm-apiconnect` or `ibm-cert-manager-operator` show the status of "Upgrade available", approve the upgrade by completing the following steps:
 - i. Click Upgrade available.
 - ii. Click Preview InstallPlan.
 - iii. Click Approve.
 - iv. Wait for the **IBM API Connect** and **IBM DataPower Gateway** operators to install. The **IBM DataPower Gateway** operator is a prerequisite to API Connect and must not be removed.

5. (10.0.5.3 and later) Create the `ibm-common-services-operator` subscription, if it does not already exist. This step only applies when you install version 10.0.5.3 or later. If you are installing an older version of API Connect, skip this step.

- a. Create a file called `common-services-sub.yaml` and paste in the following contents:

```
apiVersion: operators.coreos.com/v1alpha1
kind: Subscription
metadata:
  name: ibm-common-service-operator
  namespace: openshift-operators
spec:
  channel: <channel>
  name: ibm-common-service-operator
  source: ibm-operator-catalog
  sourceNamespace: openshift-marketplace
```

Where `<channel>` is one of the following values:

- `v3.23` if you are using IBM Cloud Pak foundational services for CD (continuous delivery)
- `v3` if you are using IBM Cloud Pak foundational services for LTSR (long term service release)

- b. Apply the subscription with the following command:

```
oc apply -f common-services-sub.yaml
```

- c. Select Operators, > Installed Operators, and ensure that Project: All Projects is selected. If any operators such as `ibm-apiconnect` or `ibm-cert-manager-operator` show the status of "Upgrade available", approve the upgrade by completing the following steps:
 - i. Click Upgrade available.
 - ii. Click Preview InstallPlan.
 - iii. Click Approve.

- iv. Check the `ibm-common-services` namespace and ensure that all operators with a status of "Upgrade available" are approved.
 - v. Wait for the **IBM Cloud Pak foundational services, IBM NamespaceScope, and Operand Deployment Lifecycle Manager** operators to install.
6. Create the namespaces for your API Connect subsystems either by selecting Project \geq Create Project in the UI, or with the command:

```
oc create ns <APIC-namespace>
```

Note: The following namespaces cannot be used to install API Connect subsystems because Red Hat OpenShift Container Platform (OCP) restricts the use of default namespaces for installing non-cluster services:

- default
- kube-system
- kube-public
- openshift-node
- openshift-infra
- openshift

7. (10.0.5.3 and later) Install cert manager:

This step only applies when you install version 10.0.5.3 or later. If you are installing an older version of API Connect, skip this step.

- a. Create a file called `cert-manager-operand-request.yaml` and paste in the following content:

```
apiVersion: operator.ibm.com/v1alpha1
kind: OperandRequest
metadata:
  name: ibm-apiconnect-cert-manager
  namespace: <namespace>
spec:
  requests:
  - operands:
    - name: ibm-cert-manager-operator
      registry: common-service
      registryNamespace: ibm-common-services
```

- b. Create the `operandRequest` for cert-manager by running the following command:

```
oc apply -f cert-manager-operand-request.yaml
```

- c. Select Operators \geq Installed Operators, and ensure that Project: All Projects is selected.

Wait for the `ibm-cert-manager-operator` to display and if it shows the status of "Upgrade available", approve the upgrade by completing the following steps:

- i. Click Upgrade available.
- ii. Click Preview InstallPlan.
- iii. Click Approve.
- iv. Wait for the **IBM Cert Manager** operator to install.

What to do next

Proceed to install the API Connect subsystems as explained in : [Installing the Management subsystem](#)

Next topic: [Installing the Management subsystem](#)

Installing the Management subsystem

Install the Management subsystem by creating and applying the `ingress-issuer` and `mgmt_cr` yaml files.

Before you begin

When installing subsystems in different namespaces you must first create the cert-manager issuers and certificates required by that subsystem in the same namespace.

1. Create a file called `ingress-issuer-management.yaml` and paste in the following content:

```
#
# Licensed under the Apache License, Version 2.0 (the "License");
# you may not use this file except in compliance with the License.
# You may obtain a copy of the License at
#
# http://www.apache.org/licenses/LICENSE-2.0
#
# Unless required by applicable law or agreed to in writing, software
# distributed under the License is distributed on an "AS IS" BASIS,
# WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied.
# See the License for the specific language governing permissions and
# limitations under the License.
#
---
apiVersion: cert-manager.io/v1
kind: Issuer
metadata:
  name: selfsigning-issuer
  labels: {
    app.kubernetes.io/instance: "management",
    app.kubernetes.io/managed-by: "ibm-apiconnect",
    app.kubernetes.io/name: "selfsigning-issuer"
```

```

}
spec:
  selfSigned: {}
---
apiVersion: cert-manager.io/v1

  usages:
    - "client auth"
    - "signing"
    - "key encipherment"
  duration: 17520h # 2 years
  renewBefore: 720h # 30 days
  privateKey:
    rotationPolicy: Always

```

2. Apply the YAML file with: `oc apply -f ingress-issuer-management.yaml -n <management namespace>`
3. Confirm that the issuers were created and are in ready state:

```

oc get issuers -n <management namespace>
NAME                READY
ingress-issuer      True
selfsigning-issuer  True

```

Procedure

1. Create a file called `mgmt_cr.yaml` and paste in the following content:

```

#
# Licensed under the Apache License, Version 2.0 (the "License");
# you may not use this file except in compliance with the License.
# You may obtain a copy of the License at
#
#     http://www.apache.org/licenses/LICENSE-2.0
#
# Unless required by applicable law or agreed to in writing, software
# distributed under the License is distributed on an "AS IS" BASIS,
# WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied.
# See the License for the specific language governing permissions and
# limitations under the License.
#

apiVersion: management.apiconnect.ibm.com/v1beta1
kind: ManagementCluster
metadata:
  name: management
  labels: {
    app.kubernetes.io/instance: "management",
    app.kubernetes.io/managed-by: "ibm-apiconnect",
    app.kubernetes.io/name: "management"
  }
spec:
  version: $APP_PRODUCT_VERSION
  profile: $PROFILE
  portal:
    admin:
      secretName: portal-admin-client
  analytics:
    ingestion:
      secretName: analytics-ingestion-client
  gateway:
    client:
      secretName: gateway-client-client
  cloudManagerEndpoint:
    annotations:
      cert-manager.io/issuer: ingress-issuer
    hosts:
      - name: admin.$STACK_HOST
        secretName: cm-endpoint
  apiManagerEndpoint:
    annotations:
      cert-manager.io/issuer: ingress-issuer
    hosts:
      - name: manager.$STACK_HOST
        secretName: apim-endpoint
  platformAPIEndpoint:
    annotations:
      cert-manager.io/issuer: ingress-issuer
    hosts:
      - name: api.$STACK_HOST
        secretName: api-endpoint
  consumerAPIEndpoint:
    annotations:

```

```

cert-manager.io/issuer: ingress-issuer
hosts:
- name: consumer.$STACK_HOST
  secretName: consumer-endpoint
databaseVolumeClaimTemplate:
  storageClassName: $STORAGE_CLASS
microServiceSecurity: certManager
certManagerIssuer:
  name: selfsigning-issuer
  kind: Issuer
license:
  accept: $LICENSE_ACCEPTANCE
  use: $LICENSE_USE
  license: '$LICENSE_ID'

```

2. Edit the YAML file and replace the variables:

\$APP_PRODUCT_VERSION

API Connect application version for the subsystems.

version: <version_number>

Example version number: 10.0.5.6

\$PROFILE

Specify your Management subsystem profile, where **n** indicates number of replicas, **c** number of cores, and **m** is the minimum memory allocation in GB. For more information on profiles, see [Planning your deployment topology](#).

\$STACK_HOST

The desired ingress subdomain for the API Connect stack. Used when specifying endpoints. Domain names that are used for endpoints cannot contain the underscore "_" character. You can do one of the following:

- Subdomain customization only
Accept the prefixes predefined for the ingress host names to use and replace all instances of **STACK_HOST** to be the desired ingress subdomain for the API Connect stack. For example, if your host is **myhost.subnet.example.com**:

```

cloudManagerEndpoint:
  < ... >
  hosts:
  - name: admin.myhost.subnet.example.com
    secret: cm-endpoint

apiManagerEndpoint:
  < ... >
  hosts:
  - name: manager.myhost.subnet.example.com
    secret: apim-endpoint

platformAPIEndpoint:
  < ... >
  hosts:
  - name: api.myhost.subnet.example.com
    secret: api-endpoint

consumerAPIEndpoint:
  < ... >
  hosts:
  - name: consumer.myhost.subnet.example.com
    secret: consumer-endpoint

```

- Complete hostname customization
Change both the predefined prefixes and the **STACK_HOST** subdomain to match your desired hostnames.

For example, for **cloudManagerEndpoint**, you can replace **admin.\$STACK_HOST** with **my.cloudmgr.myhost.subnet.example.com**, where **my.cloudmgr** replaces **admin**, and **myhost.subnet.example.com** replaces **STACK_HOST**. For example:

```

cloudManagerEndpoint:
  < ... >
  hosts:
  - name: my.cloudmgr.myhost.subnet.example.com
    secret: cm-endpoint

```

You can do this for some or all of the hostnames, depending on your customization requirements.

\$STORAGE_CLASS

The OCP storage class to be used for Persistent Volume Claims. Find the available storage classes in the target cluster by running the following command: **oc**

```

get
sc.

```

storageClassName: local-storage

\$LICENSE_ACCEPTANCE

Set **accept** to **true**. You must accept the license to successfully deploy API Connect.

\$LICENSE_USE

Set **use** to either **production** or **nonproduction** to match the license that you purchased.

\$LICENSE_ID

Set **license:** to the license ID for the version of API Connect that you purchased. See [API Connect licenses](#).

3. Optional: If you are installing Cloud Pak for Integration 2022.2.1 or 2022.4.1 and don't want to use Cloud Pak endpoints, add the following annotation to the **metadata** section of the Management CR:

Note: Beginning with API Connect 10.0.5.6, this annotation is added automatically to the stand-alone Management CR. You must still add it manually if you are installing an older version of 10.0.5.x.

```
metadata:
  annotations:
    apiconnect-operator/cp4i: "false"
```

4. Configure database backups for the Management subsystem.
To successfully restore API Connect in the event of a disaster where you must redeploy a new cluster, you must configure the database backup settings before the initial installation of the Management subsystem. For instructions on configuring backup settings, see [Configuring backup settings for a fresh install of the Management subsystem on OpenShift or Cloud Pak for Integration](#).

5. Install the Management subsystem by applying the modified CR with the following command:

```
oc apply -f mgmt_cr.yaml -n <management_namespace>
```

6. Verify that the Management subsystem is fully installed by running the following command:

```
oc get ManagementCluster -n <management_namespace>
```

The installation is complete when the **READY** status is **True**, and the **SUMMARY** reports that all services are online:

NAME	READY	SUMMARY	VERSION	RECONCILED VERSION	AGE
management	True	16/16	<version>	<version-build>	7m17s

7. Verify that you can log in to the API Connect Cloud Manager UI:
 - a. Determine the URL for the Cloud Manager UI by running the following command to view the API Connect endpoints:

```
oc get routes -n <management_namespace>
```

- b. Locate the **management-admin** endpoint, and note it down.
- c. Determine the Cloud Manager administrator password by running the following commands:

```
oc get secret -n <management-namespace> | grep management-admin-secret
```

```
oc get secret -n <management-namespace> <secret_name_from_previous_command> -o jsonpath="{.data.password}" | base64 -d && echo ""
```

- d. Open a browser and go to the **management-admin-apic** endpoint.
 - e. Log in to the Cloud Manager as **admin** with the administrator password.
8. Store all secrets and passwords in a safe place.
 9. Prepare the Management subsystem for disaster recovery.
Follow the appropriate instructions for your environment:
 - [Preparing the Management subsystem for disaster recovery on OpenShift](#)
 - [Preparing the Management subsystem for disaster recovery on Cloud Pak for Integration](#)

What to do next

If you are creating a new deployment of API Connect, install other subsystems as needed.

When you have completed the installation of all required API Connect subsystems, you can proceed to defining your API Connect configuration by using the API Connect Cloud Manager; refer to the [Cloud Manager configuration checklist](#).

Previous topic: [Installing operators](#)

Next topic: [Extracting the Management ingress-ca certificates](#)

Extracting the Management ingress-ca certificates

In order for the Management subsystem to be able to communicate with subsystems in different namespaces, these subsystems need to have the same ingress-ca certificates as the Management subsystem.

About this task

This task describes how to extract the ingress-ca certificates to a yaml file, ready for applying to the subsystems that are in different namespaces.

Procedure

1. Export the ingress-ca secret to a yaml file with:

```
oc -n <management_namespace> get secret ingress-ca -o yaml > ingress-ca.yaml
```
2. Edit the ingress-ca.yaml file and remove the following properties: metadata.creationTimestamp, metadata.namespace, metadata.resourceVersion, metadata.uid, metadata.selfLink
3. Keep this file safe. You will need to apply it in the namespaces of your other subsystems so that they can communicate with the Management subsystem.

Previous topic: [Installing the Management subsystem](#)

Next topic: [Installing the Gateway subsystem](#)

Installing the Gateway subsystem

Install the Gateway subsystem by creating and applying the ingress-ca, common-issuer, gateway-certs and gateway_cr yaml files.

Before you begin

When installing subsystems in different namespaces you must first create the cert-manager issuers and certificates required by that subsystem in the same namespace.

1. Using the file obtained from [Extracting the Management ingress-ca certificates](#), run: `oc apply -f ingress-ca.yaml -n <gateway namespace>`
2. Create a file called `common-issuer-and-gateway-certs.yaml` and paste in these contents:

```
#
# Licensed under the Apache License, Version 2.0 (the "License");
# you may not use this file except in compliance with the License.
# You may obtain a copy of the License at
#
#     http://www.apache.org/licenses/LICENSE-2.0
#
# Unless required by applicable law or agreed to in writing, software
# distributed under the License is distributed on an "AS IS" BASIS,
# WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied.
# See the License for the specific language governing permissions and
# limitations under the License.
#

---

apiVersion: cert-manager.io/v1
kind: Issuer
metadata:
  name: selfsigning-issuer
  labels: {
    app.kubernetes.io/instance: "management",
    app.kubernetes.io/managed-by: "ibm-apiconnect",
    app.kubernetes.io/name: "selfsigning-issuer"
  }
spec:
  selfSigned: {}
---

apiVersion: cert-manager.io/v1
kind: Issuer
metadata:
  name: ingress-issuer
  labels: {
    app.kubernetes.io/instance: "management",
    app.kubernetes.io/managed-by: "ibm-apiconnect",
    app.kubernetes.io/name: "ingress-issuer"
  }
spec:
  ca:
    secretName: ingress-ca
---

apiVersion: cert-manager.io/v1
kind: Certificate
metadata:

  - "client auth"
  - "signing"
  - "key encipherment"
  duration: 17520h # 2 years
  renewBefore: 720h # 30 days
  privateKey:
    rotationPolicy: Always
```

3. Apply the above YAML file with: `oc apply -f common-issuer-and-gateway-certs.yaml -n <gateway_namespace>`
4. Confirm that the issuers were created and are in ready state:

```
oc get issuers -n <gateway namespace>
NAME          READY
ingress-issuer  True
selfsigning-issuer  True
```

5. Confirm that the gateway secrets were created with `oc get secrets -n <gateway namespace>`:

```
oc get secrets -n <gateway namespace>
NAME          TYPE          DATA  AGE
...
gateway-peering  kubernetes.io/tls  3      2m
gateway-service  kubernetes.io/tls  3      2m3s
...
```

About this task

Use the OpenShift CLI to edit the custom resource template for the Gateway, apply the resource, verify that the pods are up and running.

Procedure

1. Create the gateway admin secret with: `oc -n <gateway namespace> create secret generic admin-secret --from-literal=password=admin`
2. If you are installing the API Gateway (v6), create a yml file that is called `apigateway_cr.yml` and paste in these contents:

```
#
# Licensed under the Apache License, Version 2.0 (the "License");
# you may not use this file except in compliance with the License.
# You may obtain a copy of the License at
#

    hosts:
      - name: rgwd.$STACK_HOST
        secretName: gwv6-manager-endpoint
  apicGatewayServiceTLS:
    secretName: gateway-service
  apicGatewayPeeringTLS:
    secretName: gateway-peering
  datapowerLogLevel: 3
  license:
    accept: $LICENSE_ACCEPTANCE
    use: $LICENSE_USE
    license: '$LICENSE_ID'
  tokenManagementService:
    enabled: true
  storage:
    storageClassName: $STORAGE_CLASS
    volumeSize: 30Gi
  adminUser:
    secretName: admin-secret
  # syslogConfig:
```

```

# enabled: false # if true, provide below details
# remoteHost: $DATAPOWER_SYSLOG_TCP_REMOTE_HOST # must be a string
# remotePort: $DATAPOWER_SYSLOG_TCP_REMOTE_PORT # must be an int
# secretName: $DATAPOWER_SYSLOG_TCP_TLS_SECRET # must be a string

```

If you are installing the v5 Gateway, create a yaml file that is called v5gateway_cr.yaml and paste in these contents:

```

#
# Licensed under the Apache License, Version 2.0 (the "License");
# you may not use this file except in compliance with the License.
# You may obtain a copy of the License at

# WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied.
# See the License for the specific language governing permissions and
# limitations under the License.
#

apiVersion: gateway.apiconnect.ibm.com/v1beta1
kind: GatewayCluster
metadata:
  name: gwv5
  labels: {
    app.kubernetes.io/instance: "gateway",
    app.kubernetes.io/managed-by: "ibm-apiconnect",
    app.kubernetes.io/name: "gwv5"
  }
spec:
  version: $APP_PRODUCT_VERSION
  profile: $PROFILE
  apicGatewayServiceV5CompatibilityMode: true
  gatewayEndpoint:
    annotations:
      cert-manager.io/issuer: ingress-issuer
    hosts:
      - name: gw.$STACK_HOST
        secretName: gwv5-endpoint
  gatewayManagerEndpoint:
    annotations:
      cert-manager.io/issuer: ingress-issuer
    hosts:
      - name: gwd.$STACK_HOST
        secretName: gwv5-manager-endpoint
  apicGatewayServiceTLS:
    secretName: gateway-service
  apicGatewayPeeringTLS:
    secretName: gateway-peering
  datapowerLogLevel: 3
  license:
    accept: $LICENSE_ACCEPTANCE
    use: $LICENSE_USE
    license: '$LICENSE_ID'
  adminUser:
    secretName: admin-secret
  # syslogConfig:
  # enabled: false # if true, provide below details
  # remoteHost: $DATAPOWER_SYSLOG_TCP_REMOTE_HOST # must be a string
  # remotePort: $DATAPOWER_SYSLOG_TCP_REMOTE_PORT # must be an int
  # secretName: $DATAPOWER_SYSLOG_TCP_TLS_SECRET # must be a string

```

3. Edit the YAML file and set the variables:

\$APP_PRODUCT_VERSION
API Connect application version for the subsystems.

version: <version number>

Example version number: 10.0.5.6

\$PROFILE
Specify your Gateway subsystem profile, where **n** indicates number of replicas, **c** number of cores, and **m** is the minimum memory allocation in GB. For more information on profiles, see [Planning your deployment topology](#).

\$STACK_HOST
The desired ingress subdomain for the API Connect stack. Used when specifying endpoints. Domain names that are used for endpoints cannot contain the underscore "_" character. You can do one of the following:

- Subdomain customization only
Accept the prefixes predefined for the ingress host names to use and replace all instances of **STACK_HOST** to be the desired ingress subdomain for the API Connect stack. For example, if your host is **myhost.subnet.example.com**:

```

gatewayEndpoint:
  < ... >
  hosts:
    - name: rgw.myhost.subnet.example.com
      secret: gwv6-endpoint

gatewayManagerEndpoint:
  < ... >
  hosts:
    - name: rgwd.myhost.subnet.example.com

```

```
secret: gwv6-manager-endpoint
```

- Complete hostname customization
Change both the predefined prefixes and the `STACK_HOST` subdomain to match your desired hostnames.

For example, for `gatewayEndpoint`, you can replace `rgw.$STACK_HOST` with `my.gateway.endpoint.myhost.subnet.example.com`, where `my.gateway.endpoint` replaces `rgw`, and `myhost.subnet.example.com` replaces `$STACK_HOST`:

```
gatewayEndpoint:
  < ... >
  hosts:
  - name: my.gateway.endpoint.myhost.subnet.example.com
    secret: gwv6-endpoint
```

You can do this for some or all of the hostnames, depending on your customization requirements.

`$STORAGE_CLASS`

The OCP storage class to be used for Persistent Volume Claims. Find the available storage classes in the target cluster by running the following command: `oc get sc`.

```
storageClassName: local-storage
```

`$LICENSE_ACCEPTANCE`

Set `accept` to `true`. You must accept the license to successfully deploy API Connect.

`$LICENSE_USE`

Set `use` to either `production` or `nonproduction` to match the license that you purchased.

`$LICENSE_ID`

Set `license` to the license ID for the version of API Connect that you purchased. See [API Connect licenses](#).

`syslogConfig`

To enable this feature uncomment this section, set `enabled`: `true`, and set the properties:

`$DATAPOWER_SYSLOG_TCP_REMOTE_HOST`

```
remoteHost: <remote.host>
```

String. The hostname of the server for `syslogConfig`.

`$DATAPOWER_SYSLOG_TCP_REMOTE_PORT`

```
remotePort: <remote.port.number>
```

Integer. The port number of the server for `syslogConfig`.

`$DATAPOWER_SYSLOG_TCP_TLS_SECRET`

```
secretName: <secret>
```

String. The TLS secret name of the server for `syslogConfig`.

4. Optional: If you are installing Cloud Pak for Integration 2022.2.1 or 2022.4.1 and don't want to have Zen endpoints, add the following annotation to the `metadata` section of the CR:

```
metadata:
  annotations:
    apiconnect-operator/cp4i: "false"
```

5. Optional: If applicable to your deployment, update the gateway CR file to configure `DataPowerService` APIs to customize your DataPower deployment. See [Customizing a DataPower deployment](#).
6. To enable mutual TLS between the Management client and the Gateway service's manager endpoint, add `mtlsValidateClient` to the `spec` section:

```
spec:
  mtlsValidateClient: true
```

This ensures that the gateway service authenticates incoming requests from the API Manager, such as gateway service registration, and publishing APIs to the gateway service. Specifically, the gateway service requires that incoming requests present a certificate that was signed by the same CA that was used to sign the gateway service management endpoint. The gateway service management endpoint secret is specified under `gatewayManagerEndpoint.hosts.secretName`. The API Manager's gateway client's TLS credentials are specified in the ManagementCluster CR under `gateway.client.secretName`.

Note: In releases previous to 10.0.5.3, this property is called `validateApimClient`.

7. Optional: If you want to enable JWT security for communications between the management and gateway, add and set the property `jwtksUrl`.

```
spec:
  ...
  jwtksUrl: <JWTKS URL>
```

where `<JWTKS URL>` is the URL of the JWKS endpoint hosted on the management subsystems. To find out the `jwtksUrl`, describe the management CR and check the `status` section:

```
kubectl describe mgmt -n <namespace>
...
status:
- name: jwtksUrl
  secretName: api-endpoint
  type: API
  uri: https://api.apic.acme.com/api/cloud/oauth2/certs
```

For more information on JWT security, see [Enable JWT security instead of mTLS](#).

Datapower version 10.5.0.4 only: To enable JWT on the gateway to analytics communications flow, you also must add a `dataPowerOverride` section to the gateway CR:

```
spec:
  jwtksUrl: <JWTKS URL>
  dataPowerOverride:
    image: customregistry.com/custom-image-datapower:10.5.0.5
```

```
version: 10.5.0.5
license: X-XXXX-XXXXXX
```

- Optional: Update the gateway CR file to enable autoscaling of gateway pods to ensure high availability of DataPower pods. See [Enabling autoscaling of gateway pods](#).
- Install the Gateway Custom Resource by applying the yaml file:
For a DataPower® API Gateway, run the following command:

```
oc apply -f apigateway_cr.yaml -n <namespace>
```

For a DataPower Gateway (v5 compatible), run the following command:

```
oc apply -f v5cgateway_cr.yaml -n <namespace>
```

- To verify that the Gateway subsystem is fully installed, run the following command:

```
oc get GatewayCluster -n <namespace>
```

The installation is complete when the **READY** status is **True**, and the **SUMMARY** reports that all services are online (2/2) for all the Gateway subsystems that were installed. Example:

NAME	READY	SUMMARY	VERSION	RECONCILED VERSION	AGE
gww6	True	2/2	<version>	<version-build>	7m32s

There is no need to wait for the **READY** status to be **True** before moving on to next subsystem installation.

- Verify that the gateway is ready to be registered with the Management subsystem by calling the **health** api on the **gatewayManagerEndpoint.hosts.name** defined in your YAML file: `https://gwd.$STACK_HOST/health`.

```
curl -k https://gwd.example.com/health
{"status": "ok"}
```

What to do next

If you are creating a new deployment of API Connect, install other subsystems as needed.

When you have completed the installation of all required API Connect subsystems, you can proceed to defining your API Connect configuration by using the API Connect Cloud Manager; refer to the [Cloud Manager configuration checklist](#).

Previous topic: [Extracting the Management ingress-ca certificates](#)

Next topic: [Installing the Portal subsystem](#)

Installing the Portal subsystem

Install the Portal subsystem by creating and applying the ingress-ca, common-issuer, and portal_cr yaml files.

Before you begin

When installing subsystems in different namespaces you must first create the cert-manager issuers and certificates required by that subsystem in the same namespace.

- Using the file obtained from [Extracting the Management ingress-ca certificates](#), run: `oc apply -f ingress-ca.yaml -n <portal namespace>`
- Create a file called `common-issuer.yaml` and paste in these contents:

```
#
# Licensed under the Apache License, Version 2.0 (the "License");
# you may not use this file except in compliance with the License.
# You may obtain a copy of the License at
#
# http://www.apache.org/licenses/LICENSE-2.0
#
# Unless required by applicable law or agreed to in writing, software
# distributed under the License is distributed on an "AS IS" BASIS,
# WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied.
# See the License for the specific language governing permissions and
# limitations under the License.
#
---

apiVersion: cert-manager.io/v1
kind: Issuer
metadata:
  name: selfsigning-issuer
  labels: {
    app.kubernetes.io/instance: "management",
    app.kubernetes.io/managed-by: "ibm-apiconnect",
    app.kubernetes.io/name: "selfsigning-issuer"
  }
spec:
  selfSigned: {}
---

apiVersion: cert-manager.io/v1
kind: Issuer
metadata:
  name: ingress-issuer
  labels: {
    app.kubernetes.io/instance: "management",
    app.kubernetes.io/managed-by: "ibm-apiconnect",
```

```

    app.kubernetes.io/name: "ingress-issuer"
  }
spec:
  ca:
    secretName: ingress-ca

```

3. If you are installing Cloud Pak for Integration 2022.2.1 or 2022.4.1 and don't want to have Zen endpoints, add the following annotation to the `metadata` section of the CR:

```

metadata:
  annotations:
    apiconnect-operator/cp4i: "false"

```

4. Apply the above YAML file with: `oc apply -f common-issuer.yaml -n <portal_namespace>`
5. Confirm that the issuers were created and are in ready state:

```

oc get issuers -n <portal namespace>
NAME          READY
ingress-issuer  True
selfsigning-issuer  True

```

About this task

Use the OpenShift CLI to edit the custom resource template for the Portal subsystem, apply the resource, verify that the pods are up and running.

Procedure

1. Create a file that is called `portal_cr.yaml` and paste in these contents:

```

#
# Licensed under the Apache License, Version 2.0 (the "License");
# you may not use this file except in compliance with the License.
# You may obtain a copy of the License at
#
# http://www.apache.org/licenses/LICENSE-2.0
#
# Unless required by applicable law or agreed to in writing, software
# distributed under the License is distributed on an "AS IS" BASIS,
# WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied.
# See the License for the specific language governing permissions and
# limitations under the License.
#

apiVersion: portal.apiconnect.ibm.com/v1beta1
kind: PortalCluster
metadata:
  name: portal
  labels: {
    app.kubernetes.io/instance: "portal",
    app.kubernetes.io/managed-by: "ibm-apiconnect",
    app.kubernetes.io/name: "portal"
  }
spec:
  version: $APP_PRODUCT_VERSION
  profile: $PROFILE
  mgmtPlatformEndpointCASecret:
    secretName: ingress-ca
  mgmtConsumerEndpointCASecret:
    secretName: ingress-ca
  mgmtPlatformEndpointSvcCASecret:
    secretName: management-ca
  mgmtConsumerEndpointSvcCASecret:
    secretName: management-ca
  portalAdminEndpoint:
    annotations:
      cert-manager.io/issuer: ingress-issuer
    hosts:
      - name: api.portal.$STACK_HOST
        secretName: portal-admin
  portalUIEndpoint:
    annotations:
      cert-manager.io/issuer: ingress-issuer
    hosts:
      - name: portal.$STACK_HOST
        secretName: portal-web
  databaseVolumeClaimTemplate:
    storageClassName: $STORAGE_CLASS
    volumeSize: 15Gi
  databaseLogsVolumeClaimTemplate:
    storageClassName: $STORAGE_CLASS
    volumeSize: 6Gi
  webVolumeClaimTemplate:
    storageClassName: $STORAGE_CLASS
    volumeSize: 8Gi
  backupVolumeClaimTemplate:
    storageClassName: $STORAGE_CLASS
    volumeSize: 15Gi
  adminVolumeClaimTemplate:
    storageClassName: $STORAGE_CLASS

```

```

volumeSize: 6Gi
certVolumeClaimTemplate:
  storageClassName: $STORAGE_CLASS
  volumeSize: 4Gi
adminClientSubjectDN: CN=portal-admin-client,O=cert-manager
microServiceSecurity: certManager
certManagerIssuer:
  name: selfsigning-issuer
  kind: Issuer
license:
  accept: $LICENSE_ACCEPTANCE
  use: $LICENSE_USE
  license: '$LICENSE_ID'

```

2. Edit the YAML file and set the variables:

\$APP_PRODUCT_VERSION

API Connect application version for the subsystems.

```
version: <version_number>
```

Example version number: 10.0.5.6

\$PROFILE

Specify your portal subsystem profile, where **n** indicates number of replicas, **c** number of cores, and **m** is the minimum memory allocation in GB. For more information on profiles, see [Planning your deployment topology](#).

\$STACK_HOST

The desired ingress subdomain for the API Connect stack. Used when you specify endpoints. Domain names that are used for endpoints cannot contain the underscore "_" character. You can do one of the following:

- Subdomain customization only
Accept the prefixes predefined for the ingress host names to use and replace all instances of `STACK_HOST` to be the desired ingress subdomain for the API Connect stack. For example, for a subdomain of `myhost.subnet.example.com`:

```

portalAdminEndpoint:
  < ... >
  hosts:
    - name: api.portal.myhost.subnet.example.com
      secret: portal-admin

portalUIEndpoint:
  < ... >
  hosts:
    - name: portal.myhost.subnet.example.com
      secret: portal-web

```

- Complete hostname customization
Change both the predefined prefixes and the `STACK_HOST` subdomain to match your desired hostnames.

For example, for `portalAdminEndpoint`, you can replace `api.portal.$STACK_HOST` with `my.api.portal.myhost.subnet.example.com`, where `my.api.portal` replaces `api.portal`, and `myhost.subnet.example.com` replaces `STACK_HOST`:

```

portalAdminEndpoint:
  < ... >
  hosts:
    - name: my.api.portal.myhost.subnet.example.com
      secret: cm-endpoint

```

You can do this for some or all of the hostnames, depending on your customization requirements.

\$STORAGE_CLASS

The Kubernetes storage class to be used for Persistent Volume Claims. Find the available storage classes in the target cluster by running the following command: `oc get sc`. For example, for local storage:

```

databaseVolumeClaimTemplate:
  storageClassName: $STORAGE_CLASS
  volumeSize: 120Gi
databaseLogsVolumeClaimTemplate:
  storageClassName: $STORAGE_CLASS
  volumeSize: 12Gi
webVolumeClaimTemplate:
  storageClassName: $STORAGE_CLASS
  volumeSize: 200Gi
backupVolumeClaimTemplate:
  storageClassName: $STORAGE_CLASS
  volumeSize: 300Gi
adminVolumeClaimTemplate:
  storageClassName: $STORAGE_CLASS
  volumeSize: 20Gi
certVolumeClaimTemplate:
  storageClassName: $STORAGE_CLASS
  volumeSize: 4Gi

```

Note:

- The `databaseVolumeClaimTemplate` has a minimum value of 30Gi. The `webVolumeClaimTemplate` has a minimum value of 20Gi. The `backupVolumeClaimTemplate` has a minimum value of 30Gi. However, all three need to be sized according to the installation.
- The `adminVolumeClaimTemplate` and `databaseLogsVolumeClaimTemplate` in this example have their minimum values and you do not need to change them.
- The `certVolumeClaimTemplate` is used by the nginx pod and in 2dcdr (two data center disaster recovery) mode it is also used by the tunnel, db-remote and www-remote pods. It can be sized small, just like the `adminVolumeClaimTemplate`, and does not need to be increased based on the number of sites.

`$LICENSE_ACCEPTANCE`

Set `accept` to `true`. You must accept the license to successfully deploy API Connect.

`$LICENSE_USE`

Set `use` to either `production` or `nonproduction` to match the license that you purchased.

`$LICENSE_ID`

Set `license`: to the license ID for the version of API Connect that you purchased. See [API Connect licenses](#).

- Optional: If you are installing Cloud Pak for Integration 2022.2.1 or 2022.4.1 and don't want to have Zen endpoints, add the following annotation to the `metadata` section of the CR:

```
metadata:
  annotations:
    apiconnect-operator/cp4i: "false"
```

- Optional: If you want to disable mTLS for communications between the management and portal, and enable JWT instead, then add and set the properties `mtlsValidateClient` and `jwtksUrl`.

```
spec:
  ...
  mtlsValidateClient: false
  jwtksUrl: <JWTKS URL>
```

where `<JWTKS URL>` is the URL of the JWKS endpoint hosted on the management subsystems. To find out the `jwtksUrl`, describe the management CR and check the `status` section:

```
kubectl describe mgmt -n <namespace>
...
status:
- name: jwtksUrl
  secretName: api-endpoint
  type: API
  uri: https://api.apic.acme.com/api/cloud/oauth2/certs
```

For more information on JWT security, see [Enable JWT security instead of mTLS](#).

- Install the Portal subsystem by applying the modified CR with the following command:

```
oc apply -f portal_cr.yaml -n <namespace>
```

- Verify that the Portal subsystem is fully installed:

```
oc get PortalCluster -n <namespace>
```

The installation is complete when `STATUS` reports `Running`, `Ready` reports that all services are online (3/3), and `MESSAGE` reports "Ready for API Cloud Manager service registration", for example:

NAME	READY	STATUS	VERSION	RECONCILED	VERSION	MESSAGE	AGE
portal	3/3	Running	<version>	<version>		Ready for API Cloud Manager service registration	2h

You do not need to wait for the portal installation to complete before you move on to the next subsystem installation.

- Verify that you can access the portal web endpoint by browsing to the `portalUIEndpoint.hosts.name` as configured in your yaml file:

```
curl -k https://portal.$STACK_HOST
<!DOCTYPE html>
<html>
<head>
<title>Developer Portal is ready to create sites!</title>
<style>
  body {
    width: 35em;
    margin: 0 auto;
    font-family: Tahoma, Verdana, Arial, sans-serif;
  }
</style>
</head>
<body>Developer Portal is ready to create sites!</h1>
<p>If you see this page, the web server is successfully installed and
working. Further configuration is required.</p>
</body>
</html>
```

- It is highly recommend that you retain the Portal subsystem encryption secret in a safe location, in case you need to restore the Portal subsystem during a disaster recovery scenario.

The encryption secret is created when the Portal subsystem is initially deployed. You can obtain the name of the encryption secret from the Portal subsystem custom resource after the installation is complete:

- Obtain the name of the encryptionSecret:

```
oc get ptl portal -o yaml -n <namespace> | grep encryptionSecret
encryptionSecret: portal-enc-key
```

The name of encryption secret is `portal-enc-key`.

- Save the secret yaml in a safe location:

```
oc get secret portal-enc-key -o yaml -n <namespace> > portal-enc-key.yaml
```

- Backup the Portal installation. See [Backing up and restoring Developer Portal on OpenShift and Cloud Pak for Integration](#).

What to do next

If you are creating a new deployment of API Connect, install other subsystems as needed.

When you have completed the installation of all required API Connect subsystems, you can proceed to defining your API Connect configuration by using the API Connect Cloud Manager; refer to the [Cloud Manager configuration checklist](#).

Previous topic: [Installing the Gateway subsystem](#)

Next topic: [Installing the Analytics subsystem](#)

Installing the Analytics subsystem

Install the Analytics subsystem by creating and applying the ingress-ca, common-issuer, and analytics_cr yaml files.

Before you begin

When installing subsystems in different namespaces you must first create the cert-manager issuers and certificates required by that subsystem in the same namespace.

1. Using the file obtained from [Extracting the Management ingress-ca certificates](#), run: `oc apply -f ingress-ca.yaml -n <analytics namespace>`
2. Create a file called `common-issuer.yaml` and paste in these contents:

Note: If you have just done [Installing the Portal subsystem](#) then you will already have this file.

```

metadata:
  name: ingress-issuer
  labels: {
    app.kubernetes.io/instance: "management",
    app.kubernetes.io/managed-by: "ibm-apiconnect",
    app.kubernetes.io/name: "ingress-issuer"
  }
spec:
  ca:
    secretName: ingress-ca
```

3. Apply the above yaml file with: `oc apply -f common-issuer.yaml -n <analytics namespace>`
4. Confirm that the issuers were created and are in ready state: `oc get issuers -n <analytics namespace>`

```
oc get issuers -n <analytics namespace>
NAME          READY
ingress-issuer  True
selfsigning-issuer  True
```

About this task

Use the OpenShift CLI to edit the custom resource template for the Analytics subsystem, apply the resource, verify that the pods are up and running.

Procedure

1. Create a file that is called `analytics_cr.yaml` and paste in these contents:

```
#
# Licensed under the Apache License, Version 2.0 (the "License");
# you may not use this file except in compliance with the License.
# You may obtain a copy of the License at
#
#     http://www.apache.org/licenses/LICENSE-2.0

  microServiceSecurity: certManager
  certManagerIssuer:
    name: selfsigning-issuer
    kind: Issuer
  ingestion:
    endpoint:
      annotations:
        cert-manager.io/issuer: ingress-issuer
      hosts:
        - name: ai.$STACK_HOST
          secretName: analytics-ai-endpoint
      clientSubjectDN: CN=analytics-ingestion-client,O=cert-manager
  storage:
    type: shared # change to 'dedicated' if you want separate master and storage pods. Three-replica deployments only.
    shared:
      volumeClaimTemplate:
        storageClassName: $STORAGE_CLASS
        volumeSize: $DATA_VOLUME_SIZE
      # master: # uncomment this section if you set storage.type = dedicated.
      # volumeClaimTemplate:
      #   storageClassName: $STORAGE_CLASS

```

2. Edit the YAML file and set the variables:

\$APP_PRODUCT_VERSION
API Connect application version for the subsystems.

```
version: <version_number>
```

Example version number: 10.0.5.6

\$PROFILE

Specify your analytics subsystem profile, where **n** indicates number of replicas, **c** number of cores, and **m** is the minimum memory allocation in GB. For more information on profiles, see [Planning your deployment topology](#).

\$STACK_HOST

The desired ingress subdomain for the API Connect stack. Used when specifying endpoints. Domain names that are used for endpoints cannot contain the underscore "_" character. You can customize the subdomain or the complete hostname:

- Subdomain customization only
Accept the prefixes predefined for the ingress hostnames to use and replace all instances of **\$STACK_HOST** with the desired ingress subdomain for the API Connect stack. For example, if your host is **myhost.subnet.example.com**:

```

ingestion:
  endpoint:
    < ... >
  hosts:
    - name: ai.myhost.subnet.example.com
      secret: analytics-ai-endpoint
    < ... >

```

- Complete hostname customization
Change both the predefined prefixes and the **\$STACK_HOST** subdomain to match your desired hostnames.

For example, you can replace **\$STACK_HOST** with **my.analytics.ingestion.myhost.subnet.example.com**, where **my.analytics.ingestion** replaces **ai**, and **myhost.subnet.example.com** replaces **STACK_HOST**.

```

ingestion:
  endpoint:
    < ... >
  hosts:
    - name: my.analytics.ingestion.myhost.subnet.example.com
      secret: analytics-ai-endpoint
    < ... >

```

\$STORAGE_CLASS

The Kubernetes storage class to be used for persistent volume claims (for more information, see [Planning the analytics profile, storage class, and storage type](#)). Find the available storage classes in the target cluster by running the following command: **oc get sc**. Example:

```

storage:
  type: shared
  shared:
    volumeClaimTemplate:
      storageClassName: ceph-block

```

\$DATA_VOLUME_SIZE

Size of storage allocated for data. To estimate the storage space you require, see [Estimating internal storage space](#). If `$DATA_VOLUME_SIZE` is not specified, it defaults to 50Gi. See [Reference: Fields in the Analytics CR](#). Example:

```

storage:
  type: shared
  shared:
    volumeClaimTemplate:
      storageClassName: ceph-block
      volumeSize: 100Gi

```

\$LICENSE_ACCEPTANCE

Set `accept` to `true`. You must accept the license to successfully deploy API Connect.

\$LICENSE_USE

Set `use` to either `production` or `nonproduction` to match the license that you purchased.

\$LICENSE_ID

Set `license` to the license ID for the version of API Connect that you purchased. See [API Connect licenses](#).

- Optional: If you are installing Cloud Pak for Integration 2022.2.1 or 2022.4.1 and don't want to have Zen endpoints, add the following annotation to the `metadata` section of the CR:

```

metadata:
  annotations:
    apiconnect-operator/cp4i: "false"

```

- Optional: Three replica deployments only: Enable dedicated storage.

If you want to use dedicated storage, update the `spec.storage` section of the yaml file as follows:

```

storage:
  type: dedicated
  shared:
    volumeClaimTemplate:
      storageClassName: $STORAGE_CLASS
      volumeSize: $DATA_VOLUME_SIZE
  master:
    volumeClaimTemplate:
      storageClassName: $STORAGE_CLASS

```

For more information about dedicated storage, see [Dedicated storage instead of shared storage](#).

- Optional: If you want to disable mTLS for communications between the management and analytics subsystem, and between the gateway and analytics subsystem, and enable JWT instead, then add and set the properties `mtlsValidateClient` and `jwtksUrl`.

```

spec:
  ...
  mtlsValidateClient: false
  jwtksUrl: <JWTKS URL>

```

where `<JWTKS URL>` is the URL of the JWKS endpoint hosted on the management subsystems. To find out the `jwtksUrl`, describe the management CR and check the `status` section:

```

kubectl describe mgmt -n <namespace>
...
status:
- name: jwtksUrl
  secretName: api-endpoint
  type: API
  uri: https://api.apic.acme.com/api/cloud/oauth2/certs

```

For more information on JWT security, see [Enable JWT security instead of mTLS](#).

Note: It is not possible to use JWT on the V5 compatible gateway to analytics message flow.

- If you want to enable additional analytics features, you can set them in the `analytics_cr.yaml` file as described here: [Analytics subsystem CR configured settings](#)
- Install the analytics subsystem by applying the modified CR with the following command:

```
oc apply -f analytics_cr.yaml -n <namespace>
```

- Verify that the analytics subsystem is fully installed:

```
oc get AnalyticsCluster -n <namespace>
```

The installation is complete when `READY` shows all pods running (n/n), and the `STATUS` reports `Running`. Example:

NAME	READY	STATUS	VERSION	RECONCILED	VERSION	AGE
analytics	n/n	Running	10.0.5.3	10.0.5.3-1281	86m	

It is not necessary to wait for analytics installation to complete before you move on to the next subsystem installation.

What to do next

If you are creating a new deployment of API Connect, install other subsystems as needed.

When you have completed the installation of all required API Connect subsystems, you can proceed to defining your API Connect configuration by using the API Connect Cloud Manager; refer to the [Cloud Manager configuration checklist](#).

Previous topic: [Installing the Portal subsystem](#)

Installing a two data center deployment with Cloud Pak for Integration

How to deploy a two data center disaster recovery (2DCDR) deployment on OpenShift with Cloud Pak for Integration.

Introduction

Ensure that you understand the concepts of 2DCDR in API Connect. For more information, see [Two data center deployment strategy on Kubernetes and OpenShift](#).

Familiarize yourself with the Cloud Pak for Integration installation instructions linked from [Deploying on OpenShift and Cloud Pak for Integration](#).

Note: During a 2DCDR installation, the management subsystem remains in a **Warning** state until the management subsystems in both data centers synchronize their databases. The management **Warning** status prevents the deployment and registration of the portal, gateway, and analytics subsystems. When the management subsystem databases are synchronized and both in **Ready** state, the deployment and registration of the other subsystems starts.

Prerequisites

The prerequisites for a 2DCDR deployment with Cloud Pak for Integration are as follows.

- The management and portal endpoints must be the same on both data centers.
- The network latency between data centers must be no more than 80 ms.
- The management cluster in each data center must use the same encryption secret.
- The portal cluster in each data center must use the same encryption secret.
- The ingress-ca certificate must be the same on both data centers.
- The Cloud Pak for Integration cluster must have a customized hostname and custom certificates.
- The API Connect namespace name must be the same in both clusters.
- The APICoordinateCluster CR name must be identical on both clusters.

Restrictions:

- API Connect is not supported on a FIPS-enabled environment.
- It is not possible to use the Automated API behavior testing application ([Installing the Automated API behavior testing application](#)) in a 2DCDR configuration ([Two data center deployment strategy on Kubernetes and OpenShift](#)).
- [Planning and initial preparation](#)
Decide on endpoint, host, and namespace names. Prepare your Cloud Pak for Integration environments for 2DCDR API Connect.
- [Preparing your active data center](#)
Create the secrets, certificates, and issuers that are needed for your active data center to replicate with the warm-standby.
- [Preparing your warm-standby data center](#)
Create the secrets, certificates, and issuers that are needed for your warm-standby data center to replicate with the active.
- [Installing API Connect on the active data center](#)
Follow the installation steps for API Connect described in the Cloud Pak for Integration documentation, adding the `multiSiteHA` configuration to the API Connect YAML.
- [Installing API Connect on the warm-standby data center](#)
Follow the installation steps for API Connect described in the Cloud Pak for Integration documentation, adding the `multiSiteHA` configuration to the API Connect YAML.

Planning and initial preparation

Decide on endpoint, host, and namespace names. Prepare your Cloud Pak for Integration environments for 2DCDR API Connect.

Procedure

1. Decide on naming. Both data centers must use the same names for:
 - API Connect namespace.
 - API Connect Cluster CR name. Also known as the API Connect instance name, and referred to in this document as `<apic-instance-name>`.
 - Portal subsystem endpoints
 - `portalAdminEndpoint`
 - `portalUIEndpoint`
 - Custom hostname and domain. This will be used in the URL for the Cloud Pak for Integration Platform UI and also for the Management subsystem endpoints. Traffic to this hostname should be directed to whichever data center is the active.

Important: Each data center must use a different backup path for your Management backups. For portal backups each data center must use the same backup path. For more information, see [Backup and restore requirements for a two data center deployment](#).
2. Create a namespace for your API Connect deployment in both data centers.
The API Connect namespace must be the same in both data centers, set it with:

```
oc create ns <namespace>
```
3. Install the Cloud Pak for Integration operator, Platform Navigator UI, and the API Connect operator in both your data centers. See <https://www.ibm.com/docs/en/cloud-paks/cp-integration>. Do not create an API Connect instance yet, install only the API Connect operator.
4. Decide which data center will start as the active and which will start as the warm-standby.
5. On the CLI of the active data center, where you run `oc` commands, create a directory called `2dcdcr-active-yamls`. On the CLI of the warm-standby data center, create a directory called `2dcdcr-ws-yamls`.

What to do next

Proceed to prepare the replication certificates, secrets, and issuers on your active data center [Preparing your active data center](#).

Preparing your active data center

Create the secrets, certificates, and issuers that are needed for your active data center to replicate with the warm-standby.

About this task

All operations are done on the CLI, in the `2dcd-active-yamls` directory you created in [Planning and initial preparation](#).

In the yaml files and commands that are shown here, replace `<apic-instance-name>` with the name you intend to use for your API Connect Cluster CR, and `<namespace>` with your API Connect namespace name (which will be the same for both Management and Portal subsystems). As decided in [Planning and initial preparation](#).

Procedure

1. Deploy the cert-manager.

a. Create a file that is called `cert-manager.yaml` and paste in the following contents:

```
apiVersion: operator.ibm.com/v1alpha1
kind: OperandRequest
metadata:
  name: ibm-apiconnect
spec:
  requests:
    - operands:
      - name: ibm-cert-manager-operator
        registry: common-service
        registryNamespace: ibm-common-services
```

b. Apply this yaml file with:

```
oc apply -f cert-manager.yaml -n <namespace>
```

c. Confirm that the cert-manager is deployed:

```
oc get deploy -n ibm-common-services | grep ibm-cert-manager-operator
```

d. Wait for the cert-manager deployment to become available:

```
oc wait --for=condition=available deployment.apps/ibm-cert-manager-operator -n ibm-common-services --timeout=900s
```

e. Wait for the three cert-manager pods and operator to be in running state:

```
oc get pods -n ibm-common-services | grep cert
```

```
cert-manager-cainjector-566b5d5698-pzccn      1/1      Running    0      18m
cert-manager-controller-766ddf8c4-ftr85      1/1      Running    0      18m
cert-manager-webhook-79bb8f67b7-gvkst       1/1      Running    0      18m
ibm-cert-manager-operator-fdfd66bd4-6rrz6    1/1      Running    0      19m
```

2. Create the encryption key secrets for the Management and Portal subsystems.

a. Run the following command to create a file that contains a random string, which is used to create the management encryption key secret:

```
cat /dev/urandom | head -c63 | base64 -w0 > mgmt-enc-key.txt
```

b. Run the following command to create the management encryption key secret:

```
oc create secret generic mgmt-encryption-key --from-file=encryption_secret.bin=mgmt-enc-key.txt -n <management namespace>
```

c. Confirm that the secret was created successfully by running:

```
oc get secrets -n <management namespace> | grep mgmt-encryption-key
```

```
mgmt-encryption-key      Opaque      1      83s
```

d. Run the following command to create a file that contains a random string, which is used to create the portal encryption key secret:

```
cat /dev/urandom | head -c63 | base64 -w0 > ptl-enc-key.txt
```

e. Run the following command to create the portal encryption key secret:

```
oc create secret generic ptl-encryption-key --from-file=encryption_secret=ptl-enc-key.txt -n <portal namespace>
```

f. Confirm that the secret was created successfully by running:

```
oc get secrets -n <portal namespace> | grep ptl-encryption-key
```

```
ptl-encryption-key      Opaque      1      15s
```

3. Create a self-signed issuer.

a. Create a file that is called `issuer.yaml` and paste in the following contents, replacing `<apic-instance-name>`:

```
apiVersion: cert-manager.io/v1
kind: Issuer
metadata:
```

```

name: <apic-instance-name>-self-signed
spec:
  selfSigned: {}

```

b. Apply this yaml file with:

```
oc apply -f issuer.yaml -n <namespace>
```

c. Verify that the issuer was created with:

```
oc get issuer -n <namespace>
```

NAME	READY	AGE
apic-self-signed	True	25s

4. Create an ingress-ca certificate:

a. Create a file that is called `self-signed-issuer-cert.yaml` and paste in the following contents, replacing `<apic-instance-name>`:

```

apiVersion: cert-manager.io/v1
kind: Certificate
metadata:
  name: <apic-instance-name>-ingress-ca
spec:
  commonName: ingress-ca
  duration: 87600h0m0s
  isCA: true
  issuerRef:
    kind: Issuer
    name: <apic-instance-name>-self-signed
  renewBefore: 720h0m0s
  privateKey:
    rotationPolicy: Always
  secretName: <apic-instance-name>-ingress-ca

```

b. Apply this yaml file with:

```
oc apply -f self-signed-issuer-cert.yaml -n <namespace>
```

c. Verify that the certificate was created with:

```
oc get cert -n <namespace>
```

NAME	READY	SECRET	AGE	EXPIRATION
apic-ingress-ca	True	apic-ingress-ca	11s	2032-08-15T13:01:47Z

5. Create the ingress issuer.

a. Create a file `ingress-issuer.yaml` and paste in the following contents, replacing `<apic-instance-name>`:

```

apiVersion: cert-manager.io/v1
kind: Issuer
metadata:
  name: <apic-instance-name>-ingress-issuer
spec:
  ca:
    secretName: <apic-instance-name>-ingress-ca

```

b. Apply this yaml file with:

```
oc apply -f ingress-issuer.yaml -n <namespace>
```

c. Verify that the issuer was created with:

```
oc get issuer -n <namespace>
```

NAME	READY	AGE
apic-ingress-issuer	True	20s

6. Create a custom hostname and certificate for Cloud Pak for Integration Platform UI and IBM Cloud Pak foundational services.

a. Create a file `custom-hostname-cert.yaml` and paste in the following contents:

```

apiVersion: cert-manager.io/v1
kind: Certificate
metadata:
  name: <apic-instance-name>-custom-hostname-cert
  namespace: <Platform UI namespace>
spec:
  secretName: <apic-instance-name>-custom-hostname-secret
  issuerRef:
    name: <apic-instance-name>-ingress-issuer
    kind: Issuer
  commonName: <custom fqdn>
  duration: 17520h0m0s
  renewBefore: 720h0m0s
  dnsNames:
  - <ocp cluster api address>
  - <ocp cluster ui address>
  - <cp console ui address>

```

Where:

- `<apic-instance-name>` is the API Connect Cluster CR name.
- `<platform ui namespace>` is the namespace used by your Cloud Pak for Integration Platform UI.
- `<custom fqdn>` is the fully qualified custom hostname.
- `<ocp cluster api address>` is the fully qualified API address of your Cloud Pak for Integration cluster.
- `<ocp cluster ui address>` is the fully qualified UI address of your Cloud Pak for Integration cluster.

- `<cp console ui address>` is the fully qualified address of your Cloud Pak console. Run the following command to see this address: `oc get route -n ibm-common-services cp-console -o jsonpath='{.spec.host}'`.

b. Apply this file with:

```
oc apply -f custom-hostname-cert.yaml -n <namespace>
```

c. Extract the generated certificate files with:

```
oc extract secret/<apic-instance-name>-custom-hostname-secret -n <namespace> --to=. --keys=tls.crt,tls.key,ca.crt --confirm
```

Check that your local directory contains these three extracted files:

```
ca.crt
tls.crt
tls.key
```

d. Follow the steps in the Cloud Pak for Integration documentation to create a custom hostname and certificate <https://www.ibm.com/docs/en/cloud-paks/cp-integration>. For Cloud Pak for Integration v2022.2 the steps are on this page: [Creating a custom hostname and certificate](#). Use the certificate files you extracted in the previous step.

e. Create a secret in the Platform UI namespace using the same certificates you created in [6.c](#).

```
oc -n ${PLATFORM_UI_NAMESPACE} create secret generic route-tls-secret --from-file=ca.crt=ca.crt --from-file=tls.crt=tls.crt --from-file=tls.key=tls.key
```

f. Add this new secret to the Platform UI CR, as described in the Cloud Pak for Integration documentation on using custom hostnames and certificates for the Platform UI. For Cloud Pak for Integration v2022.2 the steps are on this page: <https://www.ibm.com/docs/en/cloud-paks/cp-integration/2022.2?topic=certificates-using-custom-hostnames-platform-ui>.

7. Create the TLS client replication certificates for Management and Portal.

a. Create a yaml file that is called `mgmt-tls-client-cert.yaml` and paste in the following contents, replacing `<apic-instance-name>`:

```
apiVersion: cert-manager.io/v1
kind: Certificate
metadata:
  name: <apic-instance-name>-mgmt-replication-client
spec:
  commonName: <apic-instance-name>-mgmt-replication-client
  duration: 17520h0m0s
  issuerRef:
    kind: Issuer
    name: <apic-instance-name>-ingress-issuer
  renewBefore: 720h0m0s
  privateKey:
    rotationPolicy: Always
  secretName: <apic-instance-name>-mgmt-replication-client
```

b. Apply this yaml file with:

```
oc apply -f mgmt-tls-client-cert.yaml -n <management namespace>
```

c. Verify that the certificate was created with:

```
oc get certs -n <management namespace>
```

NAME	READY	SECRET	AGE
EXPIRATION			
...			
<apic-instance-name>-mgmt-replication-client	True	<apic-instance-name>-mgmt-replication-client	16m 2024-08-17T13:04:27Z

d. Create a file `ptl-tls-client-cert.yaml` and paste in the following contents, replacing `<apic-instance-name>`:

```
apiVersion: cert-manager.io/v1
kind: Certificate
metadata:
  name: <apic-instance-name>-ptl-replication-client
spec:
  commonName: <apic-instance-name>-ptl-replication-client
  duration: 17520h0m0s
  issuerRef:
    kind: Issuer
    name: <apic-instance-name>-ingress-issuer
  renewBefore: 720h0m0s
  privateKey:
    rotationPolicy: Always
  secretName: <apic-instance-name>-ptl-replication-client
```

e. Apply this yaml file with:

```
oc apply -f ptl-tls-client-cert.yaml -n <portal namespace>
```

f. Verify that the certificate was created with:

```
oc get certs -n <portal namespace>
```

NAME	READY	SECRET	AGE
EXPIRATION			
...			
<apic-instance-name>-ptl-replication-client	True	<apic-instance-name>-ptl-replication-client	16m 2024-08-17T13:04:27Z

8. Export the ingress-ca issuer secret.

The ingress-ca issuer secret must be the same on the warm-standby data center. Export it from the active so that it can be imported on the warm-standby data center.

- a. Run the following command to export the secret to a file called `ca-issuer-secret.yaml`:

```
oc get secret <apic-instance-name>-ingress-ca -o yaml -n <namespace> > ca-issuer-secret.yaml
```

- b. Edit the `ca-issuer-secret.yaml` file to remove the `creationTimestamp`, `resourceVersion`, `uid`, and `managedFields`. Remove the labels and annotations sections completely. The contents should look like this:

```
apiVersion: v1
data:
  ca.crt: <long cert string>
  tls.crt: <long cert string>
  tls.key: <long cert string>
kind: Secret
metadata:
  name: <apic-instance-name>-ingress-ca
  namespace: <namespace>
type: kubernetes.io/tls
```

9. Copy the following files from your `2dcd-actve-yamls` directory to the `2dcd-ws-yamls` directory in your warm-standby data center.

```
ca-issuer-secret.yaml
mgmt-enc-key.txt
ptl-enc-key.txt
```

These files are required to ensure that the ingress-ca and encryption secrets on both sites are the same.

Tip: To save time during the preparation of your warm-standby data center you can also copy these yaml files:

```
ptl-tls-client-cert.yaml
mgmt-tls-client-cert.yaml
ingress-issuer.yaml
```

What to do next

Create your secrets, certs, and issuers on your warm-standby data center: [Preparing your warm-standby data center](#).

Preparing your warm-standby data center

Create the secrets, certificates, and issuers that are needed for your warm-standby data center to replicate with the active.

About this task

All operations are done on the CLI, in the `2dcd-ws-yamls` directory you created in [Planning and initial preparation](#).

In the yaml files and commands that are shown here, replace `<apic-instance-name>` with the name you intend to use for your API Connect Cluster CR, and `<namespace>` with your API Connect namespace name (which will be the same for both Management and Portal subsystems). As decided in [Planning and initial preparation](#).

Procedure

1. Deploy the cert-manager.

- a. Create a file that is called `cert-manager.yaml` and paste in the following contents:

```
apiVersion: operator.ibm.com/v1alpha1
kind: OperandRequest
metadata:
  name: ibm-apiconnect
spec:
  requests:
  - operands:
    - name: ibm-cert-manager-operator
      registry: common-service
      registryNamespace: ibm-common-services
```

- b. Apply this yaml file with:

```
oc apply -f cert-manager.yaml -n <namespace>
```

- c. Confirm that the cert-manager is deployed:

```
oc get deploy -n ibm-common-services | grep ibm-cert-manager-operator
```

- d. Wait for the cert-manager deployment to become available:

```
oc wait --for=condition=available deployment.apps/ibm-cert-manager-operator -n ibm-common-services --timeout=900s
```

- e. Wait for the three cert-manager pods and operator to be in running state:

```
oc get pods -n ibm-common-services | grep cert
```

```
cert-manager-cainjector-566b5d5698-pzccn      1/1      Running    0      18m
cert-manager-controller-766dff8c4-ftr85     1/1      Running    0      18m
cert-manager-webhook-79bb8f67b7-gvkst      1/1      Running    0      18m
ibm-cert-manager-operator-fdfd66bd4-6rrz6   1/1      Running    0      19m
```

2. Import the ingress-ca issuer secret.

This secret was created on your active data center here: [Export the ingress-ca issuer secret](#)

- Copy the `ca-issuer-secret.yaml` file to your warm-standby data center (if not done already).
- Create the secret with:

```
oc apply -f ca-issuer-secret.yaml -n <namespace>
```

- Verify that the secret was created with:

```
oc get secret -n <namespace>
```

NAME	TYPE	DATA	AGE
<apic-instance-name>-ingress-ca	kubernetes.io/tls	3	19h

3. Create the ingress issuer.

- Create a file `ingress-issuer.yaml` and paste in the following contents, replacing `<apic-instance-name>`:

```
apiVersion: cert-manager.io/v1
kind: Issuer
metadata:
  name: <apic-instance-name>-ingress-issuer
spec:
  ca:
    secretName: <apic-instance-name>-ingress-ca
```

- Apply this yaml file with:

```
oc apply -f ingress-issuer.yaml -n <namespace>
```

- Verify that the issuer was created with:

```
oc get issuer -n <namespace>
```

NAME	READY	AGE
apic-ingress-issuer	True	20s

4. Create a custom hostname and certificate for Cloud Pak for Integration Platform UI and IBM Cloud Pak foundational services.

- Create a file `custom-hostname-cert.yaml` and paste in the following contents:

```
apiVersion: cert-manager.io/v1
kind: Certificate
metadata:
  name: <apic-instance-name>-custom-hostname-cert
  namespace: <Platform UI namespace>
spec:
  secretName: <apic-instance-name>-custom-hostname-secret
  issuerRef:
    name: <apic-instance-name>-ingress-issuer
    kind: Issuer
  commonName: <custom fqdn>
  duration: 17520h0m0s
  renewBefore: 720h0m0s
  dnsNames:
  - <ocp cluster api address>
  - <ocp cluster ui address>
  - <cp console ui address>
```

Where:

- `<apic-instance-name>` is the API Connect Cluster CR name.
- `<platform ui namespace>` is the namespace used by your Cloud Pak for Integration Platform UI.
- `<custom fqdn>` is the fully qualified custom hostname.
- `<ocp cluster api address>` is the fully qualified API address of your Cloud Pak for Integration cluster.
- `<ocp cluster ui address>` is the fully qualified UI address of your Cloud Pak for Integration cluster.
- `<cp console ui address>` is the fully qualified address of your Cloud Pak console. Run the following command to see this address: `oc get route -n ibm-common-services cp-console -o jsonpath='{.spec.host}'`.

- Apply this file with:

```
oc apply -f custom-hostname-cert.yaml -n <namespace>
```

- Extract the generated certificate files with:

```
oc extract secret/<apic-instance-name>-custom-hostname-secret -n <namespace> --to=. --keys=tls.crt,tls.key,ca.crt --confirm
```

Check that your local directory contains these three extracted files:

```
ca.crt
tls.crt
tls.key
```

- Follow the steps in the Cloud Pak for Integration documentation to create a custom hostname and certificate <https://www.ibm.com/docs/en/cloud-paks/cp-integration>. For Cloud Pak for Integration v2022.2 the steps are on this page: [Creating a custom hostname and certificate](#). Use the certificate files you extracted in the previous step.
- Create a secret in the Platform UI namespace using the same certificates you created in [4.c](#).

```
oc -n ${PLATFORM_UI_NAMESPACE} create secret generic route-tls-secret --from-file=ca.crt=ca.crt --from-file=tls.crt=tls.crt --from-file=tls.key=tls.key
```

- Add this new secret to the Platform UI CR, as described in the Cloud Pak for Integration documentation on using custom hostnames and certificates for the Platform UI. For Cloud Pak for Integration v2022.2 the steps are on this page: <https://www.ibm.com/docs/en/cloud-paks/cp-integration/2022.2?topic=certificates-using-custom-hostnames-platform-ui>.

5. Create the encryption key secrets for the Management and Portal subsystems, by using the random string generated on the active data center. Use the `mgmt-enc-key.txt` and `ptl-enc-key.txt` files that were copied to your warm-standby data center here: [Copy keys to warm-standby](#).
 - a. Run the following command to create the management encryption key secret:

```
oc create secret generic mgmt-encryption-key --from-file=encryption_secret.bin=mgmt-enc-key.txt -n <management namespace>
```

- b. Confirm that the secret was created successfully by running:

```
oc get secrets -n <management namespace> | grep mgmt-encryption-key

mgmt-encryption-key      Opaque      1      83s
```

- c. Run the following command to create the portal encryption key secret:

```
oc create secret generic ptl-encryption-key --from-file=encryption_secret=ptl-enc-key.txt -n <portal namespace>
```

- d. Confirm that the secret was created successfully by running:

```
oc get secrets -n <portal namespace> | grep ptl-encryption-key

ptl-encryption-key      Opaque      1      15s
```

6. Create the TLS client replication certificates for Management and Portal.

- a. Create a yaml file that is called `mgmt-tls-client-cert.yaml` and paste in the following contents, replacing `<apic-instance-name>`:

```
apiVersion: cert-manager.io/v1
kind: Certificate
metadata:
  name: <apic-instance-name>-mgmt-replication-client
spec:
  commonName: <apic-instance-name>-mgmt-replication-client
  duration: 17520h0m0s
  issuerRef:
    kind: Issuer
    name: <apic-instance-name>-ingress-issuer
  renewBefore: 720h0m0s
  privateKey:
    rotationPolicy: Always
  secretName: <apic-instance-name>-mgmt-replication-client
```

- b. Apply this yaml file with:

```
oc apply -f mgmt-tls-client-cert.yaml -n <management namespace>
```

- c. Verify that the certificate was created with:

```
oc get certs -n <management namespace>
```

NAME	READY	SECRET	AGE
EXPIRATION			
...			
<apic-instance-name>-mgmt-replication-client	True	<apic-instance-name>-mgmt-replication-client	16m 2024-08-17T13:04:27Z

- d. Create a file `ptl-tls-client-cert.yaml` and paste in the following contents, replacing `<apic-instance-name>`:

```
apiVersion: cert-manager.io/v1
kind: Certificate
metadata:
  name: <apic-instance-name>-ptl-replication-client
spec:
  commonName: <apic-instance-name>-ptl-replication-client
  duration: 17520h0m0s
  issuerRef:
    kind: Issuer
    name: <apic-instance-name>-ingress-issuer
  renewBefore: 720h0m0s
  privateKey:
    rotationPolicy: Always
  secretName: <apic-instance-name>-ptl-replication-client
```

- e. Apply this yaml file with:

```
oc apply -f ptl-tls-client-cert.yaml -n <portal namespace>
```

- f. Verify that the certificate was created with:

```
oc get certs -n <portal namespace>
```

NAME	READY	SECRET	AGE
EXPIRATION			
...			
<apic-instance-name>-ptl-replication-client	True	<apic-instance-name>-ptl-replication-client	16m 2024-08-17T13:04:27Z

What to do next

Install API Connect in your active data center: [Installing API Connect on the active data center](#).

Installing API Connect on the active data center

Follow the installation steps for API Connect described in the Cloud Pak for Integration documentation, adding the `multiSiteHA` configuration to the API Connect YAML.

Before you begin

Verify that all the secrets, certificates, and issuers are ready:

```
oc get secrets -n <namespace> | grep <apic-instance-name>
<apic-instance-name>-ingress-ca          kubernetes.io/tls          3          3d21h
<apic-instance-name>-mgmt-replication-client  kubernetes.io/tls          3          3d21h
<apic-instance-name>-ptl-replication-client  kubernetes.io/tls          3          3d21h

oc get certs -n <namespace> | grep <apic-instance-name>
<apic-instance-name>-ingress-ca          True          <apic-instance-name>-ingress-ca          3d21h          2032-08-15T13:01:47Z
<apic-instance-name>-mgmt-replication-client  True          <apic-instance-name>-mgmt-replication-client  3d21h          2024-08-17T13:04:27Z
<apic-instance-name>-ptl-replication-client  True          <apic-instance-name>-ptl-replication-client  3d21h          2024-08-17T13:04:26Z

oc get issuer -n <namespace> | grep <apic-instance-name>
<apic-instance-name>-ingress-issuer      True          3d21h
<apic-instance-name>-self-signed          True          3d21h
```

Where `<apic-instance-name>` is the name you intend to use for your API Connect cluster CR, and `<namespace>` is the namespace you created for API Connect.

Ensure that your network is redirecting the custom hostname to the Platform UI in your active data center.

About this task

In the yaml files that are shown here, replace `<apic-instance-name>` with the name you intend to use for your API Connect Cluster CR. As decided in [Planning and initial preparation](#). Set `<active data center ingress domain>` and `<warm-standby data center ingress domain>` to their appropriate values, which can be determined by running this command in each data center:

```
oc get ingresses.config/cluster -o jsonpath={.spec.domain}
```

Procedure

1. Follow the API Connect installation steps using the Platform UI, as described in the Cloud Pak for Integration documentation <https://www.ibm.com/docs/en/cloud-paks/cp-integration>. At the point where you specify the configuration properties of your API Connect instance, switch to the YAML tab so you can edit the YAML directly.

Remember: Use the same `<apic-instance-name>` value when you specify the API Connect instance name in the Cloud Pak for Integration Platform UI.

2. Add the management `multiSiteHA` section to the YAML file under the `spec:` section.

```
management:
  encryptionSecret:
    secretName: mgmt-encryption-key
  multiSiteHA:
    mode: active
  replicationEndpoint:
    annotations:
      cert-manager.io/issuer: <apic-instance-name>-ingress-issuer
    hosts:
      - name: mgmt-replication.<active data center ingress domain>
        secretName: <apic-instance-name>-mgmt-replication-server
    replicationPeerFQDN: mgmt-replication.<warm-standby data center ingress domain>
  tlsClient:
    secretName: <apic-instance-name>-mgmt-replication-client
```

3. Add the portal `multiSiteHA` section to the YAML file under the `spec:` section:

```
portal:
  portalAdminEndpoint:
    annotations:
      cert-manager.io/issuer: <apic-instance-name>-ingress-issuer
    hosts:
      - name: <external load balanced portal admin hostname>
        secretName: portal-admin
  portalUIEndpoint:
    annotations:
      cert-manager.io/issuer: <apic-instance-name>-ingress-issuer
    hosts:
      - name: <external load balanced portal web hostname>
        secretName: portal-web
  encryptionSecret:
    secretName: ptl-encryption-key
  multiSiteHA:
    mode: active
  replicationEndpoint:
    annotations:
      cert-manager.io/issuer: <apic-instance-name>-ingress-issuer
    hosts:
      - name: ptl-replication.<active data center ingress domain>
        secretName: <apic-instance-name>-ptl-replication-server
    replicationPeerFQDN: ptl-replication.<warm-standby data center ingress domain>
  tlsClient:
    secretName: <apic-instance-name>-ptl-replication-client
```

4. Continue the installation steps as described in [Deploying on OpenShift and Cloud Pak for Integration](#).

Results

Confirm that the management subsystem is ready, but in **Warning** state with `oc get`

`mgmt`:

```
oc get mgmt -n <namespace>
```

NAME	READY	STATUS	VERSION	RECONCILED	VERSION	MESSAGE
management	n/n	Warning	10.0.5.3-0	10.0.5.3-0		Management is ready. HA Status Warning - see HAStatus in CR for details

status:

```
haStatus
{
  "lastTransitionTime": "2023-03-31T19:47:08Z",
  "message": "Replication not working, install or upgrade in progress.",
  "reason": "na",
  "status": "True",
  "type": "Pending"
}
```

The management CR is expected to report the status of **Warning** until the warm-standby management subsystem is deployed, and both management subsystems complete data replication. When you see the status message "Management is ready. HA Status Warning - see HAStatus in CR for details", you can move on to [Installing API Connect on the warm-standby data center](#).

Note: The portal, analytics, and gateway subsystems are not deployed until the management replication is complete and the management CRs in both data centers report the following:

NAME	READY	STATUS	VERSION	RECONCILED	VERSION	MESSAGE
management	n/n	Running	10.0.5.3-0	10.0.5.3-0		Management is ready. 8m59s

status:

```
haStatus
{
  "lastTransitionTime": "2023-03-31T19:47:08Z",
  "message": "Replication is working",
  "reason": "na",
  "status": "True",
  "type": "Ready"
}
```

What to do next

Install API Connect on your warm-standby data center: [Installing API Connect on the warm-standby data center](#).

Installing API Connect on the warm-standby data center

Follow the installation steps for API Connect described in the Cloud Pak for Integration documentation, adding the `multiSiteHA` configuration to the API Connect YAML.

Before you begin

Verify that all the secrets, certificates, and issuers are ready:

```
oc get certificate -n <namespace> | grep <apic-instance-name>
NAME                                READY  SECRET  AGE  EXPIRATION
apic-mgmt-replication-client        True   apic-mgmt-replication-client  57s  2024-08-24T09:45:03Z
apic-ptl-replication-client         True   apic-ptl-replication-client   45s  2024-08-24T09:45:17Z

[root@api.iaincp4ilarge2.cp.fyre.ibm.com ~]# oc get secrets -n <namespace> | grep <apic-instance-name>
NAME                                TYPE  DATA  AGE
apic-ingress-ca                     kubernetes.io/tls  3  4m6s
apic-mgmt-replication-client        kubernetes.io/tls  3  2m40s
apic-ptl-replication-client         kubernetes.io/tls  3  2m26s

[root@api.iaincp4ilarge2.cp.fyre.ibm.com ~]# oc get issuer -n <namespace> | grep <apic-instance-name>
NAME                                READY  AGE
apic-ingress-issuer                 True   4m8s
```

Where `<apic-instance-name>` is the name you intend to use for your API Connect cluster CR, and `<namespace>` is the namespace you created for API Connect.

Ensure that your network is redirecting the custom hostname to the Platform UI in your warm-standby data center.

About this task

In the yml files that are shown here, replace `<apic-instance-name>` with the name you intend to use for your API Connect Cluster CR. As decided in [Planning and initial preparation](#). Set `<active data center ingress domain>` and `<warm-standby data center ingress domain>` to their appropriate values, which can be determined by running this command in each data center:

```
oc get ingresses.config/cluster -o jsonpath={.spec.domain}
```

Procedure

- Follow the API Connect installation steps using the Platform UI, as described in the Cloud Pak for Integration documentation <https://www.ibm.com/docs/en/cloud-paks/cp-integration>. At the point where you specify the configuration properties of your API Connect instance, switch to the YAML tab so you can edit the YAML directly.
Remember: Use the same `<apic-instance-name>` value when you specify the API Connect instance name in the Cloud Pak for Integration Platform UI.
- Add the management `multiSiteHA` section to the YAML file under the `spec` section.

```
management:
  encryptionSecret:
    secretName: mgmt-encryption-key
  multiSiteHA:
    mode: passive
    replicationEndpoint:
      annotations:
        cert-manager.io/issuer: <apic-instance-name>-ingress-issuer
      hosts:
        - name: mgmt-replication.<warm-standby data center ingress domain>
          secretName: <apic-instance-name>-mgmt-replication-server
    replicationPeerFQDN: mgmt-replication.<active data center ingress domain>
    tlsClient:
      secretName: <apic-instance-name>-mgmt-replication-client
```

Note: Warm-standby is referred to as 'passive' in the CR YAML.

- Add the portal `multiSiteHA` section to the YAML file under the `spec` section:

```
portal:
  portalAdminEndpoint:
    annotations:
      cert-manager.io/issuer: <apic-instance-name>-ingress-issuer
    hosts:
      - name: <external load balanced portal admin hostname>
        secretName: portal-admin
  portalUIEndpoint:
    annotations:
      cert-manager.io/issuer: <apic-instance-name>-ingress-issuer
    hosts:
      - name: <external portal load balanced web hostname>
        secretName: portal-web
  encryptionSecret:
    secretName: ptl-encryption-key
  multiSiteHA:
    mode: passive
    replicationEndpoint:
      annotations:
        cert-manager.io/issuer: <apic-instance-name>-ingress-issuer
      hosts:
        - name: ptl-replication.<warm-standby data center ingress domain>
          secretName: <apic-instance-name>-ptl-replication-server
    replicationPeerFQDN: ptl-replication.<active data center ingress domain>
    tlsClient:
      secretName: <apic-instance-name>-ptl-replication-client
```

- Disable the configurator service, as this will have already run on the active site.
 - Add the following section to the API Connect cluster CR:

```
disabledServices:
  - configurator
```

- Continue the installation steps as described in [Deploying on OpenShift and Cloud Pak for Integration](#).

Results

Installation can take around 1 hour to complete.

While the management subsystems on the warm-standby and active data centers are synchronizing, the management status reports **Warning**, and the `haStatus` reports **pending**:

```
oc get mgmt -n <namespace>
```

NAME	READY	STATUS	VERSION	RECONCILED	VERSION	MESSAGE
management	n/n	Warning	10.0.5.3-0	10.0.5.3-0		Management is ready. HA Status Warning - see HAStatus in CR for details

```
status:
  haStatus
  {
    "lastTransitionTime": "2023-03-31T19:47:08Z",
    "message": "Replication not working, install or upgrade in progress.",
    "reason": "na",
    "status": "True",
    "type": "Pending"
  }
```

When the management database replication between sites is complete, the management status reports **Running**, and `status.haStatus` reports **Ready**:

NAME	READY	STATUS	VERSION	RECONCILED	VERSION	MESSAGE
management	n/n	Running	10.0.5.3-0	10.0.5.3-0		Management is ready. 8m59s

```
status:
  haStatus
  {
```

```

"lastTransitionTime": "2023-03-31T19:47:08Z",
"message": "Replication is working",
"reason": "na",
"status": "True",
"type": "Ready"
}

```

After the management subsystems in the active and warm-standby sites are synchronized, the other subsystems are deployed. Verify on both active and warm-standby sites that all subsystems reach **Running** state:

```
oc get all -n <namespace>
```

```

...

```

NAME	READY	STATUS	VERSION	RECONCILED VERSION	AGE
analyticscluster.analytics.apiconnect.ibm.com/apis-minimum-a7s	n/n	Running	10.0.5.3	10.0.5.3-1281	27m
NAME	READY	STATUS	VERSION	RECONCILED VERSION	AGE
apiconnectcluster.apiconnect.ibm.com/apis-minimum	n/n	Ready	10.0.5.3	10.0.5.3-1281	2d20h
NAME	PHASE	READY	SUMMARY	VERSION	AGE
datapowerservice.datapower.ibm.com/apis-minimum-gw	Running	True	StatefulSet replicas ready: 1/1	10.5.0.0	25m
NAME	PHASE	LAST EVENT	WORK PENDING	WORK IN-PROGRESS	AGE
datapowermonitor.datapower.ibm.com/apis-minimum-gw	Running		false	false	25m
NAME	READY	STATUS	VERSION	RECONCILED VERSION	AGE
gatewaycluster.gateway.apiconnect.ibm.com/apis-minimum-gw	n/n	Running	10.0.5.3	10.0.5.3-1281	27m
NAME	READY	STATUS	VERSION	RECONCILED VERSION	AGE
managementcluster.management.apiconnect.ibm.com/apis-minimum-mgmt	8/8	Running	10.0.5.3	10.0.5.3-1281	2d20h
NAME	READY	STATUS	VERSION	RECONCILED VERSION	AGE
portalcluster.portal.apiconnect.ibm.com/apis-minimum-ptl	n/n	Running	10.0.5.3	10.0.5.3-1281	27m

Note: The warm-standby site has fewer **managementcluster** pods than the active site.

If the management database replication between sites fails for any reason other than because an install or upgrade is in progress, the **haStatus** output shows:

NAME	READY	STATUS	VERSION	RECONCILED VERSION	MESSAGE
management	n/n	Warning	10.0.5.3-0	10.0.5.3-0	Management is ready. HA Status Warning - see HAStatus in CR for details
	8m59s				

```

status:
  haStatus
  {
    "lastTransitionTime": "2023-03-31T19:47:08Z",
    "message": "Replication not working",
    "reason": "na",
    "status": "True",
    "type": "Warning"
  }

```

If the warning persists, see [Troubleshooting a two data center deployment](#).

You can validate that your portal deployments are synchronizing by running `oc get pods` on both the active and warm-standby data centers. Confirm that the number and names of the pods all match (the UUIDs in the names might be different on each site), and that all are in the **Ready** state.

For additional replication verification checks, see [Verifying replication between data centers](#). It is recommended to run a test failover, and confirm that all of the expected data is present and correct on the newly active site. See [How to failover API Connect from the active to the warm-standby data center](#) for details.

What to do next

Configure your deployment: [Cloud Manager configuration checklist](#).

Important: It is strongly recommended to complete the disaster recovery preparation on both sites: [Disaster recovery on OpenShift and Cloud Pak for Integration](#). Disaster recovery preparation ensures that you can recover your API Connect installation if both data centers are lost, or if a replication failure occurs. Both sites must use different backup paths for their Management and Portal backups.

Installing a two data center deployment on OpenShift

How to deploy a two data center disaster recovery (2DCDR) deployment on OpenShift.

Introduction

Ensure that you understand the concepts of 2DCDR in API Connect. For more information, see [Two data center deployment strategy on Kubernetes and OpenShift](#).

Familiarize yourself with the OpenShift installation instructions linked from [Deploying on OpenShift and Cloud Pak for Integration](#).

Note: 2DCDR is not supported on OpenShift where the top-level CR is used. For 2DCDR on OpenShift, you must install API Connect as individual subsystems. See [Installing with subsystem CRs in a shared namespace on OpenShift](#) and [Installing with subsystem CRs in different namespaces or environments on OpenShift](#).

Prerequisites

The prerequisites for a 2DCDR deployment on OpenShift are as follows.

- The management and portal endpoints must be the same on both data centers.
- The network latency between data centers must be no more than 80 ms.

- The management cluster in each data center must use the same encryption secret.
- The portal cluster in each data center must use the same encryption secret.
- The ingress-ca certificate must be the same on both data centers.

Restrictions:

- API Connect is not supported on a FIPS-enabled environment.
- It is not possible to use the Automated API behavior testing application ([Installing the Automated API behavior testing application](#)) in a 2DCDR configuration ([Two data center deployment strategy on Kubernetes and OpenShift](#)).
- [Planning and initial preparation](#)
Decide on endpoint names. Prepare your OpenShift environments for 2DCDR API Connect.
- [Preparing your active data center](#)
Create the secrets, certificates, and issuers that are needed for your active data center to replicate with the warm-standby.
- [Preparing your warm-standby data center](#)
Create the secrets, certificates, and issuers that are needed for your warm-standby data center to replicate with the active.
- [Installing API Connect on the active data center](#)
Add the `multiSiteHA` configuration to the API Connect Management and Portal CR YAML files before they are applied.
- [Installing API Connect on the warm-standby data center](#)
Add the `multiSiteHA` configuration to the API Connect Management and Portal YAML files before they are applied.

Planning and initial preparation

Decide on endpoint names. Prepare your OpenShift environments for 2DCDR API Connect.

Procedure

1. Decide on naming. Both data centers must use the same names for:
 - Management subsystem endpoints
 - `cloudManagerEndpoint`
 - `apiManagerEndpoint`
 - `platformAPIEndpoint`
 - `consumerAPIEndpoint`
 - Portal subsystem endpoints
 - `portalAdminEndpoint`
 - `portalUIEndpoint`

Each data center must have a different `siteName`. For example, `dallas` in data center 1, and `raleigh` in data center 2. The site name can contain only `a-z` and `0-9` characters. You set `siteName` in the `ManagementCluster` and `PortalCluster` CRs when the subsystems are first deployed. You cannot change the name after deployment. If you don't specify `siteName` at first deployment, a random `siteName` is created for you.

Important: Each data center must use a different backup path for your Management backups. For portal backups each data center must use the same backup path. For more information, see [Backup and restore requirements for a two data center deployment](#).

2. Install the API Connect operators in both your data centers. See [Installing operators for a single namespace API Connect installation](#) or [Installing operators for a multi namespace API Connect installation](#), depending on whether all your API Connect subsystems are to be in the same namespace or not. Return here when the operators are installed.
3. If not already done, create namespaces for your API Connect subsystems in both data centers.

```
oc create ns <namespace>
```

the data centers do not have to use the same namespace name.

4. Decide which data center will start as the active and which will start as the warm-standby.
5. On the CLI of the active data center, where you run `oc` commands, create a directory called `2dcd-active-yamls`. On the CLI of the warm-standby data center, create a directory called `2dcd-ws-yamls`.

What to do next

Proceed to prepare the replication certificates, secrets, and issuers on your active data center [Preparing your active data center](#).

Preparing your active data center

Create the secrets, certificates, and issuers that are needed for your active data center to replicate with the warm-standby.

About this task

All operations are done on the CLI, in the `2dcd-active-yamls` directory you created in [Planning and initial preparation](#).

In the yaml files and commands that are shown here, replace `<namespace>` with the name of the corresponding subsystem namespace.

Procedure

1. Deploy the cert-manager.
 - a. Create a file that is called `cert-manager.yaml` and paste in the following contents:

```

apiVersion: operator.ibm.com/v1alpha1
kind: OperandRequest
metadata:
  name: ibm-apiconnect
spec:
  requests:
  - operands:
    - name: ibm-cert-manager-operator
      registry: common-service
      registryNamespace: ibm-common-services

```

b. Apply this yaml file with:

```
oc apply -f cert-manager.yaml -n <namespace>
```

c. Confirm that the cert-manager is deployed:

```
oc get deploy -n ibm-common-services | grep ibm-cert-manager-operator
```

d. Wait for the cert-manager deployment to become available:

```
oc wait --for=condition=available deployment.apps/ibm-cert-manager-operator -n ibm-common-services --timeout=900s
```

e. Wait for the three cert-manager pods and operator to be in running state:

```
oc get pods -n ibm-common-services | grep cert
```

```

cert-manager-cainjector-566b5d5698-pzccn      1/1      Running    0          18m
cert-manager-controller-766dff8c4-ftr85     1/1      Running    0          18m
cert-manager-webhook-79bb8f67b7-gvkst      1/1      Running    0          18m
ibm-cert-manager-operator-fdfd66bd4-6rrz6   1/1      Running    0          19m

```

2. Create the encryption key secrets for the Management and Portal subsystems.

a. Run the following command to create a file that contains a random string, which is used to create the management encryption key secret:

```
cat /dev/urandom | head -c63 | base64 -w0 > mgmt-enc-key.txt
```

b. Run the following command to create the management encryption key secret:

```
oc create secret generic mgmt-encryption-key --from-file=encryption_secret.bin=mgmt-enc-key.txt -n <management namespace>
```

c. Confirm that the secret was created successfully by running:

```
oc get secrets -n <management namespace> | grep mgmt-encryption-key
```

```

mgmt-encryption-key      Opaque      1          83s

```

d. Run the following command to create a file that contains a random string, which is used to create the portal encryption key secret:

```
cat /dev/urandom | head -c63 | base64 -w0 > ptl-enc-key.txt
```

e. Run the following command to create the portal encryption key secret:

```
oc create secret generic ptl-encryption-key --from-file=encryption_secret=ptl-enc-key.txt -n <portal namespace>
```

f. Confirm that the secret was created successfully by running:

```
oc get secrets -n <portal namespace> | grep ptl-encryption-key
```

```

ptl-encryption-key      Opaque      1          15s

```

3. If all your API Connect subsystems are to be installed in the same namespace, then create your certificates, issuers, and secrets as described here: [Setting up a certificate issuer](#). Return here when complete, do not proceed to install the subsystems.

4. If your API Connect subsystems are to be installed in different namespaces, then create your certificates, issuers, and secrets for your Management subsystem as described here [Create Management subsystem issuers and secrets](#). For your Portal subsystem, follow the steps here [Create Portal subsystem issuers and secrets](#). Return here when complete, do not proceed to install either subsystem.

5. Create the TLS client replication certificates for Management and Portal.

a. Create a yaml file that is called `mgmt-tls-client-cert.yaml` and paste in the following contents:

```

apiVersion: cert-manager.io/v1
kind: Certificate
metadata:
  name: mgmt-replication-client
spec:
  commonName: mgmt-replication-client
  duration: 17520h0m0s
  issuerRef:
    kind: Issuer
    name: ingress-issuer
  renewBefore: 720h0m0s
  privateKey:
    rotationPolicy: Always
  secretName: mgmt-replication-client

```

b. Apply this yaml file with:

```
oc apply -f mgmt-tls-client-cert.yaml -n <management namespace>
```

c. Verify that the certificate was created with:

```
oc get certs -n <management namespace>
```

```

NAME                                READY    SECRET    AGE    EXPIRATION

```

```
...
mgmt-replication-client True mgmt-replication-client 16m 2024-08-17T13:04:27Z
```

d. Create a file `ptl-tls-client-cert.yaml` and paste in the following contents:

```
apiVersion: cert-manager.io/v1
kind: Certificate
metadata:
  name: ptl-replication-client
spec:
  commonName: ptl-replication-client
  duration: 17520h0m0s
  issuerRef:
    kind: Issuer
    name: ingress-issuer
  renewBefore: 720h0m0s
  privateKey:
    rotationPolicy: Always
  secretName: ptl-replication-client
```

e. Apply this yaml file with:

```
oc apply -f ptl-tls-client-cert.yaml -n <portal namespace>
```

f. Verify that the certificate was created with:

```
oc get certs -n <portal namespace>
```

```
NAME                                READY  SECRET                                AGE  EXPIRATION
...
ptl-replication-client  True   ptl-replication-client  16m  2024-08-17T13:04:27Z
```

6. Export the ingress-ca issuer secret.

The ingress-ca issuer secret must be the same on the warm-standby data center. Export it from the active so that it can be imported on the warm-standby data center.

Note: If you are deploying API Connect subsystems in different namespaces, then you export the Management subsystem ingress-ca secret.

a. Run the following command to export the secret to a file called `ca-issuer-secret.yaml`:

```
oc get secret ingress-ca -o yaml -n <management namespace> > ca-issuer-secret.yaml
```

b. Edit the `ca-issuer-secret.yaml` file to remove the creationTimestamp, resourceVersion, uid, namespace, and managedFields. Remove the labels and annotations sections completely. The resulting contents should look like this:

```
apiVersion: v1
data:
  ca.crt: <long cert string>
  tls.crt: <long cert string>
  tls.key: <long cert string>
kind: Secret
metadata:
  name: ingress-ca
type: kubernetes.io/tls
```

7. Copy the following files from your `2dcd-active-yamls` directory to the `2dcd-ws-yamls` directory in your warm-standby data center.

```
ca-issuer-secret.yaml
mgmt-enc-key.txt
ptl-enc-key.txt
```

These files are required to ensure that the ingress-ca and encryption secrets on both sites are the same.

Tip: To save time during the preparation of your warm-standby data center you can also copy these yaml files:

```
ptl-tls-client-cert.yaml
mgmt-tls-client-cert.yaml
```

8. If you are installing the Portal subsystem in a different namespace to the Management subsystem on the active data center, use the `ca-issuer-secret.yaml` file to create the issuer in your portal namespace. Follow the 'Before you begin' steps here: [Create issuer](#). Do not proceed to install the Portal subsystem after creating the issuer.

What to do next

Prepare your warm-standby data center [Preparing your warm-standby data center](#).

Preparing your warm-standby data center

Create the secrets, certificates, and issuers that are needed for your warm-standby data center to replicate with the active.

About this task

All operations are done on the CLI, in the `2dcd-ws-yamls` directory you created in [Planning and initial preparation](#).

In the yaml files and commands that are shown here, replace `<namespace>` with the name of the corresponding subsystem namespace.

Procedure

1. Deploy the cert-manager.

- a. Create a file that is called `cert-manager.yaml` and paste in the following contents:

```
apiVersion: operator.ibm.com/v1alpha1
kind: OperandRequest
metadata:
  name: ibm-apiconnect
spec:
  requests:
  - operands:
    - name: ibm-cert-manager-operator
      registry: common-service
      registryNamespace: ibm-common-services
```

- b. Apply this yaml file with:

```
oc apply -f cert-manager.yaml -n <namespace>
```

- c. Confirm that the cert-manager is deployed:

```
oc get deploy -n ibm-common-services | grep ibm-cert-manager-operator
```

- d. Wait for the cert-manager deployment to become available:

```
oc wait --for=condition=available deployment.apps/ibm-cert-manager-operator -n ibm-common-services --timeout=900s
```

- e. Wait for the three cert-manager pods and operator to be in running state:

```
oc get pods -n ibm-common-services | grep cert
```

cert-manager-cainjector-566b5d5698-pzccn	1/1	Running	0	18m
cert-manager-controller-766ddf8c4-ftr85	1/1	Running	0	18m
cert-manager-webhook-79bb8f67b7-gvkst	1/1	Running	0	18m
ibm-cert-manager-operator-fdfd66bd4-6rrz6	1/1	Running	0	19m

2. Import the ingress-ca issuer secret.

This secret was created on your active data center here: [Preparing your active data center](#)

- a. If you did not do it as part of [Preparing your active data center](#), copy the `ca-issuer-secret.yaml` file to your warm-standby data center.

- b. Create the secret with:

```
oc apply -f ca-issuer-secret.yaml -n <namespace>
```

- c. Verify that the secret was created with:

```
oc get secret -n <namespace>
```

NAME	TYPE	DATA	AGE
ingress-ca	kubernetes.io/tls	3	19h

- d. If your Portal subsystem is in a different namespace in your warm-standby data center, then repeat the `oc apply` operation against the portal namespace.

3. Create a file that is called `warm-standby-certs.yaml` and paste in:

```

---
apiVersion: cert-manager.io/v1
kind: Certificate
metadata:
  name: gateway-peering
  labels: {
    app.kubernetes.io/instance: "gatewaycluster",
    app.kubernetes.io/managed-by: "ibm-apiconnect",
    app.kubernetes.io/name: "gateway-peering"
  }
spec:
  subject:
    organizations:
    - cert-manager
  commonName: gateway-peering
  secretName: gateway-peering
  issuerRef:
    name: ingress-issuer
  usages:
  - "server auth"
  - "client auth"
  - "signing"
  - "key encipherment"
  duration: 17520h # 2 years
  renewBefore: 720h # 30 days
  privateKey:
    rotationPolicy: Always
  secretTemplate:
    labels:
      app.kubernetes.io/instance: "gatewaycluster"
      app.kubernetes.io/managed-by: "ibm-apiconnect"
      app.kubernetes.io/name: "gateway-peering"

```

4. Apply this file by running against your Management subsystem namespace:

```
oc apply -f warm-standby-certs.yaml -n <namespace>
```

5. Verify that the certificates, secrets, and issuers were created with:

```
oc get secrets -n <namespace>
```

NAME	TYPE	DATA	AGE
analytics-ingestion-client	kubernetes.io/tls	3	12s
gateway-client-client	kubernetes.io/tls	3	21s
gateway-peering	kubernetes.io/tls	3	11s
gateway-service	kubernetes.io/tls	3	21s
ingress-ca	kubernetes.io/tls	3	18m
portal-admin-client	kubernetes.io/tls	3	17s

```
oc get certificates -n <namespace>
```

NAME	READY	SECRET	AGE	EXPIRATION
analytics-ingestion-client	True	analytics-ingestion-client	2m18s	2024-09-04T12:27:38Z
gateway-client-client	True	gateway-client-client	2m19s	2024-09-04T12:27:28Z
gateway-peering	True	gateway-peering	2m17s	2024-09-04T12:27:39Z
gateway-service	True	gateway-service	2m18s	2024-09-04T12:27:28Z
portal-admin-client	True	portal-admin-client	2m19s	2024-09-04T12:27:33Z

```
oc get issuers -n <namespace>
```

NAME	READY	AGE
ingress-issuer	True	18m
selfsigning-issuer	True	2m42s

6. If your Portal subsystem is in a different namespace in your warm-standby data center, then to create your certificates, issuers, and secrets in the Portal subsystem namespace:

a. Create a file that is called `warm-standby-pt1-certs.yaml` and paste in:

```

#
# Licensed under the Apache License, Version 2.0 (the "License");
# you may not use this file except in compliance with the License.
# You may obtain a copy of the License at
#

```

```

# http://www.apache.org/licenses/LICENSE-2.0
#
# Unless required by applicable law or agreed to in writing, software
# distributed under the License is distributed on an "AS IS" BASIS,
# WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied.
# See the License for the specific language governing permissions and
# limitations under the License.
#
---
apiVersion: cert-manager.io/v1
kind: Issuer
metadata:
  name: selfsigning-issuer
  labels: {
    app.kubernetes.io/instance: "management",
    app.kubernetes.io/managed-by: "ibm-apiconnect",
    app.kubernetes.io/name: "selfsigning-issuer"
  }
spec:
  selfSigned: {}
---
apiVersion: cert-manager.io/v1
kind: Issuer
metadata:
  name: ingress-issuer
  labels: {
    app.kubernetes.io/instance: "management",
    app.kubernetes.io/managed-by: "ibm-apiconnect",
    app.kubernetes.io/name: "ingress-issuer"
  }
spec:
  ca:
    secretName: ingress-ca

```

b. Apply this file to your Portal subsystem namespace:

```
oc apply -f warm-standby-certs.yaml -n <namespace>
```

c. Verify that your issuers and secrets were created successfully:

```
oc get issuers -n <portal namespace>
NAME                READY   AGE
ingress-issuer      True    43s
selfsigning-issuer True    43s
```

```
oc get secrets -n <portal namespace>
NAME                TYPE                DATA   AGE
ingress-ca          kubernetes.io/tls   3       4m18s
```

7. Create the encryption key secrets for the Management and Portal subsystems, by using the random string generated on the active data center.

Use the `mgmt-enc-key.txt` and `ptl-enc-key.txt` files that were copied to your warm-standby data center when you followed [Preparing your active data center](#).

a. Run the following command to create the management encryption key secret:

```
oc create secret generic mgmt-encryption-key --from-file=encryption_secret.bin=mgmt-enc-key.txt -n <management namespace>
```

b. Confirm that the secret was created successfully by running:

```
oc get secrets -n <management namespace> | grep mgmt-encryption-key
```

```
mgmt-encryption-key    Opaque                1       83s
```

c. Run the following command to create the portal encryption key secret:

```
oc create secret generic ptl-encryption-key --from-file=encryption_secret=ptl-enc-key.txt -n <portal namespace>
```

d. Confirm that the secret was created successfully by running:

```
oc get secrets -n <portal namespace> | grep ptl-encryption-key
```

```
ptl-encryption-key    Opaque                1       15s
```

8. Create the TLS client replication certificates for Management and Portal.

a. Create a yaml file that is called `mgmt-tls-client-cert.yaml` and paste in the following contents:

```

apiVersion: cert-manager.io/v1
kind: Certificate
metadata:
  name: mgmt-replication-client
spec:
  commonName: mgmt-replication-client
  duration: 17520h0m0s
  issuerRef:
    kind: Issuer
    name: ingress-issuer
  renewBefore: 720h0m0s
  privateKey:
    rotationPolicy: Always
  secretName: mgmt-replication-client

```

b. Apply this yaml file with:

```
oc apply -f mgmt-tls-client-cert.yaml -n <management namespace>
```

c. Verify that the certificate was created with:

```
oc get certs -n <management namespace>
```

NAME	READY	SECRET	AGE	EXPIRATION
...				
mgmt-replication-client	True	mgmt-replication-client	16m	2024-08-17T13:04:27Z

d. Create a file `ptl-tls-client-cert.yaml` and paste in the following contents:

```
apiVersion: cert-manager.io/v1
kind: Certificate
metadata:
  name: ptl-replication-client
spec:
  commonName: ptl-replication-client
  duration: 17520h0m0s
  issuerRef:
    kind: Issuer
    name: ingress-issuer
  renewBefore: 720h0m0s
  privateKey:
    rotationPolicy: Always
  secretName: ptl-replication-client
```

e. Apply this yaml file with:

```
oc apply -f ptl-tls-client-cert.yaml -n <portal namespace>
```

f. Verify that the certificate was created with:

```
oc get certs -n <portal namespace>
```

NAME	READY	SECRET	AGE	EXPIRATION
...				
ptl-replication-client	True	ptl-replication-client	16m	2024-08-17T13:04:27Z

What to do next

Install API Connect on your active data center [Installing API Connect on the active data center](#).

Installing API Connect on the active data center

Add the `multiSiteHA` configuration to the API Connect Management and Portal CR YAML files before they are applied.

Before you begin

Verify that all the secrets, certificates, and issuers are ready:

```
oc get secrets -n <namespace>
ingress-ca          kubernetes.io/tls          3          3d21h
mgmt-replication-client kubernetes.io/tls          3          3d21h
ptl-replication-client kubernetes.io/tls          3          3d21h

oc get certs -n <namespace>
ingress-ca          True    ingress-ca          3d21h    2032-08-15T13:01:47Z
mgmt-replication-client True    mgmt-replication-client 3d21h    2024-08-17T13:04:27Z
ptl-replication-client True    ptl-replication-client  3d21h    2024-08-17T13:04:26Z

oc get issuer -n <namespace>
ingress-issuer      True    3d21h
self-signed         True    3d21h
```

Where `<namespace>` are the namespaces you created for API Connect.

Note: If you have separate namespaces for Management and Portal subsystems, then run the check in both namespaces. You should not see the `mgmt-replication-client` in the portal namespace, nor the `ptl-replication-client` in the management namespace.

Procedure

1. Follow these steps for installing the Management subsystem on OpenShift [Installing the Management subsystem in a shared namespace](#), but add the `encryptionSecret` and `multiSiteHA` section to the `mgmt_cr.yaml` file:

```
siteName: <dcl site name>
encryptionSecret:
  secretName: mgmt-encryption-key
multiSiteHA:
  mode: active
  replicationEndpoint:
    annotations:
      cert-manager.io/issuer: ingress-issuer
  hosts:
    - name: mgmt-replication.<active data center ingress domain>
      secretName: mgmt-replication-server
```

```
replicationPeerFQDN: mgmt-replication.<warm-standby data center ingress domain>
tlsClient:
  secretName: mgmt-replication-client
```

where

- `<dc1 site name>` is the site name for this data center, as decided in [Planning and initial preparation](#).
- `<active data center ingress domain>` and `<warm-standby data center ingress domain>` can be determined by running the command `oc get ingresses.config/cluster -o jsonpath={.spec.domain}` in each data center.

Note: If you are installing the Management subsystem in a separate namespace, these same steps apply.

2. Apply the update `mgmt_cr.yaml` file as directed in [Installing the Management subsystem in a shared namespace](#). You can monitor the deployment with:

```
oc get ManagementCluster -n <management namespace>
NAME      READY   STATUS    VERSION   RECONCILED VERSION   AGE
management 19/19   Running   10.0.5.0   10.0.5.0-1281        74m
```

3. Follow these steps for installing the Portal subsystem on OpenShift [Installing the Portal subsystem in a shared namespace](#), but add the `encryptionSecret` and `multiSiteHA` section to the `portal_cr.yaml` file.

```
siteName: <dc1 site name>
encryptionSecret:
  secretName: ptl-encryption-key
multiSiteHA:
  mode: active
  replicationEndpoint:
    annotations:
      cert-manager.io/issuer: ingress-issuer
    hosts:
      - name: ptl-replication.<active data center ingress domain>
        secretName: ptl-replication-server
  replicationPeerFQDN: ptl-replication.<warm-standby data center ingress domain>
tlsClient:
  secretName: ptl-replication-client
```

where

- `<dc1 site name>` is the site name for this data center, as decided in [Planning and initial preparation](#).
- `<active data center ingress domain>` and `<warm-standby data center ingress domain>` can be determined by running the command `oc get ingresses.config/cluster -o jsonpath={.spec.domain}` in each data center.

Note: If you are installing the Portal subsystem in a separate namespace, these same steps apply.

4. Apply the updated `portal_cr.yaml` file as directed in [Installing the Portal subsystem in a shared namespace](#).

```
oc get PortalCluster -n <portal namespace>
NAME      READY   STATUS    VERSION   RECONCILED VERSION   AGE
portal    6/6     Running   10.0.5.0   10.0.5.0-1281        49m
```

Results

Confirm that the management subsystem is ready, but in **Warning** state with `oc get mgmt:`

```
oc get mgmt -n <namespace>
```

NAME	READY	STATUS	VERSION	RECONCILED VERSION	MESSAGE
management	n/n	Warning	10.0.5.3-0	10.0.5.3-0	Management is ready. HA Status Warning - see HAStatus in CR for details

```
status:
  haStatus
  {
    "lastTransitionTime": "2023-03-31T19:47:08Z",
    "message": "Replication not working, install or upgrade in progress.",
    "reason": "na",
    "status": "True",
    "type": "Pending"
  }
```

The management CR is expected to report the status of **Warning** until the warm-standby management subsystem is deployed, and both management subsystems complete data replication. When you see the status message "Management is ready. HA Status Warning - see HAStatus in CR for details", you can move on to [Installing API Connect on the warm-standby data center](#).

What to do next

Install API Connect in your warm-standby data center [Installing API Connect on the warm-standby data center](#).

Deploy your Gateway and Analytics subsystems in your active data center. For shared namespace: [Installing with subsystem CRs in a shared namespace on OpenShift](#) or multiple namespaces: [Installing with subsystem CRs in different namespaces or environments on OpenShift](#).

Installing API Connect on the warm-standby data center

Add the `multiSiteHA` configuration to the API Connect Management and Portal YAML files before they are applied.

Before you begin

Verify that all the secrets, certificates, and issuers are ready:

```
oc get secrets -n <namespace>
ingress-ca          kubernetes.io/tls          3          3d21h
mgmt-replication-client kubernetes.io/tls          3          3d21h
ptl-replication-client kubernetes.io/tls          3          3d21h

oc get certs -n <namespace>
mgmt-replication-client True      mgmt-replication-client 3d21h 2024-08-17T13:04:27Z
ptl-replication-client True      ptl-replication-client 3d21h 2024-08-17T13:04:26Z

oc get issuer -n <namespace>
ingress-issuer      True      3d21h
self-signed         True      3d21h
```

Where `<namespace>` are the namespaces you created for API Connect.

Note: If you have separate namespaces for Management and Portal subsystems, then run the check in both namespaces. You should not see the `mgmt-replication-client` in the portal namespace, nor the `ptl-replication-client` in the management namespace.

Procedure

1. Follow these steps for installing the Management subsystem on OpenShift [Installing the Management subsystem in a shared namespace](#), but add the `encryptionSecret` and `multiSiteHA` section to the `mgmt_cr.yaml` file:

```
siteName: <dc2 site name>
encryptionSecret:
  secretName: mgmt-encryption-key
multiSiteHA:
  mode: passive
  replicationEndpoint:
    annotations:
      cert-manager.io/issuer: ingress-issuer
  hosts:
    - name: mgmt-replication.<warm-standby data center ingress domain>
      secretName: mgmt-replication-server
  replicationPeerFQDN: mgmt-replication.<active data center ingress domain>
tlsClient:
  secretName: mgmt-replication-client
```

where

- `<dc2 site name>` is the site name for this data center, as decided in [Planning and initial preparation](#).
- `<active data center ingress domain>` and `<warm-standby data center ingress domain>` can be determined by running the command `oc get ingresses.config/cluster -o jsonpath={.spec.domain}` in each data center.

Note: If you are installing the Management subsystem in a separate namespace, these same steps apply.

Remember: Make sure that the management endpoints are set the same as for your active data center deployment.

2. Apply the update `mgmt_cr.yaml` file as directed in [Installing the Management subsystem in a shared namespace](#). Monitor the deployment, but note that on the warm-standby there are fewer pods than on the active:

```
oc get ManagementCluster -n <namespace>NAME          READY   STATUS    VERSION   RECONCILED VERSION   AGE
management  n/n     Running  10.0.5.3  10.0.5.3-1281  62m
```

3. Follow these steps for installing the Portal subsystem on OpenShift [Installing the Portal subsystem in a shared namespace](#), but add the `encryptionSecret` and `multiSiteHA` section to the `portal_cr.yaml` file.

```
siteName: <dc2 site name>
encryptionSecret:
  secretName: ptl-encryption-key
multiSiteHA:
  mode: passive
  replicationEndpoint:
    annotations:
      cert-manager.io/issuer: ingress-issuer
  hosts:
    - name: ptl-replication.<warm-standby data center ingress domain>
      secretName: ptl-replication-server
  replicationPeerFQDN: ptl-replication.<warm-standby data center ingress domain>
tlsClient:
  secretName: ptl-replication-client
```

where

- `<dc2 site name>` is the site name for this data center, as decided in [Planning and initial preparation](#).
- `<active data center ingress domain>` and `<warm-standby data center ingress domain>` can be determined by running the command `oc get ingresses.config/cluster -o jsonpath={.spec.domain}` in each data center.

Remember: Make sure that the portal endpoints are set the same as for your active data center deployment.

4. Apply the updated `portal_cr.yaml` file as directed in [Installing the Portal subsystem in a shared namespace](#).

```
oc get PortalCluster -n <namespace>
NAME   READY   STATUS    VERSION   RECONCILED VERSION   AGE
portal  6/6     Running  10.0.5.3  10.0.5.3-1281  47m
```

Results

While the management subsystems on the warm-standby and active data centers are synchronizing their databases, the management status reports `Warning`, and the `haStatus` reports `pending`:

```
oc get mgmt -n <namespace>
```

NAME	READY	STATUS	VERSION	RECONCILED VERSION	MESSAGE
AGE					
management for details	n/n 8m59s	Warning	10.0.5.3-0	10.0.5.3-0	Management is ready. HA Status Warning - see HAStatus in CR

```

status:
  haStatus
  {
    "lastTransitionTime": "2023-03-31T19:47:08Z",
    "message": "Replication not working, install or upgrade in progress.",
    "reason": "na",
    "status": "True",
    "type": "Pending"
  }

```

When the management database replication between sites is complete, the management status reports `Running`, and `status.haStatus` reports `Ready`:

NAME	READY	STATUS	VERSION	RECONCILED VERSION	MESSAGE
AGE					
management	n/n	Running	10.0.5.3-0	10.0.5.3-0	Management is ready. 8m59s

```

status:
  haStatus
  {
    "lastTransitionTime": "2023-03-31T19:47:08Z",
    "message": "Replication is working",
    "reason": "na",
    "status": "True",
    "type": "Ready"
  }

```

If the management database replication between sites fails for any reason other than because an install or upgrade is in progress, the `haStatus` output shows:

NAME	READY	STATUS	VERSION	RECONCILED VERSION	MESSAGE
AGE					
management for details	n/n 8m59s	Warning	10.0.5.3-0	10.0.5.3-0	Management is ready. HA Status Warning - see HAStatus in CR

```

status:
  haStatus
  {
    "lastTransitionTime": "2023-03-31T19:47:08Z",
    "message": "Replication not working",
    "reason": "na",
    "status": "True",
    "type": "Warning"
  }

```

If the warning persists, see [Troubleshooting a two data center deployment](#).

You can validate that your portal deployments are synchronizing by running `oc get pods` on both the active and warm-standby data centers. Confirm that the number and names of the pods all match (the UUIDs in the names might be different on each site), and that all are in the `Ready` state.

For additional replication verification checks, see [Verifying replication between data centers](#). It is recommended to run a test failover, and confirm that all of the expected data is present and correct on the newly active site. See [How to failover API Connect from the active to the warm-standby data center](#) for details.

What to do next

Deploy your Gateway and Analytics subsystems for shared namespace: [Installing with subsystem CRs in a shared namespace on OpenShift](#) or multiple namespaces: [Installing with subsystem CRs in different namespaces or environments on OpenShift](#)

Configure your deployment: [Cloud Manager configuration checklist](#), and complete a test failover to verify that your data replicated to the warm-standby. See [How to failover API Connect from the active to the warm-standby data center](#) for details.

Troubleshooting installation on OpenShift

Review the following troubleshooting tips if you encounter a problem while installing or upgrading API Connect on OpenShift, including as a component of IBM Cloud Pak for Integration (CP4I).

- [One or more pods in CrashLoopBackoff or Error state, and report a certificate error in the logs](#)
- [You see the denied: insufficient scope error during an air-gapped deployment](#)
- [Apiconnect operator crashes](#)
- [Disabling the Portal web endpoint check](#)

Note: In the  Help page of the Cloud Manager, API Manager, and API Designer user interfaces, there's a Product information tile that you can click to find out information about your product versions, as well as Git information about the package versions being used. Note that the API Designer product information is based on its associated management server, but the Git information is based on where it was downloaded from.

One or more pods in CrashLoopBackoff or Error state, and report a certificate error in the logs

In rare cases, cert-manager might detect a certificate in a bad state right after it has been issued, and then re-issues the certificate. If a CA certificate has been issued twice, the certificate that was signed by the previously issued CA will be left stale and can't be validated by the newly issued CA. In this scenario, one of the following messages displays in the log:

- `javax.net.ssl.SSLHandshakeException: Received fatal alert: certificate_unknown`
- `Error: unable to verify the first certificate`
- `ERROR: openssl verify failed to verify the Portal CA tls.crt, ca.crt chain signed the Portal Server tls.crt cert`

Resolve the problem by completing the following steps:

1. Use `apicops` (v10 version 0.10.57+ required) to validate the certificates in the system:

```
apicops upgrade:stale-certs -n <namespace>
```

2. If any certificate that is managed by `cert-manager` fails the validation, delete the stale certificate secret:

```
oc delete secret <stale-secret> -n <namespace>
```

`Cert-manager` automatically generates a new certificate to replace the one you deleted.

3. Use `apicops` to make sure all certificates can be verified successfully:

```
apicops upgrade:stale-certs -n <namespace>
```

You see the denied: insufficient scope error during an air-gapped deployment

Problem: You encounter the `denied: insufficient scope` message while mirroring images during an air-gapped installation.

Reason: This error occurs when a problem is encountered with the entitlement key used for obtaining images.

Solution: Obtain a new entitlement key by completing the following steps:

1. Log in to the [IBM Container Library](#).
2. In the Container software library, select Get entitlement key.
3. After the Access your container software heading, click Copy key.
4. Copy the key to a safe location.

Apiconnect operator crashes

Problem: During installation, the Apiconnect operator crashes with the following message:

```
panic: unable to build API support: unable to get Group and Resources: unable to retrieve the complete list of server APIs:
packages.operators.coreos.com/v1: the server is currently unable to handle the request
```

```
goroutine 1 [running]:
github.ibm.com/velox/apiconnect-operator/operator-utils/v2/apiversions.GetAPISupport(0x0)
operator-utils/v2/apiversions/api-versions.go:89 +0x1e5
main.main()
ibm-apiconnect/cmd/manager/main.go:188 +0x4ee
```

Additional symptoms:

- Apiconnect operator is in crash loopback status
- Kube apiserver pods log the following information:

```
E1122 18:02:07.853093 18 available_controller.go:437] v1.packages.operators.coreos.com failed with:
failing or missing response from https://10.128.0.3:5443/apis/packages.operators.coreos.com/v1:
bad status from https://10.128.0.3:5443/apis/packages.operators.coreos.com/v1: 401
```

- The IP logged here belongs to the `package server` pod present in the `openshift-operator-lifecycle-manager` namespace
- Package server pods log the following: `/apis/packages.operators.coreos.com/v1` API call is being rejected with 401 issue

```
E1122 18:10:25.614179 1 authentication.go:53] Unable to authenticate the request due to an error: x509:
certificate signed by unknown authority I1122 18:10:25.614224 1 httplog.go:90]
verb="GET" URI="/apis/packages.operators.coreos.com/v1" latency=161.243µs resp=401
UserAgent="Go-http-client/2.0" srcIP="10.128.0.1:41370":
```

- Problem is intermittent

Solution:

- If you find the exact symptoms as described, the solution is to delete package server pods in the `openshift-operator-lifecycle-manager` namespace.
- New package server pods will log the `200 Success` message for the same API call.

Disabling the Portal web endpoint check

When you create or register a Developer Portal service, the Portal subsystem checks that the Portal web endpoint is accessible. However sometimes, for example due to the complexity of public and private networks, the endpoint cannot be reached. The following example shows the errors that you might see in the `portal-www` pod, admin container logs, if the endpoint cannot be reached:

```
An error occurred contacting the provided portal web endpoint: example.com
The provided Portal web endpoint example.com returned HTTP status code 504
```

In this instance, you can disable the Portal web endpoint check so that the Developer Portal service can be created successfully.

To disable the endpoint check, complete the following update:

On Kubernetes, OpenShift, and IBM® Cloud Pak for Integration

Add the following section to the Portal custom resource (CR) template:

```
spec:
  template:
    - containers:
      - env:
        - name: PORTAL_SKIP_WEB_ENDPOINT_VALIDATION
          value: "true"
        name: admin
      name: www
```

Upgrading API Connect

You can upgrade a v10 deployment of API Connect to a newer version.

About this task

Select from the following sections to find detailed information about upgrading your API Connect deployment.

Attention: Upgrading to v10.0.5.x from v10.0.4-ifix3 or later, or v10.0.1.7 or later, will result in the deletion of existing analytics data. If you want to retain your analytics data then you must export it before upgrade. For instructions on exporting see [Additional considerations for upgrading analytics from a version prior to 10.0.5.0](#).

Note: For information about how to maintain a two data center deployment, including upgrade considerations, see [Maintaining a two data center deployment](#).

- [Upgrading on Kubernetes](#)
Upgrade API Connect on native Kubernetes distributions.
- [Upgrading on OpenShift and Cloud Pak for Integration](#)
You can upgrade API Connect in an OpenShift environment and as part of IBM Cloud Pak for Integration.
- [Upgrading a two data center deployment on Kubernetes and OpenShift](#)
How to upgrade a two data center disaster recovery (DR) deployment on Kubernetes and OpenShift.
- [Upgrading a two data center deployment on Cloud Pak for Integration](#)
How to upgrade a two data center disaster recovery (DR) deployment on Cloud Pak for Integration.

Upgrading on Kubernetes

Upgrade API Connect on native Kubernetes distributions.

After reviewing the overview, use the procedures in this section to upgrade API Connect on native Kubernetes distributions.

Note: For upgrading from v5, see [Migrating a Version 5 deployment](#).

- [Upgrade considerations on native Kubernetes](#)
Review the supported versions, requirements, and limitations for upgrading API Connect on Kubernetes.
- [Upgrading subsystems on native Kubernetes](#)
Upgrade your API Connect subsystems to the latest version on native Kubernetes.
- [Upgrading from 2018 to 10.0.5.4 on Kubernetes](#)
Upgrade API Connect 2018 FP24 and higher directly to 10.0.5.4 on Kubernetes.
- [Troubleshooting upgrades on Kubernetes](#)
Review the following troubleshooting guidance if you encounter a problem while upgrading API Connect on Kubernetes.
- [Migrating API test data](#)
Back up API testing data before upgrading your IBM® API Connect to V10.0.1, and then restore the data after the upgrade is complete.

Upgrade considerations on native Kubernetes

Review the supported versions, requirements, and limitations for upgrading API Connect on Kubernetes.

Tip: After upgrade, clear your browser cache, and open a new browser window. This action avoids stale cache issues in your browser, that can result in unexpected behavior in the Cloud Manager and API Manager UIs.

Supported upgrade paths

Attention: API Connect 10.0.5.x is not supported on a FIPS-enabled environment.

Table 1 lists the releases of IBM® API Connect v10 that can be upgraded to the newest version.

Table 1. Supported upgrade paths on Kubernetes

Upgrade from:	How to upgrade to 10.0.5.6
---------------	----------------------------

Upgrade from:	How to upgrade to 10.0.5.6
<ul style="list-style-type: none"> • 10.0.5.5 • 10.0.5.4 • 10.0.5.3 • 10.0.5.2 • 10.0.5.1 • 10.0.5.0 • 10.0.4.0- ifix3 • 10.0.1.15- eus • 10.0.1.12- eus • 10.0.1.11- eus • 10.0.1.9- eus • 10.0.1.8- eus • 10.0.1.7- eus 	<p>Complete the procedure in Upgrading subsystems on native Kubernetes in this 10.0.5 documentation..</p>
<p>Older versions of 10.0.x:</p> <ul style="list-style-type: none"> • 10.0.4.0- ifix2 • 10.0.4.0- ifix1 • 10.0.4.0 • 10.0.3.0- ifix1 • 10.0.3.0 • 10.0.2.0 	<p>Complete 2 upgrades:</p> <ol style="list-style-type: none"> 1. First, upgrade to 10.0.4.0-ifix3 as explained in Upgrading subsystems on native Kubernetes in the API Connect 10.0.4 documentation. 2. Then, upgrade to 10.0.5.6 as explained in Upgrading subsystems on native Kubernetes in this documentation.
<p>Older versions of 10.0.1.x:</p> <ul style="list-style-type: none"> • 10.0.1.6- ifix1-eus • 10.0.1.6- eus • 10.0.1.5- ifix4-eus • 10.0.1.5- ifix3-eus • 10.0.1.5- eus • 10.0.1.4- ifix1-eus • 10.0.1.4- eus • 10.0.1.2- ifix2-eus • 10.0.1.2- ifix1-eus • 10.0.1.2- eus 	<p>Complete 2 upgrades:</p> <ol style="list-style-type: none"> 1. First, upgrade to 10.0.1.8-eus as explained in Upgrading to 10.0.1.8-eus on Kubernetes in the API Connect 10.0.1.x-eus documentation. You do not need to upgrade to a higher version because you can move directly from 10.0.1.8-eus to 10.0.5.6. 2. Then, upgrade to 10.0.5.6 as explained in Upgrading subsystems on native Kubernetes in this documentation.
<ul style="list-style-type: none"> • 10.0.1.1 • 10.0.1.0 • 10.0.0.0- ifix2 	<p>Complete 3 upgrades:</p> <ol style="list-style-type: none"> 1. First, upgrade to 10.0.1.2-ifix1-eus as explained in Upgrading from v10 to v10.0.1.2 on Kubernetes in the API Connect 10.0.1.x-eus documentation. 2. Next, upgrade to 10.0.1.8-eus as explained in Upgrading to 10.0.1.8-eus on Kubernetes in the API Connect 10.0.1.x-eus documentation. You do not need to upgrade to a higher version because you can move directly from 10.0.1.8-eus to 10.0.5.6. 3. Then, upgrade to 10.0.5.6 as explained in Upgrading subsystems on native Kubernetes in this documentation.
<p>2018 FP24</p>	<p>Complete 2 upgrades:</p> <ol style="list-style-type: none"> 1. First, upgrade to 10.0.5.4 as explained in Upgrading from 2018 to 10.0.5.4 on Kubernetes. 2. Then, upgrade to 10.0.5.6 as explained in Upgrading subsystems on native Kubernetes.

Attention: Different releases of API Connect support different versions of Kubernetes, so you might need to upgrade Kubernetes before upgrading API Connect. For more information, see [IBM API Connect Version 10 software product compatibility requirements](#).

Ensuring compatibility with Drupal 10 for Developer Portal customizations

Review the [Guidelines on upgrading your Developer Portal from Drupal 9 to Drupal 10](#) to ensure that any customizations to the Developer Portal are compatible with Drupal 10.

In API Connect 10.0.5.3, the Developer Portal moved from Drupal 9 to Drupal 10 (this upgrade also requires PHP 8.1). The upgrade tooling will update your Developer Portal sites; however, if you have any custom modules or themes, it is your responsibility to ensure their compatibility with Drupal 10 and PHP 8.1 before starting the upgrade.

Note: If you are upgrading to 10.0.5.3 from 10.0.1.7 or earlier, or from 10.0.5.0 or earlier, your Developer Portal sites will first be upgraded to Drupal 9.5 and then to Drupal 10. When you are planning your the upgrade to 10.0.5.3, consider the extended time frame. To shorten your upgrade window, consider removing the Developer Portal sites that you do not need.

Exporting analytics data before upgrading from a version prior to 10.0.5.0

If upgrading from v10.0.4-ifix3, or upgrading from v10.0.1.7-eus (or higher): Upgrading to 10.0.5.x from an earlier version will result in the deletion of existing analytics data. If you want to retain your analytics data then you must export it before starting the upgrade. For instructions on exporting data, see [Additional considerations for upgrading analytics from a version prior to 10.0.5.0](#)

Validating an API definition file with the API Dev Tools Swagger Parser

From IBM API Connect Version 10.0.3.0 or later, SwaggerDoc (OpenAPI 2.0) and OpenAPI 3.0 documents that form API definition files are now validated at stage or publish time by the API Dev Tools Swagger Parser. Before upgrading, you should ensure that your existing API definition files can be parsed and are considered valid by the Swagger Parser tool. Note that any API definitions that are already staged or published are not impacted, but would undergo Swagger Parser validation again should they be re-staged or re-published in the future.

You can use either of the following techniques to ensure that existing API definition files are can be parsed and considered valid by the Swagger Parser:

- Download and install the `swagger-parser-cli` tool (see <https://www.npmjs.com/package/swagger-cli>). This tool includes a `validate` command that can validate local API definition files against the SwaggerDoc (OpenAPI 2.0) and OpenAPI 3.0 schemas, in both JSON and YAML formats.
- Use the browser-based Swagger Parser Validator available at <https://apitools.dev/swagger-parser/online/>; this accepts a URL to existing files available online, or can accept text copied and pasted into the tool, in both JSON and YAML formats. It can likewise validate against the SwaggerDoc (OpenAPI 2.0) and OpenAPI 3.0 schemas.

Note: Staging or publishing an API in API Connect results in additional syntactic validation of IBM extensions to SwaggerDoc (OpenAPI 2.0) and OpenAPI 3.0, as well as semantic validation to make sure that policies and other resources that the API refers to are valid within the context of the staging or publishing operation. Any errors associated with this additional validation will not be caught by the local or online Swagger Parser tool, nor will they be caught by the `apic validate` toolkit CLI command.

The Swagger Parser tool will report an invalid OpenAPI document. For example, if a document is missing a mandatory section such as `info` or `paths`, the following error is reported:

```
[object Object] is not a valid Swagger API definition
```

If a required property is missing from a given section, a specific error is reported. For example, if the `info` section is missing the required `version` property, the following error is reported:

```
Swagger schema validation failed.  
Missing required property: version at #/info
```

```
JSON_OBJECT_VALIDATION_FAILED
```

Additionally, if the document contains any local references (that is, values of `$ref` properties) that do not resolve to an existing reference within the document (known as de-referencing), this is also be flagged as an error. For example, if a document contains the following as a reference:

```
schema:  
  $ref: '#/definitions/Pet'
```

then the definition of `Pet` (that is, `#/definitions/Pet`) **must** exist in the same document, at the given path (`definitions` section in this example), similar to the following:

```
definitions:  
  Pet:  
    type: object  
    required:  
    - name  
    properties:  
      id:  
        type: integer  
        format: int64
```

If the local reference is not found within the document, the following de-referencing error is reported:

```
Token "Pet" does not exist.
```

Upgrading to v10.0.5.3 (or later) from an earlier 10.05.x release.

Additional features related to inter-subsystem communication were added in v10.0.5.3. To enable and configure these features see: [Optional post-upgrade steps for upgrade to 10.0.5.3 \(or later\) from earlier 10.0.5 release.](#)

- [Additional considerations for upgrading analytics from a version prior to 10.0.5.0](#)
API Connect v10.0.5.0 introduced a new architecture for the Analytics subsystem, so some additional steps are required before and after upgrading from API Connect 10.0.4-ifix3 or 10.0.1.x.

Additional considerations for upgrading analytics from a version prior to 10.0.5.0

API Connect v10.0.5.0 introduced a new architecture for the Analytics subsystem, so some additional steps are required before and after upgrading from API Connect 10.0.4-ifix3 or 10.0.1.x.

The key changes to the Analytics subsystem are highlighted in [What's new in Version 10.0.5](#).

The most important consideration is that existing analytics data is deleted during the upgrade from 10.0.4-ifix3, and from 10.0.1.7-eus (or higher), and cannot be restored. After upgrading to v10.0.5.0 or later, you will have an empty analytics database. If you want to keep your existing analytics data on an external system, there are three options:

- **[Exporting analytics data from the UI](#)**
Before upgrading to v10.0.5, export any analytics data that you wish to keep using the UI.
- **[Exporting analytics data by using the REST API](#)**
Before upgrading to v10.0.5, export any analytics data that you want to keep by using the REST API.
- **[Offloading analytics data](#)**
An alternative to exporting your analytics data before upgrading to v10.0.5 is to enable analytics offload. However, when enabled this feature only offloads new analytics data. But if your upgrade is not planned for a few days or weeks, you can enable this feature now and avoid the need to export any new analytics data.
- **[Remove template overrides from your analytics CR](#)**
If you are upgrading to v10.0.5.4 or earlier, remove any analytics CR template overrides. Pre-10.0.5 analytics CR template overrides are not compatible with 10.0.5 and must be removed.

Exporting analytics data from the UI

Before upgrading to v10.0.5, export any analytics data that you wish to keep using the UI.

About this task

Note: This page refers to analytics features that existed in pre-v10.0.5 releases, for the purposes of exporting analytics data before upgrade. Exporting analytics data from v10.0.5 is described here [Exporting analytics from v10.0.5](#)

Use the Analytics Discover tab to search for event data and then export the *hits* (the records in the search results) to a file. Each hit represents one API invocation in the Gateway server. When you view the hits in the UI, the display is limited to 500 records. To view the entire set of hits, export the data to a CSV or JSON Lines file.

Procedure

1. Navigate to the Analytics page and click Discover.
2. Run a search.

Select a predefined search to run, or click  to define your own search, and then run it. Optionally apply filters to refine the results. The export option is only available when a search returns at least one hit.

3. Click Export (this option displays before the search results).
4. In the "Export Hits" panel, select the Filetype for the exported data.

There are two options for the file's type:

- a. JSON Lines (.txt): Exports data to a .txt file that contains a complete JSON record for each hit.
 - b. Comma-separated Values (.csv): Exports to a .csv file that can be viewed either in a text editor, a spreadsheet, or some other CSV viewer.
- If you intend to view the .csv file in a viewer that does not support special characters, select the following options as needed to ensure compatibility with your viewer:

- i. Escape double quotes: Insert an additional quotation mark (") as an escape character before each " that is already included in the file.
- ii. Escape special characters: Insert a quotation mark (") as an escape character before each of the following characters: = _ + % @

The content of the API event records in the CSV file depends on the logging policy that is set for the operation. If the logging policy includes the HTTP headers and the payload, then these details are included in the API event record. Where the payload is large, it might take longer to complete the export of the analytics data. For more information, see [activity-log.policy](#). For information about the fields that are included in the CSV file, see [API event records](#).

5. In the panel, click Export to start the export operation.
6. When the "The export has completed successfully." message displays, click Download to save the file, or click Another one? to run a new export operation. (Remember to save the current export results before running a new export).

Attention:

- If your browser is configured to block pop-ups, the download might be blocked. The precise behavior varies across browsers, but if you see a notification about "blocked pop-ups", reconfigure the browser to always allow pop-ups for the API Manager host address. Then check the "Export Hits" panel for the Download option, which completes the operation. If you do not see a Download option, repeat the export operation.
 - If you navigate away from the Analytics interface before the exported file is downloaded, the download operation is suspended. If you return to Analytics before any other export operation begins and before the file expires, you might see a Download option that allows you to finish downloading the file. Otherwise, you must repeat the entire export operation.
 - Each downloaded file is saved to the download location that is configured for your browser, using a randomly generated file name. If you intend to export more than once, and you are exporting to the same location each time, you might want to rename each file with a meaningful name.
- **[Exporting aggregated analytics data from a visualization](#)**
From a visualization, you can view the raw aggregated data from which the graphical representation is constructed, and then export that data to a CSV file.

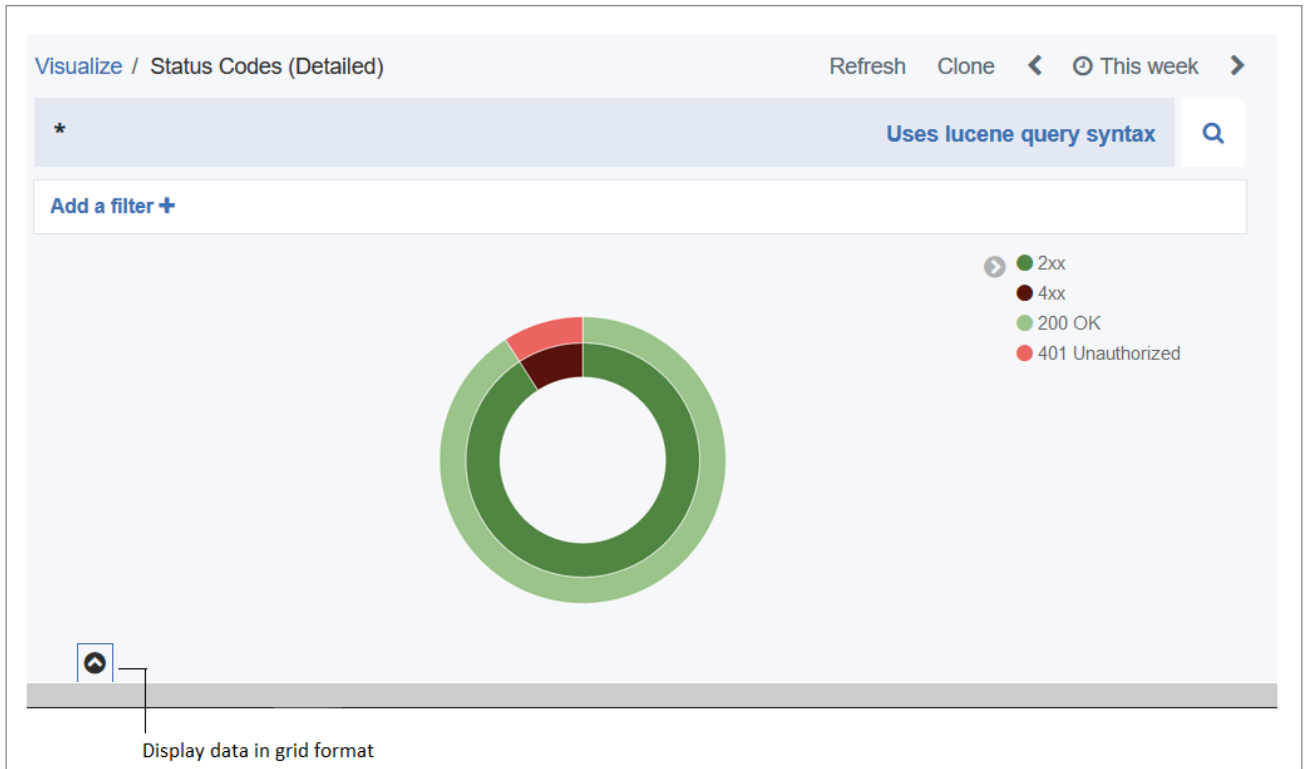

Exporting aggregated analytics data from a visualization

From a visualization, you can view the raw aggregated data from which the graphical representation is constructed, and then export that data to a CSV file.

Procedure

Note: This page refers to analytics features that existed in pre-v10.0.5 releases, for the purposes of exporting analytics data before upgrade. Exporting analytics data from v10.0.5 is described here [Exporting analytics from v10.0.5](#). To export analytics data from a visualization, complete the following steps.

1. Navigate to the Analytics page and click Visualize.
2. Select a visualization by clicking it.
For example, you might select the visualization called "Status Codes (Detailed)" as shown in the following image:

3. Display the data in grid format by clicking the  that displays after the visualization.
In the resulting grid, a row is displayed for each aggregated data set that matches the search criteria configured in the visualization's aggregation builder. The raw data shown in the columns and rows depends on the type of visualization accessed and the aggregations configured for that visualization.

Visualize / Status Codes (Detailed) Refresh Clone < This week >

Table

filters	Count	status_code.keyword: Descending	Count
1xx	0		
2xx	20	200 OK	20
3xx	0		
4xx	2	401 Unauthorized	2
5xx	0		

Export: Raw Formatted

Page Size 10

Display in graph format Export options

4. Export a tabular format of the raw data that is displayed in the grid:
5. When prompted, choose to save the file, which is named *visualization_name.csv* by default.
The file is saved to the download location that is configured for your browser. If you intend to export more than once from the same or another visualization, and you are exporting to the same location each time, you might want to rename each file with a meaningful name.

Exporting analytics data by using the REST API

Before upgrading to v10.0.5, export any analytics data that you want to keep by using the REST API.

Before you begin

API Connect REST API calls are authenticated by using a bearer token in the authorization header. Use the toolkit credentials to request a bearer token. Toolkit credentials can be found in the API Manager UI:

1. Log in to the API Manager UI.
2. From the home page, click the Download toolkit tile.
3. Download the Toolkit credentials.
4. Open the downloaded `credentials.json` file, example:

```
...
"toolkit": {
  "endpoint": "https://mgmt.api.example.com/api",
  "client_id": "7409693f-f726-48b4-8909-7c0d26f13e81",
  "client_secret": "5feeb0be-17f8-41a4-96d6-d40f33d69ef6"
},
...
```

Take note of the `toolkit.client_id`, `toolkit.client_secret`, and `toolkit.endpoint` from this file. You will use these to get your bearer token.

About this task

The Analytics REST API is documented in the [API Connect v10.0.5LATEST](#) API Explorer. You can export the data catalog-by-catalog using `/analytics/catalogs/{org}/{catalog}/analytics-services/{analytics-service}/events`

Procedure

1. Use your provider organization credentials and `client_id/secret` to request a bearer token:

```
curl -v -k -X POST -d '{"username": "<username>", "password": "<password>", "realm": "<realm>", "client_id": "<client_id>", "client_secret": "<client_secret>", "grant_type": "password"}' -H 'Content-Type: application/json' -H
```

```
'Accept: application/json' https://<management server platform api endpoint>/token
```

Where:

- `<username>` is the provider org owner.
- `<password>` is the password for the specified `<username>`.
- `<realm>` is the user registry realm for the specified `<username>`. The default provider organization user registry realm is `provider/default-idp-2`.
- `<client_id>` is the client ID from the "toolkit" section of the `credentials.json` file, or as provided by your API Connect cloud administrator.
- `<client_secret>` is the client secret from the "toolkit" section of the `credentials.json` file, or as provided by your API Connect cloud administrator.
- `<management server platform api endpoint>` is the platform API endpoint from the "toolkit" section of the `credentials.json` file, or as provided by your API Connect cloud administrator.

The bearer token is returned in the `access_token` property:

```
{
  "access_token": "<bearer token>",
  "token_type": "Bearer",
  "expires_in": 28800
}
```

Note the `expires_in` value, which is the number of seconds before the token expires. After expiry you need to request a new bearer token.

2. Use the returned bearer token to call the analytics REST API:

```
curl -v -k -H 'Accept: application/json' -H 'Authorization: Bearer <bearer token>' -X GET --url 'https://<management server platform api endpoint>/analytics/catalogs/<provider org name>/<catalog name>/analytics-services/<analytics service name>/events?after=now-7d'
```

Where:

- `<management server platform api endpoint>` is the `toolkit.endpoint`, but with the `/api` at the end replaced with `/analytics` to access the analytics APIs.

In this example, the REST API call returns the last 7 days (note the `?after=now-7d` at end of the URL) of event data for the specified catalog:

```
{ "total": 2, "found": true, "events": [ { "id": "AYGp1P_4umraqLKQkId3", "event": { "immediate_client_ip": "9.145.95.209", "developer_org_name": "", "resource_id": ":GET:/hola-mundo", "developer_org_id": "", "log_policy": "activity" ...
```

Note: For large data sets it might be necessary to make the REST call repeatedly, specifying a different time range for each call. For example, to capture events logged during a specific 30-minute interval, use: `?after=2022-06-28T09:00:00&before=2022-06-28T09:30:00`

3. Additional filters can be used as described in the REST API documentation for the call to `GET /analytics/catalogs/{org}/{catalog}/analytics-services/{analytics-service}/events`

Offloading analytics data

An alternative to exporting your analytics data before upgrading to v10.0.5 is to enable analytics offload. However, when enabled this feature only offloads new analytics data. But if your upgrade is not planned for a few days or weeks, you can enable this feature now and avoid the need to export any new analytics data.

The steps for configuring analytics offload are covered in the v10.0.1 documentation:

https://www.ibm.com/docs/en/SSMNE110/com.ibm.apic.install.doc/analytics_install_offload_k8s.html

Remove template overrides from your analytics CR

If you are upgrading to v10.0.5.4 or earlier, remove any analytics CR template overrides. Pre-10.0.5 analytics CR template overrides are not compatible with 10.0.5 and must be removed.

If you are upgrading to v10.0.5.5 or later, then template overrides are automatically removed in the upgrade, and no action is needed. If you are upgrading to v10.0.5.4 or an earlier v10.0.5 fix pack, then review your analytics CR and if it has a `template` section, remove this section. For example:

```
kubectl edit a7s -n <namespace>
```

Remove the `template` section:

```
# Please edit the object below. Lines beginning with a '#' will be ignored,
# and an empty file will abort the edit. If an error occurs while saving this file will be
# reopened with the relevant failures.
#
apiVersion: analytics.apiconnect.ibm.com/v1beta1
kind: AnalyticsCluster
...
spec:
...
  template: # REMOVE THIS SECTION
  - name: storage-data
    containers:
    - name: storage-data
      env:
      - name: ES_JAVA_OPTS
        value: "-Xms2g -Xmx2g"
      resources:
        requests:
          memory: 3Gi
        limits:
          memory: 4Gi
```

In this example, the template section specified custom memory allocations for internal analytics processes. These settings are applicable only to pre-v10.0.5 analytics deployments. v10.0.5 has additional deployment profiles that provide increased memory allocations: [Analytics component deployment profile limits](#).

Upgrading subsystems on native Kubernetes

Upgrade your API Connect subsystems to the latest version on native Kubernetes.

Before you begin

- To ensure operator compatibility, upgrade API Connect management subsystem first and DataPower gateway subsystem second. This requirement applies to all upgrade scenarios.
The Gateway subsystem remains available during the upgrade of the Management, Portal, and Analytics subsystems.
- Verify that your installed Kubernetes version is supported by the API Connect version that you are upgrading to. See [IBM API Connect Version 10 software product compatibility requirements](#). If your Kubernetes version is older than the minimum supported version for your target API Connect version, then upgrade Kubernetes first.
Note: If you are upgrading from an old API Connect version, it is possible that it does not support the minimum supported Kubernetes version that is required by the latest API Connect release. If so, one or more intermediate upgrades of API Connect might be required to ensure that API Connect is always running on a supported Kubernetes version.

Procedure

- Complete the prerequisites:
 - Ensure you are upgrading from a supported version and reviewed the upgrade requirements and limitations. See [Upgrade considerations on native Kubernetes](#).
 - Verify that the `pgcluster` is healthy:
 - Get the name of the `pgcluster`:

```
kubectl get pgcluster -n <APIC_namespace>
```

The response displays the name of the postgres cluster running in the specified namespace.
 - Check the status of the `pgcluster`:

```
kubectl get pgcluster <pgcluster_name> -n <APIC_namespace> -o yaml | grep status -A 2 | tail -n3
```

The response for a healthy `pgcluster` looks like the following example, where the state is `Initialized`:

```
status:
  message: Cluster has been initialized
  state: pgcluster Initialized
```

Important: If the `pgcluster` returns any other state, it is not healthy and an upgrade will fail.
 - If there are any on-going backup or restore jobs, wait until they complete and then check the status again. Do not proceed with the upgrade until the status is `Initialized`.
 - If all of the background jobs complete but the `pgcluster` remains unhealthy, contact IBM Support for assistance.
 - Backup the current deployment. Wait until the backup completes before starting the upgrade.
 - Do not start an upgrade if a backup is scheduled to run within a few hours.
 - Do not perform maintenance tasks such as rotating key-certificates, restoring from a backup, or starting a new backup, at any time while the upgrade process is running.
 - If you used any microservice image overrides in the management CR during a fresh install, you must remove the image overrides prior to upgrade.
Important: When upgrading, if you used any microservice image overrides in the management CR during a fresh install then prior to upgrade these image overrides will be automatically removed by the operator during upgrade. You can apply them again after the upgrade is complete.
 - Back up API test data in the Automated API behavior testing application as explained in [Backing up API test data](#). After the upgrade is complete, you can migrate the data as explained in [Restoring API test data](#).
- Run the pre-upgrade health check:

Attention: This is a required step. Failure to run this check before upgrading could result in problems during the upgrade.

 - Verify that the `apicops` utility is installed by running the following command to check the current version of the utility:

```
apicops --version
```

If the response indicates that `apicops` is not available, install it now. See [The API Connect operations tool: apicops](#) in the API Connect documentation.
 - Run the following command to set the KUBECONFIG environment.

```
export KUBECONFIG=</path/to/kubeconfig>
```
 - Run the following command to execute the pre-upgrade script:

```
apicops version:pre-upgrade -n <namespace>
```

If the system is healthy, the results will not include any errors.

Note: This command asks for the Cloud Manager admin password in order to make a call to the platform API. If you do not have this password, or the platform API URL is not accessible from your `apicops` location, then this part of the pre-upgrade check can be skipped by adding the argument `--no-topology`. The topology check output that is produced by this API call is typically only required for debugging purposes, when the `apicops version:pre-upgrade` returns output that suggests the system is unhealthy.
- Obtain the API Connect files from IBM Fix Central.
From the [IBM Fix Central](#) site, download the Docker image-tool file of the API Connect subsystems. Next, you will upload the image-tool file to your Docker local registry. If necessary, you can populate a remote container registry with repositories. Then you can push the images from the local registry to the remote registry.

You will also download the Kubernetes operators, API Connect Custom Resource (CR) templates, and Certificate Manager, for use during deployment configuration.

The following files are used for deployment on native Kubernetes:

IBM® API Connect <version> for Containers

Docker images for all API Connect subsystems

IBM® API Connect <version> Operator Release Files for Containers

Kubernetes operators and API Connect Custom Resource (CR) templates

IBM® API Connect <version> Toolkit for <operating_system_type>

Toolkit command line utility. Packaged standalone, or with API Designer or Loopback:

- IBM® API Connect <version> Toolkit for <operating_system_type>
- IBM® API Connect <version> Toolkit with Loopback for <operating_system_type>
- IBM® API Connect <version> Toolkit Designer with Loopback for <operating_system_type>

Not required during initial installation. After installation, you can download directly from the Cloud Manager UI and API Manager UI. See [Installing the toolkit](#).

IBM® API Connect <version> Local Test Environment

Optional test environment. See [Testing an API with the Local Test Environment](#)

IBM® API Connect <version> Security Signature Bundle File

Checksum files that you can use to verify the integrity of your downloads.

4. Next, upload the image files that you obtained from Fix Central in Step 3.

a. Load the image-tool image for the new version into your Docker local registry:

```
docker load < apiconnect-image-tool-<version>.tar.gz
```

Ensure that the registry has sufficient disk space for the files.

b. If your Docker registry requires repositories to be created before images can be pushed, create the repositories for each of the images listed by the image tool. If your Docker registry does not require creation of repositories, skip this step and go to Step 4.c.

i. Run the following command to get a list of the images from image-tool:

```
docker run --rm apiconnect-image-tool-<version> version --images
```

ii. From the output of each entry of the form <image-name>:<image-tag>, use your Docker registry repository creation command to create a repository for <image-name>.

For example in the case of AWS ECR the command would be for each <image-name>:

```
aws ecr create-repository --repository-name <image-name>
```

c. Upload the image:

- If you do not need to authenticate with the docker registry, use:

```
docker run --rm apiconnect-image-tool-<version> upload <registry-url>
```

- Otherwise, if your docker registry accepts authentication with username and password arguments, use:

```
docker run --rm apiconnect-image-tool-<version> upload <registry-url> --username <username> --password <password>
```

- Otherwise, such as with IBM Container Registry, if you need the image-tool to use your local Docker credentials, first authenticate with your Docker registry, then upload images with the command:

```
docker run --rm -v ~/.docker:/root/.docker --user 0 apiconnect-image-tool-<version> upload <registry-url>
```

Review the following installation notes as appropriate for your environment:

- [Alternative Docker command for macOS if Docker is configured to use osxkeychain](#)
- [Docker authentication notes](#)
- [Providing a certificate for verification, or disabling TLS verification](#)

5. If needed, delete old Postgres client certificates.

If you are upgrading from 10.0.1.x or 10.0.4.0-ifix1, or if you previously installed any of those versions before upgrading to 10.0.5.x, there might be old Postgres client certificates. To verify, run the following command:

```
kubectl -n <namespace> get certs | grep db-client
```

For example, if you see that both `-db-client-apicuser` and `apicuser` exist, `apicuser` is no longer in use. Remove the old certificates by running one of the following commands, depending on how many old certifications left in your system:

```
kubectl -n <namespace> delete certs apicuser pgbouncer primaryuser postgres replicator
```

or:

```
kubectl -n <namespace> delete certs apicuser pgbouncer postgres replicator
```

6. **If upgrading from v10.0.4-ifix3, or upgrading from v10.0.1.7-eus (or higher)** and you want to retain your analytics data, then you must export it before running the upgrade.

For instructions on exporting data, see [Additional considerations for upgrading analytics from a version prior to 10.0.5.0](#).

7. **If upgrading from v10.0.4-ifix3, or upgrading from v10.0.1.7-eus (or higher)**: Disassociate and delete your Analytics services.

a. In Cloud Manager, click Topology.

b. In the section for the Availability Zone that contains the Analytics service, locate the Gateway service that the Analytics service is associated with.

c. Click the actions menu, and select Unassociate analytics service.

Remember to disassociate each Analytics service from all Gateways.

d. In the section for the Availability Zone that contains the Analytics services, locate each Analytics service and click Delete.

8. Download and decompress IBM API Connect <version> Operator Release Files for Containers.

Make a directory called `helper_files` and extract the contents of `helper_files.zip` from the `release_files.zip` into `helper_files`.

9. Apply the new CRDs from the version you just extracted:

```
kubectl apply -f ibm-apiconnect-crds.yaml
```

10. Apply the new DataPower Operator YAML into the namespace where the DataPower Operator is running.

a. Verify that the correct namespace is referenced in the `ibm-datapower.yaml` file:

If your product was not deployed in the namespace called `default`, open the `ibm-datapower.yaml` file in a text editor and replace all instances of `default` with the appropriate name of the namespace where you deployed the product.

b. Specify the location of the `datapower-operator` image:

Open the `ibm-datapower.yaml` file in a text editor and locate the `image`: key in the `containers` section of the deployment file (immediately after `imagePullSecrets`:). Replace the value of the `image`: key with the location of the `datapower-operator` image, either uploaded to your own registry or pulled from a public registry.

c. Run the following command:

```
kubectl apply -f ibm-datapower.yaml -n <namespace>
```

The Gateway CR goes to `Pending` state when the operator is updated, and then changes to `Running` after installation of the API Connect operator in the next step.

Note: There is a known issue on Kubernetes version 1.19.4 or higher that can cause the DataPower operator to fail to start. In this case, the DataPower Operator pods can fail to schedule, and will display the status message: `no nodes match pod topology spread constraints (missing required label)`. For example:

```
0/15 nodes are available: 12 node(s) didn't match pod topology spread constraints (missing required label), 3 node(s) had taint {node-role.kubernetes.io/master: }, that the pod didn't tolerate.
```

You can work around the issue by editing the DataPower operator deployment and re-applying it, as follows:

i. Delete the DataPower operator deployment, if deployed already:

```
kubectl delete -f ibm-datapower.yaml -n <namespace>
```

ii. Open `ibm-datapower.yaml`, and locate the `topologySpreadConstraints`: section. For example:

```
topologySpreadConstraints:
- maxSkew: 1
  topologyKey: zone
  whenUnsatisfiable: DoNotSchedule
```

iii. Replace the values for `topologyKey`: and `whenUnsatisfiable`: with the corrected values shown in the example below:

```
topologySpreadConstraints:
- maxSkew: 1
  topologyKey: topology.kubernetes.io/zone
  whenUnsatisfiable: ScheduleAnyway
```

iv. Save `ibm-datapower.yaml` and deploy the file to the cluster:

```
kubectl apply -f ibm-datapower.yaml -n <namespace>
```

11. Upgrade cert-manager to version 1.12.7.

a. Run the following command to back up the existing certificates and issuers to a file called `backup.yaml`:

```
kubectl get --all-namespaces -oyaml issuer,clusterissuer,cert,secret > backup.yaml
```

b. Run the following command to determine the version of the existing cert-manager:

```
kubectl get crds certificates.cert-manager.io -o jsonpath='{.metadata.labels.app\.kubernetes\.io\/version}'
```

c. If the current version is 1.5.1, 1.7.1, 1.9.1, or 1.11.5, run the following command to upgrade cert-manager to version 1.12.7:

```
kubectl apply -f helper-files/cert-manager-1.12.7.yaml
```

12. If you used customized internal certificates and are upgrading from 10.0.5.1: The `helper_files/custom-certs-internal.yaml` includes a new certificate called `dbClientPrimaryuser`. This new certificate must be created before you update the Management CR.

Follow the instructions in [Generate custom internal certificates](#) to update the `helper_files/custom-certs-internal.yaml` file to match your namespace and site name, and then apply the new `yaml` file with the following command:

```
kubectl apply -f custom-certs-internal.yaml -n <namespace>
```

Alternatively, add the new certificate to your existing `custom-certs-internal.yaml` and apply it, updating the namespace to match your deployment:

```
---
apiVersion: cert-manager.io/v1
kind: Certificate
metadata:
  name: db-client-primaryuser
  labels: {
    app.kubernetes.io/instance: "management",
    app.kubernetes.io/managed-by: "ibm-apiconnect",
    app.kubernetes.io/name: "db-client-primaryuser"
  }
spec:
  commonName: primaryuser
  secretName: db-client-primaryuser
  dnsNames:
  - "*.<namespace>"
  - "*.<namespace>.svc"
  - "primaryuser.<namespace>.svc"
  - "primaryuser"
  issuerRef:
    name: ingress-issuer
  usages:
```

```

- "client auth"
- "signing"
- "key encipherment"
duration: 17520h # 2 years
renewBefore: 720h # 30 days
privateKey:
  rotationPolicy: Always
---
```

13. Clean up the webhook configuration before deploying the newer API Connect operator:

a. Run the following command to get the webhook configuration:

```
kubectl get mutatingwebhookconfiguration,validatingwebhookconfiguration | grep ibm-apiconnect
```

b. Use the `kubectl delete` command to delete the webhook configuration; for example:

```
kubectl delete mutatingwebhookconfiguration ibm-apiconnect-mutating-webhook-configuration
kubectl delete validatingwebhookconfiguration ibm-apiconnect-validating-webhook-configuration
```

14. Apply the new API Connect operator YAML into the namespace where the API Connect operator is running.

• For single namespace deployment:

- If the operator is not running in the `default` namespace, open the `ibm-apiconnect.yaml` file in a text editor, and then replace all references to `default` with the name of the namespace where you deployed API Connect.
Note: Skip this step if you are using Operator Lifecycle Manager (OLM).
- Open `ibm-apiconnect.yaml` in a text editor. Replace the value of each `image:` key with the location of the `apiconnect` operator images (from the `ibm-apiconnect` container and the `ibm-apiconnect-init` container), either uploaded to your own registry or pulled from a public registry.
- Run the following command:

```
kubectl apply -f ibm-apiconnect.yaml -n <namespace>
```

• For multi-namespace deployment:

- Locate and open the newly downloaded `ibm-apiconnect-distributed.yaml` in a text editor of choice. Then, find and replace each occurrence of `$OPERATOR_NAMESPACE` with the desired namespace for the deployment.
- Also in `ibm-apiconnect-distributed.yaml`, locate the `image:` keys in the containers sections of the deployment yaml right below `imagePullSecrets:`. Replace the placeholder values `REPLACE-DOCKER-REGISTRY` of the `image:` keys with the docker registry host location of the API Connect operator image (either uploaded to own registry or pulled from public registry).
- Install `ibm-apiconnect-distributed.yaml` with the following command

```
kubectl apply -f ibm-apiconnect-distributed.yaml
```

15. Verify that the `ibm-datapower-operator` and the `ibm-apiconnect` operators are restarted.

16. Ensure that the `apiconnect` operator recreated the necessary microservices:

Be sure to complete this step before attempting to upgrade the operands.

```
kubectl get apic -n <namespace>
```

17. Upgrade the operands (subsystems):

- [Upgrading Management subsystem on native Kubernetes](#)
- [Upgrading Portal subsystem on native Kubernetes](#)
- [Upgrading Analytics subsystem on native Kubernetes](#)
- [Upgrading Gateway subsystem on native Kubernetes](#)

18. Verify that the upgraded subsystems report as `Running` and the `RECONCILED VERSION` displays the new version of API Connect.

Run the following command:

```
kubectl get apic --all-namespaces
```

Example response:

NAME	READY	STATUS	VERSION	RECONCILED VERSION	AGE
analyticscluster.analytics.apiconnect.ibm.com/analytics	8/8	Running	10.0.5.6	10.0.5.6-1074	121m
NAME	PHASE	READY	SUMMARY	VERSION	AGE
datapowerservice.datapower.ibm.com/gw1	Running	True	StatefulSet replicas ready: 1/1	10.0.5.6	100m
NAME	PHASE	LAST EVENT	WORK PENDING	WORK IN-PROGRESS	AGE
datapowermonitor.datapower.ibm.com/gw1	Running		false	false	100m
NAME	READY	STATUS	VERSION	RECONCILED VERSION	AGE
gatewaycluster.gateway.apiconnect.ibm.com/gw1	2/2	Running	10.0.5.6	10.0.5.6-1074	100m
NAME	READY	STATUS	VERSION	RECONCILED VERSION	AGE
managementcluster.management.apiconnect.ibm.com/m1	16/16	Running	10.0.5.6	110.0.5.6-1074	162m
NAME	READY	STATUS	VERSION	RECONCILED VERSION	AGE
portalcluster.portal.apiconnect.ibm.com/portal	3/3	Running	10.0.5.6	10.0.5.6-1074	139m

Important: If you need to restart the deployment, wait until all Portal sites complete the upgrade. Run the following commands to check the status of the sites:

a. Log in as an admin user:

```
apic login -s <server_name> --realm admin/default-idp-1 --username admin --password <password>
```

b. Get the portal service ID and endpoint:

```
apic portal-services:get -o admin -s <management_server_endpoint> \
  --availability-zone availability-zone-default <portal-service-name> \
  --output - --format json
```

c. List the sites:

```
apic --mode portaladmin sites:list -s <management_server_endpoint> \  
--portal_service_name <portal-service-name> \  
--format json
```

Any sites currently upgrading display the **UPGRADING** status; any site that completed its upgrade displays the **INSTALLED** status and the new platform version. Verify that all sites display the **INSTALLED** status before proceeding.

For more information on the `sites` command, see [apic sites:list](#) and [Using the sites commands](#).

d. After all sites are in **INSTALLED** state and have the new platform listed, run:

```
apic --mode portaladmin platforms:list -s <server_name> --portal_service_name <portal_service_name>
```

Verify that the new version of the platform is the only platform listed.

For more information on the `platforms` command, see [apic platforms:list](#) and [Using the platforms commands](#).

19. If you are upgrading from v10.0.4-ifix3, or upgrading from v10.0.1.7-eus (or higher): Enable analytics as explained in [Enabling Analytics after upgrading](#).

20. If you are upgrading from v10.0.5.3 or earlier: Update the certificates with the `ingress-issuer-v1.yaml` from your target release.

```
kubectl apply -f helper_files/ingress-issuer-v1.yaml -n <namespace>
```

For a multi-namespace deployment, repeat the command for each namespace.

21. Optional: For the optional components API Connect Toolkit and API Connect Local Test Environment, install the latest version of each after you complete the upgrade of the subsystems.

22. Optional: Configure additional features related to inter-subsystem communication security, such as CA verification and JWT security: [Optional post-upgrade steps for upgrade to 10.0.5.3 \(or later\) from earlier 10.0.5 release](#).

- [Upgrading Management subsystem on native Kubernetes](#)

Upgrade the management subsystem to the latest version of API Connect.

- [Upgrading Portal subsystem on native Kubernetes](#)

Upgrade the Portal subsystem to the latest version of API Connect.

- [Upgrading Analytics subsystem on native Kubernetes](#)

Upgrade the Analytics subsystem to the latest version of API Connect.

- [Upgrading Gateway subsystem on native Kubernetes](#)

Upgrade the Gateway subsystem to the latest version of API Connect.

- [Enabling gateway peering and verifying cluster status](#)

To complete the operand upgrade, restart the gateway pods to enable gateway peering.

- [Enabling Analytics after upgrading](#)

After the upgrade successfully completes, re-enable Analytics data collection.

- [Optional post-upgrade steps for upgrade to 10.0.5.3 \(or later\) from earlier 10.0.5 release](#)

Version 10.0.5.3 introduces some new features that are related to inter-subsystem communication. This topic explains how to configure these features when you upgrade from a previous 10.0.5 release to v10.0.5.3 or later.

Upgrading Management subsystem on native Kubernetes

Upgrade the management subsystem to the latest version of API Connect.

Before you begin

Complete all steps in [Upgrading subsystems on native Kubernetes](#) prior to the step that links to this topic.

About this task

When upgrading to a new mod release the version must be changed to the latest mod release version on each CR. This change will be picked up by the operator, and the operator will then start the upgrade.

Procedure

1. Update the management CR for the new version of API Connect.

a. Run the following command to edit the CR:

```
kubectl -n $NAMESPACE edit mgmt <CLUSTERNAME>
```

where `CLUSTERNAME` is the name specified in the subsystem CR at installation time.

b. **If upgrading from v10.0.4-ifix3, or upgrading from v10.0.1.7-eus (or higher):** In the `spec` section, add a new `allowUpgrade` attribute and set it to `true`:

```
spec:  
  allowUpgrade: true
```

The `allowUpgrade` attribute enables the upgrade to 10.0.5.0 or later. Because the upgrade to 10.0.5.x deletes your existing analytics data, the attribute is required to prevent an accidental upgrade. See [Additional considerations for upgrading analytics from a version prior to 10.0.5.0](#). After the Management subsystem has been upgraded, the Analytics subsystem must also be upgraded.

c. Update the API Connect `version` in the CR:

For example:

```
version: 10.0.5.6
```

- d. If you are upgrading to a version of API Connect that requires a new license, update the license value now.
For example:

```
license: L-GVEN-GFUPVE
```

For the list of licenses, see [API Connect licenses](#).

- e. Run the following command to save and apply the CR: `wq`
When you save the updated CR, the upgrade starts automatically.

Note: If you see an error message when you attempt to save the CR, check if it is one of the following known issues:

- Webhook error for incorrect license.
If you did not update the license ID in the CR, then when you save your changes, the following webhook error might display:

```
admission webhook "vmanagementcluster.kb.io" denied the request:
ManagementCluster.management.apiconnect.ibm.com "management" is invalid:
spec.license.license: Invalid value: "L-RJON-BYGHM4":
License L-RJON-BYGHM4 is invalid for the chosen version 10.0.5.6.
Please refer license document https://ibm.biz/apiclicenses
```

To resolve the error, see [API Connect licenses](#) for the list of the available license IDs and select the appropriate License IDs for your deployment.
Update the CR with the new license value as in the following example, and then save and apply your changes again.

- Webhook error: `Original postgres primary is running as replica`
If you see the error message:

```
Original PostgreSQL primary is running as replica,
please perform failover to original primary before attempting upgrade. Refer - https://ibm.biz/BdPLWU"
```

you must complete a Postgres failover before the upgrade can proceed, see [Postgres failover steps](#). After you apply the Postgres failover steps, the upgrade resumes automatically.

- Webhook error: `Original PostgreSQL primary not found`
If you see the error message:

```
Original PostgreSQL primary not found. Upgrade is blocked. Set apiconnect-operator/db-primary-not-found-allow-
upgrade: true annotation
to unblock the upgrade. A warning will be issued after the upgrade with further steps.
```

take the following actions to complete the upgrade and fix the cause of the error message:

- Edit the management CR:

```
kubectl -n $NAMESPACE edit mgmt <CLUSTERNAME>
```

- Add the following annotation:

```
apiVersion: management.apiconnect.ibm.com/v1beta1
kind: ManagementCluster
metadata:
  annotations:
    apiconnect-operator/db-primary-not-found-allow-upgrade: true
  ...
```

- Continue with the upgrade. When the upgrade is complete, the management CR reports the warning:

```
Original PostgreSQL primary not found. Run apicops upgrade:pg-health-check to check the health of the
database and to ensure pg_wal symlinks exist. If database health check passes please perform a management
database backup and restore to restore the original PostgreSQL primary pod
```

- Take a new [management database backup](#).
- Immediately [restore](#) from the new backup taken in the previous step. The action of taking and restoring a management backup results in the establishment of a new Postgres primary, eliminating the CR warning message. Be careful to restore from the backup that is taken after the upgrade, and not from a backup taken before upgrade.

2. Run the following command to verify that the upgrade was successful:

```
kubectl get apic -n <namespace>
```

Example output after upgrading the management subsystem:

NAME	READY	STATUS	VERSION	RECONCILED	VERSION	AGE
managementcluster.management.apiconnect.ibm.com/ml	16/16	Running	<version>	<version-build>	162m	
NAME	AGE	STATUS	MESSAGE			
managementdbupgrade.management.apiconnect.ibm.com/management-up-8c28g	up-to-date) 13m	Running	Upgrade is running (DB Schema/data are			

3. Restart all nats-server pods by running the following command:

```
kubectl -n <namespace> delete po -l app.kubernetes.io/name=natscluster
```

What to do next

Upgrade your Portal subsystem: [Upgrading Portal subsystem on native Kubernetes](#).

If you are upgrading from v10.0.5.1 or earlier to v10.0.5.2: The change in deployment profile CPU and memory limits that are introduced in 10.0.5.2 (see [New deployment profiles and CPU licensing](#)) can result in a change in the performance of your Management component. If you notice any obvious reduction in performance of the Management UI or toolkit CLI where you have multiple concurrent users, open a support case.

Upgrading Portal subsystem on native Kubernetes

Upgrade the Portal subsystem to the latest version of API Connect.

Before you begin

- Complete all steps in [Upgrading subsystems on native Kubernetes](#) prior to the step that links to this topic.
- if you are upgrading from 10.0.5.2 or earlier: If you did not verify that your Portal customizations are compatible with Drupal 10, do that now. In API Connect 10.0.5.3, the Developer Portal moved from Drupal 9 to Drupal 10 (this upgrade also requires PHP 8.1). The upgrade tooling will update your Developer Portal sites; however, if you have any custom modules or themes, it is your responsibility to ensure their compatibility with Drupal 10 and PHP 8.1 before starting the upgrade. Review the [Guidelines on upgrading your Developer Portal from Drupal 9 to Drupal 10](#) to ensure that any customizations to the Developer Portal are compatible with Drupal 10 and PHP 8.1.

About this task

When upgrading to a new mod release, the version must be changed to the latest mod release version on each CR. This change will be picked up by the operator, and the operator will then start the upgrade.

Procedure

1. Update the portal CR for the new version of API Connect.

- a. Run the following command to edit the CR:

```
kubectl -n $NAMESPACE edit ptl <CLUSTERNAME>
```

where **CLUSTERNAME** is the name specified in the subsystem CR at installation time.

- b. Update the API Connect **version** in the CR:
For example:

```
version: 10.0.5.6
```

- c. If you are upgrading to a version of API Connect that requires a new license, update the license value now.
For example:

```
license: L-GVEN-GFUPVE
```

For the list of licenses, see [API Connect licenses](#).

- d. Run the following command to save and apply the CR: **wq**
When you save the updated CR, the upgrade starts automatically.

Known issue: Webhook error for incorrect license.

If you did not update the license ID in the CR, then when you save your changes, the following webhook error might display:

```
admission webhook "vmanagementcluster.kb.io" denied the request:
ManagementCluster.management.apiconnect.ibm.com "management" is invalid:
spec.license.license: Invalid value: "L-RJON-BYGHM4":
License L-RJON-BYGHM4 is invalid for the chosen version 10.0.5.6.
Please refer license document https://ibm.biz/apiclicenses
```

To resolve the error, see [API Connect licenses](#) for the list of the available license IDs and select the appropriate License IDs for your deployment. Update the CR with the new license value as in the following example, and then save and apply your changes again.

2. Run the following command to verify that the upgrade was successful:

```
kubectl get apic -n <namespace>
```

Example output after upgrading the portal subsystem:

NAME	READY	STATUS	VERSION	RECONCILED	VERSION	MESSAGE
portalcluster.portal.apiconnect.ibm.com/portal	3/3	Running	<version>	<version>		Site Upgrades
Executing: (1) Queued(5) Failed(0) Success(0) 22h						

Note: After the portal subsystem code upgrade is complete, each portal site is upgraded. You can monitor the site upgrade progress from the **MESSAGE** column in the "kubectl get apic" output. You can still use the portal while sites are upgrading, although a maintenance page is shown for any sites that are being upgraded. When the site upgrades are complete the "kubectl get apic" output will show how many sites the portal is serving:

NAME	READY	STATUS	VERSION	RECONCILED	VERSION	MESSAGE	AGE
portal	3/3	Running	<version>	<version>		Serving 2 sites	22h

3. Optional: **If upgrading to v10.0.5.3 (or later) from an earlier 10.0.5.x release:** Review and configure the new inter-subsystem communication features: [Optional post-upgrade steps for upgrade to 10.0.5.3 \(or later\) from earlier 10.0.5 release](#).

Upgrading Analytics subsystem on native Kubernetes

Upgrade the Analytics subsystem to the latest version of API Connect.

About this task

Attention: Upgrading to v10.0.5.x from v10.0.4-ifix3 or later, or v10.0.1.7 or later, will result in the deletion of existing analytics data. If you want to retain your analytics data then you must export it before upgrade. For instructions on exporting see [Additional considerations for upgrading analytics from a version prior to 10.0.5.0](#). When upgrading to a new mod release, the version must be changed to the latest mod release version on each CR. This change will be picked up by the operator, and the operator will then start the upgrade.

Procedure

1. Update the analytics CR for the new version of API Connect.
 - a. Run the following command to edit the CR:

```
kubectl -n $NAMESPACE edit a7s <CLUSTERNAME>
```

where **CLUSTERNAME** is the name specified in the subsystem CR at installation time.

- b. **If upgrading from v10.0.4-ifix3, or upgrading from v10.0.1.7-eus (or higher):** Add an `allowUpgrade` attribute and set it to `true`:

```
spec:
  allowUpgrade: true
```

The `allowUpgrade` attribute enables the upgrade to 10.0.5.x. Because the upgrade to 10.0.5.x deletes your existing analytics data, the attribute is required to prevent an accidental upgrade. You must also delete any `template` section from your analytics CR. See [Additional considerations for upgrading analytics from a version prior to 10.0.5.0](#)

- c. Update the API Connect `version` in the CR:
For example:

```
version: 10.0.5.6
```

- d. If you are upgrading to a version of API Connect that requires a new license, update the license value now.
For example:

```
license: L-RJON-CEBLEH
```

For the list of licenses, see [API Connect licenses](#).

- e. Save your changes to the CR.
When you save the updated CR, the upgrade starts automatically.

Known issue: Webhook error for incorrect license.

If you did not update the license ID in the CR, then when you save your changes, the following webhook error might display:

```
admission webhook "vmanagementcluster.kb.io" denied the request:
ManagementCluster.management.apiconnect.ibm.com "management" is invalid:
spec.license.license: Invalid value: "L-RJON-BYGHM4":
License L-RJON-BYGHM4 is invalid for the chosen version 10.0.5.6.
Please refer license document https://ibm.biz/apiclicenses
```

To resolve the error, see [API Connect licenses](#) for the list of the available license IDs and select the appropriate License IDs for your deployment. Update the CR with the new license value as in the following example, and then save and apply your changes again.

2. Run the following command to verify that the upgrade was successful:

```
kubectl get apic -n <namespace>
```

Example output after upgrading the analytics subsystem:

NAME	READY	STATUS	VERSION	RECONCILED	VERSION
analyticscluster.analytics.apiconnect.ibm.com/analytics	5/5	Running	<version>	<version-build>	121m

3. Optional: **If upgrading to v10.0.5.3 (or later) from an earlier 10.0.5.x release:** Review and configure the new inter-subsystem communication features: [Optional post-upgrade steps for upgrade to 10.0.5.3 \(or later\) from earlier 10.0.5 release](#).
4. **If upgrading from v10.0.4-ifix3, or upgrading from v10.0.1.7-eus (or higher):** Re-enable analytics data collection as explained in [Enabling Analytics after upgrading](#).
If you are upgrading from 10.0.5.x, skip this step.

Upgrading Gateway subsystem on native Kubernetes

Upgrade the Gateway subsystem to the latest version of API Connect.

Before you begin

1. Complete all steps in [Upgrading subsystems on native Kubernetes](#) prior to the step that links to this topic.
2. Ensure your upgrade path is supported.
3. To ensure operator compatibility, upgrade the API Connect management subsystem before you upgrade the DataPower gateway subsystem. This requirement applies to all upgrade scenarios.
4. When you upgrade a cluster of gateway pods in Kubernetes, a small number of API transactions may fail. During the upgrade, Kubernetes removes the pod from the load balancer configuration, deletes the pod and then starts a new pod. The steps are repeated for each pod. Socket hang ups occur on transactions that are in process at the time the pod is killed.

The number of transactions that fail depends on the rate of incoming transactions and the length of time needed to complete each transaction. Typically the number of failures is a very small percentage. This behavior is expected during an upgrade. If the failure level is not acceptable, schedule the upgrade during an off-hours maintenance window.

Note also that DataPower Gateway supports long-lived connections such as GraphQL subscriptions or other websockets connections. These long-lived connections might not be preserved when upgrading. Workloads with long-lived connections are more vulnerable to failed API transactions during upgrading.

You can limit the number of failed API transactions during the upgrade by using the DataPower Operator's `lifecycle` property to configure the `preStop` container lifecycle hook on the gateway pods. This approach mitigates the risk of API failures during the rolling update of the gateway StatefulSet by sleeping the pod for a span of time, allowing in-flight transactions to complete prior to the SIGTERM being delivered to the container. While this feature does not guarantee that no in-flight APIs would fail, it does provide some mitigation for in-flight transactions that can complete successfully within the configured time window. For more information, see [Delaying SIGTERM with preStop](#) in the DataPower documentation.

- When upgrading a high-availability cluster, ensure that you meet the following requirements:
 - Gateways must be updated one at a time.
 - Before starting the upgrade, a single gateway must be running as primary for all gateway-peering definitions.
 - When upgrading multiple gateways, the primary gateway must be upgraded last.
 - Ensure that the pod with a name like `gww6-0` or `gww5-0` is the primary because it is the last node to be upgraded.

To determine which gateway is running as primary, use either the `show gateway-peering-status` command in the DataPower CLI, or use the Gateway Peering Status display in the WebGUI in the API Connect application domain by running the following command:

```
kubectl attach -it <podname>
```

To move the primary to the DataPower on which you're currently working, you can issue the following command:

```
gateway-peering-switch-primary <peering-object-name>
```

command.

About this task

When upgrading to a new mod release, the version must be changed to the latest mod release version on each CR. This change will be picked up by the operator, and the operator will then start the upgrade.

Procedure

- Update the gateway CR for the new version of API Connect.

- Run the following command to edit the CR:

```
kubectl -n $NAMESPACE edit gw <CLUSTERNAME>
```

where `CLUSTERNAME` is the name specified in the subsystem CR at installation time.

- Update the API Connect `version` in the CR:

For example:

```
version: 10.0.5.6
```

- If you are upgrading to a version of API Connect that requires a new license, update the license value now.

For example:

```
license: L-GVEN-GFUPVE
```

For the list of licenses, see [API Connect licenses](#).

- Delete any `template` or `dataPowerOverride` sections. You cannot perform an upgrade if the CR contains an override.

- Run the following command to save and apply the CR: `wq`

When you save the updated CR, the upgrade starts automatically.

Known issue: Webhook error for incorrect license.

If you did not update the license ID in the CR, then when you save your changes, the following webhook error might display:

```
admission webhook "vmanagementcluster.kb.io" denied the request:
ManagementCluster.management.apiconnect.ibm.com "management" is invalid:
spec.license.license: Invalid value: "L-RJON-BYGHM4":
License L-RJON-BYGHM4 is invalid for the chosen version 10.0.5.6.
Please refer license document https://ibm.biz/apiclicenses
```

To resolve the error, see [API Connect licenses](#) for the list of the available license IDs and select the appropriate License IDs for your deployment. Update the CR with the new license value as in the following example, and then save and apply your changes again.

- Run the following command to verify that the upgrade was successful:

```
kubectl get apic -n <namespace>
```

Example output after upgrading the gateway subsystem:

NAME	READY	STATUS	VERSION	RECONCILED	VERSION	AGE
gatewaycluster.gateway.apiconnect.ibm.com/gw1	2/2	Running	<version>	<version-build>	100m	

- (Optional). If you upgraded from 10.0.5.4 or earlier, delete the DataPowerService CRs so that they will be regenerated with random passwords for gateway-peering. Starting with API Connect 10.0.5.5, GatewayCluster pods are configured by default to secure the gateway-peering sessions with a unique, randomly generated password. However, GatewayCluster pods created prior to API Connect 10.0.5.5 are configured to use a single, hard-coded password and upgrading to 10.0.5.5 or later does not replace the hard-coded password.

After upgrading to API Connect 10.0.5.5 or later, you can choose to secure the gateway-peering sessions by running the following command to delete the DataPowerService CR that was created by the GatewayCluster:

```
kubectl delete dp <gateway_cluster_name>
```

This action prompts the API Connect Operator to recreate the DataPowerService CR with the unique, randomly generated password. This is a one-time change and does not need to be repeated for subsequent upgrades.

4. Optional: **If upgrading to v10.0.5.3 (or later) from an earlier 10.0.5.x release:** Review and configure the new inter-subsystem communication features: [Optional post-upgrade steps for upgrade to 10.0.5.3 \(or later\) from earlier 10.0.5 release.](#)

Enabling gateway peering and verifying cluster status

To complete the operand upgrade, restart the gateway pods to enable gateway peering.

About this task

Follow these steps to fix gateway peering. Due to the ingress issuer changes, the gateway pods must be scaled down and back up. This process will cause 5 to 10 minutes of API downtime.

Procedure

1. After operand upgrade completes, wait for Management, Portal and Analytics subsystems to report **Running** status.
2. Scale down the gateway firmware containers by editing the Gateway CR and setting `replicaCount` to 0:

```
kubectl edit gw <gw-cr-name>
```

For example:

```
...
spec:
  replicaCount: 0
...
```

3. Wait for the Gateway firmware pods to scale down and terminate. Ensure that the Gateway firmware pods are terminated before moving to next step.
4. Scale up the Gateway firmware containers back to their original value, or remove the `replicaCount` field if none was there before.

```
kubectl edit gw <gw-cr-name>
```

5. Your operands should all have an upgraded version. To verify, wait for the cluster status to become **Running**, and Reconciled version to show the new version number.

For example:

```
kubectl get apic -n <namespace>
```

NAME	READY	STATUS	VERSION	RECONCILED	VERSION	AGE
analyticscluster.analytics.apiconnect.example.com/analytics	8/8	Running	10.0.4.0	10.0.4.0-1074		121m
NAME	PHASE	READY	SUMMARY	VERSION	AGE	
datapowerservice.datapower.example.com/gw1	Running	True	StatefulSet replicas ready: 1/1	10.0.4.0	100m	
NAME	PHASE	LAST EVENT	WORK PENDING	WORK IN-PROGRESS	AGE	
datapowermonitor.datapower.example.com/gw1	Running		false	false	100m	
NAME	READY	STATUS	VERSION	RECONCILED	VERSION	AGE
gatewaycluster.gateway.apiconnect.example.com/gw1	2/2	Running	10.0.4.0	10.0.4.0-1074		100m
NAME	READY	STATUS	VERSION	RECONCILED	VERSION	AGE
managementcluster.management.apiconnect.example.com/m1	16/16	Running	10.0.4.0	10.0.4.0-1074		162m
NAME	READY	STATUS	VERSION	RECONCILED	VERSION	AGE
portalcluster.portal.apiconnect.example.com/portal	3/3	Running	10.0.4.0	10.0.4.0-1074		139m

Note: Troubleshooting if Gateway pods not in sync with Management after upgrade

A rare failure has been seen during upgrade where some API Connect manager tasks are unable to run after the upgrade. Check if the API Connect 'taskmanager' pods log has the following error message. It would start 15 minutes after upgrade and repeat every 15 minutes for any stuck task.

```
TASK: Stale claimed task set to errored state:
```

If these errors are reported, restart all the `management-natscluster` pods, for example: `management-natscluster-1`.

```
kubectl -n <namespace> delete pod management-natscluster-1 management-natscluster-2 management-natscluster-3
```

Enabling Analytics after upgrading

After the upgrade successfully completes, re-enable Analytics data collection.

Before you begin

If upgrading from v10.0.5.x you do not need to do these steps.

About this task

This task is only required if you are upgrading from releases prior to 10.0.5.0.

Procedure

1. Re-create your analytics backup secret:
 - a. Delete the secret: `kubectl delete secret analytics-backup-secret`
 - b. Re-create the secret with a new name: `kubectl create secret generic <new backup secret name> --from-literal=access_key='Your_Access_Key' --from-literal=secret_key='Your_access_key_secret' -n Namespace_of_Analytics_Subsystem`
 - c. Update the credentials value in your analytics CR with the new backup secret name. Also, change your backup path to prevent the backups list showing pre-upgrade backups that you cannot restore from. For example:

```
spec:
  analytics:
    databaseBackup:
      ...
      credentials: <new backup secret name>
      path: <new backup path>
      ...
```

If this step is skipped, then backups will not run.

2. Delete the old analytics PVCs. If this step is not done, then your previous (and now inaccessible) analytics data will continue to occupy storage space. List your PVCs and identify those that contain the following strings in their names: `storage-master`, `storage-coord`, `storage-data`, `storage-shared`, `kafka`, `zk`. These PVCs should all have an `AGE` that dates back to before you started your upgrade.

```
kubectl get pvc -n <namespace>
NAME                                STATUS  VOLUME          CAPACITY  ACCESS MODES  STORAGECLASS  AGE
...
data-ger2-analytics-storage-0       Bound  a7s-pv-8735e017  250Gi    RWO           rook-ceph-block  3h29m
data-ger2-analytics-storage-shared-0 Bound  a7s-pv-30aac7ed  250Gi    RWO           rook-ceph-block  227d
...
```

In this example, `data-ger2-analytics-storage-shared-0` contains the string `storage-shared`, and it is 227 days old. To delete it, run:

```
kubectl delete pvc data-ger2-analytics-storage-shared-0 -n <namespace>
```

3. Add the new `analytics:view` permission to the Administrator role in the Cloud Manager UI.
 - a. Click , then select Roles
 - b. Click  on the Administrator role and select Edit
 - c. Select the checkbox next to the analytics permission and click save:

Analytics

View

4. Register new analytics services: [Registering an analytics service](#)
5. Associate your new analytics services with your gateways [Associating an analytics service with a gateway service](#)

Optional post-upgrade steps for upgrade to 10.0.5.3 (or later) from earlier 10.0.5 release

Version 10.0.5.3 introduces some new features that are related to inter-subsystem communication. This topic explains how to configure these features when you upgrade from a previous 10.0.5 release to v10.0.5.3 or later.

Enabling management CA certification on the REST API

The portal and gateway subsystems make requests to the management subsystem through the REST API that is hosted by the management subsystem. This communication is standard TLS, where each REST API endpoint has a server certificate that is presented to the client during TLS handshaking. For additional security, validation of the management server certificate CA is enabled on all subsystems for new installations of API Connect v10.0.5.3 and later. If you are upgrading from an earlier release, and want to enable this feature for the portal and gateway then edit the portal and gateway CRs, and add the following settings to the `spec`: section depending on if you are using `external` or `in-cluster` inter-subsystem communications ([In-cluster service communication between subsystems](#)):

- If you are using `external` inter-subsystem communication, in the portal CR add:

```
spec:
  mgmtPlatformEndpointCASecret:
    secretName: ingress-ca # Or <instance-name>-ingress-ca if using top-level CR. If you have customized certs, change
    ingress-ca to $PLATFORM_CA_SECRET
  mgmtConsumerEndpointCASecret:
    secretName: ingress-ca # Or <instance-name>-ingress-ca if using top-level CR. If you have customized certs, change
    ingress-ca to $CONSUMER_CA_SECRET
```

and in the gateway CR add:

```
spec:
  mgmtPlatformEndpointCASecret:
    secretName: ingress-ca # Or <instance-name>-ingress-ca if using top-level CR. If you have customized certs, change
    ingress-ca to $PLATFORM_CA_SECRET
```

where:

- o `$PLATFORM_CA_SECRET` is the Kubernetes secret object that contains the CA certificate that is used by the platform REST API.
- o `$CONSUMER_CA_SECRET` is the Kubernetes secret object that contains the CA certificate that is used by the consumer REST API.

- If you are using `in-cluster` inter-subsystem communications, in the portal CR add:

```
spec:
  mgmtPlatformEndpointSvcCASecret:
    secretName: management-ca # Or <instance-name>-mgmt-ca if using top-level CR. If you have customized certs, change
    ingress-ca to $PLATFORM_CA_SECRET
  mgmtConsumerEndpointSvcCASecret:
    secretName: management-ca # Or <instance-name>-mgmt-ca if using top-level CR. If you have customized certs, change
    ingress-ca to $CONSUMER_CA_SECRET
```

and in the gateway CR add:

```
spec:
  mgmtPlatformEndpointSvcCASecret:
    secretName: management-ca # Or mgmt-ca or <instance-name>-mgmt-ca if using top-level CR. If you have customized certs,
    change ingress-ca to $PLATFORM_CA_SECRET
```

If changing to use `in-cluster` inter-subsystem communication after an upgrade, you must also reregister all subsystems: [Converting existing registered subsystems to use in-cluster communications](#).

Note: If you are not sure of the secret names, follow these steps:

1. Check the management subsystem CR with `kubect1 describe mgmt`, and identify the issuer of the platform and consumer API endpoints:

```
kubect1 describe mgmt -n <namespace>

...
Platform API Endpoint:
  Annotations:
    cert-manager.io/issuer:          ingress-issuer
...
Consumer API Endpoint:
  Annotations:
    cert-manager.io/issuer:          ingress-issuer
```

2. Describe the issuer with `kubect1 describe issuer`, and identify the secret name:

```
kubect1 describe issuer ingress-issuer -n <namespace>
...
Spec:
  Ca:
    Secret Name: ingress-ca
...
```

Enable JWT security for inter-subsystem communication

If you want to use JWT security instead of mTLS for inter-subsystem communication, then follow these steps. For more information on JWT security, see: [Enable JWT security instead of mTLS](#).

1. Describe the `mgmt` CR to get the JWKS URL:

```
kubect1 describe mgmt -n <namespace>

status:
- name: jwksUrl
  secretName: api-endpoint
  type: API
  uri: https://api.apic.acme.com/api/cloud/oauth2/certs
```

2. For each portal, gateway, and analytics subsystem where you want to use JWT security, edit the CR corresponding that subsystem to disable mTLS and specify the `jwksUrl`:

```
spec:
  ...
  mtlsValidateClient: false
  jwksUrl: <JWKS URL>
```

<JWKS URL> is the URL identified in step 1.

3. **v10.0.5.4 and later:** Enable JWT on the gateway to analytics communications flow. Enable the Use JWT switch for the registered gateway in the Topology page of the Cloud Manager UI.

Datapower version 10.5.0.4 only: To enable JWT on the gateway to analytics communications flow, you also must add a `dataPowerOverride` section to the gateway CR:

```
spec:
  jwksUrl: <JWKS URL>
  dataPowerOverride:
    image: customregistry.com/custom-image-datapower:10.5.0.5
    version: 10.5.0.5
    license: X-XXXX-XXXXXX
```

Converting existing registered subsystems to use in-cluster communications

If you want to change your existing portal, gateway, and analytics subsystems to use `in-cluster` inter-subsystem communication then they must be reregistered. For more information about `in-cluster` communication, see [In-cluster service communication between subsystems](#).

Important: Understand the following points before you change the communication type of a subsystem:

- Reregistering any of the subsystems requires an outage of that subsystem.
- When you change communication type, any backup of the management subsystem that was taken before this change becomes unusable. Do not change the inter-subsystem communication type if you might want to restore the management subsystem from an earlier backup.
- To reregister the portal, all portal sites must be deleted first. Deleting a portal site means that any customizations that were made to the site must manually be reapplied after the portal is reregistered and the site recreated.
- To reregister the gateway, all published products must be deleted from the gateway.

To reregister a portal subsystem, the steps are:

1. Delete all portal sites from the portal service. From the API Manager UI, for each catalog that has a site on the portal, delete the portal site: [Edit or delete portal site](#).
2. Delete the portal service in the Topology section of the Cloud Manager UI.
3. Reregister the portal service, specifying the inter-subsystem communication type that you want, in the Topology section of the Cloud Manager UI. See [Register portal service](#).

To reregister a gateway subsystem, the steps are:

1. In the API Manager UI, delete all products from all catalogs that use the gateway service. See [Removing a product from a catalog](#).
2. In the API Manager UI, for each catalog that uses the gateway service, remove the gateway service from the catalog settings. See [Configure catalog gateway service](#).
3. Delete the gateway service in the Topology section of the Cloud Manager UI.
4. Reregister the gateway service, specifying the inter-subsystem communication type that you want, in the Topology section of the Cloud Manager UI. See [Registering a gateway service](#).

To reregister the analytics subsystem, the steps are:

1. Unassociate the analytics service from all gateway services that it is associated with. See [Unassociate analytics service](#).
2. Delete the analytics service in the Topology section of the Cloud Manager UI.
3. Reregister the analytics service, specifying the inter-subsystem communication type that you want, in the Topology section of the Cloud Manager UI. See [Registering an analytics service](#).

Upgrading from 2018 to 10.0.5.4 on Kubernetes

Upgrade API Connect 2018 FP24 and higher directly to 10.0.5.4 on Kubernetes.

About this task

Attention: Beginning with version 10.0.5.5, a direct upgrade from version 2018 is not supported. To upgrade from version 2018, first upgrade to 10.0.5.4, and then perform the upgrade to the newest release.

Use the following versions of components and related software when upgrading to version 10.0.5.4:

- Upgrade from: 2018 FP24 and higher
- Kubernetes: v1.27
- Cert-manager: v1.9.1
- API Connect Operator: 3.4.0
- DataPower Operator: 1.6.8
- License: Select the appropriate license from [Table 1. API Connect 10.0.5.3 and later licenses](#).

Complete the API Connect upgrade from 2018 to 10.0.5.4 by performing the following tasks:

- [Preparing the 2018 deployment for upgrade](#)
Prepare your 2018 deployment for upgrade to 10.0.5.x.
- [Obtaining files for upgrade from 2018](#)
Obtain the product files, load them into a local Docker registry, and then upload them as required to a remote Docker registry. Decompress the release files that are distributed as a zip file.
- [Deploying operators in a single-namespace API Connect cluster](#)
When upgrading from 2018 to the latest release of v10, first deploy the operators to your namespace.
- [Deploying operators in a multi-namespace API Connect cluster](#)
When you have a multiple namespace deployment in 2018, use these instructions to deploy the version 10 operators.
- [Upgrading the Management subsystem from 2018 to v10](#)
You can upgrade the management subsystem from 2018 to the latest version of v10.
- [Upgrading the Developer Portal subsystem from 2018 to v10](#)
You can upgrade the Developer Portal subsystem from 2018.4.1.20 or later to the latest release of v10.
- [Upgrading the Analytics subsystem from v2018 to v10](#)
It is not possible to directly upgrade the analytics subsystem from v2018 to v10.0.5. New v10.0.5 analytics subsystems must be deployed to replace your v2018 analytics subsystems.
- [Upgrading the gateway subsystem from 2018 to v10](#)
You can upgrade the DataPower Gateway subsystem from API Connect 2018.4.1.20 or later to the latest release of v10.
- [Post-upgrade steps for upgrading to v10](#)
After you upgrade API Connect from v2018 to v10, complete these final steps.
- [Disaster recovery of a 2018 deployment](#)
You can optionally return to a 2018 deployment, if necessary, after completion of a successful upgrade from 2018 to v10.

Preparing the 2018 deployment for upgrade

Prepare your 2018 deployment for upgrade to 10.0.5.x.

Before you begin

Before you move from 2018 to 10.0.5.x, ensure that you have reviewed v10 requirements and features:

- Review the IBM Support page [API Connect: v2018 to v10 upgrade paths](#) to determine whether your Version 2018 deployment can be directly upgraded to the latest release of API Connect.
- [IBM API Connect Version 10 software product compatibility requirements](#)
- [Deployment requirements](#)
- [Planning your deployment](#)
- [What's New in the latest release](#)
- [Version 10 known limitations](#)

About this task

Before you start an upgrade, make sure that your 2018 database is in a consistent state, perform the necessary backups, and set up external logging.

Procedure

1. Review the upgrade considerations. See [Upgrade considerations on native Kubernetes](#).

2. Configure external logging prior to upgrade.

This step is not mandatory but is recommended. For example, you could use <https://logdna.com/>.

3. Be sure you know the name of each subsystem on your 2018 deployment.

The 2018 subsystem names are carried over to version 10 installations. To view the names:

```
apicup subsys list
```

These subsystem names are the values used in the `spec.subsystemName` field for each custom resource (CR) when upgrading.

4. On 2018, check the health of each subsystem before upgrade:

```
apicup subsys health-check <subsystem_name>
```

5. On the 2018 system, back up the original `apicup` project directory to a location from which it can always be retrieved.

Note: The original project directory created with the `apicup` installer during the initial 2018 product installation (for example, `myProject`) is required if you need to restore the database and to run disaster recovery back to v2018. You cannot restore the database or perform a disaster recovery without the initial project directory because it contains pertinent information about the 2018 cluster.

6. Complete a full backup for the API Connect 2018 Management, Portal, and Analytics subsystems. Verify that you can successfully restore from the backups.

Note: The Analytics subsystem cannot be upgraded due to changes in v10.0.5.0, and you cannot restore it into v10 but you should back it up in case a rollback is needed.

Make sure you have current and correct configuration for backup and restore for all of the 2018 subsystems. See [Backing up and restoring](#).

7. If you want to retain your analytics data, then you must export it before running the upgrade.

For instructions on exporting data from v2018, see the v2018 documentation: <https://www.ibm.com/docs/en/api-connect/2018.x?topic=analytics-exporting-api-event-data>. Also, you can set up analytics offload so that all new analytics data is sent to a third-party system for storage: <https://www.ibm.com/docs/en/api-connect/2018.x?topic=cloud-configuring-analytics-offload-api-connect>.

8. Disassociate and delete your Analytics services.

Note: If you want your v2018 deployment to continue gathering analytics data up to the last possible moment, this step can instead be done just before the Management subsystem upgrade: [5](#).

- a. In Cloud Manager, click Topology.

- b. In the section for the Availability Zone that contains the Analytics service, locate the Gateway service that the Analytics service is associated with.

- c. Click the actions menu, and select Unassociate analytics service. Remember to disassociate each Analytics service from all Gateways.

- d. In the section for the Availability Zone that contains the Analytics services, locate each Analytics service and click Delete.

9. On the 2018 deployment, use the `apicops` utility to resolve any known inconsistencies and synchronization problems with the database:

The `apicops preupgrade` command must be run in fix mode just prior to starting the management upgrade. The fix mode fixes any inconsistencies and synchronization problems in the database.

Important: Upgrade will fail if the `apicops` command is not successfully completed within 2 hours of starting the management upgrade. If the management upgrade must be run more than once, you must run the command in fix mode each time within 2 hours of starting the management upgrade.

- a. Obtain the latest 2018 release of `apicops` from <https://github.com/ibm-apiconnect/apicops#latest-v2018-release>.

- b. Set up the environment. See <https://github.com/ibm-apiconnect/apicops#requirements>.

- c. Run the command:

```
apicops preupgrade -m fix --upgrade_to v10 -l <outputLogFileName>
```

- The `-m` option runs the utility in fix mode. Running the utility in fix mode resolves most problems. If the utility identifies a problem it cannot resolve, contact IBM Support.
- Set the `-l` option to send output to a log file.

10. Next, install the upgrade files. Continue with [Obtaining files for upgrade from 2018](#).

Obtaining files for upgrade from 2018

Obtain the product files, load them into a local Docker registry, and then upload them as required to a remote Docker registry. Decompress the release files that are distributed as a zip file.

Before you begin

Verify you completed [Preparing the 2018 deployment for upgrade](#).

About this task

To upgrade from v2018, complete the steps in this task to navigate to [IBM Fix Central](#) site and download the Docker image-tool file of the API Connect subsystems, as well as the Kubernetes operators and API Connect Custom Resource (CR) templates. Next, upload the image-tool file to your Docker local registry. If necessary, you can populate a remote container registry with repositories. Then you can push the images from the local registry to the remote registry. Decompress the zip files that contain the operators and templates, so that you can use those files during deployment.

Procedure

1. Obtain the API Connect files from IBM Fix Central:

The following files are used for deployment on native Kubernetes:

IBM® API Connect <version> for Containers

Docker images for all API Connect subsystems

IBM® API Connect <version> Operator Release Files for Containers

Kubernetes operators and API Connect Custom Resource (CR) templates

IBM® API Connect <version> Operator Upgrade Release Files for Containers

Kubernetes upgrade operators and API Connect upgrade CRs.

IBM® API Connect <version> Toolkit for <operating_system_type>

Toolkit command line utility. Packaged standalone, or with API Designer or Loopback:

- IBM® API Connect <version> Toolkit for <operating_system_type>
- IBM® API Connect <version> Toolkit with Loopback for <operating_system_type>
- IBM® API Connect <version> Toolkit Designer with Loopback for <operating_system_type>

Not required during initial installation. After installation, you can download directly from the Cloud Manager UI and API Manager UI. See [Installing the toolkit](#).

IBM® API Connect <version> Local Test Environment

Optional test environment. See [Testing an API with the Local Test Environment](#)

IBM® API Connect <version> Security Signature Bundle File

Checksum files that you can use to verify the integrity of your downloads.

2. Load the image-tool image in your Docker local registry:

```
docker load < apiconnect-image-tool-<version>.tar.gz
```

Ensure that the registry has sufficient disk space for the files.

3. If your Docker registry requires repositories to be created before images can be pushed, create the repositories for each of the images listed by the image tool. (If your Docker registry does not require creation of repositories, skip this step and go to Step 4.)

- a. Run the following command to get a list of the images from image-tool:

```
docker run --rm apiconnect-image-tool-<version> version --images
```

For `docker run`: For example, version is 10.0.1.5. Note that the value does not contain an `-eus` suffix.

- b. From the output of each entry of the form `<image-name>:<image-tag>`, use your Docker registry repository creation command to create a repository for `<image-name>`.

For example in the case of AWS ECR the command would be for each `<image-name>`:

```
aws ecr create-repository --repository-name <image-name>
```

4. Upload the image:

- If you do not need to authenticate with the docker registry, use:

```
docker run --rm apiconnect-image-tool-<version> upload <registry-url>
```

- Otherwise, if your docker registry accepts authentication with username and password arguments, use:

```
docker run --rm apiconnect-image-tool-<version> upload <registry-url> --username <username> --password <password>
```

- Otherwise, such as with IBM Container Registry, if you need the image-tool to use your local Docker credentials, first authenticate with your Docker registry, then upload images with the command:

```
docker run --rm -v ~/.docker:/root/.docker --user 0 apiconnect-image-tool-<version> upload <registry-url>
```

Note: The previous command does not work on macOS if Docker is configured to use the `osxkeychain` credential store. In this case, complete the following steps:

- Disable **Docker > Preferences... > Securely store Docker logins in the macOS keychain**.
- Inspect `~/.docker/config.json` to make sure that it does not contain `"credStore": "osxkeychain"`, as some versions of Docker-for-mac may handle the setting correctly per <https://github.com/docker/for-mac/issues/4192>.
- Authenticate with the Docker registry you intend to upload to.
- Run the command:

```
docker run --rm -v ~/.docker:/root/.docker --user 0 apiconnect-image-tool-<version> upload <registry-url>
```

- Once the upload of images is successful you may enable **Docker > Preferences... > Securely store Docker logins in the macOS keychain**.

Docker authentication notes:

- Both HTTPS and HTTP are supported. Best practice for Docker registry security is to use HTTPS by utilizing standard Docker load tools, to ensure your images and platform are protected. However, when necessary you can use HTTP by specifying the `--tls-verify=false` flag.
- When using a Docker registry on `localhost`, you might encounter that the image-tool Docker container is on the Docker network and typically without access to `localhost`. You can work around this issue by using the `--network host` argument to the Docker command. Note that `--network host` is a Docker argument, not an image-tool argument.
- Example of using `--network host` and `--tls-verify=false`:

```
$ docker run -d -p 5000:5000 --name registry registry:2
...
$ docker run --rm --network host apiconnect-image-tool-<version> upload localhost:5000 --tls-verify=false
...
```

Providing a certificate for verification, or disabling TLS verification

See the sample output of the tool usage for options to provide a certificate for verification or to disable TLS verification:

```
$ docker run --rm apiconnect-image-tool-<version> upload --help
upload docker images

Usage:
  image-tool upload REGISTRY [flags]

Flags:
  --cert-dir string   Directory with destination registry certificate tls.crt file
  --username string   User name
  -h, --help          help for upload
  --password          password for <username>
  --tls-verify        Verify TLS on destination registry (default true)

Global Flags:
  --accept-license   Accept the license for API Connect
  --debug            Enable debug logging
```

Notes:

- `--username=<username>` and `--password=<password>` can be used to specify credentials for authentication with the destination Docker registry.
- `--tls-verify=false` can be used to disable verification of the destination Docker registry certificate
- `--cert-dir <path>` can be used to provide a `tls.crt` file to be used for validation of the destination Docker registry certificate. For example:

```
docker run --rm -v <path-to-folder-with-tls.crt-file>:/cert apiconnect-image-tool-<version> upload <registry> --
cert-dir /cert
```

5. Download and decompress the IBM® API Connect `<version>` files needed for upgrade:

a. Decompress IBM® API Connect `<version>` Operator Release Files for Containers.

Contents:

- API Connect Operator operator custom resource definition (CRDs)
- API Connect Operator Deployment and required resources CRDs
- API Connect Operator Deployment and required resources CRDs, for multiple-namespace installations
- DataPower Gateway Operator operator custom CRDs
- API Connect custom resource templates, and Certificate Manager

The Operator Release for Containers files will be used later in deployment instructions.

Note: The Operator Release files may include catalog and operator source for OpenShift. These files are not used when upgrading on native Kubernetes.

b. Decompress IBM® API Connect `<version>` Operator Upgrade Release Files for Containers.

Contents:

- API Connect Operator upgrade operator custom resource definition (CRDs).
- API Connect Upgrade Operator Deployment and required resources CRDs, for single-namespace installations.
- API Connect Upgrade Operator Deployment and required resources CRDs, for multiple-namespace installations.
- API Connect upgrade custom resource templates, and Certificate Manager.

c. Decompress the archive `helper_files.zip` from IBM® API Connect `<version>` Operator Upgrade Release Files for Containers, to access the API Connect custom resource templates and Certificate Manager for use in upgrade.

The zip file contains custom resource templates for:

- Upgrade CRs for each subsystem (Management, Portal, Gateway, and Analytics)
- Certificate Manager
- Ingress Issuer and Subsystem Certificates Resources.

The templates will be used later in deployment instructions.

6. Next, prepare the API Connect cluster for upgrade.

There are separate instructions for 2018 single namespace clusters and multi-namespace cluster. Continue with the instructions that apply to your deployment:

- [Deploying operators in a single-namespace API Connect cluster](#)
- [Deploying operators in a multi-namespace API Connect cluster](#)

Deploying operators in a single-namespace API Connect cluster

When upgrading from 2018 to the latest release of v10, first deploy the operators to your namespace.

Before you begin

You must have completed the prerequisite steps and obtained the latest API Connect v10 software. See [Preparing the 2018 deployment for upgrade](#).

Procedure

1. Apply the new version 10 Custom Resource Definitions (CRDs) and the upgrade operator CRDs into the 2018 cluster at your namespace.

a. version 10 CRDs:

```
kubectl apply -f ibm-apiconnect-crds.yaml
```

b. version 2018 to version 10 upgrade CRDs:

```
kubectl apply -f ibm-apiconnect-upgrade-crds.yaml
```

2. Create secrets to pull down version 10 images from docker registry:

a. Create `apic-registry-secret` secret to pull down product v10 API Connect images.

```
kubectl create secret docker-registry apic-registry-secret
--docker-server=<registry_server>
--docker-username=<username@example.com>
--docker-password=<password>
--docker-email=<username@example.com>
-n <v2018_namespace>
```

b. Create `datapower-docker-local-cred` secret to pull down DataPower images:

```
kubectl create secret docker-registry datapower-docker-local-cred
--docker-server=<docker_server>
--docker-username=<username@example.com>
--docker-password=<password>
--docker-email=<username@example.com>
-n <v2018_namespace>
```

c. Create `datapower-admin-secret`

```
kubectl create secret generic datapower-admin-credentials
--from-literal=password=admin
-n <v2018_namespace>
```

You will use the image pull secret key name in the CR files, `spec.ImagePullSecret`.

3. Install cert-manager and configure certificates:

a. Install cert-manager 1.9.1 but do not specify a custom namespace because cert manager will be installed in its own namespace.

```
kubectl apply -f <path>/cert-manager-1.9.1.yaml
```

b. Wait for cert-manager pods to enter `Running 1/1` status before proceeding. Use the following command to check:

```
kubectl -n cert-manager get po
```

There are 3 cert-manager pods in total.

4. Install `ingress-issuer-v1.yaml`.

```
kubectl apply -f <path>/ingress-issuer-v1.yaml -n <v2018_namespace>
```

This step creates ingress resources in the `namespace` of v2018 subsystems.

5. Apply the version 10 apiconnect-operator into your namespace.

The apiconnect-operator launches and maintains the v10 micro-services.

- a. If you are using a namespace other than `default`, open `ibm-apiconnect.yaml` in a text editor. Replace each occurrence of `default` with the 2018 namespace for your deployment.
- b. Open `ibm-apiconnect.yaml` in a text editor. Replace `REPLACE-DOCKER-REGISTRY` with the root of the docker registry you are working with.
- c. Install the ibm-apiconnect Kubernetes deployment.

```
kubectl apply -f ibm-apiconnect.yaml -n <2018_namespace>
```

This command gets the version 10 apiconnect-operator up and running in the namespace of the 2018 subsystems.

6. Start the DataPower operator in the cluster namespace.

Note: Deployment of the DataPower operator is only needed if you have at least one API Connect 2018 Gateway subsystem (whether v5-compatible or not) to upgrade. If you are using DataPower in a different form factor such as an Appliance, you will not have an API Connect 2018 Gateway subsystem to upgrade, and will not need the DataPower operator for your upgrade.

Create `ibm-datapower.yaml` in the cluster namespace:

- a. Open `ibm-datapower.yaml` and replace `REPLACE-DOCKER-REGISTRY` with the root of the docker registry you are working with.
- b. Use the following command to start the version 10 operator in the cluster (namespace):

```
kubectl apply -f ibm-datapower.yaml -n <2018_namespace>
```

7. Apply the version 10 ibm-apiconnect-upgrade operator into your namespace, to perform the 2018-to-10 upgrade process.

a. Open `ibm-apiconnect-upgrade.yaml` in a text editor.

- i. If you are using a namespace other than `default`, replace each occurrence of `default` with the API Connect 2018 namespace for your deployment.
- ii. Replace `REPLACE-DOCKER-REGISTRY` with the root of the docker registry you are working with.
- iii. Optionally, you can supply values for the environment variables `DEFAULT_IMAGE_REGISTRY` and `DEFAULT_IMAGE_PULL_SECRET` in `ibm-apiconnect-upgrade.yaml`. If you do not set these variables in `ibm-apiconnect-upgrade.yaml`, you can (and must) set `$IMAGE_REGISTRY` and `$IMAGE_PULL_SECRET` later in the upgrade CR for each subsystem.

Example:

```

---
apiVersion: apps/v1
kind: Deployment
metadata:
  name: ibm-apiconnect-upgrade
<...>
containers:
- name: ibm-apiconnect-upgrade
  image: REPLACE-DOCKER-REGISTRY/ibm-apiconnect-upgrade-
operator@sha256:b1e09c3ed2f52b6724c7ef8a399ac36db63f9f64f19458736fec9a043458435e
  command:
  - ibm-apiconnect-upgrade
  args:
  - --zap-time-encoding=iso8601
  imagePullPolicy: Always
  env:
  - name: WATCH_NAMESPACE
    valueFrom:
      fieldRef:
        fieldPath: metadata.namespace
  - name: POD_NAMESPACE
    valueFrom:
      fieldRef:
        fieldPath: metadata.namespace
  - name: POD_NAME
    valueFrom:
      fieldRef:
        fieldPath: metadata.name
  - name: OPERATOR_NAME
    value: ibm-apiconnect-upgrade
  - name: DEFAULT_IMAGE_REGISTRY
    value: <registry-url>
  - name: DEFAULT_IMAGE_PULL_SECRET
    value: <image-pull-secret-name>

```

b. Install the ibm-apiconnect upgrade Kubernetes deployment.

```
kubectl apply -f ibm-apiconnect-upgrade.yaml -n <v2018_namespace>
```

This command gets the v10 apiconnect upgrade operator up and running in the namespace.

8. Next, upgrade the subsystems. Continue with [Upgrading the Management subsystem from 2018 to v10](#).

Deploying operators in a multi-namespace API Connect cluster

When you have a multiple namespace deployment in 2018, use these instructions to deploy the version 10 operators.

Before you begin

You must have completed the prerequisite steps and obtained the latest API Connect v10 software. See [Preparing the 2018 deployment for upgrade](#) and [Obtaining files for upgrade from 2018](#).

Procedure

1. Prepare your environment:

a. Ensure `KUBECONFIG` is set for the target cluster:

```
export KUBECONFIG=<path_to_cluster_config_YAML_file>
```

An example path is `/Users/user/.kube/clusters/<cluster_name>/kube-config-<cluster_name>.yaml`

b. Create namespaces on which subsystems are planned to be installed.

The required namespaces are:

- Apiconnect operator namespace
- Gateway subsystem namespace
- Management subsystem namespace
- Portal subsystem namespace
- Analytics subsystem namespace

The following example values and deployment are used in this topic:

- Apiconnect operator is installed in `operator` namespace
- DataPower operator and gateway subsystem is installed in `gtw` namespace
- Management subsystem is installed in `mgmt` namespace
- Portal subsystem is installed in `portal` namespace
- Analytics subsystem is installed in `a7s` namespace

c. Multi-namespace templates are provided in `helper_files.zip`, inside the `release_files.zip` you downloaded in [Obtaining files for upgrade from 2018](#):

```
helper_files_unpack/multi-ns/
```

2. Install cert-manager and configure certificates:

a. Install cert-manager 1.9.1 but do not specify a custom namespace because cert manager will be installed in its own namespace.

```
kubectl apply -f cert-manager-1.9.1.yaml
```

b. Wait for cert-manager pods to enter **Running 1/1** status before proceeding. Use the following command to check:

```
kubectl -n cert-manager get po
```

There are 3 cert-manager pods in total.

c. Install **ingress-ca** certificate:

- i. Locate **ingress-ca** certificate at **helper_files/multi-ns/ingress-ca-cert.yaml**
- ii. Create **ingress-ca** certificate in one of the subsystems. For example, if we choose **mgmt** namespace:

```
kubectl -n mgmt apply -f ingress-ca-cert.yaml
```

d. Install common issuers on all the namespaces:

- i. Locate **common-issuer.yaml** in **helper_files/multi-ns-support/**
- ii. Create **common-issuer.yaml** in all namespaces:

```
kubectl create -f common-issuer.yaml -n mgmt
kubectl create -f common-issuer.yaml -n gtw
kubectl create -f common-issuer.yaml -n ptl
kubectl create -f common-issuer.yaml -n a7s
```

e. Obtain the ingress-ca secret created by cert manager and create the secret on all namespaces:

- i. Make sure ingress-ca certificate READY status is set to true:

```
kubectl get certificate ingress-ca -n mgmt
NAME      READY  SECRET  AGE
ingress-ca  True   ingress-ca  9m24s
```

- ii. Cert-manager creates a secret called **ingress-ca** in **mgmt** namespace which represents the certificate we created in Step [2.d](#).
- iii. Use the following command to obtain the yaml format of the secret:

```
kubectl get secret ingress-ca -n <namespace-where-ingress-ca-cert-is-created> -o yaml > ingress-ca-secret-in-cluster.yaml
```

- iv. Remove unwanted content from the secret yaml:

```
cat ingress-ca-secret-in-cluster.yaml | grep -v 'creationTimestamp' | grep -v 'namespace' | grep -v 'uid' | grep -v 'resourceVersion' > ingress-ca-secret.yaml
```

- v. Create the secret using the yaml we prepared in previous step on rest of the subsystem namespaces. In this example, in the **gtw**, **a7s** and **ptl** namespaces.

```
kubectl create -f ingress-ca-secret.yaml -n gtw
kubectl create -f ingress-ca-secret.yaml -n ptl
kubectl create -f ingress-ca-secret.yaml -n a7s
```

f. Install management certs in management namespace:

- i. Locate **management-certs.yaml** in **helper_files/multi-ns-support/**
- ii. Create **management-certs.yaml** in the **mgmt** namespace:

```
kubectl create -f management-certs.yaml -n mgmt
```

g. Install gateway certs in the gateway namespace:

- i. Locate **gateway-certs.yaml** in **helper_files/multi-ns-support/**
- ii. Create **gateway-certs.yaml** in the **gtw** namespace:

```
kubectl create -f gateway-certs.yaml -n gtw
```

3. Install the apiconnect operator:

- a. Install the **ibm-apiconnect** CRDs with the following command. Do not specify a namespace:

```
kubectl apply -f ibm-apiconnect-crds.yaml
```

- b. Create a registry secret with the credentials to be used to pull down product images with the following command, replacing **<v10_Operator_Namespace>** with the desired namespace for the apiconnect operator deployment.

```
kubectl -n <v10_Operator_Namespace> create secret docker-registry apic-registry-secret
--docker-server=apic-dev-docker-local.artifactory.swg-devops.com
--docker-username=XXX@ibm.com --docker-password=XXXXXX
--docker-email=XXX@ibm.com
```

- For example, replace **<v10_Operator_Namespace>** with **operator**.
- **docker-password** can be your artifactory API key.
- **-n <v10_Operator_Namespace>** may be omitted if **default** namespace is being used for installation.

c. Locate and open **ibm-apiconnect-distributed.yaml** in a text editor of choice. Then, find and replace each occurrence of **\$OPERATOR_NAMESPACE** with **<v10_Operator_Namespace>**, replacing **<v10_Operator_Namespace>** with the desired namespace for the deployment. In this example, the namespace is **operator**.

d. Also in **ibm-apiconnect-distributed.yaml**, locate the **image:** keys in the containers sections of the deployment yaml right below **imagePullSecrets:**. Replace the placeholder values **REPLACE-DOCKER-REGISTRY** of the **image:** keys with the docker registry host location of the apiconnect operator image (either uploaded to own registry or pulled from public registry).

e. Install **ibm-apiconnect-distributed.yaml** with the following command

```
kubectl apply -f ibm-apiconnect.yaml -n <v10_Operator_Namespace>
```

4. Install DataPower operator:

Note: Deployment of the DataPower operator is only needed if you have at least one API Connect 2018 Gateway subsystem (whether v5-compatible or not) to upgrade. If you are using DataPower in a different form factor such as an Appliance, you will not have an API Connect 2018 Gateway subsystem to upgrade, and will not need the DataPower operator for your upgrade.

- a. Create a registry secret for the DataPower registry with the credentials to be used to pull down product images with the following command, replacing `<namespace>` with the desired namespace for the deployment. (In this case `gtw`):

```
kubectl -n <v2018_gateway_subsystem> create secret docker-registry datapower-docker-local-cred
--docker-server=datapower-docker-local.artifactory.swg-devops.com
--docker-username=XXX@ibm.com --docker-password=XXXXXX
--docker-email=XXX@ibm.com
```

- For example, replace `<v2018_gateway_subsystem>` with `gtw`.
 - `docker-password` can be your artifactory API key.
 - `-n <v2018_gateway_subsystem>` may be omitted if `default` namespace is being used for installation
- b. Create a DataPower admin secret, replacing `<v2018_gateway_subsystem>` with the desired namespace for the deployment. For example, `gtw`. This secret will be used for `$ADMIN_USER_SECRET` later in the Gateway CR:

```
kubectl -n <v2018_gateway_subsystem> create secret generic datapower-admin-credentials --from-literal=password=admin

<v2018_gateway_subsystem> may be omitted if default namespace is being used for installation.
```

- c. Locate and open `ibm-datapower.yaml` in a text editor of choice. Then, find and replace each occurrence of `default` with `<v2018_gateway_subsystem>`, replacing `<v2018_gateway_subsystem>` with the desired namespace for the deployment. For example, `gtw`.
- d. Install `ibm-datapower.yaml` with the following command:

```
kubectl -n <v2018_gateway_subsystem> apply -f ibm-datapower.yaml
```

5. Install the API Connect upgrade operator:

- a. Create upgrade CRDs:

```
kubectl apply -f <path>/ibm-apiconnect-upgrade-crds.yaml
```

- b. The `ibm-apiconnect-upgrade-operator` must be installed in the namespace of the `ibm-apiconnect-operator`.

- c. Open the `ibm-apiconnect-upgrade-distributed.yaml` in a text editor:

Note:

You can obtain `ibm-apiconnect-upgrade-distributed.yaml` from the file IBM® API Connect `<version>` Operator Upgrade Release Files for Containers that you downloaded in [Obtaining files for upgrade from 2018](#).

- i. Replace all the `$OPERATOR_NAMESPACE` namespaces with the namespace of `ibm-apiconnect-operator`.
- ii. Replace `REPLACE-DOCKER-REGISTRY` with the root of the docker registry you are working with.
- iii. Optionally, you can supply values for the environment variables `DEFAULT_IMAGE_REGISTRY` and `DEFAULT_IMAGE_PULL_SECRET` in `ibm-apiconnect-upgrade-distributed.yaml`

Example:

```
---
apiVersion: apps/v1
kind: Deployment
metadata:
  name: ibm-apiconnect-upgrade
<...>
containers:
- name: ibm-apiconnect-upgrade
  image: REPLACE-DOCKER-REGISTRY/ibm-apiconnect-upgrade-operator@sha256:b1e09c3ed2f52b6724c7ef8a399ac36db63f9f64f19458736fec9a043458435e
  command:
  - ibm-apiconnect-upgrade
  args:
  - --zap-time-encoding=iso8601
  imagePullPolicy: Always
  env:
  - name: WATCH_NAMESPACE
    valueFrom:
      fieldRef:
        fieldPath: metadata.namespace
  - name: POD_NAMESPACE
    valueFrom:
      fieldRef:
        fieldPath: metadata.namespace
  - name: POD_NAME
    valueFrom:
      fieldRef:
        fieldPath: metadata.name
  - name: OPERATOR_NAME
    value: ibm-apiconnect-upgrade
  - name: DEFAULT_IMAGE_REGISTRY
    value: <registry-url>
  - name: DEFAULT_IMAGE_PULL_SECRET
    value: <image-pull-secret-name>
```

- d. Run the following command to get `ibm-apiconnect-upgrade-operator` up and running in the cluster:

```
kubectl apply -f ibm-apiconnect-upgrade-distributed.yaml -n <v10_Operator_Namespace>
```

`ibm-apiconnect-upgrade-operator` is used to perform the v2018-v10 upgrade process.

6. Next, upgrade the subsystems. Continue with [Upgrading the Management subsystem from 2018 to v10](#).

Note: Unless otherwise stated, when performing the individual subsystem upgrades the `<namespace>` value of example `kubectl` commands for a given subsystem should be set to the namespace for the particular subsystem component they are acting on.

Upgrading the Management subsystem from 2018 to v10

You can upgrade the management subsystem from 2018 to the latest version of v10.

Before you begin

Before you can upgrade the management subsystem, you must prepare the API Connect cluster namespaces. If you haven't done so already, see one of the following:

- [Deploying operators in a single-namespace API Connect cluster](#)
- [Deploying operators in a multi-namespace API Connect cluster](#)

About this task

- One of the major changes between 2018 and v10 is the change from Cassandra to Postgres for the management database. The upgrade process uses the following steps to upgrade the management subsystem database:
 1. Take management database backup.
Backup and restore must be configured for management subsystem on 2018.
 2. Scale down the 2018 pods except Cassandra database
 3. Extract data from Cassandra database.
This task runs as an **extract** job. The extract job creates logs.
 4. Bring up Postgres database.
 5. Load the extracted data into Postgres database and do the necessary transformations.
This task runs as the **load** job. The load job creates a log.
- To upgrade the management subsystem, you configure an upgrade CR and apply it. When you apply the CR, the upgrade process runs automatically.

Procedure

1. Take a full backup of the API Connect 2018 Management subsystem. This backup is in addition to the backup taken in [Preparing the 2018 deployment for upgrade](#), which was taken before the pre-upgrade operations. The pre-upgrade operations will have changed some of the contents of the database and so it is recommended to have backups from before and after.
2. Populate the template upgrade CR for `management.apiconnect.ibm.com_v1beta1_upgradefromv2018_cr.yaml` with values for your deployment:

Table 1. Variables to set in the Upgrade CR template

Variable	Description
<code>\$NAME</code>	Name to uniquely identify this resource. Example: <code>mgmt</code>
<code>\$MANAGEMENT_SUBSYS TEM_NAME</code>	Must match the v2018's management subsystem name. Use <code>apicup subsys list</code> to find the name. For example: <pre>\$ apicup subsys list Name Type Target mgmt ManagementSubsystem kubernetes gww5 GatewaySubsystem kubernetes gww6 GatewaySubsystem kubernetes portal PortalSubsystem kubernetes analytics AnalyticsSubsystem kubernetes</pre>
<code>\$TRIGGER_ROLLBACK</code>	Can be <code>true</code> or <code>false</code> . Must initially be set to <code>false</code> (default value) when creating the resource. After creation can be updated and set to <code>true</code> to trigger a management subsystem rollback.
<code>\$IMAGE_REGISTRY</code>	Provide valid image registry to access the upgrade and version 10 artifacts. Must be provided if <code>DEFAULT_IMAGE_REGISTRY</code> is not set.
<code>\$IMAGE_PULL_SECRET S</code>	Valid image pull secrets to pull images from image registry specified in <code>\$IMAGE_REGISTRY</code> . Must be provided if <code>DEFAULT_IMAGE_PULL_SECRET</code> is not set.
<code>\$PROFILE</code>	Specifies the deployment profile, see Planning your deployment topology .
<code>\$STORAGE_CLASS_NAM E</code>	Storage class name must be provided for all Volume Claim templates. The <code>default-class-name</code> will be used only if cluster's default-class-name has been set.
<code>\$VOLUME_SIZE</code>	<ul style="list-style-type: none">• <code>upgradeVolumeClaimTemplate</code>: The size of the PVC created for the extract job. Minimum size 50Gi.• <code>databaseVolumeClaimTemplate</code>: - Minimum size 120 Gi• <code>dbBackupVolumeClaimTemplate</code>: - Minimum size 120 Gi• <code>dbArchiveVolumeClaimTemplate</code>: - Minimum size 30 Gi.• <code>messageQueueVolumeClaimTemplate</code>: - Minimum size of 10 Gi

3. Edit the `license` setting:
 - a. Set `accept`: to `true` to accept the license. Note that the default value is `false`. If you do not accept the license, the Operator will not install the subsystem.
 - b. Set `metric`: to track your product usage. Enter the unit of measure that is used for your program license:
 - `PROCESSOR_VALUE_UNIT` - Default value. If you leave the field blank, this value is used.
 - `MONTHLY_API_CALL` - Applies only to the IBM API Connect Hybrid Entitlement program.
For information on tracking monthly call volume, see [Tracking API volume for auditing and compliance](#).
 - c. Set `use`: to either `production` or `nonproduction`, to match the license you purchased.
 - d. Set `license`: to the License ID for the version of API Connect that you purchased. See [API Connect licenses](#).

Example entry to accept the license for a production system:

```
license:
  accept: true
  metric: PROCESSOR_VALUE_UNIT
  use: production
  license: L-RJON-CEBLEH
```

4. Optional: - Database backup configuration can be specified in the upgrade CR.
You can also specify the database backup config after the management subsystem has been upgraded to version 10. If you choose to specify the database backup config in the management upgrade CR, the backup configuration will be carried forward to the v10 management subsystem. The upgraded management subsystem (version 10) will use this database backup config to perform backups as per the schedule.

Note:

You must:

- Use a new location (path) for the version 10 management database backup configuration; do not use the 2018 management backup path.
- Ensure that `Spec.ManagementSpec.DatabaseBackup.RestartDB` is set to `false`.
- Create a management backup secret before configuring database backups.

To review database backup configuration, including creation of a management backup secret, see [Configuring backup settings for fresh install of the Management subsystem](#).

Sample upgrade CR with database backup configuration:

```
apiVersion: management.apiconnect.ibm.com/v1beta1
kind: ManagementUpgradeFromV2018
metadata:
  name: mgmt
spec:
  subsystemName: mgmt
  triggerRollback: false
  upgradeVolumeClaimTemplate:
    storageClassName: local-storage
    volumeSize: 50Gi
  imageRegistry: apic-dev-docker-local.artifactory.swg-devops.com
  imagePullSecrets:
  - apic-registry-secret
  profile: nlxc4.m16
  license:
    accept: true
    metric: PROCESSOR_VALUE_UNIT
    use: production
    license: L-RJON-CEBLEH
  certManagerIssuer:
    name: selfsigning-issuer
    kind: Issuer
  managementSpec:
    databaseVolumeClaimTemplate:
      storageClassName: local-storage
      volumeSize: 120Gi
    dbBackupVolumeClaimTemplate:
      storageClassName: local-storage
      volumeSize: 120Gi
    dbArchiveVolumeClaimTemplate:
      storageClassName: local-storage
      volumeSize: 30Gi
    messageQueueVolumeClaimTemplate:
      storageClassName: local-storage
      volumeSize: 10Gi
    databaseBackup:
      credentials: ibmdbcreds
      host: s3.us-east.cloud-object-storage.appdomain.cloud/us-east
      path: $BUCKET_PATH/$BUCKET_NAME
      protocol: objstore
      restartDB:
        accept: false
      s3provider: ibm
```

5. Create the 2018 upgrade CR for management:

```
kubectl apply -f management.apiconnect.ibm.com_v1beta1_upgradefromv2018_cr.yaml -n <management-subsystem-namespace>
```

Note: `management-subsystem-namespace` in a single namespace APICoconnect cluster will be same as the namespace as that of all the other subsystem namespaces.

The upgrade CR triggers the upgrade process for management.

6. Monitor upgrade progress:

a. Open a new terminal and tail upgrade-operator pod:

```
kubectl logs <upgrade-operator-pod> -n <management-subsystem-namespace>
```

b. Open a new terminal and check the status of the management upgrade:

```
kubectl get up2018m -n <management-subsystem-namespace>
```

Note: `up2018m` is the short name for management-upgrade-type and can be used to track the management upgrade progress. Each subsystem has a dedicated short name for upgrade:

Upgrade Subsystem	Short name
Management	up2018m
Analytics	up2018a
Portal	up2018p
Gateway	up2018g

Look for `READY` and `STATUS` in the resource's status to track your progress:

```
NAME      READY      STATUS      AGE
mgmt      14/14: Upgrade completed  Complete  12h
```

c. Once the upgrade process has completed the `extract` job, open a new terminal and monitor the progress of version 10 installation:

```
kubectl get apic -n <management-subsystem-namespace>
```

When the upgrade succeeds, the upgrade state displays `Upgrade is Complete`. Sample output:

```
NAME      STATUS      MESSAGE
AGE
```

```
managementdbupgrade.management.apiconnect.ibm.com/mgmt-up-4n6gq Complete Upgrade is Complete (DB Schema/data are up-to-date) 12h
```

NAME	READY	STATUS	AGE
managementupgradefromv2018.management.apiconnect.ibm.com/mgmt	14/14: Upgrade completed	Complete	12h

NAME	READY	STATUS	VERSION	RECONCILED	VERSION	AGE
managementcluster.management.apiconnect.ibm.com/mgmt	16/16	Running	10.0.5.1	10.0.5.1-xxxx		12h

If you encounter an error, see [Rolling back a management upgrade to v2018](#).

7. Restart all nats-server pods by running the following command:

```
kubectl -n <namespace> delete po -l app.kubernetes.io/name=natscluster
```

8. If you did not specify backup settings in the upgrade CR in step 4, you must configure backup settings on the new version 10 management subsystem.

Note:

You must:

- Use a new location (path) for the version 10 management database backup configuration; do not use the 2018 management backup path.
- Ensure that `Spec.ManagementSpec.DatabaseBackup.RestartDB` is set to `false`.
- Create a management backup secret before configuring database backups.
- Expect that there will be a brief downtime upon configuring s3 backup settings in a new version 10 cluster.

To review database backup configuration, including creation of a management backup secret, see [Configuring backup settings for fresh install of the Management subsystem](#).

9. Save the upgrade logs after a successful upgrade. This is not mandatory but is recommended, to retain the ability to track the extract and load jobs.

a. Save the PVC logs after a successful upgrade.

The upgrade logs are stored in the `/upgrade` folder in the PVC. See [Logs for management upgrade](#)

b. Optionally, you can view logs of orphaned data from database upgrades. In the downloaded PVC contents, the logs are located in `logs/apim/orphans` and `logs/lur/orphans`. The data represents records which were deleted or updated because of invalid or missing references to data in other tables. If necessary, you can contact IBM Support to better understand the orphaned data.

c. Save the extract and load jobs logs. See [Logs for extract and load jobs](#)

10. We highly recommend that you retain the encryption secret and database credential secrets in a safe location, in case you need to restore during a disaster recovery scenario. Complete the steps in [Preparing the management subsystem for disaster recovery using S3 backups](#) or [Preparing the management subsystem for disaster recovery using SFTP backups](#).

Note: If you do not complete the steps in [Preparing the management subsystem for disaster recovery using S3 backups](#) or [Preparing the management subsystem for disaster recovery using SFTP backups](#), you will not be able to restore your management subsystem to a new cluster during a disaster recovery scenario.

11. Once the management subsystem has been upgraded, clear your browser cache and verify that you can log in to Cloud Manager UI and API manager UI and access the configuration menus.

12. Next, upgrade the Developer Portal subsystem. Continue with [Upgrading the Developer Portal subsystem from 2018 to v10](#).

Note: If the management subsystem upgraded encountered problems, see the instructions in the links at the end of this page. See also [Disaster recovery of a 2018 deployment](#)

- [Rolling back a management upgrade to v2018](#)

If the upgrade of the management subsystem from v2018 to v10 fails, you can rollback to v2018.

- [Cleaning up a failed management upgrade](#)

If the management upgrade fails, remove any unneeded artifacts.

- [Stopping the v2018 to v10 management upgrade](#)

You can stop the v2018 to v10 upgrade process.

- [Troubleshooting the management subsystem upgrade from v2018 to v10](#)

You can troubleshoot the upgrade of the management subsystem from v2018 to v10.

Rolling back a management upgrade to v2018

If the upgrade of the management subsystem from v2018 to v10 fails, you can rollback to v2018.

About this task

The management subsystem upgrade can only be rolled back to v2018 before the upgrade CR reaches the `Status: cleanUpInProgress` state. The `cleanUpInProgress` state is set after the load job has successfully completed.

Complete the following steps to trigger a rollback and then clean up the cluster after a management rollback:

Procedure

1. Determine the status of the upgrade:

a. To view status:

```
kubectl get up2018m <management-subsystem-name> -n <management-subsystem-namespace>
```

b. To view details of the upgrade:

```
kubectl describe up2018m <management-subsystem-name> -n <management-subsystem-namespace>
```

Check for the condition with `Status: True` to know about the current state of the upgrade.

A status condition of `RollbackRequired` indicates that the upgrade is unable to proceed and should be rolled back.

If any errors are encountered, see [Troubleshooting the management subsystem upgrade from v2018 to v10](#).

2. If a rollback is needed ensure that the required must gather logs have been collected. See [Logs for management upgrade](#) and [Logs for extract and load jobs](#)
3. The Operator does not perform an automated roll back. To trigger a rollback, update the upgrade CR:
 - a. Edit the CR:

```
kubectl edit up2018m <management-subsystem-name> -n <management-subsystem-namespace>
```

- b. Under `spec`, add:

```
triggerRollback: true
```

- c. Save and exit to trigger roll back of v2018 upgrade.

- When performing a rollback, the upgrade operator clean-ups any v10 resources and brings back up the v2018 installation, as follows:
 - There will be no V10 resources created if the upgrade process gets reverted before running `extract job`.
 - You must wait for upgrade operator to delete v10 resources and scale up v2018 resources if the upgrade process gets reverted after running of `extract job`.
- The rollback performs the following steps:
 - Delete v10 secrets (if they were created). Note, however, that you must manually delete some secrets, as follows:

- Run `kubectl get secret -n <management-subsystem-namespace>` to fetch the secrets.
Returned secrets:

```

• mgmt-<uuid>-postgres
• mgmt-<uuid>-postgres-backrest-repo-config
• mgmt-<uuid>-postgres-pgbouncer
• mgmt-<uuid>-postgres-postgres-secret
• mgmt-<uuid>-postgres-postgres-secret-apicuser
• mgmt-<uuid>-postgres-postgres-secret-replicator
• mgmt-<uuid>-postgres-primaryuser-secret
• mgmt-<uuid>-postgres-testuser-secret
• mgmt-ca
• mgmt-client
• mgmt-db-client-apicuser
• mgmt-db-client-pgbouncer
• mgmt-db-client-postgres
• mgmt-db-client-replicator
• mgmt-natscluster-mgmt
• mgmt-server
• mgmt-v2018-to-v10-extract-token-xxxxx
• mgmt-v2018-to-v10-load-token-xxxxx

```

- Use the following command to delete the returned secrets:

```
kubectl delete secret <secretName> -n <management-subsystem-namespace>
```

- Restarts the Cassandra cluster. Upgrade operator waits for Cassandra to be `Healthy` before scaling up v2018 deployments
- Scale up v2018 deployment.
- Once rollback on management upgrade completes, operator status is set to `Failed`.

Cleaning up a failed management upgrade

If the management upgrade fails, remove any unneeded artifacts.

About this task

You can remove artifacts left from the failed upgrade, and then either retry the upgrade or stop the upgrade process.

Procedure

1. Determine if you have any v10 ingresses left after successful rollback, and delete them:
 - a. Check for ingresses:

```
kubectl get ingress -n <management-subsystem-namespace>
```

If any of the following ingresses are found, delete them manually:

- `<management-subsystem-name>-admin`
- `<management-subsystem-name>-api-manager`
- `<management-subsystem-name>-consumer-api`
- `<management-subsystem-name>-platform-api`

Note: v10 ingresses are not deleted if the upgrade operator entered `Failed` status during any of these upgrade steps:

- Creating postgres cluster
- Running load job
- Bringing up v10 deployments

- b. To manually delete the v10 ingresses after a rollback:

```
kubectl delete ingress <ingress-name> -n <management-subsystem-namespace>
```

Note: Delete only the v10 ingresses (if any). If not sure, compare the ingresses saved before performing the management upgrade to v10.

2. Use the following instructions to manually delete the PVC used by the upgrade process:

Note: Why is this step necessary?

The PVC used by extract and load job has the same name as that of the management upgrade CR name. Rolling back the management upgrade process does not delete the PVC used by extract/load jobs. This is done to ensure that you can access to the extract and load jobs after a rollback or a successful upgrade.

- a. If applicable, gather extract and load job logs. See [Logs for extract and load jobs](#).
- b. Gather logs for the upgrade operator. See [Logs for management upgrade](#).
- c. Manually delete the PVC:

Important: Save the PVC data before deleting it.

- i. Delete extract jobs:

```
kubectl delete jobs v2018-to-v10-extract -n <management-subsystem-namespace>
```

- ii. Delete load jobs:

```
kubectl delete jobs v2018-to-v10-load -n <management-subsystem-namespace>
```

- iii. Get the PVC name. The PVC name is the same as the name of the management upgrade CR.

```
kubectl get pvc -n <management-subsystem-namespace>
```

- iv. Delete the PVC:

```
kubectl delete pvc <management-upgrade-CR-name> -n <management-subsystem-namespace>
```

3. If necessary, delete the postgres PVCs.

The postgres PVCs must be deleted if you triggered a rollback on or after the upgrade reconciles the v10 cluster with only a postgres database.

- a. List the postgres PVCs:

```
kubectl get pvc -n <management-subsystem-namespace>
```

The following PVCs are used by `postgres` and must be deleted manually:

- `mgmt-xxxxxxx-postgres`
- `mgmt-xxxxxxx-postgres-pgbr-repo`
- `mgmt-xxxxxxx-postgres-wal`

- b. Delete the PVCs:

```
kubectl delete pvc mgmt-xxxxxxx-postgres -n <management-subsystem-namespace>
kubectl delete pvc mgmt-xxxxxxx-postgres-pgbr-repo -n <management-subsystem-namespace>
kubectl delete pvc mgmt-xxxxxxx-postgres-wal -n <management-subsystem-namespace>
```

4. Decide whether to troubleshoot and retry the management upgrade to v10, or to stop the upgrade process.

- To troubleshoot and retry, continue with [Step 5](#).
- To stop the upgrade process, go to [Stopping the v2018 to v10 management upgrade](#).

5. To re-run the management upgrade from v2018 to v10:

- a. Delete management upgrade CR:

```
kubectl delete up2018m <management-subsystem-name> -n <management-subsystem-namespace>
```

- b. Fix the errors in your v2018 installation. See [Common errors on management upgrades](#).

- c. Re-create the management upgrade v10 CR to trigger v10 management upgrade. See [Preparing the 2018 deployment for upgrade](#).

Stopping the v2018 to v10 management upgrade

You can stop the v2018 to v10 upgrade process.

About this task

If you do not want to continue a management upgrade in case of a failure, you can remove the upgrade artifacts.

Procedure

1. Ensure that either the management upgrade operator is in either **Failed** state, or the upgrade process has not yet created `managementupgradefromv2018s.management.apiconnect.ibm.com`.
2. If you started the upgrade process and are ready to abandon it, clean up the artifacts from the management upgrade. See [Cleaning up a failed management upgrade](#).
3. Delete the all the upgrade CRDs and management upgrade resources. From the location of the downloaded files, run:

- a. Delete all the left over upgrade resources:

- If upgrading a v2018 single namespace:

```
kubectl delete -f ibm-apiconnect-upgrade-crds.yaml
```

- If upgrading a v2018 multi-namespace:

```
kubectl delete -f ibm-apiconnect-upgrade-distributed.yaml -n <management-subsystem-namespace>
```

- b. Delete all the left over v10 resources:

- If upgrading a v2018 single namespace:

```
kubectl delete -f ibm-apiconnect.yaml -n <v10-operator-namespace>
```

- If upgrading a v2018 multi-namespace:

```
kubectl delete -f ibm-apiconnect-distributed.yaml -n <v10-operator-namespace>
```

4. Delete DataPower resources:

```
kubect1 delete -f ibm-datapower.yaml -n <gateway-namespace>
```

5. Delete `cert manager` and `ingress-issuer` resources applied in each namespace:

```
kubect1 delete -f <path-to-cert-manager>/cert-manager-1.7.1.yaml  
kubect1 delete -f <path-to-ingress-issuer>/ingress-issuer-v1-alpha1.yaml -n <namespace>
```

Troubleshooting the management subsystem upgrade from v2018 to v10

You can troubleshoot the upgrade of the management subsystem from v2018 to v10.

Contents:

- [Management upgrade states](#)
- [Common errors on management upgrades](#)
- [Logs for management upgrade](#)
- [Logs for extract and load jobs](#)

Management upgrade states

Upgrade operator uses the following states to log the progress with management subsystem upgrades. The operator can be, but not necessarily be, in more than one state at a given point in time during management upgrade.

To determine the state of the operator, run:

```
kubect1 describe up2018m <management-subsystem-name> -n <management-subsystem-namespace>.
```

Table 1. Management upgrade states

State	Description
Running	The management upgrade CR starts with this state. The management upgrade CR reports its progress in Reason and Message fields of this condition.
CleanupInProgress	The management upgrade CR enters this state after successfully creating all the v10 microservices. The upgrade CR remains in this state until all v2018 management components have been deleted. To track the progress of the v10 management cluster deployment run: <pre>kubect1 get <management-subsystem-name> -n <management-subsystem-namespace></pre> The next condition set from here is Complete , upon successful upgrade completion.
RollbackRequired	The management upgrade CR enters this state when it hits any error during the upgrade process. Until the error gets fixed or upon setting triggerRollback: true , the upgrade CR will remain in this state. While in this state, you can either probe into the error and fix it or trigger a rollback by setting spec.triggerRollback: true to continue with the upgrade process. If you choose to trigger a rollback, the subsystem will be rolled-back and the original v2018 management subsystem installation will be brought up. The next condition set from this state is Failed .
Failed	This condition is true when the upgrade process has failed.
Complete	This management upgrade CR enters this state upon a successful upgrade of the management subsystem.

Common errors on management upgrades

- Unable to perform backup due to incorrect backup configuration
- Unable to perform backup due to improper access rights to the backup folder
- Extract job stuck or not terminating with an Exit Code = 0
- Load job stuck or not terminating with an Exit Code = 0
- Unable to create v10 Management CR

Troubleshooting actions:

- Trigger a rollback. See [Rolling back a management upgrade to v2018](#).
- Review [Management upgrade states](#).
- Gather logs. See [Logs for management upgrade](#) and [Logs for extract and load jobs](#).
- Update the v2018 backup configuration. See [Backing up the management database in a Kubernetes environment](#)
- Restart the v2018 to v10 upgrade. See [Preparing the 2018 deployment for upgrade](#).
- Resolve any inconsistencies with the database. See [Preparing the 2018 deployment for upgrade](#).

Logs for management upgrade

The following logs are *must gather* logs. This means they are needed in order to diagnosis problems with the upgrade.

You must collect the following logs prior to setting **triggerRollback: true** in the management upgrade CR. Be sure to redirect the output of each to a suitable file location:

- Upgrade operator logs:

```
kubect1 logs <upgrade_operator_pod> -n <management-subsystem-namespace>
```

- API Connect operator logs:

```
kubect1 logs <apiconnect_operator_pod> -n <management-subsystem-namespace>
```

- Management CR description:

```
kubectl get up2018m <management-subsystem-name> -n <management-subsystem-namespace> -o yaml
```

Logs for extract and load jobs

- Example `kubectl` commands for viewing logs of extract and (or) load jobs:

- Example for extract pod :

```
kubectl logs <mgmt-v2018-to-v10-extract-xxxx>
```

To get information on the `extract` pod:

```
kubectl describe pod <mgmt-v2018-to-v10-extract-xxxx>
```

- Example for load pod:

```
kubectl logs <mgmt-v2018-to-v10-load-xxxx>
```

To get information on the `load` pod:

```
kubectl describe pod <mgmt-v2018-to-v10-load-xxxx>
```

- The management upgrade logs the following output for extract and (or) load jobs:
 - Any data that expires after a fixed time, such as access tokens and refresh token.
 - Invitations for creating provider org, catalog, space and consumer org as they have expiration time set.
 - Member invitations created in an admin org, provider org, catalog or space as they have expiration time set.
 - Logs and data directory from the PVC. These are the contents of /upgrade directory. You must have a logging service setup prior to attempting upgrade. For example, <https://logdna.com/>.
 - The output of `apicops preupgrade -m fix --upgrade_to v10`
 - The output of `apicops preupgrade -m report --upgrade_to v10` which is run before and after the fix option is run.

Upgrading the Developer Portal subsystem from 2018 to v10

You can upgrade the Developer Portal subsystem from 2018.4.1.20 or later to the latest release of v10.

Before you begin

Review the following requirements:

- The 2018 Developer Portal subsystem must be configured with either SFTP or S3 backups.
- All `portal-www` and `portal-db` pods must be up and ready. If they are not, the upgrade will not proceed.
- The environment must have enough storage space to accommodate the v10 PVCs.

If applicable, take the following optional steps:

1. Optional:

The portal subsystem upgrade is based around the backup and restore of the portal. All **INSTALLED** sites at the time of triggering the upgrade will be backed up. You can confirm the list of sites that will be backed up and subsequently upgraded by running the following command against one of the 2018 Portal www pods:

```
kubectl exec -it <portal_www_pod_name> -c admin -n <namespace> -- /opt/ibm/bin/list_sites -p
```

2. Optional: Make a note of the site name of any essential sites that you want to ensure are upgraded first. To view the site names:

```
kubectl exec -it <portal_www_pod_name> -c admin -n <namespace> -- /opt/ibm/bin/list_sites -p
```

You can provide these site names when creating the portal upgrade CR (see step 2 of the upgrade procedure), to ensure they are queued for upgrade in the order provided, before any remaining sites found in the specified backup location.

Important:

- The length of time it takes for the Portal subsystem upgrade to complete is directly related to the number of sites that are present in the portal. The more sites, the longer it takes. It is recommended that any non essential sites (especially those without any customizations) be removed prior to starting the upgrade and recreated once the upgrade has completed.
- Ensure that the specified backup location does not contain any old backups of portal sites that have subsequently been deleted. The upgrade procedure will restore (and upgrade) the backup for all sites found in the backup location. The backup location should only contain backups of the sites present and configured in API Manager at the time the upgrade is to take place.

About this task

The Portal upgrade procedure is primarily based around backing up a 2018 Portal subsystem and restoring it onto a newly deployed version 10 Portal cluster.

The steps which the operator goes through to upgrade the portal subsystem are as follows:

1. Upgrade initialization
2. Take a backup of the 2018 portal subsystem
3. Freeze the 2018 portal-www and portal-db pods
4. Create the 10 portal cluster CR.
5. Create a v10 portal restore CR to restore the 2018 portal backup onto the 10 portal subsystem and upgrade each portal site
6. Remove the 2018 portal subsystem resources
7. Set the **Complete** status condition of the portal upgrade CR to **true**.

To upgrade the Portal from 2018 to 10, complete the following steps:

Procedure

- Verify that all prerequisites have been met:
 - The Portal upgrade CR template file `portal.apiconnect.ibm.com_v1beta1_upgradefromv2018_cr.yaml` has been obtained from the API Connect upgrade `helper_files.zip` in IBM® API Connect <version> Operator Upgrade Release Files for Containers. See [Installing the files for upgrade from 2018](#).
 - The apiconnect operator and apiconnect upgrade operator are installed and running: [Upgrading from 2018 to 10.0.5.4 on Kubernetes](#)
 - The Management subsystem upgrade is complete: [Upgrading the Management subsystem from 2018 to v10](#)
 - All of the Portal prerequisites have been met: [Before you begin](#)
- Populate the template upgrade CR for Portal `portal.apiconnect.ibm.com_v1beta1_upgradefromv2018_cr.yaml` with values for your deployment:

Table 1. Variables to set in the Upgrade CR template

Variable	Description
<code>NAME</code>	Name to uniquely identify this resource. Example: <code>pt1</code>
<code>PORTAL_SUBSYSTEM_NAME</code>	Must match the v2018's portal subsystem name. Use <code>apicup subsys list</code> to find the name. For example: <pre>\$ apicup subsys list Name Type Target mgmt ManagementSubsystem kubernetes gwv5 GatewaySubsystem kubernetes gwv6 GatewaySubsystem kubernetes portal PortalSubsystem kubernetes analytics AnalyticsSubsystem kubernetes</pre> Note: The value of the <code>subsystemName</code> property must match the name of your v2018 portal subsystem. You can also specify the optional <code>siteName</code> property in the <code>portalSpec</code> section to define the site name given to the v10 cluster.
<code>TRIGGER_ROLLBACK</code>	Can be <code>true</code> or <code>false</code> . Must initially be set to <code>false</code> (default value) when creating the resource. After creation can be updated and set to <code>true</code> to trigger a portal subsystem rollback.
<code>SITEURL1</code> - <code>SITEURL2</code> - <code>SITEURL3</code>	PriorityList: entries prioritize the restore of any sites listed in the order in which they are provided. They will be queued for restore first, followed by any remaining sites present in the backup location. This is an optional property that can be omitted if the order of site restore or upgrades is not important. To obtain the site names, see Before you begin
<code>IMAGE_REGISTRY</code>	Provide valid image registry to access the upgrade and version 10 artifacts. Must be provided if <code>DEFAULT_IMAGE_REGISTRY</code> is not set.
<code>IMAGE_PULL_SECRETS</code>	Valid image pull secrets to pull images from image registry specified in <code>IMAGE_REGISTRY</code> . Must be provided if <code>DEFAULT_IMAGE_PULL_SECRET</code> is not set.
<code>PROFILE</code>	Specifies the deployment profile, see Planning your deployment topology .
<code>STORAGE_CLASS_NAME</code>	Storage class name must be provided for all Volume templates. The <code>default-class-name</code> will be used only if cluster's default-class-name has been set.
<code>VOLUME_SIZE</code>	<ul style="list-style-type: none"> <code>databaseVolumeClaimTemplate</code>: - Minimum size of 15Gi for Dev Profile and 30Gi for Prod. Adjust the size of the PVC according to the number of portal sites required <code>databaseLogsVolumeClaimTemplate</code>: - Minimum size of 6Gi for Dev Profile and 12Gi for Prod. <code>webVolumeClaimTemplate</code>: - Minimum size of 8Gi for Dev Profile and 12Gi for Prod. Adjust the size of the PVC according to the number of portal sites required. <code>backupVolumeClaimTemplate</code>: - Minimum size of 15Gi for Dev Profile and 30Gi for Prod. Adjust the size of the PVC according to the number of portal sites required. <code>adminVolumeClaimTemplate</code>: - Minimum size of 6Gi for Dev Profile and 12Gi for Prod. <code>certVolumeClaimTemplate</code>: - 4Gi is the recommended size for this template. Increasing this size does not provide any benefit.

Note: Note: The PVC sizes of your existing 2018 deployment should be specified in the first instance.

The PVC sizes allocated may need to be adjusted further (beyond the minimum and existing 2018 values) depending on the number and content of the sites required.

The minimum PVC sizes are large enough to cater for a small number of portal sites. As a rough estimate, for every 10 additional small portal sites (with a limited number of apps, apis, consumer orgs, members and portal content) the amount of space allocated should be increased in line with the following estimates:

- `databaseVolumeClaimTemplate`: +10 Gi
- `webVolumeClaimTemplate`: +1 Gi
- `backupVolumeClaimTemplate`: +2 Gi

If you have sites that have a lot of provider org content and lots of documentation, images, and additional content stored in the portal, then you may require a lot more space to be allocated to your PVCs. The following 2 PVCs do not need to be scaled based on the number of sites:

- `databaseLogsVolumeClaimTemplate`
- `adminVolumeClaimTemplate`

- Edit the `license` setting:
 - Set `accept`: to `true` to accept the license. Note that the default value is `false`. If you do not accept the license, the Operator will not install the subsystem.
 - Set `use`: to either `production` or `nonproduction`, to match the license you purchased.
 - Set `license`: to the License ID for the version of API Connect that you purchased. See [API Connect licenses](#).

Example entry to accept the license for a production system:

```
license:
  accept: true
  use: production
  license: L-RJON-CEBLEH
```

Example CR:

```
apiVersion: portal.apiconnect.ibm.com/v1beta1
kind: PortalUpgradeFromV2018
metadata:
  name: pt1
spec:
  subsystemName: pt1
  triggerRollback: false
```

```

imageRegistry: apic-dev-docker-local.artifactory.swg-devops.com
imagePullSecrets:
  - apic-registry-secret
profile: n3xc4.m8
license:
  accept: true
  use: production
  license: 'L-RJON-CEBLEH' # Refer license document https://ibm.biz/apiclicenses
certManagerIssuer:
  name: selfsigning-issuer
  kind: Issuer

portalSpec:
  databaseVolumeClaimTemplate:
    storageClassName: local-storage
    volumeSize: 30Gi
  databaseLogsVolumeClaimTemplate:
    storageClassName: local-storage
    volumeSize: 12Gi
  webVolumeClaimTemplate:
    storageClassName: local-storage
    volumeSize: 12Gi
  backupVolumeClaimTemplate:
    storageClassName: local-storage
    volumeSize: 30Gi
  adminVolumeClaimTemplate:
    storageClassName: local-storage
    volumeSize: 12Gi
  certVolumeClaimTemplate:
    storageClassName: local-storage
    volumeSize: 4Gi

```

4. Apply the portal upgrade from the 2018 CR:

```
kubectl apply -f portal.apiconnect.ibm.com_v1beta1_upgradefromv2018_cr.yaml -n <namespace>
```

5. Monitor the progression of the upgrade CR:
 - Check the current state of the upgrade CR itself:

```
kubectl get up2018p -n <namespace>
```

- Monitor the activity of the upgrade by tailing the apiconnect-upgrade-operator pod logs:

```
kubectl logs -f <apiconnect-upgrade-operator-pod-name>
```

Upon completion the upgrade CR will display the status condition **Complete**.

6. Verify the state of your portal sites once the portal upgradefromv2018 has completed:
Run the `list_sites` command against one of the version 10 www pod admin containers

```
kubectl exec -it <v10_portal_www_pod_name> -c admin -n <namespace> -- /opt/ibm/bin/list_sites -p
```

You should see all sites installed. If you have a large number of sites then some may show as out of sync. Note that it can take a short while for API Manager to serve the snapshot requests for all sites, and for the portal to process them all.

Note: With the upgrade to version 10, the developer portal has had a major update to its look and appearance. This might require you to make some additional updates to pre-existing themes. Changes include:

- Forms such as Sign up and login are updated.
- The subscription wizard is refreshed.
- New styling for hovering on navigation bars.
- New concepts such as ghost and tertiary buttons.

If any sites have not successfully been installed then check the portal-www logs for more information. See:

- [Rolling back Developer Portal to v2018](#)
- [Troubleshooting Portal subsystem upgrade from v2018 to v10](#)

7. Retain the Portal subsystem encryption secret in a safe location, in case you need to restore the Portal subsystem during a disaster recovery scenario. The encryption secret is created when the Portal subsystem is initially deployed. You can obtain the name of the encryption secret from the Portal subsystem custom resource once the installation is complete. For example:

- a. Obtain the name of the encryptionSecret:

```
kubectl get ptl portal -o yaml | grep encryptionSecret
encryptionSecret: portal-enc-key
```

The name of encryption secret is **portal-enc-key**.

- b. Save the secret yaml in a safe location:

```
kubectl get secret portal-enc-key -o yaml > portal-enc-key.yaml
```

8. Next upgrade the Analytics subsystem. Continue with [Upgrading the Analytics subsystem from v2018 to v10](#).
If your deployment does not use Analytics, continue with [Upgrading the gateway subsystem from 2018 to v10](#).

- [Rolling back Developer Portal to v2018](#)
 - [Troubleshooting Portal subsystem upgrade from v2018 to v10](#)
- If problems are encountered during the upgrade of Developer Portal to v10, you can rollback to v2018.
You can troubleshoot the Portal subsystem upgrade from v2018 to v10.

Rolling back Developer Portal to v2018

If problems are encountered during the upgrade of Developer Portal to v10, you can rollback to v2018.

About this task

The rollback process removes any v10 portal related resources and reinstates the v2018 resources. During rollback:

- The v2018 ingress resources are recreated.
- The v2018 portal `www` and `db` pods are unfrozen.
- Once the pods have come back up and reached `READY` status, any remaining portal upgrade related resources are removed.

If a portal upgrade CR has been rolled back, then in order to retry the upgrade a new portal upgrade CR must be created. It is recommended to delete the failed upgrade CR instance first.

The upgrade CR property `triggerRollback` provides the ability to define when a rollback should or should not be initiated. The `triggerRollback` property can take the following values:

Value	Description
<code>false</code>	Rollback of the portal subsystem will not be triggered. Default value
<code>true</code>	The upgrade of the portal subsystem will be rolled back immediately unless the upgrade process has already started to remove the v2018 portal resources, as indicated by the status condition <code>CleanupInProgress</code> is true. The upgrade CR is rejected if <code>triggerRollback</code> is set to <code>true</code> on creation.

You should gather log information before editing the upgrade CR and setting the `triggerRollback` value to `true`, as follows:

Note: For OpenShift users: The steps that are detailed in this topic use the Kubernetes `kubectl` command. On OpenShift, use the equivalent `oc` command in its place. If you are using a top-level CR you must edit the `multiSiteHA` section for the subsystem in the top-level CR, instead of directly in the subsystem CRs. If the subsystem section is not included in the top-level CR, copy and paste the section from the subsystem CR to the top-level CR.

Procedure

1. Prior to setting `triggerRollback: true` in the upgrade CR, collect the following logs and details, and redirect the output of each to a suitable file location:

- a. Upgrade operator logs:

```
kubectl logs <upgrade_operator_pod> -n <namespace>
```

- b. Apiconnect operator logs:

```
kubectl logs <apiconnect_operator_pod> -n <namespace>
```

- c. Portal upgradefromv2018 CR description:

```
kubectl describe up2018p <name> -n <namespace>
```

- d. Portal restore CR description (if present):

```
kubectl describe portalrestore <subsystem_name> -n <namespace>
```

- e. Portal v10 subsystem CR description (if present):

```
kubectl describe ptl <subsystem_name> -n <namespace>
```

- f. Portal v10 subsystem pod logs (if present):

- `kubectl logs <v10_portal_www> -c [admin/web] -n <namespace>`
- `kubectl logs <v10_portal_db> -c [db/dbproxy] -n <namespace>`
- `kubectl logs <v10_portal_nginx> -n <namespace>`

2. Specify the rollback in the upgrade CR:

- a. Edit the upgrade CR:

```
kubectl edit up2018p <name> -n <namespace>
```

- b. Set `triggerRollback`:

```
triggerRollback: true
```

3. Monitor the progress of the rollback operation:

- Check the current status of the upgrade CR:

```
kubectl describe up2018p <name> -n <namespace>
```

- Monitor the activity of the rollback operation by tailing the apiconnect-upgrade-operator pod logs:

```
kubectl logs -f <apiconnect-upgrade-operator-pod-name>
```

Upon completion the upgrade CR will display the status condition `Failed`.

4. Once the rollback has completed you can delete the upgrade CR:

```
kubectl delete up2018p <name> -n <namespace>
```

Troubleshooting Portal subsystem upgrade from v2018 to v10

You can troubleshoot the Portal subsystem upgrade from v2018 to v10.

Restored site failed to be upgraded successfully

If one or more of the restored sites failed to be upgraded successfully then check the portal-www admin container logs to see what prevented the site upgrade from completing successfully.

To trigger the site upgrade again, exec into the portal-www pod admin container and run the command:

```
upgrade_devportal -s <site_uuid> -p <platform>
```

- Site uuid can be obtained from the command `list_sites`
- Platform can be obtained from the command `list_platforms`

Upgrading the Analytics subsystem from v2018 to v10

It is not possible to directly upgrade the analytics subsystem from v2018 to v10.0.5. New v10.0.5 analytics subsystems must be deployed to replace your v2018 analytics subsystems.

- If you want to preserve your v2018 analytics data, export it to a backup location as explained in [Preparing the 2018 deployment for upgrade](#).
- Disassociate and delete your v2018 analytics subsystems before you upgrade your management subsystem, as explained in [Preparing the 2018 deployment for upgrade](#).

After your management subsystem upgrade is complete, deploy your v10.0.5 analytics subsystems: [Installing the Analytics subsystem](#).

Register your v10.0.5 analytics subsystems with your management subsystem: [Register an analytics service](#).

Upgrading the gateway subsystem from 2018 to v10

You can upgrade the DataPower Gateway subsystem from API Connect 2018.4.1.20 or later to the latest release of v10.

Before you begin

The apiconnect operator, apiconnect upgrade operator, and ibm-datapower operator must be installed and running, and the Management subsystem upgrade must be complete.

Note: Do not use this process if your 2018 deployment used a non-Kubernetes DataPower appliance or virtual appliance. This process is for 2018 deployments that configured gateway services through an API Connect gateway subsystem distribution on Kubernetes. For non-Kubernetes DataPower appliance or virtual appliance, see [Upgrading DataPower Gateway Service](#).

About this task

- How the gateway upgrade process works:
 1. Dual backend phase
 - The first part of the process uses a dual backend. The gateway upgrade starts by checking the replica count of the 2018 Gateway to set it as target for the upgraded version 10 gateway. The 2018 StatefulSet is scaled down by one, and the v10 Gateway is set to one replica.

While the first version 10 replica is starting, the api request traffic as well as admin traffic is only routed to 2018. Once the first v10 gateway pod is ready, admin traffic is routed to the version 10 gateway, and a `syncDelaySeconds` timer is used to allow the first version 10 gateway to synchronize with the API Connect Management subsystem.

After this delay, api traffic is routed to both 2018 pods and the first version 10 pod. The 2018 StatefulSet is then progressively scaled down, while the version 10 StatefulSet is scaled up to reach the target replicas matching the initial 2018 subsystem. Once the 2018 replicas is 0, the api traffic is only routed to version 10 Gateway (admin remains routed only to version 10 as well). The upgrade CR transitions then to "single backend".

While this dual backend upgrade is happening, it is possible to update the upgrade CR to set a value `triggerRollback: true` which will remove the version 10 StatefulSet and scale back the 2018 StatefulSet to its initial replica count. The api and admin traffic is then also only routed to 2018 pods.
 2. Single backend phase

Once the target replica for version 10 is reached, the 2018 artifacts are deleted, and the upgrade CR transitions then to "complete". During this single backend upgrade phase, it is no longer possible to trigger a rollback.
 3. Completion

Once the upgrade has completed successfully the state of the upgrade CR is `Complete`.
- When the Gateway is upgraded from 2018 the following information is derived directly from the 2018 deployment:
 - The apic-gw-service-ingress certificate, per 2018 certificate reference, is carried over as the `-apic-gateway-service-tls` secret and pointed to by the version 10 `.cr.Spec.APICGatewayServiceTLS`
 - The gateway-peering certificate, per 2018 certificate reference, is carried over as the `-apic-gateway-peering-tls` secret and pointed to by `.cr.Spec.APICGatewayPeeringTLS`.
 - The admin user secret from 2018 is carried over in version 10 as a `-datapower-admin-credentials` secret pointed to by `.cr.Spec.AdminUser`.
 - The v5 compatibility mode setting of the 2018 deployment is carried over as the version 10 `.cr.Spec.APICGatewayServiceV5CompatibilityMode`.
 - Whether TMS is enabled in 2018 is carried over as the version 10 `.cr.Spec.TokenManagementService.Enabled` flag.
 - The 2018 deployment resource limits (for cpu and memory) for the statefulset pods are carried over as the resource requests and limits (for cpu and memory) for the version 10 deployment.

- Additional Gateway configuration from 2018:
 - In case TMS is used, the storage class and size from 2018 is not carried over; it must instead be specified in the upgrade CR as `.upgradeCR.Spec.TokenManagementServiceVolumeClaimTemplate`. If size is not specified, the default size is 30Gi.
 - If not specified, the default storage class is set to the default storage class defined in the cluster. If there is no default storage class on the cluster, an error will occur: `Cannot find default storage class.`
 - In 2018, you used an extra values file when a specialized DataPower configuration was required. In version 10, operators do not use extra values files. Instead, you can set the following properties in the CR:
 - `AdditionalDomainConfig` - see :
 - [Domains](#)
 - [Guides: Domain Configuration](#)
See the guide for more detail on how to set up the structure, and components such as `Secret`, `ConfigMap`, and more.
 - [Features: Configuration Management](#)
 - `AdditionalExtraExe` - see [Extraexe](#)
 - `AdditionalInitCmds` - see [Initcmds](#)
- Upgrade considerations:
 - When upgrading from a Dev mode 2018 gateway deployment (single replica, rather than the three replicas in Standard mode), there will be downtime during the upgrade. In this case, the 2018 gateway StatefulSet is scaled down before the v10 StatefulSet is scaled up. API requests to the gateway cannot succeed until the version 10 upgrade is completed, or until the version 10 upgrade is rolled back to 2018.
 - During the upgrade, rate-limiting of API transactions are not properly enforced. In this case, the 2018 gateway cluster has no way to share the rate-limit information with the version 10 gateway cluster.

Procedure

1. Verify that all prerequisites are met. See [Before you begin](#).
2. Populate the template upgrade CR for Gateway `gateway.apiconnect.ibm.com/v1beta1/upgradefromv2018_cr.yaml` with values for your deployment:

Table 1. Gateway service upgrade CR variables

Variable	Description
<code>\$NAME</code>	Must be unique for each Gateway service upgraded
<code>\$GATEWAY_SUBSYSTEM_NAME</code>	Must match the name of the Gateway subsystem to be upgraded as it is named in the v2018 API Connect <code>apicup</code> installer project. Use <code>apicup subsys list</code> to display names of Gateway subsystems in the v2018 API Connect <code>apicup</code> installer project. For example: <pre>\$ apicup subsys list Name Type Target mgmt ManagementSubsystem kubernetes gww5 GatewaySubsystem kubernetes gww6 GatewaySubsystem kubernetes portal PortalSubsystem kubernetes analytics AnalyticsSubsystem kubernetes</pre> In this example, the gateway upgrade CR should specify <code>subsystemName: gww5</code> to upgrade the <code>gww5</code> gateway, or <code>subsystemName: gww6</code> to upgrade the <code>gww6</code> gateway. Note that if the 2018 deployment contained multiple gateway services, the gateway services must be updated individually, by creating one upgrade CR per gateway service to be upgraded.
<code>\$TRIGGER_ROLLBACK</code>	Can be <code>true</code> or <code>false</code> . Must initially be set to <code>false</code> (default value) when creating the resource. After creation can be updated and set to <code>true</code> to trigger a portal subsystem rollback.
<code>\$IMAGE_REGISTRY</code>	Provide valid image registry to access the upgrade and version 10 artifacts. Must be provided if <code>DEFAULT_IMAGE_REGISTRY</code> is not set.
<code>\$IMAGE_PULL_SECRETS</code>	Valid image pull secrets to pull images from image registry specified in <code>\$IMAGE_REGISTRY</code> . Must be provided if <code>DEFAULT_IMAGE_PULL_SECRET</code> is not set in the upgrade operator deployment yaml file (<code>ibm-apiconnect-upgrade.yaml</code>)
<code>\$PROFILE</code>	Specifies deployment profile of the version 10 installation to upgrade to. See Planning your deployment topology , for details of the available profiles.
<code>\$SYNC_DELAY_SECONDS</code>	The delay is the amount of time given to the first version 10 DataPower pod to complete its synchronization with the API Connect Management subsystem. After that delay, api request traffic starts being forwarded to the first version 10 pod. The version 10 StatefulSet is then scaled up progressively to the target replicas, allowing about 2 minutes for each new pod to be synchronized with the others. The default is 600 seconds (10 minutes)
<code>\$STORAGE_CLASS_NAME</code>	If the Gateway to be upgraded has Token Management Service (TMS) enabled, the <code>tokenManagementServiceVolumeClaimTemplate</code> settings must be populated. Provide a storage class name. The default-class-name will be used only if cluster's default-class-name has been set. For example, <pre>storageClassName: local-storage</pre>
<code>\$VOLUME_SIZE</code>	If the Gateway to be upgraded has Token Management Service (TMS) enabled, the <code>tokenManagementServiceVolumeClaimTemplate</code> settings must be populated. Provide a volume size. The minimum size is 30Gi.

3. Edit the `license:` setting:
 - a. Set `accept:` to `true` to accept the license. Note that the default value is `false`. If you do not accept the license, the Operator will not install the subsystem.
 - b. Set `use:` to either `production` or `nonproduction`, to match the license you purchased.
 - c. Set `license:` to the License ID for the version of API Connect that you purchased. See [API Connect licenses](#).

Example entry to accept the license for a production system:

```
license:
  accept: true
  use: production
  license: L-RJON-CEBLEH
```

Example CR:

```
apiVersion: gateway.apiconnect.ibm.com/v1beta1
kind: GatewayUpgradeFromV2018
metadata:
  name: $NAME # name to uniquely identify this resource. Example: `gwupgrade`
spec:
```

```

subsystemName: $GATEWAY_SUBSYSTEM_NAME # must be same as v2018's gateway subsystem name. Find out using the following
v2018 installer command: apicup subsys list
triggerRollback: $TRIGGER_ROLLBACK # takes true or false. Must initially be set to false (default value) when creating
the resource. After creation can be updated and set to true to trigger a gateway subsystem rollback
imageRegistry: $IMAGE_REGISTRY # provide valid image registry to access the upgrade and v10 artifacts. Must be provided
if DEFAULT_IMAGE_REGISTRY is not set.
imagePullSecrets:
  - $IMAGE_PULL_SECRETS # valid image pull secrets to pull images from image registry specified above. Must be provided
if DEFAULT_IMAGE_PULL_SECRET is not set.
profile: $PROFILE # specifies deployment profile of the v10 gateway installation to upgrade to.
license: # must be defined
  accept: true
  use: production
  license: L-RJON-CEBLEH # Refer license document https://ibm.biz/apiclicenses
gatewaySpec:
  syncDelaySeconds: $SYNC_DELAY_SECONDS # amount of time given to the first v10 Datapower pod to complete its
synchronization with the API Connect Management subsystem. Defaults to 600 seconds if not defined.
  tokenManagementServiceVolumeClaimTemplate: # should be populated if the Gateway to be upgraded has TMS enabled. Refer
upgrade doc for more info.
  storageClassName: $STORAGE_CLASS_NAME # storage class name must be provided. default-class-name will be used only if
cluster's default-class-name has been set.
  volumeSize: $VOLUME_SIZE # must be atleast 30Gi

```

4. Apply the gateway upgradefromv2018 CR with the following command:

```
kubectl apply -f gateway.apiconnect.ibm.com_v1beta1_upgradefromv2018_cr.yaml -n <namespace>
```

5. Monitor the progression of the upgrade CR:

- To check the current state of the upgrade CR:

```
kubectl get up2018g -n <namespace>
```

- To monitor the activity of the upgrade, tail the apiconnect-upgrade-operator pod logs:

```
kubectl logs -f <apiconnect-upgrade-operator-pod-name> -n <namespace>
```

Once completed the upgrade CR will enter the status condition **Complete**.

6. Continue with [Post-upgrade steps for upgrading to v10](#).

- Rollback of gateway subsystem to v2018**

If the upgrade from v2018 to v10 does not succeed, you can rollback the gateway subsystem to v2018.

Rollback of gateway subsystem to v2018

If the upgrade from v2018 to v10 does not succeed, you can rollback the gateway subsystem to v2018.

About this task

The upgrade CR has an optional property `triggerRollback` which provides the ability to define when a rollback should or should not be initiated. The `triggerRollback` property can take the following values:

Value	Description
<code>false</code>	Rollback of the gateway subsystem will not be triggered. Default value
<code>true</code>	The upgrade of the gateway subsystem will be rolled back immediately unless the upgrade process has already moved to a status condition of Complete . The upgrade CR is rejected if <code>triggerRollback</code> is set to <code>true</code> on creation.

You can rollback the gateway subsystem upgrade during the upgrade's dual backend phase, but not during the single backend phase:

1. Dual backend phase

- The first part of the process uses a dual backend. The gateway upgrade starts by checking the replica count of the v2018 Gateway to set it as target for the upgraded v10 gateway. The v2018 StatefulSet is scaled down by one, and the v10 Gateway is set to one replica.

While the first v10 replica is starting, the api request traffic as well as admin traffic is only routed to v2018. Once the first v10 gateway pod is ready, admin traffic is routed to the v10 gateway, and a `syncDelaySeconds` timer is used to allow the first v10 gateway to synchronize with the API Connect Management subsystem.

After this delay, api traffic is routed to both v2018 pods and the first v10 pod. v2018 StatefulSet is then progressively scaled down, while the v10 StatefulSet is scaled up to reach the target replicas matching the initial v2018 subsystem. Once the v2018 replicas is 0, the api traffic is only routed to v10 Gateway (admin remains routed only to v10 as well). The upgrade CR transitions then to "single backend".

While this dual backend upgrade is happening, it is possible to update the upgrade CR to add a value `triggerRollback: true` which will remove the v10 StatefulSet and scale back the v2018 StatefulSet to its initial replica count. The api and admin traffic is then also only routed to v2018 pods.

2. Single backend phase

Once the target replica for v10 is reached, the v2018 artifacts are deleted, and the upgrade CR transitions then to **Complete**. During this single backend phase, you cannot trigger a rollback.

Procedure

- Ensure that the state of upgrade CR has not reached the **Complete** status.
- Specify the rollback in the upgrade CR:
 - Edit the upgrade CR:

```
kubectl edit up2018g <upgrade_cr_name> -n <namespace>
```

- b. Change the `triggerRollback` value to `true`:

```
triggerRollback: true
```

When the upgrade was rolled back, then after the v2018 resources are scaled back to the initial replicas and the v10 resources are deleted, the upgrade CR is marked `RollbackComplete`.

Post-upgrade steps for upgrading to v10

After you upgrade API Connect from v2018 to v10, complete these final steps.

Procedure

1. Enable the Analytics subsystem as explained in [Enabling Analytics after upgrading](#).
2. To ensure that the v10 user interface works correctly, clear your browser cache.
3. Clear out v2018 resources:
 - a. List the helm charts.

```
helm list
```

- b. Note the `Name` of the release relating to each of the following v2018 chart names:

- `apic-analytics-x.x.x`
- `apiconnect-x.x.x`
- `cassandra-operator-x.x.x`
- `apic-portal-x.x.x`
- `dynamic-gateway-service-x.x.x`

- c. Clear out v2018 resources. For each `Release Name`, run:

```
helm delete <Release-Name> --purge
```

- d. If helm version is 3.5.1, use the following command to dry run uninstalling of the helm release:

```
helm uninstall <Release-Name> -n <management_subsystem_namespace> --dry-run
```

Run the below command to uninstall the v2018 helm release

```
helm uninstall <Release-Name> -n <management_subsystem_namespace>
```

4. Manually delete any remaining v2018 pods for the current release:

```
kubectl delete pod <releaseName>-apim-schema-init-job-xxxx -n <ManagementNamespace>
```

and

```
kubectl delete pod <releaseName>-lurschema-init-job-xxxx -n <ManagementNamespace>
```

5. Delete secrets:

- a. Search for cassop (cassandra) secrets with the below names:

- `cassandra-backup-auth-secret-xxx`,
- `cassop-client-certs-xxx`,
- `cassop-server-certs-xxx`

- b. For each secret, run:

```
kubectl delete secret <Listed_Cassop_Secrets_from_Search> -n <managementNamespace>
```

- c. Manually delete the following secrets:

- ```
kubectl delete secret analytics-proxy-velox-certs-xxx -n <managementNamespace>
```
- ```
kubectl delete secret apim-elasticsearch-velox-certs-xxx -n <managementNamespace>
```
- ```
kubectl delete secret apim-ui-basic-auth -n <managementNamespace>
```
- ```
kubectl delete secret apim-velox-certs-xxx -n <managementNamespace>
```
- ```
kubectl delete secret client-downloads-server-velox-certs-xxx -n <managementNamespace>
```
- ```
kubectl delete secret db-client-velox-certs-xxx -n <managementNamespace>
```
- ```
kubectl delete secret db-velox-certs-xxx -n <managementNamespace>
```
- ```
kubectl delete secret juhu-velox-certs-xxx -n <managementNamespace>
```
- ```
kubectl delete secret ldap-velox-certs-xxx -n <managementNamespace>
```
- ```
kubectl delete secret lur-velox-certs-xxx -n <managementNamespace>
```
- ```
kubectl delete secret migration-inputs-xxx -n <managementNamespace>
```
- ```
kubectl delete secret migration-velox-certs-xxx -n <managementNamespace>
```

- `kubectl delete secret plugin-certs-xxx -n <managementNamespace>`
- `kubectl delete secret ui-velox-certs-xxx -n <managementNamespace>`

Attention: When you upgrade to v10 from v2018, some external certificates are carried over from the v2018 deployment and are not managed by cert-manager. When you update any of the retained certificates, you must restart the affected pods manually. For a list of the certificates that are retained after an upgrade and must be updated manually, see [V2018 upgrade: List of certificates to update manually](#) in the [Renewing TLS certificates](#) section of this documentation.

6. Delete any remnant v2018 Analytics cronjob pods.

Two cronjob pods can remain after the upgrade with names matching the format shown below:

- `r*****-analytics-cronjobs-retention-*****-*****`
- `r*****-analytics-cronjobs-rollover-*****-*****`

These are remnant pods from v2018 and are now redundant. To remove them:

a. List the pods:

```
kubectl get pods -n <namespace>
```

b. Delete the pods:

```
kubectl delete pods <name-of-remnant-cronjob-pod> -n <namespace>
```

7. Optional: Configure additional features related to inter-subsystem communication security, such as CA verification and JWT security: [Optional post-upgrade steps for upgrade to 10.0.5.3 \(or later\) from earlier 10.0.5 release](#).

Disaster recovery of a 2018 deployment

You can optionally return to a 2018 deployment, if necessary, after completion of a successful upgrade from 2018 to v10.

About this task

You can return to the 2018 system by performing a disaster recovery restore on each subsystem.

Note:

- You must have upgraded the subsystems in the order specified in [Upgrade requirements and limitations](#).
- To return to a 2018 system, you must remove all version 10 subsystems. To uninstall API Connect entirely, see [Removing API Connect](#). You can optionally follow the links below to remove individual subsystems, but you must remove all subsystems to successfully restore a 2018 system.

Procedure

1. Management subsystem

Perform disaster recovery of the management subsystem if the 2018 Management subsystem was successfully upgraded and all 2018 Management resources were deleted but you now need to revert to version 2018. You also must perform disaster recovery of the management subsystem if the 2018 Portal subsystem was successfully upgraded and all 2018 Portal resources were deleted, but you now need to revert to version 2018.

- To uninstall the v10 management subsystem, see [Uninstalling API Connect subsystems](#).
 - To uninstall API Connect entirely, see [Removing API Connect](#).
- Follow the 2018 instructions in [Restoring the management database in a Kubernetes environment](#).

Note:

- You will need to restore both the Management subsystem and the Portal subsystem. Be sure to choose backups from the same time to perform a restore.
- You must perform disaster recovery for Portal, as described in Step 2, immediately after the Management restore. Carefully follow all the prerequisites of 2018 Portal disaster recovery.

2. Developer Portal subsystem

Perform disaster recovery of the 2018 Portal if the 2018 Portal subsystem was successfully upgraded and all 2018 portal resources were deleted but you now need to revert to version 2018

- You must first complete disaster recovery for the Management subsystem, as described in Step 1, and then perform Portal disaster recovery.
- Uninstall the version 10 Portal:
 - To uninstall just the Portal subsystem, see [Uninstalling API Connect subsystems](#).
 - To uninstall the entire API Connect deployment, see [Removing API Connect](#).
- Follow the instructions in [Backing up and restoring the Developer Portal in a Kubernetes environment](#), being sure to follow all the prerequisites. When restoring, be sure to choose backups for both the Management subsystem and the Portal subsystem from the same time.

3. Gateway subsystem

You will want to perform disaster recovery of the 2018 Gateway subsystem if the 2018 Gateway subsystem was successfully upgraded and all the 2018 gateway resources were deleted, but you now need to revert to 2018.

Note that although the upgrade from 2018 to 10.0.1.x-eus Gateway on Kubernetes is designed for zero downtime (when using a 3 node setup), reverting to the 2018 gateway will incur downtime.

You must perform Management disaster recovery first and then perform Gateway disaster recovery.

- Uninstall the v10 Gateway:
 - To uninstall just the Gateway subsystem, see [Uninstalling API Connect subsystems](#).
 - To uninstall the entire API Connect deployment, see [Removing API Connect](#).
- Install the 2018 Gateway subsystem. See [Installing the Gateway subsystem into a Kubernetes environment](#).

4. Analytics subsystem

You will want to perform disaster recovery of the 2018 Analytics subsystem if your 2018 Analytics subsystem was successfully upgraded and all the 2018 Analytics resources were deleted, but you now need to revert to 2018.

If Management and Portal subsystems are already upgraded to 10.0.1.x-eus, you must complete disaster recovery for Management subsystem, as described in Step 1, and then disaster recovery for the Portal subsystem, as described in Step 2.

- a. Uninstall the v10 Analytics subsystem:
 - To uninstall just the Analytics subsystem, see [Uninstalling API Connect subsystems](#).
 - To uninstall the entire API Connect deployment, see [Removing API Connect](#).
- b. Install 2018 Analytics. See [Installing the Analytics subsystem into a Kubernetes environment](#).
- c. Restore the 2018 backup that you took before upgrading. See [Restoring the Analytics database](#).
- d. Re-associate the Analytics service with your Gateways.

Troubleshooting upgrades on Kubernetes

Review the following troubleshooting guidance if you encounter a problem while upgrading API Connect on Kubernetes.

Locating your product version

In the  Help page of the Cloud Manager, API Manager, and API Designer user interfaces, there's a Product information tile that you can click to find out information about your product versions, as well as Git information about the package versions being used. Note that the API Designer product information is based on its associated management server, but the Git information is based on where it was downloaded from.

Pgbouncer pod enters a `CrashLoopBackoff` state when upgrading to API Connect 10.0.5.3

This issue might be caused by a corrupt compliance entry in the pgbouncer.ini file. When the operator is upgraded to v10.0.5.3 but the ManagementCluster CR is not yet upgraded, the operator might update the pgbouncer.ini file in the PGBouncer secret with the older ManagementCluster CR's profile file, which does not contain any value for the `compliance pool_size`. As a result, the value gets incorrectly set to the string `<no value>`.

In the majority of cases this bad configuration update is temporary, until the ManagementCluster CR's version is also updated as part of the upgrade process and the problem is resolved. The issue will only become evident if the pgbouncer pod restarts prior to the ManagementCluster CR's version field being updated.

After the operator updates, if the other pods are restarted (specifically the pgbouncer pod) before the ManagementCluster CR's version is updated, then the pgbouncer pod will get stuck in a `CrashLoopBackOff` state due to the missing value for the `compliance pool_size` setting.

The following example shows what the error looks like in the pgbouncer logs:

```
Wed May 17 09:00:02 UTC 2023 INFO: Starting pgBouncer..
2023-05-17 09:00:02.897 UTC [24] ERROR syntax error in connection string
2023-05-17 09:00:02.897 UTC [24] ERROR invalid value "host=mgmt-a516d013-postgres port=5432 dbname=compliance pool_size=<no value>" for parameter compliance in configuration (/pgconf/pgbouncer.ini:7)
2023-05-17 09:00:02.897 UTC [24] FATAL cannot load config file
```

Resolve the issue by running the commands in the following script:

```
NAMESPACE=<mgmt-namespace>
BOUNCER_SECRET=<management-prefix>-postgres-pgbouncer-secret
TEMP_FILE=/tmp/pgbouncer.ini

**Step 1 - Common: Get the existing pgbouncer.ini file**
kubectl get secret -n $NAMESPACE $BOUNCER_SECRET -o jsonpath='{.data.pgbouncer\.ini}' | base64 -d > $TEMP_FILE

**Step 2 - Linux version: Update the file and use it to patch the Secret on the cluster**
sed 's/<no value>/20/' $TEMP_FILE | base64 -w0 | xargs -I{} kubectl patch secret -n $NAMESPACE $BOUNCER_SECRET --type='json' -p="{['op': 'replace', 'path': '/data/pgbouncer.ini', 'value': {} ]}"

**Step 2 - Mac version: Update the file and use it to patch the Secret on the cluster**
sed 's/<no value>/20/' $TEMP_FILE | base64 -b0 | xargs -S2000 -I{} kubectl patch secret -n $NAMESPACE $BOUNCER_SECRET --type='json' -p="{['op': 'replace', 'path': '/data/pgbouncer.ini', 'value': {} ]}"

# Step 3 - Common: Restart pgbouncer to pick up the updated Secret configuration
kubectl delete pod <bouncer_pod_name> -n $NAMESPACE
```

Upgrading a 3 node profile might result in some `portal-db/www` pods being stuck in the `Pending` state

IBM® API Connect 10.0.3.0 introduces the pod anti-affinity required rule, meaning that in a 3 node profile deployment, all 3 db and www pods can run only if there are at least 3 running worker nodes. This rule can cause some upgrades to version 10.0.3.0 or later to become stuck in the `Pending` state, in which case some extra steps are needed during the upgrade to workaround the issue. See the following example for detailed information about the issue, and how to continue with the upgrade.

Important: You must have a backup of your current deployment before starting the upgrade.

The following example shows 3 worker nodes:

```
$ kubectl get nodes
NAME           STATUS    ROLES    AGE   VERSION
apimdev0103    Ready    worker   42m   v1.20.0
apimdev0129    Ready    worker   45m   v1.20.0
apimdev1066    Ready    worker   39m   v1.20.0
```

The pods have been scheduled across only 2 of the 3 worker nodes due to a transient problem with `apimdev1066`, as shown in the following pod list. Pods without persistent storage, such as `nginx-X`, can be rescheduled to `apimdev1066` as soon as they are restarted, but any pods with persistent local storage, such as `db-X` and `www-X`, have to be rescheduled onto the same worker node as that is where their files live.

```
$ kubectl get po -o wide
NAME                                READY   STATUS    RESTARTS   AGE   IP              NODE              NOMINATED NODE
READINESS GATES
ejs-portal-nginx-84f57ffd8c-hbf66  1/1     Running   0           5m12s  888.16.109.208  apimdev0103      <none>         <none>
ejs-portal-nginx-84f57ffd8c-mvq96  1/1     Running   0           5m12s  888.16.142.215  apimdev0129      <none>         <none>
ejs-portal-nginx-84f57ffd8c-vpmtl  1/1     Running   0           5m12s  888.16.142.214  apimdev0129      <none>         <none>
ejs-portal-sitel-db-0              2/2     Running   0           4m39s  888.16.109.209  apimdev0103      <none>         <none>
ejs-portal-sitel-db-1              2/2     Running   0           6m37s  888.16.109.206  apimdev0103      <none>         <none>

ejs-portal-sitel-www-2             0/2     Pending   0           111s  <none>          <none>         <none>         <none>
ibm-apiconnect-75b47f9f87-p25dd   1/1     Running   0           10m   888.16.109.207  apimdev0103      <none>         <none>
```

The pod list shows that `db-2` has restarted, and has been rescheduled to `apimdev0129` as there were no other db pods running on that node. However, `db-1` and `www-2` are both stuck in `Pending` state, as there is already a pod of the same type running on the worker node that is hosting the local storage that they are bound to. If you run a `describe` command of either pod you will see the following output:

```
Events:
  Type            Reason             Age             From              Message
  ----            -
Warning          FailedScheduling  10s (x4 over 2m59s)  default-scheduler  0/3 nodes are available: 1 node(s) didn't match pod affinity/anti-affinity, 1 node(s) didn't match pod anti-affinity rules, 2 node(s) had volume node affinity conflict.
```

To resolve this situation you need to delete the PVCs for each pod, and then delete the pod itself, so that Kubernetes will regenerate the PVCs and schedule the pod on the worker node that does not have the anti-affinity conflict.

Therefore, for the `db-1` pod the following commands must be run:

```
$ kubectl get pvc | grep ejs-portal-sitel-db-1
db-ejs-portal-sitel-db-1      Bound      local-pv-fa445e30  250Gi      RWO              local-storage  15m
dblogs-ejs-portal-sitel-db-1 Bound      local-pv-d57910e7  250Gi      RWO              local-storage  15m

$ kubectl delete pvc db-ejs-portal-sitel-db-1 dblogs-ejs-portal-sitel-db-1
persistentvolumeclaim "db-ejs-portal-sitel-db-1" deleted
persistentvolumeclaim "dblogs-ejs-portal-sitel-db-1" deleted

$ kubectl delete po ejs-portal-sitel-db-1
pod "ejs-portal-sitel-db-1" deleted
```

For the `www-2` pod the following commands must be run:

```
$ kubectl get pvc | grep ejs-portal-sitel-www-2
admin-ejs-portal-sitel-www-2 Bound      local-pv-48799536  245Gi      RWO              local-storage  51m
backup-ejs-portal-sitel-www-2 Bound      local-pv-a93f5607  245Gi      RWO              local-storage  51m
web-ejs-portal-sitel-www-2    Bound      local-pv-facd4489  245Gi      RWO              local-storage  51m

$ kubectl delete pvc admin-ejs-portal-sitel-www-2 backup-ejs-portal-sitel-www-2 web-ejs-portal-sitel-www-2
persistentvolumeclaim "admin-ejs-portal-sitel-www-2" deleted
persistentvolumeclaim "backup-ejs-portal-sitel-www-2" deleted
persistentvolumeclaim "web-ejs-portal-sitel-www-2" deleted

$ kubectl delete po ejs-portal-sitel-www-2
pod "ejs-portal-sitel-www-2" deleted
```

If the PVC has `persistentVolumeReclaimPolicy: Delete` set on it, no cleanup is necessary, as the old data will have been deleted on the worker node that is no longer running the `db-1` and `www-2` pods. However, if you are using local-storage in a Kubernetes installation, then there might be some cleanup to do to remove the old data from the worker node that had the anti-affinity conflict.

Kubernetes can now reschedule the pods. All pods with persistent storage are now spread across the available worker nodes, and the pods whose PVCs were deleted will get a full copy of the data from the existing running pods. The following pod list is now observed in our example:

```
$ kubectl get po -o wide
NAME                                READY   STATUS    RESTARTS   AGE   IP              NODE              NOMINATED NODE
READINESS GATES
ejs-portal-nginx-84f57ffd8c-f85wm  1/1     Running   0           30s   888.16.29.136   apimdev1066      <none>         <none>

Migrating API test data

Back up API testing data before upgrading your IBM® API Connect to V10.0.1, and then restore the data after the upgrade is complete.

About this task

Starting with V10.0.1, the Automated API behavior testing application no longer uses MongoDB to store data. When you upgrade from V10 to V10.0.1 on Kubernetes, you must migrate data that is currently stored in MongoDB into the internal database storage used by API Connect.

You can migrate the following types of API test data:

- Snapshots
- Project environments
- Vault entities, vault variables (password fields cannot be migrated)
- Tests, test variables (test results cannot be migrated)

To migrate data, complete the following tasks:

1. [Backing up API test data](#)
Before upgrading your IBM API Connect to V10.0.1, back up your API test data from the Automated API behavior testing application.
2. [Restoring API test data](#)
After you complete the upgrade of IBM API Connect to V10.0.1, restore your API test data.
3. [Uninstalling Percona Server for MongoDB](#)
After you restore API test data in IBM API Connect V10.0.1, uninstall Percona Server for MongoDB.

Backing up API test data

Before upgrading your IBM® API Connect to V10.0.1, back up your API test data from the Automated API behavior testing application.

Open the Automated API behavior testing application and then complete the steps in the following sections to back up each type of API test data.

Snapshots

Back up each snapshot by completing the following steps:

1. Select HTTP Client.
2. Select a snapshot and load it into the client.
3. Copy the following snapshot properties to a text file:
 - Name
 - Description
 - Method
 - URL
 - Headers
 - Body
4. Save the file.

Repeat the steps for each additional snapshot that you want to migrate.

Project environments

Back up each project environment by completing the following steps:

1. Click Vault_>_project name.
2. Click Environments_>_Open Presets Editor.
3. Select an environment to back up.
4. Copy the following properties to a text file:
 - Name of the environment
 - Each Key:Value pair
5. Save the file.

Repeat the steps for each additional project environment that you want to migrate.

Vault entities

Back up each vault entity by completing the following steps:

1. Click Vault_>_project name_>_Snippets.
2. Select a snippet and copy the following properties to a text file:
 - Name
 - Description
 - Code
3. Repeat step 4 for each snippet in the vault.

4. Save the file.

Repeat this procedure for each additional vault entity that you want to migrate.

Vault variables

Back up each vault variable by completing the following steps:

1. Click Vault > *project name* > Variables.
2. Select a variable and copy the following properties to a text file:
 - Name
 - Value
3. Repeat step 2 for each variable in the vault.
4. Save the file.

Repeat the steps for each additional vault variable that you want to migrate.

Tests and test variables

Back up each test with all of its test variables in a text file by completing the following steps:

Test

1. Click Vault > *project name* > Tests.
2. Edit a test.
3. Select Source.
4. Copy the entire test document to a text file.
5. Save the file.

Test variable

To make restoring easier, use the same text file to contain a test document and the related test variables.

1. Edit the test that you just backed up.
2. Select Data Sets.
3. Go to a set of variables (such as **Global**) and note the scope in your file.
4. For each variable in the data set, copy the following properties to the file containing the corresponding test document:
 - Name
 - ValueFor each data set, you should have a scope noted, plus a list of name/value pairs.
5. Repeat steps 3 and 4 for each set of variables.
6. Save the file.

Repeat the steps for each additional test or test variable that you want to migrate.

Next topic: [Restoring API test data](#)

Restoring API test data

After you complete the upgrade of IBM® API Connect to V10.0.1, restore your API test data.

Open the Automated API behavior testing application and then complete the steps in the following sections to restore each type of API test data.

Snapshots

Restore each saved snapshot by completing the following steps:

1. Open the file containing a snapshot's data.
2. In the test application, select HTTP Client.
3. Copy the following snapshot properties into the client fields:
 - Name
 - Description
 - Method
 - URL
 - Headers
 - Body
4. Submit the request.
5. Save the snapshot.

Repeat the steps for each additional snapshot that you want to restore.

Project environments

Restore each project environment by completing the following steps:

1. Click Vault > *project name* > Tests.
2. Click New Preset.
3. Add an environment.

4. Copy the following data from the text file to the environment properties:
 - Name of the environment
 - Each Key:Value pair
5. Save the environment.

Repeat the steps for each additional project environment that you want to restore.

Vault entities

Restore each vault entity by completing the following steps to recreate the snippet:

1. Click Vault > *project name* > Tests.
2. Create a test within the project.
3. Edit the test, and select From Scratch.
4. Go to the Source view of the test and paste the snippet's code from your text file.
5. Go to the Code view and select all Components.
6. Select Vault and click the Add icon.
7. Save the snippet with the same name and description as the original.
8. Delete the test.

Repeat this procedure for each additional vault entity that you want to restore.

Vault variables

Restore each vault variable by completing the following steps:

1. Click Vault > *project name* > New Variable.
2. Paste the name and value from the file into the variable, and save it.

Repeat the steps for each additional vault variable that you want to restore.

Tests and test variables

Restore each test and its test variables by completing the following steps:

Test

1. Click Vault > *project name* > Tests.
2. Create a test with the same name as the original.
3. Select Source and paste the copied code into the source.
4. Save the new test.

Test variable

1. Select a test and click Data sets.
2. Refer to your notes and set the scope of the test variable.
3. Create the variable by copying the name and value from your file.

Repeat the steps for each additional test or test variable that you want to restore.

Previous topic: [Backing up API test data](#)

Next topic: [Uninstalling Percona Server for MongoDB](#)

Uninstalling Percona Server for MongoDB

After you restore API test data in IBM® API Connect V10.0.1, uninstall Percona Server for MongoDB.

About this task

After your API test data is migrated, you don't need Percona Server for MongoDB (PSMDB). Uninstall PSMDB by completing running the commands described in the following steps.

Procedure

1. Delete PSMDB, as well as the backup and restore CRs:

```
kubectl -n namespace delete psmdb --all
```

where *namespace* is the namespace where PSMDB was installed.

2. Delete the PSMDB Operator deployments:

```
kubectl -n namespace delete deployment percona-server-mongodb-operator
```

where *namespace* is the namespace where PSMDB was installed.

3. Delete the PSMDB service account:

```
kubectl -n namespace delete sa percona-server-mongodb-operator
```

where `namespace` is the namespace where PSMDB was installed.

4. Delete the PSMDB secrets:

```
kubectl -n namespace delete secret ibm-apiconnect-mongo-cluster-secrets
kubectl -n namespace delete secret ibm-apiconnect-mongo-cluster-ssl
kubectl -n namespace delete secret ibm-apiconnect-mongo-cluster-ssl-internal
kubectl -n namespace delete secret ibm-apiconnect-mongodb-encryption-key
```

where `namespace` is the namespace where PSMDB was installed.

5. Delete the PSMDB role binding:

```
kubectl -n namespace delete rolebindings service-account-percona-server-mongodb-operator
```

where `namespace` is the namespace where PSMDB was installed.

6. Delete the PSMDB roleDelete PSMDB role

```
kubectl -n namespace delete role
percona-server-mongodb-operator
```

where `namespace` is the namespace where PSMDB was installed.

7. Delete the PSMDB PVCs:

```
kubectl -n namespace delete pvc pvc_name
```

where:

- `namespace` is the namespace where PSMDB was installed.
- `pvc_name` is the name of a Persistent Volume Claim that is used by PSMDB.
- The PVCs use the following naming pattern: `mongod-data-ibm-apiconnect-mongo-cluster-rs0-...`

8. Delete the PSMDB CRDs:

```
kubectl delete crds perconaservermongodbackubectlups.psmdb.percona.com
kubectl delete crds perconaservermongodbrestores.psmdb.percona.com
kubectl delete crds perconaservermongodbs.psmdb.percona.com
```

Upgrading on OpenShift and Cloud Pak for Integration

You can upgrade API Connect in an OpenShift environment and as part of IBM Cloud Pak for Integration.

- [Upgrading API Connect in Cloud Pak for Integration](#)
In Cloud Pak for Integration, the API management capability is provided by API Connect.
- [Upgrade considerations on OpenShift](#)
Review the supported upgrade paths and other upgrade considerations on OpenShift or Cloud Pak for Integration.
- [Preparing to upgrade on OpenShift](#)
Prepare your OpenShift or Cloud Pak for Integration deployment for upgrading to the new version of API Connect 10.0.5x.
- [Upgrading on OpenShift in an online environment](#)
Perform an online (connected to the internet) upgrade of IBM® API Connect on Red Hat OpenShift Container Platform using either the top-level `APIConnectCluster` CR or individual subsystem CRs.
- [Air-gapped upgrade](#)
In a disconnected, network-restricted, upgrade API Connect on a Red Hat OpenShift Container Platform (OCP) cluster by mirroring product images to a bastion host or a portable device and then completing the upgrade process.
- [Upgrading from 2018 to 10.0.5.4 on OpenShift](#)
Upgrade API Connect 2018 FP24 and higher directly to 10.0.5.4 on Red Hat OpenShift.
- [Optional post-upgrade steps for upgrade to 10.0.5.3 from earlier 10.0.5 release](#)
Version 10.0.5.3 introduces some new features that are related to inter-subsystem communication. This topic explains how to configure these features when you upgrade from a previous 10.0.5 release to v10.0.5.3 or later.
- [Enabling Analytics after upgrading](#)
After the upgrade successfully completes, re-enable Analytics data collection.
- [Troubleshooting upgrade on OpenShift](#)
Review the following troubleshooting tips if you encounter a problem while installing or upgrading API Connect on OpenShift, including as a component of IBM Cloud Pak for Integration (CP4I).

Upgrading API Connect in Cloud Pak for Integration

In Cloud Pak for Integration, the API management capability is provided by API Connect.

About this task

Cloud Pak for Integration 2022 uses API Connect 10.0.5.x, which requires Red Hat OpenShift 4.10 and IBM Cloud Pak common services 3.19 (or higher). Before you can upgrade to API Connect 10.0.5.x in Cloud Pak for Integration, you must upgrade to a version of API Connect that supports the newer versions of OpenShift and common services.

Tip: After upgrade, clear your browser cache, and open a new browser window. This action avoids stale cache issues in your browser, that can result in unexpected behavior in the Cloud Manager and API Manager UIs.

Procedure

1. Required: Upgrade the API management capability to the following version of API Connect:

To ensure a successful upgrade to Cloud Pak for Integration 2022.2 with API Connect 10.0.5.x, upgrade your current version of API Connect:

- 2020.4: If you will upgrade to Cloud Pak for Integration 2022 from 2020.4, your 2020.4 deployment must be at the latest version (API Connect 10.0.1.7-eus). For upgrade instructions, see [Upgrading API management](#) in the 2020.4 version of the Cloud Pak for Integration documentation.
- 2021: If you will upgrade to Cloud Pak for Integration 2022 from 2021.x, your 2021 deployment must be at the latest version of 2021.4 (API Connect 10.0.4-ifix3). For upgrade instructions, see [Upgrading API management](#) in the 2021.4 version of the Cloud Pak for Integration documentation.

Attention: If you previously upgraded to API Connect 10.0.4-ifix3 in 2021.4, you might not have upgraded to OpenShift 4.10 because it was not required. Be sure to upgrade your deployment to OpenShift 4.10 before attempting to upgrade to API Connect 10.0.5.x in Cloud Pak for Integration 2022. For upgrade instructions, see the [Red Hat OpenShift documentation](#).

2. **Upgrading from 10.0.1.x only:** If you don't want to have Zen endpoints in Cloud Pak for Integration 2022.2.1 or 2022.4.1, add the following annotation to your CR before upgrading:

```
metadata:
  annotations:
    apiconnect-operator/cp4i: "false"
```

Notes:

- Beginning with API Connect 10.0.5.6 (Cloud Pak for Integration 2022.2.1), this annotation is added automatically to the stand-alone Management CR. You must still add it manually if you are upgrading to an older version of 10.0.5.x, or if you are upgrading with the top-level API Connect Cluster CR.
 - You can only use this annotation to disable Zen features in Cloud Pak for Integration; you cannot set it to `true` to enable Zen features on a deployment that was installed without them.
 - Complete this step before upgrading the `ibm-apiconnect` operator.
 - If you installed using a top-level CR, add the annotation to the `metadata.annotations` section at the beginning of the CR -- do not add it to the subsystem sections.
 - If you installing using individual subsystem CRs, add the annotation to the `metadata.annotations` section of the Management subsystem CR.
3. Upgrade the API management capability to API Connect 10.0.5.x in Cloud Pak for Integration 2022. For instructions, see "Upgrading API management" in the appropriate version of the [Cloud Pak for Integration documentation](#).

Upgrade considerations on OpenShift

Review the supported upgrade paths and other upgrade considerations on OpenShift or Cloud Pak for Integration.

Tip: After upgrade, clear your browser cache, and open a new browser window. This action avoids stale cache issues in your browser, that can result in unexpected behavior in the Cloud Manager and API Manager UIs.

Supported upgrade paths

Attention: API Connect 10.0.5.x is not supported on a FIPS-enabled environment.

Table 1 lists the releases of IBM® API Connect v10 that can be upgraded to the newest version.

Table 1. Supported upgrade paths on OpenShift

Upgrade from:	How to upgrade to 10.0.5.6
<ul style="list-style-type: none">• 10.0.5.5• 10.0.5.4• 10.0.5.3• 10.0.5.2• 10.0.5.1• 10.0.5.0• 10.0.4.0-ifix3• 10.0.1.15-eus• 10.0.1.12-eus• 10.0.1.11-eus• 10.0.1.9-eus• 10.0.1.8-eus• 10.0.1.7-eus	Complete the procedure in Upgrading on OpenShift and Cloud Pak for Integration in this documentation.

Upgrade from:	How to upgrade to 10.0.5.6
Older versions of 10.0.x: <ul style="list-style-type: none"> • 10.0.4.0-ifix2 • 10.0.4.0-ifix1 • 10.0.4.0 • 10.0.3.0-ifix1 • 10.0.3.0 • 10.0.2.0 	Complete 2 upgrades: <ol style="list-style-type: none"> 1. First, upgrade to 10.0.4-ifix3 as explained in Upgrading on OpenShift and Cloud Pak for Integration in the API Connect 10.0.4 documentation. 2. Then, upgrade to 10.0.5.6 as explained in Upgrading on OpenShift and Cloud Pak for Integration in this documentation.
Older versions of 10.0.1.x: <ul style="list-style-type: none"> • 10.0.1.6-ifix1-eus • 10.0.1.6-eus • 10.0.1.5-ifix4-eus • 10.0.1.5-ifix3-eus • 10.0.1.5-eus • 10.0.1.4-ifix1-eus • 10.0.1.4-eus • 10.0.1.2-ifix2-eus • 10.0.1.2-ifix1-eus • 10.0.1.2-eus 	Complete 2 upgrades: <ol style="list-style-type: none"> 1. First, upgrade to 10.0.1.8-eus as explained in Upgrading to 10.0.1.8-eus online in the API Connect 10.0.1.x-eus documentation. You do not need to upgrade to a higher version because you can move directly from 10.0.1.8-eus to 10.0.5.6. 2. Then, upgrade to 10.0.5.6 as explained in Upgrading on OpenShift and Cloud Pak for Integration in this documentation.
<ul style="list-style-type: none"> • 10.0.1.1 • 10.0.1.0 • 10.0.0.0-ifix2 	Complete 3 upgrades: <ol style="list-style-type: none"> 1. First, upgrade to 10.0.1.2-ifix2-eus as explained in Upgrading on OpenShift and Cloud Pak for Integration in the API Connect 10.0.1.x-eus documentation. Note: Be sure to use the 10.0.1.2-ifix2-eus version of the operator channel, operator, and if applicable, case, as noted in the Operator, operand, and CASE version topic. 2. Then, upgrade to 10.0.1.8-eus as explained in Upgrading to 10.0.1.8-eus online in the API Connect 10.0.1.x-eus documentation. You do not need to upgrade to a higher version because you can move directly from 10.0.1.8-eus to 10.0.5.6. 3. Finally, upgrade to 10.0.5.6 as explained in Upgrading on OpenShift and Cloud Pak for Integration in this documentation.
2018 FP24	Complete 2 upgrades: <ol style="list-style-type: none"> 1. First, upgrade to 10.0.5.4 as explained in Upgrading from 2018 to 10.0.5.4 on OpenShift. 2. Then, upgrade to 10.0.5.6 as explained in Preparing to upgrade on OpenShift.

Attention: Different releases of API Connect support different versions of OpenShift, so you might need to upgrade OpenShift after upgrading API Connect. For more information, see [IBM API Connect Version 10 software product compatibility requirements](#).

For information on the operator, operand, and CASE version used with each API Connect release, see [Operator, operand, and CASE versions](#).

Supported DataPower Gateway versions

You can use any combination of API Connect 10.0.5.x with DataPower Gateway 10.5.0.x or DataPower API Gateway 10.5.0.x.

However, before you install, best practice is to review the latest compatibility support for your version of API Connect. To view compatibility support, follow the instructions in [IBM API Connect Version 10 software product compatibility requirements](#) to access API Connect information on the Software Product Compatibility Reports website. Once you access information for your version of API Connect, select Supported Software, Integration Middleware, and view the list of compatible DataPower Gateway versions.

Exporting analytics data before upgrading to 10.0.5.0 or later

If upgrading from v10.0.4-ifix3, or upgrading from v10.0.1.7-eus (or higher): Upgrading to 10.0.5.x from an earlier version will result in the deletion of existing analytics data. If you want to retain your analytics data then you must export it before starting the upgrade. For instructions on exporting data, see the following API Connect documentation:

- 10.0.4-ifix3: [Exporting API event data](#)
- 10.0.1.7-eus or later: [Exporting API event data](#)

Upgrading multiple instances of API Connect

- If a single operator manages multiple instances, all of those instances must be upgraded, one at a time, as soon as possible.

The operator should not be managing an operand based on an older version any longer than necessary.

- Ensure that each instance is fully upgraded before starting the upgrade on the next instance.

API transactions might fail during the upgrade of gateway pods.

Consider scheduling the upgrade during off-hours to avoid transaction failures.

When you upgrade a cluster of gateway pods in Kubernetes, a small number of API transactions may fail. During the upgrade, Kubernetes removes the pod from the load balancer configuration, deletes the pod, and then starts a new pod. The steps are repeated for each pod. Socket hang ups occur on transactions that are in process at the time the pod is deleted.

The number of transactions that fail depends on the rate of incoming transactions and the length of time needed to complete each transaction. Typically the number of failures is a very small percentage. This behavior is expected during an upgrade. If the failure level is not acceptable, schedule the upgrade during an off-hours maintenance window.

Note also that DataPower Gateway supports long-lived connections such as GraphQL subscriptions or other websockets connections. These long-lived connections might not be preserved when upgrading. Workloads with long-lived connections are more vulnerable to failed API transactions during upgrading.

You can limit the number of failed API transactions during the upgrade by using the DataPower Operator's `lifecycle` property to configure the `preStop` container lifecycle hook on the gateway pods. This approach mitigates the risk of API failures during the rolling update of the gateway StatefulSet by sleeping the pod for a span of time, allowing in-flight transactions to complete prior to the SIGTERM being delivered to the container. While this feature does not guarantee that no in-flight APIs would fail, it does provide some mitigation for in-flight transactions that can complete successfully within the configured time window. For more information, see [Delaying SIGTERM with preStop](#) in the DataPower documentation.

Upgrading to v10.0.5.3 (or later) from an earlier 10.05.x release.

Additional features related to inter-subsystem communication were added in v10.0.5.3. To enable and configure these features see: [Optional post-upgrade steps for upgrade to 10.0.5.3 from earlier 10.0.5 release.](#)

What to do next

Proceed to [Preparing to upgrade on OpenShift](#) to prepare your deployment for upgrading.

- [Additional considerations for upgrading to analytics from a version prior to 10.0.5.0](#)
API Connect v10.0.5.0 introduced a new architecture for the Analytics subsystem, so some additional steps are required before and after upgrading from API Connect 10.0.4-ifix3 or 10.0.1.x.

Additional considerations for upgrading to analytics from a version prior to 10.0.5.0

API Connect v10.0.5.0 introduced a new architecture for the Analytics subsystem, so some additional steps are required before and after upgrading from API Connect 10.0.4-ifix3 or 10.0.1.x.

The key changes to the Analytics subsystem are highlighted in [What's new in Version 10.0.5.](#)

The most important consideration is that existing analytics data is deleted during the upgrade from 10.0.4-ifix3, and from 10.0.1.7-eus (or higher), and cannot be restored. After upgrading to v10.0.5.0 or later, you will have an empty analytics database. If you want to keep your existing analytics data on an external system, there are three options:

- [Exporting analytics data from the UI](#)
Before upgrading to v10.0.5, export any analytics data that you wish to keep using the UI.
- [Exporting analytics data by using the REST API](#)
Before upgrading to v10.0.5, export any analytics data that you want to keep by using the REST API.
- [Offloading analytics data](#)
An alternative to exporting your analytics data before upgrading to v10.0.5 is to enable analytics offload. However, when enabled this feature only offloads new analytics data. But if your upgrade is not planned for a few days or weeks, you can enable this feature now and avoid the need to export any new analytics data.
- [Remove template overrides from your analytics CR](#)
If you are upgrading to v10.0.5.4 or previous, remove any analytics CR template overrides. The v10.0.1 and v10.0.4 analytics CR template overrides are not compatible with v10.0.5 and must be removed.

Exporting analytics data from the UI

Before upgrading to v10.0.5, export any analytics data that you wish to keep using the UI.

About this task

Note: This page refers to analytics features that existed in pre-v10.0.5 releases, for the purposes of exporting analytics data before upgrade. Exporting analytics data from v10.0.5 is described here [Exporting analytics from v10.0.5](#)

Use the Analytics Discover tab to search for event data and then export the *hits* (the records in the search results) to a file. Each hit represents one API invocation in the Gateway server. When you view the hits in the UI, the display is limited to 500 records. To view the entire set of hits, export the data to a CSV or JSON Lines file.

Procedure

1. Navigate to the Analytics page and click Discover.
2. Run a search.

Select a predefined search to run, or click  to define your own search, and then run it. Optionally apply filters to refine the results. The export option is only available when a search returns at least one hit.

3. Click Export (this option displays before the search results).
4. In the "Export Hits" panel, select the Filetype for the exported data.
There are two options for the file's type:

- a. JSON Lines (.txt): Exports data to a .txt file that contains a complete JSON record for each hit.
- b. Comma-separated Values (.csv): Exports to a .csv file that can be viewed either in a text editor, a spreadsheet, or some other CSV viewer.
If you intend to view the .csv file in a viewer that does not support special characters, select the following options as needed to ensure compatibility with your viewer:
 - i. Escape double quotes: Insert an additional quotation mark (") as an escape character before each " that is already included in the file.
 - ii. Escape special characters: Insert a quotation mark (") as an escape character before each of the following characters: = _ + % @The content of the API event records in the CSV file depends on the logging policy that is set for the operation. If the logging policy includes the HTTP headers and the payload, then these details are included in the API event record. Where the payload is large, it might take longer to complete the export of the analytics data. For more information, see [activity-log.policy](#). For information about the fields that are included in the CSV file, see [API event records](#).

5. In the panel, click Export to start the export operation.
6. When the "The export has completed successfully." message displays, click Download to save the file, or click Another one? to run a new export operation.
(Remember to save the current export results before running a new export).

Attention:

- If your browser is configured to block pop-ups, the download might be blocked. The precise behavior varies across browsers, but if you see a notification about "blocked pop-ups", reconfigure the browser to always allow pop-ups for the API Manager host address. Then check the "Export Hits" panel for the Download option, which completes the operation. If you do not see a Download option, repeat the export operation.
 - If you navigate away from the Analytics interface before the exported file is downloaded, the download operation is suspended. If you return to Analytics before any other export operation begins and before the file expires, you might see a Download option that allows you to finish downloading the file. Otherwise, you must repeat the entire export operation.
 - Each downloaded file is saved to the download location that is configured for your browser, using a randomly generated file name. If you intend to export more than once, and you are exporting to the same location each time, you might want to rename each file with a meaningful name.
- [Exporting aggregated analytics data from a visualization](#)
From a visualization, you can view the raw aggregated data from which the graphical representation is constructed, and then export that data to a CSV file.

Exporting aggregated analytics data from a visualization

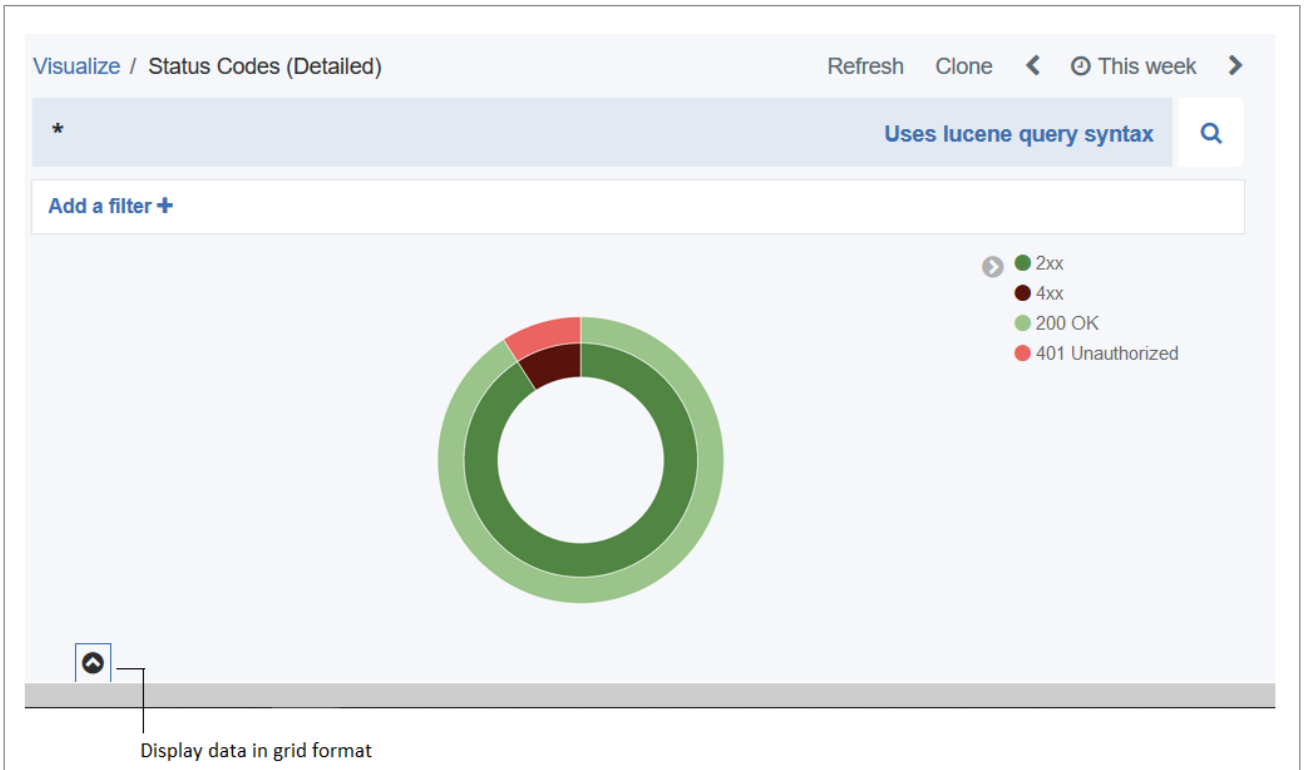

From a visualization, you can view the raw aggregated data from which the graphical representation is constructed, and then export that data to a CSV file.

Procedure

Note: This page refers to analytics features that existed in pre-v10.0.5 releases, for the purposes of exporting analytics data before upgrade. Exporting analytics data from v10.0.5 is described here [Exporting analytics from v10.0.5](#)

To export analytics data from a visualization, complete the following steps.

1. Navigate to the Analytics page and click Visualize.
2. Select a visualization by clicking it.
For example, you might select the visualization called "Status Codes (Detailed)" as shown in the following image:

3. Display the data in grid format by clicking the  that displays after the visualization. In the resulting grid, a row is displayed for each aggregated data set that matches the search criteria configured in the visualization's aggregation builder. The raw data shown in the columns and rows depends on the type of visualization accessed and the aggregations configured for that visualization.

Visualize / Status Codes (Detailed) Refresh Clone < This week >

* Uses lucene query syntax

Add a filter +

Table

filters	Count	status_code.keyword: Descending	Count
1xx	0		
2xx	20	200 OK	20
3xx	0		
4xx	2	401 Unauthorized	2
5xx	0		

Export: Raw Formatted

Page Size 10

Display in graph format Export options

4. Export a tabular format of the raw data that is displayed in the grid:
5. When prompted, choose to save the file, which is named `visualization_name.csv` by default. The file is saved to the download location that is configured for your browser. If you intend to export more than once from the same or another visualization, and you are exporting to the same location each time, you might want to rename each file with a meaningful name.

Exporting analytics data by using the REST API

Before upgrading to v10.0.5, export any analytics data that you want to keep by using the REST API.

Before you begin

API Connect REST API calls are authenticated by using a bearer token in the authorization header. Use the toolkit credentials to request a bearer token. Toolkit credentials can be found in the API Manager UI:

1. Log in to the API Manager UI.
2. From the home page, click the Download toolkit tile.
3. Download the Toolkit credentials.
4. Open the downloaded `credentials.json` file, example:

```
...
"toolkit": {
  "endpoint": "https://mgmt.api.example.com/api",
  "client_id": "7409693f-f726-48b4-8909-7c0d26f13e81",
  "client_secret": "5feeb0be-17f8-41a4-96d6-d40f33d69ef6"
},
...
```

Take note of the `toolkit.client_id`, `toolkit.client_secret`, and `toolkit.endpoint` from this file. You will use these to get your bearer token.

About this task

The Analytics REST API is documented in the [API Connect v10.0.5LATEST](#) API Explorer. You can export the data catalog-by-catalog using `/analytics/catalogs/{org}/{catalog}/analytics-services/{analytics-service}/events`

Procedure

1. Use your provider organization credentials and client_id/secret to request a bearer token:

```
curl -v -k -X POST -d '{"username": "<username>", "password": "<password>", "realm": "<realm>", "client_id": "<client_id>", "client_secret": "<client_secret>", "grant_type": "password"}' -H 'Content-Type: application/json' -H 'Accept: application/json' https://<management server platform api endpoint>/token
```

Where:

- `<username>` is the provider org owner.
- `<password>` is the password for the specified `<username>`.
- `<realm>` is the user registry realm for the specified `<username>`. The default provider organization user registry realm is `provider/default-idp-2`.
- `<client_id>` is the client ID from the "toolkit" section of the `credentials.json` file, or as provided by your API Connect cloud administrator.
- `<client_secret>` is the client secret from the "toolkit" section of the `credentials.json` file, or as provided by your API Connect cloud administrator.
- `<management server platform api endpoint>` is the platform API endpoint from the "toolkit" section of the `credentials.json` file, or as provided by your API Connect cloud administrator.

The bearer token is returned in the `access_token` property:

```
{
  "access_token": "<bearer token>",
  "token_type": "Bearer",
  "expires_in": 28800
}
```

Note the `expires_in` value, which is the number of seconds before the token expires. After expiry you need to request a new bearer token.

2. Use the returned bearer token to call the analytics REST API:

```
curl -v -k -H 'Accept: application/json' -H 'Authorization: Bearer <bearer token>' -X GET --url 'https://<management server platform api endpoint>/analytics/catalogs/<provider org name>/<catalog name>/analytics-services/<analytics service name>/events?after=now-7d'
```

Where:

- `<management server platform api endpoint>` is the `toolkit.endpoint`, but with the `/api` at the end replaced with `/analytics` to access the analytics APIs.

In this example, the REST API call returns the last 7 days (note the `?after=now-7d` at end of the URL) of event data for the specified catalog:

```
{"total":2,"found":true,"events":[{"id":"AYGp1P_4umraqLKQkId3","event":{"immediate_client_ip":"9.145.95.209","developer_org_name":"","resource_id":"","GET:/hola-mundo","developer_org_id":"","log_policy":"activity"...
```

Note: For large data sets it might be necessary to make the REST call repeatedly, specifying a different time range for each call. For example, to capture events logged during a specific 30-minute interval, use: `?after=2022-06-28T09:00:00&before=2022-06-28T09:30:00`

3. Additional filters can be used as described in the REST API documentation for the call to `GET /analytics/catalogs/{org}/{catalog}/analytics-services/{analytics-service}/events`

Offloading analytics data

An alternative to exporting your analytics data before upgrading to v10.0.5 is to enable analytics offload. However, when enabled this feature only offloads new analytics data. But if your upgrade is not planned for a few days or weeks, you can enable this feature now and avoid the need to export any new analytics data.

The steps for configuring analytics offload are covered in the v10.0.1 documentation:
https://www.ibm.com/docs/en/SSMNE1 v10/com.ibm.apic.install.doc/analytics_install_offload_k8s.html

Remove template overrides from your analytics CR

If you are upgrading to v10.0.5.4 or previous, remove any analytics CR template overrides. The v10.0.1 and v10.0.4 analytics CR template overrides are not compatible with v10.0.5 and must be removed.

Note: If you are using a top-level CR, you must edit the top-level CR instead of the subsystem CR. If the section you want to edit is missing from the top-level CR, copy it from the subsystem CR and paste it into the top-level CR.
If you are upgrading to v10.0.5.5 or later, then template overrides are automatically removed in the upgrade, and no action is needed. If you are upgrading to v10.0.5.4 or a previous v10.0.5 fix pack, then review your analytics CR, and if it has a `template:` section, remove this section. For example:

```
oc edit a7s -n <namespace>
```

Remove the `template:` section:

```
# Please edit the object below. Lines beginning with a '#' will be ignored,
# and an empty file will abort the edit. If an error occurs while saving this file will be
# reopened with the relevant failures.
#
apiVersion: analytics.apiconnect.ibm.com/v1beta1
kind: AnalyticsCluster
...
spec:
...
  template: # REMOVE THIS SECTION
  - name: storage-data
    containers:
      - name: storage-data
        env:
          - name: ES_JAVA_OPTS
            value: "-Xms2g -Xmx2g"
        resources:
          requests:
            memory: 3Gi
          limits:
            memory: 4Gi
```

In this example, the template section specified custom memory allocations for internal analytics processes. These settings are applicable only to pre-v10.0.5 analytics deployments. v10.0.5 has additional deployment profiles that provide increased memory allocations: [Analytics component deployment profile limits](#).

Preparing to upgrade on OpenShift

Prepare your OpenShift or Cloud Pak for Integration deployment for upgrading to the new version of API Connect 10.0.5x.

Before you begin

Review the [Upgrade considerations on OpenShift](#) to ensure that you are following a supported upgrade path and that you understand important changes that might affect your deployment.

Attention: Upgrading to v10.0.5.x from v10.0.4-ifix3 or later, or v10.0.1.7 or later, will result in the deletion of existing analytics data. If you want to retain your analytics data then you must export it before upgrade. For instructions on exporting see [Additional considerations for upgrading analytics from a version prior to 10.0.5.0](#).

About this task

Complete the following steps to prepare your deployment for upgrading to the newest version of API Connect.

Procedure

1. Verify that the `pgcluster` is healthy:

- a. Get the name of the `pgcluster`:

```
oc get pgcluster -n <APIC_namespace>
```

The response displays the name of the postgres cluster running in the specified namespace.

- b. Check the status of the `pgcluster`:

```
oc get pgcluster <pgcluster_name> -n <APIC_namespace> -o yaml | grep status -A 2 | tail -n3
```

The response for a healthy `pgcluster` looks like the following example, where the state is `Initialized`:

```
status:
  message: Cluster has been initialized
  state: pgcluster Initialized
```

If the cluster is healthy, proceed to the next step.

Important: If the `pgcluster` is not healthy (returns any other state):

The cluster is not healthy and an upgrade will fail. Complete the following steps:

- a. If there are any ongoing backup or restore jobs, wait until they complete and then check the status again. Do not proceed with the upgrade until the status is **Initialized**.
 - b. If all of the background jobs complete but the `pgcluster` remains unhealthy, contact IBM Support for assistance.
2. Run the pre-upgrade health check:

Attention: This is a required step. Failure to run this check before upgrading could result in problems during the upgrade.

- a. Verify that the `apicops` utility is installed by running the following command to check the current version of the utility:

```
apicops --version
```

If the response indicates that `apicops` is not available, install it now. See [The API Connect operations tool: apicops](#) in the API Connect documentation.

- b. Run the following command to set the KUBECONFIG environment.

```
export KUBECONFIG=/path/to/kubeconfig
```

- c. Run the following command to execute the pre-upgrade script:

```
apicops version:pre-upgrade -n <namespace>
```

If the system is healthy, the results will not include any errors.

Note: This command asks for the Cloud Manager admin password in order to make a call to the platform API. If you do not have this password, or the platform API URL is not accessible from your `apicops` location, then this part of the pre-upgrade check can be skipped by adding the argument `--no-topology`. The topology check output that is produced by this API call is typically only required for debugging purposes, when the `apicops version:pre-upgrade` returns output that suggests the system is unhealthy.

3. [Back up the current deployment](#) in case the upgrade fails and you need to perform a roll back.
4. **If upgrading from v10.0.4-ifix3, or upgrading from v10.0.1.7-eus (or higher)** and you want to retain your analytics data, then you must export it before upgrade. You must also delete any `template` section from your analytics CR. For instructions on exporting data and removing the template section, see [Additional considerations for upgrading analytics from a version prior to v10.0.5.0](#)
5. **If upgrading from v10.0.4-ifix3, or upgrading from v10.0.1.7-eus (or higher)**: Disassociate and delete your Analytics services.
 - a. In Cloud Manager, click Topology.
 - b. In the section for the Availability Zone that contains the Analytics service, locate the Gateway service that the Analytics service is associated with.
 - c. Click the actions menu, and select Unassociate analytics service.
Remember to disassociate each Analytics service from all Gateways.
 - d. In the section for the Availability Zone that contains the Analytics services, locate each Analytics service and click Delete.
6. Upgrade your deployment to a version of OpenShift that is supported by both the current release of API Connect and the target release of API Connect.
Note: If you are upgrading from a version of API Connect earlier than 10.0.1.11 or 10.0.5.2, you might need to complete multiple upgrades of OpenShift and API Connect. For more information, see [Supported versions of OpenShift](#).
7. Review the [Guidelines on upgrading your Developer Portal from Drupal 9 to Drupal 10](#) to ensure that any customizations to the Developer Portal are compatible with Drupal 10.
In API Connect 10.0.5.3, the Developer Portal moved from Drupal 9 to Drupal 10 (this upgrade also requires PHP 8.1). The upgrade tooling will update your Developer Portal sites; however, if you have any custom modules or themes, it is your responsibility to ensure their compatibility with Drupal 10 and PHP 8.1 before starting the upgrade.

Note: If you are upgrading to 10.0.5.3 or later from 10.0.1.7 or earlier, or from 10.0.5.0 or earlier, your Developer Portal sites will first be upgraded to Drupal 9.5 and then to Drupal 10. When you are planning your the upgrade to 10.0.5.3, consider the extended time frame. To shorten your upgrade window, consider removing the Developer Portal sites that you do not need.

Upgrading on OpenShift in an online environment

Perform an online (connected to the internet) upgrade of IBM® API Connect on Red Hat OpenShift Container Platform using either the top-level `APICoconnectCluster` CR or individual subsystem CRs.

Before you begin

- If you are upgrading an air-gapped (disconnected from the internet) installation, see [Air-gapped upgrade](#).
- The Gateway subsystem remains available during the upgrade of the Management, Portal, and Analytics subsystems.
- If you are upgrading to a version of API Connect that supports a newer version of Red Hat OpenShift, complete the API Connect upgrade before upgrading Red Hat OpenShift.
- Upgrading from 10.0.5.2 or earlier: If you did not verify that your Portal customizations are compatible with Drupal 10, do that now.
In API Connect 10.0.5.3, the Developer Portal moved from Drupal 9 to Drupal 10 (this upgrade also requires PHP 8.1). The upgrade tooling will update your Developer Portal sites; however, if you have any custom modules or themes, it is your responsibility to ensure their compatibility with Drupal 10 and PHP 8.1 before starting the upgrade. Review the [Guidelines on upgrading your Developer Portal from Drupal 9 to Drupal 10](#) to ensure that any customizations to the Developer Portal are compatible with Drupal 10 and PHP 8.1.

Procedure

1. Ensure that you have completed all of the steps in [Preparing to upgrade on OpenShift](#), including reviewing the [Upgrade considerations on OpenShift](#). Do not attempt an upgrade until you have reviewed the considerations and prepared your deployment.
2. Ensure your API Connect deployment is ready to upgrade:
 - Your API Connect release (operand) supports a direct upgrade to this release.
For information on the operator and operand version that is used with each API Connect release, see [Operator, operand, and CASE versions](#).
 - The DataPower operator version is correct for the currently deployed version of API Connect.
For information on upgrade paths and supported versions of DataPower Gateway, see [Upgrade considerations on OpenShift](#).

- Your deployment is running on a version of Red Hat OpenShift that is supported by both the current version of API Connect and the target version of API Connect.

For information, see [Supported versions of OpenShift](#).

3. Update the operator channels for DataPower and API Connect.

- If you previously chose automatic subscriptions, the operator version upgrades automatically when you update the operator channel.
- If you previously chose manual subscriptions and the operator channel is already on the previous version, OpenShift OLM notifies you that an upgrade is available. You must manually approve the upgrade before proceeding.
- Both the API Connect and DataPower channels must be changed before either operator upgrades. The upgrade of both operators begins when the channel is changed for both operators.

- Upgrade the DataPower operator channel to v1.6. From Operators, Installed Operators, select the **IBM DataPower Gateway** operator, then select the **Subscription** tab. Click the channel version underneath **Update channel** to update it.

Known issue:

If you see messages in the `datapower-operator` pod log indicating that the pod is waiting for a lock to be removed:

```
{"level": "info", "ts": "2021-03-08T19:29:53.432Z", "logger": "leader", "msg": "Not the leader. Waiting."}
{"level": "info", "ts": "2021-03-08T19:29:57.971Z", "logger": "leader", "msg": "Leader pod has been deleted, waiting for garbage collection to remove the lock."}
```

The DataPower operator cannot be upgraded until this problem is resolved; see: [DataPower operator documentation](#).

- Update the API Connect operator channel to v3.6. From Operators, Installed Operators select the **IBM API Connect** operator, then select the **Subscription** tab. Click the channel version underneath **Update channel** to update it.

If you are upgrading from 10.0.4-ifix3 and the API Connect operator does not begin its upgrade within a few minutes, perform the following workaround to delete the `ibm-ai-wmltraining` subscription and the associated csv:

- Run the following command to get the name of the subscription:

```
oc get subscription --no-headers=true | grep ibm-ai-wmltraining | awk '{print $1}' -n <APIC_namespace>
```

- Run the following command to delete the subscription:

```
oc delete subscription <subscription-name> -n <APIC_namespace>
```

- Run the following command to get the name of the csv:

```
oc get csv --no-headers=true | grep ibm-ai-wmltraining | awk '{print $1}' -n <APIC_namespace>
```

- Run the following command to delete the csv:

```
oc delete csv <csv-name> -n <APIC_namespace>
```

Deleting the subscription and csv triggers the API Connect operator upgrade.

Wait for the operators to update, for the pods to restart, and for the instances to display the **Ready** status.

4. Ensure that the operators and operands are healthy before proceeding.

- Operators: Verify that the OpenShift UI indicates that all operators are in the **Succeeded** state without any warnings.
- If you are using a top-level CR: To verify that your API Connect cluster is healthy, run the following command:

```
oc get apiconnectcluster -n <APIC_namespace>
```

Confirm that the `apiconnectcluster` CR reports all pods as **READY**.

```
oc get ManagementCluster -n apicupgrade
NAME      READY  STATUS   VERSION   RECONCILED VERSION  AGE
management 17/17  Running  10.0.5.1  10.0.5.1-95         70m
```

- If you are using individual subsystem CRs: To verify the health of each subsystem, run the following commands:

```
oc get ManagementCluster -n <mgmt_namespace>
oc get GatewayCluster -n <gway_namespace>
oc get PortalCluster -n <portal_namespace>
oc get AnalyticsCluster -n <mgmt_namespace>
```

Check that all pods are **READY**, for example:

```
oc get PortalCluster -n apic
NAME      READY  STATUS   VERSION   RECONCILED VERSION  AGE
portal    3/3    Running  10.0.5.6  10.0.5.6-95         57m
```

5. If you are using a top-level CR: Update the top-level `apiconnectcluster` CR:

The `spec` section of the `apiconnectcluster` looks like the following example:

```
apiVersion: apiconnect.ibm.com/v1beta1
kind: APICConnectCluster
metadata:
  labels:
    app.kubernetes.io/instance: apiconnect
    app.kubernetes.io/managed-by: ibm-apiconnect
    app.kubernetes.io/name: apiconnect-production
  name: prod
  namespace: <APIC_namespace>
spec:
  allowUpgrade: true
  license:
    accept: true
    use: production
    license: L-GVEN-GFUPVE
  profile: n12xc4.m12
```

```
version: 10.0.5.6
storageClassName: rook-ceph-block
```

a. Edit the `apiconnectcluster` CR by running the following command:

```
oc -n <APIC_namespace> edit apiconnectcluster
```

b. If upgrading from v10.0.4-ifix3, or upgrading from v10.0.1.7-eus (or higher): In the `spec` section, add a new `allowUpgrade` attribute and set it to `true`:

```
spec:
  allowUpgrade: true
```

The `allowUpgrade` attribute enables the upgrade to 10.0.5.x. Because the upgrade to 10.0.5.x deletes your analytics data, the attribute is required to prevent an accidental upgrade.

c. In the `spec` section, update the API Connect version:

Change the `version` setting to `10.0.5.6`.

d. If you are upgrading to a version of API Connect that requires a new license, update the license value now.

For the list of licenses, see [API Connect licenses](#).

e. In the `spec.gateway` section of the CR, delete any `template` or `dataPowerOverride` sections.

You cannot perform an upgrade if the CR contains an override.

f. Save and close the CR to apply your changes.

The response looks like the following example:

```
apiconnectcluster.apiconnect.ibm.com/prod configured
```

Note: If you see an error message when you attempt to save the CR, check if it is one of the following known issues:

- Webhook error for incorrect license.

If you did not update the license ID in the CR, then when you save your changes, the following webhook error might display:

```
admission webhook "vapiconnectcluster.kb.io" denied the request:
APIConnectCluster.apiconnect.ibm.com "<instance-name>" is invalid: spec.license.license:
Invalid value: "L-RJON-BYGHM4": License L-RJON-BYGHM4 is invalid for the chosen version version.
Please refer license document https://ibm.biz/apiclicenses
```

To resolve the error, see [API Connect licenses](#) for the list of the available license IDs and select the appropriate license IDs for your deployment.

Update the CR with the new license value as in the following example, and then save and apply your changes again.

- Webhook error: `Original PostgreSQL primary not found`. Take the following actions to complete the upgrade and fix the cause of the error message:

- Edit your `apiconnectcluster` CR and add the following annotation:

```
...
metadata:
  annotations:
    apiconnect-operator/db-primary-not-found-allow-upgrade: "true"
...
```

- Continue with the upgrade. When the upgrade is complete, the management CR reports the warning:

```
Original PostgreSQL primary not found. Run apicops upgrade:pg-health-check to check the health of the
database and to ensure pg_wal symlinks exist. If database health check passes please perform a management
database backup and restore to restore the original PostgreSQL primary pod
```

- Take a new [management database backup](#).
- Immediately [restore](#) from the new backup taken in the previous step. The action of taking and restoring a management backup results in the establishment of a new Postgres primary, eliminating the CR warning message. Be careful to restore from the backup that is taken after the upgrade, and not from a backup taken before upgrade.
- Webhook error: `Original postgres primary is running as replica`. Complete a Postgres failover, see [Postgres failover steps](#). After you apply the Postgres failover steps, the upgrade resumes automatically.

g. Run the following command to verify that the upgrade is completed and the status of the top-level CR is `READY`:

```
oc get apiconnectcluster -n <APIC_namespace>
```

Important: If you need to restart the deployment, wait until all Portal sites complete the upgrade. Run the following commands to check the status of the sites:

i. Get the portal service ID and endpoint:

```
apic portal-services:get -o admin -s <management_server_endpoint> \
  --availability-zone availability-zone-default <portal-service-name> \
  --output - --format json
```

ii. List the sites:

```
apic --mode portaladmin sites:list -s <management_server_endpoint> \
  --portal_service_name <portal-service-name> \
  --format json
```

Any sites currently upgrading display the `UPGRADING` status; any site that completed its upgrade displays the `INSTALLED` status and the new platform version. Verify that all sites display the `INSTALLED` status before proceeding.

For more information on the `sites` command, see [apic sites:list](#) and [Using the sites commands](#).

iii. After all sites are in `INSTALLED` state and have the new platform listed, run:

```
apic --mode portaladmin platforms:list -s <management_server_endpoint> \
  --portal_service_id <portal_service_id_from_above_command> \
  --portal_service_endpoint <portal_service_endpoint_from_above_command> \
  --format json
```

Verify that the new version of the platform is the only platform listed.

For more information on the `platforms` command, see [apic_platforms:list](#) and [Using the platforms commands](#).

h. If needed, delete old Postgres client certificates.

If you are upgrading from 10.0.1.x or 10.0.4.0-ifix1, or if you previously installed any of those versions before upgrading to 10.0.5.x, there might be old Postgres client certificates. To verify, run the following command:

```
oc -n <namespace> get certs | grep db-client
```

For example, if you see that both `-db-client-apicuser` and `apicuser` exist, `apicuser` is no longer in use. Remove the old certificates by running one of the following commands, depending on how many old certifications left in your system:

```
oc -n <namespace> delete certs apicuser pgbouncer primaryuser postgres replicator
```

or:

```
oc -n <namespace> delete certs apicuser pgbouncer postgres replicator
```

6. If you are using individual subsystem CRs: Start with the Management subsystem. Update the Management CR as follows:

a. Edit the `ManagementCluster` CR:

```
oc edit ManagementCluster -n <mgmt_namespace>
```

b. **If upgrading from v10.0.4-ifix3, or upgrading from v10.0.1.7-eus (or higher):** In the `spec` section, add a new `allowUpgrade` attribute and set it to `true`

```
spec:
  allowUpgrade: true
```

The `allowUpgrade` attribute enables the upgrade to 10.0.5.x. Because the upgrade to 10.0.5.x. deletes your analytics data, the attribute is required to prevent an accidental upgrade.

c. In the `spec` section, update the API Connect version:

Change the `version` setting to `10.0.5.6`.

d. If you are upgrading to a version of API Connect that requires a new license, update the license value now.

For the list of licenses, see [API Connect licenses](#).

e. Save and close the CR to apply your changes.

The response looks like the following example:

```
managementcluster.management.apiconnect.ibm.com/management edited
```

Note: If you see an error message when you attempt to save the CR, check if it is one of the following known issues:

- Webhook error for incorrect license.

If you did not update the license ID in the CR, then when you save your changes, the following webhook error might display:

```
admission webhook "vapiconnectcluster.kb.io" denied the request:
APIConnectCluster.apiconnect.ibm.com "<instance-name>" is invalid: spec.license.license:
Invalid value: "L-RJON-BYGHM4": License L-RJON-BYGHM4 is invalid for the chosen version.
Please refer license document https://ibm.biz/apiclicenses
```

To resolve the error, see [API Connect licenses](#) for the list of the available license IDs and select the appropriate license IDs for your deployment. Update the CR with the new license value as in the following example, and then save and apply your changes again.

- Webhook error: **Original PostgreSQL primary not found**. Take the following actions to complete the upgrade and fix the cause of the error message:

- Edit your `ManagementCluster` CR and add the following annotation:

```
...
metadata:
  annotations:
    apiconnect-operator/db-primary-not-found-allow-upgrade: "true"
...
```

- Continue with the upgrade. When the upgrade is complete, the management CR reports the warning:

```
Original PostgreSQL primary not found. Run apicops upgrade:pg-health-check to check the health of the
database and to ensure pg_wal symlinks exist. If database health check passes please perform a management
database backup and restore to restore the original PostgreSQL primary pod
```

- Take a new [management database backup](#).
- Immediately [restore](#) from the new backup taken in the previous step. The action of taking and restoring a management backup results in the establishment of a new Postgres primary, eliminating the CR warning message. Be careful to restore from the backup that is taken after the upgrade, and not from a backup taken before upgrade.
- Webhook error: **Original postgres primary is running as replica**. Complete a Postgres failover, see [Postgres failover steps](#). After you apply the Postgres failover steps, the upgrade resumes automatically.

f. Wait until the Management subsystem upgrade is complete before proceeding to the next subsystem. Check the status of the upgrade with: `oc get ManagementCluster -n <mgmt_namespace>`, and wait until all pods are running at the new version. For example:

```
oc get ManagementCluster -n <mgmt_namespace>
NAME          READY   STATUS    VERSION   RECONCILED VERSION   AGE
management   18/18   Running   10.0.5.6   10.0.5.6-1281        97m
```

g. Management subsystem only: If needed, delete old Postgres client certificates.

Skip this step for the Portal, Analytics, and Gateway subsystems.

If you are upgrading from 10.0.1.x or 10.0.4.0-ifix1, or if you previously installed any of those versions before upgrading to 10.0.5.x, there might be old Postgres client certificates. To verify, run the following command:

```
oc -n <namespace> get certs | grep db-client
```

For example, if you see that both `-db-client-apicuser` and `apicuser` exist, `apicuser` is no longer in use. Remove the old certificates by running one of the following commands, depending on how many old certifications left in your system:

- `oc -n <namespace> delete certs apicuser pgbouncer primaryuser postgres replicator`
- `oc -n <namespace> delete certs apicuser pgbouncer postgres replicator`

h. Repeat the process for the remaining subsystem CRs in your preferred order: `GatewayCluster`, `PortalCluster`, `AnalyticsCluster`.

Important:

- In the `GatewayCluster` CR, delete any `template` or `dataPowerOverride` sections. You cannot perform an upgrade if the CR contains an override.
- **If upgrading from v10.0.4-ifix3, or upgrading from v10.0.1.7-eus (or higher):** The `allowUpgrade` attribute set in the Management CR must also be set in the `AnalyticsCluster` CR. It is not required for Gateway or Portal CRs.

i. If you need to restart the deployment, wait until all Portal sites complete the upgrade. Run the following commands to check the status of the sites:

ii. Log in as an admin user:

```
apic login -s <server_name> --realm admin/default-idp-1 --username admin --password <password>
```

iii. Get the portal service ID and endpoint:

```
apic portal-services:get -o admin -s <management_server_endpoint> \
  --availability-zone availability-zone-default <portal-service-name> \
  --output - --format json
```

iv. List the sites:

```
apic --mode portaladmin sites:list -s <management_server_endpoint> \
  --portal_service_name <portal-service-name> \
  --format json
```

Any sites currently upgrading display the `UPGRADING` status; any site that completed its upgrade displays the `INSTALLED` status and the new platform version. Verify that all sites display the `INSTALLED` status before proceeding.

For more information on the `sites` command, see [apic sites:list](#) and [Using the sites commands](#).

v. After all sites are in `INSTALLED` state and have the new platform listed, run:

```
apic --mode portaladmin platforms:list -s <server_name> --portal_service_name <portal_service_name>
```

Verify that the new version of the platform is the only platform listed.

For more information on the `platforms` command, see [apic platforms:list](#) and [Using the platforms commands](#).

7. Upgrading to 10.0.5.5: Verify that the `GatewayCluster` upgraded correctly.

When upgrading to 10.0.5.5 on OpenShift, the rolling update might fail to start on gateway operand pods due to a gateway peering issue, even though the reconciled version on the gateway CR (incorrectly) displays as 10.0.5.5. Complete the following steps to check for this issue and correct it if needed.

a. Check the `productVersion` of each gateway pod to verify that it is 10.0.5.7 (the version of DataPower Gateway that was released with API Connect 10.0.5.5) by running one of the following commands:

```
oc get po -n apic_namespace <gateway_pods> -o yaml | yq .metadata.annotations.productVersion
```

or

```
oc get po -n apic_namespace <gateway_pods> -o custom-columns="productVersion:.metadata.annotations.productVersion"
```

where:

- `apic_namespace` is the namespace where API Connect is installed
- `<gateway_pods>` is a space-delimited list of the names of your gateway peering pods

b. If any pod returns an incorrect value for the version, resolve the issue as explained in [Incorrect productVersion of gateway pods after upgrade](#).

8. (Optional). If you upgraded to 10.0.5.4 or earlier, delete the `DataPowerService` CRs so that they will be regenerated with random passwords for gateway-peering. Starting with API Connect 10.0.5.5, `GatewayCluster` pods are configured by default to secure the gateway-peering sessions with a unique, randomly generated password. However, `GatewayCluster` pods created prior to API Connect 10.0.5.5 are configured to use a single, hard-coded password and upgrading to 10.0.5.5 or later does not replace the hard-coded password.

After upgrading to API Connect 10.0.5.5 or later, you can choose to secure the gateway-peering sessions by running the following command to delete the `DataPowerService` CR that was created by the `GatewayCluster`:

```
oc delete dp <gateway_cluster_name>
```

This action prompts the API Connect Operator to recreate the `DataPowerService` CR with the unique, randomly generated password. This is a one-time change and does not need to be repeated for subsequent upgrades.

9. **If upgrading from v10.0.4-ifix3, or upgrading from v10.0.1.7-eus (or higher):** Enable analytics as explained in [Enabling Analytics after upgrading](#)

10. If you are upgrading to 10.0.5.3 (or later) from an earlier 10.0.5.x release: Review and configure the new inter-subsystem communication features: [Optional post-upgrade steps for upgrade to 10.0.5.3 from earlier 10.0.5 release](#).

11. Restart all `nats-server` pods by running the following command:

```
oc -n <namespace> delete po -l app.kubernetes.io/name=natscluster
```

What to do next

Update your toolkit CLI by downloading it from IBM Fix Central or from the Cloud Manager UI, see [Installing the toolkit](#).

If you are upgrading from v10.0.5.1 or earlier to v10.0.5.2: The change in deployment profile CPU and memory limits that are introduced in 10.0.5.2 (see [New deployment profiles and CPU licensing](#)) can result in a change in the performance of your Management component. If you notice any obvious reduction in performance of the Management UI or toolkit CLI where you have multiple concurrent users, open a support case.

Air-gapped upgrade

In a disconnected, network-restricted, upgrade API Connect on a Red Hat OpenShift Container Platform (OCP) cluster by mirroring product images to a bastion host or a portable device and then completing the upgrade process.

About this task

If you previously deployed or upgraded API Connect in an air-gapped environment, you can use the same bastion host, portable computer, or portable storage as before and just update the product information for the new release.

- **Upgrading with a bastion host**
Use a bastion host to perform an air-gapped upgrade of IBM® API Connect on Red Hat OpenShift Container Platform (OCP) using either the top-level **APIConnectCluster** CR or individual subsystem CRs. First the operator is updated, and then the operands (IBM API Connect itself).
- **Upgrading with a portable computer or storage device**
Use a portable computer or portable storage device to perform an air-gapped upgrade of IBM API Connect on Red Hat OpenShift Container Platform (OCP) using either the top-level **APIConnectCluster** CR or individual subsystem CRs. First the operator is updated, and then the operands (IBM API Connect itself).

Upgrading with a bastion host

Use a bastion host to perform an air-gapped upgrade of IBM® API Connect on Red Hat OpenShift Container Platform (OCP) using either the top-level **APIConnectCluster** CR or individual subsystem CRs. First the operator is updated, and then the operands (IBM API Connect itself).

Before you begin

- If you are upgrading an installation online (connected to the internet), see [Upgrading on OpenShift in an online environment](#).
- The upgrade procedure requires you to use Red Hat Skopeo for moving container images. Skopeo is not available for Microsoft Windows, so you cannot perform this task using a Windows host.
- If you are upgrading to a version of API Connect that supports a newer version of Red Hat OpenShift, complete the API Connect upgrade before upgrading Red Hat OpenShift.
- Upgrading from 10.0.5.2 or earlier: If you did not verify that your Portal customizations are compatible with Drupal 10, do that now. In API Connect 10.0.5.3, the Developer Portal moved from Drupal 9 to Drupal 10 (this upgrade also requires PHP 8.1). The upgrade tooling will update your Developer Portal sites; however, if you have any custom modules or themes, it is your responsibility to ensure their compatibility with Drupal 10 and PHP 8.1 before starting the upgrade. Review the [Guidelines on upgrading your Developer Portal from Drupal 9 to Drupal 10](#) to ensure that any customizations to the Developer Portal are compatible with Drupal 10 and PHP 8.1.

About this task

- The Gateway subsystem remains available during the upgrade of the Management, Portal, and Analytics subsystems.
- Don't use the tilde ~ within double quotation marks in any command because the tilde doesn't expand and your commands might fail.

Procedure

1. Ensure that you have completed all of the steps in [Preparing to upgrade on OpenShift](#), including reviewing the [Upgrade considerations on OpenShift](#). Do not attempt an upgrade until you have reviewed the considerations and prepared your deployment.
2. Ensure your API Connect deployment is ready to upgrade:
 - Your API Connect release (operand) supports a direct upgrade to this release.
For information on the operator and operand version that is used with each API Connect release, see [Operator, operand, and CASE versions](#).
 - The DataPower operator version is correct for the currently deployed version of API Connect.
For information on upgrade paths and supported versions of DataPower Gateway, see [Upgrade considerations on OpenShift](#).
 - Your deployment is running on a version of Red Hat OpenShift that is supported by both the current version of API Connect and the target version of API Connect.
For information, see [Supported versions of OpenShift](#).
3. Set up the mirroring environment.
 - a. Prepare the target cluster:
 - Deploy a supported version of Red Hat OpenShift Container Platform (OCP) as a cluster.
For information, see Table 2 "API Connect and OpenShift Container Platform (OCP) compatibility matrix" in [IBM API Connect Version 10 software product compatibility requirements](#).
 - Configure storage on the cluster and make sure that it is available.
 - b. Prepare the bastion host:

You must be able to connect your bastion host to the internet and to the restricted network environment (with access to the Red Hat OpenShift Container Platform (OCP) cluster and the local registry) at the same time. Your host must be on a Linux x86_64 or Mac platform with any operating system that the Red Hat OpenShift Client supports (in Windows, execute the actions in a Linux x86_64 VM or from a Windows Subsystem for Linux terminal).

 - i. Ensure that the sites and ports listed in Table 1 can be reached from the bastion host:

Table 1. Sites that must be reached from the bastion host

Site	Description
<code>icr.io:443</code>	IBM entitled registry
<code>quay.io:443</code>	Local API Connect image repository

Site	Description
github.com	CASE files and tools
redhat.com	Red Hat OpenShift Container Platform (OCP) upgrades

- ii. On the bastion host, install either Docker or Podman (not both).
Docker and Podman are used for managing containers; you only need to install one of these applications.

- To install Docker (for example, on Red Hat Enterprise Linux), run the following commands:

```
yum check-update
yum install docker
```

- To install Podman, see the [Podman installation instructions](#).
For example, on Red Hat Enterprise Linux 9, install Podman with the following command:

```
yum install podman
```

- iii. Install the Red Hat OpenShift Client tool (`oc`) as explained in [Getting started with the OpenShift CLI](#).
The `oc` tool is used for managing Red Hat OpenShift resources in the cluster.

- iv. Download the IBM Catalog Management Plug-in for IBM Cloud Paks version 1.1.0 or later from [GitHub](#).
The `ibm-pak` plug-in enables you to access hosted product images, and to run `oc ibm-pak` commands against the cluster. To confirm that `ibm-pak` is installed, run the following command and verify that the response lists the command usage:

```
oc ibm-pak --help
```

- c. Set up a local image registry and credentials.

The local Docker registry stores the mirrored images in your network-restricted environment.

- i. Install a registry, or get access to an existing registry.

You might already have access to one or more centralized, corporate registry servers to store the API Connect images. If not, then you must install and configure a production-grade registry before proceeding.

The registry product that you use must meet the following requirements:

- Supports multi-architecture images through Docker Manifest V2, Schema 2
For details, see [Docker Manifest V2, Schema 2](#).
- Is accessible from the Red Hat OpenShift Container Platform cluster nodes
- Allows path separators in the image name

Note: Do not use the Red Hat OpenShift image registry as your local registry because it does not support multi-architecture images or path separators in the image name.

- ii. Configure the registry to meet the following requirements:

- Supports auto-repository creation
- Has sufficient storage to hold all of the software that is to be transferred
- Has the credentials of a user who can create and write to repositories (the mirroring process uses these credentials)
- Has the credentials of a user who can read all repositories (the Red Hat OpenShift Container Platform cluster uses these credentials)

To access your registries during an air-gapped installation, use an account that can write to the target local registry. To access your registries during runtime, use an account that can read from the target local registry.

4. Set environment variables and download CASE files.

Create environment variables to use while mirroring images, connect to the internet, and download the API Connect CASE files.

- a. Create the following environment variables with the installer image name and the image inventory on your host:

Because you will use values from two different CASE files, you must create environment variables for both; notice that the variables for the foundational services (common services) CASE file are prefixed with "CS_" to differentiate them.

```
export CASE_NAME=ibm-apiconnect
export CASE_VERSION=4.0.7
export ARCH=amd64
```

For information on API Connect CASE versions and their corresponding operators and operands, see [Operator, operand, and CASE versions](#).

```
export CS_CASE_NAME=ibm-cp-common-services
export CS_CASE_VERSION=1.15.10
export CS_ARCH=amd64
```

For example, for IBM Cloud Pak foundational services 3.19.X (Long Term Service Release), use version 1.15.10; for foundational services 3.23.X (Continuous Delivery), use version 1.19.2.

For information on IBM Cloud Pak foundational services (common services) CASE versions, see "Table 1. Image versions for offline installation" in [Installing IBM Cloud Pak foundational services in an air-gapped environment](#) in the IBM Cloud Pak foundational services documentation.

- b. Connect your host to the internet (it does not need to be connected to the network-restricted environment at this time).

- c. Download the CASE file to your host:

Be sure to download both CASE files as shown in the example:

```
oc ibm-pak get $CASE_NAME --version $CASE_VERSION

oc ibm-pak get $CS_CASE_NAME --version $CS_CASE_VERSION
```

If you omit the `--version` parameter, the command downloads the latest version of the file.

5. Mirror the images.

The process of mirroring images pulls the images from the internet and pushes them to your local registry. After mirroring your images, you can configure your cluster and pull the images to it before installing API Connect.

- a. Generate mirror manifests.

- i. Define the environment variable `$TARGET_REGISTRY` by running the following command:

```
export TARGET_REGISTRY=<target-registry>
```

- Replace `<target-registry>` with the IP address (or host name) and port of the local registry; for example: `172.16.0.10:5000`. If you want the images to use a specific namespace within the target registry, you can specify it here; for example: `172.16.0.10:5000/registry_ns`.
- ii. Generate mirror manifests by running the following commands:

```
oc ibm-pak generate mirror-manifests $CASE_NAME $TARGET_REGISTRY --version $CASE_VERSION

oc ibm-pak generate mirror-manifests $CS_CASE_NAME $TARGET_REGISTRY --version $CS_CASE_VERSION
```

If you need to filter for a specific image group, add the parameter `--filter <image_group>` to this command.

The `generate` command creates the following files at `~/ibm-pak/data/mirror/$CASE_NAME/$CASE_VERSION` and `~/ibm-pak/data/mirror/$CS_CASE_NAME/$CS_CASE_VERSION`:

- `catalog-sources.yaml`
- `catalog-sources-linux-<arch>.yaml` (if there are architecture-specific catalog sources)
- `image-content-source-policy.yaml`
- `images-mapping.txt`

The files are used when mirroring the images to the `TARGET_REGISTRY`.

- b. Obtain an entitlement key for the entitled registry where the images are hosted:
 - i. Log in to the [IBM Container Library](#).
 - ii. In the Container software library, select Get entitlement key.
 - iii. In the "Access your container software" section, click Copy key.
 - iv. Copy the key to a safe location; you will use it to log in to `cp.icr.io` in the next step.

- c. Authenticate with the entitled registry where the images are hosted.

The image pull secret allows you to authenticate with the entitled registry and access product images.

- i. Run the following command to export the path to the file that will store the authentication credentials that are generated on a Podman or Docker login:

```
export REGISTRY_AUTH_FILE=$HOME/.docker/config.json
```

The authentication file is typically located at `$HOME/.docker/config.json` on Linux or `%USERPROFILE%\.docker/config.json` on Windows.

- ii. Log in to the `cp.icr.io` registry with Podman or Docker; for example:

```
podman login cp.icr.io
```

Use `cp` as the username and your entitlement key as the password.

- d. Authenticate with the local registry.

Log in to the local registry using an account that can write images to that registry; for example:

```
podman login $TARGET_REGISTRY
```

If the registry is insecure, add the following flag to the command: `--tls-verify=false`.

- e. Update the CASE manifest to correctly reference the DataPower Operator image.

Files for the DataPower Operator are now hosted on `icr.io`; however, the CASE manifest still refers to `docker.io` as the image host. To work around this issue, visit [Airgap install failure due to 'unable to retrieve source image docker.io'](#) in the DataPower documentation and update the manifest as instructed. After the manifest is updated, continue to the next step in this procedure.

- f. Mirror the product images.

- i. Connect the bastion host to both the internet and the restricted-network environment that contains the local registry.
- ii. Run the following commands to copy the images to the local registry:

```
oc image mirror \
-f ~/.ibm-pak/data/mirror/$CASE_NAME/$CASE_VERSION/images-mapping.txt \
--filter-by-os '*' \
-a $REGISTRY_AUTH_FILE \
--skip-multiple-scopes \
--max-per-registry=1

oc image mirror \
-f ~/.ibm-pak/data/mirror/$CS_CASE_NAME/$CS_CASE_VERSION/images-mapping.txt \
-a $REGISTRY_AUTH_FILE \
--filter-by-os '*' \
--skip-multiple-scopes \
--max-per-registry=1
```

Note: If the local registry is not secured by TLS, or the certificate presented by the local registry is not trusted by your device, add the `--insecure` option to the command.

There might be a slight delay before you see a response to the command.

- g. Configure the target cluster.

Now that images have been mirrored to the local registry, the target cluster must be configured to pull the images from it. Complete the following steps to configure the cluster's global pull secret with the local registry's credentials and then instruct the cluster to pull the images from the local registry.

- i. Log in to your Red Hat OpenShift Container Platform cluster:

```
oc login <openshift_url> -u <username> -p <password> -n <namespace>
```

- ii. [Update the global image pull secret](#) for the cluster as explained in the Red Hat OpenShift Container Platform documentation. Updating the image pull secret provides the cluster with the credentials needed for pulling images from your local registry.

Note: If you have an insecure registry, add the registry to the cluster's `insecureRegistries` list by running the following command:

```
oc edit image.config.openshift.io/cluster -o yaml
```

and add the TARGET_REGISTRY to `spec.registrySources.insecureRegistries` as shown in the following example:

```
spec:
  registrySources:
    insecureRegistries:
      - insecure0.svc:5001
      - <TARGET_REGISTRY>
```

If the `insecureRegistries` field does not exist, you can add it.

- iii. Create the ImageContentSourcePolicy, which instructs the cluster to pull the images from your local registry (run both commands):

```
oc apply -f ~/.ibm-pak/data/mirror/${CASE_NAME}/${CASE_VERSION}/image-content-source-policy.yaml
oc apply -f ~/.ibm-pak/data/mirror/${CS_CASE_NAME}/${CS_CASE_VERSION}/image-content-source-policy.yaml
```

- iv. Verify that the ImageContentSourcePolicy resource was created:

```
oc get imageContentSourcePolicy
```

- v. Verify your cluster node status:

```
oc get MachineConfigPool -w
```

Wait for all nodes to be updated before proceeding to the next step.

6. Apply the catalog sources.

Now that you have mirrored images to the target cluster, apply the catalog sources.

In the following steps, replace `<Architecture>` with either `amd64`, `s390x` or `ppc64le` as appropriate for your environment.

- a. Export the variables for the command line to use:

```
export CASE_NAME=ibm-apiconnect
export CASE_VERSION=4.0.7
export ARCH=amd64

export CS_CASE_NAME=ibm-cp-common-services
export CS_CASE_VERSION=1.15.10
export CS_ARCH=amd64
```

- b. Generate the catalog sources and save them in another directory in case you need to replicate this installation in the future.

- i. Get the catalog sources:

```
cat ~/.ibm-pak/data/mirror/${CASE_NAME}/${CASE_VERSION}/catalog-sources.yaml
cat ~/.ibm-pak/data/mirror/${CS_CASE_NAME}/${CS_CASE_VERSION}/catalog-sources.yaml
```

- ii. Get any architecture-specific catalog sources that you need to back up as well:

```
cat ~/.ibm-pak/data/mirror/${CASE_NAME}/${CASE_VERSION}/catalog-sources-linux-${ARCH}.yaml
```

You can also navigate to the directory in your file browser to copy these artifacts into files that you can keep for re-use or for pipelines.

- c. Apply the catalog sources to the cluster.

- i. Apply the universal catalog sources:

```
oc apply -f ~/.ibm-pak/data/mirror/${CASE_NAME}/${CASE_VERSION}/catalog-sources.yaml
oc apply -f ~/.ibm-pak/data/mirror/${CS_CASE_NAME}/${CS_CASE_VERSION}/catalog-sources.yaml
```

- ii. Apply any architecture-specific catalog sources:

```
oc apply -f ~/.ibm-pak/data/mirror/${CASE_NAME}/${CASE_VERSION}/catalog-sources-linux-${ARCH}.yaml
```

- iii. Confirm that the catalog sources have been created in the `openshift-marketplace` namespace:

```
oc get catalogsources -n openshift-marketplace
```

7. Update the operator channel.

- a. Open the Red Hat OpenShift web console and click Operators > Installed Operators > IBM API connect > Subscriptions.

- b. Change the channel to the new version (v3.6), which triggers an upgrade of the API Connect operator.

If you are upgrading from 10.0.4-ifix3 and the API Connect operator does not begin its upgrade within a few minutes, perform the following workaround to delete the `ibm-ai-wmltraining` subscription and associated csv:

- i. Run the following command to get the name of the subscription:

```
oc get subscription -n <APIC_namespace> --no-headers=true | grep ibm-ai-wmltraining | awk '{print $1}'
```

- ii. Run the following command to delete the subscription:

```
oc delete subscription <subscription-name> -n <APIC_namespace>
```

- iii. Run the following command to get the name of the csv:

```
oc get csv --no-headers=true -n <APIC_namespace> | grep ibm-ai-wmltraining | awk '{print $1}'
```

- iv. Run the following command to delete the csv:

```
oc delete csv <csv-name> -n <APIC_namespace>
```

Deleting the subscription and csv triggers the API Connect operator upgrade.

When the API Connect operator is updated, the new operator pod starts automatically.

8. Verify that the API Connect operator was updated by completing the following steps:

- a. Get the name of the pod that hosts the operator by running the following command:

```
oc get po -n <APIC_namespace> | grep apiconnect
```

The response looks like the following example:

```
ibm-apiconnect-7bdb795465-8f7rm      1/1      Running    0          4m23s
```

- b. Get the API Connect version deployed on that pod by running the following command:

```
oc describe po <ibm-apiconnect-operator-podname> -n <APIC_namespace> | grep -i productversion
```

The response looks like the following example:

```
productVersion: 10.0.5.6
```

9. If you are using a top-level CR: Update the top-level `APIConnectCluster` CR:
The `spec` section of the `apiconnectcluster` looks like the following example:

```
apiVersion: apiconnect.ibm.com/v1beta1
kind: APIConnectCluster
metadata:
  labels:
    app.kubernetes.io/instance: apiconnect
    app.kubernetes.io/managed-by: ibm-apiconnect
    app.kubernetes.io/name: apiconnect-production
  name: prod
  namespace: <APIC_namespace>
spec:
  allowUpgrade: true
  license:
    accept: true
    use: production
    license: L-GVEN-GFUPVE
  profile: n12xc4.m12
  version: 10.0.5.6
  storageClassName: rook-ceph-block
```

- a. Edit the `apiconnectcluster` CR by running the following command:

```
oc -n <APIC_namespace> edit apiconnectcluster
```

- b. If upgrading from v10.0.4-ifix3, or upgrading from v10.0.1.7-eus (or higher): In the `spec` section, add a new `allowUpgrade` attribute and set it to `true`:

```
spec:
  allowUpgrade: true
```

The `allowUpgrade` attribute enables the upgrade to 10.0.5.x. Because the upgrade deletes your analytics data, the attribute is required to prevent an accidental upgrade.

- c. In the `spec` section, update the API Connect version:
Change the `version` setting to 10.0.5.6.
d. In the `spec.gateway` section of the CR, delete any `template` or `dataPowerOverride` sections.
You cannot perform an upgrade if the CR contains an override.
e. Save and close the CR.
The response looks like the following example:

```
apiconnectcluster.apiconnect.ibm.com/prod configured
```

Note: If you see an error message when you attempt to save the CR, check if it is one of the following known issues:

- Webhook error for incorrect license.
If you did not update the license ID in the CR, then when you save your changes, the following webhook error might display:

```
admission webhook "vapiconnectcluster.kb.io" denied the request:
APIConnectCluster.apiconnect.ibm.com "<instance-name>" is invalid: spec.license.license:
Invalid value: "L-RJON-BYGHM4": License L-RJON-BYGHM4 is invalid for the chosen version.
Please refer license document https://ibm.biz/apiclicenses
```

To resolve the error, see [API Connect licenses](#) for the list of the available license IDs and select the appropriate license IDs for your deployment. Update the CR with the new license value as in the following example, and then save and apply your changes again.

- Webhook error: `Original PostgreSQL primary not found`. Take the following actions to complete the upgrade and fix the cause of the error message:
 - Edit your `apiconnectcluster` CR and add the following annotation:

```
...
metadata:
  annotations:
    apiconnect-operator/db-primary-not-found-allow-upgrade: "true"
  ...
```

- Continue with the upgrade. When the upgrade is complete, the management CR reports the warning:

```
Original PostgreSQL primary not found. Run apicops upgrade:pg-health-check to check the health of the
database and to ensure pg wal symlinks exist. If database health check passes please perform a management
database backup and restore to restore the original PostgreSQL primary pod
```

- Take a new [management database backup](#).
- Immediately [restore](#) from the new backup taken in the previous step. The action of taking and restoring a management backup results in the establishment of a new Postgres primary, eliminating the CR warning message. Be careful to restore from the backup that is taken after the upgrade, and not from a backup taken before upgrade.

- Webhook error: **Original postgres primary is running as replica**. Complete a Postgres failover, see [Postgres failover steps](#). After you apply the Postgres failover steps, the upgrade resumes automatically. If needed, delete old Postgres client certificates.

If you are upgrading from 10.0.1.x or 10.0.4.0-ifix1, or if you previously installed any of those versions before upgrading to 10.0.5.x, there might be old Postgres client certificates. To verify, run the following command:

```
oc -n <namespace> get certs | grep db-client
```

For example, if you see that both `-db-client-apicuser` and `apicuser` exist, `apicuser` is no longer in use. Remove the old certificates by running one of the following commands, depending on how many old certifications left in your system:

```
oc -n <namespace> delete certs apicuser pgbouncer primaryuser postgres replicator
```

or:

```
oc -n <namespace> delete certs apicuser pgbouncer postgres replicator
```

10. If you are using individual subsystem CRs: Start with the Management subsystem and update by completing the following steps:

a. Edit the `ManagementCluster` CR:

```
oc edit ManagementCluster -n <mgmt_namespace>
```

b. **If upgrading from v10.0.4-ifix3, or upgrading from v10.0.1.7-eus (or higher):** In the `spec` section, add a new `allowUpgrade` attribute and set it to `true`.

```
spec:
  allowUpgrade: true
```

The `allowUpgrade` attribute enables the upgrade to 10.0.5.x. Because the upgrade to 10.0.5.x. deletes your analytics data, the attribute is required to prevent an accidental upgrade.

c. In the `spec` section, update the API Connect version:

Change the `version` setting to `10.0.5.6`.

d. If you are upgrading to a version of API Connect that requires a new license, update the license value now.

For the list of licenses, see [API Connect licenses](#).

e. Save and close the CR to apply your changes.

The response looks like the following example:

```
managementcluster.management.apiconnect.ibm.com/management edited
```

Note: If you see an error message when you attempt to save the CR, check if it is one of the following known issues:

- Webhook error for incorrect license.

If you did not update the license ID in the CR, then when you save your changes, the following webhook error might display:

```
admission webhook "vapiconnectcluster.kb.io" denied the request:
APIConnectCluster.apiconnect.ibm.com "<instance-name>" is invalid: spec.license.license:
Invalid value: "L-RJON-BYGHM4": License L-RJON-BYGHM4 is invalid for the chosen version version.
Please refer license document https://ibm.biz/apiclicenses
```

To resolve the error, see [API Connect licenses](#) for the list of the available license IDs and select the appropriate license IDs for your deployment.

Update the CR with the new license value as in the following example, and then save and apply your changes again.

- Webhook error: **Original PostgreSQL primary not found**. Take the following actions to complete the upgrade and fix the cause of the error message:

- Edit your `ManagementCluster` CR and add the following annotation:

```
...
metadata:
  annotations:
    apiconnect-operator/db-primary-not-found-allow-upgrade: true
...
```

- Continue with the upgrade. When the upgrade is complete, the management CR reports the warning:

```
Original PostgreSQL primary not found. Run apicops upgrade:pg-health-check to check the health of the
database and to ensure pg_wal symlinks exist. If database health check passes please perform a management
database backup and restore to restore the original PostgreSQL primary pod
```

- Take a new [management database backup](#).
- Immediately [restore](#) from the new backup taken in the previous step. The action of taking and restoring a management backup results in the establishment of a new Postgres primary, eliminating the CR warning message. Be careful to restore from the backup that is taken after the upgrade, and not from a backup taken before upgrade.

- Webhook error: **Original postgres primary is running as replica**. Complete a Postgres failover, see [Postgres failover steps](#). After you apply the Postgres failover steps, the upgrade resumes automatically.

f. Confirm that the Management subsystem upgrade is complete.

Check the status of the upgrade with: `oc get ManagementCluster -n <mgmt_namespace>`, and wait until all pods are running at the new version. For example:

```
oc get ManagementCluster -n <mgmt_namespace>
NAME          READY   STATUS    VERSION   RECONCILED VERSION   AGE
management   18/18   Running   10.0.5.6   10.0.5.6-1281        97m
```

g. Management subsystem only: If needed, delete old Postgres client certificates.

Skip this step for the Portal, Analytics, and Gateway subsystems.

If you are upgrading from 10.0.1.x or 10.0.4.0-ifix1, or if you previously installed any of those versions before upgrading to 10.0.5.x, there might be old Postgres client certificates. To verify, run the following command:

```
oc -n <namespace> get certs | grep db-client
```

For example, if you see that both `-db-client-apicuser` and `apicuser` exist, `apicuser` is no longer in use. Remove the old certificates by running one of the following commands, depending on how many old certifications left in your system:

```
oc -n <namespace> delete certs apicuser pgbouncer postgres replicator
```

or:

```
oc -n <namespace> delete certs apicuser pgbouncer postgres replicator
```

h. Repeat the process for the remaining subsystem CRs: `GatewayCluster`, `PortalCluster`, and then `AnalyticsCluster`.

Important:

- In the `GatewayCluster` CR, delete any `template` or `dataPowerOverride` sections. You cannot perform an upgrade if the CR contains an override.
- **If upgrading from v10.0.4-ifix3, or upgrading from v10.0.1.7-eus (or higher):** The `allowUpgrade` attribute set in the Management CR must also be set in the `AnalyticsCluster` CR. It is not required for Gateway or Portal CRs.

11. Validate that the upgrade was successfully deployed by running the following command:

```
oc get apic -n <APIC_namespace>
```

The response looks like the following example:

NAME	READY	STATUS	VERSION	RECONCILED VERSION	AGE
analyticscluster.analytics.apiconnect.ibm.com/prod-a7s	5/5	Running	10.0.5.6	10.0.5.6	21h

NAME	STATUS	MESSAGE			
managementdbupgrade.management.apiconnect.ibm.com/prod-mgmt-up-649mc	Complete	Upgrade is Complete (DB Schema/data are up-to-date)			
managementdbupgrade.management.apiconnect.ibm.com/prod-mgmt-up-9mjhk	Complete	Fresh install is Complete (DB Schema/data are up-to-date)			
NAME	READY	STATUS	VERSION	RECONCILED VERSION	AGE
portalcluster.portal.apiconnect.ibm.com/prod-ptl	3/3	Running	10.0.5.6	10.0.5.6	21h

Important: If you need to restart the deployment, wait until all Portal sites complete the upgrade. Run the following commands to check the status of the sites:

a. Log in as an admin user:

```
apic login -s <server_name> --realm admin/default-idp-1 --username admin --password <password>
```

b. Get the portal service ID and endpoint:

```
apic portal-services:get -o admin -s <management_server_endpoint> \
  --availability-zone availability-zone-default <portal-service-name> \
  --output - --format json
```

c. List the sites:

```
apic --mode portaladmin sites:list -s <management_server_endpoint> \
  --portal_service_name <portal-service-name> \
  --format json
```

Any sites currently upgrading display the `UPGRADING` status; any site that completed its upgrade displays the `INSTALLED` status and the new platform version. Verify that all sites display the `INSTALLED` status before proceeding.

For more information on the `sites` command, see [apic sites:list](#) and [Using the sites commands](#).

d. After all sites are in `INSTALLED` state and have the new platform listed, run the following command:

```
apic --mode portaladmin platforms:list -s <server_name> --portal_service_name <portal_service_name>
```

Verify that the new version of the platform is the only platform listed.

For more information on the `platforms` command, see [apic platforms:list](#) and [Using the platforms commands](#).

12. Upgrading to 10.0.5.5: Verify that the GatewayCluster upgraded correctly.

When upgrading to 10.0.5.5 on OpenShift, the rolling update might fail to start on gateway operand pods due to a gateway peering issue, even though the reconciled version on the gateway CR (incorrectly) displays as 10.0.5.5. Complete the following steps to check for this issue and correct it if needed.

a. Check the `productVersion` of each gateway pod to verify that it is 10.0.5.7 (the version of DataPower Gateway that was released with API Connect 10.0.5.5) by running one of the following commands:

```
oc get po -n apic_namespace <gateway_pods> -o yaml | yq .metadata.annotations.productVersion
```

or

```
oc get po -n apic_namespace <gateway_pods> -o custom-columns="productVersion:.metadata.annotations.productVersion"
```

where:

- `apic_namespace` is the namespace where API Connect is installed
- `<gateway_pods>` is a space-delimited list of the names of your gateway peering pods

b. If any pod returns an incorrect value for the version, resolve the issue as explained in [Incorrect productVersion of gateway pods after upgrade](#).

13. (Optional). If you upgraded from 10.0.5.4 or earlier, delete the DataPowerService CRs so that they will be regenerated with random passwords for gateway-peering. Starting with API Connect 10.0.5.5, GatewayCluster pods are configured by default to secure the gateway-peering sessions with a unique, randomly generated password. However, GatewayCluster pods created prior to API Connect 10.0.5.5 are configured to use a single, hard-coded password and upgrading to 10.0.5.5 or later does not replace the hard-coded password.

After upgrading to API Connect 10.0.5.5 or later, you can choose to secure the gateway-peering sessions by running the following command to delete the DataPowerService CR that was created by the GatewayCluster:

```
oc delete dp <gateway_cluster_name>
```

This action prompts the API Connect Operator to recreate the DataPowerService CR with the unique, randomly generated password. This is a one-time change and does not need to be repeated for subsequent upgrades.

14. **If upgrading from v10.0.4-ifix3, or upgrading from v10.0.1.7-eus (or higher):** Enable analytics as explained in [Enabling Analytics after upgrading](#)

15. If you are upgrading to 10.0.5.3 (or later) from an earlier 10.0.5.x release: Review and configure the new inter-subsystem communication features: [Optional post-upgrade steps for upgrade to 10.0.5.3 from earlier 10.0.5 release](#).

16. Restart all nats-server pods by running the following command:

```
oc -n <namespace> delete po -l app.kubernetes.io/name=natscluster
```

What to do next

Update your toolkit CLI by downloading it from IBM Fix Central or from the Cloud Manager UI, see [Installing the toolkit](#).

If you are upgrading from v10.0.5.1 or earlier to v10.0.5.2: The change in deployment profile CPU and memory limits that are introduced in 10.0.5.2 (see [New deployment profiles and CPU licensing](#)) can result in a change in the performance of your Management component. If you notice any obvious reduction in performance of the Management UI or toolkit CLI where you have multiple concurrent users, open a support case.

Upgrading with a portable computer or storage device

Use a portable computer or portable storage device to perform an air-gapped upgrade of IBM® API Connect on Red Hat OpenShift Container Platform (OCP) using either the top-level `APICConnectCluster` CR or individual subsystem CRs. First the operator is updated, and then the operands (IBM API Connect itself).

Before you begin

- If you are upgrading an installation online (connected to the internet), see [Upgrading on OpenShift in an online environment](#).
- The upgrade procedure requires you to use Red Hat Skopeo for moving container images. Skopeo is not available for Microsoft Windows, so you cannot perform this task using a Windows host.
- If you are upgrading to a version of API Connect that supports a newer version of Red Hat OpenShift, complete the API Connect upgrade before upgrading Red Hat OpenShift.
- Upgrading from 10.0.5.2 or earlier: If you did not verify that your Portal customizations are compatible with Drupal 10, do that now. In API Connect 10.0.5.3, the Developer Portal moved from Drupal 9 to Drupal 10 (this upgrade also requires PHP 8.1). The upgrade tooling will update your Developer Portal sites; however, if you have any custom modules or themes, it is your responsibility to ensure their compatibility with Drupal 10 and PHP 8.1 before starting the upgrade. Review the [Guidelines on upgrading your Developer Portal from Drupal 9 to Drupal 10](#) to ensure that any customizations to the Developer Portal are compatible with Drupal 10 and PHP 8.1.

About this task

- The Gateway subsystem remains available during the upgrade of the Management, Portal, and Analytics subsystems.
- Don't use the tilde ~ within double quotation marks in any command because the tilde doesn't expand and your commands might fail.

Procedure

1. Ensure that you have completed all of the steps in [Preparing to upgrade on OpenShift](#), including reviewing the [Upgrade considerations on OpenShift](#). Do not attempt an upgrade until you have reviewed the considerations and prepared your deployment.
2. Ensure your API Connect deployment is ready to upgrade:
 - Your API Connect release (operand) supports a direct upgrade to this release.
For information on the operator and operand version that is used with each API Connect release, see [Operator, operand, and CASE versions](#).
 - The DataPower operator version is correct for the currently deployed version of API Connect.
For information on upgrade paths and supported versions of DataPower Gateway, see [Upgrade considerations on OpenShift](#).
 - Your deployment is running on a version of Red Hat OpenShift that is supported by both the current version of API Connect and the target version of API Connect.
For information, see [Supported versions of OpenShift](#).
3. Set up the mirroring environment.
 - a. Prepare the target cluster:
 - Deploy a supported version of Red Hat OpenShift Container Platform (OCP) as a cluster.
For information, see Table 2 "API Connect and OpenShift Container Platform (OCP) compatibility matrix" in [IBM API Connect Version 10 software product compatibility requirements](#).
 - Configure storage on the cluster and make sure that it is available.
 - b. Prepare the portable device:

You must be able to connect your portable device to the internet and to the restricted network environment (with access to the Red Hat OpenShift Container Platform (OCP) cluster and the local registry). The portable device must be on a Linux x86_64 or Mac platform with any operating system that the Red Hat OpenShift Client supports (in Windows, execute the actions in a Linux x86_64 VM or from a Windows Subsystem for Linux terminal).

 - i. Ensure that the portable device has sufficient storage to hold all of the software that is to be transferred to the local registry.
 - ii. On the portable device, install either Docker or Podman (not both).
Docker and Podman are used for managing containers; you only need to install one of these applications.
 - To install Docker (for example, on Red Hat Enterprise Linux), run the following commands:

```
yum check-update
yum install docker
```
 - To install Podman, see the [Podman installation instructions](#).
For example, on Red Hat Enterprise Linux 9, install Podman with the following command:

```
yum install podman
```
 - iii. Install the Red Hat OpenShift Client tool (`oc`) as explained in [Getting started with the OpenShift CLI](#).
The `oc` tool is used for managing Red Hat OpenShift resources in the cluster.
 - iv. Download the IBM Catalog Management Plug-in for IBM Cloud Paks version 1.1.0 or later from [GitHub](#).
The `ibm-pak` plug-in enables you to access hosted product images, and to run `oc ibm-pak` commands against the cluster. To confirm that `ibm-pak` is installed, run the following command and verify that the response lists the command usage:

```
oc ibm-pak --help
```
 - c. Set up a local image registry and credentials.
The local Docker registry stores the mirrored images in your network-restricted environment.
 - i. Install a registry, or get access to an existing registry.
You might already have access to one or more centralized, corporate registry servers to store the API Connect images. If not, then you must install and configure a production-grade registry before proceeding.

The registry product that you use must meet the following requirements:
 - Supports multi-architecture images through Docker Manifest V2, Schema 2
For details, see [Docker Manifest V2, Schema 2](#).
 - Is accessible from the Red Hat OpenShift Container Platform cluster nodes
 - Allows path separators in the image name

Note: Do not use the Red Hat OpenShift image registry as your local registry because it does not support multi-architecture images or path separators in the image name.
 - ii. Configure the registry to meet the following requirements:
 - Supports auto-repository creation
 - Has sufficient storage to hold all of the software that is to be transferred
 - Has the credentials of a user who can create and write to repositories (the mirroring process uses these credentials)
 - Has the credentials of a user who can read all repositories (the Red Hat OpenShift Container Platform cluster uses these credentials)

To access your registries during an air-gapped installation, use an account that can write to the target local registry. To access your registries during runtime, use an account that can read from the target local registry.
4. Set environment variables and download CASE files.
Create environment variables to use while mirroring images, connect to the internet, and download the API Connect CASE files.
 - a. Create the following environment variables with the installer image name and the image inventory on your portable device:
Because you will use values from two different CASE files, you must create environment variables for both; notice that the variables for the foundational services (common services) CASE file are prefixed with "CS_" to differentiate them.

```
export CASE_NAME=ibm-apiconnect
export CASE_VERSION=4.0.7
export ARCH=amd64
```

For information on API Connect CASE versions and their corresponding operators and operands, see [Operator, operand, and CASE versions](#).

```
export CS_CASE_NAME=ibm-cp-common-services
export CS_CASE_VERSION=1.15.10
export CS_ARCH=amd64
```

For example, for IBM Cloud Pak foundational services 3.19.X (Long Term Service Release), use version 1.15.10; for foundational services 3.23.X (Continuous Delivery), use version 1.19.2.

For information on IBM Cloud Pak foundational services (common services) CASE versions, see "Table 1. Image versions for offline installation" in [Installing IBM Cloud Pak foundational services in an air-gapped environment](#) in the IBM Cloud Pak foundational services documentation.

- b. Connect your portable device to the internet (it does not need to be connected to the network-restricted environment at this time).
- c. Download the CASE file to your portable device:
Be sure to download both CASE files as shown in the example:

```
oc ibm-pak get $CASE_NAME --version $CASE_VERSION

oc ibm-pak get $CS_CASE_NAME --version $CS_CASE_VERSION
```

If you omit the `--version` parameter, the command downloads the latest version of the file.

5. Mirror the images.

The process of mirroring images pulls the images from the internet and pushes them to your local registry. After mirroring your images, you can configure your cluster and pull the images to it before installing API Connect.

- a. Generate mirror manifests.
 - i. Define the environment variable `$TARGET_REGISTRY` by running the following command:

```
export TARGET_REGISTRY=<target-registry>
```

Replace `<target-registry>` with the IP address (or host name) and port of the local registry; for example: `172.16.0.10:5000`. If you want the images to use a specific namespace within the target registry, you can specify it here; for example: `172.16.0.10:5000/registry_ns`.

- ii. Generate mirror manifests by running the following commands:

```
oc ibm-pak generate mirror-manifests $CASE_NAME $TARGET_REGISTRY --version $CASE_VERSION

oc ibm-pak generate mirror-manifests $CS_CASE_NAME $TARGET_REGISTRY --version $CS_CASE_VERSION
```

If you need to filter for a specific image group, add the parameter `--filter <image_group>` to this command.

The `generate` command creates the following files at `~/.ibm-pak/data/mirror/$CASE_NAME/$CASE_VERSION` and `~/.ibm-pak/data/mirror/$CS_CASE_NAME/$CS_CASE_VERSION`:

- `catalog-sources.yaml`
- `catalog-sources-linux-<arch>.yaml` (if there are architecture-specific catalog sources)
- `image-content-source-policy.yaml`
- `images-mapping-to-filesystem.txt`
- `images-mapping-from-filesystem.txt`

The files are used when mirroring the images to the `TARGET_REGISTRY`.

- b. Obtain an entitlement key for the entitled registry where the images are hosted:
 - i. Log in to the [IBM Container Library](#).
 - ii. In the Container software library, select Get entitlement key.
 - iii. In the "Access your container software" section, click Copy key.
 - iv. Copy the key to a safe location; you will use it to log in to `cp.icr.io` in the next step.
- c. Authenticate with the entitled registry where the images are hosted.

The image pull secret allows you to authenticate with the entitled registry and access product images.

- i. Run the following command to export the path to the file that will store the authentication credentials that are generated on a Podman or Docker login:

```
export REGISTRY_AUTH_FILE=$HOME/.docker/config.json
```

The authentication file is typically located at `$HOME/.docker/config.json` on Linux or `%USERPROFILE%\.docker/config.json` on Windows.

- ii. Log in to the `cp.icr.io` registry with Podman or Docker; for example:

```
podman login cp.icr.io
```

Use `cp` as the username and your entitlement key as the password.

- d. Update the API Connect CASE manifest to correctly reference the DataPower Operator image.
Files for the DataPower Operator are now hosted on `icr.io`; however, the CASE manifest still refers to `docker.io` as the image host. To work around this issue, visit [Airgap install failure due to 'unable to retrieve source image docker.io'](#) in the DataPower documentation and update the manifest as instructed. The manifest for API Connect (which uses the DataPower Operator) is stored in `~/.ibm-pak/data/mirror/$CASE_NAME/$CASE_VERSION`.

After the manifest is updated, continue to the next step in this procedure.

- e. Mirror the images from the internet to the portable device.
 - i. Define the environment variable `$IMAGE_PATH` by running the following command:

```
export IMAGE_PATH=<image-path>
```

where `<image-path>` indicates where the files will be stored on the portable device's file system.

- ii. Mirror the images to the portable device:

```
oc image mirror \
-f ~/.ibm-pak/data/mirror/$CASE_NAME/$CASE_VERSION/images-mapping-to-filesystem.txt \
--filter-by-os '*' \
-a $REGISTRY_AUTH_FILE \
--skip-multiple-scopes \
```

```

--max-per-registry=1 \
--dir "$IMAGE_PATH"

oc image mirror \
-f ~/.ibm-pak/data/mirror/$CS_CASE_NAME/$CS_CASE_VERSION/images-mapping-to-filesystem.txt \
--filter-by-os '*' \
-a $REGISTRY_AUTH_FILE \
--skip-multiple-scopes \
--max-per-registry=1 \
--dir "$IMAGE_PATH"

```

There might be a slight delay before you see a response to the command.

- f. Move the portable device to the restricted-network environment.

The procedure depends on the type of device that you are using:

If you are using a portable computer, disconnect the device from the internet and connect it to the restricted-network environment. The same environment variables can be used.

If you are using portable storage, complete the following steps:

- i. Transfer the following files to a device in the restricted-network environment:
 - The `~/.ibm-pak` directory.
 - The contents of the `<image-path>` that you specified in the previous step.
- ii. Create the same environment variables as on the original device; for example:

```

export CASE_NAME=ibm-apiconnect
export CASE_VERSION=4.0.7
export ARCH=amd64

export CS_CASE_NAME=ibm-cp-common-services
export CS_CASE_VERSION=1.15.10
export CS_ARCH=amd64

export REGISTRY_AUTH_FILE=$HOME/.docker/config.json

export IMAGE_PATH=<image-path>

```

- g. Authenticate with the local registry.

Log in to the local registry using an account that can write images to that registry; for example:

```
podman login $TARGET_REGISTRY
```

If the registry is insecure, add the following flag to the command: `--tls-verify=false`.

- h. Mirror the product images to the target registry.

- i. If you are using a portable computer, connect it to the restricted-network environment that contains the local registry. If you are using portable storage, you already transferred files to a device within the restricted-network environment.
- ii. Run the following commands to copy the images to the local registry:

```

oc image mirror \
-f ~/.ibm-pak/data/mirror/$CASE_NAME/$CASE_VERSION/images-mapping-from-filesystem.txt \
-a $REGISTRY_AUTH_FILE \
--filter-by-os '*' \
--skip-multiple-scopes \
--max-per-registry=1 \
--dir "$IMAGE_PATH"

oc image mirror \
-f ~/.ibm-pak/data/mirror/$CS_CASE_NAME/$CS_CASE_VERSION/images-mapping-to-filesystem.txt \
-a $REGISTRY_AUTH_FILE \
--filter-by-os '*' \
--skip-multiple-scopes \
--max-per-registry=1 \
--dir "$IMAGE_PATH"

```

Note: If the local registry is not secured by TLS, or the certificate presented by the local registry is not trusted by your device, add the `--insecure` option to the command.

There might be a slight delay before you see a response to the command.

- i. Configure the target cluster.

Now that images have been mirrored to the local registry, the target cluster must be configured to pull the images from it. Complete the following steps to configure the cluster's global pull secret with the local registry's credentials and then instruct the cluster to pull the images from the local registry.

- i. Log in to your Red Hat OpenShift Container Platform cluster:

```
oc login <openshift_url> -u <username> -p <password> -n <namespace>
```

- ii. [Update the global image pull secret](#) for the cluster as explained in the Red Hat OpenShift Container Platform documentation. Updating the image pull secret provides the cluster with the credentials needed for pulling images from your local registry.

Note: If you have an insecure registry, add the registry to the cluster's `insecureRegistries` list by running the following command:

```
oc edit image.config.openshift.io/cluster -o yaml
```

and add the `TARGET_REGISTRY` to `spec.registrySources.insecureRegistries` as shown in the following example:

```

spec:
  registrySources:
    insecureRegistries:
      - insecure0.svc:5001
      - <TARGET_REGISTRY>

```

If the `insecureRegistries` field does not exist, you can add it.

- iii. Create the `ImageContentSourcePolicy`, which instructs the cluster to pull the images from your local registry (run both commands):

```
oc apply -f ~/.ibm-pak/data/mirror/${CASE_NAME}/${CASE_VERSION}/image-content-source-policy.yaml
```

```
oc apply -f ~/.ibm-pak/data/mirror/${CS_CASE_NAME}/${CS_CASE_VERSION}/image-content-source-policy.yaml
```

- iv. Verify that each `ImageContentSourcePolicy` resource was created:

```
oc get imageContentSourcePolicy
```

- v. Verify your cluster node status:

```
oc get MachineConfigPool -w
```

Wait for all nodes to be updated before proceeding to the next step.

6. Apply the catalog sources.

Now that you have mirrored images to the target cluster, apply the catalog sources.

In the following steps, replace `<Architecture>` with either `amd64`, `s390x` or `ppc64le` as appropriate for your environment.

- a. Export the variables for the command line to use:

```
export CASE_NAME=ibm-apiconnect
export CASE_VERSION=4.0.7
export ARCH=amd64
```

```
export CS_CASE_NAME=ibm-cp-common-services
export CS_CASE_VERSION=1.15.10
export CS_ARCH=amd64
```

- b. Generate the catalog source and save it in another directory in case you need to replicate this installation in the future.

- i. Get the catalog source:

```
cat ~/.ibm-pak/data/mirror/${CASE_NAME}/${CASE_VERSION}/catalog-sources.yaml
```

```
cat ~/.ibm-pak/data/mirror/${CS_CASE_NAME}/${CS_CASE_VERSION}/catalog-sources.yaml
```

- ii. Get any architecture-specific catalog sources that you need to back up as well:

```
cat ~/.ibm-pak/data/mirror/${CASE_NAME}/${CASE_VERSION}/catalog-sources-linux-${ARCH}.yaml
```

You can also navigate to the directory in your file browser to copy these artifacts into files that you can keep for re-use or for pipelines.

- c. Apply the catalog sources to the cluster.

- i. Apply the universal catalog sources:

```
oc apply -f ~/.ibm-pak/data/mirror/${CASE_NAME}/${CASE_VERSION}/catalog-sources.yaml
```

```
oc apply -f ~/.ibm-pak/data/mirror/${CS_CASE_NAME}/${CS_CASE_VERSION}/catalog-sources.yaml
```

- ii. Apply any architecture-specific catalog source:

```
oc apply -f ~/.ibm-pak/data/mirror/${CASE_NAME}/${CASE_VERSION}/catalog-sources-linux-${ARCH}.yaml
```

- iii. Confirm that the catalog source was created in the `openshift-marketplace` namespace:

```
oc get catalogsource -n openshift-marketplace
```

7. Update the operator channel.

- a. Open the Red Hat OpenShift web console and click `Operators`, `Installed Operators`, `IBM API connect`, `Subscriptions`.

- b. Change the channel to the new version (`v3.6`), which triggers an upgrade of the API Connect operator.

If you are upgrading from `10.0.4-ifix3` and the API Connect operator does not begin its upgrade within a few minutes, perform the following workaround to delete the `ibm-ai-wmltraining` subscription and associated csv:

- i. Run the following command to get the name of the subscription:

```
oc get subscription -n <APIC_namespace> --no-headers=true | grep ibm-ai-wmltraining | awk '{print $1}'
```

- ii. Run the following command to delete the subscription:

```
oc delete subscription <subscription-name> -n <APIC_namespace>
```

- iii. Run the following command to get the name of the csv:

```
oc get csv --no-headers=true -n <APIC_namespace> | grep ibm-ai-wmltraining | awk '{print $1}'
```

- iv. Run the following command to delete the csv:

```
oc delete csv <csv-name> -n <APIC_namespace>
```

Deleting the subscription and csv triggers the API Connect operator upgrade.

When the API Connect operator is updated, the new operator pod starts automatically.

8. Verify that the API Connect operator was updated by completing the following steps:

- a. Get the name of the pod that hosts the operator by running the following command:

```
oc get po -n <APIC_namespace> | grep apiconnect
```

The response looks like the following example:

```
ibm-apiconnect-7bdb795465-8f7rm          1/1      Running    0          4m23s
```

b. Get the API Connect version deployed on that pod by running the following command:

```
oc describe po <ibm-apiconnect-operator-podname> -n <APIC_namespace> | grep -i productversion
```

The response looks like the following example:

```
productVersion: 10.0.5.6
```

9. If you are using a top-level CR: Update the top-level `APIConnectCluster` CR:

The `spec` section of the `apiconnectcluster` looks like the following example:

```
apiVersion: apiconnect.ibm.com/v1beta1
kind: APIConnectCluster
metadata:
  labels:
    app.kubernetes.io/instance: apiconnect
    app.kubernetes.io/managed-by: ibm-apiconnect
    app.kubernetes.io/name: apiconnect-production
  name: prod
  namespace: <APIC_namespace>
spec:
  allowUpgrade: true
  license:
    accept: true
    use: production
    license: L-GVEN-GFUPVE
  profile: n12xc4.m12
  version: 10.0.5.6
  storageClassName: rook-ceph-block
```

a. Edit the `apiconnectcluster` CR by running the following command:

```
oc -n <APIC_namespace> edit apiconnectcluster
```

b. If upgrading from v10.0.4-ifix3, or upgrading from v10.0.1.7-eus (or higher): In the `spec` section, add a new `allowUpgrade` attribute and set it to `true`:

```
spec:
  allowUpgrade: true
```

The `allowUpgrade` attribute enables the upgrade to 10.0.5.x. Because the upgrade deletes your analytics data, the attribute is required to prevent an accidental upgrade.

c. In the `spec` section, update the API Connect version:

Change the `version` setting to 10.0.5.6.

d. In the `spec.gateway` section of the CR, delete any `template` or `dataPowerOverride` sections.

You cannot perform an upgrade if the CR contains an override.

e. Save and close the CR.

The response looks like the following example:

```
apiconnectcluster.apiconnect.ibm.com/prod configured
```

Note: If you see an error message when you attempt to save the CR, check if it is one of the following known issues:

- Webhook error for incorrect license.

If you did not update the license ID in the CR, then when you save your changes, the following webhook error might display:

```
admission webhook "vapiconnectcluster.kb.io" denied the request:
APIConnectCluster.apiconnect.ibm.com "<instance-name>" is invalid: spec.license.license:
Invalid value: "L-RJON-BYGHM4": License L-RJON-BYGHM4 is invalid for the chosen version version.
Please refer license document https://ibm.biz/apiclicenses
```

To resolve the error, see [API Connect licenses](#) for the list of the available license IDs and select the appropriate license IDs for your deployment.

Update the CR with the new license value as in the following example, and then save and apply your changes again.

- Webhook error: **Original PostgreSQL primary not found**. Take the following actions to complete the upgrade and fix the cause of the error message:

- Edit your `apiconnectcluster` CR and add the following annotation:

```
...
metadata:
  annotations:
    apiconnect-operator/db-primary-not-found-allow-upgrade: "true"
  ...
```

- Continue with the upgrade. When the upgrade is complete, the management CR reports the warning:

```
Original PostgreSQL primary not found. Run apicops upgrade:pg-health-check to check the health of the
database and to ensure pg_wal symlinks exist. If database health check passes please perform a management
database backup and restore to restore the original PostgreSQL primary pod
```

- Take a new [management database backup](#).
- Immediately [restore](#) from the new backup taken in the previous step. The action of taking and restoring a management backup results in the establishment of a new Postgres primary, eliminating the CR warning message. Be careful to restore from the backup that is taken after the upgrade, and not from a backup taken before upgrade.
- Webhook error: **Original postgres primary is running as replica**. Complete a Postgres failover, see [Postgres failover steps](#). After you apply the Postgres failover steps, the upgrade resumes automatically.

f. If needed, delete old Postgres client certificates.

If you are upgrading from 10.0.1.x or 10.0.4.0-ifix1, or if you previously installed any of those versions before upgrading to 10.0.5.x, there might be old Postgres client certificates. To verify, run the following command:

```
oc -n <namespace> get certs | grep db-client
```

For example, if you see that both `-db-client-apicuser` and `apicuser` exist, `apicuser` is no longer in use. Remove the old certificates by running one of the following commands, depending on how many old certifications left in your system:

```
oc -n <namespace> delete certs apicuser pgbouncer primaryuser postgres replicator
```

or:

```
oc -n <namespace> delete certs apicuser pgbouncer postgres replicator
```

10. If you are using individual subsystem CRs: Start with the Management subsystem and update by completing the following steps:

a. Edit the `ManagementCluster` CR:

```
oc edit ManagementCluster -n <mgmt_namespace>
```

b. If upgrading from `v10.0.4-ifix3`, or upgrading from `v10.0.1.7-eus` (or higher): In the `spec` section, add a new `allowUpgrade` attribute and set it to `true`.

```
spec:
  allowUpgrade: true
```

The `allowUpgrade` attribute enables the upgrade to 10.0.5.x. Because the upgrade to 10.0.5.x. deletes your analytics data, the attribute is required to prevent an accidental upgrade.

c. In the `spec` section, update the API Connect version:

Change the `version` setting to `10.0.5.6`.

d. If you are upgrading to a version of API Connect that requires a new license, update the license value now.

For the list of licenses, see [API Connect licenses](#).

e. Save and close the CR to apply your changes.

The response looks like the following example:

```
managementcluster.management.apiconnect.ibm.com/management edited
```

Note: If you see an error message when you attempt to save the CR, check if it is one of the following known issues:

- Webhook error for incorrect license.

If you did not update the license ID in the CR, then when you save your changes, the following webhook error might display:

```
admission webhook "vapiconnectcluster.kb.io" denied the request:
APIConnectCluster.apiconnect.ibm.com "<instance-name>" is invalid: spec.license.license:
Invalid value: "L-RJON-BYGHM4": License L-RJON-BYGHM4 is invalid for the chosen version version.
Please refer license document https://ibm.biz/apiclicenses
```

To resolve the error, see [API Connect licenses](#) for the list of the available license IDs and select the appropriate license IDs for your deployment. Update the CR with the new license value as in the following example, and then save and apply your changes again.

- Webhook error: `Original PostgreSQL primary not found`. Take the following actions to complete the upgrade and fix the cause of the error message:
 - Edit your `ManagementCluster` CR and add the following annotation:

```
...
metadata:
  annotations:
    apiconnect-operator/db-primary-not-found-allow-upgrade: true
...
```

- Continue with the upgrade. When the upgrade is complete, the management CR reports the warning:

```
Original PostgreSQL primary not found. Run apicops upgrade:pg-health-check to check the health of the
database and to ensure pg_wal symlinks exist. If database health check passes please perform a management
database backup and restore to restore the original PostgreSQL primary pod
```

- Take a new [management database backup](#).
- Immediately [restore](#) from the new backup taken in the previous step. The action of taking and restoring a management backup results in the establishment of a new Postgres primary, eliminating the CR warning message. Be careful to restore from the backup that is taken after the upgrade, and not from a backup taken before upgrade.
- Webhook error: `Original postgres primary is running as replica`. Complete a Postgres failover, see [Postgres failover steps](#). After you apply the Postgres failover steps, the upgrade resumes automatically.

f. Confirm that the Management subsystem upgrade is complete.

Check the status of the upgrade with: `oc get ManagementCluster -n <mgmt_namespace>`, and wait until all pods are running at the new version. For example:

```
oc get ManagementCluster -n <mgmt_namespace>
NAME      READY   STATUS    VERSION   RECONCILED VERSION   AGE
management 18/18   Running   10.0.5.6   10.0.5.6-1281         97m
```

g. Management subsystem only: If needed, delete old Postgres client certificates.

Skip this step for the Portal, Analytics, and Gateway subsystems.

If you are upgrading from 10.0.1.x or 10.0.4.0-ifix1, or if you previously installed any of those versions before upgrading to 10.0.5.x, there might be old Postgres client certificates. To verify, run the following command:

```
oc -n <namespace> get certs | grep db-client
```

For example, if you see that both `-db-client-apicuser` and `apicuser` exist, `apicuser` is no longer in use. Remove the old certificates by running one of the following commands, depending on how many old certifications left in your system:

```
oc -n <namespace> delete certs apicuser pgbouncer primaryuser postgres replicator
```

or:

```
oc -n <namespace> delete certs apicuser pgbouncer postgres replicator
```

h. Repeat the process for the remaining subsystem CRs: `GatewayCluster`, `PortalCluster`, and then `AnalyticsCluster`.

Important:

- In the `GatewayCluster` CR, delete any `template` or `dataPowerOverride` sections. You cannot perform an upgrade if the CR contains an override.
- **If upgrading from v10.0.4-ifix3, or upgrading from v10.0.1.7-eus (or higher):** The `allowUpgrade` attribute set in the Management CR must also be set in the `AnalyticsCluster` CR. It is not required for Gateway or Portal CRs.

11. Validate that the upgrade was successfully deployed by running the following command:

```
oc get apic -n <APIC_namespace>
```

The response looks like the following example:

NAME	READY	STATUS	VERSION	RECONCILED	VERSION	AGE
analyticscluster.analytics.apiconnect.ibm.com/prod-a7s	5/5	Running	10.0.5.6	10.0.5.6	21h

NAME	STATUS	MESSAGE				
managementdbupgrade.management.apiconnect.ibm.com/prod-mgmt-up-649mc	Complete	Upgrade is Complete (DB Schema/data are up-to-date) 142m				
managementdbupgrade.management.apiconnect.ibm.com/prod-mgmt-up-9mjhk	Complete	Fresh install is Complete (DB Schema/data are up-to-date) 22h				
NAME	READY	STATUS	VERSION	RECONCILED	VERSION	AGE
portalcluster.portal.apiconnect.ibm.com/prod-ptl	3/3	Running	10.0.5.6	10.0.5.6	21h	

Important: If you need to restart the deployment, wait until all Portal sites complete the upgrade. Run the following commands to check the status of the sites:

a. Log in as an admin user:

```
apic login -s <server_name> --realm admin/default-idp-1 --username admin --password <password>
```

b. Get the portal service ID and endpoint:

```
apic portal-services:get -o admin -s <management_server_endpoint> \
--availability-zone availability-zone-default <portal-service-name> \
--output - --format json
```

c. List the sites:

```
apic --mode portaladmin sites:list -s <management_server_endpoint> \
--portal_service_name <portal-service-name> \
--format json
```

Any sites currently upgrading display the `UPGRADING` status; any site that completed its upgrade displays the `INSTALLED` status and the new platform version. Verify that all sites display the `INSTALLED` status before proceeding.

For more information on the `sites` command, see [apic sites:list](#) and [Using the sites commands](#).

d. After all sites are in `INSTALLED` state and have the new platform listed, run the following command:

```
apic --mode portaladmin platforms:list -s <server_name> --portal_service_name <portal_service_name>
```

Verify that the new version of the platform is the only platform listed.

For more information on the `platforms` command, see [apic_platforms:list](#) and [Using the platforms commands](#).

12. Upgrading to 10.0.5.5: Verify that the GatewayCluster upgraded correctly.

When upgrading to 10.0.5.5 on OpenShift, the rolling update might fail to start on gateway operand pods due to a gateway peering issue, even though the reconciled version on the gateway CR (incorrectly) displays as 10.0.5.5. Complete the following steps to check for this issue and correct it if needed.

- a. Check the `productVersion` of each gateway pod to verify that it is 10.0.5.7 (the version of DataPower Gateway that was released with API Connect 10.0.5.5) by running one of the following commands:

```
oc get po -n apic_namespace <gateway_pods> -o yaml | yq .metadata.annotations.productVersion
```

or

```
oc get po -n apic_namespace <gateway_pods> -o custom-columns="productVersion:.metadata.annotations.productVersion"
```

where:

- `apic_namespace` is the namespace where API Connect is installed
- `<gateway_pods>` is a space-delimited list of the names of your gateway peering pods

- b. If any pod returns an incorrect value for the version, resolve the issue as explained in [Incorrect productVersion of gateway pods after upgrade](#).

13. (Optional). If you upgraded from 10.0.5.4 or earlier, delete the DataPowerService CRs so that they will be regenerated with random passwords for gateway-peering. Starting with API Connect 10.0.5.5, GatewayCluster pods are configured by default to secure the gateway-peering sessions with a unique, randomly generated password. However, GatewayCluster pods created prior to API Connect 10.0.5.5 are configured to use a single, hard-coded password and upgrading to 10.0.5.5 or later does not replace the hard-coded password.

After upgrading to API Connect 10.0.5.5 or later, you can choose to secure the gateway-peering sessions by running the following command to delete the DataPowerService CR that was created by the GatewayCluster:

```
oc delete dp <gateway_cluster_name>
```

This action prompts the API Connect Operator to recreate the DataPowerService CR with the unique, randomly generated password. This is a one-time change and does not need to be repeated for subsequent upgrades.

14. **If upgrading from v10.0.4-ifix3, or upgrading from v10.0.1.7-eus (or higher):** Enable analytics as explained in [Enabling Analytics after upgrading](#)
15. If you are upgrading to 10.0.5.3 (or later) from an earlier 10.0.5.x release: Review and configure the new inter-subsystem communication features: [Optional post-upgrade steps for upgrade to 10.0.5.3 from earlier 10.0.5 release](#).
16. Restart all nats-server pods by running the following command:

```
oc -n <namespace> delete po -l app.kubernetes.io/name=natscluster
```

What to do next

Update your toolkit CLI by downloading it from IBM Fix Central or from the Cloud Manager UI, see [Installing the toolkit](#).

If you are upgrading from v10.0.5.1 or earlier to v10.0.5.2: The change in deployment profile CPU and memory limits that are introduced in 10.0.5.2 (see [New deployment profiles and CPU licensing](#)) can result in a change in the performance of your Management component. If you notice any obvious reduction in performance of the Management UI or toolkit CLI where you have multiple concurrent users, open a support case.

Upgrading from 2018 to 10.0.5.4 on OpenShift

Upgrade API Connect 2018 FP24 and higher directly to 10.0.5.4 on Red Hat OpenShift.

About this task

Attention: Beginning with version 10.0.5.5, a direct upgrade from version 2018 is not supported. To upgrade from version 2018, first upgrade to 10.0.5.4, and then perform the upgrade to the newest release.

Use the following versions of components and related software when upgrading to version 10.0.5.4:

- Upgrade from: 2018 FP24 and higher
- Red Hat OpenShift Container Platform: 4.12
- Cert-manager: v1.9.1
- API Connect Operator channel: v3.4
- API Connect Operator: 3.4.0
- DataPower Operator: 1.6.8
- Upgrade channel v2.0.6
- License: Select the appropriate license from [Table 1. API Connect 10.0.5.3 and later licenses](#).

Complete the API Connect upgrade from 2018 to 10.0.5.4 by performing the following tasks:

1. [OpenShift: Preparing the 2018 deployment for upgrade](#)
Prepare the API Connect V2018 deployment for the upgrade to the latest version 10.0.5.x on OpenShift.
2. [OpenShift: Upgrading from 2018 to v10](#)
Perform an online upgrade of IBM® API Connect 2018 to the latest release of v10 on OpenShift using a top-level upgrade CR.
3. [OpenShift: Post-upgrade steps](#)
After you complete the API Connect upgrade, remove files left over from Version 2018 and optionally enable the Automated API behavior testing application.
4. [OpenShift: Recovering the V2018 deployment](#)
Use the disaster recovery process to revert a failed upgrade to the IBM API Connect V2018 deployment on OpenShift.

OpenShift: Preparing the 2018 deployment for upgrade

Prepare the API Connect V2018 deployment for the upgrade to the latest version 10.0.5.x on OpenShift.

Before you begin

Review the IBM Support page [API Connect: v2018 to v10 upgrade paths](#) to determine whether your Version 2018 deployment can be directly upgraded to the latest release of API Connect.

Procedure

1. Review the 10.0.5.x requirements and features; in particular:

- [IBM API Connect Version 10 software product compatibility requirements](#)
- [Deployment requirements](#)
- [Planning your deployment](#)
- [What's New in the latest release](#)
- [Version 10 known limitations](#)

2. Configure external logging prior to upgrade. This is not mandatory but is recommended. For example, <https://logdna.com/>.

3. Be sure you know the name of each subsystem on your 2018 deployment.

The 2018 subsystem names are carried over to 10.0.5.x installations. To view the names, run the following command:

```
apicup subsys list
```

These subsystem names are the values used in the `spec.subsystemName` field for each custom resource (CR) when upgrading.

4. On 2018, check the health of each subsystem before upgrade:

```
apicup subsys health-check <subsystem_name>
```

5. On the 2018 system, back up the original `apicup` project directory to a location from which it can always be retrieved.

Note: The original project directory created with the `apicup` installer during the initial 2018 product installation (for example, `myProject`) is required if you need to restore the database and to run disaster recovery back to 2018. You cannot restore the database or perform a disaster recovery without the initial project directory because it contains pertinent information about the 2018 cluster.

6. Complete a full backup for the 2018 Management, Portal, and Analytics subsystems.

- You must back up both the Management and Portal subsystems at the same time, to ensure synchronicity across the services.
- For the Analytics backup,
 - The S3 repository access/credentials must be set
 - The backup `REPO_NAME` must be `apic-analytics`

Attention: Backups are intended for recovery of the Management, Portal, and Analytics subsystems onto the same deployment from which they were taken, or onto a new replacement installation in the same environment for disaster recovery. The same environment means the same network configuration and project directory as the original installation. Make sure you have current and correct configuration for backup and restore for all of the 2018 subsystems. Verify that you can successfully restore from the backups. For information on backing up and restoring 2018, see [Backing up and restoring](#).

7. Run the following command to create a backup secret for the Analytics subsystem's S3 repository credentials.

```
oc create secret generic analytics-backup-secret -n APIC_namespace \
  --from-literal=access_key='<YOUR-ACCESS-KEY>' \
  --from-literal=secret_key='<YOUR-KEY-SECRET>'
```

The secret must be called `analytics-backup-secret` and must be in the same namespace as the v2018 Analytics deployment. For more information on creating the secret, see [Configuring backup settings for Analytics](#).

This secret is used as part of the backup configuration for the v10 install. While upgrading to version 10.0.5.x, the backup is configured in v10 using this secret; however the analytics data from v2018 is not restored due to changes in the Analytics subsystem (you can export that data in the next step).

8. If you want to retain your analytics data, then you must export it before running the upgrade.

For instructions on exporting data from v2018, see the v2018 documentation: <https://www.ibm.com/docs/en/api-connect/2018.x?topic=analytics-exporting-api-event-data>. Also, you can set up analytics offload so that all new analytics data is sent to a third-party system for storage: <https://www.ibm.com/docs/en/api-connect/2018.x?topic=cloud-configuring-analytics-offload-api-connect>.

9. Disassociate and delete your Analytics services.

Note: If you want your v2018 deployment to continue gathering analytics data up to the last possible moment, this step can instead be done just before the Management subsystem upgrade: [7](#).

- a. In Cloud Manager, click Topology.
- b. In the section for the Availability Zone that contains the Analytics service, locate the Gateway service that the Analytics service is associated with.
- c. Click the actions menu, and select Unassociate analytics service. Remember to disassociate each Analytics service from all Gateways.
- d. In the section for the Availability Zone that contains the Analytics services, locate each Analytics service and click Delete.

10. Limit permissions in the target namespace.

In 2018, it was recommended to apply a broad set of permissions; however, 10.0.5.0 and later use a more limited set of permissions. If your permissions are too broad, the upgrade might fail. For best results, assign a more limited set of permissions now by completing the following steps:

- a. Remove the broad set of permissions by running the following command:

```
oc adm policy remove-scc-from-group anyuid system:serviceaccounts:APIC_namespace
```

- b. List the Helm releases in the 2018 deployment by running the following command:

```
helm ls
```

The response looks like the following example, with the name of each Helm release displaying in the `CHART` column:

NAME	NAMESPACE	REVISION	UPDATED	STATUS	CHART
APP VERSION					
r19b9d4b2eb	e2e	1	2021-02-05 17:22:11.050619495 -0800 PST	deployed	apiconnect-
2.0.0					
r5d63b7fc92	e2e	1	2021-02-05 17:22:24.115569226 -0800 PST	deployed	apic-portal-
2.0.0					
r6c7b1188e0	e2e	1	2021-02-05 17:22:50.169539831 -0800 PST	deployed	apic-

```

analytics-2.0.0
r8dacbcffda e2e 1 2021-02-05 17:22:36.248182901 -0800 PST deployed dynamic-
gateway-service-1.0.63 1.0
rff8ba771c8 e2e 1 2021-02-05 17:22:10.329984775 -0800 PST deployed cassandra-
operator-1.0.0 1.0.1

```

c. Assign permissions to each of the Helm releases by running the following command:

```

for __sa in $(oc get sa -l release=<helm_release>); do oc adm policy add-scc-to-user anyuid system:serviceaccount:
<namespace>:__$sa; done

```

where:

- `<helm_release>` is the name of the Helm release from the **NAME** column; for example `r19b9d4b2eb`
- `APIC_namespace` is the namespace where you installed API Connect.

For example, the sample response lists 5 Helm releases, so you must run the command for each of those names:

- `r19b9d4b2eb`
- `r5d63b7fc92`
- `r6c7b1188e0`
- `r8dacbcffda`
- `rff8ba771c8`

d. Assign permissions to the default service account by running the following command:

```

oc adm policy add-scc-to-user anyuid system:serviceaccount:APIC_namespace:default

```

11. Upgrade the OpenShift cluster to version 4.10.

- Change the channel in OpenShift, and wait for the upgrade to finish.
- Wait for nodes to all show the newer version of Kubernetes.

12. On 2018, check the health of each subsystem again:

```

apicup subsys health-check <subsystem_name>

```

What to do next

When you are ready to upgrade, proceed to [OpenShift: Upgrading from 2018 to v10](#) for instructions.

Next topic: [OpenShift: Upgrading from 2018 to v10](#)

OpenShift: Upgrading from 2018 to v10

Perform an online upgrade of IBM® API Connect 2018 to the latest release of v10 on OpenShift using a top-level upgrade CR.

Before you begin

Be sure to complete all of the steps in [OpenShift: Preparing the 2018 deployment for upgrade](#). If you need to perform a disaster recovery to revert to 2018, you will need the backed-up `apicup` project as well as the backups of all the API Connect subsystems.

Attention: This task uses a single, top-level upgrade CR to upgrade all API Connect subsystems at once. Only use these instructions if all 4 API Connect v2018 subsystems are installed in a single namespace.

If your v2018 deployment installed subsystems into different namespaces, you must upgrade the subsystems individually using separate upgrade CRs. Follow the instructions for a Kubernetes deployment and upgrade the subsystems in the following sequence:

1. [Upgrading the Management subsystem from 2018 to v10](#)
2. [Upgrading the Developer Portal subsystem from 2018 to v10](#)
3. [Upgrading the Analytics subsystem from v2018 to v10](#)
4. [Upgrading the gateway subsystem from 2018 to v10](#)

About this task

Run the `apicops fix` on the database, install operators, create the top-level upgrade CR, and then perform the upgrade.

Procedure

1. On the 2018 deployment, use the `apicops` utility to resolve any known inconsistencies and synchronization problems with the database:

The `apicops preupgrade` command must be run in fix mode just prior to starting the management upgrade. The fix mode fixes any inconsistencies and synchronization problems in the database.

Important: Upgrade will fail if the `apicops` command is not successfully completed within 2 hours of starting the Management upgrade. If the Management upgrade must be run more than once, you must run the command in fix mode within 2 hours each time you run the upgrade.

a. Obtain the latest 2018 release of `apicops` from <https://github.com/ibm-apiconnect/apicops#latest-v2018-release>.

b. Set up the environment. See <https://github.com/ibm-apiconnect/apicops#requirements>.

c. Run the `apicops` report with the following command:

```

apicops preupgrade -m report --upgrade_to v10 -l apicops_preupgrade_get_out.txt

```

d. Run the `apicops` fix with the following command:

```

apicops preupgrade -m fix --upgrade_to v10 -l apicops_preupgrade_fix_out.txt

```

- The `-m` option runs the utility in fix mode. Running the utility in fix mode resolves most problems. If the utility identifies a problem it cannot resolve, contact IBM Support.

- Set the `-l` option to send output to a log file.

If `apicops` indicates that you need to have a `KUBECONFIG` environment variable set then run the following command before trying the fix again:

```
export KUBECONFIG=~/.kube/config
```

2. Take a full backup of the API Connect 2018 Management subsystem. This is in addition to the backup taken in [OpenShift: Preparing the 2018 deployment for upgrade](#), which was taken before the pre-upgrade operations. The pre-upgrade operations will have changed some of the contents of the database and so it is recommended to have backups from before and after.
3. From the OpenShift web console, click + (plus sign), and select create CatalogSource resources. Create the resources by completing the following steps:

- a. Create the `ioc-catsrc.yaml` file with IBM Operator Catalog source; for example :

```
apiVersion: operators.coreos.com/v1alpha1
kind: CatalogSource
metadata:
  name: ibm-operator-catalog
  namespace: openshift-marketplace
spec:
  displayName: "IBM Operator Catalog"
  publisher: IBM
  sourceType: grpc
  image: icr.io/cpopen/ibm-operator-catalog
  updateStrategy:
    registryPoll:
      interval: 45m
```

- b. Apply the IBM Operator Catalog source with the following command:

```
oc apply -f ioc-catsrc.yaml -n openshift-marketplace
```

- c. Create the `cs-catsrc.yaml` file with the IBM Cloud Pak foundational services (previously called Common Services) operator catalog source:

```
apiVersion: operators.coreos.com/v1alpha1
kind: CatalogSource
metadata:
  name: opencloud-operators
  namespace: openshift-marketplace
spec:
  displayName: IBMCS Operators
  image: icr.io/cpopen/ibm-common-service-catalog:latest
  publisher: IBM
  sourceType: grpc
  updateStrategy:
    registryPoll:
      interval: 45m
```

- d. Apply the IBM Cloud Pak foundational services operator catalog source with the following command:

```
oc apply -f cs-catsrc.yaml -n openshift-marketplace
```

4. Install the API Connect V2018 Upgrade operator:

- a. Open the OCP Operator Hub in the namespace where you previously installed API Connect.
- b. Set the filter to "IBM API Connect V2018 Upgrade" to quickly locate the operators required for API Connect.
- c. Click the IBM API Connect V2018 Upgrade tile.
- d. Click Install again and set the following options for the API Connect V2018 Upgrade operator:
 - Set the Update Channel to v2.0.6.
Selecting a channel installs the latest upgrade operator version that is available for the channel.
 - For the Install Mode, select A specific namespace on the cluster and select the namespace where you previously installed API Connect
 - Set the Approval Strategy to Automatic
- e. Click Install and wait while the upgrade operator is installed.
- f. Verify that the operator installed successfully by clicking Installed Operators, selecting the namespace where you installed API Connect, and making sure that the IBM API Connect V2018 Upgrade operator is listed.

5. (10.0.5.2 and earlier) Create a cert-manager Issuer:

Note: Skip this step if you are upgrading to version 10.0.5.3 or later because the cert-manager Issuer is created automatically.

Example cert-manager Issuer

```
apiVersion: cert-manager.io/v1
kind: Issuer
metadata:
  name: selfsigning-issuer
  labels: {
    app.kubernetes.io/instance: "management",
    app.kubernetes.io/managed-by: "ibm-apiconnect",
    app.kubernetes.io/name: "selfsigning-issuer"
  }
spec:
  selfSigned: {}
```

6. Create an entitlement key; for example:

```
oc create secret docker-registry ibm-entitlement-key \
  --docker-username=cp \
  --docker-password=<entitlement_key> \
  --docker-server=cp.icr.io \
  --namespace=<APIC_namespace>
```

7. Create the top-level CR.

- a. In the Operator Hub, click Installed Operators, IBM API Connect V2018 Upgrade
- b. Select the API Connect Upgrade tab.

- c. Create the top-level CR for upgrade by clicking `APIConnectUpgradeFromV2018`.
- d. Select the YAML view and populate the CR with the settings for your environment.

In particular, provide values for the following settings:

- `license accept` - set to `true` (installation fails if this is left as the default value of `false`)
- `license use` - set to `production` or `nonproduction` according to your license purchase
- Set `license`: to the License ID for the version of API Connect that you purchased. See [API Connect licenses](#).
- `namespace` - namespace where API Connect is installed
- `storageClassName` - a storage class that is available in your cluster (you must specify a default storage class)
- `certManagerIssuer name` - the name of the cert-manager Issuer that you created in the previous step (or another issuer that you want to use)
- `profile` - the deployment profile that you want to install, see: [API Connect deployment profiles for OpenShift and Cloud Pak for Integration](#).
- `subsystemName` - the name of your V2018 subsystem

Example top-level CR:

```
apiVersion: apiconnect.ibm.com/v1beta1
kind: APIConnectUpgradeFromV2018
metadata:
  name: topcr-upgrade
  namespace: test1
spec:
  license:
    accept: true
    license: L-GVEN-GFUPVE
    use: nonproduction
  management:
    subsystemName: mgmt
    triggerRollback: false
  gateway:
    subsystemName: gw
    triggerRollback: false
  analytics:
    analyticsSpec:
      storage:
        enabled: true
        shared:
          volumeClaimTemplate:
            storageClassName: rook-ceph-block
            volumeSize: 50Gi
          type: shared
        subsystemName: a7s
        triggerRollback: false
      storageClassName: rook-ceph-block
      profile: n3xc4.m16
  portal:
    adminVolumeClaimTemplate:
      storageClassName: rook-ceph-block
      volumeSize: 12Gi
    backupVolumeClaimTemplate:
      storageClassName: rook-ceph-block
      volumeSize: 30Gi
    databaseLogsVolumeClaimTemplate:
      storageClassName: rook-ceph-block
      volumeSize: 12Gi
    databaseVolumeClaimTemplate:
      storageClassName: rook-ceph-block
      volumeSize: 30Gi
    webVolumeClaimTemplate:
      storageClassName: rook-ceph-block
      volumeSize: 12Gi
    certVolumeClaimTemplate:
      storageClassName: rook-ceph-block
      volumeSize: 4Gi
      subsystemName: ptl
      triggerRollback: false
  v10InstanceName: topcr
```

Note: Note: To avoid issues with PVCs being sized too small, specify the PVC sizes of your existing 2018 deployment in the `spec.portal` section of the CR. The PVC sizes allocated might need to be adjusted further (beyond the minimum and existing 2018 values) depending on the number and content of the sites required.

The minimum PVC sizes are large enough to cater for a small number of portal sites. As a rough estimate, for every 10 additional small portal sites (with a limited number of apps, apis, consumer orgs, members and portal content) the amount of space allocated should be increased in line with the following estimates:

- `databaseVolumeClaimTemplate`: +10 Gi
- `webVolumeClaimTemplate`: +1 Gi
- `backupVolumeClaimTemplate`: +2 Gi

If you have sites that have a lot of provider org content and lots of documentation, images, and additional content stored in the portal, then you may require a lot more space to be allocated to your PVCs. The following 2 PVCs do not need to be scaled based on the number of sites:

- `databaseLogsVolumeClaimTemplate`
- `adminVolumeClaimTemplate`

- e. Click Create to apply the CR and upgrade the deployment.

8. If needed, rollback a failed upgrade and try again:

- a. Set `triggerRollback` to `true` in the top-level upgrade CR (in the section under the failed subsystem) to rollback the upgrade for that subsystem.
- b. Edit the top-level upgrade CR to correct the issue, and then change the value of `triggerRollback` to `false`, which stats the upgrade of that subsystem.

9. Verify that the upgrade completed.

Keep checking the status using `oc get apic` and wait for the upgrade to complete.

10. Restart all nats-server pods by running the following command:

```
oc -n <namespace> delete po -l app.kubernetes.io/name=natscluster
```

11. Configure backup settings on the upgraded deployment as explained in [Backups on OpenShift](#).
12. Set the `topCRName-mgmt-admin-pass` secret to match the Cloud Manager admin password.

The secret with name `topCRName-mgmt-admin-pass` (containing the Cloud Manager admin password) will have the password that was used when v10 was launched, but this does not impact logging in to Cloud Manager. After the upgrade, complete the following steps to set the secret to match the correct password:

 - a. Log in to Cloud Manager using the admin password that you used in v2018.
 - b. Edit the `topCRName-mgmt-admin-pass` secret and set the password to match the v2018 password, so that it is consistent.

What to do next

If the upgrade failed and cannot be corrected, revert to the API Connect 2018 deployment using the disaster recovery process. For information, see [OpenShift: Recovering the V2018 deployment](#).

If the upgrade succeeded, complete the steps in [OpenShift: Post-upgrade steps](#) to remove 2018 files that were left over from the upgrade process.

Previous topic: [OpenShift: Preparing the 2018 deployment for upgrade](#)

Next topic: [OpenShift: Post-upgrade steps](#)

OpenShift: Post-upgrade steps

After you complete the API Connect upgrade, remove files left over from Version 2018 and optionally enable the Automated API behavior testing application.

About this task

Complete the following steps to remove files left over from Version 2018. Optionally, you can enable the Automated API behavior testing application by following the instructions in the last step.

Procedure

1. Enable the Analytics subsystem as explained in [Enabling Analytics after upgrading](#).
2. To ensure that the 10.0.5.x user interface works correctly, clear your browser cache.
3. Delete each Helm release used in 2018:
 - a. List the Helm releases in the 2018 API Connect deployment by running the following command:

```
helm ls
```

The response looks like the following example, with the name of each Helm release displaying in the `CHART` column:

NAME	NAMESPACE	REVISION	UPDATED	STATUS	CHART
APP VERSION					
r19b9d4b2eb	e2e	1	2021-02-05 17:22:11.050619495	-0800 PST deployed	apiconnect-2.0.0
r5d63b7fc92	e2e	1	2021-02-05 17:22:24.115569226	-0800 PST deployed	apic-portal-2.0.0
r6c7b1188e0	e2e	1	2021-02-05 17:22:50.169539831	-0800 PST deployed	apic-
analytics-2.0.0					
r8dacbcffda	e2e	1	2021-02-05 17:22:36.248182901	-0800 PST deployed	dynamic-
gateway-service-1.0.63	1.0				
rff8ba771c8	e2e	1	2021-02-05 17:22:10.329984775	-0800 PST deployed	cassandra-
operator-1.0.0	1.0.1				

- b. For each Helm release, run the following command to delete it:

```
helm uninstall <helm_release_name>
```

where `<helm_release_name>` is the name of the Helm release from the `NAME` column.

For example, in the sample response, there are five Helm releases listed, so you must run the command 5 times.

4. Manually delete any remaining 2018 pods for the current release by running the following commands, where `APIC_namespace` is the namespace where you installed API Connect:
 - a. `oc delete pod <releaseName>-apim-schema-init-job-xxxx -n <APIC_namespace>`
 - b. `oc delete pod <releaseName>-lurschema-init-job-xxxx -n <APIC_namespace>`
5. Delete the secrets left over from 2018:
 - a. Search for `cassop` (cassandra) secrets with the following names:
 - `cassandra-backup-auth-secret-xxx`,
 - `cassop-client-certs-xxx`,
 - `cassop-server-certs-xxx`
 - b. For each `cassop` secret, run the following command:

```
oc delete secret <Listed_Cassop_Secrets_from_Search> -n <APIC_namespace>
```

where `APIC_namespace` is the namespace where you installed API Connect (if you installed subsystems into different namespaces, specify the namespace for the Management subsystem).

- c. Manually delete the following secrets by running each of the specified commands, where `APIC_namespace` is the namespace where you installed API Connect (if you installed subsystems into different namespaces, specify the namespace for the Management subsystem).

- `oc delete secret analytics-proxy-velox-certs-xxx -n <APIC_namespace>`
- `oc delete secret apim-elasticsearch-velox-certs-xxx -n <APIC_namespace>`
- `oc delete secret apim-ui-basic-auth -n <APIC_namespace>`
- `oc delete secret apim-velox-certs-xxx -n <APIC_namespace>`
- `oc delete secret client-downloads-server-velox-certs-xxx -n <APIC_namespace>`
- `oc delete secret db-client-velox-certs-xxx -n <APIC_namespace>`
- `oc delete secret db-velox-certs-xxx -n <APIC_namespace>`
- `oc delete secret juhu-velox-certs-xxx -n <APIC_namespace>`
- `oc delete secret ldap-velox-certs-xxx -n <APIC_namespace>`
- `oc delete secret lur-velox-certs-xxx -n <APIC_namespace>`
- `oc delete secret migration-inputs-xxx -n <APIC_namespace>`
- `oc delete secret migration-velox-certs-xxx -n <APIC_namespace>`
- `oc delete secret plugin-certs-xxx -n <APIC_namespace>`
- `oc delete secret ui-velox-certs-xxx -n <APIC_namespace>`

Attention: When you upgrade to API Connect 10.0.5.x from 2018, some external certificates are carried over from the 2018 deployment and are not managed by cert-manager. When you update any of the retained certificates, you must restart the affected pods manually. For a list of the certificates that are retained after an upgrade and must be updated manually, see [V2018 upgrade: List of certificates to update manually](#), in the [Renewing TLS certificates](#) section of this documentation.

6. Delete any remnant 2018 Analytics cronjob pods.

Two cronjob pods can remain after the upgrade with names matching the format shown below:

- `r*****-analytics-cronjobs-retention-*****-*****`
- `r*****-analytics-cronjobs-rollover-*****-*****`

These are remnant pods from 2018 and are now redundant. To remove them, run the following commands, where `APIC_namespace` is the namespace where you installed API Connect (if you installed subsystems into different namespaces, specify the namespace for the Analytics subsystem).

a. List the pods:

```
oc get pods -n <APIC_namespace>
```

b. Delete the pods:

```
oc delete pods <APIC_namespace> -n <namespace>
```

7. Optional: Configure additional features related to inter-subsystem communication security, such as CA verification and JWT security: [Optional post-upgrade steps for upgrade to 10.0.5.3 from earlier 10.0.5 release](#).

8. Optional: Enable the Automated API behavior testing application.

The Automated API behavior testing provides a simple set of fields where users can quickly invoke APIs to validate them, optionally automating tests and defining schedules for running them. Automated API behavior testing is an optional add-on to API Connect, and must be deployed separately. If you want to install the Automated API behavior testing application, complete the following steps.

a. Create an ingress-issuer and ingress-ca for use with the Automated API behavior testing application.

Note: The Automated API behavior testing application requires that the API Connect deployment use the cert-manager and the default certificates. Custom certificates are not supported and if used, the Automated API behavior testing application will not install correctly.

The following example shows the configuration of the ingress-issuer and ingress-ca for the Automated API behavior testing application:

```
apiVersion: cert-manager.io/v1
kind: Certificate
metadata:
  name: ingress-ca
  labels: {
    app.kubernetes.io/instance: "management",
    app.kubernetes.io/managed-by: "ibm-apiconnect",
    app.kubernetes.io/name: "ingress-ca"
  }
spec:
  duration: 87600h # 10 years
  renewBefore: 720h # 30 days
  secretName: ingress-ca
  commonName: "ingress-ca"
  usages:
  - digital signature
  - key encipherment
  - cert sign
  isCA: true
  issuerRef:
    name: selfsigning-issuer
    kind: Issuer
---
```

```
apiVersion: cert-manager.io/v1
kind: Issuer
metadata:
  name: ingress-issuer
  labels: {
```

```

    app.kubernetes.io/instance: "management",
    app.kubernetes.io/managed-by: "ibm-apiconnect",
    app.kubernetes.io/name: "ingress-issuer"
  }
spec:
  ca:
    secretName: ingress-ca
---

```

- b. [Add the Automated API behavior testing application to your deployment.](#)

Remember: When you configure the Automated API behavior testing application, make sure to use the same issuer name, `ingress-issuer`, that you created in the previous step.

Previous topic: [OpenShift: Upgrading from 2018 to v10](#)

Next topic: [OpenShift: Recovering the V2018 deployment](#)

OpenShift: Recovering the V2018 deployment

Use the disaster recovery process to revert a failed upgrade to the IBM® API Connect V2018 deployment on OpenShift.

Before you begin

A recovery can only be performed if you saved a backup copy of the apicup project that was created when you installed.

About this task

To revert to V2018, remove artifacts from the failed upgrade, install V2018, and then restore the backups that you created for the V2018 deployment before you started the upgrade.

You can also use this process if you find a need to revert to V2018 after a successful upgrade to V10.

Procedure

- Delete the upgrade tasks by running the following commands:
 - `oc delete up2018g -n <APIC_namespace> --all`
 - `oc delete up2018a -n <APIC_namespace> --all`
 - `oc delete up2018p -n <APIC_namespace> --all`
 - `oc delete up2018m -n <APIC_namespace> --all`

where `APIC_namespace` is the namespace where you installed API Connect.
- Delete all of the V10 subsystems by running the following commands in the sequence shown:
 - Delete the Gateway subsystem: `oc delete gw -n <APIC_namespace> --all`
 - Delete the Analytics subsystem: `oc delete a7s -n <APIC_namespace> --all`
 - Delete the Portal subsystem: `oc delete ptl -n <APIC_namespace> --all`
 - Delete the Management subsystem: `oc delete mgmt -n <APIC_namespace> --all`

where `APIC_namespace` is the namespace where you installed API Connect.

Note: To revert to 2018 FP24 and higher, you remove all of the 10.0.5.4 subsystems.

- Delete the Helm releases that were used in 2018 FP24 and higher.
 - List the Helm releases in the 2018 FP24 and higher API Connect deployment by running the following command:

```
helm ls
```

The response looks like the following example, with the name of each Helm release displaying in the **CHART** column:

NAME	NAMESPACE	REVISION	UPDATED	STATUS	CHART
APP VERSION					
r19b9d4b2eb	e2e	1	2021-02-05 17:22:11.050619495 -0800 PST	deployed	apiconnect-2.0.0
r5d63b7fc92	e2e	1	2021-02-05 17:22:24.115569226 -0800 PST	deployed	apic-portal-2.0.0
r6c7b1188e0	e2e	1	2021-02-05 17:22:50.169539831 -0800 PST	deployed	apic-analyt
analytics-2.0.0					
r8dacbcffda	e2e	1	2021-02-05 17:22:36.248182901 -0800 PST	deployed	dynamic-gateway
gateway-service-1.0.63	1.0				
rff8ba771c8	e2e	1	2021-02-05 17:22:10.329984775 -0800 PST	deployed	cassandra-operator-1.0.0
operator-1.0.0	1.0.1				

- For each Helm release, run the following command to delete it:

```
helm uninstall <helm_release>
```

where `<helm_release>` is the name of the Helm release from the **CHART** column.

For example, in the sample response, there are five Helm releases, so you must run the command to delete each of those releases:

- `apiconnect-2.0.0`
- `apic-portal-2.0.0`
- `apic-analytics-2.0.0`

- `dynamic-gateway-service-1.0.63`
 - `cassandra-operator-1.0.0`
4. Delete all PVCs related to the API Connect V2018 and V10 deployments.
- If there is no PVC in the namespace other than those created by API Connect, you can delete them all at once by running the following command:

```
oc delete pvc --all -n <APIC_namespace>
```

- If there are other PVCs in the same namespace, then delete the API Connect PVCs individually by running the following commands:
- Get the list of PVCs in the namespace:

```
oc get pvc
```

- Delete one PVC:

```
oc delete pvc <PVC_name> -n <APIC_namespace>
```

where:

- `PVC_name` is the name of a particular PVC that you want to delete
 - `APIC_namespace` is the namespace where you installed API Connect
5. If you do not intend to attempt the V10 upgrade again, use Operator Hub to uninstall the operators and catalog sources related to the upgrade.
6. Install API Connect V2018.
- Use the `apicup` project that you created in V2018 and backed up before starting the upgrade (this is necessary to ensure that settings such as certificates and encryption secrets are retained).
 - Grant all of the security permissions required for the V2018 installation.
7. Configure backup and restore settings for each subsystem, and then restore the subsystems with the data you backed up previously in V2018, in the following sequence:
- Management
 - Portal
 - Analytics
- For instructions, see [Backing up and restoring](#) in the V2018 documentation.

Previous topic: [OpenShift: Post-upgrade steps](#)

Optional post-upgrade steps for upgrade to 10.0.5.3 from earlier 10.0.5 release

Version 10.0.5.3 introduces some new features that are related to inter-subsystem communication. This topic explains how to configure these features when you upgrade from a previous 10.0.5 release to v10.0.5.3 or later.

Note: If you are using a top-level CR, you must edit the top-level CR instead of the subsystem CR. If the section you want to edit is missing from the top-level CR, copy it from the subsystem CR and paste it into the top-level CR.

Enabling management CA certification on the REST API

The portal and gateway subsystems make requests to the management subsystem through the REST API that is hosted by the management subsystem. This communication is standard TLS, where each REST API endpoint has a server certificate that is presented to the client during TLS handshaking. For additional security, validation of the management server certificate CA is enabled on all subsystems for new installations of API Connect v10.0.5.3 and later. If you are upgrading from an earlier release, and want to enable this feature for the portal and gateway then edit the portal and gateway CRs, and add the following settings to the `spec:` section depending on if you are using `external` or `in-cluster` inter-subsystem communications ([In-cluster service communication between subsystems](#)):

- If you are using `external` inter-subsystem communication, in the portal CR add:

```
spec:
  mgmtPlatformEndpointCASecret:
    secretName: ingress-ca # Or <instance-name>-ingress-ca if using top-level CR. If you have customized certs, change
ingress-ca to $PLATFORM_CA_SECRET
  mgmtConsumerEndpointCASecret:
    secretName: ingress-ca # Or <instance-name>-ingress-ca if using top-level CR. If you have customized certs, change
ingress-ca to $CONSUMER_CA_SECRET
```

and in the gateway CR add:

```
spec:
  mgmtPlatformEndpointCASecret:
    secretName: ingress-ca # Or <instance-name>-ingress-ca if using top-level CR. If you have customized certs, change
ingress-ca to $PLATFORM_CA_SECRET
```

where:

- `$PLATFORM_CA_SECRET` is the Kubernetes secret object that contains the CA certificate that is used by the platform REST API.
 - `$CONSUMER_CA_SECRET` is the Kubernetes secret object that contains the CA certificate that is used by the consumer REST API.
- If you are using `in-cluster` inter-subsystem communications, in the portal CR add:

```
spec:
  mgmtPlatformEndpointSvcCASecret:
    secretName: management-ca # Or <instance-name>-mgmt-ca if using top-level CR. If you have customized certs, change
ingress-ca to $PLATFORM_CA_SECRET
  mgmtConsumerEndpointSvcCASecret:
    secretName: management-ca # Or <instance-name>-mgmt-ca if using top-level CR. If you have customized certs, change
ingress-ca to $CONSUMER_CA_SECRET
```

and in the gateway CR add:

```
spec:
  mgmtPlatformEndpointSvcCASecret:
    secretName: management-ca # Or mgmt-ca or <instance-name>-mgmt-ca if using top-level CR. If you have customized certs,
change ingress-ca to $PLATFORM_CA_SECRET
```

If changing to use `in-cluster` inter-subsystem communication after an upgrade, you must also reregister all subsystems: [Converting existing registered subsystems to use in-cluster communications](#).

Note: If you are not sure of the secret name, follow these steps:

1. Check the management subsystem CR with `oc describe mgmt`, and identify the issuer of the platform and consumer API endpoints:

```
oc describe mgmt -n <namespace>
...
Platform API Endpoint:
  Annotations:
    cert-manager.io/issuer:      apic-ingress-issuer
...
Consumer API Endpoint:
  Annotations:
    cert-manager.io/issuer:      apic-ingress-issuer
```

2. Describe the issuer with `oc describe issuer`, and identify the secret name:

```
oc describe issuer apic-ingress-issuer -n <namespace>
...
Spec:
  Ca:
    Secret Name:  apic-ingress-ca
...
```

Enable JWT security for inter-subsystem communication

If you want to use JWT security instead of mTLS for inter-subsystem communication, then follow these steps. For more information on JWT security, see: [Enable JWT security instead of mTLS](#)

Cloud Pak for Integration and OpenShift top-level CR installations

Configure JWT as described in the post-install steps: [Enable JWT security and disable mTLS between subsystems](#).

Individual subsystem CR installations

1. Describe the `mgmt` CR to get the JWKS URL:

```
kubectl describe mgmt -n <namespace>
...
status:
  - name: jwksUrl
    secretName: api-endpoint
    type: API
    uri: https://api.apic.acme.com/api/cloud/oauth2/certs
```

2. For each portal, gateway, and analytics subsystem where you want to use JWT security, edit the CR corresponding that subsystem to disable mTLS and specify the `jwksUrl`:

```
spec:
  ...
  mtlsValidateClient: false
  jwksUrl: <JWKS URL>
```

<JWKS URL> is the URL identified in step [1](#).

3. **v10.0.5.4 and later:** Enable JWT on the gateway to analytics communications flow. Enable the Use JWT switch for the registered gateway in the Topology page of the Cloud Manager UI.

Datapower version 10.5.0.4 only: To enable JWT on the gateway to analytics communications flow, you also must add a `dataPowerOverride` section to the gateway CR:

```
spec:
  jwksUrl: <JWKS URL>
  dataPowerOverride:
    image: customregistry.com/custom-image-datapower:10.5.0.5
    version: 10.5.0.5
    license: X-XXXX-XXXXXX
```

Converting existing registered subsystems to use in-cluster communications

If you want to change your existing portal, gateway, and analytics subsystems to use `in-cluster` inter-subsystem communication then they must be reregistered. For more information about `in-cluster` communication, see [In-cluster service communication between subsystems](#).

Important: Understand the following points before you change the communication type of a subsystem:

- Reregistering any of the subsystems requires an outage of that subsystem.
- When you change communication type, any backup of the management subsystem that was taken before this change becomes unusable. Do not change the inter-subsystem communication type if you might want to restore the management subsystem from an earlier backup.
- To reregister the portal, all portal sites must be deleted first. Deleting a portal site means that any customizations that were made to the site must manually be reapplied after the portal is reregistered and the site recreated.
- To reregister the gateway, all published products must be deleted from the gateway.

To reregister a portal subsystem, the steps are:

1. Delete all portal sites from the portal service. From the API Manager UI, for each catalog that has a site on the portal, delete the portal site: [Edit or delete portal site](#).
2. Delete the portal service in the Topology section of the Cloud Manager UI.
3. Reregister the portal service, specifying the inter-subsystem communication type that you want, in the Topology section of the Cloud Manager UI. See [Register portal service](#).

To reregister a gateway subsystem, the steps are:

1. In the API Manager UI, delete all products from all catalogs that use the gateway service. See [Removing a product from a catalog](#).
2. In the API Manager UI, for each catalog that uses the gateway service, remove the gateway service from the catalog settings. See [Configure catalog gateway service](#).
3. Delete the gateway service in the Topology section of the Cloud Manager UI.
4. Reregister the gateway service, specifying the inter-subsystem communication type that you want, in the Topology section of the Cloud Manager UI. See [Registering a gateway service](#).

To reregister the analytics subsystem, the steps are:

1. Unassociate the analytics service from all gateway services that it is associated with. See [Unassociate analytics service](#).
2. Delete the analytics service in the Topology section of the Cloud Manager UI.
3. Reregister the analytics service, specifying the inter-subsystem communication type that you want, in the Topology section of the Cloud Manager UI. See [Registering an analytics service](#).

Update duration of certificates

In earlier releases of API Connect, some of the certificates had a duration of 12720 hours. On new API Connect v10.0.6 installations, all certificates have a duration of 17520 hours. After you upgrade to v10.0.6, update API Connect certificates to have a duration of 17520 hours:

1. List all the certificates that have a 12720 hour duration with the following command:

```
oc -n <namespace> get certificate -o custom-columns=NAME:metadata.name,DURATION:spec.duration | grep 12720h0m0s | awk '{print $1}'
```

Example output:

```
small-a7s-ai-endpoint
small-gw-gateway
small-gw-gateway-manager
small-mgmt-admin
small-mgmt-api-manager
small-mgmt-consumer-api
small-mgmt-platform-api
small-ptl-portal-director
small-ptl-portal-web
```

2. Trigger the recreation of each certificate by deleting the certificate:

```
oc -n <namespace> delete certificate <certificate name>
```

For example:

```
oc -n apic delete certificate small-ptl-portal-web
certificate.cert-manager.io "small-ptl-portal-web" deleted
```

3. Verify that the recreated certificate has a 17520 hour duration:

```
oc -n <namespace> get certificate <certificate name> -o custom-columns=DURATION:spec.duration
```

For example:

```
oc -n apic get certificate small-ptl-portal-web -o custom-columns=DURATION:spec.duration
DURATION
17520h0m0s
```

Enabling Analytics after upgrading

After the upgrade successfully completes, re-enable Analytics data collection.

Before you begin

If upgrading from v10.0.5.x you do not need to do these steps.

About this task

This task is only required if you are upgrading from releases prior to 10.0.5.0.

Procedure

1. Recreate your analytics backup secret:
 - a. Delete the secret: `oc delete secret analytics-backup-secret`
 - b. Re-create the secret with a new name: `oc create secret generic <new backup secret name> --from-literal=access_key='Your_Access_Key' --from-literal=secret_key='Your_access_key_secret' -n Namespace_of_Analytics_Subsystem`
 - c. Update the credentials value in your top-level CR with the new backup secret name. Also, change your backup path to prevent the backups list showing pre-upgrade backups that you cannot restore from. For example:

```
spec:
  analytics:
```

```

databaseBackup:
  ...
  credentials: <new backup secret name>
  path: <new backup path>
  ...

```

If you are not using top-level CR, update these properties in your Analytics CR.

If this step is skipped then backups will not run.

2. Delete the old analytics PVCs. If this step is not done, then your previous (and now inaccessible) analytics data will continue to occupy storage space. List your PVCs and identify those that contain the following strings in their names: `storage-master`, `storage-coord`, `storage-data`, `storage-shared`, `kafka`, `zk`. These PVCs should all have an `AGE` that dates back to before you started your upgrade.

```

kubect1 get pvc -n <namespace>
NAME                                STATUS    VOLUME             CAPACITY   ACCESS MODES   STORAGECLASS   AGE
...
data-ger2-analytics-storage-0       Bound    a7s-pv-8735e017   250Gi      RWO             rook-ceph-block 3h29m
data-ger2-analytics-storage-shared-0 Bound    a7s-pv-30aac7ed   250Gi      RWO             rook-ceph-block 227d
...

```

In this example, `data-ger2-analytics-storage-shared-0` contains the string `storage-shared`, and it is 227 days old. To delete it, run:

```
kubect1 delete pvc data-ger2-analytics-storage-shared-0 -n <namespace>
```

3. Add the new analytics:view permission to the Administrator role in the Cloud Manager UI.

- a. Click , then select Roles
- b. Click  on the Administrator role and select Edit
- c. Select the checkbox next to the analytics permission and click save:

Analytics View

4. Register new analytics services: [Registering an analytics service](#)
5. Associate your new analytics services with your gateways [Associating an analytics service with a gateway service](#)

Troubleshooting upgrade on OpenShift

Review the following troubleshooting tips if you encounter a problem while installing or upgrading API Connect on OpenShift, including as a component of IBM Cloud Pak for Integration (CP4I).

In the  Help page of the Cloud Manager, API Manager, and API Designer user interfaces, there's a Product information tile that you can click to find out information about your product versions, as well as Git information about the package versions being used. Note that the API Designer product information is based on its associated management server, but the Git information is based on where it was downloaded from.

Incorrect productVersion of gateway pods after upgrade

When upgrading on OpenShift, the rolling update might fail to start on gateway operand pods due to a gateway peering issue, so that the `productVersion` of the gateway pods is incorrect even though the reconciled version on the gateway CR displays correctly. This problem happens when there are multiple primary pods for gateway peering, and some of the peering pods are assigned to each primary. There can only be one primary pod for gateway-peering; the existence of multiple primaries prevents the upgrade from completing.

Verify that you have a gateway-peering issue with multiple primaries, and then resolve the issue by assigning a single primary for all gateway-peering pods. Complete the following steps:

1. Determine whether multiple primary pods is causing the problem:
 - a. Run one of the following commands to check the `productVersion` of each gateway pod.

```
oc get po -n apic_namespace <gateway_pods> -o yaml | yq .metadata.annotations.productVersion
```

or

```
oc get po -n apic_namespace <gateway_pods> -o custom-columns="productVersion:.metadata.annotations.productVersion"
```

where:

- `apic_namespace` is the namespace where API Connect is installed
 - `<gateway_pods>` is a space-delimited list of the names of your gateway peering pods
- b. Verify that the `productVersion` is supported with the newer version of API Connect. For information on supported versions of DataPower Gateway, see [Supported DataPower Gateway versions](#).

- c. If any pod returns an incorrect value for the `productVersion`, check the DataPower operator logs for peering issues; look for messages similar to the following example:

```

"level": "error", "ts": "2023-10-20T16:31:47.824751077Z", "logger": "controllers.DataPowerRollout", "msg": "Unable to check primaries", "Updater.id": "d3858eb3-4a34-4d72-8c51-e4290b6f9cda", "Request.Namespace": "apic", "Request.Name": "production-gw-b725a391-4768-4ddc-a73a-d655cf806586", "Request.Stage": "mainWork", "error": "Multiple primaries found: map[10.254.14.107:true 10.254.20.175:true]", "stacktrace": "github.ibm.com/datapower/datapower-operator/internal/controllers/datapowerrollout.(*DataPowerRolloutUpdater).mainWork\n\t/home/jenkins/agent/workspace/datapower-operator_build_v1.6/internal/controllers/datapowerrollout/workers.go:107"}

operator_build_v1.6/internal/controllers/datapowerrollout/workers.go:105"}

```

If you confirmed that gateway-peering (multiple primaries) is the issue, complete the following steps to resolve the issue.

2. Attach to a gateway pod:

- a. Run the following command to get a list of gateway pods:

```
oc get pods -l app.kubernetes.io/managed-by=datapower-operator
```

The response looks like the following example:

NAME	READY	STATUS	RESTARTS	AGE
datapower-operator-conversion-webhook-585d95cf87-mktrv	1/1	Running	0	2d22h
datapower-operator-f4d8fbd85-5xt47	1/1	Running	0	2d22h
production-gw-0	1/1	Running	0	2d22h
production-gw-1	1/1	Running	0	2d22h
production-gw-2	1/1	Running	0	2d22h

- b. Select a pod from the list and run the following command to attach to it using the NAME:

```
oc -n ns attach -it <pod_NAME> -c datapower
```

3. Select the new primary:

- a. Run the following commands to switch to the API Connect configuration:

```
config; switch apiconnect
```

- b. Run the following command to show the current peering status:

```
show gateway-peering-status
```

Example response:

Address	Name	Pending	Offset	Link	Primary	Service port	Monitor port	Priority
10.254.12.45	api-probe	0	19114431	ok	no	16382	26382	2
10.254.12.45	gwd	0	1589848370	ok	no	16380	26380	2
10.254.12.45	rate-limit	0	19148496	ok	no	16383	26383	2
10.254.12.45	ratelimit-module	0	19117538	ok	no	16386	26386	2
10.254.12.45	subs	0	26840742	ok	no	16384	26384	2
10.254.12.45	tms	0	19115634	ok	no	16381	26381	2
10.254.12.45	tms-external	0	19116159	ok	no	16385	26385	2
10.254.28.61	api-probe	0	19114431	ok	no	16382	26382	1
10.254.28.61	gwd	0	1589849802	ok	yes	16380	26380	1
10.254.28.61	rate-limit	0	19148496	ok	yes	16383	26383	1
10.254.28.61	ratelimit-module	0	19117538	ok	yes	16386	26386	1
10.254.28.61	subs	0	26842695	ok	yes	16384	26384	1
10.254.28.61	tms	0	19117734	ok	yes	16381	26381	1
10.254.28.61	tms-external	0	19117965	ok	yes	16385	26385	1
10.254.36.32	api-probe	0	19114739	ok	yes	16382	26382	3
10.254.36.32	gwd	0	1589848370	ok	no	16380	26380	3
10.254.36.32	rate-limit	0	19148496	ok	no	16383	26383	3
10.254.36.32	ratelimit-module	0	19117538	ok	no	16386	26386	3
10.254.36.32	subs	0	26840742	ok	no	16384	26384	3
10.254.36.32	tms	0	19115634	ok	no	16381	26381	3
10.254.36.32	tms-external	0	19116159	ok	no	16385	26385	3

- c. Take note of the IP that has the most primary **yes** options; this will be the new primary for all **functions** involved in gateway peering.

In this example, 10.254.28.61 is the primary for the largest number of **functions**; however **api-probe** is not primary on this pod. In the following steps, set **api-probe** as primary on this pod.

- 4. For every function that needs the primary changed, attach to the primary pod and set the function to primary:

- a. Log out of the current pod by pressing Ctrl+P, and then pressing Ctrl+Q.
- b. Run the following command to attach to a pod that needs its primary updated:

```
oc -n ns attach -it <IP_of_pod> -c datapower
```

- c. Run the following command to switch to the API Connect configuration:

```
config; switch apiconnect
```

- d. Run the following command to show the current peering status:

```
show gateway-peering-status
```

Verify that the function is set to the wrong primary IP and requires updating (in the example, `api-probe` requires updating).

- e. Run the following command to change the primary for the function:

```
gateway-peering-switch-primary <function>
```

For example:

```
gateway-peering-switch-primary api-probe
```

- f. Repeat this process for every function that needs its primary updated.
5. Verify that all functions are now primary on the same IP address by running the following command:

```
show gateway-peering-status
```

6. Log out of the gateway pod (Ctrl+P, then Ctrl+Q).

Upgrade stuck in Pending state

If your upgrade displays the `Pending` status and seems to be stuck, and the `postgres-operator` pod shows an error like the following example:

```
time="2023-07-17T06:41:09Z" level=error msg="refusing to upgrade due to unsuccessful resource removal"
func="internal/operator/cluster.AddUpgrade()" file="internal/operator/cluster/upgrade.go:134" version=4.7.10
```

You can resolve the problem by deleting the `clustercreate` and `upgrade` pgtasks, which triggers a new attempt at the upgrade.

First, check the logs to verify the error:

1. Run the following command to get the name of the pod:

```
oc get po -n <APIC_namespace> | grep postgres-operator
```

2. Run the following command to get the log itself, using the pod name from the previous step:

```
oc logs <pod-name> -c operator -n <APIC_namespace>
```

3. Once you confirm that the problem was caused by the resource-removal issue, delete the `clustercreate` and `upgrade` pgtasks. The following example shows the commands to get the pgtask names and then delete the `clustercreate` and `upgrade` pgtasks:

```
oc get pgtasks
NAME                                     AGE
backrest-backup-large-mgmt-bce926ab-postgres 36h
large-mgmt-bce926ab-postgres-createcluster 6d5h
large-mgmt-bce926ab-postgres-upgrade       36h

oc delete pgtasks large-mgmt-bce926ab-postgres-createcluster
pgtask.crunchydata.com "large-mgmt-bce926ab-postgres-createcluster" deleted

oc delete pgtasks large-mgmt-bce926ab-postgres-upgrade
pgtask.crunchydata.com "large-mgmt-bce926ab-postgres-upgrade" deleted
```

One or more pods in CrashLoopBackoff or Error state, and report a certificate error in the logs

In rare cases, `cert-manager` might detect a certificate in a bad state right after it has been issued, and then re-issues the certificate. If a CA certificate has been issued twice, the certificate that was signed by the previously issued CA will be left stale and can't be validated by the newly issued CA. In this scenario, one of the following messages displays in the log:

- `javax.net.ssl.SSLHandshakeException: Received fatal alert: certificate_unknown`
- `Error: unable to verify the first certificate`
- `ERROR: openssl verify failed to verify the Portal CA tls.crt, ca.crt chain signed the Portal Server tls.crt cert`

Resolve the problem by completing the following steps:

1. Use `apicops` (v10 version 0.10.57+ required) to validate the certificates in the system:

```
apicops upgrade:stale-certs -n <namespace>
```

2. If any certificate that is managed by `cert-manager` fails the validation, delete the stale certificate secret:

```
oc delete secret <stale-secret> -n <namespace>
```

`Cert-manager` automatically generates a new certificate to replace the one you deleted.

3. Use `apicops` to make sure all certificates can be verified successfully:

```
apicops upgrade:stale-certs -n <namespace>
```

Pgbouncer pod enters a CrashLoopBackoff state when upgrading to API Connect 10.0.5.3

This issue might be caused by a corrupt compliance entry in the pgbouncer.ini file. When the operator is upgraded to v10.0.5.3 but the ManagementCluster CR is not yet upgraded, the operator might update the pgbouncer.ini file in the PGBouncer secret with the older ManagementCluster CR's profile file, which does not contain any value for the `compliance pool_size`. As a result, the value gets incorrectly set to the string `<no value>`.

In the majority of cases this bad configuration update is temporary, until the ManagementCluster CR's version is also updated as part of the upgrade process and the problem is resolved. The issue will only become evident if the pgbouncer pod restarts prior to the ManagementCluster CR's version field being updated.

After the operator updates, if the other pods are restarted (specifically the pgbouncer pod) before the ManagementCluster CR's version is updated, then the pgbouncer pod will get stuck in a `CrashLoopBackOff` state due to the missing value for the `compliance pool_size` setting.

The following example shows what the error looks like in the pgbouncer logs:

```
Wed May 17 09:00:02 UTC 2023 INFO: Starting pgBouncer..
2023-05-17 09:00:02.897 UTC [24] ERROR syntax error in connection string
2023-05-17 09:00:02.897 UTC [24] ERROR invalid value "host=mgmt-a516d013-postgres port=5432 dbname=compliance pool_size=<no value>" for parameter compliance in configuration (/pgconf/pgbouncer.ini:7)
2023-05-17 09:00:02.897 UTC [24] FATAL cannot load config file
```

Resolve the issue by running the commands in the following script, where `<namespace>` is the API Connect instance's namespace if you deployed using the top-level `APIConnectCluster` CR, or is the management subsystem's namespace if you deploying using individual subsystem CRs.

```
NAMESPACE=<APIC-namespace>
BOUNCER_SECRET=<management-prefix>-postgres-pgbouncer-secret
TEMP_FILE=/tmp/pgbouncer.ini

**Step 1 - Common: Get the existing pgbouncer.ini file**
oc get secret -n $NAMESPACE $BOUNCER_SECRET -o jsonpath='{.data.pgbouncer\.ini}' | base64 -d > $TEMP_FILE

**Step 2 - Linux version: Update the file and use it to patch the Secret on the cluster**
sed 's/<no value>/20/' $TEMP_FILE | base64 -w0 | xargs -I{} kubectl patch secret -n $NAMESPACE $BOUNCER_SECRET --type='json' -p="{['op' : 'replace' , 'path' : '/data/pgbouncer.ini' , 'value' : {} ]}"

**Step 2 - Mac version: Update the file and use it to patch the Secret on the cluster**
sed 's/<no value>/20/' $TEMP_FILE | base64 -b0 | xargs -S2000 -I{} kubectl patch secret -n $NAMESPACE $BOUNCER_SECRET --type='json' -p="{['op' : 'replace' , 'path' : '/data/pgbouncer.ini' , 'value' : {} ]}"

# Step 3 - Common: Restart pgbouncer to pick up the updated Secret configuration
oc delete pod <bouncer_pod_name> -n $NAMESPACE
```

You see the denied: insufficient scope error during an air-gapped deployment

Problem: You encounter the `denied: insufficient scope` message while mirroring images during an air-gapped upgrade.

Reason: This error occurs when a problem is encountered with the entitlement key used for obtaining images.

Solution: Obtain a new entitlement key by completing the following steps:

1. Log in to the [IBM Container Library](#).
2. In the Container software library, select Get entitlement key.
3. After the Access your container software heading, click Copy key.
4. Copy the key to a safe location.

Apiconnect operator crashes

Problem: During upgrade, the Apiconnect operator crashes with the following message:

```
panic: unable to build API support: unable to get Group and Resources: unable to retrieve the complete list of server APIs:
packages.operators.coreos.com/v1: the server is currently unable to handle the request
```

```
goroutine 1 [running]:
github.ibm.com/velox/apiconnect-operator/operator-utils/v2/apiversions.GetAPISupport(0x0)
operator-utils/v2/apiversions/api-versions.go:89 +0x1e5
main.main()
ibm-apiconnect/cmd/manager/main.go:188 +0x4ee
```

Additional symptoms:

- Apiconnect operator is in crash loopback status
- Kube apiserver pods log the following information:

```
E1122 18:02:07.853093 18 available_controller.go:437] v1.packages.operators.coreos.com failed with:
failing or missing response from https://10.128.0.3:5443/apis/packages.operators.coreos.com/v1:
bad status from https://10.128.0.3:5443/apis/packages.operators.coreos.com/v1: 401
```

- The IP logged here belongs to the `package server` pod present in the `openshift-operator-lifecycle-manager` namespace
- Package server pods log the following: `/apis/packages.operators.coreos.com/v1` API call is being rejected with 401 issue

```
E1122 18:10:25.614179 1 authentication.go:53] Unable to authenticate the request due to an error: x509:
certificate signed by unknown authority I1122 18:10:25.614224 1 httplog.go:90]
verb="GET" URI="/apis/packages.operators.coreos.com/v1" latency=161.243µs resp=401
UserAgent="Go-http-client/2.0" srcIP="10.128.0.1:41370":
```

- Problem is intermittent

Solution:

- If you find the exact symptoms as described, the solution is to delete package server pods in the `openshift-operator-lifecycle-manager` namespace.
- New package server pods will log the `200 Success` message for the same API call.

Upgrading a two data center deployment on Kubernetes and OpenShift

How to upgrade a two data center disaster recovery (DR) deployment on Kubernetes and OpenShift.

To upgrade API Connect in a 2DCDR deployment, use the upgrade instructions for your platform, but with the extra considerations and steps documented in this topic.

- [Upgrading on Kubernetes](#).
- [Upgrading on OpenShift and Cloud Pak for Integration](#).

Note: For OpenShift users: The steps that are detailed in this topic use the Kubernetes `kubectl` command. On OpenShift, use the equivalent `oc` command in its place.

Before you begin

- Ensure that API Connect is running in both data centers and that replication is working: [Verifying replication between data centers](#).
- Ensure that you have recent backups of Management and Portal subsystems: [Backup and restore requirements for a two data center deployment](#).

Key points applicable to both Management and Portal subsystems

- Your API Connect deployments must be upgraded to the same API Connect release, down to the interim fix level.
- Both data centers must be upgraded in the same maintenance window.
- Upgrade the data center that has the `ingress-ca` Kubernetes cert-manager certificate object first.
- Extra steps must be taken to ensure that the `ingress-ca` secret in both data centers contains the same `ingress-ca` X.509 certificate

The X.509 CA certificate that is used for TLS communication between the API Connect deployments in each data center is referred to as the `ingress-ca` X.509 certificate. This certificate is stored in the `ingress-ca` secret in both data centers, and it must be the same in each data center for 2DCDR to function. The cert-manager has a separate object that is referred to as the `ingress-ca` Kubernetes cert-manager certificate object. This object exists on the data center that was the original active data center on installation.

Key points:

- The `ingress-ca` Kubernetes cert-manager certificate object exists on only one of the data centers in a 2DCDR deployment.
- The `ingress-ca` X.509 certificate is contained in the `ingress-ca` secret of both data centers in a 2DCDR deployment, as shown:

```
kubectl get secret ingress-ca -n <namespace> -o yaml

apiVersion: v1
data:
  ca.crt: <long cert string>
  tls.crt: <long cert string>
  tls.key: <long cert string>
kind: Secret
...
```

To identify the data center that has the `ingress-ca` Kubernetes cert-manager certificate object, run:

```
kubectl -n <namespace> get cert ingress-ca
```

NAME	READY	SECRET	AGE
ingress-ca	True	ingress-ca	30h

Note: If the data center that has the `ingress-ca` Kubernetes cert-manager certificate object is unrecoverable, a new `ingress-ca` Kubernetes cert-manager certificate object can be created on the active data center by using the `ingress-ca` certificate section of the installation yaml file: `helper_files/ingress-issuer-v1.yaml`:

```
apiVersion: cert-manager.io/v1
kind: Certificate
metadata:
  name: ingress-ca
  labels: {
    app.kubernetes.io/instance: "management",
    app.kubernetes.io/managed-by: "ibm-apiconnect",
    app.kubernetes.io/name: "ingress-ca"
  }
spec:
  secretName: ingress-ca
  commonName: "ingress-ca"
  usages:
  - digital signature
  - key encipherment
  - cert sign
  isCA: true
  duration: 87600h # 10 years
  renewBefore: 720h # 30 days
  privateKey:
    rotationPolicy: Always
  issuerRef:
    name: selfsigning-issuer
    kind: Issuer
```

Pre-upgrade operations in the upgrade documentation for your platform might result in an update to the `ingress-ca` X.509 certificate. Extra steps must then be taken during the 2DCDR deployment upgrade to ensure that both data centers always use the same `ingress-ca` X.509 certificate.

Note: If you are not using cert-manager and you customized your certificates, the `ingress-ca` certificate might have a different name. Ensure that the CA certificate that is used by both data centers is the same during all stages of the upgrade.

Steps for Management upgrades

1. Remove the `multiSiteHA` section from the management CRs in both data centers, converting them both to stand-alone deployments.
2. Verify that the management subsystem in both data centers is running as a stand-alone, and that all the pods are running:

```
kubectl get mgmt -n <namespace>
```

NAME	READY	STATUS	VERSION	RECONCILED VERSION	AGE
<management instance name>	15/15	Running	<version>	<version>-xxxx	14d

If one of the data centers returns 6/6 pods then this means it is still running as a warm-standby, wait a few minutes for it to complete the transition to a stand-alone data center. Run `kubectl describe` and confirm that the `multiSiteHA` section is gone from the `spec` section, and that the `Status` section shows `ha mode` of active in both data centers:

```
kubectl describe mgmt -n <namespace>
...
Status
  Ha Mode:          active
...
```

3. Upgrade both data centers.
4. Verify that both data centers have the same `ingress-ca` X.509 certificate in their `ingress-ca` secret. Run the following command in both data centers and check that the output is the same:

```
openssl x509 -noout -fingerprint -sha256 -in <(kubectl get secret ingress-ca -n <namespace> -o yaml | grep "^ tls.crt:" | awk '{print $2}' | base64 -d)>
```

if you do not have the `openssl` command available, you can instead run only the `kubectl` part, which produces a larger output:

```
kubectl get secret ingress-ca -n <namespace> -o yaml | grep "^ tls.crt:" | awk '{print $2}' | base64 -d
```

if the outputs are different, follow these steps to synchronize the certificates: [Synchronizing ingress-ca X.509 certificates](#).

5. Add the `multiSiteHA` sections to the management CRs, setting one of them to be the active and the other to be the warm-standby.

Steps for Portal upgrades

1. Verify that both data centers have the same `ingress-ca` X.509 certificate in their `ingress-ca` secret. Run the following command in both data centers and check that the output is the same:

```
openssl x509 -noout -fingerprint -sha256 -in <(kubectl get secret ingress-ca -n <namespace> -o yaml | grep "^ tls.crt:" | awk '{print $2}' | base64 -d)>
```

if you do not have the `openssl` command available, you can instead run only the `kubectl` part, which produces a larger output:

```
kubectl get secret ingress-ca -n <namespace> -o yaml | grep "^ tls.crt:" | awk '{print $2}' | base64 -d
```

if the outputs are different, follow these steps to synchronize the certificates: [Synchronizing ingress-ca X.509 certificates](#).

2. Determine which data center has the `ingress-ca` Kubernetes cert-manager certificate object:

```
kubectl get certificates -n <portal namespace> | grep ingress-ca
```

If this data center is the active, failover the portal subsystem to make it the warm-standby data center: [How to failover API Connect from the active to the warm-standby data center](#).

3. Start the upgrade of your warm-standby data center by following the upgrade documentation for your platform. Stop at the point where the portal CR is updated with the new API Connect version.
4. Verify that both data centers still have the same `ingress-ca` X.509 certificate, repeating step 1. If they are different, then follow these steps: [Synchronizing ingress-ca X.509 certificates](#).
5. Complete the upgrade of your warm-standby data center by updating the portal subsystem CR, following the remaining upgrade steps for your platform.
6. Start the upgrade of your active data center by following the upgrade documentation for your platform. Stop at the point where the portal CR is updated with the new API Connect version.
7. Verify that both data centers still have the same `ingress-ca` X.509 certificate, repeating step 1. If they are different, then follow these steps: [Synchronizing ingress-ca X.509 certificates](#).
8. Upgrade the portal subsystem in your active data center by updating the portal subsystem CR, following the remaining upgrade steps for your platform.

Synchronizing the ingress-ca X.509 certificate across data centers

Follow these steps to extract your `ingress-ca` X.509 certificate from your source data center and prepare it for application on your target data center:

1. Determine which data center has the `ingress-ca` Kubernetes cert-manager certificate object certificate:

```
kubectl get certificates -n <namespace> | grep ingress-ca
```

this is your source data center.

2. Extract the `ingress-ca` secret from your source data center to a file called `new-ca-issuer-secret.yaml`:

```
kubectl get secret ingress-ca -o yaml -n <namespace> > new-ca-issuer-secret.yaml
```

3. Edit the `new-ca-issuer-secret.yaml` file and remove the `creationTimestamp`, `resourceVersion`, `uid`, `namespace`, and `managedFields`. Remove the labels and annotations sections completely. The resulting contents should include the `ingress-ca` X.509 certificate, and the secret name:

```
apiVersion: v1
data:
```

```
ca.crt: <long cert string>
tls.crt: <long cert string>
tls.key: <long cert string>
kind: Secret
metadata:
  name: ingress-ca
  type: kubernetes.io/tls
```

4. Copy the `new-ca-issuer-secret.yaml` to the target data center.

Follow these steps to apply the extracted `ingress-ca` X.509 certificate on your target data center:

1. To apply the `new-ca-issuer-secret.yaml` file, run:

```
kubectl apply -f new-ca-issuer-secret.yaml -n <namespace>
```

2. Regenerate all `ingress-ca` end-entity certificates:

```
kubectl get secrets -n <namespace> -o custom-columns='NAME:.metadata.name,ISSUER:.metadata.annotations.cert-manager.io/issuer-name' --no-headers=true | grep ingress-issuer | awk '{ print $1 }' | xargs kubectl delete secret -n <namespace>
```

All affected pods should automatically restart. For more information on regenerating certificates, see: [Renewing certificates with cert-manager](#).

How to upgrade when one data center is down

If API Connect is still running on the failed data center, follow the steps that are documented previously to upgrade both data centers, before you bring the failed data center back online.

If the failed data center is expected to be down for a long time, you can convert the active data center to a stand-alone data center following these steps: [Removing a two data center deployment](#), but note the following points:

1. Ensure that the network links to the failed data center are removed.
2. Ensure that the failed data center is set to warm-standby in the `multiSiteHA` section. Do not proceed to the next step until the data center completes the transition to warm-standby. View the status of the management and portal CRs to confirm that `HA Mode` reports "passive".
3. Remove the `multiSiteHA` section from failed data center, and ensure that the failed data center resets itself to become an empty stand-alone API Connect deployment (all data is deleted).
4. Before you restore the network links between the data centers, do the following:
 - Upgrade API Connect on the failed data center to the same version as the active.
 - Add the `multiSiteHA` sections to both data centers, setting the failed data center to be warm-standby.Important: Do not set the failed data center to be active in the `multiSiteHA` section because it results in an overwrite of the data on your working data center with the empty database of your failed data center.

Upgrading a two data center deployment on Cloud Pak for Integration

How to upgrade a two data center disaster recovery (DR) deployment on Cloud Pak for Integration.

To upgrade a Cloud Pak for Integration deployment of API Connect in a 2DCDR deployment, use the Cloud Pak for Integration upgrade instructions [Upgrading API Connect in Cloud Pak for Integration](#), but with the extra considerations and steps documented in this topic.

Before you begin

- Ensure that API Connect is running in both data centers and that replication is working: [Verifying replication between data centers](#).
- Ensure that you have recent backups of Management and Portal subsystems: [Backup and restore requirements for a two data center deployment](#).

Key points applicable to both Management and Portal subsystems

- Your API Connect deployments must be upgraded to the same API Connect release, down to the interim fix level.
- Both data centers must be upgraded in the same maintenance window.
- Extra steps must be taken to ensure that the `ingress-ca` secret in both data centers contains the same `ingress-ca` X.509 certificate

The X.509 CA certificate that is used for TLS communication between the API Connect deployments in each data center is referred to as the `ingress-ca` X.509 certificate. This certificate is stored in the `ingress-ca` secret in both data centers, and it must be the same in each data center for 2DCDR to function. The cert-manager has a separate object that is referred to as the `ingress-ca` Kubernetes cert-manager certificate object.

Pre-upgrade operations might result in an update to the `ingress-ca` X.509 certificate. Extra steps must then be taken during the 2DCDR deployment upgrade to ensure that both data centers always use the same `ingress-ca` X.509 certificate.

2DCDR upgrade steps for Cloud Pak for Integration

In Cloud Pak for Integration, the Management and Portal subsystems are managed by the `apiconnectcluster` CR (also known as the top-level CR). When the `apiconnectcluster` CR is updated with the new API Connect version, all the subsystems are updated automatically. Follow the upgrade process for Cloud Pak for Integration, starting from [Upgrading API Connect in Cloud Pak for Integration](#), along with the following steps.

1. Verify that both data centers have the same `ingress-ca` X.509 certificate in their `<apic instance-name>-ingress-ca` secret. Run the following command in both data centers and check that the output is the same:

```
openssl x509 -noout -fingerprint -sha256 -in <(oc get secret <apic instance-name>-ingress-ca -n <namespace> -o yaml | grep "^ tls.crt:" | awk '{print $2}' | base64 -d)
```

if you do not have the `openssl` command available, you can instead run only the `oc` part, which produces a larger output:

```
oc get secret <apic instance-name>-ingress-ca -n <namespace> -o yaml | grep "^ tls.crt:" | awk '{print $2}' | base64 -d
```

if the outputs are different, follow these steps to synchronize the certificates: [Synchronizing the ingress-ca X.509 certificate across data centers](#).

2. Remove the `multiSiteHA` section from the Management sections of the `apiconnectcluster` CRs in both data centers, converting them both to stand-alone management deployments. Be careful to do this only in the management sections, and not the portal sections of the `apiconnectcluster` CR.
3. Start the upgrade of your portal warm-standby data center by following the upgrade documentation for the API Management capability in <https://www.ibm.com/docs/en/cloud-paks/cp-integration>. Stop at the point after the API Connect and DataPower operators are updated but before the operands are updated.
4. Repeat step 1 to verify that the `ingress-ca` X.509 certificates are still the same in both data centers.
5. Complete the upgrade of your portal warm-standby data center, updating the operands as described in the Cloud Pak for Integration documentation.
6. Repeat step 1 to verify that the `ingress-ca` X.509 certificates are still the same in both data centers.
7. Start the upgrade of your portal active data center by following the upgrade documentation for the API Management capability in <https://www.ibm.com/docs/en/cloud-paks/cp-integration>. Stop at the point after the API Connect and DataPower operators are updated but before the operands are updated.
8. Repeat step 1 to verify that the `ingress-ca` X.509 certificates are still the same in both data centers.
9. Complete the upgrade of the portal active data center, updating the operands as described in the Cloud Pak for Integration documentation.
10. Add the `multiSiteHA` sections to the management section of the `apiconnectcluster` CRs in both data centers. Set the same active data center for management as for portal.

Synchronizing the `ingress-ca` X.509 certificate across data centers

Follow these steps to extract your `ingress-ca` X.509 certificate from your source data center and prepare it for application on your target data center. Your source data center is the data center that you are upgrading first:

1. Extract the `<apic instance-name>-ingress-ca` secret from your source data center to a file called `new-ca-issuer-secret.yaml`:

```
oc get secret <apic instance-name>-ingress-ca -o yaml -n <namespace> > new-ca-issuer-secret.yaml
```

2. Edit the `new-ca-issuer-secret.yaml` file and remove the `creationTimestamp`, `resourceVersion`, `uid`, `namespace`, and `managedFields`. Remove the labels and annotations sections completely. The resulting contents should include the `ingress-ca` X.509 certificate, and the secret name:

```
apiVersion: v1
data:
  ca.crt: <long cert string>
  tls.crt: <long cert string>
  tls.key: <long cert string>
kind: Secret
metadata:
  name: ingress-ca
  type: kubernetes.io/tls
```

3. Copy the `new-ca-issuer-secret.yaml` to the target data center.

Follow these steps to apply the extracted `ingress-ca` X.509 certificate on your target data center:

1. To apply the `new-ca-issuer-secret.yaml` file, run:

```
oc apply -f new-ca-issuer-secret.yaml -n <namespace>
```

2. Regenerate all `ingress-ca` end-entity certificates:

```
oc get secrets -n <namespace> -o custom-columns='NAME:.metadata.name,ISSUER:.metadata.annotations.cert-manager\.io/issuer-name' --no-headers=true | grep ingress-issuer | awk '{ print $1 }' | xargs oc delete secret -n <namespace>
```

All affected pods should automatically restart. For more information on regenerating certificates, see: [Renewing certificates with cert-manager](#).

How to upgrade when one data center is down

If API Connect is still running on the failed data center, follow the steps that are documented previously to upgrade both data centers, before you bring the failed data center back online.

If the failed data center is expected to be down for a long time, you can convert the active data center to a stand-alone data center following these steps: [Removing a two data center deployment](#), but note the following points:

1. Ensure that the network links to the failed data center are removed.
2. Ensure that the failed data center is set to warm-standby in the `multiSiteHA` section. Do not proceed to the next step until the data center completes the transition to warm-standby. View the status of the management and portal CRs to confirm that `HA Mode` reports "passive".
3. Remove the `multiSiteHA` section from failed data center, and ensure that the failed data center resets itself to become an empty stand-alone API Connect deployment (all data is deleted).
4. Before you restore the network links between the data centers, do the following:
 - Upgrade API Connect on the failed data center to the same version as the active.
 - Add the `multiSiteHA` sections to both data centers, setting the failed data center to be warm-standby.Important: Do not set the failed data center to be active in the `multiSiteHA` section because it results in an overwrite of the data on your working data center with the empty database of your failed data center.

Maintaining API Connect

You can use utilities to complete maintenance tasks such as backup, restore, and certificate management on Kubernetes.

Note: When maintaining API Connect, do not use `kubect1 exec` or `oc exec` commands to access API Connect pods unless advised by IBM.

- [Advanced configuration](#)
You can optionally install and configure advanced features.
- [Backing up and restoring](#)
You can backup and restore API Connect subsystems.
- [Disaster recovery](#)
Prepare for, or recover from, a disaster affecting an API Connect deployment running on Kubernetes, OpenShift, or Cloud Pak for Integration.
- [Disabling and re-enabling the Analytics subsystem on Kubernetes](#)
During maintenance of an API Connect cluster, you can shut down the Analytics subsystem by disabling the ingestion, and storage microservices so that those processes are not running and there is no way to reach them.
- [Disabling and re-enabling the Analytics subsystem on OpenShift and Cloud Pak for Integration](#)
During maintenance of an API Connect cluster, you can shut down the Analytics subsystem by disabling the client, ingestion, and storage microservices so that those processes are not running and there is no way to reach them.
- [Maintaining a two data center deployment](#)

- [Advanced configuration for the gateway subsystem](#)
Specify advanced configuration for the gateway subsystem.

Installing License Service

License Service helps you assess whether your IBM® API Connect deployment in a Kubernetes environment is compliant with licensing requirements.

About this task

License Service provides useful features for managing virtualized environments and measuring license utilization. License Service discovers the software that is installed in your infrastructure, helps you to analyze the consumption data, and allows you to generate audit reports. Each report provides you with different information about your infrastructure, for example the computer groups, software installations, and the content of your software catalog.

By default, every License Service audit report presents data from the previous 90 days. You can customize the type and amount of information that is displayed in a report by using filters, and save your personal settings for future use. You can also export the reports to .csv or .pdf format, and schedule report emails so that specified recipients are notified when important events occur.

When you install API Connect, the `license-use` setting that is configured in the `ibm-apiconnect` operator CR (custom resource) for a particular subsystem is reflected in the Pod annotations. For the Analytics, Portal, and Management subsystems the `license-use` value can be "production" or "nonproduction". For the Gateway subsystem, the `license-use` value can be "production", "nonproduction", or "developer". The subsystem pod annotations are scanned by the `ibm-licensing-operator`, which reports license and CPU usage for each subsystem.

For more information, see [License Service](#) in the IBM Cloud Pak foundational services documentation.

Procedure

Install License Service as explained in the installation instructions in [License Service](#) in the IBM Cloud Pak foundational services documentation. The instructions describe the appropriate License Service installation procedure for API Connect deployments, and apply to the Analytics, Portal, Management, and Gateway subsystems.

Installing the Automated API behavior testing application

Update the custom resource for installing IBM® API Connect to deploy the Automated API behavior testing application on Kubernetes.

About this task

You can install the Automated API behavior testing application as part of a new IBM API Connect deployment, or you can add it to an existing deployment:

- [Adding the Automated API behavior testing application to an existing deployment](#)
- [Including the Automated API behavior testing application in a new deployment](#)

Note: It is not possible to use the Automated API behavior testing application with a two data center disaster recovery configuration ([Two data center deployment strategy on Kubernetes and OpenShift](#)).

Adding the Automated API behavior testing application to an existing deployment

Before you begin

Make sure that the following requirements are met before attempting to deploy the Automated API behavior testing application:

- The IBM API Connect subsystems are installed.
- The cert-manager is installed for use with IBM API Connect and you are using the default certificates that it generates. The Automated API behavior testing application requires that the IBM API Connect deployment use the cert-manager and the default certificates. Custom certificates are not supported and if used, the Automated API behavior testing application will not install correctly.

About this task

Edit the deployed CR (custom resource) for the Management subsystem and add the settings for the Automated API behavior testing application.

Procedure

1. Retrieve the name of the deployed Management subsystem's deployed CR by running the following command:

```
kubectl get managementcluster -n <management_namespace>
```

2. Edit the deployed CR by running the following command:

```
kubectl edit managementcluster <management-cr-name> -n <management_namespace>
```

3. Append the new `testAndMonitor` definition at the end of the `spec` section, making sure to adhere to the spacing used in the file. Attention: The hub and turnstile endpoints should be distinct and must not overlap with any of the 4 management endpoints.

```
testAndMonitor:
  enabled: true
  hubEndpoint:
    annotations:
      cert-manager.io/issuer: ingress-issuer
    hosts:
      - name: hub.$STACK_HOST
        secretName: hub-endpoint
  turnstileEndpoint:
    annotations:
      cert-manager.io/issuer: ingress-issuer
    hosts:
      - name: turnstile.$STACK_HOST
        secretName: turnstile-endpoint
```

`$STACK_HOST` is the ingress subdomain for the API Connect stack, as documented in [Installing the Management subsystem cluster](#).

4. Save the update. The Automated API behavior testing application will be installed into the existing Management subsystem.
5. Check the Hub and Turnstile pods periodically until their "READY" values are both "1/1" and their "STATUS" are both "Running". Verify that the Hub and Turnstile pods are running, by executing the following command:

```
kubectl get pods -n <management_namespace>
```

Look for pods with names similar to `management-hub-XXXX-XXXX` and `management-turnstile-XXXX-XXXX`. The following example shows how the response might look:

NAME	READY	STATUS	RESTARTS	AGE
<code>management-hub-68745dc4b7-gmlkk</code>	1/1	Running	0	29m
<code>management-turnstile-b7d978b56-jghvn</code>	1/1	Running	0	24m

Including the Automated API behavior testing application in a new deployment

Before you begin

Make sure that the cert-manager is installed for use with IBM API Connect and you are using the default certificates that it generates. The Automated API behavior testing application requires that the IBM API Connect deployment use the cert-manager and the default certificates. Custom certificates are not supported and if used, the Automated API behavior testing application will not install correctly.

About this task

Edit the CR (custom resource) for the Management subsystem and add the settings for the Automated API behavior testing application.

Procedure

1. Edit the `ManagementCluster` custom resource (CR) and add the following definition for the Automated API behavior testing application. Append the new definition at the end of the `spec` section, making sure to adhere to the spacing used in the file.

```
testAndMonitor:
  enabled: true
  hubEndpoint:
    annotations:
      cert-manager.io/issuer: ingress-issuer
    hosts:
      - name: hub.$STACK_HOST
        secretName: hub-endpoint
  turnstileEndpoint:
    annotations:
      cert-manager.io/issuer: ingress-issuer
    hosts:
      - name: turnstile.$STACK_HOST
        secretName: turnstile-endpoint
```

`$STACK_HOST` is the ingress subdomain for the API Connect stack, as documented in [Installing the Management subsystem cluster](#).

Attention: The hub and turnstile endpoints should be distinct and must not overlap with any of the 4 management endpoints.

2. Apply the updated CR by running the following command:

```
kubectl apply -f management_cr.yaml -n <management_namespace>
```

where `namespace` is the name of the target installation namespace in the Kubernetes cluster.

The Automated API behavior testing application will be installed with the Management subsystem.

3. Check the Hub and Turnstile pods periodically until their "READY" values are both "1/1" and their "STATUS" are both "Running". Verify that the Hub and Turnstile pods are running, by executing the following command:

```
kubectl get pods -n <management_namespace>
```

Look for pods with names similar to `management-hub-XXXX-XXXX` and `management-turnstile-XXXX-XXXX`. The following example shows how the response might look:

NAME	READY	STATUS	RESTARTS	AGE
<code>management-hub-68745dc4b7-gmlkk</code>	1/1	Running	0	29m
<code>management-turnstile-b7d978b56-jghvn</code>	1/1	Running	0	24m

Installing the toolkit

You can install the toolkit that provides CLI commands, and the API Designer user interface, for IBM® API Connect.

About this task

The toolkit is provided as executable files, so no actual installation is necessary, you just need to download the required compressed file and extract the contents.

There are two toolkit options available:

- CLI: provides a command line environment for working with IBM API Connect.
- CLI + LoopBack + Designer: provides a command line environment for working with IBM API Connect, including LoopBack® support, and the API Designer application.

To install the toolkit, download the compressed file that is appropriate for your chosen toolkit option and platform, then extract the contents to a chosen location on your local machine. The compressed file contains an executable file for running CLI commands and, if you choose the CLI + LoopBack + Designer option, an executable file for launching the API Designer application.

You can download the toolkit from one of the following locations:

- From IBM Fix Central.

- From the Cloud Manager or API Manager user interface.

Procedure

To install and run the toolkit, complete the following steps:

1. Download the toolkit compressed file.
 - To download the toolkit from IBM Fix Central, complete the following steps:
 - Open the [IBM Fix Central site](#) in your browser.
 - In the Product selector field, enter `API Connect`, then select IBM API Connect from the drop down list.
 - Select your Installed Version and click Continue. If you do not know your installed IBM API Connect version, contact your administrator.
 - In the Text field, enter `toolkit`, then click Continue.
 - Select the toolkit file that you want to download.
 - Click Continue, then follow the instructions to complete the download operation.
 - To download the toolkit from Cloud Manager or API Manager user interface, complete the following steps:
 - Open the Cloud Manager or API Manager user interface.
 - On the welcome page, click the Download Toolkit tile. The two toolkit options are listed.
 - Click your platform alongside either the CLI option or the CLI + LoopBack + Designer option as required, then save the associated compressed file to your local file system.
 - To download the API Designer credentials (Client ID and Client Secret), click Download alongside API Designer Credentials, then save the `designer_credentials.json` file to your local file system. A command is provided for installing the credentials, as described in detail in [step 6](#).
 - To download the toolkit credentials (Client ID and Client Secret), click Download alongside Credential, then save the `credentials.json` file to your local file system. A command is provided for installing the credentials, as described in detail in [step 5](#).
 - Close the Install API Connect Toolkit window.
2. Extract the contents of the toolkit compressed file to a folder of your choice.

The contents of the file depend on the your chosen toolkit option and platform, as follows:

 - The `apic-slim` or `apic-slim.exe` file is the CLI for IBM API Connect.
 - The `apic` or `apic.exe` file is the CLI for IBM API Connect including LoopBack support.

Tip: If you are using the CLI option, then if you rename the `apic-slim` file to `apic`, or the `apic-slim.exe` file to `apic.exe`, you can run the CLI commands exactly as documented, copy and paste sample commands from the documentation, and use any command scripts as-is if you later move to the CLI + LoopBack + Designer option.
 - The `api_designer-platform` file is the API Designer user interface application for the specified platform.
3. Optional: Delete the `$HOME/.apiconnect/node_cli` directory.

You need to do this only if you replaced a version of `apic` or `apic.exe` and are using the `apic lb4` command. You need to delete the directory `get apic` to unpack the new loopback.

On Windows, `$HOME` is defined by environment `USERPROFILE`.

4. Run the CLI.
 - For the Mac OSX or Linux® platforms, complete the following steps:
 - Open a terminal instance and navigate to the folder where you extracted the contents of the toolkit compressed file.
 - Make the CLI file an executable file by entering the following command:

```
chmod +x download_name
```

Where `download_name` is the name of the toolkit file that you downloaded, either `apic` or `apic-slim`.
 - Run CLI commands as follows:

```
./apic command_name_and_parameters
```

or

```
./apic-slim command_name_and_parameters
```

For details of the CLI commands, see [apic](#).
 - For the Windows platform, complete the following steps:
 - Open a command prompt and navigate to the folder where you extracted the contents of the toolkit compressed file.
 - Run CLI commands as follows:

```
apic command_name_and_parameters
```

or

```
apic-slim command_name_and_parameters
```

For details of the CLI commands, see [apic](#).

Tip: Add the folder location of your CLI file to your `PATH` variable so that you can run CLI commands from anywhere in your file system.

5. Install the toolkit credentials.

If you do not install the toolkit credentials that are provided for download, as detailed previously in the [toolkit credentials download instructions](#), API Connect uses a default set of credentials that are identical for all deployments. However, the downloaded credentials were generated during the deployment of your API Connect system and are unique to your installation. To install the credentials into your local toolkit, run the following command:

```
apic client-creds:set toolkit_credentials_file_path/credentials.json
```

where `credentials_file_path` is the location to which you downloaded the toolkit credentials JSON file. After you have run this command, your toolkit uses these new credentials to authenticate with the management server.

Note: At any one time, you can use only one set of toolkit credentials for login to a management server from the toolkit CLI. If you want to log in to a different management server you must install the toolkit credentials from that management server.

To revert to the default toolkit credentials for all login operations from the toolkit CLI, use the following command:

```
apic client-creds:clear
```

For increased security, an administrator can remove the default credentials from the management server by completing the following steps:

- a. Log in to the management server as an administrator; see [Logging in to a management server](#).

b. Delete the default credentials by running the following commands:

```
apic registrations:delete toolkit --server mgmt_endpoint_url
apic registrations:delete consumer-toolkit --server mgmt_endpoint_url
```

6. Install the API Designer credentials.

If you do not install the API Designer credentials that are provided for download, as detailed previously in the [API Designer credentials download instructions](#), API Connect uses a default set of credentials that are identical for all deployments. However, the downloaded credentials were generated during the deployment of your API Connect system and are unique to your installation. To install the custom credentials into your local API Designer, set the `APIC_DESIGNER_CREDENTIALS` environment variable to the credentials download location, using the mechanism appropriate for your operating system.

After you have set the `APIC_DESIGNER_CREDENTIALS` environment variable, your API Designer uses the new credentials to authenticate with the management server.

- Windows:

If you are using Windows, create an environment variable using one of the following methods:

- Create a permanent environment variable so that you can start API Designer from any location on your computer:
 - Open the Environment Variables page: Click Start, Settings, System and in the "Related Settings" section of the page, click Advanced System Settings.
 - On the Advanced tab of the System Properties dialog box, click Environment Variables.
 - In the "User variables" section, click New and create an environment variables with the following settings:
 - Variable: `APIC_DESIGNER_CREDENTIALS`
 - Value: `<designer_credentials_file_path>\designer_credentials.json` where `<designer_credentials_file_path>` is the location where you stored the `designer_credentials.json` file.
 - Click OK to save the new environment variable, and then exit the dialog box.
- If you don't have the required permissions to create a permanent environment variable, you can create a temporary one that will only be used while you are running the API Designer application. The following steps must be performed every time you start API Designer:
 - Open the Windows command prompt.
 - Run the following command to set the temporary environment variable:

```
set APIC_DESIGNER_CREDENTIALS=<designer_credentials_file_path>\designer_credentials.json
```

where `<designer_credentials_file_path>` is the location where you stored the `designer_credentials.json` file.

Note: Leave the command prompt open for the next step. You must set the temporary variable and start the API Designer within the same Windows command session.

- Now run the following command to start API Designer:

```
C:\>"Program Files\API Designer\API Designer.exe"
```

By default, API Designer is installed in the C:\Program Files\API Designer folder as shown in the example. If you installed it into a different location, use your own location in the command. Note that the path and file name are enclosed in quotation marks because they contain spaces.

- Mac:

If you are using Mac OS X, create an environment variable using one of the following methods:

- Run the following command to set the global environment variable:

```
launchctl setenv APIC_DESIGNER_CREDENTIALS <designer_credentials_file_path>/designer_credentials.json
```

where `<designer_credentials_file_path>` is the location where you stored the API Designer credentials JSON file.

- Pass in the environment variable while starting API Designer from the command line. With this method, you must run the following command every time you start API Designer:

```
APIC_DESIGNER_CREDENTIALS=<designer_credentials_file_path>/designer_credentials.json open <designer_application_file_path>/API Designer.app'
```

where:

- `<designer_credentials_file_path>` is the location to which you downloaded the API Designer credentials JSON file.
- `<designer_application_file_path>` is the location to which you downloaded and uncompressed the API Designer application.

7. Start the API Designer application from the location to where you stored the extracted file.

Note:

- To uninstall the API Designer application on a Windows platform with a non Administrator account, complete the following steps:
 - In Windows File Explorer, navigate to the `USER_HOME\AppData\Local\Programs\api-designer` folder.
 - Run the **Uninstall API Designer application** application. Do **not** use the **Add or remove programs** window.
- To uninstall the API Designer application on a Windows platform with an Administrator account, you can either run the **Uninstall API Designer application** application, or you can use the **Add or remove programs** window.

Results

The IBM API Connect toolkit CLI and, if selected, the API Designer user interface application are installed on your local system.

For information on using the API Designer user interface, see [Developing your APIs and applications](#).

For information on using the toolkit CLI, see [Using the developer toolkit command-line tool](#).

Changing deployment profiles on Kubernetes

You can change an API Connect installation to use different deployment profiles.

About this task

After you complete initial installation of the API Connect subsystems, you can change to another of the profiles that are supported for the subsystem. For more information on the available profiles, see: [Planning your deployment topology](#).

Important considerations:

- If you are changing from a one replica profile to a three replica profile, ensure that you have three replica profile hardware (at least 3 worker nodes).
- Based on the resources configured for each microservice in the profile, there might be downtime during the profile change.

Procedure

1. Management subsystem:

- a. Verify that subsystem is in **Running** state.

```
kubectl get ManagementCluster -n <namespace>
```

- b. Edit the CR:

```
kubectl edit ManagementCluster -n <namespace>
```

Change `spec.profile` value to the new profile you want to use.

- c. When switching from one replica profile to a three replica profile, wait for the microservice to scale up. When switching from a three replica profile to a one replica profile, wait for the microservice to scale down.
- d. Verify that subsystem is in **Running** state.

```
kubectl get ManagementCluster -n <namespace>
```

2. Developer Portal subsystem:

- a. Verify that subsystem is in **Running** state.

```
kubectl get PortalCluster -n <namespace>
```

- b. Edit the CR:

```
kubectl edit PortalCluster -n <namespace>
```

Change `spec.profile` value to the new profile you want to use.

- c. When switching from one replica profile to a three replica profile, wait for the microservice to scale up. When switching from a three replica profile to a one replica profile, wait for the microservice to scale down.
- d. Verify that subsystem is in **Running** state.

```
kubectl get PortalCluster -n <namespace>
```

3. Analytics subsystem:

- a. Verify that subsystem is in **Running** state.

```
kubectl get AnalyticsCluster -n <namespace>
```

- b. Edit the Analytics CR:

```
kubectl edit AnalyticsCluster -n <namespace>
```

Change `spec.profile` value to the new profile you want to use.

- c. When switching from one replica profile to a three replica profile, wait for the microservice to scale up. When switching from a three replica profile to a one replica profile, wait for the microservice to scale down.
- d. Verify that subsystem is in **Running** state.

```
kubectl get AnalyticsCluster -n <namespace>
```

- e. Restart analytics data collection as explained in the topic, [Restarting Analytics pods and data collection](#).

4. Gateway subsystem

- a. Verify that subsystem is in **Running** state.

```
kubectl get GatewayCluster -n <namespace>
```

- b. Edit the CR:

```
kubectl edit GatewayCluster -n <namespace>
```

Change `spec.profile` value to the new profile you want to use.

- c. When switching from one replica profile to a three replica profile, wait for the microservice to scale up. When switching from a three replica profile to a one replica profile, wait for the microservice to scale down.
- d. Verify that subsystem is in **Running** state.

```
kubectl get GatewayCluster -n <namespace>
```

Changing deployment profiles on OpenShift

You can change an API Connect installation to use different profiles.

Before you begin

This task assumes that you have already deployed an API Connect cluster as explained in [Deploying on OpenShift and Cloud Pak for Integration](#). If you are changing from a one replica profile to a three replica profile, ensure that you have three replica profile hardware (3 worker nodes) available. For more information on the available profiles, see: [Planning your deployment topology](#).

Procedure

1. Verify that the API Connect cluster is in the **Ready** state by running the following command:

```
oc get apiconnectcluster -n <APIC_namespace>
```

2. Update the API Connect Cluster CR:

- a. Open the API Connect Cluster CR in edit mode by running the following command:

```
oc edit apiconnectcluster <APIC-instance-name> -n <APIC_namespace>
```

- b. In the CR, change the `spec.profile` value to the profile that you want to use.
- c. Save the change by running the following command: `:wq`

3. Wait for microservice to scale up, or scale down, as needed.

4. Verify that the API Connect cluster is in the **Ready** state by running the following command:

```
oc get apiconnectcluster -n <APIC_namespace>
```

Replica override for microservices

Modify the replica count for microservices by using template overrides for Custom Resources.

When API Connect is deployed, the deployment profile you select drives the number of replicas to be used for most deployment. For one replica profiles, specified by `n1x...`, the replica count is 1. For three replica profiles, specified by `n3x...`, replica count is 3. Note, however, that for Cloud Pak for Integration the API Connect Cluster profile `n3xc4.m16` replica count is 1.

You can override the replica count for individual deployments by using template overrides.

- Template overrides are a piece of yml that should be added to the Kubernetes custom resource. The examples provided in this topic show only that the `template:` element should be under the main `spec:` element of a CR. The rest of the CR is not shown.
- Specification of microservice overrides in CP4I requires prefixing the microservice name with a designator for the subsystem type, as follows:
 - Management subsystem: `mgmt-`
 - Gateway: `gw-`
 - Analytics: `a7s-`

For example, for the `apim` Management microservice, use `apim` when defining the override for OpenShift (or Kubernetes), but use `mgmt-apim` for a CP4I override.

Management subsystem

For a Management CR in Kubernetes or OpenShift, the following override specifies 5 replicas for the `apim` deployment:

```
spec:
  template:
  - name: apim
    replicaCount: 5
```

You can also configure replicate count through a similar template override for:

- `juhu`
- `ldap`
- `lur`

The same override for CP4I:

```
spec:
  template:
  - name: mgmt-apim
    replicaCount: 5
```

On CP4I, you can also configure replicate count through a similar template override for:

- `mgmt-juhu`
- `mgmt-ldap`
- `mgmt-lur`

Gateway subsystem

The following override is supported for a Gateway CR in Kubernetes or OpenShift:

```
spec:
  template:
  - name: datapower
    replicaCount: 5
```

The same override for CP4I:

```
spec:
  template:
    - name: gw-datapower
      replicaCount: 5
```

Analytics subsystem

The Analytics microservices that can be scaled using template override are:

- `director`
- `ingestion`
- `mtls-gw`
- `storage`

Note that this microservice cannot be scaled below 2 replicas when using a three replica deployment profile.

On CP4I, you can also configure replica count through a similar template override for:

- `a7s-directory`
- `a7s-ingestion`
- `a7s-mtls-gw`
- `a7s-storage`

Note that this microservice cannot be scaled below 2 replicas when using a three replica deployment profile.

Changing the deployment profile on Cloud Pak for Integration

You can change an API Connect installation to use a different profile.

Before you begin

This task assumes that you have already deployed an API Connect cluster as explained in [Deploying on OpenShift and Cloud Pak for Integration](#). If you are switching from a one replica profile to a three replica profile, ensure that you have three replica profile hardware (3 worker nodes) available. For more information on the available profiles, see: [Planning your deployment topology](#).

Procedure

1. Verify that the API Connect cluster is in the **Ready** state.
Open the IBM Cloud Pak Platform UI, locate the API Management capability on the Integration instances tab, and verify that the state displays as **Ready**. Leave the page open for the next step.
2. Update the API Management instance:
 - a. In the Platform UI, click the overflow menu next to the instance and select Edit.
 - b. In the Details section of the deployment pages, navigate to the Deployment profile field.
 - c. Click the field and select the new deployment profile.
3. Click Update to save the change.
4. Wait for microservice to scale up, or scale down, as needed.
5. Verify that the status for the API Management instance displays as **Ready**.

Enabling Developer Portal feature flags on Kubernetes

Use a template override to update the installation CR with settings that control the default behavior of the Developer Portal subsystem.

About this task

You can add a template override to the Developer Portal subsystem CR to change the default behavior of the Portal subsystem, or to turn specific features on and off. Table 1 describes the available feature flags.

Table 1. List of available feature flags for the Developer Portal

Feature flag name	Default value	Pod	Container	Description
<code>DISABLE_MEMCACHE</code>	false	www	admin	Controls whether the distributed in-memory cache is disabled. From IBM® API Connect 10.0.5.6 Portal web sites use a distributed in-memory cache by default, instead of using cache tables in the main site database. This update provides better performance for web site operations, but does mean that the cache needs to be repopulated when any of the Portal pods or virtual machines are restarted, for example, during an upgrade. While the cache is being repopulated, there is a reduction in performance. You can set the <code>DISABLE_MEMCACHE</code> flag to <code>true</code> to disable the distributed in-memory cache for all Portal sites, both existing and new.

Feature flag name	Default value	Pod	Container	Description
<code>ENABLE_TRUSTED_REVERSE_PROXY</code>	false	www	admin	<p>Controls whether the Drupal <code>trusted_reverse_proxy</code> module can manage the reverse proxies list.</p> <p>If you have multiple load balancers and reverse proxies in your upstream network, and the perimeter module is triggered, the incorrect IP address might be banned rather than the intended client IP address. However, you can manage which IP addresses are banned by using the Drupal <code>trusted_reverse_proxy</code> module, and setting this feature flag to <code>true</code>.</p> <p>The Drupal module inspects the <code>x-forwarded-for</code> headers to identify the reverse proxies, and trusts that the first IP address found in the list is the client IP. For example, in <code>X-Forwarded-For: <client>, <proxy1>, <proxy2></code>, the client IP <code><client></code> will be banned. For more information about this module, see https://www.drupal.org/project/trusted_reverse_proxy.</p> <p>To use this module, you must ensure that all of the proxies in your upstream network, including the ingress controller, are configured correctly so that the <code>x-forwarded-for</code> header is passed through to the <code>portal-www</code> pod. For example, the default behavior of the <code>nginx-ingress-controller</code> is to ignore the inbound <code>x-forwarded-for</code> header, and create a new one. To change this behavior, update the <code>nginx-ingress-controller configmap</code> with the following information:</p> <pre>data: compute-full-forwarded-for: "true" use-forwarded-headers: "true"</pre> <p>Warning: Enable this feature flag only if you trust your upstream reverse proxies, as it is possible to trick the <code>x-forwarded-for</code> header.</p>
<code>MEMCACHE_MEMORY_LIMIT</code>	"128" or "256"	www	admin	<p>Controls the amount of memory that the distributed in-memory cache can use, before space is freed up by removing the least used entries.</p> <p>The default memory limit value depends on your deployment profile, for example:</p> <ul style="list-style-type: none"> 8 GB profiles have 128 MB per <code>portal-www</code> pod. 16 GB profiles have 256 MB per <code>portal-www</code> pod. <p>If you think that performance is consistently worse when using the in-memory cache, you can either disable it by using the <code>DISABLE_MEMCACHE</code> setting, or change the memory limit by setting a specific <code>MEMCACHE_MEMORY_LIMIT</code> value. Note that the value is always in MB, and is always set as a number enclosed in quotes, for example "512".</p> <p>Note:</p> <ul style="list-style-type: none"> The cache is distributed across the pods, so an n1 8 GB profile has only 128 MB of in-memory cache storage, but an n3 8 GB profile has 3 x 128 MB of in-memory cache storage. An empty site consumes about 3 MB of the memory cache. A site with around 6000 objects (spread across APIs, Products, Apps, Consumer Organizations, and so on) can consume about 87 MB of in-memory cache when every object is cached. However, this consumption is not usually the case unless every single page in your site is accessed. You don't need to be able to fit the entire cache of every single site into memory, as the less often used cache entries will be evicted, and their space reused for new cache entries.
<code>PORTAL_SKIP_WEB_ENDPOINT_VALIDATION</code>	false	www	admin	<p>Controls whether the Portal subsystem checks whether the Portal web endpoint is accessible.</p> <p>Sometimes, the endpoint cannot be reached, for example due to the complexity of the networks. In which case the following type of error can be seen in the <code>portal-www</code> pod, and <code>admin</code> container logs:</p> <pre>An error occurred contacting the provided portal web endpoint: example.com The provided Portal web endpoint example.com returned HTTP status code 504</pre> <p>You can disable the check by setting this flag to <code>true</code>.</p>

Procedure

1. If API Connect is already deployed, retrieve the name of the deployed CR for the Developer Portal subsystem by running the following command:

```
kubectl get portalcluster -n <portal_namespace>
```

If API Connect yet is not yet deployed, skip this step.

2. Edit the `portal` CR by running the following command:

```
kubectl edit portalcluster <portal-cr-name> -n <portal_namespace>
```

3. In the editor, append the feature flag definition to the end of the `spec:` section, making sure to adhere to the spacing used in the file. The following example enables the `trusted_reverse_proxy` feature.

```
spec:
  ...
  template:
```

```

- containers:
- env:
  - name: ENABLE_TRUSTED_REVERSE_PROXY
    value: true
  name: container
name: pod

```

Where:

- `container` is the name of the portal container.
- `pod` is the name of the portal pod.

Note: You can add multiple feature flags to the CR.

4. Save the update.

The Developer Portal subsystem is updated to enable or disable features as specified.

Enabling Developer Portal feature flags on OpenShift and Cloud Pak for Integration

Use a template override to update the installation CR with settings that control the default behavior of the Developer Portal subsystem.

About this task

You can add a template override to the Developer Portal subsystem CR to change the default behavior of the Portal subsystem, or to turn specific features on and off. Table 1 describes the available feature flags.

Table 1. List of available feature flags for the Developer Portal

Feature flag name	Default value	Pod	Container	Description
<code>DISABLE_MEMCACHE</code>	false	www	admin	<p>Controls whether the distributed in-memory cache is disabled.</p> <p>From IBM® API Connect 10.0.5.6 Portal web sites use a distributed in-memory cache by default, instead of using cache tables in the main site database. This update provides better performance for web site operations, but does mean that the cache needs to be repopulated when any of the Portal pods or virtual machines are restarted, for example, during an upgrade. While the cache is being repopulated, there is a reduction in performance. You can set the <code>DISABLE_MEMCACHE</code> flag to <code>true</code> to disable the distributed in-memory cache for all Portal sites, both existing and new.</p>
<code>ENABLE_TRUSTED_REVERSE_PROXY</code>	false	www	admin	<p>Controls whether the Drupal <code>trusted_reverse_proxy</code> module can manage the reverse proxies list.</p> <p>If you have multiple load balancers and reverse proxies in your upstream network, and the perimeter module is triggered, the incorrect IP address might be banned rather than the intended client IP address. However, you can manage which IP addresses are banned by using the Drupal <code>trusted_reverse_proxy</code> module, and setting this feature flag to <code>true</code>.</p> <p>The Drupal module inspects the <code>x-forwarded-for</code> headers to identify the reverse proxies, and trusts that the first IP address found in the list is the client IP. For example, in <code>x-Forwarded-For: <client>, <proxy1>, <proxy2></code>, the client IP <code><client></code> will be banned. For more information about this module, see https://www.drupal.org/project/trusted_reverse_proxy.</p> <p>To use this module, you must ensure that all of the proxies in your upstream network, including the ingress controller, are configured correctly so that the <code>x-forwarded-for</code> header is passed through to the <code>portal-www</code> pod. For example, the default behavior of the <code>nginx-ingress-controller</code> is to ignore the inbound <code>x-forwarded-for</code> header, and create a new one. To change this behavior, update the <code>nginx-ingress-controller configmap</code> with the following information:</p> <pre> data: compute-full-forwarded-for: "true" use-forwarded-headers: "true" </pre> <p>Warning: Enable this feature flag only if you trust your upstream reverse proxies, as it is possible to trick the <code>x-forwarded-for</code> header.</p>

Feature flag name	Default value	Pod	Container	Description
<code>MEMCACHE_MEMORY_LIMIT</code>	"128" or "256"	www	admin	<p>Controls the amount of memory that the distributed in-memory cache can use, before space is freed up by removing the least used entries.</p> <p>The default memory limit value depends on your deployment profile, for example:</p> <ul style="list-style-type: none"> 8 GB profiles have 128 MB per <code>portal-www</code> pod. 16 GB profiles have 256 MB per <code>portal-www</code> pod. <p>If you think that performance is consistently worse when using the in-memory cache, you can either disable it by using the <code>DISABLE_MEMCACHE</code> setting, or change the memory limit by setting a specific <code>MEMCACHE_MEMORY_LIMIT</code> value. Note that the value is always in MB, and is always set as a number enclosed in quotes, for example "512".</p> <p>Note:</p> <ul style="list-style-type: none"> The cache is distributed across the pods, so an n1 8 GB profile has only 128 MB of in-memory cache storage, but an n3 8 GB profile has 3 x 128 MB of in-memory cache storage. An empty site consumes about 3 MB of the memory cache. A site with around 6000 objects (spread across APIs, Products, Apps, Consumer Organizations, and so on) can consume about 87 MB of in-memory cache when every object is cached. However, this consumption is not usually the case unless every single page in your site is accessed. You don't need to be able to fit the entire cache of every single site into memory, as the less often used cache entries will be evicted, and their space reused for new cache entries.
<code>PORTAL_SKIP_WEB_ENDPOINT_VALIDATION</code>	false	www	admin	<p>Controls whether the Portal subsystem checks whether the Portal web endpoint is accessible.</p> <p>Sometimes, the endpoint cannot be reached, for example due to the complexity of the networks. In which case the following type of error can be seen in the <code>portal-www</code> pod, and <code>admin</code> container logs:</p> <pre>An error occurred contacting the provided portal web endpoint: example.com The provided Portal web endpoint example.com returned HTTP status code 504</pre> <p>You can disable the check by setting this flag to <code>true</code>.</p>

Procedure

1. If API Connect is already deployed, retrieve the name of the deployed CR by running the following command:

```
oc get apiconnectcluster -n <APIC_namespace>
```

If API Connect yet is not yet deployed, skip this step.

2. Edit the `apiconnectcluster` CR by running the following command:

```
oc edit apiconnectcluster <APIC_instance_name> -n <APIC_namespace>
```

3. In the CR, append the feature flag definition to the end of the `spec.portal` section, making sure to adhere to the spacing used in the file. The following example enables the `trusted_reverse_proxy` feature.

```
spec:
  ...
  portal:
    template:
      - containers:
        - env:
          - name: ENABLE_TRUSTED_REVERSE_PROXY
            value: true
            name: container
          name: pod
```

Where:

- `container` is the name of the portal container.
- `pod` is the name of the portal pod.

Note: You can add multiple feature flags to the CR.

4. Close and save the file with the following command:

```
:wq
```

The Developer Portal subsystem is updated to enable or disable features as specified.

Enabling UI feature flags on Kubernetes

Use a template override to update the installation CR with settings that control UI features.

About this task

You can add a template override to the Management subsystem CR and use it to control whether specific features are available in the UI. Some features can be optionally disabled by users (by disabling them in the browser) provided you have enabled the feature for the cluster as a whole. Table 1 describes the available feature flags.

Table 1. Flags and settings for controlling UI features

Feature ID	Default Value	Partial Override For	Description
ffAdvancedPublish	true		Enable advanced publish option (deprecated)
allOmniSearch	true		Enables OmniSearch for all lists. This flag is used in conjunction with other flags.
draftsOmniSearch	true	allOmniSearch	Enable OmniSearch for drafts list
catalogProductsOmniSearch	true	allOmniSearch	Enable OmniSearch for catalog
orgsOmniSearch	true	allOmniSearch	Enable OmniSearch for org lists
appsOmniSearch	true	allOmniSearch	Enable OmniSearch for apps
subscriptionsOmniSearch	true	allOmniSearch	Enable OmniSearch for subscriptions, if disabled, subscription lists will be removed from catalog list
requestedApprovalsOmniSearch	true	allOmniSearch	Enable OmniSearch for requested approvals
approvalTasksOmniSearch	true	allOmniSearch	Enable OmniSearch for approvals
productApisOmniSearch	true	allOmniSearch	Enable OmniSearch for apis within products
membersOmniSearch	true	allOmniSearch	Enable OmniSearch for member lists

Procedure

1. If you already deployed API Connect, retrieve the name of the deployed CR for the Management subsystem by running the following command:

```
kubectl get managementcluster -n <management_namespace>
```

If you did not deploy API Connect yet, skip this step.

2. Edit the `management` CR by running the following command:

```
kubectl edit managementcluster <management-cr-name> -n <management_namespace>
```

3. In the editor, append the feature-flag definition to the end of the `spec:` section, making sure to adhere to the spacing used in the file. The following example enables the OmniSearch feature on all possible UI pages.

```
spec:
  template:
    - name: ui
      containers:
        - name: ui
          env:
            - name: APIC_UI_FEATURES
              value: allOmniSearch=always
```

`APIC_UI_FEATURES` is a URL-encoded string. Each parameter is formed as `featureId=$featureValue`, and you can list multiple parameters with the `&` delimiter (`featureId=$featureValue&featureId=$featureValue`).

Use the `featureId` values from Table 1. For each feature, specify one of the following `featureValue` settings:

- **true** - On by default, but can be overridden by the user, for their browser alone
- **false** - Off by default, but can be overridden by the user, for their browser alone
- **never** - Off regardless of browser setting, disabled in feature flag page
- **always** - On regardless of browser setting, disabled in feature flag page

4. Save the update.

The cluster is updated to enable or disable features as specified.

Enabling UI feature flags on OpenShift and Cloud Pak for Integration

Use a template override to update the installation CR with settings that control UI features.

About this task

You can add a template override to the Management subsystem CR and use it to control whether specific features are available in the UI. Some features can be optionally disabled by users (by disabling them in the browser) provided you have enabled the feature for the cluster as a whole. Table 1 describes the available feature flags.

Table 1. Flags and settings for controlling UI features

Feature ID	Default Value	Partial Override For	Description
ffAdvancedPublish	true		Enable advanced publish option (deprecated)
allOmniSearch	true		Enables OmniSearch for all lists. This flag is used in conjunction with other flags.
draftsOmniSearch	true	allOmniSearch	Enable OmniSearch for drafts list
catalogProductsOmniSearch	true	allOmniSearch	Enable OmniSearch for catalog
orgsOmniSearch	true	allOmniSearch	Enable OmniSearch for org lists
appsOmniSearch	true	allOmniSearch	Enable OmniSearch for apps
subscriptionsOmniSearch	true	allOmniSearch	Enable OmniSearch for subscriptions, if disabled, subscription lists will be removed from catalog list

Feature ID	Default Value	Partial Override For	Description
requestedApprovalsOmniSearch	true	allOmniSearch	Enable OmniSearch for requested approvals
approvalTasksOmniSearch	true	allOmniSearch	Enable OmniSearch for approvals
productApisOmniSearch	true	allOmniSearch	Enable OmniSearch for apis within products
membersOmniSearch	true	allOmniSearch	Enable OmniSearch for member lists

Procedure

1. If you already deployed API Connect, retrieve the name of the deployed CR by running the following command:

```
oc get apiconnectcluster -n <APIC_namespace>
```

If you did not deploy API Connect yet, skip this step.

2. Edit the `apiconnectcluster` CR by running the following command:

```
oc edit apiconnectcluster <APIC_instance_name> -n <APIC_namespace>
```

3. In the CR, append the feature-flag definition to the end of the `spec.management` section, making sure to adhere to the spacing used in the file. The following example enables the OmniSearch feature on all possible UI pages.

```
spec:
  management:
    template:
      - name: ui
        containers:
          - name: ui
            env:
              - name: APIC_UI_FEATURES
                value: allOmniSearch=always
```

`APIC_UI_FEATURES` is a URL-encoded string. Each parameter is formed as `featureId=$featureValue`, and you can list multiple parameters with the `&` delimiter (`featureId=$featureValue&featureId=$featureValue`).

Use the `featureId` values from Table 1. For each feature, specify one of the following `featureValue` settings:

- **true** - On by default, but can be overridden by the user, for their browser alone
- **false** - Off by default, but can be overridden by the user, for their browser alone
- **never** - Off regardless of browser setting, disabled in feature flag page
- **always** - On regardless of browser setting, disabled in feature flag page

4. Close and save the file with the following command:

```
:wq
```

The cluster is updated to enable or disable features as specified.

Advanced configuration for the management subsystem

Specify advanced configuration for the management subsystem.

See:

- [Configuring maximum size of client requests to the Management subsystem](#)
You can configure the maximum allowed size of the client request body for requests made to the Management subsystem.
- [Setting rate limits for public APIs on the management service for a Kubernetes environment](#)
Describes the procedure for setting a rate limit for public APIs on the management service. Rate limits provide protection from DDoS (distributed denial of service) attacks.
- [Configuring monetization on Kubernetes](#)
You can optionally configure monetization in API Connect on a Kubernetes deployment by enabling the billing microservice.
- [Overriding resources for Postgres components on Kubernetes](#)
You can optionally override the CPU and Memory resources used by postgres database components.
- [Overriding resources for Postgres components on OpenShift](#)
You can optionally override the CPU and Memory resources used by postgres database components.

Configuring maximum size of client requests to the Management subsystem

You can configure the maximum allowed size of the client request body for requests made to the Management subsystem.

About this task

The default maximum size is 8 megabytes. You can increase this value.

Increasing the setting can be useful if you get errors when using the CLI to import a large API. Example error:

```
HTTP/1.1 413 Request Entity Too Large
```

Procedure

1. Edit the Management CR. Refer to the Management CR templates:

```
spec:
  ...
  ...
  template:
  - name: juhu
    containers:
    - name: juhu
      env:
      - name: CLIENT_MAX_BODY_SIZE
        value: "12m"
```

Note that the default value is "8m". The `template:` entry must be indented two spaces, and be located within the `spec:` element.

2. Apply the changes:

```
kubectl -n <namespace> apply -f management_cr.yaml
```

Setting rate limits for public APIs on the management service for a Kubernetes environment

Describes the procedure for setting a rate limit for public APIs on the management service. Rate limits provide protection from DDoS (distributed denial of service) attacks.

Before you begin

Note:

- This article does not apply to the IBM® DataPower® Gateway component that is a part of the IBM API Connect solution.
- This article applies to third-party software that IBM does not control. As such, the software may change and this information may become outdated.

These instructions assume you have a working Kubernetes environment with the `kubectl` command-line tool installed, and that you understand how to manage Kubernetes. For more information, see <https://kubernetes.io>.

About this task

Rate limits can be set for public APIs on the management service. Rate limits on APIs help provide protection from DDoS (distributed denial of service) attacks. Without a rate limit, API calls from public APIs are unlimited.

The rate limit configuration requires that the header contains the actual client IP address. Any load balancer or proxy (for example, HAProxy) that is installed in front of the management service must be configured to pass the actual client IP address.

This procedure must be performed on a running API Connect deployment.

Rate limits are calculated as requests per seconds per client.

Note: If the rate limit has been reached on the management subsystem, the client will get an HTTP error: **429 Too Many Requests**.

Procedure

- Configure the ingress-nginx-ingress-controller to pass the real client IP address:
 1. Set the `use-proxy-protocol` parameter to `true` by entering the following command:

```
kubectl edit ConfigMap -n kube-system ingress-nginx-ingress-controller
```

2. In the ConfigMap, set the following: `use-proxy-protocol:`
`"true"`

- Set a rate limit:
 1. You can add a `template:` value in your subsystem CR to provide an override. For example, the Management CR template value can be:

```
spec:
  ...
  template:
  - name: juhu
    containers:
    - name: juhu
      env:
      - name: RATE_LIMIT_PER_CLIENT
        value: "10"
      - name: LIMIT_REQUEST_OPTION
        value: "burst=10 nodelay"
```

Note that the `template:` entry must be indented two spaces, and must be located in the `spec:` element.

In this example, the first option sets the rate to 10 requests per second (10r/s). The second option allows 10 requests boosted without delay within < 1 second. You can customize as needed.

The `rateLimitPerClient` property sets `rate`, and `limitRequestOption` sets `[burst=number] [nodelay | delay=number]` in the following nginx configuration:

```
limit_req_zone key zone=name:size rate=rate;  
limit_req zone=name [burst=number] [nodelay | delay=number];
```

Note that `zone` has been pre-defined and can't be configured. For more details, see the nginx doc http://nginx.org/en/docs/http/ngx_http_limit_req_module.html.

2. Apply the changes:

```
kubectl -n <namespace> apply -f management_cr.yaml
```

3. Validate that the juhu pod has restarted by listing the pods:

```
kubectl get pods -n <namespace> | grep juhu
```

4. Check the AGE column to ensure a new juhu pod has started.

5. If the older juhu pod is still running, delete it with the following command:

```
kubectl delete pods -n <namespace> <old-juhu-pod>
```

• Disable a rate limit:

1. Validate that the juhu pod has restarted by listing the pods:

```
kubectl get pods -n <namespace> | grep juhu
```

2. Check the AGE column to ensure a new juhu pod has started.

3. If the older juhu pod is still running, delete it with the following command:

```
kubectl delete pods -n <namespace> <old-juhu-pod>
```

Configuring monetization on Kubernetes

You can optionally configure monetization in API Connect on a Kubernetes deployment by enabling the billing microservice.

About this task

API Connect includes a subscription billing microservice that allows API providers to define pricing plans in their API Products, and monetize their API offerings. If a Product contains a pricing plan, API Consumers must enter their payment information into the Developer Portal before they can subscribe to that plan. API Connect supports integration with Stripe Subscription Billing, an independent cloud service that manages monetized product plans, customers, their payment information, and their subscription history, in order to generate monthly invoices and charge customers automatically. With this integration, Stripe serves as both the subscription billing system and the payment processing system.

Note:

- These instructions apply only to Kubernetes installations. For VMware installations, see [Configuring monetization on VMware](#).
- To use Stripe as your credit card processing vendor, you must have port 443 open to HTTPS communication between the Stripe API and your Developer Portal management and the Management cluster servers. See [Firewall requirements on Kubernetes](#) and [Firewall requirements on VMware](#) for more information about this requirement.
- Provider organizations cannot add any billing integrations until the billing microservice is enabled.
- After provider organizations have added billing integrations, the billing microservice must not be disabled.

To enable or disable the billing microservice, you must configure the Management subsystem custom resource (CR) file. See the following instructions:

- [Enabling the billing microservice as part of a new deployment](#)
- [Enabling the billing microservice as part of an existing deployment](#)
- [Disabling the billing microservice](#)

Procedure

- **Enabling the billing microservice as part of a new deployment**

Edit the CR file for the Management subsystem and add the settings for the billing microservice.

1. Edit the `ManagementCluster` CR and add the following definition for the billing microservice. Append the billing definition to the end of the `spec`: section, making sure to adhere to the spacing used in the file.

```
spec:  
  ...  
  billing:  
    enabled: true
```

2. Apply the updated CR by running the following command as part of the standard Management subsystem installation (see [Installing the Management subsystem cluster](#) for details):

```
kubectl apply -f management_cr.yaml -n <management_namespace>
```

Where `management_namespace` is the name of the target installation namespace in the Kubernetes cluster. The billing microservice will be enabled with the Management subsystem.

3. You can monitor your Kubernetes deployments by running the following command:

```
kubectl get deployments -n <management_namespace>
```

The installation is complete when the `management-billing` pod is shown in the list of returned values. After the billing microservice is enabled, provider organization owners can create billing integration resources for API providers in the API Manager UI. For more information, see [Monetizing your Products](#).

- **Enabling the billing microservice as part of an existing deployment**

Edit the deployed CR for the Management subsystem and add the settings for the billing microservice.

1. Retrieve the name of the deployed CR for the Management subsystem by running the following command:

```
kubectl get managementcluster -n <management_namespace>
```

Where `management_namespace` is the name of the target installation namespace in the Kubernetes cluster.

2. Edit the deployed CR by running the following command:

```
kubectl edit managementcluster <management-cr-name> -n <management_namespace>
```

Where:

- `management-cr-name` is the name of the deployed CR for the Management subsystem.
- `management_namespace` is the name of the target installation namespace in the Kubernetes cluster.

3. In the editor, append the billing definition to the end of the `spec:` section, making sure to adhere to the spacing used in the file.

```
spec:
  ...
  billing:
    enabled: true
```

4. Save the update.

The billing microservice is enabled in the Management subsystem.

5. You can monitor your Kubernetes deployments by running the following command:

```
kubectl get deployments -n <management_namespace>
```

The installation is complete when the `management-billing` pod is shown in the list of returned values.

After the billing microservice is enabled, provider organization owners can create billing integration resources for API providers in the API Manager UI. For more information, see [Monetizing your Products](#).

- **Disabling the billing microservice**

Important: After provider organizations have added billing integrations, the billing microservice must not be disabled.

Edit the deployed CR for the Management subsystem and update the settings for the billing microservice.

1. Retrieve the name of the deployed CR for the Management subsystem by running the following command:

```
kubectl get managementcluster -n <management_namespace>
```

Where `management_namespace` is the name of the target installation namespace in the Kubernetes cluster.

2. Edit the deployed CR by running the following command:

```
kubectl edit managementcluster <management-cr-name> -n <management_namespace>
```

Where:

- `management-cr-name` is the name of the deployed CR for the Management subsystem.
- `management_namespace` is the name of the target installation namespace in the Kubernetes cluster.

3. In the editor, change the billing definition to `enabled:`

```
false.
```

```
spec:
  ...
  billing:
    enabled: false
```

4. Save the update.

The billing microservice is disabled in the Management subsystem.

Overriding resources for Postgres components on Kubernetes

You can optionally override the CPU and Memory resources used by postgres database components.

About this task

There are three postgres components:

- `postgres`
- `pgBouncer`
- `pgBackRest`

The CPU, memory, and PVC resources used by the `postgres`, `pgBouncer`, and `pgBackRest` components depend on the deployment profile that was selected on installation. The resources that are defined for each deployment profile are shown here: [Management component deployment profile limits](#).

Important: The postgres pod is licensed based on CPU use, so adjusting this pod's CPU limit has licensing implications, see: [Component profiles, CPU limits, memory limits, and licensing](#)

Procedure

To override resources, complete the following procedure

1. Prepare a patch yaml.

- Ensure that you specify the name of the container for the resource you want to override. Names:
 - `postgres`
 - `pgBouncer`
 - `pgBackRest`
- You can override multiple postgres components in parallel. Adding one container section under `pgcluster` template.
- You can override just a single value, such as CPU limit.

Examples:

- Example yaml, to replace all postgres DB resources:

```
spec:
  template:
    - name: pgcluster
      containers:
        - name: postgres
          resources:
            requests:
              cpu: 1500m
              memory: 8Gi
            limits:
              cpu: 600m
              memory: 512Mi
```

- Example yaml, to replace all pgBouncer resources:

```
spec:
  template:
    - name: pgcluster
      containers:
        - name: pgBouncer
          resources:
            requests:
              cpu: 200m
              memory: 128Mi
            limits:
              cpu: 300m
              memory: 256Mi
```

- Example yaml, to replace CPU limit of `postgres` database:

```
spec:
  template:
    - name: pgcluster
      containers:
        - name: postgres
          resources:
            limits:
              cpu: 1000m
```

- Example yaml, to replace CPU limits of `postgres` DB and `pgBouncer`:

```
spec:
  template:
    - name: pgcluster
      containers:
        - name: postgres
          resources:
            limits:
              cpu: 1000m
        - name: pgBouncer
          resources:
            limits:
              cpu: 1000m
```

2. Apply the patch yaml:

```
kubectl patch mgmt <mgmt-cr-name> --type merge --patch "$(cat patch.yaml)"
```

Results

The postgres components will restart with updated values.

Overriding resources for Postgres components on OpenShift

You can optionally override the CPU and Memory resources used by postgres database components.

About this task

There are three postgres components:

- `postgres`
- `pgBouncer`
- `pgBackRest`

The CPU, memory, and PVC resources used by the `postgres`, `pgBouncer`, and `pgBackRest` components depend on the deployment profile that was selected on installation. The resources that are defined for each deployment profile are shown here: [Management component deployment profile limits](#). Important: The postgres pod is licensed based on CPU use, so adjusting this pod's CPU limit has licensing implications, see: [Component profiles, CPU limits, memory limits, and licensing](#)

Procedure

To override resources, complete the following procedure

1. Prepare a patch yaml.

- Ensure that you specify the name of the container for the resource you want to override. Names:

- `postgres`
- `pgBouncer`
- `pgBackRest`

- You can override multiple postgres components in parallel. Adding one container section under `mgmt-pgcluster` template.
- You can override just a single value, such as CPU limit.

Examples:

- Example yaml, to replace all postgres DB resources:

```
spec:
  template:
    - name: mgmt-pgcluster
      containers:
        - name: postgres
          resources:
            requests:
              cpu: 1500m
              memory: 8Gi
            limits:
              cpu: 600m
              memory: 512Mi
```

- Example yaml, to replace all `pgBouncer` resources:

```
spec:
  template:
    - name: mgmt-pgcluster
      containers:
        - name: pgBouncer
          resources:
            requests:
              cpu: 200m
              memory: 128Mi
            limits:
              cpu: 300m
              memory: 256Mi
```

- Example yaml, to replace CPU limit of `postgres` database:

```
spec:
  template:
    - name: mgmt-pgcluster
      containers:
        - name: postgres
          resources:
            limits:
              cpu: 1000m
```

- Example yaml, to replace CPU limits of `postgres` DB and `pgBouncer`:

```
spec:
  template:
    - name: mgmt-pgcluster
      containers:
        - name: postgres
          resources:
            limits:
              cpu: 1000m
        - name: pgBouncer
          resources:
            limits:
              cpu: 1000m
```

2. Apply the patch yaml:

```
oc patch apiconnectcluster <apiconnectcluster-cr-name> --type merge --patch "$(cat patch.yaml)"
```

Results

The postgres components will restart with updated values.

Advanced configuration for the analytics subsystem

Specify advanced configuration for the analytics subsystem on Kubernetes, OpenShift, or Cloud Pak for Integration.

- [Changing storage type between shared and dedicated](#)
How to change from dedicated analytics storage to shared, or from shared to dedicated.
- [Horizontal scaling of analytics data storage pod replicas](#)
When analytics dedicated storage is used, you can scale your data storage pod replicas for increased API event data storage and throughput.

Changing storage type between shared and dedicated

How to change from dedicated analytics storage to shared, or from shared to dedicated.

If you have a three replica deployment and want to change storage type, follow the steps in this topic.

Note: Dedicated storage is not available on a one replica deployment.

For more information about dedicated storage, see [Planning the analytics profile, storage class, and storage type](#).

Note: For OpenShift users: The example steps in this topic use the Kubernetes `kubectl` command. On OpenShift, use the equivalent `oc` command in its place. If you are using a top-level CR you must edit the API Connect cluster CR (the top-level CR), instead of directly in the subsystem CRs. If the subsystem section is not included in the top-level CR, copy and paste the section from the subsystem CR to the top-level CR.

Changing from shared to dedicated storage

Edit your analytics CR, and change storage type to dedicated:

```
kubectl edit analyticscluster -n <namespace>
```

```
...
storage:
  type: dedicated
```

If your environment does not have a default storage class, or want to use a different storage class for your `storage-os-master` pods, then also add the `spec.storage.master` section to specify the storage class, for example:

```
storage:
  type: dedicated
...
master:
  volumeClaimTemplate:
    storageClassName: local_storage
```

Changing from dedicated to shared storage

1. Edit your analytics CR, and change storage type to shared:

```
kubectl edit analyticscluster -n <namespace>
```

```
...
storage:
  type: shared
```

2. Wait until all of your `storage` pods restart and are in the `Ready` state.
3. Edit your analytics CR and remove the `spec.storage.master` section.
4. Delete the `data-analytics-storage-os-master` PVCs:

```
kubectl delete pvc data-analytics-storage-os-master-<integer> -n <namespace>
```

Horizontal scaling of analytics data storage pod replicas

When analytics dedicated storage is used, you can scale your data storage pod replicas for increased API event data storage and throughput.

To take advantage of analytics storage pod scaling, you must have a three replica deployment, and be using dedicated storage, see [Planning the analytics profile, storage class, and storage type](#).

Note:

- The term "replica" when used with data storage pod refers to the Kubernetes storage pod, not OpenSearch replicas, which are not configurable in API Connect.
- The OpenSearch term "node" refers to OpenSearch data storage nodes. OpenSearch nodes have a one-to-one relationship with the API Connect storage pod replicas, and use the same name.

This operation requires the use of the Analytics CLI. [Using the Analytics CLI](#).

Increase number of data storage pod replicas

1. Edit your analytics CR, and add the following to the `spec`: section:

```
template:
- name: storage
  replicaCount: <new replica count>
```

where `<new replica count>` must be less than or equal to the number of worker nodes you have available.

2. Wait for the new storage pod replicas to start on your new worker nodes, and for the analytics cluster to rebalance your API event data to use your new replicas. The time the rebalancing takes depends on the size of your API event data and the network transmission speed between worker nodes. You can check the rebalancing status with the CLI health command:

```
apic --mode analytics clustermgmt:getHealth --server <management server platform api endpoint> --analytics-service <analytics service name> --format json
```

where:

- `<management server platform api endpoint>` is the management subsystem platform API endpoint.
- `<analytics service name>` is the name of the analytics service as configured in the Cloud Manager UI.

When rebalancing is complete, the `number_of_data_nodes` matches your updated `replicaCount`, and the highlighted `_shards` properties are all zero, as shown:

```
{
  "cluster_name":"apic-analytics-cluster",
  "status":"green",
  "timed_out":false,
  "number_of_nodes":8,
  "number_of_data_nodes":5,
  "discovered_master":true,
  "discovered_cluster_manager":true,
  "active_primary_shards":8,
  "active_shards":24,
  "relocating_shards":0,
  "initializing_shards":0,
  "unassigned_shards":0,
  "delayed_unassigned_shards":0,
  "number_of_pending_tasks":0,
  "number_of_in_flight_fetch":0,
  "task_max_waiting_in_queue_millis":0,
  "active_shards_percent_as_number":100
}
```

Note: If in the past you increased and then reduced the number of data storage replicas in your deployment, you might have an OpenSearch exclude list that contains the names of the previous replicas you removed. New storage pod replicas cannot be created if their name is in the OpenSearch exclude list. To empty the OpenSearch exclude list, use the CLI to set the list to an empty string:

1. Create a JSON file called `empty_exclude_list.json`, and paste in the following contents:

```
{ "persistent.cluster.routing.allocation.exclude._name" : "" }
```

2. Apply the exclude list to your OpenSearch cluster. Use the `clustermgmt:putSettings` CLI command with the JSON file created in step 1.

```
apic -m analytics clustermgmt:putSettings --analytics-service <analytics service name> --server <management server platform api endpoint> empty_exclude_list.json --format json
```

The command returns showing that the list is set to an empty string:

```
...
  "persistent": {
    "cluster": {
      "routing": {
        "allocation": {
          "exclude": {
            "_name": ""
          }
        }
      }
    }
  }
...

```

Reduce number of data storage pod replicas

1. Verify that your analytics cluster health is green. Use the analytics CLI health command:

```
apic --mode analytics clustermgmt:getHealth --server <management server platform api endpoint> --analytics-service <analytics service name> --format json
```

where:

- `<management server platform api endpoint>` is the management subsystem platform API endpoint.
- `<analytics service name>` is the name of the analytics service as configured in the Cloud Manager UI.

Check that the status property is green:

```
{
  "cluster_name":"apic-analytics-cluster",
  "status":"green",
  "timed_out":false,
  "number_of_nodes":8,
  "number_of_data_nodes":5,
  "discovered_master":true,
  "discovered_cluster_manager":true,
  "active_primary_shards":8,
  "active_shards":24,
  "relocating_shards":0,
  "initializing_shards":0,
  "unassigned_shards":0,
  "delayed_unassigned_shards":0,
  "number_of_pending_tasks":0,

```

```

"number_of_in_flight_fetch":0,
"task_max_waiting_in_queue_millis":0,
"active_shards_percent_as_number":100
}

```

Do not proceed if the status is not green.

- Replicas are removed by reducing the Kubernetes `replicaCount` in the analytics CR. When `replicaCount` is reduced, the replicas that are deleted are always the highest numbered replicas. For example:

```
kubectl get pods | grep storage
```

NAME	READY	STATUS	RESTARTS	AGE
analytics-storage-0	1/1	Running	0	140d
analytics-storage-1	1/1	Running	0	140d
analytics-storage-2	1/1	Running	0	140d
analytics-storage-3	1/1	Running	0	140d
analytics-storage-4	1/1	Running	0	140d

If you reduce `replicaCount` from 5 to 3, the two replicas that are deleted are `analytics-storage-3` and `analytics-storage-4`.

Before you reduce the `replicaCount`, you must ensure that replicas to be deleted contain no API event data. To make OpenSearch relocate all API event data to the replicas you are keeping, add the replicas that you want to delete to the OpenSearch exclude list:

- Create a JSON file called `replicas_exclude_list.json`, and paste in the following contents:

```
{ "persistent.cluster.routing.allocation.exclude._name" : "<replicas to remove>" }
```

where `<replicas to remove>` is a comma-separated list of the replicas to be removed, for example:

```
{ "persistent.cluster.routing.allocation.exclude._name" : "analytics-storage-3,analytics-storage-4" }
```

- Apply the exclude list to your OpenSearch cluster. Use the `clustermgmt:putSettings` CLI command with the JSON file created in step [2.a](#):

```
apic -m analytics clustermgmt:putSettings --analytics-service <analytics service name> --server <management server platform api endpoint> replica_exclude_list.json --format json
```

The command returns confirmation that the list is updated with what is in `replicas_exclude_list.json`:

```

...
  "persistent": {
    "cluster": {
      "routing": {
        "allocation": {
          "exclude": {
            "_name": "<replicas to remove>"
          }
        }
      }
    }
  }
...

```

- Wait for your analytics cluster to remove all data from the replicas you want to delete, which you specified in step [2](#). You can check that the data rebalancing is complete with the `clustermgmt:catAllocation` CLI command:

```
apic -m analytics clustermgmt:catAllocation --analytics-service <analytics service name> --server <management server platform api endpoint> --format json --return_format json
```

Replicas that don't have data appear as entries with a `shards` value of zero in the output (you can ignore the `disk.*` properties):

```
[
  {
    "shards": "5",
    "disk.indices": "113.3kb",
    "disk.used": "27.3gb",
    "disk.avail": "222.5gb",
    "disk.total": "249.8gb",
    "disk.percent": "10",
    "host": "192.168.87.226",
    "ip": "192.168.87.226",
    "node": "analytics-storage-0"
  },
  {
    "shards": "0",
    "disk.indices": "0",
    "disk.used": "36.9kb",
    "disk.avail": "212.9kb",
    "disk.total": "249.8kb",
    "disk.percent": "1",
    "host": "192.168.64.225",
    "ip": "192.168.64.225",
    "node": "analytics-storage-3"
  },
  {
    "shards": "5",
    "disk.indices": "16.8kb",
    "disk.used": "28.2gb",
    "disk.avail": "221.6gb",
    "disk.total": "249.8gb",
    "disk.percent": "11",
    "host": "192.168.112.227",
    "ip": "192.168.112.227",
    "node": "analytics-storage-1"
  },
  {
    "shards": "5",
    "disk.indices": "23.3kb",
    "disk.used": "29.3gb",
    "disk.avail": "220.4gb",
    "disk.total": "249.8gb",

```

```

    "disk.percent": "11",
    "host": "192.168.24.102",
    "ip": "192.168.24.102",
    "node": "analytics-storage-2"
  },
  {
    "shards": "0",
    "disk.indices": "0",
    "disk.used": "35.4kb",
    "disk.avail": "214.4kb",
    "disk.total": "249.8kb",
    "disk.percent": "1",
    "host": "192.168.91.149",
    "ip": "192.168.91.149",
    "node": "analytics-storage-4"
  }
]

```

The time rebalancing takes depends on the size of your API event data and the network transmission speed between pod replicas.

Note: The value in the `node` property of the `clustermgmt:catAllocation` output is the same as the names of the Kubernetes data storage pod replicas.

4. Verify that your analytics cluster health is green. Use the analytics CLI health command:

```

apic --mode analytics clustermgmt:getHealth --server <management server platform api endpoint> --analytics-service
<analytics service name> --format json

```

where:

- `<management server platform api endpoint>` is the management subsystem platform API endpoint.
- `<analytics service name>` is the name of the analytics service as configured in the Cloud Manager UI.

Check that the status property is green:

```

{
  "cluster_name": "apic-analytics-cluster",
  "status": "green",
  "timed_out": false,
  "number_of_nodes": 8,
  "number_of_data_nodes": 5,
  "discovered_master": true,
  "discovered_cluster_manager": true,
  "active_primary_shards": 8,
  "active_shards": 24,
  "relocating_shards": 0,
  "initializing_shards": 0,
  "unassigned_shards": 0,
  "delayed_unassigned_shards": 0,
  "number_of_pending_tasks": 0,
  "number_of_in_flight_fetch": 0,
  "task_max_waiting_in_queue_millis": 0,
  "active_shards_percent_as_number": 100
}

```

Do not proceed if the status is not green.

5. Edit your analytics CR, and update the `replicaCount`:

```

template:
- name: storage
  replicaCount: <new replica count>

```

where `<new replica count>` is the reduced number of replicas that you want.

Note: If the `replicaCount` property does not exist in the analytics CR, check that you are not attempting to reduce `replicaCount` to 2. Reducing `replicaCount` to less than 3 is not a supported operation.

6. Monitor the health status of your analytics cluster with the CLI health command:

```

apic --mode analytics clustermgmt:getHealth --server <management server platform api endpoint> --analytics-service
<analytics service name> --format json

```

where:

- `<management server platform api endpoint>` is the management subsystem platform API endpoint.
- `<analytics service name>` is the name of the analytics service as configured in the Cloud Manager UI.

Confirm that the `status` is green, the `number_of_data_nodes` matches your updated `replicaCount`, and that the highlighted shard properties are all zero:

```

{
  "cluster_name": "apic-analytics-cluster",
  "status": "green",
  "timed_out": false,
  "number_of_nodes": 6,
  "number_of_data_nodes": 3,
  "discovered_master": true,
  "discovered_cluster_manager": true,
  "active_primary_shards": 8,
  "active_shards": 24,
  "relocating_shards": 0,
  "initializing_shards": 0,
  "unassigned_shards": 0,
  "delayed_unassigned_shards": 0,
  "number_of_pending_tasks": 0,
  "number_of_in_flight_fetch": 0,
  "task_max_waiting_in_queue_millis": 0,
  "active_shards_percent_as_number": 100
}

```

Specify advanced configuration for the gateway subsystem.

See:

- [Customizing a DataPower deployment](#)
Update the `GatewayCluster` CR to configure `DataPowerService` APIs to customize your DataPower deployment.
- [Overriding the default DataPower image, version, and license](#)
Update the `GatewayCluster` CR to override the image, version, and license information for the Gateway subsystem.
- [Enabling autoscaling of gateway pods](#)
Enable autoscaling of gateway pods to ensure high availability of DataPower pods.
- [Dynamically re-registering and reconfiguring a Gateway service in a Kubernetes deployment](#)
In API Connect, Gateway services do not persist their configuration settings by default. Instead, the master configuration is stored on the Management server and the *Dynamic Reregistration and Reconfiguration* (DRR) mechanism resynchronizes configuration data when needed. The DRR process is used when proper High Availability/Disaster Recovery (HA/DR) is not configured, or if a manual resynchronization is required.

Customizing a DataPower deployment

Update the `GatewayCluster` CR to configure `DataPowerService` APIs to customize your DataPower deployment.

You can set the following properties in the CR. Note that each `GatewayCluster` CR property has a corresponding `DataPowerService` API. Refer to the DataPower Operator documentation link for each property:

Table 1. Mapping of `GatewayCluster` properties to `DataPowerService` properties

GatewayCluster property	DataPowerService property	DataPowerService API Docs
<code>AdditionalDomainConfig</code>	<code>domains</code>	domains For domain configuration, see also: <ul style="list-style-type: none">• Guides: Domain Configuration• Features: Configuration Management
<code>AdditionalExtraExe</code>	<code>extraExe</code>	extraExe
<code>AdditionalInitCmds</code>	<code>initCmds</code>	initCmds
<code>lifecycle</code>	<code>lifecycle</code>	lifecycle
<code>healthcheck</code>	<code>healthcheck</code>	healthcheck
<code>readinessTimeoutSeconds</code>	<code>readinessTimeoutSeconds</code>	readinessTimeoutSeconds
<code>hostAliases</code>	<code>hostAliases</code>	hostAliases

Examples of how to add the DataPower service properties to a `GatewayCluster` CR, in an API Connect deployment on native Kubernetes:

- Adding `additionalDomainConfig`:

```
spec:
  additionalDomainConfig:
  - name: "default"
    certs:
    - certType: "usrcerts"
      secret: "default-cert"
    - certType: "sharedcerts"
      secret: "shared-cert"
  dpApp:
    config:
    - "default-config"
    local:
    - "default-local"
```

- Extending the `apiconnect` domain:

```
spec:
  additionalDomainConfig:
  - name: "apiconnect"
    dpApp:
      config:
      - "custom-apiconnect-config"
      local:
      - "custom-apiconnect-local"
```

Overriding the default DataPower image, version, and license

Update the `GatewayCluster` CR to override the image, version, and license information for the Gateway subsystem.

Procedure

To override these settings in the CR, add a `spec.dataPowerOverride` section as shown in the following example:

```
spec:
  dataPowerOverride:
    image: customregistry.com/custom-image-datapower:10.5.0.3
    version: 10.5.0.3
    license: X-XXXX-XXXXXX
```

Enabling autoscaling of gateway pods

Enable autoscaling of gateway pods to ensure high availability of DataPower pods.

Autoscaling enables the gateway deployment to scale dynamically, either vertically or horizontally.

It is not possible to use both horizontal and vertical pod scaling simultaneously. You must configure either **HPA** (for horizontal scaling) or **VPA** (for vertical scaling) as scaling method.

- To enable HPA, add the following fields to the CR:
In OpenShift or Cloud Pak for Integration, add the fields to the `spec.gateway` section of the API Connect Cluster CR.

```
podAutoScaling:
  hpa:
    maxReplicas: 5
    minReplicas: 3
    targetCPUUtilizationPercentage: 90
    targetMemoryUtilizationPercentage: 80
  method: HPA
```

- To enable VPA, add the following fields to the CR:
In OpenShift or Cloud Pak for Integration, add the fields to the `spec.gateway` section of the API Connect Cluster CR.

```
podAutoScaling:
  method: VPA
  vpa:
    maxAllowedCPU: 4
    maxAllowedMemory: 16G
```

Note that the values shown in the CR entries are just examples.

Table 1. Autoscaling configuration settings

Setting	Description
<code>method</code>	Specifies either Horizontal Pod Autoscaling or Vertical Pod Autoscaling Value must be either HPA or VPA . To disable autoscaling, leave <code>method</code> blank or omit the <code>podAutoScaling</code> section from the CR.
<code>maxReplicas</code>	HPA. Maximum pods that can be scaled up to by the horizontal pod autoscaler. Must be a value greater than <code>minReplicas</code> .
<code>minReplicas</code>	HPA. Minimum pods that can be scaled down to by the horizontal pod autoscaler.
<code>targetCPUUtilizationPercentage</code>	HPA. Percent threshold on average CPU usage by pods for triggering horizontal scaling.
<code>targetMemoryUtilizationPercentage</code>	HPA. Percent threshold on average memory usage by pods for triggering horizontal scaling.
<code>maxAllowedCPU</code>	VPA. Maximum value for CPU resource that can be assigned to a DataPower container when scaling vertically. Minimum value is set from <code>DataPowerRequestsSpec.ResourceCPU</code>
<code>maxAllowedMemory</code>	VPA. Maximum amount of memory that can be assigned to a DataPower container when scaling vertically. Minimum value is set from <code>DataPowerRequestsSpec.ResourceMemory</code>

Note:

DataPower Gateway supports long-lived connections such as GraphQL subscriptions or other websockets connections. These long-lived connections might not be preserved when pods are scaled down based on defined CPU or memory thresholds. Workloads with long-lived connections are more vulnerable to failed API transactions when auto-scaling is occurring.

To learn more about HPA and VPA autoscaling, see

- <https://ibm.github.io/datapower-operator-doc/features/pod-auto-scaling/>
- <https://ibm.github.io/datapower-operator-doc/apis/datapowerservice/v1beta3#podautoscaling>

Dynamically re-registering and reconfiguring a Gateway service in a Kubernetes deployment

In API Connect, Gateway services do not persist their configuration settings by default. Instead, the master configuration is stored on the Management server and the *Dynamic Reregistration and Reconfiguration* (DRR) mechanism resynchronizes configuration data when needed. The DRR process is used when proper High Availability/Disaster Recovery (HA/DR) is not configured, or if a manual resynchronization is required.

If a Gateway service is not configured properly for resiliency and is restarted, the gateways in the Gateway service will lose the configuration from the Management server. Configuration data from the Management server is maintained on the gateway service according to the gateway peering configuration on the gateways.

Preventing the loss of configuration data

For high availability in production environments, use a minimum of three gateways in the Gateway service.

Forcing re-population of the configuration data

To repopulate the configuration data, complete the steps in the following section to trigger an outage-less DRR.

Triggering an outage-less DRR

To force a Dynamic Reregistration and Reconfiguration across a peer group from within the gateway service without requiring a restart, complete the following steps using the CLI. This process flushes the primary peering object configured for the apic-gw-service. This task can only be performed with CLI, and requires the default admin ID for running the `diag` command.

1. Access the gateway service:

- For a virtual gateway, run the following command to access the DataPower CLI:

```
kubectl attach -it <pod_name>
```

- For a physical gateway, use `ssh` to connect to the gateway service.

2. Switch to the API Connect application:

```
switch <APIC_APP_DOMAIN>
```

3. Show the current gateway-peering-status:

```
show gateway-peering-status
```

4. If the server that you connected to is not primary for the apic-gw-service gateway-peering object, force this server to become primary:

```
config; gateway-peering-switch-primary <gateway-peering-name-for-apic-gw-service>;
```

5. Flush the apic-gw-service gateway-peering object:

```
diag; gateway-peering-flush <gateway-peering-name-for-apic-gw-service>; exit
```

When prompted, confirm the operation.

6. Disable and then re-enable the apic-gw-service object for every member of the gateway service:

```
config; apic-gw-service; admin-state disabled; exit
apic-gw-service; admin-state enabled; exit; exit
```

7. Confirm that the apic-gw-service was flushed and is now waiting for gateway service registration:

Look in the debug log target for the apic-gw-service, located in `logtemp:///` and check for a message similar to the following example:

```
20200618T232339.332Z [0x88e000d7][apic-gw-service][notice]
apic-gw-service(default): tid(2653): Waiting for gateway service registration.
```

The DRR will be triggered by the next arrival of a webhook event. The Management server sends a heartbeat to the gateway at five-minute intervals, prompting the gateway to check whether it has lost its configuration and if so, trigger a DRR. In addition, if the Management server has previously marked a Catalog or cloud as being unavailable for a particular gateway service, a successful heartbeat triggers synchronization for that Catalog or cloud on that gateway service.

8. If you attached to a virtual gateway, you can detach by pressing Ctrl+P and then pressing Ctrl+Q.

9. (Optional) Force a BAU webhook event to be sent from API Manager to trigger the DRR:

If you do not want to wait for the Management server to send a heartbeat, you can trigger the DRR manually by completing the following steps:

- a. Open the API Manager.
- b. Open the Catalog.
- c. Click Settings, > Edit.
- d. Update the Summary field with some text so that it is modified.
- e. Click Save.

When the event is received, the DRR is initiated.

Backing up and restoring

You can backup and restore API Connect subsystems.

API Connect Version 10 uses Kubernetes operators to back up and restore databases.

- Backups are for recovery of the API Connect subsystems in the same environment that the backups were taken. If you want to move your API Connect deployment to a different environment and change the form factor or modify your API Connect endpoints, then see [Migrating from v10 to v10 on a different form factor](#).
- Manual backups
For the management database, the backup configuration is specified in a Management CR (custom resource). You create the backup CR manually. Once the backup CR is created, the `apiconnect` operator performs backup and updates the status into the backup CR.
- Scheduled backups
For scheduled backups, you can add a backup schedule to the backup configuration details in the management CR. The `apiconnect` operator will then trigger and perform backups as specified in the custom `cron` schedule. A backup CR is created for every individual backup invocation as described in the cron schedule. You can view each backup CR to determine the status of each backup.
- Restore
For restore, you update the backup Management CR. You then create a restore CR with the backup name in it. You can list the backup CRs and determine the backup name by looking at individual backup CR. The `apiconnect` operator performs the restore.
- You must backup both the Management and Portal subsystems at the same time, to ensure synchronicity across the services.
- If you have to perform a restore, you must complete the restoration of the Management Service first, and then immediately restore the Developer Portal. The backups of the Management and Portal must be taken at the same time to ensure that the Portal sites are consistent with Management database.
- When restoring, the Management, Analytics, and Developer Portal subsystems must be at the same version and fix pack level.

Note: For information about how to maintain a two data center deployment, see [Maintaining a two data center deployment](#).

- [Backups on Kubernetes](#)

Use the procedures in this section to backup and restore API Connect on generic Kubernetes distributions.

- [Backups on OpenShift](#)
You can backup and restore API Connect subsystems on OpenShift and Cloud Pak for Integration.

Backups on Kubernetes

Use the procedures in this section to backup and restore API Connect on generic Kubernetes distributions.

- [Backing up and restoring the management subsystem](#)
You can use the following instructions to back up and restore your Management subsystem on API Connect.
- [Backing up and restoring the Developer Portal in a Kubernetes environment](#)
You can back up and restore your Developer Portal service in your Kubernetes environment.
- [Backing up and restoring the analytics database](#)
The IBM® API Connect Analytics database can be backed up and restored from an S3 repository. S3 compatible object storage is required; for example, IBM Cloud Object Storage.

Backing up and restoring the management subsystem

You can use the following instructions to back up and restore your Management subsystem on API Connect.

- To complete a backup and restore of your Management subsystem, you must have the **custom resource** configured with the **databaseBackup** subsection in the management subsystem custom resource.
- Backups can be scheduled or generated manually (on-demand). You can then list what backups are available and then use one to restore your Management subsystem if required:

```
kubect1 get mgmtb -n <namespace>
```

- Postgres replica pods depend on a successful completed backup. If backup configuration is not correct, replica pods won't come up.
- Custom resource (CR) templates are provided in the **helper_files** archive to install each API Connect subsystem. You decompressed these files into an installation folder of your choosing in [Obtaining product files](#).
- For points to consider when backing up and restoring a two data center disaster recovery deployment on Kubernetes, see [Backup and restore requirements for a two data center deployment](#).
- Restoring a backup restores the registration credentials (client_ID, client_secret) that were in use at the time that the selected backup was created. For information on the registration credentials, see [Changing the registration client id and client secret for applications](#).

Note: You must backup both the Management and Portal subsystems at the same time, to ensure synchronicity across the services.

Types of backups supported

- Cloud-based S3 storage
 - IBM Cloud Object Storage
 - AWS S3
 - **v10.0.2.0 or greater**: Any custom S3, such as minIO.
- SFTP
- Local storage backups

Configuring backup settings for fresh install of the Management subsystem

You can configure backups for your Management subsystem in your Kubernetes environment.

Use the instructions for your backup type:

- [Configuring S3 backup settings for fresh install of the Management subsystem](#)
You can configure backups for your management subsystem in your Kubernetes environment.
- [Configuring SFTP backup settings for fresh install of the Management subsystem](#)
You can configure backups for your Management subsystem in your Kubernetes environment.
- [Configuring local backup settings for fresh install of the Management subsystem](#)
You can configure backups for your Management subsystem in your Kubernetes environment.

Configuring S3 backup settings for fresh install of the Management subsystem

You can configure backups for your management subsystem in your Kubernetes environment.

Before you begin

Review [Backing up and restoring the management subsystem](#).

If you have a two data center disaster recovery deployment, before you configure S3 backup settings you must first disable 2DCDR on both sites. Follow these steps:

1. Remove the `multiSiteHA` section from the `spec` section of the management CRs on both data centers. Take note of which data center is the active and which is the warm-standby. Keep a copy of the `multiSiteHA` sections that you remove.
2. Configure your S3 backup settings. You must specify different backup locations for each data center, see [Backup and restore requirements for a two data center deployment](#).
3. Add the `multiSiteHA` sections back to the management CRs in both data centers, ensuring that your original active is set to be the active again.

About this task

If you haven't already, configure your management subsystem `custom resource` with the `databaseBackup` subsection.

Note: `S3Provider` supports `custom` S3 solutions in 10.0.2.0 and greater. The support includes new backup parameters `backupCerts` and `backups3URISyle`.

Important: For S3 backups of the management subsystem, do not use retention features provided by Cloud-based S3 storage providers. Use of such features can result in periodic deletion of archived backups, which can cause backup corruptions that can cause database restores to fail.

Warning:

When configuring a new management subsystem for S3 backup, the content of the S3 bucket path must be empty. If you want to configure a management subsystem to use the content of an S3 bucket path already used by another management subsystem, you have two options:

1. Shutdown the postgres database on the existing management subsystem that points to the S3 bucket path before you start the new management subsystem.
2. In a disaster recovery scenario where you want to restore from the backup of an existing installation: Create a new S3 path and use S3 tools to copy the backup content from the existing management subsystem S3 bucket path, to the new bucket path.

Procedure

1. Create a backup secret.

The backup secret is a Kubernetes secret that contains your username and password for your S3 backup database.

For examples of how to generate the appropriate access key and secret for two of them, see:

- IBM (Cloud Object Storage): [Service credentials](#).
- AWS: [Managing access keys](#).
- Custom: See documentation for your S3 provider. For example, minIO.

The secret can be created with the following command:

```
$ kubectl create secret generic mgmt-backup-secret --from-literal=key='<YOUR ACCESS KEY>' \
--from-literal=keysecret='<YOUR ACCESS KEY SECRET>' -n <namespace_of_management_subsystem>
```

2. Ensure that your Management subsystem `custom resource` is configured with the `databaseBackup` subsection.

For example:

```
databaseBackup:
  protocol: objstore
  s3provider: ibm
  host: s3.eu-gb.cloud-object-storage.appdomain.cloud/eu-standard
  path: apic-backup
  credentials: mgmt-backup-secret
  backupCerts: <custom-s3-server-CA-cert>
  backups3URISyle: host(default)/path
  schedule: "0 3 * * *"
  repoRetentionFull: 2
```

Note: `backupCerts` and `backups3URISyle` are used for custom s3 only, on **v10.0.2.0 or greater**.

Table 1. Backup configuration settings

Setting	Description
<code>protocol</code>	The type of the backup. For s3 storage: <code>objstore</code> . When the parameter is not set, the backup type defaults to local storage backup.
<code>s3provider</code>	Name of the S3 provider to use. You must specify one of the supported values of <code>aws</code> , <code>ibm</code> , or <code>custom</code> . Support for <code>custom</code> is available in v10.0.2.0 or greater . Note: The public certificate on the S3 storage provider must be signed by a known certificate authority that is trusted by API Connect. Use of an untrusted authority can cause the following error during backup upload: <code>x509: certificate signed by unknown authority</code> .
<code>host</code>	For <code>objstore</code> type backup, specify S3 endpoint with the corresponding S3 region in the format <code><S3endpoint>/<S3region></code>
<code>path</code>	The path to the location of the backup: For <code>objstore</code> backups, the name of your S3 bucket to store backup data. For example, <code>bucket-name/folder</code> . The use of subdirectories in the bucket name is not supported. Note: When your deployment includes a management subsystem in two different clusters (with active databases), the two management subsystems cannot use the same s3 bucket name in the database backup configurations. Each management subsystem must use a unique s3 bucket name. Ensure that <code>bucket-name/folder</code> is empty. If the folder was previously used for backups, the folder will not be empty, and stanza create might encounter an error. Explanation: Once a folder is used, <code>archive.info</code> and <code>backup.info</code> files are created. During stanza creation, the process compares the database version and database system id between the two info files and the current Postgres database cluster. Stanza creation fails if there is a mismatch. To prevent this possibility, remove all files from the folder before configuring.

Setting	Description
credentials	For objstore type backups, the name of the Kubernetes secret containing your S3 Access Key / Key Secret
backupCerts	<p>v10.0.2.0 or greater</p> <p>Custom certificate. Used only when s3Provider is set to custom. Most of the custom S3 providers are created based on custom CA certificate.</p> <p>This field accepts name of the Kubernetes secret containing your upstream custom S3 CA certificate. The key of the secret must be ca.crt and value should be base64 encoded value of CA certificate.</p> <p>The API Connect management subsystem validates the custom S3 certificate against the customer-provided CA certificate.</p> <p>Sample bash script to create the Kubernetes secret:</p> <pre>cat >customs3ca.yaml <<EOF apiVersion: v1 data: ca.crt: \$(base64 <path-to-ca-certificate> tr -d '\n') kind: Secret metadata: name: custom-server-ca type: generic EOF</pre> <p>kubectl apply -f customs3ca.yaml -n <namespace></p>
backups3URIS tyle	<p>v10.0.2.0 or greater</p> <p>Valid values: host and path.</p> <p>Only allowed if s3Provider is set to custom.</p> <p>Some custom S3 providers require URI style to be set to path. For example, minIO supports both host and path style setup. You can create a minIO S3 server to only accept path style client communications.</p> <p>Important: Contact your custom S3 administrator before configuring this field. If not properly configured, upstream custom S3 can reject connections from the client, such as API Connect management subsystem.</p>
schedule	<p>Cron like schedule for performing automatic backups. The format for the schedule is:</p> <ul style="list-style-type: none"> • ***** • ----- • • +----- day of week (0 - 6) (Sunday=0) • +----- month (1 - 12) • +----- day of month (1 - 31) • +----- hour (0 - 23) • +----- min (0 - 59) <p>The timezone for backups is that of the node on which the postgres-operator pod is scheduled.</p> <p>There is no default backup schedule set. Be sure to set your backup schedule.</p> <p>All scheduled Management subsystem backups are of type full only.</p>
repoRetentio nFull	<p>v10.0.3.0 or later - The number of full S3 backups to retain. When the next full backup successfully completes, and the specified number of retained backups is reached, the oldest full backup is deleted. All incremental backups and archives associated with the oldest full backup also expire. Incremental backups are not counted for this setting. Applies to both manual backups and scheduled backups.</p> <p>Minimum value: 1</p> <p>Maximum value: 9999999</p> <p>Default: none</p>

3. Verify that the configuration deploys successfully.

When you configure Management subsystem backups, the operator runs a **stanza-create** job. This job creates the stanza (Postgres cluster configuration) on the upstream S3 server, which is used for backup and archive procedures. The job also brings up the necessary pod.

Check the status of the **stanza-create** job:

```
kubectl get jobs -n <namespace> | grep stanza
```

- On success:

- The **stanza-create** job status is 1/1:

```
kubectl get jobs -n <namespace> | grep stanza
m1-b722e361-postgres-stanza-create 1/1 5s 127m
```

- The **stanza-create** job shows **status: "True"** and **type: Complete**:

```
kubectl get job -n <namespace> m1-b722e361-postgres-stanza-create -o yaml
```

```
status:
  completionTime: "2021-04-13T18:38:50Z"
  conditions:
    - lastProbeTime: "2021-04-13T18:38:50Z"
      lastTransitionTime: "2021-04-13T18:38:50Z"
      status: "True"
      type: Complete
  startTime: "2021-04-13T18:38:45Z"
  succeeded: 1
```

- The `stanza-create` pod is in `Completed` state:

```
kubectl get pods -n <namespace> | grep stanza
m1-b722e361-postgres-stanza-create-q4fvp          0/1    Completed    0          127m
```

- Exec into the pod:

```
kubectl -n <namespace> exec -it <backrest-shared-repo-pod> -- bash
```

- The `pgbackrest` command returns the S3 contents in valid JSON:

```
pgbackrest info --output json --repol-type s3
{"backup": {"held": false}, "message": "ok"}] [pgbackrest@m1-b722e361-postgres-backrest-shared-repo-69cdfdfd5-rs882
/
```

- On failure, see [Troubleshooting stanza-create job for S3 backup configuration](#).

Configuring SFTP backup settings for fresh install of the Management subsystem

You can configure backups for your Management subsystem in your Kubernetes environment.

Before you begin

Review [Backing up and restoring the management subsystem](#).

About this task

If you haven't already, configure your Management subsystem `custom resource` with the `databaseBackup` subsection.

Procedure

1. Create a backup secret.

The backup secret is a Kubernetes secret that contains your credentials for accessing the SFTP backup database. Supported credentials types:

- Username and password (v10.0.2.0 or later).
- Username and SSH-key (v10.0.3.0 or later). Only OpenSSH keys are supported.¹

Use one of the following commands to create the secret:

- Username and password credentials

```
$ kubectl create secret generic mgmt-backup-secret --from-literal=username='<YOUR USERNAME>'
--from-literal=password='<YOUR PASSWORD>' -n <namespace-of-mgmt-subsystem>
```

- Version 10.0.3.0 or later:** Username and SSH-key credentials:

```
$ kubectl create secret generic mgmt-backup-secret --from-literal=username='<YOUR USERNAME>'
--from-file=ssh-privatekey='<YOUR PRIVATEKEY FILE>' -n <namespace-of-mgmt-subsystem>
```

Note: If the username contains the backslash character, insert an extra backslash to escape it. For example, if the username is:

```
backup\svc-apic
```

set this as:

```
--from-literal=username='backup\\svc-apic'
```

2. Ensure that your Management subsystem `custom resource` is configured with the `databaseBackup` subsection.

For example:

```
databaseBackup:
  protocol: sftp
  host: <SFTP-host-name>
  port: <SFTP-port>
  path: apic-backup
  retries: 0
  credentials: mgmt-backup-secret
  schedule: "0 3 * * *"
```

Table 1. Backup configuration settings

Setting	Description
<code>protocol</code>	The type of the backup. For SFTP storage: <code>sftp</code> .
<code>host</code>	The backups host. For <code>sftp</code> type, the SFTP server hostname
<code>port</code>	The SFTP server port. Optional. Default: <code>22</code> .
<code>path</code>	The path to the location of the backup. For <code>sftp</code> type, the full absolute path of the folder on the SFTP server, beginning with <code>/</code> .
<code>retries</code>	The number of times the <code>ibm-apiconnect</code> Operator attempts backups in the event of a failed SFTP backup. Default value: <code>0</code> .
<code>credentials</code>	Name of the Kubernetes secret containing your SFTP Username/password. For Version 10.0.3.0 or later, the Kubernetes secret can contain your SFTP Username and SSH key.

Setting	Description
<code>schedule</code>	<p>Cron like schedule for performing automatic backups. The format for the schedule is:</p> <ul style="list-style-type: none"> • <code>*****</code> • <code>-----</code> • <code> </code> • <code> +-----</code> day of week (0 - 6) (Sunday=0) • <code> +-----</code> month (1 - 12) • <code> +-----</code> day of month (1 - 31) • <code> +-----</code> hour (0 - 23) • <code>+-----</code> min (0 - 59) <p>The timezone for backups is that of the node on which the postgres-operator pod is scheduled.</p> <p>There is no default backup schedule set. Be sure to set your backup schedule.</p> <p>All scheduled Management subsystem backups are of type <code>full</code> only.</p>

¹ PuTTY style keys can be converted to OpenSSH by using the PuTTY Key Generator (PuTTYgen) application; see <https://www.puttygen.com/>.

Configuring local backup settings for fresh install of the Management subsystem

You can configure backups for your Management subsystem in your Kubernetes environment.

Before you begin

Review [Backing up and restoring the management subsystem](#).

About this task

If you haven't already, configure your Management subsystem `custom resource`.

Procedure

Configure your Management subsystem `custom resource` with the `databaseBackup` subsection. Specify `schedule` and `repoRetentionFull`, the default settings are 01:00 UTC and 14 days.

```
databaseBackup:
  schedule: "0 1 * * *"
  repoRetentionFull: 14
```

Table 1. Backup configuration settings

Setting	Description
<code>schedule</code>	<p>Cron like schedule for performing automatic backups. The format for the schedule is:</p> <ul style="list-style-type: none"> • <code>*****</code> • <code>-----</code> • <code> </code> • <code> +-----</code> day of week (0 - 6) (Sunday=0) • <code> +-----</code> month (1 - 12) • <code> +-----</code> day of month (1 - 31) • <code> +-----</code> hour (0 - 23) • <code>+-----</code> min (0 - 59) <p>The timezone for backups is that of the node on which the postgres-operator pod is scheduled.</p> <p>The default is daily backups at 01:00 UTC.</p> <p>All scheduled Management subsystem backups are of type <code>full</code> only.</p>
<code>repoRetentionFull</code>	<p>- The number of full local backups to retain. When the next full backup successfully completes, and the specified number of retained backups is reached, the oldest full backup is deleted. All incremental backups and archives associated with the oldest full backup also expire. Incremental backups are not counted for this setting.</p> <p>Applies to both manual backups and scheduled backups.</p> <p>Minimum value: 1</p> <p>Maximum value: <code>9999999</code></p> <p>Default: 14</p>

Reconfiguring or adding backup settings after installation of the management subsystem

You can reconfigure the backup settings after installation of the management subsystem.

Procedure

1. Make sure that the management cluster status is **Running** and the READY condition displays the same value before and after the "/".

For example:

```
k get mgmt
NAME   READY   STATUS    VERSION      RECONCILED VERSION  AGE
mgmt   16/16   Running   10.0.2.0     10.0.2.0-xxxx      19h
```

2. Create backup secret as described in [Configuring backup settings for fresh install of the Management subsystem](#).

3. Complete the following steps, based on your storage type:

- S3 storage

In 10.0.1.0 and greater, you can change or add the **DatabaseBackup** s3 configuration via the Management Cluster CR after fresh install. However, doing so requires a reconfiguration of the database and a brief downtime. The operator restarts the database with the new backup configurations as soon as the new configuration in the management CR is saved.

If you have a two data center disaster recovery deployment, before you configure S3 backup settings you must first disable 2DCDR on both sites. Follow these steps:

- Remove the **multiSiteHA** section from the **spec** section of the management CRs on both data centers. Take note of which data center is the active and which is the warm-standby. Keep a copy of the **multiSiteHA** sections that you remove.
- Configure your S3 backup settings. You must specify different backup locations for each data center, see [Backup and restore requirements for a two data center deployment](#).
- Add the **multiSiteHA** sections back to the management CRs in both data centers, ensuring that your original active is set to be the active again.

Note:

If you have an **APIConnectCluster** custom resource installed, do not modify the **ManagementCluster** CR. Instead, modify the **APIConnectCluster** CR.

You can verify if you have an **apiconnectcluster** CR with the command

```
$ kubectl get apiconnectcluster -n <your-namespace>
```

Configuration of s3 backups uses a new parameter **restartDB** is required when changing the backup configuration. This parameter is in addition to the parameters described in [Configuring backup settings for fresh install of the Management subsystem](#).

Example CR:

```
databaseBackup:
  protocol: objstore
  s3provider: ibm
  host: s3.eu-gb.cloud-object-storage.appdomain.cloud/eu-standard
  path: apic-backup
  credentials: mgmt-backup-secret
  schedule: "0 3 * * *"
  restartDB:
    accept: true
```

Table 1. Additional parameter for S3 backup type reconfiguration

Parameter	Description
restartDB: accept: <value>	Required when changing the backup configuration. The parameter accept is a boolean: <value> can be true or false . When accept is true , and a new configuration for management CR is saved, the operator: <ul style="list-style-type: none">• Stops the database and any dependent services• Applies the change• Restarts the stopped components. Note: restartDB is not required for initial deployments, only for modifications after the cluster is deployed.

- SFTP

You can change/add the **DatabaseBackup** SFTP configuration via the Management Cluster CR after fresh install. This process does not involve any downtime. The same backup settings are used for reconfiguring as for initial configuration. For complete description of backup settings, see [Configuring backup settings for fresh install of the Management subsystem](#).

Example CR:

```
protocol: sftp
host: <SFTP-hostname>
port: <SFTP-port>
path: apic-backup
retries: 0
credentials: mgmt-backup-secret
schedule: "0 3 * * *"
```

Generating a manual backup of the management subsystem

You can generate a manual (non-scheduled) backup of the management subsystem

Procedure

1. Make sure that the management cluster status is **Running** and the READY condition displays the same value before and after the "/".

For example:

```
kubectl get mgmt
NAME   READY   STATUS    VERSION      RECONCILED VERSION  AGE
mgmt   16/16   Running   10.0.2.0     10.0.2.0-xxxx      19h
```

Note: Be sure **READY** status is 16/16. If you have just configured or reconfigured the backup settings, there is a period of time when the postgres pods are taken offline and brought back up with the new configuration. During this time, the `kubectl get mgmt` command will show 11/11 instead of 16/16. If you start a backup before the Management cluster is on 16/16, the backup attempt might stall indefinitely.

2. Decide which of the two types of manual backups you want to do:

- **full**: backs up the entire Management Subsystem database.
- **incr**: backs up any data that has not been backed up since the last **full** or **incr** backup.

3. You generate a backup manually by creating a managementBackup custom resource which is detected by the ibm-apiconnect operator that then triggers the backup process.

You can use `mgmtbackup_cr.yaml` in the `helper_files` directory as an example:

```
apiVersion: management.apiconnect.ibm.com/v1beta1
kind: ManagementBackup
metadata:
  generateName: management-
spec:
  type: full
  crType: create
  clusterName: management
```

Table 1 lists the CR settings for a manual backup.

Table 1. CR settings for manual backup

Setting	Description
type	The type of backup to be done. Valid arguments are: <ul style="list-style-type: none"> • full Backs up the entire Management subsystem database • incr Backs up any data that has not been backed up since the last full or incr backup.
crType	Use create to trigger a backup process.
clusterName	The name of the target ManagementCluster you want to backup.

4. Create the ManagementBackup custom resource in the namespace of your Management Subsystem to trigger the backup process:

```
$ kubectl create -f mgmtbackup_cr.yaml -n <namespace-of-mgmt-subsystem>
```

5. (Optional): You can list current backups by using the command:

```
$ kubectl get managementbackup -n <namespace-of-mgmt-subsystem> --sort-by=.metadata.creationTimestamp
```

Here is an example of some possible output:

NAME	STATUS	ID	CLUSTER	TYPE	CR TYPE	AGE
m1-e46bbac4	Ready	20201023-183005F	m1	full	record	66m
mgmt-backup-dnvxw	Ready	20201023-193137F	m1	full	create	9m37s

6. (Optional): You can get a detailed view of a specific backup by using the command:

```
$ kubectl get managementbackup <bup-name> -n <namespace-of-mgmt-subsystem> -o yaml
```

Here is an example of some possible output:

```
apiVersion: management.apiconnect.ibm.com/v1beta1
kind: ManagementBackup
metadata:
  creationTimestamp: "2020-10-23T18:34:11Z"
  generation: 1
  labels:

```

Restoring the management subsystem (v10.0.1.1 or later)

You can restore your Management subsystem in your Kubernetes environment.

Before you begin

You must have backups of the management subsystem in order to restore. See [Configuring backup settings for fresh install of the Management subsystem](#) and [Generating a manual backup of the management subsystem](#).

About this task

To trigger a restore, you will create a **ManagementRestore** custom resource. When the **ibm-apiconnect** operator detects the new CR, it starts the restore process.

- Ensure that the backup method that you used is complete before you attempt a restore. The backup data that is stored in the remote server is used for restoring the Management subsystem data back to a previous state. Ensure that these backups are on your remote server before you attempt a restore, and that the backup ID in the selected backup exists in remote storage.
- Restoring a backup restores the registration credentials (client_ID, client_secret) that were in use at the time that the selected backup was created. For information on the registration credentials, see [Changing the registration client id and client secret for applications](#).
- If you have to perform a restore, you must complete the restoration of the Management Service first, and then immediately restore the Developer Portal. The backups of the Management and Portal must be taken at the same time to ensure that the Portal sites are consistent with Management database.

Note: There is a known issue where sometimes a restore from the Management subsystem's SFTP backup succeeds but the data is not restored. If this happens, run the restore again.

Procedure

1. Obtain a list of the available backups, and decide which one to restore your Management subsystem:

```
kubectl get mgmtb -n <your-namespace>
```

For example:

```

$ kubectl get mgmtb
NAME                                STATUS  ID                                CLUSTER  TYPE  CR TYPE  AGE
management-3aa3bebf                 Ready  20200929-152150F                 management  full  record  10h
management-3c4ca8df                 Ready  20200929-115520F                 management  full  record  20h
management-5tbxj                    Ready  20200929-224349F                 management  full  create  17h
management-f10af337                 Ready  20200925-133703F                 management  full  record  5d2h
management-jtlcd                    Ready  20200929-224349F                 management  full  create  25h
management-zxjtz                    Ready  20200929-224349F                 management  full  create  28h

```

Attention: You can restore the Management subsystem from any backup where the STATUS is Ready; however, you should avoid restoring to the initial system backup. During installation, the Management database is used for an initial system backup before certain database schema jobs are complete. Restoring to this backup will result in an unstable system.

You will use one of the values in the **NAME** column.

2. Configure **mgmtrestore_cr.yaml**. Use the copy in the **helper_files** directory as an example:

```

apiVersion: management.apiconnect.ibm.com/v1beta1
kind: ManagementRestore
metadata:
  generateName: management-
spec:
  backupName: management-3aa3bebf

```

backupName: is the name of the backup custom resource you want to restore to. Note that the sample uses example output from the previous step, to specify the backup named **management-3aa3bebf**:

```
backupName: management-3aa3bebf
```

3. Create the **ManagementRestore** CR in the namespace of the Management Subsystem to trigger the restore process:

```
$ kubectl create -f mgmtrestore_cr.yaml -n <namespace-of-mgmt-susbsystem>
```

4. You can list current restores using the following command:

```
$ kubectl get managementrestore -n <namespace-of-mgmt-subsytem> --sort-by=.metadata.creationTimestamp
```

Here is an example of some possible output:

- SFTP:

NAME	AGE	STATUS	BACKUP	CLUSTER	MESSAGE
mgmt-restore-ptx6d	6m31s	Complete	mgmt-backup-w4h8c	m1	Restore process completed (DB Restore + DRR job)

- S3

NAME	AGE	STATUS	BACKUP	CLUSTER	MESSAGE
mgmt-restore-hr9zx	2020-11-23 23:08:32+00	Complete	mgmt-backup-xnjkl	m1	Restore process completed (DB Restore + DRR job)

Troubleshooting management subsystem backups

You can troubleshoot failures of the management subsystem backups.

Note: In the  Help page of the Cloud Manager, API Manager, and API Designer user interfaces, there's a Product information tile that you can click to find out information about your product versions, as well as Git information about the package versions being used. Note that the API Designer product information is based on its associated management server, but the Git information is based on where it was downloaded from.
See:

- [Troubleshooting resiliency issues](#)
Resolve resiliency issues with API Connect management system backups.
- [Troubleshooting stanza-create job for S3 backup configuration](#)
Troubleshoot configuration of s3 backups when the stanza-create job fails.
- [Restore failure with bootstrap pod error](#)
Postgres bootstrap pod reports an error and restore does not progress.

Troubleshooting resiliency issues

Resolve resiliency issues with API Connect management system backups.

pgbackrest-shared-repo resiliency problems

If the Kubernetes node hosting pgbackrest-shared-repo pod is down and the PVC attached to the pod has strict zone requirements (for example, in AWS or other clouds) or if the storage class is set to `local-storage`, then pgbackrest-shared-repo pod will not get rescheduled to another Kubernetes node.

As a result, there is a single point of failure and the following conditions might occur:

- Backups of the management database fails
- Disk space fills with accumulated Postgres wal (Write-Ahead Logging) files

To avoid this problem, monitor the disk usage: [Monitoring Postgres disk usage](#).

When the Kubernetes node comes back up, the pod is scheduled and all the processes should resume properly.

Troubleshooting stanza-create job for S3 backup configuration

Troubleshoot configuration of s3 backups when the stanza-create job fails.

When you configure Management subsystem backups for s3 providers, the operator runs a `stanza-create` job. This job creates the stanza (Postgres cluster configuration) on the upstream S3 server, which is used for backup and archive procedures. The job also brings up the necessary pod.

Check the status of the `stanza-create` job:

```
kubectl get jobs -n <namespace> | grep stanza
```

On failure:

- `stanza-create` pods fail, and job status is 0/1:

```
kubectl get jobs | grep stanza
m1-3bfe12ac-postgres-stanza-create 0/1 32m 32m
```

- Listing all pods brought up by `stanza-create` job shows multiple pods because a job tries `backoffLimit` times to complete the job. By default, there will be 7 pods in error state:

```
kubectl get pods | grep stanza
m1-3bfe12ac-postgres-stanza-create-726z4 0/1 Error 0 11m
m1-3bfe12ac-postgres-stanza-create-9vq4n 0/1 Error 0 22m
m1-3bfe12ac-postgres-stanza-create-gbtgb 0/1 Error 0 30m
m1-3bfe12ac-postgres-stanza-create-g15g5 0/1 Error 0 17m
m1-3bfe12ac-postgres-stanza-create-q8qhw 0/1 Error 0 26m
```

m1-3bfe12ac-postgres-stanza-create-t84zs	0/1	Error	0	8m54s
m1-3bfe12ac-postgres-stanza-create-z8tfs	0/1	Error	0	12m

Note: In some cases, the pods are cleaned by Kubernetes and the logs of these pods can be lost.

- Pod log errors show a reason for the failure. For example, when a hostname is not valid:

```
kubectl logs m1-3bfe12ac-postgres-stanza-create-gbtgb

time="2021-04-13T20:01:19Z" level=info msg="pgo-backrest starts"
time="2021-04-13T20:01:19Z" level=info msg="debug flag set to false"
time="2021-04-13T20:01:19Z" level=info msg="backrest stanza-create command requested"
time="2021-04-13T20:01:19Z" level=info msg="s3 flag enabled for backrest command"
time="2021-04-13T20:01:19Z" level=info msg="command to execute is [pgbackrest stanza-create --db-host=192.1.2.3 --db-path=/pgdata/m1-3bfe12ac-postgres --repol-type=s3]"
time="2021-04-13T20:01:19Z" level=info msg="command is pgbackrest stanza-create --db-host=192.1.2.3 --db-path=/pgdata/m1-3bfe12ac-postgres --repol-type=s3 "
time="2021-04-13T20:05:21Z" level=error msg="command terminated with exit code 49"
time="2021-04-13T20:05:21Z" level=info msg="output=[]"
```

- Job status is set to `type: Failed` and `status: "True"`, with reason: `BackoffLimitExceeded`:

```
kubectl get job m1-3bfe12ac-postgres-stanza-create -o yaml

status:
  conditions:
  - lastProbeTime: "2021-04-13T20:28:03Z"
    lastTransitionTime: "2021-04-13T20:28:03Z"
    message: Job has reached the specified backoff limit
    reason: BackoffLimitExceeded
    status: "True"
    type: Failed
    failed: 7
  startTime: "2021-04-13T20:01:18Z"
```

- If pod logs are lost, you can execute a command inside the `backrest-shared-repo` pod:
 - Obtain the `backrest-shared-repo` pod name:

```
kubectl get pods -n <namespace> | grep backrest-shared-repo
```

For example:

```
kubectl get pods | grep backrest-shared-repo
m1-eb8edc18-postgres-backrest-shared-repo-98dd46cc6-tw195 1/1 Running
```

- Exec into the pod:

```
kubectl exec -it <backrest-shared-repo-pod> -- bash
```

- Run:

```
pgbackrest info --output json --repol-type s3
```

For example, for invalid hostname:

```
ERROR: [049]: unable to get address for 'test1-v10-backup.s3.exampleaws.com': [-2] Name or service not knownCopy
```

The exact **ERROR**: will vary depending on the misconfiguration. Common errors:

```
Invalid access key
Invalid access key secret
Invalid bucket region
Invalid bucket or folder path
```

- To fix the incorrect settings, see [Reconfiguring or adding backup settings after installation of the management subsystem](#).

Restore failure with bootstrap pod error

Postgres bootstrap pod reports an error and restore does not progress.

Symptoms

The postgres bootstrap pod goes into an error state. Subsequent bootstrap pods come up showing **running**, but the restore does not progress. The logs of the postgres bootstrap pod show:

```
2022-08-01 15:03:58,337 INFO: Lock owner: None; I am management-09384302-postgres-bootstrap-v6xwz
2022-08-01 15:03:58,337 INFO: not healthy enough for leader race
2022-08-01 15:03:58,337 INFO: bootstrap in progress

    raise PatroniFatalException('Failed to bootstrap cluster')
patroni.exceptions.PatroniFatalException: 'Failed to bootstrap cluster'

```

Resolution

Delete the Kubernetes API Connect ManagementCluster oplock and restore job, then start the restore again:

```

kubect1 delete cm <cr name>-oplock
kubect1 delete mgmtr <restoreCR name>

```

Backing up and restoring the Developer Portal in a Kubernetes environment

You can back up and restore your Developer Portal service in your Kubernetes environment.

Before you begin

Important: If you have to perform a restore, you must complete the restoration of the Management Service first, and then immediately restore the Developer Portal. The backups of the Management and Portal must be taken at the same time to ensure that the Portal sites are consistent with Management database.

About this task

To complete a backup and restore of your Developer Portal, you must have the **custom resource** configured with the **portalBackup** subsection. Backups can be scheduled or generated manually (on-demand). You can then list what backups are available and then use one to restore your Developer Portal if required. Ensure that your backup **path** has the correct permissions to allow your backup user to be able to read and write to it from within the Developer Portal. CR, **custom resource**, templates are provided in the **helper_files** archive to install each API Connect subsystem. You decompressed these files into an installation folder of your choosing in [Deploying operators and cert-manager](#).

Note: For points to consider when you are backing up and restoring a two data center disaster recovery deployment on Kubernetes, see [Backup and restore requirements for a two data center deployment](#).

The default Developer Portal backup schedule is once every 24 hours, but the schedule can be changed in the backup settings. The Developer Portal saves all system and site backups locally, and also saves them remotely based on the configured SFTP and s3 settings.

The local backups are automatically maintained so that the latest three backups of each site and of the system are kept, and older backups are removed. This maintenance means that the Developer Portal retains the latest three backups for each site and for the system however old they are, but there is no deletion of the old backups on the remote server. If a site is deleted, then all of the local backups for that site are also deleted, as otherwise the backup volume might become full of old site backups. For remote backups, you can configure a retention policy on your remote server to remove the old backup files as required.

Tip: If you are using remote backups, and there are a large number of rows in your **portalbackup** list that have a **CR TYPE** of **record**, there might be a slow down in system performance, including during Developer Portal upgrades. Although there is no upper limit to how many portal backups you can have, it is recommended that you prune your remote backups so that the number of rows does not become excessively large. One **portalbackup** row of type **record**, corresponds to one backup file on the configured remote backup server. For more information, see [Overview of the Developer Portal backup resources](#).

Procedure

- If you haven't already, configure your Developer Portal **custom resource** with the **portalBackup** subsection.

- Create your Developer Portal backup secret.

The backup secret is a Kubernetes secret that contains your credentials for accessing the s3 or SFTP backup database.

- s3

Only password-based authentication is supported for s3, not authentication based on public certificates and private keys. Password-based authentication for s3 requires that you generate an access key and secret. For example:

- IBM (Cloud Object Storage): [Service credentials](#).
- AWS: [Managing access keys](#).

The secret can be created with the following command:

```

kubect1 create secret generic portal-backup-secret --from-literal=username='<YOUR ACCESS KEY OR USER NAME>'
--from-literal=password='<YOUR ACCESS KEY SECRET OR PASSWORD>' -n <namespace-of-portal-subsystem>

```

- SFTP

Supported credentials types:

- Username and password (v10.0.2.0 or later).

- Username and SSH-key (v10.0.3.0 or later). Only OpenSSH keys are supported.¹

Use one of the following commands to create the secret:

- Username and password credentials

```
$ kubectl create secret generic portal-backup-secret --from-literal=username='<YOUR USERNAME>'
--from-literal=password='<YOUR PASSWORD>' -n <namespace-of-portal-subsystem>
```

- Version 10.0.3.0 or later: Username and SSH-key credentials:

```
$ kubectl create secret generic portal-backup-secret --from-literal=username='<YOUR USERNAME>'
--from-file=ssh-privatekey='<YOUR PRIVATEKEY FILE>' -n <namespace-of-portal-subsystem>
```

2. Ensure that your Developer Portal `custom` resource is configured with the `portalBackup` subsection.

- All of your settings must be added in the `spec`: section of the file.
- To schedule automated backups, specify values for the `schedule` setting.

An example when you use `protocol`: `objstore`.

```
spec:
  portalBackup:
    credentials: portal-backup-secret
    host: s3.eu-gb.cloud-object-storage.appdomain.cloud/
    path: test-bucket/restore-test
    port: 443
    protocol: objstore
    backupCerts: <custom-s3-server-CA-cert>
    backups3URISyle: <host-or-path>
    schedule: '0 2 * * *'
```

An example when you use `protocol`: `sftp`.

```
spec:
  portalBackup:
    credentials: portal-backup-secret
    host: sftp-service.example.com
    path: /home/fvtuser/site-backups
    port: 22
    protocol: sftp
    schedule: '0 2 * * *'
```

Notes about `portalBackup`: entry:

- If `portalBackup`: entry is not present or contain nothing, just `local` backups will be taken if a backup CR is created. If the `schedule` exists, backups are taken at the scheduled time.
- For S3 and SFTP, `portalBackup`: entry must contain host, credentials, protocol, and path.
- For s3, the `portalBackup`: section can optionally also contain either, or both, of `backupCerts` and `backups3URISyle`.

Table 1. Developer Portal backup settings

Setting	Description
<code>credentials</code>	The name of the secret you created. Supported credential types: <ul style="list-style-type: none"> • s3 Only password-based authentication is supported for s3, not authentication based on public certificates and private keys. Password-based authentication for s3 requires that you generate an access key and secret. • SFTP <ul style="list-style-type: none"> • Username and password (v10.0.2.0 or later) • Username and SSH-key (v10.0.3.0 or later) To create a secret, see step 1.
<code>host</code>	<ul style="list-style-type: none"> • s3 - <code>host</code>: is the S3 endpoint with the corresponding S3 region in the format <code><S3endpoint></code>, or with an optional S3 region in the format <code><S3endpoint>/<S3region></code>. • sftp - the hostname of the sftp server
<code>path</code>	<ul style="list-style-type: none"> • S3 - the name of your S3 bucket to store backup data, optionally followed by a / and then any subdirectories inside the bucket. Valid examples: <pre>bucket bucket/path bucket/lots/of/paths</pre> • sftp - the full absolute path of the folder on the SFTP server, beginning with /.
<code>port</code>	The port for the protocol to connect to the host. <ul style="list-style-type: none"> • S3 - Defaults to 443 if not specified. • SFTP - Defaults to 22 if not specified. • local - Ignored for local.
<code>protocol</code>	The protocol that is used to communicate with your remote backup endpoint. Specify one of the following values: <ul style="list-style-type: none"> • <code>sftp</code> - for secure file transfer protocol. • <code>objstore</code> - for S3 compatible object storage.

Setting	Description
backupCerts	<p>(S3 storage only) backupCerts is the name of a custom certificate that contains your upstream custom S3 CA certificate. Supported beginning with 10.0.2.</p> <p>Note: If you use a public certificate for the S3 storage provider, it must be signed by a known certificate authority that is trusted by API Connect. Use of an untrusted authority can cause the following error during backup upload:</p> <pre>x509: certificate signed by unknown authority</pre> <p>This field accepts name of the Kubernetes secret containing your upstream custom S3 CA certificate. The key of the secret must be ca.crt and the value is the base64-encoded value of the CA certificate.</p> <p>If the server certificate that is presented by your S3/object-store endpoint is signed by a well known CA and includes any intermediate certificates in the chain, then you do not need to provide the CA certificate using this feature because the Portal subsystem already trusts the server certificate. You can test this by configuring the Portal backup to your S3/object-store server without providing the CA certificate.</p> <p>If you do need to provide the CA certificate then you must provide the entire chain in the ca.crt member of the secret, as follows:</p> <pre>intermediate-certificate-1 intermediate-certificate-2 . . intermediate-certificate-n root-certificate</pre> <p>Where the first certificate in the ca.crt member (intermediate-certificate-1) is the issuer of the S3/object-store server certificate, and each subsequent certificate in the ca.crt member is the issuer of the preceding certificate. The root certificate in the ca.crt member must be self-signed.</p> <p>If there are no intermediate certificates involved, then the ca.crt member contains only the root certificate.</p> <p>The following sample bash script creates the Kubernetes secret:</p> <pre>cat >customs3ca.yaml <<EOF apiVersion: v1 data: ca.crt: \$(base64 <path-to-ca-certificate> tr -d '\n') kind: Secret metadata: name: custom-server-ca type: generic EOF</pre> <pre>kubectl apply -f customs3ca.yaml -n <namespace></pre>
backups3URIStyle	<p>(S3 storage only) Optional - backups3URIStyle indicates whether URIs to your S3 backup should use specify a host or a path value. When not specified, default to host. Supported beginning with 10.0.2.</p> <p>Valid values: host and path.</p> <p>Some custom S3 providers require URI style to be set to path. For example, MinIO supports both host and path style setup. You can create a MinIO S3 server to only accept path style client communications.</p> <p>Important: Contact your custom S3 administrator before configuring this field. If not properly configured, an upstream custom S3 can reject connections from the client, such as the API Connect Management subsystem.</p>
schedule	<p>The schedule for how often automatic Developer Portal backups are run. The format for the schedule is any valid cron string. The timezone for backups is UTC.</p> <p>Valid for all backup types: s3, sftp, and local.</p> <pre>spec: portalBackup: . . schedule: '0 2 * * *'</pre>
backupRecordDays	<p>The backupRecordDays setting denotes the number of days that backup records (backups that exist on the remote backup server) are shown when you list your remote backups. It is defaulted to 30 days.</p>

- Reconfiguring Developer Portal backups
You can edit the deployed Developer Portal **custom resource**. You might want to do an edit if you did not include a **portalBackup** section before the installation. Or, if you made a mistake in your **portalBackup**, or if you'd like to change the **portalBackup** config. To edit your **portalcluster** CR:

- Get the name of your **portalcluster** CR:

```
kubectl get portalcluster -n <namespace-of-portal-subsystem>
```

- Edit your **portalcluster** CR:

```
kubectl edit portalcluster <name-of-portal-cr> -n <namespace-of-portal-subsystem>
```

- Inside the **spec**, add the **portalBackup** section as explained in step 2.
- Write and quit **wq**.

- How to generate a manual backup.

You can use these steps to configure a Developer Portal with backups that use IBM's Cloud Object Storage S3, AWS S3, or SFTP.

Decide which of the three types of manual backups you want to do:

- all**: backs up the Developer Portal system and all its sites to the remote server
- system**: backs up the Developer Portal system to the remote server
- site**: backs up a Developer Portal site to the remote server

- You generate a backup manually by creating a **portalBackup custom resource** that is detected by the **ibm-apiconnect** operator that then triggers the backup process.

You can use **portalbackup_cr.yaml** in the **helper_files** directory as an example:

```

apiVersion: portal.apiconnect.ibm.com/v1beta1
kind: PortalBackup
metadata:
  generateName: portal-bup-
spec:
  type: all
  portalCluster: portal
  crType: create
  comment: "test comment"

```

- **type**: is the type of backup to be done. Valid arguments are:
 - all
 - system
 - site
- **portalCluster**: The name of the portal cluster you want to backup. You can find this with:

```
kubectl get portalcluster -n <namespace>
```
- **crType**: Use **create** to trigger a backup process. When the backup is created, the operator generates another backup CR with **crType**: **record**, which represents the stored backup that you can use for a restore operation.
- **comment**: you can optionally add a comment to the CR before you create a backup.

2. Create the **PortalBackup** custom resource in the **namespace** of your Developer Portal to trigger the backup process:

```
kubectl create -f portalbackup_cr.yaml -n <ns-of-portal-subsystem>
```

3. Optional: You can list current backups by using the command:

```
kubectl get portalbackup -n <ns-of-portal-subsystem>
```

Here is an example of some possible output:

NAME	ID	STATUS	TYPE	CR TYPE	AGE	COMMENT
p1-bup-gqz8f	20200526.142449	Ready	system	record	55m	
p1-bup-jx4vc	20200526.142458	Ready	site	record	54m	
p1-bup-st412		Ready	all	create	56m	y
p1-bup-th2dm		Ready	all	create	4h51m	y

Tip: If you want to order your **portalbackups** by ID, you can use the Kubernetes keyword **--sort-by**. For example:

```
kubectl get pb -n <ns> --sort-by=.status.backupId
```

4. Optional: You can get a detailed view of a specific backup by using the command:

```
kubectl get portalbackup <backup-name> -n <ns-of-portal-subsystem> -o yaml
```

Here is an example of some possible output:

```

apiVersion: portal.apiconnect.ibm.com/v1beta1
kind: PortalBackup
metadata:
  creationTimestamp: "2020-10-01T10:00:16Z"

```

- How to list available Developer Portal backups on remote server.
Use command:

```
kubectl get portalbackups -n <ns-of-portal-subsystem>
```

Here is an example of some possible output:

```
kubectl get portalbackup -n <ns-of-portal-subsystem>
```

NAME	ID	STATUS	TYPE	CR TYPE	AGE	COMMENT
p1-bup-gqz8f	20200526.142449	Ready	system	record	55m	
p1-bup-jx4vc	20200526.142458	Ready	site	record	54m	
p1-bup-st4l2		Ready	all	create	56m	y
p1-bup-th2dm		Ready	all	create	4h51m	y

Note: You can only restore the Portal subsystem from backups where the **CR TYPE** is **record**.
Optionally, if you need more information, such as the name of the .tgz file that you can run, use command:

```
kubectl get portalbackups <bup-name> -n <ns-of-portal-subsystem> -o yaml
```

Here is an example of some possible output:

```

apiVersion: portal.apiconnect.ibm.com/v1beta1
kind: PortalBackup
metadata:
  creationTimestamp: "2020-10-01T10:01:19Z"
  generateName: portal-bup-

```

- How to restore a Developer Portal subsystem.
Ensure that the backup method that you used is complete before you attempt a restore. The backup data that is stored in the remote server is used for restoring the Developer Portal subsystem data back to a previous state. Ensure that these backups are on your remote server before you attempt a restore.

There are three types of restores:

- **all**: restores the Developer Portal system and all the sites that are found on the remote server by using the latest backup.
- **system**: restores the Developer Portal system to the remote server
- **site**: restores the Developer Portal site from the remote server

1. Decide on the options to use for your **PortalRestore custom resource**. The **PortalRestore custom resource** is detected by the **ibm-apiconnectoperator** that then triggers the backup process.

You can use `portalrestore_cr.yaml` in the `helper_files` directory as an example:

```

apiVersion: portal.apiconnect.ibm.com/v1beta1
kind: PortalRestore
metadata:
  generateName: portal-restore-
spec:
  type: all
  portalCluster: portal
  dryRun: true

```

```
timestamp: now
priorityList:
- myportal-critical-site.com
- myportal-important.com
```

- **type**: is the type of restore to be done. Valid arguments are:
 - all
 - system
 - site
- **portalCluster** is the name of the portal cluster you want to restore. You can find this with:

```
kubectl get portalcluster -n <namespace>
```
- **systemName** - Valid arguments are:
 - *ID*, for example 20200526.142449: the backup ID of a portal backup CR. The ID must be taken from a portal backup that is of **type system**, and **crType record**.
 - **system_backup-1234.tgz**: restores the system from the given file that exists on the pod's local file system or the remote server.
 - **latest**: restores from latest system backup that is found from either local file system or remote server.
- **timestamp** - Valid arguments are:
 - **now**: use the latest backups available.
 - **<TIMESTAMP >**: in '**YYYYMMDD.HHMMSS**' format, specify a timestamp to retrieve the backup from. The nearest backup, searching backwards from this timestamp, is used.

Note: From IBM® API Connect Version 10.0.3.0, the timestamp format changed to **YYYYMMDD.HHMMSS**. For Version 10.0.2.0 and earlier, the timestamp format is **YYYY-MM-DD HH:MM:SS**.
- **dryRun** - Valid arguments are:
 - **true**: runs a dry run of the command, returning the actions that will be taken. These actions can be found in the custom resource by following step 4.
 - **false**: runs the command, restoring and replacing the system files and all sites. Any existing sites are reinstalled.
- **priorityList** - Prioritizes the restore of any sites. The sites are listed in the order in which they are provided. They are queued for restore first, followed by any remaining sites present in the backup location. Valid arguments are:
 - **myportalsite.com**
 - **mysecondportalsite.com**
- **customPlatformApiHostname** - If the **API** hostname of your management subsystem platform has changed since taking the backup you are restoring, then update it to the new platform API hostname of the management subsystem. (Optional)

Table 2. The options that are needed for each Developer Portal restore

	all	system	site
type	X	X	X
portalCluster	X	X	X
siteName			X
systemName		X	
timestamp	X		
dryRun	X		
priorityList	X		

2. Create the **PortalRestore** custom resource in the **namespace** of the Developer Portal subsystem to trigger the restore process:

```
kubectl create -f portalrestore_cr.yaml -n <ns-of-portal-susbsystem>
```

3. Optional: You can list current restores by using the command:

```
kubectl get portalrestore -n <ns-of-portal-susbsystem>
```

Here is an example of some possible output:

```
NAME                READY   AGE
portal-restore-twjrp Ready   28s
```

4. Optional: You can get a detailed view of a specific restore by using the command:

```
kubectl get portalrestore <restore-name> -n <ns-of-portal-susbsystem> -o yaml
```

Here is an example of some possible output:

```
apiVersion: portal.apiconnect.ibm.com/v1beta1
kind: PortalRestore
metadata:
  creationTimestamp: "2020-11-11T10:14:39Z"

```

- Troubleshooting

1. Check the Developer Portal backup CR or restore CR.
Use command:

```
kubectl get <portalbackup/portalrestore> <bup-name/restore-name> -n <namespace> -o yaml
```

Here is an example of some possible output:

```

apiVersion: portal.apiconnect.ibm.com/v1beta1
kind: PortalRestore
metadata:
  creationTimestamp: "2020-05-26T13:10:46Z"
  generateName: portal-restore-
  generation: 1
  name: portal-restore-x2bf9
  namespace: portal
  resourceVersion: "1493471"
  selfLink: /apis/portal.apiconnect.ibm.com/v1beta1/namespaces/portal/portalrestores/portal-restore-x2bf9
  uid: 9f6ale22-55ab-4595-8b98-bdfaec40d58c
spec:
  portalCluster: portal
  type: site
status:
  backupId: ""
  commentLeft: ""
  conditions:
  - lastTransitionTime: "2020-05-26T13:10:49Z"
    message: |
      Please provide a site to restore. To restore all sites use value 'all' in the CR
    status: Failed
    type: Ready
  fullBackupName: ""
  id: ""
  message: ""

```

Read the message inside the conditions of the Developer Portal backup CR or the restore CR.

2. Retrieving logs

Look for information in the logs of the `ibm-apiconnect` pod:

- Locate the `ibm-apiconnect` pod with:

```
kubectl get pods -n <namespace-of-portal-subsystem>
```

- View the logs with:

```
kubectl logs <ibm-apiconnect-pod-NAME> -n <namespace-of-portal-subsystem>
```

- [Overview of the Developer Portal backup resources](#)

How to manage your Developer Portal remote backup resources.

¹ PuTTY style keys can be converted to OpenSSH by using the PuTTY Key Generator (PuTTYgen) application; see <https://www.puttygen.com/>.

Overview of the Developer Portal backup resources

How to manage your Developer Portal remote backup resources.

Note: This information is relevant only if you're taking remote Developer Portal backups.

The Developer Portal uses two types of portal backup resources. When you run the command `kubectl get portalbackup`, you see a list of backups, for example:

NAME	ID	TASK ID	STATUS	TYPE	CR TYPE	CLUSTER	AGE	COMMENT
my-backup-f91ms	n/a	20b47fe090f5	Ready	system	create	portal	78m	
portal-record-222cg	20220108.010033		Ready	system	record	portal	94m	
portal-record-22xdc	20220702.010339		Ready	site	record	portal	9m49s	
portal-record-245j7	20221002.010340		Ready	site	record	portal	5m	
portal-record-246hm	20221218.010103		Ready	site	record	portal	32m	
portal-record-24h44	20220509.010037		Ready	site	record	portal	68m	
portal-record-24wb4	20221003.010029		Ready	site	record	portal	60m	
portal-record-264mh	20221119.010453		Ready	system	record	portal	78m	

There are two types of resources listed, and these are denoted by the **CR TYPE** column; **create** or **record** types.

1. **create**: This resource is a representation of a `portalbackup` task that was created manually. See [Backing up and restoring the Developer Portal in a Kubernetes environment](#), [Backing up Developer Portal on OpenShift and Cloud Pak for Integration](#), or [Backing up the Developer Portal subsystem](#) on VMware, for information about how to create a manual portal backup.
2. **record**: This resource is generated by the operator, and it's a representation of a backup file that's stored on the remote backup server. A record listing can be modified only to add a comment to it. You can describe each record to understand which file it is referring to by running the following command:

```
kubectl describe portalbackup portal-record-name
```

For example:

```
kubectl describe portalbackup portal-record-zmmfw
.
.
Name:      portal-record-zmmfw
Namespace: apic
Labels:    createdBy
.
.
Full Backup Name:  my-portal-s3-hostname@my-porg@catal-20220604.010302.tar.gz
```

Record rows are generated and updated on a schedule, according to the backups that exist on your remote backup server. If you have 10 backup files stored on your remote server, then there will be 10 record rows; one row for each file.

The Developer Portal doesn't have a retention policy for remote backups. Therefore, it's your responsibility to ensure that you're keeping the number of backups that are stored remotely under control. An excessive number of portal backups results in delays administrating and upgrading the Developer Portal. This is due to the operator needing to maintain the excessive number of record rows that correspond to each remote portal backup.

Backing up and restoring the analytics database

The IBM® API Connect Analytics database can be backed up and restored from an S3 repository. S3 compatible object storage is required; for example, IBM Cloud Object Storage.

About this task

Before you can initiate a backup or restore operation, you must update the Analytics CR (custom resource) to configure your settings. Generating a backup for Analytics is performed on demand by deploying a backup CR. You can deploy a restore CR to start the restoration of a previously generated backup.

Note: On a v10.0.5 API Connect deployment, you can restore only analytics backups that were taken from a v10.0.5 analytics deployment. You cannot restore analytics backups that were taken from a deployment that was on v10.0.4 or an earlier release.

- [Configuring backup settings for Analytics](#)
Configure the IBM API Connect Analytics subsystem on Kubernetes to support backing up and restoring the Analytics database.
- [Running a backup of the Analytics database](#)

Deploy the `analyticsrestore_cr.yaml` CR to initiate restoration of a backup of the IBM API Connect Analytics database on Kubernetes.
- [Troubleshooting Analytics backup and restore](#)
If you encounter problems when backing up or restoring the IBM API Connect Analytics database on Kubernetes, review the following troubleshooting tips.

Configuring backup settings for Analytics

Configure the IBM® API Connect Analytics subsystem on Kubernetes to support backing up and restoring the Analytics database.

About this task

The Analytics database can be backed up and restored from an S3 repository. S3-compatible object storage is required; for example, IBM Cloud Object Storage. Generating a backup for Analytics is performed on demand by creating a backup CR (custom resource). You can create a restore CR to start the restoration of a previously generated backup.

Note:

- Only host-style S3 backups are supported. Path-style S3 backups are not supported.
- If you are using a self-managed S3 backup server, check that you have a DNS hostname entry and matching TLS certificate for your S3 backup endpoint.
- When you specify a filepath in a backup setting, be sure to escape any blank spaces in the path.

Note: You can only run one backup or restore process at a time.

Procedure

1. Create the analytics backup secret for your S3-compatible storage:

a. Obtain an access key and corresponding access key secret from your S3 provider.

For example, you might obtain the key and secret from one of the following providers, using the instructions found on their sites:

- [IBM Cloud Object Storage](#)
- [AWS](#)

b. Create the Kubernetes secret by running the following command and filling in your access key, access key secret, and namespace:

```
kubectl create secret generic analytics-backup-secret --from-literal=access_key='Your_Access_Key' --from-literal=secret_key='Your_access_key_secret' -n Namespace_of_Analytics_Subsystem
```

2. Add the backup configuration to the Analytics CR:

a. Open the analytics_cr.yaml file for editing.

If you already installed Analytics without configuring backup settings, run the following command to open the deployed version of the Analytics CR:

```
kubectl edit analyticscluster analytics_cr -n namespace
```

where:

- `analytics_cr` is the name of the YAML file containing the Analytics CR
- `namespace` is the name of the Analytics namespace

b. In the `spec` section, add a `databaseBackup` section and configure the backup settings as shown in the following example:

```
spec:
  databaseBackup:
    credentials: analytics-backup-secret
    host: s3.eu-gb.cloud-object-storage.appdomain.cloud
    path: my-s3-bucket/apic-analytics-backups
    backupCerts: <custom-s3-server-CA-cert>
    schedule: "0 2 * * *"
    enableCompression: true
    chunkSize: 1GB
    enableServerSideEncryption: false
```

where:

- `credentials` is the name of the Kubernetes secret you created in step 1
- `host` is the S3 endpoint with the corresponding S3 region in the format:

```
s3.s3region.s3domain
```

Attention: A path style host value (formatted as `S3endpoint/S3region`) is not supported.

- `path` is a combination of the S3 bucket and the base path within the bucket, using the format: `bucket_name/path`
- `backupCerts` is the name of a custom certificate that contains your upstream custom S3 CA certificate. This field accepts name of the Kubernetes secret containing your upstream custom S3 CA certificate. The key of the secret must be `ca.crt` and the value is the base64-encoded value of the CA certificate.

If the server certificate that is presented by your S3/object-store endpoint is signed by a well known CA and includes any intermediate certificates in the chain, then you do not need to provide the CA certificate using this feature because the Analytics subsystem already trusts the server certificate. You can test this by configuring the Analytics backup to your S3/object-store server without providing the CA certificate.

If you do need to provide the CA certificate then you must provide the entire chain in the `ca.crt` member of the secret, as follows:

```
intermediate-certificate-1
intermediate-certificate-2
. . .
intermediate-certificate-n
root-certificate
```

Where the first certificate in the `ca.crt` member (`intermediate-certificate-1`) is the issuer of the S3/object-store server certificate, and each subsequent certificate in the `ca.crt` member is the issuer of the preceding certificate. The root certificate in the `ca.crt` member must be self-signed.

If there are no intermediate certificates involved, then the `ca.crt` member contains only the root certificate.

The following sample bash script creates the Kubernetes secret:

```
cat >customs3ca.yaml <<EOF
apiVersion: v1
data:
  ca.crt: $(base64 <path-to-ca-certificate> | tr -d '\n' )
kind: Secret
metadata:
  name: custom-server-ca
type: generic
EOF

kubectl apply -f customs3ca.yaml -n <namespace>
```

- **schedule** is the schedule that determines how often backups will be invoked automatically. The format for the schedule is any valid **cron** string. The timezone for backups is that of the kube-controller-manager. Backing up once a day is probably sufficient; remember that the more frequently you run backups, the more storage space you need.
 - Optional: **enableCompression** determines whether metadata files are stored in compressed format. Default value is true.
 - Optional: **chunkSize** specifies how large files are stored. Large files can be stored as chunks when the snapshot is created. This setting specifies the size of the chunks as GB, MB, or KB. Default value is 1GB.
 - Optional: **enableServerSideEncryption** determines whether files are encrypted. When set to true, files are encrypted on the server side using AES256. Default value is false.
3. Save and close the file.
 4. Install or modify the Analytics subsystem with the updated CR as explained in [Installing analytics](#).

Running a backup of the Analytics database

Deploy the analyticsbackup_cr.yaml CR to initiate a backup of the IBM® API Connect Analytics database on Kubernetes.

Before you begin

[Configure backup settings for Analytics](#).

About this task

A backup is triggered by creating the analyticsbackup_cr.yaml CR. The new CR is detected by the **ibm-apiconnect** operator, which requests a new backup.

Procedure

1. Create the **AnalyticsBackup** CR for your deployment in a file called analyticsbackup_cr.yaml. For example:

```
apiVersion: analytics.apiconnect.ibm.com/v1beta1
kind: AnalyticsBackup
metadata:
  generateName: a7s-bup-
  namespace: <analytics namespace>
spec:
  crType: create
  comment: "test comment"
  indices:
  - all
  enableIgnoreUnavailable: true
```

where:

- **metadata.generateName** - Use to specify a prefix for your backup name, the remainder of the name will be generated at runtime.
 - **metadata.name** - Use as an alternative to **generateName**, where you want to specify the full name of the backup.
 - Optional: **metadata.namespace** - Specify the analytics namespace.
 - **spec.crType** - Use **create** to trigger a backup process. When the backup is created, the operator generates another backup CR with **crType: record**, which represents the stored backup that you can use for a restore operation.
 - Optional: **spec.comment** - You can use this field to describe the back up for later reference.
 - Optional: **spec.indices** - A list of index names or keywords, indicating which indices you want to back up. Options are: **all|apievents|ui**, or the names of individual indices. If no indices are specified, then all indices are backed up. The default of 'all' is specified explicitly in the above sample.
 - Optional: **spec.enableIgnoreUnavailable** - Default value is **false**. If set to **false**, the backup fails if a specified index is not present. If set to **true**, missing indices are skipped and the backup continues.
2. Deploy your CR by running the following command to create it in the namespace for your Analytics subsystem:

```
kubectl create -f analyticsbackup_cr.yaml -n namespace
```

where **namespace** is the name of the Analytics namespace.

The backup's name and ID are generated when the backup operation runs.

3. To get a list of available backups, run the following command:

```
kubectl get analyticsbackup -n namespace
```

The response looks like the following example:

NAME	STATUS	ID	CR TYPE	INDICES	AGE	COMMENT
a7s-bup-266p8	Ready		create	[all]	20h	y
a7s-bup-pffdh	Ready		create	[all]	34h	y

4. Display the details for a particular backup by running the following command: Use the backup name from the results in step 4.

```
kubectl get analyticsbackup backup_NAME -n namespace -o yaml
```

The result looks like the following example:

```
apiVersion: analytics.apiconnect.ibm.com/v1beta1
kind: AnalyticsBackup
```

```

metadata:
  creationTimestamp: "2020-05-20T16:18:05Z"
  generateName: a7s-bup-
  generation: 1
  name: a7s-bup-gb6s5
  namespace: my-namespace
  resourceVersion: "867329"

  id: my-backup-id

```

Restoring the Analytics database

Deploy the `analyticsrestore_cr.yaml` CR to initiate restoration of a backup of the IBM® API Connect Analytics database on Kubernetes.

Before you begin

[Create a backup.](#)

About this task

A restore operation is triggered by creating the `analyticsrestore_cr.yaml` CR. The new CR is detected by the `ibm-apiconnect` operator, which requests a restore of the specified backup.

Note: You can only run one backup or restore process at a time.

Procedure

1. Get a list of available backups by running the following command:

```
kubectl get analyticsbackup -n namespace
```

where `namespace` is the name of the Analytics namespace.

The response looks like the following example. Note down the ID of the backup that you want to restore.

NAME	STATUS	ID	CR TYPE	INDICES	AGE	COMMENT
a7s-bup-266p8	Ready		create	[all]	20h	y
a7s-bup-pffdh	Ready		create	[all]	34h	y
analytics-bup-kxwq5	Ready	analytics-all-2020-09-07t03:49:15utc	record	[all]	34h	
analytics-bup-p29z8	Ready	analytics-all-2020-09-07t18:04:03utc	record	[all]	20h	

Note: You can only restore the Analytics subsystem from backups where the **CR TYPE** is **record**.

2. Create the **AnalyticsRestore** CR for your deployment in a file called `analyticsrestore_cr.yaml`. The following code shows the sample `analyticsrestore_cr.yaml`, which is stored in the `helper_files` directory:

```

apiVersion: analytics.apiconnect.ibm.com/v1beta1
kind: AnalyticsRestore
metadata:
  generateName: a7s-restore-
spec:
  indices:
  - all
  backupID: analytics-all-2022-07-01t03:49:15utc
  enableIgnoreUnavailable: true
  enableOverride: false

```

3. In your copy of the CR, update the following settings:
 - **indices** - A list of index names or keywords, indicating which indices you want to restore. Options are: `all` | `apievents` | `ui`, or the names of individual indices. If no indices are specified, then all indices are restored. The default of 'all' is specified explicitly in the above sample.
 - **backupID** - The ID of the backup to be restored, which you obtained in step 2.
 - **enableIgnoreUnavailable** - Default value is `false`. If set to `false`, the restore fails if a specified index is not present in the backup identified by the **backupID**. If set to `true`, missing indices are skipped and the restore continues.
 - **enableOverride** - Default value is `false`. If set to `true`, then the restore overrides existing indices. When **enableOverride** is set to `false` and you specified indices that already exist in the database that you are restoring, then the restore fails. The failure prevents you from accidentally replacing or losing data that exists in the current database.

4. Deploy your CR by running the following command to create it in the namespace for your Analytics subsystem:

```
kubectl create -f analyticsrestore_cr.yaml -n namespace
```

where `namespace` is the name of the Analytics namespace.

The restore's name is generated when the restore operation runs.

5. To get a list of restores, run the following command:

```
kubectl get analyticsrestore -n namespace
```

The response looks like the following example.

NAME	STATUS	ID	AGE
a7s-restore-9z4fr	Ready	analytics-all-2022-07-01t04:49:15utc	1h

6. Display the details for a particular restore by running the following command:

Use the restore name from the results in step 6.

```
kubectl get analyticsrestore restore_NAME -n namespace -o yaml
```

The result looks like the following example:

```
apiVersion: analytics.apiconnect.ibm.com/v1beta1
kind: AnalyticsRestore
metadata:
  creationTimestamp: "2022-07-01T04:06:03Z"
  generateName: a7s-restore-
  generation: 1
  name: a7s-restore-9z4fr
  namespace: my-namespace
  resourceVersion: "975152"
  uid: fd9a9105-17ab-44ac-83de-852620a4dcde
spec:
  backupID: analytics-all-2022-07-01t03:49:15utc
  enableIgnoreUnavailable: false
  enableOverride: true
  indices:
  - all
status:
  conditions:
  - lastTransitionTime: "2022-07-01T04:08:03Z"
    message: WARNING
    status: Warning
    type: Ready
  details: |
    &{NumberOfDataNodes:1
      Status:yellow
      ActivePrimaryShards:23
      ActiveShards:23
      RelocatingShards:0
      InitializingShards:0
      UnassignedShards:40
      PendingTasks:0}
  id: analytics-all-2022-07-01t04:49:15utc
```

When the restore is successfully started, the `status: condition` section displays **Running**. If the restore does not start correctly, the `status: condition` section displays **Failed**.

The restore process is successful when the storage cluster status is green, there are no unassigned shards, and there are no initializing shards. At that time the `status: condition` section displays **Complete**. If `status: Complete` is not achieved after 3 hours, the status changes to **Warning** and the details are no longer updated.

Important: For deployment profiles with fewer than 3 storage nodes, the restore process is never marked as **Complete**. The storage cluster status is expected to be yellow and to have more than 0 unassigned shards. In this situation, the restore process is likely to be complete when there are 0 initializing shards.

Troubleshooting Analytics backup and restore

If you encounter problems when backing up or restoring the IBM® API Connect Analytics database on Kubernetes, review the following troubleshooting tips.

Note: In the  Help page of the Cloud Manager, API Manager, and API Designer user interfaces, there's a Product information tile that you can click to find out information about your product versions, as well as Git information about the package versions being used. Note that the API Designer product information is based on its associated management server, but the Git information is based on where it was downloaded from.

Check the CR status

Look for messages in the `status` section of the backup or restore CR by running the following command:

```
kubectl get analytics[backup|restore] restore|backup_NAME -n namespace -o yaml
```

where:

- You specify whether to retrieve the `analyticsbackup` CR or the `analyticsrestore` CR
- `restore|backup_NAME` is the name that is generated when you initially deploy the backup or restore CR.

- `namespace` is the namespace where Analytics is deployed.

For example:

```
kubectl get analyticsbackup a7s-bup-gb6s5 -n analytics -o yaml
```

Check the logs

Look for information in the logs of the `ibm-apiconnect` pod:

1. Locate the `ibm-apiconnect` pod by running the following command:

```
kubectl get pods -n namespace
```

2. View the logs with:

```
kubectl logs ibm-apiconnect-pod-NAME -n namespace
```

If there is a problem with your `databaseBackup` configuration, there are messages with the label "error" to indicate the problem

Backups on OpenShift

You can backup and restore API Connect subsystems on OpenShift and Cloud Pak for Integration.

- [Backing up and restoring the management subsystem on OpenShift and Cloud Pak for Integration](#)
You can use the following instructions to backup and restore your Management subsystem on OpenShift and Cloud Pak for Integration.
- [Backing up and restoring Developer Portal on OpenShift and Cloud Pak for Integration](#)
You can back up and restore your Developer Portal service in your OpenShift or Cloud Pak for Integration environment.
- [Backing up and restoring the Analytics database on OpenShift and Cloud Pak for Integration](#)
The IBM® API Connect Analytics database can be backed up and restored from an S3 repository. S3 compatible object storage is required; for example, IBM Cloud Object Storage.

Backing up and restoring the management subsystem on OpenShift and Cloud Pak for Integration

You can use the following instructions to backup and restore your Management subsystem on OpenShift and Cloud Pak for Integration.

- To complete a backup and restore of your Management subsystem, you must have the `custom resource` configured with the `databaseBackup` subsection in the management subsystem custom resource.
- Backups can be scheduled or generated manually (on-demand). You can then list what backups are available and then use one to restore your Management subsystem if required.
- Postgres replica pods depend on a successful completed backup. If backup configuration is not correct, replica pods won't come up.
- In v10.0.1.1-eus and later, a new parameter called `protocol` is required in `databaseBackup` section
- Restoring a backup restores the registration credentials (`client_ID`, `client_secret`) that were in use at the time that the selected backup was created. For information on the registration credentials, see [Changing the registration client id and client secret for applications](#).

Note: You must backup both the Management and Portal subsystems at the same time, to ensure synchronicity across the services.

Types of backups supported

- Cloud-based S3 storage
 - IBM Cloud Object Storage
 - AWS S3
- SFTP
 - In v10.0.1.1-eus, SFTP backup/restore procedure is automatically handled by apiconnect operator.
 - In v10.0.1.0 and later, local Backups can be stored remotely on an sftp server, and retrieved later from the sftp server for restore operations. See [Using an sftp server for backup files \(v10.0.1.0\)](#).
- Local storage backups

Support for Cloud Pak for Integration

IBM Cloud Pak for Integration is deployed on OpenShift, and uses the API Connect distribution for OpenShift. The backup and restore instructions in this section apply to both API Connect on OpenShift, and API Connect within a Cloud Pak for Integration environment.

When you perform configuration tasks you can use either a graphical user interface or a command line. The IBM Cloud Pak Platform UI differs from the OpenShift web console. The configuration topics in this section provide instructions for both interfaces. Note that Cloud Pak for Integration uses the OpenShift command line utility `oc`. Command line instructions for configuration are identical for both platforms.

- [Configuring backup settings for a fresh install of the Management subsystem on OpenShift or Cloud Pak for Integration](#)
You can configure backups for the API Connect Management subsystem that you will deploy in your OpenShift or Cloud Pak for Integration environment. Use the appropriate instructions for the type of backup that you want to configure:
- [Reconfiguring or adding backup settings after installation of the management subsystem on OpenShift and Cloud Pak for Integration](#)
You can reconfigure the backup settings after installation of the management subsystem on OpenShift and Cloud Pak for Integration.
- [Generating a manual backup of the management subsystem on OpenShift and Cloud Pak for Integration](#)
You can generate a manual (non-scheduled) backup of the management subsystem in your OpenShift and Cloud Pak for Integration environments.

- [Restoring the management subsystem on OpenShift and Cloud Pak for Integration](#)
You can restore your Management subsystem in your OpenShift and Cloud Pak for Integration environments.
- [Troubleshooting management subsystem backups on OpenShift and Cloud Pak for Integration](#)
You can troubleshoot failures of the API Connect management subsystem backups in an OpenShift or Cloud Pak for Integration environment.

Configuring backup settings for a fresh install of the Management subsystem on OpenShift or Cloud Pak for Integration

You can configure backups for the API Connect Management subsystem that you will deploy in your OpenShift or Cloud Pak for Integration environment. Use the appropriate instructions for the type of backup that you want to configure:

- [Configuring S3 backup settings for a fresh install of the Management subsystem on OpenShift or Cloud Pak for Integration](#)
Configure backups for the API Connect Management subsystem that you will deploy in your OpenShift or Cloud Pak for Integration environment.
- [Configuring SFTP backup settings for fresh install of the Management subsystem on OpenShift and Cloud Pak for Integration](#)
Beginning with API Connect V10.0.1.1, you can configure SFTP backups for your Management subsystem in your OpenShift and Cloud Pak for Integration environments.
- [Configuring local backup settings for a fresh install of the Management subsystem on OpenShift or Cloud Pak for Integration](#)
Configure local backups for the API Connect Management subsystem that you will deploy in your OpenShift or Cloud Pak for Integration environment.

Configuring S3 backup settings for a fresh install of the Management subsystem on OpenShift or Cloud Pak for Integration

Configure backups for the API Connect Management subsystem that you will deploy in your OpenShift or Cloud Pak for Integration environment.

Before you begin

If the `APIConnectCluster` instance is already created, do not use these instructions. Instead, add the Management backup configuration by following the instructions in [Reconfiguring or adding backup settings after installation of the management subsystem on OpenShift and Cloud Pak for Integration](#).

About this task

When creating an instance of API Connect, use the advanced configuration settings to configure database backups for the Management subsystem. Beginning with v10.0.2, the Management subsystem supports custom S3 solutions such as MinIO.

Important: For S3 backups of the management subsystem, do not use retention features provided by Cloud-based S3 storage providers. Use of such features can result in periodic deletion of archived backups, which can cause backup corruptions that can cause database restores to fail.

Warning:

When configuring a new management subsystem for S3 backup, the content of the S3 bucket path must be empty. If you want to configure a management subsystem to use the content of an S3 bucket path already used by another management subsystem, you have two options:

1. Shutdown the postgres database on the existing management subsystem that points to the S3 bucket path before you start the new management subsystem.
2. In a disaster recovery scenario where you want to restore from the backup of an existing installation: Create a new S3 path and use S3 tools to copy the backup content from the existing management subsystem S3 bucket path, to the new bucket path.

Procedure

1. Create a backup secret.
The backup secret is a Kubernetes secret that contains your username and password for your S3 backup database.

For examples of how to generate the appropriate access key and secret for two of them, see:

- IBM (Cloud Object Storage): [Service credentials](#).
- AWS: [Managing access keys](#).

The secret can be created with the following command:

```
oc create secret generic mgmt-backup-secret --from-literal=key='<YOUR ACCESS KEY>' --from-literal=keysecret='<YOUR ACCESS KEY SECRET>' -n <namespace_of_management_subsystem>
```

2. Configure the Management backup settings.
Create the `APIConnectCluster` installation CR and add the Management backup configuration using one of the following methods:

- OpenShift web console:
 - Navigate to Advanced Configuration > ManagementSubsystem > Advanced Configuration > Database Backups > Advanced Configuration
 - See the on-screen instructions for how to fill in each field. See also [Management subsystem settings](#).
Note that there is downtime involved when changing S3 protocol backup configuration.
- IBM Cloud Pak Platform UI:
 - In the Platform UI for the API Connect cluster instance, select Configuration. On the Form UI tab, set Advanced Options to On.
 - See the on-screen instructions for how to fill in values for:
 - Credentials
 - Hostname
 - Path
 - Protocol

- Restart DB (toggle on)
- S3 Provider
- Backup Credentials
- Backup URI Style
- Schedule (The timezone for backups is that of the node on which the postgres-operator pod is scheduled.)
- Repo Retention

For more information, see [Management subsystem settings](#).

- YAML file: Use Table 1 for guidance while you define the backup settings as shown in the following example.

```
spec:
  management:
    databaseBackup:
      protocol: objstore
      s3provider: ibm
      host: s3.eu-gb.cloud-object-storage.appdomain.cloud/eu-standard
      path: apic-backup
      credentials: mgmt-backup-secret
      schedule: "0 3 * * *"
      repoRetentionFull: 2
```

Note: The `protocol` setting was introduced in v10.0.1.1. Do not specify it on v10.0.1.0 or earlier deployments

Table 1. Backup configuration settings

Setting	Description
<code>protocol</code>	<p>The type of the backup; required in 10.0.1.1-eus and greater. For s3 storage, use <code>objstore</code>. When the parameter is not set, the backup type defaults to local storage backup.</p> <p>Note: The <code>protocol</code> setting was introduced in v10.0.1.1. Do not specify it on v10.0.1.0 or earlier deployments</p>
<code>s3Provider</code>	<p>Name of the S3 provider to use. You must specify one of the supported values of <code>aws</code>, <code>ibm</code>, or <code>custom</code>. The <code>custom</code> option is supported beginning with 10.0.2 or later. If you use a custom S3 provider, you must also specify the <code>backupCerts</code>.</p> <p>Note: The public certificate on the S3 storage provider must be signed by a known certificate authority that is trusted by API Connect. Use of an untrusted authority can cause the following error during backup upload: <code>x509: certificate signed by unknown authority</code>.</p>
<code>backupCerts</code>	<p>The name of a custom certificate that contains your upstream custom S3 CA certificate. Supported beginning with 10.0.2. Used only when <code>s3Provider</code> is set to <code>custom</code>. Most of the custom S3 providers are created based on custom CA certificates.</p> <p>This field accepts name of the Kubernetes secret containing your upstream custom S3 CA certificate. The key of the secret must be <code>ca.crt</code> and the value is the base64-encoded value of the CA certificate.</p> <p>If the server certificate that is presented by your S3/object-store endpoint is signed by a well known CA and includes any intermediate certificates in the chain, then you do not need to provide the CA certificate using this feature because the Analytics subsystem already trusts the server certificate. You can test this by configuring the Analytics backup to your S3/object-store server without providing the CA certificate.</p> <p>If you do need to provide the CA certificate then you must provide the entire chain in the <code>ca.crt</code> member of the secret, as follows:</p> <pre>intermediate-certificate-1 intermediate-certificate-2 . . . intermediate-certificate-n root-certificate</pre> <p>Where the first certificate in the <code>ca.crt</code> member (intermediate-certificate-1) is the issuer of the S3/object-store server certificate, and each subsequent certificate in the <code>ca.crt</code> member is the issuer of the preceding certificate. The root certificate in the <code>ca.crt</code> member must be self-signed.</p> <p>If there are no intermediate certificates involved, then the <code>ca.crt</code> member contains only the root certificate.</p> <p>The following sample bash script creates the Kubernetes secret:</p> <pre>cat >customs3ca.yaml <<EOF apiVersion: v1 data: ca.crt: \$(base64 <path-to-ca-certificate> tr -d '\n') kind: Secret metadata: name: custom-server-ca type: generic EOF kubectl apply -f customs3ca.yaml -n <namespace></pre>
<code>backups3URISyle</code>	<p>Indicates whether URIs to your S3 backup should use specify a host or a path value. Supported beginning with 10.0.2. Valid values: <code>host</code> and <code>path</code>.</p> <p>Used only when <code>s3Provider</code> is set to <code>custom</code>.</p> <p>Some custom S3 providers require URI style to be set to <code>path</code>. For example, MinIO supports both <code>host</code> and <code>path</code> style setup. You can create a MinIO S3 server to only accept <code>path</code> style client communications.</p> <p>Important: Contact your custom S3 administrator before configuring this field. If not properly configured, an upstream custom S3 can reject connections from the client, such as the API Connect Management subsystem.</p>
<code>host</code>	<p>For <code>objstore</code> type backup, specify S3 endpoint with the corresponding S3 region in the format <code><S3endpoint>/<S3region></code></p>

Setting	Description
path	<p>The path to the location of the backup: For objstore backups, the name of your S3 bucket to store backup data. For example, bucket-name/folder. The use of subdirectories in the bucket name is not supported.</p> <p>Note: When your deployment includes a management subsystem in two different clusters (with active databases), the two management subsystems cannot use the same s3 bucket name in the database backup configurations. Each management subsystem must use a unique s3 bucket name.</p> <p>Ensure that bucket-name/folder is empty. If the folder was previously used for backups, the folder will not be empty, and stanza create might encounter an error.</p> <p>Explanation: Once a folder is used, archive.info and backup.info files are created. During stanza creation, the process compares the database version and database system id between the two info files and the current Postgres database cluster. Stanza creation fails if there is a mismatch. To prevent this possibility, remove all files from the folder before configuring.</p>
credentials	For objstore type backups, the name of the Kubernetes secret containing your S3 Access Key / Key Secret
schedule	<p>Cron like schedule for performing automatic backups. The format for the schedule is:</p> <ul style="list-style-type: none"> • ***** • ----- • • +----- day of week (0 - 6) (Sunday=0) • +----- month (1 - 12) • +----- day of month (1 - 31) • +----- hour (0 - 23) • +----- min (0 - 59) <p>The timezone for backups is that of the node on which the postgres-operator pod is scheduled.</p> <p>There is no default backup schedule set. Be sure to set your backup schedule.</p> <p>All scheduled Management subsystem backups are of type full only.</p>
repoRetentionFull	<p>v10.0.3.0 or later - The number of full S3 backups to retain. When the next full backup successfully completes, and the specified number of retained backups is reached, the oldest full backup is deleted. All incremental backups and archives associated with the oldest full backup also expire. Incremental backups are not counted for this setting.</p> <p>Applies to both manual backups and scheduled backups.</p> <p>Minimum value: 1</p> <p>Maximum value: 9999999</p> <p>Default: none</p>

3. Verify that the configuration deploys successfully.

When you configure Management subsystem backups, the operator runs a **stanza-create** job. This job creates the stanza (Postgres cluster configuration) on the upstream S3 server, which is used for backup and archive procedures. The job also brings up the necessary pod.

Check the status of the **stanza-create** job:

```
oc get jobs -n <namespace> | grep stanza
```

- On success:

- The **stanza-create** job status is 1/1:

```
oc get jobs | grep stanza
m1-b722e361-postgres-stanza-create 1/1 5s 127m
```

- The **stanza-create** job shows **status: "True"** and **type: Complete**:

```
oc get job m1-b722e361-postgres-stanza-create -o yaml
```

```
status:
  completionTime: "2021-04-13T18:38:50Z"
  conditions:
  - lastProbeTime: "2021-04-13T18:38:50Z"
    lastTransitionTime: "2021-04-13T18:38:50Z"
    status: "True"
    type: Complete
  startTime: "2021-04-13T18:38:45Z"
  succeeded: 1
```

- The **stanza-create** pod is in **Completed** state:

```
oc get pods | grep stanza
m1-b722e361-postgres-stanza-create-q4fvp 0/1 Completed 0 127m
```

- Exec into the pod:

```
oc exec -it <backrest-shared-repo-pod> -- bash
```

- The **pgbackrest** command returns the S3 contents in valid JSON:

```
pgbackrest info --output json --repol-type s3
{"backup":{"held":false}}, {"message":"ok"} } [pgbackrest@m1-b722e361-postgres-backrest-shared-repo-69cdfdfdd5-rs882/
```

- On failure, see [Troubleshooting the stanza-create job for S3 backup configuration on OpenShift and Cloud Pak for Integration](#).

Configuring SFTP backup settings for fresh install of the Management subsystem on OpenShift and Cloud Pak for Integration

Beginning with API Connect V10.0.1.1, you can configure SFTP backups for your Management subsystem in your OpenShift and Cloud Pak for Integration environments.

Before you begin

If the `APIConnectCluster` instance is already created, do not use these instructions. Instead, add the Management backup configuration by following the instructions in [Reconfiguring or adding backup settings after installation of the management subsystem on OpenShift and Cloud Pak for Integration](#).

About this task

When creating an instance of API Connect, use the advanced configuration settings to configure database backups for the Management subsystem.

Procedure

1. Create a backup secret.

The backup secret is a Kubernetes secret that contains your credentials for accessing the SFTP backup database. Supported credentials types:

- Username and password (v10.0.2.0 or later).
- Username and SSH-key (v10.0.3.0 or later). Only OpenSSH keys are supported.¹

Use one of the following commands to create the secret:

- Username and password credentials

```
oc create secret generic mgmt-backup-secret --from-literal=username='<YOUR USERNAME>' --from-literal=password='<YOUR PASSWORD>' -n <namespace-of-mgmt-subsystem>
```

- **Version 10.0.3.0 or later:** Username and SSH-key credentials:

```
oc create secret generic mgmt-backup-secret --from-literal=username='<YOUR USERNAME>' --from-file=ssh-privatekey='<YOUR PRIVATEKEY FILE>' -n <namespace-of-mgmt-subsystem>
```

Note: If the username contains the backslash character, insert an extra backslash to escape it. For example, if the username is:

```
backup\svc-apic
```

set this as:

```
--from-literal=username='backup\\svc-apic'
```

2. Configure the Management backup settings.

Create the `APIConnectCluster` installation CR and add the Management backup configuration using one of the following methods:

- OpenShift web console:
 - Navigate to Advanced Configuration > ManagementSubsystem > Advanced Configuration > Database Backups > Advanced Configuration
 - See the on-screen instructions for how to fill in each field. See also [Management subsystem settings](#).
The following fields are unique to SFTP backup configuration:
 - Server port. Default is 22.
 - The fields in the Restart Database section. Changing SFTP (protocol) backup configures does not involve any downtime.
 - Retries.
- IBM Cloud Pak Platform UI:
 - In the Platform UI for the API Connect cluster instance, select Configuration. On the Common settings tab, set Advanced Options to On.
 - See the on-screen instructions for how to fill in values for:
 - Credentials
 - Server Hostname
 - Path
 - Server Port
 - Protocol
 - Retries
 - Schedule (The timezone for backups is that of the node on which the postgres-operator pod is scheduled.)

For more information, see [Management subsystem settings](#).

- YAML file: Use Table 1 for guidance while you define the backup settings as shown in the following example.

```
spec:
  management:
    databaseBackup:
      protocol: sftp
      host: <SFTP-host-name>
      port: <SFTP-port>
      path: apic-backup
      retries: 0
      credentials: mgmt-backup-secret
      schedule: "0 3 * * *"
```

Table 1. Backup configuration settings

Setting	Description
protocol	The type of the backup. For SFTP storage: <code>sftp</code> .

Setting	Description
host	The backups host. For sftp type, the SFTP server hostname
port	The SFTP server port. Optional. Default: 22.
path	The path to the location of the backup. For sftp type, the folder name on the SFTP server.
retries	The number of times the ibm-apiconnect Operator attempts backups in the event of a failed SFTP backup. Default value: 0.
credentials	Name of the Kubernetes secret containing your SFTP Username/password. For Version 10.0.3.0 or later, the Kubernetes secret can contain your SFTP Username and SSH key.
schedule	<p>Cron like schedule for performing automatic backups. The format for the schedule is:</p> <ul style="list-style-type: none"> • * * * * * • - - - - - • • +----- day of week (0 - 6) (Sunday=0) • +----- month (1 - 12) • +----- day of month (1 - 31) • +----- hour (0 - 23) • +----- min (0 - 59) <p>The timezone for backups is that of the node on which the postgres-operator pod is scheduled.</p> <p>There is no default backup schedule set. Be sure to set your backup schedule.</p> <p>All scheduled Management subsystem backups are of type full only.</p>

¹ PuTTY style keys can be converted to OpenSSH by using the PuTTY Key Generator (PuTTYgen) application; see <https://www.puttygen.com/>.

Configuring local backup settings for a fresh install of the Management subsystem on OpenShift or Cloud Pak for Integration

Configure local backups for the API Connect Management subsystem that you will deploy in your OpenShift or Cloud Pak for Integration environment.

About this task

When creating an instance of API Connect, use the advanced configuration settings to configure database backups for the Management subsystem.

Procedure

Configure the Management section of the top-level **APICoconnectCluster** installation CR with the **databaseBackup** subsection. Specify **schedule** and **repoRetentionFull**, the default settings are 01:00 UTC and 14 days.

```
databaseBackup:
  schedule: "0 1 * * *"
  repoRetentionFull: 14
```

Table 1. Backup configuration settings

Setting	Description
schedule	<p>Cron like schedule for performing automatic backups. The format for the schedule is:</p> <ul style="list-style-type: none"> • * * * * * • - - - - - • • +----- day of week (0 - 6) (Sunday=0) • +----- month (1 - 12) • +----- day of month (1 - 31) • +----- hour (0 - 23) • +----- min (0 - 59) <p>The timezone for backups is that of the node on which the postgres-operator pod is scheduled.</p> <p>The default is daily backups at 01:00 UTC.</p> <p>All scheduled Management subsystem backups are of type full only.</p>
repoRetentionFull	<p>- The number of full local backups to retain. When the next full backup successfully completes, and the specified number of retained backups is reached, the oldest full backup is deleted. All incremental backups and archives associated with the oldest full backup also expire. Incremental backups are not counted for this setting. Applies to both manual backups and scheduled backups.</p> <p>Minimum value: 1</p> <p>Maximum value: 9999999</p> <p>Default: 14</p>

Reconfiguring or adding backup settings after installation of the management subsystem on OpenShift and Cloud Pak for Integration

You can reconfigure the backup settings after installation of the management subsystem on OpenShift and Cloud Pak for Integration.

About this task

Backup configurations under `management.databaseBackup` in `APIConnectCluster` instance can be modified using the OpenShift web console, IBM Cloud Pak Platform UI, or the command-line utility `oc`.

Note:

Using OpenShift web console or Platform UI can prevent updates because `APIConnectCluster` CR refreshes very quickly. If you encounter this problem, use the command line to modify backup configurations; for example:

```
oc edit apiconnectcluster <name-of-instance>
```

Procedure

1. Make sure that the management cluster status is `Running` and the `READY` condition displays the same value before and after the `/`.
For example:

```
oc get mgmt
NAME   READY   STATUS   VERSION   RECONCILED VERSION   AGE
mgmt   16/16   Running  10.0.5-eus  10.0.5.1-eus-0-eus   19h
```

2. Create backup secret for your backup type. See the appropriate instructions:
 - [Configuring S3 backup settings for a fresh install of the Management subsystem on OpenShift or Cloud Pak for Integration](#)
 - [Configuring SFTP backup settings for fresh install of the Management subsystem on OpenShift and Cloud Pak for Integration](#)
3. Complete the following steps, based on your storage type:
 - S3 storage
You can change or add the `DatabaseBackup` s3 configuration via the Management section of the API Connect Cluster CR after a fresh install. However, doing so requires a reconfiguration of the database and a brief downtime. The operator restarts the database with the new backup configurations as soon as the new configuration in the management CR is saved.

If you have a two data center disaster recovery deployment, before you configure S3 backup settings you must first disable 2DCDR on both sites. Follow these steps:

- Remove the `multiSiteHA` section from the `spec` section of the management CRs on both data centers. Take note of which data center is the active and which is the warm-standby. Keep a copy of the `multiSiteHA` sections that you remove.
- Configure your S3 backup settings. You must specify different backup locations for each data center, see [Backup and restore requirements for a two data center deployment](#).
- Add the `multiSiteHA` sections back to the management CRs in both data centers, ensuring that your original active is set to be the active again.

```
spec:
  management:
    databaseBackup:
      protocol: objstore
      s3provider: ibm
      host: s3.eu-gb.cloud-object-storage.appdomain.cloud/eu-standard
      path: apic-backup
      credentials: mgmt-backup-secret
      schedule: "0 3 * * *"
      restartDB:
        accept: true
```

Configuration of s3 backups uses a new parameter `restartDB` that is required when changing the backup configuration. `restartDB` is not required for initial deployments, only for modifications after the cluster is deployed.

Table 1. Additional parameter for S3 backup type reconfiguration

Parameter	Description
<code>restartDB:</code> <code>accept: <value></code>	Required when changing the backup configuration. The parameter <code>accept</code> is a boolean: <code><value></code> can be <code>true</code> or <code>false</code> . When <code>accept</code> is <code>true</code> , and a new configuration for management CR is saved, the operator: <ul style="list-style-type: none">• Stops the database and any dependent services• Applies the change• Restarts the stopped components. Note: <code>restartDB</code> is not required for initial deployments, only for modifications after the cluster is deployed.

- SFTP
You can change/add the `DatabaseBackup` SFTP configuration via the Management section of the API Connect Cluster CR after a fresh install. This process does not involve any downtime. The same backup settings are used for reconfiguring as for initial configuration. For complete description of backup settings, see [Configuring SFTP backup settings for fresh install of the Management subsystem on OpenShift and Cloud Pak for Integration](#).

```
spec:
  management:
    databaseBackup:
      protocol: sftp
      host: <SFTP-hostname>
      port: <SFTP-port> (Optional, default is 22)
      path: apic-backup
      retries: 0
      credentials: mgmt-backup-secret
      schedule: "0 3 * * *"
```

Generating a manual backup of the management subsystem on OpenShift and Cloud Pak for Integration

You can generate a manual (non-scheduled) backup of the management subsystem in your OpenShift and Cloud Pak for Integration environments.

Procedure

1. Make sure that the management cluster status is Running and the READY condition displays matching values before and after the "\". You can use either the OpenShift web console or the `oc` command line to verify the health. For example:

```
oc get mgmt
NAME   READY   STATUS   VERSION   RECONCILED VERSION   AGE
mgmt   16/16   Running  10.0.1-eus  10.0.1.1-eus-0-eus   19h
```

2. Decide which of the two types of manual backups you want to do:
 - **full**: backs up the entire Management Subsystem database.
 - **incr**: backs up any data that has not been backed up since the last **full** or **incr** backup.
3. You generate a backup manually by creating a `managementBackup` custom resource which is detected by the `ibm-apiconnect` operator that then triggers the backup process.

You can create the `ManagementBackup` custom resource by using either the Form UI or the command line. For example:

```
apiVersion: management.apiconnect.ibm.com/v1beta1
kind: ManagementBackup
metadata:
  generateName: mgmt
spec:
  type: full
  crType: create
  clusterName: management
```

Table 1. CR settings for manual backup

Setting	Description
<code>type</code>	The type of backup to be done. Valid arguments are: <ul style="list-style-type: none">• full Backs up the entire Management subsystem database• incr Backs up any data that has not been backed up since the last full or incr backup.
<code>crType</code>	Use create to trigger a backup process.
<code>clusterName</code>	The name of the target ManagementCluster you want to backup.

4. Create the `ManagementBackup` custom resource in the namespace of your Management Subsystem to trigger the backup process. Use the Form UI or the following command:

```
$ oc create -f mgmtbackup_cr.yaml -n <APIC_namespace>
```

5. (Optional): You can list current backups by using Form UI to list `ManagementBackup` resources, or by using `oc`:

```
$ oc get managementbackup -n <APIC_namespace> --sort-by=.metadata.creationTimestamp
```

Here is an example of some possible output:

```
NAME           STATUS   ID                CLUSTER   TYPE   CR TYPE   AGE
m1-e46bbac4    Ready   20201023-183005F  m1        full  record    66m
mgmt-backup-dnvxw  Ready   20201023-193137F  m1        full  create    9m37s
```

6. (Optional): You can get a detailed view of a specific backup by using the command:

```
$ oc get managementbackup <bup-name> -n <APIC_namespace> -o yaml
```

Here is an example of some possible output:

```
apiVersion: management.apiconnect.ibm.com/v1beta1
kind: ManagementBackup
metadata:
  creationTimestamp: "2020-10-23T18:34:11Z"
  generation: 1
  labels:
    app.kubernetes.io/instance: m1

```

7. **Version 10.0.1.0 only:** If a local-backup was performed on v10.0.1.0, and you now wish to upload the local-backup file to an sftp server, see [Uploading backup files to an sftp server](#) for the required steps.

Restoring the management subsystem on OpenShift and Cloud Pak for Integration

You can restore your Management subsystem in your OpenShift and Cloud Pak for Integration environments.

Before you begin

You must have backups of the management subsystem in order to restore. See [Configuring backup settings for a fresh install of the Management subsystem on OpenShift or Cloud Pak for Integration](#) and [Generating a manual backup of the management subsystem on OpenShift and Cloud Pak for Integration](#).

About this task

To trigger a restore, you will create a **ManagementRestore** custom resource. When the **ibm-apiconnect** operator detects the new CR, it starts the restore process.

- Ensure that the backup method that you used is complete before you attempt a restore. The backup data that is stored in the remote server is used for restoring the Management subsystem data back to a previous state. Ensure that these backups are on your remote server before you attempt a restore, and that the backup ID in the selected backup exists in remote storage.
- Restoring a backup restores the registration credentials (client_ID, client_secret) that were in use at the time that the selected backup was created. For information on the registration credentials, see [Changing the registration client id and client secret for applications](#).
- If you have to perform a restore, you must complete the restoration of the Management Service first, and then immediately restore the Developer Portal. The backups of the Management and Portal must be taken at the same time to ensure that the Portal sites are consistent with Management database.

Note: There is a known issue where sometimes a restore from the Management subsystem's SFTP backup succeeds but the data is not restored. If this happens, run the restore again.

Procedure

1. Use the Form UI or the **oc** command to obtain a list of the available backups, and decide which one to restore your Management subsystem:

```
oc get mgmtb -n <APIC_namespace>
```

For example:

```

$ oc get mgmtb
NAME                                STATUS  ID                                CLUSTER  TYPE  CR TYPE  AGE
management-3aa3bebf                 Ready  20200929-152150F                 management  full  record  10h
management-3c4ca8df                 Ready  20200929-115520F                 management  full  record  20h
management-5tbxj                    Ready  20200929-224349F                 management  full  create  17h
management-f10af337                 Ready  20200925-133703F                 management  full  record  5d2h
management-jt1cd                     Ready  20200929-224349F                 management  full  create  25h
management-zxjtz                     Ready  20200929-224349F                 management  full  create  28h

```

Attention: You can restore the Management subsystem from any backup where the STATUS is Ready; however, you should avoid restoring to the initial system backup. During installation, the Management database is used for an initial system backup before certain database schema jobs are complete. Restoring to this backup will result in an unstable system.

You will use one of the values in the **NAME** column.

2. Use the instructions that apply to your release of API Connect:
 - Version 10.0.1.1 or later
 - Use the following code as an example:

```

apiVersion: management.apiconnect.ibm.com/v1beta1
kind: ManagementRestore
metadata:
  generateName: management-
spec:
  backupName: management-3aa3bebf

```

Note that `backupName` is the name of the backup custom resource you want to restore to. For example, using the output from the previous step:

```
backupName: management-3aa3bebf
```

- Use the Form UI or `oc` to create the `ManagementRestore` custom resource in the namespace of the Management Subsystem, to trigger the restore process:

```
$ oc create -f mgmtrestore_cr.yaml -n <APIC_namespace>
```

- You can list current restores using the following command, or if using OCP UI you can list all `ManagementResource` list:

```
$ oc get managementrestore -n <APIC_namespace> --sort-by=.metadata.creationTimestamp
```

Example output:

- SFTP:

NAME	STATUS	BACKUP	CLUSTER	MESSAGE
PITR	AGE			
mgmt-restore-ptx6d	Complete	mgmt-backup-w4h8c	m1	Restore process completed (DB Restore +
DRR job)	6m31s			

- S3

NAME	STATUS	BACKUP	CLUSTER	MESSAGE
PITR	AGE			
mgmt-restore-hr9zx	Complete	mgmt-backup-xnjkl	m1	Restore process completed (DB Restore +
DRR job)	2020-11-23 23:08:32+00	9m8s		

- Version 10.0.1.0

- Use the following command to obtain the Point-in-Time-Recovery target for the selected backup:

```
oc get mgmtb <backup_name> -o jsonpath="{.status.info.range}"
```

For example:

```
$ oc get mgmtb management-3aa3bebf -o jsonpath="{.status.info.range}"
2020-09-29 15:21:50 +0000 UTC - 2020-09-29 15:30:56 +0000 UTC
```

The target for recovery is the second half the `range` value in the backup custom resource. In the prior example: `2020-09-29 15:30:56 +0000`.

The custom resource uses the `pitrtarget` setting to specify the Point-in-Time-Recovery target. You must set `pitrtarget` to be later than the value obtained above (such as by one second newer). Use the format `YYYY-MM-DD HH:MM:SS+Z`.

Using the example above, where `2020-09-29 15:30:56 +0000` is the `range`, the `pitrtarget` is `2020-09-29 15:30:57+00`:

```
pitrtarget: "2020-09-29 15:30:57+00"
```

- Use the following code as an example:

```

apiVersion: management.apiconnect.ibm.com/v1beta1
kind: ManagementRestore
metadata:
  generateName: management-
spec:
  backupName: management-3aa3bebf
  pitrtarget: "2020-09-30 13:53:21+00" ## Not required in 10.0.1.1-eus and greater

```

- `backupName` - The name of the backup custom resource you want to restore to. For example, using the output from the previous step, `management-3aa3bebf`.
- `pitrtarget`: - The time you want to restore to, in format `YYYY-MM-DD HH:MM:SS+Z`.

- Use the Form UI or `oc` to create the `ManagementRestore` custom resource in the namespace of the Management Subsystem, to trigger the restore process:

```
$ oc create -f mgmtrestore_cr.yaml -n <APIC_namespace>
```

- You can list current restores using the following command, or if using Form UI you can list all `ManagementResource` lists:

```
$ oc get managementrestore -n <APIC_namespace> --sort-by=.metadata.creationTimestamp
```

Example output:

NAME	STATUS	BACKUP	CLUSTER	PITR	AGE
management-6nzjr	Complete	mgmt-backup-dg4s4	m1	2020-01-05 19:05:00+01	14m

- The operator creates an upgrade CR when the postgres database is restarted during the restore:

```

managementdbupgrade.management.apiconnect.ibm.com/m1-up-zqkk5 Complete Fresh install is Complete (DB
Schema/data are up-to-date)
63s5s

```

Troubleshooting management subsystem backups on OpenShift and Cloud Pak for Integration

You can troubleshoot failures of the API Connect management subsystem backups in an OpenShift or Cloud Pak for Integration environment.

Note: In the  Help page of the Cloud Manager, API Manager, and API Designer user interfaces, there's a Product information tile that you can click to find out information about your product versions, as well as Git information about the package versions being used. Note that the API Designer product information is based on its associated management server, but the Git information is based on where it was downloaded from.
See:

- [Troubleshooting resiliency issues on OpenShift and Cloud Pak for Integration](#)
Resolve resiliency issues with API Connect management system backups.
- [Troubleshooting the stanza-create job for S3 backup configuration on OpenShift and Cloud Pak for Integration](#)
Troubleshoot configuration of s3 backups when the stanza-create job fails in an OpenShift or Cloud Pak for Integration environment.

Troubleshooting resiliency issues on OpenShift and Cloud Pak for Integration

Resolve resiliency issues with API Connect management system backups.

pgbackrest-shared-repo resiliency problems

If the Kubernetes node hosting `pgbackrest-shared-repo` pod is down and the PVC attached to the pod has strict zone requirements (for example, in AWS or other clouds) or if the storage class is set to `local-storage`, then `pgbackrest-shared-repo` pod will not get rescheduled to another Kubernetes node.

As a result, there is a single point of failure and the following conditions might occur:

- Backups of the management database fails
- Disk space fills with accumulated Postgres wal (Write-Ahead Logging) files

To avoid this problem, monitor the disk usage, see: [Monitoring Postgres disk usage on OpenShift](#) or [Monitoring Postgres disk usage on Cloud Pak for Integration](#).

When the Kubernetes node comes back up, the pod is scheduled and all the processes should resume properly.

Troubleshooting the stanza-create job for S3 backup configuration on OpenShift and Cloud Pak for Integration

Troubleshoot configuration of s3 backups when the stanza-create job fails in an OpenShift or Cloud Pak for Integration environment.

When you configure Management subsystem backups for s3 providers, the operator runs a `stanza-create` job. This job creates the stanza (Postgres cluster configuration) on the upstream S3 server, which is used for backup and archive procedures. The job also brings up the necessary pod.

Check the status of the `stanza-create` job:

```
oc get jobs -n <namespace> | grep stanza
```

On failure:

- `stanza-create` pods fail, and job status is 0/1:

```
oc get jobs | grep stanza
m1-3bfe12ac-postgres-stanza-create      0/1      32m      32m
```

- Listing all pods brought up by `stanza-create` job shows multiple pods because a job tries `backoffLimit` times to complete the job. By default, there will be 7 pods in error state:

```
oc get pods | grep stanza
m1-3bfe12ac-postgres-stanza-create-726z4      0/1      Error    0      11m
m1-3bfe12ac-postgres-stanza-create-9vq4n      0/1      Error    0      22m
m1-3bfe12ac-postgres-stanza-create-gbtgb      0/1      Error    0      30m
m1-3bfe12ac-postgres-stanza-create-g15g5      0/1      Error    0      17m
m1-3bfe12ac-postgres-stanza-create-q8qhw      0/1      Error    0      26m
m1-3bfe12ac-postgres-stanza-create-t84zs      0/1      Error    0      8m54s
m1-3bfe12ac-postgres-stanza-create-z8tfs      0/1      Error    0      12m
```

Note: In some cases, the pods are cleaned by Kubernetes and the logs of these pods can be lost.

- Pod log errors show a reason for the failure. For example, when a hostname is not valid:

```
kubectl logs m1-3bfe12ac-postgres-stanza-create-gbtgb
```

```
time="2021-04-13T20:01:19Z" level=info msg="pgo-backrest starts"
time="2021-04-13T20:01:19Z" level=info msg="debug flag set to false"
time="2021-04-13T20:01:19Z" level=info msg="backrest stanza-create command requested"
time="2021-04-13T20:01:19Z" level=info msg="s3 flag enabled for backrest command"
time="2021-04-13T20:01:19Z" level=info msg="command to execute is [pgbackrest
```

```
stanza-create --db-host=192.1.2.3 --db-path=/pgdata/m1-3bfe12ac-postgres --
repol-type=s3]"
time="2021-04-13T20:01:19Z" level=info msg="command is pgbackrest stanza-create --
db-host=192.1.2.3 --db-path=/pgdata/m1-3bfe12ac-postgres --repol-type=s3 "
time="2021-04-13T20:05:21Z" level=error msg="command terminated with exit code 49"
time="2021-04-13T20:05:21Z" level=info msg="output=[]"
```

- Job status is set to `type: Failed` and `status: "True"`, with `reason: BackoffLimitExceeded`:

```
oc get job m1-3bfe12ac-postgres-stanza-create -o yaml

status:
  conditions:
  - lastProbeTime: "2021-04-13T20:28:03Z"
    lastTransitionTime: "2021-04-13T20:28:03Z"
    message: Job has reached the specified backoff limit
    reason: BackoffLimitExceeded
    status: "True"
    type: Failed
    failed: 7
  startTime: "2021-04-13T20:01:18Z"
```

- If pod logs are lost, you can execute a command inside the `backrest-shared-repo` pod:
 1. Obtain the `backrest-shared-repo` pod name:

```
oc get pods -n <namespace> | grep backrest-shared-repo
```

For example:

```
oc get pods | grep backrest-shared-repo
m1-eb8edc18-postgres-backrest-shared-repo-98dd46cc6-tw195 1/1 Running
```

2. Exec into the pod:

```
oc exec -it <backrest-shared-repo-pod> -- bash
```

3. Run:

```
pgbackrest info --output json --repol-type s3
```

For example, for invalid hostname:

```
ERROR: [049]: unable to get address for 'test1-v10-backup.s3.exampleaws.com': [-2] Name or service not knownCopy
```

The exact **ERROR**: will vary depending on the misconfiguration. Common errors:

```
Invalid access key
Invalid access key secret
Invalid bucket region
Invalid bucket or folder path
```

- To fix the incorrect settings, see [Reconfiguring or adding backup settings after installation of the management subsystem on OpenShift and Cloud Pak for Integration](#).

Backing up and restoring Developer Portal on OpenShift and Cloud Pak for Integration

You can back up and restore your Developer Portal service in your OpenShift or Cloud Pak for Integration environment.

About this task

Before you can initiate a backup or restore operation, you must update the Portal CR (custom resource) to configure your settings. Generating a backup for Portal is performed on demand by deploying a backup CR. You can deploy a restore CR to start the restoration of a previously generated backup.

For points to consider when you are backing up and restoring a two data center disaster recovery deployment, see [Backup and restore requirements for a two data center deployment](#).

The default Developer Portal backup schedule is once every 24 hours, but the schedule can be changed in the backup settings. The Developer Portal saves all system and site backups locally, and also saves them remotely based on the configured SFTP and s3 settings.

The local backups are automatically maintained so that the latest three backups of each site and of the system are kept, and older backups are removed. This maintenance means that the Developer Portal retains the latest three backups for each site and for the system however old they are, but there is no deletion of the old backups on the remote server. If a site is deleted, then all of the local backups for that site are also deleted, as otherwise the backup volume might become full of old site backups. For remote backups, you can configure a retention policy on your remote server to remove the old backup files as required.

Important: Backups of the Management and Portal subsystems must be taken at the same time to ensure that the Portal sites are consistent with Management database. When you perform a restore, you must complete the restoration of the Management subsystem first, and then immediately restore the Developer Portal subsystem.

Configuring backups for Developer Portal on OpenShift and Cloud Pak for Integration

Configure backups for the Developer Portal service in your OpenShift or Cloud Pak for Integration environment.

About this task

Run commands in the namespace where the Developer Portal is installed.

For points to consider when you are backing up and restoring a two data center configuration, see [Backup and restore requirements for a two data center deployment](#).

The default Developer Portal backup schedule is once every 24 hours, but the schedule can be changed in the backup settings. The Developer Portal saves all system and site backups locally, and also saves them remotely based on the configured SFTP and s3 settings.

The local backups are automatically maintained so that the latest three backups of each site and of the system are kept, and older backups are removed. This maintenance means that the Developer Portal retains the latest three backups for each site and for the system however old they are, but there is no deletion of the old backups on the remote server. If a site is deleted, then all of the local backups for that site are also deleted, as otherwise the backup volume might become full of old site backups. For remote backups, you can configure a retention policy on your remote server to remove the old backup files as required.

Procedure

1. Create your Developer Portal backup secret.

The backup secret is a Kubernetes secret that contains your credentials for accessing the s3 or sftp backup database.

- S3

Only password-based authentication is supported for S3, not authentication based on public certificates and private keys. Password-based authentication for S3 requires that you generate an access key and secret. For example:

- IBM (Cloud Object Storage): [Service credentials](#).
- AWS: [Managing access keys](#).

The secret can be created with the following command:

```
oc create secret generic portal-backup-secret --from-literal=username='Your_access_key-or-user_name'
--from-literal=password='Your_access_key_secret-or-password' -n <Portal_namespace>
```

- SFTP

Supported credentials types:

- User name and password (v10.0.2.0 or later).
- User name and SSH-key (v10.0.3.0 or later). Only OpenSSH keys are supported.¹

Use one of the following commands to create the secret:

- User name and password credentials

```
oc create secret generic portal-backup-secret --from-literal=username='<Your_user_name>'
--from-literal=password='<Your_password>' -n <Portal_namespace>
```

- Version 10.0.3.0 or later: User name and SSH-key credentials:

```
oc create secret generic portal-backup-secret --from-literal=username='<Your_user_name>'
--from-file=ssh-privatekey='<Your_private_key_file>' -n <Portal_namespace>
```

2. Add a `portalBackup` subsection to the `spec.portal` section of the top-level `apiconnectcluster` CR.

You can edit the YAML in the UI, or you can run the following command and then add the `portalBackup` block:

```
oc edit apiconnectcluster <Portal_namespace>
```

An example when you use `protocol: objstore`:

```
spec:
  portal:
    portalBackup:
      credentials: portal-backup-secret
      host: s3.eu-gb.cloud-object-storage.appdomain.cloud/eu-standard
      path: test-bucket/restore-test
      port: 443
      backupCerts: <custom-s3-server-CA-cert>
      backups3URISyle: <host-or-path>
      schedule: '0 2 * * *'
```

An example when you use `protocol: sftp`:

```
spec:
  portal:
    portalBackup:
      credentials: portal-backup-secret
      host: sftp-service.example.com
      path: /home/fvtuser/site-backups
      port: 22
      protocol: sftp
      schedule: '0 2 * * *'
```

Notes about the `portalBackup`: entry:

- If **portalBackup**: entry is empty or omitted from the API Connect Cluster CR, then **local** backups will be taken if a backup CR is created. If the **schedule** exists, backups are taken at the scheduled time.
- For S3 and SFTP, the **portalBackup**: entry must contain host, credentials, protocol, and path.
- For S3, the **portalBackup**: section can optionally contain either, or both, of **backupCerts** and **backupS3URISStyle**.

Table 1. Developer Portal backup settings

Setting	Description
credentials	<p>The name of the secret you created. Supported credential types:</p> <ul style="list-style-type: none"> • S3 Only password-based authentication is supported for S3, not authentication based on public certificates and private keys. Password-based authentication for S3 requires that you generate an access key and secret. • SFTP <ul style="list-style-type: none"> • User name and password (v10.0.2.0 or later) • User name and SSH-key (v10.0.3.0 or later)
host	<ul style="list-style-type: none"> • S3 - host: is the S3 endpoint with the corresponding S3 region in the format <code><S3endpoint></code>, or with an optional S3 region in the format <code><S3endpoint>/<S3region></code>. • SFTP - the hostname of the sftp server
path	<ul style="list-style-type: none"> • S3 - the name of your S3 bucket to store backup data, optionally followed by a / and then any subdirectories inside the bucket. Valid examples: <pre>bucket bucket/path bucket/lots/of/paths</pre> • SFTP - the full absolute path of the folder on the SFTP server, beginning with /. <p>Attention: Ensure that your backup path has the correct permissions to allow your backup user to be able to read and write to it from within the Developer Portal.</p>
port	<p>The port for the protocol to connect to the host.</p> <ul style="list-style-type: none"> • S3 - Ignored for S3 (because objstore always connects to port 443) • SFTP - Defaults to 22 if not specified • local - Ignored for local
protocol	<p>The protocol that is used to communicate with your remote backup endpoint. Specify one of the following values:</p> <ul style="list-style-type: none"> • sftp - for secure file transfer protocol. • objstore - for S3 compatible object storage.
backupCerts	<p>(S3 storage only) backupCerts is the name of a custom certificate that contains your upstream custom S3 CA certificate. Supported beginning with 10.0.2.</p> <p>Note: If you use a public certificate for the S3 storage provider, it must be signed by a known certificate authority that is trusted by API Connect. Use of an untrusted authority can cause the following error during backup upload:</p> <pre>x509: certificate signed by unknown authority</pre> <p>This field accepts name of the Kubernetes secret containing your upstream custom S3 CA certificate. The key of the secret must be <code>ca.crt</code> and the value is the base64-encoded value of the CA certificate.</p> <p>If the server certificate that is presented by your S3/object-store endpoint is signed by a well known CA and includes any intermediate certificates in the chain, then you do not need to provide the CA certificate using this feature because the Portal subsystem already trusts the server certificate. You can test this by configuring the Portal backup to your S3/object-store server without providing the CA certificate.</p> <p>If you do need to provide the CA certificate then you must provide the entire chain in the <code>ca.crt</code> member of the secret, as follows:</p> <pre>intermediate-certificate-1 intermediate-certificate-2 . intermediate-certificate-n root-certificate</pre> <p>Where the first certificate in the <code>ca.crt</code> member (intermediate-certificate-1) is the issuer of the S3/object-store server certificate, and each subsequent certificate in the <code>ca.crt</code> member is the issuer of the preceding certificate. The root certificate in the <code>ca.crt</code> member must be self-signed.</p> <p>If there are no intermediate certificates involved, then the <code>ca.crt</code> member contains only the root certificate.</p> <p>The following sample bash script creates the Kubernetes secret:</p> <pre>cat >customs3ca.yaml <<EOF apiVersion: v1 data: ca.crt: \$(base64 <path-to-ca-certificate> tr -d '\n') kind: Secret metadata: name: custom-server-ca type: generic EOF kubectl apply -f customs3ca.yaml -n <APIC_namespace></pre>

Setting	Description
<code>backups3URIS</code> <code>style</code>	<p>(S3 storage only) Optional - <code>backups3URIS</code><code>style</code> indicates whether URIs to your S3 backup should use specify a host or a path value. When not specified, default to <code>host</code>. Supported beginning with 10.0.2.</p> <p>Valid values: <code>host</code> and <code>path</code>.</p> <p>Some custom S3 providers require URI style to be set to <code>path</code>. For example, MinIO supports both <code>host</code> and <code>path</code> style setup. You can create a MinIO S3 server to only accept <code>path</code> style client communications.</p> <p>Important: Contact your custom S3 administrator before configuring this field. If not properly configured, an upstream custom S3 can reject connections from the client, such as the API Connect Management subsystem.</p>
<code>schedule</code>	<p>The schedule for how often automatic Developer Portal backups are run. The format for the schedule is any valid cron string. The timezone for backups is UTC.</p> <p>Valid for all backup types: S3, SFTP, and local.</p> <pre>spec: portal: portalBackup: ... schedule: '0 2 * * *'</pre>

- [Overview of the Developer Portal backup resources](#)
How to manage your Developer Portal remote backup resources.

¹ PuTTY style keys can be converted to OpenSSH by using the PuTTY Key Generator (PuTTYgen) application; see <https://www.puttygen.com/>.

Overview of the Developer Portal backup resources

How to manage your Developer Portal remote backup resources.

Note: This information is relevant only if you're taking remote Developer Portal backups.

The Developer Portal uses two types of portal backup resources. When you run the command `kubect1 get portalbackup`, you see a list of backups, for example:

NAME	ID	TASK ID	STATUS	TYPE	CR TYPE	CLUSTER	AGE	COMMENT
<code>my-backup-f91ms</code>	n/a	20b47fe090f5	Ready	system	create	portal	78m	
<code>portal-record-222cg</code>	20220108.010033		Ready	system	record	portal	94m	
<code>portal-record-22xdc</code>	20220702.010339		Ready	site	record	portal	9m49s	
<code>portal-record-245j7</code>	20221002.010340		Ready	site	record	portal	5m	
<code>portal-record-246hm</code>	20221218.010103		Ready	site	record	portal	32m	
<code>portal-record-24h44</code>	20220509.010037		Ready	site	record	portal	68m	
<code>portal-record-24wb4</code>	20221003.010029		Ready	site	record	portal	60m	
<code>portal-record-264mh</code>	20221119.010453		Ready	system	record	portal	78m	

There are two types of resources listed, and these are denoted by the `CR TYPE` column; `create` or `record` types.

1. **create**: This resource is a representation of a `portalbackup` task that was created manually. See [Backing up and restoring the Developer Portal in a Kubernetes environment](#), [Backing up Developer Portal on OpenShift and Cloud Pak for Integration](#), or [Backing up the Developer Portal subsystem](#) on VMware, for information about how to create a manual portal backup.
2. **record**: This resource is generated by the operator, and it's a representation of a backup file that's stored on the remote backup server. A record listing can be modified only to add a comment to it. You can describe each record to understand which file it is referring to by running the following command:

```
kubect1 describe portalbackup portal-record-name
```

For example:

```
kubect1 describe portalbackup portal-record-zmmfw
```

```
.
```

```
Name:      portal-record-zmmfw
Namespace: apic
Labels:    createdBy
```

```
.
```

```
Full Backup Name:  my-portal-s3-hostname@my-porg@catal-20220604.010302.tar.gz
```

Record rows are generated and updated on a schedule, according to the backups that exist on your remote backup server. If you have 10 backup files stored on your remote server, then there will be 10 record rows; one row for each file.

The Developer Portal doesn't have a retention policy for remote backups. Therefore, it's your responsibility to ensure that you're keeping the number of backups that are stored remotely under control. An excessive number of portal backups results in delays administrating and upgrading the Developer Portal. This is due to the operator needing to maintain the excessive number of record rows that correspond to each remote portal backup.

Backing up Developer Portal on OpenShift and Cloud Pak for Integration

Perform a manual backup of the Developer Portal subsystem in your OpenShift or Cloud Pak for Integration environment.

About this task

Run commands in the namespace where the Developer Portal is installed.

Important: Backups of the Management and Portal subsystems must be taken at the same time to ensure that the Portal sites are consistent with Management database. When you perform a restore, you must complete the restoration of the Management subsystem first, and then immediately restore the Developer Portal subsystem. The default Developer Portal backup schedule is once every 24 hours, but the schedule can be changed in the backup settings. The Developer Portal saves all system and site backups locally, and also saves them remotely based on the configured SFTP and s3 settings.

The local backups are automatically maintained so that the latest three backups of each site and of the system are kept, and older backups are removed. This maintenance means that the Developer Portal retains the latest three backups for each site and for the system however old they are, but there is no deletion of the old backups on the remote server. If a site is deleted, then all of the local backups for that site are also deleted, as otherwise the backup volume might become full of old site backups. For remote backups, you can configure a retention policy on your remote server to remove the old backup files as required.

Tip: If you are using remote backups, and there are a large number of rows in your `portalbackup` list that have a `CR TYPE` of `record`, there might be a slow down in system performance, including during Developer Portal upgrades. Although there is no upper limit to how many portal backups you can have, it is recommended that you prune your remote backups so that the number of rows does not become excessively large. One `portalbackup` row of type `record`, corresponds to one backup file on the configured remote backup server. For more information, see [Overview of the Developer Portal backup resources](#).

Procedure

1. Required: Backup the Management subsystem as explained in [Generating a manual backup of the management subsystem on OpenShift and Cloud Pak for Integration](#).
2. Create the `PortalBackup` CR (custom resource) as a YAML file with the backup options that you want to use for Developer Portal. You can use `portalbackup_cr.yaml` in the `helper_files` directory as an example:

```
apiVersion: portal.apiconnect.ibm.com/v1beta1
kind: PortalBackup
metadata:
  generateName: portal-bup-
spec:
  crType: create
  portalCluster: portal
  type: all
  comment: "test comment"
```

Set the following backup properties as needed:

- `crType` - Use `create` to trigger a backup process. When the backup is created, the operator generates another backup CR with `crType: record`, which represents the stored backup that you can use for a restore operation.
- `portalCluster` - the name of the portal cluster you want to backup. You can find this with:

```
oc get portalcluster -n <namespace>
```

- `record` - Includes a backup ID so you can choose it for restoring. If you plan to preserve the backup for use in recovering from a disaster, use the `record` argument to ensure that all necessary data is captured.
 - `type` - The extent of the backup; select one of the following options:
 - `all` - Backup the Developer Portal subsystem and all of the sites
 - `system` - Backup the Developer Portal subsystem
 - `site` - Backup only a specified Developer Portal site
 - `siteName`: Used only when you perform a `site` backup. Valid arguments are:
 - `site uuid` or `url` - back up only the specified site
 - `installed` - backup all installed sites
 - `comment`: Optional. You can optionally add a comment (such as a description or special notes) to the CR before you create a backup.
3. Run the following command to create the backup CR, which triggers the backup operation:

```
oc create -f portalbackup_cr.yaml -n <APIC_namespace>
```

4. Verify that the backup was successful by completing the following steps:
 - a. Run the following command to get a list of backups:

```
oc get portalbackup -n <APIC_namespace>
```

The response looks like the following example, where only `crType: record` backups include an ID.

NAME	ID	STATUS	TYPE	CR TYPE	AGE	COMMENT
p1-bup-gqz8f	20200526.142449	Ready	system	record	55m	
p1-bup-jx4vc	20200526.142458	Ready	site	record	54m	
p1-bup-st4l2		Ready	all	create	56m	y
p1-bup-th2dm		Ready	all	create	4h51m	y

- b. Run the following command to view the details of a particular backup,, which is specified using the `<bup-name>` from the `NAME` column in the list of backups:

```
oc get portalbackup <bup-name> -n <APIC_namespace> -o yaml
```

The details of a backup look like the following example:

```
apiVersion: portal.apiconnect.ibm.com/v1beta1
kind: PortalBackup
metadata:
  creationTimestamp: "2020-10-01T10:00:16Z"
  generateName: portal-bup-
  generation: 1
  name: portal-bup-g66gv
  namespace: default
  resourceVersion: "8940"
  selfLink: /apis/portal.apiconnect.ibm.com/v1beta1/namespaces/default/portalbackups/portal-bup-g66gv
  uid: b1d5b295-b966-48f2-b6ef-dfcd1c499741
spec:
  comment: test comment
  portalCluster: portal
```

```

crType: create

  state: ""

```

c. Check the contents of the backup and make sure that it contains the following statements, which indicate a successful operation:

```

. . .
  reason: BackupComplete
  status: "True"
  type: Ready

```

If the operation did not complete successfully, see [Troubleshooting Developer Portal backup and restore on OpenShift and Cloud Pak for Integration](#) for information on reviewing logs to help resolve the problem.

Restoring Developer Portal on OpenShift and Cloud Pak for Integration

You can restore the Developer Portal subsystem and sites in your OpenShift or Cloud Pak for Integration environment.

About this task

Run commands in the namespace where the Developer Portal is installed.

Important: Backups of the Management and Portal subsystems must be taken at the same time to ensure that the Portal sites are consistent with Management database. When you perform a restore, you must complete the restoration of the Management subsystem first, and then immediately restore the Developer Portal subsystem.

Procedure

1. Required: Restore up the Management subsystem as explained in [Generating a manual backup of the management subsystem on OpenShift and Cloud Pak for Integration](#).
2. Choose which backup you want to restore.
 - a. Run the following command to get a list of available backups:

```
oc get portalbackup -n <APIC_namespace>
```

The response looks like the following example:

NAME	ID	STATUS	TYPE	CR TYPE	AGE	COMMENT
p1-bup-gqz8f	20200526.142449	Ready	system	record	55m	
p1-bup-jx4vc	20200526.142458	Ready	site	record	54m	
p1-bup-st412		Ready	all	create	56m	y
p1-bup-th2dm		Ready	all	create	4h51m	y

Note: You can only restore the Portal subsystem from backups where the CR TYPE is record.

- b. Run the following command to view the details of a particular backup,, which is specified using the <bup-name> from the NAME column in the list of backups:

```
oc get portalbackup <bup-name> -n <APIC_namespace> -o yaml
```

The details of a backup look like the following example:

```

apiVersion: portal.apiconnect.ibm.com/v1beta1
kind: PortalBackup
metadata:
  creationTimestamp: "2020-10-01T10:00:16Z"
  generateName: portal-bup-
  generation: 1
  name: portal-bup-g66gv
  namespace: default
  resourceVersion: "8940"
  selfLink: /apis/portal.apiconnect.ibm.com/v1beta1/namespaces/default/portalbackups/portal-bup-g66gv
  uid: b1d5b295-b966-48f2-b6ef-dfcd1c499741
spec:
  comment: test comment
  portalCluster: portal
  crType: record
  siteName: installed
  type: site
status:
  backupId: ""
  commentLeft: "y"
  conditions:
  - lastTransitionTime: "2020-10-01T10:00:18Z"
    reason: BackupFailed
    status: "False"
    type: Error
  - lastTransitionTime: "2020-10-01T10:01:19Z"
    message: |-
      2020-10-01 10:00:18: CLI task (backup:site) starting.
      2020-10-01 10:00:20: Making a backup for site conor.com
      2020-10-01 10:00:27: A local backup was succesfully created: /var/aegir/backups/conor.com-
      20201001.100021.tar.gz
      2020-10-01 10:00:30: Attempting to upload backup to remote backup server
      2020-10-01 10:00:30: Uploading conor.com-20201001.100021.tar.gz to s3.eu-gb.cloud-object-
      storage.appdomain.cloud/eu-standard:22:cq-test/ptlcq4/ using objstore
      2020-10-01 10:00:33: Site with URL conor.com (conor.com-20201001.100021.tar.gz) successfully uploaded
      2020-10-01 10:00:33: All installed sites have been successfully backed up
      2020-10-01 10:00:33: CLI task (backup:site) completed successfully.
    reason: BackupComplete
    status: "True"
    type: Ready

    reason: BackupInProgress
    status: "False"
    type: Running
  - lastTransitionTime: "2020-10-01T10:00:18Z"
    reason: BackupStatusUnknown
    status: "False"
    type: Warning
  fullBackupName: ""
  id: f8t0ux7z4zfnnjnu
  message: ""
  phase: Ready
  state: ""

```

3. Create the `PortalRestore` CR (custom resource) as a YAML file with the backup options that you want to use for Developer Portal. You can use `portalrestore_cr.yaml` in the `helper_files` directory as an example:

```

apiVersion: portal.apiconnect.ibm.com/v1beta1
kind: PortalRestore
metadata:
  generateName: portal-restore-
spec:
  type: all
  portalCluster: portal
  dryRun: true
  timestamp: now
  priorityList:
  - myportal-critical-site.com
  - myportal-important.com

```

Add the following restore options as needed. Table 1 indicates which options are needed for each type of restore operation:

Table 1. The options that are needed for each type of Developer Portal restore operation

Option	Applies to all	Applies to system	Applies to site
<code>type</code>	X	X	X
<code>portalCluster</code>	X	X	X
<code>siteName</code>			X
<code>systemName</code>		X	
<code>timestamp</code>	X		
<code>dryRun</code>	X		
<code>priorityList</code>			

- `type`: Indicates the extent of the restore operation; specify one of the following options:
 - `all` - Restore the Developer Portal subsystem and all of the sites (supports only remote restores).
 - `system` - Restore the Developer Portal subsystem.
 - `site` - Restore only a specified Developer Portal site (you will indicate the site with the `siteName` option).
- `portalCluster` is the name of the portal cluster you want to restore. You can find this with:

```
oc get portal -n <namespace>
```

- **siteName**: Indicates which site to restore (used only with the **site** option); specify one of the following options:
 - **ID** - Restore the backup specified by the ID. The ID must correspond to a Developer Portal backup of **type**: **site** and **crType**: **record**.
 - **site-1234.tgz** - Restore the site by using this file name (which must exist on the local file system or remote server).
 - **myportal.com**: find the latest backup for this URL (locally or remotely) and restore it.
 - **all** - Restore all sites that are found on the remote server by using the latest backup.
 - **site** - Restore only the site that matches the specified uuid or url.
 - **installed** - Restore all installed sites.
- **systemName** - Restore from a backup that corresponds to the specified system; use one of the following options:
 - **ID** - Restore the backup specified by the ID. The ID must correspond to a Developer Portal backup of **type**: **site** and **crType**: **record**.
 - **system_backup-1234.tgz** - Restore the system from the given file that exists on the pod's local file system or the remote server.
 - **latest** - Restore from latest subsystem backup that is found on either the local file system or the remote server.
- **timestamp** - Valid arguments are:
 - **now** - Restore using the latest backups available.
 - **< TIMESTAMP >** - Specified in **'YYYYMMDD.HHMMSS'** format to indicate a timestamp to retrieve the backup from. The nearest backup, searching backwards from this timestamp, is used.

Note: From IBM® API Connect Version 10.0.3.0, the timestamp format changed to **YYYYMMDD.HHMMSS**. For Version 10.0.2.0 and earlier, the timestamp format is **YYYY-MM-DD HH:MM:SS**.
- **dryRun**: Indicates whether an actual restore operation is run; use one of the following options:
 - **true** - Execute a test, or dry run, of the command and return the list of actions that will be taken. These actions can be found in the custom resource.
 - **false** - Run a real restore operation, replacing the subsystem files and all sites. Any existing sites are reinstalled.
- **priorityList** - Restore sites in the sequence in which they are listed. The priority sites are queued for restoring first, followed by any remaining sites present in the backup location. Valid arguments are:
 - **myportalsite.com**
 - **mysecondportalsite.com**
- **customPlatformApiHostname** - If the **API** hostname of your management subsystem platform has changed since taking the backup you are restoring, then update it to the new platform API hostname of the management subsystem. (Optional)

4. Run the following command to create the restore CR, which triggers the restore operation:

```
oc create -f portalrestore_cr.yaml -n <APIC_namespace>
```

5. When the restore operation is finished, verify that the restore was successful by completing the following steps:

- Run the following command to get the name of the most recent restore record:

```
oc get portalrestore -n <APIC_namespace>
```

The response looks like the following example:

NAME	READY	AGE
portal-restore-twjrp	Ready	28s

- Run the following command to view information about a specific restore operation, which is indicated with the **<portal_restore_name>** shown in the **NAME** column:

```
oc get portalrestore <portal_restore_name> -n <APIC_namespace> -o yaml
```

The details of a restore look like the following example:

```
apiVersion: portal.apiconnect.ibm.com/v1beta1
kind: PortalRestore
metadata:
  creationTimestamp: "2020-11-11T10:14:39Z"

c. Check the contents of the restore and make sure that it contains the following statements, which indicate a successful operation:

```

. . .
  reason: RestoreComplete
  status: "True"
  type: Ready

```

If the operation did not complete successfully, see [Troubleshooting Developer Portal backup and restore on OpenShift and Cloud Pak for Integration](#) for information on reviewing logs to help resolve the problem.

Troubleshooting Developer Portal backup and restore on OpenShift and Cloud Pak for Integration

Review details on a failed backup or restore operation for Developer Portal backup on OpenShift and Cloud Pak for Integration.

Check the status of a backup operation

1. Run the following command to get a list of backups:

```
oc get portalbackup -n <Portal_namespace>
```

The response looks like the following example, where only `crType: record` backups include an ID.

NAME	ID	STATUS	TYPE	CR TYPE	AGE	COMMENT
p1-bup-gqz8f	20200526.142449	Ready	system	record	55m	
p1-bup-jx4vc	20200526.142458	Ready	site	record	54m	
p1-bup-st4l2		Ready	all	create	56m	y
p1-bup-th2dm		Ready	all	create	4h51m	y

2. Run the following command to view the details of a particular backup, which is specified using the `<bup-name>` from the `NAME` column in the list of backups:

```
oc get portalbackup <bup-name> -n <Portal_namespace> -o yaml
```

The details of a backup look like the following example:

```

apiVersion: portal.apiconnect.ibm.com/v1beta1
kind: PortalBackup
metadata:
  creationTimestamp: "2020-10-01T10:00:16Z"
  generateName: portal-bup-
  generation: 1
  name: portal-bup-g66gv
  namespace: default
  resourceVersion: "8940"
  selfLink: /apis/portal.apiconnect.ibm.com/v1beta1/namespaces/default/portalbackups/portal-bup-g66gv
  uid: b1d5b295-b966-48f2-b6ef-dfcd1c499741
spec:
  comment: test comment

fullBackupName: ""
id: f8t0ux7z4zfnnjnu
message: ""
phase: Ready
state: ""

```

3. If the operation failed, check the associated `message` for more information.

Check the status of a restore operation

1. Run the following command to get the name of the most recent restore record:

```
oc get portalrestore -n <Portal_namespace>
```

The response looks like the following example:

NAME	READY	AGE
portal-restore-twjrp	Ready	28s

2. Run the following command to view information about the restore operation; which is indicated with the `<portal_restore_name>` shown in the `NAME` column:

```
oc get portalrestore <portal_restore_name> -n <Portal_namespace> -o yaml
```

The details of a failed restore operation look like the following example:

```

apiVersion: portal.apiconnect.ibm.com/v1beta1
kind: PortalRestore
metadata:
  creationTimestamp: "2020-05-26T13:10:46Z"
  generateName: portal-restore-
  generation: 1
  name: portal-restore-x2bf9
  namespace: portal
  resourceVersion: "1493471"
  selfLink: /apis/portal.apiconnect.ibm.com/v1beta1/namespaces/portal/portalrestores/portal-restore-x2bf9
  uid: 9f6ale22-55ab-4595-8b98-bdfaec40d58c
spec:
  type: site
  portalCluster: portal
status:
  backupId: ""
  commentLeft: ""
  conditions:
  - lastTransitionTime: "2020-05-26T13:10:49Z"
    message: |
      Please provide a site to restore. To restore all sites use value 'all' in the CR
    status: Failed
    type: Ready
  fullBackupName: ""
  id: ""
  message: ""

```

3. If the operation failed, check the associated `message` for more information.

Review the logs for additional information

Look for information in the logs of the `ibm-apiconnect` pod:

- Locate the `ibm-apiconnect` pod with:

```
oc get pods -n <Portal_namespace>
```

- View the logs with:

```
oc logs <ibm-apiconnect-pod-NAME> -n <Portal_namespace>
```

Backing up and restoring the Analytics database on OpenShift and Cloud Pak for Integration

The IBM® API Connect Analytics database can be backed up and restored from an S3 repository. S3 compatible object storage is required; for example, IBM Cloud Object Storage.

About this task

Before you can initiate a backup or restore operation, you must update the Analytics CR (custom resource) to configure your settings. Generating a backup for Analytics is performed on demand by deploying a backup CR. You can deploy a restore CR to start the restoration of a previously generated backup.

Note: On a v10.0.5 API Connect deployment, you can restore only analytics backups that were taken from a v10.0.5 analytics deployment. You cannot restore analytics backups that were taken from a deployment that was on v10.0.4 or an earlier release.

- [Configuring backup settings for Analytics on OpenShift and Cloud Pak for Integration](#)
Configure the IBM API Connect Analytics subsystem on OpenShift and Cloud Pak for Integration to support backing up and restoring the Analytics database.
- [Running a backup of the Analytics database on OpenShift and Cloud Pak for Integration](#)

Deploy the `AnalyticsRestore` CR to initiate restoration of a backup of the IBM API Connect Analytics database on OpenShift or Cloud Pak for Integration.

Configuring backup settings for Analytics on OpenShift and Cloud Pak for Integration

Configure the IBM® API Connect Analytics subsystem on OpenShift and Cloud Pak for Integration to support backing up and restoring the Analytics database.

About this task

Generating a backup for Analytics is performed on demand by configuring backup settings in the Analytics section of the top-level `APIConnectCluster` CR. You can create a restore CR to start the restoration of a previously generated backup.

- Backups can be scheduled or generated manually (on-demand), but you can only run one backup or restore process at a time.
- The backup and restore solution for Analytics supports only remote, cloud-based S3 storage (such as IBM Cloud Object Storage, or AWS S3).

Note:

- Only host-style S3 backups are supported. Path-style S3 backups are not supported.
- If you are using a self-managed S3 backup server, check that you have a DNS hostname entry and matching TLS certificate for your S3 backup endpoint.
- When you specify a filepath in a backup setting, be sure to escape any blank spaces in the path.

Procedure

1. Create the analytics backup secret for your S3-compatible storage:

- a. Obtain an access key and corresponding access key secret from your S3 provider.

For example, you might obtain the key and secret from one of the following providers, using the instructions found on their sites:

- [IBM Cloud Object Storage](#)
- [AWS](#)

- b. Create the Kubernetes secret by running the following command and filling in your access key, access key secret, and namespace:

```
oc create secret generic analytics-backup-secret --from-literal=access_key='Your_Access_Key' --from-literal=secret_key='Your_access_key_secret' -n Analytics_namespace
```

2. Add the backup configuration to the Analytics section of the top-level `APIConnectCluster` CR:

You can add or modify the Analytics backup configuration using one of the following methods:

- OpenShift web console:
 - Navigate to `Advanced Configuration > Analytics Subsystem > Advanced Configuration > Database Backups > Advanced Configuration`.
 - Configure the backup settings using the settings described in Table 1.
- IBM Cloud Pak Platform UI:
 - Open the API Connect instance for editing.
 - On the Details page, enable Advanced settings, which allows you to add backup configurations in the Analytics subsystem section.
 - Click Analytics subsystem and configure settings in the "Database backups" section using the settings described in Table 1.
- YAML: Edit the top-level `APIConnectCluster` CR and add a `databaseBackup` section using the settings described in Table 1; for example:

```
spec:
  analytics:
    databaseBackup:
      credentials: analytics-backup-secret
      host: s3.eu-gb.cloud-object-storage.appdomain.cloud
      path: my-s3-bucket/apic-analytics-backups
      backupCerts: <custom-s3-server-CA-cert>
      schedule: "0 2 * * *"
      enableCompression: true
      chunkSize: 1GB
      enableServerSideEncryption: false
```

Table 1. Backup configuration settings for Analytics

Field name in UI	Field name in YAML	Description
Credentials	<code>credentials</code>	The name of the Kubernetes secret that you created in step 1.
Server hostname	<code>host</code>	The S3 endpoint with the corresponding S3 region in the format <code>s3.s3region.s3domain</code>
Backup path	<code>path</code>	A combination of the S3 bucket and the base path within the bucket, using the format <code>bucket_name/base_path</code>

Field name in UI	Field name in YAML	Description
Schedule	<code>schedule</code>	(Optional) The schedule that determines how often backups will be invoked automatically. The format for the schedule is any valid cron string. The timezone for backups is that of the kube-controller-manager. Backing up once a day is probably sufficient; remember that the more frequently you run backups, the more storage space you need.
Compress	<code>enableCompression</code>	(Optional) Determines whether metadata files are stored in compressed format. Default value is <code>true</code> .
Backup chunk size	<code>chunkSize</code>	(Optional) Specifies how large files are stored. Large files can be stored as chunks when the snapshot is created. This setting specifies the size of the chunks as GB, MB, or KB. Default value is <code>1GB</code> .
Enable server side encryption	<code>enableServerSideEncryption</code>	(Optional) Determines whether files are encrypted. When set to true, files are encrypted on the server side using AES256. Default value is <code>false</code> .
Backup Certs	<code>backupCerts</code>	<p>The name of a custom certificate that contains your upstream custom S3 CA certificate. This field accepts name of the Kubernetes secret containing your upstream custom S3 CA certificate. The key of the secret must be <code>ca.crt</code> and the value is the base64-encoded value of the CA certificate.</p> <p>If the server certificate that is presented by your S3/object-store endpoint is signed by a well known CA and includes any intermediate certificates in the chain, then you do not need to provide the CA certificate using this feature because the Analytics subsystem already trusts the server certificate. You can test this by configuring the Analytics backup to your S3/object-store server without providing the CA certificate.</p> <p>If you do need to provide the CA certificate then you must provide the entire chain in the <code>ca.crt</code> member of the secret, as follows:</p> <pre>intermediate-certificate-1 intermediate-certificate-2 . . . intermediate-certificate-n root-certificate</pre> <p>Where the first certificate in the <code>ca.crt</code> member (intermediate-certificate-1) is the issuer of the S3/object-store server certificate, and each subsequent certificate in the <code>ca.crt</code> member is the issuer of the preceding certificate. The root certificate in the <code>ca.crt</code> member must be self-signed.</p> <p>If there are no intermediate certificates involved, then the <code>ca.crt</code> member contains only the root certificate.</p> <p>The following sample bash script creates the Kubernetes secret:</p> <pre>cat >customs3ca.yaml <<EOF apiVersion: v1 data: ca.crt: \$(base64 <path-to-ca-certificate> tr -d '\n') kind: Secret metadata: name: custom-server-ca type: generic EOF kubectl apply -f customs3ca.yaml -n <namespace></pre>

Running a backup of the Analytics database on OpenShift and Cloud Pak for Integration

Deploy the `AnalyticsBackup` CR to initiate a backup of the IBM® API Connect Analytics database on OpenShift or Cloud Pak for Integration.

Before you begin

[Configure backup settings for Analytics.](#)

About this task

A backup is triggered by creating the `AnalyticsBackup` CR. The new CR is detected by the `ibm-apiconnect` operator, which requests a new backup.

Procedure

1. Make sure your analytics cluster status is **Running** and **READY**.

The cluster is ready when the **READY** condition states `x/y` where `x = y`. You can check the status in the OpenShift Form UI, or by running the following command:

```
oc get a7s -n <analytics namespace>
```

where `a7s` is the name of your Analytics subsystem. The response looks like the following example:

NAME	READY	STATUS	VERSION	RECONCILED VERSION	AGE
analytics	5/5	Running	10.0.5.0	10.0.5.0-426	19h

2. Create the `AnalyticsBackup` CR using either the IBM Cloud Pak Platform UI, the OpenShift web console, or the CLI.

For example:

```
apiVersion: analytics.apiconnect.ibm.com/v1beta1
kind: AnalyticsBackup
metadata:
```

```

generateName: a7s-bup-
namespace: <analytics namespace>
spec:
  crType: create
  comment: "test comment"
  indices:
  - all
  enableIgnoreUnavailable: true

```

where:

- `metadata.generateName` - Use to specify a prefix for your backup name, the remainder of the name will be generated at runtime.
- `metadata.name` - Use as an alternative to `generateName`, where you want to specify the full name of the backup.
- Optional: `metadata.namespace` - Specify the analytics namespace.
- `spec.crType` - Use `create` to trigger a backup process. When the backup is created, the operator generates another backup CR with `crType: record`, which represents the stored backup that you can use for a restore operation.
- Optional: `spec.comment` - You can use this field to describe the backup for later reference.
- Optional: `spec.indices` - A list of index names or keywords, indicating which indices you want to back up. Options are: `all|apievents|ui`, or the names of individual indices. If no indices are specified, then all indices are backed up. The default of 'all' is specified explicitly in the above sample.
- Optional: `spec.enableIgnoreUnavailable` - Default value is `false`. If set to `false`, the backup fails if a specified index is not present. If set to `true`, missing indices are skipped and the backup continues.

3. Trigger the backup operation by clicking Create in the UI, or by running the following command to deploy the CR in the namespace for your Analytics subsystem:

```
oc create -f analyticsbackup_cr.yaml -n <Analytics-namespace>
```

The backup's name and ID are generated when the backup operation runs.

4. To get a list of available backups, run the following command:

```
oc get analyticsbackup -n <Analytics-namespace>
```

where `<Analytics-namespace>` is the namespace where the Analytics subsystem is deployed. The response looks like the following example:

NAME	STATUS	ID	CR TYPE	INDICES	AGE	COMMENT
a7s-bup-266p8	Ready		create	[all]	20h	y
a7s-bup-pffdh	Ready		create	[all]	34h	y

5. Display the details for a particular backup by running the following command:

Use the backup name from the results in the previous step.

```
oc get analyticsbackup backup_NAME -n <Analytics-namespace> -o yaml
```

The result looks like the following example:

```

apiVersion: analytics.apiconnect.ibm.com/v1beta1
kind: AnalyticsBackup
metadata:
  creationTimestamp: "2022-06-29T12:48:56Z"
  generateName: analytics-bup-
  generation: 1
  name: analytics-bup-4m7g8
  namespace: apic
  resourceVersion: "11207730"
  uid: e1d1c259-850f-4b90-82b3-6a13c05e5d72
spec:
  comment: ""
  crType: create
  enableIgnoreUnavailable: false
  indices:
  - all
status:
  backupID: analytics-all-2022-06-29t12:48:49utc
  commentLeft: ""
  conditions:
  - lastTransitionTime: "2022-06-30T16:18:24Z"
    message: SUCCESS
    status: Complete
    type: Ready

    Shards:{Failed:0
    Successful:1}
  id: my-backup-id

```

Restoring the Analytics database on OpenShift and Cloud Pak for Integration

Deploy the `AnalyticsRestore` CR to initiate restoration of a backup of the IBM® API Connect Analytics database on OpenShift or Cloud Pak for Integration.

Before you begin

[Create a backup.](#) If you intend to restore from a recent backup, ensure that the backup is finished before you start the restore operation.

About this task

A restore operation is triggered by creating the **AnalyticsRestore** CR. The new CR is detected by the **ibm-apiconnect** operator, which requests a restore of the specified backup.

Note: You can only run one backup or restore process at a time.

Procedure

1. Find the backup that you want to restore.
 - a. Get a list of available backups by running the following command:

```
oc get analyticsbackup -n <APIC_namespace>
```

where **<APIC_namespace>** is the namespace where the Analytics subsystem is deployed. The response looks like the following example. Note down the ID of the backup that you want to restore.

NAME	STATUS	ID	CR TYPE	INDICES	AGE	COMMENT
a7s-bup-266p8	Ready		create	[all]	20h	y
a7s-bup-pffdh	Ready		create	[all]	34h	y
analytics-bup-kxwq5	Ready	analytics-all-2020-09-07t03:49:15utc	record	[all]	34h	
analytics-bup-p29z8	Ready	analytics-all-2020-09-07t18:04:03utc	record	[all]	20h	

Note: You can only restore the Analytics subsystem from backups where the **CR TYPE** is **record**.

2. Create the **AnalyticsRestore** CR using either the IBM Cloud Pak Platform UI, the OpenShift web console, or the CLI.
In the CR, specify the ID of the backup that you want to restore. For example:

```
apiVersion: analytics.apiconnect.ibm.com/v1beta1
kind: AnalyticsRestore
metadata:
  generateName: a7s-restore-
spec:
  indices:
  - all
  backupID: analytics-all-2022-07-01t03:49:15utc
  enableIgnoreUnavailable: true
  enableOverride: false
```

where:

- **indices** - A list of index names or keywords, indicating which indices you want to restore. Options are: **all** | **apievents** | **ui**, or the names of individual indices. If no indices are specified, then all indices are restored. The default of 'all' is specified explicitly in the above sample.
- **backupID** - The ID of the backup to be restored. In the example, the backup ID is **analytics-all-2022-07-01t03:49:15utc**.
- **enableIgnoreUnavailable** - Default value is **false**. If set to **false**, the restore fails if a specified index is not present in the backup identified by the **backupID**. If set to **true**, missing indices are skipped and the restore continues.
- **enableOverride** - Default value is **false**. If set to **true**, then the restore overrides existing indices. This might result in a loss of data from the current database.
When **enableOverride** is set to **false** and you specified indices that already exist in the database that you are restoring, then the restore fails. The failure prevents you from accidentally replacing or losing data that exists in the current database.

3. Trigger the restore operation by clicking Create in the UI, or by running the following command to deploy the CR in the namespace for your Analytics subsystem:

```
oc create -f analyticsrestore_cr.yaml -n <APIC_namespace>
```

The restore's name is generated when the restore operation runs.

4. To get a list of restores, run the following command:

```
oc get analyticsrestore -n <APIC_namespace>
```

The response looks like the following example.

NAME	STATUS	ID	AGE
a7s-restore-01	Running	analytics-all-2026-07-01t12:48:49utc	11s

5. Display the details for a particular restore by running the following command:
Use the restore name from the results in the previous step.

```
oc get analyticsrestore <restore_NAME> -n <APIC_namespace> -o yaml
```

The result looks like the following example,;

```
apiVersion: analytics.apiconnect.ibm.com/v1beta1
kind: AnalyticsRestore
metadata:
  generateName: a7s-restore-
  selfLink: >-
  /apis/analytics.apiconnect.ibm.com/v1beta1/namespaces/apic/analyticsrestores/a7s-restore-01
  resourceVersion: '11267266'
  name: a7s-restore-01
  uid: e772c6c9-754a-45da-a7c7-507a56cbb94a
  creationTimestamp: '2022-07-01T12:48:50Z'
  generation: 1
  namespace: apic
spec:
  backupID: 'analytics-all-2026-07-01t12:48:49utc'
```

```

enableIgnoreUnavailable: false
enableOverride: true
indices:
  - all
status:
  backupID: ''
  commentLeft: ''
  conditions:
conditions:
- lastTransitionTime: "2022-07-01T14:08:03Z"
  message: WARNING
  status: Warning
  type: Ready
details: |
  &{NumberOfDataNodes:1
  Status:yellow
  ActivePrimaryShards:23
  ActiveShards:23
  RelocatingShards:0
  InitializingShards:0
  UnassignedShards:40
  PendingTasks:0}
id: analytics-all-2022-07-01t14:49:15utc

```

When the restore is successfully started, the **status: condition** section displays **Running**. If the restore does not start correctly, the **status: condition** section displays **Failed**.

The restore process is successful when the storage cluster status is green, there are no unassigned shards, and there are no initializing shards. At that time the **status: condition** section displays **Complete**. If **status: Complete** is not achieved after 3 hours, the status changes to **Warning** and the details are no longer updated.

Attention: For deployment profiles with fewer than 3 storage nodes, the restore process is never marked as **Complete**. The storage cluster status is expected to be yellow and to have more than 0 unassigned shards. In this situation, the restore process is likely to be complete when there are 0 initializing shards.

Disaster recovery

Prepare for, or recover from, a disaster affecting an API Connect deployment running on Kubernetes, OpenShift, or Cloud Pak for Integration.

The backups that you create for disaster recovery are for recovery of the API Connect subsystems in the same data center that the backups were taken. If you want to restore your backups in a different data center (a cold-standby), it must have the same network configuration and API Connect form factor.

If you want to move your API Connect deployment to a different data center and change the form factor or modify your API Connect endpoints, then see [Migrating from v10 to v10 on a different form factor](#).

- [Disaster recovery on Kubernetes](#)
Prepare for disaster events and recover API Connect on Kubernetes if a disaster event occurs.
- [Disaster recovery on OpenShift and Cloud Pak for Integration](#)
Prepare for, or recover from, a disaster affecting an API Connect deployment running on OpenShift or Cloud Pak for Integration

Disaster recovery on Kubernetes

Prepare for disaster events and recover API Connect on Kubernetes if a disaster event occurs.

You must complete preparation steps prior to a disaster in order to recover API Connect on Kubernetes.

Note: For information about how to maintain a two data center deployment, including failover and recovery procedures, see [Maintaining a two data center deployment](#).

- [Preparing for a disaster](#)
Prepare your API Connect deployment for disaster recovery in a Kubernetes environment.
- [Recovering from a disaster](#)
Recover the API Connect subsystems on Kubernetes.

Preparing for a disaster

Prepare your API Connect deployment for disaster recovery in a Kubernetes environment.

Begin preparing for disaster recovery by creating a back-up copy of the installation CR for each subsystem with the following commands:

1. `kubectl -n <namespace> get mgmt <mgmt-subsystem-name> -o yaml > mgmt-susbsystem-cr.yaml`
2. `kubectl -n <namespace> get a7s <a7s-subsystem-name> -o yaml > a7s-susbsystem-cr.yaml`
3. `kubectl -n <namespace> get ptl <ptl-subsystem-name> -o yaml > ptl-susbsystem-cr.yaml`

- [Preparing the management subsystem for disaster recovery](#)
You can prepare a Management subsystem for disaster recovery from S3 or SFTP backups by taking specific steps before and after the installation of the subsystem.

- [Preparing the Developer Portal for disaster recovery](#)
You can prepare a Developer Portal subsystem for disaster recovery by taking specific steps before and after the installation of the subsystem.
- [Preparing the Analytics subsystem for disaster recovery](#)
Prepare the API Connect Analytics subsystem for disaster recovery in a Kubernetes environment.

Preparing the management subsystem for disaster recovery

You can prepare a Management subsystem for disaster recovery from S3 or SFTP backups by taking specific steps before and after the installation of the subsystem.

About this task

- This task must be performed before any disaster event occurs, and also prior to the installation of a replacement Management subsystem during the recovery process. Best practice is to complete these steps immediately after initial configuration of a management subsystem during your original v10 deployment.
- Any `local` backups are presumed to have been lost in the disaster scenario and are non-recoverable in this procedure.

Important: Successful disaster recovery depends on recovery of both the Management subsystem and the Developer Portal subsystem. You must complete preparation steps for both subsystems in order to achieve disaster recovery. If you have to perform a restore, you must complete the restoration of the Management Service first, and then immediately restore the Developer Portal. Therefore, the backups of the Management and Portal must be taken at the same time, to ensure that the Portal sites are consistent with Management database.

Procedure

1. Prior to initial installation, configure the Management subsystem for database backups:
See [Configuring backup settings for fresh install of the Management subsystem](#).
2. After installation, back up essential Kubernetes secrets that are used by the Management subsystem.
The Kubernetes secrets are created during installation. You must save these in case a restore is needed after a disaster has occurred. At that time, you will use them in the setup of the restored Management subsystem:
 - a. Obtain and save the Management database encryption secret.
Use the following command to find the name of the secret in the status of the Management Subsystem. Replace `<namespace>` with the namespace used for the subsystem installation:

```
kubectl get mgmt -n <namespace> -o yaml | grep encryption
```

The output of this command shows the name of the Kubernetes secret storing the database encryption key, for example:

```
encryptionSecret: management-enc-key
```

In this case, the name of the Management database encryption secret is `management-enc-key`. Use the following command to back up this secret locally:

```
kubectl get secret management-enc-key -n <namespace> -o yaml > management_enc_key.yaml
```

The secret is stored in a file called `management_enc_key.yaml`, located in the present working directory.

- b. Obtain and save the Management client application credential secrets.
 - i. Use the following command to find the names of the secrets in the status of the Management subsystem:

```
kubectl get mgmt -n <namespace> -o yaml | grep CredentialSecret
```

The output of this command shows the names of the Kubernetes Secrets used to store the various client application credentials. For example:

```
atmCredentialSecret: management-atm-cred
consumerToolkitCredentialSecret: management-ccli-cred
consumerUICredentialSecret: management-cui-cred
designerCredentialSecret: management-dsgr-cred
governanceCredentialSecret: management-governance-cred
juhuCredentialSecret: management-juhu-cred
toolkitCredentialSecret: management-cli-cred
uiCredentialSecret: management-ui-cred
```

Here, for example, the name of the ATM Client Application Credential Secret is `management-atm-cred`.

- ii. Next, back up all of the secrets locally. Use the following command for each listed Credential Secret, replacing `<secret_name>` with the secret name listed each time:

```
kubectl get secret <secret_name> -n <namespace> -o yaml > <secret_name>.yaml
```

For example, use the following command to backup the ATM Client Credential Secret:

```
kubectl get secret management-atm-cred -n <namespace> -o yaml > management-atm-cred.yaml
```

- iii. After you save each of the client application Credential Secrets locally, open each of the YAML files saved for each secret in turn. Remove both the `ownerReferences` subsection and the `selfLink` property. Re-save the file.
For example, the `ownerReferences` and `selfLink` properties to be removed appear in the YAML files similar to the following:

```
ownerReferences:
- apiVersion: management.apiconnect.ibm.com/v1beta1
  blockOwnerDeletion: true
  controller: true
  kind: ManagementCluster
  name: management
  uid: 623e6b20-7eb8-46ce-94ac-6b64cd71afc4
selfLink: /api/v1/namespaces/default/secrets/management-atm-cred
```

- c. Ensure that all of the YAML files that contain the various backed-up Secrets are stored persistently and safely. Important: If the files are lost, you cannot restore after a disaster event.
- d. Take note of the following values in the Management subsystem CR. You will need them to restore the Management subsystem.

Table 1. Management subsystem CR settings

Setting	Used with Protocol	Example value
<code>name</code>	S3 and SFTP	<code>management</code>
<code>siteName</code>	S3 and SFTP	<code>82b290a2</code>
<code>originalUID</code>	S3 and SFTP	<code>fa0f6f49-b931-4472-b84d-0922a9a92dfd</code> : During restore, if you do not specify <code>originalUID</code> , the operator automatically sets its value in the new CR to the value of <code>metadata.uid</code> . If the <code>originalUID</code> in the new CR does not match <code>originalUID</code> in the saved CR, the restore will fail.
<code>databaseBackup.protocol</code>	S3 and SFTP only	<ul style="list-style-type: none"> • S3: <code>objstore</code> • SFTP: <code>sftp</code>
<code>databaseBackup.s3provider</code>	S3 only	<code>aws</code>
<code>databaseBackup.host</code>	S3 and SFTP	<ul style="list-style-type: none"> • SFTP <code><SFTP-host-name></code> • S3: <code>s3.amazonaws.com/eu-west-1</code>
<code>databaseBackup.path</code>	S3 and SFTP	<ul style="list-style-type: none"> • SFTP <code><SFTP-path></code> • S3: <code>my-bucket/mgmt</code>
<code>databaseBackup.schedule</code>	S3 and SFTP	<code>0 3 * * *</code>
<code>databaseBackup.credentials</code>	S3 and SFTP	<code>secret-containing-credentials</code>
<code>databaseBackup.backupCerts</code>	S3 (custom only, v10.0.2.0 or later)	<code>my-custom-s3-ca-cert</code>
<code>databaseBackup.backups3URIStyle</code>	S3 (custom only, v10.0.2.0 or later)	<code>my-s3-uri-style</code>

- The values `name` and `siteName` form the name of the database cluster name, such as `management-82b290a2-postgres` and is needed to synchronize the backups from your old Management subsystem to your new one. The `siteName` is either be a randomly generated alphanumeric ID, or a custom name that was specified by the administrator in the Management Subsystem CR helper YAML file at deploy time. Use the following command to get the `siteName`:

```
kubectl get mgmt -o yaml -n <namespace> | grep siteName
```
 - The `databaseBackup.host` and `databaseBackup.path` settings must be identical to what was configured on your old Management subsystem. This is the location of your old Management subsystem backups from where we will recover from.
 - Take note of `databaseBackupschedule`. The schedule will be included during the restoration.
3. Make sure that you have a backup that can be used in case of a disaster event:
- If scheduled backups were configured as part of [Configuring backup settings for fresh install of the Management subsystem](#), backups to the specified cloud storage will take place as scheduled.
 - You can also perform a manual backup at any time by creating a manual backup CR. See [Generating a manual backup of the management subsystem](#).

What to do next

You should now complete the preparation steps for the Developer Portal subsystem; see [Preparing the Developer Portal for disaster recovery](#).

Preparing the Developer Portal for disaster recovery

You can prepare a Developer Portal subsystem for disaster recovery by taking specific steps before and after the installation of the subsystem.

About this task

- This task must be performed before any disaster event occurs, and also prior to the installation of a replacement Developer Portal subsystem for the recovery process. Best practice is to complete these steps immediately after initial configuration of a Developer Portal subsystem during your original v10 deployment.
- Any `local` backups are presumed to have been lost in the disaster scenario and are non-recoverable in this procedure.

Important: Successful disaster recovery depends on recovery of both the Management subsystem and the Developer Portal subsystem. You must complete preparation steps for both subsystems in order to achieve disaster recovery. For information about preparing the Management subsystem, see [Preparing the management subsystem for disaster recovery on Kubernetes](#). If you have to perform a restore, you must complete the restoration of the Management Service first, and then immediately restore the Developer Portal. Therefore, the backups of the Management and Portal must be taken at the same time, to ensure that the Portal sites are consistent with Management database.

Procedure

1. Before the initial installation, configure the Developer Portal subsystem for database backups:
 - a. Ensure that the Developer Portal backup subsystem secret is created in the cluster. This secret contains the credentials (username and password) for the remote storage, such as S3 or IBM Cloud Object Storage, that is used for storing the database backups.
 - b. Ensure that the Developer Portal subsystem is configured for database backups. Add a `databaseBackups` subsection to the `spec` subsection of the Developer Portal subsystem Custom Resource (CR) YAML file. For example:

```
portalBackup:
  credentials: portal-backup-secret
  host: s3.eu-gb.cloud-object-storage.appdomain.cloud/eu-standard
  path: test-bucket/restore-test
  port: 443
  protocol: objstore
  schedule: ''
```

See also: [Backing up and restoring the Developer Portal in a Kubernetes environment](#)

2. After installation, you must back up essential Kubernetes secrets that are used by the Developer Portal subsystem.

The Kubernetes secrets are created during installation. You must save these secrets in case a restore is needed after a disaster. Then, you use them in the setup of the restored Developer Portal subsystem:

a. Obtain and save the Developer Portal database encryption secret.

Use the following command to find the name of the secret in the status of the Developer Portal Subsystem. Replace `<namespace>` with the namespace used for the subsystem installation:

```
kubectl get portal -n <namespace> -o yaml | grep encryption
```

The output of this command shows the name of the Kubernetes secret that is storing the database encryption key, for example:

```
encryptionSecret: portal-enc-key
```

In this case, the name of the Developer Portal database encryption secret is `portal-enc-key`. Use the following command to back up this secret locally:

```
kubectl get secret portal-enc-key -n <namespace> -o yaml > portal_enc_key.yaml
```

The secret is stored in a file that is called `portal_enc_key.yaml`, located in the present working directory.

b. Obtain the endpoint definitions as they need to stay the same during the restore.

Get the `portalAdminEndpoint` name:

```
kubectl get portalcluster.portal.apiconnect.ibm.com portal -o jsonpath="{..portalAdminEndpoint.hosts[0].name}"
```

Get the `portalUIEndpoint` name:

```
kubectl get portalcluster.portal.apiconnect.ibm.com portal -o jsonpath="{..portalUIEndpoint.hosts[0].name}"
```

Note: If you have more than one host specified in the `portalUIEndpoint` definition, you must get the name for each one.

c. Ensure that all of these YAML files that contain the various backed-up Secrets are stored persistently and safely.

Important: If the files are lost, you cannot restore after a disaster event.

3. Take note of the value of `originalUID` in the Portal subsystem CR. You will need it to restore the Portal subsystem. For example:

```
spec:
  originalUID: "447ea4b3-9514-4a84-a34b-ce0b349838da"
```

Note:

- **Version 10.0.3.0 or later:** During restore, if you do not specify `originalUID`, the operator automatically sets its value in the new CR to the value of `metadata.uid`. If the `originalUID` in the new CR does not match `originalUID` in the saved CR, the restore will fail.
- **Version 10.0.2 backups:** If planning to restore a Version 10.0.2 backup on Version 10.0.3.0 or later, make a note of the subsystem CR `metadata.uid`. You must use it when performing a restore on v10.0.3.0 or later, to populate the `spec.originalUID` value of the CR.
- **Limitation for Version 10.0.2:** If planning to restore on Version 10.0.2, performing a restore may not work if the subsystem CR name exceeds 15 characters.

4. If Scheduled backups are set as part of the `databaseBackup` subsection in the Developer Portal Subsystem CR helper YAML file (`portal_cr.yaml`), backups to the specified cloud storage take place.

You can also complete a manual backup at any time by creating a manual backup CR.

a. To complete a manual backup, use the Developer Portal backup CR helper YAML file (`portalbackup_cr.yaml`). For example:

```
apiVersion: portal.apiconnect.ibm.com/v1beta1
kind: PortalBackup
metadata:
  generateName: portal-bup-
spec:
  type: all
  crType: create
  comment: "test comment"
```

Run the following command to start a manual backup to the configured cloud storage:

```
kubectl create -f portalbackup_cr.yaml -n <namespace>
```

b. Use the following command to list the backups:

```
kubectl get portalbackup -n <namespace>
```

For example:

```
loginabc@localhost ibm-apiconnect]$ kubectl get pb
NAME          ID                STATUS  TYPE  CR TYPE  AGE      COMMENT
portal-bup-g66gv      Ready    site   create  5m27s   y
portal-bup-z7wgk     20201001.100021  Ready    site   record   4m24s
```

With stored backups, secrets and `siteName` saved, the stack is now ready for a restore after a disaster event.

What to do next

To restore the Developer Portal on Kubernetes after a disaster, see [Recovering the Developer Portal after a disaster](#).

Preparing the Analytics subsystem for disaster recovery

Prepare the API Connect Analytics subsystem for disaster recovery in a Kubernetes environment.

About this task

Preparing for disaster recovery involves backing up data and making a local copy of the Custom Resource (CR) that was used for installing the Analytics subsystem.

Procedure

1. [Perform a backup of the Analytics database.](#)

Scheduling automatic backups ensures that a recovery includes recent updates. For more information on configuring backups, see [Configuring backup settings for Analytics](#).

2. Make a copy of the AnalyticsCluster CR (custom resource).

a. Find the Analytics cluster's name by running the following command and looking for the value in the **NAME** column:

```
kubectl get AnalyticsCluster
```

The response looks like the following example:

NAME	READY	STATUS	VERSION	RECONCILED	VERSION	AGE
gj01-analytics	6/6	Running	10.0.1-eus	10.0.1.1-1402-eus		22h

In this example the cluster's name is `gj01-analytics`.

b. Get the YAML that describes the Analytics cluster, and save it in a file using the following command:
Use the name of the AnalyticsCluster that you obtained in the previous step.

```
kubectl get AnalyticsCluster gj01-analytics -o yaml > gj01-analytics.yaml
```

c. Save the file locally.

Recovering from a disaster

Recover the API Connect subsystems on Kubernetes.

- [Recovering the management subsystem on Kubernetes](#)
Recover the management subsystem on Kubernetes.
- [Recovering the Developer Portal after a disaster](#)
You can restore the Developer Portal subsystem after a disaster event.
- [Recovering the Analytics subsystem after a disaster](#)
Recover the API Connect Analytics subsystem in a Kubernetes environment.

Recovering the management subsystem on Kubernetes

Recover the management subsystem on Kubernetes.

The recovery procedures for the management subsystem are specific to the type of backup. Use the instructions for your backup type:

- [Recovering the management subsystem from S3 backups](#)
You can recover the management subsystem from S3 backups after a disaster event.
- [Recovering the management subsystem from SFTP backups](#)
You can recover the management subsystem from SFTP backups after a disaster event.

Recovering the management subsystem from S3 backups

You can recover the management subsystem from S3 backups after a disaster event.

Before you begin

To successfully recover the management subsystem, you must have previously completed the steps in [Preparing the management subsystem for disaster recovery](#). Important: Successful disaster recovery depends on recovery of both the Management subsystem and the Developer Portal subsystem. You must complete preparation steps for both subsystems in order to achieve disaster recovery. If you have to perform a restore, you must complete the restoration of the Management Service first, and then immediately restore the Developer Portal. Therefore, the backups of the Management and Portal must be taken at the same time, to ensure that the Portal sites are consistent with Management database.

About this task

To recover from a disaster event, you must create a new IBM API Connect® installation with a running IBM API Connect Operator.

Note: Limitation for backups created on Version 10.0.2

- If restoring a Version 10.0.2 backup onto a new Version 10.0.2 deployment, performing a restore may not work if the subsystem CR name exceeds 15 characters. This limitation applies only to restoring onto Version 10.0.2.
- Restoration is supported for Version 10.0.2 backups onto a Version 10.0.3.0 or later deployment when subsystem name exceeds 15 characters, as long as the correct `spec.originalUID` is specified upon restore. See Step 3.f.

Procedure

1. Determine which backup to restore from.

- For IBM®'s Cloud Object Storage, you can check currently stored backups in the COS console. Select Buckets > Objects. See the Object Names displayed on the `<cos_name>/backup/db` panel. For example:

```
20200605-105429F
20200605-100008F
20200605-11040F
```

- For Amazon's AWS, you can check currently stored backups in the S3 console For example, under Amazon S3 > `cluster_name` > old cluster > backup > db:

```
20200606-144315F
20200606-145011F
```

The format of the backup ID is `YYYYMMDD-HHMMSS<F|I>`

Take note of the ID of the backup you wish to restore to. Each ID contains the date, time, and type of the backup stored. This will be used later in the procedure.

- Incremental backups are denoted with a suffix `I` on the ID, ensure each incremental backup has it's prior backup also present in storage. You can check this by examining the ID `<prior-backup-id>_<backup-id>`.
- Full backups are denoted with a suffix `F` on the ID.

Note:

During the disaster recovery process, the S3 configuration detail of the older management system is used, but the older management system must be in offline mode. The old subsystem must be offline because you cannot have two management systems simultaneously using the same s3 bucket name in the database backup configurations.

2. Make sure you know the management database cluster name.

You can get this name from the original management subsystem CR. You made note of this name in Step 2.d in [Preparing the management subsystem for disaster recovery](#).

If you are not able to recover the original management subsystem CR, use the following steps to recover the Management database cluster name:

- Open your IBM Cloud® Object Storage or AWS S3 console and proceed to the bucket location where the old Management subsystem backups are located.
- Download `backup/db/<backup-id>/pg_data/postgresql.conf.gz`. Open `postgresql.conf` to view the database cluster name:
 - IBM Cloud Object Storage

```
.
.
cluster_name = 'm1-a6287572-postgres'
.
```

- `m1` - Management subsystem name
- `a6287572` - site name

- AWS S3

```
.
.
cluster_name = 'm1-c91dc0b9-postgres'
.
```

- `m1` - Management subsystem name
- `c91dc0b9` - site name

3. Before installing the replacement management subsystem CR:

- Apply the YAML file that contains the Management Database Encryption Secret into the cluster. For example, where `encryption-bin-secret.yaml` is the local YAML file containing the backup-up encryption secret:

```
kubectl apply -f encryption-bin-secret.yaml -n <namespace>.
```

Replace `<namespace>` with the namespace being used for the management subsystem installation.

This command re-creates the original Management Database encryption secret on the cluster. It will be named as the original name of the secret.

- Add the following `encryptionSecret` subsection to the `spec` of the Management CR. For example, if `management-enc-key` is the name of the newly created secret on the cluster containing the original Management Database encryption secret from the previous step:

```
encryptionSecret:
  secretName: management-enc-key
```

- For each of the saved YAML Files that contain the Management Client Application Credential Secrets, apply each file into the cluster using the following command:

```
kubectl create -f <secret_name>.yaml -n <namespace>
```

where `<secret_name>` is the local YAML file containing one of the backed-up Credential Secrets.

Repeat this for each of the backed-up Credential Secrets. These are the secrets you saved in Step 2.b in [Preparing the management subsystem for disaster recovery](#).

These commands will re-create the original Management Client Application Credential Secrets on the cluster. Each will be named as the original name of the Secret.

d. Add the following `customApplicationCredentials` subsection to the `spec` subsection of the Management CR:

```
customApplicationCredentials:
- name: atm-cred
  secretName: management-atm-cred
- name: ccli-cred
  secretName: management-ccli-cred
- name: cli-cred
  secretName: management-cli-cred
- name: cui-cred
  secretName: management-cui-cred
- name: dsgr-cred
  secretName: management-dsgr-cred
- name: juhu-cred
  secretName: management-juhu-cred
- name: ui-cred
  secretName: management-ui-cred
```

For each named credential above, the `secretName` is given as the corresponding name of the newly created secret from Step 3.c.

e. Add the `siteName` property to the `spec` of the Management CR.

For example, if `a2a5e6e2` is the original `siteName` that was noted after the installation of the original Management Subsystem:

```
siteName: a2a5e6e2
```

f. **Version 10.0.3.0 or later:** Add the `originalUID` property to the `spec` of the Management CR.

When recreating a system, to restore a backup into it, you must specify the same `spec.originalUID` in the CR as was present in the system that was backed up. If the `spec.originalUID` in the new CR for recreating the system does not match the `spec.originalUID` that was present in the system that was backed up, the restore will fail.

```
spec:
  originalUID: "fa0f6f49-b931-4472-b84d-0922a9a92dfd"
```

Note:

- For Version 10.0.3.0 or later, if you do not specify `spec.originalUID` in the new CR, the operator automatically sets the Management CR value of `spec.originalUID` to match the new CR value `metadata.uid`. In this case, the restore will fail because the `spec.originalUID` in the saved (backed-up) CR does not match `spec.originalUID` in the new CR.
- The originalUID is only essential when the subsystem CR name exceeds 15 characters in length, or 10 characters limit for the API Connect Cluster CR. Recommended practice is that all backups should include the originalUID for Management.
- See also Step 2.d in [Preparing the management subsystem for disaster recovery](#).

g. Verify that the name of the management subsystem in the CR matches with the old management subsystem name, as described in Step 2.d in [Preparing the management subsystem for disaster recovery](#).

4. Install the Management subsystem CR with the values obtained in Step 2.d in [Preparing the management subsystem for disaster recovery](#).

Important: The hostnames of the endpoints cannot be changed, and must remain the same in the Management CR YAML file used for installation now as they were for the original installation.

To review installation of the management subsystem, see [Installing the Management subsystem cluster](#).

Once the Management subsystem is installed you may notice `backup` job pods and `stanza-create` job pods in `Error` state.

```
m1-82b290a2-postgres-stanza-create-4zcgz          0/1    Error    0        35m
m1-82b290a2-postgres-full-sch-backup-2g9hm       0/1    Error    0        20m
```

This is expected behavior.

- The `stanza-create` job normally expects buckets or subdirectories within buckets to be empty. However, since we have configured the Management subsystem with a pre-populated bucket (ie. where our backups exist), the job will go into `Error` state.
- Any scheduled or manual backups will go into `Error` state. While we have configured the Management subsystem with our already populated S3 bucket, the new database isn't yet configured to write backups into remote storage.

Important:

For S3, the recovery remains in an intermediate state until the restore is complete, and Postgres wal files might cause serious disk issues. To avoid this possibility, continue immediately with the next step.

Note that if you delay completion of the restore:

- Health check might fail. In this case, you can still proceed to the next step and perform a restore.
- Postgres wal files might cause problems by consuming all disk space. In this case, you must either:
 - Re-install the system, prepare again for disaster recovery, and perform the restore.
 - Or increase disk space so that the system returns to a stable state, and then proceed with the restore.

5. Get a list of available backups and confirm that the backup ID noted in Step 1 is in the backup list.

The API Connect Operator automatically reads backups from configured remote storage and populates the list of available backups we can restore to.

```
$ kubectl get mgmtb
NAME                STATUS    ID                CLUSTER                SUBSYSTEM    TYPE    CR TYPE    AGE
mgmt-backup-4z87f   Complete  20200606-145011F  m1-82b290a2-postgres  m1           full    record    11m
mgmt-backup-6bms2   Complete  20200606-144315F  m1-82b290a2-postgres  m1           full    record    11m
```

6. Update the Management subsystem CR `databaseBackup.schedule` to what was noted in Step 2.d in [Preparing the management subsystem for disaster recovery](#).

7. Perform a Management Restore using the name of the backup that has the ID you want to restore. For example, as shown in Step 5, for ID `20200606-145011F` the backup name is `mgmt-backup-4z87f`.

For more info on restoring the management subsystem, see [Restoring the management subsystem \(v10.0.1.1 or later\)](#).

8. Use the following command to check the status of the restore:

```
kubectl get mgmtr -n <namespace>
```

Once the Management Restore has completed and the database is running again, the data of the old Management subsystem will be successfully restored onto the new Management subsystem. Note:

- Manual and scheduled backups should perform as normal once again
 - `stanza-create` jobs will continue to report **Error** state as stated in Step 4.
9. Verify that the Cloud Manager UI can now be logged-in to as before, and that Provider Orgs exist as before. The restore from the disaster event is now complete.

What to do next

You should now complete the recovery steps for the Developer Portal subsystem on Kubernetes, see [Recovering the Developer Portal after a disaster](#).

Recovering the management subsystem from SFTP backups

You can recover the management subsystem from SFTP backups after a disaster event.

Before you begin

To successfully recover the management subsystem, you must have previously completed the steps in [Preparing the management subsystem for disaster recovery](#). Important: Successful disaster recovery depends on recovery of both the Management subsystem and the Developer Portal subsystem. You must complete preparation steps for both subsystems in order to achieve disaster recovery. If you have to perform a restore, you must complete the restoration of the Management Service first, and then immediately restore the Developer Portal. Therefore, the backups of the Management and Portal must be taken at the same time, to ensure that the Portal sites are consistent with Management database.

About this task

To recover from a disaster event, you must create a new IBM API Connect installation with a running IBM API Connect Operator.

Note: Limitation for backups created on Version 10.0.2

- If restoring a Version 10.0.2 backup onto a new Version 10.0.2 deployment, performing a restore may not work if the subsystem CR name exceeds 15 characters. This limitation applies only to restoring onto Version 10.0.2.
- Restoration is supported for Version 10.0.2 backups onto a Version 10.0.3.0 or later deployment when subsystem name exceeds 15 characters, as long as the correct `spec.originalUID` is specified upon restore. See Step 3.f.

Procedure

1. Determine which backup to restore from.

View the SFTP backups available on your remote storage site:

```
-rw-r--r-- 1 root root 13092333 Aug 26 08:56 20200826-154646F.tgz
-rw-r--r-- 1 root root 18703758 Aug 26 09:10 20200826-160010F.tgz
-rw-r--r-- 1 root root 24318561 Aug 26 09:21 20200826-161301F.tgz
```

Take note of the backup ID of the backup you wish to restore to. Each filename contains the date, time, and type of the backup stored. This will be used later in the procedure.

The format of the backup ID is `YYYYMMDD-HHMMSS<F|I>`. For example, if we want to use the Aug 26, 09:21 backup, its backup ID will be `20200826-161301F`

- a. Incremental backups are denoted with a suffix `I` on the ID, ensure each incremental backup has its prior backup also present in storage. You can check this by examining the ID `<prior-backup-id>_<backup-id>`.
 - b. Full backups are denoted with a suffix `F` on the ID.
2. Make sure you know the management database cluster name.
You can get this name from the original management subsystem CR. You made note of this name in Step 2.d in [Preparing the management subsystem for disaster recovery](#).

If you are not able to recover the original management subsystem CR, you can also recover the Management database cluster name and siteName by examining the SFTP backup tar:

- a. Download or move the SFTP backup tar file and decompress (untar) it.
- b. Open `<management-subsystem-name>-<siteName>-postgres-backrest-shared-repo/backup/db/<backup-id>/pg_data/postgresql.conf.gz` which contains the management subsystem name and siteName. For example:

```
# Do not edit this file manually!
# It will be overwritten by Patroni!
include 'postgresql.base.conf'

archive_command = 'source /opt/cpm/bin/pgbackrest/pgbackrest-set-env.sh && pgbackrest archive-push "%p"'
archive_mode = 'True'
archive_timeout = '60'
autovacuum_vacuum_cost_limit = '1000'
autovacuum_vacuum_scale_factor = '0.01'
cluster_name = 'm1-f785a3e3-postgres'
```

In this example:

- `cluster_name` has both the management subsystem name and siteName
 - `m1` - Management subsystem name
 - `f785a3e3` - site name
3. Before installing the replacement management subsystem CR:

- a. Apply the YAML file that contains the Management Database Encryption Secret into the cluster. For example, where `encryption-bin-secret.yaml` is the local YAML file containing the backup-up encryption secret:

```
kubect1 create -f encryption-bin-secret.yaml -n <namespace>.
```

Replace `<namespace>` with the namespace being used for the management subsystem installation.

This command re-creates the original Management Database encryption secret on the cluster. It will be named as the original name of the secret.

- b. Add the following `encryptionSecret` subsection to the `spec` of the Management CR. For example, if `management-enc-key` is the name of the newly created secret on the cluster containing the original Management Database encryption secret from the previous step:

```
encryptionSecret:
  secretName: management-enc-key
```

- c. For each of the saved YAML Files that contain the Management Client Application Credential Secrets, apply each file into the cluster using the following command:

```
kubect1 create -f <secret_name>.yaml -n <namespace>
```

where `<secret_name>` is the local YAML file containing one of the backed-up Credential Secrets.

Repeat this for each of the backed-up Credential Secrets. These are the secrets you saved in Step 2.b in [Preparing the management subsystem for disaster recovery](#).

These commands will re-create the original Management Client Application Credential Secrets on the cluster. Each will be named as the original name of the Secret.

- d. Add the following `customApplicationCredentials` subsection to the `spec` subsection of the Management CR:

```
customApplicationCredentials:
- name: atm-cred
  secretName: management-atm-cred
- name: ccli-cred
  secretName: management-ccli-cred
- name: cli-cred
  secretName: management-cli-cred
- name: cui-cred
  secretName: management-cui-cred
- name: dsgr-cred
  secretName: management-dsgr-cred
- name: juhu-cred
  secretName: management-juhu-cred
- name: ui-cred
  secretName: management-ui-cred
```

For each named credential above, the `secretName` is given as the corresponding name of the newly created secret from Step 3.c.

- e. Add the `siteName` property to the `spec` of the Management CR.

For example, if `a2a5e6e2` is the original `siteName` that was noted after the installation of the original Management Subsystem:

```
siteName: a2a5e6e2
```

- f. **Version 10.0.3.0 or later:** Add the `originalUID` property to the `spec` of the Management CR.

When recreating a system, to restore a backup into it, you must specify the same `spec.originalUID` in the CR as was present in the system that was backed up. If the `spec.originalUID` in the new CR for recreating the system does not match the `spec.originalUID` that was present in the system that was backed up, the restore will fail.

```
spec:
  originalUID: "fa0f6f49-b931-4472-b84d-0922a9a92dfd"
```

Note:

- For Version 10.0.3.0 or later, if you do not specify `spec.originalUID` in the new CR, the operator automatically sets the Management CR value of `spec.originalUID` to match the new CR value `metadata.uid`. In this case, the restore will fail because the `spec.originalUID` in the saved (backed-up) CR does not match `spec.originalUID` in the new CR.
- The originalUID is only essential when the subsystem CR name exceeds 15 characters in length, or 10 characters limit for the API Connect Cluster CR. Recommended practice is that all backups should include the originalUID for Management.
- See also Step 2.d in [Preparing the management subsystem for disaster recovery](#).

- g. Verify that the name of the management subsystem in the CR matches with the old management subsystem name, as described in Step 2.d in [Preparing the management subsystem for disaster recovery](#).

4. Install the Management subsystem CR with the values obtained in Step 2.d in [Preparing the management subsystem for disaster recovery](#).

Important: The hostnames of the endpoints cannot be changed, and must remain the same in the Management CR YAML file used for installation now as they were for the original installation.

To review installation of the management subsystem, see [Installing the Management subsystem cluster](#).

5. Get a list of available backups and confirm that the backup ID noted in Step 1 is in the backup list.

The API Connect Operator automatically reads backups from configured remote storage and populates the list of available backups we can restore to.

```
$ kubect1 get mgmtb
NAME                STATUS    ID                CLUSTER                SUBSYSTEM    TYPE    CR TYPE    AGE
mgmt-backup-4z87f   Complete  20200606-145011F  m1-82b290a2-postgres  m1          full    record    11m
mgmt-backup-6bms2   Complete  20200606-144315F  m1-82b290a2-postgres  m1          full    record    11m
```

6. Perform a Management Restore using the name of the backup that has the ID you want to restore. For example, as shown in Step 5, for ID `20200606-145011F` the backup name is `mgmt-backup-4z87f`.

For more info on restoring the management subsystem, see [Restoring the management subsystem \(v10.0.1.1 or later\)](#).

7. Use the following command to check the status of the restore:

```
kubectl get mgmtr -n <namespace>
```

Once the Management Restore has completed and the database is running again, the data of the old Management subsystem will be successfully restored onto the new Management subsystem. Manual and scheduled backups should perform as normal once again.

What to do next

You should now complete the recovery steps for the Developer Portal subsystem on Kubernetes, see [Recovering the Developer Portal after a disaster](#).

Recovering the Developer Portal after a disaster

You can restore the Developer Portal subsystem after a disaster event.

Before you begin

Important: Successful disaster recovery depends on recovery of both the Management subsystem and the Developer Portal subsystem. You must complete preparation steps for both subsystems in order to achieve disaster recovery. If you have to perform a restore, you must complete the restoration of the Management Service first, and then immediately restore the Developer Portal. Therefore, the backups of the Management and Portal must be taken at the same time, to ensure that the Portal sites are consistent with Management database.

About this task

To recover from a disaster event, you must create a new IBM API Connect installation with a running IBM API Connect Operator.

Note: Limitation for backups created on Version 10.0.2:

- If restoring a Version 10.0.2 backup onto a new Version 10.0.2 deployment, performing a restore may not work if the subsystem CR name exceeds 15 characters. This limitation applies only to restoring onto Version 10.0.2.
- Restoration is supported for Version 10.0.2 backups onto a Version 10.0.3.0 or later deployment when subsystem name exceeds 15 characters, as long as the correct `spec.originalUID` is specified upon restore. See Step [1.f](#).

Procedure

1. To prepare for the restoration, you must complete some steps before you reinstall the Developer Portal subsystem.

Warning:

- Ensure that the hostnames of the endpoints remain the same in the Developer Portal subsystem that is used for installation now as they were for the original installation. The hostnames for the endpoints cannot be changed.
- a. Ensure that the Developer Portal backup subsystem secret is created in the cluster.
This secret contains the credentials (username and password) for the remote storage, such as S3 or IBM Cloud Object Storage, that is used for storing the database backups. This secret must be the same secret as used for the original installation.
- b. Ensure that the Developer Portal subsystem is configured for database backups.
Configuration is done by adding a `databaseBackups` subsection to the `spec` subsection of the Developer Portal subsystem Custom Resource (CR) YAML file, `portal_cr.yaml`. The file is located in the `helper_files` archive that was extracted as part of the preparation for installation. See [Backing up and restoring the Developer Portal in a Kubernetes environment](#).

For example:

```
portalBackup:
  credentials: portal-backup-secret
  host: <backup-host>
  path: <backup-path>
  port: 22
  protocol: sftp
  schedule: ''
```

The `host` and `path` must be the same as was specified for the original installation so that the IBM API Connect Operator can access the saved Developer Portal database backups.

- c. Apply the saved YAML file that contains the Developer Portal database encryption secret into the cluster.
Use the following command, where `portal_enc_key.yaml` is the local YAML file that contains the backup encryption secret. Replace `<namespace>` with the namespace that is being used for subsystem installation:

```
kubectl apply -f portal_enc_key.yaml -n <namespace>
```

This command re-creates the original Developer Portal database encryption secret on the cluster, which is named as the original name of the secret.

- d. Add the `encryptionSecret` to the Developer Portal subsystem Custom Resource (CR) YAML file, `portal_cr.yaml`.
For example, add the following `encryptionSecret` subsection to the `spec` section. In this example, `portal-enc-key` is the name of the new created secret on the cluster that contains the original Developer Portal Database Encryption Secret. The name of the secret that is created in Step [1.a](#) is used here:

```
encryptionSecret:
  secretName: portal-enc-key
```

- e. Ensure the name `spec.metadata.name` of the new Developer Portal cluster CR is the same as the previous Developer Portal CR.
- f. **Version 10.0.3.0 or later:** Add the `originalUID` property to the `spec` of the Portal CR.
When recreating a system, to restore a backup into it, you must specify the same `spec.originalUID` in the CR as was present in the system that was backed up. If the `spec.originalUID` in the new CR for recreating the system does not match the `spec.originalUID` that was present in the system that was backed up, the restore will fail.

```
spec:
  originalUID: "447ea4b3-9514-4a84-a34b-ce0b349838da"
```

Note:

- For Version 10.0.3.0 or later, if you do not specify `spec.originalUID` in the new CR, the operator automatically sets the Portal CR value of `spec.originalUID` to match the new CR value `metadata.uid`. In this case, the restore will fail because the `spec.originalUID` in the saved (backed-up) CR does not match `spec.originalUID` in the new CR.
- The originalUID is only essential when the subsystem CR name exceeds 15 characters in length, or 10 characters limit for the API Connect Cluster CR. Recommended practice is that all backups should include the originalUID for Portal.
- See also [Preparing the Developer Portal for disaster recovery](#).

g. Ensure that the endpoint definitions are the same as the previous Developer Portal CR.

2. Apply the Developer Portal subsystem custom resource (CR) YAML file (`portal_cr.yaml`) to the cluster as documented as part of the original installation instructions.

You can do this step now because the secrets are re-created, and additions made to `portal_cr.yaml`.

Note: Wait for the Developer Portal subsystem to become fully up and running before proceeding.

3. Use the following command to check that the Developer Portal database backups that are stored in the configured cloud storage are now present as Developer Portal backup CRs:

Note: You might wait for the cron job at the 10th minute `*/10 * * * *` to re-create your Developer Portal backup CRs.

```
kubect1 get portalbackups -n <namespace>
```

For example:

```
loginabc@localhost ibm-apiconnect]$ kubect1 get pb
NAME                ID                STATUS    TYPE    CR TYPE    AGE    COMMENT
portal-bup-g66gv    Ready            site     create  5m27s     Y
portal-bup-z7wgk    20201001.100021  Ready    site     record     4m24s
```

The **AGE** of each is new.

4. Perform a Developer Portal restore. See [Backing up and restoring the Developer Portal in a Kubernetes environment](#)

For a disaster recovery scenario, it is advised that you restore all sites and systems. `portalCluster` is the name of the portal cluster you want to restore. An example restore CR:

```
apiVersion: portal.apiconnect.ibm.com/v1beta1
kind: PortalRestore
metadata:
  generateName: portal-restore-
spec:
  type: all
  dryRun: false
  portalCluster: portal
  timestamp: now
  priorityList:
  - myportal-critical-site.com
  - myportal-important.com
```

5. When the Developer Portal restore CR is marked as **Ready**, the Disaster recovery is complete for the Developer Portal.

```
kubect1 get portalrestore
```

6. Verify that you can access the restored Developer Portal sites and that you are able to log in to each one. The restore from the disaster event is now complete.

Recovering the Analytics subsystem after a disaster

Recover the API Connect Analytics subsystem in a Kubernetes environment.

About this task

Recovering the Analytics subsystem involves deploying a new installation of the Analytics subsystem, updating it with a saved copy of the Custom Resource (CR) that was originally used for installing Analytics, and then restoring the Analytics database from a back-up copy.

Procedure

1. Deploy the Analytics subsystem by applying the `analytics_cr.yaml` CR to the cluster as explained in [Installing analytics](#).
2. Restore your local copy of the original AnalyticsCluster CR by running the following command:

```
kubect1 apply -f gj01-analytics.yaml
```

Replace `gj01-analytics.yaml` with the file name that you used for your saved CR.

3. Restore the Analytics data from a back up, as explained in [Restoring the Analytics database](#).

Disaster recovery on OpenShift and Cloud Pak for Integration

Prepare for, or recover from, a disaster affecting an API Connect deployment running on OpenShift or Cloud Pak for Integration

You must complete preparation steps prior to a disaster in order to recover API Connect.

- [Preparing for disaster recovery on OpenShift](#)
Back up data and essential deployment information from each API Connect subsystem so that you can use it to recover your deployment after a disaster.
- [Recovering from a disaster on OpenShift](#)
Install and configure API Connect, then restore backed up data to recover the deployment after a disaster.
- [Preparing for disaster recovery on Cloud Pak for Integration](#)
Back up data and essential deployment information from each API Connect subsystem so that you can use it to recover your deployment after a disaster.
- [Recovering from a disaster on Cloud Pak for Integration](#)
Install and configure API Connect, then restore the backed up data to recover the deployment after a disaster.

Preparing for disaster recovery on OpenShift

Back up data and essential deployment information from each API Connect subsystem so that you can use it to recover your deployment after a disaster.

About this task

To prepare your deployment for disaster, complete this task to copy the API Connect deployment settings, and then proceed to the following tasks to backup additional information for each subsystem.

Procedure

Complete the following steps to copy the API Connect deployment settings for use when you recover the deployment.

1. Find the API Connect cluster's name by running the following command and looking for the value in the NAME column:

```
oc get APICConnectCluster
```

The response looks like the following example:

NAME	READY	STATUS	VERSION	RECONCILED	VERSION	AGE
apic-cluster	7/7	Running	10.0.3	10.0.3-149		6d4h

2. Create a back-up copy of the installation CR for each subsystem, as well as the top-level APICConnectCluster CR, with the following commands:

```
a. oc -n <APIC_namespace> get apiconnectcluster apic-cluster-name -o yaml > apic-cluster-cr.yaml
```

```
b. oc -n <APIC_namespace> get mgmt apic-cluster-name-mgmt -o yaml > mgmt-susbsystem-cr.yaml
```

```
c. oc -n <APIC_namespace> get a7s apic-cluster-name-a7s -o yaml > a7s-susbsystem-cr.yaml
```

```
d. oc -n <APIC_namespace> get ptl apic-cluster-name-ptl -o yaml > ptl-susbsystem-cr.yaml
```

What to do next

Proceed to [Preparing the Management subsystem for disaster recovery on OpenShift](#).

1. [Preparing the Management subsystem for disaster recovery on OpenShift](#)
Back up data and essential deployment information so that you can use it to recover your deployment after a disaster.
2. [Preparing the Portal subsystem for disaster recovery on OpenShift](#)
Back up data and essential deployment information so that you can use it to recover your deployment after a disaster.
3. [Preparing the Analytics subsystem for disaster recovery on OpenShift](#)
Back up data and essential deployment information so that you can use it to recover your deployment after a disaster.

Preparing the Management subsystem for disaster recovery on OpenShift

Back up data and essential deployment information so that you can use it to recover your deployment after a disaster.

About this task

Make sure to store all backups and deployment information to a secure location where you can access it after a disaster. You cannot recover a deployment without the information that you collect during this task.

Procedure

1. Save a copy of the Management database encryption secret.
 - a. Run the following command to get the name of the encryption secret:

```
oc get mgmt -n <APIC_namespace> -o yaml | grep encryption
```

The output of this command shows the name of the secret that is storing the database encryption key, for example:

```
encryptionSecret: management-enc-key
```

- b. Run the following command to save a local copy of the secret as a YAML file:

```
oc get secret management-enc-key -n <APIC-namespace> -o yaml > management-enc-key.yaml
```

2. Save a copy of the Management client application credential secrets.

Save the credential secrets (the `client_id` and `client_secret`) for client applications provided by the Management subsystem.

a. Run the following command to get the names of the secrets:

```
oc get mgmt -n <APIC-namespace> -o yaml | grep CredentialSecret
```

The output of this command shows the names of the secrets used to store each of the client application credentials. For example:

```
atmCredentialSecret: production-mgmt-atm-cred
consumerToolkitCredentialSecret: production-mgmt-ccli-cred
consumerUICredentialSecret: production-mgmt-cui-cred
designerCredentialSecret: production-mgmt-dsgr-cred
governanceCredentialSecret: production-mgmt-governance-cred
juhuCredentialSecret: production-mgmt-juhu-cred
toolkitCredentialSecret: production-mgmt-cli-cred
uiCredentialSecret: production-mgmt-ui-cred
```

b. Run the following command to save a local copy of each secret as a YAML file, replacing `<secret_name>` with the name of the application credential secret:

```
oc get secret <secret_name> -n <APIC-namespace> -o yaml > <secret_name>.yaml
```

c. Edit each of the saved YAML files and remove both the `ownerReferences` subsection and the `selfLink` property, and then save the updated file.

The information to remove looks like the following example:

```
ownerReferences:
- apiVersion: management.apiconnect.ibm.com/v1beta1
  blockOwnerDeletion: true
  controller: true
  kind: ManagementCluster
  name: management
  uid: 623e6b20-7eb8-46ce-94ac-6b64cd71afc4
  selfLink: /api/v1/namespaces/default/secrets/management-atm-cred
```

3. Run a backup of the Management subsystem database.

a. [Configure the Management subsystem for backups.](#)

b. [Perform a backup of the Management subsystem.](#)

c. Get the name and ID of the newest Management backup and save them for reference during a recovery.

Run the following command to list the Management backups:

```
oc get mgmtb -n <APIC-namespace>
```

The response looks like the following example; the newest backup is the one with the smallest `AGE`:

NAME	STATUS	ID	CLUSTER	TYPE	CR TYPE	AGE
management-3aa3bebf	Ready	20200929-152150F	management	full	record	10h
management-3c4ca8df	Ready	20200929-115520F	management	full	record	20h
management-5tbxj	Ready	20200929-224349F	management	full	create	17h
management-f10af337	Ready	20200925-133703F	management	full	record	5d2h
management-jtlcd	Ready	20200929-224349F	management	full	create	25h
management-zxjtz	Ready	20200929-224349F	management	full	create	28h

4. Save a copy of the username and password for a Cloud Manager administrator.

When you recover the deployment, you will need to log in to the Cloud Manager as an administrator using the Cloud Manager User Registry. Any user with Administrator permission defined in the Cloud Manager User Registry can be used. Before backing up the information, verify that you can log in to Cloud Manager using that account.

If you want to backup the secret that contains the administrator password that was created by the API Connect operator during the original deployment, run the following command to get the secret:

```
oc --kubeconfig kubeconfig -n <APIC_namespace> get secret <instance-name>-mgmt-admin-pass -o jsonpath="{.data.password}" | base64 -d
```

It is possible that the password was changed at some point and the secret is now out-of-date. Be sure to verify that you can log in to Cloud Manager with the password contained in the secret. If the password is not valid, then make sure you have another Cloud Manager administrator account in the Cloud Manager User Registry, and back up that username and password instead.

5. Copy all of the information that you saved to a secure location.

What to do next

Immediately proceed to [Preparing the Portal subsystem for disaster recovery on OpenShift.](#)

Important: Backups of the Management and Portal subsystems must be performed in sequence, and close together in time, to ensure that the Portal sites are consistent with Management database.

Next topic: [Preparing the Portal subsystem for disaster recovery on OpenShift](#)

Preparing the Portal subsystem for disaster recovery on OpenShift

Back up data and essential deployment information so that you can use it to recover your deployment after a disaster.

Before you begin

[Perform a backup of the Management subsystem.](#)

Important: Backups of the Management and Portal subsystems must be performed in sequence, and close together in time, to ensure that the Portal sites are consistent with Management database.

About this task

Make sure to store all backups and deployment information to a secure location where you can access it after a disaster. You cannot recover a deployment without the information that you collect during this task.

Procedure

1. Save the ID of the Portal subsystem.

If your original CR **name** was 10 characters or longer, you must add the **originalUID** (Version 10.0.3 or later) or **metadata.uid** (Version 10.0.2 or earlier) value from the original Portal subsystem into the appropriate section of the installation CR during the recovery process.

When you deployed API Connect using the top-level APICConnectCluster CR, the deployment settings were added to subsystem-specific CRs that are managed by the top-level CR. When you recover the Portal subsystem after a disaster, you can locate the subsystem's ID in the saved copy of the Portal subsystem CR.

- a. Find the API Connect cluster's name by running the following command and looking for the value in the NAME column:

```
oc get APICConnectCluster
```

The response looks like the following example:

NAME	READY	STATUS	VERSION	RECONCILED	VERSION	AGE
apic-cluster-name	7/7	Running	10.0.3	10.0.3-149		6d4h

- b. Get the YAML that describes the Portal subsystem CR and save it in a file using the following command:

```
oc get ptl apic-cluster-name-ptl -o yaml > apic-cluster-name-ptl.yaml
```

2. Back up the Developer Portal database encryption secret.

- a. Run the following command to get the name of the encryption secret:

```
oc get ptl -n <APIC-namespace> -o yaml | grep encryption
```

The output of this command shows the name of the secret that is storing the database encryption key, for example:

```
encryptionSecret: portal-enc-key
```

- b. Run the following command to save a local copy of the secret as a YAML file:

```
oc get secret portal-enc-key -n <APIC-namespace> -o yaml > portal-enc-key.yaml
```

3. Back up the Portal endpoint definitions.

Save the information to a file because you must use the same names in the recovered deployment.

- a. Get the **portalAdminEndpoint** definition by running the following command:

```
oc get route | grep portal-director | awk '{print $2}'
```

The response looks like the following example:

```
dr-ptl-portal-director-apic.apps.vlxocp-1556.cp.fyre.ibm.com
```

- b. Get the **portalUIEndpoint** definition by running the following command:

```
oc get route | grep portal-web | awk '{print $2}'
```

The response looks like the following example:

```
dr-ptl-portal-web-apic.apps.vlxocp-1556.cp.fyre.ibm.com
```

4. Back up the Portal subsystem database.

- a. [Configure the Portal subsystem for backups.](#)

- b. [Perform a backup of the Portal subsystem.](#)

Note: Make sure that you set the property **type: all** when you backup the Portal database, to ensure that you capture data for the Portal subsystem and all Portal sites.

- c. Get the name of the newest Portal backup and save it for reference during a recovery.

Run the following command to list the Portal backups:

```
oc get portalbackup -n <APIC-namespace>
```

The response looks like the following example; the newest backup is the one with the smallest **AGE**:

NAME	ID	TASK ID	STATUS	TYPE	CR TYPE	CLUSTER	AGE	COMMENT
portal-manual-bup-9lghk	n/a	p5rkbbpyejrbqjab	Ready	all	create	production-ptl	15h	test comment
portal-manual-bup-jqbdm	n/a	cn8frkey1vgbls2u	Ready	all	create	production-ptl	15h	test comment

5. Copy all of the information that you saved to a secure location.

What to do next

Proceed to [Preparing the Analytics subsystem for disaster recovery on OpenShift.](#)

Previous topic: [Preparing the Management subsystem for disaster recovery on OpenShift](#)

Next topic: [Preparing the Analytics subsystem for disaster recovery on OpenShift](#)

Preparing the Analytics subsystem for disaster recovery on OpenShift

Back up data and essential deployment information so that you can use it to recover your deployment after a disaster.

About this task

Make sure to store all backups and deployment information to a secure location where you can access it after a disaster. You cannot recover a deployment without the information that you collect during this task.

Procedure

1. Backup the Analytics subsystem database.

- a. [Configure the Analytics subsystem for backups.](#)
- b. [Perform a backup of the Analytics subsystem.](#)

Note: Be sure to specify `indices: all` when you backup the Analytics database. Backing up a full set of indices ensures that your complete Analytics configuration, event data, and custom UI configuration (such as custom dashboards) can be restored.

- c. Get the name of the newest Analytics backup and save it for reference during a recovery.

Run the following command to list the Analytics backups:

```
oc get analyticsbackup -n <APIC-namespace>
```

The response looks like the following example; the newest backup is the one with the smallest `AGE`:

NAME	STATUS	ID	CR TYPE	INDICES	AGE	COMMENT
a7s-bup-266p8	Ready		create	[all]	20h	y
a7s-bup-pffdh	Ready		create	[all]	34h	y
analytics-bup-kxwq5	Ready	analytics-all-2020-09-07t03:49:15utc	record	[ui apievents config]	34h	
analytics-bup-p29z8	Ready	analytics-all-2020-09-07t18:04:03utc	record	[ui apievents config]	20h	

2. Copy all of the information that you saved to a secure location.

Previous topic: [Preparing the Portal subsystem for disaster recovery on OpenShift](#)

Recovering from a disaster on OpenShift

Install and configure API Connect, then restore backed up data to recover the deployment after a disaster.

Before you begin

To successfully recover API Connect from a disaster, you must have previously completed the steps to prepare the Management, Portal, and Analytics subsystems for disaster recovery. Make sure that you can access the backups and deployment information because you cannot recover your deployment without it.

Attention: Successful disaster recovery depends on recovery of both the Management subsystem and the Developer Portal subsystem. You must complete preparation steps for both subsystems in order to achieve disaster recovery. If you have to perform a restore, you must complete the restoration of the Management Service first, and then immediately restore the Developer Portal.

About this task

To recover from a disaster event, recreate your API Connect Cluster CR and add recovery details as explained in the following procedure. Use the file containing the original CR (which you saved during the preparation task) as a reference.

Important: Do not install API Connect until you have configured the CR as explained in this task.

Procedure

1. Make a local copy of the `apiconnectcluster_cr.yaml` template custom resource so that you can customize it for your deployment.

Template files are stored in `helper_files.zip`. For both OpenShift and CP4I, you can configure settings directly in the YAML file as explained in this task. In CP4I, you will then copy the YAML code and paste it in using the YAML tab in IBM Cloud Pak Platform UI.

2. Configure backup and restore settings for each subsystem.

Remember to create the backup secret for each subsystem as well, using the same name that you used in the original deployment (you can see the name in the `credentials` setting of each subsystem's backup section). The backup and restore settings, including the secrets, must exactly match the settings that you created in the original deployment. See the following topics for instructions on configuring backup and restore settings:

- [Configuring backup settings for a fresh install of the Management subsystem on OpenShift or Cloud Pak for Integration](#)
- [Configuring backups for Developer Portal on OpenShift and Cloud Pak for Integration](#)
- [Configuring backup settings for Analytics on OpenShift and Cloud Pak for Integration](#)

Note:

During the disaster recovery process, the S3 configuration detail of the older management system is used, but the older management system must be in offline mode. The old subsystem must be offline because you cannot have two management systems simultaneously using the same s3 bucket name in the database backup configurations.

3. Apply the Management and Portal encryption secrets to the cluster.

- a. Apply the YAML file that contains the Management database encryption secret into the cluster.

Run the following command, using the filename of the encryption secret that you saved when you prepared the Management subsystem for disaster recovery:

```
oc -n <APIC_namespace> apply -f mgmt-enc-key.yaml
```

b. Apply the YAML file that contains the Portal encryption secret into the cluster.

Run the following command, using the filename of the encryption secret that you saved when you prepared the Portal subsystem for disaster recovery:

```
oc -n <APIC_namespace> apply -f portal-enc-key.yaml
```

4. Important: Make sure that your new version of the API Connect Cluster installation CR uses the same value for the **name** setting as the original CR. Edit the YAML file that you copied from the template in the `helper_files.zip`. In the following steps, you will configure additional deployment and recovery settings in the new API Connect Cluster installation CR before you install API Connect.

5. Add the Management and Portal encryption secrets to the API Connect Cluster CR.

Add each secret to the appropriate `spec.subsystem` section of the CR, as shown in the following example:

```
spec:
  management:
    encryptionSecret:
      secretName: mgmt-enc-key
  portal:
    encryptionSecret:
      secretName: portal-enc-key
```

6. Apply each of the Management client application credential secrets to the cluster.

Run the following command to apply each secret, using the filename of each client application credential secret that you saved when you prepared the Management subsystem for disaster recovery:

```
oc -n <APIC_namespace> apply -f <secretName>.yaml
```

For example, a deployment might use the following names for the secrets:

```
atmCredentialSecret: management-atm-cred
consumerToolkitCredentialSecret: management-ccli-cred
consumerUICredentialSecret: management-cui-cred
designerCredentialSecret: management-dsgr-cred
governanceCredentialSecret: management-governance-cred
juhuCredentialSecret: management-juhu-cred
toolkitCredentialSecret: management-cli-cred
uiCredentialSecret: management-ui-cred
```

7. Add the credential secrets to the `spec.management` section of API Connect Cluster CR.

For example:

```
spec:
  management:
    customApplicationCredentials:
      - name: atm-cred
        secretName: management-atm-cred
      - name: governance-cred
        secretName: management-governance-cred
      - name: ccli-cred
        secretName: management-ccli-cred
      - name: cui-cred
        secretName: management-cui-cred
      - name: dsgr-cred
        secretName: management-dsgr-cred
      - name: juhu-cred
        secretName: management-juhu-cred
      - name: cli-cred
        secretName: management-cli-cred
      - name: ui-cred
        secretName: management-ui-cred
```

8. Add the `siteName` property to the `spec.management` and `spec.portal` sections of the API Connect Cluster CR.

For example, if the `a2a5e6e2` is the original `siteName` of the Management subsystem, and `890772e3` is the original `siteName` of the Developer Portal subsystem, the CR looks like the following example:

```
spec:
  management:
    siteName: "a2a5e6e2"
  portal:
    siteName: "890772e3"
```

9. If your original CR `name` was 10 characters or longer, you must add the `originalUID` or `metadata.uid` value from the original Management and Portal subsystems into the appropriate sections of the installation CR.

Important: If your original CR name was 10 characters or longer and you do not add this value, the deployments and routes that are generated during installation will include a different UID, which will cause the recovery process to fail.

The IDs were created with the original deployment of the Management and Portal subsystems, and the recovered subsystems must continue to use the same IDs. You can locate the ID in the Management (`apic-cluster-name-mgt.yaml`) or Portal (`apic-cluster-name-ptl.yaml`) CR that you saved while preparing for disaster recovery. (Do not use the `metadata.uid` setting from the API Connect Cluster CR).

The CR setting that contains the ID depends on the version of API Connect that you are recovering:

- Version 10.0.3 or later: `spec.originalUID`
- Version 10.0.2 or earlier: `metadata.uid`

Locate each of the original settings in the appropriate subsystem CR, and copy them to corresponding sections of the new API Connect Cluster CR using the same key and value.

For example, if you originally deployed version 10.0.2, the setting name was `uid`. If you are deploying Version 10.0.3 as part of disaster recover, copy the original value and use it for the `originalUID` setting in the new CR. For example, in 10.0.3:

```
spec:
  management:
    originalUID: "fa0f6f49-b931-4472-b84d-0922a9a92dfd"
  portal:
    originalUID: "447ea4b3-9514-4a84-a34b-ce0b349838da"
```

10. If you installed the API Connect using an S3 provider for the Management subsystem backups, add the following annotation to the `apiconnectcluster` CR. If you specified SFTP or local as the backup, skip this step.

- Using the Platform UI:
 - Edit the API Management instance and click the YAML tab to edit the CR.
 - Add the following statement to the `spec.metadata.annotations` section:

```
apiconnect-operator/deployment-mode: disasterRecovery
```

For example:

```
metadata:
  annotations:
    apiconnect-operator/deployment-mode: disasterRecovery
```

- Using the CLI:
 - Get the name of the CR by running the following command:

```
oc get apiconnectcluster -o name -n <APIC_namespace>
```

The response looks like the following example:

```
apiconnectcluster.apiconnect.domain/instance_name
```

- Add the following annotation to the `spec.metadata.annotations` section of the CR by running the following command:

```
oc annotate apiconnectcluster/instance_name apiconnect-operator/deployment-mode="disasterRecovery" -n <APIC_namespace>
```

The response looks like the following example:

```
apiconnectcluster.apiconnect.domain/instance_name annotated
```

11. Verify that you correctly added all of the settings to the API Connect Cluster CR. For example, the completed CR might look like the following example:

```
apiVersion: apiconnect.ibm.com/v1beta1
kind: APICConnectCluster
metadata:
  namespace: apiconnect
  name: apis-minimum
  labels:
    app.kubernetes.io/instance: apiconnect
    app.kubernetes.io/managed-by: ibm-apiconnect
    app.kubernetes.io/name: apiconnect-minimum
  annotations:
    apiconnect-operator/deployment-mode: disasterRecovery
spec:
  license:
    accept: true
    license: L-RJON-C2YLGB
    metric: VIRTUAL_PROCESSOR_CORE
    use: nonproduction
  management:
    originalUID: "fa0f6f49-b931-4472-b84d-0922a9a92dfd"
    encryptionSecret:
      secretName: apis-minim-faaa44bf-enc-key
      siteName: "faaa44bf"
    customApplicationCredentials:
      - name: atm-cred
      - secretName: apis-minim-faaa44bf-atm-cred
      - name: governance-cred
      - secretName: management-governance-cred
      - name: ccli-cred
      - secretName: apis-minim-faaa44bf-ccli-cred
      - name: cli-cred
      - secretName: apis-minim-faaa44bf-cli-cred
      - name: cui-cred
      - secretName: apis-minim-faaa44bf-cui-cred
      - name: dsgr-cred
      - secretName: apis-minim-faaa44bf-dsgr-cred
      - name: juhu-cred
      - secretName: apis-minim-faaa44bf-juhu-cred
      - name: ui-cred
      - secretName: apis-minim-faaa44bf-ui-cred
  analytics:
    client: {}
    ingestion: {}

    schedule: 0 1 * * *
version: 10.0.3

```

12. Prepare your environment for installing API Connect by completing the prerequisites and all components of step 1 in [Installing API Connect](#). After you prepare your environment, continue with this procedure to install API Connect and then restore data.

13. Install API Connect by creating the CR with the following command:
Replace `<cr_name>` with the value of the `name` setting in the API Connect Cluster CR.

```
oc -n <APIC_namespace> create -f <cr_name>.yaml
```

14. Wait for **all** subsystems to be created.
When the Management subsystem is installed, you might see `backup` job pods and `stanza-create` job pods in **Error** state; for example:

m1-82b290a2-postgres-stanza-create-4zcgz	0/1	Error	0	35m
m1-82b290a2-postgres-full1-sch-backup-2g9hm	0/1	Error	0	20m

This is expected behavior, for the following reasons:

- The `stanza-create` job normally expects buckets or subdirectories within buckets to be empty. However, since you configured the Management subsystem with your already-populated S3 bucket (where your backups exist), the job will enter the **Error** state.
- Any scheduled or manual backups will enter the **Error** state. Although you configured the Management subsystem with your already-populated S3 bucket, the new database isn't yet configured to write backups into remote storage.

The errors will not prevent a successful restore, so continue to the next step.

Important:

For S3, the recovery remains in an intermediate state until the restore is complete, and Postgres wal files might cause serious disk issues. To avoid this possibility, continue immediately with the next step.

Note that if you delay completion of the restore:

- Health check might fail. In this case, you can still proceed to the next step and perform a restore.
- Postgres wal files might cause problems by consuming all disk space. In this case, you must either:
 - Re-install the system, prepare again for disaster recovery, and perform the restore.
 - Or increase disk space so that the system returns to a stable state, and then proceed with the restore.

15. Restore the subsystems in the following sequence:
 - a. [Restore the Management subsystem](#).
When you perform a restore, you must complete the restoration of the Management subsystem first, and then immediately restore the Portal subsystem.

Important: Be sure to restore the Management subsystem from the backup whose name and ID of the you noted while preparing for disaster recovery.

- b. [Restore the Developer Portal subsystem](#).
Use the restore type `a11` to ensure that you restore the complete subsystem and all Portal sites.
- c. [Restore the Analytics subsystem](#).

16. Version 10.0.2 or earlier: Update the Management OIDC credentials as explained in [Configuring the OIDC credentials on OpenShift](#).

17. Verify that the recovery was successful:
 - a. Ensure that you can log in to the Cloud Manager UI.
 - b. Verify that your provider organizations exist.
 - c. Ensure that you can log in to each Developer portal.
 - d. Ensure that the Analytics dashboard contains all of the analytics data that you preserved.
18. After the successful recovery, remove the annotation that you added to the `apiconnectcluster` CR in step [10](#).
If you skipped step [10](#), then skip this step as well.

- Using the Platform UI:
 - Edit the API Management instance and click the YAML tab to edit the CR.
 - Delete the following statement from the `spec.metadata.annotations` section:

```
apiconnect-operator/deployment-mode: disasterRecovery
```

- Using the CLI:
 - Get the name of the CR by running the following command:

```
oc get apiconnectcluster -o name -n <APIC_namespace>
```

 The response looks like the following example:

```
apiconnectcluster.apiconnect.domain/instance_name
```
 - Remove the annotation by running the following command, making sure to include the trailing "-" on `deployment-mode-` to indicate the removal:

```
oc -n <APIC_namespace> annotate apiconnectcluster/instance_name apiconnect-operator/deployment-mode-
```

 The response looks like the following example:

```
apiconnectcluster.apiconnect.domain/instance_name annotated
```
- [Configuring the OIDC credentials on OpenShift](#)
 When you recover API Connect V10.0.x, you must manually update the values for the Management OIDC credentials (`client_id` and `client_secret`) in the Common Services User Registry.

Configuring the OIDC credentials on OpenShift

When you recover API Connect V10.0.x, you must manually update the values for the Management OIDC credentials (`client_id` and `client_secret`) in the Common Services User Registry.

Before you begin

This task is required for all of the 10.0.x releases up to, and including, version 10.0.2 (skip this task for version 10.0.3 and later). The procedure requires you to log in to the Cloud Manager on the new API Connect deployment. Use the Cloud Manager administrator username and password that you saved while preparing for disaster recovery.

About this task

When you deploy API Connect, the OIDC `client_id` and `client_secret` resources are automatically generated and added to the Common Services User Registry. These resources enable single sign-on with the IBM Cloud Pak platform. When you reinstall API Connect as part of disaster recovery, the original versions of those resources are retained but cannot be used. You must update the Common Services User Registry and replace the original values with the values from the new deployment.

Procedure

1. Retrieve the `client_id` and `client_secret` from the stored secret in API Connect.

- a. Run the following command to retrieve the `client_id`:

```
oc -n <APIC_namespace> get secret <instance_name>-oidc-client -o jsonpath="{.data.CLIENT_ID}" | base64 -D
```

- b. Run the following command to retrieve the `client_secret`:

```
oc -n <APIC_namespace> get secret <instance_name>-oidc-client -o jsonpath="{.data.CLIENT_SECRET}" | base64 -D
```

2. Update the Common Services User Registry with the new values.

Using the Cloud Manager UI:

- a. In API Connect, open the Cloud Manager interface.
- b. Select the Cloud Manager User Registry.
You will use the Cloud Manager User Registry to modify settings for the Common Service User Registry.
- c. Log in to the Cloud Manager User Registry using the administrator username and password that you saved while preparing for disaster recovery.
- d. In Cloud Manager, click **Resources**, **User Registries** and edit Common Services User Registry.
- e. In the Client information section, paste the `client_id` value from step 1 into the Client ID field.
- f. Paste the `client_secret` value from step 1 into the Client secret field.
- g. Save your changes.

Using the toolkit CLI:

- a. Run the following command to determine the `<mgmt_endpoint_url>` that you will use for accessing the management server:

```
oc -n <APIC_namespace> get mgmt <instance_name> -o jsonpath="{.status.zenRoute}" && echo ""
```

- b. Log in to the management server:

- i. Run the following command to start the login process:

```
apic login --server <mgmt_endpoint_url>
```

- ii. Provide your login credentials:

- **Realm?** Type your realm (for example: `admin/default-idp-1`) and press Enter.
The realm refers to your identity provider. For information on determining your realm value, see [How to determine the identity provider](#).
- **Username?** Type your Cloud Manager administrator username and press Enter.
- **Password?** Type the password for your Cloud Manager administrator account and press Enter.

- c. Run the following command to download the Common Service User Registry as a YAML file:

```
apic user-registries:get common-services --server <mgmt_endpoint_url> -o admin --fields name,configuration
```

- d. Edit the file and update the `client_ID` and `client_secret` settings with the values you obtained in step 1.
- e. Save and close the file.
- f. Run the following command to upload the modified file to Cloud Manager:

```
apic user-registries:update common-services --server <mgmt_endpoint_URL> -o admin common-services.yaml
```

Preparing for disaster recovery on Cloud Pak for Integration

Back up data and essential deployment information from each API Connect subsystem so that you can use it to recover your deployment after a disaster.

About this task

To prepare your deployment for disaster, complete this task to copy the API Connect deployment settings, and then proceed to the following tasks to backup additional information for each subsystem.

Procedure

Complete the following steps to copy the API Connect deployment settings for use when you recover the deployment.

1. Find the API Connect cluster's name by running the following command and looking for the value in the NAME column:

```
oc get APICConnectCluster
```

The response looks like the following example:

NAME	READY	STATUS	VERSION	RECONCILED	VERSION	AGE
apic-cluster	7/7	Running	10.0.3	10.0.3-149		6d4h

2. Create a back-up copy of the installation CR for each subsystem, as well as the top-level APICConnectCluster CR, with the following commands:

```
a. oc -n <APIC_namespace> get apiconnectcluster apic-cluster-name -o yaml > apic-cluster-cr.yaml
```

```
b. oc -n <APIC_namespace> get mgmt apic-cluster-name-mgmt -o yaml > mgmt-susbsystem-cr.yaml
```

```
c. oc -n <APIC_namespace> get a7s apic-cluster-name-a7s -o yaml > a7s-susbsystem-cr.yaml
```

```
d. oc -n <APIC_namespace> get ptl apic-cluster-name-ptl -o yaml > ptl-susbsystem-cr.yaml
```

What to do next

Proceed to [Preparing the Management subsystem for disaster recovery on Cloud Pak for Integration](#).

1. [Preparing the Management subsystem for disaster recovery on Cloud Pak for Integration](#)
Back up data and essential deployment information so that you can use it to recover your deployment after a disaster.
2. [Preparing the Portal subsystem for disaster recovery on Cloud Pak for Integration](#)
Back up data and essential deployment information so that you can use it to recover your deployment after a disaster.
3. [Preparing the Analytics subsystem for disaster recovery on Cloud Pak for Integration](#)
Back up data and essential deployment information so that you can use it to recover your deployment after a disaster.

Preparing the Management subsystem for disaster recovery on Cloud Pak for Integration

Back up data and essential deployment information so that you can use it to recover your deployment after a disaster.

About this task

Make sure to store all backups and deployment information to a secure location where you can access it after a disaster. You cannot recover a deployment without the information that you collect during this task.

Procedure

1. Save a copy of the Management database encryption secret.
 - a. Run the following command to get the name of the encryption secret:

```
oc get mgmt -n <APIC_namespace> -o yaml | grep encryption
```

The output of this command shows the name of the secret that is storing the database encryption key; for example:

```
encryptionSecret: management-enc-key
```

- b. Run the following command to save a local copy of the secret as a YAML file:

```
oc get secret management-enc-key -n <APIC_namespace> -o yaml > management-enc-key.yaml
```

2. Save a copy of the Management client application credential secrets.
Save the credential secrets (the `client_id` and `client_secret`) for client applications provided by the Management subsystem.

- a. Run the following command to get the names of the secrets:

```
oc get mgmt -n <APIC-namespace> -o yaml | grep CredentialSecret
```

The output of this command shows the names of the secrets used to store each of the client application credentials; for example:

```
atmCredentialSecret: management-atm-cred
consumerToolkitCredentialSecret: management-ccli-cred
consumerUICredentialSecret: management-cui-cred
designerCredentialSecret: management-dsgr-cred
governanceCredentialSecret: management-governance-cred
juhuCredentialSecret: management-juhu-cred
toolkitCredentialSecret: management-cli-cred
uiCredentialSecret: management-ui-cred
```

- b. Run the following command to save a local copy of each secret as a YAML file, replacing `<secret_name>` with the name of the application credential secret:

```
oc get secret <secret_name> -n <APIC-namespace> -o yaml > <secret_name>.yaml
```

- c. Edit each of the saved YAML files and remove both the `ownerReferences` subsection and the `selfLink` property, and then save the updated file. The information to remove looks like the following example:

```
ownerReferences:
- apiVersion: management.apiconnect.ibm.com/v1beta1
  blockOwnerDeletion: true
  controller: true
  kind: ManagementCluster
  name: management
  uid: 623e6b20-7eb8-46ce-94ac-6b64cd71afc4
selfLink: /api/v1/namespaces/default/secrets/management-atm-cred
```

3. Save a copy of the CP4I credentials secret.

- a. Run the following command to get the name of the encryption secret and save a local copy of the secret as a YAML file:

```
oc get secrets <instance_name>-cp4i-creds -o yaml > <cp4i_creds_secret>.yaml
```

- b. Edit the saved YAML file and remove both the `ownerReferences` subsection and the `selfLink` property, and then save the updated file.

4. Run a backup of the Management subsystem database.

- a. [Configure the Management subsystem for backups.](#)
- b. [Perform a backup of the Management subsystem.](#)
- c. Get the name and ID of the newest Management backup and save them for reference during a recovery. Run the following command to list the Management backups:

```
oc get mgmtb -n <APIC-namespace>
```

The response looks like the following example; the newest backup is the one with the smallest `AGE`:

NAME	STATUS	ID	CLUSTER	TYPE	CR TYPE	AGE
management-3aa3bebf	Ready	20200929-152150F	management	full	record	10h
management-3c4ca8df	Ready	20200929-115520F	management	full	record	20h
management-5tbxj	Ready	20200929-224349F	management	full	create	17h
management-f10af337	Ready	20200925-133703F	management	full	record	5d2h
management-jt1cd	Ready	20200929-224349F	management	full	create	25h
management-zxjtz	Ready	20200929-224349F	management	full	create	28h

5. Save a copy of the username and password for a Cloud Manager administrator.

When you recover the deployment, you will need to log in to the Cloud Manager as an administrator using the Cloud Manager User Registry. Any user with Administrator permission defined in the Cloud Manager User Registry can be used. Before backing up the information, verify that you can log in to Cloud Manager using that account.

If you want to backup the secret that contains the administrator password that was created by the API Connect operator during the original deployment, run the following command to get the secret:

```
oc -n <APIC_namespace> get secret <instanceName>-mgmt-admin-pass -o jsonpath="{.data.password}" | base64 -d
```

It is possible that the password was changed at some point and the secret is now out-of-date. Be sure to verify that you can log in to Cloud Manager with the password contained in the secret. If the password is not valid, then make sure you have another Cloud Manager administrator account in the Cloud Manager User Registry, and back up that username and password instead.

6. Copy all of the information that you saved to a secure location.

What to do next

Immediately proceed to [Preparing the Portal subsystem for disaster recovery on Cloud Pak for Integration](#).

Important: Backups of the Management and Portal subsystems must be performed in sequence, and close together in time, to ensure that the Portal sites are consistent with Management database.

Next topic: [Preparing the Portal subsystem for disaster recovery on Cloud Pak for Integration](#)

Preparing the Portal subsystem for disaster recovery on Cloud Pak for Integration

Back up data and essential deployment information so that you can use it to recover your deployment after a disaster.

Before you begin

[Perform a backup of the Management subsystem.](#)

Important: Backups of the Management and Portal subsystems must be performed in sequence, and close together in time, to ensure that the Portal sites are consistent with Management database.

About this task

Make sure to store all backups and deployment information to a secure location where you can access it after a disaster. You cannot recover a deployment without the information that you collect during this task.

Procedure

1. Save the ID of the Portal subsystem.

If your original CR **name** was 10 characters or longer, you must add the **originalUID** (Version 10.0.3 or later) or **metadata.uid** (Version 10.0.2 or earlier) value from the original Portal subsystem into the appropriate section of the installation CR during the recovery process.

When you deployed API Connect using the top-level APICConnectCluster CR, the deployment settings were added to subsystem-specific CRs that are managed by the top-level CR. When you recover the Portal subsystem after a disaster, you can locate the subsystem's ID in the saved copy of the Portal subsystem CR.

- a. Find the API Connect cluster's name by running the following command and looking for the value in the NAME column:

```
oc get APICConnectCluster
```

The response looks like the following example:

NAME	READY	STATUS	VERSION	RECONCILED VERSION	AGE
apic-cluster-name	7/7	Running	10.0.3	10.0.3-149	6d4h

- b. Get the YAML that describes the Portal subsystem CR and save it in a file using the following command:

```
oc get ptl apic-cluster-name-ptl -o yaml > apic-cluster-name-ptl.yaml
```

2. Back up the Developer Portal database encryption secret.

- a. Run the following command to get the name of the encryption secret:

```
oc get ptl -n <APIC-namespace> -o yaml | grep encryption
```

The output of this command shows the name of the secret that is storing the database encryption key, for example:

```
encryptionSecret: portal-enc-key
```

- b. Run the following command to save a local copy of the secret as a YAML file:

```
oc get secret portal-enc-key -n <APIC-namespace> -o yaml > portal-enc-key.yaml
```

3. Back up the Portal endpoint definitions.

Save the information to a file because you must use the same names in the recovered deployment.

- a. Get the **portalAdminEndpoint** definition by running the following command:

```
oc get route | grep portal-director | awk '{print $2}'
```

The response looks like the following example:

```
dr-ptl-portal-director-apic.apps.vlxocp-1556.cp.fyre.ibm.com
```

- b. Get the **portalUIEndpoint** definition by running the following command:

```
oc get route | grep portal-web | awk '{print $2}'
```

The response looks like the following example:

```
dr-ptl-portal-web-apic.apps.vlxocp-1556.cp.fyre.ibm.com
```

4. Back up the Portal subsystem database.

- a. [Configure the Portal subsystem for backups.](#)

- b. [Perform a backup of the Portal subsystem.](#)

Note: Be sure to **type: all** when you backup the Portal database, to ensure that you capture data for the Portal subsystem and all Portal sites.

- c. Get the ID of the latest **all** Portal backup and save it for reference during a recovery.

Run the following command to list the Portal backups:

```
oc get portalbackup -n <APIC-namespace>
```

The response looks like the following example; the latest backup is the one with a **TYPE** of **all** and the smallest **AGE**:

NAME	ID	STATUS	TYPE	CR TYPE	AGE	COMMENT
p1-bup-gqz8f	20200526.142449	Ready	system	record	55m	
p1-bup-jx4vc	20200526.142458	Ready	site	record	54m	
p1-bup-st412		Ready	all	create	56m	y
p1-bup-th2dm		Ready	all	create	4h51m	y

5. Copy all of the information that you saved to a secure location.

What to do next

Proceed to [Preparing the Analytics subsystem for disaster recovery on Cloud Pak for Integration.](#)

Previous topic: [Preparing the Management subsystem for disaster recovery on Cloud Pak for Integration](#)

Preparing the Analytics subsystem for disaster recovery on Cloud Pak for Integration

Back up data and essential deployment information so that you can use it to recover your deployment after a disaster.

About this task

Make sure to store all backups and deployment information to a secure location where you can access it after a disaster. You cannot recover a deployment without the information that you collect during this task.

Procedure

1. Backup the Analytics subsystem database.

- a. [Configure the Analytics subsystem for backups.](#)
- b. [Perform a backup of the Analytics subsystem.](#)

Note: Be sure to specify **indices: all** when you backup the Analytics database. Backing up a full set of indices ensures that your complete Analytics configuration, event data, and custom UI configuration (such as custom dashboards) can be restored.

- c. Get the name of the newest Analytics backup and save it for reference during a recovery.

Run the following command to list the Analytics backups:

```
oc get analyticsbackup -n <APIC-namespace>
```

The response looks like the following example; the newest backup is the one with the smallest **AGE**:

NAME	STATUS	ID	CR TYPE	INDICES	AGE	COMMENT
a7s-bup-266p8	Ready		create	[all]	20h	y
a7s-bup-pffdh	Ready		create	[all]	34h	y
analytics-bup-kxwq5	Ready	analytics-all-2020-09-07t03:49:15utc	record	[ui apievents config]	34h	
analytics-bup-p29z8	Ready	analytics-all-2020-09-07t18:04:03utc	record	[ui apievents config]	20h	

2. Copy all of the information that you saved to a secure location.

Previous topic: [Preparing the Portal subsystem for disaster recovery on Cloud Pak for Integration](#)

Recovering from a disaster on Cloud Pak for Integration

Install and configure API Connect, then restore the backed up data to recover the deployment after a disaster.

Before you begin

To successfully recover API Connect from a disaster, you must have previously completed the steps to prepare the Management, Portal, and Analytics subsystems for disaster recovery. Make sure that you can access the backups and deployment information because you cannot recover your deployment without it.

Attention: Successful disaster recovery depends on recovery of both the Management subsystem and the Portal subsystem. You must complete preparation steps for both subsystems in order to achieve disaster recovery. If you have to perform a restore, you must complete the restoration of the Management subsystem first, and then immediately restore the Portal subsystem.

About this task

To recover from a disaster event, recreate your API Connect Cluster CR and add recovery details as explained in the following procedure. Use the file containing the original CR (which you saved during the preparation task) as a reference.

Note: Your recovery installation of Cloud Pak for Integration must include the Platform UI if your original deployment used it. In addition, the CR must use the same settings as in the original deployment.

Procedure

1. Prepare your Cloud Pak for Integration environment for deploying API Connect as explained in the appropriate version of the [Cloud Pak for Integration documentation](#).

After you prepare your environment, return to this procedure to configure the installation CR, deploy API Connect, and then restore data to the API Connect subsystems.

Important: Do not install API Connect until you have configured the CR as explained in following steps.

2. Apply the Management and Portal encryption secrets to the cluster where you will install API Connect.

- a. Apply the YAML file that contains the Management database encryption secret into the cluster.

Run the following command, using the filename of the encryption secret that you saved when you prepared the Management subsystem for disaster recovery:

```
oc apply -f mgmt-enc-key.yaml
```

- b. Apply the YAML file that contains the Portal encryption secret into the cluster.

Run the following command, using the filename of the encryption secret that you saved when you prepared the Portal subsystem for disaster recovery:

```
oc apply -f portal-enc-key.yaml
```

3. Apply the YAML file that contains the CP4I credentials secret into the cluster.

Run the following command, using the filename of the secret that you saved when you prepared the Management subsystem for disaster recovery:

```
oc apply -f <cp4i_creds_secret>.yaml -n <APIC_namespace>
```

4. Set up the installation CR for deploying API Connect.

In this step, you perform the initial steps for deploying API Connect in Cloud Pak for Integration, but you do not begin the actual installation until step [15](#). Instead, you will complete a series of steps to configure the CR with deployment settings and additional recovery settings.

- a. Log in to the IBM Cloud Pak Platform UI.
- b. On the home page, click Create capability.
- c. Select the API Connect tile and click Next.
- d. On the Create an instance of API Connect cluster page, select the deployment type and click Next.
Choose the same deployment type that you used when you originally deployed API Connect.
- e. On the deployment settings page, click the YAML tab to edit the installation CR in YAML format.
- f. Copy the content of the saved CR into the YAML tab, replacing the default CR.
Keep the YAML tab open. In the following steps, you will configure additional deployment and recovery settings in the new API Connect Cluster installation CR before you install API Connect.

5. Important: Make sure that your new version of the API Connect Cluster installation CR uses the same value for the **name** setting as the original CR.

6. Verify the backup and restore settings for each subsystem.

For more information on the backup settings, see the following topics for instructions on configuring backup and restore settings:

- [Configuring backup settings for a fresh install of the Management subsystem on OpenShift or Cloud Pak for Integration](#)
- [Configuring backups for Developer Portal on OpenShift and Cloud Pak for Integration](#)
- [Configuring backup settings for Analytics on OpenShift and Cloud Pak for Integration](#)

7. Generate the Kubernetes secret for each subsystem's backups by running the appropriate command:

For each secret, use the same name that you used in the original deployment (you can see the name in the **credentials** setting of each subsystem's backup section).

- Management subsystem:

- S3:

```
oc create secret generic mgmt-backup-secret --from-literal=username='<Your_access_key-or-user_name>' --from-literal=password='<Your_access_key_secret-or-password>' -n <APIC_namespace>
```

- SFTP with username and password:

```
oc create secret generic mgmt-backup-secret --from-literal=username='<Your_user_name>' --from-literal=password='<Your_password>' -n <APIC_namespace>
```

- SFTP with username and SSH-key

```
oc create secret generic mgmt-backup-secret --from-literal=username='<Your_user_name>' --from-file=ssh-privatekey='<Your_private_key_file>' -n <APIC_namespace>
```

- Portal subsystem:

- S3:

```
oc create secret generic portal-backup-secret --from-literal=username='<Your_access_key-or-user_name>' --from-literal=password='<Your_access_key_secret-or-password>' -n <APIC_namespace>
```

- SFTP with username and password:

```
oc create secret generic portal-backup-secret --from-literal=username='<Your_user_name>' --from-literal=password='<Your_password>' -n <APIC_namespace>
```

- SFTP with username and SSH-key

```
oc create secret generic portal-backup-secret --from-literal=username='<Your_user_name>' --from-file=ssh-privatekey='<Your_private_key_file>' -n <APIC_namespace>
```

- Analytics:

```
oc create secret generic analytics-backup-secret --from-literal=access_key='<Your_Access_Key>' --from-literal=secret_key='<Your_access_key_secret>' -n <APIC_namespace>
```

8. Add the saved Management and Portal encryption secrets to the installation CR.

Add each secret to the appropriate **spec.subsystem** section of the CR, as shown in the following example:

```
spec:
  management:
    encryptionSecret:
      secretName: mgmt-enc-key
  portal:
    encryptionSecret:
      secretName: portal-enc-key
```

9. Apply each of the Management client application credential secrets to the cluster.

Run the following command to apply each secret, using the filename of each client application credential secret that you saved when you prepared the Management subsystem for disaster recovery:

```
oc apply -f <secretName>.yaml
```

For example, a deployment might use the following names for the secrets:

```
atmCredentialSecret: management-atm-cred
consumerToolkitCredentialSecret: management-ccli-cred
```

```

consumerUICredentialSecret: management-cui-cred
designerCredentialSecret: management-dsgr-cred
governanceCredentialSecret: management-governance-cred
juhuCredentialSecret: management-juhu-cred
toolkitCredentialSecret: management-cli-cred
uiCredentialSecret: management-ui-cred

```

10. Add each of the credential secrets to the `spec.management` section of installation CR.
For example:

```

spec:
  management:
    customApplicationCredentials:
      - name: atm-cred
        secretName: management-atm-cred
      - name: ccli-cred
        secretName: management-ccli-cred
      - name: cui-cred
        secretName: management-cui-cred
      - name: dsgr-cred
        secretName: management-dsgr-cred
      - name: governance-cred
        secretName: management-governance-cred
      - name: juhu-cred
        secretName: management-juhu-cred
      - name: cli-cred
        secretName: management-cli-cred
      - name: ui-cred
        secretName: management-ui-cred

```

11. Add the `siteName` property to the `spec.management` and `spec.portal` sections of the installation CR.
For example, if the `a2a5e6e2` is the original `siteName` of the Management subsystem, and `890772e3` is the original `siteName` of the Portal subsystem, the CR looks like the following example:

```

spec:
  management:
    siteName: "a2a5e6e2"
  portal:
    siteName: "890772e3"

```

12. If your original CR name was 10 characters or longer, you must add the `originalUID` or `metadata.uid` value from the original Management and Portal subsystems into the appropriate sections of the installation CR.
Important: If your original CR name was 10 characters or longer and you do not add this value, the deployments and routes that are generated during installation will include a different UID, which will cause the recovery process to fail.
The IDs were created with the original deployment of the Management and Portal subsystems, and the recovered subsystems must continue to use the same IDs. You can locate the ID in the Management (`apic-cluster-name-mgt.yaml`) or Portal (`apic-cluster-name-ptl.yaml`) CR that you saved while preparing for disaster recovery. (Do not use the `metadata.uid` setting from the API Connect Cluster CR).

The CR setting that contains the ID depends on the version of API Connect that you are recovering:

- Version 10.0.3 or later: `spec.originalUID`
- Version 10.0.2 or earlier: `metadata.uid`

Locate each of the original settings in the appropriate subsystem CR, and copy them to corresponding sections of the new API Connect Cluster CR using the same key and value.

For example, if you originally deployed version 10.0.2, the setting name was `uid`. If you are deploying Version 10.0.3 as part of disaster recover, copy the original value and use it for the `originalUID` setting in the new CR. For example, in 10.0.3:

```

spec:
  management:
    originalUID: "fa0f6f49-b931-4472-b84d-0922a9a92dfd"
  portal:
    originalUID: "447ea4b3-9514-4a84-a34b-ce0b349838da"

```

13. If you installed the API Connect using an S3 provider for the Management subsystem backups, add the following annotation to the `apiconnectcluster` CR.
If you specified SFTP or local as the backup, skip this step.

- Using the Platform UI:
 - Edit the API Management instance and click the YAML tab to edit the CR.
 - Add the following statement to the `spec.metadata.annotations` section:

```
apiconnect-operator/deployment-mode: disasterRecovery
```

For example:

```

metadata:
  annotations:
    apiconnect-operator/deployment-mode: disasterRecovery

```

- Using the CLI:
 - Get the name of the CR by running the following command:

```
oc get apiconnectcluster -o name -n <APIC_namespace>
```

 The response looks like the following example:

```
apiconnectcluster.apiconnect.domain/instance_name
```
 - Add the following annotation to the `spec.metadata.annotations` section of the CR by running the following command:

```
oc annotate apiconnectcluster/instance_name apiconnect-operator/deployment-mode="disasterRecovery" -n
<APIC_namespace>
```

The response looks like the following example:

```
apiconnectcluster.apiconnect.domain/instance_name annotated
```

14. Verify that you correctly added all of the settings to the installation CR.
For example, the completed CR might look like the following example:

```
apiVersion: apiconnect.ibm.com/v1beta1
kind: APICConnectCluster
metadata:
  namespace: apiconnect
  name: apis-minimum
  labels:
    app.kubernetes.io/instance: apiconnect
    app.kubernetes.io/managed-by: ibm-apiconnect
    app.kubernetes.io/name: apiconnect-minimum
spec:
  license:
    accept: true
    license: L-RJON-C2YLGE
    metric: VIRTUAL_PROCESSOR_CORE
    use: nonproduction
  management:
    originalUID: "fa0f6f49-b931-4472-b84d-0922a9a92dfd"
    encryptionSecret:
      secretName: apis-minim-faaa44bf-enc-key
    siteName: "faaa44bf"
    customApplicationCredentials:
      - name: atm-cred
        secretName: apis-minim-faaa44bf-atm-cred
      - name: cli-cred
        secretName: apis-minim-faaa44bf-cli-cred
      - name: cli-cred
        secretName: apis-minim-faaa44bf-cli-cred
      - name: cui-cred
        secretName: apis-minim-faaa44bf-cui-cred
      - name: dsgr-cred
        secretName: apis-minim-faaa44bf-dsgr-cred
      - name: governance-cred
        secretName: apis-minim-faaa44bf-governance-cred
      - name: juhu-cred
        secretName: apis-minim-faaa44bf-juhu-cred
      - name: ui-cred
        secretName: apis-minim-faaa44bf-ui-cred
  analytics:
    client: {}
    ingestion: {}
  apiManagerEndpoint: {}
  cloudManagerEndpoint: {}
  consumerAPIEndpoint: {}
  platformAPIEndpoint: {}
  portal:
    admin: {}
  databaseBackup:
    path: ocp-dr-mgmt
    host: s3.eu-gb.cloud-object-storage.appdomain.cloud/eu-standard
    s3provider: ibm
    schedule: 0 1 * * *
    protocol: objstore
    credentials: mgmt-backup-secret
  analytics:
    storage:
      enabled: true
      type: unique
  databaseBackup:
    chunkSize: 1GB
    credentials: a7s-backup-secret
    host: s3.eu-gb.cloud-object-storage.appdomain.cloud/eu-standard
    path: ocp-dr-a7s
    schedule: 0 1 * * *
  storageClassName: rook-ceph-block
  profile: nlxc7.m48
  portal:
    adminClientSubjectDN: ""
    portalAdminEndpoint: {}
    portalUIEndpoint: {}
    originalUID: "447ea4b3-9514-4a84-a34b-ce0b349838da"
    encryptionSecret:
      secretName: apis-minim-913edd20-enc-key
    siteName: "913edd20"
    portalBackup:
      credentials: portal-backup-secret
      host: s3.eu-gb.cloud-object-storage.appdomain.cloud/eu-standard
      path: ocp-dr-portal
      protocol: objstore
      schedule: 0 1 * * *
  version: 10.0.3
```

Important: If you are restoring your deployment in a different data center, the endpoints that are used in your original deployment must be the same in your new data center. The Platform UI in Cloud Pak for Integration autogenerates the endpoints if they are left empty in the CR, therefore ensure that you explicitly set the endpoints in the CR to match what was set in your original data center. For example:

```

apiManagerEndpoint:
  annotations:
    cert-manager.io/issuer: prod-ingress-issuer
    haproxy.router.openshift.io/timeout: 240s
  hosts:
    - name: prod-api-manager.example.com
      secretName: prod-be787dd3-api-manager

```

15. On the deployment page, install API Connect by clicking Create.

16. Wait for **all** subsystems to be created.

When the Management subsystem is installed, you might see **backup** job pods and **stanza-create** job pods in **Error** state; for example:

m1-82b290a2-postgres-stanza-create-4zcgz	0/1	Error	0	35m
m1-82b290a2-postgres-full-sch-backup-2g9hm	0/1	Error	0	20m

This is expected behavior, for the following reasons:

- The **stanza-create** job normally expects buckets or subdirectories within buckets to be empty. However, since you configured the Management subsystem with your already-populated S3 bucket (where your backups exist), the job will enter the **Error** state.
- Any scheduled or manual backups will enter the **Error** state. Although you configured the Management subsystem with your already-populated S3 bucket, the new database isn't yet configured to write backups into remote storage.
- The configurator job will fail because the CP4I credentials secret that you manually restored does not match the value in the Management database. As a result, the state of new cluster is not "Ready" and will show "6/7". This error will be resolved when you restore the Management subsystem from the backup that you prepared earlier.

The errors will not prevent a successful restore, so continue to the next step.

17. Restore the subsystems in the following sequence:

Important: Make sure that you restore using the backup (locate the one with the correct backup name and ID) that you created when you prepared each subsystem for disaster recovery.

a. [Restore the Management subsystem.](#)

When you perform a restore, you must complete the restoration of the Management subsystem first. Verify that the restoration completed successfully and that the Management subsystem is Ready. When the Management subsystem is healthy, proceed to the next step and restore the Portal subsystem.

b. [Restore the Developer Portal subsystem.](#)

Use the restore type **all** to ensure that you restore the complete subsystem and all Portal sites.

c. [Restore the Analytics subsystem.](#)

18. Force the configurator to run again.

The cluster will still not be ready after restore at this stage because the configurator has yet to successfully complete (refer to point 12). In order for the configurator to run again, delete the associated job so that a new pod will start running:

a. Run the following command to get the list of jobs:

```
oc get jobs -n <APIC_namespace>
```

b. Run the following command to determine the name of your API Connect instance:

```
oc get apiconnectcluster -n <APIC_namespace>
```

c. Run the following command to delete the configurator job:

```
oc -n <APIC_namespace> delete job <instance_name>-configurator
```

19. Version 10.0.2 or earlier: Update the Management OIDC credentials as explained in [Configuring the OIDC credentials on Cloud Pak for Integration](#).

20. Verify that the recovery was successful:

- Ensure that you can log in to the Cloud Manager UI.
- Verify that your provider organizations exist.
- Ensure that you can log in to each Developer portal.
- Ensure that the Analytics dashboard contains all of the analytics data that you preserved.

21. After the successful recovery, remove the annotation that you added to the **apiconnectcluster** CR in step [13](#).

If you skipped step [13](#), then skip this step as well.

- Using the Platform UI:
 - Edit the API Management instance and click the YAML tab to edit the CR.
 - Delete the following statement from the **spec.metadata.annotations** section:

```
apiconnect-operator/deployment-mode: disasterRecovery
```

- Using the CLI:
 - Get the name of the CR by running the following command:

```
oc get apiconnectcluster -o name -n <APIC_namespace>
```

The response looks like the following example:

```
apiconnectcluster.apiconnect.domain/instance_name
```

- Remove the annotation by running the following command, making sure to include the trailing "-" on **deployment-mode** to indicate the removal:

```
oc -n <APIC_namespace> annotate apiconnectcluster/instance_name apiconnect-operator/deployment-mode-
```

The response looks like the following example:

```
apiconnectcluster.apiconnect.domain/instance_name annotated
```

- [Configuring the OIDC credentials on Cloud Pak for Integration](#)

When you recover API Connect V10.0.x, you must manually update the values for the Management OIDC credentials (**client_ID** and **client_secret**) in the Common Services User Registry.

Configuring the OIDC credentials on Cloud Pak for Integration

When you recover API Connect V10.0.x, you must manually update the values for the Management OIDC credentials (`client_id` and `client_secret`) in the Common Services User Registry.

Before you begin

This task is required for all of the 10.0.x releases up to, and including, version 10.0.2 (skip this task for version 10.0.3 and later). The procedure requires you to log in to the Cloud Manager on the new API Connect deployment. Use the Cloud Manager administrator username and password that you saved while preparing for disaster recovery.

About this task

When you deploy API Connect, the OIDC `client_id` and `client_secret` resources are automatically generated and added to the Common Services User Registry. These resources enable single sign-on with the IBM Cloud Pak platform. When you reinstall API Connect as part of disaster recovery, the original versions of those resources are retained but cannot be used. You must update the Common Services User Registry and replace the original values with the values from the new deployment.

Procedure

1. Retrieve the `client_id` and `client_secret` from the stored secret in API Connect.

- a. Run the following command to retrieve the `client_id`:

```
oc -n <APIC_namespace> get secret <instance_name>-oidc-client -o jsonpath="{.data.CLIENT_ID}" | base64 -D
```

- b. Run the following command to retrieve the `client_secret`:

```
oc -n <APIC_namespace> get secret <instance_name>-oidc-client -o jsonpath="{.data.CLIENT_SECRET}" | base64 -D
```

2. Update the Common Services User Registry with the new values.

Using the Cloud Manager UI:

- a. In API Connect, open the Cloud Manager interface.
- b. Select the Cloud Manager User Registry.
You will use the Cloud Manager User Registry to modify settings for the Common Service User Registry.
- c. Log in to the Cloud Manager User Registry using the administrator username and password that you saved while preparing for disaster recovery.
- d. In Cloud Manager, click Resources, User Registries and edit Common Services User Registry.
- e. In the Client information section, paste the `client_id` value from step 1 into the Client ID field.
- f. Paste the `client_secret` value from step 1 into the Client secret field.
- g. Save your changes.

Using the toolkit CLI:

- a. Run the following command to determine the `<mgmt_endpoint_url>` that you will use for accessing the management server:

```
oc -n <APIC_namespace> get mgmt <instance_name> -o jsonpath="{.status.zenRoute}" && echo ""
```

- b. Log in to the management server:
 - i. Run the following command to start the login process:

```
apic login --server <mgmt_endpoint_url>
```

- ii. Provide your login credentials:

- **Realm?** Type your realm (for example: `admin/default-idp-1`) and press Enter.
The realm refers to your identity provider. For information on determining your realm value, see [How to determine the identity provider](#).
- **Username?** Type your Cloud Manager administrator username and press Enter.
- **Password?** Type the password for your Cloud Manager administrator account and press Enter.

- c. Run the following command to download the Common Service User Registry as a YAML file:

```
apic user-registries:get common-services --server <mgmt_endpoint_url> -o admin --fields name,configuration
```

- d. Edit the file and update the `client_id` and `client_secret` settings with the values you obtained in step 1.
- e. Save and close the file.
- f. Run the following command to upload the modified file to Cloud Manager:

```
apic user-registries:update common-services --server <mgmt_endpoint_url> -o admin common-services.yaml
```

Disabling and re-enabling the Analytics subsystem on Kubernetes

During maintenance of an API Connect cluster, you can shut down the Analytics subsystem by disabling the ingestion, and storage microservices so that those processes are not running and there is no way to reach them.

Before you begin

This operation requires the use of the Analytics CLI. [Using the Analytics CLI](#).

About this task

When you disable Analytics, there will be no data in either the API Manager Dashboards or third-party offloads. Disabling the Analytics subsystem stops the collection and storage of data as well as making the subsystem unavailable.

Procedure

1. Backup your Analytics data as explained in [Backing up and restoring the analytics database](#).
2. Log in to the Management server: [Toolkit CLI Login](#).

```
apic login --server <management server platform api endpoint> --username <username> --realm <realm>
```

Where:

- *<username>* is the cloud admin user.
- *<realm>* is the user registry realm for the specified *<username>*. By default this is `admin/default-idp-1`.

3. Disable shard allocation for storage by following these steps:
Disabling shard allocation is optional, but is recommended because it prevents new shards from being created for replication when a node is unavailable, and helps avoid corruption issues in full system restarts.

- a. Create a json file called `analytics_persistent_settings.json` and insert the contents:

```
{"persistent":{"cluster.routing.allocation.enable":"none"}}
```

- b. Run the following Analytics CLI command:

```
apic --mode analytics clustermgmt:putSettings --server <management server platform api endpoint> --analytics-service <analytics service name> --format json analytics_persistent_settings.json
```

where:

- *<management server platform api endpoint>* is the Management server platform api endpoint.
- *<analytics service name>* is the name of Analytics service as configured in the Cloud Manager.

The output from this command should be:

```
{"acknowledged":true,"persistent":{"cluster":{"routing":{"allocation":{"enable":"none"}}},"transient":{}}
```

4. Perform a synced flush of storage by running the following command:
Flushing the storage is optional, but is recommended because it helps to avoid losing the data that was not yet written to disk before you restart pods. This step flushes all current index operations synchronously and attempts to write everything that is in flux to disk.

```
apic --mode analytics clustermgmt:postFlush --server <management server platform api endpoint> --analytics-service <analytics service name> --format json
```

where:

- *<management server platform api endpoint>* is the Management server platform endpoint.
- *<analytics service name>* is the name of Analytics service as configured in the Cloud Manager.

When you flush storage, the response looks like the following example, with the *failed* count set to zero:

```
{
  "_shards": {
    "total": 16,
    "successful": 6,
    "failed": 0
  }
}
```

This operation occasionally fails, but it is safe to rerun it multiple times until it passes and the "failed" count is zero.

5. Unassociate the Analytics service from all gateway services.
 - a. In Cloud Manager, click  Topology.
 - b. In the section for the Availability Zone that contains the Analytics service, locate the Gateway service that the Analytics service is associated with.
 - c. Click  and select Unassociate.For more information, see [Associating an analytics service with a gateway service](#).
6. Unregister the Analytics service from Cloud Manager:
 - a. In Cloud Manager, click  Topology.
 - b. In the section for the Availability Zone that contains the Analytics service, locate the Analytics service and click Delete.For more information, see [Registering an analytics service](#).
7. Set replicas to zero for the analytics pods by editing the deployments and statefulsets that manage them: `director`, `mtls-gw`, `ingestion`, and `storage`:

```
kubectl edit deploy analytics-director -n <namespace>
kubectl edit deploy analytics-mtls-gw
kubectl edit sts analytics-ingestion
kubectl edit sts analytics-storage
```

setting *replicas* to zero:

```
spec:
  ...
  replicas: 0
  ...
```

The analytics `director`, `mtls-gw`, `ingestion`, and `storage` pods should all terminate.

Re-enabling the analytics subsystem

8. Repeat step 7 but in reverse order and setting the *replicas* value back to what it was before.

9. Wait for all the pods to be running:

```
kubectl get deploy -n <namespace> | grep analytics
analytics-director          1/1      1          1          7h10m
analytics-mtls-gw          1/1      1          1          7h6m

kubectl get sts -n <namespace> | grep analytics
analytics-ingestion        1/1      7h10m
analytics-storage          1/1      7h12m
```

10. Re-register the analytics service: [Registering an analytics service](#)
11. Re-associate your analytics service with your gateways [Associate new analytics service\(s\) with gateway\(s\)](#)
12. Enable shard allocation by following these steps:

Note: If you did not disable shard allocation, skip this step.

- a. Create a json file called `analytics_persistent_settings.json` and insert the contents:

```
{"persistent":{"cluster.routing.allocation.enable":"all"}}
```

- b. Run the following Analytics CLI command:

```
apic --mode analytics clustermgmt:putSettings --server <management server platform api endpoint> --analytics-service <analytics service name> --format json analytics_persistent_settings.json
```

where:

- `<management server platform api endpoint>` is the Management server platform api endpoint.
- `<analytics service name>` is the name of Analytics service as configured in the Cloud Manager.

When you enable shard allocation, the response looks like the following example:

```
{"acknowledged":true,"persistent":{"cluster":{"routing":{"allocation":{"enable":"all"}}},"transient":{}}
```

Disabling and re-enabling the Analytics subsystem on OpenShift and Cloud Pak for Integration

During maintenance of an API Connect cluster, you can shut down the Analytics subsystem by disabling the client, ingestion, and storage microservices so that those processes are not running and there is no way to reach them.

Before you begin

This operation requires the use of the Analytics CLI. [Using the Analytics CLI](#).

About this task

Disabling the Analytics subsystem stops the collection and storage of data as well as making the subsystem unavailable.

When you disable Analytics, there will be no data in either the API Manager Dashboards or third-party offloads.

Procedure

1. Backup your Analytics data as explained in [Backing up and restoring the Analytics database on OpenShift and Cloud Pak for Integration](#).
2. Log in to the Management server: [Toolkit CLI Login](#).

```
apic login --server <management server platform api endpoint> --username <username> --realm <realm>
```

Where:

- `<username>` is the cloud admin user.
- `<realm>` is the user registry realm for the specified `<username>`. By default this is `admin/default-idp-1`.

3. Disable shard allocation for storage by following these steps:

Disabling shard allocation is optional, but is recommended because it prevents new shards from being created for replication when a node is unavailable, and helps avoid corruption issues in full system restarts.

- a. Create a json file called `analytics_persistent_settings.json` and insert the contents:

```
{"persistent":{"cluster.routing.allocation.enable":"none"}}
```

- b. Run the following Analytics CLI command:

```
apic --mode analytics clustermgmt:putSettings --server <management server platform api endpoint> --analytics-service <analytics service name> --format json analytics_persistent_settings.json
```

where:

- `<management server platform api endpoint>` is the Management server platform api endpoint.
- `<analytics service name>` is the name of Analytics service as configured in the Cloud Manager.

The output from this command should be:

```
{"acknowledged":true,"persistent":{"cluster":{"routing":{"allocation":{"enable":"none"}}},"transient":{}}
```

4. Perform a synced flush of storage by running the following command:

Flushing the storage is optional, but is recommended because it helps to avoid losing the data that was not yet written to disk before you restart pods. This step flushes all current index operations synchronously and attempts to write everything that is in flux to disk.

```
apic --mode analytics clustermgmt:postFlush --server <management server platform api endpoint> --analytics-service <analytics service name> --format json
```

where:

- `<management server platform api endpoint>` is the Management server platform endpoint.
- `<analytics service name>` is the name of Analytics service as configured in the Cloud Manager.

When you flush storage, the response looks like the following example, with the `failed` count set to zero:

```
{
  "_shards": {
    "total": 16,
    "successful": 6,
    "failed": 0
  }
}
```

This operation occasionally fails, but it is safe to rerun it multiple times until it passes and the "failed" count is zero.

5. Unassociate the Analytics service from all gateway services.

- In Cloud Manager, click  Topology.
- In the section for the Availability Zone that contains the Analytics service, locate the Gateway service that the Analytics service is associated with.
- Click  and select Unassociate.

For more information, see [Associating an analytics service with a gateway service](#).

6. Unregister the Analytics service from Cloud Manager:

- In Cloud Manager, click  Topology.
- In the section for the Availability Zone that contains the Analytics service, locate the Analytics service and click Delete.

For more information, see [Registering an analytics service](#).

7. Set replicas to zero for the analytics pods by editing the deployments and statefulsets that manage them: `director`, `mtls-gw`, `ingestion`, and `storage`:

```
oc edit deploy analytics-director -n <namespace>
oc edit deploy analytics-mtls-gw
oc edit sts analytics-ingestion
oc edit sts analytics-storage
```

setting `replicas` to zero:

```
spec:
  ...
  replicas: 0
  ...
```

The analytics `director`, `mtls-gw`, `ingestion`, and `storage` pods should all terminate.

Re-enabling the analytics subsystem

- Repeat step 7 but in reverse order and setting the `replicas` value back to what it was before.
- Wait for all the pods to be running:

```
oc get deploy -n <namespace> | grep analytics
analytics-director          1/1      1          1          7h10m
analytics-mtls-gw          1/1      1          1          7h6m

oc get sts -n <namespace> | grep analytics
analytics-ingestion        1/1      7h10m
analytics-storage          1/1      7h12m
```

- Re-register the analytics service: [Registering an analytics service](#)
- Re-associate your analytics service with your gateways [Associate new analytics service\(s\) with gateway\(s\)](#)
- Enable shard allocation by following these steps:

Note: If you did not disable shard allocation, skip this step.

- Create a json file called `analytics_persistent_settings.json` and insert the contents:

```
{"persistent": {"cluster.routing.allocation.enable": "all"}}
```

- Run the following Analytics CLI command:

```
apic --mode analytics clustermgmt:putSettings --server <management server platform api endpoint> --analytics-service <analytics service name> --format json analytics_persistent_settings.json
```

where:

- `<management server platform api endpoint>` is the Management server platform api endpoint.
- `<analytics service name>` is the name of Analytics service as configured in the Cloud Manager.

When you enable shard allocation, the response looks like the following example:

```
{"acknowledged": true, "persistent": {"cluster": {"routing": {"allocation": {"enable": "all"}}}}, "transient": {}}
```

Maintaining a two data center deployment

How to maintain a two data center disaster recovery (DR) deployment on Kubernetes and OpenShift, including information about normal operation, failure handling, and recovery.

See the following topics for information about failure handling, backup, upgrade, and removing a 2DCDR deployment.

Key concepts of 2DCDR and failure scenarios

Understand how API Connect 2DCDR works and what to do when a data center fails.

This topic discusses the concepts around the operation and maintenance of an existing API Connect 2DCDR deployment. For information on the planning and installation of a 2DCDR deployment, see: [Two data center deployment strategy on Kubernetes and OpenShift](#).

Failover of services and reverting to a stand-alone deployment

Failover means the API Connect management and portal subsystems on the warm-standby data center, become the active management and portal subsystems. Whether it is possible to convert the original active data center to be the warm-standby at the same time depends on the problems the active data center has that required the failover. However, the failed active data center must be set to warm-standby before you re-establish its connectivity to the new active data center.

Important: When the active data center is set to warm-standby, all data is deleted from its management database. The management data from the new active (what was the warm-standby) is replicated to the new warm-standby data center. Do not set the active data center to warm-standby until you confirm that data replication is working, see: [Verifying replication between data centers](#), or you have backups of your management data.

If you want to revert to a stand-alone API Connect deployment, before you start the process, ensure that the data center where you choose to keep API Connect is set to active.

- When API Connect is reverted to be a stand-alone deployment on the warm-standby data center, all management and portal data is deleted from that data center. It becomes an empty stand-alone deployment.
- When API Connect on the active data center is reverted to be a stand-alone deployment, all management and portal data remains.

Failure scenarios

The action that you should take when a failure occurs depends on the type of failure and which data center the failure occurs in:

API Connect failure in the active data center.

When the active data center is still working correctly, and still has connectivity to the warm-standby data center, but API Connect is not working correctly:

1. It might be possible to recover API Connect on the active data center. Review the troubleshooting documentation:
 - [Troubleshooting two data center replication problems](#).
 - [Installation troubleshooting](#).
 - [Troubleshooting operational problems](#).
2. Follow the failover steps to make the warm-standby the active data center. If your failed active data center cannot be changed to warm-standby, then disable the network link used by API Connect between the data centers.
3. Gather API Connect post-mortem logs from the failed data center and open a support request: [Gathering post-mortem logs](#).
4. Do not restore the network connection between data centers until API Connect on the failed data center is recovered and set to warm-standby.

Complete active data center failure

When the active data center has a failure, and API Connect is not accessible, follow these steps:

1. Disable the network connection between the active and the warm-standby data center.
2. Follow the failover steps to make the warm-standby the active data center: [How to failover API Connect from the active to the warm-standby data center](#).
3. Do not restore the network connection between data centers until API Connect on the failed data center is recovered and set to warm-standby.

Network failure that prevents API calls or user access to Management and Portal subsystems on active data center.

In this scenario, the API Connect 2DCDR deployment is working correctly, but unusable because the active data center is not accessible for API calls or for Management and Portal UI/CLI/REST API users.

1. Complete a failover, setting warm-standby to active, and the active to warm-standby: [How to failover API Connect from the active to the warm-standby data center](#).

API Connect failure on the Warm-standby data center

Where the API Connect pods on the warm-standby data center are not running as expected.

1. Review the troubleshooting documentation [Troubleshooting two data center replication problems](#).
2. Gather API Connect post-mortem logs from the failed data center and open a support case: [Gathering post-mortem logs](#).

Warm-standby data center failure

The data center where API Connect was running as warm-standby fails. In this case when the data center is recovered:

1. Verify that API Connect is running correctly as warm-standby and that the data from the active is replicated to it: [Verifying replication between data centers](#).

Network failure between data centers

When the network connection between data centers is recovered, verify that 2DCDR database replication resumes: [Verifying replication between data centers](#).

Operational states

API Connect has various transitory states that it passes through during startup and failover. The current 2DCDR operational state can be observed from the CR status section, for example:

```
kubectl describe mgmt -n <namespace>
```

```
...
Status:
...
Ha Mode: active
```

Table 1. 2DCDR Management subsystem operational states

Operational state	Description
progressing to active	Pods are progressing to the active state, but the subsystem is not capable of serving traffic.
active	All of the pods are ready and in the correct disaster recovery state for the active data center.
progressing to passive	Pods are progressing to the warm-standby state. The subsystem is not capable of serving traffic.
passive	All of the pods are ready and in the correct disaster recovery state for the warm-standby data center.

Table 2. 2DCDR Portal subsystem operational states

Operational state	Description
progressing to active	Pods are progressing to the active state, but the subsystem is not capable of serving traffic.
progressing to active (ready for traffic)	At least one pod of each type is ready for traffic. The dynamic router can be linked to this service.
active	All of the pods are ready and in the correct disaster recovery state for the active data center.
progressing to passive	Pods are progressing to the warm-standby state. The subsystem is not capable of serving traffic.
progressing to passive (ready for traffic)	At least one pod of each type is ready for traffic.
passive	All of the pods are ready and in the correct disaster recovery state for the warm-standby data center.
progressing to down	Portal is preparing to do a factory reset. This is what happens to a warm-standby portal data center when the <code>multiSiteHA</code> section is removed.

How to failover API Connect from the active to the warm-standby data center

How to complete service failover in a 2DCDR deployment on Kubernetes, OpenShift, and Cloud Pak for Integration.

Before you begin

Ensure that you have read and understand the 2DCDR concepts and reviewed the failure scenarios that are described in [Key concepts of 2DCDR and failure scenarios](#). Do not proceed with the failover until you confirm that it is the correct course of action for your situation.

About this task

Carefully follow the steps in this topic. Be aware of the following important points:

- The first step in the process is to set the active data center to warm-standby. When the active data center is set to warm-standby, all data is deleted from the active data center's management database, to be replaced by data copied from the warm-standby when it becomes active. Do not proceed with failover if you suspect there is also a problem on the warm-standby data center and you are unsure it has the most recent management data. See [Verifying replication between data centers](#), and consider restoring your active site from backup instead of attempting a failover: [Backup and restore requirements for a two data center deployment](#).
- If the warm-standby data center is offline for more than 24 hours, there can be issues with the disk space on the active data center. In this case, you should revert your deployment to a single data center topology. For more information, see [Removing a two data center deployment](#).
- Avoid both data centers being set to active at the same time while the network links between data centers are enabled. This causes split-brain.
- If the active data center failure prevents you from updating the active data center API Connect custom resources (CRs), then you should disable the network links used by API Connect between the data centers.

Note: For OpenShift users: The steps that are detailed in this topic use the Kubernetes `kubectl` command. On OpenShift, use the equivalent `oc` command in its place. If you are using a top-level CR you must edit the `multiSiteHA` section for the subsystem in the top-level CR, instead of directly in the subsystem CRs. If the subsystem section is not included in the top-level CR, copy and paste the section from the subsystem CR to the top-level CR.

Procedure

- **Management subsystem failover. In this example, DC1 is the active and DC2 is the warm-standby.**
To initiate a failover from DC1 to DC2, you first must set DC1 to warm-standby before you set the DC2 data center to active. This action is needed to prevent split-brain, as there can't be two active data centers at the same time. The following instructions show how to failover DC1 to DC2 for the Management subsystem.

1. Set the DC1 Management subsystem to be warm-standby.

Edit the DC1 `ManagementCluster` custom resource (CR) by running the following command:

```
kubectl edit mgmt -n <namespace>
```

and change the `mode` to `passive`:

```
multiSiteHA:
  mode: passive
```

Note: If API Connect on DC1 is down, such that you can't set it to be warm-standby, you must ensure that the network links between DC1 and DC2 are disabled before you set DC2 to be active. You must then not restore the network links until you can set DC1 to be warm-standby.

2. Run the following command on DC1 to check that the Management subsystem HA mode is no longer **active**:

```
kubectl describe mgmt -n <namespace>
```

During transition to warm-standby, the **Ha mode** part of the **Status** output shows **progressing to passive**. When the transition is complete, it shows **passive**.

```
Status:
...
Ha mode:                passive
...
```

You can proceed to set DC2 to active while DC1 is still **progressing to passive**.

3. Change the DC2 Management subsystem from warm-standby to active. Edit the DC2 **ManagementCluster** custom resource (CR) by running the following command:

```
kubectl edit mgmt -n <namespace>
```

and change the **mode** to **active**:

```
multiSiteHA:
  mode: active
```

4. Run the following command on DC2 to check that the Management subsystem is ready for traffic:

```
kubectl describe mgmt -n <namespace>
```

The services are ready for traffic when the **Ha mode** part of the **Status** object is set on DC2 to **active**. For example:

```
Status:
...
Ha mode:                active
...
```

Note: Failover can take 10 minutes or more to complete. If there are any problems, you can check the API Connect operator pod log for errors (search for the word "Multi").

5. Update your dynamic router to redirect all traffic to DC2 instead of DC1. Until the DC2 site becomes **active**, the UIs might not be operational.

• Developer Portal subsystem failover

If you have multiple portal services, you can failover a specific portal service, or all of the portal services that are running in a particular data center.

The following instructions show how to failover DC1 to DC2 for the Developer Portal subsystem. If you have multiple Developer Portal services, you must repeat these steps for each Developer Portal subsystem that you want to failover.

Note:

- Developer Portal failover does result in a temporary Developer Portal website outage until the warm-standby data center is ready to accept traffic.
- If you want to monitor the failover process, you can run the following command to check the status:

```
kubectl describe ptl
```

- Do not edit the portal CR file during the failover process.

1. Set the DC1 Developer Portal subsystem to be warm-standby.

Edit the DC1 **PortalCluster** custom resource (CR) by running the following command:

```
kubectl edit ptl <ptl-cluster-name> -n <namespace>
```

and change the **mode** to **passive**:

```
multiSiteHA:
  mode: passive
```

Where *<ptl-cluster-name>* is the name of your portal cluster if you have more than one. To see a list of your portal clusters, run:

```
kubectl get PortalCluster -n <namespace>
```

Note: If API Connect on DC1 is down, such that you can't set it to be warm-standby, you must ensure that the network links between DC1 and DC2 are disabled before you set DC2 to be active. You must then not restore the network links until you can set DC1 to be warm-standby.

2. Run the following command on DC1 to check the Developer Portal subsystem status:

```
kubectl describe ptl <ptl-cluster-name> -n <namespace>
```

You can continue to the next step when the **Ha mode** part of the **Status** object is set to **progressing to passive**, or any of the **passive** states. For example:

```
Status:
...
Ha mode:                progressing to passive
...
```

Important: You must not set DC2 to active until DC1 is either in **passive** or **progressing to passive** state. In other words, DC1 and DC2 must never both be in active state at the same time.

3. Change the DC2 Developer Portal subsystem from warm-standby to active.

Edit the DC2 **PortalCluster** custom resource (CR) by running the following command:

```
kubectl edit ptl <ptl-cluster-name> -n <namespace>
```

and change the `mode` to `active`:

```
multiSiteHA:  
  mode: active
```

Where `<ptl-cluster-name>` is the name of your portal cluster if you have more than one. To see a list of your portal clusters, run:

```
kubectl get PortalCluster -n <namespace>
```

4. Update your dynamic router to redirect all traffic to DC2 instead of DC1.
5. Run the following command to check that the Developer Portal services on DC1 and DC2 are ready for traffic:

```
kubectl describe ptl <ptl-cluster-name> -n <namespace>
```

The services are ready for traffic when the `Ha mode` part of the `Status` object is set on DC1 to `passive`, and is set on DC2 to `active`. For example, on DC2:

```
Status:  
...  
  Ha mode: active  
...
```

- **Failover of both Management and Portal subsystems**

Failover the Management subsystem first, followed by the Portal subsystem.

How long it takes to complete the failover varies, and depends on hardware speed, network latency, and the size of the databases. Approximate timings are:

For the Management subsystem:

- `warm-standby` to `active`: 5 minutes
- `active` to `warm-standby`: 15 minutes

For the Developer Portal:

- `warm-standby` to `active`: 15 - 40 minutes
- `active` to `warm-standby`: 10 minutes

What to do next

As soon as the failure on the data center is resolved, the failed data center should be brought back online and relinked to the currently active data center to maintain the highest availability; see [Recovering from a failover of a two data center deployment](#) for more information.

Recovering from a failover of a two data center deployment

What to do after completing a 2DCDR failover.

Ensure that you have read and understand the concepts of 2DCDR. See [Two data center deployment strategy on Kubernetes and OpenShift](#) and [Key concepts of 2DCDR and failure scenarios](#).

This topic describes what to do after you have completed a failover of your 2DCDR deployment, as described in [How to failover API Connect from the active to the warm-standby data center](#).

If after the failover operation, the failed data center was successfully updated to warm-standby, then verify that replication is working: [Verifying replication between data centers](#). If replication is working, you can either:

- Revert your 2DCDR deployment to the original active and warm-standby data center designations. To revert your deployment, follow the same failover steps: [How to failover API Connect from the active to the warm-standby data center](#).
- Do nothing, and continue with your current active and warm-standby data center designations.

If your failed data center could not be updated to warm-standby, then ensure that the network links between the data centers are disabled. If the network links remain enabled then a split-brain could occur if your failed data center recovers before you are able to set it to warm-standby.

When you are able to recover the failed data center, ensure that API Connect is set to warm-standby before restoring the network connectivity to the active data center.

If you expect your failed data center to be down for a long time, then convert your active data center to a stand-alone deployment:

- Remove the `multiSiteHA` section from the `spec` sections of your management and portal CRs.

The steps to restore 2DCDR when the failed data center is recovered depend on the state of API Connect on the recovered data center.

- If API Connect is still working on the recovered data center, re-enable 2DCDR as follows:
 1. Add the `multiSiteHA` section back to your working stand-alone deployment. Ensure that it is set to `active`.
 2. Ensure that the `multiSiteHA` section is set to warm-standby (`passive`) on the recovered data center.

3. Restore the network links between data centers.
- If the API Connect installation on the failed data center is not recoverable, then reinstall API Connect on this data center, and re-enable 2DCDR as follows:
 1. Add the `multiSiteHA` section back to your working stand-alone deployment. Ensure that it is set to `active`.
 2. Ensure that the `multiSiteHA` section is set to warm-standby (`passive`) on the recovered data center.
 3. Copy the `ingress-ca X.509` certificate from the active data center and apply it on your reinstalled warm-standby data center. For more information, see [Check the ingress-ca X.509 certificates match](#).
 4. Restore the network links between data centers.

Note: If your original active data center was in a failed state for some time, when it is recovered to warm-standby state it will take time for the data from your active data center to replicate across. The time that is taken depends on the size of your management and portal databases and how many changes were made to them while your original active data center was in a failed state.

Backup and restore requirements for a two data center deployment

Points to consider when you configure backup and restore settings on a two data center disaster recovery (2DCDR) deployment.

The 2DCDR backup requirements are different for the Portal and Management subsystems.

Ensure that you have read and understand the concepts of 2DCDR. See [Two data center deployment strategy on Kubernetes and OpenShift](#) and [Key concepts of 2DCDR and failure scenarios](#)

Management subsystem 2DCDR backup and restore requirements

- Different remote backup locations must be specified for each data center.
- Both active and warm-standby Management subsystems run the scheduled backup job.
- To restore from a management backup, follow these steps:
 1. Make each management data center a stand-alone API Connect deployment: Remove the `multiSiteHA` section from the `spec` section of the management CRs on both data centers. Keep a copy of the `multiSiteHA` sections that you remove, they are added back at the end of the restore process.
 2. You now have two stand-alone API Connect deployments. Decide which data center is to be the active, and restore the backup from that data center. Do not attempt to restore the backup from one data center, to the other data center.
 3. Add the `multiSiteHA` section back to the management CR in the restored data center. Ensure that the `multiSiteHA` section defines the data center as the active.
 4. Add the `multiSiteHA` section back to the management CR in the other data center. Ensure that the `multiSiteHA` section defines the data center as the warm-standby (passive).
 5. The management database takes some time to resync across the data centers. To confirm that replication is working, see: [Verifying replication between data centers](#).

Portal subsystem 2DCDR backup requirements

- The backup settings for both the active and warm-standby portal must be identical.
- Only the active data center portal takes backups. On failover, the backup job of the new warm-standby is disabled, and the backup job of the new active is enabled.
- Portal restores are only done on the active data center.

Configuring backups for 2DCDR deployments

The steps for configuring backups for both subsystems are the same as for a single API Connect deployment, but keep the additional 2DCDR requirements in mind when following them:

- [Backups on Kubernetes](#)
- [Backups on OpenShift](#)

Related concepts

- [Two data center deployment strategy on Kubernetes and OpenShift](#)

Removing a two data center deployment

Convert your 2DCDR deployment to a stand-alone deployment on Kubernetes, OpenShift, and Cloud Pak for Integration.

Ensure that you have read and understand the concepts of 2DCDR. See [Two data center deployment strategy on Kubernetes and OpenShift](#) and [Key concepts of 2DCDR and failure scenarios](#).

Note: For OpenShift users: The steps that are detailed in this topic use the Kubernetes `kubectl` command. On OpenShift, use the equivalent `oc` command in its place. If you are using a top-level CR you must edit the `multiSiteHA` section for the subsystem in the top-level CR, instead of directly in the subsystem CRs. If the subsystem section is not included in the top-level CR, copy and paste the section from the subsystem CR to the top-level CR.

If you want to revert to a single data center topology:

1. Decide which data center you want to keep. If this data center is not the current active data center, then complete the failover operation to make it the active: [How to failover API Connect from the active to the warm-standby data center](#).
2. Remove the `spec.multiSiteHA` section from the management subsystem CR on the active data center.

a. Run:

```
kubectl edit mgmt -n <namespace>
```

b. Delete the `spec.multiSiteHA` section.

3. Remove the `spec.multiSiteHA` section from the portal subsystem CR on the active data center.

a. Run:

```
kubectl edit ptl <ptl-cluster-name> -n <namespace>
```

Where `<ptl-cluster-name>` is the name of your portal cluster if you have more than one. To see a list of your portal clusters, run:

```
kubectl get PortalCluster -n <namespace>
```

b. Delete the `spec.multiSiteHA` section.

c. Repeat for each portal cluster if you have more than one.

4. If you want to permanently revert to a single data center topology, then uninstall API Connect on the warm-standby data center. See: [Uninstalling API Connect](#). If you plan to restore your 2DCDR deployment in the future with the same warm-standby data center, then you do not need to uninstall API Connect on the warm-standby. Instead, remove the `spec.multiSiteHA` sections from the management and portal CRs, as you did on the active data center. When the `spec.multiSiteHA` section is removed from the CR of the warm-standby data center, all API Connect data is deleted from it, and it remains in an unconfigured state.

Related concepts

- [Backup and restore requirements for a two data center deployment](#)
- [Recovering from a failover of a two data center deployment](#)

Related tasks

- [How to failover API Connect from the active to the warm-standby data center](#)

Verifying replication between data centers

How to verify that your API Connect data is replicating to your warm-standby data center.

The Management and Portal UIs are not accessible on the warm-standby data center, so it is not possible to check that data replication is working by logging in to the UIs. Instead, you can verify that the warm-standby Management and Portal databases are in sync with command-line operations.

Note: For OpenShift users: The steps that are detailed in this topic use the Kubernetes `kubectl` command. On OpenShift, use the equivalent `oc` command in its place.

Verifying Management replication

The management CR reports a warning if it detects a problem with management data replication:

NAME	READY	STATUS	VERSION	RECONCILED	VERSION	MESSAGE
management	n/n	Warning	10.0.5.3-0	10.0.5.3-0		Management is ready. HA Status Warning - see HAStatus in CR
for details	8m59s					

```
status:
  haStatus
  {
    "lastTransitionTime": "2023-03-31T19:47:08Z",
    "message": "Replication not working",
    "reason": "na",
    "status": "True",
    "type": "Warning"
  }
```

If the warning persists, then see [Troubleshooting a two data center deployment](#).

To verify replication by creating new data on the active and checking that it is copied to the warm-standby, follow these steps:

1. Login to the Cloud Manager UI.
2. Create a local user registry called `2dcdrtst`: [Configuring a Local User Registry](#).
3. Run the following command in your warm-standby data center to query the management database for the new user registry:

```
kubectl exec -n <namespace> `kubectl -n <namespace> get po -l role=master -o name` -- bash -c "psql apim -c \"select name,created_at from user_registry where name = '2dcdrtst'\""
```

Expected output is:

```
Defaulted container "database" out of: database, set-libpq-certs (init)
name | created_at
```

```
-----+-----
2dcdrtest | <date and time when step 2 was done>
(1 row)
```

- If `2dcdrtest` is returned and has a creation time consistent with when you did step 2, then replication is working. If it is not returned, then either replication is not working, or the data is not yet replicated. If an older creation date is returned, then it's possible the registry was not deleted after a previous check, in which case delete the registry and repeat this test. If replication is not working, follow the 2DCDR troubleshooting steps: [Troubleshooting a two data center deployment](#).
- Return to the Cloud Manager UI, and delete the `2dcdrtest` user registry.

Verifying Portal replication

Follow these steps to verify that the portal database is replicating from the active data center to the warm-standby data center.

- In the active data center, identify the active db pod:

```
kubectl get pods -n <namespace> | grep "<active site name>-db"
```

Example output:

```
<portal instance name>-<active site name>-db-0          2/2    Running    0
22h
```

where `<active site name>` is the `siteName` property from the portal CR on your active data center. The active data center db pods have 2 containers, so show a status of 2/2. A three replica deployment has three db pods and you can pick any one of them for the next step.

- In the active data center, run the following command:

```
kubectl exec -ti -n <namespace> <active portal db pod> -c db -- bash -ic "dbstatus 2>&1 | grep Last | sed 's/.*committed: \([0-9]*\)*/\1/'"
```

Example output:

```
355175
```

where `<active portal db pod>` is the pod name that is returned from step 1. The command returns a number.

- In the warm-standby data center, identify the warm-standby db pod:

```
kubectl get pods -n <namespace> | grep "<warm-standby site name>-db"
```

Example output:

```
<portal instance name>-<warm-standby site name>-db-0    2/2    Running    0
22h
```

where `<warm-standby site name>` is the `siteName` property from the portal CR on your warm-standby data center. The warm-standby data center db pods have 1 container, so show a status of 1/1. A three replica deployment has three db pods and you can pick any one of them for the next step.

- In the warm-standby data center, run the following command:

```
kubectl exec -ti -n <namespace> <passive portal db pod> -c db -- bash -ic "dbstatus 2>&1 | grep Last | sed 's/.*committed: \([0-9]*\)*/\1/'"
```

Example output:

```
355495
```

where `<passive portal db pod>` is the pod name that is returned from step 3. The command returns a number.

- The numbers that are returned from steps 2 and 4 represent the portal database's last committed transaction number. When the active data center commits a new transaction the number is incremented, this update is replicated to the warm-standby data center. If replication is working the number that is returned from the warm-standby data center should always be close to the number that is returned from the active data center. It is unlikely to be the same number that is returned, unless you are able to run step 4 and step 2 at precisely the same time.
- Repeat steps 2 and 4 several times to confirm that the warm-standby number is keeping up with the active number. If the number returned from the warm-standby data center is far behind, or ahead of the number that is returned from the active, then there is likely to be a replication problem, see [Troubleshooting a two data center deployment](#).

Troubleshooting a two data center deployment

What to check when a 2DCDR deployment is not starting or not replicating data.

Typical causes of 2DCDR failures are network problems between data centers, TLS certificate mismatches, or environmental problems on one of the data centers.

Note: For OpenShift users: The steps that are detailed in this topic use the Kubernetes `kubectl` command. On OpenShift, use the equivalent `oc` command in its place.

Check that API Connect pods are running

Confirm that all the pods are ready and running:

- To check portal, run:

```
kubectl get ptl -n <namespace>
```

NAME	READY	STATUS	VERSION	RECONCILED	VERSION	MESSAGE
AGE						
<portal instance name>	<ready pods>/<total number of pods>	Running	10.0.5.x	10.0.5.x-xxxx		Serving 1
site	14d					

- To check management, run:

```
kubectl get mgmt -n <namespace>
```

NAME	READY	STATUS	VERSION	RECONCILED VERSION	AGE
<management instance name>	<ready pods>/<total number of pods>	Running	10.0.5.x	10.0.5.x-xxxx	14d

The number of <ready pods> must match the <total number of pods>. If not all the pods are in ready state, run

```
kubectl get <mgmt or ptl> -n <namespace> -o yaml
```

and check the `status.conditions` output, for example:

```
conditions:
- lastTransitionTime: "2022-09-27T21:37:21Z",
  message: "Management installation in progress. Not all services are ready, pending services: analytics-proxy, apim, client-downloads-server, juhu, ldap, ...",
  reason: na
  status: "True"
  type: Pending
```

Also, check which pods are not running with:

```
kubectl get pods -n <namespace>
```

and review their logs:

```
kubectl logs <pod name> -n <namespace>
```

Note: The warm-standby management subsystem has fewer pods than the active management subsystem. The active and warm-standby portal subsystems have the same number of pods.

Check the multiSiteHA sections of the management and portal CRs

Run `kubectl describe` on your management and portal CRs to confirm that the `multiSiteHA` specification and status sections of the CR are as expected. For example, on the warm-standby management CR you should see:

```
kubectl describe mgmt -n <namespace>
```

```
...
spec:
  Multi Site HA:
    Mode: passive
    Replication Endpoint:
      Annotations:
        cert-manager.io/issuer: ingress-issuer
      Hosts:
        Name: mgmt-replication.apps.example.com
        Secret Name: mgmt-replication-server
    Replication Peer FQDN: mgmt-replication.apps.example.com
    Tls Client:
      Secret Name: mgmt-replication-client
...
Status
...
  Ha Mode: passive
...
  Multi Site HA:
    Remote Site Deployment Name: management
    Remote Site Name: passive
    Remote UUID: c736b702-b1ab-4fe2-b132-9c9d3b3a3bd3.9f986be1-14fc-4b3a-8eee-094217ce361e
    Replication Peer: https://mgmt-replication.apps.example.com/
```

Check that the `Hosts` and `Replication Peer` properties are set correctly in the `multiSiteHA` section, and that the hostnames resolve correctly in each data center.

Check the ingress-ca X.509 certificates match

Replication fails if both data centers do not have the same X.509 certificate in their `ingress-ca` secrets. Run the following command in both data centers to see the X.509 certificate, and check that the output is the same:

```
openssl x509 -noout -fingerprint -sha256 -in <(kubectl get secret ingress-ca -n <namespace> -o yaml | grep "^  tls.crt:" | awk '{print $2}' | base64 -d)
```

If you do not have the `openssl` command available, you can instead run only the `kubectl` part, which produces a larger output:

```
kubectl get secret ingress-ca -n <namespace> -o yaml | grep "^  tls.crt:" | awk '{print $2}' | base64 -d
```

if the outputs are different, follow these steps to synchronize the certificates:

1. If you installed API Connect on Kubernetes or OpenShift using individual subsystem CRs, determine which data center has the `ingress-ca` Kubernetes cert-manager certificate object:

```
kubectl get certificates -n <namespace> | grep ingress-ca
```

this is your source data center.

2. If you installed API Connect on Cloud Pak for Integration, use the current active data center as the source data center, and the warm-standby as the target data center.
3. Extract the `ingress-ca secret` from your source data center to a file called `new-ca-issuer-secret.yaml`:

```
kubectl get secret ingress-ca -o yaml -n <namespace> > new-ca-issuer-secret.yaml
```

4. Edit the `new-ca-issuer-secret.yaml` file and remove the `creationTimestamp`, `resourceVersion`, `uid`, `namespace`, and `managedFields`. Remove the labels and annotations sections completely. The resulting contents should include the `ingress-ca` X.509 certificate, and the secret name:

```
apiVersion: v1
data:
  ca.crt: <long cert string>
  tls.crt: <long cert string>
  tls.key: <long cert string>
kind: Secret
metadata:
  name: ingress-ca
  type: kubernetes.io/tls
```

5. Copy the `new-ca-issuer-secret.yaml` to the target data center.

Follow these steps to apply the extracted `ingress-ca` X.509 certificate on your target data center:

1. To apply the `new-ca-issuer-secret.yaml` file, run:

```
kubectl apply -f new-ca-issuer-secret.yaml -n <namespace>
```

2. Regenerate all `ingress-ca` end-entity certificates:

```
kubectl get secrets -n <namespace> -o custom-columns='NAME:.metadata.name,ISSUER:.metadata.annotations.cert-manager.io/issuer-name' --no-headers=true | grep ingress-issuer | awk '{ print $1 }' | xargs kubectl delete secret -n <namespace>
```

All affected pods should automatically restart. For more information on regenerating certificates, see: [Renewing certificates with cert-manager](#).

Check the operator and tunnel pod logs

The API Connect operator pod manages the 2DCDR deployment. The tunnel pods manage the communication between data centers.

Check the logs of the API Connect operator pod and search for the text "multi" to see any errors that are related to 2DCDR. For example:

```
kubectl logs <ibm-apiconnect operator pod> -n <operator namespace> | grep -i multi
```

The `<ibm-apiconnect operator pod>` has `ibm-apiconnect` in its name, and might be in a different namespace to your API Connect operand pods.

Check the logs of your API Connect `tunnel` pods. These pods always have `tunnel` in their name. For example:

```
kubectl logs portal-tunnel-0 -n <namespace> --since=10m
```

```
...
[ ws-tunnel stderr] 400 0eec87:fb8309:21aa2d 2022-12-02 12:27:33: 2022-12-02T12:27:33.786Z INFO tls incoming
request {"remote-addr": "10.254.20.144:55042", "uri": "/portal-active-db-0/3060"}
[ ws-tunnel stderr] 400 0eec87:fb8309:21aa2d 2022-12-02 12:27:33: 2022-12-02T12:27:33.786Z INFO tls connect to
upstream {"remote-addr": "10.254.20.144:55042", "uri": "/portal-active-db-0/3060"}
[ ws-tunnel stderr] 400 0eec87:fb8309:21aa2d 2022-12-02 12:27:33: 2022-12-02T12:27:33.817Z INFO tls closing
connection {"remote-addr": "10.254.20.144:55042", "uri": "/portal-active-db-0/3060"}
[ ws-tunnel stderr] 400 0eec87:fb8309:21aa2d 2022-12-02 12:27:33: 10.254.20.144 - - [02/Dec/2022:12:27:33 +0000] "GET
/portal-active-db-0/3060 HTTP/1.1" 101 0
```

Note: It is normal for the management tunnel pod to repeatedly log:

```
2022/12/02 12:29:17 http: TLS handshake error from 10.254.16.1:44812: EOF
```

This message can be filtered out with `grep`

```
-v:
```

```
kubectl logs management-tunnel-574bdcd865-48zh6 -n <namespace> | grep -v "http: TLS handshake error from"
```

Monitoring and health checks

Monitor your deployment and complete health checks on subsystems.

See:

- [Monitoring on Kubernetes](#)
Monitor the API Connect subsystems on Kubernetes.
- [Monitoring on OpenShift](#)
Monitor your API Connect deployment on OpenShift.
- [Monitoring on Cloud Pak for Integration](#)
Monitor your API Connect deployment on Cloud Pak for Integration.
- [Obtaining simple health check data of Developer Portal sites by using a REST API call](#)
Call a simple health check API from your external load balancer to dynamically determine whether a specific Developer Portal site in a cluster is working. This API call can be used by a load balancer to help determine where to route traffic.

Monitoring on Kubernetes

Monitor the API Connect subsystems on Kubernetes.

See:

- [Monitoring subsystems on Kubernetes](#)
Use `kubect1 get` to check the health of the API Connect clusters in your Kubernetes deployment.
- [Monitoring Postgres disk usage](#)
Monitor disk usage by the Postgres database in the management subsystem.
- [Monitoring platform health using Kubernetes events](#)
Monitor the health of your API Connect deployment by viewing the Kubernetes events that are generated for every status change in each subsystem CR.

Monitoring subsystems on Kubernetes

Use `kubect1 get` to check the health of the API Connect clusters in your Kubernetes deployment.

The APICoconnect operator controls the life-cycle of management subsystem microservices. When you install, you create the following custom resources (CRs) in order to install API Connect and all subsystems:

- `ManagementCluster` or `mgmt`
- `AnalyticsCluster` or `a7s`
- `PortalCluster` or `ptl`
- `GatewayCluster` or `gw`

Every CR has a `status` section. The APICoconnect operator regularly updates this section with the current status of the subsystem.

For example, use the following command to obtain the status of `ManagementCluster`:

```
kubect1 get mgmt -n <namespace>
```

Example:

```
kubect1 get mgmt
NAME   READY   STATUS    VERSION           RECONCILED VERSION   AGE
ml     16/16   Running   10.0.1-eus        10.0.1.4-ifix1-44-eus 24m
```

Output:

- **NAME**: Name of the Management Subsystem
- **READY**: Current number of management subsystem which are up, followed by the expected number of management subsystem components which should be up. For example: 16/16.
- **STATUS**: Current status of Management Subsystem
During fresh install, upgrade or any maintenance operation, such as changing configuration for S3 backups, Management CR status can go to different states depending on the action, but ultimately it should **always** reach **Running** status.

If the status says **Warning**, then run `kubect1 describe mgmt -n <namespace>` and check for more details in the **Status** section. For example,

```
Status:
...
Conditions:
...
Message:          WAL Archiving is not working. Last successful archive time: 2022-07-26
20:37:14.456465 +0000 UTC. Last archive failed time: 2022-07-26 21:10:34.172539 +0000 UTC
Reason:           WALArchiveNotWorking
...
```

Note: If you see the **WAL Archiving is not working** warning message, then verify your S3 backup settings (bucket name, folder name, credentials, certificates), gather logs and open a support request.

- **VERSION**: Version chosen in `spec.version` in the management CR.
- **RECONCILED VERSION**: Current management subsystem version. Includes a build number.
- **AGE**: Age of the management subsystem CR.

Monitoring Postgres disk usage

Monitor disk usage by the Postgres database in the management subsystem.

Postgres Database is the core database used in Management Subsystem. It is important to monitor the Postgres disk usage.

In 10.0.3.0 and greater, the APICoconnect operator tracks the current disk usage of the Postgres components, and regularly updates the `ManagementCluster` status. When one or more of the Postgres components occupy 50% of the PVC (persistent volume claim) capacity, the APICoconnect operator changes the status from **Running** to **Warning**.

APICoconnect operator **brings down** Postgres if the disk allocation reaches **80%**. In this case, you must contact IBM support.

Note that there are various types of storage classes which can be used to deploy Management Subsystem. For example, `local-storage` or `ceph block`.

- [Management Cluster disk stats](#)
- [Warning condition is populated at 50% usage](#)
- [Error condition is populated at 80% usage](#)

Management Cluster disk stats

The `ManagementCluster` instance has `.status.postgresDataStats` where the operator prints the current disk usage of Postgres components. For example:

```
kubectl get mgmt ml -o json | jq .status.postgresDataStats
[
  {
    "instanceName": "ml-ed60c42d-postgres",
    "podName": "ml-ed60c42d-postgres-86766f69cb-xs7t5",

    "podName": "ml-ed60c42d-postgres-cimo-5769868b75-5z7ln",
    "pvcCapacity": 250181844992,
    "pvcName": "ml-ed60c42d-postgres-cimo",
    "pvcType": "PostgreSQL",
    "pvcUsed": 59994112,
    "pvcUsedPercentage": 0
  },
  {
    "instanceName": "ml-ed60c42d-postgres-cimo",
    "podName": "ml-ed60c42d-postgres-cimo-5769868b75-5z7ln",
    "pvcCapacity": 250181844992,
    "pvcName": "ml-ed60c42d-postgres-cimo-wal",
    "pvcType": "WAL",
    "pvcUsed": 201334784,
    "pvcUsedPercentage": 0
  }
]

```

Warning condition is populated at 50% usage

When one of the Postgres components occupy 50% usage, the operator marks the overall status of the **ManagementCluster** to **Warning** with an appropriate warning message. The operator also updates the **postgresDataStats** section with the current data usage of the Postgres components.

Example of warning state:

```
kubectl get mgmt ml
```

NAME	READY	STATUS	VERSION	RECONCILED	VERSION	AGE
ml	17/17	Warning	10.0.1-eus	10.0.1.4-ifix1-44-eus		26h

```
kubectl get mgmt ml -o json | jq .status.phase
```

```
"Warning"
```

Example of list of warning conditions:

```
kubectl get mgmt ml -o json | jq .status.conditions
```

```
[
  {
    "lastTransitionTime": "2021-09-08T19:49:51Z",
    "message": "Current WAL disk usage of ml-ed60c42d-postgres is 51 percent. DATABASE SHUTDOWN starts at 80 percent utilization. Please contact IBM Support immediately",
    "reason": "disk_usage_more_than_50_percent",
  }
]

```

```

    "status": "True",
    "type": "Warning"
  },
  {
    "lastTransitionTime": "2021-09-08T19:42:30Z",
    "message": "",
    "reason": "na",
    "status": "False",
    "type": "Ready"
  },
  {
    "lastTransitionTime": "2021-09-08T19:41:35Z",
    "message": "",
    "reason": "na",
    "status": "False",
    "type": "Pending"
  },
  {
    "lastTransitionTime": "2021-09-07T17:18:02Z",
    "message": "",
    "reason": "na",
    "status": "False",
    "type": "Error"
  },
  {
    "lastTransitionTime": "2021-09-07T17:18:02Z",
    "message": "",
    "reason": "na",
    "status": "False",
    "type": "Failed"
  }
]

```

The warning condition explains why the warning condition was set. For example:

```

Current WAL disk usage of m1-ed60c42d-postgres is 51 percent. DATABASE SHUTDOWN starts at 80 percent utilization. Please contact IBM Support immediately

```

If you encounter the warning, contact IBM support to fix the root cause.

Error condition is populated at 80% usage

An error condition is populated when the operator brings down Postgres because is using 80% of available disk space. Postgres is brought down to avoid problems, such as disk corruption, that can occur if the disk becomes completely filled.

```

- lastTransitionTime: "2021-08-28T01:42:56Z"
  message: Current WAL disk usage of nihar-stac-3955b42d-site1-postgres is more
           than 70 percent, initiating DATABASE SHUTDOWN
  reason: disk_usage_more_than_70_percent
  status: "True"
  type: Error

```

If you encounter the error, contact IBM support to fix the root cause.

Important:

When `local-storage` is used, it uses the entire disk that is allocated to the worker node. In some cases, Kubernetes itself can face disk pressure before the operator reacts to 80% usage, and will start evicting pods. In these cases, you might need to increase the disk allocated to the worker node, in order to stabilize the worker node, by following [Recovering when disks are filled by the management database](#).

Monitoring platform health using Kubernetes events

Monitor the health of your API Connect deployment by viewing the Kubernetes events that are generated for every status change in each subsystem CR.

What are the Kubernetes events?

The CR for every subsystem of API Connect has a status condition section, which is regularly updated by the API Connect operator with the current status. Beginning in 10.0.5.3, the API Connect operator additionally generates a Kubernetes event whenever there is a change in the CR status.

Events are enabled in API Connect operator for the following resources.

- `APIConnectCluster` CR
- `ManagementCluster` CR
- `GatewayCluster` CR
- `AnalyticsCluster` CR
- `PortalCluster` CR

Two types of events are generated when the CR status changes:

- **Normal** - Indicates that the status change is not causing any issues.
- **Warning** - Indicates that there a problem that requires your attention.

You can automatically monitor the status condition in your existing alerting system, or by integrating the Kubernetes events into a third-party alerting solution. For more information, see the following blog post: [How to use Kubernetes events for effective alerting and monitoring](#).

Viewing the events

The default retention period of events in Kubernetes is 1 hour (controlled by `kube-apiserver`). To view the events, complete the following steps:

1. Run the `kubectl describe` against the resource you want to monitor; for example:

```
kubectl describe APICoconnectCluster
```

2. In the response, scroll to the end to see the events information, which looks like the following example:

```
Name:          10.0.5.3-1
Reconciled:    10.0.5.3-1
Events:
  Type    Reason      Age   From              Message
  ----    -
Normal   Running     10h   ibm-apiconnect-operator All services ready.
Normal   Deploying   10h   ibm-apiconnect-operator Not all services are ready, pending services: management
```

Monitoring on OpenShift

Monitor your API Connect deployment on OpenShift.

See:

- [Monitoring the API Connect cluster on OpenShift](#)
Monitor the status of the API Connect cluster on OpenShift using either the command line or the OpenShift web console.
- [Monitoring Postgres disk usage on OpenShift](#)
In API Connect, you can monitor the disk space that is used by the Postgres database in the Management subsystem.
- [Monitoring platform health on Red Hat OpenShift using Kubernetes events](#)
Monitor the health of your API Connect deployment by viewing the Kubernetes events that are generated for every status change in each subsystem CR.

Monitoring the API Connect cluster on OpenShift

Monitor the status of the API Connect cluster on OpenShift using either the command line or the OpenShift web console.

You deploy the API Connect subsystems on OpenShift with the `APICoconnect` operator and the `apiconnectcluster` CR. The CR contains a status section that is regularly updated by the operator to display the current status of the all the API Connect subsystems.

When you finish deploying API Connect, you can monitor the status of `apiconnectcluster` using the command line or the OpenShift web console.

- [Monitoring the API Connect cluster using the command line](#)
- [Monitoring the API Connect cluster using the OpenShift web console](#)

Version 10.0.3 and later: You can also monitor the disk usage of Postgres microservices. The `APICoconnect` operator continuously tracks the disk usage of postgres microservices and provides useful information in the `ManagementCluster` custom resource. For information on viewing the postgres disk status, see [Monitoring Postgres disk usage on OpenShift](#).

Monitoring the API Connect cluster using the command line

Run the following command to display the status of the API Connect cluster:

```
oc get apiconnectcluster -n <APIC_namespace>
```

The response looks like the following example:

```
NAME          READY   STATUS    VERSION          RECONCILED VERSION  AGE
production    7/7    Ready     10.0.1.5-eus     10.0.1.5-3323-eus   24h
```

The following list explains the values in the response:

- **NAME:** Name of the API Connect instance (in the example, the instance name is "production").
- **READY:** Current number of subsystems and components that are running / Expected number of subsystems and components that should be running.
- **STATUS:** Current status of API Connect.

If the status says `Warning`, then run `oc describe apiconnectcluster -n <namespace>` and check for more details in the `Status` sections. For example, for the management CR:

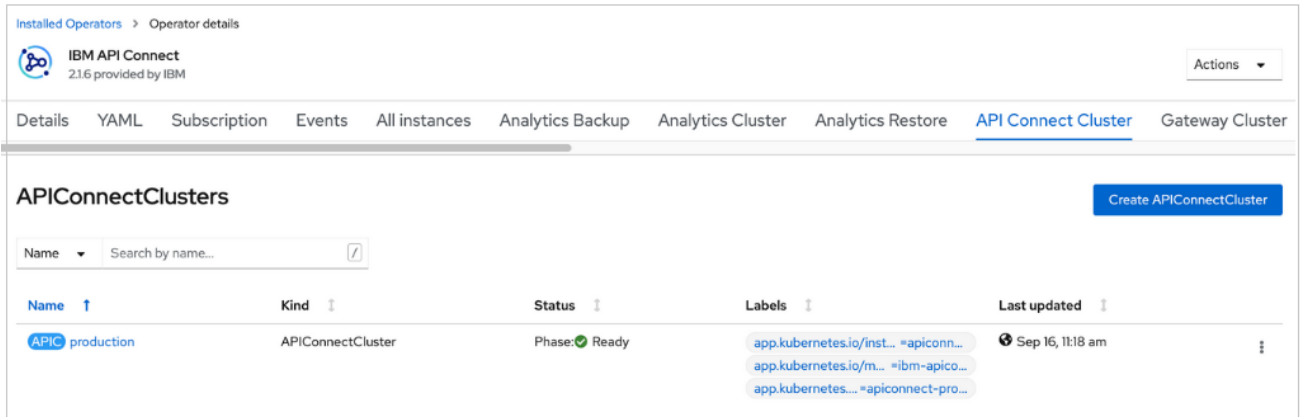

```
Status:
...
Conditions:
...
Message:          WAL Archiving is not working. Last successful archive time: 2022-07-26
20:37:14.456465 +0000 UTC. Last archive failed time: 2022-07-26 21:10:34.172539 +0000 UTC
Reason:          WALArchiveNotWorking
...
```

Note: If you see the `WAL Archiving is not working` warning message, then verify your S3 backup settings (bucket name, folder name, credentials, certificates), gather logs and open a support request.

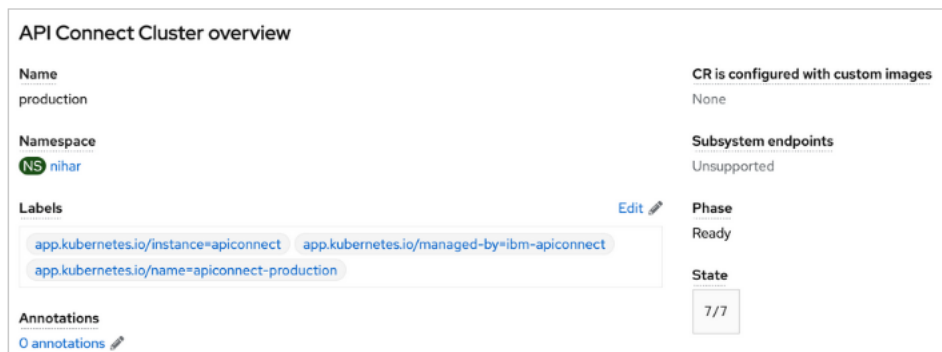

- **VERSION:** API Connect version specified in the CR's `spec.version` setting.
- **RECONCILED VERSION:** Current API Connect version.
- **AGE:** Age of the `apiconnectcluster` CR.

Monitoring the API Connect cluster using the OpenShift web console

1. Start the OpenShift web console.
2. Click Installed operators.
3. Locate the namespace (project) where you installed API Connect:
 - If you installed the API Connect operator in all namespaces, select openshift-operators
 - if you installed the API Connect operator in a single namespace, select specific project
4. Hover next to the name of the API Connect namespace and click API Connect Cluster.
5. On the API Connect Clusters page, check the Status column.
The status should display "Ready" as in the following image:

6. Click the instance name (in the example, the instance name is production to display the status overview page.
The overview page displays high-level information about your deployment, as in the following image:

Also on the overview page, the "Conditions" section displays the list of possible service conditions, as in the following image:

Type	Status	Updated	Reason	Message
Warning	False	Sep 16, 11:18 am	na	-
Ready	True	Sep 16, 8:26 pm	Running	7/7
Pending	False	Sep 16, 8:26 pm	na	-
Error	False	Sep 16, 11:18 am	na	-

A healthy deployment displays "True" for the "Ready" status.

During a fresh install, an upgrade or a day-2 operation (such as a Management backup S3 configuration change), the `apiconnectcluster` CR status might change to a different state depending on the action, but ultimately it should always reach the **Ready** status.

Monitoring Postgres disk usage on OpenShift

In API Connect, you can monitor the disk space that is used by the Postgres database in the Management subsystem.

The Postgres database is the core database used in the Management subsystem. It is important to monitor the Postgres disk usage to avoid running out of space and causing an outage in your deployment.

In Version 10.0.3 and later, the `APICConnect` operator tracks the current disk usage of the Postgres components, and regularly updates the `ManagementCluster` CR's status. When one or more of the Postgres components occupy 50% of the PVC (persistent volume claim) capacity, the `APICConnect` operator changes the CR's status from **Running** to **Warning**.

Important: If the Postgres disk usage reaches 80%, then the `APICConnect` operator brings down Postgres. If this situation occurs, contact IBM Support.

Note that there are various types of storage classes which can be used to deploy Management subsystem; for example, `local-storage` or `ceph block`. When `local-storage` is used, the entire disk is allocated to the worker node. In some cases, before the `APIConnect` operator reacts to an 80% usage condition, Kubernetes itself might face disk pressure and start evicting pods. In this situation, you might want to increase the size of the disk allocated to the worker node as explained in [Recovering on OpenShift and Cloud Pak for Integration when disks are filled by the management database](#).

Viewing the current disk usage

The `ManagementCluster` instance includes the `.status.postgresDataStats` field, where the operator displays the current disk usage of Postgres components. Run the following command to get the disk usage:

```
oc get mgmt m1 -n APIC_namespace -o json | jq .status.postgresDataStats
```

The response looks like the following example:

```
[
  {
    "instanceName": "m1-ed60c42d-postgres",
    "podName": "m1-ed60c42d-postgres-86766f69cb-xs7t5",
    "pvcCapacity": 250181844992,
    "pvcName": "m1-ed60c42d-postgres",
    "pvcType": "PostgreSQL",
    "pvcUsed": 60895232,
    "pvcUsedPercentage": 0
  },
  {
    "instanceName": "m1-ed60c42d-postgres-backrest-shared-repo",
    "podName": "m1-ed60c42d-postgres-backrest-shared-repo-859484b5f6-r7cv6",
    "pvcCapacity": 250181844992,
    "pvcName": "m1-ed60c42d-postgres-pgbr-repo",
    "pvcType": "pgBackRest",
    "pvcUsed": 16203776,
    "pvcUsedPercentage": 0
  },
  {
    "instanceName": "m1-ed60c42d-postgres",
    "podName": "m1-ed60c42d-postgres-86766f69cb-xs7t5",
    "pvcCapacity": 250181844992,

    "pvcUsed": 201338880,
    "pvcUsedPercentage": 0
  },
  {
    "instanceName": "m1-ed60c42d-postgres-fqbg",
    "podName": "m1-ed60c42d-postgres-fqbg-84869d976c-49qgc",
    "pvcCapacity": 250181844992,
    "pvcName": "m1-ed60c42d-postgres-fqbg",
    "pvcType": "PostgreSQL",
    "pvcUsed": 59994112,
    "pvcUsedPercentage": 0
  },
  {
    "instanceName": "m1-ed60c42d-postgres-fqbg",
    "podName": "m1-ed60c42d-postgres-fqbg-84869d976c-49qgc",
    "pvcCapacity": 250181844992,
    "pvcName": "m1-ed60c42d-postgres-fqbg-wal",
    "pvcType": "WAL",
    "pvcUsed": 201334784,
    "pvcUsedPercentage": 0
  },
  {
    "instanceName": "m1-ed60c42d-postgres-cimo",
    "podName": "m1-ed60c42d-postgres-cimo-5769868b75-5z7ln",
    "pvcCapacity": 250181844992,
    "pvcName": "m1-ed60c42d-postgres-cimo",
    "pvcType": "PostgreSQL",
    "pvcUsed": 59994112,
    "pvcUsedPercentage": 0
  },
  {
    "instanceName": "m1-ed60c42d-postgres-cimo",
    "podName": "m1-ed60c42d-postgres-cimo-5769868b75-5z7ln",
    "pvcCapacity": 250181844992,
    "pvcName": "m1-ed60c42d-postgres-cimo-wal",
    "pvcType": "WAL",
    "pvcUsed": 201334784,
    "pvcUsedPercentage": 0
  }
]
```

Warning condition is populated at 50% usage

When one of the Postgres components uses 50% of its allocated space, the operator changes the overall status of the `ManagementCluster` to `Warning` with an appropriate warning message. The operator also updates the `postgresDataStats` section with the current data usage of the Postgres components.

Attention: If you encounter the `Warning` condition, contact IBM Support for help correcting the root cause. To view the status, run the following command:

```
oc get mgmt m1
```

The following example response shows the warning state:

NAME	READY	STATUS	VERSION	RECONCILED VERSION	AGE
m1	17/17	Warning	10.0.1-eus	10.0.1.4-ifix1-44-eus	26h

To view just the status, run the following command:

```
oc get mgmt m1 -o json | jq .status.phase
```

In this example, the status displayed in the response is "Warning":

```
"Warning"
```

To see the list of current status conditions, run the following command:

```
oc get mgmt m1 -o json | jq .status.conditions
```

The following example response displays the list of status conditions. Notice that the **Warning** condition is set to "True" and the other conditions are set to "False":

```
[
  {
    "lastTransitionTime": "2021-09-08T19:49:51Z",
    "message": "Current WAL disk usage of m1-ed60c42d-postgres is 51 percent. DATABASE SHUTDOWN starts at 80 percent utilization. Please contact IBM Support immediately",
    "reason": "disk_usage_more_than_50_percent",
    "status": "True",
    "type": "Warning"
  },
  {
    "lastTransitionTime": "2021-09-08T19:42:30Z",
    "message": "",
    "reason": "na",
    "status": "False",
    "type": "Ready"
  },
  {
    "lastTransitionTime": "2021-09-08T19:41:35Z",
    "message": "",
    "reason": "na",
    "status": "False",
    "type": "Pending"
  },
  {
    "lastTransitionTime": "2021-09-07T17:18:02Z",
    "message": "",
    "reason": "na",
    "status": "False",
    "type": "Error"
  },
  {
    "lastTransitionTime": "2021-09-07T17:18:02Z",
    "message": "",
    "reason": "na",
    "status": "False",
    "type": "Failed"
  }
]
```

The warning condition includes an explanation of why the condition was set to "True"; for example:

```
Current WAL disk usage of m1-ed60c42d-postgres is 51 percent. DATABASE SHUTDOWN starts at 80 percent utilization. Please contact IBM Support immediately
```

Error condition is populated at 80% usage

When one of the Postgres components uses 80% of its allocated space, the operator changes the overall status of the **ManagementCluster** to **Error** and brings down Postgres avoid problems that can occur if the disk becomes completely filled.

Attention: If you encounter the **Error** condition, contact IBM Support for help correcting the root cause.

In this case, when you run the following command to view the status conditions, you will see that the "Error" condition is set to "True":

```
oc get mgmt m1 -o json | jq .status.conditions
```

For example, the following condition shows the **Error** status set to "True" due to disk usage:

```
- lastTransitionTime: "2021-08-28T01:42:56Z"
  message: Current WAL disk usage of nihar-stac-3955b42d-sitel-postgres is more than 70 percent, initiating DATABASE SHUTDOWN
  reason: disk_usage_more_than_70_percent
  status: "True"
  type: Error
```

Monitoring platform health on Red Hat OpenShift using Kubernetes events

Monitor the health of your API Connect deployment by viewing the Kubernetes events that are generated for every status change in each subsystem CR.

What are the Kubernetes events?

The CR for every subsystem of API Connect has a status condition section, which is regularly updated by the API Connect operator with the current status. Beginning in 10.0.5.3, the API Connect operator additionally generates a Kubernetes event whenever there is a change in the CR status.

Events are enabled in API Connect operator for the following resources.

- **APIConnectCluster** CR
- **ManagementCluster** CR
- **GatewayCluster** CR
- **AnalyticsCluster** CR
- **PortalCluster** CR

Two types of events are generated when the CR status changes:

- **Normal** - Indicates that the status change is not causing any issues.
- **Warning** - Indicates that there is a problem that requires your attention.

You can automatically monitor the status condition in your existing alerting system, or by integrating the Kubernetes events into a third-party alerting solution. For more information, see the following blog post: [How to use Kubernetes events for effective alerting and monitoring](#).

Viewing the events

The default retention period of events in Red Hat OpenShift is 3 hours (controlled by `kube-apiserver`). To view the events, complete the following steps:

1. In the Web UI, click Operators > Installed Operators > IBM API Connect > API Connect Clusters.
2. Select an instance by clicking its name: Management cluster, Gateway cluster, Portal cluster, or Analytics cluster. If you installed using the top-level **APIConnectCluster** CR, you can additionally select API Connect cluster.
3. Select the Events tab to see all of the events that were generated for that instance.

Monitoring on Cloud Pak for Integration

Monitor your API Connect deployment on Cloud Pak for Integration.

See:

- [Monitoring the API Connect cluster on Cloud Pak for Integration](#)
Monitor the status of the API Connect cluster on Cloud Pak for Integration using either the command line or the IBM Cloud Pak Platform UI.
- [Monitoring Postgres disk usage on Cloud Pak for Integration](#)
In API Connect, you can monitor the disk space that is used by the Postgres database in the Management subsystem.

Monitoring the API Connect cluster on Cloud Pak for Integration

Monitor the status of the API Connect cluster on Cloud Pak for Integration using either the command line or the IBM Cloud Pak Platform UI.

In Cloud Pak for Integration, the API Management capability is provided by API Connect. You deploy the API Connect subsystems on Cloud Pak for Integration with the **APIConnect** operator and the **apiconnectcluster** CR. The CR contains a status section that is regularly updated by the operator to display the current status of all the API Connect subsystems.

When you finish deploying API Connect, you can monitor the status of **apiconnectcluster** using the command line or the OpenShift web console.

- [Monitoring the API Connect cluster using the command line](#)
- [Monitoring the API Connect cluster using the Platform UI](#)

API Connect 10.0.3 and later: You can also monitor the disk usage of Postgres microservices. The **APIConnect** operator continuously tracks the disk usage of postgres microservices and provides useful information in the **ManagementCluster** custom resource. For information on viewing the postgres disk status, see [Monitoring Postgres disk usage on Cloud Pak for Integration](#).

Monitoring the API Connect cluster using the command line

Run the following command to display the status of the API Connect cluster:

```
oc get apiconnectcluster -n <APIC_namespace>
```

The response looks like the following example:

NAME	READY	STATUS	VERSION	RECONCILED	VERSION	AGE
production	7/7	Ready	10.0.1.5-eus	10.0.1.5-3323-eus		24h

The following list explains the values in the response:

- **NAME**: Name of the API Connect instance (in the example, the instance name is "production").
- **READY**: Current number of subsystems and components that are running / Expected number of subsystems and components that should be running.
- **STATUS**: Current status of API Connect.

If the status says **Warning**, then run `oc describe apiconnectcluster -n <namespace>` and check for more details in the **Status** sections. For example, for the management CR:

```
Status:
...
Conditions:
...
```

```

Message:                WAL Archiving is not working. Last successful archive time: 2022-07-26
20:37:14.456465 +0000 UTC. Last archive failed time: 2022-07-26 21:10:34.172539 +0000 UTC
Reason:                 WALArchiveNotWorking
...

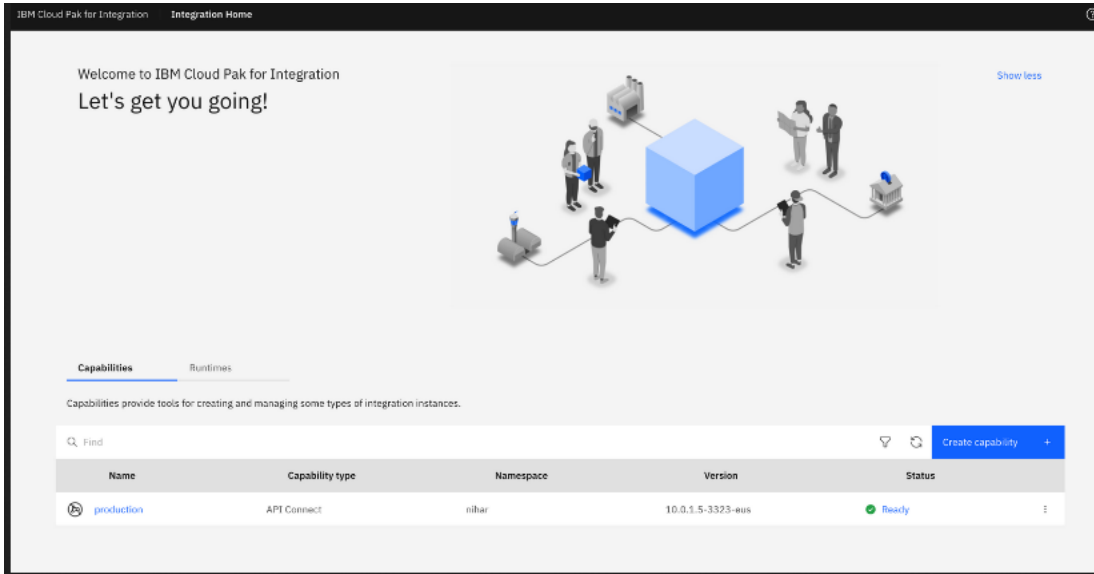

```

Note: If you see the **WAL Archiving is not working** warning message, then verify your S3 backup settings (bucket name, folder name, credentials, certificates), gather logs and open a support request.

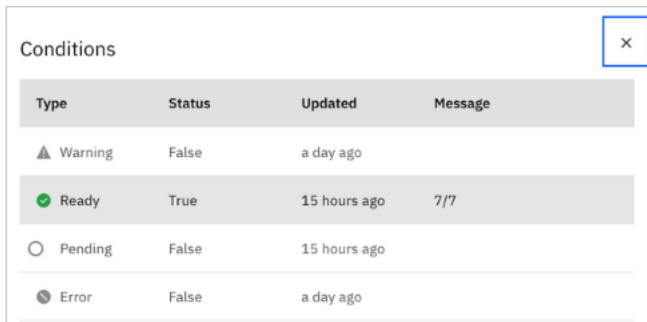

- **VERSION**: API Connect version specified in the CR's `spec.version` setting.
- **RECONCILED VERSION**: Current API Connect version.
- **AGE**: Age of the `apiconnectcluster` CR.

Monitoring the API Connect cluster using the Platform UI

1. Start the Platform UI.
2. Click the Integration instances tab.
3. Locate the "API Connect" capability that uses the instance name that you specified as the Name during installation.
A healthy API Connect deployment displays "Ready" in the Status column

4. Click the status value to display information about the current conditions, as in the following image:

A healthy deployment displays "True" for the "Ready" status.

During a fresh install, an upgrade or a day-2 operation (such as a Management backup S3 configuration change), the `apiconnectcluster` CR status might change to a different state depending on the action, but ultimately it should always reach the **Ready** status.

Monitoring Postgres disk usage on Cloud Pak for Integration

In API Connect, you can monitor the disk space that is used by the Postgres database in the Management subsystem.

The Postgres database is the core database used in the Management subsystem. It is important to monitor the Postgres disk usage to avoid running out of space and causing an outage in your deployment.

In API Connect 10.0.3 and later, the `APIConnect` operator tracks the current disk usage of the Postgres components, and regularly updates the `ManagementCluster` CR's status. When one or more of the Postgres components occupy 50% of the PVC (persistent volume claim) capacity, the `APIConnect` operator changes the CR's status from **Running** to **Warning**.

Important: If the Postgres disk usage reaches 80%, then the `APIConnect` operator brings down Postgres. If this situation occurs, contact IBM Support.

Note that there are various types of storage classes which can be used to deploy Management subsystem; for example, `local-storage` or `ceph-block`. When `local-storage` is used, the entire disk is allocated to the worker node. In some cases, before the `APIConnect` operator reacts to an 80% usage condition, Kubernetes itself might face disk pressure and start evicting pods. In this situation, you might want to increase the size of the disk allocated to the worker node as explained in [Recovering on OpenShift and Cloud Pak for Integration when disks are filled by the management database](#).

Viewing the current disk usage

The `ManagementCluster` instance includes the `.status.postgresDataStats` field, where the operator displays the current disk usage of Postgres components. Run the following command to get the disk usage:

```
ocp get mgmt m1 -n APIC_namespace -o json | jq .status.postgresDataStats
```

The response looks like the following example:

```
[
  {
    "instanceName": "m1-ed60c42d-postgres",
    "podName": "m1-ed60c42d-postgres-86766f69cb-xs7t5",
    "pvcCapacity": 250181844992,
    "pvcName": "m1-ed60c42d-postgres",
    "pvcType": "PostgreSQL",
    "pvcUsed": 60895232,
    "pvcUsedPercentage": 0
  },

    "pvcUsed": 16203776,
    "pvcUsedPercentage": 0
  },
  {
    "instanceName": "m1-ed60c42d-postgres",
    "podName": "m1-ed60c42d-postgres-86766f69cb-xs7t5",
    "pvcCapacity": 250181844992,
    "pvcName": "m1-ed60c42d-postgres-wal",
    "pvcType": "WAL",
    "pvcUsed": 201338880,
    "pvcUsedPercentage": 0
  },
  {
    "instanceName": "m1-ed60c42d-postgres-fqbg",
    "podName": "m1-ed60c42d-postgres-fqbg-84869d976c-49qgc",
    "pvcCapacity": 250181844992,
    "pvcName": "m1-ed60c42d-postgres-fqbg",
    "pvcType": "PostgreSQL",
    "pvcUsed": 59994112,
    "pvcUsedPercentage": 0
  },
  {
    "instanceName": "m1-ed60c42d-postgres-fqbg",
    "podName": "m1-ed60c42d-postgres-fqbg-84869d976c-49qgc",
    "pvcCapacity": 250181844992,
    "pvcName": "m1-ed60c42d-postgres-fqbg-wal",
    "pvcType": "WAL",
    "pvcUsed": 201334784,
    "pvcUsedPercentage": 0
  },
  {
    "instanceName": "m1-ed60c42d-postgres-cimo",
    "podName": "m1-ed60c42d-postgres-cimo-5769868b75-5z7ln",
    "pvcCapacity": 250181844992,
    "pvcName": "m1-ed60c42d-postgres-cimo",
    "pvcType": "PostgreSQL",
    "pvcUsed": 59994112,
    "pvcUsedPercentage": 0
  },
  {
    "instanceName": "m1-ed60c42d-postgres-cimo",
    "podName": "m1-ed60c42d-postgres-cimo-5769868b75-5z7ln",
    "pvcCapacity": 250181844992,
    "pvcName": "m1-ed60c42d-postgres-cimo-wal",
    "pvcType": "WAL",
    "pvcUsed": 201334784,
    "pvcUsedPercentage": 0
  }
]
```

Warning condition is populated at 50% usage

When one of the Postgres components uses 50% of its allocated space, the operator changes the overall status of the `ManagementCluster` CR and the `APICConnectCluster` CR to `Warning` with an appropriate warning message. The operator also updates the `postgresDataStats` section with the current data usage of the Postgres components.

Attention: If you encounter the `Warning` condition, contact IBM Support for help correcting the root cause. To view the status from the command line, run the following command:

- `APICConnectCluster` CR:

```
oc get apiconnect
```

The following example response shows the warning status:

NAME	READY	RECONCILED	VERSION	AGE
------	-------	------------	---------	-----

```
production Current WAL disk usage of production-mgmt-31be1757-postgres is 60 percent. DATABASE SHUTDOWN starts at 80 percent utilization. Please contact IBM Support immediately. Warning 10.0.1.5-eus 10.0.1.5-3394-eus 11d
```

- **ManagementCluster** CR:

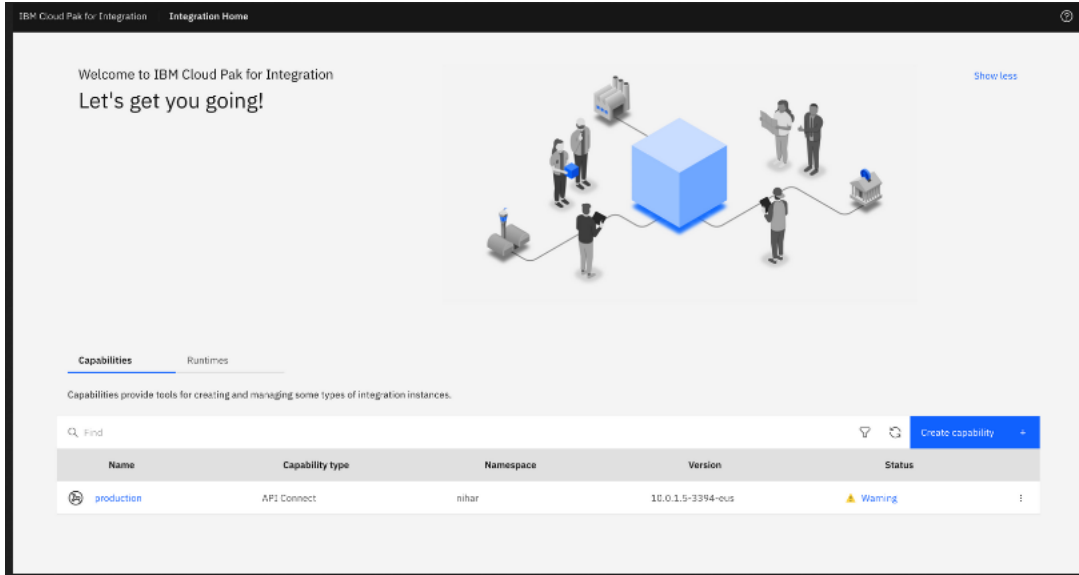

```
oc get mgmt
```

The following example response shows the warning status:

```
NAME          READY   STATUS    VERSION          RECONCILED VERSION  AGE
production-mgmt 18/18   Warning   10.0.1.5-eus    10.0.1.5-3394-eus  43h
```

```
Current WAL disk usage of m1-ed60c42d-postgres is 51 percent. DATABASE SHUTDOWN starts at 80 percent utilization. Please contact IBM Support immediately
```

To view the status in IBM Cloud Pak Platform UI, click the Integration instances tab to see the status displayed next to the instance name

Click the status value (Warning, for this example) to display the Conditions list where a detailed message explains why the condition was set:

Type	Status	Updated	Message
Warning	True	6 minutes ago	Current WAL disk usage of production-mgmt-31be1757-postgres is 60 percent. DATABASE SHUTDOWN starts at 80 percent utilization. Please contact IBM Support immediately
Ready	False	6 minutes ago	
Pending	False	an hour ago	
Error	False	6 minutes ago	

Error condition is populated at 80% usage

When one of the Postgres components uses 80% of its allocated space, the operator changes the overall status of the **ManagementCluster** to **Error** and brings down Postgres avoid problems that can occur if the disk becomes completely filled.

Attention: If you encounter the **Error** condition, contact IBM Support for help correcting the root cause. To view the status from the command line, run the following command:

- **APICoconnectCluster** CR:

```
oc get apiconnect
```

The following example response shows the error status:

```
NAME          READY   STATUS    VERSION          RECONCILED VERSION  AGE
production    Current disk usage is more than 80 percent. DATABASE will be shutdown. Please contact IBM Support immediately. Error 10.0.1.5-eus 10.0.1.5-3394-eus 11d
```

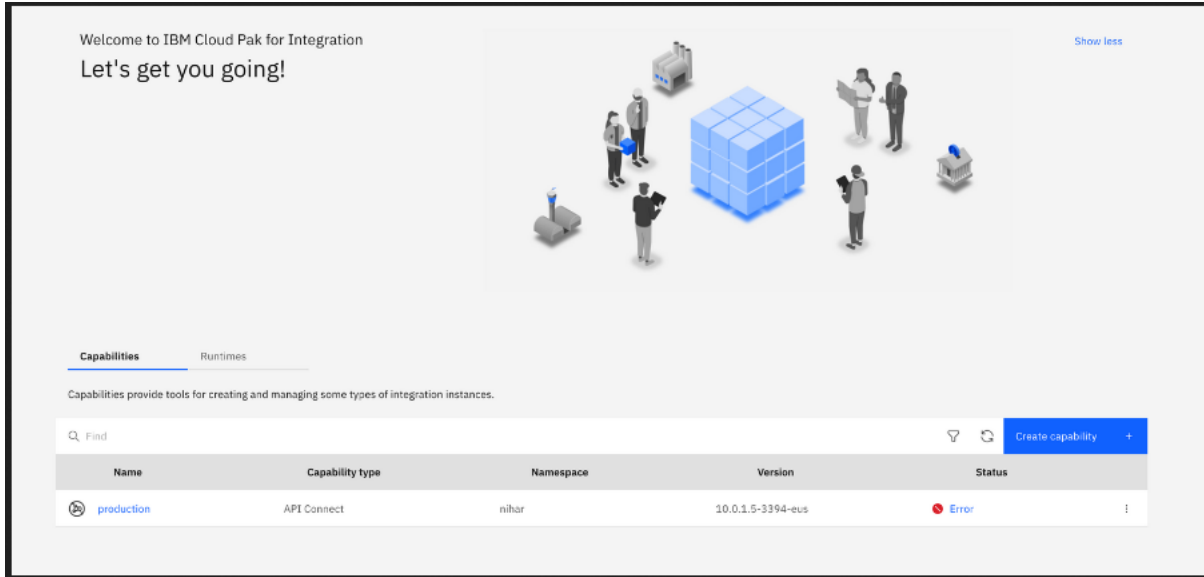

- **ManagementCluster** CR:

```
oc get mgmt
```

The following example response shows the warning status:

NAME	READY	STATUS	VERSION	RECONCILED VERSION	AGE
production-mgmt	9/9	Error	10.0.1.5-eus	10.0.1.5-3394-eus	11d

To view the status in the Platform UI, click the Integration instances tab to see the status displayed next to the instance name

Click the status value (Error in this example) to display the Conditions list where a detailed message explains why the condition was set:

Type	Status	Updated	Message
Warning	False	10 days ago	
Ready	False	11 days ago	
Pending	False	2 days ago	
Error	True	2 days ago	Current disk usage is more than 80 percent. DATABASE will be shutdown. Please contact IBM Support immediately.

Obtaining simple health check data of Developer Portal sites by using a REST API call

Call a simple health check API from your external load balancer to dynamically determine whether a specific Developer Portal site in a cluster is working. This API call can be used by a load balancer to help determine where to route traffic.

About this task

You can use the site health REST API to determine whether a particular Developer Portal site is running. The site health API returns the current system time of the site if both the database and web server are running. This API is fast and puts no load on the system, so it is ideal for use with load balancers to help them determine where to route traffic.

Procedure

To call the site health REST API, append `/health` to the end of your Developer Portal site URL in your web browser, as follows:

`site_url/health`

Where `site_url` is the URL of the Developer Portal site that you want to check.

If both the database and web server of the site are running, the web browser returns the current system time. For example:

1511367695

If either the database or the web server of the site is not running, the web browser returns an error that the site can't be reached.

Logging

Configure logging for your deployment on Kubernetes.

See:

- [Gathering post-mortem logs](#)
The `generate_postmortem.sh` script gathers all logs for troubleshooting and diagnostics.
- [Changing logging levels](#)
You can enable logging for entry and exit trace and for large payloads for apim-v2 pods.

Gathering post-mortem logs

The `generate_postmortem.sh` script gathers all logs for troubleshooting and diagnostics.

About this task

When you contact IBM Support, API Connect pod logs and associated Kubernetes or OpenShift environment data are normally required to help in diagnostics. The `generate_postmortem.sh` script gathers all the required logs and data.

The logs that are gathered by the `generate_postmortem.sh` script include the logs of the current running API Connect containers. The container logs have a maximum size, and older log messages are not retained when the maximum size is reached. To ensure that the logs gathered cover the time when the problem occurred, it is recommended to reproduce the problem and then immediately gather the logs. Also, to ensure that you have logs of previous failed containers, the recommended best practice is to offboard your logs to a remote server for long-term storage. Use ELK, or another logging infrastructure, to gather logs that include terminated pods and processes. For more information, see <https://www.elastic.co/elk-stack>

Procedure

1. Download the v10 `generate_postmortem.sh` script from <https://github.com/ibm-apiconnect/v10-postmortem>.
2. Run the script in your Kubernetes or OpenShift environment, following the instructions on <https://github.com/ibm-apiconnect/v10-postmortem>.
3. Upload the generated output file with your IBM support case.

What to do next

If the logs do not cover far enough back in time, or conversely if they are too large, adjust the log retention size. For further information, see: <https://docs.docker.com/config/containers/logging/json-file/>.

If you are not able to run the `generate_postmortem.sh` script, the API Connect container logs can be gathered manually with the following command:

```
kubectl logs -n <namespace> <pod name> [-c <container name>]
```

Redirect the output of the `logs` command to a file that you can upload to the support case, for example:

```
kubectl logs -n apic-ns apic-apim-77fdf47c55-vgnr2 > apimpod.log
```

Changing logging levels

You can enable logging for entry and exit trace and for large payloads for apim-v2 pods.

About this task

For apim-v2 pods, the default logging settings do not include entry and exit trace and logging of large payloads.

Logging of large payloads is typically needed if you are logging `apim:webhookPayload` or other processes that log large variables.

You can also set the debug level without needing to restart the pods.

You can enable the settings through either the APIM deployment YAML file, the toolkit, or the REST APIs. Note, you must use the toolkit or REST API to set the debug level without restarting the pods.

Procedure

- Updating the settings in the APIM deployment YAML file
Note: This action causes a pod restart.
 - The DEBUG variable works the same as prior releases.

```
- env:
  - name: DEBUG
    value:
audit,bhendi:error,bhendi:probe,bhendi:flags,apim:server,apim:error,apim:routes:*,apim:routesc:*,apim:oidc,apim:oidc:*
```

To enable entry and exit trace, add `trace:*` to the start of the debug string:

```
- env:
  - name: DEBUG
    value: trace:*,audit,bhendi:error,bhendi:probe,bhendi:flags,bhendi:webhookAudit,bhendi:cassandra-transactions,apim:server,apim:error,apim:routes:*,apim:routesc:*,apim:oidc,apim:oidc:*,apim:taskmanager:info
```

- To enable large object logging:

```
- env:  
  - name: VELOX_LOG_FULL_PAYLOAD  
    value: "true"
```

- Updating the settings by using the toolkit
Note: This action does not cause a pod restart. Also, this action is for a single APIM pod environment only.

```
apic log-spec:get  
apic log-spec:update LOG_SPEC_FILE
```

Where the spec file contains:

```
{"specification": "apim:routes:log_spec,audit,bhendi:error,apim:server,apim:error", "large_objects": true}
```

- Updating the settings by using the REST API
Note: This action does not cause a pod restart. Also, this action is for a single APIM pod environment only.

```
GET /cloud/api/log-spec  
PUT /cloud/api/log-spec
```

For example, to set debug level and large objects logging:

```
curl -k https://172.16.140.212:3003/api/cloud/log-spec -X PUT -H "Authorization: Bearer $BEARER"  
-H "Accept: application/json" -d '{"specification":  
"apim:routes:log_spec,audit,bhendi:error,apim:server,apim:error", "large_objects": true}'  
-H "Content-Type: application/json"
```

The command responds with:

```
{  
  "specification": "apim:routes:log_spec,audit,bhendi:error,apim:server,apim:error",  
  "large_objects": true,  
  "message": "Successfully changed the log specification on all apim-v2 pods. Success on IP(s): 172.16.140.212,  
172.16.140.213"  
}
```

Note: The response might include the following warning, which can be ignored:

```
WARNING: Could not change the log specification on all apim-v2 pods. Success on IP(s): 4.5.6.7 Failed on IP(s): 1.2.3.4
```

To view the REST APIs for logging, go to [API Connect REST APIs](#), and select IBM API Connect Platform - Cloud Management API 2.0.0 reference_>_Resource: Log Spec.

Troubleshooting

Troubleshoot API Connect subsystems on Kubernetes.

Note: In the  Help page of the Cloud Manager, API Manager, and API Designer user interfaces, there's a Product information tile that you can click to find out information about your product versions, as well as Git information about the package versions being used. Note that the API Designer product information is based on its associated management server, but the Git information is based on where it was downloaded from.
See:

- [Troubleshooting on Kubernetes](#)
Review the following topics for help in resolving issues with your API Connect deployment on Kubernetes.
- [Troubleshooting on OpenShift and Cloud Pak for Integration](#)
Review the following topics for help in resolving issues with your API Connect deployment on OpenShift or Cloud Pak for Integration.

Database Replica Pods stuck in Unknown or Pending state

In certain scenarios, a postgres replica pod may not recover to a healthy state when a restore completes, a node outage occurs, or after a fresh install or upgrade. In these cases, a postgres pod remains in a **Unknown** or a **Pending** state after a number of minutes. The pod fail to get into a **Running** state.

This situation occurs when the replicas do not initialize properly. You can use the `patronictl reinit` command to reinitialize the replica. Note that this command syncs the replica's volume data from the current Primary pod.

Use the following steps to get the pod back into a working state:

1. Exec onto the failing pod:

```
kubectl exec -it <postgres_replica_pod_name> -n <namespace> -- bash
```

2. List the cluster members:

```
patronictl list
+ Cluster: fxpk-management-01191b80-postgres (6893134118851096752) -----+
| Member | Host | Role | State | TL | Lag in MB |
+-----+-----+-----+-----+-----+-----+
| fxpk-management-01191b80-postgres-586f899fdf-6s25b | 172.16.172.244 | | start failed | | unknown |
| fxpk-management-01191b80-postgres-rkww-795665698f-4rh4s | 172.16.148.51 | Leader | running | 3 | |
| fxpk-management-01191b80-postgres-uvag-9475f7c5f-qr84m | 172.16.53.68 | | running | 3 | 0 |
+-----+-----+-----+-----+-----+-----+

```

In the example shown above `fxpk-management-01191b80-postgres-586f899fdf-6s25b` is not in running state.

Note the `clusterName` and `replicaName` which are not up:

- `clusterName - fxpk-management-01191b80-postgres`
- `replicaName - fxpk-management-01191b80-postgres-586f899fdf-6s25b`

3. Run:

```
patronictl reinit <clusterName> <replicaName-which-is-not-running>
```

Example:

```
patronictl reinit fxpk-management-01191b80-postgres fxpk-management-01191b80-postgres-586f899fdf-6s25b
+ Cluster: fxpk-management-01191b80-postgres (6893134118851096752) -----+
| Member | Host | Role | State | TL | Lag in MB |
+-----+-----+-----+-----+-----+-----+
| fxpk-management-01191b80-postgres-586f899fdf-6s25b | 172.16.172.244 | | start failed | | unknown |
| fxpk-management-01191b80-postgres-rkww-795665698f-4rh4s | 172.16.148.51 | Leader | running | 3 | |
| fxpk-management-01191b80-postgres-uvag-9475f7c5f-qr84m | 172.16.53.68 | | running | 3 | 0 |
+-----+-----+-----+-----+-----+-----+
Are you sure you want to reinitialize members fxpk-management-01191b80-postgres-586f899fdf-6s25b? [y/N]: y
Success: reinitialize for member fxpk-management-01191b80-postgres-586f899fdf-6s25b

```

4. Run `patronictl list` again.

You may also observe that the replica is on a different Timeline (TL) and possibly have a Lag in MB. It may take a few minutes for the pod to switch onto the same TL as the others and the Lag should slowly go to 0.

For example:

```
bash-4.2$ patronictl list
+ Cluster: fxpk-management-01191b80-postgres (6893134118851096752) -----+
| Member | Host | Role | State | TL | Lag in MB |
+-----+-----+-----+-----+-----+-----+
| fxpk-management-01191b80-postgres-586f899fdf-6s25b | 172.16.172.244 | | running | 1 | 23360 |
| fxpk-management-01191b80-postgres-rkww-795665698f-4rh4s | 172.16.148.51 | Leader | running | 3 | |
| fxpk-management-01191b80-postgres-uvag-9475f7c5f-qr84m | 172.16.53.68 | | running | 3 | 0 |
+-----+-----+-----+-----+-----+-----+

```

5. The pod that previously was in an **Unknown** or **Pending** state or **(0/1) Running** state is now in **(1/1) Running** state.

Increasing the PostgreSQL `archive_timeout` on Kubernetes

Increase the `archive_timeout` to 3600 (seconds) so that accumulated wal files do not cause a disk-space issue during a network outage.

About this task

PostgreSQL sends its wal archives to the backup location (S3 or local PVC) whenever the configured `archive_timeout` period elapses. By default, the `archive_timeout` is set to 60 seconds. During a network outage, the files cannot be transferred and instead accumulate on the current server, and could cause a disk-space issue. Increasing the `archive_timeout` value helps to mitigate this issue by creating archive files less frequently.

For information on tracking the Postgres disk space, see [Monitoring Postgres disk usage](#).

Complete the following steps to increase the PostgreSQL `archive_timeout` value.

Procedure

1. Get the name of the `pgha` config map by running the following command:

```
kubectl -n <namespace> get cm -l pgha-config='true'
```

The response looks like the following example:

NAME	DATA	AGE
apis-prod-d18f3f0-0d18f3f0-postgres-pgha-config	5	22d

2. Edit the config map by running the following command:

```
kubectl -n <namespace> edit configmap <config-map-name>
```

In the command, replace `<config-map-name>` with the `NAME` returned in step 1.

3. Change the `archive_timeout` value to `3600`.
The value must be an integer, and represents the number of seconds that must elapse before the archive file is generated.
4. Save the file and exit the editor.
The configuration is updated automatically; archives will be generated and pushed every `3600` seconds.

Recovering when disks are filled by the management database

Resize a PersistentVolumeClaim (PVC) to recover when disks are filled by the management database.

There are two methods to resize a PVC:

- Expand the PVC.
- Create a new, larger PVC, and copy the PVC contents.

Expansion of the PVC is easier and quicker than creating a new PVC and copying contents. However, some storage classes do not support PVC volume expansion. For these classes, you must create a new PVC.

Note: If you are using local storage, the only way to support increased data size is to add a disk

1. Determine if the StorageClass which provisioned the PVC supports VolumeExpansion.
You can only expand a PVC if its storage class `allowVolumeExpansion` field is set to `true`.

```
$ kubectl get sc
NAME          PROVISIONER
rook-ceph-block  rook-ceph.rbd.csi.ceph.com

$ kubectl describe sc/rook-ceph-block | grep "AllowVolumeExpansion"
AllowVolumeExpansion: True
```

2. Choose a resizing method for the storage class:
 - If `AllowVolumeExpansion` is `true`, go to [Resizing a PersistentVolumeClaim for Postgres by volume expansion](#)
 - If `AllowVolumeExpansion` is not `true`, you cannot expand the PVC. Go to [Resizing a PersistentVolumeClaim for Postgres by moving content to a new PVC](#).
- [Resizing a PersistentVolumeClaim for Postgres by volume expansion](#)
Resize a PersistentVolumeClaim (PVC) for Postgres that supports volume expansion, on native Kubernetes.
- [Resizing a PersistentVolumeClaim for Postgres by moving content to a new PVC](#)
Resize a PersistentVolumeClaim (PVC) for Postgres by creating a new, larger PVC, and moving content between the PVCs, on native Kubernetes.

Resizing a PersistentVolumeClaim for Postgres by volume expansion

Resize a PersistentVolumeClaim (PVC) for Postgres that supports volume expansion, on native Kubernetes.

Before you begin

Determine whether your storage class supports volume expansion. See [Recovering when disks are filled by the management database](#).

About this task

You can expand a PVC if your storage provisioner supports volume expansion. This procedure is for use on native Kubernetes.

Note: This procedure is for use only with Postgres.

Procedure

1. Determine the primary Postgres pod.

```
kubectl get pods --selector role=master | grep -v bootstrapselector=role=master
```

2. Gracefully shutdown Postgres pods.

a. Exec into the Postgres primary pod.

```
kubectl exec -it <postgres-pod> -- bash
```

b. Pause Patroni process. Note: you can skip this step if using the one replica profile.

```
patronictl pause
```

c. Stop the Postgres process gracefully.

```
pg_ctl stop -D /pgdata/<cluster-name>
```

For example:

- `cluster-name` is usually the name of the cluster. If primary pod name is `m1-1b12bf81-postgres-58dfcc5f97-fsvvt`, `cluster-name` is `m1-1b12bf81-postgres`.
- There will be a folder named `cluster-name` located under `/pgdata/`.
- In this example, the command is:

```
pg_ctl stop -D /pgdata/m1-1b12bf81-postgres
```

3. Determine the PVC linked to the primary Postgres pod, and obtain the `claimName` of the PVC.

```
kubectl get pod <postgres-pod> -o json | jq '.spec.volumes[] | select ( has ("persistentVolumeClaim"))'
```

4. Scale down the Postgres deployment.

```
kubectl get deploy | grep postgres | grep -v bouncer | grep -v bootstrap | grep -v backrest | grep -v operator
```

If you are using `n3` profile then you find 3 deployments. Scale them down:

```
kubectl scale deploy <deployment-name> --replicas=0
```

5. Edit the PVC you want to increase.

```
kubectl edit pvc <claimName>
```

6. Update `spec.resources.requests.storage` field value with new size. For example:

```
spec:
  resources:
    requests:
      storage: 20Gi
```

7. Scale up the Postgres deployment.

```
kubectl get deploy | grep postgres | grep -v bouncer | grep -v bootstrap | grep -v backrest | grep -v operator
```

If you are using the `n3` profile then you find 3 deployments. Scale them up:

```
kubectl scale deploy <deployment-name> --replicas=1
```

8. If using the `n3` profile, resume the Patroni process. If using the `n1` profile, skip this step.

a. Determine the new primary Postgres pod.

```
kubectl get pods --selector role=master | grep -v bootstrapselector=role=master
```

b. Exec into the new Postgres primary pod.

```
kubectl exec -it <postgres-pod> -- bash
```

c. Resume Patroni.

```
patronictl resume
```

Resizing a PersistentVolumeClaim for Postgres by moving content to a new PVC

Resize a PersistentVolumeClaim (PVC) for Postgres by creating a new, larger PVC, and moving content between the PVCs, on native Kubernetes.

Before you begin

Determine whether your storage class supports volume expansion. See [Recovering when disks are filled by the management database](#).

About this task

Use this procedure when the storage class does not support volume expansion. This procedure is for use on native Kubernetes.

Note: This procedure is for use only with Postgres.

Procedure

1. Create a new temporary PVC. Ensure the requested storage size is more than the original PVC. For example:

```
apiVersion: v1
kind: PersistentVolumeClaim
metadata:
  name: temp-pvc
spec:
  storageClassName: rook-ceph-block
  accessModes:
    - ReadWriteOnce
  resources:
    requests:
      storage: 10Gi
```

2. Determine the primary Postgres pod.

```
kubectl get pods --selector role=master | grep -v bootstrapselector=role=master
```

3. Gracefully shutdown Postgres pods.

a. Exec into the Postgres primary pod.

```
kubectl exec -it <postgres-pod> -- bash
```

b. Pause the Patroni process. Note: you can skip this step if using the one replica profile.

```
patronictl pause
```

c. Stop the Postgres process gracefully.

```
pg_ctl stop -D /pgdata/<cluster-name>
```

For example:

- `<cluster-name>` is usually the name of the cluster. If primary pod name is `m1-1b12bf81-postgres-58dfcc5f97-fsvvt`, `<cluster-name>` is `m1-1b12bf81-postgres`.
- There will be a folder named `<cluster-name>` located under `/pgdata/`.
- In this example, the command is:

```
pg_ctl stop -D /pgdata/m1-1b12bf81-postgres
```

4. Determine the PVC linked to the primary Postgres pod, and obtain the `claimName` of the PVC.

```
kubectl get pod <postgres-pod> -o json | jq '.spec.volumes[] | select ( has ("persistentVolumeClaim"))'
```

5. Scale down the Postgres deployment.

```
kubectl get deploy | grep postgres | grep -v bouncer | grep -v bootstrap | grep -v backrest | grep -v operator
```

If you are using `n3` profile then you find 3 deployments. Scale them down:

```
kubectl scale deploy <deployment-name> --replicas=0
```

6. Start a BusyBox pod with the source and destination PVC volumes mounted, to swap the content between PVCs. For example:

```
apiVersion: v1
kind: Pod
metadata:
  name: swap-pvc
spec:
  volumes:
    - name: volume-source
      persistentVolumeClaim:
        claimName: m1-mgmt-35817114-postgres-wal
    - name: volume-destination
      persistentVolumeClaim:
        claimName: temp-pvc
  containers:
    - name: debug
      image: busybox
      command: ['sleep', '3600']
      volumeMounts:
        - name: volume-source
          mountPath: /data-source
        - name: volume-destination
          mountPath: /data-destination
```

7. Exec to the BusyBox pod, and

```
kubectl exec -it <busybox-pod-name> -- sh
cp -r data-source/ data-destination/
```

8. Copy content to the temporary PVC. For example, using the `mountPath` values shown in Step 6:

```
cp -r data-source/ data-destination/
```

9. Delete the BusyBox pod.

```
kubectl delete pod <busybox-pod-name>
```

10. Delete the original PVC.

```
kubectl delete pvc <claimName>
```

11. Create an original PVC with the same name but with increased size. For example:

```

kind: PersistentVolumeClaim
apiVersion: v1
metadata:
  name: ml-mgmt-35817114-postgres-wal
spec:
  accessModes:
    - ReadWriteOnce
  resources:
    requests:
      storage: 20Gi
  storageClassName: rook-ceph-block
  volumeMode: Filesystem

```

12. Start the BusyBox pod again and this time copy the content from destination to source PVC.

```

kubectl exec -it <busybox-pod> -- sh

cp -r data-destination/ data-source/

```

13. Delete the BusyBox pod.

```

kubectl delete pod <busybox-pod>

```

14. Delete the temporary PVC that you created for swapping the content.

```

kubectl delete pvc temp-pvc

```

15. Scale up the Postgres deployment.

```

kubectl get deploy | grep postgres | grep -v bouncer | grep -v bootstrap | grep -v backrest | grep -v operator

```

If you are using the `n3` profile then you find 3 deployments. Scale them up:

```

kubectl scale deploy <deployment-name> --replicas=1

```

16. If using the `n3` profile, resume the Patroni process. If using the `n1` profile, skip this step.

a. Determine the new primary Postgres pod.

```

kubectl get pods --selector role=master | grep -v bootstrapselector=role=master

```

b. Exec into the new Postgres primary pod.

```

kubectl exec -it <postgres-pod> -- bash

```

c. Resume Patroni.

```

patronictl resume

```

Troubleshooting Analytics on Kubernetes

If your API Connect Analytics subsystem encounters problems, review the following topics for help resolving the issue.

- [Analytics offload issues on Kubernetes](#)
If your Analytics offload fails, you can perform checks to help determine the cause. Common causes for an offload failure are connection or security-related issues.
- [Empty Analytics display on Kubernetes](#)
If your API Connect analytics data doesn't display in the Analytics dashboard, complete the following steps to determine the cause of the problem.
- [Analytics running out of disk space on Kubernetes](#)
Actions that you can take if your analytics data is using more persistent storage space than you expected.

Analytics offload issues on Kubernetes

If your Analytics offload fails, you can perform checks to help determine the cause. Common causes for an offload failure are connection or security-related issues.

When you save the configuration files, their syntax is first validated to verify that it can be applied. However, this does not confirm that other parts of your analytics collection ecosystem are trouble-free, for example, that your endpoints are running, or that the TLS certificates are validated. Errors in these areas may also result in no data output.

To verify issues you will need to examine the logs of your analytics ingestion pods. (Note that it may take a few minutes for the pods to pick up changes in the configuration files after edits are applied.)

For information on obtaining logs, refer to [Logging](#).

Following are some common checks you can make to troubleshoot the offload:

- Verify that the specified URL or the host and port values for the target system are accurate.
- Verify that the server or cluster of servers in the target system are running and reachable. If applicable, also verify that the connection problems are not caused by firewall settings.
- If you are using Transport Layer Security (TLS) to establish a private and secure communication channel to the target system, investigate whether the issue is caused by SSL certificate errors; for example, untrusted server certificates, certificates that have expired or are not yet valid, or missing intermediate (or chain) certificates. For more information on using TLS, see [Creating a TLS profile](#).
- If offloading to an Elasticsearch or Kafka target, verify that your configuration settings are valid; for example, the user credentials for authenticating to Elasticsearch or the Kafka topic name.

Empty Analytics display on Kubernetes

If your API Connect analytics data doesn't display in the Analytics dashboard, complete the following steps to determine the cause of the problem.

Procedure

1. Run the following command to check the logs of the mtl1s-gw pod:

```
kubectl logs analyt-mtl1s-gw-7665f5d445-4cx4n -n <APIC_namespace>
```

The response looks like the following example:

```
10.254.6.1 - - [22/Sep/2021:18:05:54 +0000] "POST /x2020/v1/apievent/_bulk HTTP/1.1" 200 2 "-" "-" 2841 0.072 0.070
```

- a. Check the response for any `_bulk` request coming from the gateway, as shown in the example.
If there are no `_bulk` requests, then the problem is with the gateway and the wsm-agent, which is not sending bulk requests to the Analytics server.
- b. If you see the `_bulk` request., then check the return code in the response.
If `_bulk` requests are processed successfully you will see a return code 200 (as in the example), which indicates that the bulk request has been ingested.
- c. If it is any other return code, check the ingestion pod logs for any errors, which will indicate any issues during ingestion:

```
kubectl logs analyt-ingestion-78d7cff7f7-6pktd
```

2. If everything with the data flow looks fine, and if you are unable to see analytics data, then check the health of Analytics using the CLI.
 - a. If you do not have the CLI installed see [./com.ibm.apic.apionprem.doc/analytics_use_cli_and_rest_api.html](#) for the steps on installing and using.
 - b. Run the following CLI command:

```
apic --mode analytics clustermgmt:getHealth --server <management server platform api endpoint> --analytics-service <analytics service name> --format json
```

where:

- *<management server platform api endpoint>* is the Management server admin endpoint.
- *<analytics service name>* is the name of Analytics service as configured in the Cloud Manager.

When you check the cluster's health, the response for a single node analytics deployment looks like the following example:

```
{
  "cluster_name": "apic-analytics-cluster",
  "status": "yellow",
  "timed_out": false,
  "number_of_nodes": 1,
  "number_of_data_nodes": 1,
  "discovered_master": true,
  "discovered_cluster_manager": true,
  "active_primary_shards": 8,
  "active_shards": 8,
  "relocating_shards": 0,
  "initializing_shards": 0,
  "unassigned_shards": 12,
  "delayed_unassigned_shards": 0,
  "number_of_pending_tasks": 0,
  "number_of_in_flight_fetch": 0,
  "task_max_waiting_in_queue_millis": 0,
  "active_shards_percent_as_number": 40
}
```

Note: Single node analytics clusters never show `green` in the health output. Green indicates that the data is replicated to at least one other node, and since there are no other nodes in a single node cluster it remains as `yellow`.

- a. Check the status of the cluster (red, yellow, green) in the response.
In the example, the status is set to yellow.
 - Green indicates all indices are fine.
 - Yellow indicates there are some unassigned shards, which might still be replicating.
 - Red indicates there is a problem with one or more of the indices.
- b. Run the following command to get a list of indices:

```
apic --mode analytics clustermgmt:catIndices --server [SERVER] --analytics-service [ANALYTICS SERVICE]
```

where:

- *SERVER* is the Management server admin endpoint.
- *ANALYTICS SERVICE* is the name of Analytics service as configured in the Cloud Manager.

- c. From the list of indices returned, identify the those with status of 'red'.
- d. Delete each red index by running the following command:

```
apic --mode analytics clustermgmt:deleteIndex --index <index_name> --server [SERVER] --analytics-service [ANALYTICS SERVICE] --format json
```

where:

- *SERVER* is the Management server admin endpoint.
- *ANALYTICS SERVICE* is the name of Analytics service as configured in the Cloud Manager.

Analytics running out of disk space on Kubernetes

Actions that you can take if your analytics data is using more persistent storage space than you expected.

Reduce retention period

The simplest remedy to running out of storage space is to reduce the data retention period.

By default, API event records are retained for 30 days on a one replica deployment, and 90 days on a three replica deployment.

If your analytics subsystem was deployed more recently than your retention period (for example, less than 30 days ago for a default one replica deployment), and you are running out of storage space, then there is a risk that your persistent storage fills up before the retention period is reached. Check in the Cloud Manager UI how many days back your API event data goes, and set the retention period to a lower number. For example, if you see API event records from 15 days ago, reduce your storage requirement by one-third by setting your retention period to 10 days. See [Configuring data retention and index rollover time periods](#).

Reinstall with larger PVCs

It is not possible to increase the PVC size after installation. If you require more space for your analytics data, the analytics subsystem must be reinstalled. Follow these steps:

1. Take a backup of your analytics subsystem: [Backing up and restoring](#).
2. Reinstall your analytics subsystem with a larger PVC size: [Deployment procedures](#).
3. Restore your analytics data from your backup: [Backing up and restoring](#).

Reduce space used by new API event data

To reduce the storage required for new analytics data, update the activity log settings of your APIs. If you have logging set to `payload` when it is not needed, then change logging to `activity`: [Configuring activity logging](#).

Note: If you're not able to update the activity log setting for your APIs, you can disable response payload logging for all APIs with ingestion filters. For example:

```
filter {
  if "apicapievent" in [tags] {
    mutate {
      remove_field => ["response_body"]
    }
  }
}
```

For more information about filters, see: [Planning to modify your incoming analytics data](#).

What to do if your storage is 100% full

If your storage space is 100% full, your analytics subsystem might be unresponsive, so reducing the retention period is not possible. In this scenario, follow the disaster recovery steps: [Disaster recovery](#).

Troubleshooting on OpenShift and Cloud Pak for Integration

Review the following topics for help in resolving issues with your API Connect deployment on OpenShift or Cloud Pak for Integration.

- [Power-cycling check on OpenShift and Cloud Pak for Integration](#)
If you cycle the power on an API Connect cluster that is deployed on OpenShift or Cloud Pak for Integration, you might need to reset the IP address for the `kubernetes.io/hostname`.
- [Troubleshooting the Management subsystem on OpenShift and Cloud Pak for Integration](#)
Troubleshoot problems with the Management subsystem and the management subsystem database.
- [Troubleshooting Analytics on OpenShift and Cloud Pak for Integration](#)
If your API Connect Analytics subsystem encounters problems, review the following topics for help resolving the issue.

Power-cycling check on OpenShift and Cloud Pak for Integration

If you cycle the power on an API Connect cluster that is deployed on OpenShift or Cloud Pak for Integration, you might need to reset the IP address for the `kubernetes.io/hostname`.

About this task

You will know there is a problem if you cycle the power for the cluster and receive an error, or find that the deployment remains in the `pending` state indefinitely because some of the pods failed to start. Complete the following steps to resolve the problem:

Procedure

1. Run the following command to check the label on the worker nodes:

```
oc get nodes -l kubernetes.io/hostname=localhost
```

If the response shows the following message, then the power cycle did not cause a problem and you can skip the rest of this task:

```
No resources found
```

If the response looks like the following example (the IP address will be different), proceed to the next step:

```
NAME                                STATUS  ROLES  AGE  VERSION
ip-233.252.0.0.us-west-1.compute.internal  Ready  worker  27h  v1.19.0+8d12420
```

2. Run the following command to correct the problem:

```
for i in $(oc get nodes -l kubernetes.io/hostname=localhost|grep worker|awk '{print $1}'); do echo $i; oc label nodes $i kubernetes.io/hostname=`echo $i|awk -F'.' '{print $1}` --overwrite=true; done
```

Troubleshooting the Management subsystem on OpenShift and Cloud Pak for Integration

Troubleshoot problems with the Management subsystem and the management subsystem database.

See:

- [Troubleshooting the management database on OpenShift and Cloud Pak for Integration](#)
You can troubleshoot the API Connect management database by complete the following tasks.
- [Increasing the PostgreSQL archive timeout on OpenShift and Cloud Pak for Integration](#)
Increase change the `archive_timeout` to 3600 (seconds) so that accumulated wal files do not cause a disk-space issue during a network outage.
- [Recovering on OpenShift and Cloud Pak for Integration when disks are filled by the management database](#)
Resize a PersistentVolumeClaim (PVC) on OpenShift to recover when disks are filled by the API Connect management database.

Troubleshooting the management database on OpenShift and Cloud Pak for Integration

You can troubleshoot the API Connect management database by complete the following tasks.

Database Replica Pods stuck in Unknown or Pending state

In certain scenarios, a postgres replica pod may not recover to a healthy state when a restore completes, a node outage occurs, or after a fresh install or upgrade. In these cases, a postgres pod remains in a **Unknown** or a **Pending** state after a number of minutes. The pod fail to get into a **Running** state.

This situation occurs when the replicas do not initialize properly. You can use the `patronictl reinit` command to reinitialize the replica. Note that this command syncs the replica's volume data from the current Primary pod.

Use the following steps to get the pod back into a working state:

1. Exec onto the failing pod:

```
oc exec -it <postgres_replica_pod_name> -n <namespace> -- bash
```

2. List the cluster members:

```
patronictl list
+ Cluster: fxpk-management-01191b80-postgres (6893134118851096752) -----+
|                               Member                               | Host      | Role   | State   | TL | Lag in MB |
+-----+-----+-----+-----+-----+-----+
| fxpk-management-01191b80-postgres-586f899fdf-6s25b | 172.16.172.244 |        | start failed |    | unknown |
| fxpk-management-01191b80-postgres-rkww-795665698f-4rh4s | 172.16.148.51 | Leader | running   | 3 |          |
| fxpk-management-01191b80-postgres-uvag-9475f7c5f-qr84m | 172.16.53.68  |        | running   | 3 | 0        |
+-----+-----+-----+-----+-----+-----+
```

In the example shown above `fxpk-management-01191b80-postgres-586f899fdf-6s25b` is not in running state.

Note the `clusterName` and `replicaName` which are not up:

- `clusterName` - `fxpk-management-01191b80-postgres`
- `replicaName` - `fxpk-management-01191b80-postgres-586f899fdf-6s25b`

3. Run:

```
patronictl reinit <clusterName> <replicaName-which-is-not-running>
```

Example:

```
patronictl reinit fxpk-management-01191b80-postgres fxpk-management-01191b80-postgres-586f899fdf-6s25b
+ Cluster: fxpk-management-01191b80-postgres (6893134118851096752) -----+
|                               Member                               | Host      | Role   | State   | TL | Lag in MB |
+-----+-----+-----+-----+-----+-----+
| fxpk-management-01191b80-postgres-586f899fdf-6s25b | 172.16.172.244 |        | start failed |    | unknown |
| fxpk-management-01191b80-postgres-rkww-795665698f-4rh4s | 172.16.148.51 | Leader | running   | 3 |          |
| fxpk-management-01191b80-postgres-uvag-9475f7c5f-qr84m | 172.16.53.68  |        | running   | 3 | 0        |
+-----+-----+-----+-----+-----+-----+
Are you sure you want to reinitialize members fxpk-management-01191b80-postgres-586f899fdf-6s25b? [y/N]: y
Success: reinitialize for member fxpk-management-01191b80-postgres-586f899fdf-6s25b
```

4. Run `patronictl list` again.

You may also observe that the replica is on a different Timeline (TL) and possibly have a Lag in MB. It may take a few minutes for the pod to switch onto the same TL as the others and the Lag should slowly go to 0.

For example:

```
bash-4.2$ patronictl list
+ Cluster: fxpk-management-01191b80-postgres (6893134118851096752) -----+-----+-----+-----+-----+-----+
| Member | Host | Role | State | TL | Lag in MB |
+-----+-----+-----+-----+-----+-----+
| fxpk-management-01191b80-postgres-586f899fdf-6s25b | 172.16.172.244 | | running | 1 | 23360 |
| fxpk-management-01191b80-postgres-rkww-795665698f-4rh4s | 172.16.148.51 | Leader | running | 3 | 0 |
| fxpk-management-01191b80-postgres-uvag-9475f7c5f-qr84m | 172.16.53.68 | | running | 3 | 0 |
+-----+-----+-----+-----+-----+-----+
```

5. The pod that previously was in an **Unknown** or **Pending** state or (0/1) **Running** state is now in (1/1) **Running** state.

Increasing the PostgreSQL `archive_timeout` on OpenShift and Cloud Pak for Integration

Increase change the `archive_timeout` to 3600 (seconds) so that accumulated wal files do not cause a disk-space issue during a network outage.

About this task

PostgreSQL sends its wal archives to the backup location (S3 or local PVC) whenever the configured `archive_timeout` period elapses. By default, the `archive_timeout` is set to 60 seconds. During a network outage, the files cannot be transferred and instead accumulate on the current server, and could cause a disk-space issue. Increasing the `archive_timeout` value helps to mitigate this issue by creating archive files less frequently.

For information on tracking the Postgres disk space, see [Monitoring Postgres disk usage](#).

Complete the following steps to increase the PostgreSQL `archive_timeout` value.

Procedure

1. Get the name of the `pgha` config map by running the following command:

```
oc -n <APIC_namespace> get cm -l pgha-config=true'
```

The response looks like the following example:

NAME	DATA	AGE
apis-produ-d18f3f0-0d18f3f0-postgres-pgha-config	5	22d

2. Edit the config map by running the following command:

```
oc -n <APIC_namespace> edit configmap <config-map-name>
```

In the command, replace `<config-map-name>` with the `NAME` returned in step 1.

3. Change the `archive_timeout` value to 3600.

The value must be an integer, and represents the number of seconds that must elapse before the archive file is generated.

4. Save the file and exit the editor.

The configuration is updated automatically; archives will be generated and pushed every 3600 seconds.

Recovering on OpenShift and Cloud Pak for Integration when disks are filled by the management database

Resize a PersistentVolumeClaim (PVC) on OpenShift to recover when disks are filled by the API Connect management database.

There are two methods to resize a PVC:

- Expand the PVC.
- Create a new, larger PVC, and copy the PVC contents.

Expansion of the PVC is easier and faster than creating a new PVC and copying contents. However, some storage classes do not support PVC volume expansion. For these classes, you must create a new PVC.

Note: If you are using local storage, the only way to support increased data size is to add a disk.

1. Determine if the StorageClass which provisioned the PVC supports VolumeExpansion.

You can only expand a PVC if its storage class `allowVolumeExpansion` field is set to `true`.

```
oc get sc
NAME PROVISIONER
rook-ceph-block rook-ceph.rbd.csi.ceph.com
oc describe sc/rook-ceph-block | grep "AllowVolumeExpansion"
AllowVolumeExpansion: True
```

2. Choose a resizing method for the storage class:

- If `AllowVolumeExpansion`: is `true`, see [Resizing a PVC for Postgres on OpenShift by using volume expansion](#)
 - If `AllowVolumeExpansion`: is not `true`, you cannot expand the PVC. See [Resizing a PVC for Postgres on OpenShift by moving content](#).
- [Resizing a PVC for Postgres on OpenShift by using volume expansion](#)
Resize a Persistent Volume Claim (PVC) for Postgres that supports volume expansion.
 - [Resizing a PVC for Postgres on OpenShift by moving content](#)
Resize a Persistent Volume Claim (PVC) for Postgres on OpenShift by creating a new, larger PVC, and then moving content between the PVCs.

Resizing a PVC for Postgres on OpenShift by using volume expansion

Resize a Persistent Volume Claim (PVC) for Postgres that supports volume expansion.

Before you begin

This task only applies to the PVC used by Postgres. To determine whether your storage class supports volume expansion, see [Recovering on OpenShift and Cloud Pak for Integration when disks are filled by the management database](#).

About this task

You can expand a PVC if your storage provisioner supports volume expansion.

Procedure

1. Determine the primary Postgres pod.

```
oc get pods --selector role=master | grep -v bootstrapselector=role=master
```

2. Gracefully shutdown Postgres pods.

- a. Exec into the Postgres primary pod.

```
oc exec -it <postgres-pod> -- bash
```

- b. Pause Patroni process. Note: you can skip this step if using the one replica profile.

```
patronictl pause
```

- c. Stop the Postgres process gracefully.

```
pg_ctl stop -D /pgdata/<cluster-name>
```

For example:

- `cluster-name` is usually the name of the cluster. If primary pod name is `m1-1b12bf81-postgres-58dfcc5f97-fsvvt`, `cluster-name` is `m1-1b12bf81-postgres`.
- There will be a folder named `cluster-name` located under `/pgdata/`.
- In this example, the command is:

```
pg_ctl stop -D /pgdata/m1-1b12bf81-postgres
```

3. Determine the PVC linked to the primary Postgres pod, and obtain the `claimName` of the PVC.

```
oc get pod <postgres-pod> -o json | jq '.spec.volumes[] | select ( has ("persistentVolumeClaim"))'
```

4. Scale down the Postgres deployment.

```
oc get deploy | grep postgres | grep -v bouncer | grep -v bootstrap | grep -v backrest | grep -v operator
```

If you are using `n3` profile then you find 3 deployments. Scale them down:

```
oc scale deploy <deployment-name> --replicas=0
```

5. Edit the PVC you want to increase.

```
oc edit pvc <claimName>
```

6. Update `spec.resources.requests.storage` field value with new size. For example:

```
spec:
  resources:
    requests:
      storage: 20Gi
```

7. Scale up the Postgres deployment.

```
oc get deploy | grep postgres | grep -v bouncer | grep -v bootstrap | grep -v backrest | grep -v operator
```

If you are using the `n3` profile then you find 3 deployments. Scale them up:

```
oc scale deploy <deployment-name> --replicas=1
```

8. If you are using the `n3` profile, resume the Patroni process. If using the `n1` profile, skip this step.

- a. Determine the new primary Postgres pod.

```
oc get pods --selector role=master | grep -v bootstrapselector=role=master
```

b. Exec into the new Postgres primary pod.

```
oc exec -it <postgres-pod> -- bash
```

c. Resume Patroni.

```
patronictl resume
```

Resizing a PVC for Postgres on OpenShift by moving content

Resize a Persistent Volume Claim (PVC) for Postgres on OpenShift by creating a new, larger PVC, and then moving content between the PVCs.

Before you begin

This task only applies to the PVC used by Postgres.

About this task

Use this procedure when the storage class does not support volume expansion.

Procedure

1. Create a new temporary PVC. Ensure the requested storage size is more than the original PVC. For example:

```
apiVersion: v1
kind: PersistentVolumeClaim
metadata:
  name: temp-pvc
spec:
  storageClassName: rook-ceph-block
  accessModes:
    - ReadWriteOnce
  resources:
    requests:
      storage: 10Gi
```

2. Determine the primary Postgres pod.

```
oc get pods --selector role=master | grep -v bootstrapselector=role=master
```

3. Gracefully shutdown Postgres pods.

a. Exec into the Postgres primary pod.

```
oc exec -it <postgres-pod> -- bash
```

b. Pause the Patroni process. Note: you can skip this step if using the one replica profile.

```
patronictl pause
```

c. Stop the Postgres process gracefully.

```
pg_ctl stop -D /pgdata/<cluster-name>
```

For example:

- `cluster-name` is usually the name of the cluster. If primary pod name is `m1-1b12bf81-postgres-58dfcc5f97-fsvvt`, `cluster-name` is `m1-1b12bf81-postgres`.
- There will be a folder named `cluster-name` located under `/pgdata/`.
- In this example, the command is:

```
pg_ctl stop -D /pgdata/m1-1b12bf81-postgres
```

4. Determine the PVC linked to the primary Postgres pod, and obtain the `claimName` of the PVC.

```
oc get pod <postgres-pod> -o json | jq '.spec.volumes[] | select ( has ("persistentVolumeClaim") )'
```

5. Scale down the Postgres deployment.

```
oc get deploy | grep postgres | grep -v bouncer | grep -v bootstrap | grep -v backrest | grep -v operator
```

If you are using `n3` profile then you find 3 deployments. Scale them down:

```
oc scale deploy <deployment-name> --replicas=0
```

6. Start a BusyBox pod with the source and destination PVC volumes mounted, to swap the content between PVCs. For example:

```
apiVersion: v1
kind: Pod
metadata:
  name: swap-pvc
spec:
  volumes:
    - name: volume-source
      persistentVolumeClaim:
        claimName: m1-mgmt-35817114-postgres-wal
    - name: volume-destination
```

```

    persistentVolumeClaim:
      claimName: temp-pvc
  containers:
  - name: debug
    image: busybox
    command: ['sleep', '3600']
    volumeMounts:
    - name: volume-source
      mountPath: /data-source
    - name: volume-destination
      mountPath: /data-destination

```

7. Exec to the BusyBox pod, and run the following commands:

```

oc exec -it <busybox-pod-name> -- sh

cp -r data-source/ data-destination/

```

8. Copy content to the temporary PVC. For example, using the `mountPath` values shown in Step 6:

```

cp -r data-source/ data-destination/

```

9. Delete the BusyBox pod.

```

oc delete pod <busybox-pod-name>

```

10. Delete the original PVC.

```

oc delete pvc <claimName>

```

11. Create an original PVC with the same name but with increased size. For example:

```

kind: PersistentVolumeClaim
apiVersion: v1
metadata:
  name: ml-mgmt-35817114-postgres-wal
spec:
  accessModes:
  - ReadWriteOnce
  resources:
    requests:
      storage: 20Gi
    storageClassName: rook-ceph-block
    volumeMode: Filesystem

```

12. Run the following commands to start the BusyBox pod again and copy the content from the destination to the source PVC:

```

oc exec -it <busybox-pod> -- sh

cp -r data-destination/ data-source/

```

13. Delete the BusyBox pod.

```

oc delete pod <busybox-pod>

```

14. Delete the temporary PVC that you created for swapping the content.

```

oc delete pvc temp-pvc

```

15. Scale up the Postgres deployment.

```

oc get deploy | grep postgres | grep -v bouncer | grep -v bootstrap | grep -v backrest | grep -v operator

```

If you are using the `n3` profile then you find 3 deployments. Scale them up:

```

oc scale deploy <deployment-name> --replicas=1

```

16. If using the `n3` profile, resume the Patroni process. If using the `n1` profile, skip this step.

a. Determine the new primary Postgres pod.

```

oc get pods --selector role=master | grep -v bootstrapselector=role=master

```

b. Exec into the new Postgres primary pod.

```

oc exec -it <postgres-pod> -- bash

```

c. Resume Patroni.

```

patronictl resume

```

Troubleshooting Analytics on OpenShift and Cloud Pak for Integration

If your API Connect Analytics subsystem encounters problems, review the following topics for help resolving the issue.

- [Analytics offload issues on OpenShift and Cloud Pak for Integration](#)
If your Analytics offload fails, you can perform checks to help determine the cause. Common causes for an offload failure are connection or security-related issues.
- [Empty Analytics display on OpenShift and Cloud Pak for Integration](#)
If your API Connect analytics data doesn't display in the Analytics dashboard, complete the following steps to determine the cause of the problem.
- [Analytics running out of disk space on OpenShift and Cloud Pak for Integration](#)
If your Analytics data is taking up too much disk space, complete the following steps to resolve the problem.

Analytics offload issues on OpenShift and Cloud Pak for Integration

If your Analytics offload fails, you can perform checks to help determine the cause. Common causes for an offload failure are connection or security-related issues.

When you save the configuration files, their syntax is first validated to verify that it can be applied. However, this does not confirm that other parts of your analytics collection ecosystem are trouble-free, for example, that your endpoints are running, or that the TLS certificates are validated. Errors in these areas may also result in no data output.

To verify issues you will need to examine the logs for one of your Kubernetes analytics ingestion pods. (Note that it may take a few minutes for the pods to pick up changes in the configuration files after edits are applied.)

For information on obtaining logs, refer to [Logging](#).

Following are some common checks you can make to troubleshoot the offload:

- Verify that the specified URL or the host and port values for the target system are accurate.
- Verify that the server or cluster of servers in the target system are running and reachable. If applicable, also verify that the connection problems are not caused by firewall settings.
- If you are using Transport Layer Security (TLS) to establish a private and secure communication channel to the target system, investigate whether the issue is caused by SSL certificate errors; for example, untrusted server certificates, certificates that have expired or are not yet valid, or missing intermediate (or chain) certificates. For more information on using TLS, see [Creating a TLS profile](#).
- If offloading to an Elasticsearch or Kafka target, verify that your configuration settings are valid; for example, the user credentials for authenticating to Elasticsearch or the Kafka topic name.

Empty Analytics display on OpenShift and Cloud Pak for Integration

If your API Connect analytics data doesn't display in the Analytics dashboard, complete the following steps to determine the cause of the problem.

Before you begin

This operation requires the use of the Analytics CLI. [Using the Analytics CLI](#).

Procedure

1. Run the following command to check the logs of the mtlS-gw pod:

```
oc logs analyt-mtls-gw-7665f5d445-4cx4n -n <APIC_namespace>
```

The response looks like the following example:

```
10.254.6.1 - - [22/Sep/2021:18:05:54 +0000] "POST /x2020/v1/apievent/_bulk HTTP/1.1" 200 2 "-" "-" 2841 0.072 0.070
```

- a. Check the response for any `_bulk` request coming from the gateway, as shown in the example.
If there are no `_bulk` requests, then the problem is with the gateway and the wsm-agent, which is not sending bulk requests to the Analytics server.
- b. If you see the `_bulk` request., then check the return code in the response.
If `_bulk` requests are processed successfully you will see a return code 200 (as in the example), which indicates that the bulk request has been ingested.
- c. If it is any other return code, check the ingestion pod logs for any errors, which will indicate any issues during ingestion:

```
oc logs analyt-ingestion-78d7cff7f7-6pktd
```

2. If everything with the data flow looks fine, and if you are unable to see analytics data, then check the health of Analytics by executing the following CLI command:

```
apic --mode analytics clustermgmt:getHealth --server <management server platform api endpoint> --analytics-service <analytics service name> --format json
```

where:

- `<management server platform api endpoint>` is the Management server admin endpoint.
- `<analytics service name>` is the name of Analytics service as configured in the Cloud Manager.

When you check the cluster's health, the response for a single node analytics deployment looks like the following example:

```
{
  "cluster_name": "apic-analytics-cluster",
  "status": "yellow",
  "timed_out": false,
  "number_of_nodes": 1,
  "number_of_data_nodes": 1,
  "discovered_master": true,
  "discovered_cluster_manager": true,
  "active_primary_shards": 8,
  "active_shards": 8,
  "relocating_shards": 0,
  "initializing_shards": 0,
  "unassigned_shards": 12,
  "delayed_unassigned_shards": 0,
  "number_of_pending_tasks": 0,
  "number_of_in_flight_fetch": 0,
  "task_max_waiting_in_queue_millis": 0,
  "active_shards_percent_as_number": 40
}
```

Note: Single node analytics clusters never show **green** in the health output. Green indicates that the data is replicated to at least one other node, and since there are no other nodes in a single node cluster it remains as **yellow**.

- a. Check the status of the cluster (red, yellow, green) in the response.
In the example, the status is set to yellow.

- Green indicates all indices are fine.
- Yellow indicates there are some unassigned shards, which might still be replicating.
- Red indicates there is a problem with one or more of the indices.

- b. Run the following command to get a list of indices:

```
apic --mode analytics clustermgmt:catIndices --server [SERVER] --analytics-service [ANALYTICS SERVICE]
```

where:

- **SERVER** is the Management server admin endpoint.
- **ANALYTICS SERVICE** is the name of Analytics service as configured in the Cloud Manager.

- c. From the list of indices returned, identify the those with status of 'red'.

- d. Delete each red index by running the following command:

```
apic --mode analytics clustermgmt:deleteIndex --index <index_name> --server [SERVER] --analytics-service [ANALYTICS SERVICE] --format json
```

where:

- **SERVER** is the Management server admin endpoint.
- **ANALYTICS SERVICE** is the name of Analytics service as configured in the Cloud Manager.

Analytics running out of disk space on OpenShift and Cloud Pak for Integration

If your Analytics data is taking up too much disk space, complete the following steps to resolve the problem.

Reduce retention period

The simplest remedy to running out of storage space is to reduce the data retention period.

By default, API event records are retained for 30 days on a one replica deployment, and 90 days on a three replica deployment.

If your analytics subsystem was deployed more recently than your retention period (for example, less than 30 days ago for a default one replica deployment), and you are running out of storage space, then there is a risk that your persistent storage fills up before the retention period is reached. Check in the Cloud Manager UI how many days back your API event data goes, and set the retention period to a lower number. For example, if you see API event records from 15 days ago, reduce your storage requirement by one-third by setting your retention period to 10 days. See [Configuring data retention and index rollover time periods](#).

Reinstall with larger PVCs

It is not possible to increase the PVC size after installation. If you require more space for your analytics data, the analytics subsystem must be reinstalled. Follow these steps:

1. Take a backup of your analytics subsystem: [Backing up and restoring](#).
2. Reinstall your analytics subsystem with a larger PVC size: [Deployment procedures](#).
3. Restore your analytics data from your backup: [Backing up and restoring](#).

Reduce space used by new API event data

To reduce the storage required for new analytics data, update the activity log settings of your APIs. If you have logging set to **payload** when it is not needed, then change logging to **activity**: [Configuring activity logging](#).

Note: If you're not able to update the activity log setting for your APIs, you can disable response payload logging for all APIs with ingestion filters. For example:

```
filter {
  if "apicapievent" in [tags] {
    mutate {
      remove_field => ["response_body"]
    }
  }
}
```

For more information about filters, see: [Planning to modify your incoming analytics data](#).

What to do if your storage is 100% full

If your storage space is 100% full, your analytics subsystem might be unresponsive, so reducing the retention period is not possible. In this scenario, follow the disaster recovery steps: [Disaster recovery](#).

Uninstalling API Connect

You can uninstall a Kubernetes deployment of API Connect.

About this task

You can choose to uninstall individual API Connect subsystems or you can uninstall the complete API Connect deployment. You can delete Custom Resource Definitions, Persistent Volumes, service accounts, secrets, operators and the namespace. Use one of the following topics.

Note: For information about how to maintain a two data center deployment, see [Maintaining a two data center deployment](#).

- [Uninstalling API Connect subsystems](#)
You can individually uninstall API Connect subsystems that have been deployed on Kubernetes.
- [Removing API Connect](#)
You can remove all parts of the API Connect deployment on Kubernetes.
- [Removing API Connect on OpenShift or Cloud Pak for Integration](#)
Remove your entire API Connect deployment on OpenShift or Cloud Pak for Integration.

Uninstalling API Connect subsystems

You can individually uninstall API Connect subsystems that have been deployed on Kubernetes.

Before you begin

If you want to disable the Analytics subsystem without uninstalling it, see [Disabling and re-enabling the Analytics subsystem on Kubernetes](#).

About this task

- To delete the API Connect deployment in a Kubernetes runtime environment, you must use the Kubernetes command-line tool, [kubectl](#).
- The API Connect operator and DataPower operator pods are needed to uninstall subsystems individually.
- If need to retain data to re-use during a re-installation later, follow the backup and restore procedures:
 - [Configuring backup settings for fresh install of the Management subsystem](#)
 - [Backing up and restoring the Developer Portal in a Kubernetes environment](#)
- If you want to delete **all** of API Connect, do not use this topic. Instead, see [Removing API Connect](#).

Procedure

1. Uninstall the Management subsystem

a. Save the management subsystem name:

```
kubectl get mgmt -n <namespace> -o yaml
```

This command returns the YAML format of the management custom resource. Make a note of the name.

b. Delete the Management Subsystem.

```
kubectl delete mgmt --all -n <namespace>
```

Important:

If your deployment uses default namespaces be cautious when using `kubectl delete <entity> --all` commands. There can be other pods, services, and more in the default namespace. When using the default namespace, keep in mind that using `kubernetes delete <entity> --all`, where `<entity>` can delete non-APIC entities, such as `sa` (Service Accounts), `secrets`, `rolebindings`, etc.

The Management CR deletion will take some time because the apiconnect operator must delete the Postgres cluster.

c. Manually delete secrets and PVCs:

i. Get all of the secrets that use the management subsystem name (which you determined in Step [1.a](#)):

```
kubectl get secrets -n <namespace> | grep <management-subsystem-name>
```

ii. For each secret that uses the management subsystem name, run the following command to delete the secret:

```
kubectl delete secrets <secret_name> -n <namespace>
```

iii. Get all the PVCs that use the management subsystem name:

```
kubectl get pvc -n <namespace> | grep <management-subsystem-name>
```

iv. For each PVC that uses the management subsystem name, run the following command to delete the PVC:

```
kubectl delete pvc <pvc_name> -n <namespace>
```

d. If management subsystem backup and restore CRs are left stale, delete them also:

i. Get the name of the backup CR:

```
kubectl get mgmtb -n <namespace>
```

ii. Delete the backup CR:

```
kubectl delete mgmtb <backup_cr_name> -n <namespace>
```

iii. Get the name of the restore CR:

```
kubectl get mgmtr -n <namespace>
```

iv. Delete the restore CR:

```
kubectl delete mgmtr <restore_cr_name> -n <namespace>
```

2. Uninstall Analytics subsystem

- a. Delete the Analytics subsystem, the Analytics backup, and the Analytics restore CRs.

```
kubectl delete a7s --all -n <namespace>
kubectl delete a7b --all -n <namespace>
kubectl delete a7r --all -n <namespace>
```

- b. Manually delete the Analytics secrets:

```
kubectl delete secrets <secret_name> -n <namespace>
```

for each of the following secrets:

```
analytics-ai-endpoint
analytics-ca
analytics-client
analytics-server
```

- c. Manually delete Analytics Persistent Volumes (PVCs):

```
kubectl delete pvc <pvc_name> -n <namespace>
```

for PVCs with the following naming pattern:

```
data-analytics-storage
```

3. Uninstall the Developer Portal subsystem

- a. Delete the Developer Portal subsystem, and the Portal backup and restore CRs.

```
kubectl delete ptl --all -n <namespace>
kubectl delete pb --all -n <namespace>
kubectl delete pr --all -n <namespace>
```

- b. Manually delete Developer Portal secrets:

```
kubectl delete secrets <secret_name> -n <namespace>
```

for secrets with the following naming pattern:

```
portal-admin
portal-admin-client
portal-ca
portal-client
portal-db-ca
portal-encryption-key-...
portal-server
portal-web
```

- c. Manually delete these Developer Portal PVCs:

```
kubectl delete pvc <pvc_name> -n <namespace>
```

for PVCs with the following naming pattern:

```
admin-portal-...-www-...
backup-portal-...-www-...
db-portal-...-db-...
dblogs-portal-...-db-...
web-portal-...-www-...
```

4. Delete the DataPower Gateway subsystem.

```
kubectl delete gw --all -n <namespace>
```

Note: The following entries include both Multi-Protocol Gateway Service (v5-compatible) and API Gateway settings. Names that include "gww5" refer to the Multi-Protocol Gateway Service (v5-compatible), and names that include "gww6" refer to the API Gateway.

- a. Delete Service Accounts.

```
kubectl delete sa <service_account> -n <namespace>
```

for each of the following Service Accounts:

```
gww5-datapower
gww6-datapower
```

- b. Delete Secrets.

```
kubectl delete secrets <secret_name> -n <namespace>
```

for secrets with the following naming pattern:

```
gww5-datapower-token-...
gww5-dpm-sa-token-...
gww5-endpoint
gww5-manager-endpoint
gww6-datapower-token-...
gww6-dpm-sa-token-...
gww6-endpoint.
gww6-manager-endpoint
```

- c. Delete PVCs.

```
kubectl delete pvc <pvc_name> -n <namespace>
```

for PVCs with the following naming pattern:

```
gwv5...
gwv6...
```

- [Removing Management subsystem postgres resources on Kubernetes](#)
When you remove the API Connect Management subsystem by deleting its files, some postgres resources from Crunchy Data remain, and must be deleted manually before you attempt to re-install the Management subsystem.

Removing Management subsystem postgres resources on Kubernetes

When you remove the API Connect Management subsystem by deleting its files, some postgres resources from Crunchy Data remain, and must be deleted manually before you attempt to re-install the Management subsystem.

About this task

Sometimes when you remove the Management subsystem, some postgres resources remain and must be deleted manually.

To determine whether you need to delete any postgres resources, use the `kubectl` `get` command and specify `vendor=crunchydata`; as shown in the following example.

```
$ kubectl get pods -n apic -l vendor=crunchydata
NAME                                READY   STATUS    RESTARTS   AGE
backrest-backup-production-mgmt-mymgmtsite123-postgres-k77xj    0/1     Completed 0           17h
production-mgmt-mymgmtsite123-postgres-backrest-shared-repk4kzc  1/1     Running   0           2d21h
production-mgmt-mymgmtsite123-postgres-full-sch-backup-9ktp5    0/1     Completed 0           164m

$ kubectl get deployments -n apic -l vendor=crunchydata
NAME                                READY   UP-TO-DATE   AVAILABLE   AGE
production-mgmt-mymgmtsite123-postgres-backrest-shared-repo    1/1     1             1           2d21h

$ kubectl get sa -n apic -l vendor=crunchydata
No resources found in apic namespace.

$ kubectl get jobs -n apic -l vendor=crunchydata
NAME                                COMPLETIONS   DURATION   AGE
backrest-backup-production-mgmt-mymgmtsite123-postgres          1/1           10s       17h
production-mgmt-mymgmtsite123-postgres-full-sch-backup          1/1           37s       164m
production-mgmt-mymgmtsite123-postgres-rmdata-cemg              1/1           20s       14m

$ kubectl get roles -n apic -l vendor=crunchydata
No resources found in apic namespace.

$ kubectl get rolebindings -n apic -l vendor=crunchydata
No resources found in apic namespace.

$ kubectl get secrets -n apic -l vendor=crunchydata
NAME                                TYPE   DATA   AGE
production-mgmt-7bc754c7-postgres-backrest-repo-config          Opaque 9        6d23h
production-mgmt-7bc754c7-postgres-postgres-secret              Opaque 2        6d23h
production-mgmt-7bc754c7-postgres-primaryuser-secret           Opaque 2        6d23h
production-mgmt-7bc754c7-postgres-testuser-secret              Opaque 2        6d23h
production-mgmt-8aac6b4e-postgres-backrest-repo-config          Opaque 9        6d22h
production-mgmt-8aac6b4e-postgres-postgres-secret              Opaque 2        6d22h
production-mgmt-8aac6b4e-postgres-primaryuser-secret           Opaque 2        6d22h
production-mgmt-8aac6b4e-postgres-testuser-secret              Opaque 2        6d22h
production-mgmt-mymgmtsite123-postgres-backrest-repo-config    Opaque 9        2d21h
production-mgmt-mymgmtsite123-postgres-postgres-secret         Opaque 2        2d21h
production-mgmt-mymgmtsite123-postgres-primaryuser-secret      Opaque 2        2d21h
production-mgmt-mymgmtsite123-postgres-testuser-secret         Opaque 2        2d21h

$ kubectl get cm -n apic -l vendor=crunchydata
NAME                                DATA   AGE
production-mgmt-mymgmtsite123-postgres-config                  0       2d21h
production-mgmt-mymgmtsite123-postgres-leader                  0       2d21h
production-mgmt-mymgmtsite123-postgres-pgbouncer-cm            2       2d21h
production-mgmt-mymgmtsite123-postgres-pgha-config             5       2d21h
```

Procedure

For each type of postgres resource, check to see if any resources are available and if so, delete the resources:

- pods:

```
kubectl get pods -n <namespace> -l vendor=crunchydata
kubectl delete pods -n <namespace> -l vendor=crunchydata
```
- deployments:

```
kubectl get deployments -n <namespace> -l vendor=crunchydata
kubectl delete deployments -n <namespace> -l vendor=crunchydata
```
- service accounts:

```
kubectl get sa -n <namespace> -l vendor=crunchydata
kubectl delete sa -n <namespace> -l vendor=crunchydata
```

- jobs:

```
kubectl get jobs -n <namespace> -l vendor=crunchydata
kubectl delete jobs -n <namespace> -l vendor=crunchydata
```
- roles:

```
kubectl get roles -n <namespace> -l vendor=crunchydata
kubectl delete roles -n <namespace> -l vendor=crunchydata
```
- rolebindings:

```
kubectl get rolebindings -n <namespace> -l vendor=crunchydata
kubectl delete rolebindings -n <namespace> -l vendor=crunchydata
```
- secrets:

```
kubectl get secrets -n <namespace> -l vendor=crunchydata
kubectl delete secrets -n <namespace> -l vendor=crunchydata
```
- cm:

```
kubectl get cm -n <namespace> -l vendor=crunchydata
kubectl delete cm -n <namespace> -l vendor=crunchydata
```
- pgtasks:

```
kubectl get pgtasks.crunchydata.com -n <namespace> -l vendor=crunchydata
kubectl delete pgtasks.crunchydata.com -n <namespace>
```
- pgreplica:

```
kubectl get pgreplica -n <management_namespace> -l vendor=crunchydata
kubectl delete pgreplica -n <management_namespace> -l vendor=crunchydata
```

Removing API Connect

You can remove all parts of the API Connect deployment on Kubernetes.

About this task

These instructions completely remove API Connect, including PVCs and secrets.

- To delete the API Connect deployment in a Kubernetes runtime environment, you must use the Kubernetes command-line tool, [kubectl](#).
- You must run the commands in the order shown in the procedure on this page. If you run commands out of order, you might encounter a problem where the deletion of namespaces hangs.
- If you want to retain the PVCs, which contain some of the data you built up when using the application, you must also keep the associated secret used to decrypt the data. To do this, you must backup each subsystem, and then uninstall the subsystems individually. In this case, do not use the instructions on this page. Instead, see [Uninstalling API Connect subsystems](#).

Procedure

1. Delete all API Connect systems.

```
kubectl delete apic --all -n <namespace>
```

This command is the equivalent of deleting each of the individual subsystems one at a time, and also deleting all of their backup and restore CRs. The commands that run during this step are:

- Subsystem CRs. For example:

```
kubectl delete mgmt --all -n <namespace>
kubectl delete a7s --all -n <namespace>
kubectl delete ptl --all -n <namespace>
kubectl delete gwv6 --all -n <namespace>
```

- Backup and restore CRs:

```
kubectl delete mgmtb --all -n <namespace>
kubectl delete mgmtr --all -n <namespace>
kubectl delete pb --all -n <namespace>
kubectl delete pr --all -n <namespace>
kubectl delete a7b --all -n <namespace>
kubectl delete a7r --all -n <namespace>
```

2. Delete the Operator deployments.

```
kubectl delete deployment datapower-operator ibm-apiconnect -n <namespace>
```

3. Delete all Service Accounts in the namespace.

Important:

If your deployment uses default namespaces be cautious when using `kubectl delete <entity> --all` commands. There can be other pods, services, and more in the default namespace. When using the default namespace, keep in mind that using `kubernetes delete <entity> --all`, where `<entity>` can delete non-API entities, such as `sa` (Service Accounts), `secrets`, `rolebindings`, etc.

```
kubectl delete sa --all -n <namespace>
```

4. Delete all Secrets in the namespace.

```
kubectl delete secrets --all -n <namespace>
```

5. Delete all Rolebindings in the namespace.

```
kubectl delete rolebindings --all -n <namespace>
```

6. Delete all Roles in the namespace.

```
kubectl delete roles --all -n <namespace>
```

7. Clean up any remaining jobs.

```
kubectl delete jobs --all -n <namespace>
```

8. Delete all PVCs in the namespace.

```
kubectl delete pvc --all -n <namespace>
```

9. Delete Issuers in the namespace.

Note that there might be none found.

```
kubectl delete issuer --all -n <namespace>
```

10. Delete certificates in the namespace.

Note that there might be none found.

```
kubectl delete certificates --all -n <namespace>
```

11. If you are not using the default namespace, delete the Namespace

Important: If your deployment uses the default namespace, do not delete it. There can be other pods, services, and more in the default namespace.

```
kubectl delete ns <namespace>
```

12. Delete `validatingwebhookconfiguration`

```
a. kubectl get validatingwebhookconfiguration | awk /<ns>/{print $1}' | xargs kubectl delete validatingwebhookconfiguration
```

```
b. kubectl delete validatingwebhookconfiguration managements.validator.subsystem.apiconnect.ibm.com
```

13. Delete `mutatingwebhookconfiguration`

```
a. kubectl get mutatingwebhookconfiguration | awk /$NS/{print $1}' | xargs kubectl delete mutatingwebhookconfiguration
```

```
b. kubectl get mutatingwebhookconfiguration | awk /apicop-management-defaultler/{print $1}' | xargs kubectl delete mutatingwebhookconfiguration
```

14. Delete the Apiconnect CRDs (custom resource definitions)

```
kubectl delete crd analyticsbackups.analytics.apiconnect.ibm.com
kubectl delete crd analyticsclusters.analytics.apiconnect.ibm.com
kubectl delete crd analyticsrestores.analytics.apiconnect.ibm.com
kubectl delete crd datapowerservices.datapower.ibm.com
kubectl delete crd gatewayclusters.gateway.apiconnect.ibm.com
kubectl delete crd managementbackups.management.apiconnect.ibm.com
kubectl delete crd managementclusters.management.apiconnect.ibm.com
kubectl delete crd managementrestores.management.apiconnect.ibm.com
kubectl delete crd natsclusters.nats.io
kubectl delete crd natsserviceroles.nats.io
kubectl delete crd natsstreamingclusters.streaming.nats.io
kubectl delete crd portalbackups.portal.apiconnect.ibm.com
kubectl delete crd portalclusters.portal.apiconnect.ibm.com
kubectl delete crd portalrestores.portal.apiconnect.ibm.com
```

15. Delete Crunchy CRDs

```
kubectl delete crd pgclusters.crunchydata.com
kubectl delete crd pgpolicies.crunchydata.com
kubectl delete crd pgreplicas.crunchydata.com
kubectl delete crd pgtasks.crunchydata.com
```

16. If you installed Cert-manager and want to remove it now, complete the following steps:

Warning: If you are using shared clusters for API Connect with a common cert manager, be aware that this step removes the components of the cert manager from cluster wide scope.

a. Delete the Cert-manager

```
kubectl delete deploy --all -n cert-manager
kubectl delete service --all -n cert-manager
kubectl delete sa -n cert-manager --all
kubectl delete secrets -n cert-manager --all
kubectl delete APIService v1beta1.webhook.cert-manager.io -n cert-manager
kubectl delete MutatingWebhookConfiguration cert-manager-webhook -n cert-manager
kubectl delete ValidatingWebhookConfiguration cert-manager-webhook -n cert-manager
kubectl delete ns cert-manager
```

b. Delete cert-manager CRDs

- Delete the cert-manager CRDs with the following:

```
kubectl delete crd issuers.cert-manager.io
kubectl delete crd certificaterequests.cert-manager.io
kubectl delete crd certificates.cert-manager.io
kubectl delete crd challenges.cert-manager.io
kubectl delete crd clusterissuers.cert-manager.io
kubectl delete crd orders.cert-manager.io
```

- Older API Connects versions may have cert-manager CRDs from an older version of cert-manager which had a different name, delete these CRDs with the following:

```
kubectl delete crd certificaterequests.certmanager.k8s.io
kubectl delete crd certificates.certmanager.k8s.io
kubectl delete crd challenges.acme.certmanager.k8s.io
kubectl delete crd clusterissuers.certmanager.k8s.io
kubectl delete crd issuers.certmanager.k8s.io
kubectl delete crd orders.acme.certmanager.k8s.io
```

- [Removing postgres resources on Kubernetes after removing API Connect](#)

When you remove API Connect by deleting its files, some of the postgres resources from Crunchy Data remain and must be deleted manually before you attempt to re-install API Connect.

Removing postgres resources on Kubernetes after removing API Connect

When you remove API Connect by deleting its files, some of the postgres resources from Crunchy Data remain and must be deleted manually before you attempt to re-install API Connect.

About this task

Sometimes when you remove API Connect, some postgres resources remain and must be deleted manually.

To determine whether you need to delete any postgres resources, use the `kubectl get` command and specify `vendor=crunchydata` as shown in the following example.

```
$ kubectl get pods -n apic -l vendor=crunchydata

production-mgmt-mymgmtsite123-postgres-primaryuser-secret       Opaque 2        2d21h
production-mgmt-mymgmtsite123-postgres-testuser-secret          Opaque 2        2d21h

$ kubectl get cm -n apic -l vendor=crunchydata
NAME                                DATA   AGE
production-mgmt-mymgmtsite123-postgres-config                    0       2d21h
production-mgmt-mymgmtsite123-postgres-leader                    0       2d21h
production-mgmt-mymgmtsite123-postgres-pgbouncer-cm              2       2d21h
production-mgmt-mymgmtsite123-postgres-pgha-config                5       2d21h
```

Procedure

For each type of postgres resources, check to see if any resources are available and if so, delete the resources:

- pods:

```
kubectl get pods -n <namespace> -l vendor=crunchydata
```

```
kubectl delete pods -n <namespace> -l vendor=crunchydata
```
- deployments:

```
kubectl get deployments -n <namespace> -l vendor=crunchydata
```

```
kubectl delete deployments -n <namespace> -l vendor=crunchydata
```
- Jobs:

```
kubectl get jobs -n <namespace> -l vendor=crunchydata
```

```
kubectl delete jobs -n <namespace> -l vendor=crunchydata
```
- roles:

```
kubectl get roles -n <namespace> -l vendor=crunchydata
```

```
kubectl delete roles -n <namespace> -l vendor=crunchydata
```
- rolebindings:

```
kubectl get rolebindings -n <namespace> -l vendor=crunchydata
```

```
kubectl delete rolebindings -n <namespace> -l vendor=crunchydata
```
- secrets:

```
kubectl get secrets -n <namespace> -l vendor=crunchydata
```

```
kubectl delete secrets -n <namespace> -l vendor=crunchydata
```
- cm:

```
kubectl get cm -n <namespace> -l vendor=crunchydata
```

```
kubectl delete cm -n <namespace> -l vendor=crunchydata
```
- pgtasks:

```
kubectl get pgtasks.crunchydata.com -n <namespace> -l vendor=crunchydata
```

```
kubectl delete pgtasks.crunchydata.com -n <namespace>
```
- pgreplica:

```
kubectl get pgreplica -n <management_namespace> -l vendor=crunchydata
```

```
kubectl delete pgreplica -n <management_namespace> -l vendor=crunchydata
```

Removing API Connect on OpenShift or Cloud Pak for Integration

Remove your entire API Connect deployment on OpenShift or Cloud Pak for Integration.

About this task

These instructions completely remove API Connect, including PVCs and secrets.

Attention: Run the commands in the sequence shown on this page. If you run commands out of sequence, you might encounter a problem where the deletion of namespaces hangs.

Procedure

1. If Event Endpoint Management is installed, run the following command to determine the name of your Event Endpoint Management instance:

```
oc get eem -n <APIC-namespace>
```

2. If you are using a top-level CR, run the following command to determine the name of your API Connect instance:

```
oc get apiconnectcluster -n <APIC-namespace>
```

3. If you are using a top-level CR, run the following command to delete the API Connect operands (subsystems):

```
oc delete apiconnectcluster <name_of_apic_instance> -n <APIC-namespace>
```

4. Run the following command to delete the API Connect backup and restore CRs:

```
oc delete apic --all -n <APIC-namespace>
```

5. Run the following command to delete the secrets that are associated with your deleted API Connect cluster:

```
oc get secrets --no-headers -n <APIC-namespace> | cut -d' ' -f1 | grep "^<first_10_characters_of_apic_instance_name>-" | xargs oc delete secret -n <APIC-namespace>
```

Where `<first_10_characters_of_apic_instance_name>` refers to the name of your API Connect instance.

Note: This step assumes that any secrets that you want to keep in your namespace do not have a name that starts with the same 10 first characters of the API Connect Cluster name.

6. If Event Endpoint Management is installed, run the following command to delete the secrets that are associated with your deleted Event Endpoint Management instance:

```
oc get secrets --no-headers -n <APIC-namespace> | cut -d' ' -f1 | grep "^<first_10_characters_of_eem_instance_name>-" | xargs oc delete secret -n <APIC-namespace>
```

Where `<first_10_characters_of_eem_instance_name>` refers to the name of your Event Endpoint Manager instance.

Note: This step assumes that any secrets that you want to keep in your namespace do not have a name that starts with the same 10 first characters of the Event Endpoint Manager name.

7. If the only software that is deployed in your namespace is API Connect, run the following command to delete the PVCs associated with your deleted API Connect cluster:

```
oc delete pvc -n <APIC-namespace> -l app.kubernetes.io/managed-by=ibm-apiconnect
```

8. If you have no other software in your namespace that uses a CrunchyData Postgres cluster, delete the CrunchyData Postgres cluster:

```
oc delete pvc -n <APIC-namespace> -l vendor=crunchydata
```

9. Check for and remove any other Crunchy data: [Removing postgres resources on OpenShift and Cloud Pak for Integration](#).

10. Run the following commands to delete the API Connect secret rotation CRs for the cluster:

```
oc delete mgmtsr -n <APIC-namespace> --all
oc delete ptlsr -n <APIC-namespace> --all
```

11. Optional: If you created a namespace specifically for API Connect, and are not using it for anything else, you can delete the namespace. If your API Connect operators are installed in this namespace, instead of in a shared global namespace, they are also deleted.

```
oc delete ns <APIC-namespace>
```

Deleting the namespace removes any remaining certificates and secrets.

Note: Namespace deletion can get stuck, check that the namespace is deleted with:

```
oc get ns <APIC-namespace>
```

If the namespace is still present, to see why deletion is stuck, run:

```
oc describe ns <APIC-namespace>
```

12. Optional: Delete the API Connect operator deployments.

If your API Connect operator deployments are in a global namespace they are not deleted when your API Connect namespace is deleted. To delete the API Connect operators:

- a. Open the OpenShift web console and go to Installed Operators, in the namespace where the API Connect operators are installed.
- b. For each operator, click the options menu, and select Uninstall Operator.

API Connect operator might have created a number of operand requests with IBM Cloud Pak foundational services (previously called Common Services) to deploy services such as Cert-Manager. In addition, API Connect requires the use of a DataPower Gateway, so the DataPower operator might be installed in the API Connect namespace. If those artifacts are no longer needed, uninstall them individually.

Note: DataPower can be deployed on its own without API Connect. It is possible that the DataPower operator was installed for another purpose and not for use with API Connect, so check with your organization before you delete it.

Deleting the operators from the web console ensures that related subscriptions, CSVs, and install plans are also removed.

Removing postgres resources on OpenShift and Cloud Pak for Integration

When you remove API Connect by deleting its files, some of the postgres resources from Crunchy Data remain and must be deleted manually before you attempt to re-install API Connect.

About this task

Sometimes when you remove API Connect, some postgres resources remain and must be deleted manually.

To determine whether you need to delete any postgres resources, use the `oc get` command and specify `vendor=crunchydata` as shown in the following example.

```
$ oc get pods -n apic -l vendor=crunchydata
NAME                                READY   STATUS    RESTARTS   AGE
backrest-backup-production-mgmt-mymgmtsite123-postgres-k77xj    0/1     Completed 0           17h
production-mgmt-mymgmtsite123-postgres-backrest-shared-repk4kzc  1/1     Running   0           2d21h
production-mgmt-mymgmtsite123-postgres-full-sch-backup-9ktp5    0/1     Completed 0           164m

$ oc get deployments -n apic -l vendor=crunchydata
NAME                                READY   UP-TO-DATE   AVAILABLE   AGE
production-mgmt-mymgmtsite123-postgres-backrest-shared-repo    1/1     1             1           2d21h

$ oc get sa -n apic -l vendor=crunchydata
No resources found in apic namespace.

$ oc get jobs -n apic -l vendor=crunchydata
NAME                                COMPLETIONS   DURATION   AGE
backrest-backup-production-mgmt-mymgmtsite123-postgres          1/1           10s       17h
production-mgmt-mymgmtsite123-postgres-full-sch-backup          1/1           37s       164m
production-mgmt-mymgmtsite123-postgres-rmdata-cemg              1/1           20s       14m

$ oc get roles -n apic -l vendor=crunchydata
No resources found in apic namespace.
```

```
$ oc get rolebindings -n apic -l vendor=crunchydata
No resources found in apic namespace.
```

```
$ oc get secrets -n apic -l vendor=crunchydata
```
