Also, the Stripe payment method module must be enabled in the Developer Portal for the Catalog; see [Configuring Stripe in the Developer Portal](#) for details.

About this task

When you decide to charge customers to use your API Products, your customers have different requirements for the number of API calls that they are willing to pay for. You can solve this issue by defining Plans at different levels of service, and at different costs.

Within your Product, you can define free Plans as well as Plans that contain billing integration. The following instructions guide you through defining a Plan with pricing information. For more detailed information about creating Products, see [Creating a draft Product](#) and [Editing a draft Product](#).

Important: Products that contain a billing integration cannot be re-staged into non-production Catalogs. To experiment with billing on the Sandbox Catalog, or any other non-production Catalogs, you must publish new versions of your monetized Product. This practice aligns with how you have to work with production Catalogs currently, as they also don't support the re-staging of existing versions of the same Product.

Procedure

To add pricing information to a Product Plan, complete the following steps:

1. In the API Manager, click  Develop.
2. Select the Products tab.
3. Select the Product that you want to add billing integration to, or create a new draft Product by clicking Add > Product and following the wizard.
4. With the Product open and the Design tab selected, select Plans in the navigation menu.
5. In the Billing integration section, select the billing integration resource that you want to apply to the Product.
In the Plans section, you can then either edit the Default Plan to add pricing information, or create a new Plan with pricing information.
6. If this is a new Plan, enter a Title, and if you require approval for someone to subscribe to this Plan also select the Approval checkbox.
7. In the Plan pricing section, complete the following steps to add the pricing information:
 - a. Change the toggle to On for Plan pricing.
The Plan pricing definition section is displayed.
 - b. Optional: If you want to include any free trial days in your Plan, select Include free trial days, and then enter the number of trial days that a subscriber can use the Plan without charge, after which their billing cycle begins.
 - c. Select the Currency for the billing process use.

- d. Enter the Price per month to bill the subscriber for.
If the selected currency supports fractional units, enter the price including any fractional units, such as cents.
8. Optional: In the Plan rate limits section, set the rate limits by entering the number of calls that are allowed per unit of time.
Remember that this rate limit applies only to this Plan. You can set multiple rate limits, at second, minute, hour, day, and week time intervals. You can override this Plan rate limit for specific endpoints if you prefer, adding a different rate limit or enabling unlimited calls to it. You can also create more Plans with different rate limits. For more information about rate limits, see [Understanding rate limits for APIs and Plans](#).
9. Optional: Select the Hard limit checkbox if you want the gateway to reject any calls beyond the specified rate, rather than adding them to a queue to be resolved when the limits reset.
10. Optional: Add more burst limits, GraphQL limits, and assembly limits, as appropriate for your APIs.
11. Complete the Plan APIs section if you want to customize the APIs and operations that are available in this Plan.
12. If you want to add more Plans to the Product, repeat the process from Step [6](#).
13. Click Save to save the Product.

Results

Your Product with billing integration and a pricing Plan is listed in the Products dashboard of the Develop area. If your Product doesn't appear, click the Refresh icon  to refresh the results from the server.

What to do next

Stage your Product to a Catalog. For more information, see [Staging a draft Product](#).

Managing your Products

You can manage your Products in API Manager by using the Products page of the associated Catalog. In this view, you can move the Products through their lifecycle and control who can see or subscribe to the Products. The syndication feature in IBM® API Connect means that Products can also be managed by using the Products tab of the associated Space.

Before you begin

To complete the Product management tasks that are described in this topic, you must either be the owner of the API provider organization, or be assigned Manage permission for Products in the Catalog that contains the Product. If you have View permission for Products, you have read-only access to the Product management page. For information on configuring Product management permissions for a Catalog, see [Creating and configuring Catalogs](#).

The syndication feature in IBM API Connect means that Products can be contained within a Space in a Catalog. In this case, to complete the Product management tasks that are described in this topic, you must either be the owner of the API provider organization, or be assigned Manage permission for Products in the Space that contains the Product. For information on configuring Product management permissions for a Space, see [Managing user access in a Space](#).

About this task

For more information about the Product lifecycle, see [The Product lifecycle](#).
For more information about the syndication feature, see [Using syndication in API Connect](#).
For information about Product billing, see [Monetizing your Products](#).

Procedure

To manage your Product, complete the following steps.

1. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with.
The Products page of the Catalog opens, and all of the Products available in that Catalog are displayed.
2. If the Product that you want to work with is contained within a Space, select the required Space by completing the following steps:
 - a. Click the Spaces tab.
 - b. Select the Space that you want to work with.The Products page of the Space opens, and all of the Products available in that Space are displayed.
3. Expand a Product to see details of the APIs and Plans in that Product.

Manage options are also available, depending on the state of the Product. To view the manage options, click the options icon  and select the options that you require.
4. To manage the lifecycle of a version of a Product, click the options icon  alongside the Product version, and select the required lifecycle action.
5. To set the migration target of a version of a Product, click the options icon  alongside the Product version, and select Set migration target. In the Set migration target window, select the Product that you want to set as the migration target, and select Next. Then map the migration source Plans to the migration target Plans,

and click OK.

Restriction: If the Plan is part of a Product that is contained within a Space in the Catalog, and the migration action is being made at the Space level, the Plan that you are migrating subscriptions from must be located in the same Space as the Plan you are migrating to. If the migration action is being made at the Catalog level, subscriptions can be migrated across Spaces. For more information about the Space feature, see [Using syndication in API Connect](#).

- **[Considerations when changing a Product lifecycle with billing integration](#)**

There are special considerations for lifecycle operations for Products that contain a billing integration in IBM API Connect.

- **[Publishing a Product](#)**

APIs become accessible when a Product is published and made visible on the IBM API Connect Developer Portal for use by application developers. A Product can be published to selected communities of application developer organizations, and the Plans within the Product can be used to tailor access and visibility further.

- **[Migrating application subscriptions to another Product](#)**

By using the Products view within a Catalog in API Manager, you can migrate application subscriptions between Products. The syndication feature in IBM API Connect means that you can also use the Products view within a Space in a Catalog to migrate application subscriptions.

- **[Migrating application subscribers to new Product versions](#)**

When new versions of Products are created in IBM API Connect, there are a number of ways that subscribers can be moved to the Plans of the new Product.

- **[Changing the availability of a Product](#)**

You can change the availability of a Product and the associated Plans by using the Products view within a Catalog or Space in API Manager. The availability of a Product covers both the visibility of that Product to users, and which users can subscribe to it.

- **[Deprecating a Product](#)**

You can deprecate a published Product by using the Manage Products page within a Catalog in API Manager. When you deprecate a Product, application developers that are already subscribed to the Product can continue to use it, but no new developers can subscribe to the Product. The syndication feature in IBM API Connect means that you can also use the Manage Products page within a Space in a Catalog to deprecate a published Product.

- **[Retiring a Product](#)**

You can retire a published or deprecated Product by using the Manage Products page within a Catalog in API Manager. When a Product is retired, all associated APIs are taken offline, and any subscriptions are deleted. The syndication feature in IBM API Connect means that you can also use the Manage Products page within a Space in a Catalog to retire a Product.

- **[Re-staging a Product](#)**

If a Product in a Catalog has been retired, you can re-stage the Product so that it can re-enter the Product lifecycle. A re-staged Product moves to the Staged state, from where it can be published. The syndication feature in IBM API Connect means that you can also re-stage a Product within a Space in a Catalog.

- **[Working with the subscriptions in a Product](#)**

You can work with the subscriptions to the Plans in a specific Product. Plan subscriptions are created by application developers in the Developer Portal.

- **[Updating the gateway services for a Product](#)**

When you stage or publish a draft Product to a Catalog, you specify the gateway services at which the APIs in the Product are to be made available. However, you can later update the selected gateway services after a Product has been stage or published.

- **[Removing a Product from a Catalog](#)**

You can remove a Product from a specific Catalog by using the Products view within a Catalog in API Manager. The syndication feature in IBM API Connect means that you can also use the Products view within a Space to remove a Product from a Catalog.

- **[Approving Product lifecycle and subscription requests](#)**

To approve or decline requests to change the lifecycle state of a Product, and requests by application developers to subscribe to a Plan, use the Tasks page in the Catalog that contains the associated Product in API Manager. The syndication feature in IBM API Connect means that you can also use the Tasks page within a Space in a Catalog to approve or decline requests.

Considerations when changing a Product lifecycle with billing integration

There are special considerations for lifecycle operations for Products that contain a billing integration in IBM® API Connect.

For example, if you release new versions of your Product that contain pricing changes, you will need to define the upgrade pathways for your existing subscribers. The following scenarios detail the special considerations for Product lifecycle changes:

Deprecating

Preparing an existing Product to be removed from production. You can define a replacement Product by using the Set Migration Target option in the Catalog. API consumers will then see a Migrate this subscription message in the Developer Portal that they can click to upgrade their subscription to the migration target. If the upgrade target is a paid Plan, they must enter a payment method before upgrading. Upgrades by API consumers from a free Plan to a paid Plan are supported. For more information about deprecating Products, see [Deprecating a Product](#).

Migrating

Moving subscriptions from one Product to a different Product, and from a free Plan to a paid Plan, is not supported. Instead, see the superseding scenario.

Replacing

Replacing a Product with a newer version of the same Product, and automatically upgrading all existing subscribers to the new Product. You must map which Plans from your new Product correspond to which Plans in your old Product. You cannot map a free Plan to a paid Plan in the replace operation. For more information about replacing Products, see [Replacing a Product with another Product](#).

Retiring

Removing a Product or Plan from production, and canceling all of the existing subscriptions and their billing cycles. For more information about retiring Products, see [Retiring a Product](#).

Superseding

Deprecating the old Product, and at the same time defining its migration target to a newer version of itself. Retaining the existing Product and Plan for subscribers who would like to keep it, but offering a different Product and Plan for the updated version of a Product. API consumers will then see a Migrate this subscription message in the Developer Portal that they can click to upgrade their subscription to the migration target. If the upgrade target is a paid Plan, they must enter a payment method before upgrading. Upgrades by API consumers from a free Plan to a paid Plan are supported. For more information about superseding Products, see [Superseding a Product with another Product](#).

Note: You can use the Set Migration Target option in the Catalog on a Product that isn't being deprecated. For example, if you wanted to give customers the option to move to a different Product without affecting the original Product.

While these follow the same basic procedures that are described in [Managing your Products](#) for Products and Plans without billing, there are some considerations that only apply to Products that contain paid Plans.

You cannot migrate a customer directly from a free Plan to a Plan with billing

Customers who subscribe to Plans with billing must set up their billing information in the Developer Portal. If they subscribe only to free Plans, they don't have billing accounts.

There are two ways to migrate customers from a free Plan to a paid Plan:

- Supersede the free Product Plan and provide a migration target to a paid Product Plan. This deprecates the free Product Plan so no new users can subscribe to it, and gives the customer a Migrate this subscription message in the Developer Portal to move to the new Product Plan.
- Set a migration target to a paid Product Plan. In this case the free Product Plan is not deprecated, but it still gives the customer the Migrate this subscription message in the Developer Portal for moving to the new Product Plan. With this method, new customers can still subscribe to the free Product Plan.

Both of these methods require action from the customer before they move from the free Product Plan to the paid Product Plan.

Note: Free trial days do not apply to customers when they migrate. They are available only for new customers.

You must map the existing Plans to the new Plans when you supersede or replace a Product

When you replace or supersede a Plan with billing with another Plan, you must map the Plans from the Product that is being removed to the Plans that are in the new Product. It is convenient if there are the same number of Plans for each, but you can map more than one Plan from the existing Product to one Plan in the new Product.

Billing charges are prorated when subscriptions are migrated

When customers change their subscriptions to a Plan that has a different price, their next monthly invoice will contain prorated charges, depending on how long they spent on different billing Plans. For more information about how Stripe handles proration, see <https://stripe.com/docs/billing/subscriptions/prorations>.

Publishing a Product

APIs become accessible when a Product is published and made visible on the IBM® API Connect Developer Portal for use by application developers. A Product can be published to selected communities of application developer organizations, and the Plans within the Product can be used to tailor access and visibility further.

Before you begin

You must stage a Product before it can be published. For more information about staging Products, see [Staging a Product](#).

Note: If you want to publish a LoopBack project, you must publish both the APIs (by publishing the Products that contain the APIs) and the associated applications so the project can be run. For more information about publishing LoopBack applications, see [Publishing APIs and applications](#).

To complete the Product management tasks that are described in this topic, you must either be the owner of the API provider organization, or be assigned Manage permission for Products in the Catalog that contains the Product. If you have View permission for Products, you have read-only access to the Product management page. For information on configuring Product management permissions for a Catalog, see [Creating and configuring Catalogs](#).

The syndication feature in IBM API Connect means that Products can be contained within a Space in a Catalog. In this case, to complete the Product management tasks that are described in this topic, you must either be the owner of the API provider organization, or be assigned Manage permission for Products in the Space that contains the Product. For information on configuring Product management permissions for a Space, see [Managing user access in a Space](#).

About this task

A community is a collection of consumer organizations, used to control which organizations have access to Products and Plans without having to assign access on an individual basis. A Product can be published to selected communities, which means that only application developers within those organizations contained within the community can see the Product on the Developer Portal and obtain application keys to access it. A Product can alternatively be published to all communities. Communities are used to restrict the visibility and accessibility of APIs, for example to particular business partners, internal organizations, or other groups of application developers.

Note: If you want to update a Product, you must republish it. The `products : update` command only updates a Product's metadata.

Procedure

You can publish a product in any of the following ways:

- Publish a new Product.
- Replace a Product with another Product.
- Supersede a Product with another Product

For details of the ways in which you can publish a Product, see the following subtopics:

- [Publishing a new Product](#)

Publish a Product from within its containing Catalog in API Manager. The syndication feature in IBM API Connect means that you can also publish a Product from within its containing Space in a Catalog.

- [Replacing a Product with another Product](#)

You can replace a published Product in IBM API Connect with another Product, and automatically migrate subscribers to the new Product, by using the API Manager.

- [Superseding a Product with another Product](#)

You can supersede a published Product with another Product by using the API Manager.

Publishing a new Product

Publish a Product from within its containing Catalog in API Manager. The syndication feature in IBM® API Connect means that you can also publish a Product from within its containing Space in a Catalog.

Before you begin

The Product that you are publishing must be in the Staged or Deprecated state.

To complete the Product management tasks that are described in this topic, you must either be the owner of the API provider organization, or be assigned Manage permission for Products in the Catalog that contains the Product. If you have View permission for Products, you have read-only access to the Product management page. For information on configuring Product management permissions for a Catalog, see [Creating and configuring Catalogs](#).

The syndication feature in IBM API Connect means that Products can be contained within a Space in a Catalog. In this case, to complete the Product management tasks that are described in this topic, you must either be the owner of the API provider organization, or be assigned Manage permission for Products in the Space that contains the Product. For information on configuring Product management permissions for a Space, see [Managing user access in a Space](#).

About this task

You can complete this task either by using the API Designer UI application, or by using the browser-based API Manager UI.

If you publish a Product to a non-development Catalog, the Product that is published is an independent and fixed copy of the version of the Product that you chose to stage. Editing the Product through the Products page will not affect the published Product. For this reason, it is recommended that when you stage a Product, you then create a new version of the Product to edit in future, so as to avoid confusion regarding the properties of the published Product. For more information on creating new versions of your Product, see [Creating a new version of your Product](#).

An exception is that if you publish a Product to a development Catalog, editing it through the Products page will enable you to re-stage and publish the same version of the Product. For information on how to create a development Catalog, see [Creating and configuring Catalogs](#).

Although you can publish to a development Catalog, the development Catalog should be used only for testing purposes. Similarly, a Developer Portal created from a development Catalog must be used for testing purposes only, and not for production use. For more information on Catalogs, see [Working with Catalogs](#).

Note: All references in this topic to a Catalog can also be applied to a Space in a Catalog, unless specified otherwise. For more information about Spaces, see [Using syndication in API Connect](#).

Procedure

To publish a Product, complete the following steps:

1. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with.
The Products page of the Catalog opens, and all of the Products available in that Catalog are displayed.
2. If the Product that you want to work with is contained within a Space, select the required Space by completing the following steps:
 - a. Click the Spaces tab.
 - b. Select the Space that you want to work with.The Products page of the Space opens, and all of the Products available in that Space are displayed.
3. Alongside the Product version that you want to work with, click the options icon  and then click Publish.
The Confirm Visibility Settings page opens.
4. Specify the following options:
 - The users that the Product is visible to
You can choose Public users, Authenticated users, or Custom.
 - Custom - You can use the Type to add... field to search for organizations or communities that you want your Product to be visible to.
 - Who can subscribe to the Product
You can add or remove one or more consumer organizations or communities.
 - Custom - You can use the Type to add... field to search for organizations or communities that you want to allow to subscribe to your Product.
5. Click Publish, then click Confirm to proceed with the publish operation.
If approval is required to publish Products in this Catalog, an approval request is sent, and the Product moves to the Pending state; the Product is published when the request is approved. If approval is not required, the Product version is published immediately, and moves to the Published state. For information on configuring Product lifecycle approvals for a Catalog, see [Creating and configuring Catalogs](#). For information on approving requests, see [Approving Product lifecycle and subscription requests](#).

Note:

- Approval for Product lifecycle state changes in a Catalog is disabled by default. You must explicitly enable the Product lifecycle state changes that you want to enforce.
- Product lifecycle approvals can be configured only at the Catalog level. This feature is not available at the Space level.
- You can view the history of Product lifecycle requests and approvals, by clicking the options icon  alongside the Product that you want to work with, and selecting View Approval History.

Results

Your Product is in the Published state.

Your Product is published to your Catalog and available to your specified organizations or communities. Application developers within the groups you selected can see and use the APIs within the Product.

Any application developer requests to use your Product are displayed on the Approvals tab in the containing Catalog, where you can decline or accept the request.

- [Deprecating a Product](#)

Related information

- [Staging a Product](#)

Replacing a Product with another Product

You can replace a published Product in IBM® API Connect with another Product, and automatically migrate subscribers to the new Product, by using the API Manager.

Before you begin

The Product to be replaced must be in the Published state, and the replacement Product must be in the Staged, Published, or Deprecated state.

To complete the Product management tasks that are described in this topic, you must either be the owner of the API provider organization, or be assigned Manage permission for Products in the Catalog that contains the Product. If you have View permission for Products, you have read-only access to the Product management page. For information on configuring Product management permissions for a Catalog, see [Creating and configuring Catalogs](#).

The syndication feature in IBM API Connect means that Products can be contained within a Space in a Catalog. In this case, to complete the Product management tasks that are described in this topic, you must either be the owner of the API provider organization, or be assigned Manage permission for Products in the Space that contains the Product. For information on configuring Product management permissions for a Space, see [Managing user access in a Space](#).

About this task

When you replace a Product with another Product, the following actions are taken:

- The replacement Product is published.
- If the visibility and subscribability settings in the replacement Product are such that access is the same as, or less restrictive than, the original Product, the settings in the replacement Product are used. If the settings in the replacement Product are more restrictive, meaning that fewer consumer organizations can see or subscribe to the Product, the replace operation fails. For more information on visibility and subscribability settings, see [Changing the availability of a Product](#).
- The subscribers to the original Product are migrated to the replacement Product.
Note: Customers cannot be migrated automatically from a free Plan to a paid Plan. To move your customers from a free Plan to a paid Plan, you can supersede the product with a new product and set a migration target to the paid Plan. The customers then select a button to migrate and must enter their credit card information before the process is complete. For more information, see [Considerations when changing a Product lifecycle with billing integration](#).
- The original Product is moved to the Retired state. Products in the Retired state are removed from the Developer Portal; they are no longer visible to the application developers, and any subscriptions to them are canceled. However, the Product can be staged again later if required.

Although you can publish to a development Catalog, the development Catalog should be used only for testing purposes. Similarly, a Developer Portal created from a development Catalog must be used for testing purposes only, and not for production use. For more information on Catalogs, see [Working with Catalogs](#).

Note: All references in this topic to a Catalog, can also be applied to a Space in a Catalog, unless specified otherwise.

Procedure

To replace a Product, complete the following steps:

1. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with.
The Products page of the Catalog opens, and all of the Products available in that Catalog are displayed.
2. If the Product that you want to work with is contained within a Space, select the required Space by completing the following steps:
 - a. Click the Spaces tab.
 - b. Select the Space that you want to work with.The Products page of the Space opens, and all of the Products available in that Space are displayed.
3. Alongside the Product version that you want to replace, click the options icon , then click Replace.
The Replace window opens.
4. Select the replacement Product, then click Next.
5. From the drop-down list, select which Plans from your new Product correspond to Plans in your old Product.
6. Click Replace.

If approval is required to replace Products in this Catalog, an approval request is sent, and the Product moves to the Pending state; the Product is replaced when the request is approved. If approval is not required, the Product is replaced immediately. For information on configuring Product lifecycle approvals for a Catalog, see [Creating and configuring Catalogs](#). For information on approving requests, see [Approving Product lifecycle and subscription requests](#).

Note:

- Approval for Product lifecycle state changes in a Catalog is disabled by default. You must explicitly enable the Product lifecycle state changes that you want to enforce.
- Product lifecycle approvals can be configured only at the Catalog level. This feature is not available at the Space level.
- You can view the history of Product lifecycle requests and approvals, by clicking the options icon  alongside the Product that you want to work with, and selecting View Approval History.

Results

Your new Product is in the Published state, and the original Product is in the Retired state.

Your new Product is published to your preferred organizations or communities. Application developers within the groups you selected can see and use the APIs within the Product.

Any application developer requests to use your Product are displayed on the Approvals tab in the containing Catalog, where you can decline or accept the request.

Superseding a Product with another Product

You can supersede a published Product with another Product by using the API Manager.

Before you begin

The Product to be superseded must be in the Published state. The superseding Product must be in the Staged, Published, or Deprecated state.

To complete the Product management tasks that are described in this topic, you must either be the owner of the API provider organization, or be assigned Manage permission for Products in the Catalog that contains the Product. If you have View permission for Products, you have read-only access to the Product management page. For information on configuring Product management permissions for a Catalog, see [Creating and configuring Catalogs](#).

The syndication feature in IBM® API Connect means that Products can be contained within a Space in a Catalog. In this case, to complete the Product management tasks that are described in this topic, you must either be the owner of the API provider organization, or be assigned Manage permission for Products in the Space that contains the Product. For information on configuring Product management permissions for a Space, see [Managing user access in a Space](#).

About this task

When you supersede a Product with another Product, the following actions are taken:

- The superseding Product is published.
- If the visibility and subscribability settings in the superseding Product are such that access is the same as, or less restrictive than, the original Product, the settings in the superseding Product are used. If the settings in the superseding Product are such that access is more restrictive, meaning that fewer consumer organizations can see or subscribe to the Product, the supersede operation fails. For more information on visibility and subscribability settings, see [Changing the availability of a Product](#).
- The original Product is moved to the Deprecated state.
- The application developers that are already subscribed to the now deprecated Product can continue to use it, but no new developers can subscribe to the Product. In the Developer Portal the application developers will see a Migrate this subscription message, which they can click to upgrade their subscription to the migration target.
- The deprecated product can be published again if required.

Although you can publish to a development Catalog, the development Catalog should be used only for testing purposes. Similarly, a Developer Portal created from a development Catalog must be used for testing purposes only, and not for production use. For more information on Catalogs, see [Working with Catalogs](#).

Note: All references in this topic to a Catalog, can also be applied to a Space in a Catalog, unless specified otherwise.

Procedure

To supersede a Product, complete the following steps:

1. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with. The Products page of the Catalog opens, and all of the Products available in that Catalog are displayed.
2. If the Product that you want to work with is contained within a Space, select the required Space by completing the following steps:
 - a. Click the Spaces tab.
 - b. Select the Space that you want to work with.The Products page of the Space opens, and all of the Products available in that Space are displayed.
3. Alongside the Product version that you want to supersede, click the options icon  and then click Supersede.
4. Select the superseding Product and then click Next.
5. From the drop-down list, select which Plans from your new Product correspond to Plans in your old Product.
6. Click Supersede.

If approval is required to supersede Products in this Catalog, an approval request is sent, and the Product moves to the Pending state; the Product is superseded when the request is approved. If approval is not required, the Product is superseded immediately. For information on configuring Product lifecycle approvals for a Catalog, see [Creating and configuring Catalogs](#). For information on approving requests, see [Approving Product lifecycle and subscription requests](#).

Note:

- Approval for Product lifecycle state changes in a Catalog is disabled by default. You must explicitly enable the Product lifecycle state changes that you want to enforce.
- Product lifecycle approvals can be configured only at the Catalog level. This feature is not available at the Space level.
- You can view the history of Product lifecycle requests and approvals, by clicking the options icon  alongside the Product that you want to work with, and selecting View Approval History.

Results

Your superseding Product is in the Published state.

The Product that was superseded is in the Deprecated state.

Your superseding Product is published to your preferred organizations or communities. Application developers within the groups you selected can see and use the APIs within the Product. The original Product is deprecated.

Any application developer requests to use your Product are displayed on the Approvals tab in the containing Catalog, where you can decline or accept the request.

Existing customers remain subscribed to the deprecated product, and any billing cycles for subscriptions to paid plans continue uninterrupted. For more information, see [Considerations when changing a Product lifecycle with billing integration](#).

Migrating application subscriptions to another Product

By using the Products view within a Catalog in API Manager, you can migrate application subscriptions between Products. The syndication feature in IBM® API Connect means that you can also use the Products view within a Space in a Catalog to migrate application subscriptions.

Before you begin

Your Product that you are migrating subscriptions from must be in one of the following states:

- Published
- Deprecated

To complete the Product management tasks that are described in this topic, you must either be the owner of the API provider organization, or be assigned Manage permission for Products in the Catalog that contains the Product. If you have View permission for Products in this Catalog, you will have read-only access to the Product management page. For information on configuring Product management permissions for a Catalog, see [Creating and configuring Catalogs](#).

The syndication feature in IBM API Connect means that Products can be contained within a Space in a Catalog. In this case, to complete the Product management tasks that are described in this topic, you must either be the owner of the API provider organization, or be assigned Manage permission for Products in the Space that contains the Product. For information on configuring Product management permissions for a Space, see [Managing user access in a Space](#).

About this task

Application developers initially subscribe their applications to one or more Plans in Products by using the Developer Portal. For more information, see [Exploring APIs and Products in the Developer Portal](#). However, by using API Manager, for a chosen Product you can migrate one or more of its application subscriptions from one Plan to a Plan in another Product.

Procedure

To migrate Product subscriptions, complete the following steps:

1. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with.
The Products page of the Catalog opens, and all of the Products available in that Catalog are displayed.
2. If the Product that you want to work with is contained within a Space, select the required Space by completing the following steps:
 - a. Click the Spaces tab.
 - b. Select the Space that you want to work with.The Products page of the Space opens, and all of the Products available in that Space are displayed.
3. Alongside the Product version that you want to work with, click the options icon  and then click Migrate Subscriptions.
4. Select the Plan from which you want to migrate subscriptions, then click Next.
5. Select the subscriptions that you want to migrate, then click Next.
6. Select the Product that you want to migrate the subscriptions to, then click Next.
7. Select the Plan that you want to migrate the application subscriptions to, and then click Migrate.

Results

The target Product has the migrated subscriptions, and those subscriptions are removed from the Product from which they were migrated.

Migrating application subscribers to new Product versions

When new versions of Products are created in IBM® API Connect, there are a number of ways that subscribers can be moved to the Plans of the new Product.

About this task

You can move users to the new Plans in different ways, depending on your Product strategy, by using the options icon  alongside the Product in the associated Catalog in the API Manager UI.

Procedure

To automatically migrate all existing subscribers to a new Product, for example, when you are applying fixes to a Product:

- You should Replace the original version of the Product with a new version of the Product.
 - The replacement Product is Published.
 - The original Product is Retired.
 - The subscribers to the original Product are automatically migrated to the replacement Product.

Note: Customers cannot be migrated automatically from a free Plan to a paid Plan. To move your customers from a free Plan to a paid Plan, you can supersede the product with a new product and set a migration target to the paid Plan. The customers then select a button to migrate and must enter their credit card information before the process is complete. For more information, see [Considerations when changing a Product lifecycle with billing integration](#).

For more information about replacing Products, see [Replacing a Product with another Product](#).

To encourage subscribers to move to a new Product, and stop new users from subscribing to the original Product, for example, if an enhancement or new feature is added:

- You should Supersede the original version of the Product with a new version of the Product.
 - The superseding Product is Published.
 - The original Product is Deprecated.
 - The application developers that are already subscribed to the now deprecated Product can continue to use it, but no new developers can subscribe to the Product. In the Developer Portal the subscribers will see a Migrate this subscription message, which they can click to upgrade their subscription to the migration target.
 - If the migration target is a paid Plan, subscribers must enter a payment method before they can upgrade. Upgrades by subscribers from a free Plan to a paid Plan are supported.

For more information about superseding Products, see [Superseding a Product with another Product](#).

To prepare a Product to be removed from production, but leave the existing subscriptions as they are:

- You should Deprecate the original Product.
 - The Product is Deprecated.
 - The application developers that are already subscribed to the now deprecated Product can continue to use it, but no new developers can subscribe to the Product.
 - You can define a replacement Product by using the Set Migration Target option in the Catalog. Application developers will then see a Migrate this subscription message in the Developer Portal that they can click to upgrade their subscription to the migration target. If the upgrade target is a paid Plan, they must enter a payment method before upgrading. Upgrades by API consumers from a free Plan to a paid Plan are supported.

For more information about deprecating Products, see [Deprecating a Product](#).

To give subscribers the option to move to a different Product, but without affecting the original Product:

- You can use the Set Migration Target option in the Catalog on a Product that isn't being deprecated or superseded. For more information, see [Managing your Products](#).

Changing the availability of a Product

You can change the availability of a Product and the associated Plans by using the Products view within a Catalog or Space in API Manager. The availability of a Product covers both the visibility of that Product to users, and which users can subscribe to it.

Before you begin

To complete the Product management tasks that are described in this topic, you must either be the owner of the API provider organization, or be assigned Manage permission for Products in the Catalog that contains the Product. If you have View permission for Products, you have read-only access to the Product management page. For information on configuring Product management permissions for a Catalog, see [Creating and configuring Catalogs](#).

The syndication feature in IBM® API Connect means that Products can be contained within a Space in a Catalog. In this case, to complete the Product management tasks that are described in this topic, you must either be the owner of the API provider organization, or be assigned Manage permission for Products in the Space that contains the Product. For information on configuring Product management permissions for a Space, see [Managing user access in a Space](#).

Note: All references in this topic to a Catalog can also be applied to a Space in a Catalog, unless specified otherwise. For more information about Spaces, see [Using syndication in API Connect](#).

Procedure

To change the availability of a Product, complete the following steps:

1. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with. The Products page of the Catalog opens, and all of the Products available in that Catalog are displayed.

2. If the Product that you want to work with is contained within a Space, select the required Space by completing the following steps:
 - a. Click the Spaces tab.
 - b. Select the Space that you want to work with.The Products page of the Space opens, and all of the Products available in that Space are displayed.
3. Alongside the Product version that you want to work with, click the options icon , then click Edit visibility. The Visibility page opens.
4. In the Visibility section, specify the users that you want the Product to be visible to. You can choose Public to make the Product visible to all users, Authenticated to make the Product available to users who have successfully authenticated, or Custom to specify the consumer organizations and consumer organization groups that you want the Product to be visible to. If you select Custom, use the Type to add organizations field to search for the consumer organizations and consumer organization groups that you want the Product to be visible to. For information about how to create and manage consumer organizations and consumer organization groups, see [Working with consumer organizations](#).

Use the Temporarily disable visibility check box to toggle whether the Product is or is not visible, without having to change other visibility settings.
5. In the Subscribability section, specify the users that can subscribe to the Plans in the Product. You can choose Authenticated to make the Plans in the Product subscribable by users who have successfully authenticated, or Custom to specify the consumer organizations and consumer organization groups that can subscribe to the Plans in the Product. If you select Custom, use the Type to add organizations field to search for the consumer organizations and consumer organization groups that can subscribe to the Plans in the Product. If you selected custom visibility, only the consumer organizations and consumer organization groups selected there are available for adding to the custom subscribability list. For information about how to create and manage consumer organizations and consumer organization groups, see [Working with consumer organizations](#).

Use the Temporarily disable subscribability check box to toggle whether the Product can or cannot be subscribed to, without having to change other subscription settings.
6. Click Save when done. The Product version is configured with the modified availability settings.
Note:
 - Changing who can view or subscribe to a Product does not affect the settings of the draft Product. The change applies only in the Catalog that was selected in Step 1.
 - Changing who can view or subscribe to a Product does not affect existing subscriptions.
 - Any updates to the visibility of a Product are always verified against the Catalog visibility setting, as the Catalog visibility setting sets the maximum visibility level that is allowed. Therefore, if Product visibility is enabled in a Catalog, and the visibility setting of a Product is less restrictive than is set in the Catalog, then the Product publish to that Catalog will fail. For example, if the Catalog visibility setting is **authenticated**, then any Products that are published to that Catalog cannot have a visibility setting of **public**.

Results

Your Product remains in the same lifecycle state, but now with new availability settings.

What to do next

You can also set Product visibility at the Catalog or Space level. For more information, see [Configuring Product visibility at a Catalog or Space level](#).

Related tasks

- [Working with Spaces](#)
- [Configuring Product visibility at a Catalog or Space level](#)

Deprecating a Product

You can deprecate a published Product by using the Manage Products page within a Catalog in API Manager. When you deprecate a Product, application developers that are already subscribed to the Product can continue to use it, but no new developers can subscribe to the Product. The syndication feature in IBM® API Connect means that you can also use the Manage Products page within a Space in a Catalog to deprecate a published Product.

Before you begin

The Product that you are deprecating must be in the Published state.

To complete the Product management tasks that are described in this topic, you must either be the owner of the API provider organization, or be assigned Manage permission for Products in the Catalog that contains the Product. If you have View permission for Products, you have read-only access to the Product management page. For information on configuring Product management permissions for a Catalog, see [Creating and configuring Catalogs](#).

The syndication feature in IBM API Connect means that Products can be contained within a Space in a Catalog. In this case, to complete the Product management tasks that are described in this topic, you must either be the owner of the API provider organization, or be assigned Manage permission for Products in the Space that contains the Product. For information on configuring Product management permissions for a Space, see [Managing user access in a Space](#).

Procedure

To deprecate a Product, complete the following steps:

1. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with. The Products page of the Catalog opens, and all of the Products available in that Catalog are displayed.

2. If the Product that you want to work with is contained within a Space, select the required Space by completing the following steps:

- a. Click the Spaces tab.
- b. Select the Space that you want to work with.

The Products page of the Space opens, and all of the Products available in that Space are displayed.

3. Alongside the Product version that you want to work with, click the options icon , then click Deprecate.

The Deprecate Product window opens.

4. Click Confirm to deprecate the Product.

If approval is required to deprecate Products in this Catalog, an approval request is sent, and the Product moves to the Pending state; the Product is deprecated when the request is approved. If approval is not required, the Product is deprecated immediately. For information on configuring Product lifecycle approvals for a Catalog, see [Creating and configuring Catalogs](#). For information on approving requests, see [Approving Product lifecycle and subscription requests](#).

Note:

- Approval for Product lifecycle state changes in a Catalog is disabled by default. You must explicitly enable the Product lifecycle state changes that you want to enforce.
- Product lifecycle approvals can be configured only at the Catalog level. This feature is not available at the Space level.
- You can view the history of Product lifecycle requests and approvals, by clicking the options icon  alongside the Product that you want to work with, and selecting View Approval History.

Results

Your Product is in the Deprecated state.

Retiring a Product

You can retire a published or deprecated Product by using the Manage Products page within a Catalog in API Manager. When a Product is retired, all associated APIs are taken offline, and any subscriptions are deleted. The syndication feature in IBM® API Connect means that you can also use the Manage Products page within a Space in a Catalog to retire a Product.

Before you begin

The Product that you are retiring must be in the Published or Deprecated state.

To complete the Product management tasks that are described in this topic, you must either be the owner of the API provider organization, or be assigned Manage permission for Products in the Catalog that contains the Product. If you have View permission for Products, you have read-only access to the Product management page. For information on configuring Product management permissions for a Catalog, see [Creating and configuring Catalogs](#).

The syndication feature in IBM API Connect means that Products can be contained within a Space in a Catalog. In this case, to complete the Product management tasks that are described in this topic, you must either be the owner of the API provider organization, or be assigned Manage permission for Products in the Space that contains the Product. For information on configuring Product management permissions for a Space, see [Managing user access in a Space](#).

Procedure

To retire a Product, complete the following steps.

1. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with.

The Products page of the Catalog opens, and all of the Products available in that Catalog are displayed.

2. If the Product that you want to work with is contained within a Space, select the required Space by completing the following steps:

- a. Click the Spaces tab.
- b. Select the Space that you want to work with.

The Products page of the Space opens, and all of the Products available in that Space are displayed.

3. Alongside the Product version that you want to work with, click the options icon , and then click Retire. The Retire Product window opens.

4. Click Confirm.

If approval is required to retire Products in this Catalog, an approval request is sent, and the Product moves to the Pending state; the Product is retired when the request is approved. If approval is not required, the Product is retired immediately. For information on configuring Product lifecycle approvals for a Catalog, see [Creating and configuring Catalogs](#). For information on approving requests, see [Approving Product lifecycle and subscription requests](#).

Note:

- Approval for Product lifecycle state changes in a Catalog is disabled by default. You must explicitly enable the Product lifecycle state changes that you want to enforce.
- Product lifecycle approvals can be configured only at the Catalog level. This feature is not available at the Space level.
- You can view the history of Product lifecycle requests and approvals, by clicking the options icon  alongside the Product that you want to work with, and selecting View Approval History.

Results

Your Product is in the Retired state. It is also removed from the Developer Portal, is no longer visible to the application developers, and any subscriptions to it are deleted. You can stage the Product again later if required; for details, see [Staging a Product](#). If the Product has any monetized Plans, the billing cycles for any subscriptions are canceled as well. For more information, see [Considerations when changing a Product lifecycle with billing integration](#).

Re-staging a Product

If a Product in a Catalog has been retired, you can re-stage the Product so that it can re-enter the Product lifecycle. A re-staged Product moves to the Staged state, from where it can be published. The syndication feature in IBM® API Connect means that you can also re-stage a Product within a Space in a Catalog.

Before you begin

The Product that you are re-staging must be in the Retired state.

To complete the Product management tasks that are described in this topic, you must either be the owner of the API provider organization, or be assigned Manage permission for Products in the Catalog that contains the Product. If you have View permission for Products, you have read-only access to the Product management page. For information on configuring Product management permissions for a Catalog, see [Creating and configuring Catalogs](#).

The syndication feature in IBM API Connect means that Products can be contained within a Space in a Catalog. In this case, to complete the Product management tasks that are described in this topic, you must either be the owner of the API provider organization, or be assigned Manage permission for Products in the Space that contains the Product. For information on configuring Product management permissions for a Space, see [Managing user access in a Space](#).

About this task

You stage a Product so that the appropriate approvals, internally within the organization, can be given for it to then be published. For information on configuring Product lifecycle approvals for a Catalog, see [Creating and configuring Catalogs](#). For information on approving requests, see [Approving Product lifecycle and subscription requests](#). For information on publishing a Product, see [Publishing a Product](#).

Procedure

To re-stage a Product, complete the following steps.

1. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with.
The Products page of the Catalog opens, and all of the Products available in that Catalog are displayed.
 2. If the Product that you want to work with is contained within a Space, select the required Space by completing the following steps:
 - a. Click the Spaces tab.
 - b. Select the Space that you want to work with.The Products page of the Space opens, and all of the Products available in that Space are displayed.
 3. Alongside the Product version that you want to work with, click the options icon  and then click Re-stage. The Re-stage Product window opens.
 4. Click Confirm.
If approval is required to stage Products in this Catalog, an approval request is sent, and the Product moves to the Pending state; the Product is re-staged when the request is approved. If approval is not required, the Product is re-staged immediately. For information on configuring Product lifecycle approvals for a Catalog, see [Creating and configuring Catalogs](#). For information on approving requests, see [Approving Product lifecycle and subscription requests](#).
- Note:
- Approval for Product lifecycle state changes in a Catalog is disabled by default. You must explicitly enable the Product lifecycle state changes that you want to enforce.
 - Product lifecycle approvals can be configured only at the Catalog level. This feature is not available at the Space level.
 - You can view the history of Product lifecycle requests and approvals, by clicking the options icon  alongside the Product that you want to work with, and selecting View Approval History.

Results

Your Product is in the Staged state, from where it can be published; see [Publishing a new Product](#).

Working with the subscriptions in a Product

You can work with the subscriptions to the Plans in a specific Product. Plan subscriptions are created by application developers in the Developer Portal.

Procedure

To work with the Plan subscriptions in a Product, complete the following steps:

1. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with.
The Products page of the Catalog opens, and all of the Products available in that Catalog are displayed.
2. Optional: If Spaces are enabled in the Catalog, select the Space that you want to work with by completing the following steps:
 - a. Click the Spaces tab.
 - b. Select the Space that you want to work with.For more information about enabling Spaces, see [Using syndication in API Connect](#).
3. Alongside the Product version that you want to work with, click the options icon  and then click View Subscriptions.
A window opens listing all subscriptions to the Plans in the selected Product.
4. Alongside the subscription that you want to work with, click the options icon .
You can then select from the following options:
 - View Consumer Organization: a window opens listing the consumer organization that the subscribing application belongs to. If required, you can click the options icon  to work with the consumer organization. For details of the available options, see [Working with consumer organizations](#).
 - View Application: a window opens listing the subscribing application. If required, you can click the options icon  to work with the application. For details of the available options, see [Working with developer applications](#).
 - View Plan: a window opens listing the Plan that the application is subscribed to. If required, you can click the options icon  to work with the Plan. For details of the available options, see [Working with Plans](#).
 - View Product: a window opens listing the Product that contains the Plan that the application is subscribed to. If required, you can click the options icon  to work with the Product. For details of the available options, see [Managing your Products](#).
5. To display the Client ID's for a particular Product subscription, click the information icon  in the Application column for the subscription that you require.

Updating the gateway services for a Product

When you stage or publish a draft Product to a Catalog, you specify the gateway services at which the APIs in the Product are to be made available. However, you can later update the selected gateway services after a Product has been stage or published.

Before you begin

To complete the Product management tasks that are described in this topic, you must either be the owner of the API provider organization, or be assigned Manage permission for Products in the Catalog that contains the Product. If you have View permission for Products, you have read-only access to the Product management page. For information on configuring Product management permissions for a Catalog, see [Creating and configuring Catalogs](#).

The syndication feature in IBM® API Connect means that Products can be contained within a Space in a Catalog. In this case, to complete the Product management tasks that are described in this topic, you must either be the owner of the API provider organization, or be assigned Manage permission for Products in the Space that contains the Product. For information on configuring Product management permissions for a Space, see [Managing user access in a Space](#).

About this task

When you stage or publish a draft Product to a Catalog, you can either choose to make the APIs in the Product available at all the gateway services that match the gateway service type of the Product, either DataPower® API Gateway or DataPower Gateway (v5 compatible), or can you select specific gateway services of that type. The APIs in the Product can then be called at those gateway service endpoints.

However, after a Product has been staged or published you can later update the gateway services to change the selections.

For more information on staging and publishing a Product, see [Staging a draft Product](#) and [Publishing a draft Product](#).

For more information on the gateway service types, see [API Connect gateway types](#).

Procedure

To update the gateway services for a Product, complete the following steps:

1. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with.
The Products page of the Catalog opens, and all of the Products available in that Catalog are displayed.
2. If the Product that you want to work with is contained within a Space, select the required Space by completing the following steps:
 - a. Click the Spaces tab.
 - b. Select the Space that you want to work with.The Products page of the Space opens, and all of the Products available in that Space are displayed.
3. Alongside the Product version that you want to work with, click the options icon , then click Update gateway services.
The Select Gateway Services window opens.

4. Select the required gateway services, then click Save.

Removing a Product from a Catalog

You can remove a Product from a specific Catalog by using the Products view within a Catalog in API Manager. The syndication feature in IBM® API Connect means that you can also use the Products view within a Space to remove a Product from a Catalog.

Before you begin

The Product that you are removing from the Catalog must be in the Staged or Retired state. For more information, see [Staging a Product](#) or [Retiring a Product](#).

To complete the Product management tasks that are described in this topic, you must either be the owner of the API provider organization, or be assigned Manage permission for Products in the Catalog that contains the Product. If you have View permission for Products, you have read-only access to the Product management page. For information on configuring Product management permissions for a Catalog, see [Creating and configuring Catalogs](#).

The syndication feature in IBM API Connect means that Products can be contained within a Space in a Catalog. In this case, to complete the Product management tasks that are described in this topic, you must either be the owner of the API provider organization, or be assigned Manage permission for Products in the Space that contains the Product. For information on configuring Product management permissions for a Space, see [Managing user access in a Space](#).

Procedure

To remove a Product from a Catalog, complete the following steps.

1. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with. The Products page of the Catalog opens, and all of the Products available in that Catalog are displayed.
2. If the Product that you want to work with is contained within a Space, select the required Space by completing the following steps:
 - a. Click the Spaces tab.
 - b. Select the Space that you want to work with. The Products page of the Space opens, and all of the Products available in that Space are displayed.
3. Alongside the Product version that you want to work with, click the options icon , then click Delete. The Delete Product window opens.
4. Click Confirm to delete the Product.

Results

Your Product is removed from the Catalog. You can stage the Product again if required; for details, see [Staging a Product](#). If your Product was contained within a Space in a Catalog, your Product is removed from both the Space and the Catalog.

Approving Product lifecycle and subscription requests

To approve or decline requests to change the lifecycle state of a Product, and requests by application developers to subscribe to a Plan, use the Tasks page in the Catalog that contains the associated Product in API Manager. The syndication feature in IBM® API Connect means that you can also use the Tasks page within a Space in a Catalog to approve or decline requests.

Before you begin

To see lifecycle change requests for a Product, you must either be the owner of the API provider organization, or you must be assigned a user role that has permission to view or manage Products in the Catalog that contains the Product. For information on configuring Product management permissions for a Catalog, see [Creating and configuring Catalogs](#).

The syndication feature in API Connect means that Products can be contained within a Space in a Catalog. In this case, to see lifecycle change requests for a Product, you must either be the owner of the API provider organization, or you must be assigned a user role that has permission to view or manage Products in the Space that contains the Product. For information on configuring Product management permissions for a Space, see [Managing user access in a Space](#).

About this task

If approvals for Product lifecycle changes are enabled for a Catalog, then an attempt to change the lifecycle state of a Product results in an approval request being sent. This request is displayed in the Tasks page in the Catalog, from where the request can be approved or declined. The authority to approve Product lifecycle state changes is restricted to users in specified roles. For information on configuring Product lifecycle approvals for a Catalog, see [Creating and configuring Catalogs](#).

Note:

- Approval for Product lifecycle state changes in a Catalog is disabled by default. You must explicitly enable the Product lifecycle state changes that you want to enforce.
- Product lifecycle approvals can be configured only at the Catalog level. This feature is not available at the Space level.
- You can view the history of Product lifecycle requests and approvals, by clicking the options icon  alongside the Product that you want to work with, and selecting View Approval History.

If a Product is set to require approval for subscription by application developers, then an attempt by an application developer to subscribe to the Product results in an approval request being sent. This request is displayed in the Approvals tab in the Catalog that contains the associated Product in API Manager, from where the request can be approved or declined.

Procedure

To work with a Product lifecycle change request, complete the following steps.

1. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with.
The Products page of the Catalog opens, and all of the Products available in that Catalog are displayed.
2. If the Product that you want to work with is contained within a Space, select the required Space by completing the following steps:
 - a. Click the Spaces tab.
 - b. Select the Space that you want to work with.
The Products page of the Space opens, and all of the Products available in that Space are displayed.
3. Click the Tasks tab, then locate the Product lifecycle change request that you want to deal with.
4. Click the Approve or Decline as required.
Note: You can approve or decline lifecycle change requests only if you have a user role that has permission to approve Product publish requests in the Catalog in which the changes will take place.
For information on configuring Product management permissions for a Catalog, see [Creating and configuring Catalogs](#).

To work with a subscription request, complete the following steps.

5. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with.
The Products page of the Catalog opens, and all of the Products available in that Catalog are displayed.
6. If the Product that you want to work with is contained within a Space, select the required Space by completing the following steps:
 - a. Click the Spaces tab.
 - b. Select the Space that you want to work with.
The Products page of the Space opens, and all of the Products available in that Space are displayed.
7. Click the Tasks tab, then locate the subscription requests that you want to deal with.
Note: To see subscription approvals, you must either be the owner of the API provider organization, or you must be assigned a user role that has permission to view or approve subscription requests. For information on creating and assigning user roles, see [Administering user access](#).
8. Click the Approve or Decline as required.
Note: The options to approve or decline a subscription request are available only if you are assigned a user role that has permission to approve subscription requests. For information on configuring permissions for a Catalog, see [Creating and configuring Catalogs](#). For information on assigning user roles, see [Managing Catalog membership](#).

Results

For a subscription request, an email is sent confirming whether you approved or declined the request. For a request to change the lifecycle state of a Product, no email is sent.

Working with APIs

For a specific Product, you can work with the APIs that are contained in the Plans in that Product.

Procedure

To work with the APIs in a Product, complete the following steps:

1. List the Plans in the Product:
 - a. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with.
 - b. If Spaces are enabled in the Catalog, select the Space that you want to work with by completing the following steps:
 - i. Click the Spaces tab.
 - ii. Select the Space that you want to work with.
 - c. If the Products page is not already displayed, click the Products tab.
 - d. Alongside the Product version that you want to work with, click the options icon , then click View Plans.
A window opens listing the Plans in the Product.
2. Alongside the required Plan, click View APIs.

A window opens listing the APIs in the Plan.

3. Alongside the required API, click the options icon .

You can then select from the following options:

- **Take Offline:** if you take an API offline, the API is no longer available to be called. When required, you can make the API available again by selecting Online.
- **View Products:** a window opens listing all the Products that contain the API. If required, you can click the options icon  alongside a Product to work with that Product. For details of the available options, see [Managing your Products](#).
- **View Plans:** a window opens listing all Plans, across all Products, that contain the API. If required, you can click the options icon  alongside a Plan to work with that Plan. For details of the available options, see [Working with Plans](#).

Working with Plans

After a Product has been published to a Catalog, you can work with the Plans in that Product.

Before you begin

For details on configuring a Plan in a Product, see [Editing a draft Product](#).

For details on Publishing a Product to a Catalog, see [Publishing a Product](#).

To complete the tasks that are described in this topic, you must either be the owner of the API provider organization, or you must be assigned a role that has either the Product_>Manage or the Product_>View permission for the Catalog. For more information, see [Adding provider organization users and assigning roles](#) and [Managing Catalog membership](#). For information on configuring Product management permissions for a Catalog, see [Creating and configuring Catalogs](#).

Procedure

To work with Plans in a Catalog, complete the following steps:

1. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with.
The Products page of the Catalog opens, and all of the Products available in that Catalog are displayed.
2. If the Product that you want to work with is contained within a Space, select the required Space by completing the following steps:
 - a. Click the Spaces tab.
 - b. Select the Space that you want to work with.
The Products page of the Space opens, and all of the Products available in that Space are displayed.
3. Alongside the Product version that you want to work with, click the options icon  and then click View Plans.
A window opens listing all the Plans in the selected Product.
4. Alongside the Plan that you want to work with, click the options icon .
You can then select from the following options:
 - **View Product:** a window opens listing the Product that contains the Plan. If required, you can click the options icon  to work with the Product. For details of the available options, see [Managing your Products](#).
 - **View APIs:** a window opens listing the APIs in the Plan. If required, you can click the options icon  alongside an API to work with that API. For details of the available options, see [Working with APIs](#).
 - **View Subscriptions:** a window opens listing the subscriptions to the Plan. If required, you can click the options icon  alongside a subscription to work with that subscriptions. For details of the available options, see [Working with application subscriptions](#).

Working with consumer organizations

Manage the consumer organizations that access your APIs and Plans when their users sign up to use the IBM® API Connect Developer Portal.

About this task

Application developers in consumer organizations access the Developer Portal and sign up to use the Plans in the Products you create in the API Manager. You can create more than one consumer organization and each organization has one owner. Application developers are added through the Developer Portal UI.

You can also create groups of consumer organizations. A consumer organization group is an efficient way of grouping application developers together to publish Products to, making it easier to control who has access to the Plans in the Products.

Use the following tasks to administer your consumer organizations and consumer organization groups:

- [Creating a consumer organization](#)
If you have permission to manage developers, you can create new consumer organizations in a Catalog. consumer organizations contain the application developers that subscribe to use the APIs that are published to the Catalog
- [Editing a consumer organization](#)
You can change the title of an IBM API Connect consumer organization, and also transfer ownership to a new organization owner.
- [Deleting a consumer organization](#)
When you delete a consumer organization, all of the resources in that organization are removed from the cloud. However, the account of the organization owner remains in IBM API Connect.
- [Working with the applications in a consumer organization](#)
You can work with the developer applications that have been registered in a consumer organization.

- [Working with the subscriptions in a consumer organization](#)

You can work with the Plan subscriptions that have been created by the developer applications registered in a consumer organization.

- [Working with consumer organization groups](#)

A *consumer organization group* is a collection of consumer organizations, and provides an efficient way of controlling who can see, and subscribe to, the APIs in your Products. By using a consumer organization group, you can define this access for all the developers in the organizations in that group in a single operation, rather than having to define access for the organizations separately.

- [Sending messages to consumer organization owners](#)

You can send email messages to the owners of consumer organizations. You can also style the email to match your business theme.

Creating a consumer organization

If you have permission to manage developers, you can create new consumer organizations in a Catalog. consumer organizations contain the application developers that subscribe to use the APIs that are published to the Catalog

Before you begin

Your IBM® API Connect Developer Portal must be enabled to perform this task. For more information, see [Creating and configuring Catalogs](#).

To complete this task, you must be defined as a member in a Catalog or Space (if Spaces are enabled), and you must be assigned a role that has the Consumer-Org_ Manage permission. For more information, see [Adding provider organization users and assigning roles](#) and [Managing Catalog membership](#).

About this task

You can create a consumer organization in either of the following ways:

- Invite a user to be a consumer organization owner, in which case they receive an invitation email with an activation link, and can complete the creation of the consumer organization and specify the title.
- Create the consumer organization yourself, specifying the owner and title. There are two ways you can specify the owner:
 - Specify the user ID of an existing user.
 - If you are using a Local User Registry, specify a new user ID; the user is added to the registry and becomes the owner of the consumer organization.

If Spaces are enabled in your Catalog, when you create a consumer organization, it is added to the Catalog and its Spaces. For more information about enabling Spaces, see [Using syndication in API Connect](#).

Procedure

1. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with.
2. Optional: If Spaces are enabled in the Catalog, select the Space that you want to work with by completing the following steps:
 - a. Click the Spaces tab.
 - b. Select the Space that you want to work with.

For more information about enabling Spaces, see [Using syndication in API Connect](#).

3. In the navigation pane of the API Manager UI, click the Consumers tab.
4. To invite a user to be a consumer organization owner, complete the following steps:
 - a. Click Add_ Invite organization owner.
 - b. Enter the email address of the organization owner.
 - c. Click Invite.

The new consumer organization is added to the list, and an email invitation is sent to the owner; by using the activation link, the owner specifies the title of the organization. The status is shown as `Pending` until the recipient of the email clicks the link in the email to complete the creation of their Developer Portal account, after which the status changes to `Enabled`.

5. To create the consumer organization yourself, complete the following steps:

- a. Click Add_ Create organization.

- b. Enter the organization Title. A Name is entered automatically.

The value in the Name field is a single string that is used to identify the consumer organization in developer toolkit CLI commands. The title is used for display.

To view the CLI commands to manage consumer organizations, see [apic consumer-orgs](#).

- c. Select the required user registry.

- d. Specify the organization owner; complete one or other of the following steps, either to specify an existing user, or to create a new user:

- To specify the user ID of an existing API Connect user who is in the selected user registry, complete the following steps:

- For the Type of user, select Existing.

- In the Username field, enter the user ID of the organization owner

After the consumer organization is created, the specified user can immediately log in to the Developer Portal associated with the Catalog.

- If you selected a Local User Registry, then to specify a new user ID, complete the following steps:

- For the Type of user, select New User.

- In the Username field, enter the new user ID.

- Enter the Email, First Name, Last Name, and Password.

After the consumer organization is created, the new user will have been added to the selected registry and can immediately log in to the Developer Portal associated with the Catalog, by using the specified user ID and password.

- e. Click Create to complete the creation of the consumer organization.

Editing a consumer organization

You can change the title of an IBM® API Connect consumer organization, and also transfer ownership to a new organization owner.

Before you begin

To complete this task, you must be defined as a member in a Catalog or Space (if Spaces are enabled), and you must be assigned a role that has the Consumer-Org. Manage permission. For more information, see [Adding provider organization users and assigning roles](#) and [Managing Catalog membership](#).

About this task

If you transfer ownership, the new organization owner can be an existing user, or you can create a new user. When the ownership changes, the new owner is assigned administration privileges for the organization, and the previous owner has their administration privileges removed. If required, you can restore the privileges to the previous owner as described in [Administering members and roles](#).

If Spaces are enabled in your Catalog, when you edit the details of a consumer organization, the updates are applied to the Catalog and its Spaces. For more information about enabling Spaces, see [Using syndication in API Connect](#).

Procedure

To change the title of a consumer organization, or to transfer ownership to a new organization owner, complete the following steps:

1. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with.
2. Optional: If Spaces are enabled in the Catalog, select the Space that you want to work with by completing the following steps:
 - a. Click the Spaces tab.
 - b. Select the Space that you want to work with.For more information about enabling Spaces, see [Using syndication in API Connect](#).
3. In the navigation pane of the API Manager UI, click the Consumers tab.
4. Click the name of the consumer organization that you want to work with.
5. To change the title, enter a new title in the Title field, then click Save.
6. To transfer ownership, select the user registry for the consumer organization owner you want to transfer ownership to. The remaining procedure varies according to the type of the selected user registry, as follows:
 - Local User Registry
 - Select whether the user is an Existing user or a New User.
 - For an existing user, complete the following steps:
 - Enter the name of an existing API Connect user that has previously been invited to register and has activated their account.
 - Click Save.
 - For a new user, complete the following steps:
 - Enter a unique user name for the new user.
 - Supply an email address, name details, and a password.
 - Click Save.
 - LDAP
 - Enter the name of a user that exists in the selected user registry.
 - Click Save.
 - Authentication URL and OIDC
 - Enter the name of an existing API Connect user that has previously been invited to register and has activated their account. If the required organization owner has not previously been invited and activated their account, you must ensure they have been invited to the organization first.
 - Click Save.

Results

If the title of the consumer organization is changed, all application developers that are members of that consumer organization will see the title change reflected in the Developer Portal user interface.

Related tasks

- [Publishing a Product](#)

Deleting a consumer organization

When you delete a consumer organization, all of the resources in that organization are removed from the cloud. However, the account of the organization owner remains in IBM® API Connect.

Before you begin

To complete this task, you must be defined as a member in a Catalog or Space (if Spaces are enabled), and you must be assigned a role that has the Consumer-Org. Manage permission. For more information, see [Adding provider organization users and assigning roles](#) and [Managing Catalog membership](#).

Important: If you delete a consumer organization, client IDs and secrets associated with applications that were registered by users in the consumer organization can no longer be used to call APIs. However, the account of the organization owner remains in API Connect.

About this task

When you delete a consumer organization, it is removed permanently and users can no longer access that organization.

If Spaces are enabled in your Catalog, when you delete a consumer organization, it is deleted from the Catalog and its Spaces. For more information about enabling Spaces, see [Using syndication in API Connect](#).

Procedure

To delete a consumer organization, complete the following steps:

1. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with.
2. Optional: If Spaces are enabled in the Catalog, select the Space that you want to work with by completing the following steps:
 - a. Click the Spaces tab.
 - b. Select the Space that you want to work with.

For more information about enabling Spaces, see [Using syndication in API Connect](#).

3. In the navigation pane of the API Manager UI, click the Consumers tab.
4. Click the options icon  alongside the consumer organization you want to work with, then click Delete.
5. Click Confirm to delete the consumer organization.

Note: If the consumer organization is the only one specified in the custom visibility settings for a published Product, the deletion operation will fail. For more information, see [Changing the availability of a Product](#).

Working with the applications in a consumer organization

You can work with the developer applications that have been registered in a consumer organization.

Procedure

To work with applications, complete the following steps:

1. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with.
 2. Optional: If Spaces are enabled in the Catalog, select the Space that you want to work with by completing the following steps:
 - a. Click the Spaces tab.
 - b. Select the Space that you want to work with.
- For more information about enabling Spaces, see [Using syndication in API Connect](#).
3. In the navigation pane of the API Manager UI, click the Consumers tab.
 4. Click the options icon  for the consumer organization that you want to work with, then click View Applications.
A window opens listing all the developer applications that have been registered in the consumer organization
 5. To view and edit the details of an application, click the title of the application.
 6. Further options are available by clicking the options icon  alongside the application you want to work with. For details, see [Working with developer applications](#).

Working with the subscriptions in a consumer organization

You can work with the Plan subscriptions that have been created by the developer applications registered in a consumer organization.

Procedure

To work with Plan subscriptions, complete the following steps:

1. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with.
 2. Optional: If Spaces are enabled in the Catalog, select the Space that you want to work with by completing the following steps:
 - a. Click the Spaces tab.
 - b. Select the Space that you want to work with.
- For more information about enabling Spaces, see [Using syndication in API Connect](#).
3. In the navigation pane of the API Manager UI, click the Consumers tab.
 4. Click the options icon  for the consumer organization that you want to work with, then click View Subscriptions.
A window opens listing all the Plan subscriptions that have been created by the developer applications registered in the consumer organization. If required, you can click the options icon  alongside a subscription to work with that subscription. For details of the available options, see [Working with application subscriptions](#).

Working with consumer organization groups

A *consumer organization group* is a collection of consumer organizations, and provides an efficient way of controlling who can see, and subscribe to, the APIs in your Products. By using a consumer organization group, you can define this access for all the developers in the organizations in that group in a single operation, rather than having to define access for the organizations separately.

About this task

A consumer organization group might represent particular business partners, internal organizations, or other groups of application developers.

When you create a Product, you can define which application developers can access the APIs in that Product. You can configure the following types of access:

- Visibility, which specifies the application developers who can see the APIs in the Developer Portal.
- Subscribability, which specifies the application developers who can create subscribe to use the APIs.

You configure this access by selecting the required consumer organizations, and Consumer organization groups. You can also change the visibility and subscribability settings for a Product after it has been published. For more information, see [Creating a draft Product](#) and [Changing the availability of a Product](#).

Procedure

To work with consumer organization groups, you first navigate to the Consumer organization groups page. You then create new groups, send an email to the owners of the consumer organizations in a group, and edit or delete existing groups.

- Navigating to the required consumer organization groups page.
 1. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with.
 2. If Spaces are enabled in the Catalog, select the Space that you want to work with by completing the following steps:
 - a. Click the Spaces tab.
 - b. Select the Space that you want to work with.
 3. Click the Consumers tab, then click Manage Groups.
- Creating a consumer organization group.
 1. Click Add.
 2. Enter a Title for the new group and, optionally, a Summary. A Name is entered automatically. The title is used for display.
 3. Use the Search orgs/groups field to search for, and select, the consumer organizations that you want to add to the group.

Note: To prevent excessive search results lists, only the first 10 matches are displayed when you begin typing in the field; lengthen your search string to shorten the list for locating the required consumer organization.
 4. Click Save to create the group.
- Editing a consumer organization group.
 1. Click the options icon  for the consumer organization group that you want to work with, then click Edit.
 2. Make the required updates, then click Save.

Note: If you remove a consumer organization from a group, and that group is specified in the custom visibility settings for a Product, applications in that consumer organization can no longer subscribe to the Product. However, any existing subscriptions are not affected. For information on managing visibility and subscribability settings, see [Editing a draft Product](#).
- Deleting a consumer organization group.
 1. Click the options icon  for the consumer organization group that you want to work with, then click Delete.
 2. Click Confirm to delete the group.
- Sending an email to the owners of the consumer organizations in a consumer group
 1. Click the options icon  for the consumer organization group that you want to work with, then click Message owners.

The Send message window opens, and the email addresses of the consumer organization owners are displayed as the recipients.
 2. Enter the subject of the message in the Subject field.
 3. Enter the content of the message in the Message field, then click Send.

Sending messages to consumer organization owners

You can send email messages to the owners of consumer organizations. You can also style the email to match your business theme.

Before you begin

To complete this task, you must be defined as a member in a Catalog or Space (if Spaces are enabled), and you must be assigned a role that has the Consumer-Org_ Manage permission. For more information, see [Adding provider organization users and assigning roles](#) and [Managing Catalog membership](#).

Email messages contain a sender name and address that's based on a hierarchical search of the configured sender details in API Connect. Depending on the email being sent, the search can start at the Space level, and then go through the Catalog, Provider Organization, and the Cloud Manager levels. The sender details that are used will be the first set of configured details found during this hierarchical search. To view which search path API Connect takes when looking for the sender details for each notification template, see tbc.

Note: You can also send email messages by using the developer toolkit CLI, or by using the API Connect REST APIs. See [API development and management commands](#), or [API Connect REST APIs](#), for more information.

Procedure

To send a message, complete the following steps:

1. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with.
2. Optional: If Spaces are enabled in the Catalog, select the Space that you want to work with by completing the following steps:
 - a. Click the Spaces tab.
 - b. Select the Space that you want to work with.

For more information about enabling Spaces, see [Using syndication in API Connect](#).
3. In the navigation pane of the API Manager UI, click the Consumers tab.
4. You can either send a message to the owner of a specific consumer organization, or to the owners of multiple selected consumer organizations.
 - To send a message to the owner of a specific consumer organization, click the options icon  alongside the consumer organization you want to work with, then click Message owner. The Send Message window opens, and the email address of the consumer organization owner is displayed as the recipient.
 - To send a message to the owners of multiple selected consumer organizations, complete the following steps:
 - Click the options icon  alongside the Add button, then click Message owners.
 - Select the required consumer organizations, then click Next. The Send Message window opens, and the email addresses of the selected consumer organization owners are displayed as the recipients.
5. Enter the subject of the message in the Subject field.

6. Select the Content type that you want to use for the entering the content of the message, from HTML, PlainText, or Both. The default content type is PlainText. An edit window for the selected content type is displayed, or both edit windows are displayed if Both is selected. For HTML content, only the tags and their attributes that are shown in the following table are allowed.

Table 1. List of allowed HTML tags and their attributes

HTML tag	Attribute
<a>	"class", "href", "hreflang", "style"
	"class", "style"
	"class", "style"
<cite>	"class", "style"
<blockquote>	"class", "cite", "style"
<code>	"class", "style"
	"class", "type", "style"
	"class", "start", "type", "style"
	"class", "style"
<dl>	"class", "style"
<dt>	"class", "style"
<dd>	"class", "style"
<h1>	"class", "id", "style"
<h2>	"class", "id", "style"
<h3>	"class", "id", "style"
<h4>	"class", "id", "style"
<h5>	"class", "id", "style"
<h6>	"class", "id", "style"
<p>	"class", "style"
<div>	"class", "style"
 	"class", "style"
	"class", "style"
	"class", "src", "alt", "data-entity-type", "data-entity-uuid", "data-align", "data-caption", "width", "height", "style"
<table>	"class", "id", "style"
<tr>	"class", "id", "style"
<td>	"class", "id", "style"

If an HTML tag that is not allowed is used in a notification, the tag and its contents are displayed in the email as plain text.

Images can be used by adding a `<img`

`src="https://path/to/image.png"/>` tag in the template. The `src` attribute for the image must be a fully qualified web URL, and must be externally accessible so that the email recipients can access the image. It's not possible to reference local images, they must be fully qualified URLs. It's also not possible to embed or attach images or other files in the emails.

7. Enter the content of the message.
8. Click Send.

Working with developer applications

You can work with the applications that have been registered in the Developer Portal associated with a Catalog.

Procedure

To work with developer applications, complete the following steps.

- In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with.
- Optional: If Spaces are enabled in the Catalog, select the Space that you want to work with by completing the following steps:
 - Click the Spaces tab.
 - Select the Space that you want to work with.

For more information about enabling Spaces, see [Using syndication in API Connect](#).
- Click the Applications tab.
- All applications that have been registered in the Developer Portal associated with this Catalog are listed.
- To view and edit the details of an application, click the title of the application.
- Further options are available by clicking the options icon  alongside the application you want to work with, as follows:
 - Client ID: lists the Client IDs for the application. You can add new client ID/client secret credentials; you can copy the client secret only at creation time. An option is provided for deleting any of the credentials from the application.
 - Create Subscription: subscribe the application to a Plan in a Product; select the required Plan and Product, then click Create Subscription.
 - View Subscriptions: a window opens listing summary details of all the Plan subscriptions for the application. If required, you can click the options icon  alongside a subscription to work with that subscriptions. For details of the available options, see [Working with application subscriptions](#).
 - View Consumer Organization: a window opens listing the consumer organization that the application belongs to. If required, you can click the options icon  to work with the consumer organization. For details of the available options, see [Working with consumer organizations](#).

Working with application subscriptions

You can work with the subscriptions to the Plans in all the Products in a specific Catalog. Plan subscriptions are created by application developers in the Developer Portal.

Procedure

To work with application subscriptions, complete the following steps:

1. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with. The Products page of the Catalog opens, and all of the Products available in that Catalog are displayed.
2. Optional: If Spaces are enabled in the Catalog, select the Space that you want to work with by completing the following steps:
 - a. Click the Spaces tab.
 - b. Select the Space that you want to work with.For more information about enabling Spaces, see [Using syndication in API Connect](#).
3. Click the Subscriptions tab. A window opens listing all subscriptions to the Plans in all the Products in the Catalog.
4. Alongside the subscription that you want to work with, click the options icon . You can then select from the following options:
 - View Consumer Organization: a window opens listing the consumer organization that the subscribing application belongs to. If required, you can click the options icon  to work with the consumer organization. For details of the available options, see [Working with consumer organizations](#).
 - View Application: a window opens listing the subscribing application. If required, you can click the options icon  to work with the application. For details of the available options, see [Working with developer applications](#).
 - View Plan: a window opens listing the Plan that the application is subscribed to. If required, you can click the options icon  to work with the Plan. For details of the available options, see [Working with Plans](#).
 - View Product: a window opens listing the Product that contains the Plan that the application is subscribed to. If required, you can click the options icon  to work with the Product. For details of the available options, see [Managing your Products](#).

Security and authentication

In API Manager, you can use TLS profiles to secure the transmission of data between the management server and other API Connect subsystems and external services, and also configure user registries to securely authenticate your Catalogs and APIs.

For details of authentication in IBM API Connect, see the following subtopics:

- [Creating a TLS client profile](#)
In the IBM API Connect API Manager interface, TLS profiles are used to secure transmission of data between the management server and other API Connect subsystems and external services. TLS and SSL certificates guarantee that information you submit will not be stolen or tampered with. In this topic, you learn how to create a TLS profile in API Manager.
- [Authenticating by using your enterprise user registry](#)
IBM API Connect supports a variety of user registry types for authenticating users and securing APIs.
- [Configuring a native OAuth provider](#)
Native OAuth providers are configured and managed by you within your cloud.
- [Configuring a third-party OAuth provider](#)
Enter the secure endpoints to provide OAuth authentication from a third party.
- [OAuth concepts for API Connect](#)
OAuth is a token-based authorization protocol that allows third-party websites or applications to access user data without requiring the user to share personal information.

Creating a TLS client profile

In the IBM® API Connect API Manager interface, TLS profiles are used to secure transmission of data between the management server and other API Connect subsystems and external services. TLS and SSL certificates guarantee that information you submit will not be stolen or tampered with. In this topic, you learn how to create a TLS profile in API Manager.

Before you begin

One of the following roles is required to configure TLS Profiles:

- Organization Administrator
- Owner
- Custom role with the `Settings: Manage permissions`

About this task

API Connect supports the use of TLS and SSL certificates, but does not itself produce strong encryption keys or manage your encryption keys. Encryption keys should be created and managed according to your own procedures. For more information, see [Viewing certificate details and adding certificates to a keystore or truststore](#) and [Generating a PKCS#12 file for Certificate Authority](#).

Note: If you update a TLS profile that is associated with a Gateway service, the updates are not automatically propagated to Gateway servers. For instructions on configuring the toolkit command-line tool to use TLS certificates when connecting to API Manager, see [Configuring the command-line tool to use TLS certificates](#).

Procedure

To create a TLS profile, complete the following steps:

1. In the API Manager, click  Resources.
2. Select TLS.
3. Click Create in the TLS Client Profile table.
4. Enter the fields to configure the TLS Client Profile:

Field	Description
Title (required)	Enter a Title for the profile. The title is displayed on the screen.
Name (required)	The Name is auto-generated. The value in the Name field is a single string that can be used in developer toolkit CLI commands. To view the CLI commands to manage a TLS Client Profile, see apic tls-client-profiles . Important: The name of the TLS Client Profile as saved on the DataPower® Gateway, depending on the gateway type, is as follows: <ul style="list-style-type: none"> DataPower API Gateway: <code>provider-org-name_catalog-name_tlsp-tls-profile-nameV1.0.0</code> DataPower Gateway (v5 compatible): <code>provider-org-name-tls-profile-nameV1.0.0</code> where <ul style="list-style-type: none"> <code>tls-profile-name</code> is the value of the auto-generated Name field for the TLS client profile in API Connect. <code>provider-org-name</code> is the name of the provider organization containing the TLS client profile. <code>catalog-name</code> is the name of the Catalog, in that provider organization, containing the TLS client profile.
Version (required)	Assign a version number for the profile. Using version numbers allows you to create multiple server profiles with the same name and different configurations, for example, <i>MyProfile 1.0</i> and <i>MyProfile 1.1</i> .
Summary (optional)	Enter a description of the profile.
Protocols (required)	Select one or more supported TLS protocol versions. The default is 1.2.
Server Connection (optional)	Specify whether to support weak or insecure credentials. <ul style="list-style-type: none"> Allow insecure server connections - Insecure server connections may result from self-signed certificates, expired or corrupted certificates, or certificates from an unknown or untrusted source. Check this box to allow the connection to proceed with an insecure connection. The default is to not allow insecure server connections. Support Server Name Indication (SNI) - Check this box to enable SNI. SNI allows support for multiple certificates presented on the same IP address using different host names. The client profile sends the name of a virtual domain as part of the TLS negotiation. The default is to enable SNI.
Keystore (optional)	A Keystore is a repository containing public and private key pairs. Select the keystore where you will store the certificates for the profile. Default keystores are provided, and you can also create your own.
Truststore (optional)	A Truststore is a repository containing verified public keys, which are usually obtained from a third-party certificate authority. Truststores provide list of certificates to verify a peer's certificate. If used in a TLSServerProfile, a truststore is used when mutual authentication is enabled. Select a truststore for the profile. Default truststores are provided, and you can also create your own.
Ciphers (required)	Cipher suites are encryption/decryption algorithms used to secure HTTPs communication within the API Connect ecosystem. Select the ciphers that the profile supports. Note: The TLS 1.3 ciphers are clearly indicated. If you select TLS version 1.3 as one of the protocols for the profile but do not select any TLS 1.3 ciphers, all the TLS 1.3 ciphers are added to the list of ciphers supported by the profile. If you do not select TLS version 1.3 but select one or more TLS 1.3 ciphers, those ciphers are not added to the list of ciphers supported by the profile.

5. Click Save.

- [Creating a Keystore](#)
Keystores contain matched pairs of public certificates and private keys used to confirm identity and encrypt/decrypt data transmission over HTTPS.
- [Creating a Truststore](#)
Truststores are repositories containing trusted certificates with verified public keys. The certificates in the truststore are usually obtained from a third-party certificate authority (CA).
- [Generating a PKCS#12 file for Certificate Authority](#)
PKCS#12 (P12) files define an archive file format for storing cryptographic objects as a single file. API Connect supports the P12 file format for uploading a keystore and truststore. The keystore should contain both a private and public key along with intermediate CA certificates.
- [Generating a self-signed certificate using OpenSSL](#)
OpenSSL is an open source implementation of the SSL and TLS protocols. It provides the transport layer security over the normal communications layer, allowing it to be intertwined with many network applications and services.
- [Viewing certificate details and adding certificates to a keystore or truststore](#)
You can view details for the certificates in an existing keystore or truststore and add additional certificates. You might need add certificates when a certificate or PKCS #12 (P12) file expires.
- [Defining elliptic curve cryptographic schemes for a TLS client profile](#)
You define the elliptic curve cryptographic schemes for a TLS client profile by using the developer toolkit CLI.

Related tasks

- [Working with user registries](#)

Creating a Keystore

Keystores contain matched pairs of public certificates and private keys used to confirm identity and encrypt/decrypt data transmission over HTTPS.

Before you begin

API Manager supports and uses TLS certificates, but does not produce strong encryption keys or manage your encryption keys. Encryption keys are generated and managed according to your own procedures. For more information, see [Generating a PKCS#12 file for Certificate Authority](#) and [Generating a self-signed certificate using OpenSSL](#).

One of the following roles is required to configure Keystores:

- Organization Administrator
- Owner
- Custom role with the `Settings: Manage permissions`

About this task

API Connect includes pre-configured Keystores which may be used for testing purposes. For production environments, we suggest creating a new, secure Keystore.

Procedure

Perform the following steps to create a TLS Client profile:

1. In the API Manager, click  Resources.
2. Select TLS.
3. Click Create in the Keystore table.

Field	Description
Title (required)	Enter a Title for the Keystore. The title is displayed on the screen.
Name (required)	The Name is auto-generated. The value in the Name field is a single string that can be used in developer toolkit CLI commands. To view the CLI commands to manage keystores, see apic keystores .
Summary (optional)	Enter a brief description.
Private Key & Public Key: Step 1: Upload private key	Upload the file containing the private key certificate. If necessary, you can click Browse to locate the file. If the file contains both the private and public keys, upload it in Step 1. Private and public keys are always uploaded in pairs, either in a single file or separate files.
Private key password (optional)	Enter the password for the private key if it has a password.
Private Key & Public Key: Step 2: Upload public key	If the public key is contained in a separate file, upload it in Step 2. Private and Public keys are always uploaded in pairs, either in a single file or separate files.

4. Click Save.

Note: After they have been uploaded, private keys cannot be downloaded from API Connect.

Related tasks

- [Creating a TLS client profile](#)
- [Creating a Truststore](#)
- [Generating a PKCS#12 file for Certificate Authority](#)

Creating a Truststore

Truststores are repositories containing trusted certificates with verified public keys. The certificates in the truststore are usually obtained from a third-party certificate authority (CA).

Before you begin

One of the following roles is required to configure truststores:

- Organization Administrator
- Owner
- Custom role with the `Settings: Manage permissions`

About this task

API Manager supports and uses TLS certificates, but does not produce strong encryption keys or manage your encryption keys. Encryption keys are generated and managed according to your own procedures. For more information, see [Generating a PKCS#12 file for Certificate Authority](#) and [Generating a self-signed certificate using OpenSSL](#).

API Connect includes pre-configured Truststores which may be used for testing purposes. For production environments, we suggest creating a new, secure Truststore.

Procedure

1. In the API Manager, click  Resources.
2. Select TLS.
3. Click Create in the Truststore table.

Field	Description
Title (required)	Enter a Title for the Truststore. The title is displayed on the screen.
Name (required)	The Name is auto-generated. The value in the Name field is a single string that can be used in developer toolkit CLI commands. To view the CLI commands to manage truststores, see apic truststores .

Field	
Summary (optional)	Enter a brief description.
Public Keys	Upload the file containing the public key certificate. If necessary you can click Browse to locate the file.

4. Click Save.

- [Creating a Keystore](#)

Generating a PKCS#12 file for Certificate Authority

PKCS#12 (P12) files define an archive file format for storing cryptographic objects as a single file. API Connect supports the P12 file format for uploading a keystore and truststore. The keystore should contain both a private and public key along with intermediate CA certificates.

Before you begin

One of the following roles is required to add a key to a keystore or truststore:

- Organization Administrator
- Owner
- Custom role with the `Settings: Manage permissions`

Before you can generate a P12 file, you must have a private key (for example: `key.pem`), a signed certificate by a Certificate Authority (for example `certificate.pem`) and one or more certificates from the CA authority (known as *intermediate CA certificates*).

Note: If your certificate file contains more than one certificate, you must manually split the file and create a single file for each entry. Each entry must be bound by the following markers:

```
-----BEGIN CERTIFICATE-----
-----END CERTIFICATE-----
```

Procedure

1. If you have intermediate certificates from your CA, concatenate them into a single `.pem` file to build your `caChain`. Be sure to enter a new line following each certificate's data.

```
cat ca1.pem ca2.pem ca3.pem > caChain.pem
cat caChain.pem
-----BEGIN CERTIFICATE-----
MIIEPjCCA46gAwIBAgIQEod26KZabjd+BQMG1Dwl6jANBgkqhkiG9w0BAQUFADCBC
...
lQX7CkTJn61AJUsyEa8H/gjVQnHp4VOLFR/dKgeVcCRvZF7Tt5AuiyHY
-----END CERTIFICATE-----
-----BEGIN CERTIFICATE-----
MIIEPDCCAySgAwIBAgIQSEus8arH1xND0aJ0NUmXJTANBgkqhkiG9w0BAQUFADBVB
...
-----END CERTIFICATE-----
-----BEGIN CERTIFICATE-----
MIIEENjCCAx6gAwIBAgIBATANBgkqhkiG9w0BAQUFADBvMQswCQYDVQQGEWJTRTEU
...
-----END CERTIFICATE-----
```

2. Create the P12 file including the private key, the signed certificate and the CA file you created in step 1, if applicable. Omit the `-CAfile` option if you don't have CA certificates to include.

The following command uses OpenSSL, an open source implementation of the SSL and TLS protocols.

```
openssl pkcs12 -inkey key.pem -in certificate.pem -export -out certificate.p12 -CAfile caChain.pem -chain
```

Once the certificate file is created, it can be uploaded to a keystore.

3. Once the certificate file is created, it can be uploaded to a Truststore. In the API Manager, click .
4. Select TLS.
5. Click Create in the Keystore table.
6. Create a Keystore and upload the certificate file following the instructions at [Creating a Keystore](#).

Note:

- API Connect supports only the P12 (PKCS12) format file for the present certificate.
- Your P12 file must contain the private key, the public certificate from the Certificate Authority, and all intermediate certificates used for signing.
- Your P12 file can contain a maximum of 10 intermediate certificates.

7. Click Save.

Results

Your P12 file is generated and ready to upload.

What to do next

Upload your P12 file to IBM® API Connect. For more information, see [Creating a TLS client profile](#).

Generating a self-signed certificate using OpenSSL

OpenSSL is an open source implementation of the SSL and TLS protocols. It provides the transport layer security over the normal communications layer, allowing it to be intertwined with many network applications and services.

Before you begin

One of the following roles is required to complete this task:

- Organization Administrator
- Owner
- Custom role with the `Settings: Manage permissions`

About this task

This topic tells you how to generate a self-signed SSL certificate request using the OpenSSL toolkit to enable HTTPS connections.

Procedure

To generate a self-signed SSL certificate using the OpenSSL, complete the following steps:

1. Write down the Common Name (CN) for your SSL Certificate. The CN is the fully qualified name for the system that uses the certificate. For static DNS, use the hostname or IP address set in your Gateway Cluster (for example, `192.16.183.131` or `dp1.acme.com`).
2. Run the following OpenSSL command to generate your private key and public certificate. Answer the questions and enter the Common Name when prompted.

```
openssl req -newkey rsa:2048 -nodes -keyout key.pem -x509 -days 365 -out certificate.pem
```

3. Review the created certificate:

```
openssl x509 -text -noout -in certificate.pem
```

4. Combine your key and certificate in a PKCS#12 (P12) bundle:

```
openssl pkcs12 -inkey key.pem -in certificate.pem -export -out certificate.p12
```

5. Validate your P2 file.

```
openssl pkcs12 -in certificate.p12 -noout -info
```

Once the certificate file is created, it can be uploaded to a keystore.

6. In the API Manager, click  Resources.
7. Select TLS.
8. Click Create in the Keystore table.
9. Create a Keystore and upload the certificate file following the instructions at [Creating a Keystore](#).

Note:

- API Connect supports only the P12 (PKCS12) format file for the present certificate.
- Your P12 file must contain the private key, the public certificate from the Certificate Authority, and all intermediate certificates used for signing.
- Your P12 file can contain a maximum of 10 intermediate certificates.

10. Click Save.

Viewing certificate details and adding certificates to a keystore or truststore

You can view details for the certificates in an existing keystore or truststore and add additional certificates. You might need add certificates when a certificate or PKCS #12 (P12) file expires.

Before you begin

One of the following roles is required to edit Keystores and Truststores:

- Organization Administrator
- Owner
- Custom role with the `Settings: Manage permissions`

About this task

API Connect includes pre-configured Keystores and Truststores which can be used for testing purposes. For production environments, we suggest creating a new, secure Keystore or Truststore. From an existing Keystore or Truststore, you can edit the title, view the details of the certificates, and add new certificates.

Procedure

To work with existing Keystores and Truststores:

1. In the API Manager, click  Resources.
2. Select TLS.
3. Click the name of the keystore or truststore.
4. Edit the name and summary if needed.
5. The Subject, Finger Print, and Expiration date is shown for each certificate in the keystore or truststore. Click > to view the certificate details.
6. Add additional private and/or public keys if needed.
7. Click Save.

Note: After they have been uploaded, private keys cannot be downloaded from API Connect.

Defining elliptic curve cryptographic schemes for a TLS client profile

You define the elliptic curve cryptographic schemes for a TLS client profile by using the developer toolkit CLI.

About this task

To define elliptic curve cryptographic schemes for a TLS client profile, you include `elliptic_curve_auto_negotiation` and `elliptic_curve` properties in a YAML file definition for the TLS client profile. The `elliptic_curve` property lists the required elliptic curve cryptographic schemes. For example:

```
elliptic_curve_auto_negotiation: false
elliptic_curve:
  - secp521r1
  - secp384r1
  - prime256v1
```

You then use the developer toolkit CLI to create the TLS client profile in API Connect.

When `elliptic_curve_auto_negotiation` is set to `true`, the system negotiates the Elliptic-curve Diffie-Hellman (ECDH) key agreement automatically with its peer, and any `elliptic_curve` property settings are ignored.

The following example shows a complete YAML file for a TLS client profile:

```
type: tls_client_profile
name: my-tls-client-profile
version: 1.0.0
title: My TLS client profile
protocols:
  - tls_v1.2
ciphers:
  - ECDHE_ECDSA_WITH_AES_256_GCM_SHA384
elliptic_curve_auto_negotiation: false
elliptic_curve:
  - sect163k1
insecure_server_connections: false
server_name_indication: true
```

Note:

- The `elliptic_curve_auto_negotiation` option is not supported by any of the API Connect gateway types. If the TLS client profile is targeted for an API Connect gateway; this setting is ignored by the gateway.
- The elliptic curve cryptographic schemes shown in each row of the following table are equivalent. However, API Connect recognizes only one or the other depending on how the TLS profile is used, as indicated in the table.

Table 1.

API enforcement on the gateway	API Connect server access security
secp192r1	prime192v1
secp256r1	prime256v1

Therefore, if you want to use either of these schemes and are unsure whether you are targeting the TLS client profile to the API Connect gateway for API enforcement, whether you are using it to secure user access to the API Connect servers, or whether it will be used for both purposes, specify both equivalent schemes; API Connect will simply ignore the non-relevant scheme. For example:

```
elliptic_curve:
  .
  .
  .
  - secp256r1
  - prime256v1
  .
  .
```

Procedure

To create a TLS client profile with elliptic curve cryptographic schemes defined, complete the following steps:

1. Create a YAML file definition for your TLS client profile, with the required `elliptic_curve` property.
2. Log in to the management server from the developer toolkit CLI. Log in either as a member of the cloud administration organization or as a member of a provider organization, depending on where you want to create the TLS client profile. For details, see [Logging in to a management server](#).
3. Create the TLS client profile by using the following command:

```
apic tls-client-profiles:create --server mgmt_endpoint_url --org organization_name tls_client_profile_yaml_file
```

where:

- `mgmt_endpoint_url` is the platform API endpoint URL, and is the same as that which was used when you logged in at step 2.
- `organization_name` is either `admin`, for the cloud administration organization, or the name of your provider organization, and is the same as that which was used when you logged in at step 2.
- `tls_client_profile_yaml_file` is the name of the YAML file that contains the definition for your TLS client profile.

Note: When you install IBM® API Connect, the API Connect gateway has a pre-supplied default TLS client profile that is used for API enforcement if you do not configure a TLS client profile; you cannot configure this default TLS client profile on the gateway.

For reference details of all the `apic tls-client-profiles` commands, see [apic tls-client-profiles](#).

You can also complete the operations described in this topic by using the API Connect REST APIs; see the [API Connect REST API documentation](#).

Authenticating by using your enterprise user registry

IBM® API Connect supports a variety of user registry types for authenticating users and securing APIs.

You can use your enterprise user registry for authentication in API Connect if it is of one of the following types:

LDAP directory

If your user registry uses Lightweight Directory Access Protocol (LDAP), you can use it in API Connect for both user authentication and API security.

Authentication URL User Registry

You can configure a non-LDAP user registry by using an authentication URL user registry. An authentication URL user registry enables integration with third-party authentication providers. You can use an authentication URL user registry in API Connect for both user authentication and API security.

Local User Registry

You can authenticate users with a local user registry. A local user registry is an internal registry stored within API Connect.

OpenID Connect

You can authenticate users through an identity provider that supports the OpenID Connect (OIDC) authentication protocol.

- [Working with user registries](#)
To secure the APIs that are published to your IBM API Connect Catalogs, you authenticate with user registries.
- [Modifying the configuration details for a user registry](#)
You modify the configuration details for a user registry by using the User Registries page in the API Manager user interface of IBM API Connect.

Working with user registries

To secure the APIs that are published to your IBM® API Connect Catalogs, you authenticate with user registries.

About this task

Create user registry resources to secure your APIs, and authenticate with users.

Procedure

To configure a user registry, complete the following steps:

1. In the API Manager user interface, select  Resources.
2. On the Resources page, select User Registries > Create.
3. Select the tile for the user registry type you want, and continue to the instructions for configuring user authentication for your selection.
Important: Do not share user registries between the API Manager and the Developer Portal, or between Developer Portal sites when self-service onboarding is enabled or account deletions in any of the sites are expected. You should create separate user registries for them, even if the separate registries point to the same backend authentication provider (for example, an LDAP server). This separation enables the Developer Portal to maintain unique email addresses across the Catalog, without API Manager needing the same requirement. It also avoids problems with users deleting their accounts from the Developer Portal that then affects their API Manager access.

Authentication URL User Registry

For more information, see [Creating an Authentication URL user registry](#).

Custom user registry

For more information, see [Creating an organization-specific custom user registry](#).

- LDAP User Registry
For more information, see [Creating an LDAP user registry in API Manager](#).
- Local User Registry
For more information, see [Creating a Local User Registry](#).
- OIDC User Registry
For more information, see [Creating an OIDC user registry in API Manager](#).

Results

The user registry information is added to API Manager.

What to do next

You can now use API Manager to chart and manage your Catalogs.

Create an organization-specific OIDC user registry when multi-factor authentication (MFA) is required.

Creating an Authentication URL user registry

An Authentication URL user registry provides a simple mechanism for authenticating users by referencing a custom identity provider.

About this task

This topic describes how to create a new Authentication URL user registry as a Resource in your organization. After the user registry is created, the user registry must be added to the Sandbox catalog.

One of the following roles is required to configure user registries:

- Administrator
- Organization Owner
- Custom role with the `Settings: Manage permissions`

Note:

API Connect issues an HTTP `GET` call to the Authentication URL endpoint, sending the user's credential. The following example shows a call made to an Authentication URL identity provider with an endpoint defined as `https://myauthurl.example.com/user/authenticate`:

```
GET /user/authenticate HTTP/1.1
Host: myauthurl.example.com
Authorization: Basic c3Bvb246Zm9yaw=
```

If the Authentication URL endpoint returns an HTTP status code of `200`, the user authenticates successfully. An HTTP status code other than `200` indicates a failed login attempt. API Connect forwards any HTTP Header starting with `X-` (with the exception of `X-Client-Certificate`), and `Cookie` to the Authentication URL identity provider, to aid the authentication decision; for example:

```
GET /user/authenticate HTTP/1.1
Host: myauthurl.example.com
Authorization: Basic c3Bvb246Zm9yaw=
X-Forwarded-For: 8.8.9.9
X-Custom-Header-From-Customer: special
Cookie: MyCookie=VGhpc01zV21ja2VkQW1hemluZw==
```

When a user is presented with the form for completing their API Connect user registration, which fields are prepopulated depends on which fields are returned in the response from the Authentication URL identity provider. If any of the following fields are returned, they will be prepopulated in the registration form:

- `username`
- `email`
- `first_name`
- `last_name`

If the `username` field is not returned, the registration form displays the user name that was provided by the user. The pre-population capability requires that the response from the Authentication URL identity provider satisfies the following conditions:

- The `Content-Type` must be `application/json`.
- The response body format must be JSON.

A sample response is as follows:

```
HTTP/1.1 200 OK
Content-Type: application/json;charset=UTF-8
Cache-Control: no-store
Pragma: no-cache
```

```
{
  "username": "myuser",
  "email": "myuser@example.com",
  "first_name": "My",
  "last_name": "User"
}
```

Procedure

1. In the API Manager, click  Resources.
2. Select User Registries to see the list of current user registries in your organization.
3. Click Create in the User Registries section.

Important: Do not share user registries between the API Manager and the Developer Portal, or between Developer Portal sites when self-service onboarding is enabled or account deletions in any of the sites are expected. You should create separate user registries for them, even if the separate registries point to the same backend authentication provider (for example, an LDAP server). This separation enables the Developer Portal to maintain unique email addresses across the Catalog, without API Manager needing the same requirement. It also avoids problems with users deleting their accounts from the Developer Portal that then affects their API Manager access.

4. Select Authentication URL User Registry and enter the following parameters:

Field	Description
Title (required)	Enter a descriptive name to use on the screen.
Name (required)	The name that is used in CLI commands. The name is auto-generated. For details of the CLI commands for managing user registries, see apic user-registries .
Summary (optional)	Enter a brief description.
Display Name (required)	The name that is displayed for selection by the user when logging in to a user interface, or activating their API Manager account. For details of user interface log in, and account activation, see Accessing the Cloud Manager user interface , Accessing the API Manager user interface , and Activating your API Manager user account . Note: The Developer Portal uses the Title of the User Registries when rendering them at the login page, rather than the Display Name .
URL (required)	Enter the URL for the authentication service. When establishing authentication, API Connect makes a GET call to the URL. The call includes the user name and password it has collected from the user in its authorization header. Either 200 OK or 401 Unauthorized will be returned.
TLS Client Profile (optional)	Select a TLS Client Profile to allow secure authentication with a specific web server.
Case sensitive	To ensure proper handling of user name capitalization, you must ensure that your case-sensitivity setting here matches the setting on your backend Authentication URL server: <ul style="list-style-type: none"> • Only select Case sensitive if your backend server supports case-sensitivity. • Do not select Case sensitive if your backend server does not support case-sensitivity. Note: The Developer Portal does not support case sensitive usernames. Note: After at least one user has been onboarded into the registry, you cannot change this setting.
Email required	Select this checkbox if an email address is required as part of the user onboarding process. If selected, the source identity provider must supply the email address as part of the authentication process during onboarding. Note: An email address is not required by default for onboarding to the Cloud Manager or the API Manager, but it is required for onboarding to the Developer Portal.
Unique email address	Select this checkbox if email addresses must be unique within the user registry. Note: Every account in the Developer Portal, including across different user registries for the same site, must have a unique email address, including the site Admin account.

5. Click Save.
6. Add the user registry to the Sandbox catalog. See [Creating and configuring Catalogs](#).

Results

The user registry can be used for Basic Authentication in the Security Definition for an API. For more information, see [Creating a basic authentication security definition](#).

Creating an organization-specific custom user registry

You can configure an organization-specific custom user registry to provide user authentication for the Developer Portal.

Before you begin

Custom user registries can be used for authenticating users to the Developer Portal, but cannot be used to secure APIs.

To configure a custom user registry as a resource in API Manager, the external user directory must be created and available to use with your API Connect ecosystem.

Also, a custom user registry definition for your external user registry must already have been created on the Cloud Manager, as you will need the information from this definition to set up the custom user registry. See [Configuring a shared custom user registry](#) for information.

One of the following roles is required to configure a custom user registry:

- Administrator
- Owner
- Topology Administrator
- Custom role with the Settings: Manage permissions

About this task

You can create a custom user registry that is specific to a provider organization, or one that can be shared and available to all of the provider organizations in your API Connect environment. An organization-specific user registry can be used for authenticating Developer Portal users in a specific provider organization. While a shared user registry can be used for authenticating Cloud Manager, API Manager, and Developer Portal users.

This topic describes how to configure an organization-specific custom user registry. If you want to create a shared registry, see [Configuring a shared custom user registry](#) for more information.

Note:

- You can also create and manage custom user registries by using the API Connect REST APIs; see the [API Connect REST API documentation](#).

You can use the following instructions to create a writable or a read-only custom user registry.

API Connect provides two methods for creating a custom user registry in the API Manager, as described in the following sections:

- [Creating a custom user registry by using the API Manager UI](#)
- [Creating a custom user registry by using the developer toolkit CLI](#)

Important: Do not share user registries between the API Manager and the Developer Portal, or between Developer Portal sites when self-service onboarding is enabled or account deletions in any of the sites are expected. You should create separate user registries for them, even if the separate registries point to the same backend authentication provider (for example, an LDAP server). This separation enables the Developer Portal to maintain unique email addresses across the Catalog, without API Manager needing the same requirement. It also avoids problems with users deleting their accounts from the Developer Portal that then affects their API Manager access.

Creating a custom user registry by using the API Manager UI

You configure a custom user registry by creating a new custom user registry resource, which references the custom user registry type that is defined in the Cloud Manager. To make the custom user registry available to the Developer Portal for user authentication, you must enable the registry in the associated Catalog. When the custom user registry is used for authentication, API Connect makes a REST call to the endpoint of your external registry, as defined in the custom user registry type.

Creating a custom user registry resource

Use the following instructions to create a new custom user registry resource in the API Manager UI.

- Click Create in the User Registries section of Resources.
- Click the Custom user registry tile.
- Enter the following information:

Property	Description
Custom type	The name of the custom user registry type. For example, <i>my-custom-user-registry-type</i> . Use the drop-down arrow to select different custom user registry types. The custom user registry type is defined in the Cloud Manager.
Title	A descriptive name to display in the UI.
Name	The name of the custom user registry. This name is auto-generated, and is used in CLI commands.
Summary	A brief description of the custom user registry.
Endpoint	Optional endpoint information.
Case sensitive	To ensure proper handling of user name capitalization, you must ensure that your case-sensitivity setting here matches the setting on your backend server: <ul style="list-style-type: none">Only select Case sensitive if your backend server supports case-sensitivity.Do not select Case sensitive if your backend server does not support case-sensitivity. Note: <ul style="list-style-type: none">The Developer Portal does not support case sensitive usernames.After at least one user has been onboarded into the registry, you cannot change this setting.
User registry managed	Determines whether API Connect manages your user registry. Valid values are: <ul style="list-style-type: none">true - select the checkboxfalse - clear the checkbox
User managed	Determines whether your user registry is writable or not. Select the checkbox to set to true for writable. Clear the checkbox for the non-writable option.
Email required	Select this checkbox if an email address is required as part of the user onboarding process. If selected, the source identity provider must supply the email address as part of the authentication process during onboarding. Note: An email address is not required by default for onboarding to the Cloud Manager or the API Manager, but it is required for onboarding to the Developer Portal.
Unique email address	Select this checkbox if email addresses must be unique within the user registry. Note: Every account in the Developer Portal, including across different user registries for the same site, must have a unique email address, including the site Admin account.

- Click Create. The new user registry is displayed in the User registries list.

Adding your custom user registry to the Developer Portal login

To make the custom user registry available for authenticating Developer Portal users, you must enable it in the Catalog that is associated with that Developer Portal. In the API Manager UI, click Manage followed by the relevant Catalog, and then click Catalog settings > Onboarding. In the Catalog User Registries section, click Edit, select the custom user registry, and click Save. For more information, see [Creating and configuring Catalogs](#).

Creating a custom user registry by using the developer toolkit CLI

You configure an organization-specific custom user registry by creating a new custom user registry resource that references the integration document that exists on the Cloud Manager. You use developer toolkit CLI commands to create the custom user registry, and to make the registry available to the Developer Portal, you must enable the registry in the associated Catalog. When the custom user registry is used for authentication, API Connect makes a REST call to the endpoint of your external registry, as defined in the integration document.

Logging in to the management server CLI

Before you can define the custom user registry configuration, you must log in to your management server from the developer toolkit CLI as a member of a provider organization. Use the following command:

```
apic login --server mgmt_endpoint_url --username user_id --password password --realm provider/identity_provider
```

You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

```
apic identity-providers:list --scope provider --server mgmt_endpoint_url --fields title,realm
```

For example,

```
apic identity-providers:list --scope provider --server myserver.com --fields title,realm
total_results: 2
results:
- title: API Manager Local User Registry
  realm: provider/default-idp-2
- title: Corporate LDAP user registry
  realm: provider/corporate-ldap
```

The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default API Manager Local User Registry for login as a member of a provider organization is `default-idp-2`.

For full details of the login command, see [Logging in to a management server](#).

For more information about how to use the CLI, see [Installing the toolkit](#), and [Overview of the command-line tool](#).

Defining your custom user registry

You define the configuration of your custom user registry in a `custom_config_file.yaml` file, as shown in the following example.

```
name: 'custom_registry_name'
title: 'display_title'
registry_type: 'custom_user_registry'
integration_url: 'custom_integration_url'
case_sensitive: true_or_false
user_managed: true_or_false
user_registry_managed: true_or_false
email_required: true_or_false
email_unique_if_exist: true_or_false
identity_providers:
- name: 'provider_name'
  title: 'provider_title'
configuration:
  custom_config1: 'value1'
  customize: true
```

The registry properties that are common to each authentication method are described in the following table:

Property	Description
<code>name</code>	The name of the custom user registry. This name is used in the CLI commands.
<code>title</code>	A descriptive name to display in a graphical user interface.
<code>registry_type</code>	The registry type that is configured in the <code>name</code> property in the integration document, for example <code>custom_user_registry</code> .
<code>integration_url</code>	The custom integration URL in your API Connect configuration. You can determine the custom integration URL by using the following CLI command: <pre>apic integrations:list --server <i>mgmt_endpoint_url</i> --subcollection <i>user-registry</i></pre>
<code>case_sensitive</code>	Determines whether your user registry is case-sensitive. Valid values are: <ul style="list-style-type: none"><code>true</code><code>false</code> To ensure proper handling of user name capitalization, you must ensure that your case-sensitivity setting here matches the setting on your backend LDAP server: <ul style="list-style-type: none">Only set <code>case_sensitive</code> to <code>true</code> if your backend LDAP server supports case-sensitivity.Set <code>case_sensitive</code> to <code>false</code> if your backend LDAP server does not support case-sensitivity. Note: After at least one user has been onboarded into the registry, you cannot change this setting.
<code>user_managed</code>	Determines whether your user registry is writable or not. Must be set to <code>true</code> for writable. Set to <code>false</code> if you don't want the registry to be writable.
<code>user_registry_managed</code>	Determines whether API Connect manages your user registry. Valid values are: <ul style="list-style-type: none"><code>true</code><code>false</code>
<code>email_required</code>	Determines whether an email address is required as part of the user onboarding process. Valid values are: <ul style="list-style-type: none"><code>true</code><code>false</code> If set to <code>true</code> , the source identity provider must supply the email address as part of the authentication process during onboarding. Note: An email address is not required by default for onboarding to the Cloud Manager or the API Manager, but it is required for onboarding to the Developer Portal.

Property	Description
<code>email_unique_if_exists</code>	<p>Determines whether email addresses must be unique within the user registry. Valid values are:</p> <ul style="list-style-type: none"> <code>true</code> <code>false</code> <p>Note: Every account in the Developer Portal, including across different user registries for the same site, must have a unique email address, including the site Admin account.</p>
<code>identity_providers</code>	<p>An array containing the details of your custom server, where:</p> <ul style="list-style-type: none"> <code>name</code> - is the name of the custom server and is the name that is used in CLI commands <code>title</code> - is the display name of the custom server
<code>configuration</code>	The user-defined configuration based on the <code>configuration_schema</code> that is defined in the integration document.

Save your `custom_config_file.yaml` so it can be accessed by the `user-registries:create` command in the following section.

Creating your custom user registry

To create your organization-specific custom user registry, run the following CLI command:

```
apic user-registries:create --server mgmt_endpoint_url --org organization_name custom_config_file.yaml
```

where:

- `mgmt_endpoint_url` is the platform API endpoint URL.
- `--org organization_name` means that the registry will be created in your provider organization.
- `custom_config_file` is the name of the YAML file that defines the configuration of your custom user registry.

On completion of the registry creation, the command displays the following summary details:

```
registry_name registry_url
```

The `registry_name` is derived from the `name` property in the custom user registry YAML file. The `registry_url` is the URL with which the custom registry resource can be accessed.

Your organization-specific user registry is now created; see the following section for instructions on how to make the registry available to users.

Configuring your custom user registry in a Catalog

To make your custom user registry available for authenticating Developer Portal users, you must enable it in the Catalog that is associated with that Developer Portal. Complete the following steps:

- Determine the URL of your custom user registry by using the following command (or you can copy and paste from the summary of the registry creation):

```
apic user-registries:list --server mgmt_endpoint_url --org organization_name
```

- Enter the following command (the terminating hyphen character means that the command takes input from the command line):

```
apic configured-catalog-user-registries:create --server mgmt_endpoint_url --org organization_name --catalog catalog_name -
```

where `catalog_name` is the value of the `name` property of the required Catalog. The command returns

```
Reading CONFIGURED_CATALOG_USER_REGISTRY_FILE arg from stdin
```

- Enter the following data, followed by a new line:

```
user_registry_url: custom_registry_url
```

where `custom_registry_url` is the URL of your custom user registry, obtained in step [1](#).

- Press **CTRL D** to terminate the input.

Creating an LDAP user registry in API Manager

You can use the API Manager UI to configure an organization-specific LDAP user registry to provide user authentication and onboarding for the Developer Portal. APIs can also be secured with an LDAP user registry.

Before you begin

To configure an LDAP user registry as a resource in API Manager, the LDAP directory must be created and populated for use with your API Connect ecosystem.

LDAP registries can be used to secure APIs, or for securing a Catalog to authenticate Developer Portal users.

Important: If you are using an LDAP registry to secure APIs, the STARTTLS protocol, which upgrades an insecure protocol to a secure one by applying TLS security, is not supported.

One of the following roles is required to configure an LDAP user registry:

- Organization Administrator
- Owner
- Topology Administrator
- Custom role with the `Settings: Manage permissions`

About this task

You can create an LDAP user registry that is specific to a provider organization, or one that can be shared and available to all of the provider organizations in your API Connect environment. An organization-specific LDAP user registry can be used for authenticating Developer Portal users in a specific provider organization. While a shared LDAP user registry can be used across the Cloud Manager, the API Manager, and the Developer Portal components in your environment.

This topic describes how to configure an organization-specific LDAP user registry. If you want to create a shared registry, see [Configuring an LDAP user registry in the Cloud Manager](#) for more information.

Note:

- You can also create and manage LDAP user registries by using the developer toolkit CLI. For more information, see [Using the CLI to create an organization-specific LDAP user registry](#).
- The API Connect REST APIs can also be used to create and manage LDAP user registries; see the [API Connect REST API documentation](#).
- You can map external LDAP groups to API Connect user roles to enable greater control of user access, but this configuration can be done only by using the developer toolkit CLI; see [Using the CLI to create an organization-specific LDAP user registry](#) for details.

You create an LDAP user registry by configuring a set of properties in the API Manager UI. If you want to enable writable LDAP, you must complete the Attribute Mapping section by selecting the User Managed checkbox, and providing the mapping of your source LDAP attribute names to the target API Connect values. You can also change a registry to be read-only again by clearing the User Managed checkbox. To make the registry available to the Developer Portal, you must define the registry for consumer onboarding in the associated Catalog. To secure APIs with an LDAP registry, you must configure security definitions.

For general information about authenticating with LDAP, see [LDAP authentication](#).

Procedure

Follow these steps to configure a new LDAP user registry as a Resource in the API Manager UI.

Note: If you are using an **Active Directory**, you must indicate this by using the property `"directory_type": "ad"` in the LDAP config.

1. In the API Manager, click  Resources.
2. Click Create in the User Registries section.

Important: Do not share user registries between the API Manager and the Developer Portal, or between Developer Portal sites when self-service onboarding is enabled or account deletions in any of the sites are expected. You should create separate user registries for them, even if the separate registries point to the same backend authentication provider (for example, an LDAP server). This separation enables the Developer Portal to maintain unique email addresses across the Catalog, without API Manager needing the same requirement. It also avoids problems with users deleting their accounts from the Developer Portal that then affects their API Manager access.

3. Select LDAP User Registry for the user registry type, and enter the following information:

Field	Description
Title	Enter a descriptive name to display on the screen.
Name	The name that is used in CLI commands. The name is auto-generated. For details of the CLI commands for managing user registries, see apic user-registries .
Display Name (required)	The name that is displayed for selection by the user when logging in to a user interface, or activating their API Manager account. For details of user interface log in, and account activation, see Accessing the Cloud Manager user interface , Accessing the API Manager user interface , and Activating your API Manager user account . Note: The Developer Portal uses the Title of the User Registries when rendering them at the login page, rather than the Display Name .
Summary (optional)	Enter a brief description.
Address	Enter the IP address or host name of the LDAP server.
Port	Enter the Port number that API Connect can use to communicate with the LDAP registry. For example, 389.
Select a TLS Client Profile (optional)	Select the TLS Client Profile that the LDAP server requires.
Select a protocol version	Select the version number for the LDAP protocol that you are using.
Remote directory is Microsoft Active Directory	Select this option if you use Active Directory.
Case sensitive	To ensure proper handling of user name capitalization, you must ensure that your case-sensitivity setting here matches the setting on your backend LDAP server: <ul style="list-style-type: none"> • Only select Case sensitive if your backend LDAP server supports case-sensitivity. • Do not select Case sensitive if your backend LDAP server does not support case-sensitivity. Note: The Developer Portal does not support case sensitive usernames. Note: After at least one user has been onboarded into the registry, you cannot change this setting.
Email required	Select this checkbox if an email address is required as part of the user onboarding process. If selected, the source identity provider must supply the email address as part of the authentication process during onboarding. Note: An email address is not required by default for onboarding to the Cloud Manager or the API Manager, but it is required for onboarding to the Developer Portal.
Unique email address	Select this checkbox if email addresses must be unique within the user registry. Note: Every account in the Developer Portal, including across different user registries for the same site, must have a unique email address, including the site Admin account.

4. Click Next and enter the authentication information, which will vary depending on the selected Authentication Method. The choices are:
 - **Compose DN** - Select this format if you can compose the user LDAP Distinguished Name (DN) from the user name. For example, `uid=<username>,ou=People,dc=company,dc=com` is a DN format that can be composed from the user name. If you are unsure whether Compose (DN) is the

correct option, contact your LDAP administrator. If you are using an LDAP registry to secure APIs, Compose DN is not supported with the DataPower API Gateway.

- Compose UPN - Select this format if your LDAP directory supports binding with User Principal Names such as `john@acme.com`. The Microsoft Active Directory is an example of an LDAP directory that supports Compose UPN authentication. If you are unsure whether your LDAP directory supports binding with UPNs, contact your LDAP administrator.

Note: The Admin Bind DN and Admin Bind Password are not used with this authentication method.

- Search DN - Select this format if you cannot compose the user LDAP Distinguished Name from the user name; for example, if the base DN of the users are different. This format might require an administrator DN and password to search for users in the LDAP directory. If your LDAP directory permits anonymous binds, you can omit the admin DN and password. If you are unsure if your LDAP directory permits anonymous binds, contact your LDAP administrator.

Optionally select a scope to specify which part of the directory information tree is examined:

- Whole subtree (default)
- Base object
- Single level

For all of the authentication methods:

If you are creating an LDAP registry to authenticate users of an API, you can specify an LDAP authorization group to restrict API access. To be able to call an API that is secured by the LDAP registry, a user must successfully authenticate with their LDAP user ID and password **and** they must be a member of the specified authorization group. The authorization group can be a Static Group or Dynamic Group. A static group is one in which the individual members of the group are explicitly listed. A dynamic group is one which is defined according to the set of attributes that the group members share in common.

5. For authentication method Compose DN, enter the following:

Field	Description
Bind Method	Anonymous or Authenticated. If specific permissions are not needed to search the registry, select Anonymous Bind. Or, if specific permissions are necessary, select Authenticated Bind.
Admin DN	For Authenticated Bind, enter the Distinguished Name of a user authorized to perform searches in the LDAP directory. For example <code>cn=admin,dc=company,dc=com</code> .
Admin Password	For Authenticated Bind, enter the user password for the Admin DN.
Prefix	Specify the prefix to the DN. For example <code>(uid=</code> .
Suffix	Specify the suffix to the DN. For example <code>)</code> .
Base DN (optional)	Enter a base DN in the Base DN field, or click Get Base DN to populate the field with a retrieved base DN.
Use group authentication (optional)	Static or Dynamic. For Static Group, enter the Group Based DN, Prefix, and Suffix. For Dynamic Group, enter the Filter condition for the group.

6. For authentication method Compose UPN, enter the following:

Field	Description
Bind Method	Anonymous or Authenticated. If specific permissions are not needed to search the registry, select Anonymous Bind. Or, if specific permissions are necessary, select Authenticated Bind.
Admin DN	For Authenticated Bind, enter the Distinguished Name of a user authorized to perform searches in the LDAP directory. For example <code>cn=admin,dc=company,dc=com</code> .
Admin Password	For Authenticated Bind, enter the user password for the Admin DN.
Suffix	Enter the domain part of the user principal name. For example, <code>@acme.com</code> .
Use group authentication (optional)	Enter the Filter condition for the group.

7. For authentication method Search DN, enter the following:

Field	Description
Bind Method	Anonymous or Authenticated. If specific permissions are not needed to search the registry, select Anonymous Bind. Or, if specific permissions are necessary, select Authenticated Bind.
Admin DN	For Authenticated Bind, enter the Distinguished Name of a user authorized to perform searches in the LDAP directory. For example <code>cn=admin,dc=company,dc=com</code> .
Admin Password	For Authenticated Bind, enter the user password for the Admin DN.
Prefix	Specify the prefix to the DN. For example <code>(uid=</code> .
Suffix	Specify the suffix to the DN. For example <code>)</code> .
Base DN (optional)	Enter a base DN in the Base DN field, or click Get Base DN to populate the field with a retrieved base DN.
Use group authentication (optional)	Static or Dynamic. For Static Group, enter the Group Based DN, Prefix, and Suffix. For Dynamic Group, enter the Filter condition for the group.

8. Optional: Click Test configuration to test the settings for your LDAP user registry. Enter valid credentials to ensure that you can access the LDAP database.

9. Optional: If you want to make your LDAP user registry writable, select the User Managed checkbox in the Attribute Mapping section, and provide the mapping of your source LDAP attribute names to the target API Connect values. Click Add to add each name/value pair, specified as follows:

- LDAP ATTRIBUTE NAME - is the name of the source LDAP attribute.
- API CONNECT VALUE - is a string that represents the value that API Connect will populate the LDAP attribute with, by replacing the content contained in [] with the value that the user supplies when signing up.

The default user profile properties that API Connect requires during user registration are `username`, `first_name`, `last_name`, `email`, and `password`, as shown in the following example:

LDAP ATTRIBUTE NAME	API CONNECT VALUE
<code>dn</code>	<code>uid=[username],ou=users,dc=company,dc=com</code>
<code>cn</code>	<code>{first_name} {last_name}</code>
<code>sn</code>	<code>{last_name}</code>
<code>mail</code>	<code>{email}</code>
<code>userPassword</code>	<code>{password}</code>

You must ensure that you enter the correct attribute mapping values for your LDAP configuration, to enable API Connect to access the LDAP database. Note that a writable LDAP user registry cannot be used to authenticate Cloud Manager and API Manager users.

10. Click Create.

Your new LDAP registry is shown in the list of User Registries on the Resources page.

What to do next

If you want to make the LDAP user registry available for authenticating Developer Portal users, you must enable it in the Catalog that is associated with that Developer Portal. Click the relevant Catalog, then click Settings > Onboarding. In the Catalog User Registries section, click Edit, select the user registry, and click Save. For more information, see [Creating and configuring Catalogs](#).

If you want to use the LDAP user registry to secure APIs, see the following information:

- To use for basic authentication in the security definition for an API, see [Creating a basic authentication security definition](#).
- To use for authentication in the User Security configuration for a native OAuth provider, see [Configuring user security for a native OAuth provider](#).
- **Using the CLI to create an organization-specific LDAP user registry**
You can use the developer toolkit CLI to configure an organization-specific LDAP user registry to provide user authentication for the Developer Portal. APIs can also be secured with an LDAP user registry.

Using the CLI to create an organization-specific LDAP user registry

You can use the developer toolkit CLI to configure an organization-specific LDAP user registry to provide user authentication for the Developer Portal. APIs can also be secured with an LDAP user registry.

Before you begin

To configure an LDAP user registry as a resource in API Manager, the LDAP directory must be created and available to use with your API Connect ecosystem.

LDAP registries can be used to secure APIs, or for securing a Catalog to authenticate Developer Portal users.

Important: If you are using an LDAP registry to secure APIs, The STARTTLS protocol, which upgrades an insecure protocol to a secure one by applying TLS security, is not supported.

Note: If you are using an **Active Directory**, you must indicate this by using the property `"directory_type": "ad"` in the LDAP config.

One of the following roles is required to configure an LDAP user registry:

- Administrator
- Owner
- Topology Administrator
- Custom role with the `Settings: Manage permissions`

About this task

You can create an LDAP user registry that is specific to a provider organization, or one that can be shared and available to all of the provider organizations in your API Connect environment. An organization-specific LDAP user registry can be used for onboarding and authenticating Developer Portal users in a specific provider organization. While a shared LDAP user registry can be used for authenticating Cloud Manager, API Manager, and Developer Portal users.

This topic describes how to configure an organization-specific LDAP user registry. If you want to create a shared registry, see [Using the CLI to configure a shared LDAP user registry](#) for more information.

Note:

- You can also create organization-specific LDAP user registries by using the API Manager UI; for more information see [Creating an LDAP user registry in API Manager](#).
- In addition, you can create and manage LDAP user registries by using the API Connect REST APIs; see the [API Connect REST API documentation](#).
- If you are using the DataPower® API Gateway, LDAP group authentication is not supported.
- You can map external LDAP groups to API Connect user roles to enable more control of user authorization by using the developer toolkit CLI. The following instructions explain how to set the `external_group_mapping_enabled` configuration on your LDAP user registry resource. For information about how to set external role mapping on your API Connect user roles, see [Configuring LDAP group mapping on Cloud Manager user roles](#).

You create an LDAP user registry by first defining the registry details in a configuration file. You then use a developer toolkit CLI command to create the registry, passing the configuration file as a parameter. To make the registry available to the Developer Portal, you must enable the registry in the associated Catalog. To secure APIs with an LDAP registry, you must configure security definitions. You can use the following instructions to create a writable or a read-only LDAP user registry.

For general information about authenticating with LDAP, see [LDAP authentication](#).

Logging in to the management server CLI

Before you can define the LDAP user registry configuration, you must log in to your management server from the developer toolkit CLI as a member of a provider organization. Use the following command:

```
apic login --server mgmt_endpoint_url --username user_id --password password --realm provider/identity_provider
```

You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

```
apic identity-providers:list --scope provider --server mgmt_endpoint_url --fields title,realm
```

For example,

```
apic identity-providers:list --scope provider --server myserver.com --fields title,realm
total_results: 2
```

```

results:
- title: API Manager Local User Registry
  realm: provider/default-idp-2
- title: Corporate LDAP user registry
  realm: provider/corporate-ldap

```

The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default API Manager Local User Registry for login as a member of a provider organization is `default-idp-2`. For full details of the login command, see [Logging in to a management server](#).

For more information about how to use the CLI, see [Installing the toolkit](#), and [Overview of the command-line tool](#).

Defining your LDAP configuration

You define the configuration of your LDAP user registry in an `ldap_config_file.yaml` file, as shown in the following example. Note that the actual contents of your YAML file will vary depending on the authentication method of your LDAP server, and this is explained in the following tables. Important: Do not share user registries between the API Manager and the Developer Portal, or between Developer Portal sites when self-service onboarding is enabled or account deletions in any of the sites are expected. You should create separate user registries for them, even if the separate registries point to the same backend authentication provider (for example, an LDAP server). This separation enables the Developer Portal to maintain unique email addresses across the Catalog, without API Manager needing the same requirement. It also avoids problems with users deleting their accounts from the Developer Portal that then affects their API Manager access.

```

name: registry_name
title: "display_title"
integration_url: LDAP_integration_url
user_managed: true_or_false
user_registry_managed: false
directory_type: ad
external_group_mapping_enabled: true_or_false
case_sensitive: true_or_false
email_required: true_or_false
email_unique_if_exist: true_or_false
identity_providers:
- name: provider_name
  title: provider_title
endpoint:
  endpoint: "ldap_server_url_and_port"
configuration:
  authentication_method: authentication_method
  authenticated_bind: "true_or_false"
  admin_dn: "admin_dn"
  admin_password: admin_password
  search_dn_base: "search_dn_base"
  search_dn_scope: search_dn_scope
  search_dn_filter_prefix: prefix
  search_dn_filter_suffix: suffix
  attribute_mapping:
    dn: "distinguished_name"
    cn: "common_name"
    sn: "last_name"
    mail: "email_address"
    userPassword: "password"

```

The registry properties that are common to each authentication method are described in the following table:

Property	Description
<code>name</code>	The name of the registry. This name is used in CLI commands.
<code>title</code>	A descriptive name to display in a graphical user interface.
<code>integration_url</code>	The LDAP integration URL in your API Connect configuration. You can determine the LDAP integration URL by using the following CLI command: <code>apic integrations:list --server mgmt_endpoint_url --subcollection user-registry</code>
<code>user_managed</code>	Determines whether your user registry is writable or not. Must be set to <code>true</code> for writable LDAP. You can change this setting to <code>false</code> if you don't want the registry to be writable; see the Switching your LDAP registry between writable and read-only section at the end of this topic for details. Note that a writable LDAP user registry cannot be used to authenticate Cloud Manager and API Manager users.
<code>user_registry_managed</code>	Must be set to <code>false</code> for LDAP. Determines whether API Connect manages your user registry. Only LUR registries are managed by API Connect.
<code>directory</code>	Specify one of the of the following values for the directory type: <ul style="list-style-type: none"> <code>ad</code> - Indicates that the LDAP is Microsoft Active Directory <code>standard</code> - (Default value) Indicates any other LDAP
<code>external_group_mapping_enabled</code>	Determines whether your user registry supports LDAP group mapping. Valid values are: <ul style="list-style-type: none"> <code>true</code> <code>false</code> The default value is <code>false</code> .

Property	Description
<code>case_sensitive</code>	<p>Determines whether your user registry is case-sensitive. Valid values are:</p> <ul style="list-style-type: none"> <code>true</code> <code>false</code> <p>To ensure proper handling of user name capitalization, you must ensure that your case-sensitivity setting here matches the setting on your backend LDAP server:</p> <ul style="list-style-type: none"> Only set <code>case_sensitive</code> to <code>true</code> if your backend LDAP server supports case-sensitivity. Set <code>case_sensitive</code> to <code>false</code> if your backend LDAP server does not support case-sensitivity. <p>Note: After at least one user has been onboarded into the registry, you cannot change this setting.</p>
<code>email_required</code>	<p>Determines whether an email address is required as part of the user onboarding process. Valid values are:</p> <ul style="list-style-type: none"> <code>true</code> <code>false</code> <p>If set to <code>true</code>, the source identity provider must supply the email address as part of the authentication process during onboarding.</p> <p>Note: An email address is not required by default for onboarding to the Cloud Manager or the API Manager, but it is required for onboarding to the Developer Portal.</p>
<code>email_unique_if_exist</code>	<p>Determines whether email addresses must be unique within the user registry. Valid values are:</p> <ul style="list-style-type: none"> <code>true</code> <code>false</code> <p>Note: Every account in the Developer Portal, including across different user registries for the same site, must have a unique email address, including the site Admin account.</p>
<code>identity_providers</code>	<p>An array containing the details of your LDAP server, where:</p> <ul style="list-style-type: none"> <code>name</code> - is the name of the LDAP server and is the name that is used in CLI commands <code>title</code> - is the display name of the LDAP server
<code>endpoint</code>	<p>The endpoint of your LDAP server, made up of the url and port, for example:</p> <pre>"ldap://server.com:389"</pre>
<code>tls_profile</code>	<p>Optionally set the TLS Client Profile that the LDAP server requires.</p>
<code>protocol_version</code>	<p>Optionally set the version number for the LDAP protocol that you are using. Valid values are:</p> <ul style="list-style-type: none"> 2 3 <p>Defaults to 3 if not explicitly set.</p>

The properties in the configuration section will vary depending on the selected authentication method. The three authentication methods are:

- `compose_dn` - Set this format if you can compose the user LDAP Distinguished Name (DN) from the user name. For example, `uid=<username>,ou=People,dc=company,dc=com` is a DN format that can be composed from the user name. If you are unsure whether Compose (DN) is the correct option, contact your LDAP administrator. If you are using an LDAP registry to secure APIs, `compose_dn` is not supported with the DataPower API Gateway.
- `compose_upn` - Set this format if your LDAP directory supports binding with User Principal Names such as `john@acme.com`. The Microsoft Active Directory is an example of an LDAP directory that supports Compose UPN authentication. If you are unsure whether your LDAP directory supports binding with UPNs, contact your LDAP administrator.
Note: The Admin Bind DN and Admin Bind Password are not used with this authentication method.
- `search_dn` - Select this format if you cannot compose the user LDAP Distinguished Name from the user name; for example, if the base DN's of the users are different. This format might require an administrator DN and password to search for users in the LDAP directory. If your LDAP directory permits anonymous binds, you can omit the admin DN and password. If you are unsure if your LDAP directory permits anonymous binds, contact your LDAP administrator.

For authentication method `compose_dn`, set the following configuration properties:

Properties	Description
<code>authentication_method</code>	<code>compose_dn</code>
<code>authenticated_bind</code>	<p>The bind method. Valid values are:</p> <ul style="list-style-type: none"> <code>"true"</code> - authenticated bind <code>"false"</code> - anonymous bind <p>If specific permissions are not needed to search the registry, select <code>"false"</code>. If specific permissions are necessary, select <code>"true"</code>.</p>
<code>admin_dn</code>	<p>If <code>authenticated_bind</code> is set to <code>"true"</code>, enter the Distinguished Name (DN) of a user authorized to perform searches in the LDAP directory. For example:</p> <pre>"cn=admin,dc=company,dc=com"</pre>
<code>admin_password</code>	<p>If <code>authenticated_bind</code> is set to <code>"true"</code>, enter the user password for the <code>admin_dn</code>.</p>
<code>search_dn_base</code>	<p>Optionally set a base DN, for example:</p> <pre>"dc=company,dc=com"</pre>
<code>bind_prefix</code>	<p>Set the prefix to the DN, for example:</p> <pre>(uid=</pre>
<code>bind_suffix</code>	<p>Set the suffix to the DN, for example:</p> <pre>)</pre>

Properties	Description
attribute_mapping	<p>If user_managed is set to true, provide the mapping of your source LDAP attribute names to the target API Connect values. This mapping is configured as a name/value pair, specified as follows:</p> <pre>ldap_registry_attribute_name: "apic_ldap_attribute_value"</pre> <p>Where:</p> <ul style="list-style-type: none"> ldap_registry_attribute_name - is the name of the source LDAP attribute apic_ldap_attribute_value - is a string that represents the value that API Connect will populate the LDAP attribute with, by replacing the content contained in [] with the value that the user supplies when signing up. <p>The user profile properties that API Connect requires during user registration are username, first_name, last_name, email, and password. The following extract shows an example of an attribute mapping:</p> <pre>attribute_mapping: dn: "uid=[username],ou=users,dc=company,dc=com" cn: "[first_name] [last_name]" sn: "[last_name]" mail: "[email]" userPassword: "[password]"</pre>

For authentication method **compose_upn**, set the following configuration properties:

Properties	Description
authentication_method	compose_upn
authenticated_bind	<p>The bind method. Valid values are:</p> <ul style="list-style-type: none"> "true" - authenticated bind "false" - anonymous bind <p>If specific permissions are not needed to search the registry, select "false". If specific permissions are necessary, select "true".</p>
admin_dn	<p>If authenticated_bind is set to "true", enter the Distinguished Name (DN) of a user authorized to perform searches in the LDAP directory. For example:</p> <pre>"cn=admin,dc=company,dc=com"</pre>
admin_password	<p>If authenticated_bind is set to "true", enter the user password for the admin_dn.</p>
bind_suffix	<p>Enter the domain part of the user principal name. For example:</p> <pre>@acme.com</pre>
attribute_mapping	<p>If user_managed is set to true, provide the mapping of your source LDAP attribute names to the target API Connect values. This mapping is configured as a name/value pair, specified as follows:</p> <pre>ldap_registry_attribute_name: "apic_ldap_attribute_value"</pre> <p>Where:</p> <ul style="list-style-type: none"> ldap_registry_attribute_name - is the name of the source LDAP attribute apic_ldap_attribute_value - is a string that represents the value that API Connect will populate the LDAP attribute with, by replacing the content contained in [] with the value that the user supplies when signing up. <p>The user profile properties that API Connect requires during user registration are username, first_name, last_name, email, and password. The following extract shows an example of an attribute mapping:</p> <pre>attribute_mapping: dn: "uid=[username],ou=users,dc=company,dc=com" cn: "[first_name] [last_name]" sn: "[last_name]" mail: "[email]" userPassword: "[password]"</pre>

For authentication method **search_dn**, set the following configuration properties:

Property	Description
authentication_method	search_dn
authenticated_bind	<p>The bind method. Valid values are:</p> <ul style="list-style-type: none"> "true" - authenticated bind "false" - anonymous bind <p>If specific permissions are not needed to search the registry, select "false". If specific permissions are necessary, select "true".</p>
admin_dn	<p>If authenticated_bind is set to "true", enter the Distinguished Name (DN) of a user authorized to perform searches in the LDAP directory. For example:</p> <pre>"cn=admin,dc=company,dc=com"</pre>
admin_password	<p>If authenticated_bind is set to "true", enter the user password for the admin_dn.</p>
search_dn_base	<p>Optionally set a base DN, for example:</p> <pre>"dc=company,dc=com"</pre>
search_dn_scope	<p>Optionally set the search DN scope. The scope determines which part of the directory information tree is examined. Possible values are:</p> <ul style="list-style-type: none"> base one sub (default value)

Property	Description
<code>search_dn_filter_prefix</code>	Set the prefix to the DN, for example: (uid=
<code>search_dn_filter_suffix</code>	Set the suffix to the DN, for example:)
<code>attribute_mapping</code>	<p>If <code>user_managed</code> is set to <code>true</code>, provide the mapping of your source LDAP attribute names to the target API Connect values. This mapping is configured as a name/value pair, specified as follows:</p> <pre>ldap_registry_attribute_name: "apic_ldap_attribute_value"</pre> <p>Where:</p> <ul style="list-style-type: none"> <code>ldap_registry_attribute_name</code> - is the name of the source LDAP attribute <code>apic_ldap_attribute_value</code> - is a string that represents the value that API Connect will populate the LDAP attribute with, by replacing the content contained in [] with the value that the user supplies when signing up. <p>The user profile properties that API Connect requires during user registration are <code>username</code>, <code>first_name</code>, <code>last_name</code>, <code>email</code>, and <code>password</code>. The following extract shows an example of an attribute mapping:</p> <pre>attribute_mapping: dn: "uid=[username],ou=users,dc=company,dc=com" cn: "[first_name] [last_name]" sn: "[last_name]" mail: "[email]" userPassword: "[password]"</pre>

Save your `ldap_config_file.yaml` so it can be accessed by the `user-registries:create` command in the following section. See the [Example](#) section for an example configuration file.

Creating your LDAP user registry

To create your organization-specific LDAP user registry, run the following CLI command:

```
apic user-registries:create --server mgmt_endpoint_url --org organization_name ldap_config_file.yaml
```

where:

- `mgmt_endpoint_url` is the platform API endpoint URL.
- `organization_name` is the value of the `name` property of your provider organization.
- `ldap_config_file` is the name of the YAML file that defines the configuration of your LDAP user registry.

On completion of the registry creation, the command displays the following summary details:

```
registry_name registry_url
```

The `registry_name` is derived from the `name` property in the configuration YAML file. The `registry_url` is the URL with which the registry resource can be accessed. Your LDAP user registry is now created; see the following section for instructions on how to make the registry available in the Developer Portal.

Configuring your LDAP registry in a Catalog

If you want to make your LDAP registry available for authenticating Developer Portal users, you must enable it in the Catalog that is associated with that Developer Portal. Complete the following steps:

- Determine the URL of your LDAP user registry by using the following command (or you can copy and paste from the summary of the registry creation):

```
apic user-registries:list --server mgmt_endpoint_url --org organization_name
```

- Log in to the management server as a member of a provider organization; enter the following command:

```
apic login --server mgmt_endpoint_url --username user_id --password password --realm provider/identity_provider
```

You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

```
apic identity-providers:list --scope provider --server mgmt_endpoint_url --fields title,realm
```

For example,

```
apic identity-providers:list --scope provider --server myserver.com --fields title,realm
total_results: 2
results:
- title: API Manager Local User Registry
  realm: provider/default-idp-2
- title: Corporate LDAP user registry
  realm: provider/corporate-ldap
```

The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default API Manager Local User Registry for login as a member of a provider organization is `default-idp-2`.

For full details of the `apic login` command, see [Logging in to a management server](#).

- Enter the following command (the terminating hyphen character means that the command takes input from the command line):

```
apic configured-catalog-user-registries:create --server mgmt_endpoint_url --org organization_name --catalog catalog_name -
```

where `catalog_name` is the value of the `name` property of the required Catalog. The command returns

```
Reading CONFIGURED_CATALOG_USER_REGISTRY_FILE arg from stdin
```

4. Enter the following data, followed by a new line:

```
user_registry_url: ldap_registry_url
```

where `ldap_registry_url` is the URL of your LDAP registry, obtained in step 1.

5. Press **CTRL D** to terminate the input.

Switching your LDAP registry between writable and read-only

After an LDAP user registry has been created, it can be switched between writable and read-only by updating the `user_managed` property in the registry configuration. Complete the following steps.

1. Determine the name or ID of the LDAP user registry that you want to update, by running the following command (or you can use the summary from the registry creation):

```
apic user-registries:list --server mgmt_endpoint_url --org organization_name
```

The command returns a list of all the user registries for that organization, shown by name followed by their registry URL. The registry ID is located at the end of the URL, for example `https://company.com/api/user-registries/x-x-x-x-x/registry_id`.

2. Enter the following command (the terminating hyphen character means that the command takes input from the command line):

```
apic user-registries:update --server mgmt_endpoint_url --org organization_name registry_name_or_id -
```

where `registry_name_or_id` is the name or ID of the LDAP user registry that you want to update (as determined in the previous step). The command returns:

```
Reading USER_REGISTRY_FILE arg from stdin
```

3. Enter the following data, followed by a new line:

```
user_managed: true_or_false
```

where `true` makes the registry writable, and `false` makes the registry read-only.

4. Press **CTRL D** to terminate the input.

Note that if you are changing your registry from read-only to writable, you must also set the `attribute_mapping` configuration, as described in the previous registry property tables.

Using an LDAP user registry to secure APIs

If you want to use the LDAP user registry to secure APIs, see the following information:

- To use for basic authentication in the security definition for an API, see [Creating a basic authentication security definition](#).
- To use for authentication in the User Security configuration for a native OAuth provider, see [Configuring user security for a native OAuth provider](#).

For details of all the `apic user-registries` and `apic`

`configured-catalog-user-registries` commands, see [apic user-registries](#) and [apic configured-catalog-user-registries](#).

Example

The following example shows a configuration file that uses the Search DN authentication method for setting up writable LDAP:

```
name: sdn-ldap
title: "SDN LDAP User Registry"
integration_url: https://mycompany.com/api/cloud/integrations/user-registry/xxx-xxx-xxx
user_managed: true
user_registry_managed: false
directory_type: standard
case_sensitive: false
identity_providers:
- name: ldap
  title: "SDN LDAP Identity Provider"
endpoint:
  endpoint: "ldap://mycompany.com:389"
configuration:
  authentication_method: search_dn
  authenticated_bind: "true"
  admin_dn: "cn=admin,dc=company,dc=com"
  admin_password: xxxx
  search_dn_base: "dc=company,dc=com"
  search_dn_scope: sub
  search_dn_filter_prefix: (uid=
  search_dn_filter_suffix: )
  attribute_mapping:
    dn: "uid=[username],ou=users,dc=company,dc=com"
    cn: "[first_name] [last_name]"
    sn: "[last_name]"
    mail: "[email]"
    userPassword: "[password]"
```

Creating a Local User Registry

A Local User Registry (LUR) can be created to provide user authentication for API Manager.

About this task

Local User Registries (LURs) are the default user registries included in API Connect. LURs are local databases included with API Connect. Two default LURs are installed and configured during installation of API Connect. They cannot be deleted. The default Admin user account is stored in the Provider LUR.

You can use API Manager to create additional Local User Registries for use with your provider organization.

One of the following roles is required to configure user registries:

- Administrator
- Organization Owner
- Custom role with the `Settings: Manage permissions`

Procedure

Follow these steps to configure a new LUR:

1. In the API Manager, click  Resources.
2. Select User Registries to see the list of current user registries in your organization.
3. Click Create in the User Registries section.

Important: Do not share user registries between the API Manager and the Developer Portal, or between Developer Portal sites when self-service onboarding is enabled or account deletions in any of the sites are expected. You should create separate user registries for them, even if the separate registries point to the same backend authentication provider (for example, an LDAP server). This separation enables the Developer Portal to maintain unique email addresses across the Catalog, without API Manager needing the same requirement. It also avoids problems with users deleting their accounts from the Developer Portal that then affects their API Manager access.

4. Select Local User Registry as the type for the user registry and enter the following information:

Field	Description
Title (required)	Enter a descriptive name for use on the screen.
Name (required)	The name that is used in CLI commands. The name is auto-generated. For details of the CLI commands for managing user registries, see apic user-registries .
Display Name (required)	The name that is displayed for selection by the user when logging in to a user interface, or activating their API Manager account. For details of user interface log in, and account activation, see Accessing the Cloud Manager user interface , Accessing the API Manager user interface , and Activating your API Manager user account . Note: The Developer Portal uses the Title of the User Registries when rendering them at the login page, rather than the Display Name .
Summary (optional)	Enter a brief description.
Case sensitive	Select this setting if user names are case-sensitive. Note: The Developer Portal does not support case sensitive usernames. Note: After at least one user has been onboarded into the registry, you cannot change this setting.
Email required	Select this checkbox if an email address is required as part of the user onboarding process. If selected, the source identity provider must supply the email address as part of the authentication process during onboarding. Note: An email address is not required by default for onboarding to the Cloud Manager or the API Manager, but it is required for onboarding to the Developer Portal.
Unique email address	Select this checkbox if email addresses must be unique within the user registry. For new Local User Registries, this setting is always selected; so if email addresses are contained in the user record, they must be unique. However, for existing Local User Registries this setting can be edited. Note: Every account in the Developer Portal, including across different user registries for the same site, must have a unique email address, including the site Admin account.

5. Click Save.
6. Add the user registry to the Sandbox Catalog. See [Creating and configuring Catalogs](#).

Results

The user registry can be used for Basic Authentication in the Security Definition for an API. For more information, see [Creating a basic authentication security definition](#).

Creating an OIDC user registry in API Manager

Create an organization-specific OIDC user registry when multi-factor authentication (MFA) is required.

You can create an OIDC user registry that is specific to a provider organization, or that is shared and available to all the provider organizations in your API Connect environment. An organization-specific OIDC user registry is used for onboarding and authenticating Developer Portal users, while a shared OIDC user registry can be used for onboarding and authenticating Cloud Manager, API Manager, and Developer Portal users.

This topic describes how to create an organization-specific registry. For information on how to create a shared registry, see [Configuring an OIDC user registry in Cloud Manager](#).

Important: If you are using X (formerly known as Twitter) as your OIDC provider, API Connect supports only the OAuth 1.0a method, so your X application must be configured to use OAuth 1.0a. Other OIDC providers support OAuth 2.0.

API Connect provides two methods for creating an OIDC user registry in API Designer, as described in the following sections:

- [Using the UI to create an OIDC user registry](#)
- [Using the CLI to create an OIDC user registry](#)

Using the UI to create an OIDC user registry

Use the API Designer user interface to create an organization-specific OIDC user registry when multi-factor authentication (MFA) is required.

1. In the API Designer navigation pane, click  Resources.
2. Click User Registries.
3. Click Create and select OIDC User Registry.

Important: Do not share user registries between the API Manager and the Developer Portal, or between Developer Portal sites when self-service onboarding is enabled or account deletions in any of the sites are expected. You should create separate user registries for them, even if the separate registries point to the same backend authentication provider (for example, an LDAP server). This separation enables the Developer Portal to maintain unique email addresses across the Catalog, without API Manager needing the same requirement. It also avoids problems with users deleting their accounts from the Developer Portal that then affects their API Manager access.

4. On the Create OIDC User Registry page, use the fields in each of the following sections to configure the registry settings, and then click Create. Many of the registry settings are preconfigured to simplify the configuration steps.

Provider Type

Use the settings in Table 1 to define the provider type.

Table 1. Provider Type settings

Field	Description
Provider Type	OIDC provider. Select one of the following supported OIDC providers: <ul style="list-style-type: none"> • Facebook • GitHub • Google • LinkedIn • Slack • X (formerly Twitter) • Windows Live • Standard OIDC (default value allows you to specify another provider)
Title	Provide a descriptive name for display purposes.
Name	Automatically generated. This name is used in CLI commands to reference the registry. For details of the CLI commands for managing user registries, see the apic user-registries topic in the Command Line tool reference section of this documentation.
Summary	Provide a brief description of the new registry.
Email required	Select this check box if an email address is required as part of the user onboarding process. If selected, the source identity provider must supply the email address as part of the authentication process during onboarding. Note: An email address is not required by default for onboarding to the Cloud Manager or the API Manager, but it is required for onboarding to the Developer Portal.
Unique email address	Select this check box if email addresses must be unique within the user registry. Note: Every account in the Developer Portal, including across different user registries for the same site, must have a unique email address, including the site Admin account.

Provider Endpoint

Automatically generated for most supported providers. In the Authorization Endpoint field, type the URL of the provider's authorization endpoint.

Token Endpoint

Fill in the settings as described in Table 2.

Table 2. Token Endpoint settings

Field	Description
URL	Preconfigured for most of the supported OIDC providers. Type the URL of the provider's token endpoint.
TLS	Select the TLS Client Profile for the token endpoint (OIDC must be configured to use TLS). Default is Default TLS Client Profile.

UserInfo Endpoint

Fill in the settings as described in Table 3.

Table 3. UserInfo Endpoint settings

Field	Description
URL	Preconfigured for most of the supported OIDC providers. Type the URL of the provider's userinfo endpoint. For LinkedIn, the endpoint changed and now uses the following value: <code>https://api.linkedin.com/v2/me</code> If you previously configure the OIDC registry using the legacy LinkedIn OIDC protocol, you do not need to specify this endpoint.
TLS	Select the TLS Client Profile for the userinfo endpoint (OIDC must be configured to use TLS). Default is Default TLS Client Profile.

Email Endpoint

Required for the legacy LinkedIn OIDC protocol.

Due to changes in LinkedIn, the configuration settings for the OIDC registry in API Connect also changed. If you are configuring a new OIDC registry for LinkedIn, you can leave the Email Endpoint field blank.

If you previously configured an OIDC registry for use with the legacy LinkedIn OIDC protocol, update your configuration by providing the Email endpoint settings as described in Table 4. The new setting is required for the legacy LinkedIn OIDC protocol.

Table 4. Email Endpoint settings

Field	Description
-------	-------------

Field	Description
URL	For the legacy LinkedIn OIDC protocol, this field defaults to the following value: <code>https://api.linkedin.com/v2/emailAddress?q=members&projection=(elements*(handle~))</code> You can override the setting by typing in a new value.
TLS	Select the TLS Client Profile for the userinfo endpoint (OIDC must be configured to use TLS). Default is Default TLS Client Profile.

JWKS Endpoint

Fill in the settings as described in Table 5.

Table 5. JWKS Endpoint settings

Field	Description
URL	Type the URL of the read-only endpoint that contains the public keys' information in JWKS format.
TLS	Select the TLS Client Profile for the userinfo endpoint (OIDC must be configured to use TLS). Default is Default TLS Client Profile.

Logout

Fill in the settings as described in Table 6.

Table 6. Logout

Field	Description
Logout redirect	Optionally, give a logout redirect URL, allowing APIC to initiate an https 302 redirect to the configured endpoint. Note: When the Developer Portal uses this feature, it does not retain control afterward. Instead, the content is presented from the redirected endpoint.

Client Information

Fill in the settings as described in Table 7.

Table 7. Client Information settings

Field	Description
Client ID	Provide the client ID of the application that is registered with the selected OIDC provider.
Client Secret	Provide the client secret of the application that is registered with the selected OIDC provider. This field is optional when you create an OIDC directory of type Standard and set the Client Authentication Method to Data encoded form body. If you do not use the Client Secret, make sure that mutual TLS is possible with the OIDC provider.
Response Type	Preconfigured for most of the supported OIDC providers. Specify the data type of the response that will be received from the OIDC provider.
Scopes	Preconfigured for most of the supported OIDC providers. Specify the access scope for the OIDC provider.
Client Authentication Method	Preconfigured for most of the supported OIDC providers. Select the authentication method to be used with the OIDC provider. Options are: <ul style="list-style-type: none"> HTTP Basic authentication schema Data encoded form body

Additional Support

Optional. Select the additional security parameters described in Table 8.

Table 8. Additional security options

Security parameter	Setting name for CLI	Description
NONCE	<code>nonce</code>	Enable the NONCE extension to prevent compromised requests from being used again (replayed).
Proof Key for Code Exchange (PKCE)	<code>pkce</code>	Enable the PKCE extension to allow public clients to mitigate the threat of having the authorization code intercepted.

Advanced Features

Optional. Select the advanced features described in Table 9.

Table 9. Advanced features

Feature / UI Label	Setting name for CLI	Description
Auto onboard	<code>auto_onboard</code>	Allow users to execute calls to APIs without logging in first, provided they present a valid token issued by the OIDC provider. Note: Does not apply to consumer organizations.
Always use the userinfo endpoint	<code>userinfo</code>	Configures the OIDC user registry to always fetch user data from the userinfo endpoint, if populated.
Use Portal as Endpoint for external OIDC provider traffic	<code>proxy_redirect</code>	When authenticating users, redirect the external OIDC provider to communicate with the Developer Portal instead of API Manager.
Return third-party access token	<code>proxy_access_token</code>	Include the third-party OIDC access token in the response. Note: Enable this setting for debugging purposes only. This setting is not recommended for use in a production environment. When this setting is enabled, the token size will increase when a request is made to API Connect using the token. The larger token size might exceed the HTTP protocol limit, resulting in an ERR_HTTP2_PROTOCOL_ERROR or ERR_CONNECTION_CLOSED error.
Return third-party id_token	<code>proxy_id_token</code>	Include the third-party OIDC id_token in the response. Note: Enable this setting for debugging purposes only. This setting is not recommended for use in a production environment. When this setting is enabled, the token size will increase when a request is made to API Connect using the token. The larger token size might exceed the HTTP protocol limit, resulting in an ERR_HTTP2_PROTOCOL_ERROR or ERR_CONNECTION_CLOSED error.
Token Relay	<code>token_relay</code>	Allow <code>access_token/refresh_token</code> to send in 302 redirect for logout
Userinfo POST	<code>post_userinfo</code>	If supported by your OIDC provider, by using HTTP POST method when contacting userinfo endpoint. Note: Not all OIDC providers support POST. Ensure that your OIDC provider supports this before you enable the feature.

Feature / UI Label	Setting name for CLI	Description
Use IBM APIC token expiration setting from cloud	<code>override_provider_ttl</code>	Override the OIDC provider's token expiration setting with the access token and refresh token expiration settings that are configured in API Connect. For information on configuring the access token and refresh token expiration settings in API Connect, see Configuring timeouts for access tokens and refresh tokens .
Disable hash verification (CLI only)	<code>disable_hash_verification</code>	Disable <code>at_hash</code> , <code>c_hash</code>

User Mapping

Fill in the settings as described in Table 10.

Note: The User Mapping fields are preconfigured for most of the supported OIDC providers to minimize potential errors; use care when changing the settings. For the Standard OIDC option, contact your OIDC provider to obtain the details of the fields.

Table 10. User mapping settings

Field	Description
Username	The name of the field in the response token that contains the user's user name. Note: The Username field must be unique for this OIDC registry, because it identifies the user in the system and cannot be changed.
Email	The name of the field in the response token that contains the user's email address.
First name	The name of the field in the response token that contains the user's given name.
Last name	The name of the field in the response token that contains the user's surname.

Redirect URI

The Redirect URI section lists the endpoints to which the OIDC authorization server will redirect the authorization code. There is one endpoint for each API Connect organization type: Cloud administration, Provider organization, and Consumer organization. The redirect endpoint is required when a user registers their application with the OIDC provider. For example, if this OIDC user registry is used by a provider organization, the user must register the provider organization's redirect endpoint with the OIDC provider. These read-only fields are provided for you to copy the endpoint values as required.

Enabling the OIDC user registry

Complete the following steps to enable the new user registry for a specific catalog in the Developer Portal. Repeat this procedure for each catalog that will use the new registry.

1. On the navigation pane, click  Manage.
2. Select the catalog for which you will enable the new OIDC user registry.
3. On the navigation pane, click the Catalog settings tab.
4. On the Settings page, click Onboarding.
5. On the Onboarding page, click Edit in the Catalog User Registries section.
6. On the Edit User Registry page, select the new OIDC user registry to enable for your catalog.
7. Click Save.

Using the CLI to create an OIDC user registry

Use the developer toolkit CLI to create an organization-specific OIDC user registry when multi-factor authentication (MFA) is required.

Important: Do not share user registries between the API Manager and the Developer Portal, or between Developer Portal sites when self-service onboarding is enabled or account deletions in any of the sites are expected. You should create separate user registries for them, even if the separate registries point to the same backend authentication provider (for example, an LDAP server). This separation enables the Developer Portal to maintain unique email addresses across the Catalog, without API Manager needing the same requirement. It also avoids problems with users deleting their accounts from the Developer Portal that then affects their API Manager access. Configure an OIDC user registry by first defining the registry details in a configuration file. Then, use a CLI command to create the registry by passing the configuration file as a parameter. To make the registry available to the Developer Portal, you must enable the registry in the associated Catalog.

Note:

- An OIDC registry cannot be used to secure APIs on the gateway.
- Because the interaction with the third-party OIDC provider is handled by the Management server, the Management server is the application from the point of view of the third-party OIDC provider. Your OIDC redirection endpoint is used by the authorization server to send the token to the Management server, so it must be accessible to the OIDC provider through your firewall. When you register your application with the third-party OIDC provider, you are required to supply the associated OIDC redirect URI, <https://consumer.mycompany.com/consumer-api/oauth2/redirect> for example. However, this information is not available until you have created your OIDC user registry in API Connect. You must first register your application without this information and then update it later, as detailed in the instructions on this page.

Logging in to the Management server

Before you can create an OIDC user registry, you must log in to your management server from the CLI. Use the following command:

```
apic login --server mgmt_endpoint_url --username user_id --password password --realm provider/identity_provider
```

You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

```
apic identity-providers:list --scope provider --server mgmt_endpoint_url --fields title,realm
```

For example,

```
apic identity-providers:list --scope provider --server myserver.com --fields title,realm
total_results: 2
results:
- title: API Manager Local User Registry
  realm: provider/default-idp-2
- title: Corporate LDAP user registry
  realm: provider/corporate-ldap
```

The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default API Manager Local User Registry for login as a member of a provider organization is `default-idp-2`. For full details of the `apic login` command, see [Logging in to a management server](#).

Defining your OIDC registry configuration

Define the configuration of your OIDC user registry in a YAML file. At a minimum, the YAML file must include the settings from the following list. For additional settings, see the tables provided with the UI version of the procedure in this topic.

```
title: registry_title
integration_url: oidc_integration_url
case_sensitive: case_sensitivity_setting
email_required: true_or_false
email_unique_if_exist: true_or_false
configuration:
  client_id: 'app_client_id'
  client_secret: 'my-client-secret'
  provider_type: oidc_provider_type
```

where:

- `registry_title` is your chosen descriptive title for the user registry.
- `oidc_integration_url` is the OIDC integration URL in your API Connect configuration. You can determine the OIDC integration URL by using the following CLI command:

```
apic integrations:list --server mgmt_endpoint_url --subcollection user-registry
```

- `case_sensitivity_setting` determines whether your user registry is case-sensitive. Valid values are:
 - `true`
 - `false`

To ensure proper handling of user name capitalization, you **must** ensure that your case-sensitivity setting here matches the setting on the backend OIDC provider:

- **Only** set `case_sensitive` to `true` if the backend OIDC provider supports case-sensitivity.
- Set `case_sensitive` to `false` if the backend OIDC provider does not support case-sensitivity.

Note: After at least one user has been on-boarded into the registry, you cannot change this setting.

- `email_required` determines whether an email address is required as part of the user onboarding process. Valid values are:
 - `true`
 - `false`

If set to `true`, the source identity provider must supply the email address as part of the authentication process during onboarding.

Note: An email address is not required by default for onboarding to the Cloud Manager or the API Manager, but it is required for onboarding to the Developer Portal.

- `email_unique_if_exist` determines whether email addresses must be unique within the user registry. Valid values are:
 - `true`
 - `false`

Note: Every account in the Developer Portal, including across different user registries for the same site, must have a unique email address, including the site Admin account.

- `app_client_id` is the client ID of the application that is registered with the OIDC server, and must be in string format.
- `my-client-secret` is the client secret of the application that is registered with the OIDC server, and must be in string format.
- `oidc_provider_type` is the type of OIDC provider; specify one of the following values:
 - `facebook`
 - `github`
 - `google`
 - `linkedin`
 - `slack`
 - `twitter`
 - `windows_live`
 - `standard`

Note:

- Use the `twitter` provider type if your OIDC provider is X (formerly known as Twitter).
- Use the `standard` provider type for any OIDC provider that is compliant with the OIDC standard.

If the provider type is `standard`, you must include the following additional properties in the `configuration` section of your YAML file:

```
authorization_endpoint: 'oidc_auth_endpoint'
token_endpoint:
  endpoint: 'oidc_token_endpoint'
```

where:

- `oidc_auth_endpoint` is the authorization endpoint on the OIDC server, and must be in string format.
- `oidc_token_endpoint` is the token endpoint on the OIDC server, and must be in string format.

Default OIDC configurations

For each OIDC provider type, API Connect assumes a default configuration, but you can override the default configuration properties in your YAML file.

Note: Endpoints are subject to change; when you create a registry you must verify the default endpoint provided by API Connect.

API Connect makes the best effort to update endpoints for the known OIDC user registry types. However the OIDC provider can change the endpoint at any time. It is the customer's responsibility to confirm that the endpoints provided by API Connect are supported by the OIDC provider and to update the OIDC configuration as needed.

The default configurations are as follows:

- Facebook

```
authorization_endpoint: 'https://www.facebook.com/v3.1/dialog/oauth'
token_endpoint:
  endpoint: 'https://graph.facebook.com/v3.1/oauth/access_token'
userinfo_endpoint:
  endpoint: 'https://graph.facebook.com/me'
```

```
scope: email public_profile
field_mapping:
  username: email
  email: email
  last_name: last_name
  first_name: first_name
```

- GitHub

```
authorization_endpoint: 'https://github.com/login/oauth/authorize'
token_endpoint:
  endpoint: 'https://github.com/login/oauth/access_token'
userinfo_endpoint:
  endpoint: 'https://api.github.com/user'
scope: 'read:user user:email'
field_mapping:
  username: login
  email: email
  last_name: name
  first_name: name
```

- Google

```
authorization_endpoint: 'https://accounts.google.com/o/oauth2/v2/auth'
token_endpoint:
  endpoint: 'https://www.googleapis.com/oauth2/v4/token'
scope: openid profile email
field_mapping:
  username: email
  email: email
  last_name: family_name
  first_name: given_name
```

- LinkedIn

Some settings differ between the legacy configuration and the newer configuration. Be sure to use the correct settings for the LinkedIn protocol that you are using.

- New OIDC protocol:

```
authorization_endpoint: 'https://www.linkedin.com/oauth/v2/authorization'
credential_location: form_body
field_mapping:
  email: email
  username: name
  first_name: given_name
  last_name: family_name

```

```
  last_name: name
  username: screen_name
```

- Windows Live

```
authorization_endpoint: 'https://login.microsoftonline.com/common/oauth2/v2.0/authorize'
token_endpoint:
  endpoint: 'https://login.microsoftonline.com/common/oauth2/v2.0/token'
scope: openid offline_access profile email
field_mapping:
  email: email
  username: preferred_username
  first_name: name
  last_name: name
```

- Standard

```
response_type: code
scope: openid
field_mapping:
  username: sub
  email: email
  last_name: family_name
  first_name: given_name
credential_location: auth_header
```

Although this is the default configuration for the `standard` provider type, you should contact your OIDC provider to obtain the details of the fields that you need to define.

Creating your OIDC user registry

To create your OIDC user registry, use the following CLI command:

```
apic user-registries:create --server mgmt_endpoint_url --org organization_name oidc_config_file
```

where:

- `mgmt_endpoint_url` is the platform API endpoint URL.
- `organization_name` is the value of the `name` property of your provider organization.
- `oidc_config_file` is the name of the YAML file that defines the configuration of your OIDC user registry.

On completion of the registry creation, the command displays the following summary details:

```
registry_name registry_url
```

By default, the `registry_name` is derived from the `title` property in the configuration YAML file but you can override this by including a `name` property in the file. The `registry_url` is an internal URL that API Connect assigns to the registry.

After you have created your OIDC user registry, you must update your application registration with the third party OIDC provider to include the OIDC redirect URI; you can obtain this information by using the following command, which displays the details of the registry in the command window:

```
apic user-registries:get --server mgmt_endpoint_url --org organization_name registry_name --output -
```

The required `oidc_redirect_uri` value is in the `consumer:` section; for example:

```
consumer:
  oidc_redirect_uri: https://consumer.mycompany.com/consumer-api/oauth2/redirect
```

Enabling your OIDC registry in a Catalog

To make your OIDC registry available for onboarding and authenticating Developer Portal users, you must enable it in the Catalog that is associated with that Developer Portal. Complete the following steps:

1. Determine the URL of your OIDC user registry by using the following command:

```
apic user-registries:list --server mgmt_endpoint_url --org organization_name
```

2. Enter the following command (the terminating hyphen character means that the command takes input from the command line):

```
apic configured-catalog-user-registries:create --server mgmt_endpoint_url --org organization_name --catalog catalog_name -
```

where `catalog_name` is the value of the `name` property of the required Catalog. The command returns

```
Reading CONFIGURED_CATALOG_USER_REGISTRY_FILE arg from stdin
```

3. Enter the following data, followed by a new line:

```
user_registry_url: oidc_registry_url
```

where `oidc_registry_url` is the URL of your OIDC registry, obtained in step 1.

4. Press **CTRL D** to terminate the input.

For details of all the `apic user-registries` and `apic configured-catalog-user-registries` commands, see [apic user-registries](#) and [apic configured-catalog-user-registries](#).

You can also complete the operations described in this topic by using the API Connect REST APIs; see the [API Connect REST API documentation](#).

Modifying the configuration details for a user registry

You modify the configuration details for a user registry by using the User Registries page in the API Manager user interface of IBM® API Connect.

About this task

If you want to authenticate an API Connect Catalog with a user registry that is not yet defined in API Connect, you define the registry when you configure the Catalog; for details, see [Working with user registries](#).

Note: User registries shared from the Cloud Manager cannot be edited.

To modify the configuration details for a user registry that is already defined, you use the User Registries page.

Procedure

To modify the configuration details for a user registry, complete the following steps:

1. In the API Manager, click  Resources, and then select User Registries.
2. On the User Registries page, click the options icon  for the user registry that you want to edit, then click Edit. The details of the registry are displayed.
3. Modify the configuration details as required, then click Save to save your changes.

Password lockout criteria

You can be locked out of your account if you attempt to log in and fail consecutively.

Note: Account lock out applies only for local user registries.

The length of time that you are locked out of using the account is based on the number of consecutive attempts that you fail. The length of time increases as the number of consecutive failed attempts increases.

For example, you can be locked out for 15 seconds if you have five consecutive failed attempts, or 32 minutes for 12 consecutive failed attempts.

Note: External user registries, such as LDAP, might enforce their own lockout criteria.

Configuring a native OAuth provider

Native OAuth providers are configured and managed by you within your cloud.

About this task

A native OAuth provider object provides settings for OAuth processing operations such as generating and validating OAuth tokens. An OAuth provider object is referenced by an OAuth security definition to protect an API. When a native OAuth provider is used, the OAuth operations are performed natively by API Connect.

Every OAuth provider object has a backing API. Your configuration here automatically updates the OpenAPI document of the API. You can edit the OpenAPI document directly by navigating to the  Resources > OAuth Providers page, selecting your OAuth provider, then clicking API Editor.

Note: Take care when modifying the code directly on the Source tab of the API Editor because validation is limited. For example:

- If you change the name of auto generated assembly actions in the source code, the assembly will be prevented from updating dynamically when the OAuth provider settings are modified.
- You must ensure that the OAuth provider name matches the value specified in the `oauth-provider-settings-ref` field in each OAuth assembly action.

When a published API references an OAuth provider object, the backing API is automatically made available in the gateway.

Token requests and `client_id` checks:

If you are calling an OAuth endpoint, the sequence of `client_id` checks in the token request is as follows:

1. Check both body and query.
 - If found in only the body, validate and return a **200** or appropriate return code.
 - If found in only the query, return a **wrong location** error.
 - If found in both the body and the query, return a **more than one location** error.
2. When not found in the body or the query, check the **Authorization** header.
 - If found in this header, validate and return a **200** or appropriate return code.
3. Not found, return the appropriate error and code.

The best location for the `client_id` is in the request body.

One of the following roles is required to configure a native OAuth provider:

- Organization Administrator
- Owner
- Custom role with the Settings > Manage permissions

Note:

- The OAuth provider logs Analytics data for failure cases, but does not log successful cases. Activity log policies that call for logging of Analytics data upon success do not apply for the OAuth provider.
- You must ensure the OAuth Provider is configured in the Sandbox Catalog before using the OAuth Provider in a non-Sandbox Catalog.

Procedure

1. In the API Manager, click  Resources.
2. Click OAuth Providers > Add > Native OAuth provider.
 - a. Complete the following parameters for the first screen, then click Next.

Field	Description
Title	Enter a title for the native OAuth provider.
Name	This field is auto-populated by the system.
Description (optional)	Enter a brief description.
Base path (optional)	The base path is the URL segment of the API that is shared by all operations in the API. It does not include the host name or any additional segments for paths or operations. The base path must be unique for a given catalog. The base path cannot include special characters and must begin with a "/" character even if it is otherwise empty.
Gateway Type	Select the gateway type, either DataPower® Gateway (v5 compatible) or DataPower API Gateway. For information about types of gateways, see API Connect gateway types . OAuth Providers apply to one gateway type.

- b. In the next screen, enter the following additional configuration parameters, then click Next.

Field	Description
Authorize Path	<code>/oauth2/authorize/</code> is the standard OAuth endpoint to login to account
Token Path	<code>/oauth2/token/</code> is the standard OAuth endpoint to exchange code for access token.
Supported grant types	<ul style="list-style-type: none"> • Implicit - An access token is returned immediately without an extra authorization code exchange step. • Application - Application to application. Corresponds to the OAuth grant type "Client Credentials." Does not require User Security. • Access code - An authorization code is extracted from a URL and exchanged for an access code. Corresponds to the OAuth grant type "Authorization Code." • Resource owner - Password - The user's username and password are exchanged directly for an access token, so can only be used by first-party clients. • API Gateway only Resource owner - JWT - A verified signed JSON Web Token is exchanged directly for an access token.
Supported client types	<ul style="list-style-type: none"> • Confidential - Client can maintain secure credentials on a secure server • Public - Client credentials are not secure.

- c. Enter the scopes in the next screen. A scope becomes an option in the request and response for an access token. Click Add to add additional fields for scopes. Click Next when done.

Field	Description
sample_scope_1	Scope for token
additional scopes	Scope for token

- d. Enter the parameters for User Security in the next screen. Define the settings to use to extract the application users' credentials, authenticate their identities, and grant authorization. User Security is not required for the Application grant type. Click Next when done.

Field	Description
Identity Extraction	Determines how the user credential is extracted: <ul style="list-style-type: none"> • Basic Authentication - HTTP basic authentication (requires no additional configuration) • Default HTML Form - Use default login form for user name and password • API Gateway only Context variable - Specify which variable contains the user name and password. API Connect OAuth context variables as listed here API Connect context variables Note: DataPower API Gateway only. Not available for DataPower Gateway (v5 compatible). • Custom HTML Form - Enter the endpoint and select an optional TLS profile for a custom HTML form. For instructions on creating a custom form, see Creating a custom HTML login form for user security. • Redirect - Enter an endpoint to redirect to a third-party identity provider. For more information, see Authenticating and authorizing through a redirect URL. • API Gateway only Disabled - do not collect the user credential Note: If you use either the Default HTML Form or Redirect identity extraction methods, the response from the redirect endpoint must maintain the order of the query parameters before the <code>state_nonce</code> query parameter, otherwise the authorization fails.
Authentication	Authenticate application users with a user registry. Select an LDAP or Authentication URL user registry or create the SampleAuthURL User Registry. For a DataPower API Gateway, you have the option to disable authentication with a user registry.
Authorization	The following methods for extracting the user credential are available: <ul style="list-style-type: none"> • Authenticated - Authorize authenticated users automatically. • Default HTML Form - Use default HTML form to authorize. • Custom HTML Form - Enter the endpoint and select an optional TLS profile for a custom HTML form. For instructions on creating a custom form, see Creating a custom HTML authorization form for user security. • API Gateway only Disabled - Disable authorization.

3. Review the Summary for the native OAuth provider configuration.
4. Click Back to make changes.
5. Click Finish to save the basic configurations and to proceed to the Advanced Parameters for a native OAuth Provider.

Results

You can use the OAuth Provider to secure the APIs in catalog.

- [Configuring basic settings for a native OAuth provider](#)
You can update the identification details and basic configuration settings for a native OAuth provider.
- [Configuring scopes for a native OAuth provider](#)
Access tokens contain authorization for specific scopes.

- [Configuring user security for a native OAuth provider](#)
Define the settings to use to extract the application users' credentials, authenticate their identities, and grant authorization.
- [Configuring tokens for a native OAuth provider](#)
Set time to live for access tokens and refresh tokens, and a time period for maximum consent for all tokens.
- [Configuring token management and revocation for a native OAuth provider](#)
Select whether to use a native gateway (DataPower) or third party endpoint for token revocation.
- [Configuring introspection for a native OAuth provider](#)
Define an introspection path to allow the metadata for an access token to be examined.
- [Configuring metadata for a native OAuth provider](#)
Use Authentication URL or External URL parameters to request user-defined content from a remote server and include it in the access token or in the response payload that contains the access token.
- [Configuring the OIDC parameters for a native OAuth provider](#)
Open ID Connect (OIDC) provides an additional authentication protocol based on OAuth 2.0. OIDC provides user information encoded in a JSON Web Token, or JWT.
- [Editing a native OAuth provider by using the API Editor](#)
You can edit the source and assembly policies for the Native OAuth Provider using the API editor.

Configuring basic settings for a native OAuth provider

You can update the identification details and basic configuration settings for a native OAuth provider.

About this task

One of the following roles is required to configure the basic settings for a native OAuth Provider:

- Organization Administrator
- Owner
- Custom role with the Settings, Manage permissions

You can select the basis settings pages for a native OAuth provider immediately on completion of the creation operation detailed in [Configuring a native OAuth provider](#), or you can update the basic settings for an existing native OAuth provider. If you want to update the basic settings for an existing native OAuth provider, complete the following steps before following the procedure described in this topic:

1. Click  Resources, OAuth Providers.
2. Select the required native OAuth provider.

Procedure

1. To modify the identification details, click Info in the sidebar menu, then update the following fields as required:

Field	Description
Title	Enter a title for the native OAuth provider.
Name	This field is auto-populated by the system.
Description (optional)	Enter a brief description.
Base path (optional)	The base path is the URL segment of the API that is shared by all operations in the API. It does not include the host name or any additional segments for paths or operations. The base path must be unique for a given catalog. The base path cannot include special characters and must begin with a "/" character even if it is otherwise empty.

2. To modify the basic configuration settings, click Configuration in the sidebar menu, then update the following fields as required:

Field	Description
Authorize Path	/oauth2/authorize/ is the standard OAuth endpoint to login to account
Token Path	/oauth2/token/ is the standard OAuth endpoint to exchange code for access token.
Supported grant types	<ul style="list-style-type: none"> • Implicit - An access token is returned immediately without an extra authorization code exchange step. • Application - Application to application. Corresponds to the OAuth grant type "Client Credentials." Does not require User Security. • Access code - An authorization code is extracted from a URL and exchanged for an access code. Corresponds to the OAuth grant type "Authorization Code." • Resource owner - Password - The user's username and password are exchanged directly for an access token, so can only be used by first-party clients. •  Resource owner - JWT - A verified signed JSON Web Token is exchanged directly for an access token. Tip: Selecting only the Resource owner - JWT grant type when defining a native OAuth provider in the user interface is not supported and results in an invalid configuration. To avoid this problem, additionally select either the Access code or the Resource owner - Password grant type. <p>Note: If you plan to configure OpenID Connect (OIDC) for a native OAuth provider, you must include at least one of the following grant types: Implicit, Access code.</p>
Supported client types	<ul style="list-style-type: none"> • Confidential - Client can maintain secure credentials on a secure server • Public - Client credentials are not secure.

 Note: If the gateway type is DataPower® Gateway (v5 compatible) and, when the native OAuth provider was created, only the Application grant type was selected, you cannot add further grant types until you configure the user security settings. In particular, you must specify the user registry for authenticating application users. To configure the user security settings, complete the following steps:

- a. Click User Security in the sidebar menu, then click Edit.
 - b. Update the user security settings as required; for more details, see [Configuring user security for a native OAuth provider](#).
 - c. Click Save when done.
3. Click Save when done.

Configuring scopes for a native OAuth provider

Access tokens contain authorization for specific scopes.

About this task

The client applications can request only the scopes or a subset of the scopes that you define here. The scopes are included in the access tokens that are generated from the provider. When an OAuth protected API is invoked, the gateway checks the scopes carried in the access tokens against the list of allowed scopes in the security definition for the API to determine whether to grant access.

In addition, you can enforce advanced scope checks. The advanced scope check URLs are invoked after application authentication or after user authentication based on which URLs are configured. The final scope permission that is granted by the access token is the result of all scope checks.

Per IETF RFC 6749, the value of the scope parameter is a list of space-delimited, case-sensitive strings. For more information, see [The OAuth 2.0 Authorization Framework](#).

One of the following roles is required to configure scopes for a native OAuth Provider:

- Organization Administrator
- Owner
- Custom role with the Settings_>_Manage permissions

You can select the scope settings page for a native OAuth provider immediately on completion of the creation operation detailed in [Configuring a native OAuth provider](#), or you can update the scope settings for an existing native OAuth provider. If you want to update the scope settings for an existing native OAuth provider, complete the following steps before following the procedure described in this topic:

1. Click  Resources_>_OAuth Providers.
2. Select the required native OAuth provider.

Procedure

1. Click Scopes in the sidebar menu. The currently configured scopes are listed. Review and update the scopes as required.

Field	Description
sample_scope_1	Scope for token
additional scopes	Scope for token

In the Default scopes section, select the default scopes to be used if the API request doesn't contain any scopes. If no default scope is defined, and the request doesn't contain a scope, an invalid scope error is returned for the request.

If the user authorization method is set to Default HTML Form in the User Security settings, all scopes specified here are added automatically to the authorization consent form.

2. Advanced scope check before token generation. This setting specifies the scope check endpoint where additional scope verification is performed in addition to the basic scopes. The advanced scope check URLs are invoked after application authentication or after owner authentication based on which URLs are configured. The scopes are included in the token and will overwrite any previous scopes.

Field	Description
Application scope check	Allow extra verification by running a scope check from an endpoint. Enter the endpoint and an optional TLS Profile to use for an application scope check.
Owner scope check	Further refine the scope with an additional check. Enter the endpoint and an optional TLS Profile to use for an owner scope check.

For more information about scope, see [Scope](#)

3. Advanced scope check after token generation. This setting specifies an additional scope check at the API consumer level to verify compliance with the scope requirements of the API.

Field	Description
Enabled	Select the check box to enable the advanced scope check after token validation. Enter an optional default validator endpoint.
Use endpoint from API	Select the check box to use the endpoint from the API, or clear the check box to override the endpoint from the API.

For more information about scope, see [Scope](#)

4. Click Save when done.

Results

You can use the OAuth Provider with these scopes to secure the APIs in catalog.

Configuring user security for a native OAuth provider

Define the settings to use to extract the application users' credentials, authenticate their identities, and grant authorization.

About this task

User security authenticates the user. It is required for the Implicit, Access code, and Resource owner - Password grant types. It is not used for the Application or Resource owner - JWT grant types.

One of the following roles is required to configure user security for a native OAuth Provider:

- Organization Administrator

- Owner
- Custom role with the Settings_>Manage permissions

You can select the user security settings page for a native OAuth provider immediately on completion of the creation operation detailed in [Configuring a native OAuth provider](#), or you can update the user security settings for an existing native OAuth provider. If you want to update the user security settings for an existing native OAuth provider, complete the following steps before following the procedure described in this topic:

1. Click  Resources_>OAuth Providers.
2. Select the required native OAuth provider.

Procedure

1. Click User Security in the sidebar menu.
2. Specify the following parameters for User Security. Define the settings to use to extract the application users' credentials, authenticate their identities, and grant authorization. User Security is not required for the Application or Resource owner - JWT grant types. Click Next when done.

Field	Description
Identity Extraction	<p>Determines how the user credential is extracted:</p> <ul style="list-style-type: none"> • Basic Authentication - HTTP basic authentication (requires no additional configuration) • Default HTML Form - Use default login form for user name and password •  Context variable - Specify which variable contains the user name and password. API Connect OAuth context variables as listed here API Connect context variables • Custom HTML Form - Enter the endpoint and select an optional TLS profile for a custom HTML form. For instructions on creating a custom form, see Creating a custom HTML login form for user security. • Redirect - Enter an endpoint to redirect to a third-party identity provider. For more information, see Authenticating and authorizing through a redirect URL. •  Disabled - do not collect the user credential <p>Note: If you use either the Default HTML Form or Redirect identity extraction methods, the response from the redirect endpoint must maintain the order of the query parameters before the state_nonce query parameter, otherwise the authorization fails.</p>
Authentication	<p>Authenticate application users with a user registry. Select an LDAP or Authentication URL user registry or create the SampleAuthURL User Registry.</p>
Authorization	<p>Various methods may be used to authorize application users. For a DataPower® API Gateway, the following methods for extracting the user credential are available:</p> <ul style="list-style-type: none"> • Authenticated - Authorize authenticated users automatically. • Default HTML Form - Use default HTML form to authorize. If you select the Default HTML Form method, all scopes that are specified in the Scopes settings are added automatically to the authorization consent form. • Custom HTML Form - Enter the endpoint and select an optional TLS profile for a custom HTML form. •  Disabled - Disable authorization.

3. Click Save when done.

Results

You can use the OAuth Provider to secure the APIs in catalog.

Configuring tokens for a native OAuth provider

Set time to live for access tokens and refresh tokens, and a time period for maximum consent for all tokens.

About this task

Access tokens are granted to the client application to allow the application to access resources on behalf of the application user. Refresh tokens are issued to the client to obtain a new access token when the current access token becomes invalid or expires, or to obtain additional access tokens with identical or more narrow scope. You can also specify how long the consent given by the combination of any number of access and refresh token remains valid.

One of the following roles is required to configure tokens for a native OAuth Provider:

- Organization Administrator
- Owner
- Custom role with the Settings_>Manage permissions

You can select the token settings page for a native OAuth provider immediately on completion of the creation operation detailed in [Configuring a native OAuth provider](#), or you can update the token settings for an existing native OAuth provider. If you want to update the token settings for an existing native OAuth provider, complete the following steps before following the procedure described in this topic:

1. Click  Resources_>OAuth Providers.
2. Select the required native OAuth provider.

Procedure

1. Click Tokens in the sidebar menu.
2. Define the settings to configure tokens.

Field	Description
-------	-------------

Field	Description
Access tokens time to live	Enter the expiration time period in seconds for access tokens.
<input type="checkbox"/> API Gateway only One time use access token	Click the check box to enable one time use for the access token. Access tokens are multiple use by default which allows them to be used for multiple requests. When one time use is enabled, the access token will be consumed after one use. The OAuth flow will need to be repeated to obtain another access token. Note: If you select this option, you must also enable token management; see one of the following topics, depending on the user interface you are using: <ul style="list-style-type: none"> • Configuring token management and revocation for a native OAuth provider (Cloud Manager) • Configuring token management and revocation for a native OAuth provider (API Manager)
Refresh tokens	Click the check box to enable Refresh tokens. Set the Count to limit the number of times a refresh token can be issued. Set the Refresh Token Time to Live value to determine the time to live, or expiration time period, for each refresh token in seconds.
One time use refresh token	Clear the check box to disable one time use for the refresh tokens. Refresh tokens are one time use by default which allows them to be used one time only to generate an access token and a new refresh token. When refresh token one time use is disabled then the refresh token count is limited to one and the refresh token can be used multiple times to generate new access tokens, however, another refresh token will not be generated unless the initial OAuth flow (Authorization Code or Password) is repeated. Note: If you select this option, you must also enable token management; see one of the following topics, depending on the user interface you are using: <ul style="list-style-type: none"> • Configuring token management and revocation for a native OAuth provider (Cloud Manager) • Configuring token management and revocation for a native OAuth provider (API Manager)
Maximum consent	Click the check box to enable Maximum consent and enter the Maximum Consent Time to Live value in seconds. This is the time to live, or expiration time period, for all tokens, both access and refresh.
<input type="checkbox"/> API Gateway only Token secret	Click the check box to select the Shared Secret which was configured for the gateway. If no Shared Secret was entered in the Gateway Configuration, then enter a key name and key value to use as the token secret.
<input type="checkbox"/> API Gateway only Proof Key for Code Exchange	Proof Key for Code Exchange (PKCE) is a method to protect OAuth 2.0 public clients from an authorization code interception attack when they use Authorization Code grant requests. You can enable this extension when deploying with the DataPower® API Gateway. For more information, see RFC 7636 . Select the options for your OAuth Providers: <ul style="list-style-type: none"> • Enable proof key for code exchange If selected, enforces PKCE when submitted in Authorization Code grant requests. • Always required If selected, requires PKCE in all Authorization Code grant requests. • Allow plain Select this check box to allow the plain challenge method in Authorization Code grant requests.

3. Click Save when done.

Results

You can use the OAuth Provider to secure the APIs in a catalog.

Configuring token management and revocation for a native OAuth provider

Select whether to use a native gateway (DataPower) or third party endpoint for token revocation.

About this task

Token management enables you to prevent replay attacks by configuring token revocation. API Connect supports token revocation using a native gateway (DataPower) or a third party endpoint. For a native gateway, quota enforcement is used to manage tokens. For a third party endpoint, a URL to an external service is used to manage tokens.

For more information, see the IETF RFC 7009 [OAuth 2.0 Token Revocation](#).

Token management relies on gateway-peering to distribute the cache for revocation details within a gateway cluster node, and does not propagate across different gateway clusters. In order to enforce token management across different gateway clusters, you must use the external token store and set the Token Management Type to **External** in your native OAuth provider configuration.

One of the following roles is required to configure token management and revocation for a native OAuth Provider:

- Organization Administrator
- Owner
- Custom role with the Settings_>Manage permissions

You can select the token management settings page for a native OAuth provider immediately on completion of the creation operation detailed in [Configuring a native OAuth provider](#), or you can update the token management settings for an existing native OAuth provider. If you want to update the token management settings for an existing native OAuth provider, complete the following steps before following the procedure described in this topic:

1. Click  Resources_>OAuth Providers.
2. Select the required native OAuth provider.

Procedure

1. Select Token Management in the sidebar menu.

2. Enable token management by selecting the check box.
3. From the Type list, select either Native or External. Native points to DataPower as the token storage location; External points to a revocation URL for token storage.
Note: If you are using the API Manager user interface then, for the External option to be available, you must be using DataPower® API Gateway Version 10.0.1.0 or later, and the gateway service must be enabled in the Sandbox Catalog; for details on how to enable a gateway service in a Catalog, see [Creating and configuring Catalogs](#).
4. For Native, select one or both of the Resource owner revocation path and Client revocation path.
 - Resource owner revocation path - Uses the standard OAuth revocation path to allow the resource owner (end user) to revoke the application permission.
 - Client revocation path - Uses the standard OAuth revocation path to allow the client (application) to revoke a single token when the application closes.For more information about managing tokens with the Native DataPower Gateway, see [Token management with the native DataPower Gateway](#).
5. For External, the settings depend on the gateway type, as follows:
 - DataPower API Gateway:
 - Endpoint - the URL of the external management endpoint.
 - TLS Client Profile (optional) - the TLS client profile to secure connections.
 - Security - how to secure connections. The only supported method is basic authentication.
 - Basic authentication username (optional) - the user name for authentication.
 - Basic authentication password (optional) - the password for authentication.
 - Basic authentication request header name (optional) - the request header that contains the authentication string; if you supply both a request header name and user name/password, the request header authentication method is used.
 - Custom header pattern (optional) - the name pattern of the headers to use for sending additional information to the external management service.
 - Cache type - the cache type to control whether and how to cache positive responses. If you select Time to live, specify how long to keep responses in the cache; the default value is 900 seconds.
 - Fail on error - if selected, processing is stopped if the connection to the external management service fails.
 - Note: For details of the JSON format that is required when exchanging messages with the external management service, see [JSON format to exchange messages with the external management service](#).
 - DataPower Gateway (v5 compatible):
 - Endpoint - Enter the URL to an external web server that contains information about access or refresh tokens. API Connect calls the URL to determine if the associated token can be trusted. The token server then checks a token *blocklist* (a data store of inactive tokens) to ensure that the token is still valid. If the token is still valid, API Connect continues the processing. For more information see [Token revocation](#).
 - TLS Client Profile - Select a TLS profile to verify the external endpoint.
6. Click Save when done.

Results

You can use the OAuth Provider to secure the APIs in a catalog.

Configuring introspection for a native OAuth provider

Define an introspection path to allow the metadata for an access token to be examined.

About this task

Token introspection allows an authorized holder of an access token to examine the contents of tokens using an introspection path. The access token to introspect must be obtained through the native OAuth provider. Introspection provides context for the token by allowing an authorized protected resource to query the authorization server to determine the set of metadata for a given token. The metadata includes whether or not the token is currently active, the scopes assigned to the token, and the authorization context in which the token was granted (including who authorized the token and which client it was issued to). API Connect token introspection conforms to IETF RFC 7662. See [OAuth 2.0 Token Introspection](#).

One of the following roles is required to enable introspection for a native OAuth Provider:

- Organization Administrator
- Owner
- Custom role with the Settings_>_Manage permissions

You can select the introspection settings page for a native OAuth provider immediately on completion of the creation operation detailed in [Configuring a native OAuth provider](#), or you can update the introspection settings for an existing native OAuth provider. If you want to update the introspection settings for an existing native OAuth provider, complete the following steps before following the procedure described in this topic:

1. Click  Resources > OAuth Providers.
2. Select the required native OAuth provider.

Procedure

1. Click Introspection in the sidebar menu.
2. Select the check box to enable Introspection. The OAuth standard path for introspection, /oauth2/introspect is automatically entered. This path will be used when another entity inspects the token contents.
3. Click Save when done.

Results

Tokens will be queried using the /oauth2/introspect path. You can use the OAuth Provider to secure the APIs in a catalog.

Configuring metadata for a native OAuth provider

Use Authentication URL or External URL parameters to request user-defined content from a remote server and include it in the access token or in the response payload that contains the access token.

About this task

Configure an Authentication URL or an External URL from which custom metadata is collected for inclusion in the token. The metadata is either stored inside the access token or it is sent along with the access token to the client application. For more information about how the metadata is collected, see [OAuth external URL and authentication URL](#).

Following are examples of metadata that can be included with the access token:

- Metadata about the authenticated resource owner
- Grant type that was used to obtain the token
- A confirmation code to be provided to the client application

One of the following roles is required to configure metadata collection for a native OAuth Provider:

- Organization Administrator
- Owner
- Custom role with the Settings_>Manage permissions

You can select the metadata settings page for a native OAuth provider immediately on completion of the creation operation detailed in [Configuring a native OAuth provider](#), or you can update the metadata settings for an existing native OAuth provider. If you want to update the metadata settings for an existing native OAuth provider, complete the following steps before following the procedure described in this topic:

1. Click  Resources_>OAuth Providers.
2. Select the required native OAuth provider.

Procedure

1. Click Metadata in the sidebar menu.
2. Select Collect metadata to enable metadata collection.
3. The Authentication URL user registry is selected by default and is required. For more information about the Authentication URL, see [Authentication URL user registry](#).
4. Select the External URL to collect metadata from an external URL. Enter the endpoint and an option TLS Client Profile.
5.  If required, override the default Header name token value. The value of this header, if returned in the response from the OAuth endpoint, is placed in the response payload and indicated as **metadata**.
6.  If required, override the default Header name payload value. The value of this header, if returned in the response from the OAuth endpoint, is placed within the access token and indicated as **miscinfo**.
7. Save the OAuth Provider.
8. Click Save when done.

Results

You can use the OAuth Provider to secure the APIs in a catalog.

Configuring the OIDC parameters for a native OAuth provider

Open ID Connect (OIDC) provides an additional authentication protocol based on OAuth 2.0. OIDC provides user information encoded in a JSON Web Token, or JWT.

About this task

When you enable OpenID connect, a template is provided for generating ID tokens along with access tokens and the required assembly policies are automatically created. You can customize the policies to suit your needs in the API Editor. The sample key provided is for test purposes only and is used to sign the JWT token.

One of the following roles is required to configure an OIDC template for a native OAuth Provider:

- Organization Administrator
- Owner
- Custom role with the System_>Manage permissions

Note: You can configure OIDC parameters only if the selected grant types for the native OAuth provider include at least one of the Implicit or Access code grant types; see [Configuring basic settings for a native OAuth provider](#).

You can select the OIDC settings page for a native OAuth provider immediately on completion of the creation operation detailed in [Configuring a native OAuth provider](#), or you can update the OIDC settings for an existing native OAuth provider. If you want to update the OIDC settings for an existing native OAuth provider, complete the following steps before following the procedure described in this topic:

1. Click  Resources_>OAuth Providers.
2. Select the required native OAuth provider.

Procedure

1. Click OpenID Connect in the sidebar menu.
2. Select the initial check box to configure an OIDC Template. Enter the following parameters:

Field	Description
API Gateway only Support hybrid response types (optional)	Select the response types for the OpenID Connect hybrid flow to be supported by this OAuth provider.
API Gateway only OpenId Connect URL	Optionally specify a URL that is exposed by the provider and allows a client to send a request for information about the provider's publicly visible configuration. If you select the provider in the OIDC security definition for an OpenAPI 3 API, this URL is configured for you based on that information.
DataPower Gateway (v5 compatible) only ID token issuer	Descriptive text to indicate the source of the key.
DataPower Gateway (v5 compatible) only ID token signing key	Specify the JSON Web Key (JWK) to be used to sign the ID token.
DataPower Gateway (v5 compatible) only ID token signing algorithm	Select the algorithm used to sign the token.

3. Click Save when done. You can edit the policies by using the API Editor.

Results

You can use the OAuth Provider to secure the APIs in a catalog.

Editing a native OAuth provider by using the API Editor

You can edit the source and assembly policies for the Native OAuth Provider using the API editor.

About this task

If you have configured an OIDC template, you can customize it in API Editor. In the API Editor, the Source tab allows you to edit the code for the configuration using a text editor. The API Assemble tab provides a graphical drag-and-drop editor (identical to the one in API Manager) that allows you to add additional elements to the assembly for the OAuth Provider.

Note: Take care when modifying the code directly on the Source tab of the API Editor because validation is limited. For example:

- If you change the name of auto generated assembly actions in the source code, the assembly will be prevented from updating dynamically when the OAuth provider settings are modified.
- You must ensure that the OAuth provider name matches the value specified in the `oauth-provider-settings-ref` field in each OAuth assembly action.

One of the following roles is required to configure tokens for a native OAuth Provider:

- Organization Administrator
- Owner
- Custom role with the Settings_>Manage permissions

You can modify the native OAuth provider configuration by selecting the API Editor page immediately on completion of the creation operation detailed in [Configuring a native OAuth provider](#), or you can update the configuration for an existing native OAuth provider. If you want to update the configuration for an existing native OAuth provider, complete the following steps before following the procedure described in this topic:

1. Click  Resources > OAuth Providers.
2. Select the required native OAuth provider.

Procedure

1. Click API Editor in the sidebar menu.
2. In the Source tab, view and edit the policies to customize the behavior for the OAuth provider.
3. In the API Assemble tab, use the drag and drop editor to add additional policies to the OIDC behavior.

Note: If you add a policy that references a TLS profile, an `invoke` policy for example, then when you publish an API that uses this OAuth provider, you must ensure that the TLS profile is enabled for the Catalog to which you publish the API. For details on how to enable a TLS profile in a Catalog, see [Creating and configuring Catalogs](#).
4. Save the edits.
5. Click Save when done.

Results

You can use the OAuth Provider to secure the APIs in a catalog.

Configuring a third-party OAuth provider

Enter the secure endpoints to provide OAuth authentication from a third party.

About this task

One of the following roles is required to configure OAuth Providers:

- Organization Administrator
- Owner
- Custom role with the Settings > Manage permissions

Procedure

1. In the API Manager, click  Resources.
2. Select OAuth Providers > Add > Third party OAuth Provider.
 - a. Complete the following parameters for the first screen and click Next.

Field	Description
Title	Enter a descriptive title for the gateway service. This title will be displayed on the screen.
Name	This field is auto-populated by the system and used as the internal field name.
Supported grant types	Select from the following options: <ul style="list-style-type: none"> • Implicit: An access token is returned immediately without an extra authorization code exchange step. • Application: Application to application. Corresponds to the OAuth grant type Client Credentials. Does not require User Security. • Access code: An authorization code is extracted from a URL and exchanged for an access code. Corresponds to the OAuth grant type Authorization Code. • Resource owner - Password: The user's username and password are exchanged directly for an access token, so can only be used by first-party clients. •  Resource owner - JWT: a JSON Web Token (JWT) Bearer Token is used as a means for requesting an OAuth 2.0 access token, and for client authentication, as defined by the JSON Web Token (JWT) Profile for OAuth 2.0 Client Authentication and Authorization Grants.
Gateway type	Select the gateway type, either DataPower® Gateway (v5 compatible) or DataPower API Gateway. For information about types of gateways, see API Connect gateway types . OAuth Providers apply to one gateway type.

- b. Specify configuration settings for the endpoints.

Field	Description
Authorization URL	An authorization URL where the resource owner grants authorization to the client application to access a protected resource. Example: <code>https://example.com/oauth2/authorize</code>
Token URL	A token request URL where the client application exchanges an authorization grant for an access token. Example: <code>https://example.com/oauth2/token</code>
Introspect URL	The introspection URL is where the API gateway validates the access tokens that are issued by the third party provider. Example: <code>https://example.com/oauth2/introspect</code> For more information on integrating third party OAuth providers for introspection, see OAuth introspection for third-party OAuth providers .
 Introspect cache type	The cache type determines how long responses from the third party provider are cached, if at all. Select one of the following options: <ul style="list-style-type: none"> • No cache (default): Responses are not cached. • Protocol: Defined by the <code>cache-control</code> header in the provider response. • Time to live: Defined by the provider.
 Cache Time to Live	The length of time, in seconds, for which provider responses are cached, if the Introspect cache type is set to Time to live. The default value is 900.
TLS Profile (optional)	Select an optional TLS profile for communicating with the third party provider.
Security	Default is Basic Authentication.
Basic authentication request header name	The <code>x-introspect-basic-authorization-header</code> is available to provide a user-configured HTTP Basic authorization header.
 Basic authentication username (optional)	The default user name for HTTP Basic authentication.
 Basic authentication password (optional)	The default password for HTTP Basic authentication.
 Token validation	Specifies the method used to determine the success of the introspection request that is sent to the third party service to validate the provided token. Select one of the following options: <ul style="list-style-type: none"> • Connected: The query is successful if the status return code is <code>200</code>. • Active (default): The query is successful if the status return code is <code>200</code> and the response JSON body includes the property <code>active</code>: <code>true</code>.
 Custom header pattern (optional)	A regular expression for request headers that are to be passed to the third-party provider; for example, <code>x-Introspect-*</code> .
 Authorization header pass through	Select this check box if you want to retain the Authorization header for a bearer token. The default behavior is to remove this header.

- c. Enter the scopes in the third screen. A scope becomes an option in the request and response for an access token. Click Add to add additional fields for scopes. Click Next when done.

Field	Description
sample_scope_1	Scope for token
sample_scope_2	Scope for token
additional scopes	Scope for token

- d. Review the settings on the Summary panel.
3. Click Save and Edit to complete the configuration.

OAuth concepts for API Connect

OAuth is a token-based authorization protocol that allows third-party websites or applications to access user data without requiring the user to share personal information.

Note: In a multi-node cluster, OAuth operations will fail if quorum is lost. Quorum requires that the number of active nodes is greater than 50% of the total number of nodes in the cluster.

- [OAuth user scenario](#)
Potential users of OAuth with IBM® API Connect have a number of methods to secure their API. The following scenario provides an overview of the available options.
- [OAuth introspection for third-party OAuth providers](#)
OAuth token validation can be offloaded to the third-party Open Authorization (OAuth)/Open ID Connect (OIDC) provider by using the Introspection URL. Clients can use a third-party OAuth or OIDC provider to obtain a token that is protected by IBM API Connect. IBM API Connect can use this feature along with the mentioned provider to protect access to the API.
- [OAuth external URL and authentication URL](#)
You can use the Authentication URL or External URL parameters to request user-defined content from a remote server and include it in the access token or in the response payload that contains the access token.
- [Scope](#)
Per IETF RFC 6749, the value of the scope parameter is expressed as a list of space-delimited, case-sensitive strings.
- [Tokens](#)
Tokens can be managed using refresh tokens and revocation URLs. You can extend the life of tokens using refresh tokens. You can end the life of a token by specifying a revocation URL.
- [Authentication URL user registry](#)
You can use an Authentication URL user registry to specify a REST authentication service that manages user authentication, and optionally provides additional metadata to be embedded in the token.
- [Custom forms for user security](#)
You can create custom forms for the authorization and identity extraction phase of OAuth.
- [Securing an API with a JSON Web Token](#)
There are two methods to secure your API with a JSON Web Token. You can use the `jwt-generate` command, or you can use a token that has been generated external to IBM API Connect.
- [Troubleshooting OAuth](#)
You can find the answers to some common questions in the Developer Portal, or in support communities and forums in DeveloperWorks, on GitHub, or on YouTube.

OAuth user scenario

Potential users of OAuth with IBM® API Connect have a number of methods to secure their API. The following scenario provides an overview of the available options.

Scenario overview

In this scenario, Alice is a user of an application. Alice can grant permission for an application to access specific information about Alice in a third-party system that is using OAuth. Depending on the type of OAuth that is supported by the target service, Alice does not enter her user name and password into the application. Instead, the application receives an access token that represents her credentials (user name and password). The application can now access the information about Alice in the target system.

For example, Alice maintains a list of books that she reads on a service that is provided by mybooks.com. Following the purchase of a smartphone, Alice installs an application on her new phone to display the book details. The phone application wants to call an API provided by mybooks.com, which can access the information. The mybooks.com API is secured by using the OAuth protocol.

To access the book details, the application must complete a two-step process:

1. The application must first obtain permission from Alice.
2. The application then uses that permission to call the target service and obtain the list of books.

In the first step, the application typically directs Alice to the provider of the target service, mybooks.com. Alice provides her user name and password, and gives permission for the application to access her information. It is important that Alice trusts that she is providing her credentials to the provider of the target service and not to an untrusted proxy application. For example, by checking that the security certificate of the website where Alice enters her credentials matches what Alice expects from the provider of the target service.

The result of this step is the access token that the application can use to call the API. The application then generates the appropriately formatted OAuth request. For example, the Authorization header, or HTTP query parameters, which includes the access token, consumer key, and signature method that are required by OAuth. This OAuth request is used to invoke the API proxy operation.

Scenario within API Connect

No changes to the definition of your API operation are required to support this scenario.

1. Alice grants permission for the application to access her information *before* the invocation of the API.
2. When the application provides the Authorization header, or query parameters, containing the OAuth details about the call to the operation endpoint, the header is automatically passed through to the target service without any additional configuration.

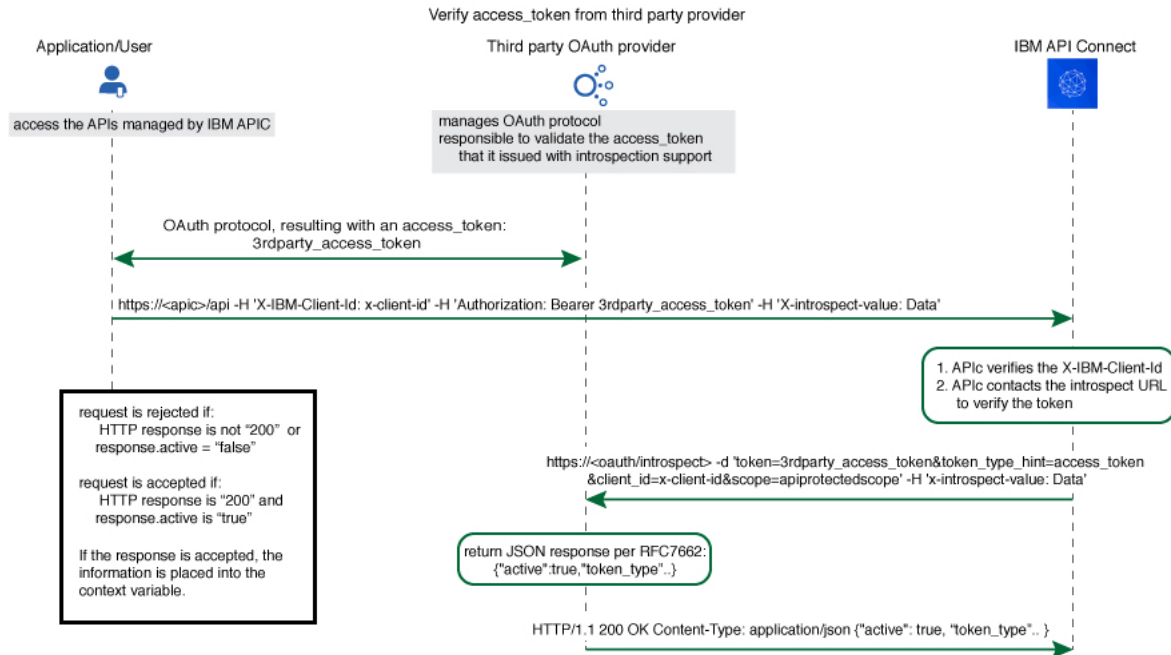

OAuth introspection for third-party OAuth providers

OAuth token validation can be offloaded to the third-party Open Authorization (OAuth)/Open ID Connect (OIDC) provider by using the Introspection URL. Clients can use a third-party OAuth or OIDC provider to obtain a token that is protected by IBM API Connect. IBM® API Connect can use this feature along with the mentioned provider to protect access to the API.

You can use API Connect to protect an API that is secured by using the third-party OAuth access token in accordance with Introspection specification as defined in [RFC 7662](#). In addition to the specification, the `x-Introspect-` header is provided to pass other content to the third party as you require.

Authentication information can be carried in the request by configuring a basic authentication request header.

The following sequence diagram depicts the overall flow of request and response. The purpose of this diagram is only to provide a general visualization of the nature of the flow; for the precise details, refer to the explanatory information after the diagram.

The Introspect URL is configured in the Third Party OAuth provider configuration. See [Configuring a third-party OAuth provider](#).

When an API is protected by a third-party OAuth provider, API Connect will extract the bearer token and issue an HTTP POST request to the endpoint specified in the Introspect URL field.

The GET request is protected by API Connect with this feature.

You can use a header prefix to pass information to the third-party provider. The header prefix can include a regular expression and specifies the name pattern of the headers to use for sending additional information, such as `x-introspect-*`.

```
GET /petstore/pet/123 HTTP/1.1
Host: apiconnect.com
x-Introspect-type: dog
x-Introspect-name: simon
x-custom-apic: petstore123
Authorization: Bearer tGzv3JOkF0XG5Qx2TlKWIA
x-IBM-Client-Id: xxx-xxx
```

However, if you want to use a different header prefix, specify the required value in the Custom header pattern field in the third party OAuth provider configuration. For third-party OAuth provider configuration details, see [Configuring a third-party OAuth provider](#). The Custom header pattern feature is available only with the DataPower® API Gateway, if you are using the DataPower Gateway (v5 compatible) the header prefix must be `x-Introspect-`.

API Connect will issue this POST request to the introspection endpoint specified in `x-tokenIntrospect`, as illustrated in the code sample:

```
POST /oauth/introspectURL HTTP/1.1
Host: apiconnect.ibm.com
Content-Type: application/x-www-form-urlencoded
x-Introspect-type: dog
x-Introspect-name: simon
x-custom-apic: petstore123
token_type_hint=access_token&token=tGzv3JOkF0XG5Qx2TlKWIA
```

The third party OAuth/OIDC provider will respond with HTTP 200 indicating the request was successful and that payload contains the token information. API Connect honors the active claim as defined in the RFC specification.

If the value of the active claim is `true`, the token is treated as valid.

```
HTTP/1.1 200 OK
Content-Type: application/json;charset=UTF-8
Cache-Control: no-store
Pragma: no-cache
```

```
{
  "active": true,
  "token_type": "bearer",
  "client_id": "xxx-xxx",
  "username": "John Smith",
  ...
}
```

If the value of the active claim is `false`, the token is treated as invalid.

```
HTTP/1.1 200 OK
Content-Type: application/json;charset=UTF-8
Cache-Control: no-store
Pragma: no-cache
```

```
{
  "active": false
}
```

A response code other than **HTTP 200** indicates failure to process the request.

When the OAuth token is valid and active, context variables are populated with information from the introspect JSON response. For more information, see [API Connect context variables](#).

When contacting the introspection endpoint, API Connect uses `client_id/appId` and `client_secret/appSecret` to construct the HTTP Basic authorization header.

By default, if `x-introspect-basic-authorization-header` exists in the request, the value is used for the HTTP Basic authentication header when the introspection endpoint is contacted. API Connect verifies that the HTTP Basic authentication header value is Base64 encoded before it is sent, and encodes it if necessary as shown in the following example. If the header is already encoded, it is sent without modification.

```
GET /petstore/pet/123 HTTP/1.1
Host: apiconnect.com
x-introspect-basic-authorization-header: user:password
```

API Connect issues the following:

```
POST ..
Authorization: Basic M3JkLXBhcnR5LWNaWVudF9pZDozcmQtcGFydH1fY2xpZW50X3N1Y3JldA==token_type_hint=access_token&token= ..
```

If you are using the DataPower API Gateway, you can specify your own value for the HTTP Basic authentication header by providing the required value in the Basic authentication request header name field in the third party OAuth provider configuration. The following rules determine what authentication data is passed to the introspection endpoint:

- If there is a basic authentication header in the request, the specified credentials are used. The value must be either a string in the format `user:password`, or the Base64 encoded equivalent; API Connect will Base64 encode the value if necessary before sending the request to the introspection endpoint.
- If there is no basic authentication header in the request but there are values specified in the Basic authentication username and Basic authentication password fields in the third party OAuth provider configuration, those values are used.
- If there is no basic authentication header in the request, and user name and password details are not supplied in the third party OAuth provider configuration, but `client_id` and `client_secret` values are supplied in the body of the request, these are used.
- Otherwise, an error is returned.

For third-party OAuth provider configuration details, see [Configuring a third-party OAuth provider](#).

If either, or both, of `scope` and `scope validate url` are configured, and if the response is an active token with a scope claim from the third-party OAuth Provider introspection endpoint, API Connect will further enforce the scope validation in the following order:

1. If `scope` is configured for the OAuth API protection, verify the third-party scope against the scope that is configured.
2. If `scope validation url` is configured, verify the third-party scope against the scope validation URL.
3. If the third-party OAuth provider introspection endpoint does not return a scope, the Gateway will not check the scope defined in the security definition of the API where the third-party OAuth provider resource is used. For details on configuring an OAuth security definition in an API, see [Creating an OAuth security definition](#).

For more information, see [Scope](#).

DataPower Gateway (v5 compatible) only By default the API Connect client ID and scope are sent to the third party OAuth provider. You can suppress this behavior in either of the following ways:

- Supply a `suppress-parameters` header as follows:

```
suppress-parameters: client_id
suppress-parameters: scope
```

or

```
suppress-parameters: client_id scope
```

depending on which parameters you want to suppress.

- Define an API property called `suppress-parameters` in the API definition itself, with one of the following string values:

```
client_id
```

```
scope
```

or

```
client_id scope
```

depending on which parameters you want to suppress. For information on how to define API properties, see [Setting API properties](#).

OAuth external URL and authentication URL

You can use the Authentication URL or External URL parameters to request user-defined content from a remote server and include it in the access token or in the response payload that contains the access token.

Including custom metadata in a token

In many scenarios, custom metadata needs to be included during the access token generation process. The metadata is either stored inside the access token or it is sent along with the access token to the client application. The client application can then send that access token, or the metadata in the payload, in a subsequent request to IBM® API Connect where the metadata is retrieved, validated, or sent to the downstream systems as required.

Examples include, but are not limited to:

- When resource owners are authenticated, metadata about the authenticated resource owner needs to be stored within the access token.
- The grant type that was used to obtain the token is another example of metadata stored within the access token.
- A confirmation code that needs to be sent to the client application along with access token is stored as metadata within the access token.

Configuring External URL or Authentication URL in API Connect to obtain metadata

Metadata can be set by using either or both of the following URLs:

- External URL - When you call the External URL, an HTTP GET request is sent and API Connect expects an HTTP 200 OK along with an optional set of the specified response headers.
- Authentication URL - When you call the Authentication URL, the API Connect gateway sends a GET request with HTTP headers and then processes any HTTP response from the URL. For authentication, a REST authentication service is expected at the Authentication URL.
See: [Authentication URL](#).

The External URL endpoint is entered in the Metadata section when you configure an OAuth Provider in the Cloud Manager or API Manager UI.

Use the following HTTP headers in the response, depending on the type of gateway you are using:

- DataPower® API Gateway:

X-API-OAUTH-METADATA-FOR-PAYLOAD

X-API-OAUTH-METADATA-FOR-ACCESSTOKEN

Note: These are the default header names for the DataPower API Gateway but you can override them; see [Configuring metadata for a native OAuth provider](#).

- DataPower Gateway (v5 compatible):

API-OAUTH-METADATA-FOR-PAYLOAD

API-OAUTH-METADATA-FOR-ACCESSTOKEN

The response header value from **X-API-OAUTH-METADATA-FOR-PAYLOAD** or **API-OAUTH-METADATA-FOR-PAYLOAD** is placed in the response payload and indicated as **metadata**.

The response header value from **X-API-OAUTH-METADATA-FOR-ACCESSTOKEN** or **API-OAUTH-METADATA-FOR-ACCESSTOKEN** is placed within the access token and indicated as **miscinfo**.

The two metadata response headers are case insensitive and you must escape any special characters in the string value content.

An example response payload that contains metadata along with the access token:

```
{
  "token_type": "bearer",
  "access_token": "AAEkNzhjDHYyyYy...cL0Mv6ct137w7ZU",
  "metadata": "m:metadata-for-payload_content",
  "expires_in": 3600,
  "scope": "read",
  "refresh_token": "AAEnj5SynCMYbF...oEZ6JjxYax_HdNg",
}
```

This example output from the token introspection endpoint shows the contents of the access token with **miscinfo** containing the metadata information.

```
{
  "active": true,
  "token_type": "bearer",
  "client_id": "78c2f10f-799a-4e1f-8e0a-098634997a35",
  "username": "Fred Smith",
  "sub": "fred",
  "exp": 1479850049,
  "expstr": "2016-11-22T21:27:29Z",
  "iat": 1479846449,
  "nbf": 1479846449,
  "nbfstr": "2016-11-22T20:27:29Z",
  "scope": "read",
  "miscinfo": "m:metadata-for-accesstoken_content",
  "client_name": "MobileApp"
}
```

Input to the External URL

The following request headers are sent to the External URL.

Note: Any existing metadata values that were previously sent from the Authentication URL are also sent in the two request headers **x-existing-metadata-for-payload** and **x-existing-metadata-for-access-token**. The Metadata URL can make use of this information to create a new set of metadata values. The two request headers that are sent to the Metadata URL are displayed in bold text.

```
X-existing-metadata-for-payload    payload-from-auth-url
X-existing-metadata-for-access-token    token-from-auth-url
X-URI-in    /org/env/miscinfo/oauth2/token (the URL that was sent to APIConnect for this particular token request)
X-METHOD-in    POST
X-POST-Body-in    client_id=client_id&grant_type=password&scope=read&username=name&password=password
X-X-Client-IP    IP_address
X-X-Global-Transaction-ID    ID_number
...
```

Note: If you are using the DataPower API Gateway rather than the DataPower Gateway (v5 compatible), the **X-POST-Body-in** header is not supported.

Retrieving Metadata in API Connect

As described in the previous example scenarios, the metadata can be retrieved from the access token in the Application API and sent to the downstream systems. Retrieval can be done in the API assembly, which is secured to accept tokens in the security definitions.

In the resource API that accepts an access token, the **miscinfo** field can be accessed in the Assembly with the **oauth.miscinfo** context variable, as in the example.

```
apim.setvariable('message.body', apim.getvariable('oauth.miscinfo'));
```

You can also use token introspection to look at the contents of the access token.

Refresh tokens and metadata

The Authentication URL (if configured for authentication) is invoked first, during authentication of the resource owner. The External URL is invoked as the last step, just before the generation of the access token. The only exception is when access tokens are generated from a refresh token. In cases where refresh tokens are used to generate new access tokens, the External URL is not invoked. The metadata from the refresh token is retained and then copied into the newly generated access token.

Identifying the source of the metadata

The metadata is prefixed with keywords to indicate whether it originated from the External URL or the Authentication URL.

- Metadata from the External URL is prefixed with **m**:
- Metadata from the Authentication URL is prefixed with **a**:

Note: When revocation is enabled, some internal details are also stored in the **miscinfo** field, in brackets within the access token as shown in the following example:

```
"miscinfo": "[tlsprofile@https://api-revoke-url:443/server/revocation-url]m:metadata-for-accesstoken_content"
```

Maximum size of the metadata

Metadata for the access token cannot exceed 512 bytes.

Metadata for the payload does not have a specific size restriction, except for when you use the Authorization code grant type. These restrictions are described in following sections.

Characters are not allowed in metadata in certain scenarios

When you use the Authorization code grant type, or when a consent form is used for implicit grant type, there is a temporary state or code where the metadata from the authentication URL is stored. API Connect internally uses two prefixes - **!ma** and **!mp** to differentiate between payload and token metadata received from the Authentication URL and store them internally in the temporary state/code. Hence these specific character sequences - **!ma** and **!mp** should not be used as the metadata itself.

Grant types and metadata

The OAuth grant types described in the following sections include **authorization code** (**access code**), **implicit**, and **client credentials** (**application**).

Authorization code grant type

- When metadata is included from an Authentication URL for an Authorization code grant type, as it is a three legged flow, both the content and the payload are stored within the **dp-state** and carried on to the authorization code and to the access token. Note that around 10 characters are used internally to differentiate between the metadata for payload and metadata for the access token when stored in the **dp-state**. In addition, if revocation is enabled, that will also be part of the token metadata. Hence the combined size of the token metadata, the payload metadata (including the 10 characters of internal data), and internal revocation details, cannot exceed 512 bytes in total.

If the overall size of the metadata exceeds 512 bytes, then the access token generation succeeds, but the metadata fields contain an error message of "metadata too large" as shown in the example.

```
"metadata": "m:error: metadata too large for AZ code grant type[Authorization Code-metadata-url-payload]"
"miscinfo": "[r:gateway]m:error: metadata too large for AZ code grant type[Authorization Code-metadata-url-token]"
```

This size restriction can be overcome when the metadata is sent from the Metadata URL and not from the Authentication URL, because the metadata is not stored in `dp-state` or in the authorization code.

Example of the `authorization code (access code)` grant type:

```
$ curl -k -d
"grant_type=authorization_code&code=$mycode&client_id=$myid&scope=scope_introspect&redirect_uri="
https://9.70.153.90/fei/sb/introspectpl/oauth2/token
{ "token_type": "bearer",
  "access_token": "AAEkOTh1ZDhhNjYtYtQ1ZS00YTMzLWE0N2QtZmE2OGZkMzQ0NzQ2OZn5T1_TqYFeIfB7BFf6HFgibEoOjWXXEA84oFsWuE4NY-
RRZVdnGSaXAIYJz7s5vczfk5EV-BIb_6P_1YKm3ahrfrhR5kI3sPO0uADEoseIP5-09anUpEM5yhsayXvZbJ_6VDYz-hyXSJHTNqVj-
PHBialoRkBD5qca6k00fV2M", "metadata": "a:[Authorization Code-Test-auth-url-payload]", "expires_in": 3600,
  "scope": "scope_introspect", "refresh_token": "AAFAG1EVMbwicr_L0FTZ4q6HZ-
RcQygniXFC9zbSKO4wd3hcnic4KQX21X0fL2c8cnmzCZgws8xxxLzNyfjQhUJNG15C1GbIe3dwhXJdiWA0Go-
dudhVtCbG26sJRRXyYrMeRwWnJsy1BETPI8HQEN4a_D7fmXKcTVRZBvq86byg95qelZKyERI0Lhxdd_O4Nvss" }

$ curl -k -H "X-IBM-Client-Id: $myid" -H "X-IBM-Client-Secret: $mysecret" -d
"token_type_hint=access_token&token=$mytoken" https://9.70.153.90/fei/sb/introspectpl/oauth2/introspect
{ "active": true, "token_type": "bearer", "client_id": "98ed8a66-a45e-4a33-a47d-fa68fd344746", "username": "anyuser",
  "sub": "anyuser", "exp": 1484766368, "expstr": "2017-01-18T19:06:08Z", "iat": 1484762768, "nbf": 1484762768,

Test-auth-url-token]", "client_name": "oauth_app" }
```

Client credentials grant type

Authentication URL will not be invoked when using client credentials grant type, as there is no resource owner. The metadata from Authentication URL is not available for this grant type. However, content returned from Metadata URL will be included as metadata.

Behavior when retrieving metadata with both an External URL and an Authentication URL

If an External URL is configured and a connection to the external server is successful, the response headers overwrite any existing metadata obtained from the Authentication URL to become the final value. Therefore, you must carefully examine the incoming request headers and create appropriate response headers from the External URL.

If an External URL is configured, but the connection to the External URL fails, then a failure message of "error on metadata url" is written for metadata in both the payload and the access token.

If an External URL is configured and the connection is successful, but the remote server does not send any of the specified HTTP response headers, a blank value is written for metadata in both the payload and the access token.

Attention: An External URL overwrites existing values from Authentication URL. This includes blank values.

If no External URL is configured, the metadata that is obtained from the Authorization URL is retained as the final value.

Scope

Per IETF RFC 6749, the value of the scope parameter is expressed as a list of space-delimited, case-sensitive strings.

In IBM® API Connect, scopes have no inherent meaning. Instead, scopes are defined in the OAuth Provider so that an application can request an access token that is valid for one or more of the scopes. In the secured API, scopes are listed as requirements for an access token to be considered valid. All scopes that are listed by the security definition for the API must be granted by the access token.

Note:

- An OAuth Provider must have at least one scope.
- An OAuth token will not be granted unless a default scope is configured at the provider, or one or more predefined scopes are included in the grant request.
- If no default scope is defined, and the request does not contain a scope, an invalid scope error is returned for the request.

OAuth provider

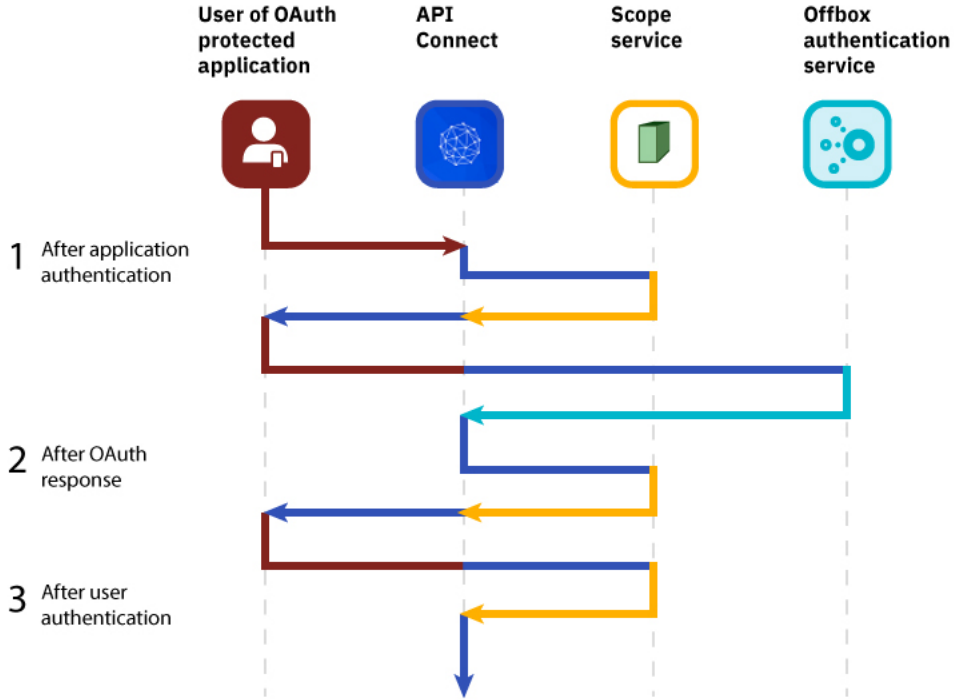

To provide more refined support for the OAuth scope handling, API Connect allows the [Authentication URL user registry](#) extension to modify the scope value.

When you define an [OAuth provider](#), the Advanced scope check extensions provide the flexibility to check and override allowed scopes. The optional extensions are Application scope check and Owner scope check.

The scope that is eventually received by the application is determined by the interactions that are described in the three following paragraphs. Scope processing follows the sequence of items 1, 2, and 3 in the following list, offering three opportunities to override the scope value. Figure 1 provides an overview of the process.

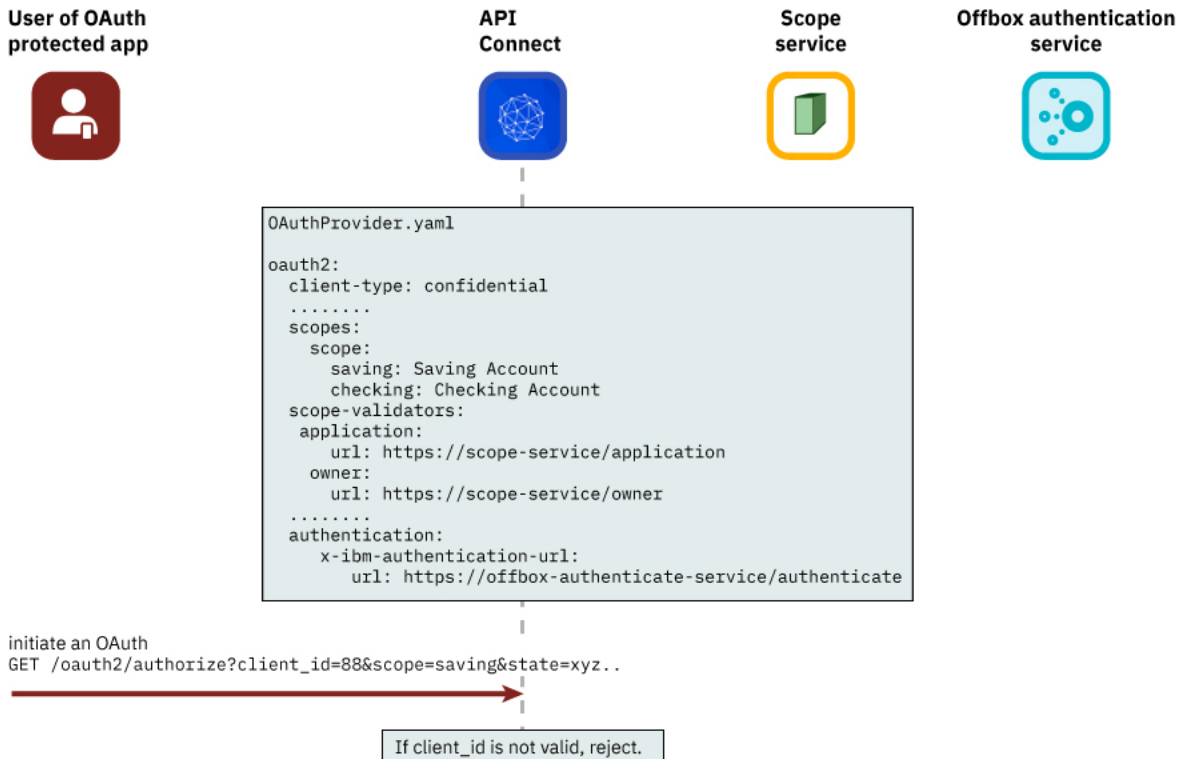

1. After the application successfully authenticates, and if OAuth Native provider `Advanced scope check` Application scope check is configured, API Connect makes a call to allow extra verification and uses the contents of `x-selected-scope` to override the scope value that was initially requested by the application. When Application scope check is enabled, the HTTP response header `x-selected-scope` must be present, or the call fails.
2. If OAuth Native provider `User Security` Authentication is configured to authenticate application users using an Authentication URL, then API Connect makes a call, as documented in [Authentication URL user registry](#). When the response code is `HTTP 200`, and the response header `x-selected-scope` is present, the value that is configured in `x-selected-scope` is used as the new scope value, overriding both what the application already requested and what was provided in the Application scope check described in paragraph 1. In the response header, `x-selected-scope` is an optional element.
3. After the user successfully authenticates, and if OAuth Native provider `Advanced scope check` Owner scope check is enabled and configured with a valid URL, API Connect makes a call to allow the content of `x-selected-scope` to refine the scope value. When Owner scope check is enabled, the HTTP response header `x-selected-scope` must be present, or the call fails.

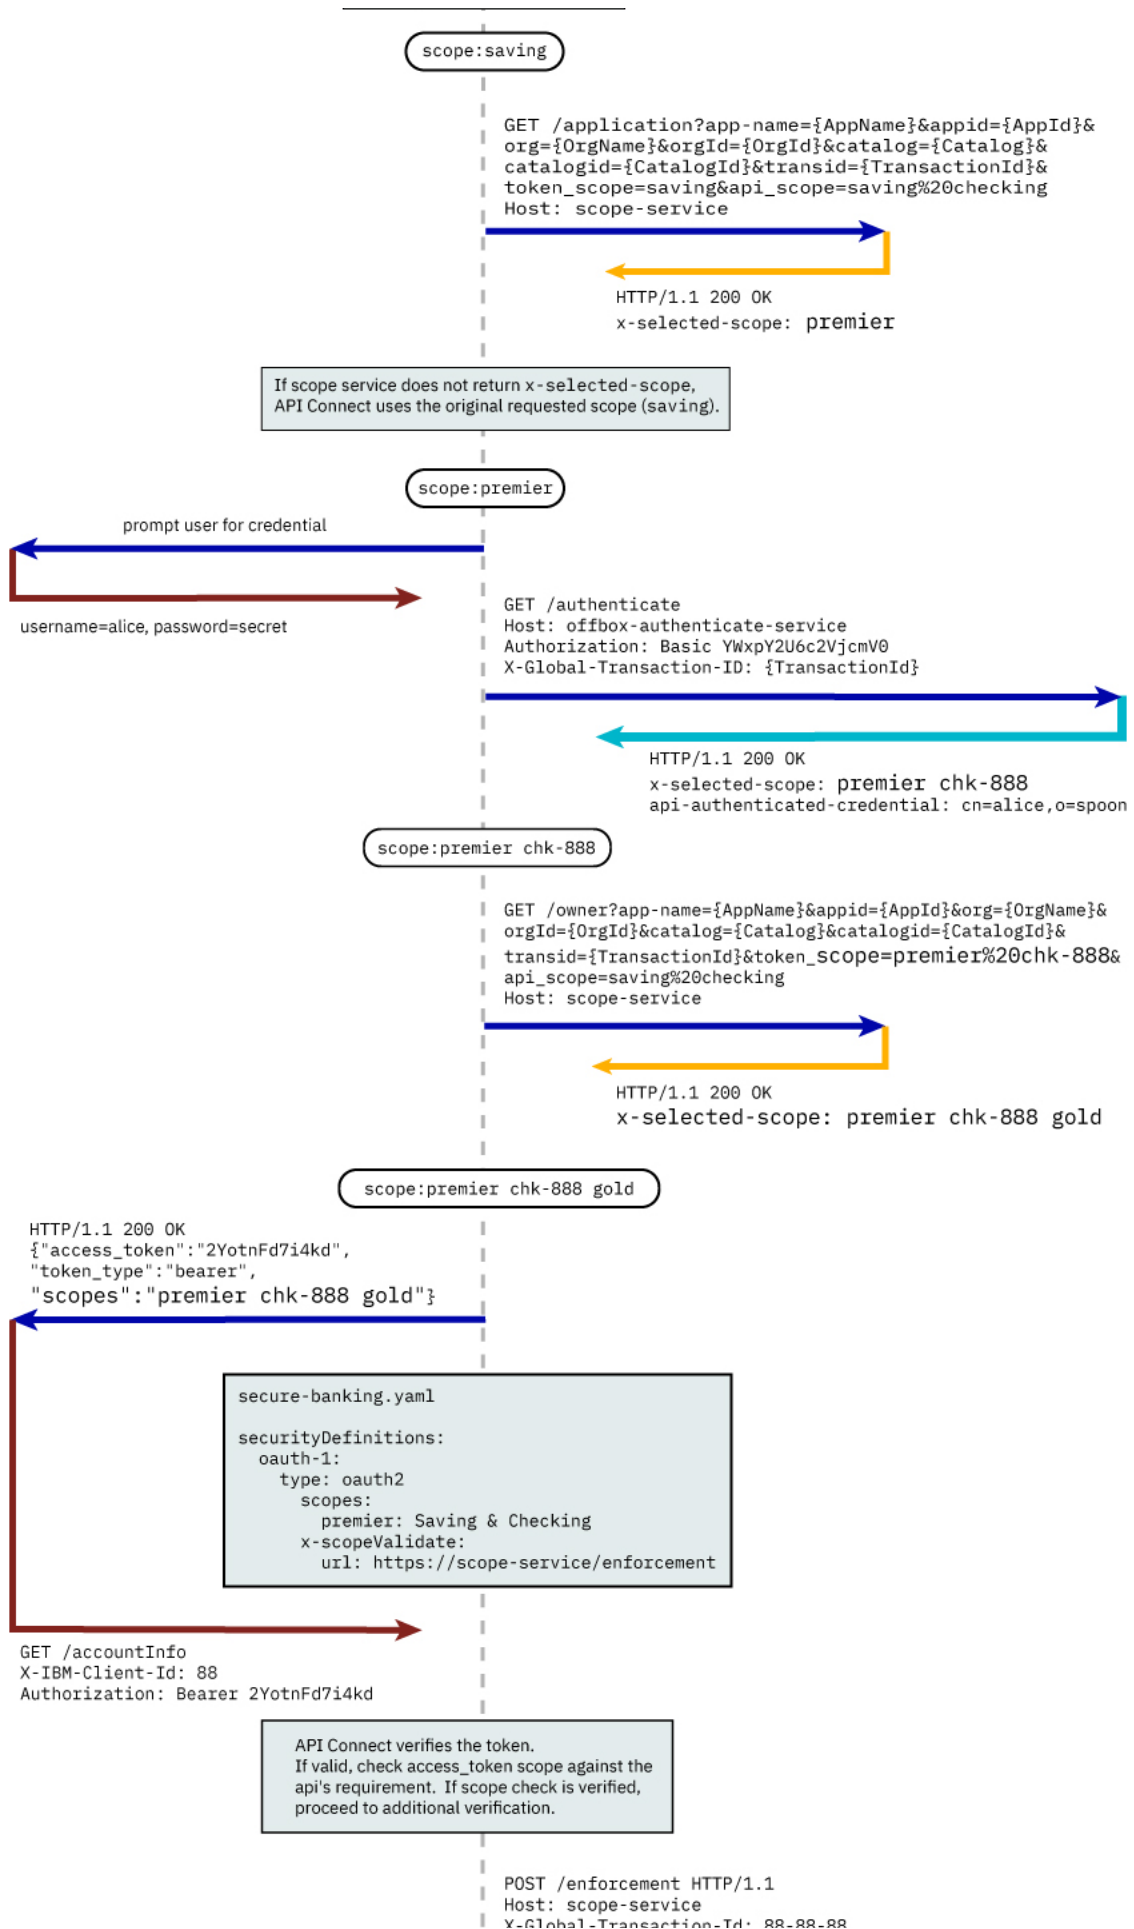

Figure 1. OAuth advanced scope overview

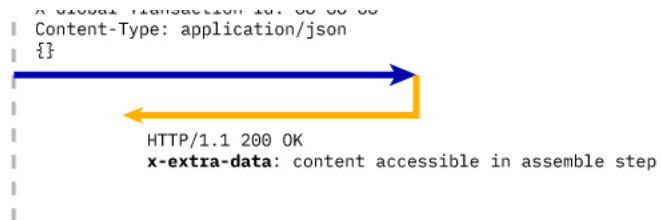

The final scope permission that is granted by the access token is the result of the flow described in items 1, 2, and 3. [Figure 2](#) shows a more detailed view of the transaction flow with examples that show when `x-selected-scope` provides a new scope value.

Figure 2. OAuth advanced scope detail

If API Connect receives HTTP 200, any HTTP headers in the response that start with "x-" will be accessible at `oauth.advanced-consent.<value>`. For the above example, `x-extra-data` is accessible at `oauth.advanced-consent.x-extra-data`. If other than HTTP 200 is returned, it has the same effect as if the access token does not contain necessary permissions to access the resource.

Consumer API enforcement

Standard scope validation

To access the API `/getaccount` the application must send a `GET` request with an access token that contains the scope, or scopes, defined in the OAuth provider. If the request doesn't contain a scope, you must specify a default scope to use. If no default scope is defined, and the request doesn't contain a scope, an invalid scope error is returned for the request.

```
GET /getaccount
HTTP/1.1
Host: server.example.com
X-IBM-Client-Id: 8888-8888-8888
Authorization: Bearer AAEkNjVkOWIyYjgtOWY5ZS00YWQwLWIyYzktZ
```

The following application OpenAPI file `secure-banking.yaml` defines the scope, or scopes, that must exist in the token to be granted access to the API `/getaccount`.

```
secure-banking.yaml

securityDefinitions:
  scope-only:
    type: oauth2
    description: ''
    flow: implicit
    authorizationUrl: ''
    scopes:
      checking: 'Checking Account'
      saving: 'Saving Account'
      mutual: 'Mutual Fund Account'
  security:
    - scope-only:
      - checking
    - scope-only:
      - saving
      - mutual
```

In the examples, the access token `AAEkNjVkOWIyYjgtOWY5ZS00YWQwLWIyYzktZ` is able to access the API because it contains one, or a combination of `scope-only` that is defined in `secure-banking.yaml` such as:

- `checking`
- `saving mutual`
- `checking saving mutual`

Advanced Scope Check

Administrators can enable an additional scope check by configuring the consumer API property Advanced Scope Check URL that becomes `x-scopeValidate` as shown in the following OpenAPI file example.

```
securityDefinitions:
  advanced-scope-only:
    type: oauth2
    description: ''
    flow: implicit
    authorizationUrl: ''
    scopes:
      checking: 'Checking Account'
      saving: 'Saving Account'
      mutual: 'Mutual Fund Account'
  x-scopeValidate:
    url: 'https://advanced-scope-check.bk.com/validate-scope'
    tls-profile: 'ssl-client'
```

After API Connect successfully verifies the access token against any scope requirement, API Connect will make an `HTTP POST` request to the `x-scopeValidate` endpoint similar to the following example. Response code `HTTP 200` from the endpoint indicates a success. Any other response code, or a connection error, is treated as a permission error for the token.

```
POST /validate-scope?app-name=..&appid=..&org=..&orgid=..&catalog=..&catalogid=..&transid=..
HTTP/1.1
Host: advanced-scope-check.bk.com
Content-Type: application/json

{"context-root" : checking,
 "resource" : accountinfo,
 "method" : GET,
```

```

"api-scope-required" : [jointaccount],
"access_token" : {"client_id" : "2cd71759-1003-4a1e-becb-0474d73455f3",
  "not_after" : 174364070,
  "not_after_text" : "2017-07-11T02:27:50Z",
  "not_before" : 174360470,
  "not_before_text" : "2017-07-11T01:27:50Z",
  "grant_type" : "code",
  "consented_on" : 1499736470,
  "consented_on_text" : "2059-07-11T01:27:50Z",
  "resource_owner" : "cn=spoon,email=spoon@poon.com",
  "scope" : "jointaccount mutual",
  "miscinfo" : "[r:gateway]"
}
}

```

An example of successful response follows.

```

HTTP/1.1 200 OK
Cache-Control: no-store
Pragma: no-cache
X-Custom-For-Assemble-Process: audit

```

Any HTTP response header that begins with "x-" is kept as the context variable `oauth.advanced-consent`. Based on the example successful response, `X-Custom-For-Assemble-Process: audit` becomes `oauth.advanced-consent.x-custom-for-assemble-process`, and can be accessed in the assemble step.

Additional validation options

You can optionally use additional fields for validation:

Request Header

Defines the regular expression to match against **request** headers. Matching headers are included in the request to the advanced scope validation endpoint.

Response Context Variable

Defines the regular expression to match against **response** headers. Matching headers are saved as context variables in the format `oauth.advanced-consent.*`.

Related information

- [IETF RFC 6749](#)

Tokens

Tokens can be managed using refresh tokens and revocation URLs. You can extend the life of tokens using refresh tokens. You can end the life of a token by specifying a revocation URL.

This section contains information regarding token management, including refreshing and revoking tokens, redirecting, and managing tokens with the DataPower Gateway.

- [Refresh tokens](#)
If you are using OAuth authentication, you can enable refresh tokens. Refresh tokens are issued to the client to obtain a new access token when the current access token becomes invalid or expires, or to obtain additional access tokens with identical or narrower scope.
- [Token revocation](#)
In IBM® API Connect, you can revoke or refresh tokens. If necessary, you can also revoke all tokens that are issued to a specific client ID or a resource owner.
- [Authenticating and authorizing through a redirect URL](#)
You can use a service that is hosted externally from IBM API Connect to collect authentication and authorization details from your user when an application requests access on that user's behalf.
- [Token management with the DataPower Gateway \(v5 compatible\)](#)
API Connect can use the DataPower distributed cache to manage the token lifecycle that includes when to revoke access rights.
- [Token management with the DataPower API Gateway](#)
API Connect can use the DataPower distributed cache to manage the token lifecycle that includes when to revoke access rights.

Refresh tokens

If you are using OAuth authentication, you can enable refresh tokens. Refresh tokens are issued to the client to obtain a new access token when the current access token becomes invalid or expires, or to obtain additional access tokens with identical or narrower scope.

When you are using OAuth authentication, API requests must include a valid access token, by using the Authorization HTTP header. Access tokens that are issued by the IBM® API Connect Token Endpoint are valid for 3600 seconds (1 hour) by default, as indicated by the `expires_in` property that is returned on the token request. The following code block shows an example API request with an Authorization header:

```

GET /bankingApi/accountSummary?client_id=32427ce5-bb7c-48a7-9de3-4bb629091103
HTTP/1.1
Accept: application/json
Host: api.ibm.com
Authorization: Bearer AAEFYy1hbGx1hdS5nVX4x6iTL2sb3ymBivQb...

```

After an access token expires, if the option is enabled in the OAuth provider configuration Tokens_Refresh tokens screen, the application uses refresh tokens. Each refresh token is valid for approximately 31 days after it is issued (or for the Time to Live time period specified) and can be used only once to request a new access token. Along with the new access token, a new refresh token is also returned. For details on how to enable refresh tokens, see [Configuring a native OAuth provider](#).

If the access token is expired and the application does not have a refresh token, it must restart the OAuth exchange by using the choice of Grant Type(s) allowed by the OAuth provider.

Token revocation

In IBM® API Connect, you can revoke or refresh tokens. If necessary, you can also revoke all tokens that are issued to a specific client ID or a resource owner.

Token revocation using an external third party service

This topic describes token revocation using a third party, external service. This option is configured in the Native OAuth provider, using the Token Management, Type = Third party screen. The revocation URL is an endpoint that links to an external service which contains information about access or refresh tokens. API Connect is involved in the initial creation and validation of tokens. When an OAuth revocation URL is present, API Connect calls the URL to determine if the associated token can be trusted. The token server then checks a token *blocklist* (a data store of inactive tokens) to ensure that the token is still valid. If the token is still valid, API Connect continues the processing.

Examples

A number of revocation examples follow. The first shows a sample fetch request and the response from a remote revocation URL.

GET request and response

In this example, an API Gateway server issues a GET request to the Revocation URL and receives a result. It shows that different resource owners (Laura and Emily) can revoke all tokens when using the same application (client ID).

Request:

```
<?xml version="1.0" encoding="UTF-8"?>
GET <revocationURL> HTTP/1.1
User-Agent: IBM-APIManagement/4.0
Accept: application/xml; text/xml
```

Response:

```
<?xml version="1.0" encoding="UTF-8"?>
<oauth-revocation>

<!--
Access Tokens and/or Refresh Tokens that are revoked can be individually listed.
To keep this list small, please only include access tokens and refresh tokens that are valid.
For access tokens, any token older than 20 minutes is no longer valid.
For refresh tokens, any token older than 44700 minutes is no longer valid.
-->

<token type="access">AAETb2F1dGgtcmV2b2t1LWN1c3RvbfZaRlVbnPSc1...</token>
<token type="refresh">fZaRlVbnPSc1UGTjCRdq4mPbOosD2+aZIKbJ6bTeW...</token>

<!--
If a resource owner has revoked all tokens issued to a given application, please
list them as shown here.
-->

<resource-owner client-id="760d75a2-44b1-4485-8c6f-0d264fcf7398">laura</resource-owner>
<resource-owner client-id="760d75a2-44b1-4485-8c6f-0d264fcf7398">emily</resource-owner>

</oauth-revocation>
```

POST request and response

The next example shows a post request and response.

Request:

```
POST <revocationURL> HTTP/1.1
User-Agent: IBM-APIManagement/4.0
Content-Type: application/xml
```

```
<?xml version="1.0" encoding="UTF-8"?>
<token>
  <token_type>bearer</token_type>
  <access_token>AAENYy1hbGwtcmVmcmVzaOfNeQKX8ZeojsBY9v0FI7/OerQvzKHq...</access_token>
  <expires_in>3600</expires_in>
  <scope>3600</scope>
  <resource-owner>alice</resource-owner>
  <client_id>83d9cdcd-ba72-4d00-abae-005da8da5fb1</client_id>
</token>
```

Response:

```
HTTP/1.1 200 OK
```

Provide token information on revocation request

In this example, the application calls an API and passes a bearer token. In response, the Gateway fetches the revocation URL and provides information on the token being verified.

Gateway:

```
GET <revocationURL>HTTP/1.1
access-token: AAETb2F1dGgtcmV2b2t1LWN1c3RvbfZaRlVbnPScl
client-id: 760d75a2-44b1-4485-8c6f-0d264fcf7398
resource-owner: alice
```

Alternatively, the same process occurs when using a refresh token to issue a new access token. The application sends a refresh request to the token service. The Gateway then fetches the revocation URL, providing information on the refresh token being verified.

Gateway:

```
GET <revocationURL>GET HTTP/1.1
refresh-token: AAETb2F1dGgtcmV2b2t1LWN1c3RvbfZaRlVbnPScl
client-id: 760d75a2-44b1-4485-8c6f-0d264fcf7398
resource-owner: alice
```

Note: If you are using a third party OAuth provider then, for API Calls with bearer tokens, when Introspect URL is enabled on the API, the revocation URL is not applicable. Instead, the third party endpoint must validate the token and also check for revocation before returning a 200 OK response to the Gateway.

Revoking tokens issued to Alice up to and including a specific date

On May 1st, Alice loses her phone and needs to reset her password. As a result, the token provider wants to revoke every token issued before Alice lost her phone. In this example, the Gateway sends a `GET` request to the revocation service. The revocation service replies confirming revocation of the specified tokens.

Gateway:

```
GET <revocationURL>HTTP/1.1
access-token: AAETb2F1dGgtcmV2b2t1LWN1c3RvbfZaRlVbnPScl
client-id: 760d75a2-44b1-4485-8c6f-0d264fcf7398
resource-owner: alice
```

Revocation Service:

```
<?xml version="1.0" encoding="UTF-8"?>
<oauth-revocation>
  <resource-owner before="2015-05-01T09:30:10Z">alice</resource-owner>
</oauth-revocation>
```

Revoking all tokens issued up to and including a specific date

Under certain catastrophic conditions, you may need to revoke all tokens issued up to and including a specific date, for example, May 1st. In this example, the Gateway sends a `GET` request to the revocation service. The revocation service replies confirming revocation of the specified tokens.

Gateway:

```
GET <revocationURL>HTTP/1.1
access-token: AAETb2F1dGgtcmV2b2t1LWN1c3RvbfZaRlVbnPScl
client-id: 760d75a2-44b1-4485-8c6f-0d264fcf7398
resource-owner: alice
```

Revocation Service:

```
<?xml version="1.0" encoding="UTF-8"?>
<oauth-revocation>
  <everytoken before="2015-05-01T09:30:10Z" />
</oauth-revocation>
```

Putting it all together

The following shows the examples contained in this topic executed in a single action:

Gateway:

```
GET <revocationURL>HTTP/1.1
access-token: AAETb2F1dGgtcmV2b2t1LWN1c3RvbfZaRlVbnPScl
client-id: 760d75a2-44b1-4485-8c6f-0d264fcf7398
resource-owner: alice
```

Revocation Service:

```
HTTP/1.1 200 OK
Content-Type: application/xml
Cache-Control: public, max-age=120
Date: Fri, 08 May 2015 21:49:03 GMT
```

```
<?xml version="1.0" encoding="UTF-8"?>
<oauth-revocation>
  <resource-owner before="2015-04-08T09:30:10Z">mary</resource-owner>
  <resource-owner before="2015-04-12T09:30:10Z">john</resource-owner>
  <resource-owner before="2015-04-13T09:30:10Z">kevin</resource-owner>
  <resource-owner before="2015-04-01T09:30:10Z">alice</resource-owner>
</oauth-revocation>
```

Notes:

- In the previous example, there are no entries older than one month in the response (the maximum life of a refresh token).
- Each response is cached for up to two minutes according to response's directive.
- The `before` attribute uses the `xs:dateTime` syntax.

Authenticating and authorizing through a redirect URL

You can use a service that is hosted externally from IBM® API Connect to collect authentication and authorization details from your user when an application requests access on that user's behalf.

Before you begin

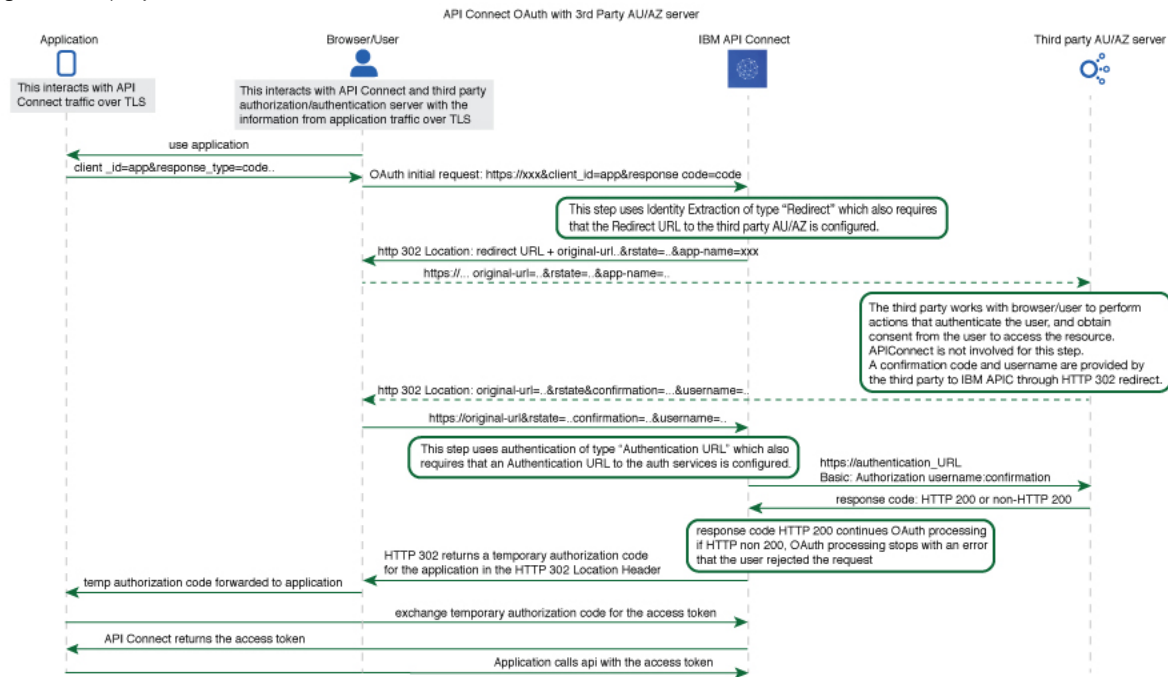

To complete this task, you will need to either create or have created an OAuth security definition that uses Implicit grant type or Access Code (Authorization Code) grant type. For more information, see [Creating an OAuth security definition](#).

About this task

If you use methods for authentication that are not supported by API Connect, you can redirect users to a suitable URL at which they can authenticate. The user is then returned to the OAuth process after authentication and authorization have been confirmed.

The following illustration indicates the transaction flow for third party authentication.

Figure 1. Third party authentication (AU) and authorization (AZ) transaction flow

1. The application initiates a request to access an API protected with a third-party entity. API Connect redirects the application with an **HTTP 302** redirect based on **identity extraction** -> **redirect** -> **redirect-url**, for user authentication (and optional authorization).
2. The application communicates directly with the third-party entity to gather user identity. API Connect is not involved in this communication. After the third-party entity finishes processing authentication (and optional authorization), it returns an **HTTP 302** redirect that uses the **original-url** from the request, with the username and confirmation code appended.
3. API Connect receives the request that includes the username and confirmation code, and communicates with the authentication URL, based on **authentication** -> **x-ibm-authentication-url**, to confirm user identity before the request is completed.
4. An **HTTP 200** response from the third-party entity allows API Connect to continue the OAuth 2.0 request process as if the owner is authenticated. The request is then processed according to the **grants** type.
 - - **accessCode** returns a temporary code to the application.
 - - **implicit** returns the access token to the application.For any response other than HTTP 200, the request fails with a statement added to the error log.

Procedure

To create an external form, and to indicate the URL to which API Connect will redirect users, complete the following instructions:

1. Create your service for authentication and authorization. You will use the URL of the landing page of this service as your redirect URL.
 - a. To include elements in your form that are provided by API Connect, use the following query parameters from the URL that your user is redirected to. Note: With the exception of **original-url**, none of these parameters are included in the URL automatically; you must add them as required.

app-name
The name of the application requesting access, as provided through the Developer Portal.

appid
The id of the application requesting access.

catalog
The name of the catalog where the product is being used by the application.

catalogid

The id of the catalog where the product is being used by the application.

catalogtitle
User-friendly display name for the catalog.

org
The name of the consumer organization that hosts the application.

orgid
The id of the consumer organization that hosts the application.

orgtitle
User-friendly display name for the organization.

original-url
The original URL that the user was directed to by the application, including query parameters from the original URL that are necessary for standard OAuth 2.0 requests. You can include these parameters in your service to provide information to the user. Additionally the `state_nonce` is appended. The `state_nonce` is a hash code generated by API Connect for verification purposes. The URL is URL-encoded and should be decoded before further use, the `state_nonce` should remain unchanged.

provider
The name of the API provider organization.

providerid
The id of the API provider organization.

providertitle
User-friendly display name for the provider organization.

requested-scope
[optional] If [Application Scope check](#) is enabled and replaces the `scope` from the initial application request, this field holds the `scope` value from the initial application request, and the new replacement scope value is put into `original-url`.

transid
transaction id used in the GW for the transaction which trigger this call

The URL to which the user is sent to when they are redirected to your page has the following form:

`Redirect_URL?original-url=Original_URL&state_nonce=R_State&app-name=Application_Name`

where all variables are as described previously. The Redirect URL does not have a size limit enforced by API Connect.

- b. Create the stages of authentication, authorization, and any intermediate stages that you require to take place before you allow access to the application. Upon completion of these stages, redirect the user to the `Original_URL` and append a user name, their confirmation code, and the application name to be evaluated for access grant or denial by API Connect. The confirmation code does not have a size limit enforced by API Connect. Original URL requires the following form:

`Original_URL&username=User_Name&confirmation=Confirmation_Code`

where all variables are as described previously.

For example:

```
https://your_gateway.com/your_org/your_catalog/your_api/oauth/authorize?
response_type=code&redirect_uri=https://example.com/redirect&scope=/your_api&client_id=5af57a4a-6db9-4141-ad08-
5709432af66e&state_nonce=HoIbRG+6bZtq1B7LDkq4gj1D3SHKq1CbnYdHs/bMz2Y=&username=spoon&confirmation=12345678
```

- c. To send your own error responses after the authentication and authorization service, redirect the user to the `Original_URL` and append an error code. You can also append a user name. Use the following form:

`Original_URL&username=User_Name&error=Error_Response`

where `Error_Response` is the message you wish to send and all other variables are described as previously.

For example:

```
https://your_gateway.com/your_org/your_catalog/your_api/oauth/authorize?
response_type=code&redirect_uri=https://example.com/redirect&scope=/your_api&client_id=5af57a4a-6db9-4141-ad08-
5709432af66e&state_nonce=HoIbRG+6bZtq1B7LDkq4gj1D3SHKq1CbnYdHs/bMz2Y=&username=User&error=access_denied
```

2. Create a service to validate the confirmation code and user name. API Connect makes a GET call to your authentication URL after the user is redirected back to the authorization URL. When the call is made, it includes in its authorization header the user name and confirmation code you supplied previously. Confirm that these are correct and respond with an HTTP success code such as 200 OK if you want to allow access, or non-200 HTTP response code, such as 401 Unauthorized to deny access.
3. In your OAuth provider configuration, supply the redirect URL that is used in Step 1 and the authentication URL that is used in Step 2.
For more information on configuring an OAuth Provider, see [Configuring a native OAuth provider](#) when using API Manager or [Configuring a native OAuth provider](#) when using Cloud Manager.

Token management with the DataPower Gateway (v5 compatible)

API Connect can use the DataPower distributed cache to manage the token lifecycle that includes when to revoke access rights.

In order to manage tokens with the DataPower® Gateway (v5 compatible), you must set the Token Management Type to Native in your Native OAuth provider configuration. See [Configuring token management and revocation for a native OAuth provider](#) when using Cloud Manager or [Configuring token management and revocation for a native OAuth provider](#) when using API Manager.

Also, the DataPower quota enforcement server must be enabled on the DataPower Gateway to use the distributed cache to manage tokens. See [Quota enforcement](#).

Token management relies on gateway-peering to distribute the cache for revocation details within a gateway cluster node, and does not propagate across different gateway clusters. In order to enforce token management across different gateway clusters, you must use the external token store and set the Token Management Type to **External** in your native OAuth provider configuration.

When distributed cache support is enabled, replay protection is provided across the gateway cluster through the quota enforcement server. This support ensures that the same token cannot be reused across the members of the quota enforcement peer group.

Important:

If you have a cluster of DataPower Gateway servers, the OAuth data synchronization behavior across the servers depends on whether or not you enable revocation:

- If you enable revocation, API Connect uses the DataPower quota enforcement server, and OAuth data is synchronized across the servers. If an access token is obtained from one server, the OAuth data synchronization ensures that the same authorization code cannot be used to obtain an access code from another server. You must ensure that the DataPower quota enforcement server is configured.
- If you disable revocation, API Connect does **not** use the DataPower quota enforcement server and OAuth data does not synchronize across the cluster of DataPower Gateway servers. Therefore, to prevent the same authorization code being used to obtain an access code from more than one server you must configure DataPower to synchronize OAuth data across the servers, by using the DataPower Gateway console.

To configure DataPower to synchronize OAuth data, ensure that the DataPower quota enforcement server is configured. For more information, see [Configuring the quota enforcement server](#).

Resource owner revocation

When Resource owner revocation path is selected in the Token Management screen, the configuration inserts two REST API calls to /oauth2/issued.

- An HTTP GET operation that retrieves a list of all granted permissions for a specific user.
- An HTTP DELETE operation that revokes an application for a specific user.

The setting inserts header-based security definitions of client ID and client secret as shown in the **View permissions example**. The API call to revoke a given application for a given user is shown in the **Revoke permissions example**.

View permissions example

To list all the applications granted by user `cn=spoon,o=ibm` with username `spoon` and password `spoon` using a registered administration application of `5287fe53-8747-438a-8262-681ec75b79c5`.

- Request:

```
GET /oauth2/issued
HTTP/1.1
Host: apic.ibm.com
x-ibm-client-id: 5287fe53-8747-438a-8262-681ec75b79c5
x-ibm-client-secret: E2qM6mG2bX2uClxT2iN1uU6bT5cV4dN7nW5kM5uP8vL3uF3cT7
Authorization: Basic c3Bvb246c3Bvb24=
```

- Response:

```
HTTP/1.1 200 OK
Content-Type: application/json;charset=UTF-8
Cache-Control: no-store
Pragma: no-cache
[
  {
    "clientId": "7369ad66-5674-b7d3-4567-de35283421aca",
    "owner": "cn=spoon,o=ibm",
    "clientName": "PetStore Application",
    "scope": "listpet",
    "issuedAt": 1503327054,
    "consentedOn": 1503327054,
    "expiredAt": 1503330654,
    "refreshTokenIssued": false,
    "appId": "d2031f0f27339315333734ab9",
    "org": "PetStoreOrg",
    "orgTitle": "Katie Pet Grooming Inc",
    "orgId": "5887803de4b06e6998c4b2c7",
    "provider": "SuperStore",
    "providerTitle": "Simon SuperStore",
    "providerId": "5887803de4b06e6998c4b2c7",
    "catalog": "publicapi",
    "catalogTitle": "For public",
    "catalogId": "5887803de4b06e6998c4b2d3"
  },
  {
    "clientId": "a8746323-9825-a842-8736-abd8202356ac8",
    "owner": "cn=spoon,o=ibm",
    ...
  }
]
```

Revoke permissions example

To revoke application `a8746323-9825-a842-8736-abd8202356ac8` by owner `cn=spoon,o=ibm`.

- Request

```
DELETE /oauth2/issued?client-id=a8746323-9825-a842-8736-abd8202356ac8
HTTP/1.1
Host: apic.ibm.com
x-ibm-client-id: 5287fe53-8747-438a-8262-681ec75b79c5
x-ibm-client-secret: E2qM6mG2bX2uClxT2iN1uU6bT5cV4dN7nW5kM5uP8vL3uF3cT7
Authorization: Basic c3Bvb246c3Bvb24=
```

- Response

```
HTTP/1.1 200 OK
Content-Type: application/json;charset=UTF-8
Cache-Control: private, no-store, no-cache, must-revalidate
Pragma: no-cache
```

```
{ "status": "success" }
```

Client revocation

When Client revocation path is selected in the Token Management screen, the result is the following:

This option inserts one REST API call to /oauth2/revoke, which supports OAuth 2.0 [IETF RFC 7009](#). An HTTP POST operation that an application can send to this API to revoke either an `access_token`, or `refresh_token` with `token_type_hint` as shown in the following examples:

Revoke `access_token`

- Request:

```
POST /oauth2/revoke
HTTP/1.1

Host: apic.ibm.com

x-ibm-client-id: 5287fe53-8747-438a-8262-681ec75b79c5
x-ibm-client-secret: E2qM6mG2bX2uClxT2iNluU6bT5cV4dN7nW5kM5uP8vL3uF3cT7
Content-Type: application/x-www-form-urlencoded

token_type_hint=access_token&token=AAIHZGVmYXVsD1-KqWd0Yc3EDn941SWX14xuR....
```

- Response:

```
HTTP/1.1 200 OK
Content-Type: application/json;charset=UTF-8
Cache-Control: private, no-store, no-cache, must-revalidate
Pragma: no-cache

{ "status": "success" }
```

Revoke `refresh_token`

- Request:

```
POST /oauth2/revoke
HTTP/1.1

Host: apic.ibm.com

x-ibm-client-id: 5287fe53-8747-438a-8262-681ec75b79c5
x-ibm-client-secret: E2qM6mG2bX2uClxT2iNluU6bT5cV4dN7nW5kM5uP8vL3uF3cT7
Content-Type: application/x-www-form-urlencoded

token_type_hint=refresh_token&token=.....
```

- Response:

```
HTTP/1.1 200 OK
Content-Type: application/json;charset=UTF-8
Cache-Control: private, no-store, no-cache, must-revalidate
Pragma: no-cache

{ "status": "success" }
```

Token management with the DataPower API Gateway

API Connect can use the DataPower distributed cache to manage the token lifecycle that includes when to revoke access rights.

Note: The steps described in this topic are required if you are using the DataPower® OVA or appliance version of the gateway. For the API Connect supplied Kubernetes deployment, the API Security Token Manager is preconfigured provided that, in the gateway service custom resource file, v5 compatibility mode is disabled and the token management service is enabled:

```
.
.
.
spec:
.
.
.
.
.
.
  apicGatewayServiceV5CompatibilityMode: false
  tokenManagementService:
    enabled: true
.
.
.
.
```

For more information, see [Installing the DataPower Gateway subsystem](#).

Token management relies on gateway-peering to distribute the cache for revocation details within a gateway cluster node, and does not propagate across different gateway clusters. In order to enforce token management across different gateway clusters, you must use the external token store and set the Token Management Type to **External** in your native OAuth provider configuration.

In order to manage tokens with the DataPower API Gateway, you must set the Token Management Type to Native in your Native OAuth provider configuration. See [Configuring token management and revocation for a native OAuth provider](#) when using Cloud Manager or [Configuring token management and revocation for a native OAuth provider](#) when using API Manager.

Note: This setting is also required when you use a third-party OAuth provider and **Introspect** **cache type** is set to **protocol** or **Time to live**.

For token management with the DataPower API Gateway, you must configure the API Security Token Manager on the gateway. Complete the following steps:

1. Log in to the DataPower administration console, selecting apiconnect for the domain, and WebGUI for the Graphical Interface.
2. In the search box, enter API Security Token Manager, then click on the API Security Token Manager link that displays in the search results.
3. For the Administrative state, select enabled.
4. Click the + icon alongside the Gateway Peering field to create a new gateway peering object.
5. Provide a Name and a Local address.
6. In the Local port and Monitor port fields, provide values that aren't already in use by services for the Local address.
7. Ensure that Peer group mode is selected.
8. Alongside the Peers field, use the add button and accompanying field to add at least two peers, to ensure that quorum is achieved.
9. If the Enable SSL option is selected, select a value for the Identification credentials.
10. For Persistence location, select a setting other than memory.
11. When done, click Apply.
12. Repeat steps 1 to 11 for each DataPower API Gateway in the peer group.
13. When done, click Apply, then click Save Configuration to save your changes.

For more information, see [Defining the API security token manager](#) and [Creating a gateway peering instance](#).

Resource owner revocation

When Resource owner revocation path is selected in the Token Management screen, the configuration inserts two REST API calls to /oauth2/issued.

- An HTTP GET operation that retrieves a list of all granted permissions for a specific user.
- An HTTP DELETE operation that revokes an application for a specific user.

The setting inserts header-based security definitions of client ID and client secret as shown in the **View permissions example**. The API call to revoke a given application for a given user is shown in the **Revoke permissions example**.

View permissions example

To list all the applications granted by user `cn=spoon,o=ibm` with username `spoon` and password `spoon` using a registered administration application of `5287fe53-8747-438a-8262-681ec75b79c5`.

- Request:

```
GET /oauth2/issued
HTTP/1.1
Host: apic.ibm.com
x-ibm-client-id: 5287fe53-8747-438a-8262-681ec75b79c5
x-ibm-client-secret: E2qM6mG2bX2uClxT2iN1uU6bT5cV4dN7nW5kM5uP8vL3uF3cT7
Authorization: Basic c3Bvb246c3Bvb24=
```

- Response:

```
HTTP/1.1 200 OK
Content-Type: application/json;charset=UTF-8
Cache-Control: no-store
Pragma: no-cache
[
  {
    "clientId": "7369ad66-5674-b7d3-4567-de35283421aca",
    "owner": "cn=spoon,o=ibm",
    "clientName": "PetStore Application",
    "scope": "listpet",
    "issuedAt": 1503327054,
    "consentedOn": 1503327054,
    "expiredAt": 1503330654,
    "refreshTokenIssued": false,
    "appId": "d2031f0f27339315333734ab9",
    "org": "PetStoreOrg",
    "orgTitle": "Katie Pet Grooming Inc",
    "orgId": "5887803de4b06e6998c4b2c7",
    "provider": "SuperStore",
    "providerTitle": "Simon SuperStore",
    "providerId": "5887803de4b06e6998c4b2c7",
    "catalog": "publicapi",
    "catalogTitle": "For public",
    "catalogId": "5887803de4b06e6998c4b2d3"
  },
  {
    "clientId": "a8746323-9825-a842-8736-abd8202356ac8",
    "owner": "cn=spoon,o=ibm",
    ...
  }
]
```

Revoke permissions example

To revoke application `a8746323-9825-a842-8736-abd8202356ac8` by owner `cn=spoon,o=ibm`.

- Request

```
DELETE /oauth2/issued?client-id=a8746323-9825-a842-8736-abd8202356ac8
HTTP/1.1
Host: apic.ibm.com
x-ibm-client-id: 5287fe53-8747-438a-8262-681ec75b79c5
x-ibm-client-secret: E2qM6mG2bX2uClxT2iN1uU6bT5cV4dN7nW5kM5uP8vL3uF3cT7
Authorization: Basic c3Bvb246c3Bvb24=
```

- Response

```
HTTP/1.1 200 OK
Content-Type: application/json;charset=UTF-8
Cache-Control: private, no-store, no-cache, must-revalidate
Pragma: no-cache

{ "status": "success" }
```

Client revocation

When Client revocation path is selected in the Token Management screen, the result is the following:

This option inserts one REST API call to `/oauth2/revoke`, which supports OAuth 2.0 [IETF RFC 7009](#). An HTTP POST operation that an application can send to this API to revoke either an `access_token`, or `refresh_token` with `token_type_hint` as shown in the following examples:

Revoke `access_token`

- Request:

```
POST /oauth2/revoke
HTTP/1.1

Host: apic.ibm.com

x-ibm-client-id: 5287fe53-8747-438a-8262-681ec75b79c5
x-ibm-client-secret: E2qM6mG2bX2uClxT2iN1luU6bT5cV4dN7nW5kM5uP8vL3uF3cT7
Content-Type: application/x-www-form-urlencoded

token_type_hint=access_token&token=AAIHZGVmYXVsdD1-KqwD0Yc3EDn941SWX14xuR....
```

- Response:

```
HTTP/1.1 200 OK
Content-Type: application/json;charset=UTF-8
Cache-Control: private, no-store, no-cache, must-revalidate
Pragma: no-cache

{ "status": "success" }
```

Revoke `refresh_token`

- Request:

```
POST /oauth2/revoke
HTTP/1.1

Host: apic.ibm.com

x-ibm-client-id: 5287fe53-8747-438a-8262-681ec75b79c5
x-ibm-client-secret: E2qM6mG2bX2uClxT2iN1luU6bT5cV4dN7nW5kM5uP8vL3uF3cT7
Content-Type: application/x-www-form-urlencoded

token_type_hint=refresh_token&token=.....
```

- Response:

```
HTTP/1.1 200 OK
Content-Type: application/json;charset=UTF-8
Cache-Control: private, no-store, no-cache, must-revalidate
Pragma: no-cache

{ "status": "success" }
```

Authentication URL user registry

You can use an Authentication URL user registry to specify a REST authentication service that manages user authentication, and optionally provides additional metadata to be embedded in the token.

This support can optionally enable any of the following:

- Providing the authenticated credential to IBM® API Connect. For example, the user logs-in with user name: `spoon`, and password: `fork`. When the user is authenticated, the credential becomes `cn=spoon,o=eatery`. The credential is kept in the OAuth `access_token` to represent the user.
- Providing metadata support. Allow extra metadata to be stored in the `access_token`.
- Overriding the `scope` that the application receives after a successful OAuth protocol processing. By responding with a specific header, the Authentication URL endpoint can replace the `scope` value that the application receives. For example, you can provide a specific resource owner an account number within the `scope` header response for use in future processing steps.

When you call the Authentication URL user registry, the API Connect gateway sends a GET request with HTTP headers and then processes any HTTP response from the URL. For authentication, a REST authentication service is expected at the Authentication URL.

The following response from the REST authentication service indicates that user authentication is successful and that API Connect will use `cn=spoon,o=eatery` as the user identity.

```
HTTP/1.1 200 OK
Server: example.org
X-API-Authenticated-Credential: cn=spoon,o=eatery
```

For information on how to configure a User Security policy in an API assembly for use with an Authentication URL user registry, see [User Security policy](#).

For an example of an OAuth provider configuration that uses an Authentication URL user registry, see [Example - using multiple OAuth policies in an OAuth provider assembly](#).

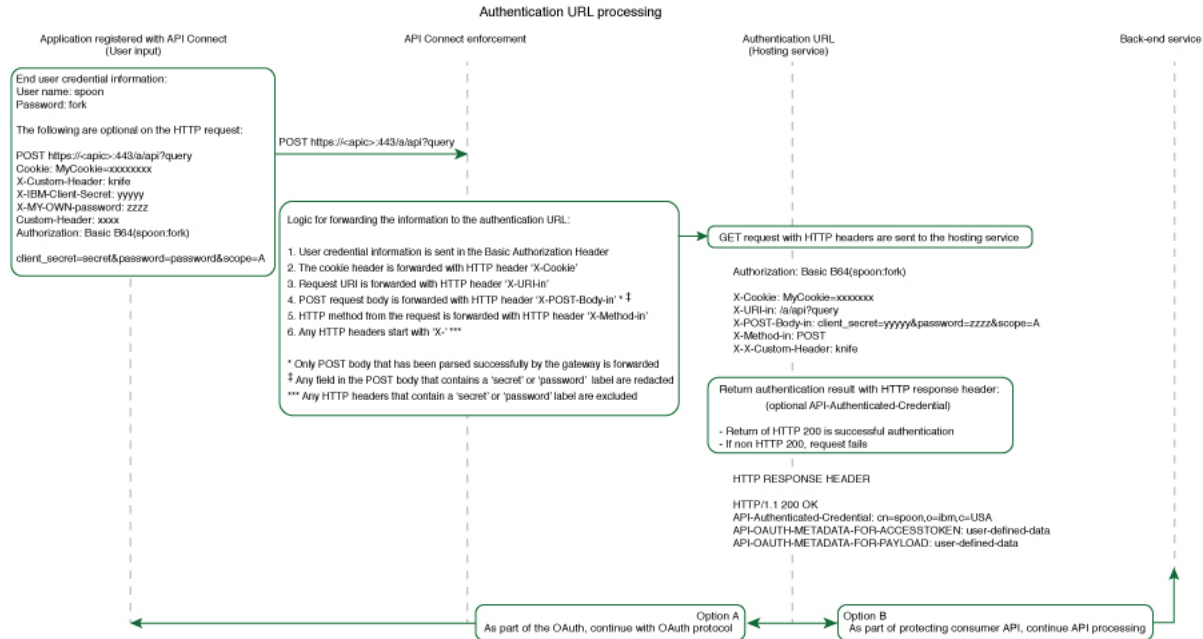

API Connect considers any non-200 HTTP response code a failed user authentication attempt.

When an Authentication URL user registry is invoked, two HTTP response headers are available that include metadata in the access token or the response payload that contains the access token. For more information, see [OAuth external URL and authentication URL](#). The two metadata response headers are:

API-OAUTH-METADATA-FOR-ACCESSTOKEN
API-OAUTH-METADATA-FOR-PAYLOAD

When an Authentication URL is invoked, an HTTP response header is available to override the requested **scope** from the application. For more information, see [Scope](#). The response header is:

x-selected-scope

If you are using the DataPower® API Gateway rather than the DataPower Gateway (v5 compatible), this diagram is provided for guidance only and is not fully accurate for this release.

Custom forms for user security

You can create custom forms for the authorization and identity extraction phase of OAuth.

About this task

The Native OAuth provider configuration provides the capability for requiring additional authentication and authorization steps for user security. Custom HTML forms may be created to extract the identity of the user and to authorize the user. This capability applies to Implicit, Resource owner password, and Access code grant types.

- [Creating a custom HTML login form for user security](#)
Custom HTML forms can be created for user security during the identity extraction stage in OAuth.
- [Creating a custom HTML authorization form for user security](#)
Custom HTML forms can be created for user security during the authorization stage in OAuth.

Creating a custom HTML login form for user security

Custom HTML forms can be created for user security during the identity extraction stage in OAuth.

Before you begin

The Native OAuth provider configuration includes Identity Extraction when using the Implicit, Access code, or Resource owner password grant types. You have the option to select how to extract the user credential and one of the choices is Custom HTML Form. For more information, see [Configuring a native OAuth provider](#) when using API Manager or [Configuring a native OAuth provider](#) when using Cloud Manager. For more information, see [Configuring a native OAuth provider](#). This topic describes how to create the Custom HTML form for identity extraction.

About this task

During three-legged OAuth definitions (Implicit flow, Resource owner password flow, and Access (Authorization) code flow, the user is presented with a form for signing in to the service provided by the API. You can present a custom form or a default form. Your custom form must fulfill certain requirements.

Important: The fields used by IBM® API Connect to inject information into your form have case-sensitive field names.

Procedure

To create a custom sign-in form for your Native OAuth provider, complete the following steps:

1. Create a well formed XHTML document that will be parsed and transformed by API Connect to inject hidden fields.
2. For your XHTML form, set the method as `POST`, the encoding type as `application/x-www-form-urlencoded`, and the action as `authorize`. Add any other parameters that you require.
For example:

```
<form method="POST" enctype="application/x-www-form-urlencoded" action="authorize">
```

3. Create a text input field that is named `username` and create a password input field named `password`.
4. Add the line `<EI-INJECT-HIDDEN-INPUT-FIELDS>`. This third element is a placeholder that API Connect replaces with input fields to complement the user-submitted data.
5. Create a button to initiate the sign-in process.
For example:

```
<button id="home_markdown_jenkins_workspace_Transform_in_SSMNED_10.0.5_com.ibm.apic.apionprem.doc_oauth_custom_login_form_2_login_button" type="submit" name="login" value="true">Log in</button>
```

6. Optional: Add text that is displayed the first time that the user visits the sign-in page. Use the tag `<EI-LOGINFIRSTTIME>` for the text that you want to display.
7. Optional: Add text that appears when the user is returned to the sign-in page if they fail to authenticate. Use the tag `<EI-LOGINFAILED>` for the text that you want to display.
8. Optional: Have an error message displayed when an error in the custom form prevents it from being displayed to the user correctly. Use the tag `<EI-INTERNAL-CUSTOM-FORM-ERROR/>`; the message text is generated automatically. You should detect such errors during testing to prevent this error message being displayed to the end user.
9. Optional: You can add elements that are loaded from external sources, such as images or JavaScript.
10. Insert spacing and other features as you require. Completing Steps 1 through to 8 results in a form similar to the following example:

```
<html lang="en" xml:lang="en">
<head><meta http-equiv="Content-Type" content="text/html; charset=UTF-8"/></head>
<body>
  <form method="POST" enctype="application/x-www-form-urlencoded" action="authorize">
    <h1>Please sign in</h1>
    <p>Username </p>
    <p ><input type="text" name="username" required="required" /> </p>
    <p>Password </p>
    <p ><input type="password" name="password" required="required" /> </p>
    <EI-INJECT-HIDDEN-INPUT-FIELDS/>
    <p > <button
id="home_markdown_jenkins_workspace_Transform_in_SSMNED_10.0.5_com.ibm.apic.apionprem.doc_oauth_custom_login_form_2_login_button" type="submit" name="login" value="true">Log in</button> </p>

    <EI-LOGINFIRSTTIME>
    <p>If you have forgotten your user name or password, contact your system administrator.</p>
    </EI-LOGINFIRSTTIME>

    <EI-LOGINFAILED>
    <p >At least one of your entries does not match our records.
      If you have forgotten your user name or password, contact your system administrator.</p>
    </EI-LOGINFAILED>

    <EI-INTERNAL-CUSTOM-FORM-ERROR/>

  </form>
</body>
</html>
```

11. Make your form available at a URL of your choice.
12. If you have not already done so, configure your Native OAuth provider to use a Custom HTML form for identity extraction and provide the URL at which your form is available. For more information, see [Configuring a native OAuth provider](#) when using API Manager or [Configuring a native OAuth provider](#) when using Cloud Manager.

Creating a custom HTML authorization form for user security

Custom HTML forms can be created for user security during the authorization stage in OAuth.

Before you begin

The Native OAuth provider configuration includes user authorization when using the Implicit, Access code, or Resource owner password grant types. You have the option to select how to authorize application users and one of the choices is Custom HTML Form. For more information, see [Configuring a native OAuth provider](#) when using API Manager or [Configuring a native OAuth provider](#) when using Cloud Manager. This topic describes how to create the Custom HTML form for authorization.

About this task

During three-legged OAuth definitions (Implicit flow, Resource owner password flow, and Access (Authorization) code flow, the user is presented with a form through which they grant permission to an application to access their data through the API on their behalf. You can present a custom form or a default form. Your custom form must fulfill certain requirements.

Important: The fields used by IBM® API Connect to inject information into your form have case-sensitive field names.

Procedure

To create a custom authorization form for your Native OAuth provider, complete the following steps:

1. Create a well-formed XHTML document. This will be parsed and transformed by API Connect to inject hidden fields.
2. For your XHTML form, set the method as `POST`, the encoding type as `application/x-www-form-urlencoded`, and the action as `authorize`. Add any other parameters that you require.

For example:

```
<form method="POST" enctype="application/x-www-form-urlencoded" action="authorize">
```

3. Add the line `<AZ-INJECT-HIDDEN-INPUT-FIELDS/>`. This line is a placeholder that API Connect will replace with input fields necessary for the completion of the OAuth process.
4. Create two buttons with the following code so that the user can grant or deny permission. Edit the text to suit your preferences.

```
<button class="cancel" type="submit" name="approve" value="false">No Thanks</button>  
<button class="submit" type="submit" name="approve" value="true">Allow Access</button>
```

5. Optional: Display an error message when an error in the custom form prevents it from being displayed to the user correctly. Use the tag `<AZ-INTERNAL-CUSTOM-FORM-ERROR/>`; the message text is generated automatically. You should detect such errors during testing to prevent this error message being displayed to the end user.
6. Optional: You can add to the form HTML elements that will load features from external sources, such as images or JavaScript. For example, `<script src="http://www.example.com/example.js" />`
7. Insert spacing and additional elements as you require. Completing Steps 1 through to 6 results in a form similar to the following example:

```
<html lang="en" xml:lang="en">  
  <head><title>Request for permission</title></head>  
  <body class="customconsent">  
    <div>  
      <div>  
        <form method="post" enctype="application/x-www-form-urlencoded" action="authorize">  
          <AZ-INJECT-HIDDEN-INPUT-FIELDS/>  
          <p>Greeting. .</p><DISPLAY-RESOURCE-OWNER/>  
          <p>This app </p><OAUTH-APPLICATION-NAME/><p> would like to access your data.</p>  
          <div>  
            <button class="cancel" type="submit" name="approve" value="false">No Thanks</button>  
            <button class="submit" type="submit" name="approve" value="true">Allow Access</button>  
          </div>  
        </form>  
      </div>  
      <AZ-INTERNAL-CUSTOM-FORM-ERROR/>  
    </div>  
  </body>  
</html>
```

8. Make your form available at a URL of your choice.
9. If you have not already done so, configure your Native OAuth provider to use a Custom HTML Form for authorization for User Security. Provide the URL as the endpoint at which your form is available. For more information, see [Configuring a native OAuth provider](#) when using API Manager or [Configuring a native OAuth provider](#) when using Cloud Manager.

Securing an API with a JSON Web Token

There are two methods to secure your API with a JSON Web Token. You can use the `jwt-generate` command, or you can use a token that has been generated external to IBM® API Connect.

About this task

JSON Web Token (JWT) is an OAuth 2.0 compliant method of authentication that can be useful to secure your API in API Connect.

You can secure your API with a JSON Web Token by using either of the following methods:

- Generate a token through the **jwt-generate** command, and then augment the response payload with your generated token replacing the **id** token.
- Use a token that was generated outside of API Connect and include it into the response payload, by using the metadata URL.

Procedure

Create a **jwt-generate** policy in the assembly.

- a. In API Manager, open the Assembly tab.
- b. Add a jwt-generate policy to the assembly for the API.

Troubleshooting OAuth

You can find the answers to some common questions in the Developer Portal, or in support communities and forums in DeveloperWorks, on GitHub, or on YouTube.

You can use the following links to go to the topics:

- [OAuth 2.0 support in the developer portal test tool](#)
- [OAuth requires quorum in a multi-node cluster](#)

OAuth 2.0 support in the developer portal test tool

OAuth 2.0 support is exposed as an API through the provider OpenAPI definition. You can use the test tool that is included with API Connect to test the OAuth 2.0 configuration. For more information, see [Testing an API using the Developer Portal test tool](#).

OAuth requires quorum in a multi-node cluster

In a multi-node cluster, OAuth operations will fail if quorum is lost. Quorum requires that the number of active nodes is greater than 50% of the total number of nodes in the cluster.

API Analytics

You can use API Connect to filter, sort, and aggregate your API event data. You can present the results within correlated charts, tables, and maps to help you manage service levels, set quotas, establish controls, set up security policies, manage communities, and analyze trends.

API analytics is built on the OpenSearch open source real-time distributed search and analytics engine.

The content of the API event data depends on the logging policy that is set for the operation. For more information about the fields that are displayed in an API event record, see [API event record fields](#). For information about how to configure your logging preferences for API events, see [activity-log.policy](#) and [Including elements in your assembly](#).

Use the following tasks to configure and manage analytics:

- [Catalogs, Spaces, and Analytics](#)
Understand how syndication and the use of Catalogs and Spaces affects the use of the features in API Connect Analytics.
- [Accessing analytics](#)
Analytics data is displayed in dashboards in the API Manager UI. Dashboards are scoped at the provider organization, Catalog, and Space level. Analytics are also accessible at the cloud level in the Cloud Manager UI, and using the Toolkit CLI and REST API.
- [Analytics dashboards](#)
IBM API Connect analytics provides dashboards for viewing your analytics data.
- [Exporting API event data](#)
Export your API Connect API event data using either the toolkit CLI or the REST API.
- [Accessing analytics data with the toolkit CLI](#)
You can access your analytics event data by using the API Connect toolkit CLI.
- [Accessing analytics data with the REST API](#)
You can access your Analytics event data by using the API Connect REST API.
- [Modifying analytics API event data](#)
How to modify API event data before it is stored.

Catalogs, Spaces, and Analytics

Understand how syndication and the use of Catalogs and Spaces affects the use of the features in API Connect Analytics.

The data for Analytics is collated from API events that are logged when API operations are invoked. Analytics data for an API is scoped to the Catalog or Space where that API resides, and is only included in search results (and thus, visualizations and dashboards) for the owning Catalog or Space.

Access to the analytics data, and to the analytics functions in the API Manager user interface, can be managed through the use of Catalogs and Spaces, and the roles and permissions that are assigned to the users (or *members*) of the provider organization.

The cloud admin user can view aggregated analytics data for all catalogs, spaces, in all provider organizations, in the admin UI.

Catalogs, Spaces, and permissions

Catalogs act as deployment targets through which APIs (in their containing Plans and Products) are staged and published to consumer organizations. API Manager users in the provider organization can be assigned the following access to the Analytics component for a Catalog:

- A role that has the Analytics_>View permission for a Catalog: These users can view the analytics data generated for the APIs in the Catalog within *dashboards*, export dashboard data in its raw format or as event records, and apply filters to the data shown within the dashboards.
- A role that has the Analytics_>Manage permission for a Catalog: This is a legacy permission and has the same permissions as the View permission.

The IBM® API Connect syndication feature provides a way for you to partition a Catalog into multiple deployment targets (or *Spaces*) through which separate groupings of APIs (in their containing Plans and Products) can be staged and published. Each Space can be allocated to a separate group of users who need to manage their Products independently, and the analytics data in each Space is scoped to those Products only. API Manager users in the provider organization can be assigned the following access to the Analytics component for a Space:

- A role that has the Analytics_>View permission for a Space: These users can view the analytics data generated for the APIs in the Space within dashboards, export dashboard data in its raw format, and apply filters to the data shown within the dashboards.
- A role that has the Analytics_>Manage permission for a Catalog: This is a legacy permission and has the same permissions as the View permission.

For more information about assigning Catalog or Space permissions to a role, see [Managing Catalog membership](#) and [Managing Space membership](#).

For more information about the default API Manager roles and permissions, see [API Connect user roles](#).

Accessing analytics

Analytics data is displayed in dashboards in the API Manager UI. Dashboards are scoped at the provider organization, Catalog, and Space level. Analytics are also accessible at the cloud level in the Cloud Manager UI, and using the Toolkit CLI and REST API.

About this task

The ability to access analytics data at a Catalog or Space level depends on your assigned roles and permissions. For more information about Catalogs and Spaces, see [Working with Catalogs](#) and [Using syndication in API Connect](#).

Restriction: If the visualizations in your dashboards display no data or show data only for a time period in the past, a possible reason might be that access to analytics data within API Connect is switched off. Contact your administrator for confirmation. (For more information, see [Configuring analytics offload for API Connect](#).)

Procedure

- To open the analytics dashboard at Catalog scope, complete the following steps:
 1. In the API Manager UI, select Manage  in the navigation pane.
 2. From the list of available Catalogs in the API Manager Dashboard, select the required Catalog.
 3. Click the Analytics tab.
The analytics dashboard for the Catalog is displayed.
 - To open the analytics dashboard at Space scope, complete the following steps:
 1. In the API Manager UI, select Manage  in the navigation pane.
 2. From the list of available Catalogs in the API Manager Dashboard, select the required Catalog.
 3. Click the Spaces tab.
 4. Select the Space that you want to view.
 5. Click the Analytics tab.
The default analytics dashboard for the Space is displayed.
 - To view analytics at Provider Organization scope, in the API Manager UI, select the analytics icon  from the navigation pane.
 - To view analytics at the Cloud level, in the Cloud Manager UI: [Accessing cloud level analytics](#)
 - You can also access Analytics data using the Toolkit CLI or the REST API: [Accessing analytics data with the toolkit CLI](#)
-

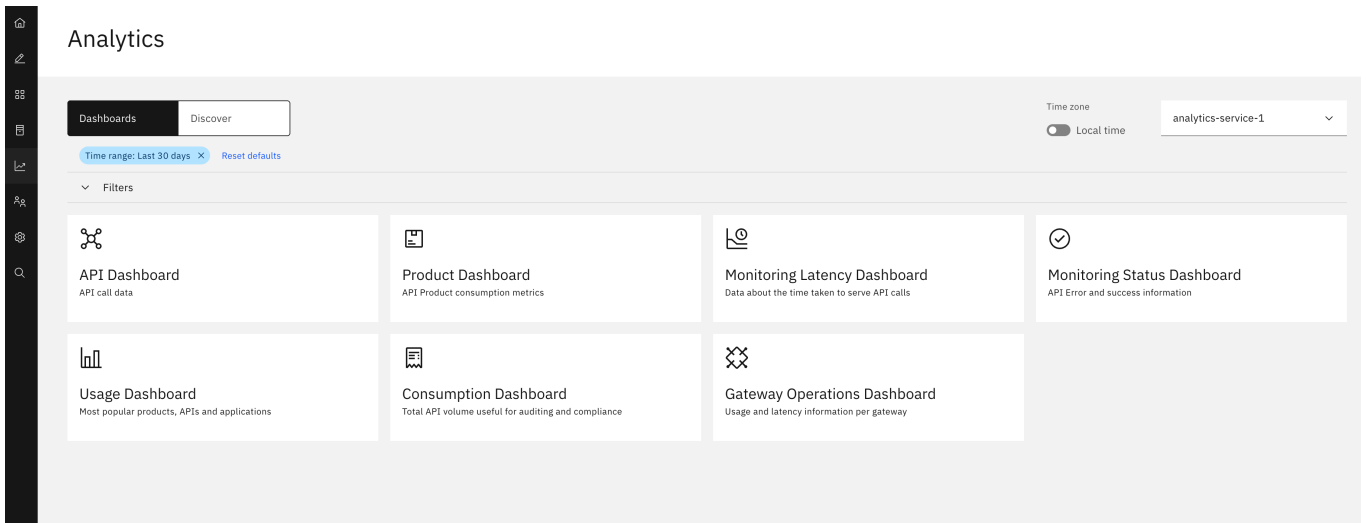

Analytics dashboards

IBM® API Connect analytics provides dashboards for viewing your analytics data.

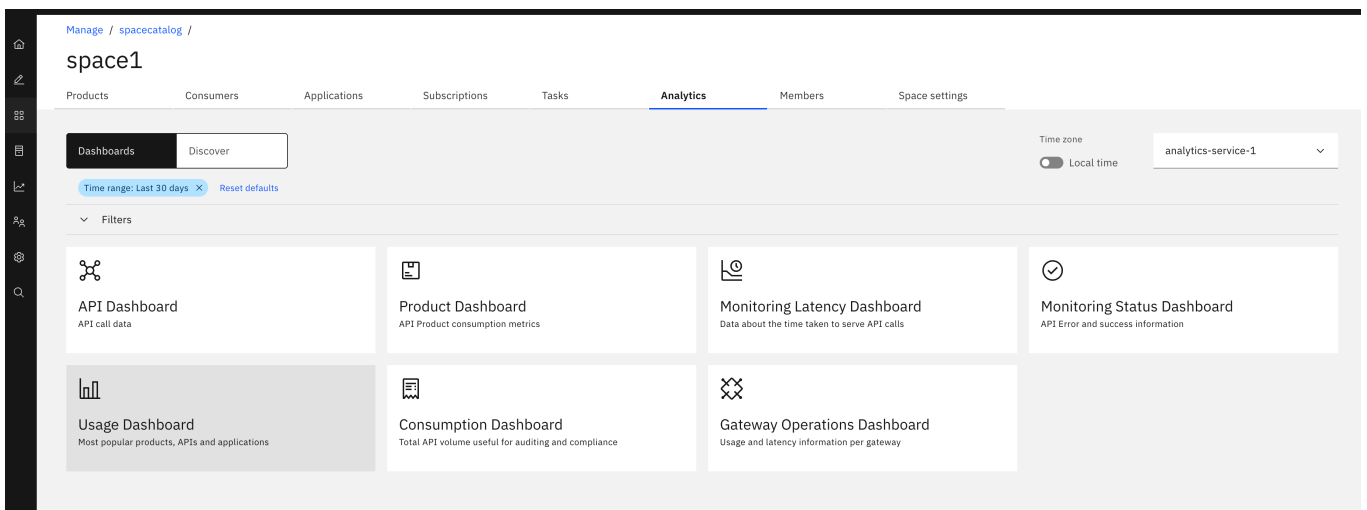

Analytics dashboards

The analytics dashboards in the API Manager UI show the API event data at the scopes of provider organization, catalog, and space. The scope of the analytics data shown depends on how you access the analytics dashboards, see: [Accessing analytics](#).

The provider organization scoped dashboards are accessed from the settings icon  in the navigation pane:

The space scoped dashboards are accessed from the Analytics tab when viewing the space:

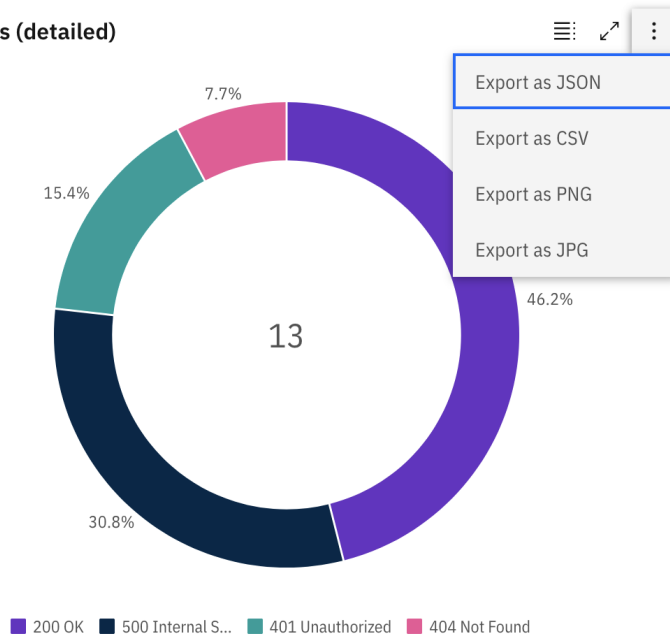

Seven dashboards are available:

- API Dashboard - contains charts that summarize total API calls, response codes, and response times.
- Product Dashboard - contains charts that show total API calls and application subscriptions per plan.
- Monitoring Latency Dashboard - contains charts that provide response time statistics and data usage.
- Monitoring Status Dashboard - contains charts that show the response codes and success/failure rates of API calls.
- Usage Dashboard - contains charts that show the top five APIs, products, and apps.
- Consumption Dashboard - contains charts that show total API consumption in your cloud.
- Gateway Operations Dashboard - contains charts that show API usage and latency by gateway.

Each chart in the dashboards can be exported as a PNG or JPG image. The source data for each chart can be exported as a JSON or CSV file. To export a chart, click

Status codes (detailed)

Actions at the upper right:

It is also possible to enlarge the chart to full-screen by clicking . To see the source data in tabular form click .

Discover view

By default the Dashboards tab is displayed. To view your API event data in tabular form, select Discover:

Analytics

Time zone: analytics-service-1 (Local time)

Time range: Last 30 days X Reset defaults

Filters

About 144 results (0.008 seconds) at 16:07:36 UTC+1

Date time	Status code	API name	API version	Method	Total time elapsed (ms)	Gateway IP	Transaction ID	App name
11/04/2023, 12:15:18	200 OK	rb-findbranch	2.0.0	GET	34	192.168.87.255	26496	andre-spacecatalog-app2
11/04/2023, 12:15:17	200 OK	rb-xmltojson	1.0.0	POST	4	192.168.87.255	26448	andre-spacecatalog-app2

The maximum number of API events that can be accessed from the UI is 10,000. The maximum number of event records that can be displayed per page on the Discover view is 200.

You can export the API event data from this view by clicking Actions at the upper right:

Note: When you export from the Discover view, only the data displayed on the current page of results is exported. If you want to export the data from all pages, you must export separately from each page. To export all your analytics data, do not use the UI, see [Exporting API event data](#).

Filtering displayed data

You can filter the data that is displayed in the Dashboards and Discover view by defining queries. Expand the Filters section to view, define, and apply analytics queries to your displayed data:

Filters

New Saved Shared

Time range Load query
Select one of the following time range filters

Last 15 minutes Last 24 hours
 Last 30 minutes Last 7 days
 Last 1 hour Last 30 days
 Last 4 hours All events
 Last 12 hours Custom

Fields Add
Select from the following dropdowns and enter a value

Field	Operator	Value	Delete
API name	equals	creditcheck	

Type
Select one of the following type filters

All events
 Success only (2xx, 3xx)
 Errors only (4xx, 5xx)

Cancel Save as... Apply

You can save and share the queries that you define:

- Shared queries are visible to all users at the same scope. They are not visible to users in a different scope. For example, a query that is shared by a Cloud Manager UI user is not visible to an API Manager UI user. Within the API Manager UI, a query that is created at catalog scope is not visible to users viewing analytics data at provider organization scope.
- Other users cannot edit or delete queries that you share, but they can create a duplicate query, which they can edit and share.
- All queries have a name and an optional description. The name does not need to be unique.

Saved queries can be exported as strings for use in REST API and toolkit CLI queries, for example:

Filters

New Saved Shared

Search by name, description or query string

Name	Description	Last modified	Shared
<input checked="" type="radio"/> boo		11/04/2023, 16:16:03	--
<input type="radio"/> ccheck		11/04/2023, 13:39:11	🔒

Edit
Share
Duplicate
Copy to clipboard
Delete

copies the following string to the clipboard:

```
api_name>equals:boo&timeframe=last30days
```

Exporting API event data

Export your API Connect API event data using either the toolkit CLI or the REST API.

The export function in the [Analytics dashboards](#) exports just the data that is displayed in the UI. To export up to 10,000 API event records, you can use the toolkit CLI. To export all your analytics data use the REST API.

To export data with the toolkit CLI:

1. Follow the steps to install and configure the toolkit CLI: [Accessing analytics data with the toolkit CLI](#).
2. Use the `events` command to export your analytics data; for example to export the events for a provider organization:

```
apic -m analytics events:orgList --analytics-service <analytics_service> --server <management_server_api_endpoint> --format=json
```

```

"total": 200,
"search_time": 7,
"events": [
  {
    "log_policy": "activity",
    ...
  }
]

```

Your data is returned as a JSON array, each element is a single API event record.

To export data with the REST API:

1. Follow the steps to get started with the REST API: [Accessing analytics data with the REST API](#).
2. Call the `events` API. For example, to get all analytics API event records from a provider organization, specify the organization's API path:

```

curl -v -k -H 'Accept: application/json' -H 'Authorization: Bearer <bearer_token>' -X GET --url
'https://<management_server_api_endpoint>/analytics/<analytics_service>/orgs/<provider_organization>/events'

```

```

{
  "total": 45543,
  "search_time": 36,
  "events": [...]
}

```

To get just the events for a provider organization, specify the organization in the API path: `orgs/<provider_organization>/events`.

Note: To get just the events for a catalog, specify the catalog in the API path; for example:

```

/analytics/<analytics_service>/catalogs/<provider_organization>/<catalog>/events

```

- [API event record fields](#)

An API event is logged each time an API operation is invoked, and an event record is generated for each API event in the Gateway server. The API event record contains information about the API call and the content of the record depends on the logging policy that is set for the operation.

API event record fields

An API event is logged each time an API operation is invoked, and an event record is generated for each API event in the Gateway server. The API event record contains information about the API call and the content of the record depends on the logging policy that is set for the operation.

You can use the activity-log policy to configure your logging preferences for the API event details that are stored in the Analytics component. By default, invocation details are logged if an API call is successful, and invocation, header, and payload (message body) details are logged if an API call results in an error code. To override these default settings and change the level of detail that is included in the API event record, you can add the activity-log policy to your API assembly and then configure the policy's properties. For example:

- To include details about the request body or response body in the API event record for a successful API call, you can add an activity-log policy to the associated API operation and set the content type to `payload`.
- To include details about the HTTP request headers or HTTP response headers in the API event record for a successful API call, you can add an activity-log policy to the associated API operation and set the content type to either `header` or `payload`.
- To ensure the value in the `client_geoip` field is accurate, the gateway must receive the `X-Forwarded-For` header in all API calls. Check with the administrator of your deployment environment to ensure that the `X-Forwarded-For` header is passed to your gateways. For example, in a Kubernetes environment where NINGX ingresses are used, configure the NGINX ingress that is used by your gateway to use the `X-Forwarded-For` header: [NGINX Configuration "use-forwarded-headers"](#).

For more information about how to configure your logging preferences, see [activity-log policy](#) and [Including elements in your OpenAPI 2.0 API assembly, Including elements in your OpenAPI 3.0 API assembly](#).

Tip: A log policy field is included in the event record to identify the logging setting. To see examples of the invocation, header, and payload details that can be included in an API event record, see:

- [Example: Event record with invocation details \(activity logging setting\)](#).
- [Example: Event record with invocation and header details \(header logging setting\)](#).
- [Example: Event record with invocation, header, and payload details \(payload logging setting\)](#).

The following table lists the static set of fields that are displayed in an API event record.

Table 1. API event record fields

Field name	Type	Description
@timestamp	Date	A timestamp that records when the record was written by the Logstash data collection engine that feeds data into OpenSearch.
api_id	String	The API identifier.
api_name	String	The name of the API.
api_resource_id	String	Field format is: <code>api_name:api_version:method:path</code> . Only available on API Gateway v10.5.0.8 or higher.
api_version	String	The version number of the API.
app_id	String	The identifier for the registered application.
app_name	String	The name of the registered application. Note: The data indicates N/A when a client ID is not used or is invalid on the API. The gateway needs a client id to determine which app was invoking the API. From this app, the gateway can determine what plan the app is subscribed to on the product that contains the API. Without a client ID, the gateway is unable to determine what plan, product, or app was invoked because a single API can belong to multiple products (each of which have multiple plans and apps subscribed to those plans with client IDs).
app_type	String	The application type, with a value of Production or Development .
bytes_received	Number	The number of bytes received on the inbound request.
bytes_sent	Number	The number of bytes sent on the outbound request.
client_id	String	The unique ID of the client that is attached to the API request.

Field name	Type	Description
client_geoop.area_code	Number	The public switched telephone network (PSTN) area code of the client, as identified from its IP address.
client_geoop.city_name	String	The city name of the client, as identified from its IP address.
client_geoop.continent_code	String	The two-letter continent code of the client, as identified from its IP address.
client_geoop.country_code2	String	The two-letter country code of the client, as identified from its IP address.
client_geoop.country_code3	String	The three-letter country code of the client, as identified from its IP address.
client_geoop.country_name	String	The country name of the client, as identified from its IP address.
client_geoop.dma_code	Number	The Designated Market Area (DMA) code of the client, as identified from its IP address.
client_geoop.ip	String	The IP address of the client.
client_geoop.latitude	Number	The latitude of the client location, as identified from its IP address.
client_geoop.location	String	The longitude and latitude of the client location (separated by a comma), as identified from its IP address.
client_geoop.longitude	Number	The longitude of the client location, as identified from its IP address.
client_geoop.postal_code	String	The postal code of the client, as identified from its IP address.
client_geoop.real_region_name	String	The full name of the region that corresponds to the IP address of the client.
client_geoop.region_name	String	The abbreviated form of the region that corresponds to the IP address of the client.
client_geoop.timezone	String	The time zone of the client, as identified from its IP address.
custom_data	Array map	Custom data can be added to this field.
datetime	Date	A time stamp that records when the API was executed. The time stamp is always shown in coordinated universal time UTC.
developer_org_id	String	The identifier for the consumer organization that owns the application.
endpoint_url	String	When the request failed, identifies the proxy or invoke target URL on which the request failed. It is not included with a successful request.
developer_org_name	String	The name of the consumer organization that owns the application.
env_id	String	The Catalog identifier.
env_name	String	The name of the Catalog.
gateway_geoop.area_code	Number	The public switched telephone network (PSTN) area code of the gateway, as identified from its IP address.
gateway_geoop.city_name	String	The city name of the gateway, as identified from its IP address.
gateway_geoop.continent_code	String	The two-letter continent code of the gateway, as identified from its IP address.
gateway_geoop.country_code2	String	The two-letter country code of the gateway, as identified from its IP address.
gateway_geoop.country_code3	String	The three-letter country code of the gateway, as identified from its IP address.
gateway_geoop.country_name	String	The country name of the gateway, as identified from its IP address.
gateway_geoop.dma_code	Number	The Designated Market Area (DMA) code of the gateway, as identified from its IP address.
gateway_geoop.ip	String	The IP address of the gateway.
gateway_geoop.latitude	Number	The latitude of the gateway location, as identified from its IP address.
gateway_geoop.location	String	The longitude and latitude of the gateway location (separated by a comma), as identified from its IP address.
gateway_geoop.longitude	Number	The longitude of the gateway location, as identified from its IP address.
gateway_geoop.postal_code	String	The postal code of the gateway, as identified from its IP address.
gateway_geoop.real_region_name	String	The full name of the region that corresponds to the IP address of the gateway.
gateway_geoop.region_name	String	The abbreviated form of the region that corresponds to the IP address of the gateway.
gateway_geoop.timezone	String	The time zone of the gateway, as identified from its IP address.
gateway_ip	String	The IP address of the gateway.

Field name	Type	Description
gateway_service_name	String	The name of the API Connect gateway service. Configured by the cloud admin user when registering the gateway service. Only available on API Gateway v10.5.0.8 or higher.
global_transaction_id	String	The DataPower global transaction ID. See https://www.ibm.com/docs/en/datapower-gateway/latest?topic=variables-variables-global-transaction-id-servicevars-globaltransactionid .
graphql_request_field_cost	Number	GraphQL APIs only. The maximum cost of all fields accessed in the query. The cost of each field access is configured in the schema.
graphql_request_type_cost	Number	GraphQL APIs only. The maximum cost of all types retrieved in the query. The cost of each type is configured in the schema.
graphql_request_max_nesting	Number	GraphQL APIs only. The maximum nesting depth found in the query by the assembly validate action. The schema configuration is used to determine which types are nested, so this value might be less than the nesting depth found by the assembly parse action.
graphql_response_field_cost	Number	GraphQL APIs only. The cost of all fields accessed in the query. The cost of each field access is configured in the schema.
graphql_response_type_cost	Number	GraphQL APIs only. The cost of all types that were retrieved in the query. The cost of each type is configured in the schema.
graphql_response_max_nesting	Number	GraphQL APIs only. The nesting depth found in the query by the assembly validate action. The schema configuration is used to determine which types are considered nested, so this value might be less than the nesting depth found by the assembly parse action.
graphql_request_top_field_counts	Object	GraphQL APIs only. The maximum number of times that each field can be retrieved by the given query. This number is equal to the number of times that the resolver is required to run. This field is stored in JSON format and is not indexed, so it is not available for visualizations. A limited number of query requests and responses are stored for each entry, based on the amount of data that each contains. The maximum amount of data that can be stored is subject to change.
graphql_request_top_type_counts	Object	GraphQL APIs only. The maximum number of times that an object of each type can be retrieved by the given query. This field is stored in JSON format and is not indexed, so it is not available for visualizations. A limited number of query requests and responses are stored for each entry, based on the amount of data that each contains. The maximum amount of data that can be stored is subject to change.
graphql_response_top_field_counts	Object	GraphQL APIs only. The number of times that each field was retrieved by the given query. This number is equal to the number of times that the resolver is required to run. This field is stored in JSON format and is not indexed, so it is not available for visualizations. A limited number of query requests and responses are stored for each entry, based on the amount of data that each contains. The maximum amount of data that can be stored is subject to change.
graphql_response_top_type_counts	Object	GraphQL APIs only. The number of times that an object of each type was retrieved by the given query. This field is stored in JSON format and is not indexed, so it is not available for visualizations. A limited number of query requests and responses are stored for each entry, based on the amount of data that each contains. The maximum amount of data that can be stored is subject to change.
headers.field_name	String	Internal information related to analytics ingestion. This is not related to the API call nor its response, see <code>request_http_headers</code> for that information.
host	String	The host name or IP address.
http_user_agent	String	The value of the User Agent header on the inbound request.
immediate_client_ip	String	The client IP address that is directly in front of the gateway. In most cases this is a load balancer.
latency_info.started	Number	The time delay (in milliseconds) between when the request was received and when the corresponding task was started by the gateway. Starting a task comprises multiple steps to prepare for executing an API; for example, completing the TCP/TLS handshake, verifying an app's client ID and secret, and matching the request URI to a Catalog, API, and Plan. When the gateway receives a request, the "Start" duration is set to 0. The duration of each step within the Start task is then added up, and the total represents the duration of the Start task.
latency_info.task	String	The API transaction that was processed.
log_policy	String	The defined logging policy. Values include none, event, headers, and payload.
org_id	String	The identifier for the provider organization that owns the API and associated Products.
org_name	String	The name of the provider organization that owns the API and associated Products.
plan_id	String	The Plan identifier.
plan_name	String	The name of the Plan. Note: The data indicates N/A when a client ID is not used or is invalid on the API. The gateway needs a client id to determine which app was invoking the API. From this app, the gateway can determine what plan the app is subscribed to on the product that contains the API. Without a client ID, the gateway is unable to determine what plan, product, or app was invoked because a single API can belong to multiple products (each of which have multiple plans and apps subscribed to those plans with client IDs).
plan_version	String	The version number of the Plan.
product_name	String	The Product name. Note: The data indicates N/A when a client ID is not used or is invalid on the API. The gateway needs a client id to determine which app was invoking the API. From this app, the gateway can determine what plan the app is subscribed to on the product that contains the API. Without a client ID, the gateway is unable to determine what plan, product, or app was invoked because a single API can belong to multiple products (each of which have multiple plans and apps subscribed to those plans with client IDs).
product_title	String	The title of the Product.
product_version	String	The version number of the Product.
query_string	String	The URL query string value on the inbound request.
rate_limit.count	Number	The number of API calls remaining in the specified rate limit time window.
rate_limit.limit	Number	The maximum number of requests an application is allowed to make to the API during a specified time window.
rate_limit.period	Number	The time window that is used to set a rate limit for API calls.
rate_limit.reject	String	An indication of whether calls that exceed the specified rate limit will be rejected. If true, the API call will be rejected with a 429 status code. If false, a record is created in the Activity log.
rate_limit.shared	String	An indication of whether the rate limit is shared at a Plan level by all operations, or whether a rate limit is specified on individual operations.

Field name	Type	Description
request_body	String	The body of the inbound request.
request_http_headers.field_name	String	A component of the HTTP header section of the inbound request; for example, the acceptable encodings, the identification string for the user agent, or the proxies through which the request was sent. Note: The following types of headers are considered sensitive and will not show in analytics data for security reasons: <ul style="list-style-type: none"> Any secret key configured in the API security Any header that contains secret Any header that contains Authorization
request_method	String	The method of the inbound request.
request_protocol	String	The protocol of the inbound request.
resource	String	The name of the operation.
resource_id	String	The operation identifier.
resource_path	String	The operation path.
response_body	String	The body of the outbound response.
response_http_headers.field_name	String	A component of the HTTP header section of the outbound response; for example, the MIME type of the content or the data and time when the message was sent.
status_code	String	The status code set on the outbound response.
time_to_serve_request	Number	The time elapsed (in milliseconds) from when the request was received by the backend application to when it sent a response.
transaction_id	String	The identifier for the API transaction. See https://www.ibm.com/docs/en/datapower-gateway/latest?topic=variables-vartransaction-id-servicevartransactionid .
uri_path	String	The URI path on the inbound request.

Example: Event record with invocation details (activity logging setting)

```

Accessing analytics data with the toolkit CLI

You can access your analytics event data by using the API Connect toolkit CLI.

About this task

The toolkit CLI provides commands for viewing your analytics data, and also for configuring analytics storage settings. To view organization scoped event data, login to the toolkit CLI using provider organization user credentials. To view cloud scoped event data and analytics storage settings, login to the toolkit CLI as the cloud admin user.

Procedure

1. Install the toolkit: [Setting up the API Connect toolkit](#)
2. Log in to the Management server: [Toolkit CLI Login](#).

```
apic login --server <management_hostname/api_base_url> --username <username> --realm <realm>
```

Where:

- **<management_hostname/api_base_url>** is the FQDN or base URL of your management API endpoints, for example: `mgmt.example.com` or `https://mgmt.example.com`
- **<username>** is either the admin user or provider org owner, depending on whether you want to access cloud or provider organization scoped analytics data.

- `<realm>` is the user registry realm for the specified `<username>`. By default this is `admin/default-idp-1` for the admin user, and `provider/default-idp-2` for provider organization users.

3. View the available toolkit analytics commands by using `-m analytics -h`. Example:

```
apic -m analytics -h
...
Available Commands:

  Creating applications and artifacts
  config                               Manage configuration variables

  Publishing to the cloud
  clustermgmt                           Clustermgmt operations
  dashboards                             Dashboards operations
  events                                 Events operations
  filterparams                           Filterparams operations

  Other commands
  licenses                               Review the license for API Connect
  validate                               Validate an API or product definition
  version                                Get the APIConnect toolkit version
...
```

4. View your analytics events by using the `events` commands:

```
apic -m analytics events -h
Type "apic [command] --help" for help on the following related commands:
events:catalogCount  Count events at catalog scope.
events:catalogGet    Get specific event at catalog scope.
events:catalogList   List events at catalog scope.
events:cloudCount    Count events at cloud scope.
events:cloudGet      Get specific event at cloud scope.
events:cloudList     List events at cloud scope.
events:orgCount      Count events at organization scope.
events:orgGet        Get specific event at organization scope.
events:orgList       List events at organization scope.
events:spaceCount    Count events at space scope.
events:spaceGet      Get specific event at space scope.
events:spaceList     List events at space scope.

# To get a count of all API events at cloud level:
apic -m analytics events:cloudCount --analytics-service <analytics service name> --server <management server api endpoint>
--format=json
{
  "total": 200
}

# To get all the cloud level events:
apic -m analytics events:cloudList --analytics-service <analytics service name> --server <management server api endpoint>
--format=json
{
  "total": 200,
  "search_time": 7,
  "events": [
    {
      "log_policy": "activity",
      ...
    }
  ]
}
```

- [Example toolkit CLI operations](#)
Examples of useful analytics CLI commands.

Example toolkit CLI operations

Examples of useful analytics CLI commands.

The CLI help lists all the filters that can be used when querying analytics data.

```
apic-slim -m analytics events:orgList -h
Usage: apic events:orgList [flags]
```

List events at provider organization scope.

Return a result set of analytics API events scoped to the provider organization. The items in the result set are determined by the passed in request query to this API. The order of the result set is sorted from newest to oldest events by specified 'datetime'. In this API, references to 'field' refer to the analytics API event fields documented here: https://www.ibm.com/docs/en/api-connect/10.0.5.x_lts?topic=data-api-event-record-fields

```
Flags:
--accept-language string      Natural language and locale that the client prefers.
--analytics-service string    Analytics service name or ID. (required)
--api_id string               Filter results by API ID.
--api_name string             Filter results by API name.
--app_id string               Filter results by application ID.
--app_lifecycle_state string  Filter results by application lifecycle state.
--app_name string             Filter results by application name.
--bytes_received string       Filter results by the number of bytes received.
--bytes_sent string           Filter results by the number of bytes sent.
--catalog_id string           Filter results by catalog ID.
--catalog_name string         Filter results by catalog name.
--client_id string            Filter results by client ID.
--client_ip client_ip=9.123.234.0/24  Filter results by client IP address. Only supports equality
```

checks and no operator prefixes. Supports CIDR notation based queries, e.g. `client_ip=9.123.234.0/24`

```

--consumer_org_id developer_org_id          Filter results by consumer organization ID (filters on the
developer_org_id data field).
--consumer_org_name developer_org_name      Filter results by consumer organization name (filters on the
developer_org_name data field).
--consumer_org_title developer_org_title    Filter results by consumer organization title (filters on the
developer_org_title data field).
--end string                                If set, only return events with a datetime equal or older than
this. The value must follow the date-time notation as defined by RFC 3339, section 5.6, for example, 2017-07-21T17:32:28Z. See
https://datatracker.ietf.org/doc/html/rfc3339#section-5.6.

--endpoint_url string                       Filter results by endpoint_url, note this field is only set on
failed API events.
--event_id string                           If set, only return this specific event ID.
--fields string                             A list of the event fields that you want included in each
event. You can use a comma as a separator when specifying the fields. Use this parameter if you require only a subset of the
event fields rather than the full set.

--format string                             Output format. One of [json yaml go-template=... go-template-
file=...], defaults to yaml.
--gateway_ip gateway_ip=9.123.234.0/24     Filter results by gateway IP address. Only supports equality
checks and no operator prefixes. Supports CIDR notation based queries, e.g. gateway_ip=9.123.234.0/24
--global_transaction_id string             Filter results by global transaction ID.
--graphql_request_field_cost string        Filter results by graphql request field cost value.
--graphql_request_type_cost string         Filter results by graphql request type cost value.
--graphql_response_type_cost string        Filter results by graphql response type cost value.
--immediate_client_ip immediate_client_ip=9.123.234.0/24 Filter results by immediate client IP address. Only supports
equality checks and no operator prefixes. Supports CIDR notation based queries, e.g. immediate_client_ip=9.123.234.0/24
--limit string                              If set, the number of items to return when requesting a list.
Maximum: 500
--method string                             Filter results by HTTP method e.g. DELETE, GET, POST.
--offset string                             If set, the offset to be applied when requesting a list. e.g.
return events starting from the 100th result
-o, --org string                            Provider organization name or ID. (required)
--output string                             Write file(s) to directory, instead of STDOUT (default "-")
--path string                               If set, only return events that contain this path value.
--path_id string                            Filter results by path_id
--plan_id string                            Filter results by plan ID
--plan_name string                          Filter results by plan name
--plan_version string                       Filter results by plan version
--product_id string                         Filter results by product ID.
--product_name string                       Filter results by product name.
--product_title string                     Filter results by product title.
--product_version string                   Filter results by product version.
--query_string string                       Filter results by query_string.
--request_body string                       Filter results by request body.
--resource_id string                       Filter results by resource ID.
--response_body string                     Filter results by response body.
-s, --server string                         management server endpoint (required)
--space_id string                           Filter results by space ID.
--space_name string                         Filter results by space name.
--start string                              If set, only return events with a datetime equal to or newer
than this. The value must follow the date-time notation as defined by RFC 3339, section 5.6, for example, 2017-07-21T17:32:28Z.
See https://datatracker.ietf.org/doc/html/rfc3339#section-5.6.

--status_code string                        If set, only return events that match this response code e.g.
200 OK, 404 Not Found. It is also possible to use wildcard based values 10x, 20x, 30x, 40x, 50x.
--time_to_serve_request string              The time in milliseconds to serve the request.
--timeframe string                          If set, only return events within the indicated timeframe.
This parameter will be ignored if either start or end have been specified.

```

Operators can be applied to these filters to provide advanced filtering.

Note: In the examples shown the full command is

```
apic-slim -m analytics events:orgList -s <management_fqdn> --analytics-service <analytics_service_name> --org <provider_org> --
format yaml <filter>
```

For brevity, only the base command and filter are shown in the following examples.

- Select all events with consumer organization ID of `7f9b6ee4-268d-449c-adc1-e0f3bbde8dfe`.

```
apic-slim -m analytics events:orgList ... --consumer_org_id 7f9b6ee4-268d-449c-adc1-e0f3bbde8dfe
```

Note: In the API event records, `consumer_org_id` is referred to as `developer_ord_id`.

- Select all events that do not have the consumer organization ID of `7f9b6ee4-268d-449c-adc1-e0f3bbde8dfe`.

```
apic-slim -m analytics events:orgList ... --consumer_org_id not:7f9b6ee4-268d-449c-adc1-e0f3bbde8dfe
```

- Select all events that have the product name of `superproduct`.

```
apic-slim -m analytics events:orgList ... --product_name superproduct
```

- Select all events that have a product name that contains the string `super`.

```
apic-slim -m analytics events:orgList ... --product_name contains:super
```

- Select all events that have a product name that does not contain the string `super`.

```
apic-slim -m analytics events:orgList ... --product_name notcontains:super
```

- Select all events that have a product name that starts with the string `super`.

```
apic-slim -m analytics events:orgList ... --product_name startswith:super
```

- Select all events that have a product name that ends with the string `super`.

```
apic-slim -m analytics events:orgList ... --product_name endswith:super
```

- Select all events that have one of a list of product names.

```
apic-slim -m analytics events:orgList ... --product_name oneof:superproduct,normalproduct,basicproduct
```

- Select all events that do not have one of a list of product names.

```
apic-slim -m analytics events:orgList ... --product_name notoneof:superproduct,normalproduct,basicproduct
```

- Select all events where the product name matches a regex:

```
apic-slim -m analytics events:orgList ... --product_name regex:"[a-zA-Z]amlet"
```

For regex syntax and examples, see [Regex syntax](#)

Note: Regex queries are more resource intensive and so can take longer than other methods.

- Select all events where the bytes received were 57.

```
--bytes_received 57
```

- Select all events where the bytes received were more than or equal to 57.

```
--bytes_received gte:57
```

For numeric fields, the available comparison operators are: `lt:`, `lte:`, `gt:`, `gte:`. For text and numeric fields these prefixes available are `not:`, `contains:`, `notcontains:`, `oneof:`.

Note:

The regex operator uses the following syntax:

- `"\"` is the escape character, to be used before any of the other reserved characters, for them to be applied literally.

```
"a\" matches "a-z"
```

- `"[]"` square brackets match a single character within the brackets.

```
"[01]m" matches "0m" or "1m"
```

- `"-"` denotes a range if used between two characters.

```
"[a-z]" matches any character between "a" and "z", for example "a", "b", "c", ...
```

When used at the start of the regex `"-"` matches `"-"`.

- `"^"` is a NOT operator that negates what is specified after it.

```
"[^k]" matches any character except for "k".
```

- `"+"` denotes repetition of the preceding character at least once.

```
"U$+" matches "U$", "U$$", "U$$$$", ...
```

- `"()"` parentheses treat their contents as if they were a single character, for use in combination with operators that apply to preceding characters.

```
"tr(cat)+" matches "trcat", "trcatcat", "trcatcatcat"
```

- `"{}"` curly brackets indicate the minimum and maximum number of repetitions of the preceding character. The maximum value is unlimited if omitted with the comma, and the same as the minimum if omitted without the comma.

```
"1{3,4}" matches "111" and "1111"  
"2{4}" matches "2222" only.  
"2{4,}" matches "2222", "22222", "222222", ...
```

- `"?"` denotes repetition of the preceding character zero or one times.

```
"ti?" matches "t" and "ti"
```

- `"."` matches any character.

```
"da." matches "daa", "dab", ...
```

- `"*"` denotes repetition of the preceding character zero or more times.

```
"cab*" matches "ca", "cab", "cabb"
```

- `"|"` denotes the OR operator. The longest pattern on either side of the `"|"` matches.

```
"Mb|Mi" matches "Mb" and "Mi"
```

- `"#"` denotes not string, not even an empty string.

- `"&"` is the AND operator.

```
"hello.+&.+rest" matches "hello-world-rest"
```

- `"~"` denotes a fuzzy logic match.

```
"hello-world~dt" matches "hello-world-test"
```

- `"@"` matches any string.

- `"<>"` angle brackets match a number range.

```
"<3-15>Mb" matches "3Mb", "4Mb", "5Mb", ...
```

Accessing analytics data with the REST API

You can access your Analytics event data by using the API Connect REST API.

Before you begin

API Connect REST API calls are authenticated by using a bearer token in the authorization header. Use the toolkit credentials to request a bearer token. Toolkit credentials can be found in the API Manager UI:

1. Log in to the API Manager UI.
2. From the home page, click the Download toolkit tile.
3. Download the Toolkit credentials.
4. Open the downloaded `credentials.json` file, example:

```
...
  "toolkit": {
    "endpoint": "https://mgmt.api.example.com/api",
    "client_id": "7409693f-f726-48b4-8909-7c0d26f13e81",
    "client_secret": "5feeb0be-17f8-41a4-96d6-d40f33d69ef6"
  },
  ...
}
```

Take note of the `toolkit.client_id`, `toolkit.client_secret`, and `toolkit.endpoint` from this file. You will use these to get your bearer token.

About this task

The Analytics REST API is documented here: [Analytics REST API](#).

Important: The Analytics REST API was replaced in API Connect 10.0.5 and the new Analytics REST API is not backwards-compatible. If you are using a previous version of the REST API, update calls to use the new REST API.

Procedure

1. Use your credentials to request a bearer token:

```
curl -v -k -X POST -d '{"username": "<username>", "password": "<password>", "realm": "<realm>", "client_id": "<client_id>", "client_secret": "<client_secret>", "grant_type": "password"}' -H 'Content-Type: application/json' -H 'Accept: application/json' https://<management_server_platform_api_endpoint>/token
```

Where:

- `<username>` is either the admin user or provider org owner, depending on whether you want to access cloud or provider organization scoped analytics data.
- `<password>` is the password for the specified `<username>`.
- `<realm>` is the user registry realm for the specified `<username>`. By default the realm is `admin/default-idp-1` for the admin user, and `provider/default-idp-2` for provider organization users.
- `<client_id>` is the client ID from the "toolkit" section of the `credentials.json` file, or as provided by your API Connect cloud administrator.
- `<client_secret>` is the client secret from the "toolkit" section of the `credentials.json` file, or as provided by your API Connect cloud administrator.
- `<management_server_platform_api_endpoint>` is the platform API endpoint from the "toolkit" section of the `credentials.json` file, or as provided by your API Connect cloud administrator.

The bearer token is returned in the `access_token` property:

```
{
  "access_token": "<bearer_token>",
  "token_type": "Bearer",
  "expires_in": 28800
}
```

Note the `expires_in` value, which is the number of seconds before the token expires. After expiry you need to request a new bearer token.

2. Use the returned bearer token to call the analytics REST API:

```
# This call to /orgs/<provider_organization>/events requires a bearer token that was requested with provider org
credentials:
curl -v -k -H 'Accept: application/json' -H 'Authorization: Bearer <bearer_token>' -X GET --url
'https://<management_server_api_endpoint>/analytics/<analytics_service>/orgs/<provider_organization>/events'
```

```
{
  "total": 300,
  "search_time": 3,
  "events": [...]
}
```

```
# This call to /cloud/events requires a bearer token that was requested with admin credentials:
curl -v -k -H 'Accept: application/json' -H 'Authorization: Bearer <bearer_token>' -X GET --url
'https://<management_server_api_endpoint>/analytics/<analytics_service>/cloud/events'
```

```
{
  "total": 45543,
  "search_time": 36,
  "events": [...]
}
```

Where:

- `<management_server_api_endpoint>` is the `toolkit.endpoint`, but with the `/api` at the end replaced with `/analytics` to access the analytics APIs.
- `<analytics_service>` is the name of the Analytics service.

Modifying analytics API event data

How to modify API event data before it is stored.

Before you begin

Ensure you are familiar with the API Manager UI, creating REST APIs, and viewing Analytics data.

About this task

The analytics subsystem stores analytics data as individual API event records. One record represents one API event that is logged by the gateway. The API event record fields are defined here: [API event record fields](#). It is possible to customize the API event records for specific APIs. You can modify the contents of existing API event fields, and add new custom fields by using a gateway script or the `set-variable` operation.

Note: If you want to make updates to all incoming API event data, rather than specific APIs, you can use filters as described here:

- [Modifying your incoming analytics data on Kubernetes and OpenShift](#).
- [Modifying your incoming analytics data on OVA](#).

Procedure

1. In the API Manager UI, click the Develop APIs and products tile, select the APIs tab, click Add, select API (from REST, GraphQL or SOAP).
2. Select New OpenAPI, give the API the title of "Hello World" and click Next. Click Next again to accept the security defaults, and then click Edit API.
3. Select the OpenAPI YAML source view `</>`, replace the generated YAML with the following YAML and click Save:

```
swagger: '2.0'
info:
  title: Hello World
  x-ibm-name: hello-world-rest
  version: 1.0.0
schemes:
  - https
basePath: /hello-world
security:
  - {}
securityDefinitions:
  clientID:
    type: apiKey
    in: header
    name: X-IBM-Client-Id
x-ibm-configuration:
  phase: realized
  testable: true
  enforced: true
  properties:
    target-url:
      value: http://example.com/operation-name
      description: The URL of the target service
      encoded: false
cors:
  enabled: true
activity-log:
  enabled: true
  error-content: header
  success-content: activity
application-authentication:
  certificate: false
assembly:
  execute:
    - map:
        version: 2.0.0
        title: map
        inputs:
          name:
            schema:
              type: string
            variable: request.parameters.name
        outputs:
          response:
            schema:
              $ref: '#/definitions/Result'
            variable: message.body
        actions:
          - set: response.hello
            from: name
            value: "'Hello ' +$(name)'"
    catch: []
    finally: []
gateway: datapower-api-gateway
categories:
  - /tests
type: rest
definitions:
  Result:
    type: object
    additionalProperties: false
    properties:
```

```

    hello:
      type: string
paths:
  /hello:
    get:
      parameters:
        - name: name
          in: query
          required: false
          type: string
      responses:
        '200':
          description: OK Response
          schema:
            $ref: '#/definitions/Result'
      parameters: []

```

4. Click the Form icon  to switch to the Form view and select the Gateway tab.
5. From the palette, select the Log policy element and drag it onto the canvas, placing it at the last position in the flow. Set the log policy to Gather-only. This step is so that the "log" context variable is populated, for use in the next step.

6. Modify API event data or add custom data either with a gateway script or by using the set-variable operation.

Gateway script method

Add a Gateway script policy to the assembly flow and paste in the following script code:

```

var logs = context.get('log');
if (logs) {
  if (!logs.custom_data) {
    logs.custom_data = {};
  }
  logs.custom_data.newAPIEventDataField = 'newData';
  logs.product_title = 'newProductTitle';
  context.set('log', logs);
}

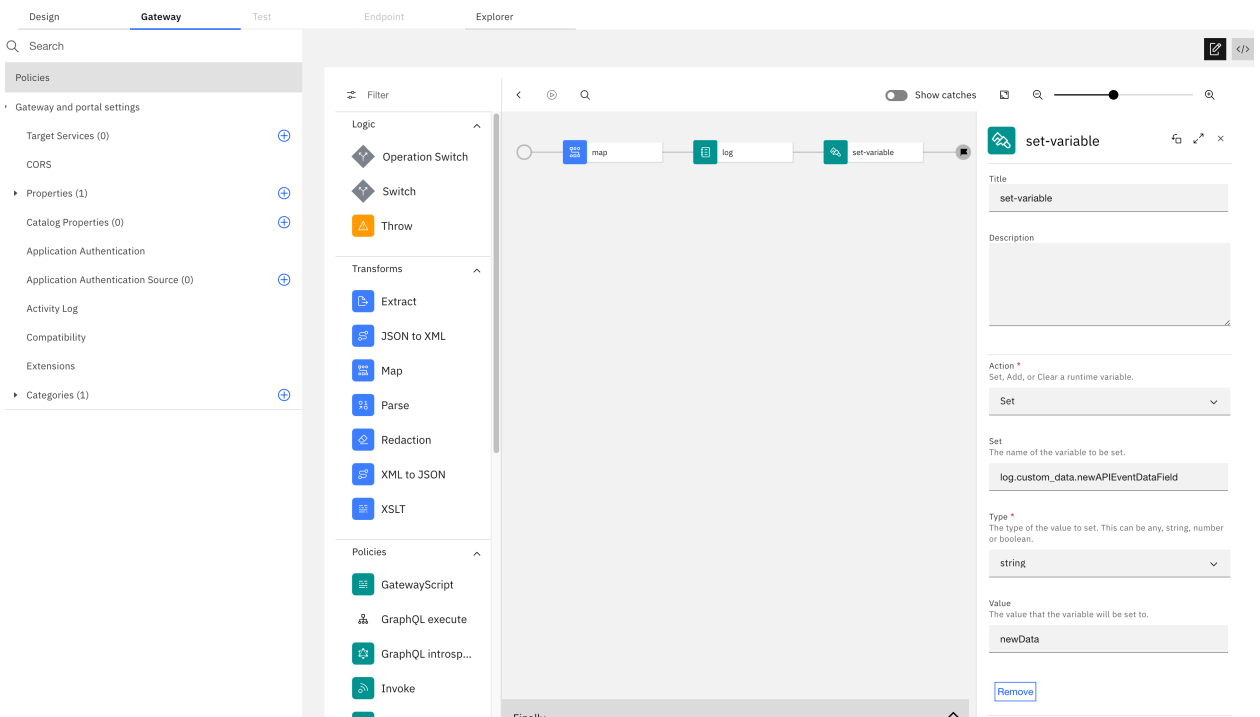

```

In this example, the new field that is added to the API event record is called **newAPIEventDataField** and its value is set to **newData**. The value of the existing field **product_title** is changed to **newProductTitle**.

Set-variable method

If you cannot or do not want to use a gateway script, then you can use a set-variable policy instead. Add a set-variable policy to the assembly flow, and set it as follows:. In this example, the new field that is added to the API event record is called **newAPIEventDataField** and its value is set to **newData**.

The YAML code for set-variable is:

```

- set-variable:
  version: 2.0.0
  title: set-variable
  actions:
    - set: log_custom_data.newAPIEventDataField
      value: newData
      type: string
    - set: log_product_title
      value: newProductTitle
      type: string

```

Note: **context.log.custom_data** supports the addition of primitive typed values such as strings and integers, and there is no enforced limit on how many you can add. Add data only to the **context.log.custom_data** object. Do not add data to **context.log**.

The type of existing fields cannot be changed. For example, **product_title** is a string and cannot be changed to an integer. Do not attempt to assign a different type to an API event field.

7. Publish your "Hello World" API to a catalog.

8. Make a test call to the API and verify that the new custom data is set.

a. From the Analytics view, select Discover and click the API event record corresponding to your test call:

b. Scroll down the page to view the API event record payload. Your custom data field should be present:

Transaction ID: 1699

Datetime: 03/02/2023, 11:19:09 UTC

```
"org_id": "b9f96e8c-ec64-498b-bee8-1714e92a017b",
"gateway_ip": "9.46.120.137",
"client_ip": "9.171.72.199",
"host": "172.16.49.215",
"developer_org_id": "",
"custom_data": {
  "newAPIEventDataField": "newData"
},
"request_protocol": "https",
"domain_name": "apiconnect",
"path_id": "::GET:/hello",
"tags": [
  "apicapievent"
],
"event_id": "6oIAF4YBHjwkR4tDdR0e"
```

9. You can use filters to view only analytics data that has your new custom field set.

The screenshot shows the 'New' filter configuration page in API Connect. It includes sections for 'Time range' (with options like 'Last 30 days' selected), 'Fields' (with a filter rule for 'Custom data' using the operator 'equals' and value 'newData'), and 'Type' (with 'All events' selected). Buttons for 'Load query', 'Add', 'Cancel', 'Save as...', and 'Apply' are visible.

10. To use new data with REST API calls, use the `custom_data` query parameter:

```
/cloud/events?custom_data[newAPIEventDataField]=newData
```

Administering user access

If you have permission to administer users in IBM® API Connect, you can add and delete users. After users are removed from an organization through deletion, the user account remains in API Manager.

About this task

You can also authorize users to perform different roles within your organization. To make any changes to the users that can access your organizations, use the following tasks:

- [Setting the expiration for invitations](#)
Set a time-out for invitations to expire.
- [Configuring notifications](#)
Specify the sender name and email address to use for email notifications. You can preview the templates and customize the text if required. You can also style the notifications to match your business theme.
- [Viewing your user information](#)
You can view the users that can access your IBM API Connect organization.
- [Adding provider organization users and assigning roles](#)
If you have the permissions that are required to edit users in API Connect, you can add users to your provider organization, remove users, assign roles and perform other user administration tasks.
- [Creating custom roles](#)
If you have permission to edit roles in IBM API Connect, you can create custom roles, and assign permissions, in a provider organization. You can create as many custom roles as you want.
- [Removing a user from a provider organization](#)
If you have permission to edit users, you can remove a user from a provider organization.
- [Configuring LDAP group mappings on API Manager user roles](#)
As an API Manager administrator, you can configure LDAP group mapping on API Connect roles in a provider organization by using the developer toolkit CLI.

Setting the expiration for invitations

Set a time-out for invitations to expire.

About this task

Invitations contain a link, which expires after the specified the timeout.

Procedure

1. In API Manager, click  Settings.
2. In the Settings navigation list, click Onboarding, then click Edit.
3. To specify a timeout value, select or type an integer value in the Number field and then choose a unit of time (Seconds, Minutes, or Hours) in the Unit field.
4. Click Save.

Configuring notifications

Specify the sender name and email address to use for email notifications. You can preview the templates and customize the text if required. You can also style the notifications to match your business theme.

About this task

The API Manager emails are sent automatically when certain system events occur. The email templates are organized by scope, as explained in Table 1.

Table 1. Notification scopes

Scope	Events that trigger the notification
catalog	Activities related to Catalogs; such as application life cycle events, invitations to catalogs, product approvals, and subscription approvals.
consumer	Activities to consumer applications and subscription requests in the Developer Portal, invitations to Consumer organizations, and password reset requests for Developer Portal accounts.
provider	Invitations.
space	Invitations.

Email notifications contain a sender name and address that's based on a hierarchical search of the configured sender details in API Connect. Depending on the email template being sent, the search can start at the Space level, and then go through the Catalog, Provider Organization, and the Cloud Manager levels. The sender details that are used will be the first set of configured details found during this hierarchical search. To view which search path API Connect takes when looking for the sender details for each notification template, see [Configuring sender details for email notifications](#).

One of the following roles is required to configure email notifications:

- Administrator
- Owner
- A custom role with the **Settings:Manage** permission

Note: You can also customize notifications by using the developer toolkit CLI, or by using the API Connect REST APIs. See [API development and management commands](#), or [API Connect REST APIs](#), for more information.

Procedure

1. In API Manager, click  Settings.
2. In the Settings navigation list, click Notifications, then click Edit.
3. Specify a sender by entering a Name and Email address, then click Save.

To configure sender details at the Space or Catalog levels, you must use the developer toolkit CLI. For more information, see [Configuring sender details for email notifications](#).

- Optional: To enable template customization, move the Customize notification templates slider to the On position.
Note: You can reload all the default notifications, as configured by a cloud administrator, by disabling and re-enabling template customization. However, doing so will overwrite any customizations that have been made. For more information on customizing notifications as a cloud administrator, see [Customizing email notification templates](#).

- To preview the text for a template, select Preview from the options menu  alongside the template name.
- To edit the text for the template, either click the template name, or select Edit in the options menu alongside the template name.
When a template is opened, an attempt is made to get the language from the browser setting, but if this isn't possible the template defaults to English.

The text includes variables; for example, `{{catalog}}`. The notification text is based on Handlebars syntax. Most variables are enclosed in double curly braces `{{ }}`, but can be enclosed in triple curly braces `{{{ }}` to disable HTML escaping, when the variable is a URL link for example. For more information on Handlebars, see <https://handlebarsjs.com/>.

To obtain the complete list of variables that are available for a particular notification template, complete the following steps:

- Log in to the management server from the command line as a member of a provider organization; for details, see [Logging in to a management server](#). You can use the same management server URL, user name, and password in the login command that you use to log in to the API Manager user interface.
- Enter the following command:

```
apic notification-templates:get template_name --server mgmt_endpoint_url --scope org --org provider_organization --subcollection template_scope --fields variables --output -
```

where:

- template_name* is the name of the required notification template, as displayed in the Template column in the user interface.
- template_scope* is the scope name displayed in the Scope column alongside that template.
- provider_organization* is the value of the **name** field for your provider organization.

For example:

```
apic notification-templates:get member-invitation --server https://myserver.com --scope org --org myorg --subcollection catalog --fields variables --output -
```

The variables that are available for the template are displayed, for example:

```
variables:
- org
- catalog
- activationLink
- expiresAt
- originator
- originatorFirstName
- originatorLastName
- originatorEmail
- username
- email
- firstName
- lastName
```

The `--output -` parameter causes the command output to be written to the command line. You can specify `--output filepath` to have the output written to a .yaml file at the specified location, or omit it altogether to have a file written to the current folder.

- To view and edit the notification template in a different language, select one of the following supported languages from the View template in drop-down list:
 - Chinese (Simplified)
 - Chinese (Traditional)
 - Czech
 - Dutch
 - English (US English)
 - French
 - German
 - Italian
 - Japanese
 - Korean
 - Polish
 - Portuguese
 - Russian
 - Spanish
 - Turkish
- Edit the Subject as required.
- Select the Content type that you want to use for the template, from HTML, PlainText, or Both. The default content type is PlainText.
An edit window for the selected content type is displayed, or both edit windows are displayed if Both is selected.
- Edit the body of the template as required.

For HTML content, only the tags and their attributes that are shown in the following table are allowed.

Table 2. List of allowed HTML tags and their attributes

HTML tag	Attribute
<a>	"class", "href", "hreflang", "style"
	"class", "style"
	"class", "style"
<cite>	"class", "style"
<blockquote>	"class", "cite", "style"
<code>	"class", "style"
	"class", "type", "style"
	"class", "start", "type", "style"
	"class", "style"
<dl>	"class", "style"

HTML tag	Attribute
<dt>	"class", "style"
<dd>	"class", "style"
<h1>	"class", "id", "style"
<h2>	"class", "id", "style"
<h3>	"class", "id", "style"
<h4>	"class", "id", "style"
<h5>	"class", "id", "style"
<h6>	"class", "id", "style"
<p>	"class", "style"
<div>	"class", "style"
 	"class", "style"
	"class", "style"
	"class", "src", "alt", "data-entity-type", "data-entity-uuid", "data-align", "data-caption", "width", "height", "style"
<table>	"class", "id", "style"
<tr>	"class", "id", "style"
<td>	"class", "id", "style"

If an HTML tag that is not allowed is used in a notification, the tag and its contents are displayed in the email as plain text.

Images can be used by adding a `<img`

`src="https://path/to/image.png"/>` tag in the template. The `src` attribute for the image must be a fully qualified web URL, and must be externally accessible so that the email recipients can access the image. It's not possible to reference local images, they must be fully qualified URLs. It's also not possible to embed or attach images or other files in the emails.

11. Click Save when done.

Note: Edits made to a template are saved only for the specific language version that is edited.

- [Configuring sender details for email notifications](#)

Understand how the hierarchical search works for the email notification sender details, and how you can configure sender details at the Space and Catalog level.

Configuring sender details for email notifications

Understand how the hierarchical search works for the email notification sender details, and how you can configure sender details at the Space and Catalog level.

Before you begin

One of the following roles is required to configure sender details for email notifications:

- Administrator
- Owner
- A custom role with the `Cloud settings:Manage` or `Settings:Manage` permission

For more information about the notification templates, their scope, and how to customize them, see [Configuring notifications](#) at the Provider Organization level, and [Customizing email notification templates](#) at the Cloud Manager level.

About this task

Email notifications are sent automatically by API Connect when certain system events occur. These notifications contain a sender name and address that's based on a hierarchical search of the configured sender details in API Connect. Depending on the email template that's being sent, the search can start at the Space level, the Catalog level, the Provider Organization level, or the Cloud level. The sender details that are used are the first set of configured details that are found during the hierarchical search.

The following table shows the starting point for the sender details hierarchical search for each email template, ordered by the scope of the template, where:

- Cloud: emails are sent from the details that are configured in the `Settings>Notifications` section of the Cloud Manager.
- Org: the search for sender details starts at the Provider Organization level; if not available, the Cloud details are used.
- Catalog: the search for sender details starts at the Catalog level; if not available, the Org details are used, and if they're not available, the Cloud details are used.
- Space: the search for sender details starts at the Space level; if not available, the Catalog details are used, if they're not available, the Org details are used, and if they're not available, the Cloud details are used.
- Space or Catalog: in these cases the search starts at the Space level, or at the Catalog level, depending on the user that made the request, as shown in the following list:
 - When the product lifecycle change is started by a user in a Space, the search for sender details starts at the Space level.
 - When the product lifecycle change is started by a user in a Catalog, the search for sender details starts at the Catalog level.
 - When the product lifecycle change is approved by a user in a Space, the search for sender details starts at the Space level.
 - When the product lifecycle change is approved by a user in a Catalog, the search for sender details starts at the Catalog level.

Table 1. Starting point for the sender details search for each email template

Scope	Template name	Email subject	Sender details
admin	mail-server-test-connection	Test message from IBM® API Connect.	Cloud
admin	member-invitation	Invitation to an admin organization in IBM API Connect.	Cloud
admin	password-changed	Password changed for your user account in IBM API Connect.	Cloud
admin	password-reset	Password reset request for your user account in IBM API Connect.	Cloud
provider	invitation	Invitation to create an API provider organization in IBM API Connect.	Cloud
provider	member-invitation	Invitation to an API provider organization in IBM API Connect.	Org
catalog	app-lifecycle-cancelled	Request withdrawn to <code>{{action}}</code> app <code>{{appName}}</code> .	Catalog
catalog	app-lifecycle-request	Request for approval to <code>{{action}}</code> app <code>{{appName}}</code> .	Catalog

Scope	Template name	Email subject	Sender details
catalog	invitation	Invitation to create an API catalog in IBM API Connect.	Org
catalog	member-invitation	Invitation to an API catalog in IBM API Connect.	Catalog
catalog	task-consumer-onboard-request	Consumer onboarding request in the <i>{{catalog}}</i> developer portal.	Catalog
catalog	task-product-lifecycle-approved	Request approved to <i>{{action}}</i> API product in catalog <i>{{catalog}}</i> .	Space or Catalog
catalog	task-product-lifecycle-cancelled	Request withdrawn to <i>{{action}}</i> an API product in the <i>{{catalog}}</i> catalog.	Space or Catalog
catalog	task-product-lifecycle-denied	Request denied to <i>{{action}}</i> API product in catalog <i>{{catalog}}</i> .	Space or Catalog
catalog	task-product-lifecycle-pending	Request received to <i>{{action}}</i> API product in catalog <i>{{catalog}}</i> .	Space or Catalog
catalog	task-product-lifecycle-request	Request for approval to <i>{{action}}</i> an API product in the <i>{{catalog}}</i> catalog.	Space or Catalog
catalog	task-subscription-cancelled	Request withdrawn to subscribe to an API product in the <i>{{catalog}}</i> catalog.	Catalog
catalog	task-subscription-request	Request for approval to subscribe to an API product in the <i>{{catalog}}</i> catalog.	Catalog
space	invitation	Invitation to create an API space in IBM API Connect.	Catalog
space	member-invitation	Invitation to an API space in IBM API Connect.	Space
consumer	account-approved	<i>{{catalogTitle}}</i> developer portal account registration is approved.	Catalog
consumer	account-denied	<i>{{catalogTitle}}</i> developer portal account registration is denied.	Catalog
consumer	account-pending-approval	<i>{{catalogTitle}}</i> developer portal account registration pending approval.	Catalog
consumer	app-lifecycle-approved	Request approved to <i>{{action}}</i> app <i>{{appName}}</i> .	Catalog
consumer	app-lifecycle-denied	Request denied to <i>{{action}}</i> app <i>{{appName}}</i> .	Catalog
consumer	app-lifecycle-pending	Request received to <i>{{action}}</i> app <i>{{appName}}</i> .	Catalog
consumer	app-reinstated	<i>{{appName}}</i> app reinstated in the <i>{{consumerOrg}}</i> developer portal.	Catalog
consumer	app-suspended	<i>{{appName}}</i> app suspended in the <i>{{consumerOrg}}</i> developer portal.	Catalog
consumer	invitation	Invitation to create an API consumer organization in the <i>{{catalog}}</i> developer portal.	Catalog
consumer	member-invitation	Invitation to an API consumer organization in the <i>{{catalog}}</i> developer portal.	Catalog
consumer	password-changed	Password changed for your user account in <i>{{portalTitle}}</i> developer portal.	Catalog
consumer	password-reset	Password reset request for your <i>{{catalog}}</i> developer portal account.	Catalog
consumer	sign-up	<i>{{catalogTitle}}</i> developer portal account registration.	Catalog
consumer	task-subscription-approved	API subscription request approved for app <i>{{appName}}</i> .	Catalog
consumer	task-subscription-denied	API subscription request denied for app <i>{{appName}}</i> .	Catalog
consumer	task-subscription-pending	API subscription request received for app <i>{{appName}}</i> .	Catalog

The sender address details can be configured at four levels: Cloud, Provider Organization, Catalog, and Space, and you can set a different sender address for each Provider Organization, Catalog, or Space, as required. The sender address for the Cloud can be configured in the Cloud Manager UI; see [Setting up notifications](#) for details. The sender address for the Provider Organization can be configured in the API Manager UI; see [Configuring notifications](#) for details. However, the sender address for Catalogs and Spaces can be configured only by using the toolkit CLI, as explained in the following steps.

Procedure

- Log in to the management server from the command line as a member of a provider organization; for more information, see [Logging in to a management server](#). You can use the same management server URL, username, and password in the login command that you use to log in to the API Manager user interface.
- To update the sender address details for a Space, run the following commands.

- Run the `apic space-settings:get` command to read the current Space settings and output them to a json file. For example:

```
apic space-settings:get --server my_mgt_server --org my_provider_org --catalog my_catalog --space my_space --format json
```

Where:

- `my_mgt_server` is your management server endpoint or URL.
- `my_provider_org` is the name of your Provider Organization.
- `my_catalog` is the name of your Catalog.
- `my_space` is the name of your Space.

- Make a copy of the output file that you can then use to update the settings, for example:

```
cp space-setting.json space-setting-update.json
```

- Edit the copied settings file to update the `email_sender` block. For example:

```
vi space-setting-update.json
...
"email_sender": {
  "custom": true,
  "name": "NO REPLY: space sender name",
  "address": "space_sender_email@nomail.com"
},
...
```

Where:

- `custom` must be changed from the default setting of `false` to `true`.
- the `name` line must be added to the file, and the `space sender name` details completed.
- the `address` line must be added to the file, and the `space_sender_email@nomail.com` address details completed.

Note: Ignore all of the other configuration details that are contained in this settings file.

- Run the `space-settings:update` command to update the Space settings with the new sender address details. For example:

```
apic space-settings:update --server my_mgt_server --org my_provider_org --catalog my_catalog --space my_space space-setting-update.json
```

Where `space-setting-update.json` is the name of your updated settings file.

- To update the sender address details for a Catalog, run the following commands.

- Run the `apic catalog-settings:get` command to read the current Catalog settings and output them to a json file. For example:

```
apic catalog-settings:get --server my_mgmt_server --org my_provider_org --catalog my_catalog --format json
```

Where:

- `my_mgmt_server` is your management server endpoint or URL.
- `my_provider_org` is the name of your Provider Organization.
- `my_catalog` is the name of your Catalog.

b. Make a copy of the output file that you can then use to update the settings, for example:

```
cp catalog-setting.json catalog-setting-update.json
```

c. Edit the copied settings file to update the `email_sender` block. For example:

```
vi catalog-setting-update.json
...
"email_sender": {
  "custom": true,
  "name": "NO REPLY: catalog sender name",
  "address": "catalog_sender_email@nomail.com"
},
...
```

Where:

- `custom` must be changed from the default setting of `false` to `true`.
- `name` line must be added to the file, and the `catalog sender name` details completed.
- `address` line must be added to the file, and the `catalog_sender_email@nomail.com` address details completed.

Note: Ignore all of the other configuration details that are contained in this settings file.

d. Run the `catalog-settings:update` command to update the Catalog settings with the new sender address details. For example:

```
apic catalog-settings:update --server my_mgmt_server --org my_provider_org --catalog my_catalog catalog-setting-update.json
```

Where `catalog-setting-update.json` is the name of your updated settings file.

Results

You now understand how the hierarchical search works for the sender details for each email template, and can update the sender details at the Space and Catalog level as required.

Viewing your user information

You can view the users that can access your IBM® API Connect organization.

Procedure

To view your organization user information, complete the following steps:

In the navigation pane of the API Manager user interface, click  Members.

What to do next

You can modify your user accounts; see [Adding provider organization users and assigning roles](#). You can create custom roles; see [Creating custom roles](#).

Adding provider organization users and assigning roles

If you have the permissions that are required to edit users in API Connect, you can add users to your provider organization, remove users, assign roles and perform other user administration tasks.

About this task

There are two ways to add a user:

- Invite member - send an invitation email with an activation link that enables the user to complete the addition operation.
- Add member - specify the user and add them as a member of the provider organization immediately.

Procedure

- To send an email invitation to a new user to register as a member of the provider organization, complete the following steps:
 1. In the navigation pane of the API Manager user interface, click  Members.
 2. Click Add > Invite member.
 3. Enter the email address of the user.
 4. Select the roles that you want to assign to the user.
 5. Click Invite.
- To specify the user and add them as a member of the Admin organization immediately, complete the following steps:

1. In the navigation pane of the API Manager user interface, click  Members.
2. Click Add > Add member.
3. Select the required user registry.
Note: For a user registry to be available in the selection list, one of the following conditions must be satisfied:
 - The visibility of the user registry is set to Public.
 - The visibility of the user registry is set to Custom, and the specified list of provider organizations includes the one to which you are adding the user.For more information, see [Setting visibility for a user registry](#).
The remaining procedure varies according to the type of the selected user registry, as follows:
 - Local User Registry
 - Select whether the user is an Existing user or a New User.
 - For an existing user, complete the following steps:
 - Enter the name of an existing API Connect user that has previously been invited to register and has activated their account.
 - Select the roles that you want to assign to the user, then click Add. The user is added and their membership is immediately enabled. The specified user can log in to the API Manager user interface.
 - For a new user, complete the following steps:
 - Enter a unique user name for the new user.
 - Supply an email address, name details, and a password.
 - Select the roles that you want to assign to the user, then click Add. The user account is created, and the user membership is immediately enabled. The specified user can log in to the API Manager user interface.
 - LDAP
 - Enter the name of a user that exists in the selected user registry.
 - Select the roles that you want to assign to the user, then click Add. The user is added, and the user membership is immediately enabled. The specified user can log in to the API Manager user interface with their LDAP user name.
 - Authentication URL and OIDC
 - Enter the name of an existing API Connect user that has previously been invited to register and has activated their account.
 - Select the roles that you want to assign to the user, then click Add. The user is added, and the user membership is immediately enabled. The specified user can log in to the API Manager user interface.

Results

The user is added to the list of provider organization members. If an email invitation was sent, the status is shown as `Pending` until the recipient of the email clicks the link in the email to complete the creation of their account, after which the status changes to `Enabled`.

What to do next

The new user can access the API Manager user interface. The user's authorization within API Manager is defined by the roles that are assigned to them.

Related tasks

- [Creating custom roles](#)

Creating custom roles

If you have permission to edit roles in IBM® API Connect, you can create custom roles, and assign permissions, in a provider organization. You can create as many custom roles as you want.

About this task

You create custom roles at the provider organization level; those roles are inherited by the Catalogs and Spaces in the provider organization. You can assign permissions at the provider organization, Catalog or Space level.

For a description of the permissions, and details of the default user roles and default permissions assigned to those roles, see [API Connect user roles](#).

Note: In API Manager, the Organization Owner role has full access and cannot be edited or deleted. All other roles, including custom roles, can be deleted. If you delete a role, users lose that role. If a user loses that role, their account remains in API Manager, enabling you to add a role to the user at a future date.

Procedure

To create a custom role, complete the following steps:

1. In the navigation pane of the API Manager user interface, click  Settings
2. Click Roles, then click Add.
The Create a Role page opens.
3. Enter a role Title and an optional Summary. A Name is entered automatically.
Note: The value in the Name field is a single string that is used to identify the role in developer toolkit CLI commands. The Title is used for display.
To view the CLI commands to manage roles, see [apic roles](#).
4. Use the check boxes to assign permissions to the new role.
5. When you are finished, click Save.
6. To delete a role, click the options icon  alongside the role that you want to delete, click Delete, then click Delete again to confirm the role deletion.
Note:
 - You can create and delete a role only at the provider organization level. You cannot create or delete a role at the Catalog level. Nor can you create or delete a role at the Space level.

You can, however, assign Catalog-specific permissions to the role; for details, see [Creating and configuring Catalogs](#). You can also assign Space-specific permissions; for details, see [Managing user access in a Space](#); for more information on Spaces, see [Using syndication in API Connect](#).

- If you assign Product-Drafts or Api-Drafts permissions to the role, these permissions are not inherited by the role in a Catalog or Space. These permissions apply to working with draft Products and APIs in a provider organization and are not relevant in a Catalog or Space.

Results

The custom role is created and assigned the permissions that you selected.

What to do next

Assign the custom role to a user.

Removing a user from a provider organization

If you have permission to edit users, you can remove a user from a provider organization.

About this task

After you have removed the user from your IBM® API Connect provider organization, their resources are deleted and the user cannot access any of the organization's artifacts.

Note: The user account of the deleted user remains in the associated API Connect user registry. The user can still log in to the API Manager user interface but only information links are available; there is no access to view or manage any resources.

If you later invite the same user again, they can re-activate their account. If you are using a Local User Registry, the user must re-activate their account by using the Sign In option, **not** by completing the registration form and using the Sign Up option; attempting to re-register will fail. For details on how to invite a user to join your organization, see [Adding provider organization users and assigning roles](#).

Procedure

To remove a user from a provider organization complete the following steps:

1. In the navigation pane of the API Manager user interface, click  Members.
2. Alongside the user that you want to delete, click the options icon , click Delete, then click Delete again to confirm the user deletion.
Note: You cannot delete the owner of a provider organization.

Results

The user is removed from the provider organization, and the user account remains in API Manager.

Configuring LDAP group mappings on API Manager user roles

As an API Manager administrator, you can configure LDAP group mapping on API Connect roles in a provider organization by using the developer toolkit CLI.

Before you begin

You must have an LDAP user registry resource in the API Manager that has the `external_group_mapping_enabled` configuration set to `true`. See [Using the CLI to create an organization-specific LDAP user registry](#) for information.

One of the following roles is required to edit roles:

- Administrator
- Owner
- Custom role with the `Settings: manage permissions`

Note: The provider organization roles apply only to API Manager users. If you want to apply LDAP group mapping to Cloud Manager users, see [Configuring LDAP group mapping on Cloud Manager user roles](#). LDAP group mapping cannot be applied to Developer Portal users.

About this task

You can map external LDAP groups to the API Connect preconfigured user roles (except for the Owner and Member roles), as well as to any custom user roles, to reflect your business needs.

Notes:

- After LDAP group mapping is enabled on a role, user onboarding always honors the group mappings.
- Once on-boarded, user membership in API Connect is valid throughout the login period (`access_token_ttl`), irrespective of any changes in the external LDAP registry. Membership is updated only on the next login, when the LDAP information is fetched and refreshed.
- One or more API Connect roles can be mapped to one or more LDAP groups, and one or more LDAP groups can be mapped to a role.
- When multiple LDAP groups are mapped to a single role, it means that a user from any one of the LDAP groups can logon to API Connect.
- If a user is removed from the external LDAP user registry, to ensure quick removal from API Connect you must also delete the user membership in API Connect.

- In API Manager you can map roles at the provider organization, Catalog and, if appropriate, Space level. However, you can only map roles at the child level of Catalog, and then the Catalog's child level of Space, if the parent level also has group mapping defined. Mapping at a child level overrides the mapping for the same role at the parent level. For example:
If the Administrator Role at the provider organization level is mapped to the LDAP group of `cn=APIC-Administrators,ou=ibmgroups,o=ibm.com`, and the Administrator Role at a Catalog level is mapped to the LDAP group of `cn=APIC-Developers,ou=ibmgroups,o=ibm.com`, then any user that is added as a Catalog member must belong to the `cn=APIC-Developers,ou=ibmgroups,o=ibm.com` group. Note that provider organization level members that belong to the `cn=APIC-Administrators,ou=ibmgroups,o=ibm.com` group can still access the Catalog due to inheritance.

You can configure LDAP group mappings using one of the following methods:

- [Using the UI to configure LDAP group mappings](#)
- [Using the CLI to configure LDAP group mappings](#)

Using the UI to configure LDAP group mappings

Use the API Manager UI to configure LDAP group mappings.

Procedure

1. Login to the API Manager as a user with the appropriate permissions.
2. Click Settings > Roles > Add a new Role or edit existing role .
3. Select the following settings:
 - Enable external group mapping - select to enable external group mapping for this role.
 - LDAP user Registry - LDAP user registry list which has external group mapping enabled. User must select one of the LDAP user registry from this list.
 - LDAP group names - add one or more LDAP group names that you want to map to the user role.
 - User group prefix - add the prefix for the LDAP user group.
 - User group suffix - add the suffix for the LDAP user group.
4. Save your changes.

Results

The role is updated with the LDAP group mapping information. Users can now log on to the API Manager, and automatically be assigned the correct access permissions for their role.

Using the CLI to configure LDAP group mappings

Use the toolkit CLI to configure LDAP group mappings.

About this task

For detailed information about how to use the CLI, see [Installing the toolkit](#), and [Overview of the command-line tool](#).

Procedure

Perform the following steps to map external LDAP groups to API Manager user roles.

1. Log in to the management server CLI.
Before you can update the role configuration, you must log in to your management server from the developer toolkit CLI as a member of a provider organization. Use the following command:

```
apic login --server mgmt_endpoint_url --username user_id --password password --realm provider/identity_provider
```

where `mgmt_endpoint_url` is the platform API endpoint URL.

You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

```
apic identity-providers:list --scope provider --server mgmt_endpoint_url --fields title,realm
```

For example,

```
apic identity-providers:list --scope provider --server myserver.com --fields title,realm
total_results: 2
results:
- title: API Manager Local User Registry
  realm: provider/default-idp-2
- title: Corporate LDAP user registry
  realm: provider/corporate-ldap
```

The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default API Manager Local User Registry for login as a member of a provider organization is `default-idp-2`.

For full details of the login command, see [Logging in to a management server](#).

2. Run the following command to get the URL of the LDAP user registry resource in the API Manager that you want to map the user roles to:

```
apic user-registries:get ldap_user_registry --org organization_name --server mgmt_endpoint_url --output -
```

where:

- `ldap_user_registry` is the name or ID of your LDAP user registry resource.
- `organization_name` is the value of the `name` property of your provider organization.
- `mgmt_endpoint_url` is the platform API endpoint URL.

This command outputs the configuration details of your LDAP user registry, and the `url` is shown at the end of the list, for example:

```
type: user_registry
api_version: 2.0.0
```

```

id: 35e75bad-1d89-4a65-a70f-xxxxxx
name: ldap
title: LDAP
integration_url: >-
  https://server.com/api/cloud/integrations/user-registry/147b5fb1-e88e-41e3-90e9-xxxxxx
registry_type: ldap
user_managed: false
user_registry_managed: false
external_group_mapping_enabled: true
...
url: >-
  https://server.com/api/user-registries/3d58ce7e-16a8-493b-9684-xxxxxx/35e75bad-1d89-4a65-a70f-xxxxxx

```

3. Create a role yaml file that contains the following LDAP group mapping configuration properties:

```

external_group_mapping:
  user_registry_url: https://server.com/api/user-registries/3d58ce7e-16a8-493b-9684-xxxxxx/35e75bad-1d89-4a65-a70f-xxxxxx
  ldap_groups:
    - 'cn=apic-administrators,ou=ibmgroups,o=ibm.com'
    - 'cn=apic-developers,ou=ibmgroups,o=ibm.com'
  user_group_filter_prefix: (&(uniquemember=
  user_group_filter_suffix: )(objectClass=groupOfUniqueNames))

```

Where:

- `user_registry_url` is the URL of your LDAP user registry resource from Step [#task_apim_role_mapping_ldap_url](#).
- `ldap_groups` is a list of the LDAP group names that you want to map to the user role.
- `user_group_filter_prefix` is the prefix for the LDAP user group.
- `user_group_filter_suffix` is the suffix for the LDAP user group.

4. Run the following command to update the user role with the `external_group_mapping` configuration properties:

```
apic roles:update role_name --scope org --org organization_name --server mgmt_endpoint_url mapping_properties_file
```

Where:

- `role_name` is the name of the user role that you want to add the LDAP group mapping to.
- `--scope` is the organization level that you want the update to apply to. Valid values are:
 - `org` to apply the mapping at the provider organization level.
 - `catalog` to apply the mapping at the Catalog level.
 - `space` to apply the mapping at the Space level.
- `organization_name` is the value of the `name` property of your provider organization.
- `mgmt_endpoint_url` is the platform API endpoint URL.
- `mapping_properties_file` is the name of your mapping properties file from Step [#task_apim_role_mapping_role_file](#), for example `role_mapping_file.yaml`.

If you prefer to enter the configuration properties interactively on the command line, you can substitute the `mapping_properties_file` for a terminating hyphen character `-`, and enter the information manually, followed by pressing **CTRL**
D to terminate the input.

If you want to create a custom role that includes LDAP group mapping, you can include the `external_group_mapping` configuration section in the `role_file`, and then create the new role by using the `apic roles:create` command.

For more information about the `apic roles` commands, see [apic roles](#) in the CLI reference section.

Results

The role is updated with the LDAP group mapping information. Users can now log on to the API Manager, and automatically be assigned the correct access permissions for their role.

Changing your API Manager password

You can change your API Manager password in IBM® API Connect.

Procedure

To change your password, complete the following steps:

1. Log in to the API Manager user interface.
2. Click the User icon  then click My Account.
3. In the Change password section, enter your current password and your new password, and confirm the new password.

Passwords must satisfy the following requirements:

- Cannot be re-used for at least 8 password cycles
- Cannot contain more than 2 consecutive repeating characters
- Must include at least 8 characters
- Must include 1 or more characters from at least 2 of the following categories:
 - Lowercase letters
 - Uppercase letters
 - Numbers
 - Special characters – only the following special characters are allowed:

```

!
\
#
$

```

```
%  
&  
\  
(  
)  
*  
+  
/  
-  
.  
/  
:  
;  
<  
=  
>  
?  
@  
[  
\  
]  
^  
_  
{  
|  
}  
~
```

4. Click Change Password.

Results

Your password is changed.

Resolving login problems by increasing HTTP header size

You can resolve login problems for the API Manager UI by increasing the maximum HTTP client header size.

About this task

Login attempts to the user interface might fail with error 502 (**Bad Gateway**). This error can occur when logging in from a browser that has a large number of cookies. The error occurs because size of the login request exceeds the maximum HTTP client header size.

The maximum HTTP client header size is limited for security reasons. To workaround this issue, you can clear the browser cache and cookies, or open an incognito window from the browser, and then retry the login.

Alternatively, you can increase the maximum HTTP client header size. Use caution when increasing the maximum size because larger headers can raise a security risk to your system.

Procedure

1. **SSH** to your management system or appliance.
2. Enter the following commands:

```
kubectl get deployment -n namespace | grep apim-v2  
kubectl edit deployment -n namespace apiconnect-apim-v2-deployment
```

3. In the `env` section of the deployment configuration, change `--max-http-header-size=12000` to a larger value that works for your environment. For example:

```
- name: NODE_OPTIONS  
  value: --max-old-space-size=8094 --max-http-header-size=16000
```

4. Save the updated configuration.
5. Run `kubectl get pod -n namespace` a few times until the new `apiconnect-apim-v2` pod is up and running.

API Gateway only

Reviewing a gateway's processing status

Review the processing status for the Gateway services that are enabled in your API Connect Catalogs and Spaces.

About this task

Sometimes you might want to check the status of an API event that is being processed by the gateway. For example, you might want to ensure that a Product was published before and is available on the gateway before you invoke one of its APIs. Or perhaps it appears that API events are being processed too slowly and you want to see if all of the events for a particular gateway service are affected. You can review a gateway's processing status to see the which events were sent for processing and which events are still waiting in the queue.

Notes:

- You can only obtain processing status information for the DataPower® API Gateway. This feature is not supported for the DataPower Gateway (v5 compatible) service.
- Processing information is collected for each Catalog. If you view information for a particular Space, the display shows the results for the entire Catalog instead.

Procedure

1. Open the Gateway services page:
 - a. Log in to API Manager.
 - b. In the navigation pane, click  Manage.
 - c. Select a Catalog.
 - d. Click the Catalog settings tab.
 - e. On the Settings page, click Gateway services.

A list of all of the gateway services for the selected Catalog, including all of its Spaces, displays the gateway type and its endpoint URL. In addition, a status icon displays for each service name to provide a quick indication of that service's current status:

-  Normal: Between 0 and 10 events are waiting to be processed
-  Increased: Between 10 and 20 events are waiting to be processed
-  High: More than 20 events are waiting to be processed

You can view details about a service's status to gain insight into possible issues.

2. On the Gateway services page, click  next to a service and select View gateway processing status. The Gateway processing status page displays a list of the events that were sent to the gateway. For each event, you can see the following information:

- Event type: The action performed by the event; for example, subscribing to a product, deleting an application, or creating a new consumer organization.
- Category: The feature area affected by the event; for example, subscriptions, applications, or consumer organizations.
- Time: The time when the event was processed by the gateway service.
- Status: The current event's processing status; for example, Queued (not yet sent for processing), Sent (but not processed yet), or Processed (complete). The number of events in the Queued and Sent states determine the status level for the service.

The display includes events that were not processed yet, as well as the last event processed. If a particular event is not listed as Sent or Queued, then that event was already processed.

API gateway response codes

When an API is called, different HTTP status codes are returned by the gateway to indicate whether the request was successfully completed.

The response codes used in IBM® API Connect correspond to the registered HTTP status codes that are typically generated to provide informational (1xx), successful (2xx), redirection (3xx), client error (4xx), or server error (5xx) responses, as described at <https://tools.ietf.org/html/rfc7231#section-6> and [Hypertext Transfer Protocol \(HTTP\) Status Code Registry](#).

In API Connect, successful responses vary depending on the API being called. Other response codes can also be generated, depending on the implementation of the assembly and the response from the external systems. The standard reasons listed for the registered HTTP status codes are considered adequate for most responses that are returned; these response codes and their causes are therefore not listed here.

In certain cases, a client or server error response code can be caused by a condition that is specific to API Connect. The following table contains a list of these error response codes and identifies possible causes for these codes being returned. For some error codes, multiple causes are possible.

Table 1. Error codes and their causes

Error Code	Cause
401 Unauthorized	<ul style="list-style-type: none">• The required client identification has not been successfully provided.• User authentication failed or did not take place.
403 Forbidden	<ul style="list-style-type: none">• The application is not registered with the plan that is used.• The application is not active.• User authentication failed because multiple client IDs provided.

Error Code	Cause
404 Not Found	<ul style="list-style-type: none"> Information for the provider organization or environment was not found. The API URL was not found in the organization or environment.
405 Method Not Allowed	The API URL was found, but no operation was found that supports the requested HTTP verb.
406 Not Acceptable	The API cannot produce any responses that are supported by the application.
429 Too Many Requests	The rate limit has been exceeded for the plan or operation being used.
500 Internal Server Error	An error occurred while executing this request.
503 Service Unavailable	The status of an API was switched from online to offline, making the API unavailable across all Products in which it is contained. For more information, see Managing your Products in the API Manager UI and Managing API Products using the developer toolkit .

Troubleshooting your billing configuration

Some issues can occur when you are setting up billing integration in IBM® API Connect.

You can use the following links to browse the issues:

- [My customer payment is not completing with Stripe, but the Product is still being accessed.](#)
- [My Product with billing is returning an error when I try to configure it with my Stripe account.](#)
- [My customer previously had a Stripe subscription to a Product but can't access its billing details.](#)

My customer payment is not completing with Stripe, but the Product is still being accessed.

When payment issues occur with the credit card payment provider, the credit card subscription is canceled, but the API Connect subscription is not canceled. You can disable an application until the payment issues are resolved by completing the following steps:

- Navigate to the Settings page in the dashboard of your Stripe account.
- In the Billing section navigate to the Subscriptions and emails page.
- In the Manage failed payments section, change the Subscription status to If all retries for a payment fail, mark the subscription as unpaid.
- Navigate to the Subscriptions page, and when the subscription has moved into the unpaid state open the subscription in the Stripe dashboard.
- In the Metadata section, copy the subscription_url value.
- Use the developer toolkit CLI, and the UUID from the subscription_url, to set the state of the application or subscription to disabled.

My Product with billing is returning an error when I try to configure it with my Stripe account.

The most common cause of this is that your Developer Portal cluster servers or your Management cluster servers cannot communicate with Stripe. To resolve this, ensure that the Stripe API is enabled with HTTPS communication with your Management cluster servers and the Developer Portal on port 443. See [Firewall requirements on Kubernetes](#) and [Firewall requirements on VMware](#) for more information about this requirement.

Other causes might be issues with the subscription billing service, network stability, or the API keys might have been rolled and not updated in API Connect and the Developer Portal.

My customer previously had a Stripe subscription to a Product but can't access its billing details.

There is more than one possible cause and resolution for this situation.

- The credit card transaction might not be completing correctly. If this situation happens, the subscription might be canceled with Stripe, but the API Connect subscription is not canceled. For instructions about how to disable a subscription, see [My customer payment is not completing with Stripe, but the Product is still being accessed](#).
- A recent change to a Product with billing might have triggered an action that was not completed correctly. Seemingly minor changes to the Product can start a number of actions that can overload a server. For example, when you replace a version of the Product with a new version, it starts an update to the Stripe server for every account that is subscribed to that Product. If the action fails to complete, the Plan's subscription status might not be reflected correctly with Stripe. You can identify this situation by viewing the Billing dashboard in the Resources section of the API Manager. The table displays the state of the job queue for the billing integration resource, and any issues with the job queue are displayed here. For more information about the job queue, and how to retry blocked jobs, see [Billing integration resource job queues](#).

Authoring policies

With the on-premise offering, you can control specific processing features in the Gateway server of IBM® API Connect by creating user-defined policies.

IBM API Connect enables organizations to easily promote business services as APIs to internal and external developer communities. API developers can rapidly create, proxy, assemble, and secure APIs through the API Designer user interface (UI). The API Designer assembly feature allows API developers to create complex REST or SOAP API operations that transform data, perform multiple service calls, aggregate data, and apply policies.

A policy is a piece of configuration that controls a specific aspect of processing in the IBM DataPower® Gateway server during the handling of an API invocation at run time. IBM API Connect provides a number of different types of policies, but you can also create user-defined policies to provide more processing control.

When would you need a user-defined policy?

A user-defined policy enables you to control extra processing features in the Gateway server, such as security, or routing of requests. The user-defined policies feature is available only with the on-premise offering of IBM API Connect.

Create a user-defined policy in IBM API Connect when you need to augment the actions or activities that are performed by the API gateway. For example, you might want to perform the following operations:

- Implement your own proprietary logic for dynamic routing of requests.
- Enforce extra security constraints to your API.
- Make accessible an extra capability that is provided in DataPower that is not yet accessible in the IBM API Connect policy catalog.

Note: For best results, do not try to update your existing user-defined policies, because those are already in use by your APIs. Instead, create a new version of the policy that you want to update, and then modify the API assembly to use the newer version of the policy.

See the following topics for more information about user-defined policies, and how to create and import them into IBM API Connect:

- [Authoring policies for the DataPower Gateway \(v5 compatible\)](#)
A user-defined policy for the DataPower Gateway (v5 compatible) consists of a package that contains a YAML definition file that describes the policy, together with the policy implementation files. You import the package into one or more Catalogs in your IBM API Connect environment to make the policy available to APIs that are published to those Catalogs.
- [Authoring policies for the DataPower API Gateway](#)
A user-defined policy for the DataPower API Gateway consists of a package containing configuration details that define the actions of the policy. You publish the package to the DataPower API Gateway to make it available to APIs that are deployed there.

DataPower Gateway (v5 compatible) only

Authoring policies for the DataPower Gateway (v5 compatible)

A user-defined policy for the DataPower® Gateway (v5 compatible) consists of a package that contains a YAML definition file that describes the policy, together with the policy implementation files. You import the package into one or more Catalogs in your IBM® API Connect environment to make the policy available to APIs that are published to those Catalogs.

How do user-defined policies work?

A user-defined policy is implemented as a DataPower processing rule. After a policy is imported into an IBM API Connect Catalog, the policy is available to be placed into an assembly flow of an enforced API. When the API is published, and invoked by an application, the API Gateway executes all policies that are associated with this API. An API Gateway that is running in DataPower calls the IBM DataPower Gateway processing rules that those policies implement.

The following diagram provides an overview of how to create and execute a user-defined policy in IBM API Connect.

Figure 1. The user-defined policy process

For details on how to define and deploy user-defined policies for the DataPower Gateway (v5 compatible), see the following subtopics:

DataPower Gateway (v5 compatible) only

Describing your policy

Describe your user-defined policy by creating a definition file in YAML format to document metadata about the policy.

About this task

A policy YAML file contains the following sections:

- A specification version.
- An information section.
- An attach section.
- A properties section.
- A gateways section.

You can create a policy YAML file by using any editor of your choice. Both .yaml and .yml file extensions are supported, but the use of the .yaml file extension is recommended by yaml.org.

Note: All keys and enumeration values that are specified in this topic are case-sensitive.

Procedure

The following steps describe how to construct a policy YAML file.

1. Set the specification version by adding the following line to the beginning of the file: `policy: 1.0.0`.
2. Complete the information section with details about the policy by using the following syntax:

```
info:
  title: Title of policy
  name: shortnameofpolicy
  version: 1.0.0
  description: An example policy
  contact:
    name: name1
    url: url1
    email: email1
```

where:

- `title` is the title of the policy. Any string can be used, but the title should be kept short so that it can be displayed in the API Manager user interface.
- `name` is the short name for the policy and must contain only alphanumeric characters, the - (dash) character, and the _ (underscore) character (blank spaces are not supported). The name is case-sensitive, and should be 20 characters or less so that it can be displayed in the API Manager user interface. In the example, the name is shown as `<policy-name>`.

Important: The policy short name must be different from the OpenAPI names of the built-in policies, otherwise it will cause a policy conflict in the API assembly definition. For a list of the OpenAPI built-in policy names, see [execute](#). Also, consider including an appropriate unique prefix or suffix string in the short names of your user-defined policies to prevent possible name conflicts with future built-in policies.

Note: The `name` property must be identical to the Node.js module name.

- `version` is the version number of the policy. This is a reserved property.
Tip: The `version.release.modification` version numbering scheme is recommended, for example `1.0.0`.
Note: The `info.version` in `policy.yaml` must match the `version` indicated in `package.json`.
- `description` (optional) is a short description of the policy.
- `contact` (optional) is the contact information for the policy, where:
 - `name` (string) is the identifying name of the contact person or organization.
 - `url` (string) is the URL that points to the contact information.
 - `email` (string) is the email address of the contact person or organization.

3. Complete the attach section by specifying which type of API flow the policy can be attached to.

```
attach:
  - rest
  - soap
```

where:

- `rest` indicates that this policy can be attached to a REST API flow.
- `soap` indicates that this policy can be attached to a SOAP API flow.

The attach section must contain at least one API flow type. If a policy can be attached to both API flow types, they must both be indicated in the attach section.

4. Complete the properties section by defining a JSON schema (based on JSON Schema Specification Draft 4, but rendered in YAML format) that contains the list of properties the policy will declare as required input. These properties are presented to the API author at development time, when the properties can be configured or mapped to values as required.

The JSON schema defines a root object that contains the following JSON properties:

- `type`
- `properties`
- `required`

The syntax and definition of these properties matches the JSON schema definition. The following code block shows an example of a simple schema that defines one required property (*a_property*):

```
properties:
  $schema: "http://json-schema.org/draft-04/schema#"
  type: object
  properties:
    a_property:
      label: a label
      description: a description
      type: a type
  required:
    - a_property
```

The root *type* of the schema must be an **object**, as shown in the example schema. You can define zero or more properties in the schema. Required properties are declared by using the **required** parameter, as shown in the example schema. The policy will not be accessible in the API Manager assembly editor, unless all the required properties have values. Each property is an object with the following items:

- **label** is a short name for the property and is displayed in the Name column of the API Manager assembly editor.
 - **description** is a short description for the property and is displayed in the Description column of the API Manager assembly editor.
 - **type** must be one of the following primitives that are supported:
 - *integer*
 - *number*
 - *string*
 - *boolean* (this primitive is shown as a check box in the assembly editor)
 - *array*
 - **default** (optional) specifies a default value for the property.
 - **enum** (for properties with a **type** of *string*) is an array of valid values.
5. In your gateways section, specify that the policy is for the DataPower® Gateway. Enter the following code:

```
gateways:
  - datapower-gateway
```

6. Save the new policy as a YAML file using the value of the **name** property (in the **info** section) as the file's name. Required: To ensure a successful import, the YAML file must use the name specified in the policy's **name** property.

Results

You have created a user-defined policy definition YAML file that documents metadata about your policy.

Example

The following code block shows an example of a policy definition file that contains all the supported primitives. This policy must be saved as `sampleimpl.yaml` to ensure that it can be imported into API Connect.

```
policy: 1.0.0

info:
  title: Sample Policy
  name: sampleimpl
  version: 1.0.1
  description: This is a sample policy.
  contact:
    name: Steve Product Manager
    url: http://developer.acme.com/contacturl
    email: steve-product-manager@someemailservice.com

attach:
  - rest
  - soap

properties:
  $schema: "http://json-schema.org/draft-04/schema#"
  type: object
  properties:
    samplestring:
      label: String Property
      description: Sample string property
      type: string
    sampleboolean:
      label: Boolean Property
      description: Sample boolean property
      type: boolean
    sampleinteger:
      label: Integer Property
      description: Sample integer property
      type: integer
    samplenumber:
      label: Number Property
      description: Sample number property
      type: number
    samplestringwithenum:
      label: Enum Property
      description: Sample string enum property
      enum:
        - one
        - two
        - three
      default: one
```

```

    type: string
  samplearray:
    label: Array of properties
    description: Sample array of properties
    type: array
    items:
      type: object
      properties:
        string:
          label: String Property
          description: Sample string property in array
          type: string
        boolean:
          label: Boolean Property
          description: Sample boolean property in array
          type: boolean
      required:
        - string
  required:
    - samplestring
    - sampleboolean
    - sampleinteger
    - samplenumber
    - samplearray

```

```

gateways:
- datapower-gateway

```

In the following code block, an example of a policy definition file for modifying message payload is shown.

```

policy: 1.0.0

info:
  title: Run GatewayScript
  name: gatewayscript-policy
  version: 1.0.0
  description: Execute GatewayScript
  contact:
    name: IBM DataPower Samples
    url: https://github.com/ibm-datapower/
    email: steve-product-manager@ibm.com

attach:
- rest
- soap

gateways:
- datapower-gateway

properties:
  $schema: "http://json-schema.org/draft-04/schema#"
  type: object
  properties:
    source:
      label: "GatewayScript Source"
      description: "The location of the GatewayScript file to execute"
      type: string
      default: store:///identity.js
    value:
      label: "New Value"
      description: "The value to be added to the payload"
      type: string
      default: "Hello Policy"
  required:
    - source
    - value

```

What to do next

Create an implementation for your user-defined policy by using DataPower processing rules and actions. For more information, see [Implementing your policy](#).

DataPower Gateway (v5 compatible) only

Implementing your policy

Create an implementation for your user-defined policy by using DataPower® processing rules and actions.

Before you begin

You must create a policy YAML file before you create an implementation. For more information, see [Describing your policy](#).

You can create an implementation for your policy by using the usual tools available to IBM® DataPower Gateway developers. However, the DataPower user interface is typically the tool that is used to create processing rules and actions.

Note: You must be skilled in DataPower tooling and concepts, before you can create a policy implementation.

In order for your processing actions to work well under the API Gateway configuration, and also to enable the use of contextual information that is relevant to the processing actions, a library of functions and templates is available that you can use to assist you in writing the XSLT or GatewayScript transformations. This library provides the following mechanisms:

- Access to input property values (input from the assembly editor).
- Access to context values (the API Gateway runtime context).
- Access to the runtime payload message and media-type.
- Ability to modify the payload message.
- Ability to end the policy execution with an error.

About this task

You create an implementation for your user-defined policy in the IBM DataPower Gateway. The implementation must adhere to the following conventions:

1. You must create a main processing rule, and this rule will be the starting point for the policy. The rule name must start with the name of the policy (the value of the **name** property in the "info" section of the policy YAML file), followed by -main; for example *checkmembership-main*.
2. There are no restrictions on what actions the processing rule can execute, on condition that the rule adheres to the naming convention in point 1. and the instructions that are detailed in this topic.
3. The names of the processing actions and all other objects also must start with the name of the user-defined policy (the value of the **name** property in the "info" section of the policy YAML file).
4. If your processing rule runs transformation actions that use XSLT or GatewayScript files, these files must be stored in the following location: `local://policy/<policy-name>`.
5. If you have certificate and key files that must be stored in the `cert:` folder, the names of these files also must start with the name of the user-defined policy (as defined in the policy YAML file).
6. If your policy is using GatewayScript transformations, your policy code must require `apim.custom.js`, for example:

```
var apic = require('local://isp/policy/apim.custom.js');
```

The following steps describe how to create an implementation for your user-defined policy:

- [Create a main processing rule.](#)
- [Create one or more processing actions:](#)
 - [Configure access to input properties.](#)
 - [Configure access to the runtime context.](#)
 - [Configure access to the input payload.](#)
 - [Configure access to the HTTP headers.](#)
 - [Modify the payload in XSLT or gatewayscript.](#)
 - [Configure the implementation to produce error information.](#)
 - [Set variables.](#)
- [Export your policy implementation.](#)

Procedure

1. Create a main processing rule that is called `<policy-name>-main` where `<policy-name>` is the name of your user-defined policy (the value of the **name** property in the "info" section of the policy YAML file).

Note: You must specify the following processing rule settings:

- Rule direction: Both Directions
- Non-XML Processing: on

2. Create one or more processing actions.

Each processing action should have a unique name and must start with the name of the user-defined policy (as defined in the policy YAML file).

Note: Different processing actions in DataPower might require different releases of the DataPower firmware. When using the GatewayScript actions, the minimum DataPower firmware that should be used is version 7.2.0.

The following processing actions are available:

- Configure access to the input properties in XSLT (`policyProperties`), or in GatewayScript (`apic.getPolicyProperty`).
If required by the properties that are defined in the policy YAML file, when the policy is attached to an API the API developer must enter the input settings or variables for a particular property. This function provides the mechanism to retrieve these input settings or variables at run time. For an example code

snippet, see [Access to input properties code snippet](#).

- Configure access to the runtime context in XSLT (`getContext`), or in GatewayScript (`apic.getContext`).
When an API is invoked, runtime information about the request can be accessed by using a user-defined policy, and this information is known as the runtime context. The function `getContext` provides the mechanism to access this runtime context. For an example code snippet, see [Access to runtime context code snippet](#). For a complete list of context variables, see [API Gateway context variables](#).
- Configure access to the input payload in XSLT (`payloadRead`), or in GatewayScript (`apic.readInput(callback)`).
Some policies require access to the input message or payload that is provided by the application. Accessing the input message or payload during an assembly flow can be difficult, as this information might change as the policies and the assembly steps run. This function provides a mechanism to get the correct input message or payload at the time of policy execution. For an example code snippet, see [Access to input payload code snippet](#).

This function returns an XML node-set that contains the payload of the request. If the payload is in JSON format, a JSONx node-set is returned that can then be manipulated within an XSLT or GatewayScript stylesheet. If the payload is not in JSON or XML format, the node-set that is returned is empty.

Note: The `payloadType()` function can be called to determine what type of payload (XML or JSONx) will be returned by the `payloadRead()` or the `apic.readInput(callback)` function.

- Configure access to the HTTP headers in XSLT (`getContext`), or in GatewayScript (`apic.getContext`).
The HTTP header information of a request can be retrieved from the request context. The HTTP header names are normalized to lowercase. The function `getContext()` provides the mechanism to access the HTTP header information. For an example code snippet, see [Access to HTTP headers code snippet](#).

Note: Access or modification of HTTP headers by using DataPower extensions, such as `dp:set-request-header`, is not advisable, as such actions might yield unexpected results when the policy is combined with other policies and assembly steps.

- Modify the payload in XSLT or GatewayScript.
When a policy implementation is required to change a payload message, you must configure the DataPower Transform Processing Action to set the Output context field to `OUTPUT` (referred to as the `OUTPUT` named context).

The output must be an XML node-set, which represents an XML or SOAP message, or a JSON message by using JSONx. To assist the API Gateway policy framework to accept the new or transformed message, call the `apim-output` template. For an example code snippet, see [Modify the payload code snippet](#).

Note: The modify the payload processing action works only with a proxy task. An HTTP or web service task always overwrites the output of a policy implementation.

- Configure the implementation to produce error information.
If you require your policy implementation to produce error information when there is a failure, you must configure the implementation by calling the error template. For an example code snippet, see [Configure error information code snippet](#).
- Set variables.
Use the `setVariable` template to set a runtime variable to a specified string value. This value can then be retrieved by using the function `getVariable()`, or by mapping the value into a step. For an example code snippet, see [Set variables code snippet](#).

3. Export your policy implementation from DataPower.

From the DataPower user interface, export the objects and files that are referenced by your main processing rule as a compressed file. No other objects or files should be exported. The following file list is an example configuration of an export from DataPower:

Archive: `checkmembership.zip`

```
11819 11-19-2014 22:53 dp-aux/basetypes.xml
3028207 11-19-2014 22:53 dp-aux/drMgmt.xml
6456 11-19-2014 22:53 dp-aux/map-dmz.xml
7299 11-19-2014 22:53 dp-aux/management.xml
23130 11-19-2014 22:53 dp-aux/SchemaUtil.xml
216003 11-19-2014 22:53 dp-aux/clixform.xml
5284 11-19-2014 22:53 local/policy/checkmembership/check.xml
5061 11-19-2014 22:53 export.xml
```

The example shows the exported configuration file (`export.xml`) that contains all the processing actions and DataPower objects, the referenced files, and the DataPower configuration schemas that are created by using the configuration export in the DataPower user interface.

Results

You have created an implementation for your user-defined policy and exported this implementation from the DataPower user interface.

What to do next

Create a user-defined policy package that can then be imported into IBM API Connect. For details, see [Packaging and importing your policies into IBM API Connect](#).

Related concepts

- [Authoring policies](#)

Related information

- [IBM DataPower Gateway](#)

DataPower Gateway (v5 compatible) only

Packaging and importing your policies into IBM API Connect

Make your user-defined policy available to API developers by packaging it and importing it into an IBM® API Connect Catalog.

Before you begin

Before you can package a user-defined policy and import it into IBM API Connect, you must complete the following tasks:

1. [Describe your policy](#) in a YAML file.
2. [Implement your policy](#), by using DataPower processing rules and actions.

Procedure

To package and import your user-defined policy, complete the following steps:

1. Create a .zip file that contains the following folder structure:

```
<policy-name>.yaml
implementation/
  policy-name.zip
```

where

- `<policy-name>.yaml` is your policy definition file. The YAML file must use the name that is specified in its `name` property.
- `implementation/policy-name.zip` is your policy implementation for a policy that is deployed to the DataPower Gateway. The policy implementation file contains the DataPower processing rules and actions that were exported from DataPower in step 2.

The name of the .zip file must start with the name of the user-defined policy (as defined in the policy YAML file). If the implementation requires certificate and key files, these files must be added to the implementation directory.

Note: Your package .zip file must contain a .zip policy implementation file.

2. Use the API Manager user interface to import your policy into a Catalog. For more information, see [Importing a user-defined policy into a Catalog](#).

Note:

- You must import your user-defined policy into every Catalog in API Manager that you require your policy to run in.
- For the policy to be displayed on the palette in the [API assembly editor](#), you must import the user-defined policy into the Sandbox Catalog.

What to do next

Make your user-defined policy package accessible to the API Designer UI. To display user-defined policies in the API Designer UI, edit the `.apiconnect/config` file to point to the directory containing the policy.yaml file. You can edit the global config file (`~/apiconnect/config`) or a project-specific config file (`~/ProjectA/.apiconnect/config`). Follow these steps:

1. Create one or more directories to hold your policy.yaml files that are accessible to Node.js, and copy the user-defined policy package into this directory. For example, create directories named `/ProjectA/Policies` and `/ProjectB/Policies`.
2. Extract the policy package so that the folder structure is visible, for example `policy.yaml` and `implementation/policy-name.zip`. The file containing the custom policies must be named `policy.yaml`.
3. Add the `userPolicies: []` array object to the config file in `~/ProjectA/.apiconnect/` or `~/apiconnect/`, and edit the array object so it contains the absolute path to the director(ies) containing the policy.yaml file.

Following is an example of an `~/apiconnect/config` file showing the `userPolicies` entry pointing to the directory containing the policy.yaml file:

```
apim_server: us.apiconnect.ibmcloud.com
us.apiconnect.ibmcloud.com.meta:
  formFactor: BLUEMIX_PUBLIC
  serverCapabilities:
    authTypes:
      - basic
      - token
  toolkit:
    version_recommended: 2.1.30
    version_minimum: 2.1.30
catalog: >-
  apic-catalog://us.apiconnect.ibmcloud.com/orgs/sampleorg-myspace2/catalogs/sb
app: >-
  apic-app://us.apiconnect.ibmcloud.com/orgs/sampleorg-myspace2/apps/acme-bank
userPolicies:
  - /ProjectA/Policies
```

Note:

- The `userPolicies: []` array object contains a list of absolute paths to the policy director(ies). The values can point to a parent location, for example `userPolicies: ["/~/mypolicies"]`. Alternatively, each policy location can be specified in the array, for example `userPolicies: ["/~/mypolicies/policya", "/~/mypolicies/policyb"]`. However, do not use both of these approaches in the same directory. For example, do not create policies in a directory structure like this `~/mypolicies`, `~/mypolicies/policya`, and `~/mypolicies/policyb`.
4. Open the API Designer UI. The user-defined policy is available on the policy assembly palette, and you can add the policy to your API definition.

Example code snippets to help the creation of a user-defined policy implementation.

DataPower Gateway (v5 compatible) only

Implementation code examples

Example code snippets to help the creation of a user-defined policy implementation.

Note: If you are using GatewayScript, you must include the following command:

```
var apic = require('./apim.custom.js');
```

where *apic* is the common name used for the GatewayScript examples in this topic. However, *apic* could be any given name of your choice, for example you could use:

```
var apim = require('./apim.custom.js');
```

and then you would start your calls with *apim*.

- [Access to input properties code snippet](#)
- [Access to runtime context code snippet](#)
- [Access to input payload code snippet](#)
- [Access to HTTP headers code snippet](#)
- [Modify the payload code snippet](#)
- [Configure error information code snippet](#)
- [Set variables code snippet](#)

Access to input properties code snippet

The following code block shows an example of how to access the input properties by using the XSLT `policyProperties()` function. The example defines a property that is named `a_property`, which is declared as an integer value, but is retrieved in XSLT as text.

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet version="1.0"
  xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:dp="http://www.datapower.com/extensions"
  xmlns:func="http://exslt.org/functions"
  xmlns:apim="http://www.ibm.com/apimanager" extension-element-prefixes="dp func apim">

  <!-- Contains the APIM functions -->
  <xsl:import
href="#_home_markdown_jenkins_workspace_Transform_in_SSMNED_10.0.5_com.ibm.apic.policy.doc_local:_isp_policy_apim.custom.xml"
/>

  <xsl:template match="/">
    <xsl:variable name="p" select="apim:policyProperties()" />
    <xsl:message>
      The value of my input property is
      <xsl:value-of select="$p/a_property" />
    </xsl:message>
  </xsl:template>
</xsl:stylesheet>
```

If you are using GatewayScript, you must call the function:

```
apic.getPolicyProperty(propertyName)
```

where *propertyName* is the name of the input property that you want to access. If the input property name is blank, the action will return all input properties.

Access to runtime context code snippet

The following code block shows an example of how to access the runtime context by using the XSLT `getContext()` function.

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet version="1.0"
  xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:dp="http://www.datapower.com/extensions"
  xmlns:func="http://exslt.org/functions"
  xmlns:apim="http://www.ibm.com/apimanager" extension-element-prefixes="dp func apim">

  <!-- Contains the APIM functions -->
  <xsl:import
href="#_home_markdown_jenkins_workspace_Transform_in_SSMNED_10.0.5_com.ibm.apic.policy.doc_local:_isp_policy_apim.custom.xml"
/>

  <xsl:template match="/">
    <xsl:variable name="client-id" select="apim:getContext('client.app.id')"/>
    <xsl:message>
      The calling application is
      <xsl:value-of select="$client-id" />
    </xsl:message>
  </xsl:template>
</xsl:stylesheet>
```

If you are using GatewayScript, you must call the function:

```
apic.getContext(varName)
```

where *varName* is the name of the context variable that you want to access. For a complete list of context variables, see [API Gateway context variables](#).

Access to input payload code snippet

The following code block shows an example of how to access the input payload by using the XSLT `payloadRead()` function.

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet version="1.0"
  xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:dp="http://www.datapower.com/extensions"
  xmlns:func="http://exslt.org/functions"
  xmlns:apim="http://www.ibm.com/apimanagement" extension-element-prefixes="dp func apim">

  <!-- Contains the APIM functions -->
  <xsl:import
href="#_home_markdown_jenkins_workspace_Transform_in_SSMNED_10.0.5_com.ibm.apic.policy.doc_local:_isp_policy_apim.custom.xsl"
/>

  <xsl:template match="/">
    <xsl:variable name="input" select="apim:payloadRead()" />
    <xsl:message>
      The input payload is
      <xsl:copy-of select="$input" />
    </xsl:message>
  </xsl:template>

</xsl:stylesheet>
```

If you are using GatewayScript, you must call the function:

```
apic.readInput(callback)
```

A callback is required because the actual payload read is asynchronous. The callback method is called when the payload is ready.

This function returns an XML node-set that contains the payload of the request. If the payload is in JSON format, a JSONx node-set is returned that can then be manipulated within an XSLT or GatewayScript stylesheet. If the payload is not in JSON or XML format, the node-set that is returned is empty.

The following example shows how to use the `payloadType()` function to determine what type of payload (XML or JSONx) will be returned by the XSLT `payloadRead()` function.

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet version="1.0"
  xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:dp="http://www.datapower.com/extensions"
  xmlns:func="http://exslt.org/functions"
  xmlns:apim="http://www.ibm.com/apimanagement" extension-element-prefixes="dp func apim">

  <!-- Contains the APIM functions -->
  <xsl:import
href="#_home_markdown_jenkins_workspace_Transform_in_SSMNED_10.0.5_com.ibm.apic.policy.doc_local:_isp_policy_apim.custom.xsl"
/>

  <xsl:template match="/">
    <xsl:variable name="payloadType" select="apim:payloadType()" />
    <xsl:message>
      <xsl:text>Payload type is [</xsl:text>
      <xsl:value-of select="$payloadType" />
      <xsl:text>]</xsl:text>
    </xsl:message>
  </xsl:template>

</xsl:stylesheet>
```

Access to HTTP headers code snippet

The following code block shows an example of how to access the HTTP headers in XSLT by using the `getContext()` function.

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet version="1.0"
  xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:dp="http://www.datapower.com/extensions"
  xmlns:func="http://exslt.org/functions"
  xmlns:apim="http://www.ibm.com/apimanagement" extension-element-prefixes="dp func apim">

  <!-- Contains the APIM functions -->
  <xsl:import
href="#_home_markdown_jenkins_workspace_Transform_in_SSMNED_10.0.5_com.ibm.apic.policy.doc_local:_isp_policy_apim.custom.xsl"
/>

  <xsl:template match="/">
    <xsl:variable name="content-type" select="apim:getContext('request.headers.content-type')" />
    <xsl:message>
      The request content type is
      <xsl:value-of select="$content-type" />
    </xsl:message>
  </xsl:template>

</xsl:stylesheet>
```

If you are using GatewayScript, you must call the function:

```
apic.getContext(request.headers.headerName)
```

where `headerName` maps to the name of the header you want to access.

Note: Access or modification of HTTP headers by using DataPower® extensions, such as `dp:set-request-header`, is not advisable, as such actions might yield unexpected results when the policy is combined with other policies and assembly steps.

Modify the payload code snippet

The output from a user-defined policy must be an XML node-set, which represents an XML or SOAP message, or a JSON message by using JSONx. The following code block shows an example of how to modify the payload in XSLT. To assist the API Gateway policy framework to accept the new or transformed message, call the `apim-output` template, as shown in the following example.

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet version="1.0"
  xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:apim="http://www.ibm.com/apimanagement"
  xmlns:jsonx="http://www.ibm.com/xmlns/prod/2009/jsonx">

  <!-- Contains the APIM functions -->
  <xsl:include
href="#_home_markdown_jenkins_workspace_Transform_in_SSMNED_10.0.5_com.ibm.apic.policy.doc_local:_isp_policy_apim.custom.xsl"
/>

  <xsl:template match="/">
    <!-- Creates a JSON document (empty object is for simplicity) -->
    <jsonx:object>
    </jsonx:object>

    <!-- Indicates the media type of the output being produced -->

    <xsl:call-template name="apim:output">
      <xsl:with-param name="mediaType" select="'application/json'" />
    </xsl:call-template>
  </xsl:template>

</xsl:stylesheet>
```

where `mediaType`:

- `'application/json'` is when the output is written in JSONx format.
- `'application/xml'` is when the output is written in XML format.

If you are using GatewayScript, you must call the function:

```
apic.output(mediaType)
```

where `mediaType` is:

- `application/json` is when the output is written in JSONx format.
- `application/xml` is when the output is written in XML format.

Specifying the media type allows the next steps in the assembly flow to understand how to process the new payload.

Tip: The output from a user-defined policy must be XML or JSONx. JSONx is an IBM standard format to represent JSON as XML. One way to convert output GatewayScript JSON data into JSONx, is to add a `Convert Query Params to XML` action to follow the GatewayScript action within the same policy rule. The `Convert Query Params to XML` action must have an `Input Conversion` with the `Default Encoding` set to `JSON`. The output from the GatewayScript action must be the input for the `Convert Query Params to XML` action for JSONx to be produced.

Configure error information code snippet

The following XSLT code block shows an example of how to configure the policy implementation to produce error information by calling the `apim-error` template.

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet version="1.0"
  xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:apim="http://www.ibm.com/apimanagement">

  <!-- Contains the APIM functions -->
  <xsl:include
href="#_home_markdown_jenkins_workspace_Transform_in_SSMNED_10.0.5_com.ibm.apic.policy.doc_local:_isp_policy_apim.custom.xsl"
/>

  <!-- Indicates this policy has a failure and provides
    additional information for the client application -->
  <xsl:template match="/">
    <xsl:call-template name="apim:error">
      <xsl:with-param name="httpCode" select="'401'" />
      <xsl:with-param name="httpReasonPhrase" select="'Unauthorized'" />
      <xsl:with-param name="errorMessage" select="'Please select a Plan'" />
    </xsl:call-template>
  </xsl:template>

</xsl:stylesheet>
```

where:

- `httpCode` is the code of the required error message.
- `httpReasonPhrase` is the reason for the error.
- `errorMessage` is the suggested action for the user.

If you are using GatewayScript, you must call the template:

```
apic.error(name, httpCode, httpReasonPhrase, message)
```

where:

- **name** is the name of the error.
- **httpCode** is the code of the required error message.
- **httpReasonPhrase** is the reason for the error.
- **message** is the suggested action for the user.

Set variables code snippet

The following XSLT code block shows an example of how to set a runtime variable to a specified string value by calling the `setVariable` template.

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet version="1.0"
  xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:dp="http://www.datapower.com/extensions"
  xmlns:func="http://exslt.org/functions"
  xmlns:apim="http://www.ibm.com/apimanagement" extension-element-prefixes="dp func apim">

  <!-- Contains the APIM functions -->
  <xsl:import
href="#_home_markdown_jenkins_workspace_Transform_in_SSMNED_10.0.5_com.ibm.apic.policy.doc_local:_isp_policy_apim.custom.xsl"
/>

  <xsl:template match="/">
    <xsl:call-template name="apim:setVariable">
      <xsl:with-param name="varName" select="'serviceEndpoint'" />
      <xsl:with-param name="value" select="'https://endpoint.host.com/data'" />
    </xsl:call-template>
    <xsl:message>
      <xsl:text>Variable [ </xsl:text>
      <xsl:value-of select="'serviceEndpoint'" />
      <xsl:text>] set to [ </xsl:text>
      <xsl:value-of select="'https://endpoint.host.com/data'" />
      <xsl:text>] </xsl:text>
    </xsl:message>
  </xsl:template>
</xsl:stylesheet>
```

where:

- **varName** is the name of the runtime variable that you want to set a value to.
- **value** is the string value that you want to set the variable to. This can be a literal value, or another variable. For example, to set your named variable to the value of the Content-Type header in a request, you would specify the **value** as `$(request.headers.content-type)`.

If you are using GatewayScript, you must call the template:

```
apic.setvariable(varName, varValue, action)
```

where:

- **varName** is the name of the runtime variable that you want to set a value to, or that you want to add or clear.
- **varValue** is the string value that you want to set the variable to. This can be a literal value, or another variable. For example, to set your named variable to the value of the Content-Type header in a request, you would specify the **varValue** as `request.headers.content-type`. This property is only required when **set** or **add** is specified as the action.
- **action** is the action that you want to apply to the variable. Valid options are:
 - **set**
 - **add**
 - **clear**

If no option is set, the default option of **set** is applied.

The following XSLT example shows how to retrieve the value of a runtime variable by using the `getVariable()` function.

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet version="1.0"
  xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:dp="http://www.datapower.com/extensions"
  xmlns:func="http://exslt.org/functions"
  xmlns:apim="http://www.ibm.com/apimanagement" extension-element-prefixes="dp func apim">

  <!-- Contains the APIM functions -->
  <xsl:import
href="#_home_markdown_jenkins_workspace_Transform_in_SSMNED_10.0.5_com.ibm.apic.policy.doc_local:_isp_policy_apim.custom.xsl"
/>

  <xsl:template match="/">
    <xsl:variable name="varValue" select="apim:getVariable('serviceEndpoint')" />
    <xsl:message>
      <xsl:text>Variable [ </xsl:text>
      <xsl:value-of select="'serviceEndpoint'" />
      <xsl:text>] = [ </xsl:text>
      <xsl:value-of select="$varValue" />
      <xsl:text>] </xsl:text>
    </xsl:message>
  </xsl:template>
</xsl:stylesheet>
```

where

- **varValue** is the name of the runtime variable that you want to retrieve a value for.

If you are using GatewayScript, you must call the function:

```
apic.getvariable (varName)
```

where `varName` is the name of the runtime variable that you want to retrieve a value for.

Authoring policies for the DataPower API Gateway

A user-defined policy for the DataPower® API Gateway consists of a package containing configuration details that define the actions of the policy. You publish the package to the DataPower API Gateway to make it available to APIs that are deployed there.

There are two types of user-defined policies, *Catalog scoped* user-defined policies and *global scoped* user-defined policies:

Catalog-scoped user-defined policies

Catalog-scoped user-defined policies are available to APIs only in the Catalogs that you specify. Use a Catalog scoped user-defined policy if you want to limit the availability of your policy on a Catalog specific basis. The possible actions of a Catalog scoped user-defined policy are limited to the API Connect built-in assembly policies. For more information, see [Defining, packaging, and publishing a catalog-scoped policy for the API Gateway](#).

Global-scoped user-defined policies

Global-scoped user-defined policies are available to APIs in every Catalog in every provider organization. Use a global scoped user-defined policy in the following situations:

- You want to make your policy available everywhere rather than limiting its availability to specific Catalogs.
- Your policy uses a DataPower implementation, where configuration changes are made directly on the DataPower API Gateway.

For more information, see [Defining, packaging, and publishing a global-scoped policy for the API Gateway](#).

- [Defining, packaging, and publishing a catalog-scoped policy for the API Gateway](#)
Create a catalog-scoped, user-defined policy that can be used in API assemblies within the catalog where the policy is published.
- [Defining, packaging, and publishing a global-scoped policy for the API Gateway](#)
Create a global-scoped, user-defined policy that is available to APIs in any of the catalogs in any provider organization.

Defining, packaging, and publishing a catalog-scoped policy for the API Gateway

Create a catalog-scoped, user-defined policy that can be used in API assemblies within the catalog where the policy is published.

About this task

When a catalog-scoped policy is published, you can only use it in the API Assembler's Policy palette for APIs contained within the same catalog where the policy was published. Complete the following tasks to define, package, and publish the catalog-scoped policy.

Tip: During this task, you will create several zip files. On Mac OS X, run the `zip` command on the command line with the following flags:

```
-x ".DS_Store" -x "__MACOSX"
```

Including the flags prevents the auto-generated `.DS_Store` and `__MACOSX` files from being added to the zip.

- [Structure of the catalog-scoped user-defined policy YAML file](#)
Review the required structure of the YAML file that contains your catalog-scoped user-defined policy.

Step 1: Define a catalog-scoped policy for API Gateway

Use the DataPower Web GUI to define a new policy that can be used in API assemblies within the catalog where the policy is published.

Procedure

1. Log in to the DataPower Web GUI.
2. Create a new "test" domain and then switch to it.
This test domain will be used as a "sandbox" to build and export the custom policies.
3. Navigate to Assembly Function and create a new object:
 - a. Name the object `<org-name>_<catalogname>_udp-<policyname>_<version>`.
Example: "testorg_stagecatalog_udp-testpolicy_1.0.0". Use the same name for all of the objects that you create in this task.
Note: This naming convention specifies the provider organization and catalog where the policy will be available, as well as the policy's name and version.
 - b. Under the "Assembly" property, create a new Assembly.
 - c. Under the new Assembly, create a new Rule.
 - d. Under the new Rule, create a new API Action.
 - e. Optionally add an implementation file for the new Action.

For example, an XSLT Action requires an XSL file. Create the file in the using the following path and name (where "udp" refers to user-defined policy):

```
local:/// <udp-name>/<udp-name>.<file-extension>
```

- f. Click Apply and then save all of the new objects.
4. Export the new user-defined policy.
 - a. Navigate to the newly created Assembly Function.
 - b. Click Export to export the new user-defined policy to a file named `<policyname>_<version>.zip`.
 - c. Open the exported `<policyname>_<version>.zip` file and confirm that all referenced files are included.
 - d. Delete the dp-aux folder from the zip.

This optional folder requires a lot of storage space and might cause a problem when you package and publish the new policy in the next task.

Step 2: Package and publish a catalog-scoped policy for API Gateway

Decide how you want the new catalog-scoped policy to be managed, and then publish it to make it available to API assemblies within a particular catalog.

About this task

Be sure to complete [Step 1: Define a catalog-scoped policy for API Gateway](#), before attempting to package and publish the new policy.

There are two methods for packaging and publishing a user-defined policy, based on how you want the policy to be managed:

- [Step 2, Option A: Package and publish a catalog-scoped policy directly in the DataPower configuration](#)
- [Step 2, Option B: Package and publish a catalog-scoped policy as a gateway extension that API Connect manages](#)

Step 2, Option A: Package and publish a catalog-scoped policy directly in the DataPower configuration

Package and publish a catalog-scoped policy so it can be stored directly on the DataPower API Gateway.

About this task

When you store a catalog-scoped policy on the DataPower API Gateway, the policy exists in the gateway's startup domain configuration and will be unaffected by the API Manager lifecycle. If you want to store the catalog-scoped policy directly on DataPower, you do not need to package it for API Manager. Instead, complete the following steps.

Procedure

1. Import the custom policy created in [Step 1: Define a catalog-scoped policy for API Gateway](#) to the application domain for every DataPower node in the cluster.
2. Proceed to [Step 3: Create and publish a policy.yaml file](#), where you will create a file that describes the new policy so that API Manager can support it.

Step 2, Option B: Package and publish a catalog-scoped policy as a gateway extension that API Connect manages

Package and publish a catalog-scoped policy as a gateway extension in API Connect.

Before you begin

The xml-manager must be enabled on the default domain of every gateway that will have a gateway-extension published to it.

About this task

When you publish a catalog-scoped policy as a gateway extension in API Connect, it is subject to the API Manager lifecycle. The individual assembly functions will not be added to the API Connect Gateway Service (only global-scoped policies are added to the service).

Procedure

1. Rename the `<policyname>_<version>.zip` file (that you created in [Step 1: Define a catalog-scoped policy for API Gateway](#)) to `<org-name>_<cat-name>_<policyname>_<version>.zip`.
The new file name indicates the provider organization and the catalog where the policy will be used.
2. Create a gateway-extension manifest.json file as explained in [Gateway extensions manifest](#).
The manifest contains one or more entries. The following example contains a sample entry for the new catalog-scoped policy and references the new policy filename.

```
{
  "filename": "<org-name>_<cat-name>_<policyname>_<version>.zip",
  "deploy": "immediate",
  "type": "dp-import",
},
```

3. Create a new zip file called gateway-extension.zip that contains the following files:
 - manifest.json
 - `<org-name>_<cat-name>_<policyname>_<version>.zip`
4. Publish the new gateway extension using the API Conref Toolkit or the Cloud Manager UI:
 - API Connect Toolkit:
Use the `apic gateway-extensions:create` command to publish the gateway extension as explained in the [apic gateway-extensions](#) topic.
 - Cloud Manager UI:
Complete the following steps to publish the gateway extension from Cloud Manager:
 - Log in to Cloud Manager.

- Click Topology > ... > Configure gateway extensions > Upload gateway-extension.zip file and upload your new gateway-extension.zip file.
5. Verify that the new catalog-scoped policy is available in the API Assembler's Policy palette.
 - a. Log in to API Manager and open the Catalog where you published the new catalog-scoped policy.
 - b. Create an API.
 - c. Open the API Assembler page and view the Policy palette; verify that your new catalog-scoped policy displays and can be added to the API.

Step 3: Create and publish a policy.yaml file

Create a file that describes the properties of the catalog-scoped policy, and then publish it to make it accessible to API Manager.

Procedure

1. Create a YAML file that describes the new catalog-scoped policy.
 - a. Create a file named `<policyname>.yaml`.
 - b. Paste the following content into the new file:

```
attach:
- rest
- soap
policy: 1.0.0
info:
  title: <policyname>
  name: <policyname>
  version: 1.0.0
  description: <description-here>
properties:
  $schema: 'http://json-schema.org/draft-04/schema#'
  type: object
  properties:
    exampleProperty:
      label: Test Property
      description: Enter any value
      type: string
    exampleProperty2:
      label: Another Test Property
      description: Enter any value
      type: string
  required:
    - exampleProperty2
gateways:
- datapower-api-gateway
```

- c. Modify the content as needed to correctly describe your new catalog-scoped policy.
For more information, see [Structure of the catalog-scoped user-defined policy YAML file](#).
 - d. Save and close the file.
2. Create a new zip file called `<policyname>.zip` that contains the new YAML file.
 3. Publish the new policy using either the API Connect Toolkit or the API Manager:
 - API Connect Toolkit:
Use the `apic policies:create` command to publish the gateway extension as explained in the [apic policies:create](#) topic.
 - API Manager:
Complete the following steps to publish the new policy:
 - Log in to API Manager.
 - Click Manage Catalogs > Select Catalog > Gateways > selected_gateway > ... > View policies and upload your new policy.zip file.
 4. Verify that the new catalog-scoped policy is available in the API Assembler's Policy palette.
 - a. In API Manager, select the Catalog where you published the new catalog-scoped policy.
 - b. Create an API.
 - c. Click  (next to Save) and for the Target Catalog, select the catalog where you published the new policy.
 - d. Save the API.
 - e. Open the API Assembler page and view the Policy palette; verify that your new catalog-scoped policy displays and can be added to the API.

Structure of the catalog-scoped user-defined policy YAML file

Review the required structure of the YAML file that contains your catalog-scoped user-defined policy.

The .yaml file for a catalog-scoped user-defined policy contains the following sections:

- [Specification version](#)
- [Information](#)
- [Attach](#)
- [Gateways](#)
- [Properties](#)
- [Assembly section](#)

Specification version

Set the specification version by adding the following line to the beginning of the file:

policy: 1.0.0

Information

Complete the information section with details about the policy by using the following syntax:

```
info:
  title: Title of policy
  name: shortnameofpolicy
  version: 1.0.0
  description: An example policy
  contact:
    name: name1
    url: url1
    email: email1
```

where:

- **title** is the title of the policy. Any string can be used, but the title should be kept short so that it can be displayed in the API Manager user interface.
- **name** is the short name for the policy. Must be a single word, and contain only alphanumeric characters, and the - (dash) and _ (underscore) characters. The name is case-sensitive, and should be 20 characters or less so that it can be displayed in the API Manager user interface.
Important: The policy short name must be different from the OpenAPI names of the built-in policies, otherwise it will cause a policy conflict in the API assembly definition. For a list of the OpenAPI built-in policy names, see [execute](#). Also, consider including an appropriate unique prefix or suffix string in the short names of your user-defined policy to prevent possible name conflicts with future built-in policies.
Note: The **name** property must be identical to the Node.js module name.
- **version** is the version number of the policy. This is a reserved property.
Tip: The *version.release.modification* version numbering scheme is recommended, for example *1.0.0*.
Note: The **info.version** in policy.yaml must match the **version** indicated in package.json.
- **description** (optional) is a short description of the policy.
- **contact** (optional) is the contact information for the policy, where:
 - **name** (string) is the identifying name of the contact person or organization.
 - **url** (string) is the URL that points to the contact information.
 - **email** (string) is the email address of the contact person or organization.

For example:

```
info:
  title: Custom Invoke Policy
  name: custom-invoke
  version: 1.0.0
  description: Invokes httpbin
  contact:
    name: IBM DataPower Samples
    url: 'https://github.com/ibm-datapower/'
    email: steve-product-manager@ibm.com
```

Attach

Complete the attach section by specifying which types of API flow the policy can be attached to.

- **rest** indicates that this policy can be attached to a REST API flow.
- **soap** indicates that this policy can be attached to a SOAP API flow.

The attach section must contain at least one API flow type. If a policy can be attached to both API flow types, they must both be indicated in the attach section.

For example:

```
attach:
- rest
- soap
```

Gateways

Specify the DataPower® API Gateway, as follows:

```
gateways:
- datapower-api-gateway
```

Properties

Complete the properties section by defining a JSON schema (based on JSON Schema Specification Draft 4, but rendered in YAML format) that contains the list of properties the policy will declare as required input. These properties are presented to the API author at development time, when the properties can be configured or mapped to values as required. The JSON schema defines a root object that contains the following JSON properties:

- **type**
- **properties**
- **required**

The syntax and definition of these properties matches the JSON schema definition. The following code block shows an example of a simple schema that defines one required property (*a_property*):

```
properties:
  $schema: "http://json-schema.org/draft-04/schema#"
  type: object
  properties:
```

```

a_property:
  label: a label
  description: a description
  type: a type
  required:
    - a_property

```

The root `type` of the schema must be an `object`, as shown in the example schema. You can define zero or more properties in the schema. Required properties are declared by using the `required` parameter, as shown in the example schema. The policy will not be accessible in the API Manager assembly editor, unless all the required properties have values. Each property is an object with the following items:

- `label` is a short name for the property and is displayed in the Name column of the API Manager assembly editor.
- `description` is a short description for the property and is displayed in the Description column of the API Manager assembly editor.
- `type` must be one of the following primitives that are supported:
 - `integer`
 - `number`
 - `string`
 - `boolean` (this primitive is shown as a check box in the assembly editor)
 - `array`
- `default` (optional) specifies a default value for the property.
- `enum` (for properties with a `type` of `string`) is an array of valid values.

For example:

```

properties:
  $schema: 'http://json-schema.org/draft-04/schema#'
  type: object
  properties:
    test:
      label: Test Property
      description: Enter any value
      type: string
  required:
    - test

```

Assembly section

The assembly section defines the assembly policy flow that will be activated when the user-defined policy is invoked. For example:

```

assembly:
  execute:
    - invoke:
        version: 2.0.0
        title: custom-invoke
        header-control:
          type: blacklist
          values: []
        parameter-control:
          type: whitelist
          values: []
        timeout: 60
        verb: keep
        cache-response: protocol
        cache-ttl: 900
        stop-on-error: []
        target-url: 'http://httpbin.org/headers'

```

You can determine the correct content of this section in either of the following ways:

- Define the assembly flow by using the graphical assembly editor in either the API Designer or API Designer user interface, then copy the `assembly` section from the Source tab. For more information on defining an assembly flow in the user interface, see [The Assemble view](#) and [API policies and logic constructs](#).
- Code the policies in the `execute` subsection of the `assembly` section by hand; for details, see [execute](#).

The assembly section can contain only the API Connect [built-in policies](#). However, you can include a [gatewayscript](#) policy that references native DataPower configuration.

Defining, packaging, and publishing a global-scoped policy for the API Gateway

Create a global-scoped, user-defined policy that is available to APIs in any of the catalogs in any provider organization.

About this task

When a global-scoped policy is published, you can use it in the API Assembler's Policy palette for APIs in any catalog belonging to any provider organization. Complete the following tasks to define, package, and publish the global-scoped policy.

Tip: During this task, you will create several zip files. On Mac OS X, run the `zip` command on the command line with the following flags:

```
-x ".DS_Store" -x "__MACOSX"
```

Including the flags prevents the auto-generated `.DS_Store` and `__MACOSX` files from being added to the zip.

Step 1: Define a global-scoped policy for API Gateway

Use the DataPower Web GUI to define a new policy that can be used in API assemblies in all catalogs belonging to all provider organizations.

Procedure

1. Log in to the DataPower Web GUI.
2. Create a new "test" domain and then switch to it.
This test domain will be used as a "sandbox" to build and export the custom policies.
3. Navigate to Assembly Function and create a new object:
 - a. Name the object `<policyname>_<version>`.
Example: "testpolicy_1.0.0". Use the same name for all of the objects that you create in this task. Because the policy will be available in all provider organizations and catalogs, there is no need to specify that information in the object name.
 - b. Under the "Assembly" property, create a new Assembly.
 - c. Under the new Assembly, create a new Rule.
 - d. Under the new Rule, create a new API Action.
 - e. Optionally add an implementation file for the new Action.
For example, an XSLT Action requires an XSL file. Create the file in the using the following path and name (where "udp" refers to user-defined policy):

`local:///<udp-name>/<udp-name>.<file-extension>`
 - f. Click Apply and then save all of the new objects.
4. Export the new user-defined policy.
 - a. Navigate to the newly created Assembly Function.
 - b. Click Export to export the new user-defined policy to a file named `<policyname>_<version>.zip`.
 - c. Open the exported `<policyname>_<version>.zip` file and confirm that all referenced files are included.
 - d. Delete the dp-aux folder from the zip.
This optional folder requires a lot of storage space and might cause a problem when you package and publish the new policy in the next task.

Step 2: Package and publish a global-scoped policy for API Gateway

Decide how you want the new global-scoped policy to be managed, and then publish it to make it available to API assemblies.

About this task

Be sure to complete the steps in [Step 1: Define a global-scoped policy for API Gateway](#) before attempting to package and publish the new global-scoped policy. There are two methods for packaging and publishing a user-defined policy, based on how you want the policy to be managed:

- [Step 2, Option A: Package and publish a global-scoped policy directly in the DataPower configuration](#)
- [Step 2, Option B: Package and publish a global-scoped policy as a gateway extension that API Connect manages](#)

Step 2, Option A: Package and publish a global-scoped policy directly in the DataPower configuration

Package and publish a global-scoped policy so it can be stored directly on the DataPower API Gateway.

About this task

When you store a global-scoped policy on the DataPower API Gateway, the policy exists in the gateway's startup domain configuration and will be unaffected by the API Manager lifecycle.

Procedure

1. Import the `<policyname>_<version>.zip` file containing the new global-scoped policy to the application domain for every DataPower node in the cluster.
Complete the following steps on every DataPower node in the cluster--if you omit a node, then the policy will not be available in the API Assembly's Policy palette.
 - a. On the DataPower node, navigate to the "API Connect Gateway Service" object.
 - b. Under the "User-defined policies" property, add a new Assembly Function by importing the `<policyname>_<version>.zip` file containing your new global-scoped policy.
 - c. Click Apply, and then Save.
2. Verify that the new global-scoped policy is available in the API Assembler's Policy palette.
 - a. Log in to API Manager.
 - b. Create an API.
 - c. Open the API Assembler page and view the Policy palette; verify that your new global-scoped policy displays and can be added to the API.

Step 2, Option B: Package and publish a global-scoped policy as a gateway extension that API Connect manages

Package and publish a global-scoped policy as a gateway extension in API Connect.

Before you begin

The xml-manager must be enabled on the default domain of every gateway that will have a gateway-extension published to it.

About this task

When you publish a global-scoped policy as a gateway extension in API Connect, it is subject to the API Manager lifecycle.

Procedure

1. Make a copy of the `<policyname>_<version>.zip` file containing your new global-scoped policy and remove the `<version>` number from the file name.
This name change ensures that the relative path of the file meets the requirement to match the following regular expression: `implementation\[w_1+\].zip`.
You can retain the copy of the file with its original name for tracking purposes.

2. Create a local folder named implementation and store the renamed zip file in that folder.
3. Create a YAML file that describes the new global-scoped policy.
 - a. Create a file named `<policyname>.yaml`.
 - b. Paste the following content into the new file:

```
policy: 1.0.0
info:
  title: <policyname>
  name: <policyname>
  version: 1.0.0
  description: <description-here>
```

Only the `policy` and `info` sections are needed in the `<policyname>.yaml` for this task.

- c. Save and close the file.
4. Create a new zip file called `<policyname>_<version>.zip` that contains the following files:
 - The implementation folder
 - `<policyname>.yaml`
5. Create a gateway-extension manifest.json file as explained in [Gateway extensions manifest](#). The manifest contains one or more entries. The following example contains a sample entry for the new global-scoped policy and references the original policy `<policyname>_<version>.zip` file that you created in [Step 1: Define a global-scoped policy for API Gateway](#):

```
{
  "filename": "<policyname>_<version>.zip",
  "deploy": "immediate",
  "type": "user-defined-policy",
},
```

6. Create a new zip file called `gateway-extension.zip` that contains the following files:
 - `manifest.json`
 - `<policyname>_<version>.zip`

This is the file that you created in [step 4](#) of this task (it contains the implementation folder and the `<policyname>.yaml` file).
7. Publish the new gateway extension using one of the following methods:
 - API Connect Toolkit:

Use the `apic gateway-extensions: create` command to publish the gateway extension as explained in the [apic gateway-extensions](#) topic.
 - Cloud Manager UI:

Complete the following steps to publish the gateway extension from Cloud Manager:

 - Log in to Cloud Manager.
 - Click [Topology](#).  [Configure gateway extensions](#) and upload your new `gateway-extension.zip` file.
8. Verify that the new global-scoped policy is available in the API Assembler's Policy palette.
 - a. Log in to API Manager.
 - b. Create an API.
 - c. Open the API Assembler page and view the Policy palette; verify that your new global-scoped policy displays and can be added to the API.

Developer Portal: socialize your APIs

The Developer Portal is your one-stop-shop for sharing your APIs with application developers.

In addition to allowing application developers to find and subscribe to APIs, the Developer Portal provides additional features including forums, blogs, comments, and ratings, together with an administrative interface for customizing the Developer Portal to your brand and theme. See the following topics for more information.

[Using the Developer Portal](#)

As well as enabling application developers to find and use your APIs, the Developer Portal also provides features such as API analytics, forums, blogs, and rating facilities.

[Configuring the Developer Portal site](#)

Customize the look and feel of the Developer Portal site, and brand it for your organization.

[Concepts in the Developer Portal](#)

Understand the various concepts and terminology that are referenced throughout the Developer Portal.

[Getting started configuring the Developer Portal site](#)

A quick start guide to configuring your Developer Portal site.

[Developer Portal tutorials](#)

Guided examples that take you through some of the most common user scenarios, as well as some of the more complex areas.

- [Using the Developer Portal](#)
As well as enabling application developers to find and use your APIs, the Developer Portal also provides features such as API analytics, forums, blogs, and rating facilities.

Tutorials for using the Developer Portal.

Using the Developer Portal

As well as enabling application developers to find and use your APIs, the Developer Portal also provides features such as API analytics, forums, blogs, and rating facilities.

The Developer Portal is a convenient place to share APIs with application developers. After a Developer Portal has been enabled through the API Manager, and one or more API Products have been published, application developers can browse and use the APIs. Typically, a Developer Portal is customized to fit the corporate branding and design requirements of a particular organization. For more information about configuring a Developer Portal site, see [Configuring the Developer Portal site](#). However, when the Developer Portal is first enabled it can be used as is, for example for test and development purposes, or for internal use only.

The following topics provide information about the main API consumer concepts in the Developer Portal, and how an application developer can navigate the default site. However, bear in mind that the actual consumer experience might be very different depending on how the site is configured. For tutorials guiding you through enabling a Developer Portal site, and navigating and using APIs as an application developer, see [Tutorial: Creating the Developer Portal](#) and [Tutorial: Creating Accounts and Applications on the Developer Portal](#).

- [Logging in as a consumer to the Developer Portal by using the CLI](#)
Use the toolkit CLI to log in to the Developer Portal as a consumer.
- [Exploring APIs and Products in the Developer Portal](#)
As an application developer, you can browse, test, and subscribe to APIs in the Developer Portal by exploring the available API Products.
- [Applications in the Developer Portal](#)
You can view, edit, configure, and create applications in the Developer Portal.
- [Analytics in the Developer Portal](#)
You can view analytics for APIs in the Developer Portal at the application and organization levels. This information is displayed in dashboard views that show the analytics metrics in the form of *visualizations* (represented as charts).
- [Consumer organizations in the Developer Portal](#)
Consumer organizations provide a way of grouping application developers together. You can add, remove, and configure Consumer organizations in the Developer Portal.
- [User accounts, passwords, and support in the Developer Portal](#)
You can change general elements such as user accounts and passwords in the Developer Portal.

Logging in as a consumer to the Developer Portal by using the CLI

Use the toolkit CLI to log in to the Developer Portal as a consumer.

Before you begin

To log in as a consumer, you must have created a developer account in the Developer Portal as explained in the following tutorial: [Tutorial: Creating Accounts and Applications on the Developer Portal](#).

About this task

You can use the toolkit CLI to log in to the Developer Portal as a consumer to view it and test how it behaves for your customers.

Procedure

1. Set up the toolkit as explained in [Installing the toolkit](#).
2. Determine the name of your identity provider.
When you log in from the CLI, you must provide the name of the realm (identity provider) that hosts your API Connect user account. If you don't know the name of your account's realm, you can look it up by using the following command.

In the CLI, run the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

```
apic identity-providers:list --server consumer_endpoint_api --mode consumer --catalog catalog_name_or_id --org  
<provider_org_name_or_id> --fields registry_type,realm
```

Where:

- *consumer_endpoint_api* is the endpoint of the consumer API.
- *catalog_name_or_id* is the name or ID of your catalog.
- *<provider_org_name_or_id>* is the name of ID of your provider organization.

For example:

```
apic identity-providers:list -s consumer.abce-ci-15608-master.abce.ibm.com -m consumer -c sandbox -o org --fields  
registry_type,realm  
total_results: 1  
results:  
- registry_type: 'lur'  
  realm: 'consumer:4da2f1b9-05c1-4506-9e2d-951198d19ad3:faa5577d-625c-4fc8-8d19-26077c8aff95/sandbox-idp'
```

In the response, the realm consists of the following elements:

```
consumer:<provider_org_name_or_id>:<catalog_name_or_id>/<catalog_identity_provider_name>
```

For example, `consumer:myorg:mycatalog/sandbox-idp`.

Note that `<catalog_identity_provider_name>` is typically made up of `catalog_name-idp`, for example `sandbox-idp`.

3. In the toolkit CLI, run the following command to log in to the Developer Portal:

Command syntax:

```
apic login --mode consumer --server consumer_endpoint_api --username username --password password --realm realm
```

Where:

- `consumer_endpoint_api` is the endpoint of the consumer API.
- `username` is your API Connect username.
- `password` is the password that corresponds to your API Connect username.
- `realm` is the user registry realm for the specified `<username>`.

Example:

```
apic login --mode consumer --server consumer.9a6e-88fa49bc.eu-gb.apiconnect.cloud.ibm.com -u my_username -p Blue123 -r consumer:frankenstein:om-portal/portal-idp
```

```
Logged into consumer.9a6e-88fb51bc.eu-gb.apiconnect.cloud.ibm.com successfully
```

Exploring APIs and Products in the Developer Portal

As an application developer, you can browse, test, and subscribe to APIs in the Developer Portal by exploring the available API Products.

Browsing available APIs

In API Connect API providers package their APIs into Products to offer one or more APIs to application developers. The providers then use Plans to control access to APIs and to manage API usage. Products are packages that contain both the APIs and the accompanying Plans.

From the Developer Portal home screen, click API Products to browse the available products. You can then select a Product to explore the available Plans and APIs further, including viewing API code snippets, and request and response examples.

Note: If you have an account on the Developer Portal, you can specify a default programming language for the code snippets to display in by editing the Code Snippet Language in your account settings.

Subscribing to a Plan

A Plan is a collection of API operations or subsets of operations from one or more APIs. In order to subscribe to a Plan, you must have an account on the Developer Portal and have created an App. For more information, see [User accounts, passwords, and support in the Developer Portal](#) and [Applications in the Developer Portal](#). Rate limits specify how many requests an App is allowed to make during a specified time interval. A Plan can have a shared rate limit for all the operations, or each operation can have a different rate limit. In addition, Plans can have multiple rate limits set per Plan and per operation, at second, minute, hour, day, and week time intervals. Plans can also have burst limits to prevent usage spikes that might damage infrastructure. Multiple burst limits can be set per Plan, at second and minute time intervals.

After you have identified the Plan that you want to use, click Subscribe and then select the App that you want to use with this Plan. If the Plan is not restricted, you can use it immediately. If the Plan is restricted, the subscription is shown as Pending Approval, and you cannot use the requested Plan until the administrator approves your request.

You cannot subscribe to a monetized Plan without first adding your payment information to your Consumer organization. You can register your payment information by editing the Billing tab for your Consumer organization. Note: you must either be the Consumer organization owner, or have `Settings: Manage` permissions for your organization to be able to edit the billing information. Consumer organizations can have at most one payment method. You can delete your payment method and add a different method, for example if your credit card expires. If you change your subscription to a Plan that has a different pricing structure, the subscription billing system will add a prorated amount to the next invoice of your subscription billing cycle.

Testing an API

You can test an API in the Developer Portal by using the interactive API document test tool. If the API operation that you want to test doesn't require a client ID, then you can use the test tool without the need to log in. For more information, see [Testing an API by using the Developer Portal test tool](#).

Calling an API in your application

When you have subscribed to a Plan and you begin coding your application, you must retrieve the operation URL in order to call the API. You can retrieve the operation URL from the API overview page. For more information, see [Calling an API](#).

- [How to use a URL to navigate directly to a Product or API in the Developer Portal](#)
You can navigate to a specific Product or API in the Developer Portal by using `x-ibm-name:version` in the URL.
- [Testing an API by using the Developer Portal test tool](#)
You can test the behavior of an API without the need to write any code by using the Developer Portal test tool. You provide the necessary API parameters within the test tool and click Invoke to see the response.
- [Calling an API](#)

When you have selected a Plan and you begin coding your application, you must retrieve the operation URL to call the API.

How to use a URL to navigate directly to a Product or API in the Developer Portal

You can navigate to a specific Product or API in the Developer Portal by using `x-ibm-name:version` in the URL.

To find a Product or API in the Developer Portal you typically navigate there by searching in the UI, clicking on the relevant Product, and then selecting the API. However, if you know the `x-ibm-name:version` of your Product or API, you can insert that information into the URL to go there directly.

To navigate directly to a specific API, use the following URL syntax:

```
portal.site.url/productsselect/api_x-ibm-name:version
```

For example:

`https://my.portal.com/myorg/sandbox/productselect/petstore-header-clientid:1.0.0`

To navigate directly to a specific Product, use the following URL syntax:

`portal.site.url/product/product_x-ibm-name:version`

For example:

`https://my.portal.com/myorg/sandbox/product/my-product:1.0.0`

To navigate directly to a specific API within a specific Product, use the following URL syntax:

`portal.site.url/product/product_x-ibm-name:version/api/api_x-ibm-name:version`

For example:

`https://my.portal.com/myorg/sandbox/product/my-product:1.0.0/api/petstore-header-clientid:1.0.0`

Testing an API by using the Developer Portal test tool

You can test the behavior of an API without the need to write any code by using the Developer Portal test tool. You provide the necessary API parameters within the test tool and click Invoke to see the response.

Before you begin

To use the Developer Portal test tool with an API that requires an App client ID, you must first complete the following tasks:

- Create an App. For more information, see [Registering an application](#).
- Subscribe to a Plan that contains the API that you want to test. For more information, see [Exploring APIs and Products in the Developer Portal](#).

About this task

The Developer Portal test tool is an interactive API document test tool. If the operation that you want to test does not require a client ID, then you can use Developer Portal test tool without the need to sign in. However, if the operation that you want to interact with requires a client ID, then you must sign in to the Developer Portal first.

Using the Developer Portal test tool is subject to the rate limit that is applied to an operation or Plan. For example, if an operation has a rate limit of 10 requests per minute and you invoke the operation, the number of requests that can be made is reduced to nine. The limitations are triggered every time that you click invoke within the minute interval. This caveat affects the quota of the App that is selected to use with the Developer Portal test tool, but it does not affect the quota of the other Apps that are using the same operation or Plan.

To test an API in the Developer Portal, the Allow this API to be tested check box must be selected in the API Manager. For more information, see [Creating API definitions](#).

Restriction:

- There are security mechanisms that prevent you using the Developer Portal test tool to test an Implicit or Authorization Code grant type in an OAuth provider API. Other grant types in the same OAuth provider API **can** be tested. If your OAuth provider allows those actions to function correctly from the test tool, you can disable this option. For more information, see [Disabling test tool restrictions](#).
- You cannot use the Developer Portal test tool with suspended applications.
- You can only test an unenforced API if `testable=true`, and if the existing API implements CORS and is using HTTPS.

Note: GraphQL APIs can be tested from the Developer Portal user interface. However, not all authentication methods are supported. You must use one of the following authentication methods:

- Unsecured
- Client ID, passed in the header
- Client ID and secret, passed in the header

Also, `cost` metrics are not supported, and rate limits specific to GraphQL are not listed in Product plans.

Procedure

1. To use the Developer Portal test tool with an API that does not require the client ID of an App, complete the following steps:

- a. Click API Products.
All of the APIs that can be used by application developers are displayed.
- b. Click the name of the API that you want to test.
- c. Select an operation and then select Try It.
- d. Click Try this operation.
- e. Supply the values for required headers or parameters.
- f. If the operation is secured with Basic Authentication, supply the credentials.
- g. Click Send Request.

The result is displayed in the Response Body field. You can continue to test different parameter values as necessary.

Note:

The first time that you click Try It, you might be presented with a security error. Copy the URL from the Request URL field, open it in a browser window, and accept the security certificate. You are not presented with the security error again.

Also, for performance reasons, if the payload is large, more than 1500 DOM highlighted elements, you get the response, but it is not pretty printed.

2. To use the Developer Portal test tool with an API that does require the client ID of an App, complete the following steps:

- a. Sign in to the Developer Portal.

- b. If you have not already done so, you must create an App so that you can test an API that requires a client ID. For more information, see [Registering an application](#).
- c. Ensure that your App is subscribed to the Plan that contains the API that you want to test. For more information, see [Exploring APIs and Products in the Developer Portal](#).
- d. Click API Products.
All of the APIs that can be used by application developers are displayed.
- e. Click the *API* that you want to test.
- f. Select the **Provide credentials for Client ID (API Key)** operation and then select Try It.
The API Key Identification window displays.
- g. Use the Register an application in order to select a client ID drop-down list to select an App to test the API with.
- h. Click Save credentials.
 - i. If a client secret is required, enter the value in the Client Secret field.
 - j. Find the operation that you want to test, then click Try It.
 - k. Supply the required parameters and values.
 - l. If the operation is secured with Basic Authentication, supply the credentials.
- m. Click Send.
The result is displayed in the Response section. You can continue to test different field values as necessary.
Note: The first time that you click Invoke, you might be presented with a security error. Click the link that is provided to accept the security certificate. You are not presented with the security error again.

Related tasks

- [Calling an API by using CORS](#)

Calling an API

When you have a selected a Plan and you begin coding your application, you must retrieve the operation URL to call the API.

About this task

Be aware of the following points when you call APIs in IBM® API Connect:

- In the HTTP response message for status code 200 the reason phrase is replaced with OK.
- API error messages are displayed in English only.

Procedure

To retrieve the operation URL, complete the following steps:

1. Click API Products, then select a product.
2. Click the API that you want to work with.
The API overview page opens.
3. Select the operation you need and then copy the endpoint.

This is the URL that the application calls, and its structure is defined:

Type of API	URL
REST APIs	<code>https://host/org/catalog/api/operation</code>
SOAP APIs	<code>https://host/org/catalog/api</code> for all operations in the WSDL.

where:

- *host* is the fully qualified host name of your gateway cluster.
 - *org* is the URL path of your organization.
 - *catalog* is the name of your Catalog.
 - *api* is the name of your API.
 - *operation* is the URL path of your operation.
4. Take note of any parameters, the request body, and the response body. Code your application to create the expected requests and handle the expected responses.

Depending on the Identify your application using setting for the API, you might have to provide a client ID, or client ID and client secret. To do this, complete the following steps:

5. To find the client ID, complete the following steps:
 - a. Click Apps, then click the application name that you want to work with.
 - b. Select the Show check box for Client ID.
The client ID is displayed.
 - c. Provide the client ID with the header parameter `&client_id=`
For example, the URL used in the API might be:

`https://host/org/catalog/api/quote?loanAmount=20000`

but when you call it with a client ID of 1234, change the URL to:

`https://host/org/catalog/api/quote?loanAmount=20000&client_id=1234`

Note: API Gateway only A client ID is generated automatically by API Connect when you register an application. However, if you specify a customized client ID, by using the CLI or REST API, then the length must not exceed 512 bytes, otherwise the gateway will reject the API request and return a 401 error.

6. The client secret is produced when you register an application. Provide the client secret with the query parameter `&client_secret=`. If you did not note the client secret when you registered the application, you must reset it; for information, see [Managing applications](#).

The client ID, or client ID and secret can be logged along with the URL. Web servers usually log the URL in their access logs, which would give away the client secret. If you do not want to expose your client ID or secret in the URL, complete the following steps.

- For the client ID, set the header, **X-IBM-Client-Id**, as part of the HTTP message that the application sends when it calls the API.
An example URL statement might be:

```
curl --header "X-IBM-Client-Id: 1234" https://host/org/catalog/api/quote?loanAmount=20000
```

Note: API Gateway only A client ID is generated automatically by API Connect when you register an application. However, if you specify a customized client ID, by using the CLI or REST API, then the length must not exceed 512 bytes, otherwise the gateway will reject the API request and return a 401 error.

- For the client secret, set the header, **X-IBM-Client-Secret**, as part of the HTTP message that the application sends when it calls the API.
For example, the URL would be:

```
https://host/org/catalog/api/quote?loanAmount=20000
```

and set the following HTTP headers:

```
X-IBM-Client-Id=1234
X-IBM-Client-Secret=ABCD
```

What to do next

Monitor the API and application usage. For more information, see [Managing applications](#).

- [Calling an API by using CORS](#)

CORS (cross origin resource sharing) is a technique that allows calls to be made from code that is running in a browser to a third-party server (such as APIs running on an API Connect). These calls are, by default, not allowed as per the same origin security policy that is applied to the browser sandbox. Without CORS support, web developers are required to use more complex techniques such as server-side proxies.

Calling an API by using CORS

CORS (cross origin resource sharing) is a technique that allows calls to be made from code that is running in a browser to a third-party server (such as APIs running on an API Connect). These calls are, by default, not allowed as per the same origin security policy that is applied to the browser sandbox. Without CORS support, web developers are required to use more complex techniques such as server-side proxies.

About this task

Note: CORS support is available only on the DataPower® API Gateway.

API Connect Gateway servers support CORS to make it as easy as possible for web developers to use APIs within their web applications.

CORS is supported in the following browsers:

- Chrome 3+
- Firefox 3.5+
- Internet Explorer V11, or later
- Opera 12+
- Safari 4+

A CORS enabled browser automatically sends either a simple CORS request, consisting of the original request with the addition of the **Origin** header, or a preflight request followed by a simple CORS request.

An example CORS preflight request is as follows:

```
OPTIONS /org/env/api/resourceHTTP/1.1
User-Agent: useragent details
Access-Control-Request-Method: GET
Access-Control-Request-Headers: header names
Host: x.xx.xxx.xx
Origin: https://example.com
Accept: */*
```

You do not need to create CORS requests yourself, other than for testing or troubleshooting purposes.

A CORS response is received from the gateway; for example:

```
HTTP/1.1 200 OK
X-Backside-Transport: FAIL FAIL
Connection: Keep-Alive
Transfer-Encoding: chunked
Access-Control-Allow-Origin: https://example.com
Access-Control-Allow-Credentials: true
Access-Control-Allow-Headers: accept, accept-language, content-type, x-ibm-client-id
Access-Control-Allow-Methods: methods allowed on the resource
Vary: Origin
```

Applications in the Developer Portal

You can view, edit, configure, and create applications in the Developer Portal.

Before you can subscribe to a Plan that contains the API or APIs that you want to use, you must first register an application by creating an App. You can create more than one App, and these Apps can be edited and deleted as required.

To learn about applications in the Developer Portal, use the following topic links.

- [Registering an application](#)
Before you can use an API, you must register your application to the Developer Portal.
- [Managing applications](#)
You can show or reset a client ID for an application, verify or reset a client secret, and view the details of the APIs in the application. You can also unsubscribe from a Plan that the application is subscribed to.
- [Editing an application](#)
You can edit applications in the Developer Portal. If a user has the correct permissions, they can edit the content of any application in their organization.
- [Deleting an application](#)
You can delete applications in the Developer Portal.
- [Changing an application image](#)
You can change the image for an application in the Developer Portal.
- [Verifying an application client secret](#)
You can verify an application client secret in the Developer Portal

Registering an application

Before you can use an API, you must register your application to the Developer Portal.

About this task

When you register an application, you are provided with a client ID and client secret for the application. You must supply the client ID when you call an API that requires you to identify your application by using a client ID, or a client ID and client secret.

You can, optionally, add further client ID/client secret pairs to an application, any of which can be used to identify the application when calling an API.

Procedure

To register an application, complete the following steps:

1. Click Apps.
The Apps page opens.
2. Click Create new app.
3. Optional: Specify a URL in the Application OAuth Redirect URL(s) field.
You can specify multiple OAuth redirect URLs by clicking Add another item. If only one redirect URL is specified, and the application does not provide the `redirect_uri` in the OAuth request, then API Connect automatically uses the one redirect URL specified. However, if more than one redirect URL is specified, then the application must provide the `redirect_uri` in the OAuth request, or the OAuth request is rejected.
4. Click Submit.
Your application is displayed.
5. The client secret is hidden; click the Show check boxes, make a note of your client secret because it is displayed only once.
You must supply the client secret when you call an API that requires you to identify your application by using a client ID and client secret.
Note: The client secret cannot be retrieved. If you forget it, you must reset it.
6. Optional: In the Certificate field, paste the public X509 certificate for your application, in PEM format.
The Certificate field is available only if the APIs that have been published to the Developer Portal include at least one API that has been secured with TLS mutual authentication. You must complete this field if you want to call an API that has been secured with TLS mutual authentication. For more information, see [Composing a REST API definition](#).

These certificates are sent to the management server and to the gateway, and are used for certificate verification when the application calls an API that has been secured with TLS mutual authentication.

Important: When you paste the certificate, ensure that it contains no line breaks, and that the (-----BEGIN CERTIFICATE-----) prefix and (-----END CERTIFICATE-----) suffix are removed.
7. Optional: The client ID is hidden, to display the client ID for your application, click Subscriptions, then select the Show check box for Client ID.
The client ID is displayed and can be hidden again by clearing the check box.
8. Optional: To verify your client secret, click Subscriptions, then click Verify, enter your client secret in the Secret field, then click Submit.
You have confirmed whether your client secret is correct or incorrect.
9. To add an additional client ID and client secret to the application, complete the following steps:
 - a. Click Subscriptions.
 - b. Click Add alongside Credentials.
The "Add new application credentials" window opens.
 - c. Enter a name and an optional summary, and click Submit.
 - d. Select the Show Client ID or Show Client Secret check box to display the client ID or client secret for the new credentials.
 - e. To add a description to a set of client credentials, or to change the current description, click Update alongside the required credentials.
 - f. To remove a set of client credentials from the application, click Delete alongside the required credentials.If you add additional credentials to an application, any of the associated client ID/client secret pairs can be used to identify the application when calling an API.
Note: If you add two or more sets of client credentials to an application, OAuth tokens are not shared between them; each client credential set uses a different OAuth token.
10. To add an image, click Upload image from the application overflow menu.
A new window opens; click Browse, select an image from your directory, and click Submit.
11. Optional: To change the URL that authenticated OAuth flows for this application should be redirected to, click Edit from the application overflow menu, then enter a URL in the Application OAuth Redirect URL(s) field.
12. Optional: To change the application name or description, click the Edit from the application overflow menu.

Results

Your application is registered.

What to do next

Select a Plan to use with your application, see [Exploring APIs and Products in the Developer Portal](#).

Related information

- [Creating an API key security definition](#)

Managing applications

You can show or reset a client ID for an application, verify or reset a client secret, and view the details of the APIs in the application. You can also unsubscribe from a Plan that the application is subscribed to.

About this task

On the application details page, you can display and reset a client ID and client secret. You might want to reset a client secret if it is compromised or you forget it. A client secret is only displayed once, so after you reveal it for the first time at a time of your choosing, you can use this window to verify that what you have is correct or reset it if necessary.

You can, optionally, add further client ID/client secret pairs to an application, any of which can be used to identify the application when calling an API.

Procedure

To manage an application, complete the following steps:

1. Click Apps.
The Apps page opens.
2. Select the application that you want to work with from the displayed list.
3. Click Subscriptions.
4. The client ID is hidden; to display the client ID, select the Show check box. The client ID is displayed, and can be hidden again by clearing the Show check box.
5. To reset your client ID, click Reset.
Warning: API calls made by the application with the existing client ID will fail.
6. If the client secret is compromised or you forget it, click Reset to generate a new value for the client secret.
7. If you are unsure whether the value that you have for the client secret is correct, you can click Verify, enter the value, and click Submit to confirm whether or not it is correct.
8. To add an additional client ID and client secret to the application, complete the following steps:
 - a. Click Subscriptions.
 - b. Click Add alongside Credentials.
The "Add new application credentials" window opens.
 - c. Enter a name and an optional summary, and click Submit.
 - d. Select the Show Client ID or Show Client Secret check box to display the client ID or client secret for the new credentials.
 - e. To add a description to a set of client credentials, or to change the current description, click Update alongside the required credentials.
 - f. To remove a set of client credentials from the application, click Delete alongside the required credentials.

If you add additional credentials to an application, any of the associated client ID/client secret pairs can be used to identify the application when calling an API.
Note: If you add two or more sets of client credentials to an application, OAuth tokens are not shared between them; each client credential set uses a different OAuth token.
9. To view more details about an individual API, click the API name.
The operations are listed.
10. To unsubscribe from a Plan, click Unsubscribe alongside the Plan name.

Related information

- [IBM API Connect overview](#)

Editing an application

You can edit applications in the Developer Portal. If a user has the correct permissions, they can edit the content of any application in their organization.

Procedure

1. From the Developer Portal home page, click Apps.
2. Select the target application.
3. Click Edit from the application overflow menu.
4. Make any required changes, then click Submit.

Deleting an application

You can delete applications in the Developer Portal.

Procedure

1. From the Developer Portal home page, click Apps.
2. Select the required application.
3. Click Delete from the application overflow menu.
4. Click Delete again to confirm.

Changing an application image

You can change the image for an application in the Developer Portal.

Procedure

1. From the Developer Portal home page, click Apps.
2. Select the required application.
3. Click Upload image from the application overflow menu.
4. Browse for the target image, then click Submit.
You can remove the image by clicking Remove.

Verifying an application client secret

You can verify an application client secret in the Developer Portal

Procedure

1. From the Developer Portal home page, click Apps.
2. Select the target application.
3. Click Subscriptions.
4. Click Verify for the client secret.
5. Enter your secret string and click Submit.
You receive a notification saying whether or not the secret that you entered is correct.

Analytics in the Developer Portal

You can view analytics for APIs in the Developer Portal at the application and organization levels. This information is displayed in dashboard views that show the analytics metrics in the form of *visualizations* (represented as charts).

Restriction:

- If the Catalog that is associated with this Developer Portal has two or more gateway services enabled then, for analytics data to be available, the gateway services must all be associated with the **same** analytics service. If the set of associated analytics services for the gateway services includes two or more different analytics services then the Developer Portal does **not** display analytics data. An analytics service is associated with a gateway service in the Cloud Manager user interface; see [Associating an analytics service with a gateway service](#).
- If the visualizations in your dashboard views display no data, show data only for a time period in the past, or the Dashboard tab does not show up, a possible reason might be that access to analytics data within API Connect has been switched off. Contact your API provider for confirmation.
- What API consumer analytics are displayed in the Developer Portal depends on the visibility configuration settings. For more information, see [Configuring the visibility of analytics in the developer portal](#).

Use the following topic links to learn how to access the various analytics available to you in the Developer Portal:

- [Application analytics in the Developer Portal](#)
From the Developer Portal, you can view interactive analytics information about all of the APIs used by an application.
- [Organization analytics in the Developer Portal](#)
From the Developer Portal, you can view interactive analytic information about all of the APIs within an organization.

Application analytics in the Developer Portal

From the Developer Portal, you can view interactive analytics information about all of the APIs used by an application.

About this task

All members of the consumer organization can view analytics information relating to APIs used by an application.

Note: What API consumer analytics are displayed in the Developer Portal depends on the visibility configuration settings. For more information, see [Configuring the visibility of analytics in the developer portal](#).

Procedure

1. Click Apps from the Developer Portal dashboard.
2. Click the name of the application for which you want to view analytics information.
From the Dashboard tab, you can see your application analytics including, API Stats, Total Calls, and Total Errors.

Organization analytics in the Developer Portal

From the Developer Portal, you can view interactive analytic information about all of the APIs within an organization.

About this task

All members of the consumer organization can view analytics information relating to the APIs that are used within an organization.

Note: What API consumer analytics are displayed in the Developer Portal depends on the visibility configuration settings. For more information, see [Configuring the visibility of analytics in the developer portal](#).

Procedure

1. Click your userName from the Developer Portal dashboard.
2. From the drop-down menu, select My organization.
3. Click the Analytics tab.
From the Analytics tab, you can see your organization analytics including, API Stats, Total Calls, and Total Errors.

Consumer organizations in the Developer Portal

Consumer organizations provide a way of grouping application developers together. You can add, remove, and configure Consumer organizations in the Developer Portal.

Developer Portal users must be a member of at least one Consumer organization. A Consumer organization can have multiple members and multiple applications. Members must register an application before they can subscribe to an API. A Consumer organization owns all the applications that are created within it. The members do not own any applications. As long as there is one member of a Consumer organization, all applications continue unchanged.

Note: Every account in the Developer Portal, including across different user registries for the same site, must have a unique email address, including the site Admin account. For example, if you configure three different user registries for a particular Developer Portal site, the email address *alice@acme.com* can be used to log in to the site from only one of the user registries. The default email address for the Admin account is the email address of the Catalog owner. It is not possible to create a user account (and associated Consumer organization) with the same email address as the Admin account (or that of the Catalog owner if their email address is different). Any attempts to create an account with the same email address results in the new account not functioning correctly, and returning the following error message when trying to log in: **A user already exists with this email address.**

To learn more about Consumer organizations in the Developer Portal, see the following topics.

- [Adding a Consumer organization from within the Developer Portal](#)
You can create a new Consumer organization from within your user account in the Developer Portal. The new Consumer organization appears also in the API Manager UI after it is created.
- [Editing the name of a Consumer organization](#)
You can edit the name of your Consumer organization from within the Developer Portal.
- [Switching Consumer organizations](#)
You can switch from one Consumer organization to another in the Developer Portal.
- [Adding users to a Consumer organization](#)
If the API Provider organization administrator has granted you permission to collaborate, you can invite users to join your Consumer organization. Those organization members can then access the Developer Portal and use the APIs that have been made available to the Consumer organization.
- [Removing a user from a Consumer organization](#)
You can remove a developer from a Consumer organization in the Developer Portal.
- [Changing the ownership of a Consumer organization](#)
You can change the ownership of a Consumer organization in the Developer Portal.
- [Deleting a Consumer organization](#)
You can delete a Consumer organization in the Developer Portal.

Adding a Consumer organization from within the Developer Portal

You can create a new Consumer organization from within your user account in the Developer Portal. The new Consumer organization appears also in the API Manager UI after it is created.

Procedure

1. Sign in to your user account in the Developer Portal.
2. Click the arrow next to your Consumer organization name on the Developer Portal home page.
3. Select Create organization from the drop-down menu.
4. In the Organization Title field, type the name of the new Consumer organization, then click Submit.

Results

Your new Consumer organization is created, and you can switch to it by clicking on its name in the Organization drop-down menu on the home page.

Editing the name of a Consumer organization

You can edit the name of your Consumer organization from within the Developer Portal.

Procedure

1. Sign in to your user account in the Developer Portal.
2. Click the arrow next to your Consumer organization name on the Developer Portal home page, and click My organization.
3. In the Manage tab, click the vertical ellipsis Manage organization icon, and click Edit organization.
4. Enter the new name for your Consumer organization in the Organization Title field, and then click Submit.
You changed the name of your Consumer organization.

Switching Consumer organizations

You can switch from one Consumer organization to another in the Developer Portal.

Procedure

1. If you are a member of more than one Consumer organization, click the menu of Consumer organizations in the Developer Portal home page.
2. Select the Consumer organization that you want to switch to, and ensure that any applications you register are registered to the correct catalog.

Adding users to a Consumer organization

If the API Provider organization administrator has granted you permission to collaborate, you can invite users to join your Consumer organization. Those organization members can then access the Developer Portal and use the APIs that have been made available to the Consumer organization.

About this task

Depending on the permissions enabled by the Provider organization administrator, members can view applications and application activity, create and edit applications, manage client keys and subscribe to API Plans, or perform all activities.

Note: Every account in the Developer Portal, including across different user registries for the same site, must have a unique email address, including the site Admin account. For example, if you configure three different user registries for a particular Developer Portal site, the email address *alice@acme.com* can be used to log in to the site from only one of the user registries. The default email address for the Admin account is the email address of the Catalog owner. It is not possible to create a user account (and associated Consumer organization) with the same email address as the Admin account (or that of the Catalog owner if their email address is different). Any attempts to create an account with the same email address results in the new account not functioning correctly, and returning the following error message when trying to log in: **A user already exists with this email address.**

Procedure

To invite users to join your Consumer organization, complete the following steps.

Note: The ability to invite users is only visible if the API Provider organization administrator has granted you permission to collaborate.

1. Sign in to your user account in the Developer Portal.
2. Click the arrow next to your Consumer organization name on the Developer Portal home page, and click My organization.
The organization page is displayed.
3. On the Manage tab, select Invite.
4. Enter the email address of the new user in the Email field.
5. Under the Assign Roles heading, use the radio buttons to select a role for the new user, the roles are:
 - **Administrator**-- Can administer the Consumer organization, including invite new members, and can create, and edit applications, manage client keys, and subscribe to API Plans.
 - **Developer**-- Can create and edit applications, manage client keys, and subscribe to API Plans.
 - **Viewer**-- Can only view applications and application activity.For full details of the permissions that are assigned to the Developer Portal roles, see [API Connect user roles](#).
6. Click Submit.
An invitation is sent to the new user.

Results

The user is added to the Consumer organization list of members, and they are sent an email inviting them to join the organization. The user must click the link that is provided in the email to activate their account, and complete the setup.

Removing a user from a Consumer organization

You can remove a developer from a Consumer organization in the Developer Portal.

Before you begin

You must be the owner of your Consumer organization and have previously added the developer you wish to remove from the organization. Note that removing a user from a Consumer organization does not delete their user account, it only removes them from that organization.

Procedure

1. Click your user name in the Developer Portal home page.
2. Click My organization in the menu.
3. Click Remove user for the user you want to remove.

Changing the ownership of a Consumer organization

You can change the ownership of a Consumer organization in the Developer Portal.

Before you begin

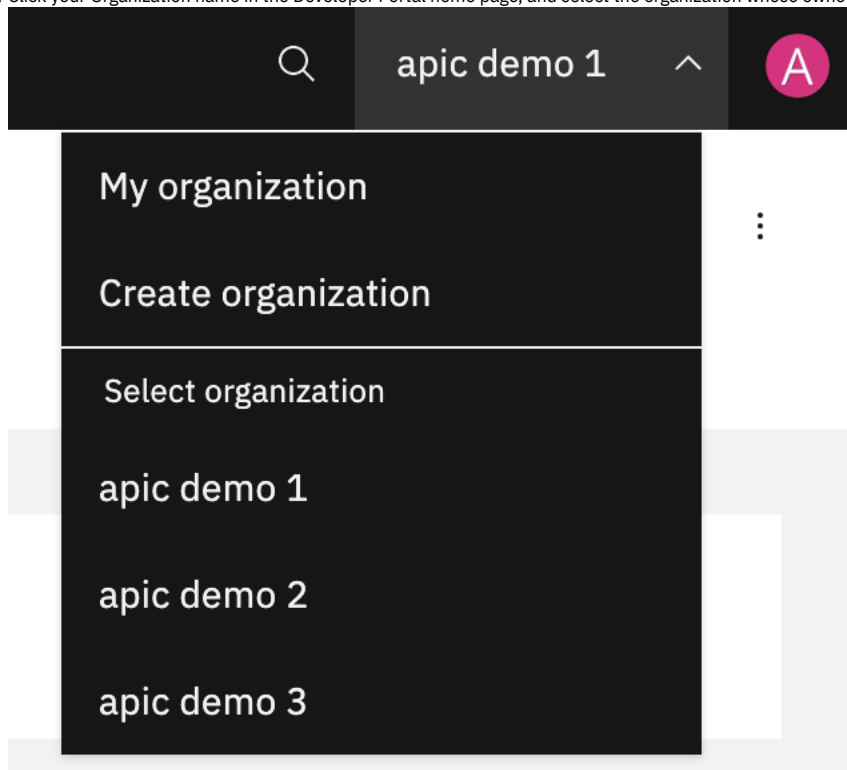

You can change the ownership of a Consumer organization only if you are the owner of that organization. The user that you transfer ownership to must already be a member of the organization. To have an account on a Developer Portal, you must be a member of at least one Consumer organization.

About this task

Transferring the ownership of a Consumer organization to another organization member, changes your role in that organization to App Developer.

Procedure

1. Click your Organization name in the Developer Portal home page, and select the organization whose owner you want to change by using the drop-down arrow.

2. Click your Organization name in the Developer Portal home page, and select My organization.
3. Click the options icon, , and select Change ownership.

Update the consumer organization owner

Save

4. Select the **New Owner** by using the drop-down arrow.
5. Use the radio buttons to **Assign Previous Owner's Role**, then click Submit.

Results

You successfully transferred ownership of a Consumer organization in the Developer Portal.

Deleting a Consumer organization

You can delete a Consumer organization in the Developer Portal.

Before you begin

You can delete a Consumer organization only if you are the owner of that organization. To have an account on a Developer Portal, you must be a member of at least one Consumer organization. Therefore, if you are a member of only one Consumer organization, to delete that organization you must first either join or create another Consumer organization, or you can delete your whole developer account. For more information, see [Deleting your developer account](#).

About this task

Deleting a Consumer organization in the Developer Portal permanently removes access to the organization, and all of its applications and subscriptions, for all members of the organization. Consider carefully the impact on any members of your Consumer organizations before you delete the organization. Any users that were members of only the deleted organization, must create a new Consumer organization when they next logon to the Developer Portal.

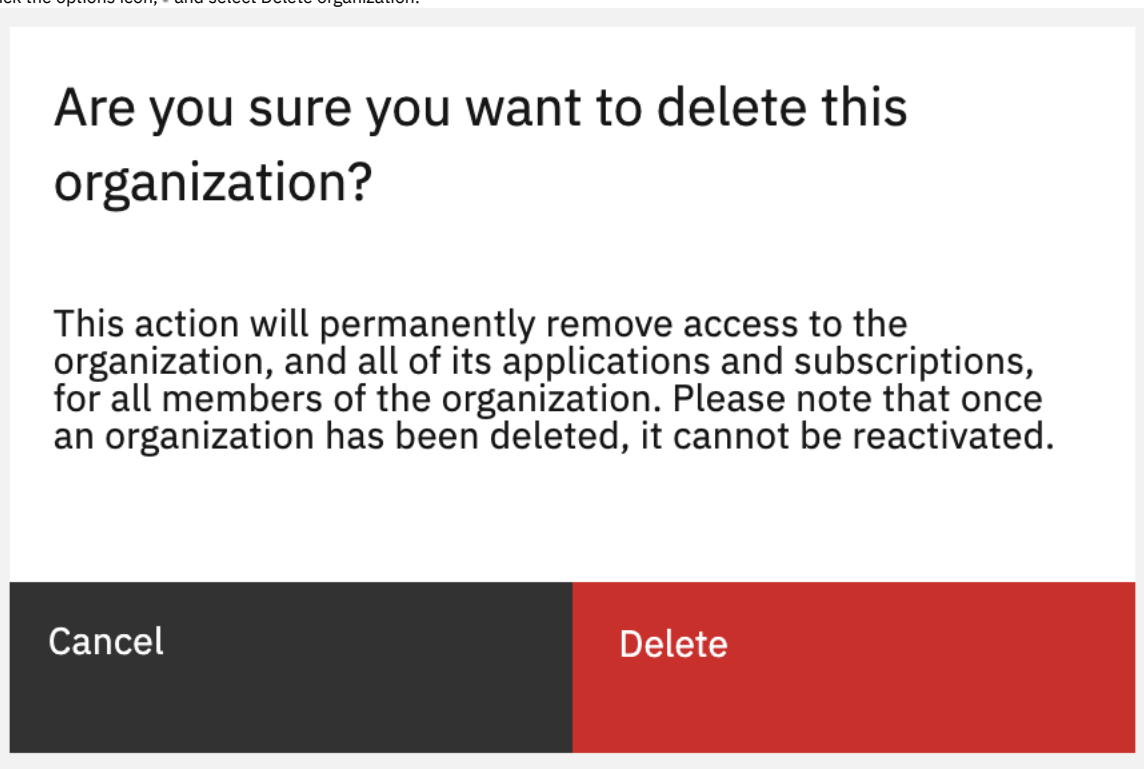

Important: When an organization is deleted, it cannot be reactivated. You might want to consider changing the ownership of a Consumer organization, rather than deleting it. For more information, see [Changing the ownership of a Consumer organization](#).

Procedure

1. Click your Organization name in the Developer Portal home page, and select the organization that you want to delete by using the drop-down arrow.
You must be in more than one Consumer organization.

2. Click your Organization name in the Developer Portal home page, and select My organization.
3. Click the options icon, , and select Delete organization.

4. Click Delete.

Results

You permanently deleted a Consumer organization in the Developer Portal.

User accounts, passwords, and support in the Developer Portal

You can change general elements such as user accounts and passwords in the Developer Portal.

Note: Every account in the Developer Portal, including across different user registries for the same site, must have a unique email address, including the site Admin account. For example, if you configure three different user registries for a particular Developer Portal site, the email address *alice@acme.com* can be used to log in to the site from only one of the user registries. The default email address for the Admin account is the email address of the Catalog owner. It is not possible to create a user account (and associated Consumer organization) with the same email address as the Admin account (or that of the Catalog owner if their email address is different). Any attempts to create an account with the same email address results in the new account not functioning correctly, and returning the following error message when trying to log in: **A user already exists with this email address.**

To learn about general user features of the Developer Portal, see the following topics:

- [Creating a new developer account](#)
You can create new developer accounts, and their associated Consumer organizations, in the Developer Portal.
- [Changing your account settings](#)
You can edit your user account settings in the Developer Portal, such as changing your name, password, time zone, and language settings.
- [Deleting your developer account](#)
You can delete your account in the Developer Portal.

Creating a new developer account

You can create new developer accounts, and their associated Consumer organizations, in the Developer Portal.

Before you begin

You need to provide an email address to create a new account. That email address must be a valid email address, and the domain that is used is required to have a valid MX record that is determined by DNS. You can disable the security module that checks that the email domain has a DNS record.

1. Log in to your Developer Portal as an administrator.
2. If the administrator dashboard isn't displayed, click **Manage** to display it.
3. Navigate to **Extend > Disable** module.
4. In the search bar enter **check dns**, then select the **Check DNS** module and click **Disable**.
5. Click **Disable** to confirm that you want to disable the module.

About this task

In order to use the Developer Portal, you must have a developer account, and be a member of at least one Consumer organization. When you create a developer account, a Consumer organization is created at the same time. You can be an owner, and a member of, multiple Consumer organizations. For more information about Consumer organizations, see [Consumer organizations in the Developer Portal](#).

Note: Every account in the Developer Portal, including across different user registries for the same site, must have a unique email address, including the site Admin account. For example, if you configure three different user registries for a particular Developer Portal site, the email address *alice@acme.com* can be used to log in to the site from only one of the user registries. The default email address for the Admin account is the email address of the Catalog owner. It is not possible to create a user account (and associated Consumer organization) with the same email address as the Admin account (or that of the Catalog owner if their email address is different). Any attempts to create an account with the same email address results in the new account not functioning correctly, and returning the following error message when trying to log in: **A user already exists with this email address.**

Procedure

1. From the Developer Portal home page, click **Create account**.
2. Populate the available fields with the details of the developer account and Consumer organization that you want to create.
3. Click **Sign up**.
The email address that you provided for the new developer account is sent an email that contains an activation link for the new developer account. Use this link to activate your new account.

Changing your account settings

You can edit your user account settings in the Developer Portal, such as changing your name, password, time zone, and language settings.

About this task

You can edit various details about your user account, for example, change your password, update your code snippet language, change your time zone, select your preferred site language, and select an avatar.

Procedure

1. Click your user name in the Developer Portal home page, and click **My account**.
2. To update your password, click **Change Password**, and update the fields as required.
3. To update other elements of your account, such as your name, time zone, and language, click **Edit** and update the fields as required.
4. Click **Save** to save your changes.

Deleting your developer account

You can delete your account in the Developer Portal.

Before you begin

You must be the owner of the developer account that you want to delete, and you must not own more than one Consumer organization. If you do own more than one Consumer organization, you must either change the ownership of those organizations, or delete them, before you can delete your account. If you own only one Consumer organization, when you delete your account the Consumer organization is deleted at the same time as your account.

About this task

When you delete your account, any Consumer organizations that you own must also be deleted or transferred to new owners. If there are other members in a Consumer organization that you delete, these members will no longer have access to that organization, or any of its applications and subscriptions. Consider carefully the impact on any members of your Consumer organizations before you delete your account. For more information, see [Deleting a Consumer organization](#). Important: When an organization has been deleted, it cannot be reactivated. You might want to consider changing the ownership of your Consumer organizations before you delete your account. For more information, see [Changing the ownership of a Consumer organization](#).

Procedure

1. Click your user name in the Developer Portal home page, and select My account.
 2. Click the Edit tab.
 3. Click Delete account.
 4. Click Delete to confirm deletion of the account.
- This action deletes your developer account and, if you own a Consumer organization, this organization is also deleted.

Results

You successfully deleted your developer account in the Developer Portal.

Configuring the Developer Portal site

Customize the look and feel of your Developer Portal site, and brand it for your organization.

In IBM® API Connect Version 10 the Developer Portal is based on the open source Drupal 10 content management system, and consequently it is almost infinitely customizable. What an individual user is able to configure, depends on the role the user has been assigned, and the associated permissions of that role. A user can be assigned one of four Developer Portal roles:

Authenticated user

An authenticated user is, typically, an application developer, and can perform all of the actions that are described in the [Using the Developer Portal](#) section.

Forum Moderator, Content Author, or Administrator

In addition to performing all of the tasks that an Authenticated user role can, a Forum Moderator, Content Author, or Administrator role have additional permissions related to configuring the Developer Portal site. For more information, see [Working with roles in the Developer Portal](#).

Note: By default, the Developer Portal administration operations are available only if you have Administrator access.

Before you start to configure your Developer Portal site, you should familiarize yourself with the various concepts and terminology that is referenced throughout the Developer Portal. See [Concepts in the Developer Portal](#).

When you are ready to start configuring your Developer Portal site, see [Getting started configuring the Developer Portal site](#) for a quick start guide on customization. There is also a tutorial that you can follow that takes you through an example customization scenario; see [Tutorial: Creating a custom theme for the Developer Portal](#).

If you are migrating from Version 5 to Version 10, see [Migrating your Developer Portal from Version 5 to Version 10](#) for guidance about how to transfer any specific customizations, such as custom modules and themes, from the Drupal 7 baseline to the Drupal 10 baseline.

In addition to the previous options, Developer Portal configuration operations are described in detail in the following sections:

[Appearance](#)

Control and configure the general appearance of your Developer Portal site by setting and configuring a default theme.

Important: Editing API Connect themes, modules, or Drupal core on the filesystem is not permitted or supported. For more information, see [Creating a sub-theme](#) and [Extend](#).

[Content](#)

Control multiple content entities in the Developer Portal, including the customization and restriction of specific content.

[Structure](#)

Control the layout of the Developer Portal, such as configuring the front page, adding and changing blocks, and displaying Products and APIs in categories.

[Configuration](#)

As an administrator, you can control multiple aspects of the Developer Portal configuration, including managing security and general configuration tasks.

[People](#)

You can manage and customize the user experience in the Developer Portal, by altering permissions and assigning roles to specific users.

[Forums](#)

Create and control forums in the Developer Portal.

[Reports](#)

You can view reports about the general configuration and status of your Developer Portal site.

[Extend](#)

You can extend the Developer Portal by creating and installing custom modules, or installing additional Drupal contributed modules.

Concepts in the Developer Portal

The Developer Portal is built on Drupal 10, an open source content management technology. A good understanding of Drupal concepts and terminology enhances your ability to work with the Developer Portal.

In Drupal, most content on the website is treated as variations on the concept of a **node**. Node types, such as static pages, blog posts, and news items, are all stored in the same way. The navigation structure of the site is designed separately by editing **menus**, **views**, and **blocks**. Finally, the **theme** of the system controls the overall appearance of the site to visitors. Access to these depends on the permissions that your role possesses. These are explained more fully in the following sections.

Nodes

A node is a set of individual related content such as a page, a poll, an article, a forum topic, or a blog post. For example, when you create a blog post, and define the body text, you also define its title, content, author link, creation date, and taxonomy. Some of these elements are shown by the theme layer when the node is displayed, and some elements are metadata that control where and when the node is displayed at all. Each set of content in a Developer Portal site is a node. You can apply new features or changes to all content of a single node type.

Fields

A field is somewhere that you can add extra metadata to a node. The following types of data are examples of fields:

- Title
- Body
- Comment body
- Tags
- Image

You can create different types of fields, and they can be defined at the content-type level for content items and comments, at the vocabulary level for taxonomy terms, and at the site level for user accounts. Field types are defined by modules, and managed by the Field module. In addition, other modules might enable fields to be defined for their data.

Content types

A content type is a predefined collection of fields. Content types define the default fields that content editors use to add content in a Developer Portal site, and help structure the authoring and developing of content. Content types can be displayed in the Developer Portal. You can control which content types, and the order and format that they are displayed, in the Developer Portal.

Themes

You can use themes to control the overall appearance of your Developer Portal site. You can modify the appearance of the theme in following ways:

1. Extend the code of an existing theme.
2. Identify and use a theme that is provided by the Drupal community or a third-party website, and modify the theme settings.
3. Create a complete custom theme from scratch.

However, you cannot directly edit the API Connect theme as editing is not supported. Any edited versions of these files are overwritten when a fix pack or iFix is installed. So, the way to create a custom theme is to create a custom subtheme of the standard API Connect theme that the Developer Portal uses by default. A subtheme inherits all of the settings of its parent theme, apart from the settings that are overridden. For more information, see [Creating a sub-theme](#).

Most themes use the Twig template engine for PHP.

Regions

The specific areas of a Developer Portal site in which content can be placed. Regions are customized and styled in the theme.

Blocks

Blocks are boxes of content that can be displayed in regions on your Developer Portal page. Blocks can be made available to your Developer Portal site by enabling specific modules. After a block is created, its appearance can be modified. You can also define which Developer Portal page or pages blocks appear on. Some modules can provide multiple blocks when they are enabled, while other modules might not define new blocks. For more information, see [Adding and changing the blocks displayed on Developer Portal pages](#).

Modules

Modules are similar to the concept of plug-ins, in that they extend the core functions of the Developer Portal site. A set of modules is implemented by default with the Drupal core, and there are extra modules that can be enabled to extend the default functions. You can find and add more modules to your Developer Portal site from the internet. For more information, see [Extend](#).

Views

You can use views to manipulate the content that is displayed on a page, block, and other visual elements in the Developer Portal site. Views can be used along with content types to format the appearance of your site to your specification. For more information, see [Using the Views module in the Developer Portal](#).

Pages

Pages are used by the features that can modify the appearance of the Developer Portal to customize the appearance of your Developer Portal site. Pages can be customized to be as specific as you require, and can be configured to satisfy the context of the situation that they are used in.

Users

After you log in to the Developer Portal site, you have a user record in the Developer Portal database. User ID 1 is always reserved for the administrator account. Regardless of whether other user accounts are using remote authentication such as LDAP, the administrator account is always a local account to enable administration of the Developer Portal site. For more information, see [People](#).

Roles

A role is a collection of permissions that define the actions that a user can do in the Developer Portal site. Users can be given one or more roles. By default, a user that is logged in to the Developer Portal is in the Authenticated role. Other roles that can be assigned to a user include:

- Administrator
- Forum Moderator
- Content Author

You can also create new custom roles. For more information, see [Working with roles in the Developer Portal](#).

Permissions

Permissions define the actions that a user can or cannot do in a Developer Portal site. Permissions are additive. If a permission that enables a user to do an action is not assigned, the user cannot do the action. If a user has multiple roles, and any of them contain a specific permission, the user is able to do that action. There are also permissions that have security implications, and you are recommended to assign those permissions to trusted roles. For more information, see [Controlling access to Developer Portal content](#).

Templates

Template files define how the output of a particular component can look. They are formatted as Twig template files. The following are examples of where you can use templates:

- `html.html.twig` - the template for Developer Portal HTML pages
- `page.html.twig` - the body of Developer Portal HTML page
- `node.html.twig` - the template for all of the content nodes
- `comment.html.twig` - the template for all of the comment nodes
- `search-result.html.twig` - the template for search results
- `node--product.html.twig` - the template for nodes that use the Product content type
- `node--product--teaser.html.twig` - the template for the previews for the Product content type

For more information about overriding templates in the Developer Portal, see [Applying a modified content type template](#).

Getting started configuring the Developer Portal site

A quick start guide to the main tasks involved in configuring the Developer Portal to your brand or theme.

The Developer Portal is based on the open source Drupal 10 content management software, and consequently is almost completely customizable. The following sections take you through the most common tasks to get started with branding the Developer Portal to your organizational requirements, including links to the related topics in the main table of contents. Many more customizing options are described in the main table of contents, and the best way of finding help with a specific customization in this content, is to use the documentation search bar.

Important:

All of the customizations that are detailed in this topic are preserved when you update to new versions of API Connect. Drupal updates, as well as new functionality, defect fixes, and security updates, are made available through API Connect update packages as determined by IBM. These update packages can be applied by upgrading your deployment; see the upgrade instructions for your platform in [Installing and maintaining your IBM API Connect cloud](#). To find out what update packages are available, select your product on [IBM Fix Central](#).

Directly editing any API Connect themes, modules, or Drupal core on the file system is not permitted or supported, as edited versions of these files are overwritten when an update package is installed. Customizations must be done by using the proper mechanisms as described in this topic, such as custom modules and themes, and not by directly editing the source.

For more information about the API Connect support policy, see [IBM® API Connect Support Lifecycle Policy](#).

- [Create a custom theme](#)
- [Changing the page layout](#)
- [Changing the front page](#)
- [Advanced theme development](#)
- [Custom modules](#)
- [Hiding the admin login form](#)

- [What to do next - exploring the main configuration content](#)

Create a custom theme

If you want your Developer Portal to have your corporate branding and style, you need to create a custom theme. Themes are composed primarily of Cascading Style Sheets (CSS) files, although they can include much more; see [Advanced theme development](#).

Directly editing the API Connect theme is not permitted or supported, as edited versions of these files are overwritten when a fix pack or iFix is installed. The way to create a custom theme is to create a custom sub-theme of the standard API Connect theme that the Developer Portal uses by default. A sub-theme inherits the parent theme's resources, and this means that your custom sub-theme CSS file needs to contain only the changes or overrides that you want to make from the default theme. The CSS file can contain as little or as many updates as you like.

For more information, see [Creating a sub-theme](#). You can also follow a tutorial that takes you through how to use the theme generator, customize a theme, and install a custom theme; see [Tutorial: Creating a custom theme for the Developer Portal](#).

While experience with Drupal is beneficial, the only skill you really need to create a sub-theme is CSS.

Changing the page layout

While the theme defines *regions* of the page, such as a footer, or sidebar first, the page layout is defined by configuring which blocks appear in which regions. Blocks are controlled by using the Structure > Block layout options on the Developer Portal administrator dashboard. You can then further limit those blocks to show only on specific pages, or show on all pages except certain ones, to show only for certain roles, or for certain languages, and more.

For information about how to configure the page layout, see [Adding and changing the blocks displayed on Developer Portal pages](#).

Changing the page layout is done entirely in the Developer Portal UI as an Administrator.

Changing the front page

The front page is a special case and does not use the blocks system that is mentioned previously. Instead, you configure it from the Structure > Pages options on the Developer Portal administrator dashboard.

For information about how to configure the front page, see [Configuring the front page](#).

Further options that you might want to consider when designing your front page include:

- Change the banner block content or image: [Changing the front page banner block](#).
- Display featured API Products by creating a featured content block: [Changing the front page Featured Content block](#).
- Create custom blocks with your own HTML content: [Adding and changing the blocks displayed on Developer Portal pages](#).
- Set up the social block to include your organization Twitter feed: [Integrating X data into the social block](#).
- Add a carousel to the front page to display a series of images: [Implementing an image carousel](#).

Again, changing the front page is done entirely in the Developer Portal UI as an Administrator.

Advanced theme development

The DOM structure for specific blocks and parts of the page is controlled by templates. These templates are Twig files that define the actual HTML output for a particular piece of content. You can override a Twig template by copying the original template into the templates folder of your custom sub-theme, and then editing the template to your specification. The Developer Portal then uses your template in preference to the original one. For more information, see [Applying a modified content type template](#).

Modifying Twig templates allows very fine-grained control over the structure of pages. However, it also means you might miss new features and defect fixes that are made to the original templates, as your Developer Portal is using your overrides instead of the originals. So, if you override a template, it is your responsibility to check the templates in the latest API Connect releases, and to ensure that any equivalent changes that are needed to your overrides to maintain functional equivalence are made.

If you're developing custom templates, knowledge of Twig templating language, Drupal, HTML, and CSS is recommended.

Custom modules

If you need to modify the functional behavior of the Developer Portal, then you can create a custom module to do so. Drupal has an extensible programmatic API that is built around a system of *hooks*. By using these hooks in your custom modules you can change what happens when, for example, forms are displayed, forms are submitted, or make extra variables available to custom templates, and other options.

For more information on writing custom modules, see [Extend](#). You can also follow a tutorial that includes using a custom module, see [Tutorial: Adding validation to a field on the sign-up form](#).

Custom modules are written in PHP, and so Drupal experience and PHP knowledge are very beneficial.

Hiding the admin login form

If your Developer Portal is public facing, you might want to hide the admin registry as an option on the login form. You can do this simply from the administrator dashboard, by clicking Configuration > System > IBM API Developer Portal, and selecting Hide the admin registry on the login form. For more information, see [Hiding the admin registry on the login form](#).

What to do next - exploring the main configuration content

There are an almost infinite number of configuration options available to you on the Developer Portal. Explore the following sections to find out more:

- [Appearance](#) - control general appearance elements, and learn how to create a custom theme.
- [Content](#) - add, configure, and control content elements, such as meta tags, custom pages, custom content types, and adding content to an API or Product.

- [Structure](#) - control how the content in your Portal is displayed, for example configuring the front page, changing block display, and using the Views module.
- [Configuration](#) - configure content moderation, perform general configuration tasks, and manage Developer Portal security.
- [People](#) - create and customize site configuration roles, control access to sites and to content, and create internal Consumer organizations to allow customization of specific API properties.
- [Forums](#) - create and control forums.
- [Reports](#) - list of available reports about the general configuration and status of your site.
- [Extend](#) - introduction to and instructions for creating custom modules, including information about developing in PHP, and how to use hooks in custom modules.
- [Developer Portal tutorials](#) - guided examples taking you through the simple and the more complex areas of configuration.

Appearance

Control and configure the general appearance of your Developer Portal site by setting and configuring a default theme.

To learn how to control the appearance of your Developer Portal site, use the following topic links.

- [Controlling general appearance elements in the Developer Portal](#)
You can control general appearance aspects of the Developer Portal.
- [Adding custom JavaScript to a custom theme](#)
To increase customization of the Developer Portal, you can add custom JavaScript to custom themes that you install.
- [Applying a modified content type template](#)
You can apply a modified content type template to override a default content type template in the Developer Portal. For example, you can override the product content type template to change its layout.
- [Creating a sub-theme](#)
Create a custom theme for your Developer Portal site by generating and configuring a sub-theme. A sub-theme is a theme that inherits all the resources of a specified parent theme. You can then override specific resources to configure your required customizations.
- [Installing additional themes](#)
You can install additional themes in the Developer Portal.
- [Deleting themes](#)
You can delete a theme from your Developer Portal site.

Controlling general appearance elements in the Developer Portal

You can control general appearance aspects of the Developer Portal.

To learn how to control general aspects of the Developer Portal appearance, use the following topic links:

- [Changing the shortcut icon](#)
You can change the shortcut icon, or favicon, in the Developer Portal.
- [Changing the site email address](#)
You can change the site email address in the Developer Portal.
- [Changing the site logo](#)
You can change the site logo for your Developer Portal.
- [Changing the site name or site slogan](#)
You can change the site name, or the site slogan, for your Developer Portal.
- [Changing the visibility of site branding](#)
You can toggle the visibility of your site branding elements for your Developer Portal.

Changing the shortcut icon

You can change the shortcut icon, or favicon, in the Developer Portal.

Before you begin

You must have administrator access to complete this task.

About this task

The shortcut icon, or favicon, is displayed in the address bar or bookmarks of most browsers. Drupal provides a default favicon, the water drop logo, but if you want to make your Developer Portal stand out, you should provide your own. The default Drupal favicon is 32 pixels high by 32 pixels wide. As a favicon is displayed only in the address bar and favorites (bookmarks) list, any favicon that you create should be similarly small.

Procedure

To change the shortcut icon, complete the following steps:

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Appearance in the administrator dashboard.
3. Click Settings for the default theme.
4. Click Favicon in the Override Global Settings section.
5. Deselect the Use the favicon supplied by the theme check box.

6. Provide a path to a custom icon on the server by entering it in the Path to custom icon field. Alternatively, you can browse for, and upload, a favicon image under the Upload favicon image subheading.
7. Click Save configuration.
Note: If the changes don't appear immediately in your browser, clear your browser's cache and reload the page. If you've bookmarked the site, you may need to delete the bookmark and then create it again, so the new favicon is used.

Results

You have changed the favicon for the site.

Changing the site email address

You can change the site email address in the Developer Portal.

Before you begin

You must have administrator access to complete this task.

Procedure

To change the site email address, complete the following steps:

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Configuration in the administrator dashboard.
3. Under the System heading, click Basic site settings.
4. In the SITE DETAILS section, enter the new site email address in the Email address field.
5. Click Save configuration.

Results

You changed the email address for the site.

Changing the site logo

You can change the site logo for your Developer Portal.

Before you begin

You must have administrator access to complete this task.

Procedure

To change the site logo, complete the following steps:

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Appearance in the administrator dashboard.
3. Click Settings for the default theme.
4. Click Logo image in the Override Global Settings section.
5. Deselect the Use the logo supplied by the theme check box.
6. Provide a path to your custom logo by completing the Path to custom logo field. Alternatively, you can browse and upload a logo image under the Upload logo image subheading.
7. Click Save configuration.
Note: If the changes don't appear immediately in your browser, clear your browser's cache and reload the page.

Results

You changed the site logo for your Developer Portal. How the site logo is used depends on the settings for your theme.

Changing the site name or site slogan

You can change the site name, or the site slogan, for your Developer Portal.

Before you begin

You must have administrator access to complete this task.

About this task

The site name is used to identify the site and can be displayed in browsers. You can also set a site slogan for your theme.

Procedure

To change the site name or site slogan, complete the following steps:

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Configuration > System > Basic site settings in the administrator dashboard.
3. In the SITE DETAILS section, enter the new site name in the Site name field, or enter a new slogan in the Slogan field.
4. Click Save configuration.

Results

The site name or site slogan is updated. How the site name and the site slogan are used depends on the settings for your site theme. For more information, see [Changing the visibility of site branding](#).

Changing the visibility of site branding

You can toggle the visibility of your site branding elements for your Developer Portal.

Before you begin

You must have administrator access to complete this task.

About this task

The site branding block includes the site logo, name, and slogan. You can choose which of these branding elements you want to be displayed in this block.

Procedure

To change the visibility of your site branding elements, complete the following steps:

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Structure > Block layout in the administrator dashboard.
3. Find the Site branding block in the Navigation section, and click Configure.
4. In the TOGGLE BRANDING ELEMENTS section, use the check boxes to select which branding elements you want to be visible.
5. Click Save block to save your changes.

Results

You changed the visibility of your site branding elements. How these elements are used depends on the settings for your theme.

Adding custom JavaScript to a custom theme

To increase customization of the Developer Portal, you can add custom JavaScript to custom themes that you install.

Procedure

1. Add your JavaScript file to your theme. For example, in a sub-directory named js and the file `myfilename.js`.
2. Add the JavaScript file to your theme, by editing your `{custom_theme}.libraries.yml` file and adding in the JavaScript file.
An example of the JavaScript file:

```
myfile:
  js:
    js/myfilename.js: {}
```

3. Add the following code to your theme's `.info.yml` file:

```
libraries:
  - {custom_theme}/myfile
```

- Note: You must replace `{custom_theme}` with your theme name. Also, both files must reference `myfile`.
4. Zip up the directory and upload it to your portal site. For more information, see [Installing additional themes](#).

Applying a modified content type template

You can apply a modified content type template to override a default content type template in the Developer Portal. For example, you can override the product content type template to change its layout.

Before you begin

You must have administrator access to complete this task.

You must also have a custom sub-theme, and a copy of an existing template that you want to update. For information about how to create a sub-theme, see [Creating a sub-theme](#).

To obtain a copy of an existing template, you can download a copy from the following locations on GitHub:

- https://github.com/ibm-apiconnect/devportal/tree/master/ibm_apim/templates
- https://github.com/ibm-apiconnect/devportal/tree/master/apic_api/templates
- https://github.com/ibm-apiconnect/devportal/tree/master/apic_app/templates
- <https://github.com/ibm-apiconnect/devportal/tree/master/product/templates>
- <https://github.com/ibm-apiconnect/devportal/tree/master/consumerorg/templates>

Note that you must copy the template to your sub-theme, and then modify the content. Do not modify the content that is stored on GitHub.

About this task

You can override the Developer Portal core templates by creating a custom sub-theme, and then adding your modified templates to the sub-theme folder. A sub-theme inherits all of the settings of its parent theme, apart from the settings that are overridden, such as by applying modified templates. After you have applied a modified content types template, these changes take precedence over the default content types template. The Developer Portal templates are formatted as Twig template files. The following levels are examples of where you can use templates:

- `html.html.twig` - the template for Developer Portal HTML pages
- `page.html.twig` - the body of Developer Portal HTML page
- `node.html.twig` - the template for all of the content nodes
- `comment.html.twig` - the template for all of the comment nodes
- `search-result.html.twig` - the template for search results
- `node--product.html.twig` - the template for nodes that use the Product content type
- `node--product--teaser.html.twig` - the template for the previews for the Product content type

For more information about Twig templates, see [Working with Twig templates](#) and [Debugging Twig templates](#) on the Drupal documentation website. Modifying Twig templates allows very fine-grained control over the structure of pages. However, it also means you might miss new features and defect fixes that are made to the original templates, as your Developer Portal is using your overrides instead of the originals. So, if you override a template, it is your responsibility to check the templates in the latest API Connect releases, and to ensure that any equivalent changes that are needed to your overrides to maintain functional equivalence are made.

Important:

Directly editing any API Connect theme files is not permitted or supported, as edited versions of these files are overwritten when a fix pack or iFix is installed.

Procedure

To override a default content type template:

1. Apply the modifications that you require to the default template that you obtained.
Warning: Although the ability to override templates is supported, if you override a template they are your responsibility. Templates can be from multiple sources and compatibility with an earlier version is not ensured. You must check the templates in the latest API Connect release to check whether you need to make equivalent changes to your overrides to maintain functional equivalence.
2. Create a directory in your custom sub-theme, and name it `templates`.
3. Add your modified template to the `templates` directory.
Note: The modified template file name must be identical to the original name of the template file that it is overriding.
4. Log in to the Developer Portal UI as an administrator.
5. If the administrator dashboard is not displayed, click `Manage` to display it.
6. Install your custom sub-theme onto the Developer Portal by clicking `Appearance > Install new theme on the administrator dashboard`.
7. Click `Choose file`, select your sub-theme, and then click `Install`.
8. Click `Install newly added theme`, find your new theme in the list of `Uninstalled themes`, and click `Install` and set as default to set your new custom sub-theme as the default theme for your site.
Your new theme, which contains the modified template file, is now set as the default theme, and is listed in the `Installed themes` section.

Results

You successfully modified and applied a template to override a default content type template in the Developer Portal.

Creating a sub-theme

Create a custom theme for your Developer Portal site by generating and configuring a sub-theme. A sub-theme is a theme that inherits all the resources of a specified parent theme. You can then override specific resources to configure your required customizations.

Before you begin

You must have administrator access to complete this task.

About this task

Directly editing the API Connect theme isn't permitted or supported, as edited versions of these files are overwritten when a fix pack or iFix is installed. So, the way to create a custom theme is to create a custom sub-theme of the standard API Connect theme that the Developer Portal uses by default. You can also create a sub-theme that is based on one of the following color templates:

Emerald Green

The screenshot shows the Acme Bank website with an Emerald Green theme. The header features the Acme Bank logo and navigation links for API Products, Apps, Blogs, Forums, and Support. A search bar and a user profile icon labeled 'myorg' are also present. The main content area has a dark background with a blue and green gradient. The headline reads 'Brace yourselves. APIs are coming.' followed by a sub-headline 'Explore, subscribe to and be creative with our APIs. We can't wait to see what you come up with!' and a green button labeled 'Explore API Documentation'. Below this, there are four columns of content: 'Let's get started!', 'Sign up' (with a sub-headline 'Create a new account and get started with our APIs. It's free to join.' and a clock icon), 'Explore our APIs' (with a sub-headline 'Take a look at our API products and quickly find APIs to construct a fully featured application' and a network icon), and 'Create' (with a sub-headline 'Subscribe to a plan and create your application to make use of our APIs.' and a document icon). A decorative bar at the bottom consists of several vertical bars in shades of green.

Golden Brown

The screenshot shows the Acme Bank website with a Golden Brown theme. The layout is identical to the Emerald Green version, but the color palette is different. The header, navigation, and main content area now feature shades of brown and gold. The 'Explore API Documentation' button is dark brown, and the decorative bar at the bottom consists of vertical bars in various shades of brown and gold.

Ruby Red

The screenshot shows the Acme Bank website with a Ruby Red theme. The layout is identical to the other two versions, but the color palette is red. The header, navigation, and main content area now feature shades of red. The 'Explore API Documentation' button is red, and the decorative bar at the bottom consists of vertical bars in various shades of red.

Selecting a color template provides you with a base theme that you can build on more easily to produce your required site branding and styling. Create a sub-theme by using the theme generator in the Developer Portal UI, customize the appearance as required, and then upload the compressed file back onto the site.

Important:

- You're not permitted to include any IBM® API Connect code within any custom themes that you create. Also, directly editing any API Connect themes on the file system is not permitted or supported, as edited versions of these files are overwritten when a fix pack or iFix is installed.
- All custom development is your responsibility. Although the use of custom themes is supported, IBM API Connect do not provide support in their development or modification.

For a guided example on creating a sub-theme, see [Tutorial: Creating a custom theme for the Developer Portal](#). In this example, you create a sub-theme, and then customize the styling by editing the `overrides.css` file.

Procedure

1. If the administrator dashboard is not displayed, click Manage to display it.
2. On the administrator dashboard, click Appearance, > Generate sub-theme.
The Generate sub-theme page is displayed.
3. Enter a Sub-theme name, and select the Sub-theme type that you would like to use. The name can contain only lowercase characters a - z, and numerals 1 - 9.
 - CSS - Cascading Style Sheets; the language that is used to describe how to display the HTML elements in the theme.
 - SCSS - Sass CSS; a superset of CSS. SCSS contains all the features of CSS, but is extended to include the features of Sass as well. However, SCSS must be compiled into CSS before it can be installed and used in the Developer Portal.
4. Select the template to base your sub-theme on:
 - Default - the standard connect_theme that the Developer Portal is based on.
 - Business Mono - a black and white color theme.
 - Sapphire Blue - a blue color theme.
 - Emerald Green - a green color theme.
 - Golden Brown - a brown color theme.
 - Ruby Red - a red color theme.
5. Click Generate.
Your sub-theme is available to download from the Generate sub-theme page.
6. Click your new sub-theme and save it to your preferred location.
7. Extract the resources from the sub-theme file, and then edit the specific resources to configure the customizations that you require.
Define your theme by creating metadata in the `your_theme_name.info.yml` file. You can then customize the appearance of your theme by configuring the `overrides.css` file. For detailed information about how to customize themes, see [Theming Drupal](#).
8. After you have completed your customizations, compress the sub-theme resources back into the .zip file.
Note that the following file extensions are also supported: tar, tgz, gz, and bz2.
9. Install your new sub-theme onto the Developer Portal by clicking Appearance, > Install new theme.
10. Click Choose file, select your sub-theme, and then click Install.
11. Click Install newly added theme, find your new theme in the list of Uninstalled themes, and click Install and set as default to set your new custom sub-theme as the default theme for your site.
Your new theme is now set as the default theme, and is listed in the Installed themes section.

Results

You created and installed a new sub-theme for your Developer Portal site.

What to do next

You can edit the display settings for your new theme, by clicking Settings next to your theme.

Installing additional themes

You can install additional themes in the Developer Portal.

Before you begin

You must have administrator access to complete this task.

Procedure

To install additional themes, complete the following steps:

1. Click Appearance in the administrator dashboard.
2. Click + Install new theme.
3. You can enter a path to the theme in the Install from a URL field. Alternatively, you can upload a theme under the Upload a module or theme archive to install heading.
4. Click Install.
5. Click Enable newly added themes.

6. Click Enable and set default for the theme that you want to be displayed in the Developer Portal. Your theme is displayed in the Developer Portal when you navigate to the home page.

Deleting themes

You can delete a theme from your Developer Portal site.

Before you begin

You must have administrator access to complete this task.

About this task

If you have a custom theme which is disabled, you can remove it from the Developer Portal. Deleting a theme is useful if you have identified a theme that you do not want to use again.

Procedure

1. Click Appearance from the administrator dashboard.
2. Identify the custom theme that you want to delete, and ensure that it is disabled.
3. Click Delete against the theme.

The theme is now deleted from your Developer Portal site.

Results

You deleted a disabled theme in the Developer Portal.

Content

Control multiple content entities in the Developer Portal, including the customization and restriction of specific content.

A *content entity* is an item of content data, which can consist of text, HTML markup, images, attached files, and other data that is intended to be displayed to site visitors. Content entities can be defined by the core software or by modules. Content entities are grouped into *entity types*, which have different purposes and are displayed in different ways on the site. Most entity types are also divided into *entity sub-types*, which are divisions within an entity type to allow for smaller variations in how the entities are used and displayed.

The Developer Portal site contains the following content entity types:

- API
- Application
- Article
- Basic page
- Blog post
- Book page
- Consumer Organization
- FAQ
- Forum Topic
- Product

Within content entity items the data is stored in individual *fields*, each of which holds one type of data, such as formatted or plain text, images or other files, or dates. Field types can be defined by the core software or by modules.

Fields can be added by an administrator on content entity sub-types, so that all the entity items of a given entity sub-type have the same collection of fields available. When you create or edit entity items, you are specifying the values for the fields on the entity item.

To learn how to configure the content entities of your Developer Portal site, use the following topic links.

- [Adding content elements in the Developer Portal](#)

Adding content elements in the Developer Portal

You can add content elements in the Developer Portal.

Note: Note that you can export and import entities from the Developer Portal UI. When you're editing a content entity type in the UI, you can click Export in the side navigation bar. To create an export entity container and export that entity, including any required embedded entities, click Export entity. Or, if you have an existing export

entity container, you can select the required container, and click Add to the export. You can also view and manage all of your export entities by clicking Content_synchronization_Exports, and all of your import entities by clicking Content_synchronization_Imports. To learn how to add various content elements in the Developer Portal, use the following topic links:

You can add .jpg, .png and .gif images to your site content in the Developer Portal.

Adding and configuring meta tags

You can customize the Developer Portal by adding and configuring meta tags.

Before you begin

You must have administrator access to complete this task.

About this task

Meta tags provide preview information that is displayed for a link to a website. The preview information can include images, descriptions, tags, and links. Meta tags are used when you link to external website, for example Facebook, Twitter, and Slack.

You can see which entities have the meta tag form available on their respective edit pages by default, and can be configured, Configuration_Search and metadata_Metadata_Settings:

- CONTENT
 - API
 - APPLICATION
 - ARTICLE
 - BLOG POST
 - BOOK PAGE
 - CONSUMER ORGANIZATION
 - FAQ
 - FORUM TOPIC
 - BASIC PAGE
 - PRODUCT
- TAXONOMY TERM
 - FORUMS
 - TAGS
- USER
 - USER

Procedure

1. In the administrator dashboard, click Extend_Update, then click List.

2. Enter `meta_tag` in the Filter list field.
3. Select the check boxes for the Meta tags you want to enable, click Enable.

- [Disabling external search engine indexing](#)

If you do not want your Developer Portal site content to be indexed by external search engines, then you can disable the indexing.

Disabling external search engine indexing

If you do not want your Developer Portal site content to be indexed by external search engines, then you can disable the indexing.

Before you begin

You must have administrator or content author access to complete this task.

About this task

By disabling the external search indexing, you can increase the confidentiality of your content and restrict its exposure.

Procedure

1. If the administrator dashboard is not displayed, click Manage to display it.
2. On the administrator dashboard, click Configuration.
3. In the SEARCH AND METADATA section, click Metatag.
4. Click Edit for the GLOBAL type.
5. Expand the ADVANCED section and, in the Robots section, select Prevents search engines from indexing this page.
6. Click Save.

Results

You have disabled external search engine indexing.

Adding custom pages

You can create custom pages within the Developer Portal. You can add a basic page for static content, or an article for news content.

Before you begin

You must have administrator or content author access to complete this task.

About this task

Use basic pages for your static content, such as an "About us" page. Typically, a basic page is used for static content that can be linked into the main navigation bar, although this is not a requirement. Use articles for time-sensitive content, like news, press releases, or blog posts.

Procedure

To add custom pages, complete the following steps.

1. Log in to the Developer Portal as an administrator or content author.
2. If the administrator dashboard is not displayed, click Manage to display it.
3. In the administrator dashboard, click Content.
4. Click +Add content, then click either Basic page or Article, depending on the type of content you want to display.
5. Enter a page title, select the language, and enter the content.
6. Specify the remaining page options as required.
 - If you want your new page to be linked to from a menu, you must complete the Menu settings section.
7. Optional: Click Edit summary and specify a summary page description.
8. Click Save to publish the new page immediately. If you don't want to publish the new page immediately, ensure that you deselect Published before saving.

Results

You added a new custom page to the Developer Portal. You can edit the page after it is created by clicking Edit for the custom page.

Integrating X data into the social block

You can retrieve and integrate data from an X (formerly known as Twitter) account of interest and display it into a social block in a Developer Portal site.

Before you begin

You must have administrator access to complete this task.

You must have an X App for the X account of interest. The X App contains information that is used to configure the social block. For information on creating X Apps, see <https://apps.twitter.com/>.

Procedure

1. If the administrator dashboard is not displayed, click Manage to display it.
2. On the administrator dashboard, click Configuration.
3. In the WEB SERVICES section, click IBM Social Block settings.
4. Using the information from your X App, enter the Consumer Key, Consumer Secret, Access Token, and Token Secret in the corresponding fields.
5. Click Save configuration.

X data from an X account of interest has been integrated with the Developer Portal, and is displayed on the social block of the site.

- **[Editing the social block](#)**

After you have integrated Twitter data into the Developer Portal social block, you can edit the content, appearance, and functionality of the social block.

Editing the social block

After you have integrated Twitter data into the Developer Portal social block, you can edit the content, appearance, and functionality of the social block.

Before you begin

You must have administrator access to complete this task.

You must have Twitter data integrated into the Developer Portal social block. For more information, see [Integrating X data into the social block](#).

Procedure

1. If the administrator dashboard is not displayed, click Manage to display it.
2. On the administrator dashboard, click Structure > Pages.
3. Click Edit next to the Welcome page (or next to the page that contains the social block that you want to edit).
4. From the Variants navigation tree, select Panels > Content, and click Edit next to the Social Block.
The Edit block window is displayed.
5. Edit the social block by configuring any of the following options:

Title

Update the title as required.

Number of tiles to display

Configure the number of tiles that you want to display on the social block by entering a number in the Number of tiles to display field. The default number of tiles that are displayed on the social block is 9, and there is a limit of 100 tiles.

FORUM

Use the check boxes to specify the forum topics that you want to display.

Get tweets from

From the Get tweets from drop-down list, select whether you want to display Twitter data from users or a search term.

Twitter search parameter

Enter the Twitter search parameter.

Types of tweets to display

Select the types of tweets that you want to display from the drop-down list. You can select to display tweets, or tweets and replies.

6. After you have configured the social block, click Update block.

Your social block is configured, and the configurations are implemented when you return to the home page.

Adding content in multiple languages

You can create content in multiple languages in the Developer Portal.

Before you begin

You must have administrator or content author access to complete this task.

About this task

You can provide custom pages in multiple languages to your APIs and Products to improve your customer experience and understanding. By default, multiple languages are enabled in the Developer Portal.

Note: In API Designer, translations for APIs and products must be done within a document. For more information, see [Using x-ibm-languages to create multilingual API and Product documentation](#).

Procedure

1. Log in to the Developer Portal as an administrator or content author.
2. If the administrator dashboard is not displayed, click Manage to display it.
3. On the administrator dashboard, click Content.
4. If you are creating a new page to be translated, click +Add content.
 - a. Click Basic page, then select type, for example **Basic page**.
 - b. Enter a title for your custom page in the Title field.
 - c. Enter your information in the Body field.
 - d. Click Save.
 - e. Click Translate.
 - f. Click Add for the language you want to translate.
 - g. Provide the language content.
 - h. Click Save (this translation).
5. If you are translating an existing page, find the page that you want to update in the list.
 - a. Click Translate from the drop-down list for the page.
 - b. Click Add for the language you want to translate.
 - c. Provide the language content.
 - d. Click Save (this translation).

Results

You successfully created a translated version of your content.

Adding custom pages to APIs and Products

After you create a custom page in the Developer Portal, you can add a link to the new page to any APIs and Products that exist in the Developer Portal.

Before you begin

You must have administrator or content author access to complete this task.

You must have an API or Product to add the custom page to.

About this task

You can add custom pages to your APIs and Products to provide further information on their use and value.

For example, you can create a custom documentation page on the implementation of an API in a specific circumstance, and add this custom documentation page to the API.

Procedure

1. Log in to the Developer Portal as an administrator or content author.
2. If the administrator dashboard is not displayed, click Manage to display it.
3. On the administrator dashboard, click Content, then click +Add content.
4. Click Basic page.

The Create Basic page window is displayed.
5. Enter a title for your custom page in the Title field.
6. Enter your information of interest in the Body field.
7. If you want to add the custom page to a specific Product, enter the Product name in the Link to one or more specific Products field. As you type into this field, a list of available Products is displayed for you to select. You can add more Products by clicking Add another item. If you want to add the custom page to all Products, select the Link to all Products check box.
8. If you want to add the custom page to a specific API, select the APIs tab, and then enter the API name in the Link to one or more specific APIs field. As you type into this field, a list of available APIs is displayed for you to select. You can add more APIs by clicking Add another item. If you want to add the custom page to all APIs, select the Link to all APIs check box.
9. Optional: Configure the additional settings of the custom page to your specification.
10. Click Save.

Results

Your custom page is created and linked to the APIs or Products that you have specified. You can edit the page after it is created, and update the APIs and Products that it is linked to, by clicking Edit for the custom page.

Adding new frequently asked questions

You can add new FAQs to the Developer Portal.

Before you begin

You must have administrator or content author access to complete this task.

About this task

To add new FAQs, you create a new FAQ node and add questions and answers to that node. Each FAQ node represents an FAQ topic, and each topic can contain multiple questions and answers.

Procedure

To add new FAQs, complete the following steps:

1. Log in to the Developer Portal as an administrator.
2. If the administrator dashboard is not displayed, click **Manage** to display it.
3. Click **Content** in the administrator dashboard.
4. Click **+Add content**.
5. Click **FAQ**.
The **Create FAQ** page displays.
6. Provide a **Title** for the new FAQ topic.
7. Enter the question in the **Question** field, and enter the answer in the **Answer** field.
8. Optional: If you have more content for this FAQ topic, click **Add another item** and complete the **Question** and **Answer** fields. Repeat this step as required.
9. Click **Save** to save your new FAQ topic.
Your new FAQ topic is displayed in the **Support** section of the Developer Portal.

Results

You successfully added new FAQs to the Developer Portal.

What to do next

You can edit the current content of FAQs by clicking **Content** in the administrator dashboard, finding the FAQ content that you want to edit, and clicking **Edit** against that FAQ.

Applying an image to an API or Product

You can apply an image to an API or a Product in the Developer Portal.

Before you begin

You must have administrator or content author access to complete this task.

Procedure

To add an image to an API or Product, complete the following steps:

1. If the administrator dashboard is not displayed, click **Manage** to display it.
2. Click **Content** in the administrator dashboard.
3. Click **Edit** next to the API or Product that you want to edit.
4. Under the **Image** heading, click **Choose File** to select an image.
5. Click **Save and keep published**, to publish the updated content, or select **Save and unpublish** if you want to publish the updated content later.
You have added a new picture to the selected API or Product.

Attaching a documentation file to APIs

You can attach a file to APIs in the Developer Portal, and display them as documentation attachments. You can attach multiple files to APIs.

Before you begin

You must have administrator or content author access to complete this task.

About this task

You can attach only one file at a time. The default file upload size limit applies to the files that you want to attach, and you can attach up to 10 files to an API by default.

Note: You can change the default limit for the number of files that you want to attach.

An administrator can configure the types of file that are uploaded, and the number of files that a user can upload.

The following file types can be uploaded:

- txt doc pdf
- xls ppt pptx
- docx xlsx rtf

- odt ods odp md json
- yaml tgz tar zip

Procedure

1. If the administrator dashboard is not displayed, click **Manage** to display it.
2. Click **Content** in the administrator dashboard.
3. Click **Edit** next to the API you want to attach the file to.
4. In the **Documentation** section, click **Browse** and identify the file that you want to upload, then click **Open**.
5. Click **Upload**, then click **Save**.
6. Optional: Clear the **Display** checkbox for the file if you want to upload and attach the file to the API, but not show it in the Developer Portal.
7. Optional: Enter a description for your file in the **Description** field. This description can be used as the label of the link to the file.
8. Optional: If you uploaded multiple files, you can use the **drag handle** next to the file name to rearrange them.

Results

You successfully attached a documentation file to your API.

Configuring blogs

You can post new blog entries in the Developer Portal, and configure them to suit your requirements. You can also turn blogs off.

Before you begin

You must have administrator or content author access to complete this task.

Procedure

To post a new blog entry, complete the following steps:

- If the administrator dashboard is not displayed, click **Manage** to display it.
- Click **Content** in the administrator dashboard.
- Click **Add content**.
- Click **Blog post**.
- Fill in the **Title** and **Body** fields.
- Click **Save and keep published**, to publish the updated content, or select **Save and unpublish** if you want to publish the updated content later.
You have posted a new blog entry.

To configure a blog post, complete the following steps:

- If the administrator dashboard is not displayed, click **Manage** to display it.
- Click **Content** in the administrator dashboard.
- Click **Edit** next to the blog post that you want to configure.
- You can configure the selected blog from this view.
- Click **Save and keep published**, to publish the updated content, or select **Save and unpublish** if you want to publish the updated content later.
You have configured the selected blog post.

Configuring the taxonomy menu block

To display your tag hierarchy in the Developer Portal, you must configure the taxonomy menu block.

Before you begin

You must have administrator or content author access to complete this task.

About this task

Along with controlling how your tag hierarchy is displayed through configuring your taxonomy menu block, you can configure options for the taxonomy tree. The following options can be configured for your taxonomy menu block:

- Vocabulary
- Parent option
- Depth
- Node options and content
- Region settings
- Visibility settings

Important: The taxonomy block will appear after configuration only if there are tags for it to display.

Procedure

1. In the Administrator dashboard, click Structure > Blocks.
2. Click configure for the Taxonomy Menu Block (Tags) block.
3. Configure the options that are available for your taxonomy menu block.
4. When you have configured your taxonomy menu block, click Save block.
You have configured your taxonomy menu block, and your tag hierarchy is displayed based on your configurations.

Customizing the URL alias for a specific API or Product page

You can customize the URL of an API or Product page from the default alias that they are assigned.

Before you begin

You must have administrator or content author access to complete this task.

About this task

Creating a custom URL, or path, alias is useful if you want to make the URL relevant to the API or Product page.

Procedure

1. If the administrator dashboard is not displayed, click Manage to display it.
2. On the administrator dashboard, click Content.
3. Identify the API or Product page that you want to customize the URL alias for, and click Edit.
4. In the Path Alias text field, enter the custom URL alias that you want to assign your API or Product page.
Note: All Path Alias must be unique, and can contain only the following characters: [A-Za-z0-9_-].
5. Click Save to publish the updated content.

Results

You have applied a custom URL alias for your specified API or Product page, and it is displayed in the URL of your browser when the API or Product page is selected. Depending on whether it is added to an API or a Product page, the application of the Path Alias differs. For example, if you add `my_new_path_alias`, you will have:

- `<my_site_url>/api/my_new_path_alias` for an API
- `<my_site_url>/product/my_new_path_alias` for a Product

Embedding multimedia in site content

You can embed multimedia elements in site content in the Developer Portal.

Before you begin

You must have administrator or content author access to complete this task.

Procedure

To embed multimedia in site content, complete the following steps:

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Content in the administrator dashboard.
3. Under the TITLE heading, click the title of the required content.
4. Click the Edit tab.
5. Use the Insert Media Embed icon  in the WYSIWYG editor to embed multimedia in the content.
Note: The Insert Media Embed icon is available only if you have selected Full HTML mode.
6. Click Save and keep published to publish the new page immediately, or select Save and unpublish if you want to publish the page later.
You have embedded multimedia in the selected site content.

Linking from one piece of site content to another

You can link from one piece of site content to another in the Developer Portal.

Before you begin

You must have administrator or content author access to complete this task.

Procedure

To link from one piece of site content to another, complete the following steps:

1. Click Content in the administrator dashboard.
2. Under the TITLE heading, click the title of the required content.
3. Select the Edit tab.

4. Use the Link to content icon in the WYSIWYG editor.
5. Click Save.
You have linked the selected site content to another site content element.

Linking to social media sites

You can link to social media sites from the Developer Portal. You can configure where and how these links are displayed and which sites you want to link to.

Before you begin

You must have administrator access to complete this task.

Procedure

1. Click Structure in the administrator dashboard.
2. Click Blocks.
3. Under the Disabled heading, locate the Follow site block.
4. Select the location for your social media block from the drop-down list for Follow Site in the REGION column.
The Follow Site block will appear under the heading that corresponds to the region you selected in the REGION drop-down list.
5. Required: Click Save blocks before you begin configuring your new block.
6. Click configure for the Follow Site block.
7. In the Block title field, type the name of your block.
8. Under the Default block title heading, select one of the following leading text options for your block using the radio buttons for each option:
 - "Follow *your.portal.site* on"
 - "Follow me on"
 - "Follow us on"
9. Use the User pages check box to decide whether you want your block to display on your user's profile pages.
10. Use the Alignment and Icon Style drop-down lists to adjust the appearance of your block.
11. Click Save block.
12. Click Configuration in the administrator dashboard.
13. Under the WEB SERVICES heading, click Follow.
14. Type the URL under the URL heading for each of the social media sites you want your users to access. The following is an example of a link to the @ibmapiconnect twitter handle:

`https://twitter.com/ibmapiconnect`
15. Click Submit.

Managing tags in the Developer Portal

These instructions show you how to add new tags to your taxonomy, and how to manage the tag hierarchy in the Developer Portal. You can use tags to classify your Developer Portal content.

Before you begin

You must have administrator or content author access to complete this task.

Procedure

To manage your tags, complete the following steps

1. If the administrator dashboard is not displayed, click Manage to display it.
 2. Click Structure > Taxonomy > Tags in the administrator dashboard.
The List window for Tags is displayed.
 3. You can add new terms, delete, and reorganize terms from this view.
 - a. To add a new term, click Add term, define the new term, then click Save.
 - b. To delete a term, select Delete from the OPERATIONS menu next to the term that you want to delete. Then click Delete to confirm.
 - c. To reorganize terms, ensure that the row weights are hidden by clicking Hide row weights if necessary, then use the drag-and-drop handles to manage the tag hierarchy. Terms can be dragged to organize a parent grouping hierarchy. Then click Save.
- [Tagging APIs based on their lifecycle phase](#)
In the Developer Portal, you can have APIs automatically tagged with their lifecycle phase; realized, identified, or specified.

Related tasks

Tagging APIs based on their lifecycle phase

In the Developer Portal, you can have APIs automatically tagged with their lifecycle phase; realized, identified, or specified.

Before you begin

You must have administrator or content author access to complete this task.

About this task

APIs are tagged in the API Manager with a lifecycle phase as follows:

- Realized (default) - The API is in the implementation phase.
- Identified - The API is in the early conceptual phase and is neither fully designed nor implemented.
- Specified - The API has been fully designed and passed an internal milestone, but has not yet been implemented.

You can configure the Developer Portal to tag APIs with their lifecycle phase automatically.

Procedure

Tagging APIs with their phase is disabled by default. To enable the function:

1. If the administrator dashboard is not displayed, click Manage to display it.
2. On the administrator dashboard, click Configuration.
3. In the SYSTEM section, click IBM API Connect.
4. Select Automatically tag APIs with their phase, and then click Save configuration.

What to do next

You can manage the tag hierarchy of your APIs. For more information, see [Managing tags in the Developer Portal](#).

Posting a poll

You can post a poll in the Developer Portal.

Before you begin

You must have administrator or content author access to complete this task.

Procedure

To post a poll, complete the following steps:

1. Click Content in the administrator dashboard.
2. Click Add content.
3. Click Poll.
4. Enter the poll question in the Poll question field.
5. Under the Choice heading, add answers to the available fields as choices.
6. From the Poll duration drop-down menu, select a time limit for the poll.
7. Click Save.

You have posted a poll.

What to do next

See [Editing sample content](#) to learn how to add a links to your poll to sample content.

Adding images to site content

You can add .jpg, .png and .gif images to your site content in the Developer Portal.

Before you begin

You must have administrator or content author access to complete this task.

Procedure

To upload images for use in site content, complete the following steps:

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Content in the administrator dashboard.
3. Under the TITLE heading, click the title of the required content.
4. Click the EDIT tab.

5. Use the Image icon in the in the WYSIWYG editor to add an image.
6. Click Save and keep published to publish the new page immediately, or select Save and unpublish if you want to publish the page later.

Configuring and restricting content in the Developer Portal

You can configure and restrict certain content elements in the Developer Portal.

To learn how to configure and restrict content in the Developer Portal, use the following topic links:

- [Creating content types](#)

Creating content types

Content types define default fields for editors to add content on your Developer Portal site and are the building blocks for authoring content. You can control which content types are available

Before you begin

You must have administrator access to complete this task.

About this task

After you create your content type, it is added to the following list of default content types that are present in the Developer Portal:

- API
- Application
- Article
- Basic page
- Blog post
- Book page
- Consumer organization
- Forum topic
- Product

The content type that you create, and the default content types, can be edited and configured further to your specifications.

Procedure

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Structure in the administrator dashboard.
3. Click Content types.
4. Click +Add content type.
5. Enter a name for your content type in the Name field.
6. Optional: Enter the text that you want to appear on the Add new content page, in the Description field.
7. Enter a title field label for your content type in the Title field label field.
8. Optional: Configure any of the following options for your content type:

- Submission form settings
 - Publishing options
 - Language settings
 - Display settings
 - Menu settings
9. After you have configured your content type to your specifications, click Save and manage fields.
You have created a new content type.

What to do next

You can add fields to your new content type; see [Adding fields to content types](#).

- [Adding fields to content types](#)
Fields can be added to content types in the Developer Portal for customization, and to add functionality.

Adding fields to content types

Fields can be added to content types in the Developer Portal for customization, and to add functionality.

Before you begin

You must have administrator access to complete this task.

About this task

You can specify the type of data that a field can store, and the form element to edit the data with. The type of form element that is available is dependent on the type of data that your field stores.

Note: You can specify the number of values that a field can store, including an unlimited amount. You can configure the value after the field is created. Reducing the number of values that can be stored after the field is created might lead to data loss.

Procedure

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Structure in the administrator dashboard.
3. Click Content types, and identify the content type that you want to add a field to.
4. Click Manage fields for the content type, then click Add field.
5. Select a field type or select an existing field to reuse, then enter a label for your field in the Label field.
The label that you specify for your field is displayed in the UI.
6. Optional: If you want to edit the machine name that is automatically created based on your label, click Edit and enter the new name.
You cannot change the machine name after the field is created.
7. Click Save and continue.
8. Modify the field type specific settings as required, then click Save field settings.
You have added a field to your content type.

Configuring documentation upload limitations

You can attach documentation to an API by uploading it in the Developer Portal. You can configure the API content type to place limitations on the uploaded documentation.

Before you begin

You must have administrator access to complete this task.

About this task

The set of configurable limitations that you can place on uploading documentation is different to the set of limitations that you can place on uploading images.

The file size limit that is applied when you upload documentation is also different to the limit that is applied when you upload images.

Procedure

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Structure in the administrator dashboard.
3. Click Content types.
4. For the API content type, click Manage fields.
5. For the Documentation field, click Edit.
6. Configure the type of files that are allowed to be uploaded in the Allowed file extensions field.
7. Enter the file size upload limit in the Maximum upload size field.
The default size is 10MB, while the maximum upload size possible is 64MB.
8. Click Save settings.

You have configured the documentation upload limitations.

Configuring image upload limitations

You can attach an image file to an API by uploading it in the Developer Portal. You can configure the API content type to place limitations on the uploaded image files.

Before you begin

You must have administrator access to complete this task.

Procedure

1. If the administrator dashboard is not displayed, click **Manage** to display it.
2. Click **Structure** in the administrator dashboard.
3. Click **Content types**.
4. For the API content type, click **Manage fields**.
5. For the **Image** field, click **Edit**.
6. Configure the type of image files that are allowed to be uploaded in the **Allowed file extensions** field.
7. Specify the maximum and minimum allowed image sizes in the **Maximum image resolution** and **Minimum image resolution** fields.
8. Enter the file size upload limit in the **Maximum upload size** field.
The default size is 2MB, while the maximum upload size possible is 64MB.
9. Click **Save settings**.
You have configured the image upload limitations.

Configuring the appearance of ratings in the Developer Portal

You can configure the appearance of ratings in the Developer Portal.

Before you begin

You must have administrator access to complete this task.

About this task

You can configure the appearance of ratings for only the following content types in the Developer Portal:

- APIs
- Applications
- Products

Note: The Applications and Products content types rating functionality is set to hidden by default.

Procedure

These following steps describe how to customize the rating on a selected API, Application, or Product. To ensure that the configured rating is also displayed in the list view of APIs, Applications, or Products, then you must repeat these steps on the **Teaser** tab in the **Manage Display** window:

1. If the administrator dashboard is not displayed, click **Manage** to display it.
2. Click **Structure** in the administrator dashboard.
3. Click **Content types**.
4. Select **Manage display** from the list in **OPERATIONS** column, next to the required content type.

5. Click the Settings icon , then select the style you require, then click Update.

Format settings: Voting api formatter

Show own vote

Show own cast vote instead of results. (Useful on add/ edit forms with rate widget).

Update Cancel

6. Click Save. You have configured the appearance of the ratings feature for the required content type.

Customizing the privacy policy statement

You can define and customize a privacy policy statement that sets out the privacy conditions of your Developer Portal site. The privacy policy can be linked to from the cookie compliance banner.

Before you begin

You must have administrator access to complete this task.

Procedure

To define or customize a privacy policy, complete the following steps:

1. Log in to the Developer Portal as an administrator.
2. If the administrator dashboard is not displayed, click Manage to display it.
3. Click Content, then enter `privacy` into the title search filter, and click Filter.
The Privacy Policy content item is displayed in the list of content.
4. Click Edit next to the Privacy Policy content item.
5. Update the content as required. For example, you can complete the following tasks:
 - a. Edit the text of the privacy policy statement.
 - b. Set the display settings.
 - c. Link the content to Products and APIs.
 - d. Enter an explanation of the changes that have been made to the privacy policy since the last version.
6. Click Save to save your changes.

Results

The privacy policy statement is successfully updated.

What to do next

You can set your cookie compliance banner to link to your updated privacy policy. For more information, see [Enabling a cookie compliance banner](#).

Related tasks

- [Enabling a cookie compliance banner](#)
- [Customizing the terms of use statement](#)

Customizing the terms of use statement

You can define and customize a terms of use statement that sets out the terms and conditions that your users must accept to use your Developer Portal site.

Before you begin

You must have administrator access to complete this task.

Procedure

To define or customize a terms of use statement, complete the following steps:

1. Log in to the Developer Portal as an administrator.
2. If the administrator dashboard is not displayed, click Manage to display it.
3. Click Content, then enter `terms` into the title search filter, and click Filter.
The Terms of use content item is displayed in the list of content.
4. Click Edit next to the Terms of use content item.
5. Update the content as required. For example, you can complete the following tasks:
 - a. Edit the text of the terms of use statement.
 - b. Set the display settings.
 - c. Link the content to Products and APIs.
 - d. Enter an explanation of the changes that have been made to the terms of use since the last version.
6. Click Save to save your changes.

Results

The terms of use statement is successfully updated.

What to do next

You can force new users to accept the terms and conditions on the Developer Portal. For more information, see [Forcing new users to accept terms and conditions](#).

Related tasks

Editing a site comment

You can edit site comments in the Developer Portal.

Before you begin

You must have administrator or content author access to complete this task.

Procedure

To edit a site comment, complete the following steps:

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Content in the administrator dashboard.
3. Click the Comments tab.
4. In the OPERATIONS column, click Edit alongside the comment that you want to edit.
5. Edit the content of the comment as required.
6. Click Save.
You have edited the selected comment.

Editing sample content

You can edit sample content, such as basic pages, in the Developer Portal.

Before you begin

You must have administrator or content author access to complete this task.

Procedure

To edit sample content, complete the following steps:

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Content in the administrator dashboard.
3. In the OPERATIONS column, click Edit alongside the content item that you want to edit.
4. Edit the sample content of the selected element as required.

5. Click Save and keep published, to publish the updated content, or select Save and unpublish if you want to publish the updated content later.

Editing tags for a specific item

You can edit tags for a specific item in the Developer Portal.

Before you begin

You must have administrator or content author access to complete this task.

You must have some tags that are available to apply to your content; see [Managing tags in the Developer Portal](#).

Procedure

To edit tags for a specific item, complete the following steps:

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Content in the administrator dashboard.
3. In the list of content items, click Edit alongside the content item that you want to update.
4. In the Tags section, select the required tag.
5. To add another tag, click Add another item, then select the required tag.
6. If you want to publish the updated content, ensure the Published check box is selected. Deselect the check box if you want to publish the updated content later.
7. Click Save.

Deleting a site comment

You can delete site comments in the Developer Portal.

Before you begin

You must have administrator or content author access to complete this task.

Procedure

To delete a site comment, complete the following steps

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Content in the administrator dashboard.
3. Click the Comments tab.
4. From the UPDATE OPTIONS list, select Delete the selected comments.
5. Select the comments that you want to delete, then click Update.
The confirmation screen displays.
6. Click Delete comments.

You have deleted the selected comments.

Deleting blocks

You can delete blocks in the Developer Portal.

Before you begin

You must have administrator access to complete this task.

Procedure

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Structure in the administrator dashboard.
3. Click Pages.
4. In the OPERATIONS column, find the welcome page row and select Edit from the drop-down list.
5. Expand Panels, then click Content.
6. In the OPERATIONS column, find the block that you want to delete and select Delete for the drop-down list.
7. Click Delete to confirm, then click Update and save.

Disabling blogs

You can disable blogs on your Developer Portal.

Before you begin

You must have administrator access to complete this task.

Before any changes are made, **Blogs** show as an option on the front page like this:

Procedure

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Structure > Menus from the administrator dashboard.
3. In the OPERATIONS column, click Edit menu for **Main navigation**.
4. Clear Enabled for the **Blogs Menu link**, then click Save.

- In the OPERATIONS column, click Edit for **Get Help**.
- In the **Body** section, delete the forum information, then click Save.

Results

You removed the forum information from the front page of your Developer Portal and the front page now looks like this:

Turning comments for specific content types on or off in the Developer Portal

You can turn the comments for specific content types on or off in the Developer Portal.

Before you begin

You must have administrator access to complete this task.

Procedure

To turn comments for specific content types on or off in the Developer Portal, complete the following steps:

- If the administrator dashboard is not displayed, click Manage to display it.
- Click Structure in the administrator dashboard.
- Click Content types.
- In the OPERATIONS column, click Manage fields for the required content type.
- In the OPERATIONS column, click Edit for the Comments field.

Note:

 - If there is no Comments field, you can enable commenting for the selected content type by adding one as follows:
 - Click Add field.
 - From the Add a new field list, select Comments.
 - Enter a field label, then click Save and continue.
 - Select the required comment type, then click Save field settings.
 - You can completely disable commenting for the selected content type, and permanently remove all current comments, by selecting Delete.
- Select the required option in the DEFAULT VALUE section.
 - To allow commenting, select Open.
 - To keep existing comments but disallow further commenting, select Closed.
 - To hide all comments, select Hidden.
- When done, click Save settings.

Turning comments off for an individual item

You can turn off comments for individual items within a content type.

Before you begin

Users with edit permission for the selected content type can perform this task.

Procedure

To turn off comments for a single item, complete the following steps:

- If the administrator dashboard is not displayed, click Manage to display it.
- Click Content in the administrator dashboard.
- In the OPERATIONS column, click Edit for the required content item.
- Click Comment settings in the side pane.
- Select Closed to turn comments off for the selected item.

6. Click Save.

Turning off ratings for specific content types in the Developer Portal

You can turn off ratings for specific content types in the Developer Portal by hiding the ratings field.

Before you begin

You must have administrator access to complete this task.

Procedure

To turn off ratings for specific content types in the Developer Portal, complete the following steps:

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Structure in the administrator dashboard.
3. Click Content types.
4. In the OPERATIONS column for the required content type, select Manage fields from the drop-down list.
5. Click on the Manage form display tab. In the FIELD list, select Rating and drag and drop it into the Disabled section, then click Save.
6. Click on the Manage display tab. Content items are displayed by using different view modes, such as Default, Card, and Teaser, and these modes are shown at the beginning of the Manage display page. For each view mode that is applicable to the content type you're editing, click the mode, and in the FIELD list select Rating, and drag and drop it into the Disabled section.
7. Click Save.

Turning the ability to tag specific content types off in the Developer Portal

You can turn the ability to tag specific content types on or off in the Developer Portal.

Before you begin

You must have administrator access to complete this task.

Procedure

To turn the ability to tag specific content types on or off in the Developer Portal, complete the following steps:

1. Click Structure in the administrator dashboard.
2. Click Content types.
3. Click Manage fields next to the required content type.
4. From the Tags field, click Edit.
5. Click Delete, then confirm the Delete as the action cannot be undone.
You have turned the ability to tag specific content types off.

Structure

Control the layout of the Developer Portal, such as configuring the front page, adding and changing blocks, and displaying Products and APIs in categories.

To learn how to control the layout of the content on your Developer Portal site, use the following topic links.

- [Configuring the front page](#)
You can configure the Developer Portal front page.
- [Adding a menu](#)
You can add a menu to the Developer Portal, and define the items that are included in the menu.
- [Adding and changing the blocks displayed on Developer Portal pages](#)
You can add new blocks, and modify the existing blocks that are displayed on Developer Portal pages.
- [Changing the front page banner block](#)
You can change the front page banner content and image that is displayed on the home page when a user first logs in to the Developer Portal.
- [Changing the front page Featured Content block](#)
You can display featured Products or APIs on the front page of your Developer Portal by configuring the Featured Content block.
- [Changing the items in the main menu](#)
You can change the items in the main menu that is displayed on all pages in the Developer Portal.
- [Changing the ratings display](#)
You can change the appearance of the content ratings in the Developer Portal.
- [Displaying APIs and Products in categories](#)
You can create taxonomies in the Developer Portal, which dictate the categorization of APIs and Products, and how they are displayed. The taxonomies that you define can be used by API developers to categorize APIs and Products in YAML files.
- [Implementing an image carousel](#)
You can customize your Developer Portal home page to display images in a carousel. The image carousel provides your Developer Portal home page with a continuous slide show that is customized to your specifications.

- [Making your application's image public](#)
You might want to display your application's image in an oauth authentication page to reassure customers that they are authenticating the correct application in the Developer Portal. That authentication uses a URL to the image that is stored on the Developer Portal. However, by default, those images are private unless you are logged in, which doesn't work if you want to display it in an oauth page. The solution is for the admin to change the `application_image` field to use public instead of private.
- [Providing navigation by tag hierarchy](#)
You can provide the ability for users in the Developer Portal to navigate by using tag hierarchy.
- [Using the Views module in the Developer Portal](#)
By using the Views module, you can fetch content from your Developer Portal site, and present it to users in different formats such as lists, graphs, and tables.

Configuring the front page

You can configure the Developer Portal front page.

Before you begin

You must have administrator access to complete this task.

About this task

Create a customized welcome page for your users. Note that blocks that are placed on the front page of the Developer Portal are visible to all users, regardless of whether the blocks have access restrictions placed on them. The visibility of blocks to all users also extends to the Featured Content block.

Procedure

To configure the front page, complete the following steps:

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Structure, then click Pages.
3. Alongside the welcome entry, click Edit.
4. Use the options provided to configure the front page.
Here you can edit the page information, access, and configuration of the welcome page.
5. Click Update and save to save your changes.

What to do next

You can create a custom page. For more information, see [Creating custom pages](#).

- [Disabling blogs](#)
You can disable blogs on your Developer Portal.
- [Deleting forums from the front page](#)
You can delete the help information on forums from the front page of your Developer Portal.

You removed the forum information from the front page of your Developer Portal and the front page now looks like this:

Adding a menu

You can add a menu to the Developer Portal, and define the items that are included in the menu.

Before you begin

You must have administrator access to complete this task.

Procedure

To add a menu, complete the following steps:

- If the administrator dashboard is not displayed, click Manage to display it.
 - Click Structure > Menus.
 - Click Add menu, provide a title, and an optional summary and menu language, and click Save.
 - To add items to your menu, click Add link, and configure the menu link details that you require.
 - Click Save to save your changes.
- A new block for your menu is created automatically, and your menu is now in the **Menus** list.

What to do next

You can use block configuration options to control which pages your menu is displayed on, and where it is positioned. You can use your menu with, or instead of, other menus available within the site. For more information, see [Changing the blocks displayed on Developer Portal pages](#).

You can also update an existing menu, or change your menu. For more information, see [Changing the items in the main menu](#).

Adding and changing the blocks displayed on Developer Portal pages

You can add new blocks, and modify the existing blocks that are displayed on Developer Portal pages.

Before you begin

You must have administrator access to complete this task.

About this task

Blocks are boxes of content that are rendered into an area, or region, of a page. The content can be custom HTML, Github Markdown, or plain text, and you can specify the appearance, size, position, and also configure which pages a block appears on by editing its visibility settings. You can also modify an existing block to change its appearance, size, position, and visibility.

- [Add a new block](#)
- [Edit the content of an existing block](#)
- [Modify the layout or visibility of an existing block](#)

Procedure

To add a new basic block, complete the following steps.

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Structure, then click Block layout.
All of the blocks that are in the system are displayed by theme. From the Block layout page you can assign blocks to a region, and control the order of the blocks within the region. Blocks are positioned on a per-theme basis, so if you enable more than one theme on your site, you can place blocks differently for each theme.
3. Click Place block > Add custom block.
The Add custom block page is displayed.
4. Complete the Block description field.
5. Enter the content that you require for your block into the Body section.
You can set the text format to Full HTML, Basic HTML, Restricted HTML, or Github Markdown. You can use the edit icons in the Body section to configure your

content. Click the Source icon  to enter code source, such as HTML.

Block description *

A brief description of your block.

Body

body p

Text format **Full HTML** [About text formats ?](#)

6. Click Save.
The new custom block is saved and the Configure block page is displayed.
7. Complete the block Title field.
8. In the Visibility section, specify how you want the block to be displayed.
You can specify the content types, configure the language settings, restrict the block to show only on pages that display specific content types, set which pages the block is displayed on, and restrict which user roles the block is visible to.

Visibility

Content type	When the user has the following roles <input type="checkbox"/> Anonymous user <input type="checkbox"/> Superuser <input type="checkbox"/> Authenticated user <input type="checkbox"/> Forum Moderator <input type="checkbox"/> Content Author <input type="checkbox"/> Administrator
Language Not restricted	
Content types Not restricted	
Pages Not restricted	
Roles Not restricted	

9. In the Region section, select the region where the block should be displayed.
10. Click Save block.
The new custom block is added to your Developer Portal site.

To edit the content of an existing block, from the Block layout page complete the following steps.

11. Click the Custom block library tab (or select Structure > Block layout > Custom block library from the administrator dashboard).
12. Click Edit alongside the required block.
13. Change the block description and body content as required.
14. Click Save to save your changes.

To modify the layout or visibility settings of an existing block, from the Block layout page complete the following steps.

15. To change the region in which a block is positioned, select the required Region from the drop-down list next to the required block.
16. To change the vertical sort-order of a block within a region, drag the block to the required position.
17. To edit the visibility settings of an existing block, click Configure from the Operations drop-down menu next to the required block.
18. To enable or disable an existing block, select Enable or Disable from the Operations drop-down menu next to the required block.
19. Click Save blocks to save your changes.

Changing the front page banner block

You can change the front page banner content and image that is displayed on the home page when a user first logs in to the Developer Portal.

Before you begin

You must have administrator or content author access to complete this task.

About this task

You can change the front page banner by editing the Welcome Banner block in the custom block library.

Procedure

To change the front page banner block, complete the following steps.

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Structure > Block layout.
3. Select the Custom block library tab.
4. Click edit against the Welcome Banner block entry.
The Edit Basic block Welcome Banner page is displayed.
5. Edit the Body section with the content and image that you require.
You can set the text format to Full HTML, Basic HTML, Restricted HTML, or Github Markdown. You can use the edit icons in the Body section to configure your content. Click the Source icon  to view and edit the code source, such as HTML.
6. Configure the language and translation settings as required.
7. Click Save to save your changes.

Results

You successfully updated the front page banner block.

Related tasks

You must have administrator access to complete this task.

About this task

You can configure the Featured Content block on the front page of your Developer Portal. By default this block displays a list of the most recently created Products, but you can configure the block to display Products or APIs, and select how the featured content is chosen.

Procedure

1. Log in to the Developer Portal as an administrator.
2. If the administrator dashboard is not displayed, click Manage to display it.
3. Click Structure > Pages.
4. Click Edit against the welcome page.
The edit menu for the Welcome page is displayed.
5. Select Panels > Content from the navigation column, and then click Edit against the Featured Content block.
The Edit block page for the Featured Content block is displayed.

Configure the node selection settings for this Featured Content block. For each node the block will display its image, title and summary. If no summary is present then a truncated form of the description field will be used instead.

To modify the content shown for a node either Edit that node in the portal or edit the YAML document for that node in the API Manager.

Note that the node selection is per user, and so depending on the visibility settings, different users may see different nodes.

Block description
Featured Content block

Title *

Display title

Node type *

Feature APIs or Products?

Number of tiles to display *

How many tiles should be shown?

Node selection algorithm *

Select how the featured content should be chosen. For example, based on creation or modification time, name, or random.

Custom nodes

Manually specify the nodes to feature. ';' separated. (This field is only used if using 'Custom' node selection.)

Region *

6. Configure the Feature Content block as required.

You can choose to display the title or not, select whether to use Products or APIs, for your node type. You can choose how many tiles to display, and select which algorithm is used to select the node. If you start typing in the **Custom nodes** field, you can choose from the options you are given.

7. Click Update block, then Update and save, to save your changes.

Results

You successfully configured the Featured Content block on the front page of your Developer Portal.

Changing the items in the main menu

You can change the items in the main menu that is displayed on all pages in the Developer Portal.

Before you begin

You must have administrator access to complete this task.

About this task

The following screen capture shows an example of a main menu:

However, you can add new menu items, remove items, and change the item order.

Procedure

To change the items in the main menu, complete the following steps:

1. Log in to the Developer Portal as an administrator.
2. If the administrator dashboard is not displayed, click Manage to display it.
3. Click Structure > Menus > Main navigation.

[+ Add link](#)

Title *
 Machine name: main

Administrative summary

Menu language

MENU LINK	ENABLED	OPERATIONS
+ Home	<input checked="" type="checkbox"/>	Edit ▾
+ API Products	<input checked="" type="checkbox"/>	Edit ▾

+ Blogs	<input checked="" type="checkbox"/>	Edit
+ Forums	<input checked="" type="checkbox"/>	Edit ▾
+ Support	<input checked="" type="checkbox"/>	Edit

[Save](#)

4. Use the options provided to change the menu items.
5. Click Save to save your changes.

Changing the ratings display

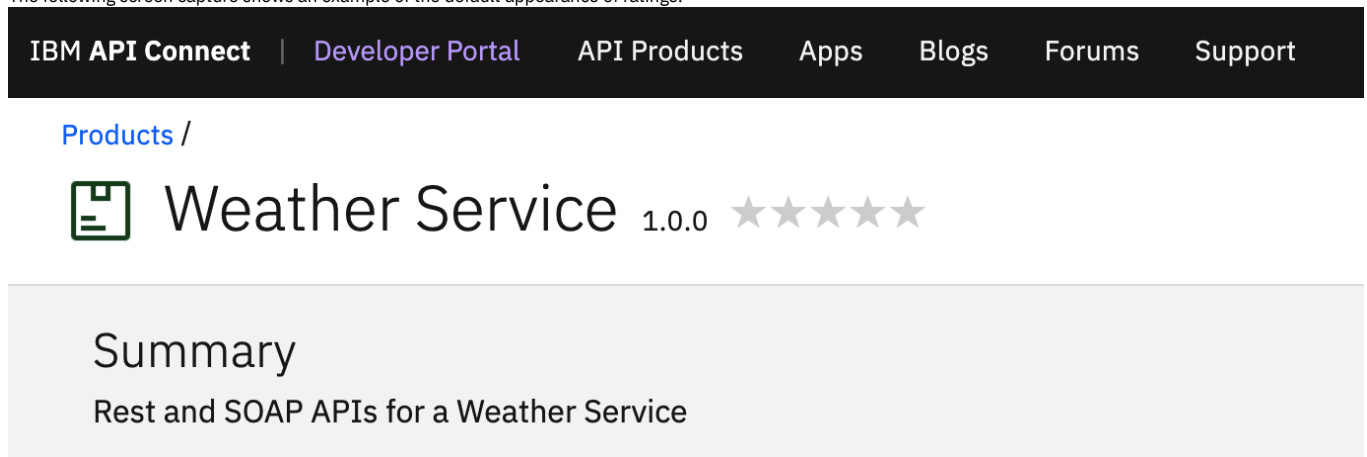

You can change the appearance of the content ratings in the Developer Portal.

Before you begin

You must have administrator access to complete this task.

About this task

The following screen capture shows an example of the default appearance of ratings:

You can change this display if you want to.

Procedure

1. Log in to the Developer Portal as an administrator.
2. If the administrator dashboard is not displayed, click Manage to display it.
3. Click Structure > Content types.
4. Click the Manage fields drop-down against the content type you want to change, for example **Product**.
5. Click Edit on the **Rating** row. Then, select the Field settings tab.

These settings apply to the *Rating* field everywhere it is used.

Vote type *
Normal vote ▼

Vote plugin *
Fivestar rating ▼

Allowed number of values
Limited ▼ 5

Save field settings

6. Change the style settings as required and click Save field settings.
Here is an example of an alternative Ratings style:

The screenshot shows the top navigation bar of the IBM API Connect Developer Portal with links for IBM API Connect, Developer Portal, API Products, Apps, Blogs, Forums, and Support. Below the navigation is a breadcrumb 'Products /' followed by a product card for 'Weather Service 1.0.0' with a 'good' rating bar. Underneath the product card is a 'Summary' section with the text 'Rest and SOAP APIs for a Weather Service'.

Results

You successfully changed the ratings display for a content type in your Developer Portal.

Note: There are different view modes, and the settings would need to be changed for each view mode for each content type.

Displaying APIs and Products in categories

You can create taxonomies in the Developer Portal, which dictate the categorization of APIs and Products, and how they are displayed. The taxonomies that you define can be used by API developers to categorize APIs and Products in YAML files.

You might want to create taxonomies to control which set of APIs and products can and cannot be used in the Developer Portal.

By default, all taxonomies must be created in the Developer Portal. For more information, see [Managing tags in the Developer Portal](#).

After you create your taxonomies for your APIs and Products, API developers can assign content to those taxonomies manually in the Developer Portal, or by using categories in YAML files.

However, if you create categories for your APIs and Products in the API Designer or API Manager UI, you can have your APIs and Products that are displayed in those categories in the Developer Portal. For more information about how to create categories for your APIs and Products in the API Designer or API Manager UI, see [Organizing your Products into categories](#). For information about how to have your APIs and Products that are displayed in those categories in the Developer Portal, see [Enabling dynamic category creation](#).

You can add more Developer Portal taxonomies to the categories that are defined in the API Designer or API Manager UI.

You can also provide the ability for users in the Developer Portal to navigate by using tag hierarchy. For more information, see [Providing navigation by tag hierarchy](#).

- [Enabling dynamic category creation](#)

You can display APIs and Products in pre-defined categories in the Developer Portal. You can define the categories that the APIs and Products are displayed in, in the API Designer or API Manager UI.

Enabling dynamic category creation

You can display APIs and Products in pre-defined categories in the Developer Portal. You can define the categories that the APIs and Products are displayed in, in the API Designer or API Manager UI.

Before you begin

You must have administrator access to complete this task.

Your APIs and Products must be categorized in the API Designer or API Manager UI, and they must be published. For more information, see [Organizing your APIs into categories](#) and [Organizing your Products into categories](#).

About this task

By organizing your APIs and Products into categories, you can provide a hierarchical display for your APIs and Products in the Developer Portal.

Note: Organizing APIs and Products into a hierarchical view in the API Manager UI is different from tagging in the Developer Portal.

The categories that are defined in the API Designer or API Manager UI can be overridden by creating taxonomies in the Developer Portal. For more information, see [Displaying APIs and Products in categories](#).

Procedure

1. To enable the Developer Portal to display the categories for your APIs and Products:
 - a. On the administrator dashboard, click Configuration > System > IBM API Developer Portal.
 - b. In the Categories section, select the Create taxonomies for categories if they do not already exist check box.
 - c. Click Save configuration.
2. To enable the Developer Portal to display the change to the categories you made in step 1, you must republish your APIs and products.

Results

You enabled the Developer Portal to display the categories that you defined for your APIs and Products. You can see the categories that you defined, including the number of APIs and Products that are in each category, by selecting your APIs and Products in the Developer Portal.

Implementing an image carousel

You can customize your Developer Portal home page to display images in a carousel. The image carousel provides your Developer Portal home page with a continuous slide show that is customized to your specifications.

Before you begin

You must have administrator access to complete this task.

About this task

By implementing an image carousel, you can replace the default welcome banner or any previously set images.

Procedure

1. Create a content type of Image for your carousel.
 - a. Click Structure > Content types > Add content type.
 - b. Enter the name of your content type in the Name field.
For example, *Slide show picture*.
 - c. Optional: Specify the description of your content type in the Description field.
For example, *A picture to display in the slideshow*.
 - d. Click Save and manage fields for your newly created content type.
 - e. Click Add field.
 - f. Select Image for Add a new field, and enter a label for your field.
For example, *slide image*.
 - g. Click Save and continue.
The Field settings page for your new field is displayed.
 - h. In the DEFAULT IMAGE section, click Choose file to assign the image that you want as your default image for your slide show if no other images are found.
 - i. Optional: Complete the Alternative text and Title fields.
 - j. Click Save field settings.
 - k. In the Manage fields tab for your newly created content type of *Slide show picture*, delete the `body` field by clicking Delete on the OPERATIONS drop-down menu. Click Delete again to confirm.
2. Upload the images that you want to appear in your carousel.
 - a. Click Content > Add content, then click the content type that you added in step 1.
 - b. Enter a title for your image in the Title field.
For example, if you had an image of a lighthouse, you can label the content as *Lighthouse*.
 - c. Click Choose file under Slide image and select an image for your slide show. Complete the Alternative text field with some text to use when the image cannot be loaded.
 - d. Click Save.
 - e. Repeat sub-steps 2.a to 2.d until you are satisfied with the content of the slides for your carousel.
3. Create a view for your carousel.
 - a. Click Structure > Views > Add new view.
 - b. Complete View name.

- For example, Slide show.
- c. Select the Create a block check box in the BLOCK SETTINGS section.
 - d. Select Slick Carousel for the display format.
 - e. Enter the number of slides you have for your carousel in the Items per block field, then click Save and edit.
The Edit page for your slide show view is displayed.
 - f. Click the title of the view and enter <none> into the text field. Click Apply.
 - g. In the FIELDS section click Add, select the check box for slide image, and click Add and configure fields.
 - h. Ensure the check box for Create a label is not selected, and click Apply.
 - i. In the FIELDS section, click Content: Title, Remove.
 - j. In the FORMAT section, click Settings for Slick Carousel, and then set Skin Main to Default.
 - k. Scroll down to the CAPTION FIELDS section, and select the Content: slide image and Override main optionset check boxes.
 - l. In the OVERRIDABLE OPTIONS section, select the Autoplay, Dots, and Draggable check boxes.
 - m. Click Apply.
 - n. In the FILTER CRITERIA section, click Content: Published, Remove.
 - o. Click Save to save the Slide show view.
4. Configure your home page to host the carousel.
 - a. Click Structure, then click Pages.
 - b. Click edit for the welcome page, then click content in the Panels section.
 - c. To remove the current welcome banner, click the down-arrow under the OPERATIONS column for the Welcome Banner, and select Delete. Click Delete again to confirm.
 - d. To add your carousel, click Add new block and select the slide show view you created in step 3. Deselect Display title and click Add block.
 - e. Click Update and save.

Results

Your Developer Portal front page now has a slide show carousel.

Making your application's image public

You might want to display your application's image in an oauth authentication page to reassure customers that they are authenticating the correct application in the Developer Portal. That authentication uses a URL to the image that is stored on the Developer Portal. However, by default, those images are private unless you are logged in, which doesn't work if you want to display it in an oauth page. The solution is for the admin to change the `application_image` field to use public instead of private.

Before you begin

You must have administrator access to complete this task.

About this task

1. Log in to your Developer Portal as an administrator.
2. If the administrator dashboard isn't displayed, click Manage to display it.
3. Navigate to Structure > Content types > Application > Manage fields
4. Navigate to the Image label, then in the Edit drop down, select **storage settings**.
5. Click **Public files** for **Upload destination**.
6. Click **Save field settings**.

Providing navigation by tag hierarchy

You can provide the ability for users in the Developer Portal to navigate by using tag hierarchy.

Before you begin

You must have administrator access to complete this task.

About this task

The Categories block provides the ability to navigate by tag hierarchy. The Categories block is disabled by default, so you need to enable the block and then configure it to your requirements.

Procedure

To provide navigation by tag hierarchy, complete the following steps:

1. Click Extend, in the filter box enter Hierarchical Taxonomy Menu.
2. Select **Hierarchical Taxonomy Menu**, then click Enable.
3. Click Structure > Block layout.
All of the blocks in the connect_theme are displayed.
4. Scroll to the region that you want to add the block to, for example Collapse right, click Place block.
5. Find the **Hierarchical Taxonomy Menu** block in the list and click Place block.
6. Complete any configuration tasks that you require for the **Collapse right** block, including selecting the correct taxonomy to use and indicating what pages to display the block on.

7. Click Save block to save your changes.

You can add new blocks, and modify the existing blocks that are displayed on Developer Portal pages. For more information, see [Adding and changing the blocks displayed on Developer Portal pages](#).

Using the Views module in the Developer Portal

By using the Views module, you can fetch content from your Developer Portal site, and present it to users in different formats such as lists, graphs, and tables.

The Views module is a powerful SQL query builder that can access almost all the information in your Developer Portal site database and display it in any format.

There are many uses cases for views, but the following list shows some of the common ones:

- You want to display some of the content differently, such as Products, APIs, and applications.
- You want to display a block with the five most recent posts of some kind.
- You want to change the way that articles are displayed.
- You want to provide an unread forum posts list.
- You want to provide a monthly archive of posts.

For information about how to create a view in the Developer Portal, see the following topic. You can also follow a tutorial about creating a custom sort order view; see [Tutorial: Using a custom weighting sort order on the product list page](#).

- [Creating views in the Developer Portal](#)
You can create new views in the Developer Portal, such as content lists of Products, APIs, and applications, by using the Views module.
- [Configuring the search results view in the Developer Portal](#)
You can configure the way that the search results are displayed in the Developer Portal.
- [Configuring the default number of items in a view list in the Developer Portal](#)
You can configure the default number of items that are displayed in a view list in the Developer Portal.

Creating views in the Developer Portal

You can create new views in the Developer Portal, such as content lists of Products, APIs, and applications, by using the Views module.

Before you begin

You must have administrator access to complete this task.

About this task

Creating views in the Developer Portal enables you to control the presentation of specific content for users. For more information about views, see [Using the Views module in the Developer Portal](#).

Procedure

To create a view, complete the following steps.

1. Log in to the Developer Portal as an administrator.
2. If the administrator dashboard is not displayed, click Manage to display it.
3. On the administrator dashboard, click Structure > Views > Add new view.
The Add view page is displayed.
4. Complete the View name and, optionally, the Description.
5. Complete the VIEW SETTINGS section with details of what you want your view to show, and how you want it to be sorted.
For example, to create a view of APIs that are sorted by title, select Show Content, of type API, and sorted by Title.
6. Select whether to Create a page, Create a block, or both, for your view.
A page is a full-screen page in the Developer Portal. Whereas a block would be a site block that you can then place on whatever pages you want to show a smaller view of the content, for example the 10 newest APIs.
7. Complete the options that you require for your view. For example, the display format, the number of items per page or block, whether to include a pager, whether to create a menu link, and whether to include an RSS feed.
8. Click Save and edit.
Your new view opens in the Edit tab.
9. Refine your view further.
Here you can further modify the display of your view or add new displays. More options include formatting of the view, what fields to include in a table or grid format, filtering and sorting criteria, add header or footer details, as well as advanced options around contextual filters, relationships, and behavior when there are no results to display. The Edit tab also includes a preview area, so you can check your view before publishing.
10. Click Save to make your changes permanent.
When saved, your new view is visible in the Structure > Views pane.

Results

You created a new view in the Developer Portal.

Configuring the search results view in the Developer Portal

You can configure the way that the search results are displayed in the Developer Portal.

Before you begin

You must have administrator access to complete this task.

About this task

In the Developer Portal, the search results are displayed as a view, and so you can control the presentation of this search content. For more information about views, see [Using the Views module in the Developer Portal](#).

Procedure

To configure the search results view, complete the following steps.

1. Log in to the Developer Portal as an administrator.
2. If the administrator dashboard is not displayed, click **Manage** to display it.
3. On the administrator dashboard, click **Structure > Views**.
The list of views is displayed.
4. Find the **Search content** view in the list, and click **Edit**.
5. Edit the **Search content** view settings as required.
Here you can modify the display of the view or add new displays. For example, you can configure the formatting of the view, the filtering and sorting criteria, add header or footer details, as well as more advanced options around contextual filters, relationships, and behavior when there are no results to display. There is also a preview area so you can check the view before publishing.
6. Click **Save** to make your changes permanent.

Results

You updated the view of the search results in the Developer Portal.

What to do next

You can configure the search index and server that are used to generate the search results. For more information, see [Configuring search indexes and servers](#).

Related information

- [Drupal Views module](#)

Configuring the default number of items in a view list in the Developer Portal

You can configure the default number of items that are displayed in a view list in the Developer Portal.

Before you begin

You must have administrator access to complete this task.

About this task

In the Developer Portal, you can manage how many items in a list are shown for each page on a view. For more information about views, see [Using the Views module in the Developer Portal](#).

Procedure

To configure the search results view, complete the following steps.

1. Log in to the Developer Portal as an administrator.
2. If the administrator dashboard is not displayed, click **Manage** to display it.
3. On the administrator dashboard, click **Structure > Views**.
The list of views is displayed.
4. In the list, find the view name that you want to update, for example, **Products**, then click **Edit**.
5. Click **Pager**.
6. Select **Display a specified number of items**, click **Apply**.

7. Set the Items per page as required, click Apply.
8. Click Save to make your changes permanent.

Results

You updated the default number of items in a view of the search results in the Developer Portal.

What to do next

The Views module is a powerful SQL query builder that can access almost all the information in your Developer Portal site database and display it in any format. For more information, see [Using the Views module in the Developer Portal](#).

Configuration

As an administrator, you can control multiple aspects of the Developer Portal configuration, including managing security and general configuration tasks.

To learn how to configure specific aspects of your Developer Portal site, use the following section links.

- [Configuring content moderation](#)
By configuring content moderation, you can configure a review and approval process for content types in the Developer Portal. You can specify which roles can perform which actions by assigning them the appropriate permissions.
- [General configuration tasks](#)
You can perform general configuration tasks in the Developer Portal as an administrator.
- [Managing Developer Portal security](#)
You can manage multiple security elements in the Developer Portal.

Configuring content moderation

By configuring content moderation, you can configure a review and approval process for content types in the Developer Portal. You can specify which roles can perform which actions by assigning them the appropriate permissions.

Before you begin

An example use case for configuring content moderation would be for a professional documentation writer to review an APIs documentation before it is published on the Developer Portal. They might, for example, notify the API Developer of typographical errors, suggest improvements to operation descriptions, or attach an image file. Edits might then be made before the documentation was republished to the API and then published to the Developer Portal.

You must have a Developer Portal enabled, and you must have administrator access to complete this task.

About this task

By using content moderation, you can configure the workflow of your Developer Portal site so that you can moderate content types, such as APIs and Products. However, you cannot moderate Consumer organizations or applications.

Procedure

1. Log in to your Developer Portal as an administrator.
2. If the administrator dashboard isn't displayed, click Manage to display it.
3. Enable the required modules:
 - a. On the administrator dashboard, click Extend.
 - b. In the search bar enter **workflows**, then select the Workflows module and click Enable.
 - c. In the search bar enter **content moderation**, then select the Content Moderation module and click Enable.
4. Navigate to Configuration > Workflow > Workflows
5. Check that **Editorial** is listed as a workflow. If it isn't listed:
 - a. Click + **Add workflow**.

Label *

Machine name: editorial [Edit]

Workflow type *

Save

- b. Enter **Editorial** as the label.
 - c. Select the workflow type **Content moderation**.
 - d. Click **Save**.
6. Set up the workflow:
 - a. Click **Edit** on the **Editorial** workflow.

b. Click the **Add a new state** link.

Label *

 Machine name: editorial

c. Enter the value **Review** in the **State label** field, leave the **Published** and **Default revision** check boxes cleared then click Save.

State label *

 Machine name: review [Edit]

Published
When content reaches this state it should be published.

Default revision
When content reaches this state it should be made the default revision; this is implied for published states.

Save

d. Drag the **review** state to between the **Draft** and **Published** states then click 'Save'. If the drag handles are not visible, then click the **Hide row weights** link in the **STATES** section to make them appear.

Label *

 Machine name: editorial

▼ STATES

⚠ * You have unsaved changes.

STATE	OPERATIONS
<input type="checkbox"/> Draft	Edit
<input type="checkbox"/> Review*	Edit ▼
<input type="checkbox"/> Published	Edit

[Add a new state](#)

e. Click the **Add a new transition** link.

f. Enter the value **Review** in the **Transition Label** field, tick the **Draft** check box in the **From** section and click **Review** in the **To** section then click Save.

g. Drag the **Review** transition to between the **Create New Draft**

Draft and **Publish** transitions, then click Save.

h. Click the **Edit** operation on the **Create New Draft** transition.

i. In the **From** check box list, untick **Published** and tick **Review** then click Save.

j. Click the **Edit** operation on the **Publish** transition.

k. In the **From** check box list, untick **Draft** and tick **Review** then click Save.

l. Click **Select** for the **Content types** item in the **THIS WORKFLOW APPLIES TO** section.

m. Select the **Product** content type then click Save.

7. Set up the permission schema for the workflow:

a. Click **People > Roles > Add a new role**.

b. In the **Role Name** field, enter the value **Editor** then click Save.

c. Drag the **Editor** role to between the **Content Author** and **Administrator** roles then click Save.

- d. Click the Permissions tab and scroll down to the **Content Moderation** permission section.
 - e. For the EDITOR role, select all the permissions in the **Content Moderation** section.
 - f. For the CONTENT AUTHOR role, select the permissions **Editorial workflow: Use Create New Draft transition**, **View any unpublished content**, and **View the latest version** then click Save permissions.
 - g. Ensure that the EDITOR and CONTENT AUTHOR roles have the permission **Use the administration toolbar**.
8. Assign the permissions to users in the portal. If you do not already have some registered users in your portal, create a new consumer organization and invite two new users to it.
- a. Click People.
 - b. Tick the check box next to one of the users in the list, but not the admin user, then from the **Action** drop-down select **Add the Content Author role to the selected user(s)** then click **Apply to selected items**.
 - c. Tick the check box next to another one of the users in the list, but not the admin user, then from the **Action** drop-down select **Add the Editor role to the selected user(s)** then click **Apply to selected items**.

Results

You successfully configured content moderation on your Developer Portal. You can now use the API manager user interface to publish a product to the portal, and transition the product from draft to review state.

- [Editing, reviewing, and publishing moderated content](#)
If you have published content from API Manager UI to your Developer Portal or created content within the Developer Portal, you can edit and review the content through the Moderated content page before you publish it in the Developer Portal.

Editing, reviewing, and publishing moderated content

If you have published content from API Manager UI to your Developer Portal or created content within the Developer Portal, you can edit and review the content through the Moderated content page before you publish it in the Developer Portal.

Before you begin

You must have administrator access to complete this task.

You must have content that is published to the Developer Portal from the API Manager UI.

Your role must have the necessary permissions that enable you to perform the tasks. For more information on assigning the necessary tasks, see [Configuring content moderation](#).

About this task

In addition to editing content through the content moderation page, you can specify whether the content needs further review, or even publish the content if you have the permission.

Procedure

1. Log in to your Developer Portal as an administrator.
2. If the administrator dashboard isn't displayed, click Manage to display it.
3. On the administrator dashboard, click Content.
4. Click the Moderated content tab.
5. If you have the necessary permissions to edit your content type, for example, you are a **Content author**:
 - a. Click the Title of the content type that you want to edit, then click the Edit.
 - b. Edit your content to your specification, then click Save.
You are redirected to the **View** tab.
 - c. When you have finished editing your content type on the **edit** tab, ensure that the **Review** state is selected from the **Change to** drop down, then click Save.
6. If you have the necessary permissions to review and publish your content type, for example, you are a **Reviewer**:
 - a. On the administrator dashboard, click Content.
The content page is displayed listing all content.
 - b. Click the Moderated content tab.
 - c. Click the Title of the content type that you want to review.
 - d. Optional: If the content that you are reviewing requires editing, click Edit, apply the changes to your content type, then click Save.
You are redirected to the View tab.

Results

You edited, reviewed, and published your draft content type.

General configuration tasks

You can perform general configuration tasks in the Developer Portal as an administrator.

To learn how to configure specific aspects of your Developer Portal site, use the following topic links.

- [Adding a page load progress indicator](#)
You can extend your Developer Portal site by adding a page load progress indicator. This option might be useful on servers that have a slow connection to the API Manager, or for customers that are using OIDC and have slow response times from their OIDC provider.
- [Adding custom fields to user records](#)
You can add custom fields to user records in the Developer Portal.
- [Checking the site status report](#)
You can check the site status report in the Developer Portal.
- [Clearing the server caches](#)
You can clear the server caches from within the Developer Portal.
- [Configuring a proxy](#)
You can configure the proxy settings in your Developer Portal.
- [Configuring the visibility of analytics in the Developer Portal](#)
How to configure the visibility of API consumer analytics in the Developer Portal.
- [Configuring Stripe in the Developer Portal](#)
You can offer free use of your Product Plans to your API consumers, or you can offer Products with paid Plans. To enable API consumers to subscribe to Products with paid Plans, you must first configure the Stripe payment method in your Developer Portal.
- [Configuring cron to run scheduled tasks](#)
You can configure cron to run scheduled tasks in the Developer Portal.
- [Configuring search indexes and servers](#)
You can configure search indexes and servers in the Developer Portal by using the Search API module.
- [Configuring the date and time](#)
You can configure the date and time in the Developer Portal.
- [Configuring the notifications event log settings](#)
You can configure the settings of the notifications event log for the activity feed on your Developer Portal.
- [Configuring the settings of a Consumer organization](#)
You can configure the settings of your Consumer organization from within your Developer Portal. The default settings allow users to delete their accounts and organizations, create more consumer organizations, rename their organization, and change the owner of their organization.
- [Configuring the site default timezone](#)
You can configure the site default timezone in the Developer Portal.
- [Configuring the site error handling](#)
You can configure the site error handling in the Developer Portal.
- [Configuring which buttons are displayed in the WYSIWYG rich text editor](#)
You can configure which buttons are displayed in the WYSIWYG rich text editor in the Developer Portal.
- [Configuring which languages are available](#)
You can configure which languages are available in the Developer Portal.
- [Customizing user account settings](#)
You can customize the user account options that are displayed to users when they register and use the Developer Portal.
- [Disabling languages](#)
You can extend your Developer Portal site by managing which languages are available for use on the site.
- [Disabling test tool restrictions](#)
The default OAuth provider contains security mechanisms that prevent the ability to obtain authorization tokens in the Developer Portal test tool when you use Implicit or Authorization Code grant types. If your OAuth provider allows those actions to function correctly from the test tool, you can disable this option.
- [Enabling a cookie compliance banner](#)
You can add a cookie compliance banner to your Developer Portal site by configuring the EU Cookie Compliance module.
- [Enabling code languages for code snippets](#)
You can specify the languages that code snippets for APIs can be displayed in.
- [Enabling code snippets for SOAP APIs](#)
By default, code snippets are only shown for REST APIs. You can enable code snippets for SOAP APIs.
- [Forcing new users to accept terms and conditions](#)
You can extend your Developer Portal site by forcing new users to accept the terms and conditions before they are able to create accounts.
- [Hiding the admin registry on the login form](#)
You can hide the admin registry as an option on the login form. The use case for this option might be a public facing Developer Portal where you want to remove the admin access from customer view.
- [Hiding the certificate in the header for APIs secured with mutual TLS](#)
You can hide the certificate in the header for APIs secured with mutual TLS. By default, the `x-client-certificate` header is shown in an API when mutual TLS is configured. You can choose to turn off this option in your Developer Portal.
- [Importing and exporting taxonomies](#)
You can import and export taxonomies in the Developer Portal.
- [Restricting access by IP address](#)
You can restrict access to a role or a user by IP address in the Developer Portal.
- [Restricting or preventing access from search engines](#)
You can restrict or prevent access to your Developer Portal from search engines. You might want to control the access if you have a development or test site.
- [Toggling the site in and out of maintenance mode](#)
You can put the Developer Portal site into maintenance mode for short periods of time. During maintenance mode, only an administrator is able to access the site, and all other users who enter the site URL get a maintenance message set by the administrator.
- [Viewing available updates](#)
You can view available updates in the Developer Portal.

Adding a page load progress indicator

You can extend your Developer Portal site by adding a page load progress indicator. This option might be useful on servers that have a slow connection to the API Manager, or for customers that are using OIDC and have slow response times from their OIDC provider.

Before you begin

You must have administrator access to complete this task.

Procedure

1. If the administrator dashboard is not displayed, click Manage to display it.
2. In the administrator dashboard, click Extend.
The List tab for the Extend page opens, and the list of installed modules is displayed. The list shows all the modules that are installed. The enabled modules are displayed with a selected check box. The disabled modules are displayed without a selected check box.
3. Enter `page_load_progress` into the search filter.
The **Page Load Progress** content item is displayed in the list of content.
4. By default, the **Page Load Progress** module is enabled. However, if not, select the check box and click Enable.
You have now enabled the default settings for the **Page Load Progress** module.
5. To change the default settings for the module, navigate to Configuration > User interface > Page Load Progress.
6. Decide which settings you want to change, for example, **Time to wait before locking the screen**, and click Save.
Note: Changing the settings does not apply to the OIDC buttons. If it is enabled, the OIDC buttons use the page load process indicator, but do not allow any configuration.
7. To enable the permissions, navigate to People > Permissions.
8. Scroll down to **Page Load Progress**, check the boxes for anonymous and authenticated for **Use Page Load Progress**.

Page Load Progress						
Administer Page Load Progress	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
Use Page Load Progress	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>

9. Click Save permissions.

Results

You successfully enabled the **Page Load Progress**. Now, the page loading spinner is automatically added to the login and register forms for OIDC buttons.

What to do next

You can customize the appearance of the modal page and spinner in CSS in a custom theme.

Adding custom fields to user records

You can add custom fields to user records in the Developer Portal.

Before you begin

You must have administrator access to complete this task.

About this task

Any data that is added to a custom field for user records will remain in the Developer Portal database.

Procedure

1. In the administrator dashboard, click Configuration > People > Account settings.
2. Click the MANAGE FIELDS tab.
3. Click Add field.
4. Specify the type of data that your field can store by selecting the type from the Add a new field list.
5. Enter a label for your field in the Label field.
6. Optional: If you want to edit the machine name that is automatically created based on your label, click Edit and enter the new name.
7. Click Save and continue.
8. Configure any additional values for the new field then click Save field settings.
You have added a custom field to your user record.

What to do next

You can configure the contents of your custom field depending on what type of data you specified it could store.

Checking the site status report

You can check the site status report in the Developer Portal.

Before you begin

You must have administrator access to complete this task.

Procedure

To check the site status report, complete the following steps:

1. Click Reports in the administrator dashboard.
2. Click Status report.
3. You can review information relating to the site status report from this view.

Clearing the server caches

You can clear the server caches from within the Developer Portal.

Before you begin

You must have administrator access to complete this task.

Procedure

1. In the administrator dashboard, click Configuration, then in the Development section, click Performance.
2. Click Clear all caches.

You have cleared the server caches, and a message will be displayed stating: `Caches cleared`.

Configuring a proxy

You can configure the proxy settings in your Developer Portal.

Before you begin

You must have administrator access to complete this task.

About this task

The Developer Portal communicates with the management server by way of the consumer and product APIs. For a Developer Portal that is deployed externally to the management server zone, and does not have access to the consumer and product APIs, a proxy can be used.

Procedure

To configure a proxy to use for communicating with management server APIs, complete the following steps:

1. Log in to the Developer Portal as an administrator.
2. If the administrator dashboard is not displayed, click Manage to display it.
3. Click Configuration > System > IBM API Connect in the administrator dashboard.
4. To configure a proxy, select **Enable Proxy Support**, and make the required changes.

PROXY CONFIGURATION (EXPERIMENTAL)

If a proxy is required to allow communication from the portal server to the management server zone, and does not have access to the consumer and product APIs, a proxy can be used.

Enable Proxy Support

Proxy type

CURLPROXY_HTTP

Select what type of proxy to use, CURLPROXY_HTTP is the default.

Proxy URL

Provide the URL of the proxy e.g. `http://proxyserver.domain.com:8080`.

Proxy Authentication

If the proxy requires authentication then provide the 'username:password'.

Save configuration

5. When your changes are complete, click Save configuration.

Results

You successfully configured a proxy on your Developer Portal.

Configuring the visibility of analytics in the Developer Portal

How to configure the visibility of API consumer analytics in the Developer Portal.

Before you begin

You must have administrator access to complete this task.

Restriction:

- If the Catalog that is associated with this Developer Portal has two or more gateway services enabled then, for analytics data to be available, the gateway services must all be associated with the **same** analytics service. If the set of associated analytics services for the gateway services includes two or more different analytics services then the Developer Portal does **not** display analytics data. An analytics service is associated with a gateway service in the Cloud Manager user interface; see [Associating an analytics service with a gateway service](#).
- If the visualizations in your dashboard views display no data, show data only for a time period in the past, or the Dashboard tab does not show up, a possible reason might be that access to analytics data within API Connect has been switched off. Contact your API provider for confirmation.

About this task

What API consumer analytics are displayed in the Developer Portal depends on the visibility configuration settings.

Procedure

- To configure the visibility of the API consumer analytics in Developer Portal, complete the following steps:
 1. If the administrator dashboard is not displayed, click Manage to display it.
 2. Click Configuration in the administrator dashboard.
 3. Under the System heading, click IBM API Developer Portal.
 4. Under the Configuration section, clear the Display Analytics checkbox to remove all the analytics links from the portal site. By default, the Display Analytics checkbox is selected and the analytics section is visible in the portal site.
 5. Click Save configuration to save the changes.
You have configured the visibility of analytics in the Developer Portal.
- To configure the visibility of the API analytics charts, complete the following steps:
 1. If the administrator dashboard is not displayed, click Manage to display it.
 2. Click Configuration in the administrator dashboard.
 3. Under the System heading, click IBM API Developer Portal Consumer Analytics.
 4. From the list of Metrics and charts, clear the checkboxes corresponding to the charts that you want to remove from the analytics section in the portal site. By default, all the charts that are displayed under the metrics and charts section are visible in the analytics section.
 5. Click Save configuration to save the changes.
You have configured the visibility of Metrics and charts in the analytics section.

Configuring Stripe in the Developer Portal

You can offer free use of your Product Plans to your API consumers, or you can offer Products with paid Plans. To enable API consumers to subscribe to Products with paid Plans, you must first configure the Stripe payment method in your Developer Portal.

Before you begin

You must have administrator access to complete this task.

To use Stripe as your credit card processing vendor, you must have port 443 open to HTTPS communication between the Stripe API and your Developer Portal management and the Management cluster servers. See [Firewall requirements on Kubernetes](#) and [Firewall requirements on VMware](#) for more information about this requirement.

The billing microservice must be enabled on your management system by your system administrator. See [Configuring monetization on VMware](#) and [Configuring monetization on Kubernetes](#) for more information.

Billing integration support must be configured in the API Manager. For more information, see [Monetizing your Products](#).

About this task

API Connect includes a subscription billing feature that allows API providers to define pricing Plans in their API Products, and monetize their API offerings. If a Product contains a pricing Plan, API consumers must enter their payment information into the Developer Portal before they can subscribe to that Plan.

API Connect supports integration with Stripe Subscription Billing, an independent cloud service that manages monetized product Plans, customers, their payment information, and their subscription history, in order to generate monthly invoices and charge customers automatically. With this integration, Stripe serves as both the subscription billing system and the payment processing system.

Support is provided for Stripe in the Developer Portal, but before API consumers can enter their payment information, you need to configure the Stripe billing support in every Developer Portal where you will offer paid Plans. After this support is configured, API consumers can provide their payment information, and then subscribe to the paid Plans. Complete the following instructions to enable the APIC Monetization Stripe Integration module, and then configure your Stripe API credentials.

Procedure

1. If the administrator dashboard is not displayed, click Manage to display it.
2. In the administrator dashboard, click Extend.
The List tab for the Extend page opens, and the list of installed modules is displayed. The list shows all the modules that are installed. The enabled modules are displayed with a selected checkbox. The disabled modules are displayed without a selected checkbox.
3. Enter `stripe` into the search filter.
The `ibm_stripe_payment_method` module called APIC Monetization Stripe Integration is displayed in the list of contents.
4. Select APIC Monetization Stripe Integration and click Enable.
The default settings for the `ibm_stripe_payment_method` module are now enabled.
5. In the administrator dashboard, click Configuration, > System, > IBM API Developer Portal Billing.
The IBM API Developer Portal Billing Settings page is displayed.
6. Change the drop-down option to be the newly enabled APIC Monetization Stripe Integration (`ibm_stripe_payment_method`) as the module to use to create payment methods for the Stripe billing provider. Click Save configuration.
7. In the administrator dashboard, click Configuration, > System, > IBM APIC Stripe Integration, and enter your Stripe API credentials. These credentials must match the Stripe API credentials for the billing integration resource that is attached to the Catalog for this Developer Portal.
Refer to your Stripe dashboard to get your publishable key and secret key; see <https://dashboard.stripe.com/apikeys>.
Note: Each Stripe account comes with two sets of API keys, one for testing, and one for production. Each set of API keys has a distinct namespace for Stripe objects. Test API keys cannot see objects created by production API keys, and vice versa. You cannot switch the API keys of one of your billing integrations with the keys from another account, or swap your test and production keys over, as that would prevent API Connect from resolving the Stripe objects that were created by using the old keys. If you want to use your Stripe test keys, you must create a separate Catalog for testing, and not add your Stripe test keys to production Catalogs.
8. Click Save integration.

Results

You successfully configured the Stripe payment method in the Developer Portal. API consumers can now add a payment method to their consumer organization, so that they can subscribe to Products with paid Plans.

What to do next

After both the Catalog and the Developer Portal are configured, you can create Products with pricing Plans. See [Defining a Product with billing integration](#) for more information.

Configuring cron to run scheduled tasks

You can configure cron to run scheduled tasks in the Developer Portal.

Before you begin

You must have administrator access to complete this task.

Procedure

To configure cron to run scheduled tasks, complete the following steps:

1. Click Configuration in the administrator dashboard.
2. Under the SYSTEM heading, click Cron.
3. Use the drop-down list for the module you want to configure and select Edit.
4. From the Run cron every drop-down menu, select the frequency of cron runs for this module.
5. Click Save.
You have configured cron to run scheduled tasks.

Configuring search indexes and servers

You can configure search indexes and servers in the Developer Portal by using the Search API module.

Before you begin

You must have administrator access to complete this task.

About this task

The Search API module provides a generic framework for search capabilities within the Developer Portal, and you can customize the default database server and content index setup that is provided. By default, the search in the Developer Portal runs over the entire OpenAPI and WSDL documentation. It is not possible to restrict the search to specific sections of an Open API or WSDL document. The search can be configured to include any custom fields that were added to the Developer Portal, but it does not include any attached files.

The search results page is a view in the Developer Portal, and so it can also be configured. For more information, see [Configuring the search results view in the Developer Portal](#).

Procedure

To configure the default database server and content index settings, complete the following steps.

1. Log in to the Developer Portal as an administrator.
2. If the administrator dashboard is not displayed, click **Manage** to display it.
3. Click **Configuration**, **Search** and **metadata**, **Search API** in the administrator dashboard.
4. To configure the server settings, click **Edit** against the Database Server and make the required changes. For example:
 - Server name; the displayed name for the server.
 - Description; a description of the server.
 - CONFIGURE DATABASE BACKEND; the minimum number of characters a word must consist of to be indexed, and whether to search on parts of a word. However, wildcard searching can make searches on large sites very slow.
 - AUTOCOMPLETE SETTINGS; how suggestions are computed when autocompletion is used.
5. To configure the index settings, click **Edit** against the Default content index and make the required changes. For example:
 - Index name; the displayed name for the index.
 - Data sources; the data sources of the items to be stored in the index.
 - CONFIGURE THE DATASOURCE; for each data source, set which bundles of content should be indexed, and in which languages.
 - Server; the server that the index should use.
 - Description; a description for the index.
 - INDEX OPTIONS; whether the index is read only, whether to index new or updated items immediately, and setting how many items to index when indexing items during a cron run.
6. When your changes are complete, click **Save**.
The View page of the updated default database server or default content index is displayed.

Results

You successfully configured the search indexes and servers in the Developer Portal.

What to do next

You can configure how searches are displayed by editing the Search content view. For more information, see [Configuring the search results view in the Developer Portal](#).

Related information

- [Search API module](#)

Configuring the date and time

You can configure the date and time in the Developer Portal.

Before you begin

You must have administrator access to complete this task.

Procedure

To configure the date and time, complete the following steps:

1. If the administrator dashboard is not displayed, click **Manage** to display it.
2. Click **Configuration** in the administrator dashboard.
3. Under the **Regional and language** heading, click **Date and time formats**.
4. Click **Edit** for the format you want to change.
5. Change the settings of the format then click **Save format**.
You have configured the date and time.

Configuring the notifications event log settings

You can configure the settings of the notifications event log for the activity feed on your Developer Portal.

About this task

The Developer Portal includes an activity feed that shows Consumer organization users the details of events that occur on the organization, such as application creation, subscriptions, and so on. This activity feed is displayed by default on the navigation bar of the organization, and as an additional tab on the organization page and the application page.

The default number of days that events are kept for is 30. You can edit this setting in the IBM APIC Notifications Settings page of your Developer Portal, as described in the following instructions.

Procedure

1. Log in to your Developer Portal as an administrator.
2. If the administrator dashboard isn't displayed, click **Manage** to display it.
3. Navigate to **Configuration > System > IBM APIC Notifications Settings**.
The **IBM APIC Activity Feed Settings** page is displayed.
4. Enter the required number of days to keep events for in the **Retention Days** field.
5. Click **Save configuration**.

Configuring the settings of a Consumer organization

You can configure the settings of your Consumer organization from within your Developer Portal. The default settings allow users to delete their accounts and organizations, create more consumer organizations, rename their organization, and change the owner of their organization.

Procedure

1. Log in to your Developer Portal as an administrator.
2. If the administrator dashboard isn't displayed, click **Manage** to display it.
3. Navigate to **Configuration > System > IBM API Connect**.
4. Scroll down to **CONSUMER ORGANIZATIONS**.

CONSUMER ORGANIZATIONS

Allow users to delete their accounts
If checked then users will be allowed to delete their accounts.

Allow users to create additional consumer organizations
If checked then users will be allowed to create additional consumer organizations. Note that self service onboarding must also be enabled in API Manager catalog settings.

Allow users to rename their organization
If checked then consumer organization Owner and Administrators will be able to rename their consumer organizations.

Allow users to change the owner of their organization
If checked then consumer organization Owner and Administrators will be able to change the owner of their consumer organizations.

Allow users to delete their organizations
If checked then Owner or Administrators users will be allowed to delete their consumer organizations.

5. Clear which ever options you want to change, click **Save configuration**.

Configuring the site default timezone

You can configure the site default timezone in the Developer Portal.

Before you begin

You must have administrator access to complete this task.

Procedure

To configure which languages are available, complete the following steps:

1. Click **Configuration** in the administrator dashboard.
2. Under the **REGIONAL AND LANGUAGE** heading, click **Regional settings**.
3. From the **Default Time Zone** drop-down menu, select the default time zone.
4. Click **Save configuration**.
You have configured the default time zone.

Configuring the site error handling

You can configure the site error handling in the Developer Portal.

Before you begin

You must have administrator access to complete this task.

Procedure

To configure the site error handling, complete the following steps:

1. Click Configuration in the administrator dashboard.
2. Under the DEVELOPMENT heading, click Logging and errors.
3. You can review and configure all information relating to site error handling from this view.
Note: On a production system, set Logging and errors to **none**, to avoid any security issues.
4. Click Save configuration.
You have configured the site error handling.

Configuring which buttons are displayed in the WYSIWYG rich text editor

You can configure which buttons are displayed in the WYSIWYG rich text editor in the Developer Portal.

Before you begin

You must have administrator access to complete this task.

Procedure

To configure which buttons are displayed in the WYSIWYG rich text editor, complete the following steps:

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Configuration > Content authoring > Text formats and editors.
3. Click Configure for the Full HTML profile.
4. In the **TOOLBAR CONFIGURATION** section, edit the buttons that you want to expose.
5. Click Save configuration.
You have configured the editor buttons that are displayed in the WYSIWYG rich text editor.

Configuring which languages are available

You can configure which languages are available in the Developer Portal.

Before you begin

You must have administrator access to complete this task.

Procedure

To configure which languages are available, complete the following steps:

1. Click Configuration in the administrator dashboard.
2. Under the REGIONAL AND LANGUAGE heading, click Languages.
3. Under the DEFAULT heading, select the radio button for the language you want to set as default.
4. To add a new language, click +Add language. Use the drop-down menu to select the language you want to add.
5. Click Save configuration.
You have configured the languages that are available.
6. You can also provide your own translations, for strings of the website that are not translated, from the User interface translation view, under Configuration > Regional and Language in the administrator dashboard.

Results

You have configured the available languages for the Developer Portal.

Note: Multilingual API and Product documentation can be created by using an **x-ibm-languages** extension directly in the OpenAPI definition. For more information, see [Using x-ibm-languages to create multilingual API and Product documentation](#).

Customizing user account settings

You can customize the user account options that are displayed to users when they register and use the Developer Portal.

Before you begin

You must have administrator access to complete this task.

About this task

You can change what fields users of the Developer Portal see when they register to use the site, when they log in, and when they view their user account profile. For instance, you can change the field order display, hide fields, and add custom fields.

As an example, the Consumer organization field is a required entry field when a user creates an account on the Developer Portal. However, you can configure this field to be hidden, in which case the field is automatically completed with a default entry of `firstname lastname` of the new user instead.

Procedure

To customize the user account settings, complete the following steps.

1. Log in to the Developer Portal as an administrator.
2. If the administrator dashboard is not displayed, click **Manage** to display it.
3. Click **Configuration**, **People**, **Account settings** in the administrator dashboard.
The Account settings page is displayed.
4. From the **Settings** tab you can edit the following options:
 - a. **CONTACT SETTINGS**; enable or disable the personal contact form for new users.
 - b. **PASSWORD RESET TIMEOUT**; set the timeout in seconds for one-time login links. This setting applies only to the admin user of the Developer Portal.
 - c. **ANONYMOUS USERS**; set the name to be used to indicate anonymous users.
 - d. **ADMINISTRATOR ROLE**; assign the administrator role that is automatically given new permissions whenever a new module is enabled. The default is Superuser.
Note: The Superuser role has the highest level of permissions in the Developer Portal. This role bypasses all content access control, which means that users that have a Superuser role can see all of the site content. For more information, see [Working with roles in the Developer Portal](#).
 - e. **LANGUAGE SETTINGS**; enable or disable translation.
 - f. **REGISTRATION AND CANCELLATION**; enable or disable the password strength indicator, and set the action to take when a user account is canceled.
 - g. **Notification email address**; set the email address to use as the from address for all account notifications.
 - h. **Emails**; edit the emails that are sent when an account is blocked or canceled, or when a new password is requested.
 - i. Click **Save configuration** to save your updates.
5. Click the **Manage fields** tab to customize the fields that are available for storing user data.
Here you can edit the settings for current fields, delete fields, and add new fields. Remember to save any updates that you make.
6. Click the **Manage form display** tab to configure how the user forms are displayed.
 - a. Click the **Default form mode** to configure how the form fields display when a user profile is being edited.
 - b. Click the **Register form mode** to configure how the form fields display when a new user creates an account.
For each user form mode you can edit the field settings, enable and disable fields, and drag the fields to change their display order. You can also manage the form modes.
For example, to hide the Consumer organization field when a new user creates an account, click the **Register form mode**, and drag the Consumer organization into the **Disabled** section.
 - c. Click **Save** to save your updates.
7. Click the **Manage display** tab to configure how fields are displayed on a user profile page.
You can edit the field settings, enable and disable fields, and drag the fields to change their display order. You can also manage the display view modes. Remember to save any updates that you make.
8. Click the **Translate account settings** tab to configure the language options for the user account settings. Remember to save any updates that you make.

Results

You successfully customized the user account settings in the Developer Portal.

Disabling languages

You can extend your Developer Portal site by managing which languages are available for use on the site.

Before you begin

You must have administrator access to complete this task.

Procedure

1. If the administrator dashboard is not displayed, click **Manage** to display it.

To disable all languages apart from English.

2. Navigate to **Configuration**, **Regional and language**, **Languages**, **Detection and selection**.

3. Select the checkbox for the **Selected language** detection method, and deselect all other methods, then click Save settings.

Interface text language detection

Order of language detection methods for interface text. If a translation of interface text is available in the detected language, it will be displayed.

Disabling test tool restrictions

The default OAuth provider contains security mechanisms that prevent the ability to obtain authorization tokens in the Developer Portal test tool when you use Implicit or Authorization Code grant types. If your OAuth provider allows those actions to function correctly from the test tool, you can disable this option.

Before you begin

You must have administrator access to complete this task.

Procedure

1. If the administrator dashboard is not displayed, click Manage to display it.
2. In the administrator dashboard, click Configuration, System, IBM API Connect.
3. In the **CONFIGURATION** section, deselect the **Optimise OAuth experience in test tool** option

Optimise OAuth experience in test tool

If checked then certain OAuth flows (such as implicit or access code) which cannot be completed from the test tool for technical reasons are optimised to improve usability.

4. Click Save configuration.

Results

You successfully disabled the **Optimise OAuth experience in test tool** option. You can now use the Developer Portal test tool to test an Implicit or Authorization Code grant type in an OAuth provider API, if your OAuth provider allows those actions to function correctly from the test tool.

What to do next

You can enable the **Optimise OAuth experience in test tool** option by repeating the task but selecting the option and then clicking Save configuration.

Enabling a cookie compliance banner

You can add a cookie compliance banner to your Developer Portal site by configuring the EU Cookie Compliance module.

Before you begin

You must have administrator access to complete this task.

About this task

The EU Cookie Compliance module provides a customizable pop-up notification that informs visitors to your site that cookies are being used. The notification enables your site visitors to find out more about cookies, and to decide not to browse the site if they disagree with using cookies. You can also provide a link from your cookie compliance banner to an internal or external privacy policy. For more information about configuring an internal privacy policy, see [Customizing the privacy policy statement](#).

The EU Cookie Compliance module is enabled by default. The following instructions show you how to configure the notification.

Procedure

1. Log in to the Developer Portal as an administrator.
2. If the administrator dashboard is not displayed, click Manage to display it.
3. Click Configuration, System, EU Cookie Compliance.
The Settings tab of the EU Cookie Compliance page is displayed.
4. In the **SETTINGS** section select Enable banner, otherwise the notification does not display.
5. In the **PRIVACY POLICY** section, edit the Privacy policy link field to provide a link to your privacy policy or other page that explains cookies to your site visitors. The default link is `/privacy`, which links to the Privacy Policy content that is configured within the Developer Portal. For more information, see [Customizing the privacy policy statement](#).
External links should start with `http://` or `https://`. For example:

`https://example.com/privacy`
6. Configure the remaining options as required. For example, you can change the wording, and edit the display size and color.
7. Click Save configuration to save your updates.

Results

You successfully enabled a cookie compliance banner on your Developer Portal site. New visitors to your site are now prompted to accept cookies.

- [Customizing the privacy policy statement](#)

Enabling code languages for code snippets

You can specify the languages that code snippets for APIs can be displayed in.

Before you begin

You must have administrator access to complete this task.

Procedure

1. On the administrator dashboard, click Configuration > System > IBM API Connect.
2. In the API Code Snippets section, select the check boxes for the languages that you want to make available for the code snippets to be displayed in.
3. Click Save configuration.
The languages that you have enabled are displayed as options for your code snippets.

Enabling code snippets for SOAP APIs

By default, code snippets are only shown for REST APIs. You can enable code snippets for SOAP APIs.

Before you begin

You must have administrator access to complete this task.

About this task

Code snippets for SOAP APIs use raw HTTP, and do not use any SOAP libraries.

Procedure

1. On the administrator dashboard, click Configuration > System > IBM API Connect.
2. In the API Code Snippets section, select the Display code snippets for SOAP APIs as well as REST APIs check box.
3. Click Save configuration.
The languages that you have enabled are displayed as options for your code snippets.

Forcing new users to accept terms and conditions

You can extend your Developer Portal site by forcing new users to accept the terms and conditions before they are able to create accounts.

Before you begin

You must have administrator access to complete this task.

Note: From IBM® API Connect Version 10.0.4.0, the **Legal** module is included in the list of core Developer Portal modules. The **Terms of use** module is still available in the Developer Portal, but the **Legal** module provides more configuration options.

About this task

Use the following instructions to enable and configure the **Legal** module for your site terms and conditions.

Procedure

1. If the administrator dashboard is not displayed, click Manage to display it.
2. In the administrator dashboard, click Extend.
The List tab for the Extend page opens, and the list of installed modules is displayed. The list shows all the modules that are installed. The enabled modules are displayed with a selected check box. The disabled modules are displayed without a selected check box.
3. Enter `legal` into the search filter.
The Legal content item is displayed in the list of content.
4. Select the check box for the **Legal** module, and click Enable.
5. Navigate to Configuration > People > Legal.
6. Enter your Terms & Conditions statement, and select the Text format that you require.
7. Click Save configuration.

Results

You successfully enabled the **Legal** module. Now, when a user tries to create an account on your Developer Portal site, they must agree to the terms and conditions as a part of the registration.

Terms and Conditions of Use

Terms & Conditions

These are the terms and conditions of using this site. Select the checkbox to accept the Terms and Conditions of Use.

Accept Terms & Conditions of Use *

What to do next

You can edit the terms and conditions page by navigating to Configuration > People > Legal, and making the changes that you require. You can disable the use of terms and conditions during site registration by deleting the terms and conditions content, and then disabling the `Legal` module.

If you prefer to use the `Terms of use` module, you can enable the module, and then navigate to Configuration > People > Terms of use, and select the page that contains your site terms and conditions, for example `Terms of use (1)`. For information about how to customize the statement, see [Customizing the terms of use statement](#). The terms are displayed when you create an account and also from the link in the site footer. You can disable the use of terms and conditions during site registration by disabling the module.

Hiding the admin registry on the login form

You can hide the admin registry as an option on the login form. The use case for this option might be a public facing Developer Portal where you want to remove the admin access from customer view.

Before you begin

You must have administrator access to complete this task.

Procedure

1. If the administrator dashboard is not displayed, click `Manage` to display it.
2. On the administrator dashboard, click Configuration > System > IBM API Developer Portal.
3. In the Configuration section, select the check box for **Hide the admin registry on the login form**.
4. Click `Save configuration`.
The **Hide the admin registry on the login form** configuration is saved.

What to do next

The admin registry is no longer shown on the login form. However, it is still accessible directly. The user can navigate to `<site_url>/user/login?registry_url=/admin`.

Hiding the certificate in the header for APIs secured with mutual TLS

You can hide the certificate in the header for APIs secured with mutual TLS. By default, the `x-client-certificate` header is shown in an API when mutual TLS is configured. You can choose to turn off this option in your Developer Portal.

Before you begin

The parameters for the example API showing the certificate.

Parameters	Header
Accept optional	Permitted values application/json
Content-Type optional	application/json
X-Client-Certificate required	The TLS certificate of your application string

Example

```
-----BEGIN CERTIFICATE-----xxxEXAMPLExxxxxxxxxxEXAMPLExxxxxxxxxxEXA
```

You must have administrator access to complete this task.

Procedure

1. If the administrator dashboard is not displayed, click **Manage** to display it.
2. On the administrator dashboard, click **Configuration > System > IBM API Developer Portal**.
3. In the Configuration section, deselect the checkbox for **Show certificate in header for APIs secured with mutual TLS**.
4. Click **Save configuration**.

The **Show certificate in header for APIs secured with mutual TLS** configuration is saved.
The parameters for the example API now not showing the certificate:

Parameters	Header
Accept optional	Permitted values application/json

Importing and exporting taxonomies

You can import and export taxonomies in the Developer Portal.

Before you begin

You must have administrator access to complete this task.

Procedure

1. Log in to the Developer Portal as an administrator.
2. If the administrator dashboard is not displayed, click **Manage** to display it.
3. In the administrator dashboard, click **Configuration > Content authoring > Term CSV Export/Import**.
4. Select **Term CSV Import**, or **Term CSV Export**.

For **Term CSV Import**

5. Enter your CSV input in the format given in the examples, and select the **Taxonomy** from the drop-down list.

CSV Term Import ☆

Term CSV Import

Term CSV Export

Home » Administration » Configuration » Content authoring

Input

See [CSV Export](#) for an example.

Enter in the form of:

```
"name,description,format,weight,parent_name,[any_additional_fields];
```

```
name,description,format,weight,parent_name[:parent_name1;parent_name2;...],[any_additional_fields]"
```

or

```
"tid,uuid,name,description,format,weight,parent_name[:parent_name1;parent_name2;...],parent_tid[:parent_tid1;parent_tid2;...],[any_additional_fields];
```

```
tid,uuid,name,description,format,weight,parent_name,parent_tid,[any_additional_fields]"
```

Note that *[any_additional_fields]* are optional and are stringified using [http_build_query](#).

Preserve Vocabularies on existing terms.

Include extra fields in export.

Note that fields are stringified using [http_build_query](#)

Export

9. Click Export.

Results

You successfully imported or exported a taxonomy.

Restricting access by IP address

You can restrict access to a role or a user by IP address in the Developer Portal.

Before you begin

You must have administrator access to complete this task.

About this task

By restricting access to a role by IP address, that role is unavailable to users outside of the IP address ranges that you define. If a role restriction is triggered, the user's session is unaffected, but the restricted role is no longer available to the user. Role restriction affects only the availability of the restricted role to users. Role restrictions are available for all roles, except `anonymous user` and `authenticated user`.

By restricting login access of a user by IP address, the user is unable to log in outside of the IP address ranges that you define. You can also specify global IP address ranges, which apply to all users. IP restrictions are checked on every page load. If a user restriction is triggered by an attempt at logging in being denied, then the user is logged out and sent to the 'error page' that is specified by the site administrator.

Note: IP address ranges must be entered in CIDR notation that is separated with semi-colons and no trailing semi-colon. For more information on CIDR notation, see [CIDR format](#).

Procedure

1. In the Developer Portal, click Configuration, People, Restrict by IP, then click **Restrict log in by IP**.
2. On the **Global restrictions** tab, enter the address of the page to which the user is redirected to if they are not allowed to log in, in the Login denied error page.
3. Select one of the following options:
 - To restrict access to a role by IP address, complete the following steps:
 - Click Restrict role by IP.
 - Decide which role you want to restrict, the roles that you can restrict include Administrator, Content Author, and Forum Moderator.
 - Enter the IP address range (in CIDR notation) that you do not want to restrict log in for in the field for that role, for example, Forum Moderator role IP range.
 - Click Save configuration.

Restrict role by IP ☆

[General Settings](#) [Restrict login by IP](#) [Restrict role by IP](#)

Forum Moderator role IP range

Enter IP Address Ranges in CIDR Notation separated with semi-colons, with no trailing semi-colon.
For more information on CIDR notation click [here](#).
Leave field blank to disable IP restrictions for Forum Moderator.

Content Author role IP range

Enter IP Address Ranges in CIDR Notation separated with semi-colons, with no trailing semi-colon.
For more information on CIDR notation click [here](#).
Leave field blank to disable IP restrictions for Content Author.

Administrator role IP range

Enter IP Address Ranges in CIDR Notation separated with semi-colons, with no trailing semi-colon.
For more information on CIDR notation click [here](#).
Leave field blank to disable IP restrictions for Administrator.

Superuser role IP range

Enter IP Address Ranges in CIDR Notation separated with semi-colons, with no trailing semi-colon.
For more information on CIDR notation click [here](#).
Leave field blank to disable IP restrictions for Superuser.

Save configuration

- To restrict login access of a user by IP address, complete the following steps:
 - Click Restrict login by IP, then click **User restrictions**.
 - In the **ADD NEW USER ALLOWED IP RANGE** section, enter a user name in the **Username** field.
 - Enter an IP address Range (in CIDR notation), that you do not want to restrict log in for in the **Allowed IP range** field.
 - Click Save configuration. Your new log in restriction can be seen after the **ADD NEW USER ALLOWED IP RANGE** section.

Allowed IP range

Enter IP Address Ranges in CIDR Notation separated with semi-colons, with no trailing semi-colon. E.G. 10.20.30.0/24;192.168.199.1/32;1.0.0.0/8
For more information on CIDR notation click [here](#).

apicdemo1 user IP range

Enter IP Address Ranges in CIDR Notation separated with semi-colons, with no trailing semi-colon. E.G. 10.20.30.0/24;192.168.199.1/32;1.0.0.0/8
For more information on CIDR notation click [here](#).

Leave field blank to disable IP restrictions for apicdemo1.

Save configuration

- To restrict login for all users, complete the following steps:
 - Click Restrict login by IP, then click **Global restrictions** tab.
 - Enter the global IP address ranges (in CIDR notation) in the Restrict global login to allowed IP range field.
 - Click Save configuration.
- 4. To remove an IP restriction, delete the value that is associated with the restriction, then click Save configuration.

Restricting or preventing access from search engines

You can restrict or prevent access to your Developer Portal from search engines. You might want to control the access if you have a development or test site.

Before you begin

You must have administrator access to complete this task.

About this task

You might have a development or test Developer Portal site on the internet, but do not want them to be indexed by Google, or other search engines, making them visible to your customers. Google explicitly advises not to use `robots.txt` as a blocking mechanism. A correct solution is to control access by using Metatag.

Procedure

1. In the Developer Portal, click Configuration » Search and metadata » Metatag.
2. On the **Global restrictions** tab, click Edit.
3. In the Advanced section, select the meta tags that you want to use to restrict or prevent the access:

Robots

- index – Allow search engines to index this page (assumed).
- follow – Allow search engines to follow links on this page (assumed).
- noindex – Prevents search engines from indexing this page.
- nofollow – Prevents search engines from following links on this page.
- noarchive – Prevents cached copies of this page from appearing in search results.
- nosnippet – Prevents descriptions from appearing in search results, and prevents page caching.
- noodp – Blocks the [Open Directory Project](#) description from appearing in search results.
- noydir – Prevents Yahoo! from listing this page in the [Yahoo! Directory](#).
- noimageindex – Prevent search engines from indexing images on this page.
- notranslate – Prevent search engines from offering to translate this page in search results.

Provides search engines with specific directions for what to do when this page is indexed.

4. Click Save.

Toggling the site in and out of maintenance mode

You can put the Developer Portal site into maintenance mode for short periods of time. During maintenance mode, only an administrator is able to access the site, and all other users who enter the site URL get a maintenance message set by the administrator.

Before you begin

You must have administrator access to complete this task.

Important:

- Maintenance mode is designed for short-term site maintenance; it is not meant for long-term usage. While a site is in maintenance mode, the database is not updated with new content from API Manager. As soon as the maintenance tasks are finished, you must take the site out of maintenance mode.
- Do not log out of the Developer Portal while the site is in maintenance mode, as you will not be able to log back in to the UI. In this case, maintenance mode can be turned off only by using the toolkit CLI; see the following instructions for details.

Procedure

To put the site into maintenance mode, complete the following steps.

1. Click Configuration in the administrator dashboard.
2. Under the DEVELOPMENT heading, click Maintenance mode.
3. Select the Put site into maintenance mode checkbox.
4. Enter a site message, or leave the default site maintenance text.
This message is what will be seen by users who visit the site while it is in maintenance mode.
5. Click Save configuration.
Your site is now in maintenance mode.

To take the site out of maintenance mode, complete one of the following steps.

6. If you remained logged in to the site as the admin user during the maintenance period, you can use the Developer Portal UI to disable maintenance mode:
 - a. Click Configuration in the administrator dashboard.
 - b. Under the DEVELOPMENT heading, click Maintenance mode.
 - c. Clear the Put site into maintenance mode checkbox.
Your site is now available to users, and out of maintenance mode.
7. If you're no longer logged in to the site, you can use the toolkit CLI to disable maintenance mode:
 - a. Log in to the toolkit CLI as a Provider org:

```
apic login --server management_server --realm provider/identity_provider --username provider_username --password provider_password
```

You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

```
apic identity-providers:list --scope provider --server mgmt_endpoint_url --fields title,realm
```

For example,

```
apic identity-providers:list --scope provider --server myserver.com --fields title,realm
total_results: 2
results:
- title: API Manager Local User Registry
  realm: provider/default-idp-2
```

```
- title: Corporate LDAP user registry
  realm: provider/corporate-ldap
```

The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default API Manager Local User Registry for login as a member of a provider organization is `default-idp-2`. For full details of the `apic login` command, see [Logging in to a management server](#).

b. Run the following command to disable maintenance mode on your Developer Portal:

```
apic --mode portaladmin drupal-state:set --server management_server --org orgid/name --catalog catalogid/name --state_key system.maintenance_mode --input_format integer --state_value 0
```

Where:

- `management_server` is the endpoint URL of your management server (required).
- `catalogid/name` is the ID or name of the catalog that your site belongs to (required).
- `orgid/name` is the ID or name of the provider organization that the catalog belongs to (required).
- `--state_key` is the name of the state key (required). Must be set to `system.maintenance_mode`.
- `--input_format` is the input format of the value of the state key. Must be set to `integer` for configuring the maintenance mode.
- `--state_value` is the value to assign to the state key (required). Set to `0` to disable maintenance mode.

For example, to disable maintenance mode for a Developer Portal in the `myOrg` organization, and in the `dev` catalog:

```
apic --mode portaladmin drupal-state:set --server my.management.server.com --org myOrg --catalog dev --state_key system.maintenance_mode --input_format integer --state_value 0
Successfully set state system.maintenance_mode to the value of 0.
```

Your site is now available to users, and out of maintenance mode.

What to do next

You can use the toolkit CLI to enable, and disable, maintenance mode. For more information, see the scenario [How to enable and disable maintenance mode on your Developer Portal](#).

Viewing available updates

You can view available updates in the Developer Portal.

Before you begin

You must have administrator access to complete this task.

Procedure

To view available updates, complete the following steps:

1. Click Reports in the administrator dashboard.
2. Click Available updates.
3. You can see what updates are available from this view. However, updates can be applied only by applying the latest available API Connect release; see [Upgrading in a Kubernetes environment](#), or [Upgrading in a VMware environment](#), for more information.

Managing Developer Portal security

You can manage multiple security elements in the Developer Portal.

- [Configuring CAPTCHA](#)
You can add a CAPTCHA challenge to any of your Developer Portal pages to protect your site from spam.
- [Configuring reCAPTCHA](#)
You can configure reCAPTCHA on your Developer Portal site to provide more protection from spam and abuse.
- [Configuring session timeout and limit](#)
You can specify session timeout settings to control when a user is automatically logged out of the Developer Portal. You can also restrict the number of sessions a single user has available to them.
- [Configuring the timeout length for the password reset link](#)
You can configure the timeout length for the one-time password reset link that is sent from the Developer Portal to the admin user account.
- [Configuring your site password policy](#)
You can configure your site password policy to define the constraints that are applied to the passwords of your Developer Portal users.

- [Disabling CORS warnings](#)
You can disable cross-origin resource sharing (CORS) warnings for unenforced APIs in the Developer Portal.
- [Disabling live testing of APIs](#)
You can disable live testing of APIs in the Developer Portal to restrict exposure of an API.
- [How to enable penetration testing, and information about Developer Portal cookies](#)
Many security features are available in the Developer Portal, but if you need to do a penetration test of your Developer Portal site, some of these features might block the scan that is required as part of the testing. This topic provides guidance on the security features that you might need to disable to allow penetration testing of your site, as well as information about Developer Portal cookies.
- [How to manage IP security in the Developer Portal](#)
The Developer Portal offers the ability to perform various IP address security measures, such as adding and removing specific IP addresses from the banned IP address list, automatically banning client IP addresses by using the Drupal Perimeter Defence module, or managing login security by using flood control.
- [Managing banned IP addresses](#)
You can ban specific IP addresses from accessing your Developer Portal site.
- [Using flood control for login security](#)
You can configure login security for your Developer Portal by using flood control.
- [Login security](#)
You can configure the login security for your Developer Portal at an IP and user level. You can also configure login security for Developer Portal contact forms.
- [Using the Security kit](#)
You can improve the security of your website by configuring various options that are available in the Security Kit module, in the Developer Portal.
- [Using Honeypot for spam protection](#)
Honeypot protection provides security mechanisms to protect your Developer Portal site from form submission by spam bots. If spam bot activity is detected, form submission is blocked.

Configuring CAPTCHA

You can add a CAPTCHA challenge to any of your Developer Portal pages to protect your site from spam.

Before you begin

You must have administrator access to complete this task.

About this task

The types of CAPTCHA challenges that are available include Image and Math based CAPTCHAs. Both types of CAPTCHA challenges are configurable in the CAPTCHA dialog box. By default, your Developer Portal site is configured with the Image based CAPTCHA challenge enabled.

You can also configure reCAPTCHA on your site. For more information, see [Configuring reCAPTCHA](#).

Procedure

To configure CAPTCHAS, complete the following steps:

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Configuration in the administrator dashboard.
3. In the PEOPLE section, click CAPTCHA module settings.
The CAPTCHA settings window opens.
4. Use the CAPTCHA configuration options provided as required. For example, you can complete the following tasks:
 - a. Specify the CAPTCHA challenge type.
 - b. Specify which forms must include a CAPTCHA challenge.
 - c. Add a description to the CAPTCHA.
 - d. Enable CAPTCHA statistics.
5. Click Save configuration to save your changes.

Configuring reCAPTCHA

You can configure reCAPTCHA on your Developer Portal site to provide more protection from spam and abuse.

Before you begin

You must have administrator access to complete this task.

About this task

reCAPTCHA is a CAPTCHA-like system that is designed to establish that a computer user is human. The types of reCAPTCHA that are available include Checkbox, Invisible, and Android.

Note: To use reCAPTCHA the administrator of your Developer Portal is required to sign up to Google's reCAPTCHA API, and your portal server must have internet access.

Procedure

To configure reCAPTCHA, complete the following steps:

1. If the administrator dashboard is not displayed, click Manage to display it.

2. Click Configuration > People > CAPTCHA module settings > reCAPTCHA in the administrator dashboard. The reCAPTCHA settings window opens.
3. In the GENERAL SETTINGS section, click register for reCAPTCHA. The Google registration site for reCAPTCHA is displayed.
4. Follow the instructions on Google to register your Developer Portal site, and obtain the Site key and Secret key.
5. Return to the reCAPTCHA settings window in the Developer Portal, and enter the Site key and Secret key that you obtained from Google into the GENERAL SETTINGS section.
6. Optional: Update the WIDGET SETTINGS section as required.
7. Click Save configuration to save your changes.
8. Click the CAPTCHA Settings tab, and in the FORM PROTECTION section change the Default challenge type to reCAPTCHA (from module reCAPTCHA).
9. Click Save configuration.

Results

The reCAPTCHA module is now enabled on your Developer Portal site.

Related tasks

- [Configuring CAPTCHA](#)

Configuring session timeout and limit

You can specify session timeout settings to control when a user is automatically logged out of the Developer Portal. You can also restrict the number of sessions a single user has available to them.

Before you begin

You must have administrator access to complete this task.

Procedure

1. If the administrator dashboard is not displayed, click Manage to display it.
2. To manage the automated logout settings, complete the following steps:
 - a. Click Configuration in the administrator dashboard.
 - b. In the PEOPLE section, click Automated logout settings.
Note: You must check **Enforce auto logout on admin pages** for **autoLogout** to apply when navigating the admin areas of the site.

Enforce auto logout on admin pages

If checked, then users will be automatically logged out when administering the site.

Save configuration

- c. Use the session timeout configuration options provided as required. For example, you can complete the following tasks:
 - Specify the length of inactivity time, in seconds, before a user is automatically logged out.
 - Specify session timeout values for individual user roles.
Note: The default session timeout is 30 minutes.
 - Provide a redirection URL at logout.
 - Provide session expiry message texts.
 - d. Click Save configuration to save your changes.
3. To restrict the number of sessions available to a user, complete the following steps:
 - a. Click Configuration in the administrator dashboard.
 - b. In the PEOPLE section, click Session limit.
 - c. Specify the default maximum number of sessions for a user by entering the number into the Default maximum number of active sessions field.
 - d. Select the required action from the When the session limit is exceeded options.
 - e. From the Logged out message severity list, select the severity of the message that the user receives when they are logged out.
 - f. Optionally, in the ROLE LIMITS section, specify separate session limits for each role.
 - g. Click Save configuration to save your changes.

Configuring the timeout length for the password reset link

You can configure the timeout length for the one-time password reset link that is sent from the Developer Portal to the admin user account.

Before you begin

You must have administrator access to complete this task.

About this task

By completing the steps in this task, you are configuring the timeout length for the one-time password reset link that is sent to the admin user account by the Developer Portal.

Note:

- Setting the password reset timeout length in the Developer Portal affects only the admin user account.
- You are not affecting the user activation or password reset links that are used by any other identification provider type in API Manager.

Procedure

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Configuration in the administrator dashboard.
3. In the PEOPLE section, click Account settings.
The Account settings window opens.
4. In the Account settings window, navigate to the PASSWORD RESET TIMEOUT section.
5. Enter your required value for the timeout in the Password Reset Timeout field.
Note: The timeout value is specified in seconds, and is 86400 seconds by default.
6. Click Save configuration.
You have configured the timeout length for the one-time link that is sent from the Developer Portal for the admin user account.

Configuring your site password policy

You can configure your site password policy to define the constraints that are applied to the passwords of your Developer Portal users.

Before you begin

You must have administrator access to complete this task.

About this task

Any passwords that are stored in the API Manager must comply with the API Manager password policy. You can configure your password policy to be the same as or stricter than the API Manager password policy.

Procedure

To configure your site password policy, complete the following steps:

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Configuration in the administrator dashboard.
3. In the SECURITY section, click Password Policy.
The Password Policies page opens.
4. In the OPERATIONS column for the default password policy, click Edit.
Note: You can create a new password policy by clicking Add Policy; this allows you to apply different password policy settings to different roles. If you need only a single password policy, just configure the pre-supplied default policy.
5. Click Next.
The Configure Constraints page opens.
6. Configure the password constraints as required.
 - a. To configure a constraint, click Edit in the OPERATIONS column for the required constraint.
 - b. To delete a constraint, select Delete in the OPERATIONS column.
 - c. To add a constraint, select the required constraint type from the drop-down list, then click Configure Constraint Settings.
 - d. When you are done, click Next.
The Apply to Roles page opens.
7. Select the roles to which the password policy settings are to be applied. then click Finish.

Disabling CORS warnings

You can disable cross-origin resource sharing (CORS) warnings for unenforced APIs in the Developer Portal.

Before you begin

You must have administrator access to complete this task.

About this task

By disabling the CORS warnings, users will not receive further warnings regarding the usage of unenforced APIs.

Procedure

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Configuration in the administrator dashboard.
3. In the SYSTEM section, click IBM API Connect.
4. Ensure that the Display CORS warnings for unenforced APIs check box is cleared.
5. Click Save Configuration.

You have disabled CORS warnings in the Developer Portal. To enable CORS warnings, repeat the steps and ensure that the Display CORS warnings for unenforced APIs check box is selected.

Disabling live testing of APIs

You can disable live testing of APIs in the Developer Portal to restrict exposure of an API.

Before you begin

You must have administrator access to complete this task.

Procedure

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Configuration in the administrator dashboard.
3. In the SYSTEM section, click IBM API Connect.
4. Ensure that the Allow live testing of APIs check box is cleared.
5. Click Save configuration.
You have disabled live testing of APIs. To enable live testing of APIs, repeat the steps and ensure that the Allow live testing of APIs check box is selected.

How to enable penetration testing, and information about Developer Portal cookies

Many security features are available in the Developer Portal, but if you need to do a penetration test of your Developer Portal site, some of these features might block the scan that is required as part of the testing. This topic provides guidance on the security features that you might need to disable to allow penetration testing of your site, as well as information about Developer Portal cookies.

Penetration testing, or pen testing, is the practice of testing a computer system, network, or web application for potential security vulnerabilities that an attacker might exploit. For certain elements of your pen testing, you might want to disable some of the security features that block scanning of the Developer Portal. The following sections describe the security features in the Developer Portal that you might need to disable. The actual requirements depend on your Developer Portal configuration, and on the type of pen testing that you are running. Note also the final section, which discusses testing for Distributed Denial of Service attacks.

Important:

- If you run a pen test, and you give the automated test tool the admin credentials, the tool submits all of the administration configuration forms as well, and this action is likely to break the Portal site configuration. Best practice is to use different credentials for the testing.
- If you disable security modules, and then run security scans, your Portal site configuration might be broken by the scanning process. Before running any security testing, ensure that you have a valid backup of your Portal site.
- If your Portal site configuration is broken by the security testing, then you must delete the Portal site from the API Manager Catalog settings and re-create it, or restore it from a backup.
For information about restoring your site, see the appropriate topic for your environment:
 - [Backing up and restoring the Developer Portal in a Kubernetes environment](#)
 - [Backing up and restoring the Developer Portal on OpenShift and Cloud Pak for Integration](#)
 - [Backing up and restoring the Developer Portal in a VMware environment](#)
- Note that disabling of security modules makes it highly likely that you will find issues that are not actually vulnerabilities, because you have disabled the modules that are designed to protect against these vulnerabilities. Therefore, any issue that is found in these circumstances must be replicated in an environment without the security modules disabled, before contacting IBM Support.
- Do not use the **Enforced** mode of the **Content Security Policy**, this mode is not supported and can break core Developer Portal functionality such as API rendering and the content editor. The **Content Security Policy** must be in **Report only** mode.

Note: You might need to disable the **Honeypot** module to allow your penetration test to run. For more information, see [Using Honeypot for spam protection](#). This topic contains the following sections:

- [CAPTCHA and reCAPTCHA verifications](#)
- [Drupal Perimeter Defense module](#)
- [Login Security module](#)
- [Developer Portal cookies](#)
- [Should I test the Developer Portal for vulnerability to Distributed Denial of Service attacks?](#)

CAPTCHA and reCAPTCHA verifications

CAPTCHA and reCAPTCHA verifications are a type of challenge-response test that are used in web applications to check whether the user is human. By default, your Developer Portal site is configured with an Image based CAPTURE challenge enabled, but you can also configure a Math based CAPTCHA challenge, and Checkbox, Invisible, and Android reCAPTCHA challenges. If you need to disable these verifications before pen testing, see the following instructions.

To disable the CAPTCHA and reCAPTCHA verifications, you must disable the modules as follows:

1. Log in to the Developer Portal as an administrator.
2. If the administrator dashboard is not displayed, click Manage to display it.
3. On the administrator dashboard, click Extend > Disable module.
4. Search through the list of modules, and select the check boxes next to the Image CAPTCHA and reCAPTCHA modules.
5. Click Disable, and click Disable again to confirm.
6. On the Disable tab, select the check box next to the CAPTCHA module, and click Disable. The display shows the forms that the CAPTCHA configuration is removed from.
7. Click Disable again to confirm. Note that the modules must be disabled in this order.

The CAPTCHA and reCAPTCHA modules are now disabled, and you can complete your pen testing. After pen testing, you can enable the modules again by clicking Extend on the administrator dashboard, selecting the check box for each module in the List tab, and clicking Enable.

Drupal Perimeter Defense module

The Drupal Perimeter Defense module (machine name: perimeter) immediately bans the IP addresses of those users that send suspicious requests to your site, so any pen testing scans would be blocked. This module is enabled by default on the Developer Portal. For more information about the module, see the Drupal documentation [Drupal Perimeter Defense module](#).

If you need to disable the Drupal Perimeter Defense module before pen testing, see the following instructions:

1. Log in to the Developer Portal as an administrator.
2. If the administrator dashboard is not displayed, click Manage to display it.
3. On the administrator dashboard, click Extend > Disable module.
4. Search through the list of modules, and select the check box next to the Drupal Perimeter Defense module.
5. Click Disable, and click Disable again to confirm.

The Drupal Perimeter Defense module is now disabled, and you can complete your pen testing. After pen testing, you can enable the module again by clicking Extend on the administrator dashboard, selecting the check box next to the Drupal Perimeter Defense module in the List tab, and clicking Enable.

Login Security module

The Login Security module (machine name: login_security) enables the site administrator to improve the security options in the login operation of your Developer Portal site. For example, controlling the number of invalid login attempts before blocking users, and denying access by IP address. This module is enabled by default on the Developer Portal. For more information about the module, see the Drupal documentation [Login Security module](#).

If you need to disable these security options before pen testing, you need to manually modify the configuration of your security options according to your requirements. For example, you might need to change the number of login attempts that are allowed before a user or IP address is blocked. To configure the security options, see the following instructions:

1. Log in to the Developer Portal as an administrator.
2. If the administrator dashboard is not displayed, click Manage to display it.
3. On the administrator dashboard, click Configuration > People > Login Security.
4. In the Login Security window, update the security options according to your requirements.
5. Click Save configuration to save your updates.

The Login Security options are now updated, and you can complete your pen testing. After pen testing, you can reconfigure your security options in the Login Security window.

Developer Portal cookies

Cookies are small text files that are placed on a computer by websites when they are visited. The Developer Portal uses cookie that remain on the computer for varying times. Some cookies expire at the end of each session, and some remain longer to enhance the user experience in the future.

Note: The cookie generated by Bigpipe does not have the **httponly** flag set. Thus, JavaScript can delete the cookie whenever required.

The list here explains the cookies that are used by the Developer Portal, and why they are used.

Note: Any load balancer that sits in front of the Developer Portal must be a transparent proxy that enables all cookies returned by the Developer Portal to pass through to the browser.

Drupal session identifier cookie

This is the main cookie that all of the Developer Portal sites have, and it stores the session identification. The session cookie is named in the format **SSESSUUID**, where **UUID** is a randomly generated unique string of characters for that session, and this is the session token itself. The session cookie is always marked with the following flags as instructions to the browser client:

- **Secure** - means that the cookie is sent only over a secure connection (that is, over TLS).
- **HttpOnly** - means that the browser adds this cookie on outbound requests only, and not provide the value to client side javascript.

session_store.id cookie

This cookie is used to store information on where a user is in the subscription flow, and any options that they selected, if they haven't yet signed in, so the Developer Portal can redirect them back there later. The session_store.id cookie is also marked with the **Secure** and **HttpOnly** flags, and it does not contain any confidential information.

Drupal.visitor.startSubscriptionWizard cookie

This cookie is used to store information on where a user started in the subscription flow if they haven't yet signed in, so the Developer Portal can redirect them back there later. The Drupal.visitor.startSubscriptionWizard cookie is also marked with the **Secure** and **HttpOnly** flags, and it does not contain any confidential information.

portal_web cookie

This cookie is used to achieve session persistence, which it does by ensuring that web traffic between the user and the Developer Portal is correctly routed to the server. The portal_web cookie is used for both HTTP and HTTPS communications, so that routing is meaningful irrespective of the transfer protocol, and ensuring consistent behavior if the switching of protocols is required. The cookie contains only a hash of the pod that served the traffic to maintain session persistence, and does not contain any confidential information. The cookie is provided by the Portal ingress. This cookie is not marked as **Secure** or **HttpOnly**, as the Kubernetes ingress does not yet support these attributes.

Other cookies

In addition to the cookies listed previously, there are other (usually temporary) cookies that might be created depending on the configuration options of your Developer Portal site. For example, if the site uses OAuth for authentication, then during the OAuth token activation flow a JSON Web Token is sent to the browser. This token is stored in a cookie for a limited lifetime. This action is part of the normal function of an OAuth flow. As the creation of these other cookies depends on your particular Developer Portal configuration, we cannot provide a complete list of cookies here.

Should I test the Developer Portal for vulnerability to Distributed Denial of Service attacks?

When you run penetration testing, it's important to understand that individual systems are not responsible for (nor capable of dealing with) Distributed Denial of Service (DDoS) attacks. DDoS attacks are launched by huge numbers of external computers simultaneously, with a goal of using up all of the resources of a system, and thereby denying service to legitimate users. These kinds of attacks are usually defended against at the level of the network and edge gateways, and information about how to protect against them is out of the scope of this topic. Although the Developer Portal does have some capabilities, including the modules mentioned previously, for potentially mitigating some of the effects of a DDoS attack, do not rely on these capabilities as the first line of defense; rather they are designed to assist in dealing only with any elements of an attack that might have gotten through the outer network layers of protection.

How to manage IP security in the Developer Portal

The Developer Portal offers the ability to perform various IP address security measures, such as adding and removing specific IP addresses from the banned IP address list, automatically banning client IP addresses by using the Drupal Perimeter Defence module, or managing login security by using flood control.

See the following links for information about how to manage IP security in the Developer Portal:

- [Enable and disable IP security](#)
- [Correctly passing through client IP addresses](#)
- [Managing banned IP addresses](#)

Enable and disable IP security

The ability to enable or disable IP security related actions can be controlled at the Portal service level by using the Developer Portal CLI command `ip-security-enabled`. When IP security is enabled, modules such as the Drupal Perimeter Defence module, or flood control, will block client IP addresses suspected of malicious behavior, as expected. When IP security is disabled, all IP related security is switched off. For example, the perimeter module won't block client IP addresses when IP security is disabled. You might want to turn off IP security if you are performing penetration tests, or if you cannot pass through the client IP address from your external load balancer. For more information, see [Using the ip-security-enabled command](#).

Correctly passing through client IP addresses

In order to correctly use modules that make use of client IP banning, such as the Drupal Perimeter Defence module, you must ensure that any external load balancer that fronts the Portal cluster passes through the client IP address. This can be achieved by passing the client IP address through in an `'x-forwarded-for'` header, or by making use of the proxy protocol (provided both the load balancer and the ingress controller are compatible with the proxy protocol, and have the protocol enabled). Failure to correctly pass through the client IP address, results in the load balancer IP address being blocked when a client attempts to send a suspicious request to the portal.

If you are fronting the Portal cluster with an HAProxy setup acting as the load balancer, then you can make use of the proxy protocol by adding the `send-proxy` directive to the end of the Portal server declarations in the HAProxy configuration file, for example:

```
server portal0 portal_host:port check send-proxy
```

You must restart the HAProxy for the change to take effect. Note that if your load balancer IP address has already been blocked, you will need to remove the blocked IP address from the banned list by using the `security` command in the Developer Portal CLI, see [Using the security command](#).

If you find your load balancers are being banned by Portal's IP Security modules, then you might need to configure your system's ingresses to send the `'x-forwarded-for'` headers. For instance, the default behavior of the `nginx-ingress-controller` is to ignore the inbound `'x-forwarded-for'` header and construct a new one. To configure the `nginx-ingress-controller` to pass through the inbound `'x-forwarded-for'` header you need to add the following to the `nginx-ingress-controller` config map:

```
data:
  compute-full-forwarded-for: "true"
  use-forwarded-headers: "true"
```

For more information about the Drupal Perimeter Defence module, see [Drupal Perimeter Defense module](#).

Managing banned IP addresses

You can manage banned IP addresses for a particular site by using the administrator dashboard for a particular Developer Portal site. For more information, see [Managing banned IP addresses](#).

Managing banned IP addresses

You can ban specific IP addresses from accessing your Developer Portal site.

Before you begin

You must have administrator access to complete this task.

Procedure

To manage banned IP addresses, complete the following steps:

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Configuration in the administrator dashboard.
3. In the PEOPLE section, click IP address bans.
The IP address bans window opens.
4. You can complete the following tasks:
 - a. To ban an IP address, enter the address in the IP address field, then click Add.
The address is added to the BANNED IP ADDRESSES list.
 - b. To remove an IP address from the banned list, click Delete alongside the required address.

Note:

- There is automatic login "flood" protection built into the Developer Portal. This feature means that an excess of login attempts from the same IP address in one hour will cause that IP to be temporarily banned. For more information, see [Using flood control for login security](#).
- You can also clear banned user/IP addresses by using the Developer Portal CLI command `security:clear-bans`. For more information, see [Using the security command](#).

Using flood control for login security

You can configure login security for your Developer Portal by using flood control.

Before you begin

You must have administrator access to complete this task.

Procedure

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Navigate to Configuration > System > Flood Control.
3. Enter values in the following fields in the LOGIN SETTINGS section according to your requirements:
 - Failed IP login limit (min 1) - the number of failed login attempts from the same client IP.
 - Failed IP login window in seconds (0 = Off) - the time window, in seconds, for the number of failed login attempts from the same client IP.
 - Failed User login limit (min 1) - the number of failed login attempts from a user.
 - Failed User login window in seconds (0 = Off) - the time window, in seconds, for the number of failed login attempts from a user.
4. Enter values in the following fields in the CONTACT FORM section according to your requirements:
 - Emails sent limit - the number of emails that can be sent.
 - Emails sent window in seconds - the time window, in seconds, for the number of emails that can be sent.
5. Click Save configuration.

What to do next

To unblock a user, see [Blocking and unblocking specific users](#). To unblock an IP address, see [Managing banned IP addresses](#).

Login security

You can configure the login security for your Developer Portal at an IP and user level. You can also configure login security for Developer Portal contact forms.

Before you begin

Important: The Login Security module is being removed from future releases. It has been replaced by Flood Control. Existing users of the Login security module should configure Flood Control with the same limits and time windows as specified here. For more information, see [Using flood control for login security](#).

You must have administrator access to complete this task.

Procedure

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Configuration in the administrator dashboard.
3. In the PEOPLE section, click Login Security.
4. Enter values in the following fields in the GENERAL SETTINGS section according to your requirements:
 - Track time - the time window to check for security violations.
 - User - the number of login failures before blocking a user.
 - Soft host - the number of login failures before soft blocking a host. The host can still browse the site as an anonymous user.
 - Host - the number of login failures before hard blocking a host. The host cannot access the site at all.
 - Attack detection - the number of login failures before warning about an ongoing attack.
5. Select the check boxes that satisfy your notification requirements in the NOTIFICATION section:
 - Disable login failure error message
 - Notify the user about the number of remaining login attempts
 - Display last login timestamp
 - Display last access timestamp
6. Optional: Edit the EMAIL FOR ONGOING ATTACK DETECTION section.
7. Optional: Edit the EMAIL FOR BLOCKED ACCOUNT section.
8. Optional: You can edit the notification texts that are displayed by configuring the following options:
 - Failed login attempt
 - Banned host (soft IP ban)
 - Banned host (hard IP ban)
 - Blocked user by uid
9. After you have configured your login security options, click Save configuration.

What to do next

To unblock a user, see [Blocking and unblocking specific users](#). To unblock an IP address, see [Managing banned IP addresses](#).

Using the Security kit

You can improve the security of your website by configuring various options that are available in the Security Kit module, in the Developer Portal.

Before you begin

You must have administrator access to complete this task.

About this task

The Security Kit module provides your website with various options to mitigate risks of common web application vulnerabilities like Cross-site Scripting, Cross-site Request Forgery and Clickjacking. It also has some options to improve your SSL/TLS security.

Procedure

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Configuration in the administrator dashboard.
3. In the SYSTEM section, click Security Kit settings.
4. In the Security Kit module, configure the security settings for your website as required.
5. When you are done, click Save configuration.

Using Honeypot for spam protection

Honeypot protection provides security mechanisms to protect your Developer Portal site from form submission by spam bots. If spam bot activity is detected, form submission is blocked.

Before you begin

You must have administrator access to complete this task.

About this task

Honeypot protection provides the following security mechanisms:

- A hidden field, unseen by users, is added to the form. If a value has been entered in the field when the form is submitted then this indicates that the form was completed by a spam bot, and the submission is blocked. You can specify the name of the hidden field.
- If the form is submitted before a specified time has elapsed (five seconds by default), it is assumed that this is too short a time for a human to have completed the form, and the submission is blocked. You can specify the time length.

Honeypot protection is provided by the Honeypot module, which is enabled by default.

Note: If you want to carry out automated testing of your Developer Portal, you might need to disable the Honeypot module, because Honeypot spam protection is designed specifically to block automated Developer Portal usage. For details on how to disable a module, see [Disabling modules](#).

Procedure

To configure Honeypot for spam protection in the Developer Portal, complete the following steps:

1. If the administrator dashboard is not displayed, click **Manage** to display it.
2. Click **Configuration** in the administrator dashboard.
3. In the **CONTENT AUTHORING** section, click **Honeypot configuration**.
4. Specify the forms that you want to protect with Honeypot.
 - a. To enable Honeypot protection for all the forms on your Developer Portal site, select **Protect all forms with Honeypot**.
 - b. To choose which forms you want to protect with Honeypot, clear the **Protect all forms with Honeypot** check box, then select the required forms in the **HONEYPOT ENABLED FORMS** section.

By default, Honeypot protection is enabled for all user management forms and all comment forms.
5. To have details of all blocked form submissions written to the log file, select **Log blocked form submissions**.
6. In the Honeypot element name field, specify the name of the hidden form field.

The default field name is `url`. You need to change the value if your form already has a field of the same name. For the most effective protection, use a generic field name; for example, `email`, `homepage`, or `link`.
7. In the Honeypot time limit field, specify the number of seconds that must elapse before it is assumed that a form is being submitted by a human rather than a spam bot. If the form is submitted before this time has elapsed then the submission is blocked.

The default value is five seconds.
8. When done, click **Save configuration**.

People

You can manage and customize the user experience in the Developer Portal, by altering permissions and assigning roles to specific users.

To learn how to configure the user experience for your Developer Portal site, use the following section links.

- [Blocking and unblocking specific users](#)

You can block and unblock specific users in the Developer Portal.
- [Controlling access to Developer Portal content](#)

In IBM® API Connect, you can restrict access to content for Consumer organizations through an access content list. However, you can also assign permissions in the Developer Portal that override the access content list, and allow users to access and edit all of the content for Products, APIs, and Applications.
- [Creating a developer account to customize API properties](#)

You can allow specific users in the Developer Portal to customize the properties for certain APIs, including APIs that are not viewable by the administrator, or other customizable features, by creating an internal Consumer organization.
- [Email Subscribers](#)

As a site administrator, you can use the email subscribers wizard to send messages to your Developer Portal community.
- [How to style the Developer Portal emails](#)

You can apply a theme to the HTML emails that are sent by the Developer Portal by using CSS and templating.
- [Working with roles in the Developer Portal](#)

As a site administrator, you can create and customize site configuration roles in the Developer Portal.

Blocking and unblocking specific users

You can block and unblock specific users in the Developer Portal.

Before you begin

You must have administrator access to complete this task.

Procedure

To block or unblock a specific user, complete the following steps:

1. If the administrator dashboard is not displayed, click **Manage** to display it.
2. Click **People** in the administrator dashboard.

A list of users is displayed.
3. Select the check box next to the target user.
4. From the drop-down list under **Action**, select **Block the selected user(s)** or **Unblock the selected user(s)**.
5. Click **Apply** to selected items.

You have blocked or unblocked specific users from the Developer Portal.

Note: If a user reports that they are unable to login, but they do not appear as blocked, then it might be that they have been blocked by Flood Control. To unblock such users, select **Configuration > System > Flood unblock**. You can configure your Flood Control settings; see [Using flood control for login security](#) for more information.

Related tasks

- [Using flood control for login security](#)

Controlling access to Developer Portal content

In IBM® API Connect, you can restrict access to content for Consumer organizations through an access content list. However, you can also assign permissions in the Developer Portal that override the access content list, and allow users to access and edit all of the content for Products, APIs, and Applications.

Before you begin

You must have administrator access to complete this task.

About this task

A user with a Content Author role is a curator of content for the Developer Portal. A Content Author user can perform the following actions:

- Set taxonomies on the content
- Provide custom icons for content
- Upload additional documentation files
- Create documentation pages in the Developer Portal.

By default, Content Author users are assigned the following user permissions:

Edit any Product content

The user can access and edit all of the Products available in the Catalog that the Developer Portal is associated with. The user can also access APIs that belong to those Products.

Edit any API content

The user can access and edit all of the APIs that are available in the Catalog, but not the Products with which they are associated. (Note that this permission is a subset of Edit any Product content; as Content Author users are assigned both permissions they can access and edit all of the Products and the associated APIs that are available.)

The Edit any Application permission grants the user access to all of the Applications that are in the Developer Portal, but is not assigned to any user or role by default.

Note: There are security implications if you grant the Edit any Application permission, and it should be assigned only to trusted roles.

A user can configure, attach, and upload content if they are assigned the appropriate permissions.

Procedure

To check and assign permissions that grant users access to all content, proceed with one of the following options:

- Assign a user to the Content Author role. For more information, see [Assigning users to a role](#).
- Create a custom role, to which you can add the relevant permissions and add users to your new custom role. For more information, see [Creating a new role](#), [Assigning permissions to a role](#), and [Assigning users to a role](#).

Creating a developer account to customize API properties

You can allow specific users in the Developer Portal to customize the properties for certain APIs, including APIs that are not viewable by the administrator, or other customizable features, by creating an internal Consumer organization.

Before you begin

You must have administrator access to complete this task.

About this task

Every user in the Developer Portal must be a member of a Consumer organization. To enable additional users to be editors of particular content in the Developer Portal, you can create an internal Consumer organization. You can then invite these additional editors to this organization, and assign them a specific role that grants certain editing permissions. For example, the following API properties can be customized by any member of the new Consumer organization that have been assigned the Administrator or Content Author role:

- Image uploading
- Tag assignment
- File attachment
- Custom field editing

Procedure

To create a new Consumer organization within the Developer Portal, complete the following steps:

1. Log in to the Developer Portal as an administrator or Content Author.
2. Click the arrow next to `your_organization_name` from the Developer Portal home page, and select Create organization.
3. In the Organization Title field, type the name of the organization that you want, then click Submit.

To invite the editor users to your new organization, complete the following steps:

4. Switch to your newly created organization by clicking the arrow next to `your_current_organization_name`, and select your new organization name from the list.
5. Click the arrow next to `your_new_organization_name` and select My organization.
Your new organization page is displayed.
6. For each new user, click Invite, complete their Email details, and click Submit. Note that you can leave the default role of Developer selected and then change the role later, or you can select the Administrator role now. However, be aware that an administrator is able to perform any task within the Developer Portal that does not involve the creation of APIs, Products, and Apps. You should be careful to ensure that only trusted users are given this access and level of control of your site. Each new user will receive an invitation email, and they need to click on the link in the email to activate their Developer Portal account.

To assign the required permissions to the users of your organization, you must log in as an administrator and complete the following steps:

7. Log in to the Developer Portal as an administrator.
8. If the administrator dashboard is not displayed, click Manage to display it.
9. Click People on the administrator dashboard.
10. Select the check box for the user, or users, to whom you want to give new permissions.
11. Under the Action heading, select the relevant role from the drop-down list.
For example, selecting Add the Content Author role to the selected user(s) means they can edit images and content within the Developer Portal.
12. Click Apply to selected items to update the roles.

What to do next

If you want specific Products or APIs to be customized by the editor users, you must ensure that the relevant Products are visible to the internal Consumer organization that you have created. For more information on how to make a plan visible in API Manager, see [Changing the availability of a Product](#).
Note that you can also create new roles and assign specific permissions to those roles. For more information, see [Creating a new role](#) and [Assigning permissions to a role](#).

Related concepts

- [Working with roles in the Developer Portal](#)

Email Subscribers

As a site administrator, you can use the email subscribers wizard to send messages to your Developer Portal community.

You can email all the subscribers of a specific API, plan, product, or all registered consumer organizations. For each consumer organization, you can select whether to email just the owner or all of the members. Each recipient receives an individual email.

You can use the wizard to specify context-specific tokens in the email subject and body. The tokens available and their replacement values depend on which flow is selected, for example, API, plan, product, or all.

- [Emailing all subscribers](#)
As a site administrator, you can use the email **All users** wizard to email all the subscribers of all the consumer organizations on your Developer Portal.
- [Emailing api subscribers](#)
As a site administrator, you can use the email **API subscribers** wizard to send messages to all subscribers of all product plans that contain a specific API on your Developer Portal.
- [Emailing plan subscribers](#)
As a site administrator, you can use the email **Plan subscribers** wizard to send messages to all subscribers of a chosen plan that belongs to a specific product on your Developer Portal.
- [Emailing product subscribers](#)
As a site administrator, you can use the email **Product subscribers** wizard to send messages to all subscribers of any plan for a specific product in your Developer Portal.
- [Token reference](#)
You can use the email subscribers wizard to specify context-specific tokens in the email subject and body. The tokens available and their replacement values depend on which flow is selected, for example, API, plan, product, or all.

Emailing all subscribers

As a site administrator, you can use the email **All users** wizard to email all the subscribers of all the consumer organizations on your Developer Portal.

Before you begin

You must have administrator access to complete this task.

About this task

You can use the **All users** wizard to send messages to all consumer organizations. You can select whether to email just the owner, or all of the members of the consumer organizations. Each recipient receives an individual email.

Procedure

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Navigate to People, > Email subscribers.
3. Select **All users**, and click Save.
4. Select the role of the recipients that you want to send the email to, then click Next.

- Owners - sends the email to the relevant consumer organization owners.
 - Members - sends the email to all members of the relevant consumer organizations.
5. Enter the content of the email, subject, and body, and set the Text Format of the email:
 - Basic HTML
 - Plain text
 6. Expand the REPLACEMENTS drop-down, and click Browse available tokens to view which tokens can be added to the subject and body fields for replacement. You can select a token to use by either typing it directly, or by clicking in the subject or body field. You are then given a list of available tokens, and you can insert the token that you want. For a reference list of tokens, see [Token reference](#).
 7. Expand the ADDITIONAL EMAIL OPTIONS drop-down to configure any additional settings:
 - **Priority**: Set the priority of the email. Many email programs ignore a priority setting.
 - **Request receipt**: Request a read receipt from your emails. Many email programs ignore these requests so it is not a definitive indication of how many people read your email.
 - **Additional headers**: Set any additional headers to be sent with the email.
 8. Use the remaining check boxes to configure what messages are to be sent and how:
 - Send the message directly by using the Batch API. This option sends the emails directly by the Batch API. If not selected, then the emails are added to the spool and sent out by cron.
 - Send a copy of all messages to the sender. Because emails might contain context-specific tokens, a new email is generated for each recipient with the correct token replacement. This option sends a copy of all generated emails to the sender.
 - Send a copy of the original message to the sender. This option sends a single copy of the original email, subject, and body, without the replacement of any specified tokens.
 9. Click Next.
 10. Confirm that the email is ready to send, then click Next.
 11. If you chose to send the emails by the Batch API, you see a progress page that indicates how many emails were sent. You are then redirected to a summary page that shows the total number of emails that were sent.
If you chose to spool the delivery of the emails, you are redirected to the summary page that shows the total number of emails that are spooled.
 12. Click Finish.

Results

You successfully sent an email to all members, or all of the owners of each consumer organization on your Developer Portal.

Emailing api subscribers

As a site administrator, you can use the email **API subscribers** wizard to send messages to all subscribers of all product plans that contain a specific API on your Developer Portal.

Before you begin

You must have administrator access to complete this task.

About this task

You can use the email **API subscribers** wizard to send messages to all subscribers of all product plans that contain a specific API in your Developer Portal community. For each consumer org, you can select whether to email just the owner or all members. Each recipient receives an individual email.

Procedure

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Navigate to People, > Email subscribers.
3. Select **API subscribers**, and click Save.
4. In the text box, enter the name of the API whose subscribers you want to email. If you start typing in the text box, you can choose from the options that you are given. Click Next.
5. Select the role of the recipients that you want to send the email to, then click Next.
 - Owners - sends the email to the relevant consumer organization owners.
 - Members - sends the email to all members of the relevant consumer organizations.
6. Enter the content of the email, subject, and body, and set the Text Format of the email:
 - Basic HTML
 - Plain text
7. Expand the REPLACEMENTS drop-down, and click Browse available tokens to view which tokens can be added to the subject and body fields for replacement. You can select a token to use by either typing it directly, or by clicking in the subject or body field. You are then given a list of available tokens, and you can insert the token that you want. For a reference list of tokens, see [Token reference](#).
8. Expand the ADDITIONAL EMAIL OPTIONS drop-down to configure any additional settings:
 - **Priority**: Set the priority of the email. Many email programs ignore a priority setting.
 - **Request receipt**: Request a read receipt from your emails. Many email programs ignore these requests so it is not a definitive indication of how many people read your email.
 - **Additional headers**: Set any additional headers to be sent with the email.
9. Use the remaining check boxes to configure what messages are to be sent and how:
 - Send the message directly by using the Batch API. This option sends the emails directly by the Batch API. If not selected, then the emails are added to the spool and sent out by cron.
 - Send a copy of all messages to the sender. Because emails might contain context-specific tokens, a new email is generated for each recipient with the correct token replacement. This option sends a copy of all generated emails to the sender.

- Send a copy of the original message to the sender. This option sends a single copy of the original email, subject, and body, without the replacement of any specified tokens.
10. Click Next.
 11. Confirm that the email is ready to send, then click Next.
 12. If you chose to send the emails by the Batch API, you see a progress page that indicates how many emails were sent. You are then redirected to a summary page that shows the total number of emails that were sent.
If you chose to spool the delivery of the emails, you are redirected to the summary page that shows the total number of emails that are spooled.
 13. Click Finish.

Results

You successfully sent an email to all members or all owners of each consumer org that contained a subscription to all product plans that contain the chosen API on your Developer Portal.

Emailing plan subscribers

As a site administrator, you can use the email **Plan subscribers** wizard to send messages to all subscribers of a chosen plan that belongs to a specific product on your Developer Portal.

Before you begin

You must have administrator access to complete this task.

About this task

You can use the email **Plan subscribers** wizard to send messages to all subscribers of a chosen plan that belongs to a specific product on your Developer Portal community. For each consumer org, you can select whether to email just the owner or all members. Each recipient receives an individual email.

Procedure

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Navigate to People > Email subscribers.
3. Select **Plan subscribers**, and click Save.
4. In the text box, enter the name of the product whose subscribers you want to email. If you start typing in the text box, you can choose from the options that you are given. Click Next.
5. Select the name of the plan whose subscribers you want to email. Click Next.
6. Select the role of the recipients that you want to send the email to, then click Next.
 - Owners - sends the email to the relevant consumer organization owners.
 - Members - sends the email to all members of the relevant consumer organizations.
7. Enter the content of the email, subject, and body, and set the Text Format of the email:
 - Basic HTML
 - Plain text
8. Expand the REPLACEMENTS drop-down, and click Browse available tokens to view which tokens can be added to the subject and body fields for replacement. You can select a token to use by either typing it directly, or by clicking in the subject or body field. You are then given a list of available tokens, and you can insert the token that you want. For a reference list of tokens, see [Token reference](#).
9. Expand the ADDITIONAL EMAIL OPTIONS drop-down to configure any additional settings:
 - **Priority**: Set the priority of the email. Many email programs ignore a priority setting.
 - **Request receipt**: Request a read receipt from your emails. Many email programs ignore these requests so it is not a definitive indication of how many people read your email.
 - **Additional headers**: Set any additional headers to be sent with the email.
10. Use the remaining check boxes to configure what messages are to be sent and how:
 - Send the message directly by using the Batch API. This option sends the emails directly by the Batch API. If not selected, then the emails are added to the spool and sent out by cron.
 - Send a copy of all messages to the sender. Because emails might contain context-specific tokens, a new email is generated for each recipient with the correct token replacement. This option sends a copy of all generated emails to the sender.
 - Send a copy of the original message to the sender. This option sends a single copy of the original email, subject, and body, without the replacement of any specified tokens.
11. Click Next.
12. Confirm that the email is ready to send, then click Next.
13. If you chose to send the emails by the Batch API, you see a progress page that indicates how many emails were sent. You are then redirected to a summary page that shows the total number of emails that were sent.
If you chose to spool the delivery of the emails, you are redirected to the summary page that shows the total number of emails that are spooled.
14. Click Finish.

Results

You successfully sent an email to all members or all owners of each consumer org that contained a subscription to the chosen plan within the chosen product, on your Developer Portal.

Emailing product subscribers

13. Click Finish.

Results

You successfully sent an email to all members or all owners of each consumer org that contained a subscription to any plan within the chosen product on your Developer Portal.

Token reference

You can use the email subscribers wizard to specify context-specific tokens in the email subject and body. The tokens available and their replacement values depend on which flow is selected, for example, API, plan, product, or all.

Application Tokens

Tokens that are related to an individual Application.

Name	Token	Description	Product Subscribers	Plan Subscribers	API Subscribers	All Users
Description	[application:description]	The description that is given to the application.	✓	✓	✓	
Enabled	[application:enabled]	The state that the application is in.	✓	✓	✓	
ID	[application:id]	The ID of the application.	✓	✓	✓	
Image URL	[application:image_url]	The URL of the image for the application.	✓	✓	✓	
Lifecycle State	[application:lifecycle_state]	The lifecycle state of the application.	✓	✓	✓	
Name	[application:name]	The name of the application.	✓	✓	✓	

Name	Token	Description	Product Subscribers	Plan Subscribers	API Subscribers	All Users
Title	[application:title]	The title of the application.	✓	✓	✓	

Consumer Organization Tokens

Tokens that are related to the individual consumer organization.

Name	Token	Description	Product Subscribers	Plan Subscribers	API Subscribers	All Users
ID	[consumer-org:id]	The ID of the consumer organization.	✓	✓	✓	✓
Name	[consumer-org:name]	The name of the consumer organization.	✓	✓	✓	✓
Title	[consumer-org:title]	The title of the consumer organization.	✓	✓	✓	✓

Product Tokens

Tokens that are related to an individual product.

Name	Token	Description	Product Subscribers	Plan Subscribers	API Subscribers	All Users
APIs	[product:apis]	A comma separated list of APIs (name:version) within the product.	✓	✓	✓	
ID	[product:id]	The ID of the product.	✓	✓	✓	
Image URL	[product:image_url]	The URL of the image for the product.	✓	✓	✓	
Name	[product:name]	The name of the product.	✓	✓	✓	
Plans	[product:plans]	A comma separated list of plan names within the product.	✓	✓	✓	
State	[product:state]	The state of the product.	✓	✓	✓	
Title	[product:title]	The title of the product.	✓	✓	✓	

Plan Tokens

Tokens that are related to an individual product plan.

Name	Token	Description	Product Subscribers	Plan Subscribers	API Subscribers	All Users
Approval required	[product-plan:approval]	Whether the plan requires approval or not.		✓		
Description	[product-plan:description]	The description of the plan.		✓		
Name	[product-plan:name]	The name of a given plan within the product.		✓		
Rate limits	[product-plan:rate-limits]	A comma separated list of rate limit name value pairs that the plan contains.		✓		
Title	[product-plan:title]	The title of the plan.		✓		

API Tokens

Tokens that are related to an individual API.

Name	Token	Description	Product Subscribers	Plan Subscribers	API Subscribers	All Users
ID	[api:id]	The ID of the API.			✓	
Image URL	[api:image_url]	The URL of the image for the API.			✓	
Name	[api:name]	The name of the API.			✓	
OAI Version	[api:oai_version]	The OAI version of the API.			✓	
Protocol	[api:protocol]	The protocol of the API.			✓	
State	[api:state]	The current state the API is in.			✓	
Title	[api:title]	The title of the API.			✓	
Version	[api:version]	The version of the API.			✓	

User Tokens

Tokens that are related to the individual user account of the recipient.

Name	Token	Description	Product Subscribers	Plan Subscribers	API Subscribers	All Users
Account Name	[user:account-name]	The login name of the user account.	✓	✓	✓	✓
Created	[user:created]	The date the user account was created.	✓	✓	✓	✓
Display Name	[user:display-name]	The display name of the user account.	✓	✓	✓	✓
Email	[user:mail]	The email address of the user account.	✓	✓	✓	✓
First Name	[user:first_name]	The first name of the user.	✓	✓	✓	✓

Name	Token	Description	Product Subscribers	Plan Subscribers	API Subscribers	All Users
Last Name	[user:last_name]	The last name of the user.	✓	✓	✓	✓
Roles	[user:roles]	The user roles associated with the user account.	✓	✓	✓	✓
State	[user:apic_state]	List (text) field.	✓	✓	✓	✓
User ID	[user:uid]	The unique ID of the user account.	✓	✓	✓	✓

Current User Tokens

Tokens that are related to the current user who is initiating the sending of the emails.

Name	Token	Description	Product Subscribers	Plan Subscribers	API Subscribers	All Users
Account name	[current-user:account-name]	The login name of the user account.	✓	✓	✓	✓
Display name	[current-user:display-name]	The display name of the user account.	✓	✓	✓	✓
Email	[current-user:mail]	The email address of the user account.	✓	✓	✓	✓

Site Information Tokens

Tokens that are related to site-wide settings and other global configuration.

Name	Token	Description	Product Subscribers	Plan Subscribers	API Subscribers	All Users
Email	[site:mail]	The administrative email address for the site.	✓	✓	✓	✓
Login page	[site:login-url]	The URL of the site's login page.	✓	✓	✓	✓
Name	[site:name]	The name of the site.	✓	✓	✓	✓
Slogan	[site:slogan]	The slogan of the site.	✓	✓	✓	✓
URL	[site:url]	The URL of the site's front page.	✓	✓	✓	✓
URL (brief)	[site:url-brief]	The URL of the site's front page without the protocol.	✓	✓	✓	✓

Current Date Tokens

Tokens that are related to the current date and time.

Name	Token	Description	Product Subscribers	Plan Subscribers	API Subscribers	All Users
Custom format	[current-date:custom:?]	A date in a custom format. See the PHP documentation for details.	✓	✓	✓	✓
Fallback date format	[current-date:fallback]	A date in 'fallback' format. (Fri, 01/08/2021 - 14:19)	✓	✓	✓	✓
HTML Date	[current-date:html_date]	A date in 'html_date' format. (2021-01-08)	✓	✓	✓	✓
HTML Datetime	[current-date:html_datetime]	A date in 'html_datetime' format. (2021-01-08T14:19:19+0000)	✓	✓	✓	✓
HTML Month	[current-date:html_month]	A date in 'html_month' format. (2021-01)	✓	✓	✓	✓
HTML Time	[current-date:html_time]	A date in 'html_time' format. (14:19:19)	✓	✓	✓	✓
HTML Week	[current-date:html_week]	A date in 'html_week' format. (2021-W01)	✓	✓	✓	✓
HTML Year	[current-date:html_year]	A date in 'html_year' format. (2021)	✓	✓	✓	✓
HTML Yearless date	[current-date:html_yearless_date]	A date in 'html_yearless_date' format. (01-08)	✓	✓	✓	✓
Long format	[current-date:long]	A date in 'long' format. (Friday, January 8, 2021 - 14:19)	✓	✓	✓	✓
Medium format	[current-date:medium]	A date in 'medium' format. (Fri, 01/08/2021 - 14:19)	✓	✓	✓	✓
Raw timestamp	[current-date:raw]	A date in UNIX timestamp format (1610115559)	✓	✓	✓	✓
Short format	[current-date:short]	A date in 'short' format. (01/08/2021 - 14:19)	✓	✓	✓	✓
Time-since	[current-date:since]	A date in 'time-since' format. (6 minutes)	✓	✓	✓	✓

How to style the Developer Portal emails

You can apply a theme to the HTML emails that are sent by the Developer Portal by using CSS and templating.

Before you begin

You must have administrator access to complete this task.

You must have a custom theme. For information about how to create a custom theme, see [Creating a sub-theme](#).

About this task

You can apply custom styling to the HTML content of the emails that are sent by the Developer Portal, such as the emails that are sent by the Email subscribers wizard. The custom styling consists of two parts: editing a twig template and, optionally, also editing a CSS file in your custom theme. See the following instructions for details. Note: These instructions apply only to emails that are sent by the Developer Portal. These instructions don't apply to the consumer invitation, activation, and password reset emails, as these emails are sent by the API Manager. For information about how to style API Manager emails, see [Configuring notifications](#) and [Sending messages to consumer organization owners](#).

Procedure

1. Download the `ibm-apic-mail-message.html.twig` template from https://github.com/ibm-apiconnect/devportal/tree/master/ibm_apim/ibm_apic_mail/templates, and save it to your custom theme templates directory.
2. Edit the `ibm-apic-mail-message.html.twig` template to fit your custom theme.
You can add styles directly into this twig template, or you can add them to the `css/mail.css` file in your custom theme, which will mean that they are automatically included in the HTML email content that is sent.

If you are using an SCSS theme that has been generated by the Developer Portal theme generator, then you can put the custom SCSS mail styles into the `mail-overrides.scss` file. These styles will then be compiled into the `mail.css` file.

Note: If you are using an older theme that was generated before API Connect Version 10.0.4.0, then the theme won't contain the mail theme support. However, you can workaround this by generating a new sub-theme with the same name, copying the `overrides.css`, or `overrides.scss`, as appropriate, `logo.png`, and `*.theme` files from the old theme into the new sub-theme, and then compress and install the new sub-theme as usual. (See [Creating a sub-theme](#) for details.)

3. Define a standard set of classes in the `ibm-apic-mail-message.html.twig` template that the Developer Portal administrators can use.
The twig template lists the variables that can be used within it. The HTML `<body>` element is the actual content of the email message as defined within Drupal. For example, that content could be the information that's entered in the WYSIWYG editor of the Email subscribers wizard. Note that the HTML content in the WYSIWYG editor is more restricted for security reasons, for example, it's not possible to use inline styles in the HTML content in the editor. However, it is possible to use CSS class names, and then define the class in the `mail.css` file, which is then included in the emails. Therefore, it's recommended that you define a standard set of classes that the Developer Portal administrators can use when they're creating emails.

4. Optional: Add images to the `ibm-apic-mail-message.html.twig` template.
Images can be used by adding a `` reference in the twig template. The `src` attribute for the image must be a fully qualified web URL, and must be externally accessible so that the email recipients can access the image. It's not possible to reference local images, they must be fully qualified URLs. It's also not possible to embed or attach images or other files in the emails.

Note: The `logo` will be automatically set to the fully qualified URL for the site logo image.

5. Compress all of your sub-theme resources back into a .zip file, and install into the Developer Portal. See [Installing additional themes](#) for details.

What to do next

It is possible to have multiple email templates. For example for different modules, where one template could be used for the emails that are sent by the contact module, and another template for the emails that are sent by the Email subscribers wizard. This more advanced configuration can be done by using the module and key attributes, and is explained within the twig template itself. Essentially, you create a twig template that's called `ibm-apic-mail-message.contact.html.twig`, for example, to override the default template for only the contact module. Then the most specific template for a module is used by the Developer Portal, before falling back on the more general template.

Working with roles in the Developer Portal

As a site administrator, you can create and customize site configuration roles in the Developer Portal.

Rather than assigning individual permissions to each user, permissions are assigned to roles, and then roles are assigned to users. Using roles gives administrators greater control over permissions, and makes it easy to assign and remove roles when necessary.

Administrators can assign the following site configuration roles to users in the Developer Portal:

Superuser

The Superuser role has the highest level of permissions in the Developer Portal, and is the role that is assigned by default to the admin user, in addition to the Administrator role, when they enable a Developer Portal site in the API Manager. This role bypasses all content access control, which means that users that have a Superuser role can see all of the site content. This level of access can lead to some unexpected behavior when they access content such as their Consumer organizations and their applications. Careful consideration should be given before you assign users to a Superuser role.

Administrator

An Administrator can use the administrator dashboard to customize and configure the Developer Portal. An Administrator is able to perform any task within the Developer Portal that does not involve the creation of APIs, Products, and Apps.

Content Author

A Content Author is a curator of content for the Developer Portal. A Content Author can perform the following actions:

- Set taxonomies on the content.
- Provide custom icons for content.
- Upload additional documentation files.
- Create documentation pages in the Developer Portal.

Forum Moderator

A Forum Moderator can moderate the content of a forum in the Developer Portal.

Note: Every account in the Developer Portal, including across different user registries for the same site, must have a unique email address, including the site Admin account. For example, if you configure three different user registries for a particular Developer Portal site, the email address *alice@acme.com* can be used to log in to the site from only one of the user registries. The default email address for the Admin account is the email address of the Catalog owner. It is not possible to create a user account (and associated Consumer organization) with the same email address as the Admin account (or that of the Catalog owner if their email address is different). Any attempts to create an account with the same email address results in the new account not functioning correctly, and returning the following error message when trying to log in: **A user already exists with this email address.**

To learn how to create and customize roles in the Developer Portal, use the following topic links:

- [Creating administrator users for the Developer Portal](#)
You can create additional administrator users for an Developer Portal.
- [Assigning users to a role](#)
Assign users to one or more roles in the Developer Portal to enable role specific permissions.
- [Assigning permissions to a role](#)
You can assign permissions to a new role in the Developer Portal, and update the permissions for current roles.
- [Creating a new role](#)
You can create a new role within the Developer Portal.

Creating administrator users for the Developer Portal

You can create additional administrator users for an Developer Portal.

Before you begin

You must have administrator access to complete this task.

About this task

After you enable a Developer Portal site in the API Manager, you are sent an email that contains a one-time log in link for the Developer Portal site Admin user. The Admin user can administer the Content Management System (CMS) capabilities of the Developer Portal. For more information about enabling a site, see [Creating and configuring Catalogs](#).

However, you can also create additional administrative roles for users from within the Developer Portal by assigning the role to users that have access to the Developer Portal. A user with an Administrator role can use the administrator dashboard to customize and configure the Developer Portal. An Administrator is able to perform any task within the Developer Portal that does not involve the creation of APIs, Products, and Apps. You should be careful to ensure that only trusted users are given this access and level of control of your site.

Procedure

To create additional administrative users, complete the following steps:

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click People in the administrator dashboard.
3. Select the List tab.
4. Select the check boxes for the target users.
5. From the drop-down list under the Action heading, select Add the Administrator role to the selected user(s).
6. Click Apply to selected items.

Results

You have assigned the selected users to the Administrator role.

Assigning users to a role

Assign users to one or more roles in the Developer Portal to enable role specific permissions.

Before you begin

You must have administrator access to complete this task.

Procedure

To assign users to a role, complete the following steps:

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click People in the administrator dashboard.
3. Select the List tab.
4. Select the check boxes for the target users.
5. From the drop-down list under the Action heading, select the role that you want to assign.
6. Click Apply to selected items.

Results

You have assigned the selected users to the required role.

Assigning permissions to a role

You can assign permissions to a new role in the Developer Portal, and update the permissions for current roles.

Before you begin

You must have administrator access to complete this task.

Procedure

To assign or update permissions for a role, complete the following steps:

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click People in the administrator dashboard.
3. Select the Permissions tab.
4. Assign a permission to a role, by selecting the check box in the relevant column for the permission that you want to assign.
5. Click Save permissions.

Results

You have assigned permissions to the target role.

Creating a new role

You can create a new role within the Developer Portal.

Before you begin

You must have administrator access to complete this task.

Procedure

To create a new role, complete the following steps:

1. Click People in the administrator dashboard.
2. Select the Roles tab.
3. Click Add role.
4. Enter a name for the new role in Role name, and click Save.
5. Your new role is displayed in the list of roles. You can drag any of the roles to re-order them. It's recommended to order roles from least permissive (for example, Anonymous user) to most permissive (for example, Administrator user). Users who aren't logged in have the Anonymous user role. Users who are logged in have the Authenticated user role, plus any other roles granted to their user account.

Results

You have created a new role in the Developer Portal.

What to do next

The new role is created with the same permissions as an Authenticated user role. You can click the Permissions tab and edit the permissions as required.

Forums

Create and control forums in the Developer Portal.

The Developer Portal lets you create threaded discussion boards, called forums, on your site. To learn how to configure forums, use the following topic links.

- [Creating a new forum](#)
You can create a new forum in the Developer Portal.
- [Creating new forum containers](#)
You can create new forum containers in the Developer Portal.

You can mark content in a forum as sticky in the Developer Portal.
- [Removing forum posts](#)
You can remove forum posts in the Developer Portal.
- [Turning off forums in the Developer Portal](#)
You can turn off forums in the Developer Portal by disabling the Forum module. This action prevents users from viewing, and contributing to, forums.

Creating a new forum

You can create a new forum in the Developer Portal.

Before you begin

You must have administrator or Forum moderator access to complete this task.

Procedure

To create a new forum, complete the following tasks:

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Structure in the administrator dashboard.
3. Click Forums.
4. Click Add forum.
5. Fill in the Name and Description fields for the new forum.
6. From the Parent drop-down list, select the hierarchical position of the new forum.
7. Click Save. You have created a new forum.

Creating new forum containers

You can create new forum containers in the Developer Portal.

Before you begin

You must have administrator or Forum moderator access to complete this task.

Procedure

To create a new forum containers, complete the following tasks:

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Structure in the administrator dashboard.
3. Click Forums.
4. Click Add container.
5. Fill in the Name and Description fields for the new forum container.
6. From the Parent drop-down list, select the hierarchical position of the new forum container.
7. Click Save. You have created a new forum container.

Configuring the creation of new forums for each API

You can choose whether or not to automatically create a new forum when an API is created in the Developer Portal.

Before you begin

You must have administrator access to complete this task.

Procedure

To configure the creation of new forums for each API, complete the following tasks:

1. If the administrator dashboard is not displayed, click **Manage** to display it.
 2. Click **Configuration** in the administrator dashboard.
 3. Under the **SYSTEM** heading, click **IBM API Connect**.
 4. Select or clear the **Automatically create a forum per API** check box to turn the feature on or off.
 5. Click **Save configuration**.
- You have configured the creation of new forums for each API.

Locking forum topics

You can lock forum topics in the Developer Portal.

Before you begin

You must have administrator or Forum moderator access to complete this task.

Procedure

To lock forum topics, complete the following tasks:

1. If the administrator dashboard is not displayed, click **Manage** to display it.
 2. Click **Content** in the administrator dashboard.
 3. Click **Edit** for the forum topic that you want to lock.
 4. Click **Comment settings**. The view expands.
 5. Select **Closed**.
 6. Keeping the **Published** selected, click **Save**.
- You have disallowed any further replies and marked the topic as locked.

Marking content in a forum as sticky

You can mark content in a forum as sticky in the Developer Portal.

Before you begin

You must have administrator or Forum moderator access to complete this task.

Procedure

To mark content in a forum as sticky, complete the following tasks:

1. If the administrator dashboard is not displayed, click **Manage** to display it.
 2. Click **Content** in the administrator dashboard.
 3. From the **Action** drop-down menu, select **Make content sticky**.
 4. Select the check boxes next to the forum topics that you want to make sticky.
 5. Click **Apply to selected items**.
- You made the selected forum content sticky.

Removing forum posts

You can remove forum posts in the Developer Portal.

Before you begin

You must have administrator or Forum moderator access to complete this task.

Procedure

To remove forum posts, complete the following tasks:

1. If the administrator dashboard is not displayed, click **Manage** to display it.
 2. Click **Content** in the administrator dashboard.
 3. From the **Action** drop-down menu, select **Delete content**.
 4. Select the check boxes next to the forum posts that you want to remove.
 5. Click **Apply to selected items**.
- You removed the selected forum posts.

Turning off forums in the Developer Portal

You can turn off forums in the Developer Portal by disabling the Forum module. This action prevents users from viewing, and contributing to, forums.

Before you begin

You must have administrator access to complete this task.

About this task

To turn off forums, you must first remove all Forums terms, and then you can disable the Forum module.

Procedure

To turn off forums, complete the following steps.

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Delete all Forums terms by completing the following steps:
 - a. Click Structure > Taxonomy > Forums in the administrator dashboard.
The list of Forums terms is displayed.
 - b. For each item in the list of terms, select Delete from the drop-down list in the OPERATIONS column, and then click Delete again to confirm.
All of the Forums terms are deleted.
3. Disable the Forum module by completing the following steps:
 - a. Click Extend > Disable module in the administrator dashboard.
 - b. Select the Forum module, then click Disable.
 - c. The display then shows a list of forum configuration that will also be removed if the Forum module is disabled. Click Disable again to confirm that you agree to this removal.

Results

You successfully turned off forums in the Developer Portal.

If you want, you can enable the Forum module again by clicking Extend, selecting the Forum module on the List tab, and clicking Enable.

Reports

You can view reports about the general configuration and status of your Developer Portal site.

Use the Reports section in the Developer Portal to view information about the following areas:

Available updates

Status report about available updates for your installed modules and themes.

Node Type Count

Status report about how much of each content type there is in your portal site, and whether it is published or not. It can also provide totals of how many users there are of each role.

Available translation updates

Status report about available interface translations for your installed modules and themes.

Field list

Overview of fields on all entity types.

Status report

Short overview of your site's parameters, as well as any problems detected with your installation.

Views plugins

Overview of the plugins that are used in all views.

Extend

You can extend the Developer Portal by creating and installing custom modules, or installing additional Drupal contributed modules.

CAUTION:

It is not recommended to use custom modules in the Developer Portal to customize the user management process or flow. Instead, make changes in the API Manager, which owns all of the consumer user records.

Modules provide functionality to your site, and the *core modules* that are included in the standard Developer Portal installation, provide all of the basic functions that most sites need. However, some of the core modules are not enabled by default, so you might want to examine the module list under the Extend menu of your site, to see whether the functionality you require is available from a core module before starting to investigate custom and contributed modules. If you still require additional custom or contributed modules, consider the following topics to help you create and implement modules consistently.

Note: The Drupal rules framework for event based actions is not supported in the Developer Portal as it is not reliable and exhibits unexpected behavior. Instead, you can create a custom module using the same events and actions as a workaround.

Custom module development: an introduction to Drupal tools for PHP development

Some guidance about the Drupal tools and environment considerations when developing in PHP, to help when writing custom modules to extend your Developer Portal functionality.

The following sections provide an overview of the key automation tools and environment considerations for PHP development in the Developer Portal. For a complete list of Drupal tools, see [Development tools overview](#) on Drupal.org, however, note that you are not permitted to access the shell inside the Developer Portal containers. Important:

- You are not permitted to include any IBM® API Connect modules within any custom modules that you create. Also, directly editing any API Connect themes, modules, included modules, or Drupal core on the file system is not permitted or supported, as edited versions of these files are overwritten when a fix pack or iFix is installed.
- All custom development is your responsibility. Although the use of custom modules and themes is supported, IBM API Connect do not provide support in their development or modification.

Devel, Devel Generate Kint, and Webprofiler development modules

The Devel, Devel Generate Kint, and Webprofiler modules are all packaged within the Devel module. These modules provide the following development support:

- *Devel* - Helper functions for Drupal developers.
- *Devel Generate Kint* - Accelerate development of your site or module by quickly generating nodes, comments, terms, users, and more.
- *Kint* - Pretty print of variables with `kint($my_var)`.
- *Webprofiler* - Port of the Symfony WebProfiler Bundle as a Drupal module.

For more information, see [Devel module](#) on drupal.org, and [Devel](#) on drupalship.org.

Admin Toolbar module

The Admin Toolbar module improves the default Drupal Toolbar by transforming it into a drop-down menu, providing fast access to the administration pages. It also adds extra links to the Drupal icon on the admin toolbar to development tools such as flush all caches, run cron, and run updates.

For more information, see [Admin toolbar module](#) on drupal.org.

Examples for developers project

The Examples for Developers project aims to provide high-quality, well-documented API examples for a broad range of Drupal core functionality.

The project contains many modules that illustrate best practices for implementing Drupal core APIs. For example there are examples for Block, Cache, Config and Content Entity, Cron, Database API, Email, Events, Form API, Field, Field Permission, File, Hooks, Javascript, Node Type, Page, Pager, PHPUnit, Plugin Type, Queue, Simple Test, Stream Wrapper, Table Sort, Testing, and Tour.

For more information, see [Examples for developers project](#) on drupal.org.

Coding standards

The Drupal Coding Standards apply to code within Drupal and its contributed modules. For more information, see [Coding standards](#) on drupal.org.

Custom module development: background and prerequisites

You can create custom modules in the Developer Portal to extend functionality. The following information provides a getting started developer guide to custom module development.

CAUTION:

It is not recommended to use custom modules in the Developer Portal to customize the user management process or flow. Instead, make changes in the API Manager, which owns all of the consumer user records.

Custom modules are written in PHP, which is an open source server-side scripting language that is used for creating dynamic web pages. For general information on the Drupal tools for PHP development, see [Custom module development: an introduction to Drupal tools for PHP development](#).

The following sections provide an overview of custom module development, with links to learn more about the required development languages and concepts. Creating custom modules affects the source of your Developer Portal site, so it is recommended that you gain Drupal experience and PHP knowledge before you start creating modules.

Important:

- You are not permitted to include any IBM® API Connect modules within any custom modules that you create. Also, directly editing any API Connect themes, modules, included modules, or Drupal core on the file system is not permitted or supported, as edited versions of these files are overwritten when a fix pack or iFix is installed.
- All custom development is your responsibility. Although the use of custom modules and themes is supported, IBM API Connect do not provide support in their development or modification.

Object-Oriented Programming (OOP)

OOP is established as best practice for development, so ensure your knowledge of OOP is good. The PHP documentation on [Classes and Objects](#) is a good place to start. For a general overview of PHP best practices, see [PHP The Right Way](#). The following resources are also helpful:

- [Object-oriented programming](#) (on Wikipedia)
- [Object Oriented Programming with PHP](#) (on phpro.org)
- [Object-Oriented PHP for Beginners](#) (on tutsplus.com)
- [Object Oriented Programming in PHP](#) (on tutorialspoint.com)

Drupal also uses some common design patterns, so you need to ensure you have a basic understanding of these. See the following pattern resources:

- [The Factory Pattern](#) (on phptherightway.com), and [Late Static Bindings](#) (on php.net)
- [Software design pattern](#) (on Wikipedia)
- [Programming Foundations: Design Patterns](#) (on lynda.com)

PHP namespaces

You must be familiar with the concept of namespaces in PHP. In most cases, the Drupal code is namespaced based on the module that code belongs to.

For example, the namespace for `block.module` is:

```
namespace Drupal\block;
```

When you create Drupal modules, it is important to consider that PHP has a global namespace, and that function names must be unique. You are recommended to prefix the name of any methods with the module name.

For example, if you have a module that is named `custom_module`, a `create` method within it is called `custom_module_create()`.

For more information about namespaces, see the following resources:

- [Drupal namespace standards](#) (on drupal.org)
- [How to use PHP namespaces](#) (on sitepoint.com)
- [PHP Namespaces](#) (on php.net)

Dependency injection

It is important that you have a baseline understanding of dependency injection. Drupal makes heavy use of this concept, so you will need this understanding to be able to access and make use of many of the core APIs.

To find out more about dependency injection, see [Dependency Injection](#) (on phptherightway.com), as well as the additional articles that are linked to on that page. See also [Services and dependency injection in Drupal](#) (on drupal.org).

Symfony

Symfony is a set of reusable PHP components and a PHP framework for web projects. Drupal borrows from this framework in order to reduce code duplication across various PHP projects. Much of the code that Drupal uses to handle routing, sessions, and the services container, amongst other things, is borrowed from Symfony.

To understand how Symfony works, see the [Symfony Documentation](#) on symfony.com.

Other useful resources

- [Drupal API Annotations](#) - list of the different annotation types that Drupal uses for plugin discovery, and to provide additional context/meta-data for the code that's being executed.
- [Plugin API overview](#) - overview about how plugins are used in Drupal.
- Tools are available for checking your custom modules, such as [drupal_check](#) on GitHub, which checks Drupal code for deprecations.

Custom module development: creating a module skeleton

You can extend your Developer Portal site by creating custom modules. The starting point for a new module is to create a module skeleton.

Before you begin

You must have administrator access to complete this task.

You must also have experience in Drupal and PHP development. For more information, see [Custom module development: an introduction to Drupal tools for PHP development](#) and [Custom module development: background and prerequisites](#).

Important:

- You are not permitted to include any IBM® API Connect modules within any custom modules that you create. Also, directly editing any API Connect themes, modules, included modules, or Drupal core on the file system is not permitted or supported, as edited versions of these files are overwritten when a fix pack or iFix is installed.
- All custom development is your responsibility. Although the use of custom modules and themes is supported, IBM API Connect do not provide support in their development or modification.

About this task

Every custom module creation starts with creating an .info.yml file. This file, or module skeleton, is used to store the metadata about the custom theme. After the module skeleton is created, the module can be installed onto your site by using the Extend menu on the administrator dashboard of the Developer Portal UI. However, without any module specific code, your site won't be affected.

The following instructions guide you through creating a custom module skeleton. What to do next in your custom module creation depends on what you want your module to do. Options are shown at the end of this task.

Procedure

1. Choose a short name, also known as a machine name, for your custom module.
The machine name is used in several files and functions in your module, as well as by Drupal core to programmatically refer to your module. The name must conform to the following rules:
 - It must start with a letter.
 - It must contain only lowercase letters and underscores. (Note that if uppercase letters are used in the name, Drupal won't recognize any hook implementations in your module.)
 - It must not contain any spaces.
 - It must be unique within your Developer Portal site.
 - It should not be any of the following reserved terms: **src, lib, vendor, assets, css, files, images, js, misc, templates, includes, fixtures, Drupal**.
2. Create a module folder in a location of your choice, for example, /modules/module_name.
You don't have to name the folder the same name as your module machine name, however, you must remember to use the machine name programmatically within your module's code and filenames.
3. Create a `module_name.info.yml` file in your module folder.
Where `module_name` is the short name, or machine name, that you chose in Step 1.
4. Insert the metadata for your custom module into the `module_name.info.yml` file as follows:

```
name: Example module name
description: Description of the module.
package: Custom

type: module
core: 8.x
core_version_requirement: '^8 || ^9'
version: 1.0

dependencies:
  - module_name

test_dependencies:
  - module_name

figure: example.settings
```

```
php: 7.1
```

```
hidden: true
```

where

- **name** (required) is the name of your module, and is the text that is shown on the module administration page in the Developer Portal UI.
- **description** (optional) is a description of your module, and is the text that is shown on the module administration page in the Developer Portal UI.
- **package** (optional) is a key that enables you to group similar modules together.
- **type** (required) is the type of extension that you are creating, for example, a module, theme or profile. In this instance you are creating a module.
- **core** (optional) specifies with which Drupal core version your module is compatible.
- **core_version_requirement** (required) specifies which versions of Drupal your module is compatible with. This example specifies that the module is compatible with all versions of Drupal 8 and 9.
- **version** (required) is the version number of your module. Note that **version** is not required if you are publishing your module on Drupal.org.
- **dependencies** (optional) is a YAML list of any modules that your module depends on. They must be namespaced in the format `module_name`, where `module_name` is the module's machine name.
- **test_dependencies** (optional) is list of any modules (in the same format as **dependencies**) that are needed to run certain automated tests for your module on Drupal's automated test runner (DrupalCI), but are not needed as module dependencies in general.
- **configure** (optional), if your module offers a configuration form, specify the route to this form here.
- **php** (optional) is the minimum PHP version that is required for your module. For the Developer Portal the minimum PHP version is 7.1.
- **hidden** (optional) is an option that, if set, will hide your module from the Extend section of the administrator dashboard on the Developer Portal UI. This option might be useful if your module only contains tests, or if the module is meant as an example to other developers.

5. Save your `module_name.info.yml`.

Results

You successfully created your module skeleton.

Example

An example `.info.yml` file:

```
name: User field example
type: module
description: Developer Portal tutorial about a user field example
package: IBM API Connect Tutorials
core: 8.x
core_version_requirement: '^8 || ^9'
version: 8.x-0.0.1
dependencies:
  - ibm_apim
  - auth_apic
```

What to do next

You now need to create the appropriate content for your custom module, depending on what you want the module to do. For information about the various options, see [Creating custom modules](#) on Drupal.org. There is also a walkthrough example of creating a basic custom module that is available on Drupal.org, see: [A "Hello World" custom page module](#).

Note: If you are defining URL paths in the routing file of your module, you must consider any potential implications of those paths, and avoid conflicts with other parts of the Developer Portal. For example, you are recommended not to prefix any paths with `ibm_apic`.

After you have created your custom module content, you need to package your custom module files up into a zip, tar, gz, or bz2 file. This file can then be installed onto your Developer Portal site by using the Extend menu on the administrator dashboard. For more information, see [Installing custom modules](#).

Related information

- [Let Drupal know about your module with an .info.yml file](#)

Custom module development: using hooks

You can use hooks in custom modules to alter the behavior of Drupal core or other modules in your Developer Portal.

Custom modules enable you to extend the functionality of your Developer Portal site. For more information about how to create custom modules, see [Custom module development: an introduction to Drupal tools for PHP development](#), and [Custom module development: background and prerequisites](#).

Hooks are one of the ways that custom modules can use to interact with other modules and with Drupal core subsystems. The following sections provide an overview of hooks, and a list of the IBM® API Connect specific hooks.

Important:

- You are not permitted to include any IBM API Connect modules within any custom modules that you create. Also, directly editing any API Connect themes, modules, included modules, or Drupal core on the file system is not permitted or supported, as edited versions of these files are overwritten when a fix pack or iFix is installed.
- All custom development is your responsibility. Although the use of custom modules and themes is supported, IBM API Connect do not provide support in their development or modification.

About hooks

Hooks define functions that alter the behavior of Drupal core. So one way for custom modules to alter these functions, is to use hooks. Hooks are specially-named functions that a module defines (this is known as *implementing the hook*), these hooks are then discovered and called at specific times to alter or add to the base behavior or data (this is known as *invoking the hook*). Each hook has a name (for example: `hook_batch_alter()`), a defined set of parameters, and a defined return value. Your custom modules can implement hooks that are defined by Drupal core, by API Connect, or by other modules that they interact with. Your custom modules can also define their own hooks in order to let other modules interact with them. For more information, see [Understanding Hooks](#) on Drupal.org.

Note: If you write a hook implementation function, the function must not throw errors or exceptions, or use `alert` level log messages. Errors, exceptions, and `alert` level log messages can break all the processing in the parent code. For example, if you write a hook that calls an external server when an application is updated, the code needs to have error handling in place to handle the server not being found, or not returning the expected result. Otherwise, Drupal stops parsing the function and the application might not get updated correctly. It can cause webhook and snapshot parsing to abort leaving the portal in an inconsistent state.

For a list of all the hooks that are available on Drupal core, and how to implement them in your custom module, see [Drupal API Hooks](#).

For a list of all the API Connect specific hooks, see the following section.

Using hooks in custom modules

To invoke a hook you need to add a function to your `.module` file in your custom module, and prefix the hook with your custom module name. For example, when using an API Connect hook in a custom module, you must replace the word `hook` in the hook name with the name of your custom module. For example:

`hook_apic_app_create`

should be referenced in your custom module as:

`moduleName_apic_app_create`

See also the following example `.module` file that shows a custom module called `user_field_example`:

```
/**
 * Implementation of hook_form_alter() to alter the Sign up form
 */
function user_field_example_form_alter(&$form, FormStateInterface $form_state, $form_id) {
  if ($form_id === 'user_register_form') {
    // add our validator to the #validate array for the user_register_form
    $form['#validate'][] = 'user_field_example_validate_department_code';
  }
}

/**
 * Validate the Department code field on the Sign up form.
 *
 * Valid entry = DEPnnn
 * where n = single figure digit.
 */
function user_field_example_validate_department_code($form, &$form_state) {
  if (isset($form_state->getValue('field_department_code')[0]['value'])) {
    $dept_code = $form_state->getValue('field_department_code')[0]['value'];
    $valid = preg_match('/^DEP\d{3}$/', $dept_code);
    if (!$valid) {
      // if the value is not valid then set an inline error on the relevant field
      $form_state->setErrorByName('field_department_code', t('Invalid department code.'));
    }
  }
}
```

API Connect specific hooks

The following tables list the hooks that are specific to the API Connect Developer Portal. Each section contains a link to the `.php` file on the API Connect Developer Portal repository on GitHub for those hooks. This file contains examples of how you can use the hooks in your modules.

Hooks about Applications

The following table lists the hooks that relate to Applications in the Developer Portal. For examples of how to use Application hooks, see [apic_app/apic_app.api.php](#) on GitHub.

Table 1. Hooks about Applications

Hook name	Description
<code>hook_apic_app_create</code>	Triggered when an Application is created.
<code>hook_apic_app_update</code>	Triggered when an Application is updated.
<code>hook_apic_app_pre_delete</code>	Triggered when an Application is deleted, before the node deletion or cascade has happened.
<code>hook_apic_app_post_delete</code>	Triggered when an Application is deleted, after the node deletion or cascade has happened.
<code>hook_apic_app_promote</code>	Triggered when an Application is promoted.
<code>hook_apic_app_creds_create</code>	Triggered when a new set of credentials is created for an Application.
<code>hook_apic_app_creds_update</code>	Triggered when a set of credentials is updated for an Application.
<code>hook_apic_app_creds_delete</code>	Triggered when a set of credentials is deleted for an Application.
<code>hook_apic_app_subscribe</code>	Triggered when a subscription is created.
<code>hook_apic_app_migrate</code>	Triggered when a subscription is migrated to a new Plan.
<code>hook_apic_app_unsubscribe</code>	Triggered when an Application is unsubscribed from a Plan.
<code>hook_apic_app_image_create</code>	Triggered when a custom Application image is created.
<code>hook_apic_app_image_delete</code>	Triggered when a custom Application image is deleted.

Hook name	Description
hook_apic_app_clientid_reset	Triggered when a credential client ID is reset.
hook_apic_app_clientsecret_reset	Triggered when a credential client secret is reset.
hook_apic_app_modify_getplaceholderimage_alter	Alter the Application placeholder image provided in \Drupal\apic_app\Application::getPlaceholderImage(). Can be used to define a specific placeholder image to use when the consumer has not uploaded their own custom image for their Application.
hook_apic_app_modify_getimageforapp_alter	Alter the Application placeholder image provided in \Drupal\apic_app\Application::getImageForApp(). Can be used to provide a full path to a specific image to use for an Application that overrides any custom image that might have been uploaded.
hook_apic_app_modify_clientid_reset_alter	Alter the client ID provided by API Manager when the ID is reset.
hook_apic_app_modify_clientsecret_reset_alter	Alter the client secret provided by API Manager when the secret is reset.
hook_apic_app_modify_credentials_create_alter	Alter the credentials provided by API Manager when a new Application is created.
hook_apic_app_modify_credentials_create_alter	Alter the credentials provided by API Manager when new credentials are created.

Hooks about Consumer organizations

The following table lists the hooks that relate to Consumer organizations in the Developer Portal. For examples of how to use Consumer organization hooks, see [consumerorg/consumerorg.api.php](#) on GitHub.

Table 2. Hooks about Consumer organizations

Hook name	Description
hook_consumerorg_create	Triggered when a Consumer organization is created.
hook_consumerorg_update	Triggered when a Consumer organization is updated.
hook_consumerorg_pre_delete	Triggered when a Consumer organization is deleted, before the node deletion or cascade has happened.
hook_consumerorg_post_delete	Triggered when a Consumer organization is deleted, after the node deletion or cascade has happened.
hook_consumerorg_payment_method_create_alter	Triggered to allow modification of the payment method creation form.
hook_consumerorg_myorg_tabs_alter	Triggered to allow more tabs to be added to the my organization page.

Hooks about APIs

The following table lists the hooks that relate to APIs in the Developer Portal. For examples of how to use API hooks, see [apic_api/apic_api.api.php](#) on GitHub.

Table 3. Hooks about APIs

Hook name	Description
hook_apic_api_create	Triggered when an API is created.
hook_apic_api_update	Triggered when an API is updated.
hook_apic_api_delete	Triggered when an API is deleted.

Hooks about Products

The following table lists the hooks that relate to Products in the Developer Portal. For examples of how to use Product hooks, see [product/product.api.php](#) on GitHub.

Table 4. Hooks about Products

Hook name	Description
hook_product_create	Triggered when a Product is created.
hook_product_update	Triggered when a Product is updated.
hook_product_delete	Triggered when a Product is deleted.

Other IBM API Connect Hooks

The following table lists the hooks that can be for other uses.

Table 5. Other APIC Hooks

Hook name	Description
hook_ibm_apim_subscription_wizard_summary_alter	Triggered to allow modification of the summary page of the subscription wizard.

Related tasks

Related information

- [Creating custom modules](#)

Installing custom modules

You can extend your Developer Portal site by installing custom modules that you created, and also installing contributed modules from the Drupal community.

Before you begin

You must have administrator access to complete this task.

About this task

You can add extra functions to your site by installing new custom or contributed modules. For more information on creating custom modules, see [Custom module development: background and prerequisites](#). Contributed modules are modules that are contributed by Drupal community members. To search for contributed modules, go to [Drupal Download & Extend](#). You can install both types of modules into your Developer Portal site by using the following instructions.

Note: The following modules are unsupported and their installation is blocked in the Developer Portal:

- `advagg`
- `advagg_bundler`
- `advagg_css_minify`
- `advagg_ext_minify`
- `advagg_js_minify`
- `advagg_mod`
- `advagg_validator`
- `backup_migrate`
- `content_sync`
- `delete_all`
- `devel_themer`
- `domain`
- `php`
- `simple_html_mail`
- `statistics`
- `swiftmailer`
- `tfa`
- `theme_editor`

Procedure

1. If the administrator dashboard is not displayed, click Manage to display it.
2. In the administrator dashboard, click Extend.
The List tab for the Extend page opens, and the list of installed modules is displayed. The list shows all the modules that are installed. The modules that are displayed with a selected checkbox are enabled, the modules that are displayed without a selected checkbox are not enabled.
3. Click + Install new module, and either complete the Install from a URL field, or click Choose file to upload a *filename.tar.gz* module file from your local computer.
4. Click Install.
The Update manager confirms that the module was installed successfully.
5. Click Enable newly added modules to return to the List tab for the Extend page.
6. Find your newly added module in the list of modules, select its checkbox, and click Enable.
Your newly added module is now enabled and available for you to use in the Developer Portal.

Deleting custom modules

You can delete custom modules from your Developer Portal if you want to remove them entirely from your site.

Before you begin

You must have administrator access to complete this task.

Note that any custom modules that you want to delete must be disabled first, including disabling any associated sub-modules. For more information, see [Disabling modules](#). Any modules that are shipped with IBM® API Connect cannot be deleted.

Procedure

1. Log in to the Developer Portal as an administrator.
2. If the administrator dashboard is not displayed, click Manage to display it.
3. In the administrator dashboard, click Extend.
4. Click the Delete tab.
The list of disabled custom modules that can be deleted is displayed. Note that any disabled modules that have sub-modules that are still enabled, are prevented from being disabled.
5. After you have found the module that you want to disable, select the check box next to the module, then click Delete.
6. At the confirmation dialogue, select Delete to delete the module completely from your site, or select Cancel to cancel the operation.

Results

You successfully deleted the module.

What to do next

To install a module, see [Installing custom modules](#).

Disabling modules

You can disable an entire module in the Developer Portal if you want to improve performance, or remove functionality.

Before you begin

You must have administrator access to complete this task.

Note that the disable process removes all data related to a module.

Procedure

1. Log in to the Developer Portal as an administrator.
2. If the administrator dashboard is not displayed, click Manage to display it.
3. In the administrator dashboard, click Extend.
The List tab for the Extend page opens, and the list of installed modules is displayed. The list shows all the modules that are installed, some of which are enabled (displayed with a selected check box), and some of which are not enabled (where the check box is not selected).
4. Click the Disable tab.
The list of modules that can be disabled is displayed. Note that any modules that are required by other enabled modules, are prevented from being disabled.
5. Either enter the name of the module that you want to disable in the Filter by name or description field, or scroll through the list of modules.
6. After you have identified the module that you want to disable, select the check box next to the module, then click Disable.
7. At the confirmation dialogue, select Disable to disable the module and remove any data that relates to it, or select Cancel to cancel the operation.

Results

You successfully disabled the module.

What to do next

To enable a module, return to the List tab, select the check box next to the module that you want to enable, and click Enable.
You can also delete custom modules completely from your Developer Portal site; see [Deleting custom modules](#).

Using Developer Portal metadata on API Manager

For content created or updated after Version 10.0.1.0, the Developer Portal propagates more metadata to API Manager for **consumerorgs**, **users**, and **applications**.

This metadata might be values that the user provided by adding extra fields to content types, or added programmatically by using custom modules.

The benefit of this is that when you add custom fields to **consumerorgs**, **users**, and **applications**, this data is now also stored as metadata in API Manager. Storing this data allows the Developer Portal to correct or repopulate the custom fields from a webhook or a snapshot.

Related tasks

- [Installing custom modules](#)

Related information

- [Creating custom modules](#)

Using a custom module for payment method creation

You can offer free use of your products to your customers or you can configure your Developer Portal to bill your customers when they use your products. You can use a custom module to configure creation of payment methods.

Before you begin

You must have administrator access to complete this task.

You must have configured billing support in API Manager.

Create your custom module. Your custom module needs to implement the `consumerorg_payment_method_create_alter` hook, so it needs to have a function like this:

```
my_custom_module_consumerorg_payment_method_create_alter(&$form, $integration, $billing) {  
  // do this payment function with $form  
}
```

For more information, see [Custom module development: background and prerequisites](#).

Procedure

1. If the administrator dashboard is not displayed, click Manage to display it.
2. In the administrator dashboard, click Extend.
The List tab for the Extend page opens, and the list of installed modules is displayed. The list shows all the modules that are installed. The enabled modules are displayed with a selected checkbox. The disabled modules are displayed without a selected checkbox.

3. Click + Install new module, and either complete the Install from a URL field, or click Choose file to upload a *filename.tar.gz* module file from your local computer.
4. Click Install.
 - The Update manager confirms that the module was installed successfully.
5. Click Enable newly added modules to return to the List tab for the Extend page.
6. Find your newly added module in the list of modules, select its checkbox, and click Enable.
 - Your newly added module is now enabled and available for you to use in the Developer Portal.
7. In the administrator dashboard, click Configuration, > System, > IBM API Connect Billing Settings in the administrator dashboard.
8. Change the drop-down option to be your newly enabled module for your billing provider.

Results

You successfully enabled your payment method by using a custom module.

Managing the Developer Portal by using the toolkit CLI

You can perform operations on your Developer Portal by using the API Connect toolkit CLI.

- [Getting started with the Portal CLI commands](#)
The toolkit CLI provides developer portal-specific commands for managing your portal servers and sites.
- [Developer Portal CLI commands](#)
A summary of the commands that are supported in the Developer Portal CLI.
- [Scenarios that use the Portal CLI](#)
Here are some scenarios of how you can use the Portal commands in the toolkit CLI to accomplish tasks that are more complex to complete, or not possible in the Developer Portal UI.

Getting started with the Portal CLI commands

The toolkit CLI provides developer portal-specific commands for managing your portal servers and sites.

Procedure

1. Install the toolkit: [Setting up the API Connect toolkit](#)
2. Log in to the Management server: [Toolkit CLI Login](#).

```
apic login --server <management hostname/api base url> --username <username> --realm <realm>
```

Where:

- *<management hostname/api base url>* is the FQDN or base URL of your management API endpoints, for example: `mgmt.example.com` or `https://mgmt.example.com`.
- *<username>* is either the admin user or provider org owner, depending on whether you want to run cloud or provider organization scoped operations.
- *<realm>* is the user registry realm for the specified *<username>*. By default this is `admin/default-idp-1` for the admin user, and `provider/default-idp-2` for provider organization users.

Note: All portal CLI commands are either cloud admin or provider org scoped.

3. View the available toolkit portal commands by using `-m portaladmin -h`. Example:

```
apic -m portaladmin -h
...Usage:
  apic [flags]
  apic [command]
```

Available Flags:

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
-h, --help       Help for apic
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

Available Commands:

```
Creating applications and artifacts
  config                               Manage configuration variables
```

```
Publishing to the cloud
  api                                   Api operations
  apic-config                           Apic Config operations
  application                             Application operations
  backups                                 Backups operations
  consumer-org                           Consumer Org operations
  custom-module                           Custom Module operations
  custom-theme                             Custom Theme operations
  custom-translation                       Custom Translation operations
  custom-webserver-page                   Custom Webserver Page operations
  drupal-config                             Drupal Config operations
  drupal-state                             Drupal State operations
  entity                                   Entity operations
  factory-reset                             Factory Reset operations
  ip-security-enabled                       Ip Security Enabled operations
  modules                                   Modules operations
  php-memory                               Php Memory operations
```

platforms	Platforms operations
product	Product operations
security	Security operations
service-ip-allowlist	Service Ip Allowlist operations
site	Site operations
site-config	Site Config operations
sites	Sites operations
themes	Themes operations
twig	Twig operations
Other commands	
licenses	Review the license for API Connect
validate	Validate an API or product definition
version	Get the APICoconnect toolkit version

Additional help topics:

Use "apic [command] --help" for more information about a command.

4. To view command-specific help, run the command with -h:

```
apic -m portaladmin php-memory -h
Usage: apic php-memory:list [flags]
```

Php Memory operations

```
Flags:
  --format string          Output format. One of [json yaml go-template=... go-template-file=...], defaults to
yaml.
  -h, --help              Help for list
  --portal_service_name string The name of the portal service (required)
  -s, --server string     management server endpoint (required)
```

Type "apic [command] --help" for help on the following related commands:

```
php-memory:list  List the PHP memory limit on the platform.
php-memory:update Set the PHP memory limit on the portal platform.
```

```
apic -m portaladmin php-memory:list -h
Usage: apic php-memory:list [flags]
```

List the PHP memory limit on the platform.

Lists the PHP memory_limit setting on the portal platform.

```
Flags:
  --format string          Output format. One of [json yaml go-template=... go-template-file=...], defaults to
yaml.
  --portal_service_name string The name of the portal service (required)
  -s, --server string     management server endpoint (required)
```

Developer Portal CLI commands

A summary of the commands that are supported in the Developer Portal CLI.

Authenticating

Use the `apic login` command to authenticate, and the `apic logout` command to remove your local authentication credentials. For more information, see [Getting started with the Portal CLI commands](#).

Note: When you authenticate successfully, your credentials are stored, in plain text, in the file `Linux .netrc` or `Windows _netrc`. Therefore, you must set the file permissions in such a way that your credentials are not accessible by others.

Command summary

The following tables summarize `apic --mode portaladmin` commands.

Table 1. Summary of the `portaladmin` commands

Command	Description	Subcommands
<code>apic api</code>	Manage your <code>api</code> .	<ul style="list-style-type: none"> <code>apic api:add-attachment</code> - Add an attachment for an API <code>apic api:add-tag</code> - Add a tag for an API. <code>apic api:get</code> - Get an API from a portal service. <code>apic api:get-document</code> - Get a specific entire API document from the portal of the given organization and catalog. <code>apic api:list</code> - List the APIs of the given organization and catalog. <code>apic api:set-icon</code> - Set an icon for an API. <p>For more information, see Using the api commands.</p>
<code>apic apic-config</code>	Manage your <code>apic-config</code> .	<ul style="list-style-type: none"> <code>apic apic-config:get</code> - Get the configuration of a site. <p>For more information, see Using the apic-config commands.</p>

Command	Description	Subcommands
<code>apic application</code>	Manage your <code>application</code> .	<ul style="list-style-type: none"> <code>apic application:get</code> - Get an application from a portal service. <code>apic application:list</code> - List the applications on a portal service. <p>For more information, see Using the application commands.</p>
<code>apic backups</code>	Manage your <code>backups</code> .	<ul style="list-style-type: none"> <code>apic backups:list</code> - List the backups of a portal service. <p>For more information, see Using the backups commands.</p>
<code>apic consumer-org</code>	Manage your <code>apic consumer-org</code> .	<ul style="list-style-type: none"> <code>apic consumer-org:get</code> - Get a consumer org from a portal service. <code>apic consumer-org:list</code> - List the consumer orgs on a portal service. <p>For more information, see Using the consumer-org commands.</p>
<code>apic content</code>	Manage your <code>content</code> entity types.	<ul style="list-style-type: none"> <code>content:create-export</code> - Create a task to export a .tgz file containing your site content entities. <code>content:create-import</code> - Create a task to import an archive of your site content. <code>content:delete-export</code> - Cancel any currently running <code>content:create-export</code> tasks, and delete any related artifacts. <code>content:delete-import</code> - Cancel any currently running <code>content:create-import</code> tasks, and delete any related artifacts. <code>content:get-export-status</code> - Return the status of a specific export task. <code>content:get-export</code> - Stream the content of a specific export task to a .tgz file. <code>content:get-import-status</code> - Return the status of a specific import task. <code>apic content:list</code> - List all of the entities in your site for a given content entity type and, if required, bundle. <code>apic content:list-type</code> - List the content entity types that are exportable from your site. <p>For more information, see Using the content commands.</p>
<code>apic custom-module</code>	Manage your <code>custom modules</code> .	<ul style="list-style-type: none"> <code>apic custom-module:create-export</code> - Create an export of a <code>custom module</code>. <code>apic custom-module:create-import</code> - Create an import of a <code>custom module</code>. <code>apic custom-module:delete-export</code> - Delete an export of a <code>custom module</code>. <code>apic custom-module:delete-import</code> - Delete an import of a <code>custom module</code>. <code>apic custom-module:get-export</code> - Get an export of a <code>custom module</code>. <code>apic custom-module:get-export-status</code> - Get the status of an export of a <code>custom module</code>. <code>apic custom-module:get-import-status</code> - Get the status of an import of a <code>custom module</code>. <p>For more information, see Using the custom-module commands.</p>
<code>apic custom-theme</code>	Manage your <code>custom themes</code> .	<ul style="list-style-type: none"> <code>apic custom-theme:create-export</code> - Create an export of a <code>custom theme</code>. <code>apic custom-theme:create-import</code> - Create an import of a <code>custom theme</code>. <code>apic custom-theme:delete-export</code> - Delete an export of a <code>custom theme</code>. <code>apic custom-theme:delete-import</code> - Delete an import of a <code>custom theme</code>. <code>apic custom-theme:get-export</code> - Get an export of a <code>custom theme</code>. <code>apic custom-theme:get-export-status</code> - Get the status of an export of a <code>custom theme</code>. <code>apic custom-theme:get-import-status</code> - Get the status of an import of a <code>custom theme</code>. <p>For more information, see Using the custom-theme commands.</p>
<code>apic custom-translation</code>	Manage your <code>custom translations</code> .	<ul style="list-style-type: none"> <code>apic custom-translation:create-export</code> - Create a task to export a <code>custom translation</code>. <code>apic custom-translation:create-import</code> - Create a task to import a <code>custom translation</code>. <code>apic custom-translation:delete-export</code> - Cancel any ongoing or recently created export tasks. <code>apic custom-translation:delete-import</code> - Cancel any ongoing or recently created import tasks. <code>apic custom-translation:get-export</code> - Streams an export artifact of a <code>custom translation</code> back to the provided task ID. <code>apic custom-translation:get-export-status</code> - Get the status of an export of a <code>custom translation</code>. <code>apic custom-translation:get-import-status</code> - Get the status of an import of a <code>custom translation</code>. <p>For more information, see Using the custom-translation commands.</p>
<code>apic custom-webserver-page</code>	Manage your <code>custom-webserver-page</code> content.	<ul style="list-style-type: none"> <code>apic custom-webserver-page:delete</code> - Delete a custom HTML web server error page. <code>apic custom-webserver-page:get</code> - Get the content of a custom HTML web server error page. <code>apic custom-webserver-page:set</code> - Set a custom HTML web server error page by using a valid HTML5 content file. <p>For more information, see Using the custom-webserver-page commands.</p>

Command	Description	Subcommands
<code>apic drupal-config</code>	Manage your <code>drupal-config</code> .	<ul style="list-style-type: none"> <code>apic drupal-config:delete</code> - Delete a Drupal config object, or a specific config key. <code>apic drupal-config:get</code> - Get all of the key values for a Drupal config object, or a specific config key value. <code>apic drupal-config:list</code> - List the Drupal config names by prefix, or list all. <code>apic drupal-config:set</code> - Set a new Drupal config key and value, or update an existing config key and value. <p>For more information, see Using the drupal-config commands.</p>
<code>apic drupal-state</code>	Manage your <code>drupal-state</code> keys and values.	<ul style="list-style-type: none"> <code>apic drupal-state:delete</code> - Delete a specific Drupal state key and value. <code>apic drupal-state:get</code> - Get a specific Drupal state key value. <code>apic drupal-state:set</code> - Set a new Drupal state key and value, or update an existing state key value. <p>For more information, see Using the drupal-state commands.</p>
<code>apic entity</code>	Manage your <code>entity</code> .	<ul style="list-style-type: none"> <code>apic entity:count</code> - A count of entities from a site. <p>For more information, see Using the entity commands.</p>
<code>apic export-entity</code>	Manage the export of your content entities.	<ul style="list-style-type: none"> <code>export-entity:create</code> - Create a new export entity, which is the container for the entity content that you want to export. <code>export-entity:add-content</code> - Adds content to an existing export entity. <code>export-entity:get</code> - Returns a list of the content of a specific export entity. <code>export-entity:remove-content</code> - Removes certain content from a specific export entity. <code>export-entity:delete</code> - Deletes a specific export entity. <code>export-entity:launch</code> - Launches an export entity polling task that creates a .tgz file of all of the entities that are contained in a specific export entity. Can be run with a <code>--no-poll</code> option, in which case the task doesn't return a .tgz file, but just returns the task ID. <code>export-entity:get-launch-export</code> - Streams the content of a specific completed <code>export-entity:launch</code> task to a .tgz file. <code>export-entity:delete-launch-export</code> - Cancels a currently running <code>export-entity:launch</code> task, and deletes any related artifacts. <code>export-entity:get-launch-export-status</code> - Returns the status of a specific <code>export-entity:launch</code> task. <code>export-entity:list</code> - Returns a list of all of the export entities within a specific Developer Portal. Each export entity contains a defined list of all of the entity content that will be exported if <code>export-entity:launch</code> is run. <p>For more information, see Using the export-entity commands.</p>
<code>apic factory-reset</code>	Perform a factory reset of your Developer Portal.	<ul style="list-style-type: none"> <code>apic factory-reset:delete</code> - Perform a factory reset of your Developer Portal, deleting the portal service and all of its associated Developer Portal sites. <p>Warning: The <code>factory-reset</code> command is irreversible. You must ensure that you have backups created before running this command.</p> <p>For more information, see Using the factory-reset command.</p>
<code>apic forums</code>	Manage your <code>forums</code> .	<ul style="list-style-type: none"> <code>apic forums:disable</code> - disables the Forum module for a given site. <code>apic forums:enable</code> - enables the Forum module for a given site. <p>For more information, see Using the forums commands.</p>
<code>apic ip-security-enabled</code>	Manage your <code>IP security</code> .	<ul style="list-style-type: none"> <code>apic ip-security-enabled:update</code> - Enable or disable the IP security at the portal service level. <p>For more information, see Using the ip-security-enabled command.</p>
<code>apic maintenance</code>	Manage your <code>maintenance</code> operations.	<ul style="list-style-type: none"> <code>apic maintenance:disable</code> - Disable your <code>maintenance</code> operations. <code>apic maintenance:enable</code> - Enable your <code>maintenance</code> operations. <code>apic maintenance:rebuild_node_access</code> - Rebuild the node access table of your <code>maintenance</code> operations. <code>apic maintenance:search_api_index_rebuild</code> - Rebuild and re-index the search API index of your <code>maintenance</code> operations. <code>apic maintenance:search_api_index_status</code> - Print the search API index status of your <code>maintenance</code> operations. <code>apic maintenance:status</code> - Get the current mode of your <code>maintenance</code> operations. <p>For more information, see Using the maintenance commands.</p>
<code>apic memcache</code>	Manage your <code>memcache</code> operations.	<ul style="list-style-type: none"> <code>apic memcache:disable</code> - Disable the default caching store operations. This sets Drupal to use database as its cache. <code>apic memcache:enable</code> - Enable the default caching store operations. This sets Drupal to use RAM as its cache. <code>apic memcache:get</code> - Get the status of the <code>memcache enabled</code> operations. <p>For more information, see Using the memcache commands.</p>
<code>apic modules</code>	Manage your <code>modules</code> .	<ul style="list-style-type: none"> <code>apic modules:delete</code> - Delete <code>modules</code>. <code>apic modules:disable</code> - Disable <code>modules</code>. <code>apic modules:enable</code> - Enable <code>modules</code>. <code>apic modules:list</code> - Get a list of your <code>modules</code>. <p>For more information, see Using the modules commands.</p>
<code>apic php-memory</code>	Manage your <code>php-memory</code> .	<ul style="list-style-type: none"> <code>apic php-memory:list</code> - List the PHP memory limit on the platform. <code>apic php-memory:update</code> - Set the PHP memory limit on the portal platform. <p>For more information, see Using the php-memory commands.</p>

Command	Description	Subcommands
<code>apic platforms</code>	Manage your <code>platforms</code> .	<ul style="list-style-type: none"> <code>apic platforms:list</code> - List the platforms of a portal service. <p>For more information, see Using the platforms commands.</p>
<code>apic product</code>	Manage your <code>product</code> .	<ul style="list-style-type: none"> <code>apic product:add-attachment</code> - Add an attachment for the given product. <code>apic product:add-tag</code> - Add a tag for the given product. <code>apic product:get</code> - Get a product from a portal service. <code>apic product:get-document</code> - Get a specific entire product document from the portal of the given organization and catalog. <code>apic product:list</code> - List the products on a portal service. <code>apic product:set-icon</code> - Set an icon image for the given product. <p>For more information, see Using the product commands.</p>
<code>apic queue</code>	View the tasks in a portal <code>queue</code> .	<ul style="list-style-type: none"> <code>apic queue:get</code> - View the queued and locked platform related tasks for a specific Developer Portal site. <code>apic queue:list</code> - View the queued and locked platform related tasks across all of the Developer Portal sites on a specific portal service. <p>For more information, see Using the queue commands.</p>
<code>apic role</code>	Manage your <code>role</code> operations.	<ul style="list-style-type: none"> <code>apic role:create</code> - Create a new Drupal user role. <code>apic role:delete</code> - Delete an unwanted Drupal user role. <code>apic role:add-permission</code> - Add specific permissions to a Drupal user role. <code>apic role:remove-permission</code> - Remove unwanted permissions from a Drupal user role. <code>apic role:get</code> - Get the details of a Drupal user role as well as all the permissions granted to the specific role. <code>apic role:list</code> - List all of the roles. You can filter the list based on the user role as well as the permission using the corresponding flags along with the <code>role:list</code> command. Use the <code>--filter_by_permission</code> flag to get the list of the roles that have the specified permission. Use the <code>--role</code> flag to get the list of permissions granted to the specified role. <p>For more information, see Using the role commands.</p>
<code>apic security</code>	Manage your <code>security</code> .	<ul style="list-style-type: none"> <code>apic security:clear-bans</code> - Clear all of the banned user/IP addresses on a portal site. <p>For more information, see Using the security command.</p>
<code>apic service</code>	Manage your <code>service</code> operations.	<ul style="list-style-type: none"> <code>apic service:list</code> - List the portal service currently installed. <p>For more information, see Using the service commands.</p>
<code>apic service-ip-allowlist</code>	Manage your <code>service-ip-allowlist</code> , which enables specific IP addresses to be exempt from being blocked by portal security checks.	<ul style="list-style-type: none"> <code>apic service-ip-allowlist:add</code> - Add specific IP addresses to the <code>allowlist</code>. <code>apic service-ip-allowlist:delete</code> - Delete all of the IP addresses from the <code>allowlist</code>. <code>apic service-ip-allowlist:list</code> - List all of the IP addresses that are currently on the <code>allowlist</code>. <code>apic service-ip-allowlist:remove</code> - Remove one or more specific IP addresses from the <code>allowlist</code>. <p>For more information, see Using the service-ip-allowlist commands.</p>
<code>apic site</code>	Manage your <code>site</code> .	<ul style="list-style-type: none"> <code>site:cache-rebuild</code> - Rebuild the cache of a portal site. <code>apic site:check</code> - Run a platform check against a portal site. <code>apic site:state</code> - Obtain the current state of a portal site. <code>apic site:login-link</code> - Get an admin login link for a specific portal site. <code>site:create-export</code> - Create a task to export a .tgz archive file of your entire site configuration. <code>site:create-import</code> - Create a task to import an archive of your entire site configuration. <code>site:delete-export</code> - Cancel any currently running <code>site:create-export</code> tasks, and delete any related artifacts. <code>site:delete-import</code> - Cancel any currently running <code>site:create-import</code> tasks, and delete any related artifacts. <code>site:get-export-status</code> - Return the status of a specific export task. <code>site:get-export</code> - Stream the content of a specific completed export task to a .tgz file. <code>site:get-import-status</code> - Return the status of a specific import task. <p>Important: If you want to import a site export configuration file, the export file must have been created on the same version of API Connect as the version that you want to import to.</p> <p>For more information, see Using the site commands.</p>
<code>apic site-config</code>	Manage your <code>site-config</code> .	<ul style="list-style-type: none"> <code>apic site-config:create-export</code> - Create an export of a <code>site config</code>. <code>apic site-config:create-import</code> - Create an import of a <code>site config</code>. <code>apic site-config:delete-export</code> - Delete an export of a <code>site config</code>. <code>apic site-config:delete-import</code> - Delete an import of a <code>site config</code>. <code>apic site-config:get-export</code> - Get an export of a <code>site config</code>. <code>apic site-config:get-export-status</code> - Get the status of an export of a <code>site config</code>. <code>apic site-config:get-import-status</code> - Get the status of an import of a <code>site config</code>. <p>For more information, see Using the site-config commands.</p>

Command	Description	Subcommands
<code>apic sites</code>	Manage your <code>sites</code> .	<ul style="list-style-type: none"> <code>apic sites:check</code> - Run a platform check against all portal sites on a portal service. <code>apic sites:list</code> - List the sites of a portal service. <code>apic sites:reset-upgrade-attempts</code> - Reset the portal upgrade attempts. <p>For more information, see Using the sites commands.</p>
<code>apic themes</code>	Manage your <code>themes</code> .	<ul style="list-style-type: none"> <code>apic themes:delete</code> - Delete <code>themes</code>. <code>apic themes:disable</code> - Disable <code>themes</code>. <code>apic themes:enable</code> - Enable <code>themes</code>. <code>apic themes:list</code> - Get a list of your <code>themes</code>. <code>apic themes:set-default</code> - Set the default theme of the portal. <p>For more information, see Using the themes commands.</p>
<code>apic twig</code>	Manage the <code>twig</code> debugging operations on a specific portal site.	<ul style="list-style-type: none"> <code>apic twig:debug-enable</code> - Enable twig debugging for a portal site. <code>apic twig:debug-disable</code> - Disable twig debugging for a portal site. <code>apic twig:debug-status</code> - Get the current state of twig debugging for a specific site. <p>For more information, see Using the twig commands.</p>
<code>apic user</code>	Manage some Developer Portal <code>user</code> tasks.	<ul style="list-style-type: none"> <code>apic user:add-role</code> - Add one or more roles to one or more specified user accounts. <code>apic user:block</code> - Block one or more users. <code>apic user:information</code> - Retrieve information about your users. <code>apic user:remove-role</code> - Remove one or more roles from one or more specified user accounts. <code>apic user:unlock</code> - Unblock one or more users. <p>For more information, see Using the user commands.</p>
<code>apic version</code>	Get the version of your API Connect toolkit.	<ul style="list-style-type: none"> <code>apic version --mode portaladmin</code> - Get toolkit version.

- [Using the api commands](#)
You can use the `api` commands to get and list the APIs on your Developer Portal service.
- [Using the apic-config commands](#)
You can use the `apic-config` commands to get the apic config of your Developer Portal service.
- [Using the application commands](#)
You can use the `application` commands to get and list the applications on your Developer Portal service.
- [Using the backups commands](#)
You can use the `backups` commands to list the backups on your Developer Portal service.
- [Using the consumer-org commands](#)
You can use the `consumer-org` commands to get and list the consumer orgs on your Developer Portal service.
- [Using the content commands](#)
You can use the `content` commands to list, import, and export content from your Developer Portal site.
- [Using the custom-module commands](#)
You can use the `custom-module` commands to create exports and imports, delete exports and imports, get the status of an export or import, and get an export, on your Developer Portal service.
- [Using the custom-theme commands](#)
You can use the `custom-theme` commands to create export and import tasks, delete export and import tasks, get the status of an export or import task, and get an export artifact, on your Developer Portal service.
- [Using the custom-translation commands](#)
You can use the `custom-translation` commands to create an import or export task that will import or export a .tgz of custom translations for a Developer Portal site. You can also delete the export and import tasks, get the status of an export or import task, and get a custom translation export artifact.
- [Using the custom-webserver-page commands](#)
You can use the `custom-webserver-page` commands to customize the web server error pages on your Developer Portal service.
- [Using the drupal-config commands](#)
You can use the `drupal-config` commands to list, get the values of, set values, create new, and delete the Drupal configuration objects on your Developer Portal service.
- [Using the drupal-state commands](#)
You can use the `drupal-state` commands to store and retrieve information about the state of your Developer Portal system.
- [Using the entity commands](#)
You can use the `entity` commands to get the entity count on your Developer Portal service.
- [Using the export-entity commands](#)
You can use the `export-entity` commands to manage the export of content entities from your Developer Portal site.
- [Using the factory-reset command](#)
You can use the `factory-reset` command to perform a factory reset of your Developer Portal, which will delete the portal service and all of its associated Developer Portal sites.
- [Using the forums commands](#)
You can use the `forums` commands to disable or enable the forums on your Developer Portal service.
- [Using the ip-security-enabled command](#)
You can use the `ip-security-enabled` commands to toggle IP security on your Developer Portal. When IP security is enabled, modules such as the Drupal Perimeter Defence module, or flood control, will block client IP addresses suspected of malicious behavior, as expected. Banned IP addresses can be cleared by using the `security:clear-bans` command. You might want to turn off IP security if you are performing penetration tests, or if you cannot pass through the client IP address from your external load balancer. Note that IP security is enabled by default on the Developer Portal.
- [Using the maintenance commands](#)
You can use the `maintenance` commands to manage the maintenance operations on your Developer Portal service.
- [Using the memcache commands](#)
You can use the `memcache` commands to get, enable, and disable the default caching store operations on your Developer Portal service.
- [Using the modules commands](#)
You can use the `modules` commands to list, enable, disable and delete the modules on your Developer Portal service.
- [Using the php-memory commands](#)
You can use the `php-memory` commands to list or update the PHP memory limits on your Developer Portal.
- [Using the platforms commands](#)
You can use the `platforms` commands to list the platforms on your Developer Portal service.

- [Using the product commands](#)
You can use the **product** commands to get and list the products on your Developer Portal service.
- [Using the queue commands](#)
You can use the **queue** commands to list the queued and locked platform tasks on your Developer Portal site.
- [Using the role commands](#)
You can use the **role** commands to complete the full lifecycle of Drupal user roles. This includes creating and deleting of roles, as well as adding and removing permissions to the roles in your Developer Portal service.
- [Using the security command](#)
You can use the **security** command to clear all of the banned user/IP addresses on a Developer Portal site.
- [Using the service commands](#)
You can use the **service** commands to check and list the Developer Portal service from the Developer Portal database.
- [Using the service-ip-allowlist commands](#)
You can use the **service-ip-allowlist** commands to add, remove, and list the IP addresses on your Developer Portal **allowlist**. IP addresses that are on the **allowlist** are exempt from being blocked by Developer Portal security checks, for example, load balancer and proxy IPs.
- [Using the site commands](#)
You can use the **site** commands to check the site on your Developer Portal service, and to export and import an entire site configuration.
- [Using the site-config commands](#)
You can use the **site-config** commands to create exports and imports, delete exports and imports, get the status of an export or import, and get an export, on your Developer Portal service.
- [Using the sites commands](#)
You can use the **sites** commands to check and list the sites on your Developer Portal service. You can also reset the portal upgrade attempt counter.
- [Using the themes commands](#)
You can use the **themes** commands to list, enable, disable, delete, and set the default themes on your Developer Portal service.
- [Using the twig commands](#)
You can use the **twig** commands to enable, disable, and check the state of twig debugging on a specific site on your Developer Portal service.
- [Using the user commands](#)
You can use the **user** commands to complete some Drupal user management tasks on your Developer Portal, such as adding and removing roles, blocking and unblocking users, and retrieving user information.

Using the api commands

You can use the **api** commands to get and list the APIs on your Developer Portal service.

1. Log in as Provider org:

```
apic login --server management_server --realm provider/identity_provider --username provider_username --password provider_password
```

You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

```
apic identity-providers:list --scope provider --server mgmt_endpoint_url --fields title,realm
```

For example,

```
apic identity-providers:list --scope provider --server myserver.com --fields title,realm
total_results: 2
results:
- title: API Manager Local User Registry
  realm: provider/default-idp-2
- title: Corporate LDAP user registry
  realm: provider/corporate-ldap
```

The **title** value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed **realm** value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default API Manager Local User Registry for login as a member of a provider organization is **default-idp-2**.

For full details of the `apic login` command, see [Logging in to a management server](#).

For a summary of the general-purpose commands and their use, see [Developer Portal CLI commands](#).

2. List the APIs from a site.

For example,

```
apic --mode portaladmin api:list --org orgid/name --server management_server --catalog catalogid/name
```

- `management_server` is the endpoint URL of the management server (required).
- `catalogid/name` is the ID or name of the catalog that the site belongs to (required).
- `orgid/name` is the ID or name of the provider organization that the catalog belongs to (required).
- `format_type` is the output format. Can be `json`, `yaml`, `go-template=...`, `go-template-file=...`. Defaults to `yaml`.

3. Get an API from a site by using the `id` or `name:version`.

For example,

```
apic --mode portaladmin api:get --org orgid/name --server management_server --catalog catalogid/name id/name:version
```

- `id/name:version` - The ID or name:version of a specific API (required). For example, `id-of-api-called-example-3` or `example:3.0.0`.

4. Get a specific entire API document from the portal of the provided organization and catalog by using the `id` or `name:version`.

```
apic --mode portaladmin api:get-document --org orgid/name --server management_server --catalog catalogid/name --format format_type id/name:version
```

For example,

```
apic --mode portaladmin api:get-document --org ibm --server management_server --catalog portal-test --format yaml intuiz-api:1.0.0
```

5. Add an attachment for your API within your Developer Portal.

For example,

```
apic --mode portaladmin api:add-attachment -s management_server --org orgid/name --catalog catalogid/name --
attachment_name attachment.txt --attachment_description "API documentation" mortgage-management-api:1.0.0 ./attachment.txt
Loading File (Large files may take a while)...
```

```
Attachment successfully added to api mortgage-management-api:1.0.0.
This product now has 4 attachments.
```

- `attachment_name` is the name given to the attachment when it is uploaded (required).
- `attachment_description` is the description of the attachment that is displayed to the users.

6. Set an icon for your API within your Developer Portal.

For example,

```
apic --mode portaladmin api:set-icon -s management_server --org orgid/name --catalog catalogid/name --icon_description
"API icon" mortgage-management-api:1.0.0 ./icon.png
Loading File (Large files may take a while)...
```

```
Icon successfully set for api mortgage-management-api:1.0.0
```

- `icon_description` is the icon description to be displayed to users and it is used as an alt text for the image (required).

7. Add a tag (Category) for your API within your Developer Portal.

For example,

```
apic --mode portaladmin api:add-tag -s management_server --org orgid/name --catalog catalogid/name --tag_name
top_level_element/next_level_element/lower_level_element mortgage-management-api:1.0.0
Successfully set taxonomy tag top_level_element/next_level_element/lower_level_element
for api mortgage-management-api:1.0.0
```

- `tag_name` is the tag name. For example, `top_level_element/next_level_element` (required).

Using the apic-config commands

You can use the **apic-config** commands to get the apic config of your Developer Portal service.

1. Log in as Provider org:

```
apic login --server management_server --realm provider/identity_provider --username provider_username --password
provider_password
```

You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

```
apic identity-providers:list --scope provider --server mgmt_endpoint_url --fields title,realm
```

For example,

```
apic identity-providers:list --scope provider --server myserver.com --fields title,realm
total_results: 2
results:
- title: API Manager Local User Registry
  realm: provider/default-idp-2
- title: Corporate LDAP user registry
  realm: provider/corporate-ldap
```

The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default API Manager Local User Registry for login as a member of a provider organization is `default-idp-2`.

For full details of the `apic login` command, see [Logging in to a management server](#).

2. Get the apic config of a site.

For example,

```
apic --mode portaladmin apic-config:get --org orgid/name --server management_server --catalog name/id
```

Using the application commands

You can use the **application** commands to get and list the applications on your Developer Portal service.

1. Log in as Provider org:

```
apic login --server management_server --realm provider/identity_provider --username provider_username --password
provider_password
```

You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

```
apic identity-providers:list --scope provider --server mgmt_endpoint_url --fields title,realm
```

For example,

```
apic identity-providers:list --scope provider --server myserver.com --fields title,realm
total_results: 2
results:
```

```
- title: API Manager Local User Registry
  realm: provider/default-idp-2
- title: Corporate LDAP user registry
  realm: provider/corporate-ldap
```

The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default API Manager Local User Registry for login as a member of a provider organization is `default-idp-2`. For full details of the `apic login` command, see [Logging in to a management server](#).

2. List the applications on a site.

For example,

```
apic --mode portaladmin application:list --org orgid/name --server management_server --catalog name/id
```

3. Get an application from a site by using application id.

For example,

```
apic --mode portaladmin application:get --org orgid/name --server management_server --catalog name/id id
```

Using the backups commands

You can use the **backups** commands to list the backups on your Developer Portal service.

1. Log in as Cloud manager:

```
apic login --server management_server --realm admin/identity_provider --username cloud_username --password cloud_password
```

You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

```
apic identity-providers:list --scope admin --server mgmt_endpoint_url --fields title,realm
```

For example:

```
apic identity-providers:list --scope admin --server myserver.com --fields title,realm
total_results: 2
results:
- title: Cloud Manager User Registry
  realm: admin/default-idp-1
- title: Corporate LDAP user registry
  realm: admin/corporate-ldap
```

The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default Cloud Manager Local User Registry for login as a member of the cloud administration organization is `default-idp-1`. For full details of the `apic login` command, see [Logging in to a management server](#).

2. Get the availability zone of the portal service's backups that you want to list:

```
apic availability-zones --org orgid/name --server management_server
```

3. List all the portal services in that availability zone

```
apic portal-services:list --org orgid/name --server management_server --availability-zone availability_zone
```

4. Get the selected portal service's name

```
apic portal-services:get --org orgid/name --server management_server --availability-zone availability_zone PORTAL-SERVICE-NAME
```

5. List the backups of the portal service

```
apic --mode portaladmin backups:list --server management_server --portal_service_name PORTAL-SERVICE-NAME --format json
```

Using the consumer-org commands

You can use the **consumer-org** commands to get and list the consumer orgs on your Developer Portal service.

1. Log in as Provider org:

```
apic login --server management_server --realm provider/identity_provider --username provider_username --password provider_password
```

You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

```
apic identity-providers:list --scope provider --server mgmt_endpoint_url --fields title,realm
```

For example,

```
apic identity-providers:list --scope provider --server myserver.com --fields title,realm
total_results: 2
results:
- title: API Manager Local User Registry
  realm: provider/default-idp-2
```

```
- title: Corporate LDAP user registry
  realm: provider/corporate-ldap
```

The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default API Manager Local User Registry for login as a member of a provider organization is `default-idp-2`.

For full details of the `apic login` command, see [Logging in to a management server](#).

2. List the consumer orgs of a site.

For example,

```
apic --mode portaladmin consumer-org:list --org orgid/name --server management_server --catalog name/id
```

3. Get a consumer org from a site by using org id.

For example,

```
apic --mode portaladmin consumer-org:get --org orgid/name --server management_server --catalog name/id id
```

Using the content commands

You can use the `content` commands to list, import, and export content from your Developer Portal site.

About

The Developer Portal is based on the Drupal content management system. In Drupal, a content entity is an item of content data that is intended to be displayed to site users, such as text, images, and HTML markup. Content entities are grouped into entity types, and most of these entity types are also subdivided into entity subtypes, also known as bundles. The `content` commands enable you to list, import, and export either one type of content entity, or all of the content entity types, at a time. If you want to manage the export of assorted content entity types at the same time, you can use the `export-entity` commands; see [Using the export-entity commands](#) for more information.

Procedure

1. Log in as Provider org as seen in the following example.

```
apic login --server management_server --realm provider/identity_provider --username provider_username --password provider_password
```

You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

```
apic identity-providers:list --scope provider --server mgmt_endpoint_url --fields title,realm
```

For example,

```
apic identity-providers:list --scope provider --server myserver.com --fields title,realm
total_results: 2
results:
- title: API Manager Local User Registry
  realm: provider/default-idp-2
- title: Corporate LDAP user registry
  realm: provider/corporate-ldap
```

The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default API Manager Local User Registry for login as a member of a provider organization is `default-idp-2`.

For full details of the `apic login` command, see [Logging in to a management server](#).

For a summary of the general-purpose commands and their use, see [Developer Portal CLI commands](#).

2. List the content entity types that are exportable from your site by using the following `content:list-types` command. This command returns a list of all of the content entity types that are allowed to be exported from your site. If a type isn't listed in the return, that type is either blocked or isn't a content entity type.

```
apic --mode portaladmin --server management_server --org orgid/name --catalog catalogid/name content:list-types
```

Where:

- `management_server` is the endpoint URL of the management server (required).
- `orgid/name` is the ID or name of the provider organization that the catalog belongs to (required).
- `catalogid/name` is the ID or name of the catalog that the site belongs to (required).

Each content entity type can have subtypes, which are known as bundles. These bundles can be used in the `content:list` command, when you want to list a particular bundle type of a content entity. In the following example, `page` is a bundle type of the content entity type `node`.

```
apic --mode portaladmin --server my_management_server --org my_org --catalog my_catalog content:list-types
block_content:
- basic
comment:
- comment
- comment_forum
export_entity: { }
file: { }
import_entity: { }
media: { }
menu_link_content: { }
node:
- article
```

```

- blog_post
- faq
- forum
- page
shortcut:
- default
taxonomy_term:
- forums
- tags

```

3. List all of the entities in your site for a given content entity type and, if required, bundle by using the following `content:list` command.

```

apic --mode portaladmin --server management_server --org orgid/name --catalog catalogid/name content:list --entity_type
entity_type_name --bundle bundle_name

```

Where:

- `entity_type_name` is the type of content entity that you want to list (required). You can use the `content:list-types` command to find the list of available content entity types.
- `bundle_name` is the name of the bundle type that you want to list (optional).

The following example lists the content of the `page` bundle type for the `node` content entity. Included in the return is an `Entity ID` for each item in the content list.

```

apic --mode portaladmin --server my_management_server --org my_org --catalog my_catalog content:list --entity_type node --
bundle page
-
Title: 'Terms of use'
Langcode: en
'Entity ID': '1'
Bundle: page
UUID: 75fc430e-fc4d-47e3-bc5f-7f23063716ac
-
Title: 'Privacy Policy'
Langcode: en
'Entity ID': '2'
Bundle: page
UUID: ddf300b-16fe-4d1e-be6f-ce7040131b68

```

4. Export your site content entities by using the following `content:create-export` command. This command creates an export task that returns a `.tgz` file containing the content entities. By default, the command polls the status of the task every 30 seconds until the task is finished, at which point the export file is returned. You can export a specific content entity type, or specific entities within an entity type, or you can generate a `.tar` file that contains all of the exportable content from your site. Note that exporting all of your site content can take a long time to complete.

```

apic --mode portaladmin --server management_server --org orgid/name --catalog catalogid/name content:create-export --
entity_type entity_type_name --entity_ids entity_ids

```

Where:

- `entity_type_name` is the type of content entity that you want to export (required). If you want to export all of the exportable content from your site, set this option to `all`.
- `entity_ids` is a comma separated list of the entity IDs that you want to export (optional).
- `--no-poll` is an optional flag meaning that the command won't poll the status of the task, but instead just returns the task ID. This task ID can then be used with the `content:get-export` command to return the export file.

Note: The command continues to poll until the maximum polling time of 25 minutes is reached. At which point you can use the commands `content:get_export_status` and `content:get-export` to get the status and, if the task has finished, an artifact.

The following example creates an export task for the `Terms of use` and `Privacy Policy` entity IDs of the `node` content entity.

```

apic --mode portaladmin --server my_management_server --org my_org --catalog my_catalog content:create-export --
entity_type node --entity_ids 1,2
201 CREATED - Task ID: 8h86b8utjtw51

```

Response Code - 202:

```

Message(s) -
The status of this task is: RUNNING

```

Response Code - 200:

```

Message(s) -
The status of this task is: FINISHED and the artifact can now be streamed

```

```

Saving File (Large files may take a while)...
Incoming project saved to content_createExport-20230627114023.tgz

```

The command saves the export file to your running directory. The export `.tgz` file includes a `root.json` file that contains an index of all of the entities that are contained in the `.tgz` file, as well as a `content_entity_type.json` file for each content entity type exported. The `content_entity_type.json` file contains all of the information needed to be able to import those entities into a different Developer Portal site.

5. If you ran the `content:create-export` command with the `--no-poll` option, you can use the following commands to manage your content export.

- `content:delete-export`
Cancels any currently running `content:create-export` tasks, and deletes any related artifacts. For example:

```

apic --mode portaladmin --server management_server --org orgid/name --catalog catalogid/name content:delete-export --
task_id task_id

```

Where `task_id` is the ID of the export task on the queue.

- `content:get-export`
Streams the content of a specific completed export task to a `.tgz` file. For example:

```

apic --mode portaladmin --server management_server --org orgid/name --catalog catalogid/name content:get-export --
task_id task_id

```

- `content:get-export-status`
Returns the status of a specific export task. For example:

```
apic --mode portaladmin --server management_server --org orgid/name --catalog catalogid/name content:get-export-status --task_id task_id
```

6. Import your site content entities by using the `content:create-import` command. This command launches an import polling task that polls the status of the task every 30 seconds until the task is finished, at which point a summary of the import is returned. If the command is run with the `--no-poll` option, the task doesn't return the status of the task, but just returns the task ID.

Important: Before you import any content, make sure that you backup the site that you're importing to, in case content gets overwritten that you weren't expecting.

```
apic --mode portaladmin --server management_server --org orgid/name --catalog catalogid/name content:create-import export_file_name
```

Where:

- `export_file_name` is the name of the export file that you want to import. You can import .tgz files that were created by using the `content:create-export` or `export-entity:launch` commands.
- `--no-poll` is an optional flag meaning that the command won't poll the status of the task, but instead just returns the task ID. This task ID can then be used with the `content:get-import-status` command to get the status of the task.

Note: The command continues to poll until the maximum polling time of 25 minutes is reached. At which point you can use the command `content:get-import-status` to get the status of the task.

In the following example, the export file from Step 4 is imported into a different Developer Portal site on a different server:

```
apic --mode portaladmin --server my_management_server2 --org my_prod_org --catalog my_prod_catalog content:create-import content_createExport-20230627114023.tgz
Loading File (Large files may take a while)...
```

```
201 CREATED - Task ID: zmaskh7oo6531tty
```

```
Response Code - 202:
```

```
Message(s) -
```

```
The status of this task is: QUEUED
```

```
Response Code - 202:
```

```
Message(s) -
```

```
The status of this task is: RUNNING
```

```
Response Code - 202:
```

```
Message(s) -
```

```
The status of this task is: RUNNING
```

```
Response Code - 200:
```

```
Message(s) -
```

```
2023-10-18 13:36:18: CLI task (content:import) starting.
```

```
2023-10-18 13:36:29: [notice] [1/2] - [node.page:1] "Terms of use" - Updated
```

```
(https://my_management_server2/my_prod_catalog/tsandcs)
```

```
[notice] [2/2] - [node.page:2] "Privacy Policy" - Updated (https://my_management_server2/my_prod_catalog/privacy)
```

```
2023-10-18 13:37:20: CLI task (content:import) completed successfully.
```

Depending on the content imported, the following three types of import can be shown in the import summary messages:

- **Overridden** - In this case a content entity existed with the same entity ID but not the same UUID, and there was also no reference to it in the synchronization table, so the entity was overridden. Care must be taken when importing entities across different sites until they are in sync with one another, as data can be lost. For example, say you have a blog post about APIs with an entity ID of 50 on a test site, and you wanted to import this post onto your production site. However, the production site already has a blog post with an entity ID of 50 that talks about policies, in which case that post would be overwritten by the blog post about APIs, and be given the imported UUID. The next time that entity ID of 50 is imported, the import type will be **Updated**, because the UUID is now the same.
 - **Updated** - In this case the same content entity, with the same UUID, was found, so its contents were updated with the content from the import file.
 - **Created** - In this case no content entity of this type was found, so a new entity was created, and it was populated with the data from the import file.
7. If you ran the `content:create-import` command with the `--no-poll` option, you can use the following commands to manage your content import.

- `content:delete-import`

Cancels any currently running `content:create-import` tasks, and deletes any related artifacts. For example:

```
apic --mode portaladmin --server management_server --org orgid/name --catalog catalogid/name content:delete-import --task_id task_id
```

Where `task_id` is the ID of the import task on the queue.

- `content:get-import-status`

Returns the status of a specific import task. For example:

```
apic --mode portaladmin --server management_server --org orgid/name --catalog catalogid/name content:get-import-status --task_id task_id
```

- [Using the export-entity commands](#)

Using the custom-module commands

You can use the **custom-module** commands to create exports and imports, delete exports and imports, get the status of an export or import, and get an export, on your Developer Portal service.

1. Log in as Provider org:

```
apic login --server management_server --realm provider/identity_provider --username provider_username --password provider_password
```

You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

```
apic identity-providers:list --scope provider --server mgmt_endpoint_url --fields title,realm
```

For example,

```
apic identity-providers:list --scope provider --server myserver.com --fields title,realm
total results: 2
results:
- title: API Manager Local User Registry
  realm: provider/default-idp-2
- title: Corporate LDAP user registry
  realm: provider/corporate-ldap
```

The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default API Manager Local User Registry for login as a member of a provider organization is `default-idp-2`.

For full details of the `apic login` command, see [Logging in to a management server](#).

2. Export your custom modules.

The `custom-module:create-export` command creates an export task against the portal of the specified `catalog` and `org`. The command then polls the status of the task until it has `FINISHED` and the artifacts are streamed back.

Note: The command continues to poll until the maximum polling time of 15 minutes is reached. At which point you can use the commands `custom-module:get-export-status` and `custom-module:get-export` to get the status and potentially an artifact.

```
apic --mode portaladmin custom-module:create-export --catalog name/id --org orgid/name --server management_server
```

- The module `.tgz` is saved to the directory in which you ran the command.
- The saved `.tgz` has the format `custom_module_createExport-20200217134637.tgz`.
- You can save your exports into your change control management system.

For example,

```
apic --mode portaladmin custom-module:create-export --catalog dev --org ibm --server api.stagingexample.com
```

3. Import your custom modules.

The `custom-module:create-import` command uses the supplied `.tgz` file to import the custom modules into the portal of the specified `catalog` and `org`. The command then polls the status of the task until the task has either `FINISHED` successfully, or failed because of an error.

Note:

- The higher level folders of the archive can contain only these characters, a-z and 0-9.
- The command continues to poll until the maximum polling time of 15 minutes is reached. At which point you can use the command `custom-module:get-import-status` to get the status of the import.
- If you import a custom module that already exists you overwrite the existing custom module.
- The Drupal cache is rebuilt in the background after the task is complete. If you want to include the cache rebuild as part of the task, you must include the `--wait` flag.

```
apic --mode portaladmin custom-module:create-import --catalog name/id --org orgid/name --server management_server /PATH/TO/MODULE/TGZ
```

```
apic --mode portaladmin custom-module:create-import --catalog name/id --org orgid/name --server management_server /PATH/TO/theme/TGZ --wait
```

Where `--wait` is an optional flag that makes the Drupal cache rebuild part of the task. Otherwise, the cache is rebuilt in the background after the task is finished.

For example,

```
apic --mode portaladmin custom-module:create-import --catalog prod --org ibm --server api.productionexample.com C:/users/example/desktop/custom_module_createExport-20200217134637.tgz
```

For example,

```
apic --mode portaladmin custom-module:create-import --catalog prod --org ibm --server api.productionexample.com C:/users/example/desktop/custom_module_export_three.tgz
Loading File (Large files may take a while)...
```

```

- [apic custom-module](#)

Using the custom-theme commands

You can use the **custom-theme** commands to create export and import tasks, delete export and import tasks, get the status of an export or import task, and get an export artifact, on your Developer Portal service.

1. Log in as Provider org:

```
apic login --server management_server --realm provider/identity_provider --username provider_username --password provider_password
```

You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

```
apic identity-providers:list --scope provider --server mgmt_endpoint_url --fields title,realm
```

For example,

```
apic identity-providers:list --scope provider --server myserver.com --fields title,realm
total_results: 2
results:
- title: API Manager Local User Registry
  realm: provider/default-idp-2
- title: Corporate LDAP user registry
  realm: provider/corporate-ldap
```

The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default API Manager Local User Registry for login as a member of a provider organization is `default-idp-2`.

For full details of the `apic login` command, see [Logging in to a management server](#).

2. Export your custom themes.

The **custom-theme:create-export** command creates an export task against the portal of the specified `catalog` and `org`. The command then polls the status of the task until it has **FINISHED** and the artifacts are streamed back.

Note: The command continues to poll until the maximum polling time of 15 minutes is reached. At which point you can use the commands **custom-theme:get-export-status** and **custom-theme:get-export** to get the status and potentially an artifact.

```
apic --mode portaladmin custom-theme:create-export --catalog name/id --org orgid/name --server management_server
```

- The theme `.tgz` is saved to the directory in which you ran the command.
- The saved `.tgz` has the format `custom_theme_createExport-20200217134637.tgz`.
- You can save your exports into your change control management system.

For example,

```
apic --mode portaladmin custom-theme:create-export --catalog dev --org ibm --server api.stagingexample.com
```

3. Import your custom themes.

The **custom-theme:create-import** command uses the supplied `.tgz` file to import the custom themes into the portal of the specified `catalog` and `org`. The command then polls the status of the task until the task has either **FINISHED** successfully, or failed because of an error.

Note:

- The higher level folders of the archive can contain only these characters, a-z and 0-9.
- The command continues to poll until the maximum polling time of 15 minutes is reached. At which point you can use the command **custom-theme:get-import-status** to get the status of the import.
- If you import a custom theme that already exists you overwrite the existing custom theme.
- The Drupal cache is rebuilt in the background after the task is complete. If you want to include the cache rebuild as part of the task, you must include the `--wait` flag.

```
apic --mode portaladmin custom-theme:create-import --catalog name/id --org orgid/name --server management_server /PATH/TO/theme/TGZ
```

```
apic --mode portaladmin custom-theme:create-import --catalog name/id --org orgid/name --server management_server /PATH/TO/theme/TGZ --wait
```

Where `--wait` is an optional flag that makes the Drupal cache rebuild part of the task. Otherwise, the cache is rebuilt in the background after the task is finished.

For example,

```
apic --mode portaladmin custom-theme:create-import --catalog prod --org ibm --server api.productionexample.com C:/users/example/desktop/custom_theme_createExport-20200217134637.tgz
```

For example,

```
apic --mode portaladmin custom-theme:create-import --catalog prod --org ibm --server api.productionexample.com
C:/users/example/desktop/custom_theme_export_three.tgz
Loading File (Large files may take a while)...
```

```

- [apic custom-theme](#)

Using the custom-translation commands

You can use the **custom-translation** commands to create an import or export task that will import or export a .tgz of custom translations for a Developer Portal site. You can also delete the export and import tasks, get the status of an export or import task, and get a custom translation export artifact.

1. Log in as Provider org:

```
apic login --server management_server --realm provider/identity_provider --username provider_username --password provider_password
```

You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

```
apic identity-providers:list --scope provider --server mgmt_endpoint_url --fields title,realm
```

For example,

```
apic identity-providers:list --scope provider --server myserver.com --fields title,realm
total results: 2
results:
- title: API Manager Local User Registry
  realm: provider/default-idp-2
- title: Corporate LDAP user registry
  realm: provider/corporate-ldap
```

The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default API Manager Local User Registry for login as a member of a provider organization is `default-idp-2`.

For full details of the `apic login` command, see [Logging in to a management server](#).

2. Export your custom translations.

The **custom-translation:create-export** command creates an export task against the portal of the specified `catalog` and `org`, to export an archive of the custom translations of the site. The command then polls the status of the task until it has **FINISHED** and the artifacts are streamed back. The task ID is printed to the terminal.

Note:

- The command continues to poll until the maximum polling time of 15 minutes is reached. At which point you can use the commands **custom-translation:get-export-status** and **custom-translation:get-export** to get the status and potentially an artifact.
- The translation .tgz archive is saved to the directory in which you ran the command.
- The saved .tgz has the format `custom_translation_createExport-20210217134637.tgz`.
- You can save your exports into your change control management system.

```
apic --mode portaladmin custom-translation:create-export --catalog catalogid/name --org orgid/name --server management_server
```

- `catalogid/name` is the ID or name of the catalog that the site belongs to (required).
- `orgid/name` is the ID or name of the provider organization that the catalog belongs to (required).
- `management_server` is the endpoint URL of the management server (required).
- `--langcodes` is a comma separated list of the language codes, for example `es, zh-hans`. You can use this option to specify which custom translations to export.
- `--no-poll` can be used to stop the command from polling the task, and just return the task ID.

For example:

```
apic --mode portaladmin custom-translation:create-export --catalog dev --org ibm --server api.stagingexample.com
```

3. Import your custom translations.

The `custom-translation:create-import` command uses the supplied `.tgz` file to create a task to import the custom translations into the portal of the specified `catalog` and `org`. The command then polls the status of the task until the task has either `FINISHED` successfully, or failed because of an error. The task ID is printed to the terminal.

Note:

- The `.tgz` archive must contain only `.po` translation files, and nothing else.
- The command continues to poll until the maximum polling time of 15 minutes is reached. At which point you can use the command `custom-translation:get-import-status` to get the status of the import.
- If you import a custom translation that already exists, the existing custom translation is overwritten.

```
apic --mode portaladmin custom-translation:create-import --catalog catalogid/name --org orgid/name --server management_server /PATH/TO/MODULE/TGZ
```

- `--no-poll` can be used to stop the command from polling the task, and just return the task ID.

For example:

```
apic --mode portaladmin custom-translation:create-import --catalog prod --org ibm --server api.productionexample.com C:/users/example/desktop/custom_translation_createExport-20210217134637.tgz
```

4. You can run the delete command to cancel any ongoing or recently created import or export tasks. Any temporarily created artifacts will be deleted from the portal filesystem. No custom translations are deleted.

For example,

```
apic --mode portaladmin custom-translation:delete-export --catalog catalogid/name --org orgid/name --server management_server --format json --task_id taskid
```

```
apic --mode portaladmin custom-translation:delete-import --catalog catalogid/name --org orgid/name --server management_server --format json --task_id taskid
```

- `taskid` is the ID of the import or export task that was created on the queue (required).
- `--format` is the output format that can be seen if you run the command with `debug`. Can be `json`, `yaml`, `go-template=...`, `go-template-file=...`. Defaults to `yaml`.

For example:

```
apic --mode portaladmin custom-translation:delete-import --catalog prod --org ibm --server api.productionexample.com --task_id 4hythbptta6z9lyx
```

Using the custom-webserver-page commands

You can use the `custom-webserver-page` commands to customize the web server error pages on your Developer Portal service.

The `custom-webserver-page` commands enable you to set, get, and delete custom HTML content for the web server error pages of index, 404, 40x, and 50x. You can embed base64 encoded images, such as `.svg` and `.png`, or inline `.svg` images in your content, but the maximum size of the content of each error page is 8 MB.

Note:

- The custom web server error pages that can be set by using the `custom-webserver-page` commands, are the pages that are returned when the URL of a specific portal site isn't used. For example, if your portal site was `https://example.com/myorg/dev`, but you went to `https://example.com/myorg/deb`, then this is when a custom 404 error page is returned. However, if the requested URL matches a portal site, then the web server will use the Drupal error handlers, and will respond according to the Drupal configuration.
- All custom content that you set must conform to the HTML5 specification. If you try to set custom content that doesn't conform to HTML5, it will fail with the following error message:

```
Error: The supplied custom HTML failed validation.
```

- Setting and deleting custom web server pages can take several minutes to complete, depending on the size of the content.

1. Log in as Cloud manager:

```
apic login --server management_server --realm admin/identity_provider --username admin --password cloud_password
```

You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

```
apic identity-providers:list --scope admin --server mgmt_endpoint_url --fields title,realm
```

For example:

```
apic identity-providers:list --scope admin --server myserver.com --fields title,realm
total_results: 2
results:
- title: Cloud Manager User Registry
  realm: admin/default-idp-1
```

```
- title: Corporate LDAP user registry
  realm: admin/corporate-ldap
```

The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default Cloud Manager Local User Registry for login as a member of the cloud administration organization is `default-idp-1`. For full details of the `apic login` command, see [Logging in to a management server](#).

2. Set a custom HTML web server error page on the Developer Portal. The maximum size of the page is 8 MB, and you must ensure that the content conforms to the HTML5 specification, or the `custom-webserver-page:set` command will fail with a validation error.

```
apic --mode portaladmin custom-webserver-page:set --server management_server --portal_service_name portal --page_type
page_type filename.html
```

- `management_server` is the endpoint URL of the management server (required).
- `portal` is the name of the portal service (required).
- `page_type` is the type of web server error page that you want to run the command against (required). Valid values are `index`, `404`, `40x`, or `50x`.
- `filename` is the name of the HTML file that contains the content for the custom web server error page.

For example, the following screen capture shows a standard 404 web server response:

404 Not Found

Then the following `custom-webserver-page:set` command is run:

```
apic --mode portaladmin custom-webserver-page:set --server my.management.server.com --portal_service_name portal --
page_type 404 custom-404.html
Loading File (Large files may take a while)...
```

```
Successfully added the custom HTML content for page type 404.
```

The following custom 404 error page is now displayed:

Error 404

Hmm, we can't seem to find that.

3. Get the custom content of a specific page type and save it to a file named `<page_type>-timestamp.html`.

```
apic --mode portaladmin custom-webserver-page:get --server management_server --portal_service_name portal --page_type
page_type
```

For example:

```
apic --mode portaladmin custom-webserver-page:get --server my.management.server.com --portal_service_name portal --
page_type 404
Incoming project saved to 404-20211027121830.html
```

If there is no custom content available for the page type, the following error is displayed:

```
apic --mode portaladmin custom-webserver-page:get --server my.management.server.com --portal_service_name portal --
page_type 50x
Error: There is currently no custom HTML content for page type 50x.
```

4. Delete the custom content of a specific page type. If there is no custom content available for a page type, the error response defaults to the standard web server error page.

```
apic --mode portaladmin custom-webserver-page:delete --server management_server --portal_service_name portal --page_type
page_type
```

For example:

```
apic --mode portaladmin custom-webserver-page:delete --server my.management.server.com --portal_service_name portal --
page_type 404
```

Using the drupal-config commands

You can use the **drupal-config** commands to list, get the values of, set values, create new, and delete the Drupal configuration objects on your Developer Portal service.

For example, you can use the **drupal-config** commands to disable CSS and JS aggregation to help with twig debug, see [Example](#).

1. Log in as Provider org:

```
apic login --server management_server --realm provider/identity_provider --username provider_username --password provider_password
```

You can determine which identity provider to use in the **--realm** parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

```
apic identity-providers:list --scope provider --server mgmt_endpoint_url --fields title,realm
```

For example,

```
apic identity-providers:list --scope provider --server myserver.com --fields title,realm
total_results: 2
results:
- title: API Manager Local User Registry
  realm: provider/default-idp-2
- title: Corporate LDAP user registry
  realm: provider/corporate-ldap
```

The **title** value should enable you to determine which identity provider to use; you can then copy the corresponding **--realm** parameter directly from the displayed **realm** value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default API Manager Local User Registry for login as a member of a provider organization is **default-idp-2**.

For full details of the **apic login** command, see [Logging in to a management server](#).

2. List all of the available Drupal config for a site.

```
apic --mode portaladmin drupal-config:list --server management_server --catalog catalogid/name --org orgid/name --format format_type
```

- **management_server** is the endpoint URL of the management server (required).
- **catalogid/name** is the ID or name of the catalog that the site belongs to (required).
- **orgid/name** is the ID or name of the provider organization that the catalog belongs to (required).
- **format_type** is the output format. Can be **json**, **yaml**, **go-template=...**, **go-template-file=...**. Defaults to **yaml**.

For example:

```
apic --mode portaladmin drupal-config:list --server my.management.server.com --org ibm --catalog portal-test --format yaml
admin_toolbar_tools.settings:
  name: admin_toolbar_tools.settings
adminimal_admin_toolbar.settings:
  name: adminimal_admin_toolbar.settings
advagg.settings:
  name: advagg.settings
advagg_css_minify.settings:
  name: advagg_css_minify.settings
advagg_js_minify.settings:
  name: advagg_js_minify.settings
autologout.settings:
  name: autologout.settings
...
```

Note that the example has been reduced as the full response is very large.

3. List a specific Drupal config for a site.

```
apic --mode portaladmin drupal-config:list --server management_server --catalog catalogid/name --org orgid/name --prefix config_prefix --format format_type
```

- **config_prefix** is the prefix of the Drupal config, for example **system**. If omitted, the command returns all config names in the system.

For example:

```
apic --mode portaladmin drupal-config:list --server my.management.server.com --org ibm --catalog portal-test --format yaml --prefix system.theme
system.theme:
  name: system.theme
system.theme.global:
  name: system.theme.global
```

4. Update a Drupal config key value.

```
apic --mode portaladmin drupal-config:set --server management_server --catalog catalogid/name --org orgid/name --config_name config_name --config_key config_key --config_value config_value
```

- **config_name** is the name of the Drupal config object, for example **system.site** (required).
- **config_key** is the Drupal config key, for example **page.front** (required).
- **config_value** is the value to assign to the config key (required).

For example, to set the default theme to **claro**:

```
apic --mode portaladmin drupal-config:set --server my.management.server.com --org ibm --catalog portal-test --config_name system.theme --config_key default --config_value claro
// Do you want to update default key in system.theme config?: yes.
```

5. Create a new Drupal config key and set the value.

```
apic --mode portaladmin drupal-config:set --server management_server --catalog catalogid/name --org orgid/name --config_name config_name --config_key new_config_key --config_value new_config_value
```

For example, to create a new config key and set the value in the `system.site` config object:

```
apic --mode portaladmin drupal-config:set --server my.management.server.com --org ibm --catalog portal-test --config_name system.site --config_key new_key --config_value new_value
// new_key key does not exist in system.site config. Do you want to create a new config key?: yes.
```

6. Get all of the key values for a Drupal config object.

```
apic --mode portaladmin drupal-config:get --server management_server --catalog catalogid/name --org orgid/name --format format_type --config_name config_name
```

For example, to find out what themes are available:

```
apic --mode portaladmin drupal-config:get --server my.management.server.com --org ibm --catalog portal-test --format json --config_name system.theme
{
  "admin": "seven",
  "default": "claro",
  "core": {
    "default_config_hash": "fOjer9hADYYnbCJVZMFZIIIm1azTFWyg84ZkFDHfAbUg"
  },
  "defaultplus": "bartisk"
}
```

7. Get the value of a specific key for a Drupal config object.

```
apic --mode portaladmin drupal-config:get --server management_server --catalog catalogid/name --org orgid/name --format format_type --config_name config_name --config_key config_key
```

For example, to find out what the default theme is:

```
apic --mode portaladmin drupal-config:get --server my.management.server.com --org ibm --catalog portal-test --format json --config_name system.theme --config_key default
{
  "system.theme:default": "claro"
}
```

8. Delete a Drupal config object, or a specific config key and its value.

```
apic --mode portaladmin drupal-config:delete --server management_server --catalog catalogid/name --org orgid/name --config_name config_name --config_key config_key
```

- `config_key` is the Drupal config key, for example `page.front` (optional).

For example, to delete the config key `new_key` and its value:

```
apic --mode portaladmin drupal-config:delete --server my.management.server.com --org ibm --catalog portal-test --config_name system.site --config_key new_key
The config object/value was successfully deleted.
```

Example

The following scenario gives an example of how to turn off CSS and JS aggregation to help with twig debug. However, on a production system aggregation should be enabled for performance reasons.

1. Check the settings for performance, which include settings for CSS and JS aggregation:

```
apic --mode portaladmin drupal-config:get --server management_server --catalog catalogid/name --org orgid/name --config_name system.performance
```

2. Turn off CSS aggregation:

```
apic --mode portaladmin drupal-config:set --server management_server --catalog catalogid/name --org orgid/name --config_name system.performance --config_key css.preprocess --config_value 0
```

3. Turn off JS aggregation:

```
apic --mode portaladmin drupal-config:set --server management_server --catalog catalogid/name --org orgid/name --config_name system.performance --config_key js.preprocess --config_value 0
```

4. Then, rebuild the cache:

```
apic --mode portaladmin site:cache-rebuild --server management_server --catalog catalogid/name --org orgid/name
```

When loading the site in a browser, you should now see CSS and JS aggregation is disabled when using development tools for site debug or customization.

Note:

- Disabling aggregation affects site performance, so if the site goes into production remember to turn aggregation back on again.
- Although the settings are shown as `true` or `false`, to set them by using the `drupal-config:set` command, you must apply a value of 1 for `true`, and 0 for `false`.

Using the drupal-state commands

You can use the `drupal-state` commands to store and retrieve information about the state of your Developer Portal system.

Information about the state of your Developer Portal system is stored in the Developer Portal database, and therefore this information is lost if the database is dropped, or the Developer Portal site is re-installed from configuration.

The **drupal-state** commands can be used to set, update, get, or delete a state key value. For example, you can use the **drupal-state** commands to enable and disable maintenance mode for your Developer Portal; for more information, see the scenario [How to enable and disable maintenance mode on your Developer Portal](#).

Warning: Use the **drupal-state** command with caution. This command enables you to modify keys for your Developer Portal site state. Incorrect usage of this command can bring down your Developer Portal, and then require restoring it from a backup.

1. Log in as Provider org:

```
apic login --server management_server --realm provider/identity_provider --username provider_username --password provider_password
```

You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

```
apic identity-providers:list --scope provider --server mgmt_endpoint_url --fields title,realm
```

For example,

```
apic identity-providers:list --scope provider --server myserver.com --fields title,realm
total_results: 2
results:
- title: API Manager Local User Registry
  realm: provider/default-idp-2
- title: Corporate LDAP user registry
  realm: provider/corporate-ldap
```

The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default API Manager Local User Registry for login as a member of a provider organization is `default-idp-2`.

For full details of the `apic login` command, see [Logging in to a management server](#).

2. Create a new Drupal state key, or update an existing key, and set the value.

```
apic --mode portaladmin drupal-state:set --server management_server --catalog catalogid/name --org orgid/name --input_format input_format_type --state_key state_key_name --state_value state_value
```

Where:

- `management_server` is the endpoint URL of the management server (required).
- `catalogid/name` is the ID or name of the catalog that the site belongs to (required).
- `orgid/name` is the ID or name of the provider organization that the catalog belongs to (required).
- `input_format_type` is the input format of the value for the state key. Can be `string`, `integer`, `float`, `boolean`, `json`, or `yaml`. Defaults to `auto`, which means that you can omit this parameter, and the toolkit CLI will decide which format to use.
- `state_key_name` is the name of the state key, for example `system.cron_last` (required).
- `state_value` is the value to assign to the state key (required).
- `--format` is the output format. Can be `json`, `yaml`, `go-template=...`, `go-template-file=...`. Defaults to `yaml`.

For example, to create a new key called `testKey`, and set the value to 123:

```
apic --mode portaladmin drupal-state:set -s my.management.server.com -o myorg -c dev-catalog --input_format yaml --state_key testKey --state_value 123
Successfully set state testKey to the value of 123
```

3. Get the value for a particular Drupal state key.

```
apic --mode portaladmin drupal-state:get --server management_server --catalog catalogid/name --org orgid/name --format format_type --state_key state_key_name
```

For example, to get the value of the state key `testKey`:

```
apic --mode portaladmin drupal-state:get -s my.management.server.com -c dev-catalog -o myorg --format yaml --state_key testKey
testKey: 123
```

4. Delete a specific Drupal state key and its value.

```
apic --mode portaladmin drupal-state:delete --server management_server --catalog catalogid/name --org orgid/name --state_key state_key_name
```

For example, to delete the state key `testKey` and its value:

```
apic --mode portaladmin drupal-state:delete -s my.management.server.com -c dev-catalog -o myorg --state_key testKey
The key/value was successfully deleted.
```

Related tasks

- [Toggling the site in and out of maintenance mode](#)

Using the entity commands

You can use the **entity** commands to get the entity count on your Developer Portal service.

1. Log in as Provider org:

```
apic login --server management_server --realm provider/identity_provider --username provider_username --password provider_password
```

You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

```
apic identity-providers:list --scope provider --server mgmt_endpoint_url --fields title,realm
```

For example,

```
apic identity-providers:list --scope provider --server myserver.com --fields title,realm
total_results: 2
results:
- title: API Manager Local User Registry
  realm: provider/default-idp-2
- title: Corporate LDAP user registry
  realm: provider/corporate-ldap
```

The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default API Manager Local User Registry for login as a member of a provider organization is `default-idp-2`.

For full details of the `apic login` command, see [Logging in to a management server](#).

2. Get the entity count for a site.

For example,

```
apic --mode portaladmin entity:count --org orgid/name --server management_server --catalog name/id
```

Using the export-entity commands

You can use the **export-entity** commands to manage the export of content entities from your Developer Portal site.

About

The Developer Portal is based on the Drupal content management system. In Drupal, a content entity is an item of content data that is intended to be displayed to site users, such as text, images, and HTML markup. Content entities are grouped into entity types, and most of these entity types are also subdivided into entity subtypes, also known as bundles. The **export-entity** commands enable you to create a predefined list, called an export entity, of all of the content entities that you want to export. You can create multiple export entities, each one containing its own set of assorted entity types. Export entities persist, so you can add content and remove content as required.

If you want to export only one type of content entity, or all of the content entity types, at a time, you can use the **content** commands; see [Using the content commands](#) for more information. You also use these commands when you want to import your entity content.

Procedure

1. Log in as Provider org as seen in the following example.

```
apic login --server management_server --realm provider/identity_provider --username provider_username --password provider_password
```

You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

```
apic identity-providers:list --scope provider --server mgmt_endpoint_url --fields title,realm
```

For example,

```
apic identity-providers:list --scope provider --server myserver.com --fields title,realm
total_results: 2
results:
- title: API Manager Local User Registry
  realm: provider/default-idp-2
- title: Corporate LDAP user registry
  realm: provider/corporate-ldap
```

The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default API Manager Local User Registry for login as a member of a provider organization is `default-idp-2`.

For full details of the `apic login` command, see [Logging in to a management server](#).

For a summary of the general-purpose commands and their use, see [Developer Portal CLI commands](#).

2. Create an export entity by using the following `export-entity:create` command. This command creates a container for the entity content that you want to export.

```
apic --mode portaladmin --server management_server --org orgid/name --catalog catalogid/name export-entity:create --export_entity_name "export_entity_name"
```

Where:

- `management_server` is the endpoint URL of the management server (required).
- `orgid/name` is the ID or name of the provider organization that the catalog belongs to (required).
- `catalogid/name` is the ID or name of the catalog that the site belongs to (required).
- `export_entity_name` is the name of the export entity that you want to create. Note that this name is not a unique identifier.

The command returns an ID for the newly created export entity. For example:

```
apic --mode portaladmin --server my_management_server --org my_org --catalog my_catalog export-entity:create --
export_entity_name "Main Content"
[notice] Created new export entity Main Content, id 5
```

Make a separate note of the ID number that is returned, as you will need this ID for future commands.

3. List all of the export entities that are available for your site by using the following `export-entity:list` command.

```
apic --mode portaladmin --server management_server --org orgid/name --catalog catalogid/name export-entity:list
```

The command returns a list of the available export entities, including their ID, and the date and time that they were created. For example:

```
apic --mode portaladmin --server my_management_server --org my_org --catalog my_catalog export-entity:list
_
id: '5'
name: 'Main Content'
created_time: '2023-09-12 15:05:04'
```

4. Add content to an export entity by using the following `export-entity:add-content` command.

```
apic --mode portaladmin --server management_server --org orgid/name --catalog catalogid/name export-entity:add-content --
export_entity_id export_entity_id --entity_type entity_type_name --entity_ids entity_ids
```

Where:

- `export_entity_id` is the ID of the export entity (required).
- `entity_type_name` is the type of content entity that you want to add to the export entity (required). You can use the `content:list-types` command to find out the type of content entities that are exportable from your site; see [Using the content commands](#).
- `entity_ids` is a comma separated list of the entity IDs that you want to add to the export entity (optional). If you want to add all of the content entities for a particular entity type, you don't need to set any entity IDs.

The following example shows three different types of entity content being added to the export entity 5:

```
apic --mode portaladmin --server my_management_server --org my_org --catalog my_catalog export-entity:add-content --
export_entity_id 5 --entity_type node --entity_ids 1,2
[notice] Successfully added entity type node - "1, 2" to export entity 5

apic --mode portaladmin --server my_management_server --org my_org --catalog my_catalog export-entity:add-content --
export_entity_id 5 --entity_type block_content --entity_ids 1,2
[notice] Successfully added entity type block_content - "1, 2" to export entity 5

apic --mode portaladmin --server my_management_server --org my_org --catalog my_catalog export-entity:add-content --
export_entity_id 5 --entity_type shortcut --entity_ids 1
[notice] Successfully added entity type shortcut - "1" to export entity 5
```

5. Delete content from an export entity by using the following `export-entity:remove-content` command.

```
apic --mode portaladmin --server management_server --org orgid/name --catalog catalogid/name export-entity:remove-content --
--export_entity_id export_entity_id --entity_type entity_type_name --entity_ids entity_ids
```

Where:

- `export_entity_id` is the ID of the export entity (required).
- `entity_type_name` is the type of content entity that you want to remove (required).
- `entity_ids` is a comma separated list of the entity IDs that you want to remove (optional). If you want to remove all of the content entities for a particular entity type, you don't need to set any entity IDs.

For example, to remove entity ID 1 of the content entity type `shortcut` from the export entity 5, you can run the following command:

```
apic --mode portaladmin --server my_management_server --org my_org --catalog my_catalog export-entity:remove-content --
export_entity_id 5 --entity_type shortcut --entity_ids 1
[notice] Successfully removed entity type shortcut - "1" from export entity 5
```

6. View the content details of an export entity by using the following `export-entity:get` command. This command returns a list of all of the content entities in a specific export entity ID, and is the entity content that will be exported if the `export-entity:launch` command is run on that ID.

```
apic --mode portaladmin --server management_server --org orgid/name --catalog catalogid/name export-entity:get --
export_entity_id export_entity_id
```

In the following example, export entity 5 contains four different content entities:

```
apic --mode portaladmin --server my_management_server --org my_org --catalog my_catalog export-entity:get --
export_entity_id 5
- bundle: basic
  id: "1"
  title: No Apps Found [en]
  type: block_content
- bundle: page
  id: "1"
  title: Terms of use
  type: node
- bundle: basic
  id: "2"
  title: No Apis Found [en]
  type: block_content
- bundle: page
  id: "2"
  title: Privacy Policy
  type: node
```

7. Export your content entities by running the following `export-entity:launch` command. This command launches an export entity polling task that creates a `.tgz` file of all of the entities that are contained in a specific export entity. By default, the command polls the status of the task every 30 seconds until the task is finished, at which point the export file is returned. If the command is run with the `--no-poll` option, the task doesn't return a `.tgz` file, but just returns the task ID.

```
apic --mode portaladmin --server management_server --org orgid/name --catalog catalogid/name export-entity:launch --
export_entity_id export_entity_id
```

Where:

- `--no-poll` is an optional flag meaning that the command won't poll the status of the task, but instead just returns the task ID. This task ID can then be used with the `export-entity:get-export` command to return the export file.

Note: The command continues to poll until the maximum polling time of 25 minutes is reached. At which point you can use the commands `export-entity:get_export_status` and `export-entity:get-export` to get the status and, if the task has finished, an artifact.

The `export-entity:launch` command can be run multiple times, and the content of the export entity updated as required by using the `export-entity:add-content` and `export-entity:remove-content` commands.

The following example exports the contents of export entity 5:

```
apic --mode portaladmin --server my_management_server --org my_org --catalog my_catalog export-entity:launch --
export_entity_id 5
201 CREATED - TASK ID: saleo5261k5a2y
```

Response Code - 202:

```
Message(s) -
The status of this task is: QUEUED
```

Response Code - 200:

```
Message(s) -
The status of this task is: FINISHED and the artifact can now be streamed
```

```
Saving File (Large files may take a while)...
Incoming project saved to export_entity_launchExport-20230912165
```

The command saves the export to your running directory. The export .tgz file includes a root.json file that contains an index of all of the entities that are contained in the .tgz file, as well as a `content_entity_type.json` file for each content entity type exported. The `content_entity_type.json` file contains all of the information needed to be able to import those entities into a different Developer Portal site.

8. If you ran the `export-entity:launch` command with the `--no-poll` option, you can use the following commands to manage your entity export.

- `export-entity:delete-launch-export`

Cancels any currently running `export-entity:launch` tasks, and deletes any related artifacts. For example:

```
apic --mode portaladmin --server management_server --org orgid/name --catalog catalogid/name export-entity:delete-
launch-export --task_id task_id
```

Where `task_id` is the ID of the export task on the queue.

- `export-entity:get-launch-export`

Streams the content of a specific completed `export-entity:launch` task to a .tgz file. For example:

```
apic --mode portaladmin --server management_server --org orgid/name --catalog catalogid/name export-entity:get-
launch-export --task_id task_id
```

- `export-entity:get-launch-export-status`

Returns the status of a specific `export-entity:launch` task. For example:

```
apic --mode portaladmin --server management_server --org orgid/name --catalog catalogid/name export-entity:get-
launch-export-status --task_id task_id
```

What to do next

You can import your export entity archive files by using the `content` commands; see [Using the content commands](#) for more information.

Related reference

- [Using the content commands](#)

Using the factory-reset command

You can use the `factory-reset` command to perform a factory reset of your Developer Portal, which will delete the portal service and all of its associated Developer Portal sites.

Warning: The `factory-reset` command is irreversible. You must ensure that you have backups created before running this command.

1. Log in as Cloud manager:

```
apic login --server management_server --realm admin/identity_provider --username admin --password cloud_password
```

You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

```
apic identity-providers:list --scope admin --server mgmt_endpoint_url --fields title,realm
```

For example:

```
apic identity-providers:list --scope admin --server myserver.com --fields title,realm
total_results: 2
results:
- title: Cloud Manager User Registry
  realm: admin/default-idp-1
```

```
- title: Corporate LDAP user registry
  realm: admin/corporate-ldap
```

The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default Cloud Manager Local User Registry for login as a member of the cloud administration organization is `default-idp-1`. For full details of the `apic login` command, see [Logging in to a management server](#).

2. Output a dry run status of a Developer Portal factory reset:

```
apic --mode portaladmin factory-reset:delete --server management_server --portal_service_endpoint portal_endpoint
```

- `management_server` is the endpoint URL of the management server.
- `portal_endpoint` is the URL endpoint of the portal service.

For example:

```
apic --mode portaladmin factory-reset:delete --server api.stagingexample.com --portal_service_endpoint https://api.portal.mystack.com
```

3. Perform a factory reset of the Developer Portal, deleting the portal service and all of its associated Developer Portal sites:

Warning: The `factory-reset` command is irreversible. You must ensure that you have backups created before running this command.

```
apic --mode portaladmin factory-reset:delete --server management_server --portal_service_endpoint portal_endpoint --execute_reset true
```

- `--execute_reset` must be set to `true` to trigger the Developer Portal reset.

For example:

```
apic --mode portaladmin factory-reset:delete --server api.stagingexample.com --portal_service_endpoint https://api.portal.mystack.com --execute_reset true
```

Using the forums commands

You can use the `forums` commands to disable or enable the forums on your Developer Portal service.

1. Log in as Provider org:

```
apic login --server management_server --realm provider/identity_provider --username provider_username --password provider_password
```

You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

```
apic identity-providers:list --scope provider --server mgmt_endpoint_url --fields title,realm
```

For example,

```
apic identity-providers:list --scope provider --server myserver.com --fields title,realm
total_results: 2
results:
- title: API Manager Local User Registry
  realm: provider/default-idp-2
- title: Corporate LDAP user registry
  realm: provider/corporate-ldap
```

The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default API Manager Local User Registry for login as a member of a provider organization is `default-idp-2`. For full details of the `apic login` command, see [Logging in to a management server](#).

2. Disable the Forum module on your Developer Portal site.

This command deletes all of the taxonomy terms in the forum vocabulary, and then disables the Forum module.

```
apic --mode portaladmin forums:disable --org orgid/name --server management_server --catalog name/id
```

- `orgid/name` is the ID or name of the provider organization that the catalog belongs to (required).
- `management_server` is the endpoint URL of the management server (required).
- `name/id` is the ID or name of the catalog that the site belongs to (required).

For example,

```
apic --mode portaladmin forums:disable --org ibm --server api.stagingexample.com --catalog dev
```

3. Enable the Forum module on your Developer Portal site.

```
apic --mode portaladmin forums:enable --org orgid/name --server management_server --catalog name/id
```

For example,

```
apic --mode portaladmin forums:enable --org ibm --server api.stagingexample.com --catalog dev
```

Using the ip-security-enabled command

You can use the `ip-security-enabled` commands to toggle IP security on your Developer Portal. When IP security is enabled, modules such as the Drupal Perimeter Defence module, or flood control, will block client IP addresses suspected of malicious behavior, as expected. Banned IP addresses can be cleared by using the

`security:clear-bans` command. You might want to turn off IP security if you are performing penetration tests, or if you cannot pass through the client IP address from your external load balancer. Note that IP security is enabled by default on the Developer Portal.

1. Log in as Cloud manager:

```
apic login --server management_server --realm admin/identity_provider --username admin --password cloud_password
```

You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

```
apic identity-providers:list --scope admin --server mgmt_endpoint_url --fields title,realm
```

For example:

```
apic identity-providers:list --scope admin --server myserver.com --fields title,realm
total_results: 2
results:
- title: Cloud Manager User Registry
  realm: admin/default-idp-1
- title: Corporate LDAP user registry
  realm: admin/corporate-ldap
```

The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default Cloud Manager Local User Registry for login as a member of the cloud administration organization is `default-idp-1`.

For full details of the `apic login` command, see [Logging in to a management server](#).

2. Enable IP security on the Developer Portal:

```
apic --mode portaladmin ip-security-enabled:update --server management_server --portal_service_name portal --enabled true
```

- `management_server` is the endpoint URL of the management server.
- `portal` is the name of the portal service.
- `--enabled` is set to `true` to enable IP security. Can be set to `false` to disable IP security.

For example:

```
apic --mode portaladmin ip-security-enabled:update --server my.management.server.com --portal_service_name my_portal_service --enabled true
IP security has been successfully set to true
```

3. Disable IP security on the Developer Portal:

```
apic --mode portaladmin ip-security-enabled:update --server management_server --portal_service_name portal --enabled false
```

Using the maintenance commands

You can use the **maintenance** commands to manage the maintenance operations on your Developer Portal service.

1. Log in as Provider org:

```
apic login --server management_server --realm provider/identity_provider --username provider_username --password provider_password
```

You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

```
apic identity-providers:list --scope provider --server mgmt_endpoint_url --fields title,realm
```

For example,

```
apic identity-providers:list --scope provider --server myserver.com --fields title,realm
total_results: 2
results:
- title: API Manager Local User Registry
  realm: provider/default-idp-2
- title: Corporate LDAP user registry
  realm: provider/corporate-ldap
```

The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default API Manager Local User Registry for login as a member of a provider organization is `default-idp-2`.

For full details of the `apic login` command, see [Logging in to a management server](#).

For a summary of the general-purpose commands and their use, see [Developer Portal CLI commands](#).

2. Get the current mode of your maintenance operations.

```
apic --mode portaladmin --server management_server maintenance:status --org orgid/name --catalog catalogid/name
```

- `mode` is the toolkit operation mode.
- `catalogid/name` is the ID or name of the catalog that the site belongs to (required).
- `orgid/name` is the ID or name of the provider organization that the catalog belongs to (required).
- `management_server` is the endpoint URL of the management server (required).

For example,

```
apic --mode portaladmin --server api.stagingexample.com maintenance:status --org ibm --catalog api-connect-catalog-1
```

3. Enable the maintenance mode to make the Developer Portal site inaccessible to everyone apart from an administrator. All other users who enter the site URL will see a maintenance message set by the administrator.

```
apic --mode portaladmin --server management_server maintenance:enable --org orgid/name --catalog catalogid/name
```

4. Disable the maintenance mode to make the Developer Portal site accessible to everyone.

```
apic --mode portaladmin --server management_server maintenance:disable --org orgid/name --catalog catalogid/name
```

5. Rebuild the node access table to prevent users from accessing the nodes to which they do not have access permissions.

```
apic --mode portaladmin --server management_server maintenance:rebuild-node-access --org orgid/name --catalog catalogid/name
```

6. Rebuild and reindex the search API index to increase the performance and storage space usage.

```
apic --mode portaladmin --server management_server maintenance:search-api-index-rebuild --org orgid/name --catalog catalogid/name
```

7. Print the search API index status.

```
apic --mode portaladmin --server management_server maintenance:search-api-index-status --org orgid/name --catalog catalogid/name
```

Using the memcache commands

You can use the **memcache** commands to get, enable, and disable the default caching store operations on your Developer Portal service.

1. Log in as Provider org:

```
apic login --server management_server --realm provider/identity_provider --username provider_username --password provider_password
```

You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

```
apic identity-providers:list --scope provider --server mgmt_endpoint_url --fields title,realm
```

For example,

```
apic identity-providers:list --scope provider --server myserver.com --fields title,realm
total_results: 2
results:
- title: API Manager Local User Registry
  realm: provider/default-idp-2
- title: Corporate LDAP user registry
  realm: provider/corporate-ldap
```

The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default API Manager Local User Registry for login as a member of a provider organization is `default-idp-2`.

For full details of the `apic login` command, see [Logging in to a management server](#).

For a summary of the general-purpose commands and their use, see [Developer Portal CLI commands](#).

2. Get the status of all the **memcache** enabled operations.

```
apic --mode portaladmin --server management_server memcache:get --org orgid/name --catalog catalogid/name
```

- `mode` is the toolkit operation mode.
- `management_server` is the endpoint URL of the management server (required).
- `catalogid/name` is the ID or name of the catalog that the site belongs to (required).
- `orgid/name` is the ID or name of the provider organization that the catalog belongs to (required).

For example,

```
apic --mode portaladmin --server api.stagingexample.com memcache:get --org ibm --catalog api-connect-catalog-1
```

3. Enable the default caching store operations. This will set Drupal to use the RAM as cache.

```
apic --mode portaladmin --server management_server memcache:enable --org orgid/name --catalog catalogid/name
```

4. Disable the default caching store operations. This will set Drupal to use the database as cache.

```
apic --mode portaladmin --server management_server memcache:disable --org orgid/name --catalog catalogid/name
```

Using the modules commands

You can use the **modules** commands to list, enable, disable and delete the modules on your Developer Portal service.

1. Log in as Provider org:

```
apic login --server management_server --realm provider/identity_provider --username provider_username --password provider_password
```

You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

```
apic identity-providers:list --scope provider --server mgmt_endpoint_url --fields title,realm
```

For example,

```
apic identity-providers:list --scope provider --server myserver.com --fields title,realm
total_results: 2
results:
- title: API Manager Local User Registry
  realm: provider/default-idp-2
- title: Corporate LDAP user registry
  realm: provider/corporate-ldap
```

The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default API Manager Local User Registry for login as a member of a provider organization is `default-idp-2`.

For full details of the `apic login` command, see [Logging in to a management server](#).

For a summary of the general-purpose commands and their use, see [Developer Portal CLI commands](#).

2. List the modules from a `packagename`.

For example,

```
apic --mode portaladmin modules:list --org orgid/name --server management_server --catalog name/id --package packagename1,packagename2
```

3. Enable the `modulename` module. You can upload this module by using the `custom-module:create-import` command. For more information, see [Using the custom-module commands](#).

For example,

```
apic --mode portaladmin modules:enable --org orgid/name --server management_server --catalog name/id --modules modulename
```

- `management_server` is the endpoint URL of the management server (required).
- `catalogid/name` is the ID or name of the catalog that the site belongs to (required).
- `orgid/name` is the ID or name of the provider organization that the catalog belongs to (required).
- `--package` enables you to filter by project packages. You can use multiple comma separated values.
- `--status` enables you to filter by extension status. Can be `enabled`, `disabled` and/or `'not installed'`. You can use multiple comma separated values.
- `--custom` enables you to filter your results to only the modules that you have installed on your Developer Portal site.

4. Disable the `modulename` module. If you disable a module, you must also disable all its dependencies.

For example,

```
apic --mode portaladmin modules:disable --org orgid/name --server management_server --catalog name/id --modules modulename,module_lib
```

5. Delete the `modulename` module. The module and all its dependencies must be disabled before you can delete them.

For example,

```
apic --mode portaladmin modules:delete --org orgid/name --server management_server --catalog name/id --modules modulename
```

Note that if you want to manage the Forum module, you can use the `forums` commands. For more information, see [Using the forums commands](#).

Using the php-memory commands

You can use the `php-memory` commands to list or update the PHP memory limits on your Developer Portal.

1. Log in as Cloud manager:

```
apic login --server management_server --realm admin/identity_provider --username cloud_username --password cloud_password
```

You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

```
apic identity-providers:list --scope admin --server mgmt_endpoint_url --fields title,realm
```

For example:

```
apic identity-providers:list --scope admin --server myserver.com --fields title,realm
total_results: 2
results:
- title: Cloud Manager User Registry
  realm: admin/default-idp-1
- title: Corporate LDAP user registry
  realm: admin/corporate-ldap
```

The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default Cloud Manager Local User Registry for login as a member of the cloud administration organization is `default-idp-1`.

For full details of the `apic login` command, see [Logging in to a management server](#).

2. Get the availability zone of the portal service's sites that you want to list:

```
apic availability-zones --org orgid/name --server management_server
```

3. List all the portal services in that availability zone:

```
apic portal-services:list --org orgid/name --server management_server --availability-zone availability_zone
```

4. Get the selected portal service's name:

```
apic portal-services:get --org orgid/name --server management_server --availability-zone availability_zone PORTAL-SERVICE-NAME
```

5. List the current PHP memory limits on the Developer Portal platform:

```
apic --mode portaladmin php-memory:list --server management_server --portal_service_name PORTAL-SERVICE-NAME
```

You receive output like this example:

```
Current web memory is set to: 768M
Current admin memory is set to: 768M
```

6. Update the current PHP memory limits on the Developer Portal platform:

```
apic --mode portaladmin php-memory:update --server management_server --portal_service_name PORTAL-SERVICE-NAME --memory_value 1024
```

You receive output like this example:

```
Setting php memory limit to 1024M within the database
Setting php memory limit to 1024M in /var/devportal/storenosync/php.ini
Setting php memory limit to 1024M in /web/local/php_config/php.ini
Done
```

Note: Consider the memory resource limits that are allocated to your Developer Portal pods before you set this value. Setting this value too high can result in the portal pods restarting because the containers request more memory than is allowed by Kubernetes. Setting the value too low can result in the internal portal processes failing because of lack of available memory.

Using the platforms commands

You can use the **platforms** commands to list the platforms on your Developer Portal service.

1. Log in as Cloud manager:

```
apic login --server management_server --realm admin/identity_provider --username cloud_username --password cloud_password
```

You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

```
apic identity-providers:list --scope admin --server mgmt_endpoint_url --fields title,realm
```

For example:

```
apic identity-providers:list --scope admin --server myserver.com --fields title,realm
total_results: 2
results:
- title: Cloud Manager User Registry
  realm: admin/default-idp-1
- title: Corporate LDAP user registry
  realm: admin/corporate-ldap
```

The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default Cloud Manager Local User Registry for login as a member of the cloud administration organization is `default-idp-1`. For full details of the `apic login` command, see [Logging in to a management server](#).

2. Get the availability zone of the portal service's platforms that you want to list:

```
apic availability-zones --org orgid/name --server management_server
```

3. List all the portal services in that availability zone

```
apic portal-services:list --org orgid/name --server management_server --availability-zone availability_zone
```

4. Get the selected portal service's name

```
apic portal-services:get --org orgid/name --server management_server --availability-zone availability_zone PORTAL-SERVICE-NAME
```

5. List the platforms of the portal service

```
apic --mode portaladmin platforms:list --server management_server --portal_service_name PORTAL-SERVICE-NAME --format json
```

Using the product commands

You can use the **product** commands to get and list the products on your Developer Portal service.

1. Log in as Provider org as seen in the following example.

```
apic login --server management_server --realm provider/identity_provider --username provider_username --password provider_password
```

You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

```
apic identity-providers:list --scope provider --server mgmt_endpoint_url --fields title,realm
```

For example,

```
apic identity-providers:list --scope provider --server myserver.com --fields title,realm
total_results: 2
results:
- title: API Manager Local User Registry
  realm: provider/default-idp-2
- title: Corporate LDAP user registry
  realm: provider/corporate-ldap
```

The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default API Manager Local User Registry for login as a member of a provider organization is `default-idp-2`.

For full details of the `apic login` command, see [Logging in to a management server](#).

For a summary of the general-purpose commands and their use, see [Developer Portal CLI commands](#).

2. Get a list of products from a site.

For example,

```
apic --mode portaladmin product:list --org orgid/name --server management_server --catalog catalogid/name
```

- `management_server` is the endpoint URL of the management server (required).
- `catalogid/name` is the ID or name of the catalog that the site belongs to (required).
- `orgid/name` is the ID or name of the provider organization that the catalog belongs to (required).
- `format_type` is the output format. Can be `json`, `yaml`, `go-template=...`, `go-template-file=...`. Defaults to `yaml`.

3. Get a product from a site by using the `id` or `name:version`.

For example,

```
apic --mode portaladmin product:get --org orgid/name --server management_server --catalog catalogid/name id/name:version
```

- `id/name:version` - The ID or name:version of a specific product (required). For example, `id-of-product-called-example-3` or `example:3.0.0`.

4. Get a specific entire product document from the portal of the provided organization and catalog by using the `id` or `name:version`.

```
apic --mode portaladmin product:get-document --org orgid/name --server management_server --catalog catalogid/name --format
format_type id/name:version
```

For example,

```
apic --mode portaladmin product:get-document --org ibm --server my.management.server.com --catalog portal-test --format
yaml intuiz-product:1.0.0
```

5. Add an attachment for your product within your Developer Portal.

For example,

```
apic --mode portaladmin product:add-attachment -s management_server --org orgid/name --catalog catalogid/name --
attachment_name attachment.txt --attachment_description "Product documentation" awesome-sleek-soft-chips-product:1.0.0
./attachment.txt
Loading File (Large files may take a while)...
```

```
Attachment successfully added to product awesome-sleek-soft-chips-product:1.0.0.
This product now has 2 attachments.
```

- `attachment_name` is the name given to the attachment when it is uploaded (required).
- `attachment_description` is the description of the attachment that is displayed to the users.

6. Set an icon for your product within your Developer Portal.

For example,

```
apic --mode portaladmin product:set-icon -s management_server --org orgid/name --catalog catalogid/name --icon_description
"product icon" awesome-sleek-soft-chips-product:1.0.0 ./icon.png
Loading File (Large files may take a while)...
```

```
Icon successfully set for product awesome-sleek-soft-chips-product:1.0.0
```

- `icon_description` is the icon description to be displayed to users and it is used as an alt text for the image (required).

7. Add a tag (Category) for your product within your Developer Portal.

For example,

```
apic --mode portaladmin product:add-tag -s management_server --org orgid/name --catalog catalogid/name --tag_name
top_level_element/next_level_element/lower_level_element awesome-sleek-soft-chips-product:1.0.0
Successfully set taxonomy tag top_level_element/next_level_element/lower_level_element
for product api-connect-cassin-llc-awesome-sleek-soft-chips-product:1.0.0
```

- `tag_name` is the tag name. For example, `top_level_element/next_level_element` (required).

Using the queue commands

You can use the `queue` commands to list the queued and locked platform tasks on your Developer Portal site.

1. List the queued and locked platform tasks for a specific Developer Portal site, including Developer Portal creates, restores, upgrades, snapshots, and cron jobs. An empty response means that there are currently no queued tasks for this Developer Portal.
 - a. Log in as Provider org as seen in the following example.

```
apic login --server management_server --realm provider/identity_provider --username provider_username --password provider_password
```

You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

```
apic identity-providers:list --scope provider --server mgmt_endpoint_url --fields title,realm
```

For example,

```
apic identity-providers:list --scope provider --server myserver.com --fields title,realm
total_results: 2
results:
- title: API Manager Local User Registry
  realm: provider/default-idp-2
- title: Corporate LDAP user registry
  realm: provider/corporate-ldap
```

The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default API Manager Local User Registry for login as a member of a provider organization is `default-idp-2`. For full details of the `apic login` command, see [Logging in to a management server](#).

For a summary of the general-purpose commands and their use, see [Developer Portal CLI commands](#).

- b. Run the following `queue:get` command:

```
apic --mode portaladmin queue:get --server management_server --org orgid/name --catalog catalogid/name
```

- `management_server` is the endpoint URL of the management server (required).
- `orgid/name` is the ID or name of the provider organization that the catalog belongs to (required).
- `catalogid/name` is the ID or name of the catalog that the site belongs to (required).

2. List the queued and locked platform related tasks for all of the Developer Portal sites on a specific portal service, including Developer Portal creates, restores, upgrades, snapshots, and cron jobs. An empty response means that there are currently no queued tasks.
 - a. Log in as Cloud manager:

```
apic login --server management_server --realm admin/identity_provider --username cloud_username --password cloud_password
```

You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

```
apic identity-providers:list --scope admin --server mgmt_endpoint_url --fields title,realm
```

For example:

```
apic identity-providers:list --scope admin --server myserver.com --fields title,realm
total_results: 2
results:
- title: Cloud Manager User Registry
  realm: admin/default-idp-1
- title: Corporate LDAP user registry
  realm: admin/corporate-ldap
```

The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default Cloud Manager Local User Registry for login as a member of the cloud administration organization is `default-idp-1`.

- b. Run the following `queue:list` command:

```
apic --mode portaladmin queue:list --server management_server --portal_service_name portal_service_name
```

- `portal_service_name` is the name of the portal service (required).

Related information

- [apic queue](#)

Using the role commands

You can use the **role** commands to complete the full lifecycle of Drupal user roles. This includes creating and deleting of roles, as well as adding and removing permissions to the roles in your Developer Portal service.

1. Log in as Provider org as seen in the following example.

```
apic login --server management_server --realm provider/identity_provider --username provider_username --password provider_password
```

You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

```
apic identity-providers:list --scope provider --server mgmt_endpoint_url --fields title,realm
```

For example,

```
apic identity-providers:list --scope provider --server myserver.com --fields title,realm
total_results: 2
results:
- title: API Manager Local User Registry
  realm: provider/default-idp-2
- title: Corporate LDAP user registry
  realm: provider/corporate-ldap
```

The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default API Manager Local User Registry for login as a member of a provider organization is `default-idp-2`.

For full details of the `apic login` command, see [Logging in to a management server](#).

For a summary of the general-purpose commands and their use, see [Developer Portal CLI commands](#).

2. Get the details of a specific Drupal user role and all of the permissions granted to the role.

```
apic --mode portaladmin --server management_server --org orgid/name --catalog catalogid/name role:get role
```

- `mode` is the toolkit operation mode.
- `management_server` is the endpoint URL of the management server (required).
- `catalogid/name` is the ID or name of the catalog that the site belongs to (required).
- `orgid/name` is the ID or name of the provider organization that the catalog belongs to (required).
- `role` is the name or label of the Drupal user role (required).

For example,

```
apic --mode portaladmin --server management-platform-api --org ibm --catalog api-connect-catalog-1 role:get portal_cli_blog
portal_cli_blog:
label: 'Portal CLI Blog'
perms:
- 'access content'
- 'access shortcuts'
```

The command returns the Drupal user role under the `portal_cli_blog` label as well as the permissions granted to the role.

3. List all of the Drupal user roles.

```
apic --mode portaladmin --server management_server --org orgid/name --catalog catalogid/name role:list
```

List the Drupal user roles based on user permissions assigned to the role.

For example,

```
apic --mode portaladmin --server management_server --org orgid/name --catalog catalogid/name role:list --
filter_by_permission=role_permission
```

- `--filter_by_permission` flag is used to filter the list based on specific permission (optional).
- `role_permission` is the permissions granted to a specific role.

List the Drupal user roles based on a specific role.

For example,

```
apic --mode portaladmin --server management_server --org orgid/name --catalog catalogid/name role:list --role=role
```

- `--role` flag is used to filter the list based on specific role (optional).

4. Create a new Drupal user role.

```
apic --mode portaladmin --server management_server --org orgid/name --catalog catalogid/name role:create --machine_name
machine_name --human_readable_name human_readable_name
```

Note: The command must include a `machine_name` and a `human_readable_name`.

- The `machine_name` is used by Drupal to refer to the role and must contain only lowercase letters, numbers, and underscores.
- The `human_readable_name` is displayed on the UI and can contain other characters such as spaces.

For example,

```
apic --mode portaladmin --server management-platform-api --org ibm --catalog api-connect-catalog-1 role:create --
machine_name "portal_cli_blog" --human_readable_name "Portal CLI Blog"
```

5. Delete an unwanted Drupal user role.

```
apic --mode portaladmin --server management_server --org orgid/name --catalog catalogid/name role:delete role
```

For example,

```
apic --mode portaladmin --server management-platform-api --org ibm --catalog api-connect-catalog-1 role:delete
portal_cli_blog
```

If you try to delete a role that does not exist, you will get an error indicating that the specific user role does not exist.

For example,

```
- [error] Unable to load the user_role: no_role
```

6. Add permissions to a Drupal user role using the `permissions` flag. You can add multiple permissions to a role using a comma separated list within a single command call.

```
apic --mode portaladmin --server management_server --org orgid/name --catalog catalogid/name role:add-permission role --
permissions=role_permissions
```

- `role_permissions` is the permissions granted to a specific role (required).

For example,

```
apic --mode portaladmin --server management-platform-api --org ibm --catalog api-connect-catalog-1 role:add-permission portal_cli_blog --permissions="access comments,access content,access shortcuts"
```

If you try to add permissions to a role that does not exist, you will get an error indicating that the permission is fake. For example,

```
- [error] Permission(s) not found: fake permission
```

7. Remove unwanted permissions from a Drupal user role using the `permissions` flag. You can delete multiple permissions from a role using a comma separated list within a single command call.

```
apic --mode portaladmin --server management_server --org orgid/name --catalog catalogid/name role:remove-permission role --permissions=role_permissions
```

For example,

```
apic --mode portaladmin --server management-platform-api --org ibm --catalog api-connect-catalog-1 role:remove-permission portal_cli_blog --permissions="access comments"
```

If you try to remove permissions from a role that does not exist, you will get an error indicating that the permission does not exist. For example,

```
- [error] Permission(s) not found: perm not on role
```

Using the security command

You can use the `security` command to clear all of the banned user/IP addresses on a Developer Portal site.

1. Log in as Provider org:

```
apic login --server management_server --realm provider/identity_provider --username provider_username --password provider_password
```

You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

```
apic identity-providers:list --scope provider --server mgmt_endpoint_url --fields title,realm
```

For example,

```
apic identity-providers:list --scope provider --server myserver.com --fields title,realm
total_results: 2
results:
- title: API Manager Local User Registry
  realm: provider/default-idp-2
- title: Corporate LDAP user registry
  realm: provider/corporate-ldap
```

The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default API Manager Local User Registry for login as a member of a provider organization is `default-idp-2`. For full details of the `apic login` command, see [Logging in to a management server](#).

2. Clear all of the user and IP addresses that are currently banned on a particular portal site:

```
apic --mode portaladmin security:clear-bans --server management_server --catalog catalogid/name --org orgid/name
```

- `management_server` is the endpoint URL of the management server.
- `catalogid/name` is the ID or name of the catalog that the site belongs to.
- `orgid/name` is the ID or name of the provider organization that the catalog belongs to.

For example:

```
apic --mode portaladmin security:clear-bans --server my.management.server.com --catalog portal-test --org ibm
[notice] All bans cleared.
```

Note: You can also manage banned IP addresses by using the Developer Portal UI. For more information, see [Managing banned IP addresses](#).

Using the service commands

You can use the `service` commands to check and list the Developer Portal service from the Developer Portal database.

1. Log in as Cloud manager:

```
apic login --server management_server --realm admin/identity_provider --username cloud_username --password cloud_password
```

You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

```
apic identity-providers:list --scope admin --server mgmt_endpoint_url --fields title,realm
```

For example:

```
apic identity-providers:list --scope admin --server myserver.com --fields title,realm
total_results: 2
results:
```

```
- title: Cloud Manager User Registry
  realm: admin/default-idp-1
- title: Corporate LDAP user registry
  realm: admin/corporate-ldap
```

The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default Cloud Manager Local User Registry for login as a member of the cloud administration organization is `default-idp-1`. For full details of the `apic login` command, see [Logging in to a management server](#).

For a summary of the general-purpose commands and their use, see [Developer Portal CLI commands](#).

2. Get the availability zone of the portal service's sites that you want to list.

```
apic availability-zones --org orgid/name --server management_server
```

- `apic service:list` - List the Portal service currently installed.
- `-s, --server mgmt_endpoint_url`. Use the value of the platform API endpoint URL for this entry.
- `--org orgid`
- `--catalog catalog id`.
- `--debug`. If you need debug information.

3. List the installed Developer Portal service.

```
apic --mode portaladmin service:list -s management_server --portal_service_name PORTAL-SERVICE-NAME --format json
```

Using the service-ip-allowlist commands

You can use the `service-ip-allowlist` commands to add, remove, and list the IP addresses on your Developer Portal `allowlist`. IP addresses that are on the `allowlist` are exempt from being blocked by Developer Portal security checks, for example, load balancer and proxy IPs.

1. Log in as Cloud manager:

```
apic login --server management_server --realm admin/identity_provider --username admin --password cloud_password
```

You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

```
apic identity-providers:list --scope admin --server mgmt_endpoint_url --fields title,realm
```

For example:

```
apic identity-providers:list --scope admin --server myserver.com --fields title,realm
total results: 2
results:
- title: Cloud Manager User Registry
  realm: admin/default-idp-1
- title: Corporate LDAP user registry
  realm: admin/corporate-ldap
```

The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default Cloud Manager Local User Registry for login as a member of the cloud administration organization is `default-idp-1`. For full details of the `apic login` command, see [Logging in to a management server](#).

2. Add one or more IP addresses to the `allowlist`:

```
apic --mode portaladmin service-ip-allowlist:add --server management_server --portal_service_name portal --ips
"list_of_ips"
```

- `management_server` is the endpoint URL of the management server.
- `portal` is the name of the portal service.
- `list_of_ips` is a comma separated list of the IP addresses that you want to add to the `allowlist`.

For example:

```
apic --mode portaladmin service-ip-allowlist:add --server my.management.server.com --portal_service_name my_portal_service
--ips "123.456.34.56,123.456.46.67"
Successfully added IP: 123.456.34.56.
Successfully added IP: 123.456.46.67.
```

3. Delete all of the IP addresses that are currently on the `allowlist`:

```
apic --mode portaladmin service-ip-allowlist:delete --server management_server --portal_service_name portal
```

4. List all of the IP addresses that are currently on the `allowlist`:

```
apic --mode portaladmin service-ip-allowlist:list --server management_server --portal_service_name portal
```

5. Remove one or more IP addresses from the `allowlist`:

```
apic --mode portaladmin service-ip-allowlist:remove --server management_server --portal_service_name portal --ips
"list_of_ips"
```

Using the site commands

You can use the **site** commands to check the site on your Developer Portal service, and to export and import an entire site configuration.

About

You can use the **site** commands to check the health of a portal site, rebuild the cache of a site, and display the login link for an admin account of a site. You can also use them to export the configuration settings for an entire Developer Portal site, and import those settings into another site. For example, you could use the export and import commands to replicate the configuration of a test site into a production site.

Important: If you want to import a site export configuration file, the export file must have been created on the same version of API Connect as the version that you want to import to.

1. Log in as Provider org:

```
apic login --server management_server --realm provider/identity_provider --username provider_username --password provider_password
```

You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

```
apic identity-providers:list --scope provider --server mgmt_endpoint_url --fields title,realm
```

For example,

```
apic identity-providers:list --scope provider --server myserver.com --fields title,realm
total results: 2
results:
- title: API Manager Local User Registry
  realm: provider/default-idp-2
- title: Corporate LDAP user registry
  realm: provider/corporate-ldap
```

The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default API Manager Local User Registry for login as a member of a provider organization is `default-idp-2`.

For full details of the `apic login` command, see [Logging in to a management server](#).

For a summary of the general-purpose commands and their use, see [Developer Portal CLI commands](#).

2. Check the site on your portal service. This command checks the file system, database, and API Manager on your portal site, which might identify platform-related problems on your portal site.

```
apic --mode portaladmin site:check --server management_server --catalog catalogid/name --org orgid/name --format format_type
```

- `management_server` is the endpoint URL of the management server (required).
- `catalogid/name` is the ID or name of the catalog that the site belongs to (required).
- `orgid/name` is the ID or name of the provider organization that the catalog belongs to (required).
- `format_type` is the output format. Can be `json`, `yaml`, `go-template=...`, `go-template-file=...`. Defaults to `yaml`.

3. Rebuild the cache of a specific portal site.

```
apic --mode portaladmin site:cache-rebuild --server management_server --catalog catalogid/name --org orgid/name
```

For example:

```
apic --mode portaladmin site:cache-rebuild --server management_server --org ibm --catalog portal-test
[success] Cache rebuild complete.
```

4. Display the state of a portal site associated with a particular organization and catalog. This command is useful as a general health check of the site.

```
apic --mode portaladmin site:state --server management_server --catalog catalogid/name --org orgid/name --format format_type
```

```
apic --mode portaladmin site:state --server my.management.server.com --org ibm --catalog portal-test --format json
{
  "alias": "ibm.portal-test.my.management.server.com",
  "check_state": "OK: 200",
  "content_refresh_required": false,
  "known_to_apim": 1,
  "platform": "platform_devportal_9_x_10_99_99_99_20210922_2000",
  "snapshot_first_requested": "0000-00-00 00:00:00",
  "snapshots_failed_processing_since_last_success": 0,
  "snapshots_requested_since_last_received": 0,
  "state": "INSTALLED",
  "subscribed_to_webhooks": true,
  "url": "my.management.server.com/ibm/portal-test",
  "uuid": "cc0ad766-e372-4988-9d45-744eb8d381de.1cd9dc41-b08d-xyz"
}
```

5. Log in to your Developer Portal admin with a link. This command displays a one time login link for the admin account for your Developer Portal site that is specified by the catalog and organization.

```
apic --mode portaladmin site:login-link --server management_server --org ibm --catalog portal-test
```

sample output:

```
https://my.portal.server.com/ibm/portal-test/user/reset/1/12345678901/ABCdef1f2gH3ijKL-4M_NOPqrs5TU6VWxy7ZABCDEFGHI7h8/new/login
```

6. Export your entire site configuration by using the following `site:create-export` command. This command creates an export task that returns a `.tgz` file containing the site configuration. By default, the command polls the status of the task every 10 seconds until the task is finished, at which point the export file is returned. Note that exporting all of your site configuration can take a long time to complete.

```
apic --mode portaladmin --server management_server --org orgid/name --catalog catalogid/name site:create-export
```

Where:

- `--no-poll` is an optional flag meaning that the command won't poll the status of the task, but instead just returns the task ID. This task ID can then be used with the `site:get-export` command to return the export file.

Note: The command continues to poll until the maximum polling time of 15 minutes is reached. At which point you can use the commands `site:get-export-status` and `site:get-export` to get the status and, if the task has finished, an artifact.

For example:

```
apic --mode portaladmin --server my_management_server --org my_org --catalog my_catalog site:create-export 201 CREATED - Task ID: vfg6b8utjtw51
```

```
Response Code - 202:
```

```
Message(s) -  
The status of this task is: QUEUED
```

```
Response Code - 202:
```

```
Message(s) -  
The status of this task is: RUNNING
```

```
Response Code - 202:
```

```
Message(s) -  
The status of this task is: RUNNING
```

```
Response Code - 200:
```

```
Message(s) -  
The status of this task is: FINISHED and the artifact can now be streamed
```

```
Saving File (Large files may take a while)...  
Incoming project saved to site_createExport-20231013154023.tgz
```

The command saves the export file to your running directory. The export .tgz file includes a site-content.tgz file, and a site-config.tgz file. The export file will also include a site-custom-themes.tgz, or a site-custom-modules.tgz file, or both, depending on whether the site contains any custom themes or custom modules.

7. If you ran the `site:create-export` command with the `--no-poll` option, you can use the following commands to manage your site export.

- `site:delete-export`
Cancels any currently running `site:create-export` tasks, and deletes any related artifacts. For example:

```
apic --mode portaladmin --server management_server --org orgid/name --catalog catalogid/name site:delete-export --task_id task_id
```

Where `task_id` is the ID of the export task on the queue.

- `site:get-export`
Streams the content of a specific completed export task to a .tgz file. For example:

```
apic --mode portaladmin --server management_server --org orgid/name --catalog catalogid/name site:get-export --task_id task_id
```

- `site:get-export-status`
Returns the status of a specific export task. For example:

```
apic --mode portaladmin --server management_server --org orgid/name --catalog catalogid/name site:get-export-status --task_id task_id
```

8. Import your site configuration by using the `site:create-import` command. This command launches an import polling task that polls the status of the task every 10 seconds until the task is finished, at which point a summary of the import is returned. If the command is run with the `--no-poll` option, the task doesn't return the status of the task, but just returns the task ID.

Important: If you want to import a site export configuration file, the export file must have been created on the same version of API Connect as the version that you want to import to.

```
apic --mode portaladmin --server management_server --org orgid/name --catalog catalogid/name site:create-import export_file_name
```

Where:

- `export_file_name` is the name of the export file that you want to import. You can import .tgz files that were created by using the `site:create-export` command.
- `--no-poll` is an optional flag meaning that the command won't poll the status of the task, but instead just returns the task ID. This task ID can then be used with the `site:get-import-status` command to get the status of the task.

Note: The command continues to poll until the maximum polling time of 15 minutes is reached. At which point you can use the command `site:get-import-status` to get the status of the task.

In the following example, the export file from Step 6 is imported into a production Developer Portal site on a different server:

```
apic --mode portaladmin --server my_management_server2 --org my_prod_org --catalog my_prod_catalog site:create-import site_createExport-20231013154023.tgz  
Loading File (Large files may take a while)...
```

```
201 CREATED - Task ID: 1z8e9zthfkhwdxh2
```

```
Response Code - 202:
```

```
Message(s) -  
The status of this task is: QUEUED
```

```
Response Code - 202:
```

```
Message(s) -  
The status of this task is: RUNNING
```

```
Response Code - 202:
```

Message(s) -
The status of this task is: RUNNING

Response Code - 202:

Message(s) -
The status of this task is: RUNNING

Response Code - 200:

```

2023-10-11 10:52:38: CLI task (site:import) completed successfully.
```

The message section provides detailed information about the import as the configuration is being imported.

9. If you ran the `site:create-import` command with the `--no-poll` option, you can use the following commands to manage your content import.

- `site:delete-import`

Cancels any currently running `site:create-import` tasks, and deletes any related artifacts. For example:

```
apic --mode portaladmin --server management_server --org orgid/name --catalog catalogid/name site:delete-import --
-task_id task_id
```

Where `task_id` is the ID of the import task on the queue.

- `site:get-import-status`

Returns the status of a specific import task. For example:

```
apic --mode portaladmin --server management_server --org orgid/name --catalog catalogid/name site:get-import-status -
-task_id task_id
```

Using the site-config commands

You can use the **site-config** commands to create exports and imports, delete exports and imports, get the status of an export or import, and get an export, on your Developer Portal service.

1. Log in as Provider org:

```
apic login --server management_server --realm provider/identity_provider --username cloud_username --password cloud_password
```

You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

```
apic identity-providers:list --scope provider --server mgmt_endpoint_url --fields title,realm
```

For example,

```
apic identity-providers:list --scope provider --server myserver.com --fields title,realm
total_results: 2
results:
- title: API Manager Local User Registry
  realm: provider/default-idp-2
- title: Corporate LDAP user registry
  realm: provider/corporate-ldap
```

The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default API Manager Local User Registry for login as a member of a provider organization is `default-idp-2`.

For full details of the `apic login` command, see [Logging in to a management server](#).

2. Export your site configs.

The **site-config:create-export** command creates an export task against the portal of the specified `catalog` and `org`. The command then polls the status of the task until it has **FINISHED** and the artifacts are streamed back.

Note: The command continues to poll until the maximum polling time of 15 minutes is reached. At which point you can use the commands **site-config:get-export-status** and **site-config:get-export** to get the status and potentially an artifact.

```
apic --mode portaladmin site-config:create-export --catalog name/id --org orgid/name --server management_server
```

- The site config .tgz is saved to the directory in which you ran the command.
- The saved .tgz has the format `site_config_createExport-20200217134637.tgz`.
- You can save your exports into your change control management system.

For example,

```
apic --mode portaladmin site-config:create-export --catalog dev --org ibm --server api.stagingexample.com
```

3. Import your site configs.

The **site-config:create-import** command uses the supplied .tgz file to import the site configs into the portal of the specified `catalog` and `org`. The command then polls the status of the task until the task has either **FINISHED** successfully, or failed because of an error.

Note: The higher level folders of the archive can contain only these characters, a-z and 0-9.

Note: The command continues to poll until the maximum polling time of 15 minutes is reached. At which point you can use the command **site-config:get-import-status** to get the status of the import.

```
apic --mode portaladmin site-config:create-import --catalog name/id --org orgid/name --server management_server /PATH/TO/SITE_CONFIG/TGZ
```

For example,

```
apic --mode portaladmin site-config:create-import --catalog prod --org ibm --server api.productionexample.com C:/users/example/desktop/site_config_createExport-20200217134637.tgz
```

4. You can run the delete command to cancel any ongoing or recently created import or export tasks. Any temporarily created artifacts will be deleted from the portal filesystem.

For example,

```
apic --mode portaladmin site-config:delete-export --catalog name/id --org orgid/name --server management_server --format json --task_id string
```

```
apic --mode portaladmin site-config:delete-import --catalog name/id --org orgid/name --server management_server --format json --task_id string
```

Related information

- [apic site-config](#)

Using the sites commands

You can use the **sites** commands to check and list the sites on your Developer Portal service. You can also reset the portal upgrade attempt counter.

1. Log in as Cloud manager:

```
apic login --server management_server --realm admin/identity_provider --username cloud_username --password cloud_password
```

You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

```
apic identity-providers:list --scope admin --server mgmt_endpoint_url --fields title,realm
```

For example:

```
apic identity-providers:list --scope admin --server myserver.com --fields title,realm
total_results: 2
results:
- title: Cloud Manager User Registry
  realm: admin/default-idp-1
- title: Corporate LDAP user registry
  realm: admin/corporate-ldap
```

The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default Cloud Manager Local User Registry for login as a member of the cloud administration organization is `default-idp-1`.

For full details of the `apic login` command, see [Logging in to a management server](#).

2. Get the availability zone of the portal service's sites that you want to list.

```
apic availability-zones --org orgid/name --server management_server
```

3. List all the portal services in that availability zone.

```
apic portal-services:list --org orgid/name --server management_server --availability-zone availability_zone
```

4. Get the selected portal service's name.

```
apic portal-services:get --org orgid/name --server management_server --availability-zone availability_zone PORTAL-SERVICE-NAME
```

5. Check the sites on your portal service. This command checks the file system, database, and API Manager on all your portal sites, which might identify platform-related problems on one or more of your portal sites.

```
apic --mode portaladmin sites:check --server management_server --portal_service_name PORTAL-SERVICE-NAME --format yaml
```

6. List the sites of the portal service.

```
apic --mode portaladmin sites:list --server management_server --portal_service_name PORTAL-SERVICE-NAME --format json
```

7. Reset the portal upgrade attempts. The following command resets the upgrade attempt counter within the portal, so that failed upgrades can be retried.

```
apic --mode portaladmin sites:reset-upgrade-attempts --server management_server --portal_service_name PORTAL-SERVICE-NAME
```

- [apic sites](#)

Using the themes commands

You can use the **themes** commands to list, enable, disable, delete, and set the default themes on your Developer Portal service.

1. Log in as Provider org:

```
apic login --server management_server --realm provider/identity_provider --username provider_username --password provider_password
```

You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

```
apic identity-providers:list --scope provider --server mgmt_endpoint_url --fields title,realm
```

For example,

```
apic identity-providers:list --scope provider --server myserver.com --fields title,realm
total_results: 2
results:
- title: API Manager Local User Registry
  realm: provider/default-idp-2
- title: Corporate LDAP user registry
  realm: provider/corporate-ldap
```

The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default API Manager Local User Registry for login as a member of a provider organization is `default-idp-2`.

For full details of the `apic login` command, see [Logging in to a management server](#).

For a summary of the general-purpose commands and their use, see [Developer Portal CLI commands](#).

2. List the themes from a *packagename*.

For example,

```
apic --mode portaladmin themes:list --org orgid/name --server management_server --catalog catalogid/name --package packagename1,packagename2
```

- `management_server` is the endpoint URL of the management server (required).
 - `catalogid/name` is the ID or name of the catalog that the site belongs to (required).
 - `orgid/name` is the ID or name of the provider organization that the catalog belongs to (required).
 - `--package` enables you to filter by project packages. You can use multiple comma separated values.
 - `--status` enables you to filter by extension status. Can be `enabled`, `disabled` and/or `'not installed'`. You can use multiple comma separated values.
 - `--custom` enables you to filter your results to only the themes that you have installed on your Developer Portal site.
3. Enable the `themename` theme. You can upload this theme by using the `custom-theme:create-import` command. For more information, see [Using the custom-theme commands](#).

For example,

```
apic --mode portaladmin themes:enable --org orgid/name --server management_server --catalog catalogid/name --themes themename
```

- `--themes` is the name of the theme, and can be multiple comma separated values (required).

4. Disable the `themename` theme.

For example,

```
apic --mode portaladmin themes:disable --org orgid/name --server management_server --catalog catalogid/name --themes themename,theme_lib
```

5. Delete the `themename` theme. The theme and all its dependencies must be disabled before you can delete them.

For example,

```
apic --mode portaladmin themes:delete --org orgid/name --server management_server --catalog catalogid/name --themes themename
```

6. Set the `themename` theme to be the default theme. The theme must exist and be enabled for it to be set as a default theme.

For example,

```
apic --mode portaladmin themes:set-default --org orgid/name --server management_server --catalog catalogid/name themename
```

- `themename` is the name of the theme to set as default.

Using the twig commands

You can use the `twig` commands to enable, disable, and check the state of twig debugging on a specific site on your Developer Portal service.

Note: Twig debugging should not be left enabled on production sites, as it causes performance issues, and can affect the caching on the site.

1. Log in as Provider org:

```
apic login --server management_server --realm provider/identity_provider --username provider_username --password provider_password
```

You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

```
apic identity-providers:list --scope provider --server mgmt_endpoint_url --fields title,realm
```

For example,

```
apic identity-providers:list --scope provider --server myserver.com --fields title,realm
total_results: 2
results:
- title: API Manager Local User Registry
  realm: provider/default-idp-2
- title: Corporate LDAP user registry
  realm: provider/corporate-ldap
```

The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default API Manager Local User Registry for login as a member of a provider organization is `default-idp-2`.

For full details of the `apic login` command, see [Logging in to a management server](#).

2. Enable twig debugging for a portal site.

```
apic --mode portaladmin twig:debug-enable --server management_server --org orgid/name --catalog catalogid/name
```

- `management_server` is the endpoint URL of the management server (required).
- `orgid/name` is the ID or name of the provider organization that the catalog belongs to (required).
- `catalogid/name` is the ID or name of the catalog that the site belongs to (required).

For example:

```
apic --mode portaladmin twig:debug-enable --server my.management.server.com --org ibm --catalog portal-test
Setting twig debug to true for site my.management.server.com/ibm/portal-test.
Rebuilding cache for my.management.server.com/ibm/portal-test so twig debug changes can take affect.
```

3. Disable twig debugging for a portal site.

```
apic --mode portaladmin twig:debug-disable --server management_server --org orgid/name --catalog catalogid/name
```

For example:

```
apic --mode portaladmin twig:debug-disable --server my.management.server.com --org ibm --catalog portal-test
Setting twig debug to false for site my.management.server.com/ibm/portal-test.
Rebuilding cache for my.management.server.com/ibm/portal-test so twig debug changes can take affect.
```

4. Get the current state of twig debugging for a specific site.

```
apic --mode portaladmin twig:debug-status --server management_server --org orgid/name --catalog catalogid/name
```

For example:

```
apic --mode portaladmin twig:debug-status --server my.management.server.com --org ibm --catalog portal-test
The current state of twig debugging is true for my.management.server.com/ibm/portal-test.
```

Using the user commands

You can use the **user** commands to complete some Drupal user management tasks on your Developer Portal, such as adding and removing roles, blocking and unblocking users, and retrieving user information.

About

In the Developer Portal, user management tasks can be completed by using the Developer Portal UI (see [People](#)), or by using the toolkit CLI as described in the following instructions. You can use these toolkit CLI commands to help you facilitate the user management process. For example, you could integrate these commands into your CI/CD processes, to find out information about inactive users that need to be notified of account deletion.

Procedure

1. Log in as Provider org:

```
apic login --server management_server --realm provider/identity_provider --username provider_username --password provider_password
```

You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

```
apic identity-providers:list --scope provider --server mgmt_endpoint_url --fields title,realm
```

For example,

```
apic identity-providers:list --scope provider --server myserver.com --fields title,realm
total_results: 2
results:
- title: API Manager Local User Registry
  realm: provider/default-idp-2
- title: Corporate LDAP user registry
  realm: provider/corporate-ldap
```

The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default API Manager Local User Registry for login as a member of a provider organization is `default-idp-2`.

For full details of the `apic login` command, see [Logging in to a management server](#).

2. Retrieve information about your Developer Portal users by using the `user:information` command. Due to the large number of users that might exist in your Developer Portal site, this command includes a default pagination limit of 50 users, with an offset of 0, but these defaults can be changed by using the optional flags. You can also use the optional flags to filter what user information is returned.

```
apic --mode portaladmin user:information --server management_server --org orgid/name --catalog catalogid/name
```

Where:

- `management_server` is the endpoint URL of the management server (required).
- `orgid/name` is the ID or name of the provider organization that the catalog belongs to (required).
- `catalogid/name` is the ID or name of the catalog that the site belongs to (required).

For example:

```
apic --mode portaladmin user:information --server my.management.server.com --org ibm --catalog portal-test
total: 2
offset: 0
limit: 2
users:
- uid: '9'
  name: 'portal1'
  mail: 'corg-email+1@ibm.com'
  roles:
  - 'authenticated'
  status: 'active'
  apic_state: 'enabled'
  last_login: '01/11/2024 12:25:40'
  user_registry: '/consumer-api/user-registries/349aa966-a081-4f10-a104-084c353bd08e (portal-ci Catalog 1 Catalog User Registry)'
  consumer_orgs:
  - '/consumer-api/orgs/d22714f4-89e0-48a2-b5a3-94e7f1043eaf (portal-ci Grant - Stokes - Practical Rustic Metal Chair Consumer Organization)'
  - '/consumer-api/orgs/b6251379-5b43-433f-a64e-c93cdae6e085 (portal-ci Krajcik, Jacobson and Kihn - Tasty Sleek Metal Mouse Consumer Organization)'
- uid: '10'
  name: 'portal2'
  mail: 'corg-email+2@ibm.com'
  roles:
  - 'authenticated'
  status: 'active'
  apic_state: 'enabled'
```

```

last_login: '01/01/1970 00:00:00'
user_registry: '/consumer-api/user-registries/349aa966-a081-4f10-a104-084c353bd08e (portal-ci Catalog 1 Catalog User Registry)'
consumer_orgs:
- '/consumer-api/orgs/d22714f4-89e0-48a2-b5a3-94e7f1043eaf (portal-ci Grant - Stokes - Practical Rustic Metal Chair Consumer Organization)'
- '/consumer-api/orgs/b6251379-5b43-433f-a64e-c93cdae6e085 (portal-ci Krajcik, Jacobson and Kihn - Tasty Sleek Metal Mouse Consumer Organization)'
```

The following user information is returned by default:

- **uid** - The unique Drupal ID that identifies the user entity.
- **name** - The name of the user.
- **mail** - The email address of the user.
- **roles** - The current active Drupal user roles that the user has assigned to them.
- **status** - The Drupal status of the user. Valid values are **active** or **blocked**.
- **apic_state** - The current status of the user account. Valid values are:
 - **enabled** - The account is activated.
 - **pending** - The account is created, but not activated.
 - **pending_approval** - The account is created, but is waiting for approval before it can be activated.
- **last_login** - The last time the user logged into the Developer Portal UI. If the user hasn't logged into the UI since creating their account, the time defaults to 01/01/1970 00:00:00, which is the start of UNIX time.
- **user_registry** - The user registry that the account is in. The entry contains both its unique identifier, and its human readable name.
- **consumer_orgs** - A list of the consumer organizations that the user is in. The list contains both the unique identifier, and the human readable name, of the organizations.

You can use the following optional command flags to filter what user information is returned, and control the pagination:

- **--apic-state** - A comma-separated list of the user account states (string).
- **--consumer-org** - A comma-separated list of consumer organization URLs (string). The users that are returned can be in one or more of the organizations listed, and you can find the consumer organization URLs by using the **consumer-org:list** command.
- **--format** - The output format of the return (string). Valid values are **json**, **yaml**, **octet-stream**, **go-template=template_name**, or **go-template-file=file_name**. Defaults to **yaml**.
- **--limit** - Limit the number of user results returned (int32). Default is 50 user results.
- **--login-after** - Filter the return to those users who last logged in after the provided date (string). The date must be in the format of **MM-DD-YYY** or **MM-DD-YY HH:MM:SS**.
- **--login-before** - Filter the return to those users who last logged in before the provided date (string). The date must be in the format of **MM-DD-YYY** or **MM-DD-YY HH:MM:SS**.
- **--mail** - A comma-separated list of user email addresses (string).
- **--names** - A comma-separated list of user names (string).
- **--offset** - Offset the user results that are returned (int32). For example, if there are 100 users in your Developer Portal site, and you want to return the user information for users 51 to 100, you can set the **--offset** option to 50.
- **--role** - A comma-separated list of Drupal user roles (string).
- **--status** - The Drupal status of the user. Valid values are **'active'** or **'blocked'**.
- **--uid** - A comma-separated list of unique Drupal user IDs.

3. Add one or more roles to one or more specified user accounts. You must provide one or more of the email address, user name, or unique Drupal ID of the user accounts that you want to update.

```

apic --mode portaladmin user:add-role --server management_server --org orgid/name --catalog catalogid/name --role role_name --names user_names
```

Where:

- **role_name** is a comma-separated list of the name of the Drupal user roles that you want to add (required). Note that the role must already exist in the Developer Portal.
- **--names** is a comma-separated list of user names.
- **--mail** is a comma-separated list of user email addresses.
- **--uid** is comma-separated list of unique Drupal IDs of users.

For example:

```

apic --mode portaladmin user:add-role --server my.management.server.com --org ibm --catalog portal-test --role administrator --names portall
[success] Added administrator role to portall
```

4. Remove one or more roles from one or more specified user accounts. You must provide one or more of the email address, user name, or unique Drupal ID of the user accounts that you want to update.

```

apic --mode portaladmin user:remove-role --server management_server --org orgid/name --catalog catalogid/name --role role_name --names user_names
```

Where:

- **role_name** is a comma-separated list of the name of the Drupal user roles that you want to remove (required).
- **--names** is a comma-separated list of user names.
- **--mail** is a comma-separated list of user email addresses.
- **--uid** is comma-separated list of unique Drupal IDs of users.

For example:

```

apic --mode portaladmin user:remove-role --server my.management.server.com --org ibm --catalog portal-test --role administrator --names portall
[success] Removed administrator role from portall
```

5. Block one or more Developer Portal users. You must provide the names of the users that you want to block.

```

apic --mode portaladmin user:block --server management_server --org orgid/name --catalog catalogid/name --names user_names
```

Where:

- **--names** is a comma-separated list of user names.

For example:

```
apic --mode portaladmin user:block --server my.management.server.com --org ibm --catalog portal-test --names portall
[success] Blocked user(s): portall
```

When a blocked user tries to log in to their Developer Portal account, an error message is displayed indicating that they are unable to sign in.

6. Unblock one or more Developer Portal users. You must provide the names of the users that you want to unblock.

```
apic --mode portaladmin user:unblock --server management_server --org orgid/name --catalog catalogid/name --names
user_names
```

Where:

- `--names` is a comma-separated list of user names.

For example:

```
apic --mode portaladmin user:unblock --server my.management.server.com --org ibm --catalog portal-test --names portall
[success] Unblocked user(s): portall
```

Scenarios that use the Portal CLI

Here are some scenarios of how you can use the Portal commands in the toolkit CLI to accomplish tasks that are more complex to complete, or not possible in the Developer Portal UI.

- [Exporting and importing custom themes and site configuration](#)
You can use the portal commands in the toolkit CLI to replicate changes from one Developer Portal instance to another. You might want to use these commands to copy your themes or a configuration change, from a staging environment to a production environment.
- [How to enable and disable maintenance mode on your Developer Portal](#)
You can use the Portal commands in the toolkit CLI to enable and disable maintenance mode on your Developer Portal site.

Exporting and importing custom themes and site configuration

You can use the portal commands in the toolkit CLI to replicate changes from one Developer Portal instance to another. You might want to use these commands to copy your themes or a configuration change, from a staging environment to a production environment.

Before you begin

To complete this scenario, you must have a staging Developer Portal and a production Developer Portal enabled. You must have administrator access, and the permission **settings:manage**, to both to complete this scenario. The tutorial [Creating the Portal](#) explains how to enable the portal if you have not already done so.

About this scenario

In this scenario, on your staging Developer Portal, you create a theme and make some configuration changes. Then, you use the toolkit CLI to replicate the changes on your production Developer Portal.

This scenario takes you through the following steps:

1. [Create a custom theme on the staging Developer Portal.](#)
2. [Add a field to an application content type to change the `site-config` on the staging Developer Portal.](#)
3. [Use the `cli` to export the custom themes and `site-config` on the staging Developer Portal.](#)
4. [Use the `cli` to import the custom themes and `site-config` on the production Developer Portal.](#)

Create a custom theme on the staging Developer Portal

1. Log in to your staging Developer Portal as an administrator.
2. If the administrator dashboard isn't displayed, click **Manage** to display it.
3. Click **Appearance** > **Generate sub-theme**. The **Generate sub-theme** window is displayed.
4. Enter a Sub-theme name, and select CSS for the Sub-theme type. (If you prefer, you can select SCSS, but this extension to CSS is for advanced theme developers, and isn't covered by this scenario.)

Generate sub-theme ☆

[List](#)[Generate](#)[Update](#)[Settings](#)

[Home](#) » [Administration](#)

The first step in customizing the branding of your Developer Portal is to create a custom sub-theme.

The sub-theme inherits all of the resources of the parent theme, and you can then override specific resources in the overrides.css file to configure your customizations. For more information, see: [Knowledge Center](#)

Complete the form below and you will be presented with a custom sub-theme to download.

Sub-theme name *

A custom theme name, for example: 'mycustom_theme' or 'banka_theme'. The name does not need to end in '_theme' but it is a common convention.

Sub-theme type

CSS

SCSS

Your sub-theme can be setup to use either CSS or SCSS. SCSS is an extension to CSS and is for more advanced theme developers.

Template

5. Select the Default template to base your **sub-theme** on. You can create a **sub-theme** based on a color template. However, for this scenario you use the default connect_theme template.
6. Click Generate.
7. Download the generated **sub-theme** to a location of your choice, and extract all the files from the .zip file.

On your computer, navigate to the files that you extracted. Find the overrides.css file in here banka_theme/banka_theme/css/overrides.css. You can now customize the overrides.css file.

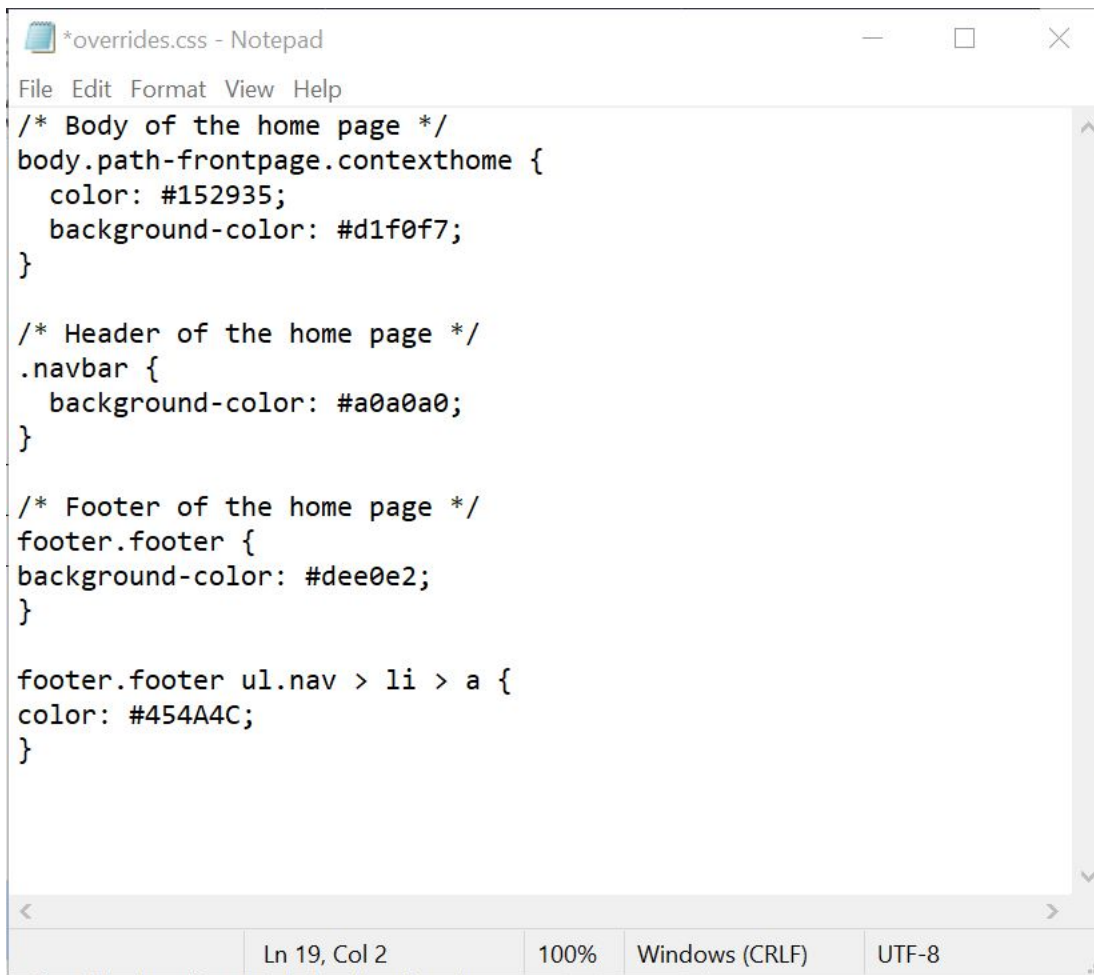

1. Open the overrides.css file in your chosen editor.
2. Customize your **sub-theme** by entering the following elements into the overrides.css file:

```
/* Body of the home page */
body.path-frontpage.contexthome {
  color: #152935;
  background-color: #d1f0f7;
}

/* Header of the home page */
.navbar {
  background-color: #a0a0a0;
}

/* Footer of the home page */
footer.footer {
  background-color: #dee0e2;
}

footer.footer ul.nav > li > a {
  color: #454A4C;
}
```

```
*overrides.css - Notepad
File Edit Format View Help
/* Body of the home page */
body.path-frontpage.contexthome {
  color: #152935;
  background-color: #d1f0f7;
}

/* Header of the home page */
.navbar {
  background-color: #a0a0a0;
}

/* Footer of the home page */
footer.footer {
  background-color: #dee0e2;
}

footer.footer ul.nav > li > a {
  color: #454A4C;
}

Ln 19, Col 2    100%    Windows (CRLF)    UTF-8
```

3. Save the overrides.css file.

You can now install and enable your customized theme.

1. After you finish updating the overrides.css file, compress all the theme files back into the .zip **sub-theme** file that you downloaded originally.
2. In the Developer Portal, click Appearance > Install new theme. The **Install new theme** window is displayed.
3. In Upload a module or theme archive to install click Browse, and navigate to your newly updated compressed theme file.
4. Click Install to install the theme onto your site.
5. Click Enable newly added themes, and find your new theme in the list of **Disabled themes**. Click Enable and set as default to set your new custom **sub-theme** as the default theme for your site.
6. Return to the Developer Portal home page by clicking Back to site. You can now see your custom theme.

Add a field to an application content type to change the `site-config` on the staging Developer Portal

1. Log in to your staging Developer Portal as an administrator.
2. If the administrator dashboard isn't displayed, click Manage to display it.
3. Click Structure > Content types > Application > Manage fields.
4. Click + Add field.
5. In **Add a new field**, select Text (plain, long). Enter Company name as the label title.

Add a new field **Re-use an existing field**
 or
Label *
 Machine name: field_company_name [Edit]

6. Click Save and continue.
7. Leave the **Allowed number of values** set to 1 and click Save field settings.
8. Click Save field settings. You can now see your new field.

Company name field_company_name Text (plain, long) Edit

Use the toolkit CLI to export the custom themes and `site-config` on the staging Developer Portal

1. Log in to the management server.

```
apic login --server management_server --realm realm --username org_username --password org_password
```

For example,

```
apic login -s api.stagingexample.com --realm provider/default-idp-2 --username ibm --password Qwerty123E
```

For more information about variable options, see [Logging in to a management server](#).

2. Export your custom themes.

The **custom-theme:create-export** command creates an export task against the portal of the specified `catalog` and `org`. The command then polls the status of the task until it has **FINISHED** and the artifacts are streamed back.

Note: The command continues to poll until the maximum polling time of 15 minutes is reached. At which point you can use the commands **custom-theme:get-export-status** and **custom-theme:get-export** to get the status and potentially an artifact.

```
apic --mode portaladmin custom-theme:create-export --catalog name/id --org name/id --server management_server
```

- The theme .tgz is saved to the directory in which you ran the command.
- The saved .tgz has the format `custom_theme_createExport-20200217134637.tgz`.
- You can save your exports into your change control management system.

For example,

```
apic --mode portaladmin custom-theme:create-export --catalog dev --org ibm --server api.stagingexample.com
```

3. Export your site config.

The `site-config:create-export` command creates an export task against the portal of the specified `catalog` and `org`, the command then polls the status of the task until it has `FINISHED` and the artifacts are streamed back.

```
apic --mode portaladmin site-config:create-export --catalog name/id --org name/id --server management_server
```

- The site config .tgz is saved to the directory in which you ran the command.
- The saved .tgz has the format `site_config_createExport-20200217134637.tgz`.
- You can save your exports into your change control management system.

For example,

```
apic --mode portaladmin site-config:create-export --catalog dev --org ibm --server api.stagingexample.com
```

Use the toolkit CLI to import the custom themes and `site-config` on the production Developer Portal

1. Log in to the management server.

```
apic login --server management_server --realm realm --username org_username --password org_password
```

For example,

```
apic login -s api.productionexample.com --realm provider/default-idp-2 --username ibm --password Qwerty123E
```

For more information about variable options, see [Logging in to a management server](#).

2. Import your custom themes.

The `custom-theme:create-import` command uses the supplied .tgz file to import the custom themes into the portal of the specified `catalog` and `org`. The command then polls the status of the task until the task has either `FINISHED` successfully, or failed because of an error.

Note: The command continues to poll until the maximum polling time of 15 minutes is reached. At which point you can use the command `custom-theme:get-import-status` to get the status of the import.

```
apic --mode portaladmin custom-theme:create-import --catalog name/id --org name/id --server management_server /PATH/TO/THEME/TGZ
```

For example,

```
apic --mode portaladmin custom-theme:create-import --catalog prod --org ibm --server api.productionexample.com C:/users/example/desktop/custom_theme_createExport-20200217134637.tgz
```

3. Import your site config.

The `site-config:create-import` command uses the supplied .tgz file to import the site config into the portal of the specified `catalog` and `org`. The command then polls the status of the task until the task has either `FINISHED` successfully, or failed because of an error.

```
apic --mode portaladmin site-config:create-import --catalog name/id --org name/id --server management_server /PATH/TO/CONFIG/TGZ
```

For example,

```
apic --mode portaladmin site-config:create-import --catalog prod --org ibm --server api.productionexample.com C:/users/example/desktop/site_config_createExport-20200217134637.tgz
```

What you did in this scenario

In this scenario, you created a theme and changed the configuration on your staging Developer Portal. Then, you used the toolkit CLI to replicate the changes on to your production Developer Portal.

You can now see the changes that you made on your production Developer Portal.

- [Exporting and importing custom themes and site configuration by using the Portal Admin API](#)

The platform REST APIs for IBM® API Connect provide complete access to the capability of the platform. So, you can use the toolkit CLI to replicate changes from one Developer Portal instance to another. However, if the toolkit CLI was unavailable for some reason, you can use the Portal Admin API.

Exporting and importing custom themes and site configuration by using the Portal Admin API

The platform REST APIs for IBM® API Connect provide complete access to the capability of the platform. So, you can use the toolkit CLI to replicate changes from one Developer Portal instance to another. However, if the toolkit CLI was unavailable for some reason, you can use the Portal Admin API.

Before you begin

To complete this scenario, you must have a staging Developer Portal and a production Developer Portal enabled. You must have administrator access, or the permission `settings:manage`, to both to complete this scenario. The tutorial [Creating the Portal](#) explains how to enable the portal if you have not already done so.

Also, you must have downloaded and installed the toolkit. For more information, see [Installing the toolkit](#).

About this scenario

In this scenario, you use the toolkit to obtain some authentication. Then, on your staging Developer Portal, you create a theme and make some configuration changes. Then, you use the Portal Admin API to replicate the changes on your production Developer Portal.

This scenario takes you through the following steps:

1. [Obtaining the client ID and secret, and a bearer token.](#)
2. [Create a custom theme on the staging Developer Portal.](#)
3. [Add a field to an application content type to change the `site-config` on the staging Developer Portal.](#)
4. [Use the Portal Admin API to export the custom themes and `site-config` on the staging Developer Portal.](#)
5. [Use the Portal Admin API to import the custom themes and `site-config` on the production Developer Portal.](#)

Obtaining the client ID and secret, and a bearer token.

From your toolkit:

1. Obtaining the client ID and secret.

- a. Obtain the list of administrator scoped providers to determine the correct realm to use:

```
apic identity-providers:list --scope admin --server <management_server>
```

For example,

```
apic identity-providers:list --scope admin --server api.stagingexample.com
```

Here is an example of some possible output:

```
default-idp-1
```

- b. Run `apic login`, complete the details:

```
apic login --server management_server --realm cloud_realm --username admin_username --password admin_password
```

For example,

```
apic login -s api.stagingexample.com --realm provider/default-idp-1 --username admin --password Qwerty123f
```

- c. Log in to cloud manager, and register an app. Make a new file locally and call it `app1.json`. Then, copy into it the following code snippet:

```
{
  "name": "app1",
  "client_id": "applid",
  "client_secret": "applsecret",
  "client_type": "toolkit"
}
```

- d. Run the registration create command:

```
apic registrations:create --server management_server app1.json
```

For example,

```
apic registrations:create --server api.stagingexample.com app1.json
```

Here is an example of some possible output:

```
app1 [state: enabled] https://api.stagingexample.com/api/cloud/registrations/d2b7572f-3406-42a7-bdcc-85f177860df7
```

2. Now, you can get a bearer token from the provider org.

- a. To obtain a list of provider realms:

```
apic identity-providers:list --scope provider --server management_server
```

For example,

```
apic identity-providers:list --scope provider --server api.stagingexample.com
```

Here is an example of some possible output:

```
default-idp-2
```

- b. Run `apic login`, complete the details:

```
apic login --server management_server --realm provider_realm --username org_username --password org_password
```

For example,

```
apic login -s api.stagingexample.com --realm provider/default-idp-2 --username ibm --password Qwerty123f
```

- c. Create an HTTP request to obtain an access token:

```
curl -k -X POST -d '{"username": "org_username", "password": "org_password", "realm": "provider/default-idp-2", "client_id": "app_id", "client_secret": "app_secret", "grant_type": "password"}' -H 'Content-Type: application/json' -H 'Accept: application/json' https://management_server/api/token
```

For example,

On your computer, navigate to the files that you extracted. Find the overrides.css file in here `banka_theme/banka_theme/css/overrides.css`. You can now customize the overrides.css file.

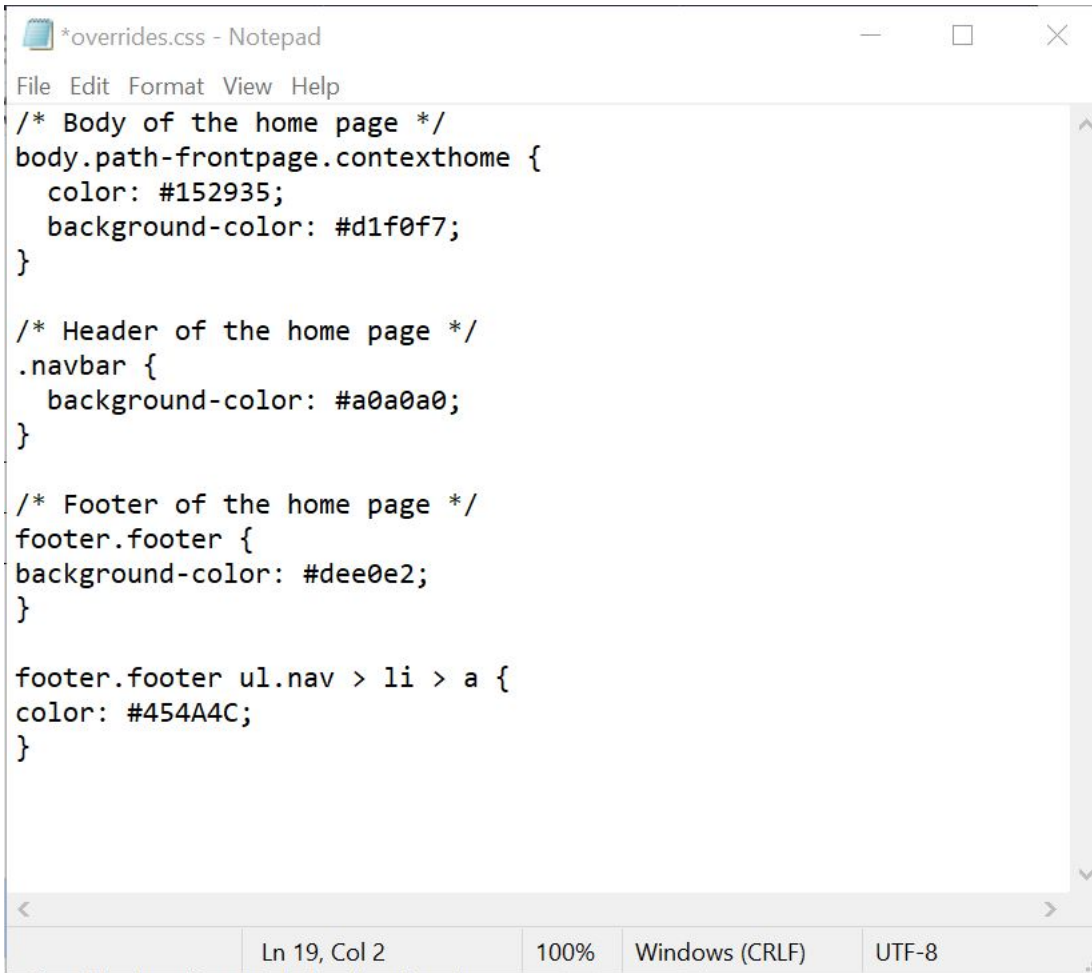

1. Open the overrides.css file in your chosen editor.
2. Customize your **sub-theme** by entering the following elements into the overrides.css file:

```
/* Body of the home page */
body.path-frontpage.contexthome {
  color: #152935;
  background-color: #d1f0f7;
}

/* Header of the home page */
.navbar {
  background-color: #a0a0a0;
}

/* Footer of the home page */
footer.footer {
  background-color: #dee0e2;
}

footer.footer ul.nav > li > a {
  color: #454A4C;
}
```

3. Save the overrides.css file.

You can now install and enable your customized theme.

1. After you finish updating the overrides.css file, compress all the theme files back into the .zip **sub-theme** file that you downloaded originally.
2. In the Developer Portal, click Appearance > Install new theme. The **Install new theme** window is displayed.
3. In Upload a module or theme archive to install click Browse, and navigate to your newly updated compressed theme file.
4. Click Install to install the theme onto your site.
5. Click Enable newly added themes, and find your new theme in the list of **Disabled themes**. Click Enable and set as default to set your new custom **sub-theme** as the default theme for your site.
6. Return to the Developer Portal home page by clicking Back to site. You can now see your custom theme.

Add a field to an application content type to change the `site-config` on the staging Developer Portal

1. Log in to your staging Developer Portal as an administrator.
2. If the administrator dashboard isn't displayed, click Manage to display it.
3. Click Structure > Content types > Application > Manage fields.
4. Click + Add field.
5. In **Add a new field**, select Text (plain, long). Enter Company name as the label title.

Add a new field

Text (plain, long) ▼

Re-use an existing field

- Select an existing field - ▼

or

Label *

Save and continue

6. Click Save and continue.
7. Leave the **Allowed number of values** set to 1 and click Save field settings.
8. Click Save field settings. You can now see your new field.

Use the Portal Admin API to export the custom themes and `site-config` on the staging Developer Portal

1. Export your custom themes.
 - a. Create the export job by using this command:

```
curl -k -X 'POST' -H "Authorization: bearer $TOKEN" -H 'Accept: application/yaml' 'https://<management_server>/portal/catalogs/<org>/<catalog>/custom-theme/export'
```

For example,

```
curl -k -X 'POST' -H "Authorization: bearer $TOKEN" -H 'Accept: application/yaml' 'https://api.stagingexample.com/portal/catalogs/ibm/staging/custom-theme/export'
```

Here is an example of some possible output:

```
status: 201
message:
  stdout: >-
    /catalogs/75cfdc05-e818-408e-8ce6-fd3fd61c8756/f09602a2-a0e4-40dc-a82d-d1af326ad092/custom-
```

```
theme/export/85z2m39znojolv2s/status
stderr: ''
errors: []
```

- b. You can check the status of the export job by invoking the `/status` endpoint.

```
curl -k -X 'GET' -H "Authorization: bearer $TOKEN" -H 'Accept: application/yaml'
'https://<management_server>/portal/catalogs/<org>/<catalog>/custom-theme/export/<task_id>/status'
```

For example,

```
curl -k -X 'GET' -H "Authorization: bearer $TOKEN" -H 'Accept: application/yaml'
'https://api.stagingexample.com/portal/catalogs/ibm/staging/custom-theme/export/85z2m39znojolv2s/status'
```

Here is an example of some possible output:

```
{
  "status": 200,
  "message": {
    "stdout": "The status of this task is: FINISHED and the artifact can now be streamed"
  },
  "errors": []
}
```

- c. You can now download the custom theme file onto your machine.

```
curl -k -X 'GET' -H "Authorization: bearer $TOKEN" -H 'Accept: application/octet-stream'
'https://<management_server>/portal/catalogs/<org>/<catalog>/custom-theme/export/<task_id>' -o <theme_name>
```

For example,

```
curl -k -X 'GET' -H "Authorization: bearer $TOKEN" -H 'Accept: application/octet-stream'
'https://api.stagingexample.com/portal/catalogs/ibm/staging/custom-theme/export/85z2m39znojolv2s' -o mytheme.tgz
```

Note: When you use the `curl` commands to download files, if you do not specify an output with `-o`, it incorrectly prints the output as binary onto the terminal screen.

- d. On Mac and Linux® machines, you can verify that you have a valid theme export `.tgz` file by invoking the `tar t --list` argument.

```
tar -tvf <theme_name>
```

For example,

```
tar -tvf mytheme.tgz
```

Here is an example of some possible output:

```
drwxrwsr-x 0 aegir aegir 0 9 Jun 13:40 ./
drwxr-sr-x 0 aegir aegir 0 9 Jun 13:40 emerald_theme_css/
-rw-r--r-- 0 aegir aegir 7 9 Jun 13:40 emerald_theme_css/emerald_theme_css.theme
-rw-r--r-- 0 aegir aegir 29224 9 Jun 13:40 emerald_theme_css/screenshot.png
-rw-r--r-- 0 aegir aegir 442 9 Jun 13:40 emerald_theme_css/composer.json
-rw-r--r-- 0 aegir aegir 599 9 Jun 13:40 emerald_theme_css/emerald_theme_css.info.yml
-rw-r--r-- 0 aegir aegir 1150 9 Jun 13:40 emerald_theme_css/favicon.ico
-rw-r--r-- 0 aegir aegir 5932 9 Jun 13:40 emerald_theme_css/logo.svg
-rw-r--r-- 0 aegir aegir 61 9 Jun 13:40 emerald_theme_css/emerald_theme_css.libraries.yml
drwxr-sr-x 0 aegir aegir 0 9 Jun 13:40 emerald_theme_css/css/
-rw-r--r-- 0 aegir aegir 47249 9 Jun 13:40 emerald_theme_css/css/overrides.css
```

2. Export your site config.

- a. Create the export job by using this command:

```
curl -k -X 'POST' -H "Authorization: bearer $TOKEN" -H 'Accept: application/json'
'https://<management_server>/portal/catalogs/<org>/<catalog>/config/export'
```

For example,

```
curl -k -X 'POST' -H "Authorization: bearer $TOKEN" -H 'Accept: application/json'
'https://api.stagingexample.com/portal/catalogs/ibm/staging/config/export'
```

Here is an example of some possible output:

```
{
  "status": 201,
  "message": {
    "stdout": "/catalogs/75cfdc05-e818-408e-8ce6-fd3fd61c8756/f09602a2-a0e4-40dc-a82d-
d1af326ad092/config/export/5cylgk55ciiwn190/status",
    "stderr": ""
  },
  "errors": []
}
```

- b. You can check the status of the export job by invoking the `/status` endpoint.

```
curl -k -X 'GET' -H "Authorization: bearer $TOKEN" -H 'Accept: application/json'
'https://<management_server>/portal/catalogs/<org>/<catalog>/config/export/<task_id>/status'
```

For example,

```
curl -k -X 'GET' -H "Authorization: bearer $TOKEN" -H 'Accept: application/json'
'https://api.stagingexample.com/portal/catalogs/ibm/staging/config/export/5cylgk55ciiwn190/status'
```

Here is an example of some possible output:

```
{
  "status": 200,
  "message": {
    "stdout": "The status of this task is: FINISHED and the artifact can now be streamed"
  },
  "errors": []
}
```

- c. You can now download the site-config file onto your machine.

```
curl -k -X 'GET' -H "Authorization: bearer $TOKEN" -H 'Accept: application/octet-stream'
'https://<management_server>/portal/catalogs/<org>/<catalog>/config/export/<task_id>' -o <config_name>
```

For example,

```
curl -k -X 'GET' -H "Authorization: bearer $TOKEN" -H 'Accept: application/octet-stream'
'https://api.stagingexample.com/portal/catalogs/ibm/staging/config/export/5cylgk55ciiwn190' -o myconfig.tgz
```

Note: When you use the `curl` commands to download files, if you do not specify an output with `-o`, it incorrectly prints the output as binary onto the terminal screen.

- d. On Mac and Linux machines, you can verify that you have a valid theme export `.tgz` file by invoking the `tar t --list` argument. The `head -n 10` option returns the first 10 lines of the result.

```
tar -tvf <config_name> | head -n 10
```

For example,

```
tar -tvf myconfig.tgz | head -n 10
```

Here is an example of some possible output, which should be a list of yaml files:

```
-rw-rw-r-- 0 aegir aegir 393 11 Jun 15:54 block.block.bartik_page_title.yml
-rw-rw-r-- 0 aegir aegir 577 11 Jun 15:54 filter.format.plain_text.yml
-rw-rw-r-- 0 aegir aegir 256 11 Jun 15:54 captcha.captcha_point.consumerorg_invite_user_form.yml
-rw-rw-r-- 0 aegir aegir 741 11 Jun 15:54 block.block.emerald_theme_css_account_menu.yml
-rw-rw-r-- 0 aegir aegir 488 11 Jun 15:54 field.field.node.application.apic_hostname.yml
-rw-rw-r-- 0 aegir aegir 460 11 Jun 15:54 field.storage.node.apic_catalog_id.yml
-rw-rw-r-- 0 aegir aegir 545 11 Jun 15:54 field.field.user.user.apic_user_registry_url.yml
-rw-rw-r-- 0 aegir aegir 427 11 Jun 15:54 language.content_settings.shortcut.default.yml
-rw-rw-r-- 0 aegir aegir 460 11 Jun 15:54 field.storage.node.api_soapversion.yml
-rw-rw-r-- 0 aegir aegir 148 11 Jun 15:54 captcha.captcha_point.node_product_form.yml
```

Use the Portal Admin API to import the custom themes and `site-config` on the production Developer Portal

Note: If you are importing your custom theme onto a new server, then before you continue, follow step 1 of this tutorial to obtain a new token to authenticate with your second server. If you are using the same server, and are importing the theme into a new catalog, then the current TOKEN remains valid for the rest of the steps.

Note: You must import the custom theme before you import the site config. This order is because the site config contains information about the default theme, and so your custom theme must exist on the portal when the site config is imported so that it can be set upon import.

1. Import your custom themes.

- a. On the production catalog, import the custom theme onto the production catalog `prod` by using this command:

```
curl -k -X 'POST' -H "Authorization: bearer $TOKEN" -H 'Accept: application/yaml' -H 'Content-Type:
application/octet-stream' 'https://<management_server>/portal/catalogs/<org>/<catalog>/custom-theme/import' --data-
binary @<path_to_theme_file>
```

For example,

```
curl -k -X 'POST' -H "Authorization: bearer $TOKEN" -H 'Accept: application/yaml' -H 'Content-Type:
application/octet-stream' 'https://api.productionexample.com/portal/catalogs/ibm/prod/custom-theme/import' --data-
binary @/Users/steve/PortaladminCLI/mytheme.tgz
```

Here is an example of some possible output:

```
status: 201
message:
  stdout: >-
    /catalogs/75cfdc05-e818-408e-8ce6-fd3fd61c8756/56f3d4ca-8be2-48f7-8f91-3d654c2b91f2/custom-
theme/import/vtscpuj08i0hfo6/status
  stderr: ''
  errors: []
```

- b. You can check the status of the import job by invoking the `/status` endpoint on this command:

```
curl -k -X 'GET' -H "Authorization: bearer $TOKEN" -H 'Accept: application/yaml'
'https://<management_server>/portal/catalogs/<org>/<catalog>/custom-theme/import/<task_id>/status'
```

For example,

```
curl -k -X 'GET' -H "Authorization: bearer $TOKEN" -H 'Accept: application/yaml'
'https://api.productionexample.com/portal/catalogs/ibm/prod/custom-theme/import/vtscpuj08i0hfo6/status'
```

Here is an example of some possible output:

```
{
  "status": 200,
  "message": {
    "stdout": "2020-06-09 13:00:59: CLI task (custom_theme:import) starting.\n2020-06-09 13:00:59: Importing custom
theme emerald_theme_css\n2020-06-09 13:01:18: CLI task (custom_theme:import) completed successfully.",
    "stderr": ""
  },
}
```

```
  "errors": []
}
```

2. Import your site config.

a. Import the existing site-config onto the production catalog `prod` by using this command:

```
curl -k -X 'POST' -H "Authorization: bearer $TOKEN" -H 'Accept: application/json' -H 'Content-Type: application/octet-stream' 'https://<management_server>/portal/catalogs/<org>/<catalog>/config/import' --data-binary @<path_to_config_import>
```

For example,

```
curl -k -X 'POST' -H "Authorization: bearer $TOKEN" -H 'Accept: application/json' -H 'Content-Type: application/octet-stream' 'https://api.productionexample.com/portal/catalogs/ibm/prod/config/import' --data-binary @/Users/steve/PortaladminCLI/myconfig.tgz
```

Here is an example of some possible output:

```
{
  "status": 201,
  "message": {
    "stdout": "/catalogs/75cfdc05-e818-408e-8ce6-fd3fd61c8756/56f3d4ca-8be2-48f7-8f91-3d654c2b91f2/config/import/kzyozx4v5sfa81a5/status",
    "stderr": ""
  },
  "errors": []
}
```

b. You can check the status of the config import job by invoking the `/status` endpoint:

```
curl -k -X 'GET' -H "Authorization: bearer $TOKEN" -H 'Accept: application/json' 'https://<management_server>/portal/catalogs/<org>/<catalog>/config/import/<task_id>/status'
```

For example,

```
curl -k -X 'GET' -H "Authorization: bearer $TOKEN" -H 'Accept: application/json' 'https://api.productionexample.com/portal/catalogs/ibm/prod/config/import/kzyozx4v5sfa81a5/status'
```

Here is an example of some possible output:

```
{
  "status": 200,
  "message": {
    "stdout": "2020-06-11 15:42:55: CLI task (site_config:import) starting.\n2020-06-11 15:43:29: CLI task (site_config:import) completed successfully.",
    "stderr": ""
  },
  "errors": []
}
```

What you did in this scenario

In this scenario, you created a theme and changed the configuration on your staging Developer Portal. Then, you used the Portal Admin API to replicate the changes on to your production Developer Portal.

You can now see the changes that you made on your production Developer Portal.

How to enable and disable maintenance mode on your Developer Portal

You can use the Portal commands in the toolkit CLI to enable and disable maintenance mode on your Developer Portal site.

Before you begin

To complete this Portal CLI scenario, you must have a Developer Portal enabled. You must also have administrator access to this site, and the permission `settings:manage`, to complete this scenario. The tutorial [Creating the Portal](#) explains how to enable the portal if you haven't enabled it already.

For more information about using the toolkit CLI with the Developer Portal, see [Getting started with the Portal CLI commands](#).

Important: Maintenance mode is designed for short-term site maintenance; it is not meant for long-term usage. While a site is in maintenance mode, the database is not updated with new content from API Manager.

About this scenario

In this scenario, you use the toolkit CLI to enable, and then disable, maintenance mode on your Developer Portal site.

The scenario takes you through the following steps:

1. [Log in to the management server as a Provider organization by using the toolkit CLI](#)
2. [Use the toolkit CLI to enable maintenance mode](#)
3. [Use the toolkit CLI to disable maintenance mode](#)

Log in to the management server as a Provider organization by using the toolkit CLI

- Log in to the toolkit CLI as a Provider org:

```
apic login --server management_server --realm provider/identity_provider --username provider_username --password provider_password
```

You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

```
apic identity-providers:list --scope provider --server mgmt_endpoint_url --fields title,realm
```

For example,

```
apic identity-providers:list --scope provider --server myserver.com --fields title,realm
total results: 2
results:
- title: API Manager Local User Registry
  realm: provider/default-idp-2
- title: Corporate LDAP user registry
  realm: provider/corporate-ldap
```

The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default API Manager Local User Registry for login as a member of a provider organization is `default-idp-2`.

For full details of the `apic login` command, see [Logging in to a management server](#).

Use the toolkit CLI to enable maintenance mode

- Run the following command to enable maintenance mode on your Developer Portal:

```
apic --mode portaladmin drupal-state:set --server management_server --org orgid/name --catalog catalogid/name --state_key system.maintenance_mode --input_format integer --state_value 1
```

Where:

- `management_server` is the endpoint URL of your management server (required).
- `catalogid/name` is the ID or name of the catalog that your site belongs to (required).
- `orgid/name` is the ID or name of the provider organization that the catalog belongs to (required).
- `--state_key` is the name of the state key (required). Must be set to `system.maintenance_mode`.
- `--input_format` is the input format of the value of the state key. Must be set to `integer` for configuring the maintenance mode.
- `--state_value` is the value to assign to the state key (required). Set to `1` to enable maintenance mode.

For example, to enable maintenance mode for a Developer Portal in the `myOrg` organization, and in the `dev` catalog:

```
apic --mode portaladmin drupal-state:set --server my.management.server.com --org myOrg --catalog dev --state_key system.maintenance_mode --input_format integer --state_value 1
Successfully set state system.maintenance_mode to the value of 1.
```

The Developer Portal site is now inaccessible to everyone apart from an administrator. All other users who enter the site URL will see a maintenance message set by the administrator.

Use the toolkit CLI to disable maintenance mode

- Run the following command to disable maintenance mode on your Developer Portal:

```
apic --mode portaladmin drupal-state:set --server management_server --org orgid/name --catalog catalogid/name --state_key system.maintenance_mode --input_format integer --state_value 0
```

Where:

- `management_server` is the endpoint URL of your management server (required).
- `catalogid/name` is the ID or name of the catalog that your site belongs to (required).
- `orgid/name` is the ID or name of the provider organization that the catalog belongs to (required).
- `--state_key` is the name of the state key (required). Must be set to `system.maintenance_mode`.
- `--input_format` is the input format of the value of the state key. Must be set to `integer` for configuring the maintenance mode.
- `--state_value` is the value to assign to the state key (required). Set to `0` to disable maintenance mode.

For example, to disable maintenance mode for a Developer Portal in the `myOrg` organization, and in the `dev` catalog:

```
apic --mode portaladmin drupal-state:set --server my.management.server.com --org myOrg --catalog dev --state_key system.maintenance_mode --input_format integer --state_value 0
Successfully set state system.maintenance_mode to the value of 0.
```

Your Developer Portal site is now accessible to everyone again.

What you did in this scenario

In this scenario, you used the toolkit CLI to put your Developer Portal site into maintenance mode, and to turn maintenance mode off again.

Troubleshooting guide for the Developer Portal

Use this guide to help you diagnose and resolve Developer Portal issues in IBM® API Connect. For example, why is the Developer Portal not connecting to the Management server, why is my site not created, and why can't I log in?

About

The following sections provide advice about how to diagnose and resolve some common problems. This information can help you to identify whether a specific IBM API Connect Version 10 component is failing, whether it's an environmental problem, and whether you should raise a support request. Some advice includes reviewing specific log files so you can narrow down the source of the problem.

Note: In the  Help page of the Cloud Manager, API Manager, and API Designer user interfaces, there's a Product information tile that you can click to find out information about your product versions, as well as Git information about the package versions being used. Note that the API Designer product information is based on its associated management server, but the Git information is based on where it was downloaded from.

1. [Why is the Developer Portal not connecting to the Management server?](#)
2. [Why is my Developer Portal site not being created?](#)
3. [Why can't I register a user?](#)
4. [Why can't I login?](#)
5. [Why are changes to Products not appearing in the Developer Portal?](#)
6. [Why am I having problems with my Developer Portal user interface?](#)
7. [Why am I having problems with my Kubernetes system?](#)
8. [Why am I having problems with my Developer Portal backup?](#)
9. [Why am I having problems installing Drupal 8 based custom modules or sub-themes into the Drupal 9 based Developer Portal?](#)

Why is the Developer Portal not connecting to the Management server?

Problems with connecting to the Management server can be due to connectivity or TLS issues. You should check the following areas:

- Can the Management server actually reach the Developer Portal?
- Is SSL passthrough enabled or required on any load balancer that sits between the Management server and the Developer Portal? For more information, see [JWT security on Kubernetes and OpenShift](#), [JWT security on OVA](#).

If you need to open a Service Request, include the following information:

- The [IBM API Connect MustGather Information](#).
- Details of the date and time that the connection attempts were made.

Why is my Developer Portal site not being created?

If you are having problems creating a site, you should take the following actions to help diagnose the issue:

1. Tail the nginx container log to confirm that the site create request reached the portal, for example:

```
kubectl logs rb93d4fb118-apic-portal-nginx-7c7b464fb6-vvx5m
```

2. Look in the container log for a site create request, for example:

```
POST /portal-service-configuration-create HTTP/1.1" 200
```

- a. If you don't find a site create request in the log, then the create request is not reaching the Developer Portal from the Management. Follow the instructions in [Why is the Developer Portal not connecting to the Management server?](#) to diagnose the connectivity issues.
- b. If a site create request is in the log, then further diagnostics can be found in the admin pod log, for example:

```
kubectl logs -f rb93d4fb118-apic-portal-www-p4bhj -c admin
```

Look in the admin pod log for messages that refer to `create_site`, as well as the name of the site.

Why can't I register a user?

If you are having problems registering a user, take the following actions to help diagnose the issue:

- The user registration links in the emails are only valid for 24 hours, so check that the system time is correctly configured across all of the pods.
- If emails aren't being received, check that the email server is correctly configured; see [Configuring an email server for notifications](#). Also, if possible, check whether other emails such as publish approval alerts or password reset emails are being received.

If you need to open a Service Request, please take the following steps:

1. Note which user registry type is being used, such as Local User Registry (LUR), or LDAP user registry.
2. Enable the debug REST server and method trace in the Developer Portal UI. Click Configuration > Development > IBM Development on the administrator dashboard. Then select the Enable method entry / exit trace and Enable API Manager REST interface debug check boxes. Click Save configuration.
3. Re-create the issue, making a note of the time, the username, and any messages displayed on the screen.
4. Gather the web container log for the www pod, for example:

```
kubectl logs portal-apic-portal-www-zhqxf web > web.log
```

5. Gather all of the Management server logs and the logs for the user registry type that is being used; see [IBM API Connect MustGather Information](#) for details.

Why can't I login?

If users are having problems with logging in to the Developer Portal, please take the following steps before opening a Service Request:

1. Note which user registry type is being used, such as Local User Registry (LUR), or LDAP user registry.
2. Enable the debug REST server and method trace in the Developer Portal UI. Click Configuration > Development > IBM Development on the administrator dashboard. Then select the Enable method entry / exit trace and Enable API Manager REST interface debug check boxes. Click Save configuration.
3. Recreate the issue, making a note of the time, the username, and any messages printed to the screen.
4. Gather the web container log for the www pod, for example:

```
kubectl logs portal-apic-portal-www-zhqxf web > web.log
```

5. Gather all of the Management server logs and the logs for the user registry type that is being used; see [IBM API Connect MustGather Information](#) for details.

Why are changes to Products not appearing in the Developer Portal?

To determine whether the problem is with the Portal server (either the nginx or the www pod), the Management server, or the network, please make the following diagnostic checks.

Portal nginx pod

1. Tail the nginx pod log on the Portal, for example:

```
kubectl logs -f portal-apic-portal-nginx-866c977c4c-n9gbf
```

2. Make a publish request to the Catalog (note that the request must be a Publish or Retire operation, not a Stage operation).
3. In the log being tailed, see if the following message appears:

```
...POST /event-create...
```

If the POST message appears in the nginx log, then the publish webhook that was sent from the Management server did arrive at the Portal. If there is an error message in place of a POST message, then the problem is likely to be with the nginx pod. If there is no message at all, then it's likely that the webhook from the Management server is not reaching the Portal and there is a network problem.

Portal www pod

1. Tail the www pod admin container log on the Portal, for example:

```
kubectl logs -f portal-apic-portal-www-dtbzw -c admin
```

2. Make a publish request to the Catalog (note that the request must be a Publish or Retire operation, not a Stage operation).
3. In the log being tailed, see if the following message appears:

```
Received webhook event 'product_lifecycle' for catalog
```

If no such message appears, it suggests that the webhook is either not arriving at the Portal, or not getting beyond the nginx pod (see the previous section [Portal nginx pod](#)). Any errors that the admin container has in processing the webhook will be logged in the www pod admin container log.

Management server apim pod

1. Tail the apim pod log on the Management server, for example:

```
kubectl logs -f apiconnect-apim-v2-86b464c4f5-4cx6r
```

2. Make a publish request to the Catalog (note that the request must be a Publish or Retire operation, not a Stage operation).
3. In the log being tailed, see if there any error messages.

Search for the word 'sending', you should see the message `webhook: sending successful` if the webhook is sent, or error messages indicating why if the webhook is not sent.

Why am I having problems with my Developer Portal user interface?

If you are having user interface (UI) problems, make the following checks:

- Try clearing the cache from your browser, try using private browsing, and try using different browsers - see whether there are any differences in behavior.
- Check your browser window size and screen resolution, and try increasing and decreasing the settings.
- Investigate the browser developer tools console and network tabs, as they might provide some diagnostic clues.
- Try clearing the Drupal caches from within the Developer Portal; see [Clearing the server caches](#) for details.

If you need to open a Service Request, along with the [IBM API Connect MustGather Information](#) logs, also include details of the time and date when the problem was reproduced. In addition, an export of the browser developer tools console and network output would be helpful.

Why am I having problems with my Kubernetes system?

Kubernetes provides a DNS server as one of the pods in the kube-system namespace (unless you have configured your Kubernetes setup differently), and sometimes this DNS server can silently fail. When the Portal www or db pods restart, they check that their own hostname and IP address is in the service that is defined for the pod. If the DNS server is down, this check fails. An indication that the DNS server is down is seeing the following log lines printed endlessly in the admin or db containers:

```
[ admin stdout] 2cd141dc:2cd141dc:2cd141dc 2018-10-08 07:27:54: service-ready:
[ admin stdout] 2cd141dc:2cd141dc:2cd141dc 2018-10-08 07:27:54: service-all:
[ admin stdout] 2cd141dc:2cd141dc:2cd141dc 2018-10-08 07:27:54: Waiting for sleep in service all check. Pid(s) 352 Seconds
24
[ admin stdout] 2cd141dc:2cd141dc:2cd141dc 2018-10-08 07:27:59: Finished waiting for sleep in service all check. Pid(s)
352 Seconds 29
[ admin stdout] 2cd141dc:2cd141dc:2cd141dc 2018-10-08 07:28:01: WARNING 5: r4c09b98d02-apic-portal-admin-all doesn't
include this pod or r4c09b98d02-apic-portal-director does. Checking again in 5 seconds.
```

To fix this problem, delete the DNS pod in the kube-system namespace to force it to restart, for example:

```
kubectl -n kube-system delete pod kube-dns-b76db4f7f-n4lvt
```

Where `kube-dns-b76db4f7f-n4lvt` is the full name of the DNS pod.

Note: To find out the full name of the DNS pod in your Kubernetes system, run the following command:

```
kubectl -n kube-system get pods
```

This command will return data like the following example:

```
$ kubectl -n kube-system get pods
NAME READY STATUS RESTARTS AGE
default-http-backend-5bccfbdc8-mjnnb 1/1 Running 0 4d
etcd-minikube 1/1 Running 0 4d
kube-addon-manager-minikube 1/1 Running 0 4d
kube-apiserver-minikube 1/1 Running 0 4d
kube-controller-manager-minikube 1/1 Running 0 4d
kube-dns-6f4fd4bdf-7zslq 3/3 Running 0 4d

nginx-ingress-controller-57bcfc76d6-z775d 1/1 Running 0 4d
storage-provisioner 1/1 Running 0 4d
tiller-deploy-587df449fb-bpwhq 1/1 Running 0 4d
```

Why am I having problems with my Developer Portal backup?

If you attempt to back up your portal system or site:

```
apicup subsys exec <portal_subsystem> backup-system|backup-site|backup-all
```

You might encounter the following message:

```
curl: (6) Could not resolve host: apic-portal-apic-portal-director
```

This error is the result of a failure of the SFTP backup file transfer to the backup system, caused by missing authentication with the portal node. To correct this error, `ssh` from the backup system to the portal node, and accept the authentication key when prompted:

1. Enter the portal-www admin container, for example:

```
kubectl exec -it WWW_POD_NAME -c admin bash
```

2. `ssh` to your backup server and accept any authentication prompts, for example:

```
ssh BACKUP_SERVER_HOSTNAME
```

When you have successfully authenticated with your backup server, you can close the session. This action needs to be done only once. Portal backups can then run without any issues.

Why am I having problems installing Drupal 8 based custom modules or sub-themes into the Drupal 9 based Developer Portal?

From IBM API Connect 10.0.3.0, the Developer Portal is based on the Drupal 9 content management system. If you want to install Drupal 8 custom modules or sub-themes into the Drupal 9 based Developer Portal, you must ensure that they are compatible with Drupal 9, including any custom code that they contain, and not using any deprecated APIs, for example. There are tools available for checking your custom code, such as [drupal_check](#) on GitHub, which checks Drupal code for deprecations.

For example, any Developer Portal sites that contain modules or sub-themes that don't contain a Drupal 9 version declaration will fail to upgrade, and errors like the following output will be seen in the `admin` logs:

```
[ queue stdout] 14834 729319:355ec8:a7d29c 2021-09-04 20:34:49: check_d9_compat: Checking theme: emeraldgreen
[ queue stdout] 14834 729319:355ec8:a7d29c 2021-09-04 20:34:49: check_d9_compat: ERROR: Incompatible
core_version_requirement '' found for emeraldgreen
[ queue stdout] 14834 729319:355ec8:a7d29c 2021-09-04 20:34:49: check_d9_compat: Checking theme: rubyred
[ queue stdout] 14834 729319:355ec8:a7d29c 2021-09-04 20:34:49: check_d9_compat: ERROR: Incompatible
core_version_requirement '8.x' found for rubyred
[ queue stdout] 14834 729319:355ec8:a7d29c 2021-09-04 20:34:49: check_d9_compat: ERROR: Found themes incompatible with
Drupal 9: emeraldgreen rubyred
[ queue stdout] 14834 729319:355ec8:a7d29c 2021-09-04 20:34:49: check_d9_compat: ERROR: /tmp/restore_site.355ec8 is NOT
Drupal 9 compatible
...
[ queue stdout] 14834 729319:355ec8:a7d29c 2021-09-04 20:44:49: check_d9_compat: Checking module: custom_mod_1
[ queue stdout] 14834 729319:355ec8:a7d29c 2021-09-04 20:44:49: check_d9_compat: ERROR: Incompatible
core_version_requirement '' found for custom_mod_1
[ queue stdout] 14834 729319:355ec8:a7d29c 2021-09-04 20:44:49: check_d9_compat: Checking module: custom_mod_2
[ queue stdout] 14834 729319:355ec8:a7d29c 2021-09-04 20:44:49: check_d9_compat: ERROR: Incompatible
core_version_requirement '8.x' found for custom_mod_2
[ queue stdout] 14834 729319:355ec8:a7d29c 2021-09-04 20:44:49: check_d9_compat: ERROR: Found modules incompatible with
Drupal 9: emeraldgreen rubyred
[ queue stdout] 14834 729319:355ec8:a7d29c 2021-09-04 20:44:49: check_d9_compat: ERROR: sitel.com is NOT Drupal 9
compatible
```

To fix version compatibility errors, all custom modules and sub-themes should declare a `core_version_requirement` key in their `*.info.yml` file that indicates Drupal 9 compatibility. For example:

```
name: Example module
type: module
description: Purely an example
core: 8.x
core_version_requirement: '^8 || ^9'
package: Example module

# Information added by Drupal.org packaging script on 2020-05-31
version: '8.x-1.3'
project: 'example_module'
datestamp: 1590905415
```

This example specifies that the module is compatible with all versions of Drupal 8 and 9. For more information, see [Let Drupal know about your module with an .info.yml file](#) on the drupal.org website.

If you have a backup of a site that you need to restore and are getting the version compatibility error, but the module or theme *.info.yml file cannot be changed easily, then you can modify the site backup.

To modify the site backup, extract the it, edit the relevant files inside it, and then tar the backup file again. Note that this procedure will overwrite the original backup file, so ensure that you keep a separate copy of the original file before you start the extraction. For example:

```
1. mkdir /tmp/backup
2. cd /tmp/backup
3. tar xzf path_to_backup.tar.gz
4. Edit the custom module and theme files to make them Drupal 9 compatible, and add the correct core_version_requirement setting.
5. rm -f path_to_backup.tar.gz
6. tar cfz path_to_backup.tar.gz
7. cd /
8. rm -rf /tmp/backup
```

Migrating your Developer Portal from Version 5 to Version 10

Guidance on how to migrate a Developer Portal site from IBM® API Connect Version 5, to IBM API Connect Version 10.

In IBM API Connect Version 10 the Developer Portal is based on the open source Drupal 9 content management software, which enables more advanced, flexible, and powerful customization capabilities. However, in IBM API Connect Version 5 the Developer Portal is based on Drupal 7. The migration tooling in Version 10 will create a new Developer Portal site, and migrate all of the associated APIs and Products, user information, and subscriptions over. However, customizations such as modules and themes cannot be automatically migrated, as the Drupal 9 baseline is very different to Drupal 7. For more information about upgrading from a Drupal 7 baseline to a Drupal 9 baseline, see [Upgrading Drupal](#) in the Drupal documentation.

The following sections take you through the migration process for the Developer Portal, and provide guidance on how to manually migrate any specific customizations to Drupal 9.

- [Migration process for the Developer Portal](#)
- [Portal Delegated User Registries](#)
- [Custom themes](#)
- [Custom modules](#)
- [Custom Rules](#)
- [Custom content types and fields](#)
- [Advanced theme development](#)
- [Changing the page layout](#)
- [Changing the front page](#)
- [Features no longer available in the Developer Portal](#)

Note: The ability to migrate is available only from IBM API Connect Version 5.0.8.7 onwards. If your deployment is at an earlier version, you must upgrade before migrating. See [Upgrading your API Connect cloud](#) for information about upgrading in Version 5. For more information about the supported versions for migration, see [Migrating a Version 5 deployment](#).

Note: In Version 5, it was possible, though not recommended, to modify files on the Developer Portal server directly. For more information, see [Developer Portal best practices for administrators](#). However, in Version 10, you should not make any system changes. Do not use the `kubect exec` command to make changes inside the Developer Portal containers, and on OVA deployments do not make any modifications on the Developer Portal VM. Make any customizations on your Developer Portal by using the UI or CLI. Do not run a `kubect exec` command on any Developer Portal containers unless asked to by IBM.

Migration process for the Developer Portal

The migration process for the Developer Portal migrates all of the following information to Version 10 for each site in your cluster:

- User information (if Portal Delegated User Registry is enabled, the process is slightly different; see [Portal Delegated User Registries](#)).
- Products and APIs.
- Consumer organizations.
- Applications.
- Subscriptions.

For information about the main migration process, see [Migrating a Version 5 deployment](#).

Portal Delegated User Registries

In IBM API Connect Version 5, if Portal Delegated User Registry (PDUR) was selected for a Catalog, the user management was delegated from the management server to the Developer Portal. The site administrator within the Portal then performed the configuration of user registries, and the management server recorded that the delegation had taken place, and stored a record of the users that existed in the Catalog. However, the management service maintained no information about the configuration of the specific registries or how users mapped to them. In IBM API Connect Version 10, all user registry configuration takes place in the management server, and PDUR is no longer needed. Therefore, to migrate the PDUR user registries and users from v5 to v10, configuration information must be gathered from both the management server and the Portal node.

If your IBM API Connect Version 5 Developer Portal uses Portal Delegated User Registry (PDUR), you must first export the user information that is stored in the Version 5 Developer Portal local database. This user information can then be fed into the migration tooling so that the correct user registries can be created in the newer version of API Connect.

For more information about how to export the PDUR information from v5, see [Exporting Portal Delegated User Registry user information](#). For more information about the migration process in v10, see [Migration steps with PDUR](#).

Custom themes

If your Version 5 Developer Portal is using a custom theme, you'll need to create the custom theme again for the Drupal 9 baseline. Start by creating a sub-theme of the new Version 10 Developer Portal site by using the theme generator, and then manually customize the sub-theme to your specifications for Drupal 9 by using Cascading Style Sheets (CSS), or Sass CSS (SCSS). Note that using SCSS in your theme makes it far simpler to change colors. We've also added a color template theme generator, which means you can quickly generate a base color theme on which to build your customized site branding. For more information, see [Creating a sub-theme](#).

Note, directly editing the API Connect theme is not permitted or supported, as edited versions of these files are overwritten when a fix pack or iFix is installed.

Other useful resources:

- [Tutorial: Creating a custom theme for the Developer Portal](#) - takes you through how to use the theme generator, customize a theme, and install a custom theme.
- [Changing the site logo](#) - how to change your site logo.
- [Changing the shortcut icon](#) - how to change the shortcut icon (favicon).
- [Creating sub-themes](#) - Drupal documentation about creating a sub-themes.
- [Theming differences between Drupal 6, 7 & 8](#) - Drupal documentation about theming differences.

Custom modules

If your Version 5 Developer Portal is using any custom modules, you will need to create these custom modules again for the Drupal 9 baseline. For more information on writing custom modules, see [Extend](#).

Other useful resources:

- [Creating custom modules](#) - Drupal documentation about creating custom modules.
- [Getting started creating custom modules](#) - Drupal documentation giving background information and prerequisites needed for custom module development.
- [Understanding hooks](#) - Drupal documentations about hooks.
- [Drupal API hooks](#) - Drupal documentation about the hooks that are available.

Custom Rules

If your Version 5 Developer Portal is using any custom Rules, you will need to create them as custom modules for the Drupal 9 baseline. You cannot export the Drupal 7 Rules, and then import them into the Drupal 9 baseline, as the events and actions are implemented in a different way. For more information about custom modules, see the [Custom modules](#) section.

Custom content types and fields

If your Version 5 Developer Portal is using any custom content, you will need to create this content again for the Drupal 9 baseline.

For information about creating custom content types, see the following topics:

- [Creating content types](#)
- [Adding fields to content types](#)
- [Adding custom fields to user records](#)

Advanced theme development

If your Version 5 Developer Portal is using modified content type templates, you must create these templates again for the Drupal 9 baseline. In Drupal 9 the templates are Twig files that define the actual HTML output for a particular piece of content. You can override a Twig template by copying the original template into the templates folder of your custom sub-theme, and then editing the template to your specification. The Developer Portal then uses your template in preference to the original one. For more information, see [Applying a modified content type template](#), and [Creating a sub-theme](#). You can also follow a guided example of how to create a new theme, see [Tutorial: Creating a custom theme for the Developer Portal](#).

Note:

Modifying Twig templates allows very fine-grained control over the structure of pages. However, it also means you might miss new features and defect fixes that are made to the original templates, as your Developer Portal is using your overrides instead of the originals. So, if you override a template, it is your responsibility to check the templates in the latest API Connect Version 10 releases, and to ensure that any equivalent changes that are needed to your overrides to maintain functional equivalence are made.

Changing the page layout

If your Version 5 Developer Portal is using a different page layout, you will need to create this layout again for the Drupal 9 baseline. The page layout is defined by configuring which blocks appear in which regions. Blocks are controlled by using the Structure_>Block layout options on the Developer Portal administrator dashboard.

For information about how to configure the page layout, see [Adding and changing the blocks displayed on Developer Portal pages](#).

Changing the front page

If your Version 5 Developer Portal is using a different front page, you will need to create this front page again for the Drupal 9 baseline. The front page is configured from the Structure_>Pages options on the Developer Portal administrator dashboard.

For information about how to configure the front page, see [Configuring the front page](#), and [Adding custom pages](#).

Further options that you might want to consider when designing your front page include:

- Change the banner block content or image: [Changing the front page banner block](#).
- Display featured API Products by creating a featured content block: [Changing the front page Featured Content block](#).
- Create custom blocks with your own HTML content: [Adding and changing the blocks displayed on Developer Portal pages](#).
- Set up the social block to include your organization Twitter feed: [Integrating X data into the social block](#).

Features no longer available in the Developer Portal

The following features that are available in IBM API Connect Version 5, are not available in IBM API Connect Version 10:

- Security questions - these can now be created inside an OpenID Connect provider.
- Two-factor authentication - this can now be performed inside an OpenID Connect provider.
- Support tickets - no Drupal 9 equivalent module is currently available.

Guidelines on upgrading your Developer Portal from Drupal 9 to Drupal 10

Information about the upgrade of the Developer Portal from Drupal 9 to Drupal 10.

The Developer Portal is based on the open source Drupal content management system. From API Connect 10.0.5.3, Drupal 9 is upgrading to Drupal 10, which also requires PHP 8.1. All existing Developer Portal sites will be upgraded to, and all new sites will be based on Drupal 10. Therefore, all modules and themes on your Developer Portal site must be compatible with Drupal 10 and PHP 8.1. The core modules and themes are automatically made compatible as part of the upgrade. However, if your Developer Portal sites contain any custom modules or themes, either written in-house or contributed by the Drupal community, it is your responsibility to ensure that they are Drupal 10 and PHP 8.1 compatible before the upgrade.

See the following topics for more detailed information about how to prepare your Developer Portal sites for the upgrade to Drupal 10.

- [How to find your custom modules and themes on your Developer Portal](#).
- [Prepare your Developer Portal for the update for Drupal 10](#).
- [Upgrade your custom modules to be Drupal 10 and PHP 8.1 compliant](#).

Upgrading from older versions of API Connect v10

If you are upgrading to 10.0.5.3 from 10.0.1.7 or earlier, or coming from 10.0.5.0 or earlier, your Developer Portal sites will first be upgraded to Drupal 9.5 and then to Drupal 10. This is because upgrading to Drupal 10 requires your site to be on at least Drupal 9.4.4.

Note that if you are in the category where a double upgrade occurs, your Developer Portal sites are going to take double the time to upgrade compared to your normal experience, because upgrading from Drupal 9 to Drupal 10 is a major upgrade. Therefore, when you are planning your maintenance window for upgrading to 10.0.5.3, you need to be aware of the extended time frame. To shorten your upgrade window, consider removing the Developer Portal sites that you do not need.

Further reading

See the following links for additional information about the Developer Portal upgrade to Drupal 10.

Guidance on how to upgrade your custom modules to be Drupal 10 and PHP 8.1 compliant.

How to find your custom modules and themes on your Developer Portal

Guidance on how to find what custom modules and themes you installed on your Developer Portal.

The Developer Portal within API Connect comes with built-in modules and themes that you can use to customize your site. You can extend your customizations by installing external custom modules and themes, or even ones written by yourself. If you are unsure which custom modules and themes are installed on your Developer Portal, you can use one of the following methods to find out.

1. [Method 1. Developer Portal admin status report \(recommended\)](#)
2. [Method 2. Developer Portal toolkit CLI](#)
3. [Method 3. Developer Portal container](#)

Method 1. Developer Portal admin status report (recommended)

1. Log in to your Developer Portal as the administrator.
2. If the administrator dashboard is not displayed, click Manage to display it.
3. Click Manage > Reports > Status report.

- The custom modules and themes are listed in the Custom Modules and Custom Themes sections at the end of the page.

General System Information

 IBM API Developer Portal Version 10.99.99.99 20230310-1122 API Explorer 6.3.418 Thu Feb 09 2023 10:51:05 GMT+0000 (Greenwich Mean Time) Consumer Analytics 0.1.33 Fri Nov 18 2022 14:20:50 GMT+0000 (Coordinated Universal Time)	 Drupal Version 10.0.4	 Last Cron Run Last run 2 hours 35 minutes ago (more information) Run cron
 Web Server nginx/1.22.1	 PHP Version 8.1.16 (more information) Memory limit 768M	 Database Version 8.0.30-22.1 System MySQL, Percona Server, or equivalent
 Custom Modules chosen google_tag snowflakes	 Custom Themes emerald_theme_css ruby_theme_scss sapphire_theme_css	 Custom User Fields None installed

4. Check which of your custom modules are enabled or disabled by clicking **Manage > Extend**.
 - The enabled modules are displayed with a selected checkbox, and the disabled ones are not selected as seen in the following example.

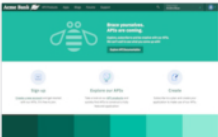

<input checked="" type="checkbox"/>	Page Load Progress	Locks the screen and adds a progress icon to indicate progress when a page takes a long time to reload.
<input type="checkbox"/>	Snowflakes	Adds pure CSS animated snowflakes to your Drupal site.

5. Check which of your custom themes are enabled or disabled by clicking **Manage > Appearance**.
 - Find your themes that are categorized into Enabled and Disabled sections.

Enabled themes

 connect_theme 8.x-99.0.15 (default theme) Uses the Bootstrap framework Sass source files and must be compiled.	 Bootstrap 8.x-3.27 Built to use Bootstrap, a sleek, intuitive, and powerful front-end framework for faster and easier web development.
 Claro 10.0.4 (administration theme) A clean, accessible, and powerful Drupal administration theme.	 Olivero 10.0.4 A clean, accessible, and flexible Drupal front-end theme.

Disabled themes

			
---	---	--	---

Method 2. Developer Portal toolkit CLI

Use the `custom-module:create-export` and `custom-theme:create-export` commands to extract your custom modules and themes into a compressed file.

The compressed file includes a list of your custom modules and themes. For more information about using the Developer Portal toolkit CLI and all the other features it offers, see [Overview of the Developer Portal command-line tool](#).

1. To list your modules, implement the following steps:
 - a. Log in to the Developer Portal toolkit CLI as a provider organization.
 - b. Run the following `custom-module:create-export` command against the Developer Portal.

```
apic custom-module:create-export --mode portaladmin [flags]
```

- c. Specify the appropriate `org` and `catalog` name.

For example,

```
> SERVER=myserver.ibm.com
> apic login -s $SERVER -r provider/default-idp-2 -u steve
```

```
Warning: Using default toolkit credentials.
Enter your API Connect credentials
Password?
Logged into myserver.ibm.com successfully

> apic -s $SERVER -m portaladmin custom-module:create-export -o ibm -c api-connect-catalog-1
201 CREATED - Task ID: x8jupowmktkf8f2r

Response Code - 202:

Message(s) -
The status of this task is: QUEUED

Response Code - 200:

Message(s) -
The status of this task is: FINISHED and the artifact can now be streamed

Saving File (Large files may take a while)...
Incoming project saved to custom_module_createExport-20230322143819.tgz
```

After the command has run, extract your compressed export to see the modules inside. Or use `tar` directly as shown in the following example.

```
> tar --exclude='*/*' -tvf custom_module_createExport-20230322143819.tgz
drwxr-sr-x aegir/aegir      0 2023-03-22 12:05 chosen/
drwxr-sr-x aegir/aegir      0 2023-03-22 12:05 google_tag/
drwxr-sr-x aegir/aegir      0 2023-03-22 12:05 snowflakes/
```

2. To check which one of your custom modules are enabled or disabled, implement the following steps:
 - a. Run the following `modules:list` command to print the list of installed modules.

```
apic modules:list --mode portaladmin [flags]
```

- b. Search for your custom modules from the result.
For example,

```
> SERVER=myserver.ibm.com
> apic -s $SERVER -m portaladmin modules:list -o ibm -c api-connect-catalog-1 --no-core
.
.
.
chosen:
  package: 'User interface'
  display_name: 'Chosen (chosen)'
  status: Disabled
  version: 3.0.5
google_tag:
  package: Statistics
  display_name: 'Google Tag Manager (google_tag)'
  status: Enabled
  version: 8.x-1.6
snowflakes:
  package: 'User interface'
  display_name: 'Snowflakes (snowflakes)'
  status: Enabled
  version: 2.0.1
.
.
```

3. To list your custom themes, implement the following steps:
 - a. Log in to the Developer Portal toolkit CLI as a provider organization.
 - b. Run the following `custom-theme:create-export` command against the Developer Portal.

```
apic custom-theme:create-export --mode portaladmin [flags]
```

- c. Specify the appropriate `org` and `catalog` name.
For example,

```
> SERVER=myserver.ibm.com
> apic login -s $SERVER -r provider/default-idp-2 -u steve
Warning: Using default toolkit credentials.
Enter your API Connect credentials
Password?
Logged into api.fyre-ci-136264-master.fyre.ibm.com successfully

> apic -s $SERVER -m portaladmin custom-theme:create-export -o ibm -c api-connect-catalog-1
201 CREATED - Task ID: oh595vuywxsz3526

Response Code - 202:

Message(s) -

The status of this task is: FINISHED and the artifact can now be streamed

Saving File (Large files may take a while)...
Incoming project saved to custom_theme_createExport-20230322143856.tgz
```

After the command has run, extract your compressed export to see the themes inside. Or use `tar` to view the contents directly as shown in the following example.

```

> tar --exclude='*/' -tvf custom_theme_createExport-20230322143856.tgz
drwxr-sr-x aegir/aegir      0 2023-03-22 14:36 emerald_theme_css/
drwxr-sr-x aegir/aegir      0 2023-03-22 14:36 ruby_theme_scss/
drwxr-sr-x aegir/aegir      0 2023-03-22 14:36 sapphire_theme_css/

```

4. To check which of your custom themes are enabled or disabled, implement the following steps:
 - a. Run the following `themes:list` command to print the list of installed themes.

```
apic themes:list --mode portaladmin [flags]
```

- b. Search for your custom themes from the result.
For example,

```

> SERVER=myserver.ibm.com
> apic -s $SERVER -m portaladmin themes:list -o ibm -c api-connect-catalog-1 --no-core
bootstrap:
  package: Bootstrap
  display_name: 'Bootstrap (bootstrap)'
  status: Enabled
  version: 8.x-3.27
.
.
.
emerald_theme_css:
  package: Bootstrap
  display_name: 'emerald_theme_css (emerald_theme_css)'
  status: Disabled
  version: null
ruby_theme_scss:
  package: Bootstrap
  display_name: 'ruby_theme_scss (ruby_theme_scss)'
  status: Disabled
  version: null
sapphire_theme_css:
  package: Bootstrap
  display_name: 'sapphire_theme_css (sapphire_theme_css)'
  status: Disabled
  version: null

```

Method 3. Developer Portal container

If you are unable to access the Developer Portal settings or the Developer Portal toolkit CLI, check the Developer Portal container running within your Kubernetes or Red Hat OpenShift environment.

Note: You need access to the Developer Portal Kubernetes pods to be able to perform these steps.

1. Use `kubectl` or `oc` for Red Hat OpenShift environment to obtain a shell to the Developer Portal running container.

Your Developer Portal sites are located within the `portal-www` pod in the `admin` container within the namespace that your Developer Portal subsystem is deployed to as seen in the following example.

```

> kubectl get pods -n apic | grep www
portal-014179b4-www-0      2/2      Running      0          8d

> kubectl exec -n apic -it portal-014179b4-www-0 -c admin -- bash
bash-4.4$

```

2. After you access the container, use the command `list_sites -a` to obtain the site alias for your Developer Portal. For example,

```

bash-4.4$ list_sites -a
daae4642-ble2-4fd8-a5a7-77a68ed812ef.944dce4f-bbad-41ce-b166-aa2c9f8c4b17 => ibm.api-connect-catalog-1.portal.fyre-ci-136264-master.fyre.ibm.com (INSTALLED)
daae4642-ble2-4fd8-a5a7-77a68ed812ef.c560c004-852d-42c3-ae4e-797144a857af => ibm.api-connect-catalog-2.portal.fyre-ci-136264-master.fyre.ibm.com (INSTALLED)

```

The Developer Portal `portal.fyre-ci-136264-master.fyre.ibm.com/ibm/api-connect-catalog-1` has the site alias `ibm.api-connect-catalog-1.portal.fyre-ci-136264-master.fyre.ibm.com`.

3. After you identify the Developer Portal that you want to look at, use the alias string within a `find` command to list your modules and themes, as shown in the following example.

```

bash-4.4$ find /web/platforms/devportal*/sites/myserver.ibm.com/modules -mindepth 1 -maxdepth 1 -type d -exec basename {} \;
\;
chosen
google_tag
snowflake

bash-4.4$ find /web/platforms/devportal*/sites/ibm.api-connect-catalog-1.portal.fyre-ci-136264-master.fyre.ibm.com/themes -mindepth 1 -maxdepth 1 -type d -exec basename {} \;
emerald_theme_css
ruby_theme_scss
sapphire_theme_css

```

4. To check which of your custom modules and themes are enabled or disabled, implement the following sub-steps:
 - a. Use the `drush` command-line tool within the container to print the list of installed modules and themes for your Developer Portal.
 - b. Then, use the site alias that you obtained earlier to run the following `drush` command and find your custom modules and themes.

```

bash-4.4$ drush @myserver.ibm.com pml --no-core
Running: drush -y @daae4642-ble2-4fd8-a5a7-77a68ed812ef-944dce4f-bbad-41ce-b166-aa2c9f8c4b17 pml --no-core

```

```

-----
Package                                     Name

```

Status	Version	
User	Enabled	Account Field Split (account_field_split)
Access control	Enabled	ACL (acl)
.	.	.
User interface	Disabled 3.0.5	Chosen (chosen)
Statistics	Disabled 8.x-1.6	Google Tag Manager (google_tag)
User interface	Disabled 2.0.1	Snowflakes (snowflakes)
Bootstrap	Enabled 8.x-3.27	Bootstrap (bootstrap)
Bootstrap	Enabled 8.x-99.0.15	connect_theme (connect_theme)
Bootstrap	Disabled	emerald_theme_css (emerald_theme_css)
Bootstrap	Disabled	ruby_theme_scss (ruby_theme_scss)
Bootstrap	Disabled	sapphire_theme_css (sapphire_theme_css)

Results

By using one of the three methods discussed in the topic, you managed to successfully list the custom modules and themes installed on your Developer Portal. This also allowed you to see which of these custom modules and themes are enabled or disabled.

1. [Method 1. Developer Portal admin status report \(recommended\)](#)
2. [Method 2. Developer Portal toolkit CLI](#)
3. [Method 3. Developer Portal container](#)

Next steps

Ensure that you keep your custom modules and themes up to date, and remove deprecated code within your own written custom modules and themes. If you are not using a custom module or theme, consider removing it. This helps mitigate problems when you want to migrate or upgrade your Developer Portal.

Prepare your Developer Portal for the update for Drupal 10

Guidance on how to prepare your Developer Portal site from Drupal 9 to Drupal 10.

If your Developer Portal contains custom modules and themes that are written by yourself or downloaded from elsewhere, ensure that they are Drupal 10 compatible before you start the upgrade process. This action aims toward a seamless IBM® API Connect upgrade experience. To find more information about your modules and themes compatibility, download the Upgrade Status module available [here](#).

Note: Before you start the upgrade, check the status of your modules and themes and if they are in use. Remove the ones that you do not use. To learn more on how to prepare your Developer Portal for the Drupal 10 upgrade, check the following steps.

1. [Installing the Upgrade Status module](#)
2. [Upgrading your module to be Drupal 10 compatible](#)
3. [Import your module into your Developer Portal](#)
4. [Verifying that your module is Drupal 10 compatible](#)

Installing the Upgrade Status module

1. Log in to your Developer Portal as the administrator.
2. If the administrator dashboard is not displayed, click Manage to display it.
3. Install the Upgrade Status module. For more information about how to install the Upgrade Status, see [Installing custom modules](#).
4. When you finish your Upgrade Status installment, click Admin > Reports > Upgrade-status.

Drupal 10 upgrade status ☆

Home » Administration » Reports

⚠ There is a security update available for your version of Drupal. To ensure the security of your server, you should update immediately! See the [available updates](#) page for more information and to install your missing updates.
There are security updates available for one or more of your modules or themes. To ensure the security of your server, you should update immediately! See the [available updates](#) page for more information and to install your missing updates.

Run the report to find out if there are detectable compatibility errors with the modules and themes installed on your site.

GATHER DATA	FIX INCOMPATIBILITIES	RELAX
<ul style="list-style-type: none"> Install Composer Deploy or Git Deploy as appropriate for accurate update recommendations Check available updates (Last checked 1 hour 1 minute ago) Scan: 7 projects Select any of the projects to rescan as needed below 	<ul style="list-style-type: none"> Environment is incompatible Remove: 42 projects Update: 41 projects Collaborate with maintainers: 33 projects Fix with rector: 1 project Fix manually: 3 projects 	<ul style="list-style-type: none"> Compatible with next major Drupal core version: 50 projects

▼ DRUPAL CORE AND HOSTING ENVIRONMENT

Upgrades to Drupal 10 are supported from Drupal 9.4.x and Drupal 9.5.x. It is suggested to update to the latest Drupal 9 version available. Several hosting platform requirements have been raised for Drupal 10.

REQUIREMENT	STATUS
Drupal core should be at least 9.4.x	⚠ Version 9.4.8 allows to upgrade but 9.5.4 is available.
PHP version should be at least 8.1.0. Before updating to PHP 8, use <code>composer why-not php 8.1</code> to check if any projects need updating for compatibility. Also check custom projects manually.	⚠ Version 8.0.27
Database JSON support required	✓ Supported.
Invalid permissions will trigger runtime exceptions in Drupal 10. Permissions should be defined in a <code>permissions.yml</code> file or a permission callback.	<ul style="list-style-type: none"> Permissions of user role: "Anonymous user": <ul style="list-style-type: none"> search content use advanced search use search autocomplete Permissions of user role: "Authenticated user": <ul style="list-style-type: none"> search content use advanced search use search autocomplete Permissions of user role: "Content Author": <ul style="list-style-type: none"> access printer-friendly version manage content access control

5. The DRUPAL CORE AND HOSTING ENVIRONMENT section can be ignored. This area is managed by IBM API Connect and gets resolved when you upgrade.

Note: Your custom modules and themes must be PHP 8.1 compatible before you upgrade to Drupal 10, and you are responsible for doing the upgrade.

6. The list of projects further on the page are the ones that your Upgrade Status believes are not compatible with Drupal 10. These projects are categorized into sections, for example: REMOVE, UPDATE, COLLABORATE WITH MAINTAINERS.

When you upgrade IBM API Connect, the Drupal 10 compatibility is automatically given to the modules and themes that you have not created or installed manually.

▼ REMOVE

The likely best action is to remove projects that are uninstalled. Why invest in updating them to be compatible if you are not using them?

<input type="checkbox"/>	PROJECT	TYPE	STATUS	LOCAL VERSION	LOCAL 10-READY	LOCAL SCAN RESULT	DRUPAL.ORG VERSION	DRUPAL.ORG 10-READY	DRUPAL.ORG ISSUES	PLAN
<input type="checkbox"/>	AddToAny (addtoany)	Contributed module	Uninstalled	8.x-1.16	⚠ Incompatible	N/A	Not applicable	⚠ Unchecked	Issues	N/A
<input type="checkbox"/>	APIC Test (apicest)	Contributed module	Uninstalled	8.x-5.2.3	⚠ Incompatible	N/A	Not applicable	⚠ Unchecked	Issues	N/A
<input type="checkbox"/>	Autocomplete Deluxe (autocomplete_deluxe)	Contributed module	Uninstalled	2.0.2	⚠ Incompatible	N/A	Not applicable	⚠ Unchecked	Issues	N/A
<input type="checkbox"/>	Back To Top (back_to_top)	Contributed module	Uninstalled	2.0.0	⚠ Incompatible	N/A	Not applicable	⚠ Unchecked	Issues	N/A
<input type="checkbox"/>	Bootstrap Site Alert (bootstrap_site_alert)	Contributed module	Uninstalled	8.x-1.9	⚠ Incompatible	N/A	Not applicable	⚠ Unchecked	Issues	N/A
<input type="checkbox"/>	Contact storage (contact_storage)	Contributed module	Uninstalled	8.x-1.2	⚠ Incompatible	N/A	Not applicable	⚠ Unchecked	Issues	N/A
<input type="checkbox"/>	Serialization (CSV) (csv_serialization)	Contributed module	Uninstalled	8.x-2.1	⚠ Incompatible	N/A	Not applicable	⚠ Unchecked	Issues	N/A
<input type="checkbox"/>	Devel (devel)	Contributed module	Uninstalled	4.2.1	⚠ Incompatible	N/A	Not applicable	⚠ Unchecked	Issues	N/A
<input type="checkbox"/>	Disable Language (disable_language)	Contributed module	Uninstalled	8.x-1.0-beta11	⚠ Incompatible	N/A	Not applicable	⚠ Unchecked	Issues	N/A
<input type="checkbox"/>	Drupal Proxy (droxy)	Contributed module	Uninstalled	2.0.1	⚠ Incompatible	N/A	Not applicable	⚠ Unchecked	Issues	N/A

7. If you find your custom modules and themes there, you can scan them to reveal what changes are needed to make them Drupal 10 compatible. For instance, the following image demonstrates the process of scanning an installed custom module, named `custom_icons`.

<input type="checkbox"/>	Warmer (warmer)	Contributed module	Installed	2.0.8	⚠ Incompatible	N/A	Up to date	⚠ Incompatible	Issues	N/A
<input type="checkbox"/>	IBM APIC Portal - custom icons (custom_icons)	Contributed module	Installed	1.0.0	⚠ Incompatible	5 problems	Not applicable	⚠ Unchecked	Issues	N/A
<input type="checkbox"/>	connect_theme (connect_theme)	Contributed theme	Installed	8.x-5.2.5	⚠ Incompatible	N/A	Not applicable	⚠ Unchecked	Issues	N/A

8. Select your custom modules and themes and then click Scan selected. When completed, if your custom module or theme requires changes, you see a link on the row of them.

Note: For Upgrade Status to identify all of the Drupal 10 compatibility issues in your custom modules and themes, you must have them enabled before scanning it.

Fix now with automation

Avoid some manual work by using [drupal-rector to fix issues automatically](#) or [Upgrade Rector to generate patches](#).

Upgrading your module to be Drupal 10 compatible

This module is an example of how you can read the report and fix your code to be compatible with Drupal 10.

- The report shows that [drupal_get_path\(\)](#) is deprecated, and the code must be changed to use the newer function [getPath\(\)](#). The following examples demonstrate the change to the newer extension type-specific version.

Before

```
$name = preg_replace("/[^\A-Za-z0-9]/", '', $returnValue);
$returnValue = Url::fromUri('internal:/' . drupal_get_path('module', 'custom_icons') . '/images/' .
_custom_image_getRandomImageName($name))
->toString();
```

After

```
$name = preg_replace("/[^\A-Za-z0-9]/", '', $returnValue);
$iconPath = \Drupal::service('extension.list.module')->getPath('custom_icons');
$returnValue = Url::fromUri('internal:/' . $iconPath . '/images/' . _custom_image_getRandomImageName($name))
->toString();
```

- Add the new version into the `info.yml` file.
- `Drupal/Core/Extension/ExtensionList` is still present in Drupal 8 and Drupal 9, so you can keep them, and add on support for Drupal 10.
- Modify the version number when you make a new change to the module as seen in the following example.

Before

```
name: 'IBM APIC Portal - custom icons'
type: module
description: 'IBM API Connect Developer Portal tutorial - Example of custom product icons'
package: 'Custom'
core_version_requirement: ^8 || ^9
```

```
version: 1.0.1
project: 'custom_icons'
dependencies:
  - ibm_apim
```

After

```
name: 'IBM APIC Portal - custom_icons'
type: module
description: 'IBM API Connect Developer Portal tutorial - Example of custom product icons'
package: 'Custom'
core_version_requirement: ^8 || ^9 || ^10
version: 1.0.2
project: 'custom_icons'
dependencies:
  - ibm_apim
```

Import your module into your Developer Portal

Import the module by using the Developer Portal [Toolkit CLI](#). For more information about how to use the Developer Portal CLI, see [Getting started with the Portal CLI commands](#).

For example,

```
> apic login -s $SERVER -r provider/default-idp-2 -u steve
Warning: Using default toolkit credentials.
Enter your API Connect credentials
Password?
Logged into api.fyre-ci-134466-master.fyre.ibm.com successfully

> apic -s $SERVER -m portaladmin custom-module:create-import -o ibm -c api-connect-catalog-2 /tmp/custom_icons.zip

```

Alternatively, import your updated module by installing it again using the Developer Portal UI. For more information about how to install custom modules, see [Installing custom modules](#).

Verifying that your module is Drupal 10 compatible

The updated module is now imported into the Developer Portal. Return to the Upgrade Status report page to rescan the module. When it becomes compatible with Drupal 10, it appears at the end of the page.

<input type="checkbox"/>	Workbench (workbench)	Contributed module	Installed	8.x-1.4	✓ Compatible	N/A	Up to date	✓ Compatible	Issues	N/A
<input type="checkbox"/>	IBM APIC Portal - custom icons (custom_icons)	Contributed module	Installed	1.0.0	✓ Compatible	No problems found	Not applicable	⚠ Unchecked	Issues	N/A
<input type="checkbox"/>	Snowflakes (snowflakes)	Contributed module	Uninstalled	2.0.1	✓ Compatible	3 problems	Not applicable	⚠ Unchecked	Issues	N/A

Results

You used the Upgrade Status module to identify and fix the Drupal 10 compatibility problems with your custom modules and themes. However, this process might not cover everything that you need to be ready for the upgrade to Drupal 10. Drupal 10 requires PHP 8.1, so you might need to change your custom modules and themes to support it. Remember to keep your custom modules and themes up to date, and to remove deprecated code within your own written custom modules and themes.

Upgrade your custom modules to be Drupal 10 and PHP 8.1 compliant

Guidance on how to upgrade your custom modules to be Drupal 10 and PHP 8.1 compliant.

The following sections provide examples of the most common updates that you might need to make. However, you must check the deprecation lists for Drupal and PHP to ensure that you cover all of the scenarios in your Developer Portal sites.

Notable changes the update brings

The following items are some of the key changes in Drupal 10.

- **CKEditor4** is removed and **CKEditor5** is now the default text editor.
- **Claro** is now the default theme for the Admin UI, which gives it a modern and refreshing look.
- Ensure that none of your custom modules depend on them as they will not be there after the upgrade.

The following modules are uninstalled as they do not support Drupal 10:

- ckeditor_media_embed
 - console
 - flood_unblock
 - message
 - message_notify
 - message_subscribe
 - video_embed_field
 - video_embed_html5
 - content_browser
 - entity_browser
 - entity_browser_enhanced
 - entity_embed
 - file_browser
 - editor_file
 - color
 - Unlimited_number
 - embed
 - ckeditor
 - quickedit
- The Drupal 10 upgrade comes with a major Symfony upgrade version. Drupal 9 used Symfony 4.4, and Drupal 10 now uses Symfony 6, so if you are using any Symfony ensure that they have not been deprecated. Symfony provides a guide at the following link https://symfony.com/doc/current/setup/upgrade_major.html.
 - The default Drush version is now Drush 11. If you are writing Drush commands in your custom modules, you must ensure they are Drush 11 compatible. The following links provide examples on how you can achieve compatibility, <https://www.specbee.com/blogs/writing-your-own-custom-drush-9-and-10-commands> and <https://www.drush.org/11.x/commands/>.

PHP 8.1 deprecations

The following items are some of the key PHP 8.1 deprecations.

Passing null to non-nullable internal function parameters is deprecated

There are multiple scenarios that require a fix with the possibility to pass a `null` to some PHP functions.

The following example is the most common PHP deprecation.

Before:

```
$redacted_url = $url;
if (strlen($redacted_url) > 0 && strpos($redacted_url, '/') !== 0) {
```

After:

```
$redacted_url = $url ?? '';
if (strlen($redacted_url) > 0 && strpos($redacted_url, '/') !== 0) {
```

Optional parameters specified before the required parameters

Some functions in code have optional parameters before the required ones. However, in PHP 8.1, the required parameters come after the optional ones.

Improved type safety

PHP 8.1 improves the type of safety, which can result in numerous warnings that might require changing functions and variable declarations.

The following example addresses the improved safety and the optional parameters before required parameters deprecations.

Before:

```
protected $id;

public function oldFunction($url = '', $data) {
    return $id;
}
```

After:

```
/**
 * Drupal entity ID
```

```

*
* @var string
*/
protected $id;

public function newFunction(someObject $data, string $url = ''): string {
    return $id;
}

```

Drupal 10 deprecations

The following items are some of the key PHP 8.1 deprecations.

Entity queries now require an `accessCheck`

If you have custom modules with entities, you must do an `accessCheck`. For more information about access checking, see <https://www.drupal.org/node/3201242>.

For example,

Before:

```

$query = \Drupal::entityQuery('node');
$query->condition('type', 'api');
$query->condition('status', 1);
$nids = $query->execute();

```

After:

```

$query = \Drupal::entityQuery('node');
$query->condition('type', 'api');
$query->condition('status', 1);
$nids = $query->accessCheck()->execute();

```

The `once` function is removed from the jQuery library and added to its own core library

If you have any modules that use the `once` function in your JavaScript files, you need an update to pull in the new library. For more information about how to remove jQuery dependency, see <https://www.drupal.org/node/3158256>.

For more examples on how you might upgrade your code, see <https://www.drupal.org/project/drupal/issues/3183149>.

For example,

Before:

```

// ibm_apim.libraries.yml
validate_password:
  version: 1.x

// validate_password.js
(function($, Drupal, drupalSettings) {
  var $passwordInput = $(context).find('input.js-password-field').once('ibmApimValidatePassword');
})(jQuery, Drupal, drupalSettings);

```

After:

```

// ibm_apim.libraries.yml
validate_password:
  version: 1.x
  dependencies:
    - core/once

// validate_password.js
(function($, Drupal, drupalSettings, once) {
  var $passwordInput = $(once('ibmApimValidatePassword', context)).find('input.js-password-field');
})(jQuery, Drupal, drupalSettings, once);

```

The `app.root` and `site.path` services that are converted into container parameters

If you use the `app.root` and `site.path` services in your custom modules, you must ensure they are converted into container parameters.

For example,

Before:

```

\Drupal::service('config.factory')
  ->getEditable('locale.settings')
  ->set('translation.use_source', 'local')
  ->set('translation.path', \Drupal::service('site.path') . '/translations')
  ->save();

```

After:

```

\Drupal::service('config.factory')
  ->getEditable('locale.settings')
  ->set('translation.use_source', 'local')
  ->set('translation.path', \Drupal::getContainer()->getParameter('site.path') . '/translations')
  ->save();

```

The parameters of some `Forms` are updated, so be aware if you are extending them.

If you are extending your `Forms`, note the parameters of some of them have changed. For more information about the updated parameters, see

<https://www.drupal.org/node/3251987>.

Next steps

The sections above cover the key upgrades you might need when upgrading your custom modules to be Drupal 10 and PHP 8.1 compliant. However, note that it is your responsibility to check the deprecation lists for Drupal and PHP to ensure that you cover all of the scenarios in your Developer Portal sites.

For more information about making your custom modules Drupal 10 and PHP 8.1 compliant, see the following links:

- [Deprecation checking and correction tools.](#)
- [Deprecated modules and themes.](#)
- [List of APIs deprecated and now removed from Drupal 10.](#)
- [Whats new in PHP 8.1.](#)
- [Symfony Upgrade Guide.](#)
- [Drush 11 commands.](#)

Developer Portal tutorials

Tutorials for using the Developer Portal.

The following guided examples help you through some of the most common user scenarios in the Developer Portal, as well as some of the more complex areas.

Developer Portal tutorials by category
For API consumers Create an Application
User authentication Adding a field to the sign up form Adding validation to a field on the sign up form Adding a field group to group fields in a content type
Getting started configuring the Developer Portal Creating the Portal Creating a private Portal site Customizing themes
Advanced customization Changing the front page Grouping products by category Adding a custom block to the front page Adding a custom block to a page other than the front page Using avatars Using image optimization Adding a Back to top button Creating a drop-down menu link Displaying blog posts on the front page Displaying tweets on the front page Changing the profile page to display firstname lastname, instead of username Using a custom weighting sort order on the product list page Configuring the RobotsTxt file Configuring the SecurityTxt file Synchronizing application credentials with an external server

Tutorial: Creating the Developer Portal

About this task

In this tutorial, you are going to complete the following lessons:

Enabling the Developer Portal through the API Manager

By proceeding with the following steps, you create an administrator account:

1. Log in to the API Manager
2. Click  Manage, then click Add, and select Create catalog.
3. Select the owner from the **Select user** list, then enter a **Title** for your catalog, for example `Production`.

Create Catalog

Create Catalog

Enter the catalog summary details; you can fully configure the catalog after you create it

Select user

Apic Tutorial (tutor), myuser@myco.com

Title

Production

Name

production

Cancel Create

4. Click Create. The Manage page appears.

Manage

A catalog hosts a collection of API products that are visible in the associated developer portal when published

 Production	:	 Sandbox
		Sandbox Catalog

5. Click on the tile that corresponds to your new catalog, for example **Production**.

6. Click Catalog settings.

7. Click Gateway Services. If the message **You currently don't have any gateway services** is displayed, click Edit, select the configured gateway service, and click Save.

Enable Gateway Services

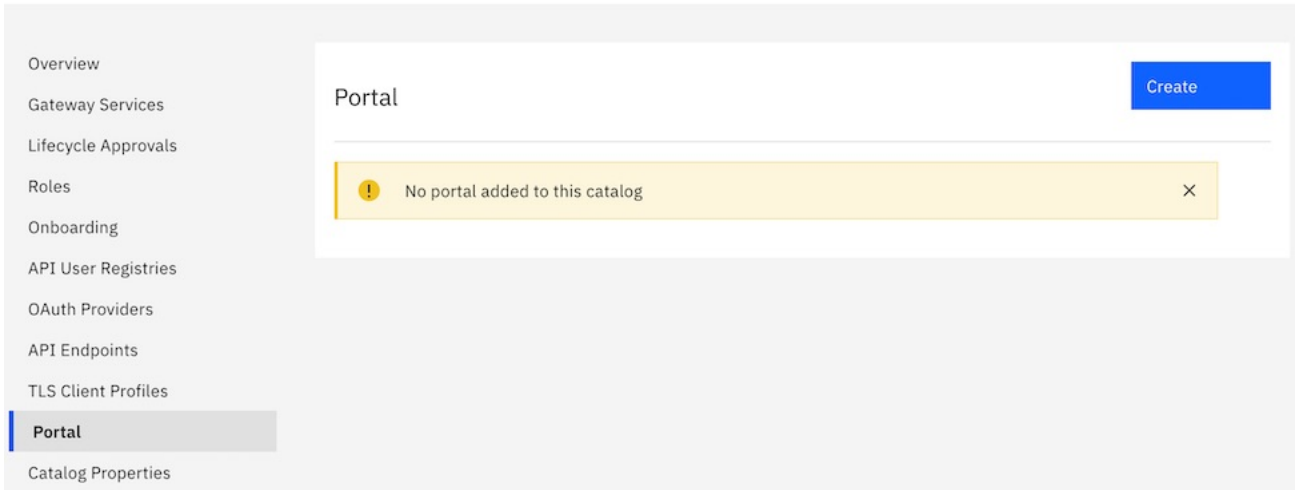

<input checked="" type="checkbox"/>	Title	Type
<input checked="" type="checkbox"/>	gateway_service	DataPower API Gateway

Cancel Save

8. Click Portal.

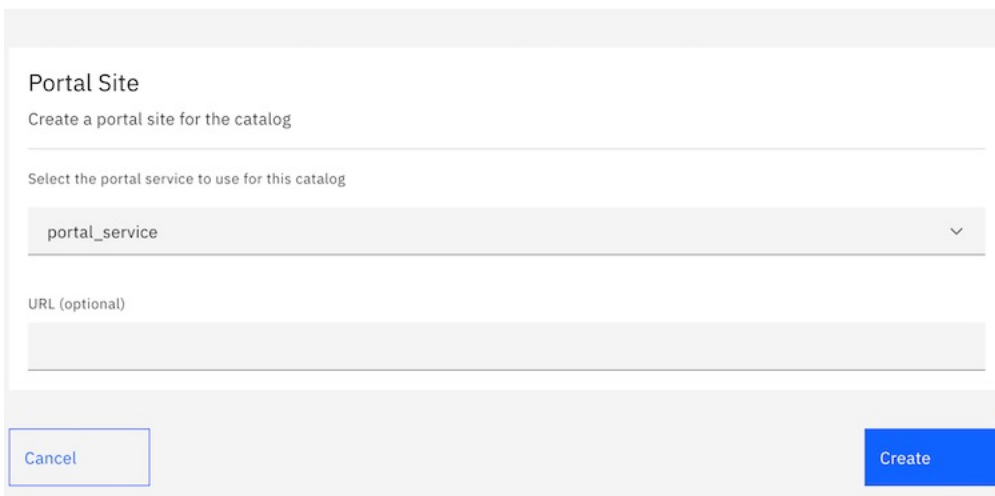

9. Click Create.

Settings

10. Select a portal service to use. Click Create.

Create Portal

After a few minutes, you receive an email with a link to your Developer Portal site for that catalog. The link is a single use only link for the administrator account.

Administrator (admin),

Your Developer Portal site has been created. You can log in as the 'admin' user by using the following one-time log in link. After you have logged in with the following link, you must change the password for the 'admin' user account immediately.

https://portal.apidemo.demo.ibm.com/tutorial/production/user/reset/1/1591727237/h26vxzf2e51UqgK7vf10LNbHiVEC5VQ_AZAoKCYH72C/new/login

11. Click the email link. Click Sign in.

API Developer Portal Reset password

If you have forgotten the password for your account or 'admin', you can reset it here. This is a one-time login for *admin*.

Click on this button to log in to the site and change your password.

This login can be used only once.

Sign in

[Back to Sign in](#)

12. Change the password. Click Submit.

✔ You have just used your one-time login link. It is no longer necessary to use this link to log in. Please change your password. ✕

Change your password

Change your password.

Tutorial: Creating a private Developer Portal site

You can create a private version of the Developer Portal, so that authenticated users only can access content on the site. You might want to do this if you want to restrict public access to your content unless they are logged in.

Before you begin

You must have a Developer Portal enabled, and you must have administrator access to complete this tutorial. The tutorial [Creating the Portal](#) explains how to enable the portal if you have not already done so.

About this tutorial

In this tutorial, you are going to restrict access for all the content to authenticated users only. This gives access to all users from **Content Author** to **Superuser**, as they are all required to authenticate to access their roles. You will then add the login form to the home page, so that public users will be able to view the public home page that contains the login form only.

This tutorial takes you through the following steps:

1. [Export your configuration settings.](#)
2. [Restrict all permissions to authenticated users.](#)
3. [Restrict blocks to authenticated users.](#)
4. [Add login form to the home page.](#)

Export your configuration settings

In case you make an error, or want to revert all of the changes made during this tutorial, you can back up your configuration settings to your machine before you make any changes.

The tutorial [Exporting and importing custom themes and site configuration](#) provides further details on how to export your configuration settings using the Developer Portal CLI.

Restrict all permissions to authenticated users

1. If the administrator dashboard isn't displayed, click **Manage** to display it.
2. Navigate to **People > Permissions**.
3. Clear all check boxes that are associated with **ANONYMOUS USER**.
4. Click **Save permissions** at the end of the page.

Restrict blocks to authenticated users

1. If the administrator dashboard isn't displayed, click **Manage** to display it.
2. Navigate to **Structure > Block layout**.
3. Find the row that is labeled **Main menu** and click **Configure**.
4. Find the setting **Roles** under the category **Visibility**.
5. Check the box **Authenticated user**.
6. Click **Save block**.
7. Repeat from step 3 for the **Footer menu**.
8. Click **Save block**.

Add login form to the home page

1. If the administrator dashboard isn't displayed, click **Manage** to display it.
2. Navigate to **Structure > Pages**.
3. Click **Edit** on the **Welcome** page.
4. Navigate to **Panels > Content**.
5. Click **Add new block**.
6. Find and click **User login**, under the **FORMS** section.
7. Clear the **Display title** check box.
8. Click **Add block**.
9. Rearrange the new login block so that it is underneath the **Welcome Banner**.
10. Click **Update and save**.

What you did in this tutorial

On your Developer Portal, you restricted access for all the content to authenticated users only. Now when you access your home page as an unauthenticated user, you see that the login form appears underneath the welcome banner. Navigating to other URLs on the site presents an **unauthorized** page to appear.

When you log in, the login form disappears from the home page and you are able to access all of the pages that are visible to your role.

Tutorial: Creating Accounts and Applications on the Developer Portal

This tutorial shows you how to create a developer account and register an application on the Developer Portal.

Before you begin

You must have a Developer Portal installed, and created and published at least one API product.

If you do not have a Developer Portal available, complete the tutorial [Creating a Developer Portal](#).

If you don't have an API product available, you can download one of the following APIs, and then import and activate it:

- If your Sandbox catalog uses a DataPower® Gateway (v5 compatible) (as one of the gateways, or as the only gateway), download the [findbranch.txt](#) file to your local filesystem. Rename this file `findbranch.yaml`.
- If your Sandbox catalog uses a DataPower API Gateway, download the [findbranch_v6.txt](#) file to your local filesystem. Rename this file `findbranch.yaml`.

For more information about importing an API, see [Adding a REST API by importing an OpenAPI definition file](#).

About this task

In this tutorial you are going to complete the following lessons:

- [Creating a developer account in the Developer Portal](#)
- [Creating a developer application in the Developer Portal](#)
- [Testing the Branches API in the Developer Portal](#)

Note: The administrator account cannot create an App, or register to an App. To create or register to an App, you must have a developer account. A developer account that has been assigned administrator privileges can create and register Apps.

Creating a developer account in the Developer Portal

Take the following steps to create a developer account:

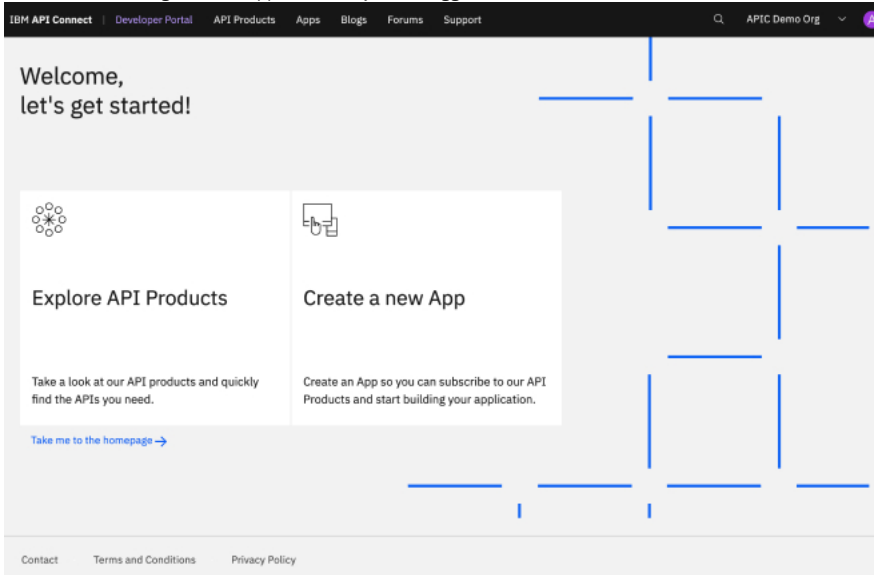

1. Follow the instructions provided on [Creating a Developer Portal](#) and open a Developer Portal.
2. Click Create account. If the Create account link is not visible, log out as Admin from the Developer Portal first, go to the home page of the Developer Portal, and click Create account.
Note: Your email is used as your user name for the Developer Portal. The email address must be different from the address used for creating the administrator account.
3. Complete the sign up form. The email address you provide must be functional. Click Sign up. A confirmation message is sent to the email address provided in the form.

4. Click the account activation link in the confirmation email to activate your account.
5. To use the Developer Portal, click Sign in and sign in with the user credentials you specified.

Creating a Developer Portal Application

To create and register a new App:

1. In the Developer Portal, click Create a new App.
Note: You cannot register new applications if you are logged in as the administrator.

2. Enter the following values for the application that is being registered.

Table 1. Values for registering the application

Field Name	Value
Title	AppOne
Application OAuth Redirect URL(s)	http://example.com

Create a new application

What you did in this tutorial

In this tutorial, you completed the following activities:

- Created a developer account in the Developer Portal.
- Created and registered a new App, and subscribed it to a Plan.
- Tested an API in the Developer Portal.

Tutorial: Creating a custom theme for the Developer Portal

Customize the appearance of your Developer Portal home page, by generating a sub-theme, configuring the overrides.css file, and installing the newly customized theme.

Before you begin

You must have a Developer Portal enabled, and you must have administrator access to complete this tutorial. The tutorial [Creating the Portal](#) explains how to enable the portal if you have not already done so.

Important: You're not permitted to include any IBM® API Connect code within any custom themes that you create.

About this tutorial

The way to create a custom theme is to create a custom sub-theme of the standard API Connect theme that the Developer Portal uses by default. The sub-theme inherits all of the resources of the parent theme, and you can then override specific resources to configure the required customizations.

This tutorial takes you through the following lessons:

1. [Creating a sub-theme](#) by using the theme generator.
2. [Customizing the overrides.css file](#).
3. [Installing and enabling your customized theme](#).

Creating a sub-theme

1. Log in to your Developer Portal as an administrator.
2. If the administrator dashboard isn't displayed, click **Manage** to display it.
3. Click **Appearance** > **Generate sub-theme**. The **Generate sub-theme** window is displayed.
4. Enter a Sub-theme name, and select **CSS** for the Sub-theme type. (If you prefer, you can select **SCSS**, but this extension to CSS is for advanced theme developers, and isn't covered by this tutorial.)

Generate sub-theme ☆

List Generate Update Settings

Home » Administration

The first step in customizing the branding of your Developer Portal is to create a custom sub-theme.

The sub-theme inherits all of the resources of the parent theme, and you can then override specific resources in the overrides.css file to configure your customizations. For more information, see: [Knowledge Center](#)

Complete the form below and you will be presented with a custom sub-theme to download.

Sub-theme name *

A custom theme name, for example: 'mycustom_theme' or 'banka_theme'. The name does not need to end in '_theme' but it is a common convention.

Sub-theme type

- CSS
 SCSS

Your sub-theme can be setup to use either CSS or SCSS. SCSS is an extension to CSS and is for more advanced theme developers.

Template

5. Select the Default template to base your **sub-theme** on. You can create a sub-theme based on a color template. However, for this tutorial you use the Default Connect Theme template.
6. Click Generate.
7. Download the generated sub-theme to a location of your choice, and extract all the files from the .zip file.

Customizing the overrides.css file

On your computer, navigate to the files that you extracted. Find the overrides.css file in here: <extract_folder>/css/overrides.css. You can now customize the overrides.css file.

1. Open the overrides.css file in your chosen editor.
2. Customize your sub-theme by entering the following elements into the overrides.css file:

```
/* Body of the home page */
body.path-frontpage.contexthome {
  color: #152935;
  background-color: #d1f0f7;
}

/* Header of the home page */
.navbar {
  background-color: #a0a0a0;
}

/* Footer of the home page */
footer.footer {
  background-color: #dee0e2;
}

footer.footer ul.nav > li > a {
  color: #454A4C;
}
```

```
File Edit Format View Help
/* Body of the home page */
body.path-frontpage.contexthome {
  color: #152935;
  background-color: #d1f0f7;
}

/* Header of the home page */
.navbar {
  background-color: #a0a0a0;
}

/* Footer of the home page */
footer.footer {
  background-color: #dee0e2;
}

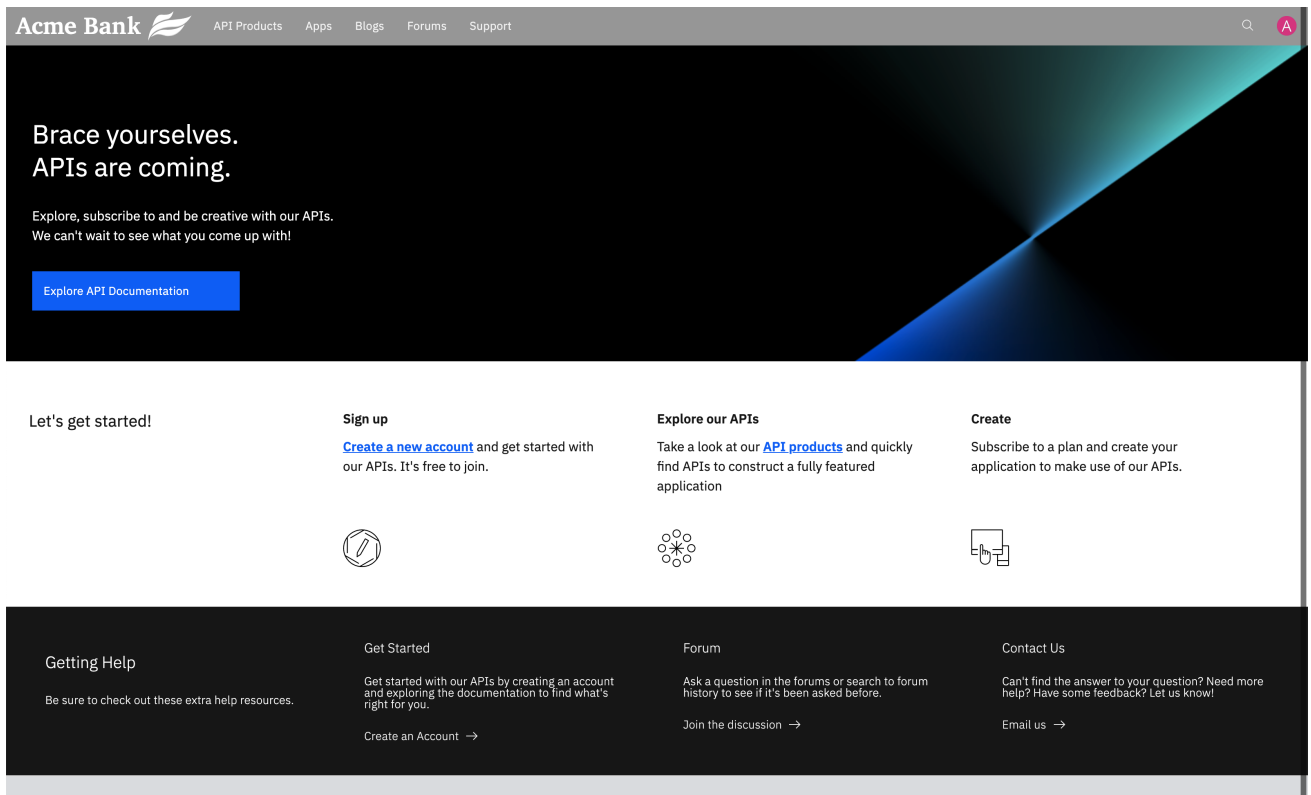

footer.footer ul.nav > li > a {
  color: #454A4C;
}

Ln 19, Col 2    100%    Windows (CRLF)    UTF-8
```

3. Save the overrides.css file.

Installing and enabling your customized theme

1. After you have finished updating the overrides.css file, compress all the theme files back into the .zip sub-theme file that you downloaded originally. Note that you can also include your own custom logo and favicon in your theme files, and these are then included as part of your theme when it is installed. These files must use the naming convention logo.svg, and favicon.ico, respectively. You can also change your logo and favicon at a later time, see [Changing the site logo](#) and [Changing the shortcut icon](#).
2. In the Developer Portal, click Appearance > Install new theme. The **Install new theme** window is displayed.
3. In Upload a module or theme archive, click Browse, and navigate to your newly updated compressed theme file.
4. Click Continue to install the theme onto your site.
5. Click Enable newly added themes, and find your new theme in the list of Disabled themes. Click Enable and set as default to set your new custom sub-theme as the default theme for your site.
6. Return to the Developer Portal home page by clicking Back to site. You can now see your custom theme.

What you did in this tutorial

In this tutorial, you completed the following tasks:

- Created a sub-theme of your Developer Portal site by using the theme generator.
- Configured some customized home page elements in the overrides.css file of your sub-theme.
- Uploaded and installed your customized theme in your Developer Portal site.
- Successfully customized the appearance of your Developer Portal home page.

Tutorial: Using avatars

You can use an avatar generator to better represent the branding of your site, and add a sense of community for your users, than the default name initial that is provided in the Developer Portal.

Before you begin

You must have a Developer Portal enabled, and you must have administrator access to complete this tutorial. The tutorial [Creating the Portal](#) explains how to enable the portal if you have not already done so.

About this tutorial

In this task, you add the **Robohash** avatar generator to your Developer Portal site, and assign it as the primary avatar generator for all users.

This tutorial takes you through the following steps:

1. [Install the Robohash avatar generator.](#)
2. [Set Robohash as the preferred avatar generator for your site.](#)
3. [Configure the permissions for the Robohash avatar generator.](#)

The avatar of the admin user displays like this before the block is added.

Enable the Robohash avatar generator

1. Log in to your Developer Portal as an administrator.
2. If the administrator dashboard isn't displayed, click Manage to display it.
3. Click Extend.
4. In the text box, enter `avatar` in the **Block description**.
5. Check the **Robohash** box, click Enable.

+ Install new module

Enter a part of the module name or description

Below is a list of installed modules. Modules that are installed and enabled are shown with a selected check box. To enable a module,

▼ AVATARS

<input type="checkbox"/>	Adorable	▶ Adds an Adorable.io avatar generator for Avatar Kit.
<input checked="" type="checkbox"/>	Avatar Kit	▶ Provides a selection of generated avatars for users.
<input type="checkbox"/>	Gravatar	▶ Adds Gravatar.com avatar generators for Avatar Kit.
<input checked="" type="checkbox"/>	Letter Avatar	▶ Adds a letter avatar generator based on the name of a user.
<input checked="" type="checkbox"/>	Robohash	▶ Adds Robohash avatar generators for Avatar Kit.

Enable

When the module is enabled, you receive a **Module Robohash has been enabled** message.

Set Robohash as the preferred avatar generator for your site

1. If the administrator dashboard isn't displayed, click Manage to display it.
2. Navigate to Configuration > People > Avatar settings.
3. Click + **Add avatar generator**.
4. Enter `Robohash` as the label.
5. Check **Robohash** for the avatar generator.
6. Click Save

Add avatar generator

Label *

Avatar generator *

- APIC Letter Avatar**
Letter generated by the ApicLetterAvatar library.
- Robohash**
Robots and monsters from Robohash.org
- User preference**
Avatar generator calculated based on user preference.
- User upload**
Image uploaded by the user to the site.

Save

7. You are then taken to the **Edit avatar generator Robohash** page. Select **Type: Robot Heads** and **Background: Transparent**. Click Save.

Label *

Type

- Robots
- Robot Heads
- Monsters

Background

- Transparent
- Places
- Patterns

Save

[Delete](#)

8. You are now on the avatar generator page. Drag **Robohash** to be first in the list, and check **Enabled**, then click Save configuration.

You have now set **Robohash** as the preferred avatar generator for your site.

Configure the permissions for the **Robohash** avatar generator

The default setting for the **Robohash** avatar generator is to generate avatars for users with **superuser** access only. In this example, the permissions are changed so that all **authenticated users** can access **Robohash**.

1. If the administrator dashboard isn't displayed, click Manage to display it.
2. Navigate to **People > Permissions**.
3. Find **Use Robohash** under the permission type **Avatar Kit**.
4. Check **AUTHENTICATED USER** for **Use Robohash** to enable the generator for all authenticated users.
Notice that all the boxes for this user type are then automatically checked because all of those users have the same permissions as an authenticated user, or higher.

PERMISSION	ANONYMOUS USER	AUTHENTICATED USER	FORUM MODERATOR	CONTENT AUTHOR	ADMINISTRATOR	SUPERUSER
Change own logout threshold	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
Avatar Kit						
Administer Avatar Kit <i>Warning: Give to trusted roles only; this permission has security implications. Manage settings for Avatar Kit.</i>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
Use Letter Generator User can select Letter Generator avatar generator.	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
Use Robohash User can select Robohash avatar generator.	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>

5. Click Save permissions.

What you did in this tutorial

The avatars of all users now have the **robohash** avatar.

You can check that the avatar of the admin user has changed by looking at your site page.

You can check that the avatars of other users have changed by finding their published content and looking for their avatar. Or, you can navigate to Manage > People, click a user, and see their avatar on their profile page.

What to do next

You can disable the **robohash** avatar generator.

1. Navigating to Extend > Disable module.
2. Search for **avatar** in the filter text box.
3. Check **Robohash**, click Disable
4. Click Disable.

You can also disable the **robohash** avatar generator by clearing it within Configuration > People > Avatar settings, or, reducing its preference by dragging it to a different order in the list. Click Save configuration.

Tutorial: Using image optimization

You can use image optimization on your Developer Portal site to enhance the use of images.

Optimized images do not overload your website and significantly increase its performance compared to using the original images. Your customer satisfaction and brand reputation improve with fast-loading and trimmed visual assets. Automatic optimization can save time and effort on editing and content moderation.

Before you begin

You must have a Developer Portal enabled, and you must have administrator access to complete this tutorial. The tutorial [Creating the Portal](#) explains how to enable the portal if you have not already done so.

About this tutorial

In this task, you create an image style that is called `User picture`, and give it a scale and crop effect. Then, use the `User picture` as the `Picture` field in the user account.

This tutorial takes you through the following steps:

1. [Create the image style `User picture`.](#)
2. [Edit the image style `User picture`.](#)
3. [Assign `User picture` to the `picture` option in `Account settings`.](#)

Create the image style `User picture`

1. Log in to your Developer Portal as an administrator.
2. If the administrator dashboard isn't displayed, click `Manage` to display it.
3. Navigate to `Configuration > Media > Image styles`.
4. Click `+` Add image style.
5. Enter `User picture` in the `Image style name` block. Click `Create new style`

Add image style

[Home](#) » [Administration](#) » [Configuration](#) » [Media](#) » [Image styles](#)

Image style name *

Machine name: `user_picture` [\[Edit\]](#)

[Create new style](#)

You created the image style `User picture`.

Edit the image style `User picture`

When you edit this style, you choose the width and height settings. Also, the part of the picture to retain during the crop, for example, the center.

1. If the administrator dashboard isn't displayed, click `Manage` to display it.
2. Navigate to `Configuration > Media > Image styles`.
3. Click `Edit` on the `User picture` style name.

Edit style *User picture* ☆

Add effect

Cancel

6. Click Save.

✓ Changes to the style have been saved.

You edited the image style **User picture**.

Assign **User picture** to the **picture** option in **Account settings**

1. If the administrator dashboard isn't displayed, click Manage to display it.

2. Navigate to Configuration > People > Account settings > Manage display, then click Compact tab.

FIELD	LABEL	FORMAT	
Picture	- Hidden -	Image	Image style: Thumbnail (100x100) Linked to content

3. On the **Picture** row, click .
4. Select **User picture** from the **Image style** drop-down.
5. Click Update and Save.

You set the **User picture** image style for all accounts.

What you did in this tutorial

You changed your account settings so that if the user displays a picture it is within the limits of the image style **User picture**.

To check the picture used by a user, navigate to Manage > People, click a user, and see their picture on their profile page. Right-click the image, then click **View image info**, you can see that the dimensions are scaled.

Type:	JPEG Image
Size:	29.95 KB (30,667 bytes)
Dimensions:	620px × 413px (scaled to 240px × 160px)
Associated Text:	Profile picture for user apicdemo1

Tutorial: Adding a Back to top button

You might want to add a Back to top button, as a navigation enhancement to help your Developer Portal users get back to the top of the page that they are viewing, instead of scrolling.

Before you begin

You must have a Developer Portal enabled, and you must have administrator access to complete this tutorial.

About this tutorial

In this tutorial, you add a Back to top button to your Developer Portal.

Before you begin, ensure that the **Back to top** module is installed and enabled:

1. Log in to your Developer Portal as an administrator.
2. If the administrator dashboard isn't displayed, click Manage to display it.
3. Click Extend.
4. In the text box, enter `back to top` in the **Block description**.
5. Check the **Back To Top** box, click Enable.

Configure the Back to top module

1. If the administrator dashboard isn't displayed, click Manage to display it.
2. Navigate to Configuration > User interface > Back to Top.

Back To Top ☆

Home » Administration » Configuration » User interface

- Prevent on mobile and touch devices
Do you want to prevent Back To Top on touch devices?
- Prevent on administration pages and node edit
Do you want to prevent Back To Top on admin pages?
- Prevent on front page
Do you want to prevent Back To Top on front page?

Trigger

Set the number of pixel which trigger the Back To Top button default 100

Placement

Where should the Back To Top button appear?

Button text

Set the text of the Back To Top button

3. Change any settings as required, or keep the defaults.
4. Click Save configuration

You now have a Back to Top button.

What you did in this tutorial

You added a Back to Top button, as a navigation enhancement to help your users get back to the top of a page that they are viewing, instead of scrolling.

Tutorial: Creating a drop-down menu link

You can create and use drop-down menus, or nested menus, to enhance the use of your Developer Portal .

Before you begin

You must have a Developer Portal enabled, and you must have administrator access to complete this tutorial. The tutorial [Creating the Portal](#) explains how to enable the portal if you have not already done so.

About this tutorial

In this tutorial, you create a drop-down menu link on the **Main navigation** menu.

Note:

Although drop-down menu links can be created in the Developer portal, the drop-down menu doesn't expand by default. To make the drop-down menu expand, you need to use the **Superfish** module.

This tutorial takes you through the following steps:

1. [Add menu links to the main navigation menu.](#)
2. [Make the drop-down menu expand by using the Superfish module.](#)

The front page **Main navigation** displays like this before the changes are made.

Add menu links to the main navigation menu

1. Log in to your Developer Portal as an administrator.
2. If the administrator dashboard isn't displayed, click Manage to display it.

- Navigate to Structure > Menu > Main navigation > Add link
- Enter API's in the **Menu link title**. Enter /api in the **Link**. Check Show as expanded, then click Save.
Note: Ensure Show as expanded is checked as this is the parent link for the submenu links.
- Add another menu link to the main navigation menu. Enter API One in the **Menu link title**. Enter /product/10/api/5 in the **Link**. Select -- API's in the Parent link, then click Save.

Add menu link

[Home](#) » [Administration](#) » [Structure](#) » [Menus](#) » [Main navigation](#)

Menu link title *

The text to be used for this link in the menu.

Link *

- The location this menu link points to.
- Start typing the title of a piece of content to select it. You can also enter an internal path such as /node/add or an external URL such as http://example.com. Enter <frc

 Enabled

A flag for whether the link should be enabled in menus or hidden.

Description

Shown when hovering over the menu link.

 Show as expanded

If selected and this menu link has children, the menu will always appear expanded. This option may be overridden for the entire menu tree when placing a menu block.

Parent link

The maximum depth for a link and all its children is fixed. Some menu links may not be available as parents if selecting them would exceed this limit.

Weight

Link weight among links in the same menu at the same depth. In the menu, the links with high weight will sink and links with a low weight will be positioned nearer the top.

- Add another menu link to the main navigation menu. Enter API Two in the **Menu link title**. Enter /product/10/api/9 in the **Link**. Select -- API's in the Parent link. Select 1 in Weight, then click Save.

Add menu link

[Home](#) » [Administration](#) » [Structure](#) » [Menus](#) » [Main navigation](#)

Menu link title *

The text to be used for this link in the menu.

Link *

- The location this menu link points to.
- Start typing the title of a piece of content to select it. You can also enter an internal path such as /node/add or an external URL such as http://example.com. Enter <from

 Enabled

A flag for whether the link should be enabled in menus or hidden.

Description

Shown when hovering over the menu link.

 Show as expanded

If selected and this menu link has children, the menu will always appear expanded. This option may be overridden for the entire menu tree when placing a menu block.

Parent link

The maximum depth for a link and all its children is fixed. Some menu links may not be available as parents if selecting them would exceed this limit.

Weight

Link weight among links in the same menu at the same depth. In the menu, the links with high weight will sink and links with a low weight will be positioned nearer the top.

7. Navigate to Structure > Menu > Main navigation. The hierarchy of the menu links now looks like this:

+ Add link

Title *

8. Click Save blocks.

9. Navigate to the home page. The **APIs** menu link that you added into the main navigation menu does now expand when you hover over it.

What you did in this tutorial

You created a drop-down menu link on the **Main navigation** menu.

What to do next

You can consider any other uses of the drop-down menu to enhance your users experience on your Developer Portal.

Tutorial: Displaying blog posts on the front page

You can customize the appearance of the front page of your Developer Portal to display recent blog posts. You might use the blog posts to provide your users with information, such as service availability or marketing campaigns.

Before you begin

You must have a Developer Portal enabled, and you must have administrator access to complete this tutorial. The tutorial [Creating the Portal](#) explains how to enable the portal if you have not already done so.

About this tutorial

In this task, you create a view, customize that view to show blog posts, then embed that view on the front page of your Developer Portal site.

Before you begin, the front page looks like this:

Let's get started!

Sign up

[Create a new account](#) and get started with our APIs. It's free to join.

Explore our APIs

Take a look at our [API products](#) and quickly find APIs to construct a fully featured application

Create

Select a plan and create your application to make use of our APIs.

This tutorial takes you through the following steps:

1. [Create a view.](#)
2. [Customize the view.](#)
3. [Embed the view on the front page of your Developer Portal.](#)

Create a view

1. Log in to your Developer Portal as an administrator.
2. If the administrator dashboard isn't displayed, click Manage to display it.
3. Navigate to Structure > Views > Add view.
4. In the **View name** block, enter a name for your view, for example Recent Blog posts.
5. Under **VIEW SETTINGS**, show **Content** of type **Blog Post** sorted by **Newest first**.
6. Check **Create a block** in **BLOCK SETTINGS**, and choose the number of blog posts that you want to be displayed.

9. Click Update and save.

What you did in this tutorial

You can check that the view you created appears on the front page of your site page.

What to do next

You can edit your view at any time by navigating to Structure > Views and selecting your view by its name. You can also modify or delete the view's layout on the front page by navigating back to the layout section of your page under Structure > Pages.

Tutorial: Displaying tweets on the front page

You can customize the appearance of the front page of your Developer Portal to display recent tweets. You might use the tweets to provide your users with information, such as service availability or marketing campaigns.

Before you begin

You must have a Developer Portal enabled, and you must have administrator access to complete this tutorial. The tutorial [Creating the Portal](#) explains how to enable the portal if you have not already done so.

About this tutorial

In this task, you create a view, customize that view to show tweets, then embed that view on the front page of your Developer Portal site.

Before you begin, the front page looks like this:

Let's get started!

Sign up

[Create a new account](#) and get started with our APIs. It's free to join.

Explore our APIs

Take a look at our [API products](#) and quickly find APIs to construct a fully featured application

Create

Select a plan and create your application to make use of our APIs.

This tutorial takes you through the following steps:

1. [Enable the Media entity Twitter module.](#)
2. [Create an entity called Twitter to store the tweets.](#)
3. [Add media items.](#)
4. [Create a carousel view.](#)
5. [Customize the carousel view.](#)
6. [Embed the carousel view on the front page of your Developer Portal.](#)

Enable the Media entity twitter module

1. Log in to your Developer Portal as an administrator.
2. If the administrator dashboard isn't displayed, click Manage to display it.
3. Click Extend, enter media in the search bar.
4. Check Media Entity Twitter, under MEDIA.

▼ MEDIA

<input checked="" type="checkbox"/>	Enhanced Entity Browser	► Provides some behavior and style enhancements to Entity Browsers, specifically for multiselect and image/media browsers.
<input checked="" type="checkbox"/>	Media Entity Twitter	► Media Entity Twitter provider.

5. Click Enable.

Create an entity called Twitter to store the tweets

1. Navigate to Structure > Media types > Add media type.
2. In the Name field, enter Twitter.

Media source *

Media source that is responsible for additional logic related to this media type.

3. In the Media source drop-down, select Twitter.
4. Ensure that Whether to use Twitter api to fetch tweets or not value is set to No.

5. Ensure the values in the FIELD MAPPING section are set to - Skip field -.

Name *
 Machine name: twitter
 The human-readable name of this media type.

Description
 Describe this media type. The text will be displayed on the *Add new media* page.

Media source *

 The media source cannot be changed after the media type is created.

MEDIA SOURCE CONFIGURATION
 Tweet URL field is used to store the essential information about the media item.

Whether to use Twitter api to fetch tweets or not.

 In order to use Twitter's api you have to create a developer account and an application. For more information consult the readme file.

Generate thumbnails
 If checked, Drupal will automatically generate thumbnails for tweets that do not reference any external media. In certain circumstances

FIELD MAPPING
 Media sources can provide metadata fields such as title, caption, size information, credits, etc. Media can automatically save this information.

Tweet ID

Twitter user information

6. Click Save.

7. Click Manage display from the Edit dropdown for the new `Twitter` media type.

8. Drag the Authored on, Authored by, and Thumbnail fields to the Disabled section, and set the FORMAT of the Tweet URL field to Twitter embed.

FIELD	LABEL	FORMAT
✚ Tweet URL	Above	Twitter embed
Disabled		
✚ Language	Above	Language

Tutorial: Changing the front page of your Developer Portal

You can create and arrange content in your Developer Portal to provide a front page that aligns with your brand, and helps your users discover your APIs.

Before you begin

You must have a Developer Portal enabled, and you must have administrator access to complete this tutorial. The tutorial [Creating the Portal](#) explains how to enable the portal if you have not already done so.

About this tutorial

In this tutorial, you create some content for a page, and then change the front page to be your new page.

This tutorial takes you through the following steps:

1. [Creating some custom blocks.](#)
2. [Create and configure a page.](#)
3. [Adding the custom blocks to the page.](#)
4. [Changing the front page to be your new page.](#)

Before the changes are made, the front page displays like the following screen capture.

Let's get started!

Sign up

[Create a new account](#) and get started with our APIs. It's free to join.

Explore our APIs

Take a look at our [API products](#) and quickly find APIs to construct a fully featured application

Create

Select a plan and create your application to make use of our APIs.

Creating some custom blocks

1. Log in to your Developer Portal as an administrator.
2. If the administrator dashboard isn't displayed, click Manage to display it.
3. Navigate to Structure > Block layout > Add custom block
4. Enter `Block 1` in the Block description.
5. In the body area, click Source, then enter the following HTML:

```
<div class="tutorial_block_1 tutorial_block_frontpage">
<h1><span>Create with our APIs</span></h1>

<p><span>Welcome to our Developer Portal where you will find APIs to create your awesome app.</span></p>
</div>
```

Home

Add content block ☆

Block description *

Block 1

A brief description of your block.

Body

B *I*  x^2 x_2 *T_x*        Choose heading   Source

```
<div class="tutorial_block_1 tutorial_block_frontpage">
  <h1>
    <span>Create with our APIs</span>
  </h1>
  <p>
    <span>Welcome to our Developer Portal where you will find APIs to create your awesome app.</span>
  </p>
</div>
```

6. Check what the block looks like by clicking Source again.

Home

Add content block ☆

Block description *

Block 1

A brief description of your block.

Body

B *I*  x^2 x_2 *T_x*        Choose heading   Source

Create with our APIs

Welcome to our Developer Portal where you will find APIs to create your awesome app.

Note: This block uses no inline-styling, instead it allows your theme to decide how it is rendered. The advantage of this set up is that you can easily change the rendering without modifying existing content in the database. Any styling that is required can be added to a custom theme. For more information, see [Tutorial: Creating a custom theme for the Developer Portal](#).

7. Click Save.

You have created Block 1, repeat steps 3 to 7 to create Block 2, Block 3, and Block 4.

8. Enter Block 2 in the Block description. In the body area, click Source, then enter the following HTML:

```
<div class="tutorial_block_2 tutorial_block_frontpage">
  <p class="text-align-center">Explore and subscribe to our APIs.<br />
  See what you come up with!</p>

  <p class="text-align-center">&nbsp;</p>

  <div class="bannerButtonRow text-align-center"><a class="button cta-btns--white_btn"
  href="#_home_markdown_jenkins_workspace_Transform_in_SSMNED_10.0.5_com.ibm.apic.devportal.doc_product">Explore API
  Documentation</a></div>
</div>
```

9. Enter **Block 3** in the Block description. In the body area, click Source, then enter the following HTML:

```
<div class="tutorial_block_3">
<p class="text-align-center"><a
href="#_home_markdown_jenkins_workspace_Transform_in_SSMNED_10.0.5_com.ibm.apic.devportal.doc_user_register">Create a new
account</a> and get started with our APIs. It's free to join.</p>
</div>
```

10. Enter **Block 4** in the Block description. In the body area, click Source, then enter the following HTML:

```
<div class="block-get-help">
<div class="get_help">
<div class="column coll">
<h3>Getting Help</h3>

<div>Be sure to check out these extra help resources.</div>

3. Navigate to Configuration > System > Basic site settings
4. In Front Page region set Default front page field to newhome .
5. Click Save configuratoin.

What you did in this tutorial

The front page of your Developer Portal is now changed and laid out with the blocks of content that you specified.

What to do next

You can add further branding by adding content to your custom blocks such as images, or try to use one of the provided custom blocks such as the Featured Content Block. By default this block is English, you might want to consider adding versions in other languages.

Tutorial: Grouping products by category

You can configure the Developer Portal so that products are displayed in groups according to the category that they are tagged with.

You can use the **Views** module to fetch content from your Developer Portal site, such as lists of products, and present the content to users in different formats. You can combine multiple views on a new page to display whatever content you want.

Before you begin

You must have a Developer Portal enabled, and you must have administrator access to complete this tutorial. The tutorial [Creating the Portal](#) explains how to enable the portal if you have not already done so.

About this tutorial

In this tutorial you create three views in the Developer Portal, each one is configured to display a list of products according to their category. You then create a new page to show the views, where you see products that are grouped by category.

1. Log in to your Developer Portal as an administrator.
2. If the administrator dashboard isn't displayed, click **Manage** to display it.
3. Create three new taxonomy tags.
 - a. Navigate to Structure > Taxonomy > Tags.
 - b. Click **Add term**.
 - c. Enter `Accounts` in the **Name** field and click **Save**.
 - d. Enter `Logistics` in the **Name** field and click **Save**.
 - e. Enter `Marketing` in the **Name** field and click **Save**.
 - f. Navigate to Structure > Taxonomy > Tags to show the list of the new tags.

Tags ☆

List Edit Manage fields Manage form display Manage display

Home » Administration » Structure » Taxonomy » Edit Tags

You can reorganize the terms in *Tags* using their drag-and-drop handles, and group terms under a parent term by sliding them under and to the right of the parent.

+ Add term

NAME	OPERATIONS
+ Accounts	Edit
+ Logistics	Edit
+ Marketing	Edit

Save Reset to alphabetical

4. Create a view to display products with the `Accounts` category.
 - a. Navigate to Structure > Views > Add new view.
 - b. Enter `Accounts products` in the **View name** field.
 - c. In **View Settings**, select **Show: Content, of type: Product, sorted by: Newest first**, from the drop-down lists.
 - d. In **Page settings** leave the **Create a page** cleared.
 - e. In **Block settings** select **Create a block** and enter `Accounts products` in the **Block title**.
 - f. Ensure **Block Display Settings** has **Display format: Masonry, of: tiles (linked)**, and select **Use a pager**.

PAGE SETTINGS

Create a page

BLOCK SETTINGS

Create a block

Block title

BLOCK DISPLAY SETTINGS

Display format: **Masonry** of: **titles (linked)**

Items per block

5

Use a pager

Save and edit **Cancel**

- g. Click **Save and edit**.
- 5. Configure the view block settings.
 - a. Under the **Format** section click the **Fields** link next to the **Show** label.
 - b. In the dialog box, select the **Content** radio button then click **Apply**.
 - c. Select **Card** from the **View mode** drop-down list, then click **Apply**.
 - d. Click **Add** next to the **Filter Criteria** section.
 - e. In the dialog box, search for **tag** then select the option **Tags (apic_tags)** from the list then click **Add and configure filter criteria**.
 - f. In the next dialog box, select the **Tags** radio button and the **Client-side hierarchical** then click **Apply and continue**.
 - g. Next set the **Operator** to **Is all of**, and from the **Select terms from vocabulary Tags** drop-down select **Accounts** and click **Apply**.
 - h. Under the **Advanced** options, click the **None** link next to the **CSS class** label.
 - i. If you are using the default API connect theme, then enter the CSS class name **product-view** and click **Apply**. If you have your own css class that you want to use, then enter its name in here instead.
 - j. Click **Save** to save all the changes.

Block* + Add Edit view name/description

Display name: **Block** Duplicate Block

<p>TITLE</p> <p>Title: Accounts products</p> <p>FORMAT</p> <p>Format: Masonry Settings</p> <p>Show: Content Card</p> <p>FIELDS</p> <p>The selected style or row format does not use fields.</p> <p>FILTER CRITERIA</p> <p>Content: Published (= Yes) Add</p> <p>Content: Content type (= Product)</p> <p>Content: Tags (= Accounts) Settings Add</p> <p>SORT CRITERIA</p> <p>Content: Authored on (desc) Add</p>	<p>BLOCK SETTINGS</p> <p>Block name: None</p> <p>Block category: Lists (Views)</p> <p>Allow settings: Items per page</p> <p>Access: Permission View published content</p> <p>HEADER Add</p> <p>FOOTER Add</p> <p>NO RESULTS BEHAVIOR Add</p> <p>PAGER</p> <p>Use pager: Full Paged, 5 items</p> <p>More link: No</p> <p>Link display: None</p> <p>LANGUAGE</p> <p>Rendering Language: Content language of view row</p>	<p>ADVANCED</p> <p>CONTEXTUAL FILTERS Add</p> <p>RELATIONSHIPS Add</p> <p>EXPOSED FORM</p> <p>Exposed form style: Basic Settings</p> <p>OTHER</p> <p>Machine Name: block_1</p> <p>Administrative comment: None</p> <p>Use AJAX: No</p> <p>Hide attachments in summary: No</p> <p>Contextual links: Shown</p> <p>Use aggregation: No</p> <p>Query settings: Settings</p> <p>Caching: Tag based</p> <p>CSS class: product-view</p> <p>Hide block if the view output is empty: No</p>
--	---	--

Save **Cancel**

- 6. Create a view for the Logistics products.
 - a. Select **Structure > Views**.
 - b. Navigate to the **Accounts products** view and select the **Duplicate** option.
 - c. Give the duplicated view the name **Logistics products** and click **Duplicate**.

- d. Click the Title **Accounts products** and change it to **Logistics products** and click **Apply**.
 - e. Under the **Filter Criteria** section click the **Content: Tags: (=Accounts)** link.
 - f. Change the value in the **Select terms from vocabulary Tags** drop-down to **Logistics** and click **Apply**.
 - g. Click **Save** to save all the changes.
7. Repeat step 6 for Marketing products.
 8. Next, create a page to display the views.
 - a. Select Structure, > Pages.
 - b. Click **Add page**.
 - c. Enter **Products by category** in the **Administrative title**, and **products-by-category** in the **Path**. Select the **Panels** option from the **Variant type** drop-down list then click **Next**.

Page information > Configure variant

PAGE MANAGER

Administrative title *

Products by category Machine name: products_by_category [Edit]

Panels

Optional features

Page access

Variant contexts

Variant selection criteria

Check any optional features you need to be presented with forms for configuring them. If you do not check them here you will still be able to utilize these features once the new page is created. If you are not sure, leave these unchecked.

Next

- d. Change the **Label** value to **Products grouped by category** and set the **Builder** to **Standard** then click **Next**.
- e. From the **Layout** drop-down list select the value **Three column** then click **Next**.
- f. Leave all the defaults on the next page and click **Next**.
- g. Click **+Add new block**.
- h. Select **Accounts products** from the **Lists (views)** section.
- i. Ensure that **Display tile** is selected and **Region** is set to **Left**, click **Add block**.

Add block ×

Block description

Accounts products

Display title

Items per block

Override title

Region *

Left

Add block

- j. Click **Add new block**. Select **Logistics products** view from the list and set the **Region** to **Middle**, click **Add block**.
- k. Click **Add new block**. Select **Marketing products** view from the list and set the **Region** to **Right**, click **Add block**.
- l. Enter **Products grouped by category** in the **Page title** field, and click **Finish**.

Page title

 Configure the page title that will be used for this display.

[+ Add new block](#)

LABEL	PLUGIN ID	REGION
Left		
Accounts products	views_block:accounts_products-block_1	Left
Middle		
Logistics products	views_block:logistics_products-block_1	Middle
Right		
Marketing products	views_block:marketing_products-block_1	Right

[Previous](#) [Finish](#)

- From your API Manager, create three new products, or update existing ones, to give each one a category value of either Accounts, Logistics, or Marketing. Publish each of the products to the catalog with the configured Developer Portal.
- Check that the **Products grouped by category** page shows your published products by category.
 - Select **Structure > Pages**.
 - Click the **/products-by-category** path link.
 - You are redirected to the **/products-by-category** page and can see the products that you assigned to these categories.

What you did in this tutorial

You created three new views in the Developer Portal, and configured each one to display a list of products according to their category. You then created a new page to show the views.

Accounts products

Logistics products

Marketing products

Tutorial: Adding a field to the sign up form

You might want to collect and store additional information about your Developer Portal users. For example, you might want to collect a department name, employee ID, or similar data when a user registers for an account on the portal.

Before you begin

You must have a Developer Portal enabled, and you must have administrator access to complete this tutorial. The tutorial [Creating the Portal](#) explains how to enable the portal if you have not already done so.

About this tutorial

In this tutorial, you will add a Department code field to the Sign up form. This field is required for all portal users.

This tutorial takes you through the following steps:

- [Adding a field to a user entity.](#)
- [Adding the new field to the Sign up form.](#)
- [Testing the new field.](#)

Adding a field to a user entity

- Log in to your Developer Portal as an administrator.
- If the administrator dashboard isn't displayed, click **Manage** to display it.
- Navigate to **Configuration > People > Account settings > Manage fields**

You are on the **Manage fields** tab.

- Click **+ Add field**.

2. In the **Select a field type** dropdown, select **Text (plain)**.
3. In the **Label** field enter, **Department code**.
4. Click **Save and continue**.

You are on the **Field settings** tab.

1. Accept the defaults of **Maximum length** (255) and **Allowed number of values** (Limited:1).
2. Click **Save field settings**.

You are on the **Edit** tab.

1. Add some help text. This is information that is displayed to the user to assist them completing the field on a form. Examples or links to further information are useful here. We are going to add an example in this tutorial.
2. Add **Example department code: DEP123** into the **Help text** field.
3. Check the **Required field**.
4. Click **Save settings**.

The field has now been created. You are back on the **Manage fields** tab.

1. Check that **Department code** is a listed field.

Adding the new field to the Sign up form

1. If the administrator dashboard isn't displayed, click **Manage** to display it.
2. Navigate to **Configuration > People > Account settings > Manage form display**

You are on the **Manage form display** tab. These tabs, one for each form, show the fields that are displayed from the user entity, and in which order.

1. Switch to the **Register** tab. Notice that initially the new **Department code** field is underneath the **Disabled row** in the page. This means that it isn't shown on the form.
2. Click the **Department code** icon and drag it so that it is between **Last name** and **Consumer organization** in the list.

The screenshot shows the 'Manage form display' configuration page for the 'Register' form. The 'Department code' field is currently in the 'Disabled' section and is being dragged to its final position between 'Last Name' and 'Consumer organization' in the list.

FIELD	WIDGET	Textfield size: 60	⚙️
Status			
Username			
Roles			
Notify user about new account			
Current password			
E-mail address			
First Name	Textfield	Textfield size: 60	⚙️
Last Name	Textfield	Textfield size: 60	⚙️
Department code	Textfield	Textfield size: 60	⚙️
Consumer organization	Textfield	Textfield size: 60	⚙️
Password			
Disabled			
Language code	Language select		

3. Click **Save**.

Testing the new field

1. Sign out as the Admin user.
2. Click **Create account**.
3. Observe that the **Department code** field is now part of the sign up form.

What you did in this tutorial

You added a **Department code** field to the **Sign up** form, then tested the form to ensure that the **Department code** field is now part of the sign up form.

In reality, you would need to add this configuration in such a way that it is available for all sites. To achieve this you would include the configuration in your custom module. For more information, see [this Drupal documentation](#).

You might want to add extra validation to the Department code field on the Sign up form. For more information, see [Tutorial: Adding validation to a field on the sign-up form](#).

Tutorial: Adding validation to a field on the sign-up form

You might want to add extra validation to a field to help your Developer Portal users. For example, you might want to validate a department name, employee ID, or similar data when a user registers for an account on the portal.

Before you begin

You must have a Developer Portal enabled, and you must have administrator access to complete this tutorial. You must have completed the tutorial about [Adding a field to the sign up form](#), where you added a Department code field to the Sign-up form.

About this tutorial

In this tutorial, you add some validation to the Department code field on the Sign-up form. This is a required field for all portal users and is a string of the format **DEPnnn**, where **DEP** is the string prefix and **nnn** is a three-digit number, for example, **DEP123**. The validation is done by using a custom module that is already available in [IBM APIC Portal - addons](#). However, for more information, see [Custom module development: creating a module skeleton](#).

This tutorial takes you through the following steps:

1. [Cloning and packaging the validation module](#).
2. [Installing and enabling the validation module](#).
3. [Testing the validation in the sign up form](#).

Look at the files we will use in this link [IBM APIC Portal - addons](#).

- `user_field_example.info.yml` - this is the metadata for the module, defining things like the name and version, and containing other important information that is required by Drupal to import and enable the module.

```
name: 'IBM APIC Portal - user field example'
type: module
description: 'IBM API Connect Developer Portal tutorial - Example of validating a custom user field'
package: 'Custom'
core_version_requirement: ^8 || ^9 || ^10
version: 1.0.0
project: 'user_field_example'
dependencies:
  - ibm_apim
  - auth_apic
```

- `user_field_example.module` - this contains a validation function and adds this to the Sign-up form by using the `hook_form_alter` function.

```
<?php
use Drupal\Core\Form\FormStateInterface;

/**
 * Implementation of hook_form_alter() to alter the Sign up form
 */
function user_field_example_form_alter(&$form, FormStateInterface $form_state, $form_id) {
  if ($form_id === 'user_register_form') {
    $form['#validate'][] = 'user_field_example_validate_department_code';
  }
}

/**
 * Validate the Department code field on the Sign up form.
 *
 * Valid entry = DEPnnn
 * where n = single figure digit.
 */
function user_field_example_validate_department_code($form, &$form_state) {
  $dept_code = $form_state->getValue('field_department_code')[0]['value'];
  $valid = preg_match('/^DEP\d{3}$/', $dept_code);
  if (!$valid) {
    $form_state->setErrorByName('field_department_code', t('Invalid department code.'));
  }
}
```

Cloning and packaging the validation module

Validation is added to the `Department code` field on the Sign-up form by using a custom module.

1. Clone the custom module. Here is an example command if you are using Mac and Linux:

```
git clone https://github.com/ibm-apiconnect/devportal-addons
```

2. Package up the custom module.

```
cd devportal-addons/apic_v10/modules
tar -czf user_field_example.tgz user_field_example/
```

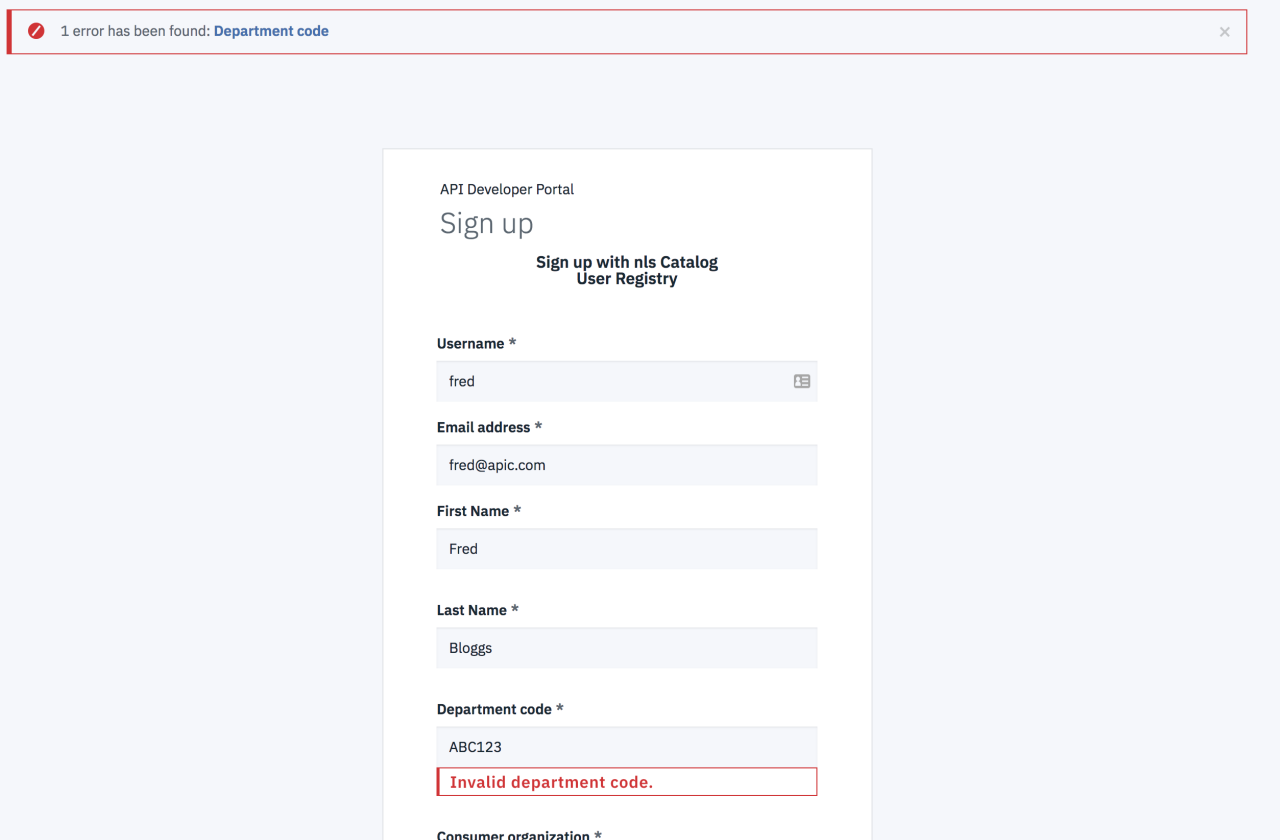

Installing and enabling the validation module

1. Log in to your Developer Portal as an administrator.
2. If the administrator dashboard isn't displayed, click **Manage** to display it.
3. Click **Extend > Install new module**.
4. Click **Choose file** from the **Upload a module or theme archive to install** section.
5. Browse to and select **user_field_example.tgz**, the packaged custom module that you created earlier. Click **Open**.
6. Click **Install**.
7. Click the **Enable newly added modules** link.
8. Enter **IBM APIC Portal - user field example** in the filter box.
9. Check the checkbox next to **IBM APIC Portal - user field example**.
10. Click **Enable**.

The module is now installed and enabled.

Testing the validation in the sign-up form

1. Sign out as the Admin user.
2. Click **Create account**.
3. Complete all fields, set **Department code** to **ABC123**.
4. Click **Sign up**.
5. Observe the failure message and highlighting on the **Department code** field.

The screenshot shows a sign-up form titled "API Developer Portal Sign up" with the subtitle "Sign up with nls Catalog User Registry". The form contains several input fields: Username (fred), Email address (fred@apic.com), First Name (Fred), Last Name (Bloggs), Department code (ABC123), and Consumer organization. A red error message "1 error has been found: Department code" is displayed at the top. Below the Department code field, a red box contains the message "Invalid department code."

6. Change the **Department code** field to **DEP245**, reenter the password and click **Sign up** to see that a valid code is accepted.

What you did in this tutorial

You added some validation to the Department code field on the Sign-up form, then tested the form to ensure that the **Department code** field accepts only codes in the format of **DEPnnn**.

In reality, you would need to add this configuration in such a way that it is available for all sites. To achieve this availability, you would include the configuration in your custom module. For more information, see [Drupal custom modules](#).

Tutorial: Adding a field group to group fields in a content type

You might want to change how your user account pages are displayed when you have lots of fields.

If you have many fields for one of your content types, for example, a user, then you might want to group some of these fields together when you display them to other users, or when these fields are being edited inside a user form.

Field groups allow you to create a parent field that contains other fields, set up as children, within that group. The **Fieldgroup** forms come with default HTML wrappers such as vertical tabs, horizontal tabs, accordions, fieldsets, or div wrappers.

Before you begin

You must have a Developer Portal enabled, and you must have administrator access to complete this tutorial.

About this tutorial

You will create field groups for various groups of user information. These groups can then be seen under the users own section on the account view and edit pages.

This tutorial takes you through the following steps:

1. [Adding a field group called Consumer Organization to the user account display.](#)
2. [Adding a field group called Personal Details to the user form display.](#)

Adding a field group called Consumer Organization to the user account display

1. Log in to your Developer Portal as an administrator.
2. If the administrator dashboard isn't displayed, click **Manage** to display it.
3. Navigate to **Configuration** > **People** > **Account settings** > **Manage display**.
4. Click + **Add field group**.
5. Select **tab** as your group type.
6. Enter **Consumer Organization** as the label.
7. Click **Save and continue**.
8. Set the default state to **open**. This sets the tab to be expanded by default.
9. Click **Create group**.

[Home](#) » [Administration](#) » [Configuration](#) » [People](#) » [Account settings](#) » [Manage display](#)

Field group label
Consumer Organization

Default state
open

Description

ID

Extra CSS classes

Create group

When the group is created, you can assign fields to that group and rearrange the group on the page. After you create the group, you are on the **Manage Display** page.

1. Drag your new group from the disable section up into the higher section, just underneath **Picture**.
2. Drag **URL**, **Consumer Organization**, and **Consumer Organization URL** underneath the **Consumer Organization** group row, and slightly to one side. It fixates itself underneath the parent, and this is now set as the child of that group.
3. Click **Save**.

FIELD	LABEL	FORMAT	
⊞ First Name	Above	Plain text	⚙
⊞ Last Name	Above	Plain text	⚙
⊞ Member for			
⊞ Picture	Above	Image	Original image ⚙
⊞ Consumer Organization		Tab	Tab: open delete ⚙
⊞ URL	Above	Plain text	⚙
⊞ Consumer organization	Above	Plain text	⚙
⊞ Consumer organization URL	Above	Plain text	⚙
⊞ State	Above	Default	⚙
⊞ Language code	Above	Language	⚙

You are now able to see the new group of fields on the account page of a user.

Consumer Organization

URL
/consumer-api/user-registries/574dbbea-e045-4457-91f3-2e8581a72d6c/users/e29beb15-2fd6-4583-854c-fe2854389ee7
Consumer organization
Joe Smith
Consumer organization URL
/consumer-api/orgs/7d9808be-eae5-44dc-a45c-551e17c2b7d1

Adding a field group called Personal Details to the user form display

1. Navigate to Configuration > People > Account settings > Manage form display.
2. Click **Add field group**.
3. Select **tab** as your group type.
4. Enter **Personal Details** as the label.

[Home](#) » [Administration](#) » [Configuration](#) » [People](#) » [Account settings](#) » [Manage form display](#)

Add a new group *

Tab ▼

Label *

Personal Details Machine name: group_personal_details [Edit]

Save and continue

5. Click **Save and continue**.
6. Set the default state to **open**. This sets the tab to be expanded by default.
7. Click **Create group**.

Again, when the group is created, you can assign fields to that group and then rearrange the group on the page as you require. After you create the group, you are returned to the **Manage Display** page.

1. Drag your new group from the disabled section up into the higher section, onto the highest row.
2. Drag **First Name**, **Last Name**, **User picture upload**, and **Avatar Generator** to underneath the **Personal Details** group row. It fixates itself underneath the parent, and this is now set as the child of that group.
3. Click **Save**.

You and your user can now see the new grouped section when you edit their account.

Before:

The screenshot shows the 'admin' user profile edit page. The left sidebar contains 'Edit', 'Shortcuts', 'Change Password', and 'View'. The main content area has the following sections: 'Email address *' with a text input containing 'sofia.ivanova1@ibm.com' and a note about email usage; 'Status' with 'Active'; 'Roles' with 'Authenticated user', 'Administrator', and 'Superuser'; 'Your current logout threshold' with an empty text input; a note about inactivity time; 'First Name' with 'admin'; 'Last Name' with an empty text input; 'Code Snippet Language' with a dropdown menu set to '- None -' and a note about preferred programming language.

After:

The screenshot shows the 'admin' user profile edit page after changes. The left sidebar is the same. The main content area has the following sections: 'Status' with 'Active'; 'Roles' with 'Authenticated user', 'Administrator', and 'Superuser'; 'Your current logout threshold' with an empty text input; a note about inactivity time; 'Personal Details' section containing 'First Name' with 'admin', 'Last Name' with an empty text input, 'User picture upload' with a 'Choose file' button and 'No file chosen' text, a note about user account images, and 'Avatar Generator' with a radio button selected for 'Let the site determine which avatar to use' and a note to 'Select source of avatar'.

What you did in this tutorial

You have successfully created field groups for various groups of user information, and presented them to the user in its own section on the account view and edit pages.

You can check whether your field groups are applied, by viewing the profile of another user. Do this check by finding any other users published content and clicking the associated avatar. Or, from the administrator dashboard you can click People and then click a user. You can see the new Consumer Organization field group on their profile page. If you then click **Edit** for the user, you can see the Personal Details field group.

What to do next

You can edit the user displays anytime by navigating back to Configuration > People > Account settings > Manage display or Manage form display.

You can delete the field group by clicking the **delete** button in the field group row on either of these pages. You can also modify the type of group it is, for example, vertical tabs, horizontal tabs, accordions, and field sets.

Tutorial: Adding a custom block to the front page

You can customize the appearance of the front page of your Developer Portal by adding a custom block. Blocks are boxes of content that are rendered into an area, or region, of a web page such as the Products page or Apps page that can be displayed in regions, such as footer or sidebar, on your page.

Before you begin

You must have a Developer Portal enabled, and you must have administrator access to complete this tutorial. The tutorial [Creating the Portal](#) explains how to enable the portal if you have not already done so. The tutorial [Adding a custom block to a page other than the front page](#) explains how to add a custom block to any other page.

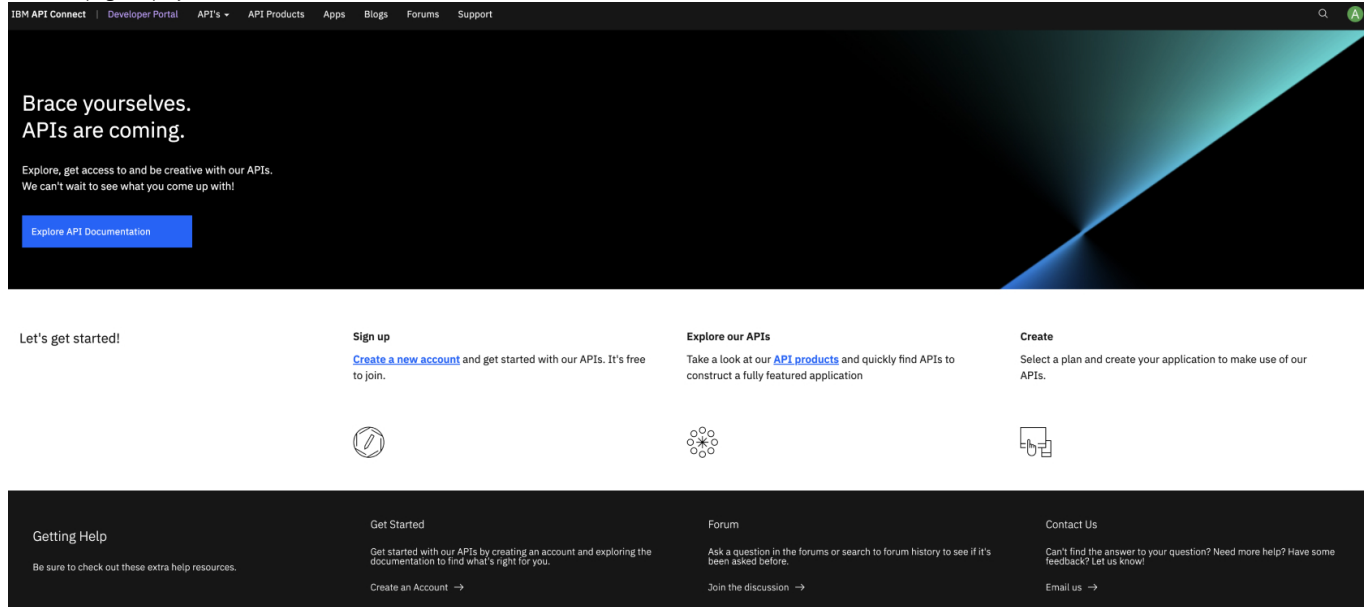

About this tutorial

In this tutorial, you create a block that contains a marketing announcement and add it to the front page of your Developer Portal.

This tutorial takes you through the following steps:

1. [Creating a custom block](#).
2. [Adding the custom block to the front page](#).

The front page displays like this before the block is added.

Creating a custom block

1. Log in to your Developer Portal as an administrator.
2. If the administrator dashboard isn't displayed, click **Manage** to display it.
3. Navigate to **Structure > Block layout > Add custom block**.
4. Enter **Marketing Info** in the **Block description**.
5. In the body area, click **Source**, then enter this HTML:

```
<div class="tutorial_block_1 tutorial_block_frontpage">
<h1><span>Create with our APIs</span></h1>
<p><span>Welcome to our Developer Portal where you will find APIs to create your awesome app.</span></p>
</div>
```

Add custom block ☆

[Home](#)

Block description *

Marketing Info

A brief description of your block.

Body

```
<div class="tutorial_block_1 tutorial_block_frontpage">
<h1><span>Create with our APIs</span></h1>

<p><span>Welcome to our Developer Portal where you will find APIs to create your awesome app.</span></p>
</div>
```

Text format Full HTML

6. To see a preview of the block click **Source** again.

Add custom block ☆

[Home](#)

Block description *

Marketing Info

A brief description of your block.

Body

Create with our APIs

Welcome to our Developer Portal where you will find APIs to create your awesome app.

Text format Full HTML

Note: This block uses almost no inline-styling, instead it allows your theme to decide how it is rendered. The advantage of this set up is that you can easily change the rendering without modifying existing content in the database. Any styling that is required can be added to a custom theme. For more information, see [Tutorial: Creating a custom theme for the Developer Portal](#).

7. Click **Save**.

You have now created the custom block.

Adding the custom block to the front page

1. If the administrator dashboard isn't displayed, click Manage to display it.
2. Navigate to Structure > Pages.
3. Click **Edit** on the Welcome page label.
4. Click **Panels** in the **Variants** section.
5. Click **Content** on the expanded menu.
6. Click + **Add new block**.
7. Click **Marketing Info** in the Custom list.
8. Clear **Display title**, keep **Content** in the drop-down list, and click **Add block**.

Add block
✕

Block description
Marketing Info

Title *

Display title

Region *

Content ▾

Add block

9. Drag **Marketing Info** to the order you want, in this example before the **Welcome banner** content.
10. Click **Update and save**.

What you did in this tutorial

The front page now has the new block with a marketing message.

Let's get started!

Sign up

[Create a new account](#) and get started with our APIs. It's free to join.

Explore our APIs

Take a look at our [API products](#) and quickly find APIs to construct a fully featured application

Create

Select a plan and create your application to make use of our APIs.

What to do next

You can add further branding by adding content to your custom blocks such as images, or try using one of the provided custom blocks such as the Featured Content Block. Instead of using inline styling like that provided in the html, adopt best practice by adding class selectors and developing a custom theme. By default this block is English, you might want to consider adding translated versions.

Tutorial: Adding a custom block to a page other than the front page

You can customize the appearance of a page on your Developer Portal by adding a custom block. Blocks are boxes of content that are rendered into an area or region of a web page, such as the Products page or Apps page. Blocks can be displayed in regions, such as footer or sidebar, on your page.

Before you begin

You must have a Developer Portal enabled, and you must have administrator access to complete this tutorial. The tutorial [Creating the Portal](#) explains how to enable the portal if you have not already done so. The tutorial [Adding a custom block to the front page](#) explains how to add a custom block to the front page.

8. Enter `Creating an App` in the **Title** box, keep the **Display title** selected.

✓ Basic block *App Info* has been created.

Block description: App Info

Title *

Creating an App

Machine name: appinfo [Edit]

This field supports tokens. [Browse available tokens.](#)

Display title

9. Click **Pages** in the **Visibility** list.

10. Enter `/application` in the **Pages** text area, keep the **Show for the listed pages** selected.

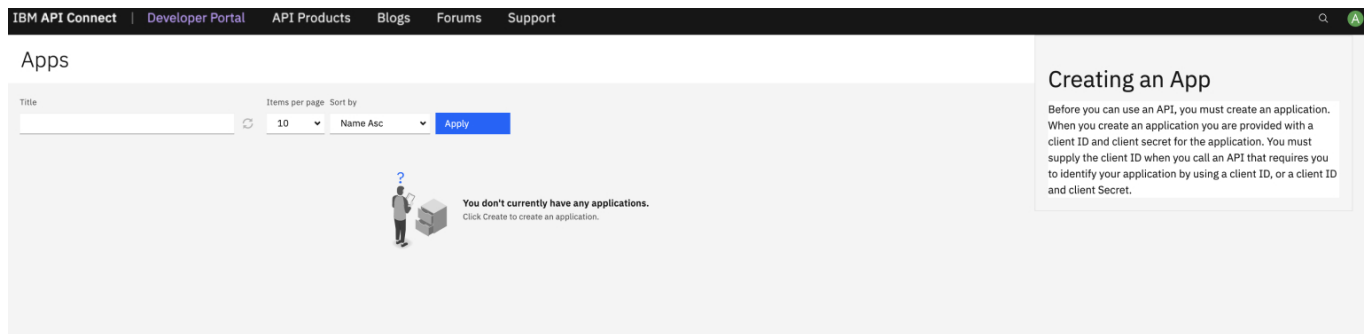

11. Select **Secondary** from the **Region** drop-down menu.

12. Click **Save block**.

13. Click **Save blocks**.

What you did in this tutorial

The Apps page now has an additional block with a guidance message.

The screenshot shows the IBM API Connect Developer Portal interface. At the top, there is a navigation bar with links for 'IBM API Connect', 'Developer Portal', 'API Products', 'Blogs', 'Forums', and 'Support'. Below the navigation bar, the main content area is titled 'Apps'. On the left, there is a search bar and a table with columns for 'Title', 'Items per page', and 'Sort by'. The table is currently empty, and a message states 'You don't currently have any applications. Click Create to create an application.' On the right side of the page, there is a block titled 'Creating an App' with a guidance message: 'Before you can use an API, you must create an application. When you create an application you are provided with a client ID and client secret for the application. You must supply the client ID when you call an API that requires you to identify your application by using a client ID, or a client ID and client Secret.'

What to do next

Instead of using inline styling like that provided in the html, adopt best practice by adding class selectors and developing a custom theme. By default this block is English, so you might want to consider adding translated versions.

Tutorial: Configuring the RobotsTxt file

You can control the access of a visiting Web robot. You can configure the `robots.txt` file that exists on your web server, usually at the root level, to control access. Web robots are programs that crawl through the web to obtain web content for all the sites that are visited, and provide indexing for better performance of search engines. You can also specify separate rules for different robots.

Why would I want to edit Drupal's pre-existing robots.txt file?

Malicious robots might choose not to honor the `robots.txt` file, and by editing this file you are broadcasting which sites you do not want others to see. Therefore, you should not use this file to hide sensitive data. Instead, you might want to edit your `robots.txt` file to:

- Prevent duplicate information from being identified on your site
- Prevent internal pages from appearing in search engines
- Prevent private pages from appearing in search engines
- Prevent particular images, files, and so on, from being crawled
- Specify a `crawl-delay` attribute to prevent robots from overloading your server at load time
- Exclude a particular robot

Before you begin

You must have a Developer Portal enabled, and you must have administrator access to complete this tutorial.

About this tutorial

You will edit the pre-existing `robots.txt` file and exclude access to a visiting robot called BadBot.

1. Log in to your Developer Portal as an administrator.
2. If the administrator dashboard isn't displayed, click **Manage** to display it.
3. Navigate to `Configuration > Search and Metadata > RobotsTxt`.

See <http://www.robotstxt.org/> for more information concerning how to write your `robots.txt` file.

Contents of robots.txt

```
#
# robots.txt
#
# This file is to prevent the crawling and indexing of certain parts
# of your site by web crawlers and spiders run by sites like Yahoo!
# and Google. By telling these "robots" where not to go on your site,
# you save bandwidth and server resources.
#
# This file will be ignored unless it is at the root of your host:
# Used: http://example.com/robots.txt
# Ignored: http://example.com/site/robots.txt
#
# For more information about the robots.txt standard, see:
# http://www.robotstxt.org/robotstxt.html

User-agent: *
# CSS, JS, Images
Allow: /core/*.css$
Allow: /core/*.css?
Allow: /core/*.js$
Allow: /core/*.js?
```

Save configuration

4. Enter the policy to exclude access to a robot called BadBot.

```
User-agent: BadBot
Disallow: /
```

5. Click **Save Configuration** to save your changes.

What you did in this tutorial

You have now successfully customized the `robots.txt` file. Robots now use this updated file to decide where they can crawl on your site. The BadBot robot is excluded access.

You can check whether your `robots.txt` file is successfully changed by navigating to your site and appending `/robots.txt`. You should see the content you entered into that file.

```
#
# robots.txt
#
# This file is to prevent the crawling and indexing of certain parts
# of your site by web crawlers and spiders run by sites like Yahoo!
# and Google. By telling these "robots" where not to go on your site,
# you save bandwidth and server resources.
#
# This file will be ignored unless it is at the root of your host:
# Used: http://example.com/robots.txt
# Ignored: http://example.com/site/robots.txt
#
# For more information about the robots.txt standard, see:
# http://www.robotstxt.org/robotstxt.html

User-agent: BadBot
Disallow: /

User-agent: *
# CSS, JS, Images
Allow: /core/*.css$
Allow: /core/*.css?
Allow: /core/*.js$
Allow: /core/*.js?
```

For more information on how to edit your `robots.txt` file, see <https://www.robotstxt.org/>.

What to do next

You can edit the `robots.txt` at any time by navigating back to the page within the configuration settings. You might choose to duplicate this file across all of your sites, or choose different policies for different sites.

Tutorial: Configuring the SecurityTxt file

You can use the `security.txt` file to provide your users with a standard way to report security vulnerabilities with your site.

The `security.txt` file is a file format that is designed to help your users disclose any security vulnerability. For more information, see securitytxt.org or [A File Format to Aid in Security Vulnerability Disclosure](#).

Before you begin

You must have a Developer Portal enabled, and you must have administrator access to complete this tutorial.

About this tutorial

You edit the `security.txt` file and provide information such as a URL of a contact page, for your customers to use if they have a security vulnerability.

1. Log in to your Developer Portal as an administrator.
2. If the administrator dashboard isn't displayed, click Manage to display it.
3. Navigate to Configuration > System > Security.txt.

Back to site Workbench Manage Shortcuts admin

Content Structure Appearance Extend Configuration People Reports Help

Home > Administration > Configuration > System

Security.txt configure

Configure Sign

A security.txt file provides a standard way for people to find out how to safely report security issues with your site. The new [Security.txt standard](#) is currently a [draft RFC](#).

- Enable the security.txt file for your site**
When enabled the security.txt file will be accessible to all users with the "view securitytxt" permission, you will almost certainly want to give this permission to everyone i.e. authenticated and anonymous users.
- Enable the security.txt.sig line**
When enabled, the signature line will display in the security.txt file. Leave this disabled if you are not going to create a sig file.

^ Contact

You must provide at least one means of contact: email, phone or contact page URL.

Email

Typically this would be of the form security@example.com. Leave it blank if you do not want to provide an email address.

Phone

Use full international format e.g. +1-201-555-0123. Leave it blank if you do not want to provide a phone number.

URL

The URL of a contact page which should be loaded over HTTPS. Leave it blank if you do not want to provide a contact page.

4. Select the checkbox for **Enable the security text file for your site**.
5. Complete the form for your requirements.
6. Click **Save Configuration** to save your changes.

What you did in this tutorial

You successfully customized the `security.txt` file.

What to do next

You can edit the `security.txt` at any time by navigating back to the page within the configuration settings.

Tutorials for using custom modules in the Developer Portal

You can configure custom modules to complete specific actions in the Developer Portal.

Note: You must have administrator access to complete the tutorials.

You can configure rules for the following events that occur in the Developer Portal:

- Change the profile page to display **firstname last name**, instead of **username**.
- Add validation to a field on the sign up form.

Tutorial: Changing the profile page to display firstname lastname, instead of username

You might want to change the profile page of your users on your Developer Portal to display their **firstname** and **lastname** rather than their **username**.

Before you begin

You must have a Developer Portal enabled, and you must have administrator access to complete this tutorial.

About this tutorial

In this tutorial, you change the profile page of your users to display their `firstname` and `lastname` rather than their `username`. The change to the profile page is done by using the custom module `change_account_display` that is already available in [IBM APIC Portal - addons](#). However, for more information, see [Custom module development: creating a module skeleton](#).

This tutorial takes you through the following steps:

1. [Cloning and packaging the `change_account_display` module](#).
2. [Installing and enabling the `change_account_display` module](#).

Cloning and packaging the `change_account_display` module

1. Clone the custom module. Here is an example command if you are using Mac and Linux:

```
git clone https://github.com/ibm-apiconnect/devportal-addons
```

2. Package up the custom module.

```
cd devportal-addons/apic_v10/modules
tar -czf change_account_display.tar.gz change_account_display/
```

Installing and enabling the `change_account_display` module

1. Log in to your Developer Portal as an administrator.
2. If the administrator dashboard isn't displayed, click **Manage** to display it.
3. Click **Extend** > **Install new module**.
4. Click **Browse** from the **Upload a module or theme archive to install** section.
5. Navigate to and select the packaged custom module that you created earlier. For example, `change_account_display.tar.gz`, then click **Open**.

Home > Administration > Extend

Add new module ☆

You can find [modules](#) and [themes](#) on [drupal.org](#). The following file extensions are supported: `tar` `tgz` `gz` `bz2` `zip`.

Add from a URL

For example: `https://ftp.drupal.org/files/projects/home.tar.gz`

Or

Upload a module or theme archive

 No file chosen

For example: `name.tar.gz` from your local computer

Continue

API Developer Portal

Update manager

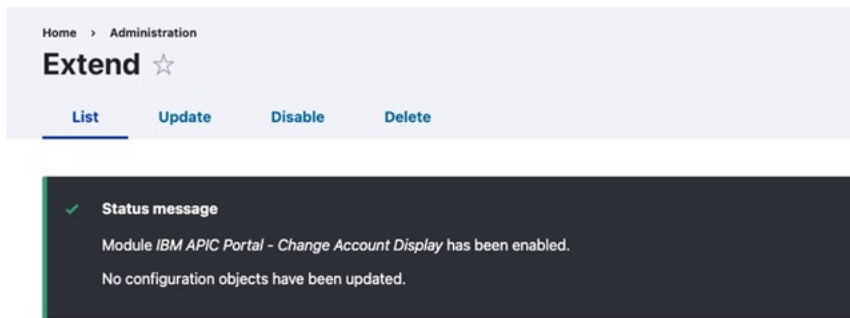

`change_account_display`

- Added / updated `change_account_display` successfully

Next steps

- [Add another module](#)
- [Enable newly added modules](#)
- [Administration pages](#)

6. Click **Continue**.
7. Click the **Enable newly added modules** link.

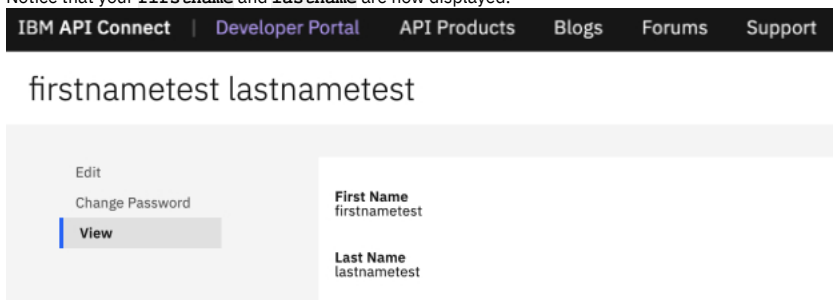

8. Enter **Change Account Display** in the filter box.
9. Check the check box next to **Change Account Display**.
10. Click **Enable**.

The module is now installed and enabled.

Test the profile page change

1. Sign out as the Admin user.
2. Sign in as a user of your Developer Portal.
3. Click **My account** from the drop down next to your **username**.
4. Notice that your **firstname** and **lastname** are now displayed.

What you did in this tutorial

You used a custom module to change the profile page display for the users of your Developer Portal.

Tutorial: Adding validation to a field on the sign-up form

You might want to add extra validation to a field to help your Developer Portal users. For example, you might want to validate a department name, employee ID, or similar data when a user registers for an account on the portal.

Before you begin

You must have a Developer Portal enabled, and you must have administrator access to complete this tutorial. You must have completed the tutorial about [Adding a field to the sign up form](#), where you added a Department code field to the Sign-up form.

About this tutorial

In this tutorial, you add some validation to the Department code field on the Sign-up form. This is a required field for all portal users and is a string of the format **DEPnnn**, where **DEP** is the string prefix and **nnn** is a three-digit number, for example, **DEP123**. The validation is done by using a custom module that is already available in [IBM APIC Portal - addons](#). However, for more information, see [Custom module development: creating a module skeleton](#).

This tutorial takes you through the following steps:

1. [Cloning and packaging the validation module](#).
2. [Installing and enabling the validation module](#).
3. [Testing the validation in the sign up form](#).

Look at the files we will use in this link [IBM APIC Portal - addons](#).

- `user_field_example.info.yml` - this is the metadata for the module, defining things like the name and version, and containing other important information that is required by Drupal to import and enable the module.

```
name: 'IBM APIC Portal - user field example'
type: module
description: 'IBM API Connect Developer Portal tutorial - Example of validating a custom user field'
package: 'Custom'
core_version_requirement: ^8 || ^9 || ^10
version: 1.0.0
project: 'user_field_example'
```

```
dependencies:
- ibm_apim
- auth_apic
```

- `user_field_example.module` - this contains a validation function and adds this to the Sign-up form by using the `hook_form_alter` function.

```
<?php
use Drupal\Core\Form\FormStateInterface;

/**
 * Implementation of hook_form_alter() to alter the Sign up form
 */
function user_field_example_form_alter(&$form, FormStateInterface $form_state, $form_id) {
  if ($form_id == 'user_register_form') {
    $form['#validate'][] = 'user_field_example_validate_department_code';
  }
}

/**
 * Validate the Department code field on the Sign up form.
 *
 * Valid entry = DEPnnn
 * where n = single figure digit.
 */
function user_field_example_validate_department_code($form, &$form_state) {
  $dept_code = $form_state->getValue('field_department_code')[0]['value'];
  $valid = preg_match('/^DEP\d{3}$/', $dept_code);
  if (!$valid) {
    $form_state->setErrorByName('field_department_code', t('Invalid department code.'));
  }
}
```

Cloning and packaging the validation module

Validation is added to the `Department code` field on the Sign-up form by using a custom module.

1. Clone the custom module. Here is an example command if you are using Mac and Linux:

```
git clone https://github.com/ibm-apiconnect/devportal-addons
```

2. Package up the custom module.

```
cd devportal-addons/apic_v10/modules
tar -czf user_field_example.tgz user_field_example/
```

Installing and enabling the validation module

1. Log in to your Developer Portal as an administrator.
2. If the administrator dashboard isn't displayed, click **Manage** to display it.
3. Click **Extend > Install new module**.
4. Click **Choose file** from the **Upload a module or theme archive to install** section.
5. Browse to and select `user_field_example.tgz`, the packaged custom module that you created earlier. Click **Open**.
6. Click **Install**.
7. Click the **Enable newly added modules** link.
8. Enter **IBM APIC Portal - user field example** in the filter box.
9. Check the checkbox next to **IBM APIC Portal - user field example**.
10. Click **Enable**.

The module is now installed and enabled.

Testing the validation in the sign-up form

1. Sign out as the Admin user.
2. Click **Create account**.
3. Complete all fields, set `Department code` to `ABC123`.
4. Click **Sign up**.

5. Observe the failure message and highlighting on the **Department code** field.

The screenshot shows a sign-up form titled "API Developer Portal Sign up with nls Catalog User Registry". The form includes fields for Username, Email address, First Name, Last Name, Department code, and Consumer organization. The Department code field contains "ABC123" and has a red border with the message "Invalid department code." below it. At the top of the page, a red error banner states "1 error has been found: Department code".

6. Change the **Department code** field to **DEP245**, reenter the password and click **Sign up** to see that a valid code is accepted.

What you did in this tutorial

You added some validation to the Department code field on the Sign-up form, then tested the form to ensure that the **Department code** field accepts only codes in the format of **DEPnnn**.

In reality, you would need to add this configuration in such a way that it is available for all sites. To achieve this availability, you would include the configuration in your custom module. For more information, see [Drupal custom modules](#).

Tutorial: Using a custom weighting sort order on the product list page

You can use a custom weighting to sort your products on the API products list page of your Developer Portal.

Before you begin

You must have a Developer Portal enabled, and you must have administrator access to complete this tutorial. The tutorial [Creating the Portal](#) explains how to enable the portal if you have not already done so.

About this tutorial

In this task, you set up a weighting sort criteria and use it to list your products, on the API Products page, in a particular order. You set up the weightings so the order reads, Product3, Product1, and Product2.

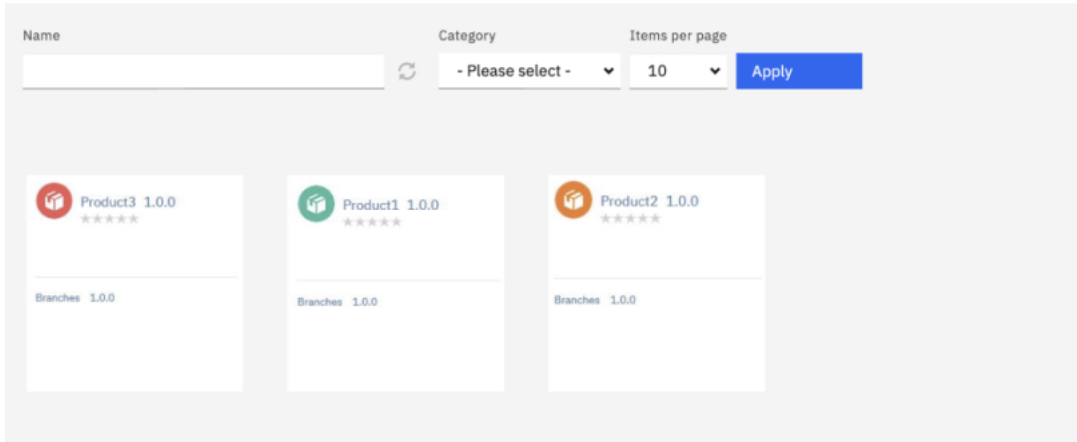

This tutorial takes you through the following steps:

1. [Add a custom integer field to the API content type.](#)
2. [Modify the Products view to change the sort order.](#)
3. [Add a weighting to each Product.](#)

Note: To complete this tutorial, you will need to have API products.

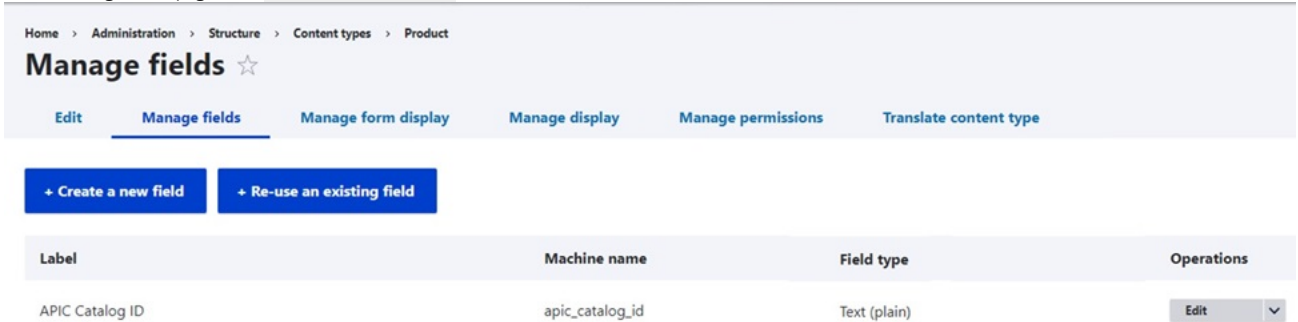

For example, the API Products page below displays Product1, Product2, and Product3 in this order before the weightings are added.

API Products

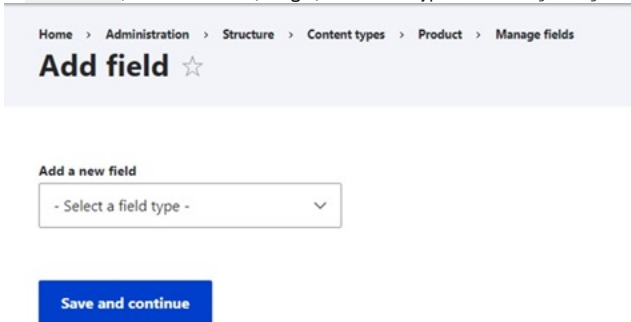

Add a custom integer field to the API content type

1. Log in to your Developer Portal as an administrator.
2. If the administrator dashboard isn't displayed, click **Manage** to display it.
3. Click **Structure > Content types > Product > Manage fields**.
4. On the **Manage fields** page, click **Create a new field**.

5. In **Add field**, select **Number (Integer)** as the field type. Enter **Weighting** as the label title.

6. Click **Save and continue**.
7. Leave the **Allowed number of values** set to **1** and click **Save field settings**.
8. Enter **0** as the default value, click **Save settings**.
9. Click **Save**.

The **Weighting** field now shows in the **Manage fields** list.

Modify the Products view to change the sort order

1. If the administrator dashboard isn't displayed, click **Manage** to display it.
2. Navigate to **Structure > Views**, scroll down to the **Products** view and click **Edit**.
3. In the **SORT CRITERIA** section click **Add**.
4. Enter **weight** in the search box. Then, select **Weighting (field_weighting)**, and click **Apply** (all displays).
5. Leave the **Order** as **Sort ascending**, click **Apply** (all displays).
6. In the **SORT CRITERIA** section, select **Rearrange** from the drop-down menu next to the **Add**.

Rearrange sort criteria ✕

For
All displays (except overridden) ▾

[Show row weights](#)

	REMOVE
Content: Title Exposed	Remove
Content: Version (apic_version) Exposed	Remove
Content: Changed Exposed	Remove
Content: Authored on Exposed	Remove
Content: Rating (apic_rating) Exposed	Remove
Content: Weighting (field_weighting) asc	Remove

Apply (all displays)
Cancel

7. For all rows except **Weighting (field_weighting)**, click **Remove**.
8. Click **Apply (all displays)**.

You modified the **Products** view to sort based on **Weighting (field_weighting)**.

Add a weighting to each Product

1. If the administrator dashboard isn't displayed, click **Manage** to display it.
2. Click **Content**, and select **Product** from the **Content type**, click **Filter**. A list of available Products on your site is displayed.

+ Add content

3. For Product1 click edit, in the **Weighting field**, select 2 as the value, click **Save**.
4. For Product2 click edit, in the **Weighting field**, select 3 as the value, click **Save**.
5. For Product3 click edit, in the **Weighting field**, select 1 as the value, click **Save**.

The API Products page displays Product3, Product1, and Product2 in this order after the weightings are added.

What you did in this tutorial

You changed the order that the API Products appear on the products page.

API Products

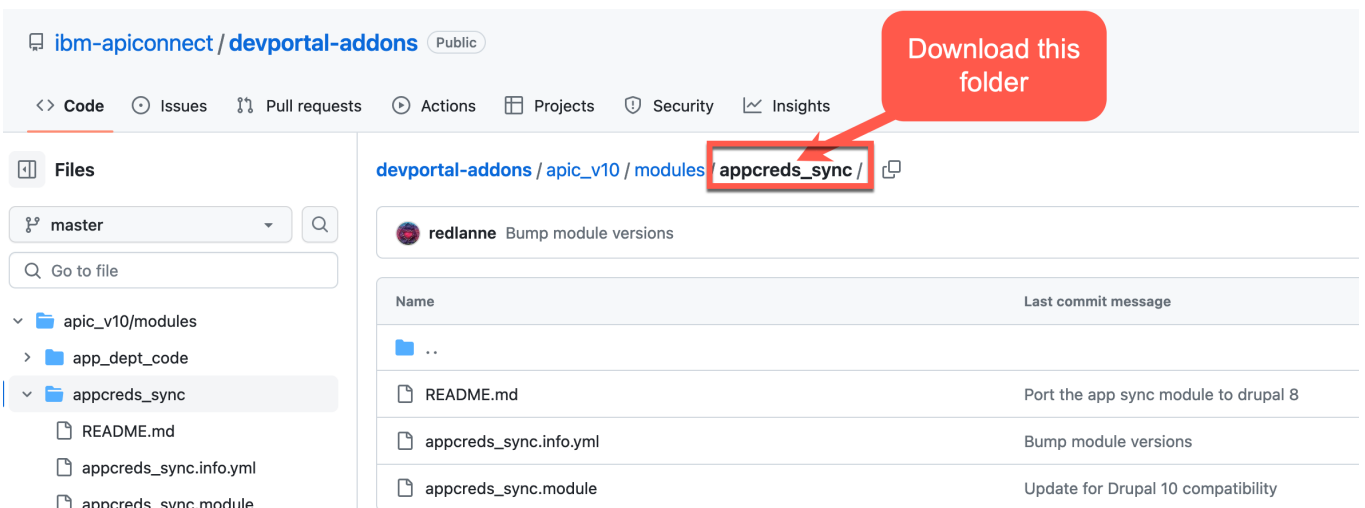

Tutorial: Synchronizing application credentials from the Developer Portal with an external server

You can synchronize application credentials from the Developer Portal with an external server.

Before you begin

You must have administrator access to complete this task.

Download the [Application credential synchronization](#) folder.

Perform the following steps:

1. Clone the custom module. Here is an example if you are using Mac and Linux:

```
git clone https://github.com/ibm-apiconnect/devportal-addons
```

2. Navigate to the `appcreds_sync` folder:

```
cd devportal-addons/apic_v10/modules/appcreds_sync
```

About this task

In this tutorial, you configure a custom module and install it in the Developer Portal to synchronize application credentials between the Developer Portal and an external credentials server.

The `appcreds_sync` folder that you downloaded is a custom module that contains multiple methods that can be configured with your REST endpoints, and any further specifications that you want to define, to synchronize your Developer Portal application credentials with an external credential server.

For more information, see [Custom module development: background and prerequisites](#).

Procedure

To configure the custom module to synchronize application credentials:

1. In the `appcreds_sync.module` file, replace `example.com` with your REST endpoint for the following method types:
 - `http://example.com/app/create`
 - `http://example.com/app/delete`
 - `http://example.com/app/creds/create`
 - `http://example.com/app/creds/update`
 - `http://example.com/app/creds/delete`
 - `http://example.com/app/clientid/reset`
 - `http://example.com/app/clientsecret/reset`
2. Optional: Replace `username` and `password` with your username and password in the `_appcreds_sync_json_http_request` function:

```
('username' . ':' . 'password')
```

Note: You can also configure the SSL settings if you need to.

3. Save the file, and package up the custom module:

```
cd .  
tar -czf appcreds_sync.tar.gz appcreds_sync/
```

To install the configured custom module in the Developer Portal:

4. Log in to your Developer Portal as an administrator.
5. If the administrator dashboard does not display, click Manage.
6. Click Extend > Install new module.
7. In the Add from a URL field, enter a path to the module . Alternatively, upload the module in the Upload a module or theme archive section.
8. Click Continue.

To enable the module:

9. If the administrator dashboard does not display, click Manage.
10. Click Extend and search for the custom module just installed, for example, Synchronise Application Credentials.
11. Select the check box and click Enable.

Results

You have configured a custom module that synchronizes application credentials from the Developer Portal, installed that module in the Developer Portal, and enabled it. No further action or configuration is required.

Reference information

Reference information for IBM® API Connect, including summary reference material for the developer toolkit command-line tool (CLI), a link to the API Connect Version 10.x Whitepaper, and information about the API Connect platform REST APIs.

Reference item	Description
Command-line tool reference for the developer toolkit	Summary reference material for each of the available commands for the developer toolkit command-line tool (CLI). (For more detailed information about how to use the command-line tool, see Using the developer toolkit command-line tool .)
Command-line tool reference for the Developer Portal	Summary reference material for each of the available commands for the Developer Portal command-line tool (CLI). (For more detailed information about how to use the command-line tool, see Using the Developer Portal command-line tool .)
API Connect REST APIs	The platform REST APIs that can be used to manage the API Connect cloud configuration, access the API provider capability, and use the consumer API microservice.
API Connect v10.x Whitepaper	A comprehensive technical guide to best practices, considerations, and deployment options for API Connect. The whitepaper covers the major components of API Connect, as well as considerations for configuring different clouds and environments, to help users with their API strategies. The target audience for the whitepaper are solution and integration architects.

APIConnect toolkit 682467625d5572c9b1f3d10b4b21045cd7df6a0b (Built 2024-02-08T14:16:29Z)

Synopsis

APIConnect toolkit 682467625d5572c9b1f3d10b4b21045cd7df6a0b (Built 2024-02-08T14:16:29Z)

```
apic [flags]
```

Options

```
--accept-license  Accept the license for API Connect  
--debug          Enable debug output  
--debug-output string Write debug output to file  
-h, --help      Help for apic
```

```
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic activations

Activations operations

Synopsis

Activations operations

```
apic activations [flags]
```

Options

```
-c, --catalog string  Catalog name or id (required)
--fields string      List of field names to return
--format string      Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for activations
--limit int32       Maximum number of items to return
--offset int32      Offset item number from list to begin return
-o, --org string     Organization name or id (required)
--output string     Write file(s) to directory, instead of STDOUT (default "-")
--scope string      scope
-s, --server string  management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic activations:clear

Activations clear operations

Synopsis

Activations clear operations

```
apic activations:clear [flags]
```

Options

```
-c, --catalog string  Catalog name or id (required)
--confirm string     Confirmation for critical updates (required)
--format string      Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for activations:clear
-o, --org string     Organization name or id (required)
--output string     Write file(s) to directory, instead of STDOUT (default "-")
--scope string      scope
-s, --server string  management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic activations:delete

Activations delete operations

Synopsis

Activations delete operations

```
apic activations:delete [flags]
```

Options

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for activations:delete
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>--scope string</code>	scope
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic activations:get

Activations get operations

Synopsis

Activations get operations

```
apic activations:get [flags]
```

Options

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--fields string</code>	List of field names to return
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for activations:get
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, use - for STDOUT. (default: cwd)
<code>--scope string</code>	scope
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic activations:list

Activations list operations

Synopsis

Activations list operations

```
apic activations:list [flags]
```

Options

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--fields string</code>	List of field names to return
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for activations:list
<code>--limit int32</code>	Maximum number of items to return
<code>--offset int32</code>	Offset item number from list to begin return
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>--scope string</code>	scope
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file

```
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic analytics

Analytics operations

Synopsis

Analytics operations

```
apic analytics [flags]
```

Options

```
-h, --help      Help for analytics
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic analytics:create

Analytics create operations

Synopsis

Analytics create operations

```
apic analytics:create [flags]
```

Options

```
--analytics-service string Analytics Service name or id (required)
-c, --catalog string       Catalog name or id (required)
--format string            Output format. One of [json yaml octet-stream go-template=... go-template-file=...],
defaults to yaml.
-h, --help                 Help for analytics:create
-o, --org string           Organization name or id (required)
--output string            Write file(s) to directory, instead of STDOUT (default "-")
--query string             Add query to request
--scope string             scope
-s, --server string        management server endpoint (required)
--space string             Space name or id (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic analytics-services

Analytics Services operations

Synopsis

Analytics Services operations

```
apic analytics-services [flags]
```

Options

```
--availability-zone string Availability Zone name or id (required)
-c, --catalog string       Catalog name or id (required)
--fields string            List of field names to return
```

```

--format string      Output format. One of [json yaml octet-stream go-template=... go-template-file=...],
defaults to yaml.
-h, --help          Help for analytics-services
--limit int32       Maximum number of items to return
--offset int32      Offset item number from list to begin return
-o, --org string    Organization name or id (required)
--output string     Write file(s) to directory, instead of STDOUT (default "-")
--scope string      scope
-s, --server string management server endpoint (required)
--space string      Space name or id (required)

```

Options inherited from parent commands

```

--accept-license    Accept the license for API Connect
--debug            Enable debug output
--debug-output string Write debug output to file
--live-help        Enable or disable tracking of limited usage information
-m, --mode string   Toolkit operation mode (default "apim")

```

apic analytics-services:clear

Clear the Analytics Service objects

Synopsis

Clear the Analytics Service objects

```
apic analytics-services:clear [flags]
```

Options

```

--availability-zone string Availability Zone name or id (required)
--confirm string          Confirmation for critical updates (required)
--format string           Output format. One of [json yaml octet-stream go-template=... go-template-file=...],
defaults to yaml.
-h, --help               Help for analytics-services:clear
-o, --org string         Organization name or id (required)
--output string          Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string      management server endpoint (required)

```

Options inherited from parent commands

```

--accept-license    Accept the license for API Connect
--debug            Enable debug output
--debug-output string Write debug output to file
--live-help        Enable or disable tracking of limited usage information
-m, --mode string   Toolkit operation mode (default "apim")

```

apic analytics-services:create

Create a Analytics Service object

Synopsis

Create a Analytics Service object

```

Fields not allowed:
- gateway_service_urls
- ingestion_endpoint
- client_endpoint

```

```

Fields allowed but ignored:
- id
- type
- api_version
- scope
- created_at
- updated_at
- url
- org_url
- availability_zone_url

```

```
apic analytics-services:create [flags]
```

Options

```

--availability-zone string Availability Zone name or id (required)
--format string           Output format. One of [json yaml octet-stream go-template=... go-template-file=...],
defaults to yaml.

```

<code>-h, --help</code>	Help for analytics-services:create
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic analytics-services:delete

Delete the Analytics Service object by name or id

Synopsis

Delete the Analytics Service object by name or id

```
apic analytics-services:delete [flags]
```

Options

<code>--availability-zone string</code>	Availability Zone name or id (required)
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for analytics-services:delete
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic analytics-services:get

Get the Analytics Service object by name or id

Synopsis

Get the Analytics Service object by name or id

```
apic analytics-services:get [flags]
```

Options

<code>--availability-zone string</code>	Availability Zone name or id (required)
<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--fields string</code>	List of field names to return
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for analytics-services:get
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, use - for STDOUT. (default: cwd)
<code>--query string</code>	Add query to request
<code>--scope string</code>	scope
<code>-s, --server string</code>	management server endpoint (required)
<code>--space string</code>	Space name or id (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic analytics-services:list

List the Analytics Service objects

Synopsis

List the Analytics Service objects

```
apic analytics-services:list [flags]
```

Options

```
--availability-zone string  Availability Zone name or id (required)
-c, --catalog string        Catalog name or id (required)
--fields string             List of field names to return
--format string             Output format. One of [json yaml octet-stream go-template=... go-template-file=...],
defaults to yaml.
-h, --help                  Help for analytics-services:list
--limit int32               Maximum number of items to return
--offset int32              Offset item number from list to begin return
-o, --org string            Organization name or id (required)
--output string             Write file(s) to directory, instead of STDOUT (default "-")
--scope string              scope
-s, --server string         management server endpoint (required)
--space string              Space name or id (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic analytics-services:update

Update the Analytics Service object by name or id

Synopsis

Update the Analytics Service object by name or id

```
Fields not allowed to be null:
- ingestion_endpoint_tls_client_profile_url
- client_endpoint_tls_client_profile_url

Fields not allowed:
- endpoint
- ingestion_endpoint
- client_endpoint

Fields allowed but ignored:
- id
- type
- api_version
- scope
- created_at
- updated_at
- url
- org_url
- availability_zone_url
```

```
apic analytics-services:update [flags]
```

Options

```
--availability-zone string  Availability Zone name or id (required)
--format string             Output format. One of [json yaml octet-stream go-template=... go-template-file=...],
defaults to yaml.
-h, --help                  Help for analytics-services:update
-o, --org string            Organization name or id (required)
--output string             Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string         management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic api-keys

Api Keys operations

Synopsis

Api Keys operations

```
apic api-keys [flags]
```

Options

```
--fields string  List of field names to return
--format string  Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help       Help for api-keys
--limit int32    Maximum number of items to return
--offset int32   Offset item number from list to begin return
--output string  Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

apic api-keys:create

Create a API Key object

Synopsis

Create a API Key object

```
Required fields:
- client_type
- description

Fields allowed but ignored:
- id
- type
- api_version
- scope
- created_at
- updated_at
- url
```

```
apic api-keys:create [flags]
```

Options

```
--format string  Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help       Help for api-keys:create
--output string  Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

apic api-keys:delete

Delete the API Key object by name or id

Synopsis

Delete the API Key object by name or id

```
apic api-keys:delete [flags]
```

Options

<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for api-keys:delete
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic api-keys:get

Get the API Key object by name or id

Synopsis

Get the API Key object by name or id

```
apic api-keys:get [flags]
```

Options

<code>--fields string</code>	List of field names to return
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for api-keys:get
<code>--output string</code>	Write file(s) to directory, use - for STDOUT. (default: cwd)
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic api-keys:list

List the API Key objects

Synopsis

List the API Key objects

```
apic api-keys:list [flags]
```

Options

<code>--fields string</code>	List of field names to return
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for api-keys:list
<code>--limit int32</code>	Maximum number of items to return
<code>--offset int32</code>	Offset item number from list to begin return
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic apis

Synopsis

Apis operations

```
apic apis [flags]
```

Options

```

--api_type string    The type of api (asynccapi, rest, graphql, wsd1_to_rest, or wsd1)
--base_path string  Base path of the API
-c, --catalog string Catalog name or id (required)
--enforced          Whether the API is enforced or not
--expand string     List of transient field to expand
--fields string     List of field names to return
--format string     Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
-h, --help          Help for apis
--limit int32       Maximum number of items to return
--metadata string   List of metadata fields in the api to filter on
--offset int32     Offset item number from list to begin return
-o, --org string    Organization name or id (required)
--output string     Write file(s) to directory, instead of STDOUT (default "-")
--scope string      scope
-s, --server string management server endpoint (required)
--space string      Space name or id (required)

```

Options inherited from parent commands

```

--accept-license    Accept the license for API Connect
--debug             Enable debug output
--debug-output string Write debug output to file
--live-help         Enable or disable tracking of limited usage information
-m, --mode string   Toolkit operation mode (default "apim")

```

apic apis:clone

Apis clone operations

Synopsis

Apis clone operations

```
apic apis:clone [flags]
```

Options

```

--api_type string    The type of api (asynccapi, rest, graphql, wsd1_to_rest, or wsd1)
--base_path string  Base path of the API
-c, --catalog string Catalog name or id (required)
--enforced          Whether the API is enforced or not
--expand string     List of transient field to expand
--fields string     List of field names to return
--format string     Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
-h, --help          Help for apis:clone
--limit int32       Maximum number of items to return
--metadata string   List of metadata fields in the api to filter on
--offset int32     Offset item number from list to begin return
-o, --org string    Organization name or id (required)
--output string     Write file(s) to directory, use - for STDOUT. (default: cwd)
--scope string      scope
-s, --server string management server endpoint (required)
--space string      Space name or id (required)

```

Options inherited from parent commands

```

--accept-license    Accept the license for API Connect
--debug             Enable debug output
--debug-output string Write debug output to file
--live-help         Enable or disable tracking of limited usage information
-m, --mode string   Toolkit operation mode (default "apim")

```

apic apis:document

Apis document operations

Synopsis

Apic document operations

```
apic apis:document [flags]
```

Options

```
-c, --catalog string  Catalog name or id (required)
--format string      Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for apis:document
--id                id
-o, --org string     Organization name or id (required)
--output string     Write file(s) to directory, instead of STDOUT (default "-")
--scope string      scope
-s, --server string  management server endpoint (required)
--space string      Space name or id (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic apis:get

Apic get operations

Synopsis

Apic get operations

```
apic apis:get [flags]
```

Options

```
-c, --catalog string  Catalog name or id (required)
--fields string      List of field names to return (default "add(wSDL,api)")
--format string      Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for apis:get
--id                id
-o, --org string     Organization name or id (required)
--output string     Write file(s) to directory, use - for STDOUT. (default: cwd)
--scope string      scope
-s, --server string  management server endpoint (required)
--space string      Space name or id (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic apis:list

Apic list operations

Synopsis

Apic list operations

```
apic apis:list [flags]
```

Options

```
--api_type string  The type of api (asynccapi, rest, graphql, wsdL_to_rest, or wsdL)
--base_path string Base path of the API
-c, --catalog string Catalog name or id (required)
--enforced         Whether the API is enforced or not
--expand string    List of transient field to expand
--fields string    List of field names to return
--format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
```

```

yaml.
-h, --help                Help for apis:list
--limit int32             Maximum number of items to return
--metadata string        List of metadata fields in the api to filter on
--offset int32           Offset item number from list to begin return
-o, --org string          Organization name or id (required)
--output string           Write file(s) to directory, instead of STDOUT (default "-")
--scope string            scope
-s, --server string       management server endpoint (required)
--space string            Space name or id (required)

```

Options inherited from parent commands

```

--accept-license        Accept the license for API Connect
--debug                 Enable debug output
--debug-output string   Write debug output to file
--live-help             Enable or disable tracking of limited usage information
-m, --mode string       Toolkit operation mode (default "apim")

```

apic apis:list-all

Apis list-all operations

Synopsis

Apis list-all operations

```
apic apis:list-all [flags]
```

Options

```

--api_type string        The type of api (asynccapi, rest, graphql, wsd1_to_rest, or wsd1)
--base_path string       Base path of the API
-c, --catalog string     Catalog name or id (required)
--enforced               Whether the API is enforced or not
--expand string          List of transient field to expand
--fields string          List of field names to return
--format string          Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
-h, --help                Help for apis:list-all
--limit int32           Maximum number of items to return
--metadata string        List of metadata fields in the api to filter on
--offset int32         Offset item number from list to begin return
-o, --org string          Organization name or id (required)
--output string          Write file(s) to directory, instead of STDOUT (default "-")
--scope string            scope
-s, --server string       management server endpoint (required)
--space string            Space name or id (required)

```

Options inherited from parent commands

```

--accept-license        Accept the license for API Connect
--debug                 Enable debug output
--debug-output string   Write debug output to file
--live-help             Enable or disable tracking of limited usage information
-m, --mode string       Toolkit operation mode (default "apim")

```

apic apis:update

Apis update operations

Synopsis

Apis update operations

```
apic apis:update [flags]
```

Options

```

-c, --catalog string     Catalog name or id (required)
--format string          Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help                Help for apis:update
--id string              id
-o, --org string          Organization name or id (required)
--output string          Write file(s) to directory, instead of STDOUT (default "-")
--scope string            scope
-s, --server string       management server endpoint (required)
--space string            Space name or id (required)

```

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic apis:validate

Validate the draft api object

Synopsis

Validate the draft api object

```
apic apis:validate [flags]
```

Options

<code>--catalog_name string</code>	Name of a catalog
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>--gateway_service_names string</code>	Names of Gateway Services
<code>-h, --help</code>	Help for apis:validate
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>--scope string</code>	scope
<code>-s, --server string</code>	management server endpoint (required)
<code>--space_name string</code>	Name of a space

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic apis:wSDL

Apis wsdL operations

Synopsis

Apis wsdL operations

```
apic apis:wSDL [flags]
```

Options

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for apis:wSDL
<code>--id</code>	id
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, use - for STDOUT. (default: cwd)
<code>--scope string</code>	scope
<code>-s, --server string</code>	management server endpoint (required)
<code>--space string</code>	Space name or id (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic apps

Apps operations

Synopsis

Apps operations

```
apic apps [flags]
```

Options

```
-c, --catalog string      Catalog name or id (required)
--consumer-org string    Consumer Organization name or id (required)
--expand string          List of transient field to expand
--fields string          List of field names to return
--format string          Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
-h, --help               Help for apps
--limit int32           Maximum number of items to return
--offset int32          Offset item number from list to begin return
-o, --org string         Organization name or id (required)
--output string         Write file(s) to directory, instead of STDOUT (default "-")
--scope string          scope
-s, --server string     management server endpoint (required)
--space string          Space name or id (required)
--space-initiated      space-initiated
```

Options inherited from parent commands

```
--accept-license      Accept the license for API Connect
--debug               Enable debug output
--debug-output string Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

apic apps:clear

Clear the Application objects

Synopsis

Clear the Application objects

```
apic apps:clear [flags]
```

Options

```
-c, --catalog string      Catalog name or id (required)
--confirm string         Confirmation for critical updates (required)
--consumer-org string    Consumer Organization name or id (required)
--format string          Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
-h, --help               Help for apps:clear
-o, --org string         Organization name or id (required)
--output string         Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string     management server endpoint (required)
--space string          Space name or id (required)
--space-initiated      space-initiated
```

Options inherited from parent commands

```
--accept-license      Accept the license for API Connect
--debug               Enable debug output
--debug-output string Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

apic apps:create

Create a Application object

Synopsis

Create a Application object

```
Fields allowed but ignored:
- id
- type
- api_version
- scope
- created_at
```

```
- updated_at
- url
- org_url
- catalog_url
- consumer_org_url
```

```
apic apps:create [flags]
```

Options

```
-c, --catalog string      Catalog name or id (required)
--consumer-org string    Consumer Organization name or id (required)
--format string          Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
-h, --help               Help for apps:create
-o, --org string         Organization name or id (required)
--output string          Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string      management server endpoint (required)
--space string           Space name or id (required)
--space-initiated       space-initiated
```

Options inherited from parent commands

```
--accept-license        Accept the license for API Connect
--debug                 Enable debug output
--debug-output string   Write debug output to file
--live-help             Enable or disable tracking of limited usage information
-m, --mode string       Toolkit operation mode (default "apim")
```

apic apps:delete

Delete the Application object by name or id

Synopsis

Delete the Application object by name or id

```
apic apps:delete [flags]
```

Options

```
-c, --catalog string      Catalog name or id (required)
--consumer-org string    Consumer Organization name or id (required)
--format string          Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
-h, --help               Help for apps:delete
-o, --org string         Organization name or id (required)
--output string          Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string      management server endpoint (required)
--space string           Space name or id (required)
--space-initiated       space-initiated
```

Options inherited from parent commands

```
--accept-license        Accept the license for API Connect
--debug                 Enable debug output
--debug-output string   Write debug output to file
--live-help             Enable or disable tracking of limited usage information
-m, --mode string       Toolkit operation mode (default "apim")
```

apic apps:get

Get the Application object by name or id

Synopsis

Get the Application object by name or id

```
apic apps:get [flags]
```

Options

```
-c, --catalog string      Catalog name or id (required)
--consumer-org string    Consumer Organization name or id (required)
--fields string          List of field names to return
--format string          Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
-h, --help               Help for apps:get
```

-o, --org string	Organization name or id (required)
--output string	Write file(s) to directory, use - for STDOUT. (default: cwd)
-s, --server string	management server endpoint (required)
--space string	Space name or id (required)
--space-initiated	space-initiated

Options inherited from parent commands

--accept-license	Accept the license for API Connect
--debug	Enable debug output
--debug-output string	Write debug output to file
--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

apic apps:list

List the Application objects

Synopsis

List the Application objects

```
apic apps:list [flags]
```

Options

-c, --catalog string	Catalog name or id (required)
--consumer-org string	Consumer Organization name or id (required)
--expand string	List of transient field to expand
--fields string	List of field names to return
--format string	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to

yaml.

-h, --help	Help for apps:list
--limit int32	Maximum number of items to return
--offset int32	Offset item number from list to begin return
-o, --org string	Organization name or id (required)
--output string	Write file(s) to directory, instead of STDOUT (default "-")
--scope string	scope
-s, --server string	management server endpoint (required)
--space string	Space name or id (required)
--space-initiated	space-initiated

Options inherited from parent commands

--accept-license	Accept the license for API Connect
--debug	Enable debug output
--debug-output string	Write debug output to file
--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

apic apps:update

Update the Application object by name or id

Synopsis

Update the Application object by name or id

```
Fields allowed but ignored:
- id
- type
- api_version
- scope
- created_at
- updated_at
- url
- org_url
- catalog_url
- consumer_org_url
```

```
apic apps:update [flags]
```

Options

-c, --catalog string	Catalog name or id (required)
--consumer-org string	Consumer Organization name or id (required)
--format string	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to

yaml.

-h, --help	Help for apps:update
------------	----------------------

-o, --org string	Organization name or id (required)
--output string	Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string	management server endpoint (required)
--space string	Space name or id (required)
--space-initiated	space-initiated

Options inherited from parent commands

--accept-license	Accept the license for API Connect
--debug	Enable debug output
--debug-output string	Write debug output to file
--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

apic associates

Associates operations

Synopsis

Associates operations

```
apic associates [flags]
```

Options

-c, --catalog string	Catalog name or id (required)
--consumer-org string	Consumer Organization name or id (required)
--fields string	List of field names to return
--format string	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help	Help for associates
--limit int32	Maximum number of items to return
--offset int32	Offset item number from list to begin return
-o, --org string	Organization name or id (required)
--output string	Write file(s) to directory, instead of STDOUT (default "-")
--scope string	scope
-s, --server string	management server endpoint (required)
--space string	Space name or id (required)
--space-initiated	space-initiated

Options inherited from parent commands

--accept-license	Accept the license for API Connect
--debug	Enable debug output
--debug-output string	Write debug output to file
--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

apic associates:get

Associates get operations

Synopsis

Associates get operations

```
apic associates:get [flags]
```

Options

-c, --catalog string	Catalog name or id (required)
--consumer-org string	Consumer Organization name or id (required)
--fields string	List of field names to return
--format string	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help	Help for associates:get
-o, --org string	Organization name or id (required)
--output string	Write file(s) to directory, use - for STDOUT. (default: cwd)
--scope string	scope
-s, --server string	management server endpoint (required)
--space string	Space name or id (required)
--space-initiated	space-initiated

Options inherited from parent commands

--accept-license	Accept the license for API Connect
--debug	Enable debug output

```
--debug-output string  Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

apic associates:list

Associates list operations

Synopsis

Associates list operations

```
apic associates:list [flags]
```

Options

```
-c, --catalog string    Catalog name or id (required)
--consumer-org string  Consumer Organization name or id (required)
--fields string        List of field names to return
--format string        Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
-h, --help             Help for associates:list
--limit int32          Maximum number of items to return
--offset int32         Offset item number from list to begin return
-o, --org string        Organization name or id (required)
--output string        Write file(s) to directory, instead of STDOUT (default "-")
--scope string         scope
-s, --server string    management server endpoint (required)
--space string         Space name or id (required)
--space-initiated     space-initiated
```

Options inherited from parent commands

```
--accept-license      Accept the license for API Connect
--debug               Enable debug output
--debug-output string Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

apic availability-zones

Availability Zones operations

Synopsis

Availability Zones operations

```
apic availability-zones [flags]
```

Options

```
--fields string    List of field names to return
--format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help         Help for availability-zones
--limit int32     Maximum number of items to return
--offset int32    Offset item number from list to begin return
-o, --org string   Organization name or id (required)
--output string   Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license      Accept the license for API Connect
--debug               Enable debug output
--debug-output string Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

apic availability-zones:clear

Clear the Availability Zone objects

Synopsis

Clear the Availability Zone objects

```
apic availability-zones:clear [flags]
```

Options

<code>--confirm</code> string	Confirmation for critical updates (required)
<code>--format</code> string	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for availability-zones:clear
<code>-o, --org</code> string	Organization name or id (required)
<code>--output</code> string	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server</code> string	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output</code> string	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode</code> string	Toolkit operation mode (default "apim")

apic availability-zones:create

Create a Availability Zone object

Synopsis

Create a Availability Zone object

```
Fields allowed but ignored:  
- id  
- type  
- api_version  
- scope  
- created_at  
- updated_at  
- url  
- org_url
```

```
apic availability-zones:create [flags]
```

Options

<code>--format</code> string	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for availability-zones:create
<code>-o, --org</code> string	Organization name or id (required)
<code>--output</code> string	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server</code> string	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output</code> string	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode</code> string	Toolkit operation mode (default "apim")

apic availability-zones:delete

Delete the Availability Zone object by name or id

Synopsis

Delete the Availability Zone object by name or id

```
apic availability-zones:delete [flags]
```

Options

<code>--format</code> string	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for availability-zones:delete
<code>-o, --org</code> string	Organization name or id (required)
<code>--output</code> string	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server</code> string	management server endpoint (required)

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic availability-zones:get

Get the Availability Zone object by name or id

Synopsis

Get the Availability Zone object by name or id

```
apic availability-zones:get [flags]
```

Options

```
--fields string List of field names to return
--format string Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help       Help for availability-zones:get
-o, --org string Organization name or id (required)
--output string Write file(s) to directory, use - for STDOUT. (default: cwd)
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic availability-zones:list

List the Availability Zone objects

Synopsis

List the Availability Zone objects

```
apic availability-zones:list [flags]
```

Options

```
--fields string List of field names to return
--format string Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help       Help for availability-zones:list
--limit int32    Maximum number of items to return
--offset int32   Offset item number from list to begin return
-o, --org string Organization name or id (required)
--output string Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic availability-zones:update

Update the Availability Zone object by name or id

Synopsis

Update the Availability Zone object by name or id

```
Fields allowed but ignored:
- id
- type
- api_version
```

```
- scope
- created_at
- updated_at
- url
- org_url
```

```
apic availability-zones:update [flags]
```

Options

```
--format string  Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for availability-zones:update
-o, --org string Organization name or id (required)
--output string Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic billings

Billings operations

Synopsis

Billings operations

```
apic billings [flags]
```

Options

```
--fields string  List of field names to return
--format string  Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for billings
--limit int32    Maximum number of items to return
--offset int32   Offset item number from list to begin return
-o, --org string Organization name or id (required)
--output string  Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic billings:clear

Clear the Billing objects

Synopsis

Clear the Billing objects

```
apic billings:clear [flags]
```

Options

```
--confirm string Confirmation for critical updates (required)
--format string  Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for billings:clear
-o, --org string Organization name or id (required)
--output string  Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
```

```
--debug-output string  Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

apic billings:delete

Delete the Billing object by name or id

Synopsis

Delete the Billing object by name or id

```
apic billings:delete [flags]
```

Options

```
--format string  Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for billings:delete
-o, --org string Organization name or id (required)
--output string  Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug          Enable debug output
--debug-output string Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic billings:get

Get the Billing object by name or id

Synopsis

Get the Billing object by name or id

```
apic billings:get [flags]
```

Options

```
--fields string  List of field names to return
--format string  Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for billings:get
-o, --org string Organization name or id (required)
--output string  Write file(s) to directory, use - for STDOUT. (default: cwd)
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug          Enable debug output
--debug-output string Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic billings:list

List the Billing objects

Synopsis

List the Billing objects

```
apic billings:list [flags]
```

Options

```
--fields string  List of field names to return
--format string  Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for billings:list
```

<code>--limit int32</code>	Maximum number of items to return
<code>--offset int32</code>	Offset item number from list to begin return
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic billings:update

Update the Billing object by name or id

Synopsis

Update the Billing object by name or id

```
Fields not allowed to be null:
- integration_url

Fields not allowed:
- job_queue_status

Fields allowed but ignored:
- id
- type
- api_version
- scope
- created_at
- updated_at
- url
```

`apic billings:update [flags]`

Options

<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for billings:update
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic catalog-settings

Catalog Settings operations

Synopsis

Catalog Settings operations

`apic catalog-settings [flags]`

Options

<code>-h, --help</code>	Help for catalog-settings
-------------------------	---------------------------

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic catalog-settings:get

Get the Catalog Setting object

Synopsis

Get the Catalog Setting object

```
apic catalog-settings:get [flags]
```

Options

```
-c, --catalog string  Catalog name or id (required)
--fields string      List of field names to return
--format string      Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for catalog-settings:get
-o, --org string     Organization name or id (required)
--output string      Write file(s) to directory, use - for STDOUT. (default: cwd)
-s, --server string  management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic catalog-settings:update

Update the Catalog Setting object

Synopsis

Update the Catalog Setting object

```
Fields allowed but ignored:
- name
- type
- api_version
- scope
- created_at
- updated_at
- url
- org_url
- catalog_url
```

```
apic catalog-settings:update [flags]
```

Options

```
-c, --catalog string  Catalog name or id (required)
--force             Force the operation
--format string      Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for catalog-settings:update
-o, --org string     Organization name or id (required)
--output string      Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string  management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic catalogs

Catalogs operations

Synopsis

Catalogs operations

apic catalogs [flags]

Options

```
--fields string  List of field names to return
--format string  Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for catalogs
--limit int32   Maximum number of items to return
--my           my
--offset int32  Offset item number from list to begin return
-o, --org string Organization name or id (required)
--output string Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic catalogs:clear

Clear the Catalog objects

Synopsis

Clear the Catalog objects

apic catalogs:clear [flags]

Options

```
--confirm string Confirmation for critical updates (required)
--format string  Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for catalogs:clear
-o, --org string Organization name or id (required)
--output string Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic catalogs:create

Create a Catalog object

Synopsis

Create a Catalog object

```
Fields allowed but ignored:
- id
- type
- api_version
- scope
- created_at
- updated_at
- url
- org_url
```

apic catalogs:create [flags]

Options

```
--format string  Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for catalogs:create
-o, --org string Organization name or id (required)
--output string Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic catalogs:delete

Delete the Catalog object by name or id

Synopsis

Delete the Catalog object by name or id

```
apic catalogs:delete [flags]
```

Options

<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for catalogs:delete
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic catalogs:email-to-owners

Send email to owners of consumer organizations

Synopsis

Send email to owners of consumer organizations, given consumer org and consumer group urls. For consumer group, email owners of all consumer orgs in the group.

```
apic catalogs:email-to-owners [flags]
```

Options

<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for catalogs:email-to-owners
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic catalogs:get

Get the Catalog object by name or id

Synopsis

Get the Catalog object by name or id

```
apic catalogs:get [flags]
```

Options

```

--fields string      List of field names to return
--format string     Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help          Help for catalogs:get
-o, --org string    Organization name or id (required)
--output string     Write file(s) to directory, use - for STDOUT. (default: cwd)
-s, --server string management server endpoint (required)

```

Options inherited from parent commands

```

--accept-license    Accept the license for API Connect
--debug            Enable debug output
--debug-output string Write debug output to file
--live-help        Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")

```

apic catalogs:list

List the Catalog objects

Synopsis

List the Catalog objects

```
apic catalogs:list [flags]
```

Options

```

--fields string      List of field names to return
--format string     Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help          Help for catalogs:list
--limit int32       Maximum number of items to return
--my                my
--offset int32      Offset item number from list to begin return
-o, --org string    Organization name or id (required)
--output string     Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)

```

Options inherited from parent commands

```

--accept-license    Accept the license for API Connect
--debug            Enable debug output
--debug-output string Write debug output to file
--live-help        Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")

```

apic catalogs:transfer-owner

Transfer owner to an associate

Synopsis

Transfer owner to an associate

```
apic catalogs:transfer-owner [flags]
```

Options

```

--cascade           Cascade the behavior
--delete_old_owner Delete old owner
--format string     Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
-h, --help          Help for catalogs:transfer-owner
-o, --org string    Organization name or id (required)
--output string     Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)

```

Options inherited from parent commands

```

--accept-license    Accept the license for API Connect
--debug            Enable debug output
--debug-output string Write debug output to file
--live-help        Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")

```

apic catalogs:update

Update the Catalog object by name or id

Synopsis

Update the Catalog object by name or id

```
Fields not allowed:
- name

Fields allowed but ignored:
- id
- type
- api_version
- scope
- created_at
- updated_at
- url
- org_url
```

```
apic catalogs:update [flags]
```

Options

```
--format string  Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for catalogs:update
-o, --org string  Organization name or id (required)
--output string  Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug          Enable debug output
--debug-output string Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic client-creds

Manage the client configuration parameters. Client ID and Client Secret.

Synopsis

Manage the client configuration parameters. Client ID and Client Secret.

```
apic client-creds [flags]
```

Options

```
-g, --global  list the global configuration variables
-h, --help    Help for client-creds
-l, --local  list the local application configuration variables
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug          Enable debug output
--debug-output string Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic client-creds:clear

clear the set client credentials.

Synopsis

clear the set client credentials.

```
apic client-creds:clear [flags]
```

Examples

```
$ apic client-creds:clear
Deleted client credentials.
```

Options

```
-g, --global    list the global configuration variables
-h, --help     Help for client-creds:clear
-l, --local    list the local application configuration variables
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

apic client-creds:list

List the set clientID/secret parameters.

Synopsis

List the set clientID/secret parameters.

```
apic client-creds:list [flags]
```

Examples

```
$ apic client-creds:list
```

Options

```
-g, --global    list the global configuration variables
-h, --help     Help for client-creds:list
-l, --local    list the local application configuration variables
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

apic client-creds:set

Set the client configuration parameters. ClientID and Client Secret.

Synopsis

Set the client configuration parameters. ClientID and Client Secret.

```
apic client-creds:set /path/to/creds/json ... [flags]
```

Examples

```
$ apic client-creds:set /Users/local_user/credential.json
```

Options

```
-g, --global    list the global configuration variables
-h, --help     Help for client-creds:set
-l, --local    list the local application configuration variables
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

apic cloud-emails

Synopsis

Cloud Emails operations

```
apic cloud-emails [flags]
```

Options

```
-h, --help Help for cloud-emails
```

Options inherited from parent commands

```
--accept-license Accept the license for API Connect
--debug Enable debug output
--debug-output string Write debug output to file
--live-help Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic cloud-emails:send-to-owners

Email provider org owners

Synopsis

Send an email to owners of provider orgs

```
apic cloud-emails:send-to-owners [flags]
```

Options

```
--format string Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help Help for cloud-emails:send-to-owners
--output string Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license Accept the license for API Connect
--debug Enable debug output
--debug-output string Write debug output to file
--live-help Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic cloud-settings

Cloud Settings operations

Synopsis

Cloud Settings operations

```
apic cloud-settings [flags]
```

Options

```
-h, --help Help for cloud-settings
```

Options inherited from parent commands

```
--accept-license Accept the license for API Connect
--debug Enable debug output
--debug-output string Write debug output to file
--live-help Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic cloud-settings:about

Return information about the cloud

Synopsis

Return public information about the cloud. You MUST supply the --format option when using this command from the API Connect toolkit.

```
apic cloud-settings:about [flags]
```

Options

--format string	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help	Help for cloud-settings:about
--output string	Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string	management server endpoint (required)

Options inherited from parent commands

--accept-license	Accept the license for API Connect
--debug	Enable debug output
--debug-output string	Write debug output to file
--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

apic cloud-settings:audit-endpoint-test-connection

Test an audit endpoint connection

Synopsis

Test an audit endpoint connection

```
apic cloud-settings:audit-endpoint-test-connection [flags]
```

Options

--format string	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help	Help for cloud-settings:audit-endpoint-test-connection
--output string	Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string	management server endpoint (required)

Options inherited from parent commands

--accept-license	Accept the license for API Connect
--debug	Enable debug output
--debug-output string	Write debug output to file
--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

apic cloud-settings:designer-credentials-list

List credential for designer

Synopsis

List credential for designer

```
apic cloud-settings:designer-credentials-list [flags]
```

Options

--format string	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help	Help for cloud-settings:designer-credentials-list
--output string	Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string	management server endpoint (required)

Options inherited from parent commands

--accept-license	Accept the license for API Connect
--debug	Enable debug output
--debug-output string	Write debug output to file
--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

apic cloud-settings:get

Get the Cloud Setting object

Synopsis

Get the Cloud Setting object

```
apic cloud-settings:get [flags]
```

Options

<code>--fields string</code>	List of field names to return
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for cloud-settings:get
<code>--output string</code>	Write file(s) to directory, use - for STDOUT. (default: cwd)
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic cloud-settings:info

Return public information about the cloud deployment

Synopsis

Return public information about the cloud deployment

```
apic cloud-settings:info [flags]
```

Options

<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for cloud-settings:info
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic cloud-settings:mail-server-configured

Return true or false based on if mail server is configured or not

Synopsis

Return true or false based on if mail server is configured or not. You MUST supply the --format option when using this command from the API Connect toolkit.

```
apic cloud-settings:mail-server-configured [flags]
```

Options

<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for cloud-settings:mail-server-configured
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic cloud-settings:oauth2-certs

Support JWKS_URI endpoint, conform to OIDC specification

Synopsis

Return JWKS that is used to issue token. You MUST supply the --format option when using this command from the API Connect toolkit.

```
apic cloud-settings:oauth2-certs [flags]
```

Options

--format string	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help	Help for cloud-settings:oauth2-certs
--output string	Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string	management server endpoint (required)

Options inherited from parent commands

--accept-license	Accept the license for API Connect
--debug	Enable debug output
--debug-output string	Write debug output to file
--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

apic cloud-settings:toolkit-credentials-list

List credential for toolkit and consumer toolkit

Synopsis

List credential for toolkit and consumer toolkit

```
apic cloud-settings:toolkit-credentials-list [flags]
```

Options

--format string	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help	Help for cloud-settings:toolkit-credentials-list
--output string	Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string	management server endpoint (required)

Options inherited from parent commands

--accept-license	Accept the license for API Connect
--debug	Enable debug output
--debug-output string	Write debug output to file
--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

apic cloud-settings:topology

Return the topology of the cloud for governance

Synopsis

Return the topology of the cloud for governance. You MUST supply the --format option when using this command from the API Connect toolkit.

```
apic cloud-settings:topology [flags]
```

Options

--format string	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help	Help for cloud-settings:topology
--output string	Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string	management server endpoint (required)

Options inherited from parent commands

--accept-license	Accept the license for API Connect
--debug	Enable debug output

```
--debug-output string  Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

apic cloud-settings:update

Update the Cloud Setting object

Synopsis

Update the Cloud Setting object

```
Fields not allowed to be null:
- email_sender
- tls_client_profile_default_url

Fields not allowed:
- service_type
- cloud_id
- ibm_cloud

Fields allowed but ignored:
- name
- type
- api_version
- scope
- created_at
- updated_at
- url
```

```
apic cloud-settings:update [flags]
```

Options

```
--format string  Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help       Help for cloud-settings:update
--output string  Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic config

Manage configuration variables

Synopsis

Manage configuration variables

```
apic config [flags]
```

Options

```
-g, --global  list the global configuration variables
-h, --help    Help for config
-l, --local   list the local application configuration variables
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic config:clear

Delete all configuration variables

Synopsis

Delete all configuration variables

```
apic config:clear [flags]
```

Examples

```
$ apic config:clear
Deleted config catalog
Deleted config org
Deleted config space

$ apic config:clear --global
Deleted config catalog
```

Options

```
-g, --global  list the global configuration variables
-h, --help    Help for config:clear
-l, --local   list the local application configuration variables
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic config:delete

Delete a configuration variable

Synopsis

Configuration variables:

catalog The catalog configuration variable should be set to the URI of an API Connect catalog. The value of the catalog provides the default identity of a catalog for all the commands that are used to manage aspects of a catalog. The default values defined by the catalog's URI can be overridden using the --server, --organization, and --catalog command line options. The catalog URI has the form: `https://MANAGEMENT_SERVER/api/catalogs/ORGANIZATION_NAME/CATALOG_NAME`

org The default value of org defined by the app's or catalog's URI can be set using the org URI. The org URI has the form: `https://MANAGEMENT_SERVER/api/orgs/ORGANIZATION_NAME`

space The space configuration variable should be set to the URI of an API Connect space. The value of the space provides the default identity of a space for all the commands that are used to manage aspects of a space. The default values defined by the spaces's URI can be overridden using the --server, --organization, --catalog, and --space command line options. The space URI has the form: `https://MANAGEMENT_SERVER/api/spaces/ORGANIZATION_NAME/CATALOG_NAME/SPACE_NAME`

consumer The consumer configuration variable should be set to the URI of an API Connect consumer. The value of the consumer-org provides the default identity of a consumer. The default values defined by the consumer URI can be overridden using the --server, --organization, --catalog, and --consumer command line options. The consumer URI has the form: `https://MANAGEMENT_SERVER/api/consumer-orgs/ORGANIZATION_NAME/CATALOG_NAME/CONSUMER_ORG_NAME`

cloud The cloud configuration variable should be set to the management server URI. The value of the cloud variable provides default server URI for cloud admin commands. It can be overridden using the --server and --mode command line options. The cloud URI has the form: `https://MANAGEMENT_SERVER/api/`

mode The value of mode configuration variable defines the toolkit operation mode. It can be overridden using the --mode command line option. The value can be set to apim or consumer

template-path List of places to look for handlebar templates

template-default-api Defines the default api template

template-default-product Defines the default product template

```
apic config:delete NAME... [flags]
```

Examples

```
$ apic config:delete catalog
Deleted config catalog

$ apic config:delete org
Deleted config org

$ apic config:delete template-path
Deleted config template-path
```

Options

```
-g, --global    list the global configuration variables
-h, --help      Help for config:delete
-l, --local     list the local application configuration variables
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic config:get

Get a configuration variable

Synopsis

Configuration variables:

catalog The catalog configuration variable should be set to the URI of an API Connect catalog. The value of the catalog provides the default identity of a catalog for all the commands that are used to manage aspects of a catalog. The default values defined by the catalog's URI can be overridden using the `--server`, `--organization`, and `--catalog` command line options. The catalog URI has the form: `https://MANAGEMENT_SERVER/api/catalogs/ORGANIZATION_NAME/CATALOG_NAME`

org The default value of `org` defined by the app's or catalog's URI can be set using the `org` URI. The `org` URI has the form: `https://MANAGEMENT_SERVER/api/orgs/ORGANIZATION_NAME`

space The space configuration variable should be set to the URI of an API Connect space. The value of the space provides the default identity of a space for all the commands that are used to manage aspects of a space. The default values defined by the space's URI can be overridden using the `--server`, `--organization`, `--catalog`, and `--space` command line options. The space URI has the form: `https://MANAGEMENT_SERVER/api/spaces/ORGANIZATION_NAME/CATALOG_NAME/SPACE_NAME`

consumer The consumer configuration variable should be set to the URI of an API Connect consumer. The value of the `consumer-org` provides the default identity of a consumer. The default values defined by the consumer URI can be overridden using the `--server`, `--organization`, `--catalog`, and `--consumer` command line options. The consumer URI has the form: `https://MANAGEMENT_SERVER/api/consumer-orgs/ORGANIZATION_NAME/CATALOG_NAME/CONSUMER_ORG_NAME`

cloud The cloud configuration variable should be set to the management server URI. The value of the cloud variable provides default server URI for cloud admin commands. It can be overridden using the `--server` and `--mode` command line options. The cloud URI has the form: `https://MANAGEMENT_SERVER/api/`

mode The value of `mode` configuration variable defines the toolkit operation mode. It can be overridden using the `--mode` command line option. The value can be set to `apim` or `consumer`

template-path List of places to look for handlebar templates

template-default-api Defines the default api template

template-default-product Defines the default product template

```
apic config:get NAME [flags]
```

Examples

```
$ apic config:get catalog
catalog: https://mgmthost.com/api/catalogs/climbon/sb
```

```
$ apic config:get org
org: https://mgmthost.com/api/orgs/climbon
```

```
$ apic config:get template-path
template-path: /etc/templates
```

Options

```
-g, --global    list the global configuration variables
-h, --help      Help for config:get
-l, --local     list the local application configuration variables
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic config:list

List the application and global configuration variables

Synopsis

Configuration variables:

catalog The catalog configuration variable should be set to the URI of an API Connect catalog. The value of the catalog provides the default identity of a catalog for all the commands that are used to manage aspects of a catalog. The default values defined by the catalog's URI can be overridden using the `--server`, `--organization`, and `--catalog` command line options. The catalog URI has the form: `https://MANAGEMENT_SERVER/api/catalogs/ORGANIZATION_NAME/CATALOG_NAME`

org The default value of `org` defined by the app's or catalog's URI can be set using the `org` URI. The `org` URI has the form: `https://MANAGEMENT_SERVER/api/orgs/ORGANIZATION_NAME`

space The space configuration variable should be set to the URI of an API Connect space. The value of the space provides the default identity of a space for all the commands that are used to manage aspects of a space. The default values defined by the spaces's URI can be overridden using the `--server`, `--organization`, `--catalog`, and `--space` command line options. The space URI has the form: `https://MANAGEMENT_SERVER/api/spaces/ORGANIZATION_NAME/CATALOG_NAME/SPACE_NAME`

consumer The consumer configuration variable should be set to the URI of an API Connect consumer. The value of the `consumer-org` provides the default identity of a consumer. The default values defined by the consumer URI can be overridden using the `--server`, `--organization`, `--catalog`, and `--consumer` command line options. The consumer URI has the form: `https://MANAGEMENT_SERVER/api/consumer-orgs/ORGANIZATION_NAME/CATALOG_NAME/CONSUMER_ORG_NAME`

cloud The cloud configuration variable should be set to the management server URI. The value of the cloud variable provides default server URI for cloud admin commands. It can be overridden using the `--server` and `--mode` command line options. The cloud URI has the form: `https://MANAGEMENT_SERVER/api/`

mode The value of mode configuration variable defines the toolkit operation mode. It can be overridden using the `--mode` command line option. The value can be set to `apim` or `consumer`

template-path List of places to look for handlebar templates

template-default-api Defines the default api template

template-default-product Defines the default product template

apic config:list [flags]

Examples

```
$ apic config
catalog: https://mgmthost.com/api/catalogs/climbon/sb
org: https://mgmthost.com/api/orgs/climbon
```

```
$ apic config --global
catalog: https://mgmthost.com/api/catlogs/climbon/sb
```

Options

```
-g, --global    list the global configuration variables
-h, --help      Help for config:list
-l, --local     list the local application configuration variables
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

apic config:set

Set or update configuration variables

Synopsis

Configuration variables:

catalog The catalog configuration variable should be set to the URI of an API Connect catalog. The value of the catalog provides the default identity of a catalog for all the commands that are used to manage aspects of a catalog. The default values defined by the catalog's URI can be overridden using the `--server`, `--organization`, and `--catalog` command line options. The catalog URI has the form: `https://MANAGEMENT_SERVER/api/catalogs/ORGANIZATION_NAME/CATALOG_NAME`

org The default value of `org` defined by the app's or catalog's URI can be set using the `org` URI. The `org` URI has the form: `https://MANAGEMENT_SERVER/api/orgs/ORGANIZATION_NAME`

space The space configuration variable should be set to the URI of an API Connect space. The value of the space provides the default identity of a space for all the commands that are used to manage aspects of a space. The default values defined by the spaces's URI can be overridden using the `--server`, `--organization`, `--catalog`, and `--space` command line options. The space URI has the form: `https://MANAGEMENT_SERVER/api/spaces/ORGANIZATION_NAME/CATALOG_NAME/SPACE_NAME`

consumer The consumer configuration variable should be set to the URI of an API Connect consumer. The value of the `consumer-org` provides the default identity of a consumer. The default values defined by the consumer URI can be overridden using the `--server`, `--organization`, `--catalog`, and `--consumer` command line options. The consumer URI has the form: `https://MANAGEMENT_SERVER/api/consumer-orgs/ORGANIZATION_NAME/CATALOG_NAME/CONSUMER_ORG_NAME`

cloud The cloud configuration variable should be set to the management server URI. The value of the cloud variable provides default server URI for cloud admin commands. It can be overridden using the --server and --mode command line options. The cloud URI has the form: https://MANAGEMENT_SERVER/api/

mode The value of mode configuration variable defines the toolkit operation mode. It can be overridden using the --mode command line option. The value can be set to apim or consumer

template-path List of places to look for handlebar templates

template-default-api Defines the default api template

template-default-product Defines the default product template

apic config:set NAME=VALUE ... [flags]

Examples

```
$ apic config:set catalog=https://mgmthost.com/api/catalogs/climbon/sb
catalog: https://mgmthost.com/api/catalogs/climbon/sb
```

```
$ apic config:set org=https://mgmthost2.com/api/orgs/hikeon
org: https://mgmthost2.com/api/orgs/hikeon
```

```
$ apic config:set --global template-path="/etc/templates"
template-path: /etc/templates
```

Options

```
-g, --global list the global configuration variables
-h, --help   Help for config:set
-l, --local  list the local application configuration variables
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

apic configured-api-user-registries

Configured Api User Registries operations

Synopsis

Configured Api User Registries operations

apic configured-api-user-registries [flags]

Options

```
-c, --catalog string  Catalog name or id (required)
--fields string       List of field names to return
--format string       Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help            Help for configured-api-user-registries
--limit int32         Maximum number of items to return
--offset int32        Offset item number from list to begin return
-o, --org string       Organization name or id (required)
--output string       Write file(s) to directory, instead of STDOUT (default "-")
--scope string        scope
-s, --server string   management server endpoint (required)
--space string        Space name or id (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

apic configured-api-user-registries:clear

Configured Api User Registries clear operations

Synopsis

Configured Api User Registries clear operations

```
apic configured-api-user-registries:clear [flags]
```

Options

-c, --catalog string	Catalog name or id (required)
--confirm string	Confirmation for critical updates (required)
--format string	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help	Help for configured-api-user-registries:clear
-o, --org string	Organization name or id (required)
--output string	Write file(s) to directory, instead of STDOUT (default "-")
--scope string	scope
-s, --server string	management server endpoint (required)
--space string	Space name or id (required)

Options inherited from parent commands

--accept-license	Accept the license for API Connect
--debug	Enable debug output
--debug-output string	Write debug output to file
--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

apic configured-api-user-registries:create

Configured Api User Registries create operations

Synopsis

Configured Api User Registries create operations

```
apic configured-api-user-registries:create [flags]
```

Options

-c, --catalog string	Catalog name or id (required)
--format string	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help	Help for configured-api-user-registries:create
-o, --org string	Organization name or id (required)
--output string	Write file(s) to directory, instead of STDOUT (default "-")
--scope string	scope
-s, --server string	management server endpoint (required)
--space string	Space name or id (required)

Options inherited from parent commands

--accept-license	Accept the license for API Connect
--debug	Enable debug output
--debug-output string	Write debug output to file
--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

apic configured-api-user-registries:delete

Configured Api User Registries delete operations

Synopsis

Configured Api User Registries delete operations

```
apic configured-api-user-registries:delete [flags]
```

Options

-c, --catalog string	Catalog name or id (required)
--format string	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help	Help for configured-api-user-registries:delete
-o, --org string	Organization name or id (required)
--output string	Write file(s) to directory, instead of STDOUT (default "-")
--scope string	scope
-s, --server string	management server endpoint (required)
--space string	Space name or id (required)

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic configured-api-user-registries:get

Configured Api User Registries get operations

Synopsis

Configured Api User Registries get operations

```
apic configured-api-user-registries:get [flags]
```

Options

```
-c, --catalog string  Catalog name or id (required)
--fields string      List of field names to return
--format string      Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for configured-api-user-registries:get
-o, --org string      Organization name or id (required)
--output string      Write file(s) to directory, use - for STDOUT. (default: cwd)
--scope string       scope
-s, --server string  management server endpoint (required)
--space string       Space name or id (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic configured-api-user-registries:list

Configured Api User Registries list operations

Synopsis

Configured Api User Registries list operations

```
apic configured-api-user-registries:list [flags]
```

Options

```
-c, --catalog string  Catalog name or id (required)
--fields string      List of field names to return
--format string      Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for configured-api-user-registries:list
--limit int32       Maximum number of items to return
--offset int32      Offset item number from list to begin return
-o, --org string      Organization name or id (required)
--output string      Write file(s) to directory, instead of STDOUT (default "-")
--scope string       scope
-s, --server string  management server endpoint (required)
--space string       Space name or id (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic configured-billings

Configured Billings operations

Synopsis

Configured Billings operations

```
apic configured-billings [flags]
```

Options

```
-c, --catalog string    Catalog name or id (required)
--fields string        List of field names to return
--format string        Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help              Help for configured-billings
--limit int32          Maximum number of items to return
--offset int32         Offset item number from list to begin return
-o, --org string        Organization name or id (required)
--output string        Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string     management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license      Accept the license for API Connect
--debug               Enable debug output
--debug-output string Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

apic configured-billings:clear

Clear the Configured Billing objects

Synopsis

Clear the Configured Billing objects

```
apic configured-billings:clear [flags]
```

Options

```
-c, --catalog string    Catalog name or id (required)
--confirm string        Confirmation for critical updates (required)
--format string        Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help              Help for configured-billings:clear
-o, --org string        Organization name or id (required)
--output string        Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string     management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license      Accept the license for API Connect
--debug               Enable debug output
--debug-output string Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

apic configured-billings:create

Create a Configured Billing object

Synopsis

Create a Configured Billing object

```
Required fields:
- billing_url

Fields allowed but ignored:
- id
- type
- api_version
- scope
- created_at
- updated_at
- url
- org_url
- catalog_url
```

```
apic configured-billings:create [flags]
```

Options

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for configured-billings:create
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic configured-billings:delete

Delete the Configured Billing object by name or id

Synopsis

Delete the Configured Billing object by name or id

```
apic configured-billings:delete [flags]
```

Options

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for configured-billings:delete
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic configured-billings:get

Get the Configured Billing object by name or id

Synopsis

Get the Configured Billing object by name or id

```
apic configured-billings:get [flags]
```

Options

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--fields string</code>	List of field names to return
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for configured-billings:get
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, use - for STDOUT. (default: cwd)
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic configured-billings:list

List the Configured Billing objects

Synopsis

List the Configured Billing objects

```
apic configured-billings:list [flags]
```

Options

```
-c, --catalog string  Catalog name or id (required)
--fields string      List of field names to return
--format string      Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for configured-billings:list
--limit int32        Maximum number of items to return
--offset int32       Offset item number from list to begin return
-o, --org string     Organization name or id (required)
--output string      Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string  management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

apic configured-catalog-user-registries

Configured Catalog User Registries operations

Synopsis

Configured Catalog User Registries operations

```
apic configured-catalog-user-registries [flags]
```

Options

```
-c, --catalog string  Catalog name or id (required)
--fields string      List of field names to return
--format string      Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for configured-catalog-user-registries
--limit int32        Maximum number of items to return
--offset int32       Offset item number from list to begin return
-o, --org string     Organization name or id (required)
--output string      Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string  management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

apic configured-catalog-user-registries:create

Create a Configured Catalog User Registry object

Synopsis

Create a Configured Catalog User Registry object

```
Required fields:
- user_registry_url

Fields allowed but ignored:
- id
- type
- api_version
- scope
- created_at
- updated_at
- url
- org_url
- catalog_url
- user_registry_url
```

```
apic configured-catalog-user-registries:create [flags]
```

Options

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for configured-catalog-user-registries:create
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic configured-catalog-user-registries:delete

Delete the Configured Catalog User Registry object by name or id

Synopsis

Delete the Configured Catalog User Registry object by name or id

```
apic configured-catalog-user-registries:delete [flags]
```

Options

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for configured-catalog-user-registries:delete
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic configured-catalog-user-registries:get

Get the Configured Catalog User Registry object by name or id

Synopsis

Get the Configured Catalog User Registry object by name or id

```
apic configured-catalog-user-registries:get [flags]
```

Options

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--fields string</code>	List of field names to return
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for configured-catalog-user-registries:get
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, use - for STDOUT. (default: cwd)
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic configured-catalog-user-registries:list

List the Configured Catalog User Registry objects

Synopsis

List the Configured Catalog User Registry objects

```
apic configured-catalog-user-registries:list [flags]
```

Options

```
-c, --catalog string    Catalog name or id (required)
--fields string        List of field names to return
--format string        Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help             Help for configured-catalog-user-registries:list
--limit int32         Maximum number of items to return
--offset int32        Offset item number from list to begin return
-o, --org string       Organization name or id (required)
--output string       Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license      Accept the license for API Connect
--debug              Enable debug output
--debug-output string Write debug output to file
--live-help          Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

apic configured-catalog-user-registries:search

Search for users in the catalog user registry

Synopsis

Search for users in the catalog user registry

```
apic configured-catalog-user-registries:search [flags]
```

Options

```
-c, --catalog string    Catalog name or id (required)
--format string        Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help             Help for configured-catalog-user-registries:search
--limit int32         Maximum number of items to return
--offset int32        Offset item number from list to begin return
-o, --org string       Organization name or id (required)
--output string       Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license      Accept the license for API Connect
--debug              Enable debug output
--debug-output string Write debug output to file
--live-help          Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

apic configured-gateway-services

Configured Gateway Services operations

Synopsis

Configured Gateway Services operations

```
apic configured-gateway-services [flags]
```

Options

```
-c, --catalog string    Catalog name or id (required)
--fields string        List of field names to return
```

--format string	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help	Help for configured-gateway-services
--limit int32	Maximum number of items to return
--offset int32	Offset item number from list to begin return
-o, --org string	Organization name or id (required)
--output string	Write file(s) to directory, instead of STDOUT (default "-")
--scope string	scope
-s, --server string	management server endpoint (required)
--space string	Space name or id (required)

Options inherited from parent commands

--accept-license	Accept the license for API Connect
--debug	Enable debug output
--debug-output string	Write debug output to file
--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

apic configured-gateway-services:clear

Configured Gateway Services clear operations

Synopsis

Configured Gateway Services clear operations

```
apic configured-gateway-services:clear [flags]
```

Options

-c, --catalog string	Catalog name or id (required)
--confirm string	Confirmation for critical updates (required)
--format string	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help	Help for configured-gateway-services:clear
-o, --org string	Organization name or id (required)
--output string	Write file(s) to directory, instead of STDOUT (default "-")
--scope string	scope
-s, --server string	management server endpoint (required)
--space string	Space name or id (required)

Options inherited from parent commands

--accept-license	Accept the license for API Connect
--debug	Enable debug output
--debug-output string	Write debug output to file
--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

apic configured-gateway-services:create

Configured Gateway Services create operations

Synopsis

Configured Gateway Services create operations

```
apic configured-gateway-services:create [flags]
```

Options

-c, --catalog string	Catalog name or id (required)
--format string	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help	Help for configured-gateway-services:create
-o, --org string	Organization name or id (required)
--output string	Write file(s) to directory, instead of STDOUT (default "-")
--scope string	scope
-s, --server string	management server endpoint (required)
--space string	Space name or id (required)

Options inherited from parent commands

--accept-license	Accept the license for API Connect
--debug	Enable debug output
--debug-output string	Write debug output to file
--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

apic configured-gateway-services:delete

Configured Gateway Services delete operations

Synopsis

Configured Gateway Services delete operations

```
apic configured-gateway-services:delete [flags]
```

Options

```
-c, --catalog string    Catalog name or id (required)
--format string        Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help             Help for configured-gateway-services:delete
-o, --org string       Organization name or id (required)
--output string        Write file(s) to directory, instead of STDOUT (default "-")
--scope string         scope
-s, --server string    management server endpoint (required)
--space string         Space name or id (required)
```

Options inherited from parent commands

```
--accept-license      Accept the license for API Connect
--debug              Enable debug output
--debug-output string Write debug output to file
--live-help          Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

apic configured-gateway-services:get

Configured Gateway Services get operations

Synopsis

Configured Gateway Services get operations

```
apic configured-gateway-services:get [flags]
```

Options

```
-c, --catalog string    Catalog name or id (required)
--fields string        List of field names to return
--format string        Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help             Help for configured-gateway-services:get
-o, --org string       Organization name or id (required)
--output string        Write file(s) to directory, use - for STDOUT. (default: cwd)
--scope string         scope
-s, --server string    management server endpoint (required)
--space string         Space name or id (required)
```

Options inherited from parent commands

```
--accept-license      Accept the license for API Connect
--debug              Enable debug output
--debug-output string Write debug output to file
--live-help          Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

apic configured-gateway-services:list

Configured Gateway Services list operations

Synopsis

Configured Gateway Services list operations

```
apic configured-gateway-services:list [flags]
```

Options

```
-c, --catalog string    Catalog name or id (required)
--fields string        List of field names to return
```

```

--format string      Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help          Help for configured-gateway-services:list
--limit int32       Maximum number of items to return
--offset int32      Offset item number from list to begin return
-o, --org string     Organization name or id (required)
--output string     Write file(s) to directory, instead of STDOUT (default "-")
--scope string      scope
-s, --server string management server endpoint (required)
--space string      Space name or id (required)

```

Options inherited from parent commands

```

--accept-license    Accept the license for API Connect
--debug            Enable debug output
--debug-output string Write debug output to file
--live-help        Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")

```

apic configured-oauth-providers

Configured OAuth Providers operations

Synopsis

Configured OAuth Providers operations

```
apic configured-oauth-providers [flags]
```

Options

```

-c, --catalog string  Catalog name or id (required)
--fields string       List of field names to return
--format string       Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for configured-oauth-providers
--limit int32        Maximum number of items to return
--offset int32       Offset item number from list to begin return
-o, --org string      Organization name or id (required)
--output string       Write file(s) to directory, instead of STDOUT (default "-")
--scope string        scope
-s, --server string  management server endpoint (required)
--space string        Space name or id (required)

```

Options inherited from parent commands

```

--accept-license    Accept the license for API Connect
--debug            Enable debug output
--debug-output string Write debug output to file
--live-help        Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")

```

apic configured-oauth-providers:clear

Configured OAuth Providers clear operations

Synopsis

Configured OAuth Providers clear operations

```
apic configured-oauth-providers:clear [flags]
```

Options

```

-c, --catalog string  Catalog name or id (required)
--confirm string     Confirmation for critical updates (required)
--format string       Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for configured-oauth-providers:clear
-o, --org string      Organization name or id (required)
--output string       Write file(s) to directory, instead of STDOUT (default "-")
--scope string        scope
-s, --server string  management server endpoint (required)
--space string        Space name or id (required)

```

Options inherited from parent commands

```

--accept-license    Accept the license for API Connect
--debug            Enable debug output
--debug-output string Write debug output to file

```

<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic configured-oauth-providers:create

Configured OAuth Providers create operations

Synopsis

Configured OAuth Providers create operations

```
apic configured-oauth-providers:create [flags]
```

Options

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for configured-oauth-providers:create
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>--scope string</code>	scope
<code>-s, --server string</code>	management server endpoint (required)
<code>--space string</code>	Space name or id (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic configured-oauth-providers:delete

Configured OAuth Providers delete operations

Synopsis

Configured OAuth Providers delete operations

```
apic configured-oauth-providers:delete [flags]
```

Options

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for configured-oauth-providers:delete
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")

--fields string        List of field names to return
--format string        Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help             Help for configured-tls-client-profiles:get
--id                   id
-o, --org string       Organization name or id (required)
--output string        Write file(s) to directory, use - for STDOUT. (default: cwd)
--scope string         scope
-s, --server string    management server endpoint (required)
--space string         Space name or id (required)
```

Options inherited from parent commands

```
--accept-license      Accept the license for API Connect
--debug               Enable debug output
```

```
--debug-output string  Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

apic configured-tls-client-profiles:list

Configured Tls Client Profiles list operations

Synopsis

Configured Tls Client Profiles list operations

```
apic configured-tls-client-profiles:list [flags]
```

Options

```
-c, --catalog string  Catalog name or id (required)
--fields string      List of field names to return
--format string      Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for configured-tls-client-profiles:list
--limit int32        Maximum number of items to return
--offset int32       Offset item number from list to begin return
-o, --org string     Organization name or id (required)
--output string      Write file(s) to directory, instead of STDOUT (default "-")
--scope string       scope
-s, --server string  management server endpoint (required)
--space string       Space name or id (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic configured-tls-client-profiles:list-all

Configured Tls Client Profiles list-all operations

Synopsis

Configured Tls Client Profiles list-all operations

```
apic configured-tls-client-profiles:list-all [flags]
```

Options

```
-c, --catalog string  Catalog name or id (required)
--fields string      List of field names to return
--format string      Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for configured-tls-client-profiles:list-all
--limit int32        Maximum number of items to return
--offset int32       Offset item number from list to begin return
-o, --org string     Organization name or id (required)
--output string      Write file(s) to directory, instead of STDOUT (default "-")
--scope string       scope
-s, --server string  management server endpoint (required)
--space string       Space name or id (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic consumer-org-settings

Consumer Org Settings operations

Synopsis

`apic consumer-org-settings [flags]`

Options

`-h, --help` Help for consumer-org-settings

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic consumer-org-settings:delete

Delete the Consumer Organization Setting object

Synopsis

Delete the Consumer Organization Setting object

`apic consumer-org-settings:delete [flags]`

Options

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--consumer-org string</code>	Consumer Organization name or id (required)
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for consumer-org-settings:delete
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)
<code>--space string</code>	Space name or id (required)
<code>--space-initiated</code>	space-initiated

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic consumer-org-settings:get

Get the Consumer Organization Setting object

Synopsis

Get the Consumer Organization Setting object

`apic consumer-org-settings:get [flags]`

Options

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--consumer-org string</code>	Consumer Organization name or id (required)
<code>--fields string</code>	List of field names to return
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for consumer-org-settings:get
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, use - for STDOUT. (default: cwd)
<code>-s, --server string</code>	management server endpoint (required)
<code>--space string</code>	Space name or id (required)
<code>--space-initiated</code>	space-initiated

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file

```
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic consumer-org-settings:update

Update the Consumer Organization Setting object

Synopsis

Update the Consumer Organization Setting object

```
Fields allowed but ignored:
- name
- type
- api_version
- scope
- created_at
- updated_at
- url
```

```
apic consumer-org-settings:update [flags]
```

Options

```
-c, --catalog string      Catalog name or id (required)
--consumer-org string    Consumer Organization name or id (required)
--format string          Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
-h, --help               Help for consumer-org-settings:update
-o, --org string         Organization name or id (required)
--output string          Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string      management server endpoint (required)
--space string           Space name or id (required)
--space-initiated       space-initiated
```

Options inherited from parent commands

```
--accept-license      Accept the license for API Connect
--debug               Enable debug output
--debug-output string Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

apic consumer-orgs

Consumer Orgs operations

Synopsis

Consumer Orgs operations

```
apic consumer-orgs [flags]
```

Options

```
-c, --catalog string      Catalog name or id (required)
--expand string          List of transient field to expand
--fields string          List of field names to return
--format string          Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
-h, --help               Help for consumer-orgs
--limit int32            Maximum number of items to return
--offset int32           Offset item number from list to begin return
-o, --org string         Organization name or id (required)
--output string          Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string      management server endpoint (required)
--space string           Space name or id (required)
--space-initiated       space-initiated
```

Options inherited from parent commands

```
--accept-license      Accept the license for API Connect
--debug               Enable debug output
--debug-output string Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

apic consumer-orgs:clear

Clear the Consumer Organization objects

Synopsis

Clear the Consumer Organization objects

```
apic consumer-orgs:clear [flags]
```

Options

```
-c, --catalog string    Catalog name or id (required)
--confirm string       Confirmation for critical updates (required)
--format string        Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
-h, --help             Help for consumer-orgs:clear
-o, --org string       Organization name or id (required)
--output string        Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string    management server endpoint (required)
--space string         Space name or id (required)
--space-initiated     space-initiated
```

Options inherited from parent commands

```
--accept-license      Accept the license for API Connect
--debug               Enable debug output
--debug-output string Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

apic consumer-orgs:create

Create a Consumer Organization object

Synopsis

Create a Consumer Organization object

```
Required fields:
- owner_url

Fields allowed but ignored:
- id
- type
- api_version
- scope
- created_at
- updated_at
- url
- org_url
- catalog_url
```

```
apic consumer-orgs:create [flags]
```

Options

```
-c, --catalog string    Catalog name or id (required)
--format string        Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
-h, --help             Help for consumer-orgs:create
-o, --org string       Organization name or id (required)
--output string        Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string    management server endpoint (required)
--space string         Space name or id (required)
--space-initiated     space-initiated
```

Options inherited from parent commands

```
--accept-license      Accept the license for API Connect
--debug               Enable debug output
--debug-output string Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

apic consumer-orgs:delete

Delete the Consumer Organization object by name or id

Synopsis

Delete the Consumer Organization object by name or id

```
apic consumer-orgs:delete [flags]
```

Options

```
-c, --catalog string    Catalog name or id (required)
--format string        Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
-h, --help             Help for consumer-orgs:delete
-o, --org string       Organization name or id (required)
--output string        Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string    management server endpoint (required)
--space string         Space name or id (required)
--space-initiated     space-initiated
```

Options inherited from parent commands

```
--accept-license      Accept the license for API Connect
--debug               Enable debug output
--debug-output string Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

apic consumer-orgs:get

Get the Consumer Organization object by name or id

Synopsis

Get the Consumer Organization object by name or id

```
apic consumer-orgs:get [flags]
```

Options

```
-c, --catalog string    Catalog name or id (required)
--fields string        List of field names to return
--format string        Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
-h, --help             Help for consumer-orgs:get
-o, --org string       Organization name or id (required)
--output string        Write file(s) to directory, use - for STDOUT. (default: cwd)
-s, --server string    management server endpoint (required)
--space string         Space name or id (required)
--space-initiated     space-initiated
```

Options inherited from parent commands

```
--accept-license      Accept the license for API Connect
--debug               Enable debug output
--debug-output string Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

apic consumer-orgs:list

List the Consumer Organization objects

Synopsis

List the Consumer Organization objects

```
apic consumer-orgs:list [flags]
```

Options

```
-c, --catalog string    Catalog name or id (required)
--expand string        List of transient field to expand
--fields string        List of field names to return
--format string        Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
```

```

-h, --help                Help for consumer-orgs:list
--limit int32             Maximum number of items to return
--offset int32           Offset item number from list to begin return
-o, --org string          Organization name or id (required)
--output string           Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string       management server endpoint (required)
--space string            Space name or id (required)
--space-initiated        space-initiated

```

Options inherited from parent commands

```

--accept-license          Accept the license for API Connect
--debug                  Enable debug output
--debug-output string     Write debug output to file
--live-help              Enable or disable tracking of limited usage information
-m, --mode string         Toolkit operation mode (default "apim")

```

apic consumer-orgs:transfer-owner

Transfer owner to an associate

Synopsis

Transfer owner to an associate

```
apic consumer-orgs:transfer-owner [flags]
```

Options

```

--cascade                Cascade the behavior
-c, --catalog string      Catalog name or id (required)
--delete_old_owner        Delete old owner
--format string           Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
-h, --help                Help for consumer-orgs:transfer-owner
-o, --org string          Organization name or id (required)
--output string           Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string       management server endpoint (required)
--space string            Space name or id (required)
--space-initiated        space-initiated

```

Options inherited from parent commands

```

--accept-license          Accept the license for API Connect
--debug                  Enable debug output
--debug-output string     Write debug output to file
--live-help              Enable or disable tracking of limited usage information
-m, --mode string         Toolkit operation mode (default "apim")

```

apic consumer-orgs:update

Update the Consumer Organization object by name or id

Synopsis

Update the Consumer Organization object by name or id

```

Fields allowed but ignored:
- id
- type
- api_version
- scope
- created_at
- updated_at
- url
- org_url
- catalog_url

```

```
apic consumer-orgs:update [flags]
```

Options

```

-c, --catalog string      Catalog name or id (required)
--fields string           List of field names to return
--format string           Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
-h, --help                Help for consumer-orgs:update
-o, --org string          Organization name or id (required)
--output string           Write file(s) to directory, instead of STDOUT (default "-")

```

```
-s, --server string      management server endpoint (required)
--space string          Space name or id (required)
--space-initiated      space-initiated
```

Options inherited from parent commands

```
--accept-license      Accept the license for API Connect
--debug              Enable debug output
--debug-output string Write debug output to file
--live-help          Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

apic create

Create an API or product definition

Synopsis

Create an API or product definition

```
apic create [flags]
```

Options

```
-h, --help          Help for create
-i, --interactive   use interactive mode
```

Options inherited from parent commands

```
--accept-license      Accept the license for API Connect
--debug              Enable debug output
--debug-output string Write debug output to file
--live-help          Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

apic create:api

Create an OpenAPI (Swagger) definition

Synopsis

Create an OpenAPI (Swagger) definition

```
apic create:api [flags]
```

Examples

Create an API

```
$ apic create:api --title Routes
Created routes.yaml API definition [routes:1.0.0]
```

Create an API and generate a product referencing the API

```
$ apic create:api --title Routes --product "Climb On"
Created routes.yaml API definition [routes:1.0.0]
Created climb-on.yaml product definition [climb-on:1.0.0]
```

Create an API interactively

```
$ apic create:api
Title: Routes
Name (routes): routes
File (routes.yaml): routes.yaml
Template: ()
Basepath (/routes): /routes
Hostname ($(catalog.host)): $(catalog.host)
Schemes:
Target url: ()
Create product [true]: true
Product title (Routes Product): Climb On
Product name (climb-on): climb-on
Product file (climb-on.yaml): climb-on.yaml
Created routes.yaml API definition [routes:1.0.0]
Created climb-on.yaml product definition [climb-on:1.0.0]
```

Create an API from a WSDL document

```
$ apic create:api --wsdl globalweather.wsdl
Created globalweather.yaml API definition [globalweather.yaml:1.0.0]
```

Create an API using APIC's default OAuth 2 provider template

```
$ apic create:api --title "OAuth2 Provider" --template oauth2
```

```
Created oauth2-provider.yaml API definition [oauth2-provider:1.0.0]
```

Create an API using one of your templates

```
$ apic config:set --global template-path="/etc/templates"
$ ls /etc/templates
proxy.hbs staging.hbs
$ apic create:api --title "Proxy Provider" --template proxy
Created proxy-provider.yaml API definition [proxy-provider:1.0.0]
```

Create an API using your default template

```
$ apic config:set --global template-path="/etc/templates"
$ ls /etc/templates
proxy.hbs staging.hbs
$ apic config:set --global template-default-api=staging
$ apic create:api --title "Staging Provider"
Created staging-provider.yaml API definition [staging-provider:1.0.0]
```

Options

```
--api_type string      The type of api (rest, wsdl-to-rest, or wsdl) (default "wsdl")
--basepath string      basepath value (default derived from name)
--disable_ws_security  Disable generation of WS-Security definitions in api
--filename string      filename (default derived from name)
--gateway-type string  The type of the gateway (datapower-gateway, datapower-api-gateway, event-gateway) (default
"datapower-gateway")
-h, --help             Help for create:api
--hostname string      host value (default $(catalog.host))
-i, --interactive      use interactive mode
--name string          x-ibm-name value (default derived from title)
--product string       generate a product definition referencing the API
--schemes string       list of schemes (valid options are http, https, ws and wss)
--services string      service names separated by space
--target-url string    target url
--template string      use a provider template (if empty defaults to apic template)
--title string         title value (required)
-v, --version string   version value (default "1.0.0")
--wsdl string          wsdl file to use as the source (required authentication via apic login)
```

Options inherited from parent commands

```
--accept-license      Accept the license for API Connect
--debug               Enable debug output
--debug-output string Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

apic create:product

Create a product definition

Synopsis

Create a product definition

```
apic create:product [flags]
```

Examples

Create a product

```
$ apic create:product --title "Climb On"
Created climb-on.yaml product definition [climb-on:1.0.0]
```

Create a product interactively

```
$ apic create:product
? Title: Climb On
? Name: climb-on
? File: climb-on.yaml
? Template:
? API Files:
Created climb-on.yaml product definition [climb-on:1.0.0]
```

Create a product referencing existing APIs

```
$ apic create:product --title "Climb On" --apis "routes.yaml ascents.yaml"
Created climb-on.yaml product definition [climb-on:1.0.0]
```

Create an product using one of your templates

```
$ apic config:set --global template-path="/etc/templates"
$ ls /etc/templates
proxy-product.hbs staging-product.hbs
$ apic create:product --title "Proxy Product" --template proxy
Created proxy-product.yaml product definition [proxy-product:1.0.0]
```

Create a product using your default template

```
$ apic config:set --global template-path="/etc/templates"
$ ls /etc/templates
proxy-product.hbs staging-product.hbs
$ apic config:set --global template-default-product=staging
$ apic create:product --title "Staging Product"
Created staging-product.yaml product definition [staging-product:1.0.0]
```

Options

<code>--apis string</code>	api file names separated by a space
<code>--filename string</code>	filename (default derived from name)
<code>--gateway-type string</code>	The type of the gateway (datapower-gateway, datapower-api-gateway, event-gateway) (default "datapower-gateway")
<code>-h, --help</code>	Help for create:product
<code>-i, --interactive</code>	use interactive mode
<code>--name string</code>	x-ibm-name value (default derived from title)
<code>--template string</code>	use a provider template (if empty defaults to apic template)
<code>--title string</code>	title value (required)
<code>-v, --version string</code>	version value (default "1.0.0")

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic credentials

Credentials operations

Synopsis

Credentials operations

`apic credentials [flags]`

Options

<code>-a, --app string</code>	Application name or id (required)
<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--consumer-org string</code>	Consumer Organization name or id (required)
<code>--fields string</code>	List of field names to return
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for credentials
<code>--limit int32</code>	Maximum number of items to return
<code>--offset int32</code>	Offset item number from list to begin return
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>--scope string</code>	scope
<code>-s, --server string</code>	management server endpoint (required)
<code>--space string</code>	Space name or id (required)
<code>--space-initiated</code>	space-initiated

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic credentials:clear

Credentials clear operations

Synopsis

Credentials clear operations

`apic credentials:clear [flags]`

Options

<code>-a, --app string</code>	Application name or id (required)
<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--confirm string</code>	Confirmation for critical updates (required)
<code>--consumer-org string</code>	Consumer Organization name or id (required)
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for credentials:clear
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")

```
-s, --server string      management server endpoint (required)
--space string          Space name or id (required)
--space-initiated      space-initiated
```

Options inherited from parent commands

```
--accept-license      Accept the license for API Connect
--debug               Enable debug output
--debug-output string Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

apic credentials:create

Create a Application Credential object

Synopsis

Create a Application Credential object

```
Fields allowed but ignored:
- id
- type
- api_version
- scope
- created_at
- updated_at
- url
- org_url
- catalog_url
- consumer_org_url
- app_url
```

```
apic credentials:create [flags]
```

Options

```
-a, --app string      Application name or id (required)
-c, --catalog string  Catalog name or id (required)
--consumer-org string Consumer Organization name or id (required)
--format string       Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
-h, --help            Help for credentials:create
-o, --org string      Organization name or id (required)
--output string       Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string   management server endpoint (required)
--space string        Space name or id (required)
--space-initiated    space-initiated
```

Options inherited from parent commands

```
--accept-license      Accept the license for API Connect
--debug               Enable debug output
--debug-output string Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

apic credentials:delete

Delete the Application Credential object by name or id

Synopsis

Delete the Application Credential object by name or id

```
apic credentials:delete [flags]
```

Options

```
-a, --app string      Application name or id (required)
-c, --catalog string  Catalog name or id (required)
--consumer-org string Consumer Organization name or id (required)
--format string       Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
-h, --help            Help for credentials:delete
-o, --org string      Organization name or id (required)
--output string       Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string   management server endpoint (required)
```

```
--space string      Space name or id (required)
--space-initiated  space-initiated
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic credentials:get

Get the Application Credential object by name or id

Synopsis

Get the Application Credential object by name or id

```
apic credentials:get [flags]
```

Options

```
-a, --app string      Application name or id (required)
-c, --catalog string  Catalog name or id (required)
--consumer-org string Consumer Organization name or id (required)
--fields string       List of field names to return
--format string       Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
-h, --help            Help for credentials:get
-o, --org string      Organization name or id (required)
--output string       Write file(s) to directory, use - for STDOUT. (default: cwd)
-s, --server string   management server endpoint (required)
--space string        Space name or id (required)
--space-initiated    space-initiated
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic credentials:list

List the Application Credential objects

Synopsis

List the Application Credential objects

```
apic credentials:list [flags]
```

Options

```
-a, --app string      Application name or id (required)
-c, --catalog string  Catalog name or id (required)
--consumer-org string Consumer Organization name or id (required)
--fields string       List of field names to return
--format string       Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
-h, --help            Help for credentials:list
--limit int32         Maximum number of items to return
--offset int32        Offset item number from list to begin return
-o, --org string      Organization name or id (required)
--output string       Write file(s) to directory, instead of STDOUT (default "-")
--scope string        scope
-s, --server string   management server endpoint (required)
--space string        Space name or id (required)
--space-initiated    space-initiated
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
```

```
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic credentials:reset-client-secret

Reset the client secret

Synopsis

Reset the client secret

```
apic credentials:reset-client-secret [flags]
```

Options

```
-a, --app string      Application name or id (required)
-c, --catalog string  Catalog name or id (required)
--consumer-org string Consumer Organization name or id (required)
--format string       Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
-h, --help            Help for credentials:reset-client-secret
-o, --org string       Organization name or id (required)
--output string       Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string   management server endpoint (required)
--space string        Space name or id (required)
--space-initiated     space-initiated
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic credentials:reset

Reset the client id and client secret

Synopsis

Reset the client id and client secret

```
apic credentials:reset [flags]
```

Options

```
-a, --app string      Application name or id (required)
-c, --catalog string  Catalog name or id (required)
--consumer-org string Consumer Organization name or id (required)
--format string       Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
-h, --help            Help for credentials:reset
-o, --org string       Organization name or id (required)
--output string       Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string   management server endpoint (required)
--space string        Space name or id (required)
--space-initiated     space-initiated
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic credentials:update

Update the Application Credential object by name or id

Synopsis

Update the Application Credential object by name or id

```
Fields not allowed to be null:
- client_id

Fields allowed but ignored:
- id
- type
- api_version
- scope
- created_at
- updated_at
- url
- org_url
- catalog_url
- consumer_org_url
- app_url
```

```
apic credentials:update [flags]
```

Options

-a, --app string	Application name or id (required)
-c, --catalog string	Catalog name or id (required)
--consumer-org string	Consumer Organization name or id (required)
--format string	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.	
-h, --help	Help for credentials:update
-o, --org string	Organization name or id (required)
--output string	Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string	management server endpoint (required)
--space string	Space name or id (required)
--space-initiated	space-initiated

Options inherited from parent commands

--accept-license	Accept the license for API Connect
--debug	Enable debug output
--debug-output string	Write debug output to file
--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

apic credentials:verify-client-secret

Verify the client secret

Synopsis

Verify the client secret

```
apic credentials:verify-client-secret [flags]
```

Options

-a, --app string	Application name or id (required)
-c, --catalog string	Catalog name or id (required)
--consumer-org string	Consumer Organization name or id (required)
--format string	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.	
-h, --help	Help for credentials:verify-client-secret
-o, --org string	Organization name or id (required)
--output string	Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string	management server endpoint (required)
--space string	Space name or id (required)
--space-initiated	space-initiated

Options inherited from parent commands

--accept-license	Accept the license for API Connect
--debug	Enable debug output
--debug-output string	Write debug output to file
--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

apic draft-apis

Draft Apis operations

Synopsis

Draft Apis operations

```
apic draft-apis [flags]
```

Options

```
--fields string  List of field names to return
--format string  Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for draft-apis
--limit int32   Maximum number of items to return
--offset int32  Offset item number from list to begin return
-o, --org string Organization name or id (required)
--output string Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic draft-apis:clear-all

Clear all Draft API objects in all collections

Synopsis

Clear all Draft API objects in all collections

```
apic draft-apis:clear-all [flags]
```

Options

```
--confirm string Confirmation for critical updates (required)
--format string  Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for draft-apis:clear-all
-o, --org string Organization name or id (required)
--output string Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic draft-apis:clear

Clear the Draft API objects

Synopsis

Clear the Draft API objects

```
apic draft-apis:clear [flags]
```

Options

```
--confirm string Confirmation for critical updates (required)
--format string  Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for draft-apis:clear
-o, --org string Organization name or id (required)
--output string Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic draft-apis:clone

Clone the draft-api objects

Synopsis

Clone the draft-api objects

```
apic draft-apis:clone [flags]
```

Options

```
--fields string    List of field names to return
--format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help         Help for draft-apis:clone
--limit int32     Maximum number of items to return
--offset int32    Offset item number from list to begin return
-o, --org string   Organization name or id (required)
--output string   Write file(s) to directory, use - for STDOUT. (default: cwd)
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic draft-apis:create

Create a Draft API object

Synopsis

Create a Draft API object

```
Fields allowed but ignored:
- id
- type
- api_version
- scope
- created_at
- updated_at
- url
- org_url
```

```
apic draft-apis:create [flags]
```

Options

```
--api_type string    The type of api (asynccapi, rest, graphql, wsd1_to_rest, or wsd1)
--assembly_type string The type of the assembly to generate (rest_to_proxy)
--disable_ws_security Disable generation of WS-Security definitions in api
--format string      Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
--gateway_type string The type of the gateway (datapower-gateway, datapower-api-gateway, event-gateway)
-h, --help           Help for draft-apis:create
-o, --org string     Organization name or id (required)
--output string     Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string  management server endpoint (required)
--wsdl_service string Name of WSDL service to create the OpenAPI definition from
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic draft-apis:delete

Delete a Draft API

Synopsis

Delete a Draft API

```
apic draft-apis:delete [flags]
```

Options

<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for draft-apis:delete
<code>--id</code>	id
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic draft-apis:document

Get the Draft API document by name and version

Synopsis

Get the Draft API document by name and version

```
apic draft-apis:document [flags]
```

Options

<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for draft-apis:document
<code>--id</code>	id
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic draft-apis:get

Get the Draft API object by name and version

Synopsis

Get the Draft API object by name and version

```
apic draft-apis:get [flags]
```

Options

<code>--fields string</code>	List of field names to return (default "add(wsd1,draft_api)")
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for draft-apis:get
<code>--id</code>	id
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, use - for STDOUT. (default: cwd)
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file

```
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic draft-apis:list

List the Draft API objects

Synopsis

List the Draft API objects

```
apic draft-apis:list [flags]
```

Options

```
--fields string List of field names to return
--format string Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for draft-apis:list
--limit int32   Maximum number of items to return
--offset int32  Offset item number from list to begin return
-o, --org string Organization name or id (required)
--output string Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license Accept the license for API Connect
--debug          Enable debug output
--debug-output string Write debug output to file
--live-help     Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic draft-apis:list-all

List all Draft API objects in all collections

Synopsis

List all Draft API objects in all collections

```
apic draft-apis:list-all [flags]
```

Options

```
--fields string List of field names to return
--format string Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for draft-apis:list-all
--limit int32   Maximum number of items to return
--offset int32  Offset item number from list to begin return
-o, --org string Organization name or id (required)
--output string Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license Accept the license for API Connect
--debug          Enable debug output
--debug-output string Write debug output to file
--live-help     Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic draft-apis:update

Update the Draft API object by name and version

Synopsis

Update the Draft API object by name and version

```
Fields allowed but ignored:
- id
- type
- api_version
- scope
```

```
- created_at
- updated_at
- url
- org_url
```

```
apic draft-apis:update [flags]
```

Options

```
--api_type string      The type of api (asynccapi, rest, graphql, wsdl_to_rest, or wsdl)
--disable_ws_security  Disable generation of WS-Security definitions in api
--format string        Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
-h, --help            Help for draft-apis:update
--id                  id
-o, --org string       Organization name or id (required)
--output string       Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string   management server endpoint (required)
--wsdl_service string Name of WSDL service to create the OpenAPI definition from
```

Options inherited from parent commands

```
--accept-license      Accept the license for API Connect
--debug               Enable debug output
--debug-output string Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

apic draft-apis:update-wsdl

Update with a new wsdl

Synopsis

Update with a new wsdl

```
apic draft-apis:update-wsdl [flags]
```

Options

```
--format string      Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for draft-apis:update-wsdl
--id                 id
-o, --org string      Organization name or id (required)
--output string      Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license      Accept the license for API Connect
--debug               Enable debug output
--debug-output string Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

apic draft-apis:validate

Validate the draft api

Synopsis

Validate the draft api

```
apic draft-apis:validate [flags]
```

Options

```
--catalog_name string Name of a catalog
--format string        Output format. One of [json yaml octet-stream go-template=... go-template-file=...],
defaults to yaml.
--gateway_service_names string Names of Gateway Services
-h, --help            Help for draft-apis:validate
--id                  id
-o, --org string       Organization name or id (required)
--output string       Write file(s) to directory, instead of STDOUT (default "-")
--scope string         scope
-s, --server string   management server endpoint (required)
--space_name string   Name of a space
```

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic draft-apis:wsdl

Get the Draft API wsdl document by name and version

Synopsis

Get the Draft API wsdl document by name and version

```
apic draft-apis:wsdl [flags]
```

Options

<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for draft-apis:wsdl
<code>--id</code>	id
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, use - for STDOUT. (default: cwd)
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic draft-products

Draft Products operations

Synopsis

Draft Products operations

```
apic draft-products [flags]
```

Options

<code>--fields string</code>	List of field names to return
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for draft-products
<code>--limit int32</code>	Maximum number of items to return
<code>--offset int32</code>	Offset item number from list to begin return
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic draft-products:clear-all

Clear all Draft Product objects in all collections

Synopsis

Clear all Draft Product objects in all collections

```
apic draft-products:clear-all [flags]
```

Options

<code>--confirm</code> string	Confirmation for critical updates (required)
<code>--format</code> string	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for draft-products:clear-all
<code>-o, --org</code> string	Organization name or id (required)
<code>--output</code> string	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server</code> string	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output</code> string	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode</code> string	Toolkit operation mode (default "apim")

apic draft-products:clear

Clear the Draft Product objects

Synopsis

Clear the Draft Product objects

```
apic draft-products:clear [flags]
```

Options

<code>--confirm</code> string	Confirmation for critical updates (required)
<code>--format</code> string	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for draft-products:clear
<code>-o, --org</code> string	Organization name or id (required)
<code>--output</code> string	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server</code> string	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output</code> string	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode</code> string	Toolkit operation mode (default "apim")

apic draft-products:clone

Clone the draft-product objects

Synopsis

Clone the draft-product objects

```
apic draft-products:clone [flags]
```

Options

<code>--fields</code> string	List of field names to return
<code>--format</code> string	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for draft-products:clone
<code>--limit</code> int32	Maximum number of items to return
<code>--offset</code> int32	Offset item number from list to begin return
<code>-o, --org</code> string	Organization name or id (required)
<code>--output</code> string	Write file(s) to directory, use - for STDOUT. (default: cwd)
<code>-s, --server</code> string	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output</code> string	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode</code> string	Toolkit operation mode (default "apim")

apic draft-products:create

Create a Draft Product object

Synopsis

Create a Draft Product object

```
Fields allowed but ignored:  
- id  
- type  
- api_version  
- scope  
- created_at  
- updated_at  
- url  
- org_url
```

```
apic draft-products:create [flags]
```

Options

```
--format string  Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.  
-h, --help      Help for draft-products:create  
-o, --org string Organization name or id (required)  
--output string Write file(s) to directory, instead of STDOUT (default "-")  
--product-only  Upload only the product document  
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect  
--debug           Enable debug output  
--debug-output string Write debug output to file  
--live-help      Enable or disable tracking of limited usage information  
-m, --mode string Toolkit operation mode (default "apim")
```

apic draft-products:delete

Delete a Draft Product

Synopsis

Delete a Draft Product

```
apic draft-products:delete [flags]
```

Options

```
--format string  Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.  
-h, --help      Help for draft-products:delete  
--id            id  
-o, --org string Organization name or id (required)  
--output string Write file(s) to directory, instead of STDOUT (default "-")  
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect  
--debug           Enable debug output  
--debug-output string Write debug output to file  
--live-help      Enable or disable tracking of limited usage information  
-m, --mode string Toolkit operation mode (default "apim")
```

apic draft-products:document

Get the Draft Product document by name and version

Synopsis

Get the Draft Product document by name and version

```
apic draft-products:document [flags]
```

Options

<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for draft-products:document
<code>--id</code>	id
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic draft-products:get

Get the Draft Product object by name and version

Synopsis

Get the Draft Product object by name and version

```
apic draft-products:get [flags]
```

Options

<code>--fields string</code>	List of field names to return (default "add(draft_product,url)")
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for draft-products:get
<code>--id</code>	id
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, use - for STDOUT. (default: cwd)
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic draft-products:list-all

List all Draft Product objects in all collections

Synopsis

List all Draft Product objects in all collections

```
apic draft-products:list-all [flags]
```

Options

<code>--fields string</code>	List of field names to return
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for draft-products:list-all
<code>--limit int32</code>	Maximum number of items to return
<code>--offset int32</code>	Offset item number from list to begin return
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic draft-products:list

List the Draft Product objects

Synopsis

List the Draft Product objects

```
apic draft-products:list [flags]
```

Options

```
--fields string  List of field names to return
--format string  Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help       Help for draft-products:list
--limit int32    Maximum number of items to return
--offset int32   Offset item number from list to begin return
-o, --org string  Organization name or id (required)
--output string  Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

apic draft-products:publish

Publish a draft product

Synopsis

Publish a draft product

```
apic draft-products:publish [flags]
```

Options

```
-c, --catalog string  Catalog name or id (required)
--format string       Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults
to yaml.
--gateway_services string The list of gateway service names to support partial publishing
-h, --help           Help for draft-products:publish
--migrate_subscriptions  Migrate subscription when republish product
-o, --org string      Organization name or id (required)
--output string       Write file(s) to directory, instead of STDOUT (default "-")
--scope string        scope
-s, --server string   management server endpoint (required)
--space string        Space name or id (required)
--stage              stage
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

apic draft-products:update

Update the Draft Product object by name and version

Synopsis

Update the Draft Product object by name and version

```
Fields allowed but ignored:
- id
- type
- api_version
```

```
- scope
- created_at
- updated_at
- url
- org_url
```

```
apic draft-products:update [flags]
```

Options

```
--format string  Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for draft-products:update
--id            id
-o, --org string Organization name or id (required)
--output string Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic draft-products:validate

Validate the draft product

Synopsis

Validate the draft product

```
apic draft-products:validate [flags]
```

Options

```
--catalog_name string  Name of a catalog
--format string        Output format. One of [json yaml octet-stream go-template=... go-template-file=...],
defaults to yaml.
--gateway_service_names string Names of Gateway Services
-h, --help            Help for draft-products:validate
--id                  id
-o, --org string       Organization name or id (required)
--output string       Write file(s) to directory, instead of STDOUT (default "-")
--scope string        scope
-s, --server string    management server endpoint (required)
--space_name string   Name of a space
--validate_apis       Whether to validate APIs also
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic drafts

Drafts operations

Synopsis

Drafts operations

```
apic drafts [flags]
```

Options

```
--fields string  List of field names to return
--format string  Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for drafts
--limit int32   Maximum number of items to return
--offset int32  Offset item number from list to begin return
-o, --org string Organization name or id (required)
--output string Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic drafts:clear

Clear the Draft objects

Synopsis

Clear the Draft objects

```
apic drafts:clear [flags]
```

Options

<code>--confirm string</code>	Confirmation for critical updates (required)
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for drafts:clear
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic drafts:list

List the Draft objects

Synopsis

List the Draft objects

```
apic drafts:list [flags]
```

Options

<code>--fields string</code>	List of field names to return
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for drafts:list
<code>--limit int32</code>	Maximum number of items to return
<code>--offset int32</code>	Offset item number from list to begin return
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic entries

Entries operations

Synopsis

Entries operations

apic entries [flags]

Options

```
--fields string      List of field names to return
--format string      Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
-h, --help           Help for entries
--limit int32       Maximum number of items to return
--offset int32      Offset item number from list to begin return
-o, --org string     Organization name or id (required)
--output string     Write file(s) to directory, instead of STDOUT (default "-")
--scope string      scope
-s, --server string  management server endpoint (required)
--truststore string Truststore name or id (required)
```

Options inherited from parent commands

```
--accept-license    Accept the license for API Connect
--debug             Enable debug output
--debug-output string Write debug output to file
--live-help         Enable or disable tracking of limited usage information
-m, --mode string   Toolkit operation mode (default "apim")
```

apic entries:clear

Entries clear operations

Synopsis

Entries clear operations

apic entries:clear [flags]

Options

```
--confirm string    Confirmation for critical updates (required)
--format string     Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
-h, --help         Help for entries:clear
-o, --org string   Organization name or id (required)
--output string    Write file(s) to directory, instead of STDOUT (default "-")
--scope string     scope
-s, --server string management server endpoint (required)
--truststore string Truststore name or id (required)
```

Options inherited from parent commands

```
--accept-license    Accept the license for API Connect
--debug             Enable debug output
--debug-output string Write debug output to file
--live-help         Enable or disable tracking of limited usage information
-m, --mode string   Toolkit operation mode (default "apim")
```

apic entries:create

Entries create operations

Synopsis

Entries create operations

apic entries:create [flags]

Options

```
--format string     Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
-h, --help         Help for entries:create
-o, --org string   Organization name or id (required)
--output string    Write file(s) to directory, instead of STDOUT (default "-")
--scope string     scope
-s, --server string management server endpoint (required)
--truststore string Truststore name or id (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug          Enable debug output
--debug-output string Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic entries:delete

Entries delete operations

Synopsis

Entries delete operations

```
apic entries:delete [flags]
```

Options

```
--format string  Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
-h, --help      Help for entries:delete
-o, --org string Organization name or id (required)
--output string Write file(s) to directory, instead of STDOUT (default "-")
--scope string  scope
-s, --server string management server endpoint (required)
--truststore string Truststore name or id (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug          Enable debug output
--debug-output string Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic entries:get

Entries get operations

Synopsis

Entries get operations

```
apic entries:get [flags]
```

Options

```
--fields string  List of field names to return
--format string  Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
-h, --help      Help for entries:get
-o, --org string Organization name or id (required)
--output string Write file(s) to directory, use - for STDOUT. (default: cwd)
--scope string  scope
-s, --server string management server endpoint (required)
--truststore string Truststore name or id (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug          Enable debug output
--debug-output string Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic entries:list

Entries list operations

Synopsis

Entries list operations

```
apic entries:list [flags]
```

Options

```
--fields string      List of field names to return
--format string     Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
-h, --help          Help for entries:list
--limit int32       Maximum number of items to return
--offset int32      Offset item number from list to begin return
-o, --org string    Organization name or id (required)
--output string     Write file(s) to directory, instead of STDOUT (default "-")
--scope string      scope
-s, --server string management server endpoint (required)
--truststore string Truststore name or id (required)
```

Options inherited from parent commands

```
--accept-license    Accept the license for API Connect
--debug             Enable debug output
--debug-output string Write debug output to file
--live-help         Enable or disable tracking of limited usage information
-m, --mode string   Toolkit operation mode (default "apim")
```

apic entries:update

Entries update operations

Synopsis

Entries update operations

```
apic entries:update [flags]
```

Options

```
--format string     Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
-h, --help          Help for entries:update
-o, --org string    Organization name or id (required)
--output string     Write file(s) to directory, instead of STDOUT (default "-")
--scope string      scope
-s, --server string management server endpoint (required)
--truststore string Truststore name or id (required)
```

Options inherited from parent commands

```
--accept-license    Accept the license for API Connect
--debug             Enable debug output
--debug-output string Write debug output to file
--live-help         Enable or disable tracking of limited usage information
-m, --mode string   Toolkit operation mode (default "apim")
```

apic extensions

Extensions operations

Synopsis

Extensions operations

```
apic extensions [flags]
```

Options

```
--availability-zone string Availability Zone name or id (required)
-c, --catalog string      Catalog name or id (required)
--configured-gateway-service string Configured Gateway Service name or id (required)
--fields string           List of field names to return
--format string           Output format. One of [json yaml octet-stream go-template=... go-template-
file=...], defaults to yaml.
--gateway-service string  Gateway Service name or id (required)
-h, --help                Help for extensions
--limit int32             Maximum number of items to return
--offset int32            Offset item number from list to begin return
-o, --org string          Organization name or id (required)
--output string           Write file(s) to directory, instead of STDOUT (default "-")
--scope string            scope
-s, --server string       management server endpoint (required)
--space string            Space name or id (required)
```

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic extensions:clear-all

Extensions clear-all operations

Synopsis

Extensions clear-all operations

```
apic extensions:clear-all [flags]
```

Options

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--configured-gateway-service string</code>	Configured Gateway Service name or id (required)
<code>--confirm string</code>	Confirmation for critical updates (required)
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for extensions:clear-all
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>--scope string</code>	scope
<code>-s, --server string</code>	management server endpoint (required)
<code>--space string</code>	Space name or id (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic extensions:clear

Extensions clear operations

Synopsis

Extensions clear operations

```
apic extensions:clear [flags]
```

Options

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--configured-gateway-service string</code>	Configured Gateway Service name or id (required)
<code>--confirm string</code>	Confirmation for critical updates (required)
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for extensions:clear
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>--scope string</code>	scope
<code>-s, --server string</code>	management server endpoint (required)
<code>--space string</code>	Space name or id (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic extensions:clone

Synopsis

Extensions clone operations

`apic extensions:clone [flags]`

Options

```

--availability-zone string      Availability Zone name or id (required)
-c, --catalog string           Catalog name or id (required)
--configured-gateway-service string  Configured Gateway Service name or id (required)
--fields string                List of field names to return
--format string                Output format. One of [json yaml octet-stream go-template=... go-template-
file=...], defaults to yaml.
--gateway-service string       Gateway Service name or id (required)
-h, --help                     Help for extensions:clone
--limit int32                  Maximum number of items to return
--offset int32                 Offset item number from list to begin return
-o, --org string               Organization name or id (required)
--output string                Write file(s) to directory, use - for STDOUT. (default: cwd)
--scope string                 scope
-s, --server string            management server endpoint (required)
--space string                 Space name or id (required)

```

Options inherited from parent commands

```

--accept-license      Accept the license for API Connect
--debug               Enable debug output
--debug-output string Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")

```

apic extensions:create

Extensions create operations

Synopsis

Extensions create operations

`apic extensions:create [flags]`

Options

```

-c, --catalog string           Catalog name or id (required)
--configured-gateway-service string  Configured Gateway Service name or id (required)
--format string                Output format. One of [json yaml octet-stream go-template=... go-template-
file=...], defaults to yaml.
-h, --help                     Help for extensions:create
-o, --org string               Organization name or id (required)
--output string                Write file(s) to directory, instead of STDOUT (default "-")
--scope string                 scope
-s, --server string            management server endpoint (required)
--space string                 Space name or id (required)

```

Options inherited from parent commands

```

--accept-license      Accept the license for API Connect

```

apic extensions:delete

Extensions delete operations

Synopsis

Extensions delete operations

`apic extensions:delete [flags]`

Options

```

-c, --catalog string          Catalog name or id (required)
--configured-gateway-service string  Configured Gateway Service name or id (required)
--format string              Output format. One of [json yaml octet-stream go-template=... go-template-
file=...], defaults to yaml.
-h, --help                  Help for extensions:delete
--id                         id
-o, --org string            Organization name or id (required)
--output string             Write file(s) to directory, instead of STDOUT (default "-")
--scope string              scope
-s, --server string         management server endpoint (required)
--space string              Space name or id (required)

```

Options inherited from parent commands

```

--accept-license      Accept the license for API Connect
--debug              Enable debug output
--debug-output string Write debug output to file
--live-help          Enable or disable tracking of limited usage information
-m, --mode string    Toolkit operation mode (default "apim")

```

apic extensions:document

Extensions document operations

Synopsis

Extensions document operations

```
apic extensions:document [flags]
```

Options

```

--availability-zone string  Availability Zone name or id (required)
-c, --catalog string        Catalog name or id (required)
--configured-gateway-service string  Configured Gateway Service name or id (required)
--format string            Output format. One of [json yaml octet-stream go-template=... go-template-
file=...], defaults to yaml.
--gateway-service string   Gateway Service name or id (required)
-h, --help                 Help for extensions:document

-s, --server string        management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic global-policies

Global Policies operations

Synopsis

Global Policies operations

```
apic global-policies [flags]
```

Options

```
-c, --catalog string          Catalog name or id (required)
--configured-gateway-service string Configured Gateway Service name or id (required)
--fields string              List of field names to return
--format string              Output format. One of [json yaml octet-stream go-template=... go-template-
file=...], defaults to yaml.
-h, --help                   Help for global-policies
--limit int32                Maximum number of items to return
--offset int32               Offset item number from list to begin return
-o, --org string             Organization name or id (required)
--output string              Write file(s) to directory, instead of STDOUT (default "-")
--scope string               scope
-s, --server string          management server endpoint (required)
--space string               Space name or id (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic global-policies:clear

Global Policies clear operations

Synopsis

Global Policies clear operations

```
apic global-policies:clear [flags]
```

Options

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--configured-gateway-service string</code>	Configured Gateway Service name or id (required)
<code>--confirm string</code>	Confirmation for critical updates (required)
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-
file=...], defaults to yaml.	
<code>-h, --help</code>	Help for global-policies:clear
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>--scope string</code>	scope
<code>-s, --server string</code>	management server endpoint (required)
<code>--space string</code>	Space name or id (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic global-policies:clear-all

Global Policies clear-all operations

Synopsis

Global Policies clear-all operations

```
apic global-policies:clear-all [flags]
```

Options

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--configured-gateway-service string</code>	Configured Gateway Service name or id (required)
<code>--confirm string</code>	Confirmation for critical updates (required)
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-
file=...], defaults to yaml.	
<code>-h, --help</code>	Help for global-policies:clear-all
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>--scope string</code>	scope
<code>-s, --server string</code>	management server endpoint (required)
<code>--space string</code>	Space name or id (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic global-policies:create

Global Policies create operations

Synopsis

Global Policies create operations

```
apic global-policies:create [flags]
```

Options

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--configured-gateway-service string</code>	Configured Gateway Service name or id (required)
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-
file=...], defaults to yaml.	
<code>-h, --help</code>	Help for global-policies:create
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>--scope string</code>	scope
<code>-s, --server string</code>	management server endpoint (required)
<code>--space string</code>	Space name or id (required)

Options inherited from parent commands

```
--accept-license    Accept the license for API Connect
--debug            Enable debug output
--debug-output string Write debug output to file
--live-help        Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

apic global-policies:delete

Global Policies delete operations

Synopsis

Global Policies delete operations

```
apic global-policies:delete [flags]
```

Options

```
-c, --catalog string      Catalog name or id (required)
--configured-gateway-service string Configured Gateway Service name or id (required)
--format string           Output format. One of [json yaml octet-stream go-template=... go-template-
file=...], defaults to yaml.
-h, --help                Help for global-policies:delete
--id                      id
-o, --org string          Organization name or id (required)
--output string           Write file(s) to directory, instead of STDOUT (default "-")
--scope string            scope
-s, --server string       management server endpoint (required)
--space string            Space name or id (required)
```

Options inherited from parent commands

```
--accept-license    Accept the license for API Connect
--debug            Enable debug output
--debug-output string Write debug output to file
--live-help        Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

apic global-policies:document

Global Policies document operations

Synopsis

Global Policies document operations

```
apic global-policies:document [flags]
```

Options

```
-c, --catalog string      Catalog name or id (required)
--configured-gateway-service string Configured Gateway Service name or id (required)
--format string           Output format. One of [json yaml octet-stream go-template=... go-template-
file=...], defaults to yaml.
-h, --help                Help for global-policies:document
--id                      id
-o, --org string          Organization name or id (required)
--output string           Write file(s) to directory, instead of STDOUT (default "-")
--scope string            scope
-s, --server string       management server endpoint (required)
--space string            Space name or id (required)
```

Options inherited from parent commands

```
--accept-license    Accept the license for API Connect
--debug            Enable debug output
--debug-output string Write debug output to file
--live-help        Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

apic global-policies:get

Global Policies get operations

Synopsis

Global Policies get operations

```
apic global-policies:get [flags]
```

Options

```
-c, --catalog string          Catalog name or id (required)
--configured-gateway-service string  Configured Gateway Service name or id (required)
--fields string              List of field names to return
--format string              Output format. One of [json yaml octet-stream go-template=... go-template-
file=...], defaults to yaml.
-h, --help                  Help for global-policies:get
--id id                      id
-o, --org string            Organization name or id (required)
--output string             Write file(s) to directory, use - for STDOUT. (default: cwd)
--scope string              scope
-s, --server string         management server endpoint (required)
--space string              Space name or id (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string  Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

apic global-policies:list

Global Policies list operations

Synopsis

Global Policies list operations

```
apic global-policies:list [flags]
```

Options

```
-c, --catalog string          Catalog name or id (required)
--configured-gateway-service string  Configured Gateway Service name or id (required)
--fields string              List of field names to return
--format string              Output format. One of [json yaml octet-stream go-template=... go-template-
file=...], defaults to yaml.
-h, --help                  Help for global-policies:list
--limit int32               Maximum number of items to return

```

Options

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--configured-gateway-service string</code>	Configured Gateway Service name or id (required)
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-
<code>file=...], defaults to yaml.</code>	
<code>-h, --help</code>	Help for global-policy-prehooks:delete
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>--scope string</code>	scope
<code>-s, --server string</code>	management server endpoint (required)
<code>--space string</code>	Space name or id (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic global-policy-prehooks:get

Global Policy Prehooks get operations

Synopsis

Global Policy Prehooks get operations

```
apic global-policy-prehooks:get [flags]
```

Options

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--configured-gateway-service string</code>	Configured Gateway Service name or id (required)
<code>--fields string</code>	List of field names to return
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-
<code>file=...], defaults to yaml.</code>	
<code>-h, --help</code>	Help for global-policy-prehooks:get

-o, --org string	Organization name or id (required)
--output string	Write file(s) to directory, use - for STDOUT. (default: cwd)
--scope string	scope
-s, --server string	management server endpoint (required)
--space string	Space name or id (required)

Options inherited from parent commands

--accept-license	Accept the license for API Connect
--debug	Enable debug output
--debug-output string	Write debug output to file
--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

apic global-policy-prehooks:update

Global Policy Prehooks update operations

Synopsis

Global Policy Prehooks update operations

```
apic global-policy-prehooks:update [flags]
```

Options

-c, --catalog string	Catalog name or id (required)
--configured-gateway-service string	Configured Gateway Service name or id (required)
--format string	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help	Help for global-policy-prehooks:update
-o, --org string	Organization name or id (required)
--output string	Write file(s) to directory, instead of STDOUT (default "-")
--scope string	scope
-s, --server string	management server endpoint (required)
--space string	Space name or id (required)

Options inherited from parent commands

--accept-license	Accept the license for API Connect
--debug	Enable debug output
--debug-output string	Write debug output to file
--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

apic groups

Groups operations

Synopsis

Groups operations

```
apic groups [flags]
```

Options

-c, --catalog string	Catalog name or id (required)
--fields string	List of field names to return
--format string	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help	Help for groups
--limit int32	Maximum number of items to return
--offset int32	Offset item number from list to begin return
-o, --org string	Organization name or id (required)
--output string	Write file(s) to directory, instead of STDOUT (default "-")
--scope string	scope
-s, --server string	management server endpoint (required)
--space string	Space name or id (required)
--space-initiated	space-initiated

Options inherited from parent commands

--accept-license	Accept the license for API Connect
--debug	Enable debug output
--debug-output string	Write debug output to file
--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

apic groups:clear

Groups clear operations

Synopsis

Groups clear operations

```
apic groups:clear [flags]
```

Options

```
-c, --catalog string    Catalog name or id (required)
--confirm string       Confirmation for critical updates (required)
--format string        Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
-h, --help             Help for groups:clear
-o, --org string       Organization name or id (required)
--output string        Write file(s) to directory, instead of STDOUT (default "-")
--scope string         scope
-s, --server string    management server endpoint (required)
--space string         Space name or id (required)
--space-initiated     space-initiated
```

Options inherited from parent commands

```
--accept-license      Accept the license for API Connect
--debug              Enable debug output
--debug-output string Write debug output to file
--live-help          Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

apic groups:create

Groups create operations

Synopsis

Groups create operations

```
apic groups:create [flags]
```

Options

```
-c, --catalog string    Catalog name or id (required)
--format string        Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
-h, --help             Help for groups:create
-o, --org string       Organization name or id (required)
--output string        Write file(s) to directory, instead of STDOUT (default "-")
--scope string         scope
-s, --server string    management server endpoint (required)
--space string         Space name or id (required)
--space-initiated     space-initiated
```

Options inherited from parent commands

```
--accept-license      Accept the license for API Connect
--debug              Enable debug output
--debug-output string Write debug output to file
--live-help          Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

apic groups:delete

Groups delete operations

Synopsis

Groups delete operations

```
apic groups:delete [flags]
```

Options

```
-c, --catalog string    Catalog name or id (required)
--format string        Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
-h, --help             Help for groups:delete
-o, --org string        Organization name or id (required)
--output string        Write file(s) to directory, instead of STDOUT (default "-")
--scope string         scope
-s, --server string     management server endpoint (required)
--space string         Space name or id (required)
--space-initiated      space-initiated
```

Options inherited from parent commands

```
--accept-license      Accept the license for API Connect
--debug               Enable debug output
--debug-output string Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

apic groups:get

Groups get operations

Synopsis

Groups get operations

```
apic groups:get [flags]
```

Options

```
-c, --catalog string    Catalog name or id (required)
--fields string        List of field names to return
--format string        Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.

-s, --server string   management server endpoint (required)
--space string        Space name or id (required)
--space-initiated    space-initiated
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug          Enable debug output
--debug-output string Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic iam-apikey

Log in to an IBM API Connect cloud Reserved Instance using an IBM Cloud API key

Synopsis

Log in to an IBM API Connect cloud Reserved Instance using an IBM Cloud API key

```
apic iam-apikey [flags]
```

Examples

```
Interactive iam-apikey login
$ apic iam-apikey
Enter your IBM Cloud details
? Server: mgmthost.com
? IBM Cloud API Key?: my-apikey
Logged into mgmthost.com successfully
```

```
Non-interactive
$ apic iam-apikey --apiKey <apikey> --server mgmthost.com
Logged into mgmthost.com successfully
```

Options

```
--apiKey string  IBM cloud api key
-h, --help      Help for iam-apikey
-s, --server string management server endpoint
--tokenendpoint string iam server endpoint (default: iam.cloud.ibm.com)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug          Enable debug output
--debug-output string Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic identity-providers

Identity Providers operations

Synopsis

Identity Providers operations

```
apic identity-providers [flags]
```

Options

```
--fields string  List of field names to return
--format string  Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help       Help for identity-providers
--limit int32    Maximum number of items to return
--offset int32   Offset item number from list to begin return
--output string  Write file(s) to directory, instead of STDOUT (default "-")
--scope string   scope
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic identity-providers:list

Identity Providers list operations

Synopsis

Identity Providers list operations

```
apic identity-providers:list [flags]
```

Options

```
--fields string  List of field names to return
--format string  Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help       Help for identity-providers:list
--limit int32    Maximum number of items to return
--offset int32   Offset item number from list to begin return
--output string  Write file(s) to directory, instead of STDOUT (default "-")
--scope string   scope
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic integrations

Integrations operations

Synopsis

Integrations operations

```
apic integrations [flags]
```

Options

```
--fields string  List of field names to return
--format string  Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help       Help for integrations
```

```
--limit int32      Maximum number of items to return
--offset int32     Offset item number from list to begin return
--output string    Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic integrations:clear

Integrations clear operations

Synopsis

Integrations clear operations

```
apic integrations:clear [flags]
```

Options

```
--confirm string Confirmation for critical updates (required)
--format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
-h, --help        Help for integrations:clear
--output string   Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
--subcollection string subcollection
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic integrations:create

Integrations create operations

Synopsis

Integrations create operations

```
apic integrations:create [flags]
```

Options

```
--format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
-h, --help        Help for integrations:create
--output string   Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
--subcollection string subcollection
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic integrations:delete

Integrations delete operations

Synopsis

Integrations delete operations

```
apic integrations:delete [flags]
```

Options

```
--format string      Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
-h, --help           Help for integrations:delete
--output string      Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string  management server endpoint (required)
--subcollection string subcollection
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic integrations:get

Integrations get operations

Synopsis

Integrations get operations

```
apic integrations:get [flags]
```

Options

```
--fields string      List of field names to return
--format string      Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
-h, --help           Help for integrations:get
--output string      Write file(s) to directory, use - for STDOUT. (default: cwd)
-s, --server string  management server endpoint (required)
--subcollection string subcollection
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic integrations:list

Integrations list operations

Synopsis

Integrations list operations

```
apic integrations:list [flags]
```

Options

```
--fields string      List of field names to return
--format string      Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
-h, --help           Help for integrations:list
--limit int32        Maximum number of items to return
--offset int32       Offset item number from list to begin return
--output string      Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string  management server endpoint (required)
--subcollection string subcollection
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug          Enable debug output
--debug-output string Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic integrations:list-all

List all Integration objects in all collections

Synopsis

List all Integration objects in all collections

```
apic integrations:list-all [flags]
```

Options

```
--fields string List of field names to return
--format string Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for integrations:list-all
--limit int32   Maximum number of items to return
--offset int32  Offset item number from list to begin return
--output string Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug          Enable debug output
--debug-output string Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic integrations:update

Integrations update operations

Synopsis

Integrations update operations

```
apic integrations:update [flags]
```

Options

```
--format string Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
-h, --help      Help for integrations:update
--output string Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
--subcollection string subcollection
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug          Enable debug output
--debug-output string Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic invitations

Invitations operations

Synopsis

Invitations operations

```
apic invitations [flags]
```

Options

```

-c, --catalog string      Catalog name or id (required)
--fields string          List of field names to return

-s, --server string      management server endpoint (required)
--space string           Space name or id (required)
--space-initiated        space-initiated

```

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic invitations:delete

Invitations delete operations

Synopsis

Invitations delete operations

```
apic invitations:delete [flags]
```

Options

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for invitations:delete
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>--scope string</code>	scope
<code>-s, --server string</code>	management server endpoint (required)
<code>--space string</code>	Space name or id (required)
<code>--space-initiated</code>	space-initiated

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic invitations:get

Invitations get operations

Synopsis

Invitations get operations

```
apic invitations:get [flags]
```

Options

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--fields string</code>	List of field names to return
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for invitations:get
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, use - for STDOUT. (default: cwd)
<code>--scope string</code>	scope
<code>-s, --server string</code>	management server endpoint (required)
<code>--space string</code>	Space name or id (required)
<code>--space-initiated</code>	space-initiated

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic invitations:list

Invitations list operations

Synopsis

Invitations list operations

```
apic invitations:list [flags]
```

Options

```
-c, --catalog string    Catalog name or id (required)
--fields string        List of field names to return
--format string        Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
-h, --help             Help for invitations:list
--limit int32         Maximum number of items to return
--offset int32        Offset item number from list to begin return
-o, --org string       Organization name or id (required)
--output string        Write file(s) to directory, instead of STDOUT (default "-")
--scope string         scope
-s, --server string    management server endpoint (required)
--space string         Space name or id (required)
--space-initiated     space-initiated
```

Options inherited from parent commands

```
--accept-license      Accept the license for API Connect
--debug              Enable debug output
--debug-output string Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

apic invitations:update

Invitations update operations

Synopsis

Invitations update operations

```
apic invitations:update [flags]
```

Options

```
-c, --catalog string    Catalog name or id (required)
--format string        Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
-h, --help             Help for invitations:update
-o, --org string       Organization name or id (required)
--output string        Write file(s) to directory, instead of STDOUT (default "-")
--scope string         scope
-s, --server string    management server endpoint (required)
--space string         Space name or id (required)
--space-initiated     space-initiated
```

Options inherited from parent commands

```
--accept-license      Accept the license for API Connect
--debug              Enable debug output
--debug-output string Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

apic jobs

Jobs operations

Synopsis

Jobs operations

```
apic jobs [flags]
```

Options

```
--billing string      Billing name or id (required)
--fields string        List of field names to return
--format string        Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
```

```
-h, --help           Help for jobs
--limit int32       Maximum number of items to return
--offset int32      Offset item number from list to begin return
-o, --org string    Organization name or id (required)
--output string     Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license    Accept the license for API Connect
--debug            Enable debug output
--debug-output string Write debug output to file
--live-help        Enable or disable tracking of limited usage information
-m, --mode string   Toolkit operation mode (default "apim")
```

apic jobs:clear

Clear the Job objects

Synopsis

Clear the Job objects

```
apic jobs:clear [flags]
```

Options

```
--billing string    Billing name or id (required)
--confirm string    Confirmation for critical updates (required)
--format string     Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help          Help for jobs:clear
-o, --org string    Organization name or id (required)
--output string     Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license    Accept the license for API Connect
--debug            Enable debug output
--debug-output string Write debug output to file
--live-help        Enable or disable tracking of limited usage information
-m, --mode string   Toolkit operation mode (default "apim")
```

apic jobs:delete

Delete the Job object by name or id

Synopsis

Delete the Job object by name or id

```
apic jobs:delete [flags]
```

Options

```
--billing string    Billing name or id (required)
--format string     Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help          Help for jobs:delete
-o, --org string    Organization name or id (required)
--output string     Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license    Accept the license for API Connect
--debug            Enable debug output
--debug-output string Write debug output to file
--live-help        Enable or disable tracking of limited usage information
-m, --mode string   Toolkit operation mode (default "apim")
```

apic jobs:get

Get the Job object by name or id

Synopsis

Get the Job object by name or id

```
apic jobs:get [flags]
```

Options

<code>--billing</code> string	Billing name or id (required)
<code>--fields</code> string	List of field names to return
<code>--format</code> string	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for jobs:get
<code>-o, --org</code> string	Organization name or id (required)
<code>--output</code> string	Write file(s) to directory, use - for STDOUT. (default: cwd)
<code>-s, --server</code> string	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output</code> string	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode</code> string	Toolkit operation mode (default "apim")

apic jobs:list

List the Job objects

Synopsis

List the Job objects

```
apic jobs:list [flags]
```

Options

<code>--billing</code> string	Billing name or id (required)
<code>--fields</code> string	List of field names to return
<code>--format</code> string	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for jobs:list
<code>--limit</code> int32	Maximum number of items to return
<code>--offset</code> int32	Offset item number from list to begin return
<code>-o, --org</code> string	Organization name or id (required)
<code>--output</code> string	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server</code> string	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output</code> string	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode</code> string	Toolkit operation mode (default "apim")

apic jobs:retry

Re-attempt blocked or failed job

Synopsis

Re-attempt blocked or failed job

```
apic jobs:retry [flags]
```

Options

<code>--billing</code> string	Billing name or id (required)
<code>--confirm</code> string	Confirmation for critical updates (required)
<code>--format</code> string	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for jobs:retry
<code>-o, --org</code> string	Organization name or id (required)
<code>--output</code> string	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server</code> string	management server endpoint (required)

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug          Enable debug output
--debug-output string Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic keystores

Keystores operations

Synopsis

Keystores operations

```
apic keystores [flags]
```

Options

```
--fields string List of field names to return
--format string Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for keystores
--limit int32   Maximum number of items to return
--offset int32  Offset item number from list to begin return
-o, --org string Organization name or id (required)
--output string Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug          Enable debug output
--debug-output string Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic keystores:clear

Clear the Keystore objects

Synopsis

Clear the Keystore objects

```
apic keystores:clear [flags]
```

Options

```
--confirm string Confirmation for critical updates (required)
--format string Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for keystores:clear
-o, --org string Organization name or id (required)
--output string Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug          Enable debug output
--debug-output string Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic keystores:create

Create a Keystore object

Synopsis

Create a Keystore object

```
Required fields:
- keystore
```

```
Fields allowed but ignored:
```

```
- id
- type
- api_version
- scope
- created_at
- updated_at
- url
```

```
apic keystores:create [flags]
```

Options

```
--format string  Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for keystores:create
-o, --org string Organization name or id (required)
--output string Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic keystores:delete

Delete the Keystore object by name or id

Synopsis

Delete the Keystore object by name or id

```
apic keystores:delete [flags]
```

Options

```
--format string  Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for keystores:delete
-o, --org string Organization name or id (required)
--output string Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic keystores:get

Get the Keystore object by name or id

Synopsis

Get the Keystore object by name or id

```
apic keystores:get [flags]
```

Options

```
--fields string  List of field names to return
--format string  Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for keystores:get
-o, --org string Organization name or id (required)
--output string Write file(s) to directory, use - for STDOUT. (default: cwd)
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
```

```
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic keystores:list

List the Keystore objects

Synopsis

List the Keystore objects

```
apic keystores:list [flags]
```

Options

```
--fields string List of field names to return
--format string Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for keystores:list
--limit int32   Maximum number of items to return
--offset int32  Offset item number from list to begin return
-o, --org string Organization name or id (required)
--output string Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license Accept the license for API Connect
--debug          Enable debug output
--debug-output string Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic keystores:update

Update the Keystore object by name or id

Synopsis

Update the Keystore object by name or id

```
Fields allowed but ignored:
- id
- type
- api_version
- scope
- created_at
- updated_at
- url
```

```
apic keystores:update [flags]
```

Options

```
--format string Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for keystores:update
-o, --org string Organization name or id (required)
--output string Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license Accept the license for API Connect
--debug          Enable debug output
--debug-output string Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic licenses

Review the license for API Connect

Synopsis

Review the license for API Connect

apic licenses [flags]

Options

```
-h, --help           Help for licenses
--non-ibm-license    Display the non IBM license files.
--notices            Display the notices file
```

Options inherited from parent commands

```
--accept-license    Accept the license for API Connect
--debug             Enable debug output
--debug-output string Write debug output to file
--live-help         Enable or disable tracking of limited usage information
-m, --mode string   Toolkit operation mode (default "apim")
```

apic log-spec

Log Spec operations

Synopsis

Log Spec operations

apic log-spec [flags]

Options

```
-h, --help  Help for log-spec
```

Options inherited from parent commands

```
--accept-license    Accept the license for API Connect
--debug             Enable debug output
--debug-output string Write debug output to file
--live-help         Enable or disable tracking of limited usage information
-m, --mode string   Toolkit operation mode (default "apim")
```

apic log-spec:get

Get the Log Spec object

Synopsis

Get the Log Spec object

apic log-spec:get [flags]

Options

```
--fields string  List of field names to return
--format string  Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help       Help for log-spec:get
--output string  Write file(s) to directory, use - for STDOUT. (default: cwd)
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license    Accept the license for API Connect
--debug             Enable debug output
--debug-output string Write debug output to file
--live-help         Enable or disable tracking of limited usage information
-m, --mode string   Toolkit operation mode (default "apim")
```

apic log-spec:update

Update the Log Spec object

Synopsis

Update the Log Spec object

```
Fields allowed but ignored:
- name
- type
- api_version
- scope
- created_at
- updated_at
- url
```

```
apic log-spec:update [flags]
```

Options

```
--format string  Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for log-spec:update
--output string  Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

apic login

Log in to an IBM API Connect cloud

Synopsis

Log in to an IBM API Connect cloud

```
apic login [flags]
```

Examples

```
Interactive login
$ apic login
Enter your API Connect credentials
? Server: mgmthost.com
? Realm: realm
? Username: tommy
? Password: password
Logged into mgmthost.com successfully
```

```
Non-interactive login
$ apic login --username tommy --password password --server mgmthost.com --realm realm
Logged into mgmthost.com successfully
```

```
Realm for Platform API is of the form: (admin|provider)/<identity-provider>
Use 'admin' for logging in to the toolkit if you are part of a Cloud administrative organization. Use 'provider' for logging in
to the toolkit if you are part of a Provider organization.
The following command can be used to identify the identity-providers available:
./apic identity-providers:list --server mgmthost.com --fields realm --scope (admin|provider)
```

```
Realm for Consumer API is of the form: consumer:<provider-org-name-or-id><catalog-name-or-id><catalog-identity-provider-name>
The catalog identity provider name is typically <catalog-name>-idp. If multiple User Registries are configured for a catalog,
please choose the one where the User's account resides.
Example of realm for Consumer API: consumer:alpha:sandbox/sandbox-idp
The following command can be used to identify the identity-providers available:
./apic identity-providers:list --server consumerhost.com --org <provider-org-name-or-id> --catalog <catalog-name-or-id> --
fields realm --mode consumer
```

Options

```
--apiKey string  apiKey
--context string context
-h, --help      Help for login
-p, --password string password
-r, --realm string realm
-s, --server string management server endpoint
--sso           sso
-u, --username string user name
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

apic logout

Log out of an IBM API Connect cloud

Synopsis

Log out of an IBM API Connect cloud

```
apic logout [flags]
```

Examples

```
Clear the local authentication credentials for mgmthost.com
$ apic logout --server mgmthost.com
Logged out of server mgmthost.com
```

Options

```
-h, --help           Help for logout
-s, --server string  management server endpoint
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

apic mail-servers

Mail Servers operations

Synopsis

Mail Servers operations

```
apic mail-servers [flags]
```

Options

```
--fields string  List of field names to return
--format string  Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help       Help for mail-servers
--limit int32    Maximum number of items to return
--offset int32   Offset item number from list to begin return
-o, --org string  Organization name or id (required)
--output string  Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

apic mail-servers:clear

Clear the Mail Server objects

Synopsis

Clear the Mail Server objects

```
apic mail-servers:clear [flags]
```

Options

```

--confirm string      Confirmation for critical updates (required)
--format string      Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for mail-servers:clear
-o, --org string      Organization name or id (required)
--output string       Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string   management server endpoint (required)

```

Options inherited from parent commands

```

--accept-license      Accept the license for API Connect
--debug              Enable debug output
--debug-output string Write debug output to file
--live-help          Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")

```

apic mail-servers:create

Create a Mail Server object

Synopsis

Create a Mail Server object

```

Fields allowed but ignored:
- id
- type
- api_version
- scope
- created_at
- updated_at
- url

```

`apic mail-servers:create [flags]`

Options

```

--format string      Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for mail-servers:create
-o, --org string      Organization name or id (required)
--output string       Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string   management server endpoint (required)

```

Options inherited from parent commands

```

--accept-license      Accept the license for API Connect
--debug              Enable debug output
--debug-output string Write debug output to file
--live-help          Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")

```

apic mail-servers:delete

Delete the Mail Server object by name or id

Synopsis

Delete the Mail Server object by name or id

`apic mail-servers:delete [flags]`

Options

```

--format string      Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for mail-servers:delete
-o, --org string      Organization name or id (required)
--output string       Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string   management server endpoint (required)

```

Options inherited from parent commands

```

--accept-license      Accept the license for API Connect
--debug              Enable debug output
--debug-output string Write debug output to file
--live-help          Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")

```

apic mail-servers:get

Get the Mail Server object by name or id

Synopsis

Get the Mail Server object by name or id

```
apic mail-servers:get [flags]
```

Options

```
--fields string  List of field names to return
--format string  Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for mail-servers:get
-o, --org string  Organization name or id (required)
--output string  Write file(s) to directory, use - for STDOUT. (default: cwd)
-s, --server string  management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string  Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

apic mail-servers:list

List the Mail Server objects

Synopsis

List the Mail Server objects

```
apic mail-servers:list [flags]
```

Options

```
--fields string  List of field names to return
--format string  Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for mail-servers:list
--limit int32    Maximum number of items to return
--offset int32   Offset item number from list to begin return
-o, --org string  Organization name or id (required)
--output string  Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string  management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string  Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

apic mail-servers:test-connection

Test a Mail Server connection

Synopsis

Test a Mail Server connection

```
apic mail-servers:test-connection [flags]
```

Options

```
--format string  Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
-h, --help      Help for mail-servers:test-connection
-o, --org string  Organization name or id (required)
--output string  Write file(s) to directory, instead of STDOUT (default "-")
```

```
-s, --server string      management server endpoint (required)
--test-config-only      test-config-only
```

Options inherited from parent commands

```
--accept-license      Accept the license for API Connect
--debug               Enable debug output
--debug-output string Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

apic mail-servers:update

Update the Mail Server object by name or id

Synopsis

Update the Mail Server object by name or id

```
Fields allowed but ignored:
- id
- type
- api_version
- scope
- created_at
- updated_at
- url
```

```
apic mail-servers:update [flags]
```

Options

```
--format string      Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for mail-servers:update
-o, --org string      Organization name or id (required)
--output string       Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license      Accept the license for API Connect
--debug               Enable debug output
--debug-output string Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

apic me

Me operations

Synopsis

Me operations

```
apic me [flags]
```

Options

```
-h, --help  Help for me
```

Options inherited from parent commands

```
--accept-license      Accept the license for API Connect
--debug               Enable debug output
--debug-output string Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

apic me:change-password

Change my password

Synopsis

Change my password

```
apic me:change-password [flags]
```

Options

<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for me:change-password
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic me:delete

Delete the Me object

Synopsis

Delete the Me object

```
apic me:delete [flags]
```

Options

<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for me:delete
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic me:get

Get the Me object

Synopsis

Get the Me object

```
apic me:get [flags]
```

Options

<code>--context string</code>	user's login context admin/manager
<code>--fields string</code>	List of field names to return
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for me:get
<code>--output string</code>	Write file(s) to directory, use - for STDOUT. (default: cwd)
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic me:update

Update the Me object

Synopsis

Update the Me object

```
Fields allowed but ignored:
- name
- type
- api_version
- scope
- created_at
- updated_at
- url
```

```
apic me:update [flags]
```

Options

```
--format string  Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for me:update
--output string  Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic member-invitations

Member Invitations operations

Synopsis

Member Invitations operations

```
apic member-invitations [flags]
```

Options

```
-c, --catalog string  Catalog name or id (required)
--consumer-org string Consumer Organization name or id (required)
--fields string       List of field names to return
--format string       Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
-h, --help           Help for member-invitations
--limit int32        Maximum number of items to return
--offset int32       Offset item number from list to begin return
-o, --org string      Organization name or id (required)
--output string       Write file(s) to directory, instead of STDOUT (default "-")
--scope string        scope
-s, --server string   management server endpoint (required)
--space string        Space name or id (required)
--space-initiated    space-initiated
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic member-invitations:clear

Member Invitations clear operations

Synopsis

Member Invitations clear operations

```
apic member-invitations:clear [flags]
```

Options

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--confirm string</code>	Confirmation for critical updates (required)
<code>--consumer-org string</code>	Consumer Organization name or id (required)
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.	
<code>-h, --help</code>	Help for member-invitations:clear
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>--scope string</code>	scope
<code>-s, --server string</code>	management server endpoint (required)
<code>--space string</code>	Space name or id (required)
<code>--space-initiated</code>	space-initiated

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic member-invitations:create

Member Invitations create operations

Synopsis

Member Invitations create operations

```
apic member-invitations:create [flags]
```

Options

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--consumer-org string</code>	Consumer Organization name or id (required)
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.	
<code>-h, --help</code>	Help for member-invitations:create
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>--scope string</code>	scope
<code>-s, --server string</code>	management server endpoint (required)
<code>--space string</code>	Space name or id (required)
<code>--space-initiated</code>	space-initiated

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic member-invitations:delete

Member Invitations delete operations

Synopsis

Member Invitations delete operations

```
apic member-invitations:delete [flags]
```

Options

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--consumer-org string</code>	Consumer Organization name or id (required)
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.	
<code>-h, --help</code>	Help for member-invitations:delete
<code>-o, --org string</code>	Organization name or id (required)

--output string	Write file(s) to directory, instead of STDOUT (default "-")
--scope string	scope
-s, --server string	management server endpoint (required)
--space string	Space name or id (required)
--space-initiated	space-initiated

Options inherited from parent commands

--accept-license	Accept the license for API Connect
--debug	Enable debug output
--debug-output string	Write debug output to file
--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

apic member-invitations:get

Member Invitations get operations

Synopsis

Member Invitations get operations

```
apic member-invitations:get [flags]
```

Options

-c, --catalog string	Catalog name or id (required)
--consumer-org string	Consumer Organization name or id (required)
--fields string	List of field names to return
--format string	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help	Help for member-invitations:get
-o, --org string	Organization name or id (required)
--output string	Write file(s) to directory, use - for STDOUT. (default: cwd)
--scope string	scope
-s, --server string	management server endpoint (required)
--space string	Space name or id (required)
--space-initiated	space-initiated

Options inherited from parent commands

--accept-license	Accept the license for API Connect
--debug	Enable debug output
--debug-output string	Write debug output to file
--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

apic member-invitations:list

Member Invitations list operations

Synopsis

Member Invitations list operations

```
apic member-invitations:list [flags]
```

Options

-c, --catalog string	Catalog name or id (required)
--consumer-org string	Consumer Organization name or id (required)
--fields string	List of field names to return
--format string	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help	Help for member-invitations:list
--limit int32	Maximum number of items to return
--offset int32	Offset item number from list to begin return
-o, --org string	Organization name or id (required)
--output string	Write file(s) to directory, instead of STDOUT (default "-")
--scope string	scope
-s, --server string	management server endpoint (required)
--space string	Space name or id (required)
--space-initiated	space-initiated

Options inherited from parent commands

--accept-license	Accept the license for API Connect
--debug	Enable debug output

```
--debug-output string Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

apic member-invitations:update

Member Invitations update operations

Synopsis

Member Invitations update operations

```

-s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license      Accept the license for API Connect
--debug              Enable debug output
--debug-output string Write debug output to file
--live-help          Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

apic notification-templates

Notification Templates operations

Synopsis

Notification Templates operations

```
apic notification-templates [flags]
```

Options

```
-c, --catalog string    Catalog name or id (required)
--fields string        List of field names to return
--format string        Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help             Help for notification-templates
--limit int32         Maximum number of items to return
--offset int32        Offset item number from list to begin return
-o, --org string       Organization name or id (required)
--output string        Write file(s) to directory, instead of STDOUT (default "-")
--scope string         scope
-s, --server string    management server endpoint (required)
--space string         Space name or id (required)
```

Options inherited from parent commands

```
--accept-license      Accept the license for API Connect
--debug              Enable debug output
--debug-output string Write debug output to file
--live-help          Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

apic notification-templates:get

Notification Templates get operations

Synopsis

Notification Templates get operations

```
apic notification-templates:get [flags]
```

Options

```
-c, --catalog string    Catalog name or id (required)
--fields string        List of field names to return
--format string        Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
-h, --help             Help for notification-templates:get
-o, --org string       Organization name or id (required)
--output string        Write file(s) to directory, use - for STDOUT. (default: cwd)
--scope string         scope
```

```
-s, --server string      management server endpoint (required)
--space string          Space name or id (required)
--subcollection string  subcollection
```

Options inherited from parent commands

```
--accept-license      Accept the license for API Connect
--debug              Enable debug output
--debug-output string Write debug output to file
--live-help          Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

apic notification-templates:list

Notification Templates list operations

Synopsis

Notification Templates list operations

```
apic notification-templates:list [flags]
```

Options

```
-c, --catalog string      Catalog name or id (required)
--fields string          List of field names to return
--format string          Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
-h, --help              Help for notification-templates:list
--limit int32           Maximum number of items to return
--offset int32          Offset item number from list to begin return
-o, --org string         Organization name or id (required)
--output string         Write file(s) to directory, instead of STDOUT (default "-")
--scope string          scope
-s, --server string      management server endpoint (required)
--space string          Space name or id (required)
--subcollection string  subcollection
```

Options inherited from parent commands

```
--accept-license      Accept the license for API Connect
--debug              Enable debug output
--debug-output string Write debug output to file
--live-help          Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

apic notification-templates:list-all

Notification Templates list-all operations

Synopsis

Notification Templates list-all operations

```
apic notification-templates:list-all [flags]
```

Options

```
-c, --catalog string      Catalog name or id (required)
--fields string          List of field names to return
--format string          Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help              Help for notification-templates:list-all
--limit int32           Maximum number of items to return
--offset int32          Offset item number from list to begin return
-o, --org string         Organization name or id (required)
--output string         Write file(s) to directory, instead of STDOUT (default "-")
--scope string          scope
-s, --server string      management server endpoint (required)
--space string          Space name or id (required)
```

Options inherited from parent commands

```
--accept-license      Accept the license for API Connect
--debug              Enable debug output
--debug-output string Write debug output to file
--live-help          Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

apic notification-templates:update

Notification Templates update operations

Synopsis

Notification Templates update operations

```
apic notification-templates:update [flags]
```

Options

```
-c, --catalog string      Catalog name or id (required)
--format string          Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
-h, --help               Help for notification-templates:update
-o, --org string         Organization name or id (required)
--output string         Write file(s) to directory, instead of STDOUT (default "-")
--scope string          scope
-s, --server string     management server endpoint (required)
--space string          Space name or id (required)
--subcollection string  subcollection
```

Options inherited from parent commands

```
--accept-license      Accept the license for API Connect
--debug               Enable debug output
--debug-output string Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

apic oauth-providers

Oauth Providers operations

Synopsis

Oauth Providers operations

```
apic oauth-providers [flags]
```

Options

```
--fields string      List of field names to return
--format string      Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for oauth-providers
--limit int32        Maximum number of items to return
--offset int32       Offset item number from list to begin return
-o, --org string     Organization name or id (required)
--output string      Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string  management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license      Accept the license for API Connect
--debug               Enable debug output
--debug-output string Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

apic oauth-providers:clear

Clear the Oauth Provider objects

Synopsis

Clear the Oauth Provider objects

```
apic oauth-providers:clear [flags]
```

Options

```

--confirm string      Confirmation for critical updates (required)
--format string      Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for oauth-providers:clear
-o, --org string      Organization name or id (required)
--output string       Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string   management server endpoint (required)

```

Options inherited from parent commands

```

--accept-license      Accept the license for API Connect
--debug              Enable debug output
--debug-output string Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")

```

apic oauth-providers:create

Create a OAuth Provider object

Synopsis

Create a OAuth Provider object

```

Fields allowed but ignored:
- id
- type
- api_version
- scope
- created_at
- updated_at
- url
- org_url

```

```
apic oauth-providers:create [flags]
```

Options

```

--format string      Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for oauth-providers:create
-o, --org string      Organization name or id (required)
--output string       Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string   management server endpoint (required)

```

Options inherited from parent commands

```

--accept-license      Accept the license for API Connect
--debug              Enable debug output
--debug-output string Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")

```

apic oauth-providers:delete

Delete the OAuth Provider object by name or id

Synopsis

Delete the OAuth Provider object by name or id

```
apic oauth-providers:delete [flags]
```

Options

```

--format string      Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for oauth-providers:delete
-o, --org string      Organization name or id (required)
--output string       Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string   management server endpoint (required)

```

Options inherited from parent commands

```

--accept-license      Accept the license for API Connect
--debug              Enable debug output
--debug-output string Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")

```

apic oauth-providers:get

Get the OAuth Provider object by name or id

Synopsis

Get the OAuth Provider object by name or id

```
apic oauth-providers:get [flags]
```

Options

```
--fields string  List of field names to return
--format string  Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for oauth-providers:get
-o, --org string  Organization name or id (required)
--output string  Write file(s) to directory, use - for STDOUT. (default: cwd)
-s, --server string  management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string  Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

apic oauth-providers:list

List the OAuth Provider objects

Synopsis

List the OAuth Provider objects

```
apic oauth-providers:list [flags]
```

Options

```
--fields string  List of field names to return
--format string  Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for oauth-providers:list
--limit int32    Maximum number of items to return
--offset int32   Offset item number from list to begin return
-o, --org string  Organization name or id (required)
--output string  Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string  management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string  Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

apic oauth-providers:update

Update the OAuth Provider object by name or id

Synopsis

Update the OAuth Provider object by name or id

```
Fields allowed but ignored:
- id
- type
- api_version
- scope
- created_at
- updated_at
- url
- org_url
```

```
apic oauth-providers:update [flags]
```

Options

```
--format string  Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.  
-h, --help      Help for oauth-providers:update  
-o, --org string Organization name or id (required)  
--output string Write file(s) to directory, instead of STDOUT (default "-")  
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect  
--debug           Enable debug output  
--debug-output string Write debug output to file  
--live-help       Enable or disable tracking of limited usage information  
-m, --mode string Toolkit operation mode (default "apim")
```

apic org-settings

Org Settings operations

Synopsis

Org Settings operations

```
apic org-settings [flags]
```

Options

```
-h, --help  Help for org-settings
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect  
--debug           Enable debug output  
--debug-output string Write debug output to file  
--live-help       Enable or disable tracking of limited usage information  
-m, --mode string Toolkit operation mode (default "apim")
```

apic org-settings:get

Get the Organization Setting object

Synopsis

Get the Organization Setting object

```
apic org-settings:get [flags]
```

Options

```
--fields string  List of field names to return  
--format string  Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.  
-h, --help      Help for org-settings:get  
-o, --org string Organization name or id (required)  
--output string Write file(s) to directory, use - for STDOUT. (default: cwd)  
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect  
--debug           Enable debug output  
--debug-output string Write debug output to file  
--live-help       Enable or disable tracking of limited usage information  
-m, --mode string Toolkit operation mode (default "apim")
```

apic org-settings:update

Update the Organization Setting object

Synopsis

Update the Organization Setting object

```
Fields allowed but ignored:
- name
- type
- api_version
- scope
- created_at
- updated_at
- url
```

```
apic org-settings:update [flags]
```

Options

```
--format string  Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for org-settings:update
-o, --org string Organization name or id (required)
--output string Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic orgs

Orgs operations

Synopsis

Orgs operations

```
apic orgs [flags]
```

Options

```
--expand string  List of transient field to expand
--fields string  List of field names to return
--format string  Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
-h, --help      Help for orgs
--limit int32   Maximum number of items to return
--my           my
--offset int32  Offset item number from list to begin return
--org_type string Type of orgs to return
--output string Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic orgs:clear

Clear the Organization objects

Synopsis

Clear the Organization objects

```
apic orgs:clear [flags]
```

Options

```
--confirm string Confirmation for critical updates (required)
--format string  Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
```

```
-h, --help           Help for orgs:clear
--output string      Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string  management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license      Accept the license for API Connect
--debug               Enable debug output
--debug-output string Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

apic orgs:create

Create an Organization object

Synopsis

Create an Organization object

```
Required fields:
- owner_url

Fields allowed but ignored:
- id
- type
- api_version
- scope
- created_at
- updated_at
- url
```

apic orgs:create [flags]

Options

```
--format string      Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for orgs:create
--output string      Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string  management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license      Accept the license for API Connect
--debug               Enable debug output
--debug-output string Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

apic orgs:delete

Delete the Organization object by name or id

Synopsis

Delete the Organization object by name or id

apic orgs:delete [flags]

Options

```
--format string      Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for orgs:delete
--output string      Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string  management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license      Accept the license for API Connect
--debug               Enable debug output
--debug-output string Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

apic orgs:get

Get the Organization object by name or id

Synopsis

Get the Organization object by name or id

```
apic orgs:get [flags]
```

Options

```
--expand string  List of transient field to expand
--fields string  List of field names to return
--format string  Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help       Help for orgs:get
--output string  Write file(s) to directory, use - for STDOUT. (default: cwd)
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

apic orgs:list

List the Organization objects

Synopsis

List the Organization objects

```
apic orgs:list [flags]
```

Options

```
--expand string  List of transient field to expand
--fields string  List of field names to return
--format string  Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
-h, --help       Help for orgs:list
--limit int32    Maximum number of items to return
--my            my
--offset int32   Offset item number from list to begin return
--org_type string Type of orgs to return
--output string  Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

apic orgs:transfer-owner

Transfer owner to an associate

Synopsis

Transfer owner to an associate

```
apic orgs:transfer-owner [flags]
```

Options

```
--cascade        Cascade the behavior
--delete_old_owner Delete old owner
--format string  Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
-h, --help       Help for orgs:transfer-owner
--output string  Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

apic orgs:update

Update the Organization object by name or id

Synopsis

Update the Organization object by name or id

```
Fields not allowed:
- name
- org_type

Fields allowed but ignored:
- id
- type
- api_version
- scope
- created_at
- updated_at
- url
```

```
apic orgs:update [flags]
```

Options

```
--format string  Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help       Help for orgs:update
--output string  Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

apic payment-methods

Payment Methods operations

Synopsis

Payment Methods operations

```
apic payment-methods [flags]
```

Options

```
-c, --catalog string  Catalog name or id (required)
--consumer-org string Consumer Organization name or id (required)
--fields string       List of field names to return
--format string       Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
-h, --help            Help for payment-methods
--limit int32         Maximum number of items to return
--offset int32        Offset item number from list to begin return
-o, --org string       Organization name or id (required)
--output string       Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string   management server endpoint (required)
--space string        Space name or id (required)
--space-initiated     space-initiated
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
```

```
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic payment-methods:create

Create a Payment Method object

Synopsis

Create a Payment Method object

```
Fields allowed but ignored:
- id
- type
- api_version
- scope
- created_at
- updated_at
- url
- consumer_org_url
```

```
apic payment-methods:create [flags]
```

Options

```
-c, --catalog string      Catalog name or id (required)
--consumer-org string    Consumer Organization name or id (required)
--format string          Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
-h, --help               Help for payment-methods:create
-o, --org string         Organization name or id (required)
--output string          Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string      management server endpoint (required)
--space string           Space name or id (required)
--space-initiated        space-initiated
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic payment-methods:delete

Delete the Payment Method object by name or id

Synopsis

Delete the Payment Method object by name or id

```
apic payment-methods:delete [flags]
```

Options

```
-c, --catalog string      Catalog name or id (required)
--consumer-org string    Consumer Organization name or id (required)
--format string          Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
-h, --help               Help for payment-methods:delete
-o, --org string         Organization name or id (required)
--output string          Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string      management server endpoint (required)
--space string           Space name or id (required)
--space-initiated        space-initiated
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic payment-methods:get

Get the Payment Method object by name or id

Synopsis

Get the Payment Method object by name or id

```
apic payment-methods:get [flags]
```

Options

```
-c, --catalog string      Catalog name or id (required)
--consumer-org string    Consumer Organization name or id (required)
--fields string          List of field names to return
--format string           Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
-h, --help                Help for payment-methods:get
-o, --org string           Organization name or id (required)
--output string           Write file(s) to directory, use - for STDOUT. (default: cwd)
-s, --server string       management server endpoint (required)
--space string            Space name or id (required)
--space-initiated        space-initiated
```

Options inherited from parent commands

```
--accept-license        Accept the license for API Connect
--debug                 Enable debug output
--debug-output string   Write debug output to file
--live-help             Enable or disable tracking of limited usage information
-m, --mode string       Toolkit operation mode (default "apim")
```

apic payment-methods:list

List the Payment Method objects

Synopsis

List the Payment Method objects

```
apic payment-methods:list [flags]
```

Options

```
-c, --catalog string      Catalog name or id (required)
--consumer-org string    Consumer Organization name or id (required)
--fields string          List of field names to return
--format string           Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
-h, --help                Help for payment-methods:list
--limit int32            Maximum number of items to return
--offset int32           Offset item number from list to begin return
-o, --org string           Organization name or id (required)
--output string           Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string       management server endpoint (required)
--space string            Space name or id (required)
--space-initiated        space-initiated
```

Options inherited from parent commands

```
--accept-license        Accept the license for API Connect
--debug                 Enable debug output
--debug-output string   Write debug output to file
--live-help             Enable or disable tracking of limited usage information
-m, --mode string       Toolkit operation mode (default "apim")
```

apic payment-methods:update

Update the Payment Method object by name or id

Synopsis

Update the Payment Method object by name or id

```
Fields allowed but ignored:
- id
- type
- api_version
- scope
```

```
- created_at
- updated_at
- url
- consumer_org_url
```

```
apic payment-methods:update [flags]
```

Options

```
-c, --catalog string      Catalog name or id (required)
--consumer-org string    Consumer Organization name or id (required)
--format string          Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
-h, --help               Help for payment-methods:update
-o, --org string         Organization name or id (required)
--output string          Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string      management server endpoint (required)
--space string          Space name or id (required)
--space-initiated       space-initiated
```

Options inherited from parent commands

```
--accept-license        Accept the license for API Connect
--debug                 Enable debug output
--debug-output string   Write debug output to file
--live-help             Enable or disable tracking of limited usage information
-m, --mode string       Toolkit operation mode (default "apim")
```

apic permissions

Permissions operations

Synopsis

Permissions operations

```
apic permissions [flags]
```

Options

```
--fields string         List of field names to return
--format string         Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help              Help for permissions
--limit int32           Maximum number of items to return
--offset int32          Offset item number from list to begin return
--output string         Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string     management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license        Accept the license for API Connect
--debug                 Enable debug output
--debug-output string   Write debug output to file
--live-help             Enable or disable tracking of limited usage information
-m, --mode string       Toolkit operation mode (default "apim")
```

apic permissions:get

Permissions get operations

Synopsis

Permissions get operations

```
apic permissions:get [flags]
```

Options

```
--fields string         List of field names to return
--format string         Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
-h, --help              Help for permissions:get
--output string         Write file(s) to directory, use - for STDOUT. (default: cwd)
-s, --server string     management server endpoint (required)
--subcollection string subcollection
```

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic permissions:list

Permissions list operations

Synopsis

Permissions list operations

```
apic permissions:list [flags]
```

Options

<code>--fields string</code>	List of field names to return
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for permissions:list
<code>--limit int32</code>	Maximum number of items to return
<code>--my</code>	my
<code>--offset int32</code>	Offset item number from list to begin return
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)
<code>--subcollection string</code>	subcollection

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic permissions:list-all

List all Permission objects in all collections

Synopsis

List all Permission objects in all collections

```
apic permissions:list-all [flags]
```

Options

<code>--fields string</code>	List of field names to return
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for permissions:list-all
<code>--limit int32</code>	Maximum number of items to return
<code>--offset int32</code>	Offset item number from list to begin return
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic policies

Policies operations

Synopsis

Policies operations

`apic policies [flags]`

Options

<code>--availability-zone string</code>	Availability Zone name or id (required)
<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--configured-gateway-service string</code>	Configured Gateway Service name or id (required)
<code>--fields string</code>	List of field names to return
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>--gateway-service string</code>	Gateway Service name or id (required)
<code>-h, --help</code>	Help for policies
<code>--limit int32</code>	Maximum number of items to return
<code>--offset int32</code>	Offset item number from list to begin return
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>--scope string</code>	scope
<code>-s, --server string</code>	management server endpoint (required)
<code>--space string</code>	Space name or id (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic policies:clear

Policies clear operations

Synopsis

Policies clear operations

`apic policies:clear [flags]`

Options

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--configured-gateway-service string</code>	Configured Gateway Service name or id (required)
<code>--confirm string</code>	Confirmation for critical updates (required)
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for policies:clear
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>--scope string</code>	scope
<code>-s, --server string</code>	management server endpoint (required)
<code>--space string</code>	Space name or id (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic policies:clear-all

Policies clear-all operations

Synopsis

Policies clear-all operations

`apic policies:clear-all [flags]`

Options

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--configured-gateway-service string</code>	Configured Gateway Service name or id (required)
<code>--confirm string</code>	Confirmation for critical updates (required)

<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-
<code>file=...], defaults to yaml.</code>	
<code>-h, --help</code>	Help for policies:clear-all
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>--scope string</code>	scope
<code>-s, --server string</code>	management server endpoint (required)
<code>--space string</code>	Space name or id (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic policies:clone

Policies clone operations

Synopsis

Policies clone operations

```
apic policies:clone [flags]
```

Options

<code>--availability-zone string</code>	Availability Zone name or id (required)
<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--configured-gateway-service string</code>	Configured Gateway Service name or id (required)
<code>--fields string</code>	List of field names to return
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-
<code>file=...], defaults to yaml.</code>	
<code>--gateway-service string</code>	Gateway Service name or id (required)
<code>-h, --help</code>	Help for policies:clone
<code>--limit int32</code>	Maximum number of items to return
<code>--offset int32</code>	Offset item number from list to begin return
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, use - for STDOUT. (default: cwd)
<code>--scope string</code>	scope
<code>-s, --server string</code>	management server endpoint (required)
<code>--space string</code>	Space name or id (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic policies:create

Policies create operations

Synopsis

Policies create operations

```
apic policies:create [flags]
```

Options

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--configured-gateway-service string</code>	Configured Gateway Service name or id (required)
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-
<code>file=...], defaults to yaml.</code>	
<code>-h, --help</code>	Help for policies:create
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>--policy-file string</code>	Policy document override
<code>--scope string</code>	scope
<code>-s, --server string</code>	management server endpoint (required)
<code>--space string</code>	Space name or id (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic policies:delete

Policies delete operations

Synopsis

Policies delete operations

```
apic policies:delete [flags]
```

Options

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--configured-gateway-service string</code>	Configured Gateway Service name or id (required)
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for policies:delete
<code>--id</code>	id
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>--scope string</code>	scope
<code>-s, --server string</code>	management server endpoint (required)
<code>--space string</code>	Space name or id (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic policies:document

Policies document operations

Synopsis

Policies document operations

```
apic policies:document [flags]
```

Options

<code>--availability-zone string</code>	Availability Zone name or id (required)
<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--configured-gateway-service string</code>	Configured Gateway Service name or id (required)
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>--gateway-service string</code>	Gateway Service name or id (required)
<code>-h, --help</code>	Help for policies:document
<code>--id</code>	id
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>--scope string</code>	scope
<code>-s, --server string</code>	management server endpoint (required)
<code>--space string</code>	Space name or id (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic policies:get

Synopsis

Policies get operations

```
apic policies:get [flags]
```

Options

```
--availability-zone string      Availability Zone name or id (required)
-c, --catalog string           Catalog name or id (required)
--configured-gateway-service string Configured Gateway Service name or id (required)
--fields string                List of field names to return (default "add(policy,implementation)")
--format string                 Output format. One of [json yaml octet-stream go-template=... go-template-
file=...], defaults to yaml.
--gateway-service string       Gateway Service name or id (required)
-h, --help                     Help for policies:get
--id                             id
-o, --org string                Organization name or id (required)
--output string                 Write file(s) to directory, use - for STDOUT. (default: cwd)
--scope string                  scope
-s, --server string             management server endpoint (required)
--space string                  Space name or id (required)
```

Options inherited from parent commands

```
--accept-license      Accept the license for API Connect
--debug                Enable debug output
--debug-output string  Write debug output to file
--live-help            Enable or disable tracking of limited usage information
-m, --mode string      Toolkit operation mode (default "apim")
```

apic policies:implementation

Policies implementation operations

Synopsis

Policies implementation operations

```
apic policies:implementation [flags]
```

Options

```
-c, --catalog string      Catalog name or id (required)
--configured-gateway-service string Configured Gateway Service name or id (required)
--format string           Output format. One of [json yaml octet-stream go-template=... go-template-
file=...], defaults to yaml.
-h, --help                Help for policies:implementation
--id                       id
-o, --org string           Organization name or id (required)
--output string            Write file(s) to directory, use - for STDOUT. (default: cwd)
--scope string             scope
-s, --server string        management server endpoint (required)
--space string             Space name or id (required)
```

Options inherited from parent commands

```
--accept-license      Accept the license for API Connect
--debug                Enable debug output
--debug-output string  Write debug output to file
--live-help            Enable or disable tracking of limited usage information
-m, --mode string      Toolkit operation mode (default "apim")
```

apic policies:list

Policies list operations

Synopsis

Policies list operations

```
apic policies:list [flags]
```

Options

--availability-zone string	Availability Zone name or id (required)
-c, --catalog string	Catalog name or id (required)
--configured-gateway-service string	Configured Gateway Service name or id (required)
--fields string	List of field names to return
--format string	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
--gateway-service string	Gateway Service name or id (required)
-h, --help	Help for policies:list
--limit int32	Maximum number of items to return
--offset int32	Offset item number from list to begin return
-o, --org string	Organization name or id (required)
--output string	Write file(s) to directory, instead of STDOUT (default "-")
--scope string	scope
-s, --server string	management server endpoint (required)
--space string	Space name or id (required)

Options inherited from parent commands

--accept-license	Accept the license for API Connect
--debug	Enable debug output
--debug-output string	Write debug output to file
--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

apic policies:list-all

Policies list-all operations

Synopsis

Policies list-all operations

```
apic policies:list-all [flags]
```

Options

--availability-zone string	Availability Zone name or id (required)
-c, --catalog string	Catalog name or id (required)
--configured-gateway-service string	Configured Gateway Service name or id (required)
--fields string	List of field names to return
--format string	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
--gateway-service string	Gateway Service name or id (required)
-h, --help	Help for policies:list-all
--limit int32	Maximum number of items to return
--offset int32	Offset item number from list to begin return
-o, --org string	Organization name or id (required)
--output string	Write file(s) to directory, instead of STDOUT (default "-")
--scope string	scope
-s, --server string	management server endpoint (required)
--space string	Space name or id (required)

Options inherited from parent commands

--accept-license	Accept the license for API Connect
--debug	Enable debug output
--debug-output string	Write debug output to file
--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

apic policies:update

Policies update operations

Synopsis

Policies update operations

```
apic policies:update [flags]
```

Options

-c, --catalog string	Catalog name or id (required)
--configured-gateway-service string	Configured Gateway Service name or id (required)
--format string	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help	Help for policies:update
--id	id
-o, --org string	Organization name or id (required)

<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>--scope string</code>	scope
<code>-s, --server string</code>	management server endpoint (required)
<code>--space string</code>	Space name or id (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic portal-services

Portal Services operations

Synopsis

Portal Services operations

```
apic portal-services [flags]
```

Options

<code>--availability-zone string</code>	Availability Zone name or id (required)
<code>--fields string</code>	List of field names to return
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for portal-services
<code>--limit int32</code>	Maximum number of items to return
<code>--offset int32</code>	Offset item number from list to begin return
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>--scope string</code>	scope
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic portal-services:clear

Clear the Portal Service objects

Synopsis

Clear the Portal Service objects

```
apic portal-services:clear [flags]
```

Options

<code>--availability-zone string</code>	Availability Zone name or id (required)
<code>--confirm string</code>	Confirmation for critical updates (required)
<code>--force</code>	Force the operation
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for portal-services:clear
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic portal-services:create

Create a Portal Service object

Synopsis

Create a Portal Service object

```
Required fields:
- endpoint
- web_endpoint_base

Fields not allowed:
- owned

Fields allowed but ignored:
- id
- type
- api_version
- scope
- created_at
- updated_at
- url
- org_url
- availability_zone_url
```

```
apic portal-services:create [flags]
```

Options

```
--availability-zone string  Availability Zone name or id (required)
--format string             Output format. One of [json yaml octet-stream go-template=... go-template-file=...],
defaults to yaml.
-h, --help                 Help for portal-services:create
-o, --org string            Organization name or id (required)
--output string            Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string        management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license           Accept the license for API Connect
--debug                    Enable debug output
--debug-output string      Write debug output to file
--live-help                Enable or disable tracking of limited usage information
-m, --mode string          Toolkit operation mode (default "apim")
```

apic portal-services:delete

Delete the Portal Service object by name or id

Synopsis

Delete the Portal Service object by name or id

```
apic portal-services:delete [flags]
```

Options

```
--availability-zone string  Availability Zone name or id (required)
--force                     Force the operation
--format string             Output format. One of [json yaml octet-stream go-template=... go-template-file=...],
defaults to yaml.
-h, --help                 Help for portal-services:delete
-o, --org string            Organization name or id (required)
--output string            Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string        management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license           Accept the license for API Connect
--debug                    Enable debug output
--debug-output string      Write debug output to file
--live-help                Enable or disable tracking of limited usage information
-m, --mode string          Toolkit operation mode (default "apim")
```

apic portal-services:get

Get the Portal Service object by name or id

Synopsis

Get the Portal Service object by name or id

```
apic portal-services:get [flags]
```

Options

```
--availability-zone string  Availability Zone name or id (required)
--fields string             List of field names to return
--format string             Output format. One of [json yaml octet-stream go-template=... go-template-file=...],
defaults to yaml.
-h, --help                  Help for portal-services:get
-o, --org string            Organization name or id (required)
--output string             Write file(s) to directory, use - for STDOUT. (default: cwd)
--scope string              scope
-s, --server string         management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license           Accept the license for API Connect
--debug                    Enable debug output
--debug-output string      Write debug output to file
--live-help                Enable or disable tracking of limited usage information
-m, --mode string          Toolkit operation mode (default "apim")
```

apic portal-services:list

List the Portal Service objects

Synopsis

List the Portal Service objects

```
apic portal-services:list [flags]
```

Options

```
--availability-zone string  Availability Zone name or id (required)
--fields string             List of field names to return
--format string             Output format. One of [json yaml octet-stream go-template=... go-template-file=...],
defaults to yaml.
-h, --help                  Help for portal-services:list
--limit int32               Maximum number of items to return
--offset int32              Offset item number from list to begin return
-o, --org string            Organization name or id (required)
--output string             Write file(s) to directory, instead of STDOUT (default "-")
--scope string              scope
-s, --server string         management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license           Accept the license for API Connect
--debug                    Enable debug output
--debug-output string      Write debug output to file
--live-help                Enable or disable tracking of limited usage information
-m, --mode string          Toolkit operation mode (default "apim")
```

apic portal-services:update-credentials

Update the Portal Service configuration

Synopsis

Update the Portal Service configuration

```
apic portal-services:update-credentials [flags]
```

Options

```
--availability-zone string  Availability Zone name or id (required)
--format string             Output format. One of [json yaml octet-stream go-template=... go-template-file=...],
defaults to yaml.
-h, --help                  Help for portal-services:update-credentials
```

<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic portal-services:update

Update the Portal Service object by name or id

Synopsis

Update the Portal Service object by name or id

```
Fields not allowed to be null:
- endpoint_tls_client_profile_url
- web_endpoint_base

Fields not allowed:
- owned
- endpoint

Fields allowed but ignored:
- id
- type
- api_version
- scope
- created_at
- updated_at
- url
- org_url
- availability_zone_url
```

`apic portal-services:update [flags]`

Options

<code>--availability-zone string</code>	Availability Zone name or id (required)
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for portal-services:update
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic primary-events

Primary Events operations

Synopsis

Primary Events operations

`apic primary-events [flags]`

Options

<code>--availability-zone string</code>	Availability Zone name or id (required)
<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--configured-gateway-service string</code>	Configured Gateway Service name or id (required)
<code>--fields string</code>	List of field names to return
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>--gateway-service string</code>	Gateway Service name or id (required)
<code>-h, --help</code>	Help for primary-events

--limit int32	Maximum number of items to return
--offset int32	Offset item number from list to begin return
-o, --org string	Organization name or id (required)
--output string	Write file(s) to directory, instead of STDOUT (default "-")
--portal-service string	Portal Service name or id (required)
--scope string	scope
-s, --server string	management server endpoint (required)
--state string	State for a webhook event in subscriber queue

Options inherited from parent commands

--accept-license	Accept the license for API Connect
--debug	Enable debug output
--debug-output string	Write debug output to file
--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

apic primary-events:get

Primary Events get operations

Synopsis

Primary Events get operations

```
apic primary-events:get [flags]
```

Options

--availability-zone string	Availability Zone name or id (required)
-c, --catalog string	Catalog name or id (required)
--configured-gateway-service string	Configured Gateway Service name or id (required)
--fields string	List of field names to return
--format string	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
--gateway-service string	Gateway Service name or id (required)
-h, --help	Help for primary-events:get
-o, --org string	Organization name or id (required)
--output string	Write file(s) to directory, use - for STDOUT. (default: cwd)
--portal-service string	Portal Service name or id (required)
--scope string	scope
-s, --server string	management server endpoint (required)

Options inherited from parent commands

--accept-license	Accept the license for API Connect
--debug	Enable debug output
--debug-output string	Write debug output to file
--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

apic primary-events:list

Primary Events list operations

Synopsis

Primary Events list operations

```
apic primary-events:list [flags]
```

Options

--availability-zone string	Availability Zone name or id (required)
-c, --catalog string	Catalog name or id (required)
--configured-gateway-service string	Configured Gateway Service name or id (required)
--fields string	List of field names to return
--format string	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
--gateway-service string	Gateway Service name or id (required)
-h, --help	Help for primary-events:list
--limit int32	Maximum number of items to return
--offset int32	Offset item number from list to begin return
-o, --org string	Organization name or id (required)
--output string	Write file(s) to directory, instead of STDOUT (default "-")
--portal-service string	Portal Service name or id (required)
--scope string	scope
-s, --server string	management server endpoint (required)
--state string	State for a webhook event in subscriber queue

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic products

Products operations

Synopsis

Products operations

```
apic products [flags]
```

Options

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--expand string</code>	List of transient field to expand
<code>--fields string</code>	List of field names to return
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for products
<code>--limit int32</code>	Maximum number of items to return
<code>--offset int32</code>	Offset item number from list to begin return
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>--scope string</code>	scope
<code>-s, --server string</code>	management server endpoint (required)
<code>--space string</code>	Space name or id (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic products:clear

Products clear operations

Synopsis

Products clear operations

```
apic products:clear [flags]
```

Options

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--confirm string</code>	Confirmation for critical updates (required)
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for products:clear
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>--scope string</code>	scope
<code>-s, --server string</code>	management server endpoint (required)
<code>--space string</code>	Space name or id (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic products:clear-all

Products clear-all operations

Synopsis

Products clear-all operations

```
apic products:clear-all [flags]
```

Options

```
-c, --catalog string    Catalog name or id (required)
--confirm string       Confirmation for critical updates (required)
--format string        Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help             Help for products:clear-all
-o, --org string        Organization name or id (required)
--output string        Write file(s) to directory, instead of STDOUT (default "-")
--scope string         scope
-s, --server string     management server endpoint (required)
--space string         Space name or id (required)
```

Options inherited from parent commands

```
--accept-license      Accept the license for API Connect
--debug               Enable debug output
--debug-output string Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

apic products:clone

Products clone operations

Synopsis

Products clone operations

```
apic products:clone [flags]
```

Options

```
-c, --catalog string    Catalog name or id (required)
--expand string        List of transient field to expand
--fields string        List of field names to return
--format string        Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help             Help for products:clone
--limit int32          Maximum number of items to return
--offset int32         Offset item number from list to begin return
-o, --org string        Organization name or id (required)
--output string        Write file(s) to directory, use - for STDOUT. (default: cwd)
--scope string         scope
-s, --server string     management server endpoint (required)
--space string         Space name or id (required)
```

Options inherited from parent commands

```
--accept-license      Accept the license for API Connect
--debug               Enable debug output
--debug-output string Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

apic products:delete

Products delete operations

Synopsis

Products delete operations

```
apic products:delete [flags]
```

Options

```
-c, --catalog string    Catalog name or id (required)
--format string        Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help             Help for products:delete
--id string            id
-o, --org string        Organization name or id (required)
```

```
--output string      Write file(s) to directory, instead of STDOUT (default "-")
--scope string       scope
-s, --server string  management server endpoint (required)
--space string       Space name or id (required)
```

Options inherited from parent commands

```
--accept-license    Accept the license for API Connect
--debug             Enable debug output
--debug-output string Write debug output to file
--live-help         Enable or disable tracking of limited usage information
-m, --mode string   Toolkit operation mode (default "apim")
```

apic products:document

Products document operations

Synopsis

Products document operations

```
apic products:document [flags]
```

Options

```
-c, --catalog string  Catalog name or id (required)
--format string       Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help            Help for products:document
--id                 id
-o, --org string      Organization name or id (required)
--output string       Write file(s) to directory, instead of STDOUT (default "-")
--scope string        scope
-s, --server string   management server endpoint (required)
--space string        Space name or id (required)
```

Options inherited from parent commands

```
--accept-license    Accept the license for API Connect
--debug             Enable debug output
--debug-output string Write debug output to file
--live-help         Enable or disable tracking of limited usage information
-m, --mode string   Toolkit operation mode (default "apim")
```

apic products:execute-migration-target

Products execute-migration-target operations

Synopsis

Products execute-migration-target operations

```
apic products:execute-migration-target [flags]
```

Options

```
-c, --catalog string  Catalog name or id (required)
--format string       Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help            Help for products:execute-migration-target
--id                 id
-o, --org string      Organization name or id (required)
--output string       Write file(s) to directory, instead of STDOUT (default "-")
--scope string        scope
-s, --server string   management server endpoint (required)
--space string        Space name or id (required)
```

Options inherited from parent commands

```
--accept-license    Accept the license for API Connect
--debug             Enable debug output
--debug-output string Write debug output to file
--live-help         Enable or disable tracking of limited usage information
-m, --mode string   Toolkit operation mode (default "apim")
```

apic products:get

Synopsis

Products get operations

`apic products:get [flags]`

Options

```

-c, --catalog string  Catalog name or id (required)
--fields string      List of field names to return (default "add(catalog_product)")
--format string       Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for products:get
--id                 id
-o, --org string      Organization name or id (required)
--output string       Write file(s) to directory, use - for STDOUT. (default: cwd)
--scope string        scope
-s, --server string   management server endpoint (required)
--space string        Space name or id (required)

```

Options inherited from parent commands

```

--accept-license      Accept the license for API Connect
--debug              Enable debug output
--debug-output string Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")

```

apic products:list

Products list operations

Synopsis

Products list operations

`apic products:list [flags]`

Options

```

-c, --catalog string  Catalog name or id (required)
--expand string       List of transient field to expand
--fields string       List of field names to return
--format string       Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for products:list
--limit int32         Maximum number of items to return
--offset int32        Offset item number from list to begin return
-o, --org string      Organization name or id (required)
--output string       Write file(s) to directory, instead of STDOUT (default "-")
--scope string        scope
-s, --server string   management server endpoint (required)
--space string        Space name or id (required)

```

Options inherited from parent commands

```

--accept-license      Accept the license for API Connect
--debug              Enable debug output
--debug-output string Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")

```

apic products:list-all

Products list-all operations

Synopsis

Products list-all operations

`apic products:list-all [flags]`

Options

```

-c, --catalog string  Catalog name or id (required)
--expand string       List of transient field to expand

```

```

--fields string      List of field names to return
--format string     Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help          Help for products:list-all
--limit int32       Maximum number of items to return
--offset int32      Offset item number from list to begin return
-o, --org string    Organization name or id (required)
--output string     Write file(s) to directory, instead of STDOUT (default "-")
--scope string      scope
-s, --server string management server endpoint (required)
--space string      Space name or id (required)

```

Options inherited from parent commands

```

--accept-license    Accept the license for API Connect
--debug            Enable debug output
--debug-output string Write debug output to file
--live-help        Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")

```

apic products:migrate-subscriptions

Products migrate-subscriptions operations

Synopsis

Products migrate-subscriptions operations

```
apic products:migrate-subscriptions [flags]
```

Options

```

-c, --catalog string  Catalog name or id (required)
--format string     Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help          Help for products:migrate-subscriptions
--id                id
-o, --org string    Organization name or id (required)
--output string     Write file(s) to directory, instead of STDOUT (default "-")
--scope string      scope
-s, --server string  management server endpoint (required)
--space string      Space name or id (required)

```

Options inherited from parent commands

```

--accept-license    Accept the license for API Connect
--debug            Enable debug output
--debug-output string Write debug output to file
--live-help        Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")

```

apic products:publish

Publish the product

Synopsis

Publish the product

```
apic products:publish [flags]
```

Options

```

-c, --catalog string  Catalog name or id (required)
--format string     Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults
to yaml.
--gateway_services string The list of gateway service names to support partial publishing
-h, --help          Help for products:publish
--migrate_subscriptions Migrate subscription when republish product
-o, --org string    Organization name or id (required)
--output string     Write file(s) to directory, instead of STDOUT (default "-")
--scope string      scope
-s, --server string  management server endpoint (required)
--space string      Space name or id (required)
--stage            stage

```

Options inherited from parent commands

```

--accept-license    Accept the license for API Connect
--debug            Enable debug output

```

```
--debug-output string  Write debug output to file
--live-help            Enable or disable tracking of limited usage information
-m, --mode string      Toolkit operation mode (default "apim")
```

apic products:replace

Products replace operations

Synopsis

Products replace operations

```
apic products:replace [flags]
```

Options

```
-c, --catalog string  Catalog name or id (required)
--format string       Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help            Help for products:replace
--id                  id
-o, --org string      Organization name or id (required)
--output string       Write file(s) to directory, instead of STDOUT (default "-")
--scope string        scope
-s, --server string   management server endpoint (required)
--space string        Space name or id (required)
```

Options inherited from parent commands

```
--accept-license      Accept the license for API Connect
--debug               Enable debug output
--debug-output string Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string      Toolkit operation mode (default "apim")
```

apic products:set-migration-target

Products set-migration-target operations

Synopsis

Products set-migration-target operations

```
apic products:set-migration-target [flags]
```

Options

```
-c, --catalog string  Catalog name or id (required)
--format string       Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help            Help for products:set-migration-target
--id                  id
-o, --org string      Organization name or id (required)
--output string       Write file(s) to directory, instead of STDOUT (default "-")
--scope string        scope
-s, --server string   management server endpoint (required)
--space string        Space name or id (required)
```

Options inherited from parent commands

```
--accept-license      Accept the license for API Connect
--debug               Enable debug output
--debug-output string Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string      Toolkit operation mode (default "apim")
```

apic products:supersede

Products supersede operations

Synopsis

Products supersede operations

```
apic products:supersede [flags]
```

Options

```
-c, --catalog string    Catalog name or id (required)
--format string        Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help              Help for products:supersede
--id                   id
-o, --org string        Organization name or id (required)
--output string        Write file(s) to directory, instead of STDOUT (default "-")
--scope string         scope
-s, --server string     management server endpoint (required)
--space string         Space name or id (required)
```

Options inherited from parent commands

```
--accept-license      Accept the license for API Connect
--debug               Enable debug output
--debug-output string Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

apic products:update

Products update operations

Synopsis

Products update operations

```
apic products:update [flags]
```

Options

```
-c, --catalog string    Catalog name or id (required)
--format string        Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help              Help for products:update
--id                   id
-o, --org string        Organization name or id (required)
--output string        Write file(s) to directory, instead of STDOUT (default "-")
--scope string         scope
-s, --server string     management server endpoint (required)
--space string         Space name or id (required)
```

Options inherited from parent commands

```
--accept-license      Accept the license for API Connect
--debug               Enable debug output
--debug-output string Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

apic products:validate

Validate the draft product object

Synopsis

Validate the draft product object

```
apic products:validate [flags]
```

Options

```
--catalog_name string  Name of a catalog
--format string        Output format. One of [json yaml octet-stream go-template=... go-template-file=...],
defaults to yaml.
--gateway_service_names string Names of Gateway Services
-h, --help              Help for products:validate
-o, --org string        Organization name or id (required)
--output string        Write file(s) to directory, instead of STDOUT (default "-")
--scope string         scope
-s, --server string     management server endpoint (required)
--space_name string    Name of a space
--validate_apis        Whether to validate APIs also
```

Options inherited from parent commands

```
--accept-license    Accept the license for API Connect
--debug            Enable debug output
--debug-output string Write debug output to file
--live-help        Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

apic properties

Properties operations

Synopsis

Properties operations

```
apic properties [flags]
```

Options

```
-c, --catalog string  Catalog name or id (required)
--fields string       List of field names to return
--format string        Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help            Help for properties
--limit int32         Maximum number of items to return
--offset int32        Offset item number from list to begin return
-o, --org string       Organization name or id (required)
--output string        Write file(s) to directory, instead of STDOUT (default "-")
--scope string         scope
-s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license    Accept the license for API Connect
--debug            Enable debug output
--debug-output string Write debug output to file
--live-help        Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

apic properties:clear

Properties clear operations

Synopsis

Properties clear operations

```
apic properties:clear [flags]
```

Options

```
-c, --catalog string  Catalog name or id (required)
--confirm string      Confirmation for critical updates (required)
--format string        Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help            Help for properties:clear
-o, --org string       Organization name or id (required)
--output string        Write file(s) to directory, instead of STDOUT (default "-")
--scope string         scope
-s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license    Accept the license for API Connect
--debug            Enable debug output
--debug-output string Write debug output to file
--live-help        Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

apic properties:create

Properties create operations

Synopsis

Properties create operations

```
apic properties:create [flags]
```

Options

```
-c, --catalog string    Catalog name or id (required)
--format string        Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help             Help for properties:create
-o, --org string       Organization name or id (required)
--output string        Write file(s) to directory, instead of STDOUT (default "-")
--scope string         scope
-s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license      Accept the license for API Connect
--debug              Enable debug output
--debug-output string Write debug output to file
--live-help          Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

apic properties:delete

Properties delete operations

Synopsis

Properties delete operations

```
apic properties:delete [flags]
```

Options

```
-c, --catalog string    Catalog name or id (required)
--format string        Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help             Help for properties:delete
-o, --org string       Organization name or id (required)
--output string        Write file(s) to directory, instead of STDOUT (default "-")
--scope string         scope
-s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license      Accept the license for API Connect
--debug              Enable debug output
--debug-output string Write debug output to file
--live-help          Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

apic properties:get

Properties get operations

Synopsis

Properties get operations

```
apic properties:get [flags]
```

Options

```
-c, --catalog string    Catalog name or id (required)
--fields string        List of field names to return
--format string        Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help             Help for properties:get
-o, --org string       Organization name or id (required)
--output string        Write file(s) to directory, use - for STDOUT. (default: cwd)
--scope string         scope
-s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license      Accept the license for API Connect
--debug              Enable debug output
--debug-output string Write debug output to file
--live-help          Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

apic properties:list

Properties list operations

Synopsis

Properties list operations

```
apic properties:list [flags]
```

Options

```
-c, --catalog string    Catalog name or id (required)
--fields string        List of field names to return
--format string        Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help             Help for properties:list
--limit int32          Maximum number of items to return
--offset int32         Offset item number from list to begin return
-o, --org string        Organization name or id (required)
--output string        Write file(s) to directory, instead of STDOUT (default "-")
--scope string         scope
-s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license      Accept the license for API Connect
--debug               Enable debug output
--debug-output string Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

apic properties:update

Properties update operations

Synopsis

Properties update operations

```
apic properties:update [flags]
```

Options

```
-c, --catalog string    Catalog name or id (required)
--format string        Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help             Help for properties:update
-o, --org string        Organization name or id (required)
--output string        Write file(s) to directory, instead of STDOUT (default "-")
--scope string         scope
-s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license      Accept the license for API Connect
--debug               Enable debug output
--debug-output string Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

apic registrations

Registrations operations

Synopsis

Registrations operations

```
apic registrations [flags]
```

Options

```
--fields string    List of field names to return
--format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
```

```
-h, --help           Help for registrations
--limit int32       Maximum number of items to return
--offset int32      Offset item number from list to begin return
--output string     Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license    Accept the license for API Connect
--debug             Enable debug output
--debug-output string Write debug output to file
--live-help         Enable or disable tracking of limited usage information
-m, --mode string   Toolkit operation mode (default "apim")
```

apic registrations:clear

Clear the Registration objects

Synopsis

Clear the Registration objects

```
apic registrations:clear [flags]
```

Options

```
--confirm string    Confirmation for critical updates (required)
--format string     Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help         Help for registrations:clear
--output string     Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license    Accept the license for API Connect
--debug             Enable debug output
--debug-output string Write debug output to file
--live-help         Enable or disable tracking of limited usage information
-m, --mode string   Toolkit operation mode (default "apim")
```

apic registrations:create

Create a Registration object

Synopsis

Create a Registration object

```
Fields allowed but ignored:
- id
- type
- api_version
- scope
- created_at
- updated_at
- url
```

```
apic registrations:create [flags]
```

Options

```
--format string     Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help         Help for registrations:create
--output string     Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license    Accept the license for API Connect
--debug             Enable debug output
--debug-output string Write debug output to file
--live-help         Enable or disable tracking of limited usage information
-m, --mode string   Toolkit operation mode (default "apim")
```

apic registrations:delete

Delete the Registration object by name or id

Synopsis

Delete the Registration object by name or id

```
apic registrations:delete [flags]
```

Options

```
--format string  Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for registrations:delete
--output string  Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

apic registrations:get

Get the Registration object by name or id

Synopsis

Get the Registration object by name or id

```
apic registrations:get [flags]
```

Options

```
--fields string  List of field names to return
--format string  Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for registrations:get
--output string  Write file(s) to directory, use - for STDOUT. (default: cwd)
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

apic registrations:list

List the Registration objects

Synopsis

List the Registration objects

```
apic registrations:list [flags]
```

Options

```
--fields string  List of field names to return
--format string  Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for registrations:list
--limit int32    Maximum number of items to return
--offset int32   Offset item number from list to begin return
--output string  Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
```

```
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic registrations:update

Update the Registration object by name or id

Synopsis

Update the Registration object by name or id

```
Fields allowed but ignored:
- id
- type
- api_version
- scope
- created_at
- updated_at
- url
```

```
apic registrations:update [flags]
```

Options

```
--format string  Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help       Help for registrations:update
--output string  Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic role-defaults

Role Defaults operations

Synopsis

Role Defaults operations

```
apic role-defaults [flags]
```

Options

```
-c, --catalog string  Catalog name or id (required)
--fields string       List of field names to return
--format string       Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help            Help for role-defaults
--limit int32         Maximum number of items to return
--offset int32        Offset item number from list to begin return
-o, --org string      Organization name or id (required)
--output string       Write file(s) to directory, instead of STDOUT (default "-")
--scope string        scope
-s, --server string   management server endpoint (required)
--space string        Space name or id (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic role-defaults:clear

Role Defaults clear operations

Synopsis

Role Defaults clear operations

```
apic role-defaults:clear [flags]
```

Options

<code>--confirm string</code>	Confirmation for critical updates (required)
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for role-defaults:clear
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>--scope string</code>	scope
<code>-s, --server string</code>	management server endpoint (required)
<code>--subcollection string</code>	subcollection

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic role-defaults:create

Role Defaults create operations

Synopsis

Role Defaults create operations

```
apic role-defaults:create [flags]
```

Options

<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for role-defaults:create
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>--scope string</code>	scope
<code>-s, --server string</code>	management server endpoint (required)
<code>--subcollection string</code>	subcollection

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic role-defaults:delete

Role Defaults delete operations

Synopsis

Role Defaults delete operations

```
apic role-defaults:delete [flags]
```

Options

<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for role-defaults:delete
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>--scope string</code>	scope
<code>-s, --server string</code>	management server endpoint (required)
<code>--subcollection string</code>	subcollection

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file

```
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic role-defaults:get

Role Defaults get operations

Synopsis

Role Defaults get operations

```
apic role-defaults:get [flags]
```

Options

```
-c, --catalog string  Catalog name or id (required)
--fields string       List of field names to return
--format string       Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
-h, --help            Help for role-defaults:get
-o, --org string       Organization name or id (required)
--output string       Write file(s) to directory, use - for STDOUT. (default: cwd)
--scope string        scope
-s, --server string   management server endpoint (required)
--space string        Space name or id (required)
--subcollection string subcollection
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic role-defaults:list

Role Defaults list operations

Synopsis

Role Defaults list operations

```
apic role-defaults:list [flags]
```

Options

```
-c, --catalog string  Catalog name or id (required)
--fields string       List of field names to return
--format string       Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
-h, --help            Help for role-defaults:list
--limit int32         Maximum number of items to return
--offset int32        Offset item number from list to begin return

--output string          Write file(s) to directory, instead of STDOUT (default "-")
--scope string           scope
-s, --server string      management server endpoint (required)
--space string           Space name or id (required)
```

Options inherited from parent commands

```
--accept-license        Accept the license for API Connect
--debug                 Enable debug output
--debug-output string   Write debug output to file
--live-help             Enable or disable tracking of limited usage information
-m, --mode string       Toolkit operation mode (default "apim")
```

apic role-defaults:update

Role Defaults update operations

Synopsis

Role Defaults update operations

```
apic role-defaults:update [flags]
```

Options

```
--format string          Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
-h, --help               Help for role-defaults:update
--output string          Write file(s) to directory, instead of STDOUT (default "-")
--scope string           scope
-s, --server string      management server endpoint (required)
--subcollection string   subcollection
```

Options inherited from parent commands

```
--accept-license        Accept the license for API Connect
--debug                 Enable debug output
--debug-output string   Write debug output to file
--live-help             Enable or disable tracking of limited usage information
-m, --mode string       Toolkit operation mode (default "apim")
```

apic roles

Roles operations

Synopsis

Roles operations

```
apic roles [flags]
```

Options

```
-c, --catalog string      Catalog name or id (required)
--consumer-org string    Consumer Organization name or id (required)
--fields string          List of field names to return
--format string          Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
-h, --help               Help for roles
--limit int32            Maximum number of items to return
--offset int32           Offset item number from list to begin return
```

-o, --org string	Organization name or id (required)
--output string	Write file(s) to directory, instead of STDOUT (default "-")
--scope string	scope
-s, --server string	management server endpoint (required)
--space string	Space name or id (required)
--space-initiated	space-initiated

Options inherited from parent commands

--accept-license	Accept the license for API Connect
--debug	Enable debug output
--debug-output string	Write debug output to file
--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

apic roles:clear

Roles clear operations

Synopsis

Roles clear operations

```
apic roles:clear [flags]
```

Options

--confirm string	Confirmation for critical updates (required)
--format string	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help	Help for roles:clear
-o, --org string	Organization name or id (required)
--output string	Write file(s) to directory, instead of STDOUT (default "-")
--scope string	scope
-s, --server string	management server endpoint (required)

Options inherited from parent commands

--accept-license	Accept the license for API Connect
--debug	Enable debug output
--debug-output string	Write debug output to file
--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

apic roles:create

Roles create operations

Synopsis

Roles create operations

```
apic roles:create [flags]
```

Options

--format string	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help	Help for roles:create
-o, --org string	Organization name or id (required)
--output string	Write file(s) to directory, instead of STDOUT (default "-")
--scope string	scope
-s, --server string	management server endpoint (required)

Options inherited from parent commands

--accept-license	Accept the license for API Connect
--debug	Enable debug output
--debug-output string	Write debug output to file
--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

apic roles:delete

Roles delete operations

Synopsis

Roles delete operations

```
apic roles:delete [flags]
```

Options

```
--format string  Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for roles:delete
-o, --org string Organization name or id (required)
--output string Write file(s) to directory, instead of STDOUT (default "-")
--scope string  scope
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic roles:get

Roles get operations

Synopsis

Roles get operations

```
apic roles:get [flags]
```

Options

```
-c, --catalog string  Catalog name or id (required)
--consumer-org string Consumer Organization name or id (required)
--fields string       List of field names to return
--format string       Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
-h, --help           Help for roles:get
-o, --org string      Organization name or id (required)
--output string       Write file(s) to directory, use - for STDOUT. (default: cwd)
--scope string        scope
-s, --server string  management server endpoint (required)
--space string        Space name or id (required)
--space-initiated    space-initiated
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic roles:list

Roles list operations

Synopsis

Roles list operations

```
apic roles:list [flags]
```

Options

```
-c, --catalog string  Catalog name or id (required)
--consumer-org string Consumer Organization name or id (required)
--fields string       List of field names to return
--format string       Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
-h, --help           Help for roles:list
--limit int32        Maximum number of items to return
--offset int32       Offset item number from list to begin return
```

-o, --org string	Organization name or id (required)
--output string	Write file(s) to directory, instead of STDOUT (default "-")
--scope string	scope
-s, --server string	management server endpoint (required)
--space string	Space name or id (required)
--space-initiated	space-initiated

Options inherited from parent commands

--accept-license	Accept the license for API Connect
--debug	Enable debug output
--debug-output string	Write debug output to file
--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

apic roles:update

Roles update operations

Synopsis

Roles update operations

`apic roles:update [flags]`

Options

-c, --catalog string	Catalog name or id (required)
--format string	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help	Help for roles:update
-o, --org string	Organization name or id (required)
--output string	Write file(s) to directory, instead of STDOUT (default "-")
--scope string	scope
-s, --server string	management server endpoint (required)
--space string	Space name or id (required)

Options inherited from parent commands

--accept-license	Accept the license for API Connect
--debug	Enable debug output
--debug-output string	Write debug output to file
--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

apic services

Services operations

Synopsis

Services operations

`apic services [flags]`

Options

-c, --catalog string	Catalog name or id (required)
--configured-gateway-service string	Configured Gateway Service name or id (required)
--fields string	List of field names to return
--format string	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help	Help for services
--limit int32	Maximum number of items to return
--offset int32	Offset item number from list to begin return
-o, --org string	Organization name or id (required)
--output string	Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string	management server endpoint (required)
--space string	Space name or id (required)
--space-initiated	space-initiated

Options inherited from parent commands

--accept-license	Accept the license for API Connect
--debug	Enable debug output
--debug-output string	Write debug output to file
--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

apic services:clear

Services clear operations

Synopsis

Services clear operations

```
apic services:clear [flags]
```

Options

```
-c, --catalog string           Catalog name or id (required)
--configured-gateway-service string  Configured Gateway Service name or id (required)
--confirm string               Confirmation for critical updates (required)
--format string                Output format. One of [json yaml octet-stream go-template=... go-template-
file=...], defaults to yaml.
-h, --help                     Help for services:clear
-o, --org string                Organization name or id (required)
--output string                Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string            management server endpoint (required)
--space string                 Space name or id (required)
--space-initiated              space-initiated
```

Options inherited from parent commands

```
--accept-license      Accept the license for API Connect
--debug                Enable debug output
--debug-output string Write debug output to file
--live-help            Enable or disable tracking of limited usage information
-m, --mode string      Toolkit operation mode (default "apim")
```

apic services:clear-all

Services clear-all operations

Synopsis

Services clear-all operations

```
apic services:clear-all [flags]
```

Options

```
-c, --catalog string           Catalog name or id (required)
--configured-gateway-service string  Configured Gateway Service name or id (required)
--confirm string               Confirmation for critical updates (required)
--format string                Output format. One of [json yaml octet-stream go-template=... go-template-
file=...], defaults to yaml.
-h, --help                     Help for services:clear-all
-o, --org string                Organization name or id (required)
--output string                Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string            management server endpoint (required)
--space string                 Space name or id (required)
--space-initiated              space-initiated
```

Options inherited from parent commands

```
--accept-license      Accept the license for API Connect
--debug                Enable debug output
--debug-output string Write debug output to file
--live-help            Enable or disable tracking of limited usage information
-m, --mode string      Toolkit operation mode (default "apim")
```

apic services:create

Services create operations

Synopsis

Services create operations

```
apic services:create [flags]
```

Options

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--configured-gateway-service string</code>	Configured Gateway Service name or id (required)
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for services:create
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)
<code>--space string</code>	Space name or id (required)
<code>--space-initiated</code>	space-initiated

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic services:delete

Services delete operations

Synopsis

Services delete operations

```
apic services:delete [flags]
```

Options

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--configured-gateway-service string</code>	Configured Gateway Service name or id (required)
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for services:delete
<code>--id</code>	id
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)
<code>--space string</code>	Space name or id (required)
<code>--space-initiated</code>	space-initiated

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic services:get

Services get operations

Synopsis

Services get operations

```
apic services:get [flags]
```

Options

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--configured-gateway-service string</code>	Configured Gateway Service name or id (required)
<code>--fields string</code>	List of field names to return
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for services:get
<code>--id</code>	id
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, use - for STDOUT. (default: cwd)
<code>-s, --server string</code>	management server endpoint (required)
<code>--space string</code>	Space name or id (required)
<code>--space-initiated</code>	space-initiated

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic services:list

Services list operations

Synopsis

Services list operations

```
apic services:list [flags]
```

Options

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--configured-gateway-service string</code>	Configured Gateway Service name or id (required)
<code>--fields string</code>	List of field names to return
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for services:list
<code>--limit int32</code>	Maximum number of items to return
<code>--offset int32</code>	Offset item number from list to begin return
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)
<code>--space string</code>	Space name or id (required)
<code>--space-initiated</code>	space-initiated

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic services:list-all

Services list-all operations

Synopsis

Services list-all operations

```
apic services:list-all [flags]
```

Options

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--configured-gateway-service string</code>	Configured Gateway Service name or id (required)
<code>--fields string</code>	List of field names to return
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for services:list-all
<code>--limit int32</code>	Maximum number of items to return
<code>--offset int32</code>	Offset item number from list to begin return
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)
<code>--space string</code>	Space name or id (required)
<code>--space-initiated</code>	space-initiated

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic services:update

Services update operations

Synopsis

Services update operations

```
apic services:update [flags]
```

Options

```
-c, --catalog string      Catalog name or id (required)
--configured-gateway-service string  Configured Gateway Service name or id (required)
--format string          Output format. One of [json yaml octet-stream go-template=... go-template-
file=...], defaults to yaml.
-h, --help              Help for services:update
--id                    id
-o, --org string        Organization name or id (required)
--output string         Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string     management server endpoint (required)
--space string         Space name or id (required)
--space-initiated      space-initiated
```

Options inherited from parent commands

```
--accept-license      Accept the license for API Connect
--debug              Enable debug output
--debug-output string Write debug output to file
--live-help          Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

apic space-settings

Space Settings operations

Synopsis

Space Settings operations

```
apic space-settings [flags]
```

Options

```
-h, --help Help for space-settings
```

Options inherited from parent commands

```
--accept-license      Accept the license for API Connect
--debug              Enable debug output
--debug-output string Write debug output to file
--live-help          Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

apic space-settings:get

Get the Space Setting object

Synopsis

Get the Space Setting object

```
apic space-settings:get [flags]
```

Options

```
-c, --catalog string      Catalog name or id (required)
--fields string          List of field names to return
--format string          Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help              Help for space-settings:get
-o, --org string        Organization name or id (required)
--output string         Write file(s) to directory, use - for STDOUT. (default: cwd)
```

```
-s, --server string    management server endpoint (required)
--space string        Space name or id (required)
```

Options inherited from parent commands

```
--accept-license      Accept the license for API Connect
--debug              Enable debug output
--debug-output string Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

apic space-settings:update

Update the Space Setting object

Synopsis

Update the Space Setting object

```
Fields allowed but ignored:
- name
- type
- api_version
- scope
- created_at
- updated_at
- url
- org_url
- catalog_url
- space_url
```

```
apic space-settings:update [flags]
```

Options

```
-c, --catalog string    Catalog name or id (required)
--format string        Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help              Help for space-settings:update
-o, --org string        Organization name or id (required)
--output string        Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string     management server endpoint (required)
--space string         Space name or id (required)
```

Options inherited from parent commands

```
--accept-license      Accept the license for API Connect
--debug              Enable debug output
--debug-output string Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

apic spaces

Spaces operations

Synopsis

Spaces operations

```
apic spaces [flags]
```

Options

```
-c, --catalog string    Catalog name or id (required)
--fields string        List of field names to return
--format string        Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help              Help for spaces
--limit int32          Maximum number of items to return
--my                   my
--offset int32         Offset item number from list to begin return
-o, --org string        Organization name or id (required)
--output string        Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string     management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license      Accept the license for API Connect
--debug              Enable debug output
```

```
--debug-output string  Write debug output to file
--live-help            Enable or disable tracking of limited usage information
-m, --mode string      Toolkit operation mode (default "apim")
```

apic spaces:clear

Clear the Space objects

Synopsis

Clear the Space objects

```
apic spaces:clear [flags]
```

Options

```
-c, --catalog string  Catalog name or id (required)
--confirm string      Confirmation for critical updates (required)
--format string       Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help            Help for spaces:clear
-o, --org string       Organization name or id (required)
--output string        Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license      Accept the license for API Connect
--debug               Enable debug output
--debug-output string Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string      Toolkit operation mode (default "apim")
```

apic spaces:create

Create a Space object

Synopsis

Create a Space object

```
Fields allowed but ignored:
- id
- type
- api_version
- scope
- created_at
- updated_at
- url
- org_url
- catalog_url
```

```
apic spaces:create [flags]
```

Options

```
-c, --catalog string  Catalog name or id (required)
--format string       Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help            Help for spaces:create
-o, --org string       Organization name or id (required)
--output string        Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license      Accept the license for API Connect
--debug               Enable debug output
--debug-output string Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string      Toolkit operation mode (default "apim")
```

apic spaces:delete

Delete the Space object by name or id

Synopsis

Delete the Space object by name or id

```
apic spaces:delete [flags]
```

Options

```
-c, --catalog string  Catalog name or id (required)
--format string      Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for spaces:delete
-o, --org string      Organization name or id (required)
--output string       Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

apic spaces:email-to-owners

Send email to owners of consumer organizations

Synopsis

Send email to owners of consumer organizations, given consumer org and consumer group urls. For consumer group, email owners of all consumer orgs in the group.

```
apic spaces:email-to-owners [flags]
```

Options

```
-c, --catalog string  Catalog name or id (required)
--format string      Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for spaces:email-to-owners
-o, --org string      Organization name or id (required)
--output string       Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

apic spaces:get

Get the Space object by name or id

Synopsis

Get the Space object by name or id

```
apic spaces:get [flags]
```

Options

```
-c, --catalog string  Catalog name or id (required)
--fields string       List of field names to return
--format string       Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for spaces:get
-o, --org string      Organization name or id (required)
--output string       Write file(s) to directory, use - for STDOUT. (default: cwd)
-s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
```

```
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic spaces:list

List the Space objects

Synopsis

List the Space objects

```
apic spaces:list [flags]
```

Options

```
-c, --catalog string  Catalog name or id (required)
--fields string      List of field names to return
--format string      Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for spaces:list
--limit int32        Maximum number of items to return
--my                 my
--offset int32       Offset item number from list to begin return
-o, --org string     Organization name or id (required)
--output string      Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string  management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic spaces:transfer-owner

Transfer owner to an associate

Synopsis

Transfer owner to an associate

```
apic spaces:transfer-owner [flags]
```

Options

```
--cascade      Cascade the behavior
-c, --catalog string  Catalog name or id (required)
--delete_old_owner Delete old owner
--format string  Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
-h, --help       Help for spaces:transfer-owner
-o, --org string  Organization name or id (required)
--output string  Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic spaces:update

Update the Space object by name or id

Synopsis

Update the Space object by name or id

```
Fields allowed but ignored:
- id
```

```
- type
- api_version
- scope
- created_at
- updated_at
- url
- org_url
- catalog_url
```

`apic spaces:update [flags]`

Options

```
-c, --catalog string  Catalog name or id (required)
--format string      Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for spaces:update
-o, --org string     Organization name or id (required)
--output string      Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string  management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

apic subscriber-events

Subscriber Events operations

Synopsis

Subscriber Events operations

`apic subscriber-events [flags]`

Options

```
-c, --catalog string  Catalog name or id (required)
--fields string      List of field names to return
--format string      Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for subscriber-events
--limit int32        Maximum number of items to return
--offset int32       Offset item number from list to begin return
-o, --org string     Organization name or id (required)
--output string      Write file(s) to directory, instead of STDOUT (default "-")
--scope string       scope
-s, --server string  management server endpoint (required)
--state string       State for a webhook event in subscriber queue
--webhook string     Webhook name or id (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

apic subscriber-events:get

Subscriber Events get operations

Synopsis

Subscriber Events get operations

`apic subscriber-events:get [flags]`

Options

```
-c, --catalog string  Catalog name or id (required)
--fields string      List of field names to return
--format string      Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for subscriber-events:get
-o, --org string     Organization name or id (required)
```

```

--output string      Write file(s) to directory, use - for STDOUT. (default: cwd)
--scope string       scope
-s, --server string  management server endpoint (required)
--webhook string     Webhook name or id (required)

```

Options inherited from parent commands

```

--accept-license    Accept the license for API Connect
--debug             Enable debug output
--debug-output string Write debug output to file
--live-help         Enable or disable tracking of limited usage information
-m, --mode string   Toolkit operation mode (default "apim")

```

apic subscriber-events:list

Subscriber Events list operations

Synopsis

Subscriber Events list operations

```
apic subscriber-events:list [flags]
```

Options

```

-c, --catalog string  Catalog name or id (required)
--fields string       List of field names to return
--format string        Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help            Help for subscriber-events:list
--limit int32         Maximum number of items to return
--offset int32        Offset item number from list to begin return
-o, --org string       Organization name or id (required)
--output string        Write file(s) to directory, instead of STDOUT (default "-")
--scope string         scope
-s, --server string    management server endpoint (required)
--state string         State for a webhook event in subscriber queue
--webhook string       Webhook name or id (required)

```

Options inherited from parent commands

```

--accept-license    Accept the license for API Connect
--debug             Enable debug output
--debug-output string Write debug output to file
--live-help         Enable or disable tracking of limited usage information
-m, --mode string   Toolkit operation mode (default "apim")

```

apic subscriptions

Subscriptions operations

Synopsis

Subscriptions operations

```
apic subscriptions [flags]
```

Options

```

-a, --app string      Application name or id (required)
-c, --catalog string  Catalog name or id (required)
--consumer-org string Consumer Organization name or id (required)
--consumer_org_url string Consumer Org Url
--expand string        List of transient field to expand
--fields string        List of field names to return
--format string        Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults
to yaml.
-h, --help            Help for subscriptions
--limit int32         Maximum number of items to return
--offset int32        Offset item number from list to begin return
-o, --org string       Organization name or id (required)
--output string        Write file(s) to directory, instead of STDOUT (default "-")
--plan string          Plan Name
--product_url string   Product Url
--scope string         scope
-s, --server string    management server endpoint (required)
--space string         Space name or id (required)
--space-initiated      space-initiated

```

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic subscriptions:clear

Clear the Subscription objects

Synopsis

Clear the Subscription objects

```
apic subscriptions:clear [flags]
```

Options

<code>-a, --app string</code>	Application name or id (required)
<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--confirm string</code>	Confirmation for critical updates (required)
<code>--consumer-org string</code>	Consumer Organization name or id (required)
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for subscriptions:clear
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)
<code>--space string</code>	Space name or id (required)
<code>--space-initiated</code>	space-initiated

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic subscriptions:create

Create a Subscription object

Synopsis

Create a Subscription object

```
Required fields:
- product_url
- plan

Fields allowed but ignored:
- id
- type
- api_version
- scope
- created_at
- updated_at
- url
- org_url
- catalog_url
- consumer_org_url
- app_url
```

```
apic subscriptions:create [flags]
```

Options

<code>-a, --app string</code>	Application name or id (required)
<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--consumer-org string</code>	Consumer Organization name or id (required)
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for subscriptions:create
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)

```
--space string      Space name or id (required)
--space-initiated  space-initiated
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic subscriptions:delete

Delete the Subscription object by name or id

Synopsis

Delete the Subscription object by name or id

```
apic subscriptions:delete [flags]
```

Options

```
-a, --app string      Application name or id (required)
-c, --catalog string  Catalog name or id (required)
--consumer-org string Consumer Organization name or id (required)
--format string       Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
-h, --help            Help for subscriptions:delete
-o, --org string      Organization name or id (required)
--output string       Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string   management server endpoint (required)
--space string        Space name or id (required)
--space-initiated    space-initiated
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic subscriptions:get

Get the Subscription object by name or id

Synopsis

Get the Subscription object by name or id

```
apic subscriptions:get [flags]
```

Options

```
-a, --app string      Application name or id (required)
-c, --catalog string  Catalog name or id (required)
--consumer-org string Consumer Organization name or id (required)
--fields string       List of field names to return
--format string       Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
-h, --help            Help for subscriptions:get
-o, --org string      Organization name or id (required)
--output string       Write file(s) to directory, use - for STDOUT. (default: cwd)
-s, --server string   management server endpoint (required)
--space string        Space name or id (required)
--space-initiated    space-initiated
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic subscriptions:list

List the Subscription objects

Synopsis

List the Subscription objects

```
apic subscriptions:list [flags]
```

Options

```
-a, --app string           Application name or id (required)
-c, --catalog string       Catalog name or id (required)
--consumer-org string      Consumer Organization name or id (required)
--consumer_org_url string  Consumer Org Url
--expand string            List of transient field to expand
--fields string            List of field names to return
--format string            Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults
to yaml.
-h, --help                 Help for subscriptions:list
--limit int32              Maximum number of items to return
--offset int32             Offset item number from list to begin return
-o, --org string           Organization name or id (required)
--output string            Write file(s) to directory, instead of STDOUT (default "-")
--plan string              Plan Name
--product_url string       Product Url
--scope string             scope
-s, --server string        management server endpoint (required)
--space string             Space name or id (required)
--space-initiated         space-initiated
```

Options inherited from parent commands

```
--accept-license          Accept the license for API Connect
--debug                   Enable debug output
--debug-output string     Write debug output to file
--live-help               Enable or disable tracking of limited usage information
-m, --mode string         Toolkit operation mode (default "apim")
```

apic subscriptions:update

Update the Subscription object by name or id

Synopsis

Update the Subscription object by name or id

```
Fields not allowed:
- billing_identifiers
- plan_title

Fields allowed but ignored:
- id
- type
- api_version
- scope
- created_at
- updated_at
- url
- org_url
- catalog_url
- consumer_org_url
- app_url
```

```
apic subscriptions:update [flags]
```

Options

```
-a, --app string           Application name or id (required)
-c, --catalog string       Catalog name or id (required)
--consumer-org string      Consumer Organization name or id (required)
--format string            Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
-h, --help                 Help for subscriptions:update
-o, --org string           Organization name or id (required)
--output string            Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string        management server endpoint (required)
--space string             Space name or id (required)
--space-initiated         space-initiated
```

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic task-queues

Task Queues operations

Synopsis

Task Queues operations

`apic task-queues [flags]`

Options

<code>--apply filter</code>	Filter tasks
<code>--cascade</code>	Cascade the behavior
<code>--fields string</code>	List of field names to return
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for task-queues
<code>--kind string</code>	kind of item
<code>--limit int32</code>	Maximum number of items to return
<code>--offset int32</code>	Offset item number from list to begin return
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>--query string</code>	Add query to request
<code>--scope string</code>	scope
<code>-s, --server string</code>	management server endpoint (required)
<code>--state string</code>	State for a webhook event in subscriber queue
<code>--target string</code>	target for the task

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic task-queues:get

Task Queues get operations

Synopsis

Task Queues get operations

`apic task-queues:get [flags]`

Options

<code>--cascade</code>	Cascade the behavior
<code>--fields string</code>	List of field names to return
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for task-queues:get
<code>--kind string</code>	kind of item
<code>--output string</code>	Write file(s) to directory, use - for STDOUT. (default: cwd)
<code>--query string</code>	Add query to request
<code>--scope string</code>	scope
<code>-s, --server string</code>	management server endpoint (required)
<code>--state string</code>	State for a webhook event in subscriber queue

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect

<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic task-queues:list

Synopsis

Task Queues list operations

```
apic task-queues:list [flags]
```

Options

```

--apply_filter  Filter tasks
--cascade      Cascade the behavior
--fields string List of field names to return
--format string Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help     Help for task-queues:list
--kind string  kind of item
--limit int32  Maximum number of items to return
--offset int32 Offset item number from list to begin return
--output string Write file(s) to directory, instead of STDOUT (default "-")
--query string Add query to request
--scope string scope
-s, --server string management server endpoint (required)
--state string State for a webhook event in subscriber queue
--target string target for the task

```

Options inherited from parent commands

```

--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")

```

apic tasks

Tasks operations

Synopsis

Tasks operations

```
apic tasks [flags]
```

Options

```

-c, --catalog string Catalog name or id (required)
--fields string      List of field names to return
--format string      Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for tasks

--debug-output string Write debug output to file
--live-help        Enable or disable tracking of limited usage information
-m, --mode string   Toolkit operation mode (default "apim")
```

apic tls-client-profiles:clear

Clear the TLS Client Profile objects

Synopsis

Clear the TLS Client Profile objects

```
apic tls-client-profiles:clear [flags]
```

Options

```
--confirm string   Confirmation for critical updates (required)
--format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help        Help for tls-client-profiles:clear
-o, --org string  Organization name or id (required)
--output string   Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license    Accept the license for API Connect
--debug            Enable debug output
--debug-output string Write debug output to file
--live-help        Enable or disable tracking of limited usage information
-m, --mode string   Toolkit operation mode (default "apim")
```

apic tls-client-profiles:clear-all

Clear all TLS Client Profile objects in all collections

Synopsis

Clear all TLS Client Profile objects in all collections

```
apic tls-client-profiles:clear-all [flags]
```

Options

```
--cascade          Cascade the behavior
--confirm string   Confirmation for critical updates (required)
--format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help        Help for tls-client-profiles:clear-all
-o, --org string   Organization name or id (required)
--output string    Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic tls-client-profiles:create

Create a TLS Client Profile object

Synopsis

Create a TLS Client Profile object

```
Fields not allowed:
- owned

Fields allowed but ignored:
- id
- type
- api_version
- scope
- created_at
- updated_at
- url
- org_url
```

```
apic tls-client-profiles:create [flags]
```

Options

```
--format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help        Help for tls-client-profiles:create
-o, --org string   Organization name or id (required)
--output string    Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic tls-client-profiles:delete

Delete a TLS Client Profile

Synopsis

Delete a TLS Client Profile

```
apic tls-client-profiles:delete [flags]
```

Options

```
--format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help        Help for tls-client-profiles:delete
--id              id
-o, --org string   Organization name or id (required)
--output string    Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic tls-client-profiles:get

Get the TLS Client Profile object by name and version

Synopsis

Get the TLS Client Profile object by name and version

```
apic tls-client-profiles:get [flags]
```

Options

<code>--fields string</code>	List of field names to return
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for <code>tls-client-profiles:get</code>
<code>--id</code>	id
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, use - for STDOUT. (default: cwd)
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic tls-client-profiles:list

List the TLS Client Profile objects

Synopsis

List the TLS Client Profile objects

```
apic tls-client-profiles:list [flags]
```

Options

<code>--fields string</code>	List of field names to return
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for <code>tls-client-profiles:list</code>
<code>--limit int32</code>	Maximum number of items to return
<code>--offset int32</code>	Offset item number from list to begin return
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic tls-client-profiles:list-all

List all TLS Client Profile objects in all collections

Synopsis

List all TLS Client Profile objects in all collections

```
apic tls-client-profiles:list-all [flags]
```

Options

```
--fields string      List of field names to return
--format string     Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help          Help for tls-client-profiles:list-all
--limit int32       Maximum number of items to return
--offset int32      Offset item number from list to begin return
-o, --org string    Organization name or id (required)
--output string     Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license    Accept the license for API Connect
--debug             Enable debug output
--debug-output string Write debug output to file
--live-help         Enable or disable tracking of limited usage information
-m, --mode string   Toolkit operation mode (default "apim")
```

apic tls-client-profiles:update

Update the TLS Client Profile object by name and version

Synopsis

Update the TLS Client Profile object by name and version

```
Fields not allowed:
- owned

Fields not allowed to be null:
- ciphers
- protocols

Fields allowed but ignored:
- id
- type
- api_version
- scope
- created_at
- updated_at
- url
- org_url
```

```
apic tls-client-profiles:update [flags]
```

Options

```
--format string     Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help          Help for tls-client-profiles:update
--id                id
-o, --org string    Organization name or id (required)
--output string     Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license    Accept the license for API Connect
--debug             Enable debug output
--debug-output string Write debug output to file
--live-help         Enable or disable tracking of limited usage information
-m, --mode string   Toolkit operation mode (default "apim")
```

apic tls-server-profiles

Tls Server Profiles operations

Synopsis

Tls Server Profiles operations

```
apic tls-server-profiles [flags]
```

Options

```
--fields string      List of field names to return
--format string     Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help          Help for tls-server-profiles
```

```
--limit int32      Maximum number of items to return
--offset int32     Offset item number from list to begin return
-o, --org string   Organization name or id (required)
--output string    Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic tls-server-profiles:clear

Clear the TLS Server Profile objects

Synopsis

Clear the TLS Server Profile objects

```
apic tls-server-profiles:clear [flags]
```

Options

```
--cascade          Cascade the behavior
--confirm string   Confirmation for critical updates (required)
--format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help         Help for tls-server-profiles:clear
-o, --org string   Organization name or id (required)
--output string    Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic tls-server-profiles:clear-all

Clear all TLS Server Profile objects in all collections

Synopsis

Clear all TLS Server Profile objects in all collections

```
apic tls-server-profiles:clear-all [flags]
```

Options

```
--cascade          Cascade the behavior
--confirm string   Confirmation for critical updates (required)
--format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help         Help for tls-server-profiles:clear-all
-o, --org string   Organization name or id (required)
--output string    Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic tls-server-profiles:create

Create a TLS Server Profile object

Synopsis

Create a TLS Server Profile object

```
Fields allowed but ignored:
- id
- type
- api_version
- scope
- created_at
- updated_at
- url
```

```
apic tls-server-profiles:create [flags]
```

Options

```
--format string  Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for tls-server-profiles:create
-o, --org string Organization name or id (required)
--output string  Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic tls-server-profiles:delete

Delete a TLS Server Profile

Synopsis

Delete a TLS Server Profile

```
apic tls-server-profiles:delete [flags]
```

Options

```
--cascade      Cascade the behavior
--format string Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for tls-server-profiles:delete
--id           id
-o, --org string Organization name or id (required)
--output string Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic tls-server-profiles:get

Get the TLS Server Profile object by name and version

Synopsis

Get the TLS Server Profile object by name and version

```
apic tls-server-profiles:get [flags]
```

Options

```
--fields string List of field names to return
--format string  Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for tls-server-profiles:get
--id           id
-o, --org string Organization name or id (required)
```

```
--output string Write file(s) to directory, use - for STDOUT. (default: cwd)
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license Accept the license for API Connect
--debug Enable debug output
--debug-output string Write debug output to file
--live-help Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic tls-server-profiles:list

List the TLS Server Profile objects

Synopsis

List the TLS Server Profile objects

```
apic tls-server-profiles:list [flags]
```

Options

```
--fields string List of field names to return
--format string Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help Help for tls-server-profiles:list
--limit int32 Maximum number of items to return
--offset int32 Offset item number from list to begin return
-o, --org string Organization name or id (required)
--output string Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license Accept the license for API Connect
--debug Enable debug output
--debug-output string Write debug output to file
--live-help Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic tls-server-profiles:list-all

List all TLS Server Profile objects in all collections

Synopsis

List all TLS Server Profile objects in all collections

```
apic tls-server-profiles:list-all [flags]
```

Options

```
--fields string List of field names to return
--format string Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help Help for tls-server-profiles:list-all
--limit int32 Maximum number of items to return
--offset int32 Offset item number from list to begin return
-o, --org string Organization name or id (required)
--output string Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license Accept the license for API Connect
--debug Enable debug output
--debug-output string Write debug output to file
--live-help Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic tls-server-profiles:update

Update the TLS Server Profile object by name and version

Synopsis

Update the TLS Server Profile object by name and version

```
Fields allowed but ignored:
- id
- type
- api_version
- scope
- created_at
- updated_at
- url
```

```
apic tls-server-profiles:update [flags]
```

Options

```
--format string  Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for tls-server-profiles:update
--id            id
-o, --org string Organization name or id (required)
--output string Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic truststores

Truststores operations

Synopsis

Truststores operations

```
apic truststores [flags]
```

Options

```
--fields string  List of field names to return
--format string  Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for truststores
--limit int32    Maximum number of items to return
--offset int32   Offset item number from list to begin return
-o, --org string Organization name or id (required)
--output string  Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic truststores:clear

Clear the Truststore objects

Synopsis

Clear the Truststore objects

```
apic truststores:clear [flags]
```

Options

```
--confirm string Confirmation for critical updates (required)
--format string  Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for truststores:clear
-o, --org string Organization name or id (required)
```

```
--output string Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license Accept the license for API Connect
--debug Enable debug output
--debug-output string Write debug output to file
--live-help Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic truststores:create

Create a Truststore object

Synopsis

Create a Truststore object

```
Fields allowed but ignored:
- id
- type
- api_version
- scope
- created_at
- updated_at
- url
```

```
apic truststores:create [flags]
```

Options

```
--format string Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help Help for truststores:create
-o, --org string Organization name or id (required)
--output string Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license Accept the license for API Connect
--debug Enable debug output
--debug-output string Write debug output to file
--live-help Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic truststores:delete

Delete the Truststore object by name or id

Synopsis

Delete the Truststore object by name or id

```
apic truststores:delete [flags]
```

Options

```
--format string Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help Help for truststores:delete
-o, --org string Organization name or id (required)
--output string Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license Accept the license for API Connect
--debug Enable debug output
--debug-output string Write debug output to file
--live-help Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic truststores:get

Get the Truststore object by name or id

Synopsis

Get the Truststore object by name or id

```
apic truststores:get [flags]
```

Options

```
--fields string  List of field names to return
--format string  Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for truststores:get
-o, --org string Organization name or id (required)
--output string Write file(s) to directory, use - for STDOUT. (default: cwd)
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic truststores:list

List the Truststore objects

Synopsis

List the Truststore objects

```
apic truststores:list [flags]
```

Options

```
--fields string  List of field names to return
--format string  Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for truststores:list
--limit int32    Maximum number of items to return
--offset int32   Offset item number from list to begin return
-o, --org string Organization name or id (required)
--output string  Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic truststores:update

Update the Truststore object by name or id

Synopsis

Update the Truststore object by name or id

```
Fields allowed but ignored:
- id
- type
- api_version
- scope
- created_at
- updated_at
- url
```

```
apic truststores:update [flags]
```

Options

```
--format string      Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for truststores:update
-o, --org string     Organization name or id (required)
--output string      Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string  management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license    Accept the license for API Connect
--debug             Enable debug output
--debug-output string Write debug output to file
--live-help         Enable or disable tracking of limited usage information
-m, --mode string   Toolkit operation mode (default "apim")
```

apic user-registries

User Registries operations

Synopsis

User Registries operations

```
apic user-registries [flags]
```

Options

```
--fields string      List of field names to return
--format string      Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for user-registries
--limit int32        Maximum number of items to return
--offset int32       Offset item number from list to begin return
-o, --org string     Organization name or id (required)
--output string      Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string  management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license    Accept the license for API Connect
--debug             Enable debug output
--debug-output string Write debug output to file
--live-help         Enable or disable tracking of limited usage information
-m, --mode string   Toolkit operation mode (default "apim")
```

apic user-registries:clear

Clear the User Registry objects

Synopsis

Clear the User Registry objects

```
apic user-registries:clear [flags]
```

Options

```
--confirm string    Confirmation for critical updates (required)
--format string      Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for user-registries:clear
-o, --org string     Organization name or id (required)
--output string      Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string  management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license    Accept the license for API Connect
--debug             Enable debug output
--debug-output string Write debug output to file
--live-help         Enable or disable tracking of limited usage information
-m, --mode string   Toolkit operation mode (default "apim")
```

apic user-registries:create

Create a User Registry object

Synopsis

Create a User Registry object

```
Required fields:
- integration_url

Fields not allowed:
- owned

Fields allowed but ignored:
- id
- type
- api_version
- scope
- created_at
- updated_at
- url
- org_url
```

```
apic user-registries:create [flags]
```

Options

```
--format string  Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for user-registries:create
-o, --org string  Organization name or id (required)
--output string  Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

apic user-registries:delete

Delete the User Registry object by name or id

Synopsis

Delete the User Registry object by name or id

```
apic user-registries:delete [flags]
```

Options

```
--format string  Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for user-registries:delete
-o, --org string  Organization name or id (required)
--output string  Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

apic user-registries:execute

Execute a User Registry operation

Synopsis

Execute a User Registry operation

```
apic user-registries:execute [flags]
```

Options

```

--format string      Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
-h, --help           Help for user-registries:execute
--operation string  Operation to perform on the user registry (get_base_dn_list, validate_password) (required)
-o, --org string     Organization name or id (required)
--output string     Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string  management server endpoint (required)
--test-config-only  test-config-only

```

Options inherited from parent commands

```

--accept-license    Accept the license for API Connect
--debug             Enable debug output
--debug-output string Write debug output to file
--live-help         Enable or disable tracking of limited usage information
-m, --mode string   Toolkit operation mode (default "apim")

```

apic user-registries:get

Get the User Registry object by name or id

Synopsis

Get the User Registry object by name or id

```
apic user-registries:get [flags]
```

Options

```

--fields string     List of field names to return
--format string     Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help         Help for user-registries:get
-o, --org string    Organization name or id (required)
--output string     Write file(s) to directory, use - for STDOUT. (default: cwd)
-s, --server string management server endpoint (required)

```

Options inherited from parent commands

```

--accept-license    Accept the license for API Connect
--debug             Enable debug output
--debug-output string Write debug output to file
--live-help         Enable or disable tracking of limited usage information
-m, --mode string   Toolkit operation mode (default "apim")

```

apic user-registries:list

List the User Registry objects

Synopsis

List the User Registry objects

```
apic user-registries:list [flags]
```

Options

```

--fields string     List of field names to return
--format string     Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help         Help for user-registries:list
--limit int32       Maximum number of items to return
--offset int32      Offset item number from list to begin return
-o, --org string    Organization name or id (required)
--output string     Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)

```

Options inherited from parent commands

```

--accept-license    Accept the license for API Connect
--debug             Enable debug output
--debug-output string Write debug output to file
--live-help         Enable or disable tracking of limited usage information
-m, --mode string   Toolkit operation mode (default "apim")

```

apic user-registries:search

Search for users in the user registry

Synopsis

Search for users in the user registry

```
apic user-registries:search [flags]
```

Options

<code>--format</code>	string	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>		Help for user-registries:search
<code>--limit</code>	int32	Maximum number of items to return
<code>--offset</code>	int32	Offset item number from list to begin return
<code>-o, --org</code>	string	Organization name or id (required)
<code>--output</code>	string	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server</code>	string	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>		Accept the license for API Connect
<code>--debug</code>		Enable debug output
<code>--debug-output</code>	string	Write debug output to file
<code>--live-help</code>		Enable or disable tracking of limited usage information
<code>-m, --mode</code>	string	Toolkit operation mode (default "apim")

apic user-registries:test-connection

Test a User Registry connection

Synopsis

Test a User Registry connection

```
apic user-registries:test-connection [flags]
```

Options

<code>--format</code>	string	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>		Help for user-registries:test-connection
<code>-o, --org</code>	string	Organization name or id (required)
<code>--output</code>	string	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server</code>	string	management server endpoint (required)
<code>--test-config-only</code>		test-config-only

Options inherited from parent commands

<code>--accept-license</code>		Accept the license for API Connect
<code>--debug</code>		Enable debug output
<code>--debug-output</code>	string	Write debug output to file
<code>--live-help</code>		Enable or disable tracking of limited usage information
<code>-m, --mode</code>	string	Toolkit operation mode (default "apim")

apic user-registries:update

Update the User Registry object by name or id

Synopsis

Update the User Registry object by name or id

```
Fields not allowed:  
- owned  
- registry_type  
- user_registry_managed  
- correlation_data  
- integration_url
```

```
Fields allowed but ignored:  
- id  
- type  
- api_version  
- scope  
- created_at  
- updated_at
```

```
- url
- org_url
```

```
apic user-registries:update [flags]
```

Options

```
--format string  Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for user-registries:update
-o, --org string Organization name or id (required)
--output string Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic user-registry-settings

User Registry Settings operations

Synopsis

User Registry Settings operations

```
apic user-registry-settings [flags]
```

Options

```
-h, --help  Help for user-registry-settings
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic user-registry-settings:get

Get the User Registry Setting object

Synopsis

Get the User Registry Setting object

```
apic user-registry-settings:get [flags]
```

Options

```
--fields string  List of field names to return
--format string  Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for user-registry-settings:get
--output string Write file(s) to directory, use - for STDOUT. (default: cwd)
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic user-registry-settings:update

Update the User Registry Setting object

Synopsis

Update the User Registry Setting object

```
Fields allowed but ignored:
- name
- type
- api_version
- scope
- created_at
- updated_at
- url
```

```
apic user-registry-settings:update [flags]
```

Options

```
--format string  Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for user-registry-settings:update
--output string  Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

apic users

Users operations

Synopsis

Users operations

```
apic users [flags]
```

Options

```
--fields string  List of field names to return
--format string  Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
-h, --help      Help for users
--limit int32   Maximum number of items to return
--offset int32  Offset item number from list to begin return
-o, --org string Organization name or id (required)
--output string Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
--user-registry string User Registry name or id (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

apic users:clear

Clear the User objects

Synopsis

Clear the User objects

```
apic users:clear [flags]
```

Options

```
--confirm string  Confirmation for critical updates (required)
--format string  Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
-h, --help      Help for users:clear
```

-o, --org string	Organization name or id (required)
--output string	Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string	management server endpoint (required)
--user-registry string	User Registry name or id (required)

Options inherited from parent commands

--accept-license	Accept the license for API Connect
--debug	Enable debug output
--debug-output string	Write debug output to file
--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

apic users:create

Create a User object

Synopsis

Create a User object

```

Required fields:
- username

Fields allowed but ignored:
- id
- type
- api_version
- scope
- created_at
- updated_at
- url
- org_url
- user_registry_url

```

apic users:create [flags]

Options

--format string	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help	Help for users:create
-o, --org string	Organization name or id (required)
--output string	Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string	management server endpoint (required)
--user-registry string	User Registry name or id (required)

Options inherited from parent commands

--accept-license	Accept the license for API Connect
--debug	Enable debug output
--debug-output string	Write debug output to file
--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

apic users:delete

Delete the User object by name or id

Synopsis

Delete the User object by name or id

apic users:delete [flags]

Options

--format string	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help	Help for users:delete
-o, --org string	Organization name or id (required)
--output string	Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string	management server endpoint (required)
--user-registry string	User Registry name or id (required)

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug          Enable debug output
--debug-output string Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic users:get

Get the User object by name or id

Synopsis

Get the User object by name or id

```
apic users:get [flags]
```

Options

```
--fields string  List of field names to return
--format string  Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
-h, --help       Help for users:get
-o, --org string  Organization name or id (required)
--output string  Write file(s) to directory, use - for STDOUT. (default: cwd)
-s, --server string management server endpoint (required)
--user-registry string User Registry name or id (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug          Enable debug output
--debug-output string Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic users:list

List the User objects

Synopsis

List the User objects

```
apic users:list [flags]
```

Options

```
--fields string  List of field names to return
--format string  Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
-h, --help       Help for users:list
--limit int32    Maximum number of items to return
--offset int32   Offset item number from list to begin return
-o, --org string  Organization name or id (required)
--output string  Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
--user-registry string User Registry name or id (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug          Enable debug output
--debug-output string Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic users:request-password-reset

Send reset password link

Synopsis

Send reset password link

```
apic users:request-password-reset [flags]
```

Options

```
--format string  Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.  
-h, --help      Help for users:request-password-reset  
--output string  Write file(s) to directory, instead of STDOUT (default "-")  
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect  
--debug           Enable debug output  
--debug-output string Write debug output to file  
--live-help       Enable or disable tracking of limited usage information  
-m, --mode string Toolkit operation mode (default "apim")
```

apic users:search-provider

Users search-provider operations

Synopsis

Users search-provider operations

```
apic users:search-provider [flags]
```

Options

```
--format string  Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.  
-h, --help      Help for users:search-provider  
--limit int32   Maximum number of items to return  
--offset int32  Offset item number from list to begin return  
-o, --org string Organization name or id (required)  
--output string Write file(s) to directory, instead of STDOUT (default "-")  
--scope string  scope  
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect  
--debug           Enable debug output  
--debug-output string Write debug output to file  
--live-help       Enable or disable tracking of limited usage information  
-m, --mode string Toolkit operation mode (default "apim")
```

apic users:update

Update the User object by name or id

Synopsis

Update the User object by name or id

```
Fields not allowed:  
- identity_provider  
- username  
- salt  
- correlation_data  
- force_password_change  
- last_login_at
```

```
Fields allowed but ignored:  
- id  
- type  
- api_version  
- scope  
- created_at  
- updated_at  
- url  
- org_url  
- user_registry_url
```

```
apic users:update [flags]
```

Options

```

--format string      Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
-h, --help          Help for users:update
-o, --org string    Organization name or id (required)
--output string     Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
--user-registry string User Registry name or id (required)

```

Options inherited from parent commands

```

--accept-license    Accept the license for API Connect
--debug            Enable debug output
--debug-output string Write debug output to file
--live-help        Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")

```

apic validate

Validate an API or product definition

Synopsis

Validate an API or product definition

```
apic validate [FILE] [flags]
```

Examples

```

Validate an API definition
$ apic validate routes.yaml
Validated routes.yaml API definition [routes:1.0]
Validate an API definition without IBM extensions
$ apic validate --no-extensions routes.yaml
Validated routes.yaml API definition [routes:1.0]
Validate a product definition and its referenced APIs
$ apic validate climb-on.yaml
Validated climb-on.yaml product definition [climb-on:1.0.0]
Validated routes.yaml API definition [valid:1.0]
Validate a product definition without validating its referenced APIs
$ apic validate --product-only climb-on.yaml
Validated climb-on.yaml product definition [climb-on:1.0.0]

```

Options

```

-h, --help          Help for validate
--no-extensions    for API definitions, do not validate against IBM Swagger extensions
-p, --product-only for products definitions, do not validate referenced APIs

```

Options inherited from parent commands

```

--accept-license    Accept the license for API Connect
--debug            Enable debug output
--debug-output string Write debug output to file
--live-help        Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")

```

apic version

Get the APIConnect toolkit version

Synopsis

Get the APIConnect toolkit version

```
apic version [flags]
```

Options

```

-h, --help          Help for version
-s, --server string management server endpoint

```

Options inherited from parent commands

```

--accept-license    Accept the license for API Connect
--debug            Enable debug output
--debug-output string Write debug output to file

```

```
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic webhooks

Webhooks operations

Synopsis

Webhooks operations

```
apic webhooks [flags]
```

Options

```
-c, --catalog string  Catalog name or id (required)
--fields string       List of field names to return
--format string       Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help            Help for webhooks
--limit int32         Maximum number of items to return
--offset int32        Offset item number from list to begin return
-o, --org string      Organization name or id (required)
--output string       Write file(s) to directory, instead of STDOUT (default "-")
--scope string        scope
-s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic webhooks:get

Webhooks get operations

Synopsis

Webhooks get operations

```
apic webhooks:get [flags]
```

Options

```
-c, --catalog string  Catalog name or id (required)
--fields string       List of field names to return
--format string       Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help            Help for webhooks:get
-o, --org string      Organization name or id (required)
--output string       Write file(s) to directory, use - for STDOUT. (default: cwd)
--scope string        scope
-s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic webhooks:list

Webhooks list operations

Synopsis

Webhooks list operations

```
apic webhooks:list [flags]
```

Options

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--fields string</code>	List of field names to return
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for webhooks:list
<code>--limit int32</code>	Maximum number of items to return
<code>--offset int32</code>	Offset item number from list to begin return
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>--scope string</code>	scope
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic webhooks:update

Webhooks update operations

Synopsis

Webhooks update operations

```
apic webhooks:update [flags]
```

Options

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for webhooks:update
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>--scope string</code>	scope
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic wsdL

Introspect WSDL files

Synopsis

Introspect a WSDL file displaying all its services \$ apic wsdL WSDL_FILE \$ apic wsdL:introspect WSDL_FILE

```
apic wsdL [flags]
```

Options

```
-h, --help Help for wsdL
```

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic wsdL:introspect

Introspect a WSDL file displaying all its services

Synopsis

Introspect a WSDL file displaying all its services

```
apic wsdl:introspect WSDL_FILE [flags]
```

Options

```
-h, --help Help for wsdl:introspect
```

Options inherited from parent commands

```
--accept-license Accept the license for API Connect
--debug Enable debug output
--debug-output string Write debug output to file
--live-help Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic

APIConnect toolkit 61bd16316ae32e02b6cd8e72d4b18e02560de16f (Built 2020-09-23T09:51:50Z)

Synopsis

APIConnect toolkit 61bd16316ae32e02b6cd8e72d4b18e02560de16f (Built 2020-09-23T09:51:50Z)

```
apic [flags]
```

Options

```
--accept-license Accept the license for API Connect
--debug Enable debug output
--debug-output string Write debug output to file
-h, --help Help for apic
--live-help Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic api

Api operations

Synopsis

Api operations

```
apic api --mode portaladmin [flags]
```

Options

```
-c, --catalog string Name or ID of the catalog that the site belongs to. (required)
--format string Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help Help for api
-o, --org string Name or ID of the organization that the catalog belongs to. (required)
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license Accept the license for API Connect
--debug Enable debug output
--debug-output string Write debug output to file
--live-help Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic api:add-attachment

Add an attachment for the given api.

Synopsis

Add an attachment for a api within the developer portal of the provided org and catalog. A api can hold 10 attachments. The id or name:version of a specific api needs to be provided. e.g. 'id-of-api-called-example-3' or 'example:3.0.0'.

```
apic api:add-attachment --mode portaladmin [flags]
```

Options

```
--attachment_description string  A description of the attachment to be displayed to users.
--attachment_name string          The name given to the attachment once it has been uploaded e.g. my-file.txt (required)
-c, --catalog string              Name or ID of the catalog that the site belongs to. (required)
--format string                  Output format. One of [json yaml go-template=... go-template-file=...], defaults to
yaml.
-h, --help                        Help for api:add-attachment
-o, --org string                  Name or ID of the organization that the catalog belongs to. (required)
-s, --server string              management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

apic api:add-tag

Add a tag for the given api.

Synopsis

Add a tag for a api within the developer portal of the provided org and catalog. The id or name:version of a specific api needs to be provided. e.g. 'id-of-api-called-example-3' or 'example:3.0.0'.

```
apic api:add-tag --mode portaladmin [flags]
```

Options

```
-c, --catalog string  Name or ID of the catalog that the site belongs to. (required)
--format string      Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for api:add-tag
-o, --org string     Name or ID of the organization that the catalog belongs to. (required)
-s, --server string  management server endpoint (required)
--tag_name string    The tag name e.g. top_level_element/next_level_element (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

apic api:get

Get a specific api from a developer portal.

Synopsis

Get a specific api from the developer portal of the provided org and catalog. The id or name:version of a specific api needs to be provided. e.g. 'id-of-api-called-example-3' or 'example:3.0.0'.

```
apic api:get --mode portaladmin [flags]
```

Options

```
-c, --catalog string  Name or ID of the catalog that the site belongs to. (required)
--format string      Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for api:get
-o, --org string     Name or ID of the organization that the catalog belongs to. (required)
-s, --server string  management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
```

```
--debug-output string  Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

apic api:get-document

Get a specific entire api document from a portal.

Synopsis

Get a specific entire api document from the portal of the provided organization and catalog. The id or name:version of a specific api needs to be provided. For example, 'id-of-api-called-example-3' or 'example:3.0.0'.

```
apic api:get-document --mode portaladmin [flags]
```

Options

```
-c, --catalog string  Name or ID of the catalog that the site belongs to. (required)
--format string      Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for api:get-document
-o, --org string     Name or ID of the organization that the catalog belongs to. (required)
-s, --server string  management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic api:list

Shows a list of apis from a site.

Synopsis

Show a list of apis of the provided org and catalog.

```
apic api:list --mode portaladmin [flags]
```

Options

```
-c, --catalog string  Name or ID of the catalog that the site belongs to. (required)
--format string      Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for api:list
-o, --org string     Name or ID of the organization that the catalog belongs to. (required)
-s, --server string  management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic api:set-icon

Set an icon image for the given api.

Synopsis

Set an icon image for a api within the developer portal of the provided org and catalog. The existing icon will be overwritten. The id or name:version of a specific api needs to be provided. e.g. 'id-of-api-called-example-3' or 'example:3.0.0'.

```
apic api:set-icon --mode portaladmin [flags]
```

Options

```
-c, --catalog string  Name or ID of the catalog that the site belongs to. (required)
--format string      Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
```

```
-h, --help          Help for api:set-icon
--icon_description string A description of the icon to be displayed to users. Used as alt text for the image.
(required)
-o, --org string     Name or ID of the organization that the catalog belongs to. (required)
-s, --server string  management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

apic apic-config

Apic Config operations

Synopsis

Apic Config operations

```
apic apic-config --mode portaladmin [flags]
```

Options

```
-h, --help  Help for apic-config
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

apic apic-config:get

Get the configuration object that the developer portal holds.

Synopsis

Get the configuration object that the developer portal holds that was sent by APIM.

```
apic apic-config:get --mode portaladmin [flags]
```

Options

```
-c, --catalog string  Name or ID of the catalog that the site belongs to. (required)
--format string       Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help            Help for apic-config:get
-o, --org string       Name or ID of the organization that the catalog belongs to. (required)
-s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

apic application

Application operations

Synopsis

Application operations

```
apic application --mode portaladmin [flags]
```

Options

<code>-c, --catalog string</code>	Name or ID of the catalog that the site belongs to. (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for application
<code>-o, --org string</code>	Name or ID of the organization that the catalog belongs to. (required)
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic application:get

Get a specific application from a developer portal.

Synopsis

Get a specific application from the developer portal of the provided org and catalog. The id of a specific consumer organization needs to be provided.

```
apic application:get --mode portaladmin [flags]
```

Options

<code>-c, --catalog string</code>	Name or ID of the catalog that the site belongs to. (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for application:get
<code>-o, --org string</code>	Name or ID of the organization that the catalog belongs to. (required)
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic application:list

Shows a list of applications from a site.

Synopsis

Show a list of applications of the provided org and catalog.

```
apic application:list --mode portaladmin [flags]
```

Options

<code>-c, --catalog string</code>	Name or ID of the catalog that the site belongs to. (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for application:list
<code>--org string</code>	Name or ID of the organization that the catalog belongs to. (required)
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic backups

Backups operations

Synopsis

Backups operations

```
apic backups --mode portaladmin [flags]
```

Options

<code>--format</code> string	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for backups
<code>--portal_service_name</code> string	The name of the portal service (required)
<code>-s, --server</code> string	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output</code> string	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode</code> string	Toolkit operation mode (default "apim")

apic backups:list

List the backups present on the remote backup server.

Synopsis

Lists all the backups that are currently present on the remote backup server, if one has been set.

```
apic backups:list --mode portaladmin [flags]
```

Options

<code>--format</code> string	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for backups:list
<code>--portal_service_name</code> string	The name of the portal service (required)
<code>-s, --server</code> string	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output</code> string	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode</code> string	Toolkit operation mode (default "apim")

apic config

Manage configuration variables

Synopsis

Manage configuration variables

```
apic config --mode portaladmin [flags]
```

Options

<code>-g, --global</code>	list the global configuration variables
<code>-h, --help</code>	Help for config
<code>-l, --local</code>	list the local application configuration variables

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output</code> string	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode</code> string	Toolkit operation mode (default "apim")

apic config:clear

Delete all configuration variables

Synopsis

Delete all configuration variables

```
apic config:clear --mode portaladmin [flags]
```

Examples

```
$ apic config:clear --mode consumer
Deleted config catalog
Deleted config org
Deleted config space
```

```
$ apic config:clear --global --mode consumer
Deleted config catalog
```

Options

```
-g, --global  list the global configuration variables
-h, --help    Help for config:clear
-l, --local   list the local application configuration variables
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

apic config:delete

Delete a configuration variable

Synopsis

Configuration variables:

catalog The catalog configuration variable should be set to the URI of an API Connect catalog. The value of the catalog provides the default identity of a catalog for all the commands that are used to manage aspects of a catalog. The default values defined by the catalog's URI can be overridden using the `--server`, `--organization`, and `--catalog` command line options. The catalog URI has the form: `https://MANAGEMENT_SERVER/consumer-api/catalogs/CONSUMER_ORG_NAME/CATALOG_NAME`

org The default value of `org` defined by the app's or catalog's URI can be set using the `org` URI. The `org` URI has the form: `https://MANAGEMENT_SERVER/consumer-api/orgs/CONSUMER_ORG_NAME`

space The space configuration variable should be set to the URI of an API Connect space. The value of the space provides the default identity of a space for all the commands that are used to manage aspects of a space. The default values defined by the spaces's URI can be overridden using the `--server`, `--organization`, `--catalog`, and `--space` command line options. The space URI has the form: `https://MANAGEMENT_SERVER/consumer-api/spaces/CONSUMER_ORG_NAME/CATALOG_NAME/SPACE_NAME`

cloud The cloud configuration variable should be set to the management server URI. The value of the cloud variable provides default server URI for cloud admin commands. It can be overridden using the `--server` and `--mode` command line options. The cloud URI has the form: `https://MANAGEMENT_SERVER/consumer-api/`

mode The value of `mode` configuration variable defines the toolkit operation mode. It can be overridden using the `--mode` command line option. The value can be set to `apim` or `consumer`

template-path List of places to look for handlebar templates

template-default-api Defines the default api template

template-default-product Defines the default product template

```
apic config:delete NAME... --mode portaladmin [flags]
```

Examples

```
$ apic config:delete catalog --mode consumer
Deleted config catalog
```

```
$ apic config:delete org --mode consumer
Deleted config org
```

Options

```
-g, --global  list the global configuration variables
-h, --help    Help for config:delete
-l, --local   list the local application configuration variables
```

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic config:get

Get a configuration variable

Synopsis

Configuration variables:

catalog The catalog configuration variable should be set to the URI of an API Connect catalog. The value of the catalog provides the default identity of a catalog for all the commands that are used to manage aspects of a catalog. The default values defined by the catalog's URI can be overridden using the `--server`, `--organization`, and `--catalog` command line options. The catalog URI has the form: `https://MANAGEMENT_SERVER/consumer-api/catalogs/CONSUMER_ORG_NAME/CATALOG_NAME`

org The default value of `org` defined by the app's or catalog's URI can be set using the `org` URI. The `org` URI has the form: `https://MANAGEMENT_SERVER/consumer-api/orgs/CONSUMER_ORG_NAME`

space The space configuration variable should be set to the URI of an API Connect space. The value of the space provides the default identity of a space for all the commands that are used to manage aspects of a space. The default values defined by the spaces's URI can be overridden using the `--server`, `--organization`, `--catalog`, and `--space` command line options. The space URI has the form: `https://MANAGEMENT_SERVER/consumer-api/spaces/CONSUMER_ORG_NAME/CATALOG_NAME/SPACE_NAME`

cloud The cloud configuration variable should be set to the management server URI. The value of the cloud variable provides default server URI for cloud admin commands. It can be overridden using the `--server` and `--mode` command line options. The cloud URI has the form: `https://MANAGEMENT_SERVER/consumer-api/`

mode The value of `mode` configuration variable defines the toolkit operation mode. It can be overridden using the `--mode` command line option. The value can be set to `apim` or `consumer`

template-path List of places to look for handlebar templates

template-default-api Defines the default api template

template-default-product Defines the default product template

`apic config:get NAME --mode portaladmin [flags]`

Examples

```
$ apic config:get catalog --mode consumer
catalog: https://mgmthost.com/consumer-api/catalogs/climbon/sb
```

```
$ apic config:get org --mode consumer
org: https://mgmthost.com/consumer-api/orgs/climbon
```

Options

<code>-g, --global</code>	list the global configuration variables
<code>-h, --help</code>	Help for config:get
<code>-l, --local</code>	list the local application configuration variables

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic config:list

List the application and global configuration variables

Synopsis

Configuration variables:

catalog The catalog configuration variable should be set to the URI of an API Connect catalog. The value of the catalog provides the default identity of a catalog for all the commands that are used to manage aspects of a catalog. The default values defined by the catalog's URI can be overridden using the `--server`, `--organization`, and `--catalog` command line options. The catalog URI has the form: `https://MANAGEMENT_SERVER/consumer-api/catalogs/CONSUMER_ORG_NAME/CATALOG_NAME`

org The default value of org defined by the app's or catalog's URI can be set using the org URI. The org URI has the form: `https://MANAGEMENT_SERVER/consumer-api/orgs/CONSUMER_ORG_NAME`

space The space configuration variable should be set to the URI of an API Connect space. The value of the space provides the default identity of a space for all the commands that are used to manage aspects of a space. The default values defined by the spaces's URI can be overridden using the `--server`, `--organization`, `--catalog`, and `--space` command line options. The space URI has the form: `https://MANAGEMENT_SERVER/consumer-api/spaces/CONSUMER_ORG_NAME/CATALOG_NAME/SPACE_NAME`

cloud The cloud configuration variable should be set to the management server URI. The value of the cloud variable provides default server URI for cloud admin commands. It can be overridden using the `--server` and `--mode` command line options. The cloud URI has the form: `https://MANAGEMENT_SERVER/consumer-api/`

mode The value of mode configuration variable defines the toolkit operation mode. It can be overridden using the `--mode` command line option. The value can be set to `apim` or `consumer`

template-path List of places to look for handlebar templates

template-default-api Defines the default api template

template-default-product Defines the default product template

```
apic config:list --mode portaladmin [flags]
```

Examples

```
$ apic config --mode consumer
catalog: https://mgmthost.com/consumer-api/catalogs/climbon/sb
org: https://mgmthost.com/consumer-api/orgs/climbon
```

```
$ apic config --global --mode consumer
catalog: https://mgmthost.com/consumer-api/catalogs/climbon/sb
```

Options

```
-g, --global    list the global configuration variables
-h, --help      Help for config:list
-l, --local     list the local application configuration variables
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic config:set

Set or update configuration variables

Synopsis

Configuration variables:

catalog The catalog configuration variable should be set to the URI of an API Connect catalog. The value of the catalog provides the default identity of a catalog for all the commands that are used to manage aspects of a catalog. The default values defined by the catalog's URI can be overridden using the `--server`, `--organization`, and `--catalog` command line options. The catalog URI has the form: `https://MANAGEMENT_SERVER/consumer-api/catalogs/CONSUMER_ORG_NAME/CATALOG_NAME`

org The default value of org defined by the app's or catalog's URI can be set using the org URI. The org URI has the form: `https://MANAGEMENT_SERVER/consumer-api/orgs/CONSUMER_ORG_NAME`

space The space configuration variable should be set to the URI of an API Connect space. The value of the space provides the default identity of a space for all the commands that are used to manage aspects of a space. The default values defined by the spaces's URI can be overridden using the `--server`, `--organization`, `--catalog`, and `--space` command line options. The space URI has the form: `https://MANAGEMENT_SERVER/consumer-api/spaces/CONSUMER_ORG_NAME/CATALOG_NAME/SPACE_NAME`

cloud The cloud configuration variable should be set to the management server URI. The value of the cloud variable provides default server URI for cloud admin commands. It can be overridden using the `--server` and `--mode` command line options. The cloud URI has the form: `https://MANAGEMENT_SERVER/consumer-api/`

mode The value of mode configuration variable defines the toolkit operation mode. It can be overridden using the `--mode` command line option. The value can be set to `apim` or `consumer`

template-path List of places to look for handlebar templates

template-default-api Defines the default api template

template-default-product Defines the default product template

```
apic config:set NAME=VALUE ... --mode portaladmin [flags]
```

Examples

```
$ apic config:set --mode consumer catalog=https://mgmthost.com/consumer-api/catalogs/climbon/sb
catalog: https://mgmthost.com/consumer-api/catalogs/climbon/sb
```

```
$ apic config:set --mode consumer org=https://mgmthost2.com/consumer-api/orgs/hikeon
org: https://mgmthost2.com/consumer-api/orgs/hikeon
```

Options

-g, --global	list the global configuration variables
-h, --help	Help for config:set
-l, --local	list the local application configuration variables

Options inherited from parent commands

--accept-license	Accept the license for API Connect
--debug	Enable debug output
--debug-output string	Write debug output to file
--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

apic consumer-org

Consumer Org operations

Synopsis

Consumer Org operations

```
apic consumer-org --mode portaladmin [flags]
```

Options

-c, --catalog string	Name or ID of the catalog that the site belongs to. (required)
--format string	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help	Help for consumer-org
-o, --org string	Name or ID of the organization that the catalog belongs to. (required)
-s, --server string	management server endpoint (required)

Options inherited from parent commands

--accept-license	Accept the license for API Connect
--debug	Enable debug output
--debug-output string	Write debug output to file
--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

apic consumer-org:get

Get a specific consumer org from a developer portal.

Synopsis

Get a specific consumer org from the developer portal of the provided org and catalog. The id of a specific consumer organization needs to be provided.

```
apic consumer-org:get --mode portaladmin [flags]
```

Options

-c, --catalog string	Name or ID of the catalog that the site belongs to. (required)
--format string	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help	Help for consumer-org:get
-o, --org string	Name or ID of the organization that the catalog belongs to. (required)
-s, --server string	management server endpoint (required)

Options inherited from parent commands

--accept-license	Accept the license for API Connect
--debug	Enable debug output
--debug-output string	Write debug output to file
--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

apic consumer-org:list

Shows a list of consumer orgs from a site.

Synopsis

Show a list of consumer orgs of the provided org and catalog.

```
apic consumer-org:list --mode portaladmin [flags]
```

Options

<code>-c, --catalog string</code>	Name or ID of the catalog that the site belongs to. (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for consumer-org:list
<code>-o, --org string</code>	Name or ID of the organization that the catalog belongs to. (required)
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic content

Content operations

Synopsis

Content operations

```
apic content --mode portaladmin [flags]
```

Options

<code>--bundle string</code>	The bundle type for a given entity type. E.g. "page" for the "node" entity type.
<code>-c, --catalog string</code>	Name or ID of the catalog that the site belongs to. (required)
<code>--entity_type string</code>	Type of entity you want to perform this operation on. To find out entity/content types see the content list-types route. (required)
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for content
<code>-o, --org string</code>	Name or ID of the organization that the catalog belongs to. (required)
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic content:create-export

Create a task that exports a tgz containing the site content.

Synopsis

Creates a task that exports a tgz containing the site content. You can export specific entity types and specific ids or you can generate a tar containing all content. Depending on your site's content please be advised that an export all can take a long time to complete. If called via the toolkit CLI, it will automatically poll the response every 30 seconds up to 25 minutes.

```
apic content:create-export --mode portaladmin [flags]
```

Options

<code>-c, --catalog string</code>	Name or ID of the catalog that the site belongs to. (required)
<code>--entity_ids string</code>	A comma separated list of entity ids.
<code>--entity_type string</code>	Type of entity you want to perform this operation on. To find out entity/content types see the content list-types route. (required)
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for content:create-export
<code>--no-poll</code>	Do not poll the created task and just return the task ID

```
-o, --org string      Name or ID of the organization that the catalog belongs to. (required)
-s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license      Accept the license for API Connect
--debug               Enable debug output
--debug-output string Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

apic content:create-import

Create a task that imports an archive of site content.

Synopsis

Creates a task that imports an archive of site content. The status of this task can be tracked with the /content/TASK_ID/status route. Depending on your site's content please be advised that an import can take a long time to complete. If called via the toolkit CLI, it will automatically poll the response every 30 seconds up to 25 minutes.

```
apic content:create-import --mode portaladmin [flags]
```

Options

```
-c, --catalog string  Name or ID of the catalog that the site belongs to. (required)
--format string       Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help            Help for content:create-import
--no-poll             Do not poll the created task and just return the task ID
-o, --org string      Name or ID of the organization that the catalog belongs to. (required)
-s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license      Accept the license for API Connect
--debug               Enable debug output
--debug-output string Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

apic content:delete-export

If running, cancels a content export task.

Synopsis

Cancels any currently running content export tasks, and deletes any related artifacts that have been generated.

```
apic content:delete-export --mode portaladmin [flags]
```

Options

```
-c, --catalog string  Name or ID of the catalog that the site belongs to. (required)
--format string       Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help            Help for content:delete-export
-o, --org string      Name or ID of the organization that the catalog belongs to. (required)
-s, --server string   management server endpoint (required)
--task_id string     ID of the task created on the queue. (required)
```

Options inherited from parent commands

```
--accept-license      Accept the license for API Connect
--debug               Enable debug output
--debug-output string Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

apic content:delete-import

If running, cancels a content import task.

Synopsis

Cancels any currently running content import tasks, and deletes any related artifacts that have been generated.

```
apic content:delete-import --mode portaladmin [flags]
```

Options

<code>-c, --catalog string</code>	Name or ID of the catalog that the site belongs to. (required)
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for content:delete-import
<code>-o, --org string</code>	Name or ID of the organization that the catalog belongs to. (required)
<code>-s, --server string</code>	management server endpoint (required)
<code>--task_id string</code>	ID of the task created on the queue. (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic content:get-export-status

Returns information about the status of this task.

Synopsis

Returns information related to the task id that is provided in the arguments.

```
apic content:get-export-status --mode portaladmin [flags]
```

Options

<code>-c, --catalog string</code>	Name or ID of the catalog that the site belongs to. (required)
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for content:get-export-status
<code>-o, --org string</code>	Name or ID of the organization that the catalog belongs to. (required)
<code>-s, --server string</code>	management server endpoint (required)
<code>--task_id string</code>	ID of the task created on the queue. (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic content:get-export

When ready, streams a content export artifact.

Synopsis

When ready, streams a content export artifact back to the related task id that is provided in the arguments.

```
apic content:get-export --mode portaladmin [flags]
```

Options

<code>-c, --catalog string</code>	Name or ID of the catalog that the site belongs to. (required)
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for content:get-export
<code>-o, --org string</code>	Name or ID of the organization that the catalog belongs to. (required)
<code>-s, --server string</code>	management server endpoint (required)
<code>--task_id string</code>	ID of the task created on the queue. (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic content:get-import-status

Returns information about the status of this task.

Synopsis

Returns information related to the task id that is provided in the arguments.

```
apic content:get-import-status --mode portaladmin [flags]
```

Options

<code>-c, --catalog string</code>	Name or ID of the catalog that the site belongs to. (required)
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for content:get-import-status
<code>-o, --org string</code>	Name or ID of the organization that the catalog belongs to. (required)
<code>-s, --server string</code>	management server endpoint (required)
<code>--task_id string</code>	ID of the task created on the queue. (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic content:list

Lists all of the entities in your site for the given entity type and bundle.

Synopsis

Lists all of the entities in your site for the given entity type and bundle.

```
apic content:list --mode portaladmin [flags]
```

Options

<code>--bundle string</code>	The bundle type for a given entity type. E.g. "page" for the "node" entity type.
<code>-c, --catalog string</code>	Name or ID of the catalog that the site belongs to. (required)
<code>--entity_type string</code>	Type of entity you want to perform this operation on. To find out entity/content types see the content list-types route. (required)
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for content:list
<code>-o, --org string</code>	Name or ID of the organization that the catalog belongs to. (required)
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic content:list-types

Lists the exportable content types on your site.

Synopsis

Lists the content types that are exportable from your site.

```
apic content:list-types --mode portaladmin [flags]
```

Options

<code>-c, --catalog string</code>	Name or ID of the catalog that the site belongs to. (required)
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for content:list-types

```
-o, --org string      Name or ID of the organization that the catalog belongs to. (required)
-s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license      Accept the license for API Connect
--debug               Enable debug output
--debug-output string Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

apic custom-module

Custom Module operations

Synopsis

Custom Module operations

```
apic custom-module --mode portaladmin [flags]
```

Options

```
-h, --help Help for custom-module
```

Options inherited from parent commands

```
--accept-license      Accept the license for API Connect
--debug               Enable debug output
--debug-output string Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

apic custom-module:create-export

Create a task that exports an archive that contains the custom modules of a site.

Synopsis

You can create a task to export an archive of the custom modules of a site. You can then use that archive to quickly and simply override the custom modules on another site.

```
apic custom-module:create-export --mode portaladmin [flags]
```

Options

```
-c, --catalog string  Name or ID of the catalog that the site belongs to. (required)
--format string       Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help            Help for custom-module:create-export
--no-poll             Do not poll the created task and just return the task ID
-o, --org string      Name or ID of the organization that the catalog belongs to. (required)
-s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license      Accept the license for API Connect
--debug               Enable debug output
--debug-output string Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

apic custom-module:create-import

Create a task that imports an archive that contains the custom modules of a site.

Synopsis

You can create a task to import an archive of the custom modules of a site. You can use the imported archive to quickly and simply override the custom modules for the specified site.

```
apic custom-module:create-import --mode portaladmin [flags]
```

Possible Usages

```
apic custom-module:create-import --mode portaladmin [flags] CUSTOM_MODULE_FILE
```

Options

```
-c, --catalog string  Name or ID of the catalog that the site belongs to. (required)
--format string      Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
--no-poll            Do not poll the created task and just return the task ID
-o, --org string     Name or ID of the organization that the catalog belongs to. (required)
-s, --server string  management server endpoint (required)
--wait              Wait on the cache to be rebuilt as part of the task, otherwise it will be rebuilt in the background
after the task has finished.
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic custom-module:delete-export

If running, cancels a custom module export task.

Synopsis

If running, cancels the custom module export task and deletes any related artifacts that have been generated.

```
apic custom-module:delete-export --mode portaladmin [flags]
```

Options

```
-c, --catalog string  Name or ID of the catalog that the site belongs to. (required)
--format string      Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for custom-module:delete-export
-o, --org string     Name or ID of the organization that the catalog belongs to. (required)
-s, --server string  management server endpoint (required)
--task_id string    ID of the task created on the queue. (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic custom-module:delete-import

If running, cancels a custom module import task.

Synopsis

If running, cancels the custom module import task and deletes any related artifacts that have been generated.

```
apic custom-module:delete-import --mode portaladmin [flags]
```

Options

```
-c, --catalog string  Name or ID of the catalog that the site belongs to. (required)
--format string      Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for custom-module:delete-import
-o, --org string     Name or ID of the organization that the catalog belongs to. (required)
-s, --server string  management server endpoint (required)
--task_id string    ID of the task created on the queue. (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic custom-module:get-export

When ready, streams a custom module export artifact.

Synopsis

When ready, streams a custom module export artifact back to the related task id that is provided in the arguments.

```
apic custom-module:get-export --mode portaladmin [flags]
```

Options

<code>-c, --catalog string</code>	Name or ID of the catalog that the site belongs to. (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for custom-module:get-export
<code>-o, --org string</code>	Name or ID of the organization that the catalog belongs to. (required)
<code>-s, --server string</code>	management server endpoint (required)
<code>--task_id string</code>	ID of the task created on the queue. (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic custom-module:get-export-status

Returns information about the status of this task.

Synopsis

Returns information related to the task id that is provided in the arguments.

```
apic custom-module:get-export-status --mode portaladmin [flags]
```

Options

<code>-c, --catalog string</code>	Name or ID of the catalog that the site belongs to. (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for custom-module:get-export-status
<code>-o, --org string</code>	Name or ID of the organization that the catalog belongs to. (required)
<code>-s, --server string</code>	management server endpoint (required)
<code>--task_id string</code>	ID of the task created on the queue. (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic custom-module:get-import-status

Get the result of the custom module import task.

Synopsis

Get the result of the custom module import task. If the import task has completed on the portal system, this command returns the result of the command. If the import task has not completed on the portal system, it returns the current status of the task.

```
apic custom-module:get-import-status --mode portaladmin [flags]
```

Options

<code>-c, --catalog string</code>	Name or ID of the catalog that the site belongs to. (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for custom-module:get-import-status
<code>-o, --org string</code>	Name or ID of the organization that the catalog belongs to. (required)
<code>-s, --server string</code>	management server endpoint (required)
<code>--task_id string</code>	ID of the task created on the queue. (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic custom-theme

Custom Theme operations

Synopsis

Custom Theme operations

```
apic custom-theme --mode portaladmin [flags]
```

Options

```
-h, --help Help for custom-theme
```

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic custom-theme:create-export

Create a task that exports an archive that contains the custom themes of a site.

Synopsis

You can create a task to export an archive of the custom themes of a site. You can then use that archive to quickly and simply override the custom themes on another site.

```
apic custom-theme:create-export --mode portaladmin [flags]
```

Options

<code>-c, --catalog string</code>	Name or ID of the catalog that the site belongs to. (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for custom-theme:create-export
<code>--no-poll</code>	Do not poll the created task and just return the task ID
<code>-o, --org string</code>	Name or ID of the organization that the catalog belongs to. (required)
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic custom-theme:create-import

Create a task that imports an archive that contains the custom themes of a site.

Synopsis

You can create a task to import an archive of the custom themes of a site. You can use the imported archive to quickly and simply override the custom themes for the specified site.

```
apic custom-theme:create-import --mode portaladmin [flags]
```

Possible Usages

```
apic custom-theme:create-import --mode portaladmin [flags] CUSTOM_THEME_FILE
```

Options

```
-c, --catalog string  Name or ID of the catalog that the site belongs to. (required)
--format string      Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
--no-poll            Do not poll the created task and just return the task ID
-o, --org string     Name or ID of the organization that the catalog belongs to. (required)
-s, --server string  management server endpoint (required)
--wait              Wait on the cache to be rebuilt as part of the task, otherwise it will be rebuilt in the background
                    after the task has finished.
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic custom-theme:delete-export

If running, cancels a custom theme export task.

Synopsis

If running, cancels the custom theme export task and deletes any related artifacts that have been generated. This does not delete any custom themes.

```
apic custom-theme:delete-export --mode portaladmin [flags]
```

Options

```
-c, --catalog string  Name or ID of the catalog that the site belongs to. (required)
--format string      Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for custom-theme:delete-export
-o, --org string     Name or ID of the organization that the catalog belongs to. (required)
-s, --server string  management server endpoint (required)
--task_id string     ID of the task created on the queue. (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic custom-theme:delete-import

Cancels a running custom theme import task.

Synopsis

Cancels the custom theme import task and deletes any generated artifacts.

```
apic custom-theme:delete-import --mode portaladmin [flags]
```

Options

```
-c, --catalog string  Name or ID of the catalog that the site belongs to. (required)
--format string      Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for custom-theme:delete-import
-o, --org string     Name or ID of the organization that the catalog belongs to. (required)
-s, --server string  management server endpoint (required)
--task_id string     ID of the task created on the queue. (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic custom-theme:get-export

When ready, streams a custom theme export artifact.

Synopsis

When ready, streams a custom theme export artifact back to the related task id that is provided in the arguments.

```
apic custom-theme:get-export --mode portaladmin [flags]
```

Options

-c, --catalog string	Name or ID of the catalog that the site belongs to. (required)
--format string	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help	Help for custom-theme:get-export
-o, --org string	Name or ID of the organization that the catalog belongs to. (required)
-s, --server string	management server endpoint (required)
--task_id string	ID of the task created on the queue. (required)

Options inherited from parent commands

--accept-license	Accept the license for API Connect
--debug	Enable debug output
--debug-output string	Write debug output to file
--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

apic custom-theme:get-export-status

Returns information about the status of this task.

Synopsis

Returns information related to the task id that is provided in the arguments.

```
apic custom-theme:get-export-status --mode portaladmin [flags]
```

Options

-c, --catalog string	Name or ID of the catalog that the site belongs to. (required)
--format string	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help	Help for custom-theme:get-export-status
-o, --org string	Name or ID of the organization that the catalog belongs to. (required)
-s, --server string	management server endpoint (required)
--task_id string	ID of the task created on the queue. (required)

Options inherited from parent commands

--accept-license	Accept the license for API Connect
--debug	Enable debug output
--debug-output string	Write debug output to file
--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

apic custom-theme:get-import-status

Get the result of the custom theme import task.

Synopsis

Get the result of the custom theme import task. If the import task has completed on the portal system, this command returns the result of the command. If the import task has not completed on the portal system, it returns the current status of the task.

```
apic custom-theme:get-import-status --mode portaladmin [flags]
```

Options

-c, --catalog string	Name or ID of the catalog that the site belongs to. (required)
--format string	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help	Help for custom-theme:get-import-status
-o, --org string	Name or ID of the organization that the catalog belongs to. (required)
-s, --server string	management server endpoint (required)
--task_id string	ID of the task created on the queue. (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic custom-translation

Custom Translation operations

Synopsis

Custom Translation operations

```
apic custom-translation --mode portaladmin [flags]
```

Options

```
-h, --help Help for custom-translation
```

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic custom-translation:create-export

Create a task that exports an archive that contains the custom translation of a site.

Synopsis

You can create a task to export an archive of the custom translation of a site. You can then use that archive to quickly and simply override the custom translations on another site.

```
apic custom-translation:create-export --mode portaladmin [flags]
```

Options

<code>-c, --catalog string</code>	Name or ID of the catalog that the site belongs to. (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for custom-translation:create-export
<code>--langcodes string</code>	A comma separated list of language codes e.g. "es,zh-hans"
<code>--no-poll</code>	Do not poll the created task and just return the task ID
<code>-o, --org string</code>	Name or ID of the organization that the catalog belongs to. (required)
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic custom-translation:create-import

Create a task that imports an archive that contains the custom translations of a site.

Synopsis

You can create a task to import an archive of the custom translations of a site. You can use the imported archive to simply override the custom translations for the specified site. This command may take several minutes to complete.

```
apic custom-translation:create-import --mode portaladmin [flags]
```

Options

<code>-c, --catalog string</code>	Name or ID of the catalog that the site belongs to. (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.

<code>-h, --help</code>	Help for custom-translation:create-import
<code>--no-poll</code>	Do not poll the created task and just return the task ID
<code>-o, --org string</code>	Name or ID of the organization that the catalog belongs to. (required)
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic custom-translation:delete-export

If running, cancels a custom translation export task.

Synopsis

If running, cancels the custom translation export task and deletes any related artifacts that have been generated. This does not delete any custom translations.

```
apic custom-translation:delete-export --mode portaladmin [flags]
```

Options

<code>-c, --catalog string</code>	Name or ID of the catalog that the site belongs to. (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for custom-translation:delete-export
<code>-o, --org string</code>	Name or ID of the organization that the catalog belongs to. (required)
<code>-s, --server string</code>	management server endpoint (required)
<code>--task_id string</code>	ID of the task created on the queue. (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic custom-translation:delete-import

If running, cancels a custom translation import task.

Synopsis

If running, cancels the custom translation import task and deletes any related artifacts that have been generated. This does not delete any custom translations.

```
apic custom-translation:delete-import --mode portaladmin [flags]
```

Options

<code>-c, --catalog string</code>	Name or ID of the catalog that the site belongs to. (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for custom-translation:delete-import
<code>-o, --org string</code>	Name or ID of the organization that the catalog belongs to. (required)
<code>-s, --server string</code>	management server endpoint (required)
<code>--task_id string</code>	ID of the task created on the queue. (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic custom-translation:get-export

When ready, streams a custom translation export artifact.

Synopsis

When ready, streams a custom translation export artifact back to the related task id that is provided in the arguments.

```
apic custom-translation:get-export --mode portaladmin [flags]
```

Options

<code>-c, --catalog string</code>	Name or ID of the catalog that the site belongs to. (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for custom-translation:get-export
<code>-o, --org string</code>	Name or ID of the organization that the catalog belongs to. (required)
<code>-s, --server string</code>	management server endpoint (required)
<code>--task_id string</code>	ID of the task created on the queue. (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic custom-translation:get-export-status

Returns information about the status of this task.

Synopsis

Returns information related to the task id that is provided in the arguments.

```
apic custom-translation:get-export-status --mode portaladmin [flags]
```

Options

<code>-c, --catalog string</code>	Name or ID of the catalog that the site belongs to. (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for custom-translation:get-export-status
<code>-o, --org string</code>	Name or ID of the organization that the catalog belongs to. (required)
<code>-s, --server string</code>	management server endpoint (required)
<code>--task_id string</code>	ID of the task created on the queue. (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic custom-translation:get-import-status

Get the result of the custom translation import task.

Synopsis

Get the result of the custom translation import task. If the import task has completed on the portal system, this command returns the result of the command. If the import task has not completed on the portal system, it returns the current status of the task.

```
apic custom-translation:get-import-status --mode portaladmin [flags]
```

Options

<code>-c, --catalog string</code>	Name or ID of the catalog that the site belongs to. (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for custom-translation:get-import-status
<code>-o, --org string</code>	Name or ID of the organization that the catalog belongs to. (required)
<code>-s, --server string</code>	management server endpoint (required)
<code>--task_id string</code>	ID of the task created on the queue. (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic custom-webserver-page

Custom Web Server Page operations

Synopsis

Custom Web Server Page operations

```
apic custom-webserver-page --mode portaladmin [flags]
```

Options

```
-h, --help Help for custom-webserver-page
```

Options inherited from parent commands

```
--accept-license Accept the license for API Connect
--debug Enable debug output
--debug-output string Write debug output to file
--live-help Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic custom-webserver-page:delete

Delete the custom HTML for a web server page.

Synopsis

Delete the custom web server HTML content of a specific web server page (index, 404, 40x, 50x). (Will fallback to a default.)

```
apic custom-webserver-page:delete --mode portaladmin [flags]
```

Options

```
--format string Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help Help for custom-webserver-page:delete
--page_type string The page type you want to run this command against. Values: index, 404, 40x, 50x
(required)
--portal_service_name string The name of the portal service (required)
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license Accept the license for API Connect
--debug Enable debug output
--debug-output string Write debug output to file
--live-help Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic custom-webserver-page:get

Get the HTML for a web server page.

Synopsis

Get the web server HTML content of a specific web server page (index, 404, 40x, 50x).

```
apic custom-webserver-page:get --mode portaladmin [flags]
```

Options

```
--format string Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help Help for custom-webserver-page:get
--page_type string The page type you want to run this command against. Values: index, 404, 40x, 50x
(required)
--portal_service_name string The name of the portal service (required)
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic custom-webserver-page:set

Set a custom HTML page for a web server page type.

Synopsis

Set the custom web server HTML content of a specific web server page (index, 404, 40x, 50x). Maximum size of 8 MB.

```
apic custom-webserver-page:set --mode portaladmin [flags]
```

Options

<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for custom-webserver-page:set
<code>--page_type string</code>	The page type you want to run this command against. Values: index, 404, 40x, 50x (required)
<code>--portal_service_name string</code>	The name of the portal service (required)
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic drupal-config

Drupal Config operations

Synopsis

Drupal Config operations

```
apic drupal-config --mode portaladmin [flags]
```

Options

<code>-c, --catalog string</code>	Name or ID of the catalog that the site belongs to. (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for drupal-config
<code>-o, --org string</code>	Name or ID of the organization that the catalog belongs to. (required)
<code>--prefix string</code>	The config prefix. For example, "system". No prefix will return all names in the system.
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic drupal-config:delete

Delete the Config object.

Synopsis

Delete the Config object or a specific config key.

```
apic drupal-config:delete --mode portaladmin [flags]
```

Options

<code>-c, --catalog string</code>	Name or ID of the catalog that the site belongs to. (required)
<code>--config_name string</code>	The config object name, for example "system.site". (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for drupal-config:delete
<code>--config_key string</code>	A config key, for example "page.front".
<code>-o, --org string</code>	Name or ID of the organization that the catalog belongs to. (required)
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic drupal-config:get

Get the Config object

Synopsis

Get the Config object or a specific config key value.

```
apic drupal-config:get --mode portaladmin [flags]
```

Options

<code>-c, --catalog string</code>	Name or ID of the catalog that the site belongs to. (required)
<code>--config_key string</code>	A config key, for example "page.front".
<code>--config_name string</code>	The config object name, for example "system.site". (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for drupal-config:get
<code>-o, --org string</code>	Name or ID of the organization that the catalog belongs to. (required)
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic drupal-config:list

List the config names by prefix

Synopsis

List the config names by prefix or provide no prefix to see all.

```
apic drupal-config:list --mode portaladmin [flags]
```

Options

<code>-c, --catalog string</code>	Name or ID of the catalog that the site belongs to. (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for drupal-config:list
<code>-o, --org string</code>	Name or ID of the organization that the catalog belongs to. (required)
<code>--prefix string</code>	The config prefix. For example, "system". No prefix will return all names in the system.
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic drupal-config:set

Set a config value.

Synopsis

Can set a new config value or update an already existing key-value.

```
apic drupal-config:set --mode portaladmin [flags]
```

Options

<code>-c, --catalog string</code>	Name or ID of the catalog that the site belongs to. (required)
<code>--config_key string</code>	A config key, for example "page.front". (required)
<code>--config_name string</code>	The config object name, for example "system.site". (required)
<code>--config_value string</code>	The value to assign to the config key. (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for drupal-config:set
<code>-o, --org string</code>	Name or ID of the organization that the catalog belongs to. (required)
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic drupal-state

Drupal State operations

Synopsis

Drupal State operations

```
apic drupal-state --mode portaladmin [flags]
```

Options

<code>-h, --help</code>	Help for drupal-state
-------------------------	-----------------------

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic drupal-state:delete

Delete the State key.

Synopsis

Delete the specific state key.

```
apic drupal-state:delete --mode portaladmin [flags]
```

Options

<code>-c, --catalog string</code>	Name or ID of the catalog that the site belongs to. (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for drupal-state:delete
<code>-o, --org string</code>	Name or ID of the organization that the catalog belongs to. (required)
<code>-s, --server string</code>	management server endpoint (required)
<code>--state_key string</code>	The state key, for example "system.cron_last". (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic drupal-state:get

Get the State key

Synopsis

Get the State key value.

```
apic drupal-state:get --mode portaladmin [flags]
```

Options

<code>-c, --catalog string</code>	Name or ID of the catalog that the site belongs to. (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for drupal-state:get
<code>-o, --org string</code>	Name or ID of the organization that the catalog belongs to. (required)
<code>-s, --server string</code>	management server endpoint (required)
<code>--state_key string</code>	The state key, for example "system.cron_last". (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic drupal-state:set

Set a state key value.

Synopsis

Can set a new state value or update an already existing key-value.

```
apic drupal-state:set --mode portaladmin [flags]
```

Options

<code>-c, --catalog string</code>	Name or ID of the catalog that the site belongs to. (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for drupal-state:set
<code>--input_format string</code>	The input format of the value for the state key. Values: string, integer, float, boolean, json, yaml. [default: auto]
<code>-o, --org string</code>	Name or ID of the organization that the catalog belongs to. (required)
<code>-s, --server string</code>	management server endpoint (required)
<code>--state_key string</code>	The state key, for example "system.cron_last". (required)
<code>--state_value string</code>	The value to assign to the state key. (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic drupal-state

Drupal State operations

Synopsis

Drupal State operations

```
apic drupal-state --mode portaladmin [flags]
```

Options

<code>-h, --help</code>	Help for drupal-state
-------------------------	-----------------------

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic drupal-state:delete

Delete the State key.

Synopsis

Delete the specific state key.

```
apic drupal-state:delete --mode portaladmin [flags]
```

Options

<code>-c, --catalog string</code>	Name or ID of the catalog that the site belongs to. (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for drupal-state:delete
<code>-o, --org string</code>	Name or ID of the organization that the catalog belongs to. (required)
<code>-s, --server string</code>	management server endpoint (required)
<code>--state_key string</code>	The state key, for example "system.cron_last". (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic drupal-state:get

Get the State key

Synopsis

Get the State key value.

```
apic drupal-state:get --mode portaladmin [flags]
```

Options

<code>-c, --catalog string</code>	Name or ID of the catalog that the site belongs to. (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for drupal-state:get
<code>-o, --org string</code>	Name or ID of the organization that the catalog belongs to. (required)
<code>-s, --server string</code>	management server endpoint (required)
<code>--state_key string</code>	The state key, for example "system.cron_last". (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic drupal-state:set

Set a state key value.

Synopsis

Can set a new state value or update an already existing key-value.

```
apic drupal-state:set --mode portaladmin [flags]
```

Options

<code>-c, --catalog string</code>	Name or ID of the catalog that the site belongs to. (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for drupal-state:set
<code>--input_format string</code>	The input format of the value for the state key. Values: string, integer, float, boolean, json, yaml. [default: auto]
<code>-o, --org string</code>	Name or ID of the organization that the catalog belongs to. (required)
<code>-s, --server string</code>	management server endpoint (required)
<code>--state_key string</code>	The state key, for example "system.cron_last". (required)
<code>--state_value string</code>	The value to assign to the state key. (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic entity

Entity operations

Synopsis

Entity operations

```
apic entity --mode portaladmin [flags]
```

Options

`-h, --help` Help for entity

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic entity:count

Shows a count of entities from a site.

Synopsis

Show a count of entities of the provided org and catalog.

```
apic entity:count --mode portaladmin [flags]
```

Options

<code>-c, --catalog string</code>	Name or ID of the catalog that the site belongs to. (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for entity:count
<code>-o, --org string</code>	Name or ID of the organization that the catalog belongs to. (required)
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic export-entity

Export Entity operations

Synopsis

Export Entity operations

```
apic export-entity --mode portaladmin [flags]
```

Options

```
-c, --catalog string      Name or ID of the catalog that the site belongs to. (required)
--format string          Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help               Help for export-entity
-o, --org string         Name or ID of the organization that the catalog belongs to. (required)
-s, --server string      management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license        Accept the license for API Connect
--debug                 Enable debug output
--debug-output string   Write debug output to file
--live-help             Enable or disable tracking of limited usage information
-m, --mode string       Toolkit operation mode (default "apim")
```

apic export-entity:add-content

Add content to an export entity

Synopsis

Add content to an existing export entity. Provide the content type and IDs that you wish to add to this export entity.

```
apic export-entity:add-content --mode portaladmin [flags]
```

Options

```
-c, --catalog string      Name or ID of the catalog that the site belongs to. (required)
--entity_ids string      A comma separated list of entity ids.
--entity_type string     Type of entity you want to perform this operation on. To find out entity/content types see
the content list-types route. (required)
--export_entity_id string ID of the export entity (required)
--format string          Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults
to yaml.
-h, --help               Help for export-entity:add-content
-o, --org string         Name or ID of the organization that the catalog belongs to. (required)
-s, --server string      management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license        Accept the license for API Connect
--debug                 Enable debug output
--debug-output string   Write debug output to file
--live-help             Enable or disable tracking of limited usage information
-m, --mode string       Toolkit operation mode (default "apim")
```

apic export-entity:create

Create an export entity

Synopsis

Create a new export entity. This export entity can be populated with content which can subsequently be exported.

```
apic export-entity:create --mode portaladmin [flags]
```

Options

```
-c, --catalog string      Name or ID of the catalog that the site belongs to. (required)
--export_entity_name string name of the export entity
--format string          Output format. One of [json yaml octet-stream go-template=... go-template-file=...],
defaults to yaml.
-h, --help               Help for export-entity:create
-o, --org string         Name or ID of the organization that the catalog belongs to. (required)
-s, --server string      management server endpoint (required)
```

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic export-entity:delete-launch-export

If running, cancels a export entity launch export task.

Synopsis

If running, cancels a export entity launch export task and deletes any related artifacts that have been generated.

```
apic export-entity:delete-launch-export --mode portaladmin [flags]
```

Options

<code>-c, --catalog string</code>	Name or ID of the catalog that the site belongs to. (required)
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for export-entity:delete-launch-export
<code>-o, --org string</code>	Name or ID of the organization that the catalog belongs to. (required)
<code>-s, --server string</code>	management server endpoint (required)
<code>--task_id string</code>	ID of the task created on the queue. (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic export-entity:delete

Delete an export entity

Synopsis

Delete an export entity by its ID.

```
apic export-entity:delete --mode portaladmin [flags]
```

Options

<code>-c, --catalog string</code>	Name or ID of the catalog that the site belongs to. (required)
<code>--export_entity_id string</code>	ID of the export entity (required)
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for export-entity:delete
<code>-o, --org string</code>	Name or ID of the organization that the catalog belongs to. (required)
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic export-entity:get-launch-export-status

Returns information about the status of this task.

Synopsis

Returns information related to the task id that is provided in the arguments.

```
apic export-entity:get-launch-export-status --mode portaladmin [flags]
```

Options

<code>-c, --catalog string</code>	Name or ID of the catalog that the site belongs to. (required)
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for export-entity:get-launch-export
<code>-o, --org string</code>	Name or ID of the organization that the catalog belongs to. (required)
<code>-s, --server string</code>	management server endpoint (required)
<code>--task_id string</code>	ID of the task created on the queue. (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic export-entity:get-launch-export

When ready, streams a content export artifact generated from an export entity.

Synopsis

When ready, streams a content export artifact generated from an export entity back to the related task id that is provided in the arguments.

```
apic export-entity:get-launch-export --mode portaladmin [flags]
```

Options

<code>-c, --catalog string</code>	Name or ID of the catalog that the site belongs to. (required)
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for export-entity:get-launch-export
<code>-o, --org string</code>	Name or ID of the organization that the catalog belongs to. (required)
<code>-s, --server string</code>	management server endpoint (required)
<code>--task_id string</code>	ID of the task created on the queue. (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic export-entity:get

Get an export entity

Synopsis

Get an export entity by its ID, which will list the content that will be exported as part of this export entity.

```
apic export-entity:get --mode portaladmin [flags]
```

Options

<code>-c, --catalog string</code>	Name or ID of the catalog that the site belongs to. (required)
<code>--export_entity_id string</code>	ID of the export entity (required)
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for export-entity:get
<code>-o, --org string</code>	Name or ID of the organization that the catalog belongs to. (required)
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic export-entity:launch

Launch a export entity

Synopsis

Launch an export entity which will create an export tgz of all the entities contained in the export. If called via the toolkit CLI, it will automatically poll the response every 30 seconds up to 25 minutes.

```
apic export-entity:launch --mode portaladmin [flags]
```

Options

<code>-c, --catalog string</code>	Name or ID of the catalog that the site belongs to. (required)
<code>--export_entity_id string</code>	ID of the export entity (required)
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for export-entity:launch
<code>--no-poll</code>	Do not poll the created task and just return the task ID
<code>-o, --org string</code>	Name or ID of the organization that the catalog belongs to. (required)
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic export-entity:list

List export entities

Synopsis

List export entities within your Developer Portal. Export Entities contain a defined list of content to be exported when launched.

```
apic export-entity:list --mode portaladmin [flags]
```

Options

<code>-c, --catalog string</code>	Name or ID of the catalog that the site belongs to. (required)
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for export-entity:list
<code>-o, --org string</code>	Name or ID of the organization that the catalog belongs to. (required)
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic export-entity:remove-content

Remove content from an export entity

Synopsis

Remove content from an export entity. Provide the content type and IDs that you wish to remove from this export entity.

```
apic export-entity:remove-content --mode portaladmin [flags]
```

Options

<code>-c, --catalog string</code>	Name or ID of the catalog that the site belongs to. (required)
<code>--entity_ids string</code>	A comma separated list of entity ids.
<code>--entity_type string</code>	Type of entity you want to perform this operation on. To find out entity/content types see the content list-types route. (required)
<code>--export_entity_id string</code>	ID of the export entity (required)
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for export-entity:remove-content
<code>-o, --org string</code>	Name or ID of the organization that the catalog belongs to. (required)
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic factory-reset

Factory Reset operations

Synopsis

Factory Reset operations

```
apic factory-reset --mode portaladmin [flags]
```

Options

```
-h, --help Help for factory-reset
```

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic factory-reset:delete

Factory resets the Developer Portal.

Synopsis

Performs a factory reset of the Developer Portal, deleting the portal service and all portal sites. WARNING: This command is irreversible - please ensure you have backups configured.

```
apic factory-reset:delete --mode portaladmin [flags]
```

Options

<code>--execute_reset string</code>	Set to true to trigger the Developer Portal reset
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for factory-reset:delete
<code>--portal_service_endpoint string</code>	The URL endpoint of the portal service (required)
<code>-s, --server string</code>	Management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic forums

Forums operations

Synopsis

Forums operations

```
apic forums --mode portaladmin [flags]
```

Options

```
-h, --help Help for forums
```

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic forums:disable

Disable the forum module for a given site

Synopsis

Removes all forums vocabulary taxonomy terms before disabling the forum module for a given site.

```
apic forums:disable --mode portaladmin [flags]
```

Options

<code>-c, --catalog string</code>	Name or ID of the catalog that the site belongs to. (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for forums:disable
<code>-o, --org string</code>	Name or ID of the organization that the catalog belongs to. (required)
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic forums:enable

Enable the forum module for a given site

Synopsis

Enables the forum module for a given site.

```
apic forums:enable --mode portaladmin [flags]
```

Options

<code>-c, --catalog string</code>	Name or ID of the catalog that the site belongs to. (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for forums:enable
<code>-o, --org string</code>	Name or ID of the organization that the catalog belongs to. (required)
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic ip-security-enabled

IP Security Enabled operations.

Synopsis

IP Security Enabled operations. Toggle the IP security on your Developer Portal between enabled and disabled. IP security is enabled by default.

```
apic ip-security-enabled --mode portaladmin [flags]
```

Options

`-h, --help` Help for ip-security-enabled

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic ip-security-enabled:update

Enable or disable IP security functionality within the Developer Portal.

Synopsis

Enable or disable IP security functionality within the Developer Portal. IP security is enabled by default.

`apic ip-security-enabled:update --mode portaladmin [flags]`

Options

<code>--enabled string</code>	Set to true or false to enable or disable IP security (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for ip-security-enabled:update
<code>--portal_service_name string</code>	The name of the portal service (required)
<code>-s, --server string</code>	Management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic licenses

Review the license for API Connect

Synopsis

Review the license for API Connect

`apic licenses --mode portaladmin [flags]`

Options

<code>-h, --help</code>	Help for licenses
<code>--non-ibm-license</code>	Display the non IBM license files.
<code>--notices</code>	Display the notices file

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic maintenance

Maintenance operations

Synopsis

Maintenance operations

`apic maintenance --mode portaladmin [flags]`

Options

`-h, --help` Help for maintenance

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic maintenance:disable

Disables maintenance mode for the given Developer Portal.

Synopsis

Disables maintenance mode on the Developer Portal installed within this org and catalog.

```
apic maintenance:disable --mode portaladmin [flags]
```

Options

<code>-c, --catalog string</code>	Name or ID of the catalog that the site belongs to. (required)
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for maintenance:disable
<code>-o, --org string</code>	Name or ID of the organization that the catalog belongs to. (required)
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic maintenance:enable

Enables maintenance mode for the given Developer Portal.

Synopsis

Enables maintenance mode on the Developer Portal installed within this org and catalog.

```
apic maintenance:enable --mode portaladmin [flags]
```

Options

<code>-c, --catalog string</code>	Name or ID of the catalog that the site belongs to. (required)
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for maintenance:enable
<code>-o, --org string</code>	Name or ID of the organization that the catalog belongs to. (required)
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic maintenance:rebuild-node-access

Rebuilds the node access table for a Developer Portal.

Synopsis

Rebuilds the node access table for a Developer Portal, which ensures the correct users can access particular content.

```
apic maintenance:rebuild-node-access --mode portaladmin [flags]
```

Options

<code>-c, --catalog string</code>	Name or ID of the catalog that the site belongs to. (required)
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for maintenance:rebuild-node-access
<code>-o, --org string</code>	Name or ID of the organization that the catalog belongs to. (required)
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic maintenance:search-api-index-rebuild

Rebuilds and reindexes the search API index for a Developer Portal.

Synopsis

Rebuilds and reindexes the search API index for a Developer Portal. NOTE: this command triggers the reindex in the background, and reindexing can take a long time. You can track the index status with `maintenance:search-api-index-status`

```
apic maintenance:search-api-index-rebuild --mode portaladmin [flags]
```

Options

<code>-c, --catalog string</code>	Name or ID of the catalog that the site belongs to. (required)
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for maintenance:search-api-index-rebuild
<code>-o, --org string</code>	Name or ID of the organization that the catalog belongs to. (required)
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic maintenance:search-api-index-status

Prints the search API index status for a Developer Portal.

Synopsis

Prints the search API index status for a Developer Portal.

```
apic maintenance:search-api-index-status --mode portaladmin [flags]
```

Options

<code>-c, --catalog string</code>	Name or ID of the catalog that the site belongs to. (required)
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for maintenance:search-api-index-status
<code>-o, --org string</code>	Name or ID of the organization that the catalog belongs to. (required)
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic maintenance:status

Gets the maintenance mode for the given Developer Portal.

Synopsis

Gets maintenance mode on the Developer Portal installed within this org and catalog.

```
apic maintenance:status --mode portaladmin [flags]
```

Options

<code>-c, --catalog string</code>	Name or ID of the catalog that the site belongs to. (required)
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for maintenance:status
<code>-o, --org string</code>	Name or ID of the organization that the catalog belongs to. (required)
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic memcache

Memcache operations

Synopsis

Memcache operations

```
apic memcache --mode portaladmin [flags]
```

Options

<code>-h, --help</code>	Help for memcache
-------------------------	-------------------

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic memcache:disable

Disables memcache on a specific Developer Portal site.

Synopsis

Disables memcache on a specific Developer Portal site. This sets Drupal to use the database as it's cache.

```
apic memcache:disable --mode portaladmin [flags]
```

Options

<code>-c, --catalog string</code>	Name or ID of the catalog that the site belongs to. (required)
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for memcache:disable
<code>-o, --org string</code>	Name or ID of the organization that the catalog belongs to. (required)
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic memcache:enable

Enables memcache on a specific Developer Portal site.

Synopsis

Enables memcache on a specific Developer Portal site. This sets Drupal to use RAM for it's cache.

```
apic memcache:enable --mode portaladmin [flags]
```

Options

<code>-c, --catalog string</code>	Name or ID of the catalog that the site belongs to. (required)
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for memcache:enable
<code>-o, --org string</code>	Name or ID of the organization that the catalog belongs to. (required)
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic memcache:get

Gets the memcache enabled status on a specific Developer Portal site.

Synopsis

Gets the memcache enabled status on a specific Developer Portal site.

```
apic memcache:get --mode portaladmin [flags]
```

Options

<code>-c, --catalog string</code>	Name or ID of the catalog that the site belongs to. (required)
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for memcache:get
<code>-o, --org string</code>	Name or ID of the organization that the catalog belongs to. (required)
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic modules

Modules operations

Synopsis

Modules operations

```
apic modules --mode portaladmin [flags]
```

Options

<code>-c, --catalog string</code>	Name or ID of the catalog that the site belongs to. (required)
<code>--core</code>	Filter out extensions that are not in drupal core.
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for modules
<code>--no-core</code>	Filter out extensions that are provided by drupal core.
<code>-o, --org string</code>	Name or ID of the organization that the catalog belongs to. (required)
<code>--package string</code>	Filter by project packages. You can use multiple comma separated values.
<code>-s, --server string</code>	management server endpoint (required)
<code>--status string</code>	Filter by extension status. Choices _ enabled, disabled and/or 'not installed'. You can use multiple comma separated values.

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic modules:delete

Deletes one or more modules.

Synopsis

Deletes one or more modules. The provided list of modules must be comma separated.

```
apic modules:delete --mode portaladmin [flags]
```

Options

<code>-c, --catalog string</code>	Name or ID of the catalog that the site belongs to. (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for modules:delete
<code>--modules string</code>	A list of modules separated by a comma. (required)
<code>-o, --org string</code>	Name or ID of the organization that the catalog belongs to. (required)
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic modules:disable

Disable one or more modules and their dependent modules.

Synopsis

Disable one or more modules and their dependent modules. The provided list of modules must be comma separated.

```
apic modules:disable --mode portaladmin [flags]
```

Options

<code>-c, --catalog string</code>	Name or ID of the catalog that the site belongs to. (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for modules:disable
<code>--modules string</code>	A list of modules separated by a comma. (required)
<code>-o, --org string</code>	Name or ID of the organization that the catalog belongs to. (required)
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic modules:enable

Enable one or more module.

Synopsis

Enable one or more module by providing a comma separated list.

```
apic modules:enable --mode portaladmin [flags]
```

Options

<code>-c, --catalog string</code>	Name or ID of the catalog that the site belongs to. (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for modules:enable
<code>--modules string</code>	A list of modules separated by a comma. (required)
<code>-o, --org string</code>	Name or ID of the organization that the catalog belongs to. (required)
<code>--resolve-dependencies</code>	Attempt to download any missing dependencies. At the moment, only works when the module name is the same as the project name.
<code>-s, --server string</code>	management server endpoint (required)
<code>--skip</code>	Skip automatic downloading of libraries (c.f. devel).

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic modules:list

Shows a list of available modules.

Synopsis

Show a list of modules for the portal of the provided org and catalog.

```
apic modules:list --mode portaladmin [flags]
```

Options

<code>-c, --catalog string</code>	Name or ID of the catalog that the site belongs to. (required)
<code>--core</code>	Filter out extensions that are not in drupal core.
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for modules:list
<code>--no-core</code>	Filter out extensions that are provided by drupal core.
<code>-o, --org string</code>	Name or ID of the organization that the catalog belongs to. (required)
<code>--package string</code>	Filter by project packages. You can use multiple comma separated values.
<code>-s, --server string</code>	management server endpoint (required)
<code>--status string</code>	Filter by extension status. Choices _ enabled, disabled and/or 'not installed'. You can use multiple comma separated values.

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic php-memory

Php Memory operations

Synopsis

Php Memory operations

```
apic php-memory --mode portaladmin [flags]
```

Options

<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for php-memory
<code>--portal_service_name string</code>	The name of the portal service (required)
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic php-memory:list

List the PHP memory limit on the platform.

Synopsis

Lists the PHP memory_limit setting on the portal platform.

```
apic php-memory:list --mode portaladmin [flags]
```

Options

<code>--format</code> string	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for php-memory:list
<code>--portal_service_name</code> string	The name of the portal service (required)
<code>-s, --server</code> string	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output</code> string	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode</code> string	Toolkit operation mode (default "apim")

apic php-memory:update

Set the PHP memory limit on the portal platform.

Synopsis

Sets the PHP memory limit on the portal platform for both admin and web containers

```
apic php-memory:update --mode portaladmin [flags]
```

Options

<code>--format</code> string	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for php-memory:update
<code>--memory_value</code> string	The memory value in megabytes (mb) (required)
<code>--portal_service_name</code> string	The name of the portal service (required)
<code>-s, --server</code> string	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output</code> string	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode</code> string	Toolkit operation mode (default "apim")

apic platforms

Platforms operations

Synopsis

Platforms operations

```
apic platforms --mode portaladmin [flags]
```

Options

<code>--format</code> string	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for platforms
<code>--portal_service_name</code> string	The name of the portal service (required)
<code>-s, --server</code> string	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output</code> string	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode</code> string	Toolkit operation mode (default "apim")

apic platforms:list

List the platforms present on the portal service.

Synopsis

Lists all the platforms that are currently present on the Portal service.

```
apic platforms:list --mode portaladmin [flags]
```

Options

<code>--format</code> string	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for platforms:list
<code>--portal_service_name</code> string	The name of the portal service (required)
<code>-s, --server</code> string	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output</code> string	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode</code> string	Toolkit operation mode (default "apim")

apic product

Product operations

Synopsis

Product operations

```
apic product --mode portaladmin [flags]
```

Options

<code>-c, --catalog</code> string	Name or ID of the catalog that the site belongs to. (required)
<code>--format</code> string	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for product
<code>-o, --org</code> string	Name or ID of the organization that the catalog belongs to. (required)
<code>-s, --server</code> string	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output</code> string	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode</code> string	Toolkit operation mode (default "apim")

apic product:add-attachment

Add an attachment for the given product.

Synopsis

Add an attachment for a product within the developer portal of the provided org and catalog. A product can hold 10 attachments. The id or name:version of a specific product needs to be provided. e.g. 'id-of-product-called-example-3' or 'example:3.0.0'.

```
apic product:add-attachment --mode portaladmin [flags]
```

Options

<code>--attachment_description</code> string	A description of the attachment to be displayed to users.
<code>--attachment_name</code> string	The name given to the attachment once it has been uploaded e.g. my-file.txt (required)
<code>-c, --catalog</code> string	Name or ID of the catalog that the site belongs to. (required)
<code>--format</code> string	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for product:add-attachment
<code>-o, --org</code> string	Name or ID of the organization that the catalog belongs to. (required)
<code>-s, --server</code> string	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic product:add-tag

Add a tag for the given product.

Synopsis

Add a tag for a product within the developer portal of the provided org and catalog. The id or name:version of a specific product needs to be provided. e.g. 'id-of-product-called-example-3' or 'example:3.0.0'.

```
apic product:add-tag --mode portaladmin [flags]
```

Options

<code>-c, --catalog string</code>	Name or ID of the catalog that the site belongs to. (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for product:add-tag
<code>-o, --org string</code>	Name or ID of the organization that the catalog belongs to. (required)
<code>-s, --server string</code>	management server endpoint (required)
<code>--tag_name string</code>	The tag name e.g. top_level_element/next_level_element (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic product:get

Get a specific product from a developer portal.

Synopsis

Get a specific product from the developer portal of the provided org and catalog. The id or name:version of a specific api needs to be provided. e.g. 'id-of-api-called-example-3' or 'example:3.0.0'.

```
apic product:get --mode portaladmin [flags]
```

Options

<code>-c, --catalog string</code>	Name or ID of the catalog that the site belongs to. (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for product:get
<code>-o, --org string</code>	Name or ID of the organization that the catalog belongs to. (required)
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic product:get-document

Get a specific entire product document from a portal.

Synopsis

Get a specific entire product document from the portal of the provided organization and catalog. The id or name:version of a specific api needs to be provided. For example, 'id-of-api-called-example-3' or 'example:3.0.0'.

```
apic product:get-document --mode portaladmin [flags]
```

Options

<code>-c, --catalog string</code>	Name or ID of the catalog that the site belongs to. (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for product:get-document
<code>-o, --org string</code>	Name or ID of the organization that the catalog belongs to. (required)
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic product:list

Shows a list of products from a site.

Synopsis

Show a list of products of the provided org and catalog.

```
apic product:list --mode portaladmin [flags]
```

Options

<code>-c, --catalog string</code>	Name or ID of the catalog that the site belongs to. (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for product:list
<code>-o, --org string</code>	Name or ID of the organization that the catalog belongs to. (required)
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic product:set-icon

Set an icon image for the given product.

Synopsis

Set an icon image for a product within the developer portal of the provided org and catalog. The existing icon will be overwritten. The id or name:version of a specific product needs to be provided. e.g. 'id-of-product-called-example-3' or 'example:3.0.0'.

```
apic product:set-icon --mode portaladmin [flags]
```

Options

<code>-c, --catalog string</code>	Name or ID of the catalog that the site belongs to. (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for product:set-icon
<code>--icon_description string</code>	A description of the icon to be displayed to users. Used as alt text for the image. (required)
<code>-o, --org string</code>	Name or ID of the organization that the catalog belongs to. (required)
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic queue

Queue operations

Synopsis

Queue operations

```
apic queue --mode portaladmin [flags]
```

Options

<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for queue
<code>--portal_service_name string</code>	The name of the portal service (required)
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic queue:get

Shows queued and locked platform related tasks for a Developer Portal.

Synopsis

Shows queued and locked platform related tasks for a Developer Portal, including Developer Portal creates, restores, upgrades, snapshots, crons etc.

```
apic queue:get --mode portaladmin [flags]
```

Options

<code>-c, --catalog string</code>	Name or ID of the catalog that the site belongs to. (required)
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for queue:get
<code>-o, --org string</code>	Name or ID of the organization that the catalog belongs to. (required)
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic queue:list

Shows queued and locked platform related tasks across all Developer Portals.

Synopsis

Shows queued and locked platform related tasks across all Developer Portal, including Developer Portal creates, restores, upgrades, snapshots, crons etc.

```
apic queue:list --mode portaladmin [flags]
```

Options

<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for queue:list
<code>--portal_service_name string</code>	The name of the portal service (required)
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic role

Role operations

Synopsis

Role operations

```
apic role --mode portaladmin [flags]
```

Options

<code>-c, --catalog string</code>	Name or ID of the catalog that the site belongs to. (required)
<code>--filter_by_permission string</code>	Limits the list of roles to only those that have been assigned the specified permission. May not be specified if a role argument is provided.
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for role
<code>-o, --org string</code>	Name or ID of the organization that the catalog belongs to. (required)
<code>--role string</code>	The name of the Drupal User Role.
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic role:add-permission

Grant specified permission(s) to a role.

Synopsis

Grant specified permission(s) to a role.

```
apic role:add-permission --mode portaladmin [flags]
```

Possible Usages

```
apic role:add-permission --mode portaladmin [flags] ROLE
```

Options

<code>-c, --catalog string</code>	Name or ID of the catalog that the site belongs to. (required)
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-o, --org string</code>	Name or ID of the organization that the catalog belongs to. (required)
<code>--permissions string</code>	The list of permission to grant, delimited by commas. (required)
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic role:create

Create a new role

Synopsis

Create a new role

```
apic role:create --mode portaladmin [flags]
```

Possible Usages

```
apic role:create --mode portaladmin [flags]
```

Options

<code>-c, --catalog string</code>	Name or ID of the catalog that the site belongs to. (required)
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>--human_readable_name string</code>	A descriptive name for the role. (required)
<code>--machine_name string</code>	The symbolic machine name for the role. (required)
<code>-o, --org string</code>	Name or ID of the organization that the catalog belongs to. (required)
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic role:delete

Delete a role

Synopsis

Delete a role

```
apic role:delete --mode portaladmin [flags]
```

Possible Usages

```
apic role:delete --mode portaladmin [flags] ROLE
```

Options

<code>-c, --catalog string</code>	Name or ID of the catalog that the site belongs to. (required)
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-o, --org string</code>	Name or ID of the organization that the catalog belongs to. (required)
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic role:get

Get a role defined on the site.

Synopsis

Gets a Drupal User Role defined on the site and all the permissions it has been granted

```
apic role:get --mode portaladmin [flags]
```

Possible Usages

```
apic role:get --mode portaladmin [flags] ROLE
```

Options

<code>-c, --catalog string</code>	Name or ID of the catalog that the site belongs to. (required)
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.

```
-o, --org string      Name or ID of the organization that the catalog belongs to. (required)
-s, --server string  management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

apic role:list

Display a list of all roles defined on the system. If a role name is provided as an argument, then all of the permissions of that role will be listed. If a permission name is provided as an option, then all of the roles that have been granted that permission will be listed.

Synopsis

Display a list of all roles defined on the system. If a role name is provided as an argument, then all of the permissions of that role will be listed. If a permission name is provided as an option, then all of the roles that have been granted that permission will be listed.

```
apic role:list --mode portaladmin [flags]
```

Possible Usages

```
apic role:list --mode portaladmin [flags]
```

Options

```
-c, --catalog string      Name or ID of the catalog that the site belongs to. (required)
--filter_by_permission string Limits the list of roles to only those that have been assigned the specified permission.
May not be specified if a role argument is provided.
--format string          Output format. One of [json yaml octet-stream go-template=... go-template-file=...],
defaults to yaml.
-o, --org string          Name or ID of the organization that the catalog belongs to. (required)
--role string             The name of the Drupal User Role.
-s, --server string       management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

apic role:remove-permission

Remove specified permission(s) from a role.

Synopsis

Remove specified permission(s) from a role.

```
apic role:remove-permission --mode portaladmin [flags]
```

Possible Usages

```
apic role:remove-permission --mode portaladmin [flags] ROLE
```

Options

```
-c, --catalog string      Name or ID of the catalog that the site belongs to. (required)
--format string          Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
-o, --org string          Name or ID of the organization that the catalog belongs to. (required)
--permissions string     The list of permission to grant, delimited by commas. (required)
-s, --server string       management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
```

```
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic security

Security operations

Synopsis

Security operations

```
apic security --mode portaladmin [flags]
```

Options

```
-h, --help      Help for security
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic security:clear-bans

Clear all user/IP bans for a site.

Synopsis

Clear any existing user/IP bans.

```
apic security:clear-bans --mode portaladmin [flags]
```

Options

```
-c, --catalog string  Name or ID of the catalog that the site belongs to. (required)
--format string      Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for security:clear-bans
-o, --org string     Name or ID of the organization that the catalog belongs to. (required)
-s, --server string  Management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic service-ip-allowlist

Service IP Allowlist operations.

Synopsis

Service IP Allowlist operations. The allowlist service enables specific IPs to be exempt from being blocked by portal security checks, for example, load balancer and proxy IPs.

```
apic service-ip-allowlist --mode portaladmin [flags]
```

Options

```
--format string      Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for service-ip-allowlist
--portal_service_name string The name of the portal service (required)
-s, --server string  Management server endpoint (required)
```

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic service-ip-allowlist:add

Add IP(s) to the allowlist.

Synopsis

Add specific IP(s) to the allowlist.

```
apic service-ip-allowlist:add --mode portaladmin [flags]
```

Options

<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for service-ip-allowlist:add
<code>--ips string</code>	Comma separated list of IPs (required)
<code>--portal_service_name string</code>	The name of the portal service (required)
<code>-s, --server string</code>	Management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic service-ip-allowlist:delete

Delete all IPs from the allowlist.

Synopsis

Delete all of the IPs from the allowlist.

```
apic service-ip-allowlist:delete --mode portaladmin [flags]
```

Options

<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for service-ip-allowlist:delete
<code>--portal_service_name string</code>	The name of the portal service (required)
<code>-s, --server string</code>	Management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic service-ip-allowlist:list

List IP(s) currently on the allowlist.

Synopsis

List all of the IP(s) that are currently on the allowlist.

```
apic service-ip-allowlist:list --mode portaladmin [flags]
```

Options

<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for service-ip-allowlist:list

```
--portal_service_name string  The name of the portal service (required)
-s, --server string           Management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

apic service-ip-allowlist:remove

Remove specific IP(s) from the allowlist.

Synopsis

Remove one or more specific IP(s) from the allowlist.

```
apic service-ip-allowlist:remove --mode portaladmin [flags]
```

Options

```
--format string  Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help       Help for service-ip-allowlist:remove
--ips string     Comma separated list of IPs (required)
--portal_service_name string The name of the portal service (required)
-s, --server string Management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

apic site

Site operations

Synopsis

Site operations

```
apic site --mode portaladmin [flags]
```

Options

```
-h, --help  Help for site
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

apic site:cache-rebuild

Rebuilds the cache of a specific portal site.

Synopsis

Clears the existing cache and rebuilds a new one for a specific portal site.

```
apic site:cache-rebuild --mode portaladmin [flags]
```

Options

<code>-c, --catalog string</code>	Name or ID of the catalog that the site belongs to. (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for site:cache-rebuild
<code>-o, --org string</code>	Name or ID of the organization that the catalog belongs to. (required)
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic site:check

Run a platform check against a portal site

Synopsis

Performs filesystem, database and API Manager checks against a portal site. This command is useful when trying to identify platform related problems if you are having issues with your portal site.

```
apic site:check --mode portaladmin [flags]
```

Options

<code>-c, --catalog string</code>	Name or ID of the catalog that the site belongs to. (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for site:check
<code>-o, --org string</code>	Name or ID of the organization that the catalog belongs to. (required)
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic site:create-export

Create a task that exports an archive that contains the entire make-up of a site.

Synopsis

You can create a task to export an archive of the entire make-up of a site. You can then use that archive to quickly and simply override another site's content and configuration to make them identical.

```
apic site:create-export --mode portaladmin [flags]
```

Options

<code>-c, --catalog string</code>	Name or ID of the catalog that the site belongs to. (required)
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for site:create-export
<code>--no-poll</code>	Do not poll the created task and just return the task ID
<code>-o, --org string</code>	Name or ID of the organization that the catalog belongs to. (required)
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic site:create-import

Create a task that imports an archive that contains the make-up of a site.

Synopsis

You can create a task to import an archive of the make-up of a site. You can use the imported archive to quickly and simply override the site config, content and custom modules and themes for the specified site.

```
apic site:create-import --mode portaladmin [flags]
```

Options

<code>-c, --catalog string</code>	Name or ID of the catalog that the site belongs to. (required)
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for site:create-import
<code>--no-poll</code>	Do not poll the created task and just return the task ID
<code>-o, --org string</code>	Name or ID of the organization that the catalog belongs to. (required)
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic site:delete-export

If running, cancels a site export task.

Synopsis

If running, cancels the site export task and deletes any related artifacts that have been generated.

```
apic site:delete-export --mode portaladmin [flags]
```

Options

<code>-c, --catalog string</code>	Name or ID of the catalog that the site belongs to. (required)
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for site:delete-export
<code>-o, --org string</code>	Name or ID of the organization that the catalog belongs to. (required)
<code>-s, --server string</code>	management server endpoint (required)
<code>--task_id string</code>	ID of the task created on the queue. (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic site:delete-import

If running, cancels a site import task.

Synopsis

If running, cancels the site import task and deletes any related artifacts that have been generated.

```
apic site:delete-import --mode portaladmin [flags]
```

Options

<code>-c, --catalog string</code>	Name or ID of the catalog that the site belongs to. (required)
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for site:delete-import
<code>-o, --org string</code>	Name or ID of the organization that the catalog belongs to. (required)
<code>-s, --server string</code>	management server endpoint (required)
<code>--task_id string</code>	ID of the task created on the queue. (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file

```
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic site:get-export-status

Returns information about the status of this task.

Synopsis

Returns information related to the task id that is provided in the arguments.

```
apic site:get-export-status --mode portaladmin [flags]
```

Options

```
-c, --catalog string  Name or ID of the catalog that the site belongs to. (required)
--format string      Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for site:get-export-status
-o, --org string     Name or ID of the organization that the catalog belongs to. (required)
-s, --server string  management server endpoint (required)
--task_id string    ID of the task created on the queue. (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic site:get-export

When ready, streams a site export artifact.

Synopsis

When ready, streams a site export artifact back to the related task id that is provided in the arguments.

```
apic site:get-export --mode portaladmin [flags]
```

Options

```
-c, --catalog string  Name or ID of the catalog that the site belongs to. (required)
--format string      Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for site:get-export
-o, --org string     Name or ID of the organization that the catalog belongs to. (required)
-s, --server string  management server endpoint (required)
--task_id string    ID of the task created on the queue. (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic site:get-import-status

Get the result of the site import task.

Synopsis

Get the result of the site import task. If the import task has completed on the portal system, this command returns the result of the command. If the import task has not completed on the portal system, it returns the current status of the task.

```
apic site:get-import-status --mode portaladmin [flags]
```

Options

```
-c, --catalog string  Name or ID of the catalog that the site belongs to. (required)
--format string      Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
```

```
-h, --help           Help for site:get-import-status
-o, --org string     Name or ID of the organization that the catalog belongs to. (required)
-s, --server string  management server endpoint (required)
--task_id string    ID of the task created on the queue. (required)
```

Options inherited from parent commands

```
--accept-license    Accept the license for API Connect
--debug            Enable debug output
--debug-output string Write debug output to file
--live-help        Enable or disable tracking of limited usage information
-m, --mode string   Toolkit operation mode (default "apim")
```

apic site:login-link

Gets an admin login link for a specific Portal site.

Synopsis

Returns a one time login link for the Drupal admin account for the site specified by org and catalog parameters

```
apic site:login-link --mode portaladmin [flags]
```

Options

```
-c, --catalog string  Name or ID of the catalog that the site belongs to. (required)
--format string      Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for site:login-link
-o, --org string     Name or ID of the organization that the catalog belongs to. (required)
-s, --server string  management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license    Accept the license for API Connect
--debug            Enable debug output
--debug-output string Write debug output to file
--live-help        Enable or disable tracking of limited usage information
-m, --mode string   Toolkit operation mode (default "apim")
```

apic site:state

Obtain the current state of a portal site.

Synopsis

Returns the state of a portal site. This command is useful as a general health check analysis of the portal site.

```
apic site:state --mode portaladmin [flags]
```

Options

```
-c, --catalog string  Name or ID of the catalog that the site belongs to. (required)
--format string      Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for site:state
-o, --org string     Name or ID of the organization that the catalog belongs to. (required)
-s, --server string  management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license    Accept the license for API Connect
--debug            Enable debug output
--debug-output string Write debug output to file
--live-help        Enable or disable tracking of limited usage information
-m, --mode string   Toolkit operation mode (default "apim")
```

apic site-config

Site Config operations

Synopsis

Site Config operations

```
apic site-config --mode portaladmin [flags]
```

Options

```
-h, --help Help for site-config
```

Options inherited from parent commands

```
--accept-license Accept the license for API Connect
--debug Enable debug output
--debug-output string Write debug output to file
--live-help Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic site-config:create-export

Create a task that exports an archive that contains the configuration of a site.

Synopsis

You can create a task to export an archive of the configuration of a site. You can then use that archive to quickly and simply override the configuration on another site.

```
apic site-config:create-export --mode portaladmin [flags]
```

Options

```
-c, --catalog string Name or ID of the catalog that the site belongs to. (required)
--format string Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help Help for site-config:create-export
--no-poll Do not poll the created task and just return the task ID
-o, --org string Name or ID of the organization that the catalog belongs to. (required)
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license Accept the license for API Connect
--debug Enable debug output
--debug-output string Write debug output to file
--live-help Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic site-config:create-import

Create a task that imports an archive that contains the configuration of a site.

Synopsis

You can create a task to import an archive of the configuration of a site. You can use the imported archive to quickly and simply override the configuration for the specified site.

```
apic site-config:create-import --mode portaladmin [flags]
```

Options

```
-c, --catalog string Name or ID of the catalog that the site belongs to. (required)
--format string Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help Help for site-config:create-import
--no-poll Do not poll the created task and just return the task ID
-o, --org string Name or ID of the organization that the catalog belongs to. (required)
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

```
--accept-license Accept the license for API Connect
--debug Enable debug output
--debug-output string Write debug output to file
--live-help Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic site-config:delete-export

If running, cancels a site configuration export task.

Synopsis

If running, cancels the site configuration export task and deletes any related artifacts that have been generated.

```
apic site-config:delete-export --mode portaladmin [flags]
```

Options

```
-c, --catalog string  Name or ID of the catalog that the site belongs to. (required)
--format string      Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for site-config:delete-export
-o, --org string      Name or ID of the organization that the catalog belongs to. (required)
-s, --server string  management server endpoint (required)
--task_id string     ID of the task created on the queue. (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic site-config:delete-import

Cancels a running site configuration import task.

Synopsis

Cancels the site configuration import task and deletes any generated artifacts.

```
apic site-config:delete-import --mode portaladmin [flags]
```

Options

```
-c, --catalog string  Name or ID of the catalog that the site belongs to. (required)
--format string      Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for site-config:delete-import
-o, --org string      Name or ID of the organization that the catalog belongs to. (required)
-s, --server string  management server endpoint (required)
--task_id string     ID of the task created on the queue. (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic site-config:get-export

When ready, streams a site configuration export artifact.

Synopsis

When ready, streams a site configuration export artifact back to the related task id that is provided in the arguments.

```
apic site-config:get-export --mode portaladmin [flags]
```

Options

```
-c, --catalog string  Name or ID of the catalog that the site belongs to. (required)
--format string      Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for site-config:get-export
-o, --org string      Name or ID of the organization that the catalog belongs to. (required)
-s, --server string  management server endpoint (required)
--task_id string     ID of the task created on the queue. (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
```

```
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic site-config:get-export-status

Returns information about the status of this task.

Synopsis

Returns information related to the task id that is provided in the arguments.

```
apic site-config:get-export-status --mode portaladmin [flags]
```

Options

```
-c, --catalog string  Name or ID of the catalog that the site belongs to. (required)
--format string      Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for site-config:get-export-status
-o, --org string     Name or ID of the organization that the catalog belongs to. (required)
-s, --server string  management server endpoint (required)
--task_id string    ID of the task created on the queue. (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic site-config:get-import-status

Get the result of the site configuration import task.

Synopsis

Get the result of the site configuration import task. If the import task has completed on the portal system, this command returns the result of the command. If the import task has not completed on the portal system, it returns the current status of the task.

```
apic site-config:get-import-status --mode portaladmin [flags]
```

Options

```
-c, --catalog string  Name or ID of the catalog that the site belongs to. (required)
--format string      Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for site-config:get-import-status
-o, --org string     Name or ID of the organization that the catalog belongs to. (required)
-s, --server string  management server endpoint (required)
--task_id string    ID of the task created on the queue. (required)
```

Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic sites

Sites operations

Synopsis

Sites operations

```
apic sites --mode portaladmin [flags]
```

Options

```
--format string  Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
```

-h, --help	Help for sites
--portal_service_name string	The name of the portal service (required)
-s, --server string	management server endpoint (required)

Options inherited from parent commands

--accept-license	Accept the license for API Connect
--debug	Enable debug output
--debug-output string	Write debug output to file
--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

apic sites:check

Run a platform check against all portal sites present on a portal service.

Synopsis

Performs filesystem, database and API Manager checks against all portal sites on a given portal service. This command is useful when trying to identify platform related problems on one of more of your portal sites.

```
apic sites:check --mode portaladmin [flags]
```

Options

--format string	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help	Help for sites:check
--portal_service_name string	The name of the portal service (required)
-s, --server string	management server endpoint (required)

Options inherited from parent commands

--accept-license	Accept the license for API Connect
--debug	Enable debug output
--debug-output string	Write debug output to file
--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

apic sites:list

List the sites present on the Portal service.

Synopsis

Lists all the sites that are currently present on the Portal service.

```
apic sites:list --mode portaladmin [flags]
```

Options

--format string	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help	Help for sites:list
--portal_service_name string	The name of the portal service (required)
-s, --server string	management server endpoint (required)

Options inherited from parent commands

--accept-license	Accept the license for API Connect
--debug	Enable debug output
--debug-output string	Write debug output to file
--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

apic sites:reset-upgrade-attempts

Resets the Developer Portal site upgrade attempts.

Synopsis

Resets the Developer Portal site upgrade attempts. Useful when upgrade has been attempted multiple times and has failed.

```
apic sites:reset-upgrade-attempts --mode portaladmin [flags]
```

Options

<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for sites:reset-upgrade-attempts
<code>--portal_service_name string</code>	The name of the portal service (required)
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic themes

Themes operations

Synopsis

Themes operations

```
apic themes --mode portaladmin [flags]
```

Options

<code>-c, --catalog string</code>	Name or ID of the catalog that the site belongs to. (required)
<code>--core</code>	Filter out extensions that are not in drupal core.
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for themes
<code>--no-core</code>	Filter out extensions that are provided by drupal core.
<code>-o, --org string</code>	Name or ID of the organization that the catalog belongs to. (required)
<code>--package string</code>	Filter by project packages. You can use multiple comma separated values.
<code>-s, --server string</code>	management server endpoint (required)
<code>--status string</code>	Filter by extension status. Choices <code>_ enabled, disabled and/or 'not installed'</code> . You can use multiple comma separated values.

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic themes:delete

Deletes one or more themes.

Synopsis

Deletes one or more themes. The provided list of themes must be comma separated.

```
apic themes:delete --mode portaladmin [flags]
```

Options

<code>-c, --catalog string</code>	Name or ID of the catalog that the site belongs to. (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for themes:delete
<code>-o, --org string</code>	Name or ID of the organization that the catalog belongs to. (required)
<code>-s, --server string</code>	management server endpoint (required)
<code>--themes string</code>	A list of themes separated by a comma. (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic themes:disable

Disable one or more themes.

Synopsis

Disable one or more themes and their dependent modules. The provided list of themes must be comma separated.

```
apic themes:disable --mode portaladmin [flags]
```

Options

<code>-c, --catalog string</code>	Name or ID of the catalog that the site belongs to. (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for themes:disable
<code>-o, --org string</code>	Name or ID of the organization that the catalog belongs to. (required)
<code>-s, --server string</code>	management server endpoint (required)
<code>--themes string</code>	A list of themes separated by a comma. (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic themes:enable

Enable one or more theme.

Synopsis

Enable one or more theme by providing a comma separated list.

```
apic themes:enable --mode portaladmin [flags]
```

Options

<code>-c, --catalog string</code>	Name or ID of the catalog that the site belongs to. (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for themes:enable
<code>-o, --org string</code>	Name or ID of the organization that the catalog belongs to. (required)
<code>--resolve-dependencies</code>	Attempt to download any missing dependencies. At the moment, only works when the module name is the same as the project name.
<code>-s, --server string</code>	management server endpoint (required)
<code>--skip</code>	Skip automatic downloading of libraries (c.f. devel).
<code>--themes string</code>	A list of themes separated by a comma. (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic themes:list

Shows a list of available themes.

Synopsis

Show a list of themes for the portal of the provided org and catalog.

```
apic themes:list --mode portaladmin [flags]
```

Options

<code>-c, --catalog string</code>	Name or ID of the catalog that the site belongs to. (required)
<code>--core</code>	Filter out extensions that are not in drupal core.
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for themes:list

<code>--no-core</code>	Filter out extensions that are provided by drupal core.
<code>-o, --org string</code>	Name or ID of the organization that the catalog belongs to. (required)
<code>--package string</code>	Filter by project packages. You can use multiple comma separated values.
<code>-s, --server string</code>	management server endpoint (required)
<code>--status string</code>	Filter by extension status. Choices <code>_ enabled, disabled and/or 'not installed'</code> . You can use multiple comma separated values.

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic themes:set-default

Set a portal's default theme.

Synopsis

Set a portal's default theme. The theme provided must be one that is already enabled.

```
apic themes:set-default --mode portaladmin [flags]
```

Options

<code>-c, --catalog string</code>	Name or ID of the catalog that the site belongs to. (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for themes:set-default
<code>-o, --org string</code>	Name or ID of the organization that the catalog belongs to. (required)
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic twig

Twig operations.

Synopsis

Twig operations.

```
apic twig --mode portaladmin [flags]
```

Options

<code>-h, --help</code>	Help for twig
-------------------------	---------------

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic twig:debug-disable

Disable twig debugging on a specific portal site.

Synopsis

Disable twig debugging on a specific portal site. Twig debugging helps locate twig template issues.

```
apic twig:debug-disable --mode portaladmin [flags]
```

Options

<code>-c, --catalog string</code>	Name or ID of the catalog that the site belongs to. (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for twig:debug-disable
<code>-o, --org string</code>	Name or ID of the organization that the catalog belongs to. (required)
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic twig:debug-enable

Enables twig debugging on a specific portal site.

Synopsis

Enables twig debugging on a specific portal site. Twig debugging helps locate twig template issues.

```
apic twig:debug-enable --mode portaladmin [flags]
```

Options

<code>-c, --catalog string</code>	Name or ID of the catalog that the site belongs to. (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for twig:debug-enable
<code>-o, --org string</code>	Name or ID of the organization that the catalog belongs to. (required)
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic twig:debug-status

Shows the current state of twig debugging on a specific portal site.

Synopsis

View the current state of twig debugging on a specific portal site, if you are unsure whether it is enabled or disabled.

```
apic twig:debug-status --mode portaladmin [flags]
```

Options

<code>-c, --catalog string</code>	Name or ID of the catalog that the site belongs to. (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for twig:debug-status
<code>-o, --org string</code>	Name or ID of the organization that the catalog belongs to. (required)
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic user

User operations

Synopsis

User operations

```
apic user --mode portaladmin [flags]
```

Options

```
-h, --help Help for user
```

Options inherited from parent commands

```
--accept-license Accept the license for API Connect
--debug Enable debug output
--debug-output string Write debug output to file
--live-help Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic user:add-role

Add a singular or multiple roles to the specified Drupal User accounts.

Synopsis

Add a singular or multiple roles to the specified Drupal User accounts. You need to provide either the mail, username, or the UID of the Drupal User account.

```
apic user:add-role --mode portaladmin [flags]
```

Possible Usages

```
apic user:add-role --mode portaladmin [flags]
```

Options

```
-c, --catalog string Name or ID of the Catalog that the site belongs to. (required)
--format string Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
--mail string A comma-separated list of Drupal User Email addresses to perform the action on.
--names string A comma-separated list of names of Drupal Users to perform the action on.
-o, --org string Name or ID of the organization that the catalog belongs to. (required)
--role string The name of the Drupal User Role. (required)
-s, --server string management server endpoint (required)
--uid string A comma-separated list of UIDs of Drupal Users to perform the action on.
```

Options inherited from parent commands

```
--accept-license Accept the license for API Connect
--debug Enable debug output
--debug-output string Write debug output to file
--live-help Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

apic user:block

Block a Developer Portal Drupal User

Synopsis

Block a Developer Portal Drupal User. This will block a Drupal User from being able to login into the Developer Portal. You need to provide the username of the Drupal User.

```
apic user:block --mode portaladmin [flags]
```

Possible Usages

```
apic user:block --mode portaladmin [flags]
```

Options

```
-c, --catalog string Name or ID of the Catalog that the site belongs to. (required)
--format string Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
--names string A comma-separated list of names of Drupal Users to perform the action on.
-o, --org string Name or ID of the organization that the catalog belongs to. (required)
-s, --server string management server endpoint (required)
```

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic user:information

Gets Developer Portal Drupal User information

Synopsis

Gets Developer Portal Drupal User information. You can filter on different fields to obtain a list of users matching your criteria.

```
apic user:information --mode portaladmin [flags]
```

Possible Usages

```
apic user:information --mode portaladmin [flags]
```

Options

<code>--apic-state string</code>	A comma-separated list of APIC states to filter Drupal Users by.
<code>-c, --catalog string</code>	Name or ID of the Catalog that the site belongs to. (required)
<code>--consumer-org string</code>	A comma-separated list of Consumer Org URLs to filter the return by.
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>--limit int32</code>	Limit the amount of results returned.
<code>--login-after string</code>	A date to filter Drupal Users who last logged in after the provided date. Date needs to be given in format of MM-DD-YYY or MM-DD-YY HH:MM:SS
<code>--login-before string</code>	A date to filter Drupal Users who last logged in before the provided date. Date needs to be given in format of MM-DD-YYY or MM-DD-YY HH:MM:SS
<code>--mail string</code>	A comma-separated list of Drupal User Email addresses to perform the action on.
<code>--names string</code>	A comma-separated list of names of Drupal Users to perform the action on.
<code>--offset int32</code>	Offset the results return to aid in Pagination.
<code>-o, --org string</code>	Name or ID of the organization that the catalog belongs to. (required)
<code>--role string</code>	A comma-separated list of Drupal User Roles.
<code>-s, --server string</code>	management server endpoint (required)
<code>--status string</code>	Filter by Drupal User status. Choices are 'active' or 'blocked'.
<code>--uid string</code>	A comma-separated list of UIDs of Drupal Users to perform the action on.

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic user:remove-role

Remove a singular or multiple roles from the specified Drupal User accounts.

Synopsis

Remove a singular or multiple roles from the specified Drupal User accounts. You need to provide either the mail, username, or the UID of the Drupal User account.

```
apic user:remove-role --mode portaladmin [flags]
```

Possible Usages

```
apic user:remove-role --mode portaladmin [flags]
```

Options

<code>-c, --catalog string</code>	Name or ID of the Catalog that the site belongs to. (required)
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>--mail string</code>	A comma-separated list of Drupal User Email addresses to perform the action on.
<code>--names string</code>	A comma-separated list of names of Drupal Users to perform the action on.
<code>-o, --org string</code>	Name or ID of the organization that the catalog belongs to. (required)
<code>--role string</code>	The name of the Drupal User Role. (required)
<code>-s, --server string</code>	management server endpoint (required)
<code>--uid string</code>	A comma-separated list of UIDs of Drupal Users to perform the action on.

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic user:unblock

Unblock a Developer Portal Drupal User

Synopsis

Unblock a Developer Portal Drupal User. This will allow a blocked Drupal User to be able to login into the Developer Portal again. You need to provide the username of the Drupal User.

```
apic user:unblock --mode portaladmin [flags]
```

Possible Usages

```
apic user:unblock --mode portaladmin [flags]
```

Options

<code>-c, --catalog string</code>	Name or ID of the Catalog that the site belongs to. (required)
<code>--format string</code>	Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
<code>--names string</code>	A comma-separated list of names of Drupal Users to perform the action on.
<code>-o, --org string</code>	Name or ID of the organization that the catalog belongs to. (required)
<code>-s, --server string</code>	management server endpoint (required)

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

apic version

Get the APIConnect toolkit version

Synopsis

Get the APIConnect toolkit version

```
apic version --mode portaladmin [flags]
```

Options

```
-h, --help Help for version
```

Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

API Connect REST APIs

The API Connect platform REST APIs provide complete access to the capability of the platform.

The API Connect platform REST APIs can be used for the following actions:

- Automate the administration of the platform.
- Implement scripts and tools to support a continuous integration environment for API development and publishing.
- Manage catalogs of APIs, and their subscribers.

Note: To authenticate with the API Connect Platform REST APIs, [generate an API Key](#) and then exchange it for an access token to use when calling the APIs. You can exchange it for an access token with the following example:

```
curl -v -k -X POST -d '{"api_key": "****", "client_id": "client-id", "client_secret": "client-secret", "grant_type": "api_key"}' -H 'Content-Type: application/json' -H 'Accept: application/json' https://platform-api.{region}.apiconnect.automation.ibm.com/api/token
```

The operations provided in the REST APIs also correspond directly with the commands in the [developer toolkit command-line tool \(CLI\)](#).

You can use the URL to navigate directly to specific APIs and operations in the OpenAPI Explorer Documentation for the API Connect REST APIs. You can also select the APIs for a specific version by using the drop-down menu in the header bar.

For descriptions of the platform APIs, see the [API Connect REST API documentation](#).

Example: Using the platform REST APIs to publish a product containing a SOAP API

Review this sample scenario to see how you can use the API Connect platform REST APIs to publish a product that contains a SOAP API.

This example demonstrates how to format a request to publish the product, and includes sample files that illustrate the product definition, the API definition, and the SOAP API's WSDL description.

Using the Catalogs API

Publish the product using the API Connect platform **Catalogs** API:

- To publish a product to a catalog, use the following syntax:

```
POST catalogs/{org}/{catalog}/publish
```

- To publish a product to a space within a catalog, additionally specify the space with the following syntax:

```
POST catalogs/{org}/{catalog}/{space}/publish
```

The payload in both cases is a multipart, form-encoded body containing three required parts and one optional part:

- (Required) A part named **product** with media type **application/yaml** or **application/json**, containing the yaml or JSON source for the product to be published.
- (Required) One or more occurrences of a part named **openapi** with media type **application/yaml** or **application/json**, containing the YAML or JSON source for each API in the product.
- (Required for SOAP APIs) One or more occurrences of a part named **wsdl** with media type **application/wsdl**, **application/wsdl+xml**, **text/xml**, or **application/zip** containing the WSDL definitions (and referenced XSD files if applicable) associated with the API content.
- (Optional) A part named **gateway_service_urls** with media type **application/yaml** or **application/json** which is a YAML or JSON array of URLs to specify a subset of the configured gateway services within the catalog or space as publish targets. These URLs can be obtained using the following calls:

- For a catalog:

```
GET /api/catalogs/{org}/{catalog}/configured-gateway-services
```

- For a space:

```
GET /spaces/{org}/{catalog}/{space}/configured-gateway-services
```

Within the **product** content, the form of the references to APIs in the **apis** section is significant. Each API reference must use the **name** property instead of the **\$ref** form that may appear in other situations. Here is an example showing a product that refers to the API **globalweather** version **1.0.0** in the correct form:

```
info:
  version: 1.0.0
  title: GlobalWeatherProduct
  name: globalweatherproduct
plans:
  ...
apis:
  globalweather1.0.0:
    name: globalweather:1.0.0
  ...
```

Example publish operation using cURL

This example publishes a product containing a SOAP API to the *Sandbox* catalog of the *onlinebanking* provider organization, using the `curl -F` option to create a set of form-encoded payload parts and the `@` prefix to read the content for each part from a file. Note the part name (**product**, **openapi**, **wsdl**) and the content type of each part given by the **type=** value.

In this example, the access token has been retrieved earlier and placed in an environment variable named **TOKEN**. The command is split onto multiple lines for ease of reading but must be entered as a single line.

Request:

```
curl -v -k
-F "product=@globalweatherproduct_1.0.0.yaml;type=application/yaml"
-F "openapi=@globalweather_1.0.0.yaml;type=application/yaml"
-F "wsdl=@globalweather.wsdl;type=application/wsdl"
-H "Authorization: Bearer $TOKEN"
-H 'Content-Type: multipart/form-data'
-H 'Accept: /*/*' https://dev.apic.example.com/api/catalogs/onlinebanking/sandbox/publish
```

Response:

201 Created

API Connect TLS certificates

Details of all Kubernetes TLS certificate objects that are created and used in a default installation of API Connect.

Overview

TLS is used to secure communications between API Connect pods, subsystems, external services, and users. The TLS certificates that are used by API Connect are created automatically during the installation of API Connect. The certificates are managed by an open source product called [cert-manager](#).

The certificates that are described in this topic all exist as Kubernetes certificate objects in the API Connect namespace where the subsystem that uses the certificate is installed. Run `kubectl get certs -n <namespace>` to see the certificates in your environment. Some of the API Connect Kubernetes certificates are also stored in the management subsystem database. These certificates can be seen in the Cloud Manager UI, in the truststores and keystores of the subsystem default TLS profiles. When the management subsystem `apim` pod is restarted, the certificates in the management database are reloaded from the Kubernetes certificates.

This topic does not cover additional TLS profiles and certificates that API Connect administrators and provider organization owners can create and configure in the Cloud Manager and API Manager UIs. These certificates are stored in the management subsystem database only and do not exist in the Kubernetes environment.

The certificates that are created and used by API Connect are categorized as follows:

- CA certificates - API Connect creates self-signed CA certificates to sign all the API Connect end-entity certificates. The CA certificates are:
 - `ingress-ca` - used by the ingress-issuer. The ingress-ca signs all user-facing and inter-subsystem certificates.
 - `management-ca` - signs all the management intra-subsystem certificates.
 - `portal-ca` - signs all the portal intra-subsystem certificates.
 - `analytics-ca` - signs all the analytics intra-subsystem certificates.

CA certificates have a default duration of 10 years. All the end-entity certificates have a default duration of 2 years.
- Ingress certificates - API Connect creates a self-signed issuer that is called the ingress-issuer. Ingress certificates are the API Connect certificates that are issued by the ingress-issuer. Ingress certificates are divided into two types:
 - Inter-subsystem certificates - certificates that are used for communication between API Connect subsystems, for example between the management subsystem and gateway. By default, communication between most subsystems uses mTLS. From v10.0.5.3, it is possible to use JWT instead of mTLS: [Using JWT instead of mTLS on Kubernetes and OpenShift](#), [Using JWT instead of mTLS on OVA](#).
 - User-facing certificates - certificates that API Connect users see when they interact with the API Connect UIs and REST API.
- Intra-subsystem certificates - certificates that are used between pods in the same subsystem. Intra-subsystem certificates are signed by a subsystem specific CA certificate: `management-ca`, `portal-ca`, `analytics-ca`. The gateway subsystem is a single pod, and has no intra-subsystem certificates.

On OVA deployments, certificate management is done with the `apicup` command. Do not login to your VMs by `ssh` and attempt to modify certificates directly, unless advised by IBM.

Note: On Cloud Pak for Integration, and OpenShift top-level CR deployments, some certificate names are contracted and prefixed with the `APICConnectCluster` instance name. For example, the certificate `management-ca` is called `<apic instance name>-mgmt-ca`.

Customizing certificates

It is possible to customize certificates with ones from your own organization. However it is recommended to customize only the user-facing certificates, which are the certificates that your users see when they access the API Connect UIs, CLI, and the REST API.

All other certificates are used internally between API Connect microservices.

Note: The inter and intra-subsystem certificates use of a self-signed root CA presents no security risk. For internal communications with a limited number of predefined endpoints, use of locally generated self-signed CA certificates can be more secure than external CA certificates, as certificates are only ever issued for the known components and the domain of trust is kept as small as possible.

Renewing certificates

Cert-manager handles the renewal of expired certificates so that the user does not need to monitor or manually renew any of the certificates. However, there are scenarios where the renewal of certificates must be triggered manually. Every API Connect certificate has a corresponding Kubernetes secret object of the same name, deleting this secret triggers cert-manager to re-create the secret with a new TLS certificate. For more information about certificate renewal, see [Renewing TLS certificates](#). Remember: The Kubernetes certificate objects do not contain the TLS certificates themselves, they are pointers to Kubernetes secrets that contain the TLS certificate. See [Key Concepts: Cert-manager, Issuers, and Secrets](#).

For most of the certificates, when they are renewed, the pods that use those certificates are automatically restarted so that they pick up the updated certificate. The minority of certificates that require manual pod restarts after renewal are identified in the reference tables.

If you renew a CA certificate, any end-entity certificates that use this CA certificate must also be renewed. The following command identifies and renews all certificates that are signed by `ingress-ca` in the specified namespace:

```
kubectl get secrets -n <namespace> -o custom-columns='NAME:.metadata.name,ISSUER:.metadata.annotations.cert-manager\.io/issuer-name' --no-headers=true | grep ingress-issuer | awk '{ print $1 }' | xargs kubectl delete secret -n <namespace>
```

Warning: Cert-manager automatically renews the `ingress-ca` 30 days before it expires. The automatic renewal of `ingress-ca` does not trigger the renewal of the end-entity certificates that are signed by `ingress-ca`. When `ingress-ca` is automatically renewed, you must manually renew all end-entity certificates.

Reference tables

The tables show all the API Connect certificates that are created in all possible deployment configurations.

Each table corresponds to a subsystem, and shows the certificates that are used by that subsystem.

Note: On Cloud Pak for Integration or top-level CR deployments, some of the certificates have a shortened name. Where two names for a certificate are shown in the tables, the second name is the name that is used on Cloud Pak for Integration or top-level CR deployments. For example, `management-ca` or `mgmt-ca`.

Table 1. Management certificates

Certificate name	Issuer	Description
<code>-ingress-ca</code>	<code>selfsigning-issuer</code>	<p>The CA and issuer of all API Connect inter-subsystem and user-facing certificates. If there is a problem with this certificate, then all API Connect subsystems are inaccessible and unable to sync with each other. Update this certificate with kubectf. When updated, all child certificates must also be updated by deleting their corresponding secrets. See ingress-ca renewal.</p> <p>The ingress-ca certificate is also stored in the management subsystem database. It is visible from the Cloud Manager UI, in the truststores of the analytics, gateway, event gateway, and portal default TLS client profiles. When the management subsystem <code>apim</code> pod is restarted the certificate is reloaded into the database from the Kubernetes ingress-ca certificate. Do not attempt to update this certificate from the Cloud Manager UI.</p> <p>In 2DCDR deployments, and when you have subsystems in different namespaces, it is necessary to manually copy the ingress-ca certificate from the management subsystem to the other subsystems. Steps are provided in the 2DCDR and multi-namespace install sections of this documentation.</p> <p>If this certificate is updated, and you have a portal deployed, then restart the <code>portal-www</code> pods for the update to take effect.</p>
<code>management-ca</code> or <code>mgmt-ca</code>	<code>selfsigning-issuer</code>	<p>The issuer for the management subsystems intra-subsystem certificates: management-client, management-server, postgres, and nats certificates. Communication between management subsystem pods fails if there is a problem with this certificate. This certificate is also used as the CA for REST API calls to the management subsystem from the other subsystems, when using <code>in-cluster</code> communication. See In-cluster service communication between subsystems</p>
<code>management-client</code> or <code>mgmt-client</code>	<code>management-ca</code>	<p>Client certificate used in communication between management subsystem pods. Communication between management subsystem pods fails if there is a problem with this certificate.</p>
<code>management-server</code> or <code>mgmt-server</code>	<code>management-ca</code>	<p>Server certificate used in communication between management subsystem pods. Communication between management subsystem pods fails if there is a problem with this certificate. Required DNS names in the certificate:</p> <ul style="list-style-type: none"> * <code><namespace></code> * <code><namespace>.svc</code> * <code><instance name>-server.<namespace>.svc</code> * <code><instance name>-server</code>
<code>analytics-client-client</code> or <code>a7s-cl-client</code>	<code>ingress-issuer</code>	<p>Legacy certificate from pre-v10.0.5 releases. Not used for anything and safe to delete. In v10.0.5, communication with the analytics subsystem uses the <code>analytics-ingestion-client</code> certificate.</p>

Certificate name	Issuer	Description
analytics-ingestion-client or a7s-ing-client	ingress-issuer	<p>Client certificate used for communication with the analytics subsystem on the ingestion endpoint. This certificate must have:</p> <ul style="list-style-type: none"> The same CA as the server certificate <code>analytics-ai-endpoint</code> on the analytics subsystem. The common name must match the <code>spec.clientSubjectDN</code> in the analytics CR: <pre>kubectl describe cert analytics-admin-client</pre> <pre>Spec: Common Name: a7s-ing-client</pre> <pre>kubectl get a7s -o yaml</pre> <pre>spec: clientSubjectDN: CN=a7s-ing-client</pre> <p>For a two data center disaster recovery deployment, both data centers must have an identical subject name. For example, both data centers subject name could be <code>CN=a7s-ingestion-client</code>, or they could both be <code>CN=a7s-ingestion-client, O=cert-manager</code>, but they must be identical.</p> <p>To update this certificate, use <code>kubectl</code>. Restart the <code>apim</code>, <code>taskmanager</code>, and <code>analytics-proxy</code> pods after the update. This certificate is also used by the gateways for sending API events to the analytics subsystem. The updated certificate is sent by the management subsystem to the gateways, it is not necessary to restart any gateway pods.</p>
portal-admin-client or ptl-adm-client	ingress-issuer	<p>Client certificate used for communication with the portal subsystem on the <code>portalAdminEndpoint</code>. This certificate must have:</p> <ul style="list-style-type: none"> The same CA as the server certificate <code>portal-admin</code> or <code>ptl-director</code> on the portal subsystem. The common name must match the <code>spec.adminClientSubjectDN</code> in the portal CR: <pre>kubectl describe cert portal-admin-client</pre> <pre>Spec: Common Name: ptl-adm-client</pre> <pre>kubectl get ptl -o yaml</pre> <pre>spec: adminClientSubjectDN: CN=ptl-adm-client</pre> <p>For a two data center disaster recovery deployment, both data centers must have an identical subject name. For example, both data centers subject name could be <code>CN=portal-admin-client</code>, or they could both be <code>CN=ptl-adm-client, O=cert-manager</code>, but they must be identical.</p>
gateway-client-client or gw-dr-client	ingress-issuer	Client certificate for communications with the gateway service. Restart the <code>apim</code> , and <code>taskmanager</code> pods after update. This certificate must have the same CA as the <code>gwv6-manager-endpoint</code> or <code>gw-gateway-manager</code> certificate on the gateway.
api-endpoint or mgmt-platform-api	ingress-issuer	Platform API endpoint server certificate. The certificate that is presented to callers of the platform REST API, and to the toolkit CLI.
consumer-endpoint or mgmt-consumer-api	ingress-issuer	Consumer API endpoint server certificate. The certificate presented that is presented to callers of the consumer REST API, and to the toolkit CLI.
apim-endpoint or mgmt-api-manager	ingress-issuer	API Manager UI server certificate.
cm-endpoint or mgmt-admin	ingress-issuer	Cloud Manager UI server certificate.
db-client-apicuser	management-ca	Intra-subsystem certificate for the management database subsystem.
db-client-pgbouncer	management-ca	Intra-subsystem certificate for the management database subsystem.
db-client-postgres	management-ca	Intra-subsystem certificate for the management database subsystem.
db-client-primaryuser	management-ca	Intra-subsystem certificate for the management database subsystem.
postgres	management-ca	Intra-subsystem certificate for the management database subsystem.
postgres-pgbouncer	management-ca	Intra-subsystem certificate for the management database subsystem.
postgres-operator	management-ca	Intra-subsystem certificate for the management database subsystem.
natscluster-mgmt	management-ca	Intra-subsystem certificate for the <code>nats</code> pods.
db-client-replicator	management-ca	2DCDR deployments only. Client certificate used by the <code><management_CR>-tunnel</code> pod to connect to the other data center's <code><management_CR>-tunnel</code> pod.
mgmt-replication-client	ingress-issuer	2DCDR deployments only. Client certificate used in the warm-standby data center's <code><remote-sitename>-postgres</code> pod to connect to the active data center.
mgmt-replication-server	ingress-issuer	2DCDR deployments only. Server certificate used in the active data center's <code><management_CR>-tunnel</code> pod. This certificate must contain the DNS Subject Alternative Name of this data center's hostname and must be valid for the <code>spec.multiSiteHA.replicationEndpoint</code> defined in the management CR.
hub-endpoint	ingress-issuer	Used by the Automated API behavior testing application. User-facing server certificate for the <code>hub-endpoint</code> . If there is a problem with this certificate, then the user's browser shows a warning or error message.
turnstile-endpoint	ingress-issuer	Used by the Automated API behavior testing application. User-facing server certificate for the <code>turnstile-endpoint</code> . If there is a problem with this certificate, then the user's browser shows a warning or error message.

Table 2. Analytics certificates

Certificate name	Issuer	Description
analytics-ai-endpoint or a7s-ai-endpoint	ingress-issuer	Server certificate used on the analytics ingestion endpoint, in the mtl-gw pod. Management and gateway subsystems communicate with the analytics subsystem on this endpoint. The client certificates that are used by the management and gateway subsystems must use the same CA certificate as the analytics-ai-endpoint certificate.
analytics-ca or a7s-ca	selfsigning-issuer	The issuer for the analytics-client and analytics-server certificates. Communication between analytics subsystem pods fails if there is a problem with this certificate. If this certificate is updated, restart the storage and ingestion pods for the update to take effect.
analytics-client or a7s-client	analytics-ca	Client certificate used in communication between analytics subsystem pods. Communication between analytics subsystem pods fails if there is a problem with this certificate. If this certificate is updated, restart the storage and ingestion pods for the update to take effect.
analytics-server or a7s-server	analytics-ca	Server certificate used in communication between analytics subsystem pods. Communication between analytics subsystem pods fails if there is a problem with this certificate. Required DNS names in the certificate: <pre>*.<namespace> *.<namespace>.svc *.<instance name>-server.<namespace>.svc <instance name>-server <instance name>-storage</pre> If this certificate is updated, restart the storage and ingestion pods for the update to take effect.

Table 3. Portal certificates

Certificate name	Issuer	Description
portal-ca or ptl-ca	selfsigning-issuer	The issuer for the portal-client and portal-server certificates. Communication between portal subsystem pods fails if there is a problem with this certificate. V10.0.5.3 and previous releases: If this certificate is updated, then all portal pods must be manually restarted. In later releases, the restart is automatic.
portal-client or ptl-client	portal-ca	Client certificate used in communication between portal subsystem pods. Communication between portal subsystem pods fails if there is a problem with this certificate. V10.0.5.3 and previous releases: If this certificate is updated, then all portal pods must be manually restarted. In later releases, the restart is automatic.
portal-server or ptl-server	portal-ca	Server certificate used in communication between portal subsystem pods. Communication between portal subsystem pods fails if there is a problem with this certificate. Required DNS names in the certificate: <pre>*.<namespace> *.<namespace>.svc *.<instance name>-server.<namespace>.svc <instance name>-server *.<instance name>-<site name>-db-all.<namespace>.svc *.<instance name>-<site name>-www-all.<namespace>.svc *.<instance name>-<site name>-db-all.<namespace>.svc.cluster.local *.<instance name>-<site name>-www-all.<namespace>.svc.cluster.local *.<namespace>.svc.cluster.local <instance name>-db #<remote portal CR name>-db # For 2DCDR only.</pre> <instance name> and <remote portal CR name> are truncated if more than 15 characters. V10.0.5.3 and previous releases: If this certificate is updated, then all portal pods must be manually restarted. In later releases, the restart is automatic.
portal-admin or ptl-director	ingress-issuer	Server certificate used on the portalAdminEndpoint . The management subsystem communicates with the portal subsystem on this endpoint. The corresponding client certificate used in the management to portal communication is the portal-admin-client certificate. This certificate must have the same CA as the portal-admin-client certificate on the management subsystem.
portal-web	ingress-issuer	The server certificate used on the portalUIEndpoint . It is the server certificate that is presented to portal site users, and which their browser authenticates. If there is a problem with this certificate, then users see an error message about an invalid or insecure certificate in their browser when they access a portal site. The default portal-web certificate is issued by the ingress-issuer , which has a self-signed root certificate. Portal users might see a browser warning about use of a self-signed certificate.
ptl-replication-client	ingress-issuer	2DCDR deployments only. Client certificate that is used in the warm-standby data center's <remote-sitename>-www and <remote-sitename>-db pods to connect to the active data center.
ptl-replication-server	ingress-issuer	2DCDR deployments only. Server certificate used in the active data center's <portal_CR>-tunnel pod, the counterpart to the ptl-replication-client certificate. This certificate must contain the DNS Subject Alternative Name of this data center's hostname and must be valid for the spec.multiSiteHA.replicationEndpoint defined in the portal CR.

Table 4. Gateway certificates

Certificate name	Issuer	Description
gateway-peering or gw-peer	ingress-issuer	This certificate secures the communication between gateways in your gateway cluster.
gateway-service or gw-svc	ingress-issuer	Legacy certificate that is not used.
gww6-endpoint or gw-gateway	ingress-issuer	

Certificate name	Issuer	Description
gmv6-manager-endpoint or gw-gateway-manager	ingress-issuer	The gatewayManager endpoint certificate. This is the server certificate on the gateway director endpoint, which the management subsystem communicates with. This certificate must be signed by the same CA as the gateway-client-client certificate on management subsystem

Table 5. Event gateway certificates -Cloud Pak for Integration only

Certificate name	Issuer	Description
event-gateway-management-client	ingress-issuer	The event-gateway-management-client certificate exists only on Cloud Pak for Integration deployments.

TLS certificates organized by usage

Table of API Connect certificates organized by where they are used.

Table 1. Management to gateway communication

Certificate name	Issuer	Description
-ingress-ca	selfsigning-issuer	The CA and issuer of all API Connect inter-subsystem and user-facing certificates. If there is a problem with this certificate, then all API Connect subsystems are inaccessible and unable to sync with each other. Update this certificate with kubectl . When updated, all child certificates must also be updated by deleting their corresponding secrets. See ingress-ca renewal . The ingress-ca certificate is also stored in the management subsystem database. It is visible from the Cloud Manager UI, in the truststores of the analytics, gateway, event gateway, and portal default TLS client profiles. When the management subsystem apim pod is restarted the certificate is reloaded into the database from the Kubernetes ingress-ca certificate. Do not attempt to update this certificate from the Cloud Manager UI. In 2DCDR deployments, and when you have subsystems in different namespaces, it is necessary to manually copy the ingress-ca certificate from the management subsystem to the other subsystems. Steps are provided in the 2DCDR and multi-namespace install sections of this documentation. If this certificate is updated, and you have a portal deployed, then restart the portal-www pods for the update to take effect.
gateway-client-client or gw-dr-client	ingress-issuer	Client certificate for communications with the gateway service. Restart the apim , and taskmanager pods after update. This certificate must have the same CA as the gmv6-manager-endpoint or gw-gateway-manager certificate on the gateway.
gmv6-manager-endpoint or gw-gateway-manager	ingress-issuer	The gatewayManager endpoint certificate. This is the server certificate on the gateway director endpoint, which the management subsystem communicates with. This certificate must be signed by the same CA as the gateway-client-client certificate on management subsystem

Table 2. Management to portal communication

Certificate name	Issuer	Description
-ingress-ca	selfsigning-issuer	The CA and issuer of all API Connect inter-subsystem and user-facing certificates. If there is a problem with this certificate, then all API Connect subsystems are inaccessible and unable to sync with each other. Update this certificate with kubectl . When updated, all child certificates must also be updated by deleting their corresponding secrets. See ingress-ca renewal . The ingress-ca certificate is also stored in the management subsystem database. It is visible from the Cloud Manager UI, in the truststores of the analytics, gateway, event gateway, and portal default TLS client profiles. When the management subsystem apim pod is restarted the certificate is reloaded into the database from the Kubernetes ingress-ca certificate. Do not attempt to update this certificate from the Cloud Manager UI. In 2DCDR deployments, and when you have subsystems in different namespaces, it is necessary to manually copy the ingress-ca certificate from the management subsystem to the other subsystems. Steps are provided in the 2DCDR and multi-namespace install sections of this documentation. If this certificate is updated, and you have a portal deployed, then restart the portal-www pods for the update to take effect.
portal-admin-client or ptl-admin-client	ingress-issuer	Client certificate used for communication with the portal subsystem on the portalAdminEndpoint . This certificate must have: <ul style="list-style-type: none"> The same CA as the server certificate portal-admin or ptl-director on the portal subsystem. The common name must match the spec.adminClientSubjectDN in the portal CR: <pre>kubectl describe cert portal-admin-client</pre> <pre>Spec: Common Name: ptl-admin-client</pre> <pre>kubectl get ptl -o yaml</pre> <pre>spec: adminClientSubjectDN: CN=ptl-admin-client</pre> For a two data center disaster recovery deployment, both data centers must have an identical subject name. For example, both data centers subject name could be CN=portal-admin-client , or they could both be CN=ptl-admin-client , O=cert-manager , but they must be identical.

Certificate name	Issuer	Description
portal-admin or ptl-director	ingress-issuer	<p>Server certificate used on the portalAdminEndpoint. The management subsystem communicates with the portal subsystem on this endpoint. The corresponding client certificate used in the management to portal communication is the portal-admin-client certificate.</p> <p>This certificate must have the same CA as the portal-admin-client certificate on the management subsystem.</p>

Table 3. Management and gateway to analytics communication

Certificate name	Issuer	Description
-ingress-ca	selfsigning-issuer	<p>The CA and issuer of all API Connect inter-subsystem and user-facing certificates. If there is a problem with this certificate, then all API Connect subsystems are inaccessible and unable to sync with each other.</p> <p>Update this certificate with kubectl. When updated, all child certificates must also be updated by deleting their corresponding secrets. See ingress-ca renewal.</p> <p>The ingress-ca certificate is also stored in the management subsystem database. It is visible from the Cloud Manager UI, in the truststores of the analytics, gateway, event gateway, and portal default TLS client profiles. When the management subsystem apim pod is restarted the certificate is reloaded into the database from the Kubernetes ingress-ca certificate. Do not attempt to update this certificate from the Cloud Manager UI.</p> <p>In 2DCDR deployments, and when you have subsystems in different namespaces, it is necessary to manually copy the ingress-ca certificate from the management subsystem to the other subsystems. Steps are provided in the 2DCDR and multi-namespace install sections of this documentation.</p> <p>If this certificate is updated, and you have a portal deployed, then restart the portal-www pods for the update to take effect.</p>
analytics-ingestion-client or a7s-ing-client	ingress-issuer	<p>Client certificate used for communication with the analytics subsystem on the ingestion endpoint. This certificate must have:</p> <ul style="list-style-type: none"> The same CA as the server certificate analytics-ai-endpoint on the analytics subsystem. The common name must match the spec.clientSubjectDN in the analytics CR: <pre>kubectl describe cert analytics-admin-client</pre> <pre>Spec: Common Name: a7s-ing-client</pre> <pre>kubectl get a7s -o yaml</pre> <pre>spec: clientSubjectDN: CN=a7s-ing-client</pre> <p>For a two data center disaster recovery deployment, both data centers must have an identical subject name. For example, both data centers subject name could be CN=a7s-ingestion-client, or they could both be CN=a7s-ingestion-client, O=cert-manager, but they must be identical.</p> <p>To update this certificate, use kubectl. Restart the apim, taskmanager, and analytics-proxy pods after the update. This certificate is also used by the gateways for sending API events to the analytics subsystem. The updated certificate is sent by the management subsystem to the gateways, it is not necessary to restart any gateway pods.</p>
analytics-ai-endpoint or a7s-ai-endpoint	ingress-issuer	<p>Server certificate used on the analytics ingestion endpoint, in the mtls-gw pod. Management and gateway subsystems communicate with the analytics subsystem on this endpoint. The client certificates that are used by the management and gateway subsystems must use the same CA certificate as the analytics-ai-endpoint certificate.</p>

Table 4. User-facing certificates

Certificate name	Issuer	Description
api-endpoint or mgmt-platform-api	ingress-issuer	Platform API endpoint server certificate. The certificate that is presented to callers of the platform REST API, and to the toolkit CLI.
consumer-endpoint or mgmt-consumer-api	ingress-issuer	Consumer API endpoint server certificate. The certificate presented that is presented to callers of the consumer REST API, and to the toolkit CLI.
apim-endpoint or mgmt-api-manager	ingress-issuer	API Manager UI server certificate.
cm-endpoint or mgmt-admin	ingress-issuer	Cloud Manager UI server certificate.
portal-web	ingress-issuer	<p>The server certificate used on the portalUIEndpoint. It is the server certificate that is presented to portal site users, and which their browser authenticates. If there is a problem with this certificate, then users see an error message about an invalid or insecure certificate in their browser when they access a portal site.</p> <p>The default portal-web certificate is issued by the ingress-issuer, which has a self-signed root certificate. Portal users might see a browser warning about use of a self-signed certificate.</p>
hub-endpoint	ingress-issuer	Used by the Automated API behavior testing application. User-facing server certificate for the hub-endpoint . If there is a problem with this certificate, then the user's browser shows a warning or error message.
turnstile-endpoint	ingress-issuer	Used by the Automated API behavior testing application. User-facing server certificate for the turnstile-endpoint . If there is a problem with this certificate, then the user's browser shows a warning or error message.

Table 5. Inter-subsystem certificates

Certificate name	Issuer	Description
------------------	--------	-------------

Certificate name	Issuer	Description
-ingress-ca	selfsigning-issuer	<p>The CA and issuer of all API Connect inter-subsystem and user-facing certificates. If there is a problem with this certificate, then all API Connect subsystems are inaccessible and unable to sync with each other. Update this certificate with kubectl. When updated, all child certificates must also be updated by deleting their corresponding secrets. See ingress-ca renewal.</p> <p>The ingress-ca certificate is also stored in the management subsystem database. It is visible from the Cloud Manager UI, in the truststores of the analytics, gateway, event gateway, and portal default TLS client profiles. When the management subsystem apim pod is restarted the certificate is reloaded into the database from the Kubernetes ingress-ca certificate. Do not attempt to update this certificate from the Cloud Manager UI.</p> <p>In 2DCDR deployments, and when you have subsystems in different namespaces, it is necessary to manually copy the ingress-ca certificate from the management subsystem to the other subsystems. Steps are provided in the 2DCDR and multi-namespace install sections of this documentation.</p> <p>If this certificate is updated, and you have a portal deployed, then restart the portal-www pods for the update to take effect.</p>
analytics-ingestion-client or a7s-ing-client	ingress-issuer	<p>Client certificate used for communication with the analytics subsystem on the ingestion endpoint. This certificate must have:</p> <ul style="list-style-type: none"> The same CA as the server certificate analytics-ai-endpoint on the analytics subsystem. The common name must match the spec.clientSubjectDN in the analytics CR: <pre>kubect</pre> l describe cert analytics-admin-client <pre>Spec: Common Name: a7s-ing-client</pre> <pre>kubect</pre> l get a7s -o yaml <pre>spec: clientSubjectDN: CN=a7s-ing-client</pre> <p>For a two data center disaster recovery deployment, both data centers must have an identical subject name. For example, both data centers subject name could be CN=a7s-ingestion-client, or they could both be CN=a7s-ingestion-client, O=cert-manager, but they must be identical.</p> <p>To update this certificate, use kubectl. Restart the apim, taskmanager, and analytics-proxy pods after the update. This certificate is also used by the gateways for sending API events to the analytics subsystem. The updated certificate is sent by the management subsystem to the gateways, it is not necessary to restart any gateway pods.</p>
portal-admin-client or ptl-admin-client	ingress-issuer	<p>Client certificate used for communication with the portal subsystem on the portalAdminEndpoint. This certificate must have:</p> <ul style="list-style-type: none"> The same CA as the server certificate portal-admin or ptl-director on the portal subsystem. The common name must match the spec.adminClientSubjectDN in the portal CR: <pre>kubect</pre> l describe cert portal-admin-client <pre>Spec: Common Name: ptl-admin-client</pre> <pre>kubect</pre> l get ptl -o yaml <pre>spec: adminClientSubjectDN: CN=ptl-admin-client</pre> <p>For a two data center disaster recovery deployment, both data centers must have an identical subject name. For example, both data centers subject name could be CN=portal-admin-client, or they could both be CN=ptl-admin-client, O=cert-manager, but they must be identical.</p>
gateway-client-client or gw-dr-client	ingress-issuer	<p>Client certificate for communications with the gateway service. Restart the apim, and taskmanager pods after update. This certificate must have the same CA as the gwv6-manager-endpoint or gw-gateway-manager certificate on the gateway.</p>
api-endpoint or mgmt-platform-api	ingress-issuer	<p>Platform API endpoint server certificate. The certificate that is presented to callers of the platform REST API, and to the toolkit CLI.</p>
consumer-endpoint or mgmt-consumer-api	ingress-issuer	<p>Consumer API endpoint server certificate. The certificate presented that is presented to callers of the consumer REST API, and to the toolkit CLI.</p>
apim-endpoint or mgmt-api-manager	ingress-issuer	<p>API Manager UI server certificate.</p>
cm-endpoint or mgmt-admin	ingress-issuer	<p>Cloud Manager UI server certificate.</p>
mgmt-replication-client	ingress-issuer	<p>2DCDR deployments only. Client certificate used in the warm-standby data center's <remote-sitename>-postgres pod to connect to the active data center.</p>
mgmt-replication-server	ingress-issuer	<p>2DCDR deployments only. Server certificate used in the active data center's <management_CR>-tunnel pod. This certificate must contain the DNS Subject Alternative Name of this data center's hostname and must be valid for the spec.multiSiteHA.replicationEndpoint defined in the management CR.</p>
hub-endpoint	ingress-issuer	<p>Used by the Automated API behavior testing application. User-facing server certificate for the hub-endpoint. If there is a problem with this certificate, then the user's browser shows a warning or error message.</p>
turnstile-endpoint	ingress-issuer	<p>Used by the Automated API behavior testing application. User-facing server certificate for the turnstile-endpoint. If there is a problem with this certificate, then the user's browser shows a warning or error message.</p>
analytics-ai-endpoint or a7s-ai-endpoint	ingress-issuer	<p>Server certificate used on the analytics ingestion endpoint, in the mtls-gw pod. Management and gateway subsystems communicate with the analytics subsystem on this endpoint. The client certificates that are used by the management and gateway subsystems must use the same CA certificate as the analytics-ai-endpoint certificate.</p>

Certificate name	Issuer	Description
portal-admin or ptl-director	ingress-issuer	Server certificate used on the <code>portalAdminEndpoint</code> . The management subsystem communicates with the portal subsystem on this endpoint. The corresponding client certificate used in the management to portal communication is the <code>portal-admin-client</code> certificate. This certificate must have the same CA as the <code>portal-admin-client</code> certificate on the management subsystem.
portal-web	ingress-issuer	The server certificate used on the <code>portalUIEndpoint</code> . It is the server certificate that is presented to portal site users, and which their browser authenticates. If there is a problem with this certificate, then users see an error message about an invalid or insecure certificate in their browser when they access a portal site. The default <code>portal-web</code> certificate is issued by the <code>ingress-issuer</code> , which has a self-signed root certificate. Portal users might see a browser warning about use of a self-signed certificate.
ptl-replication-client	ingress-issuer	2DCDR deployments only. Client certificate that is used in the warm-standby data center's <code><remote-sitename>-www</code> and <code><remote-sitename>-db</code> pods to connect to the active data center.
ptl-replication-server	ingress-issuer	2DCDR deployments only. Server certificate used in the active data center's <code><portal_CR>-tunnel</code> pod, the counterpart to the <code>ptl-replication-client</code> certificate. This certificate must contain the DNS Subject Alternative Name of this data center's hostname and must be valid for the <code>spec.multiSiteHA.replicationEndpoint</code> defined in the portal CR.
gateway-peering or gw-peer	ingress-issuer	This certificate secures the communication between gateways in your gateway cluster.
gww6-endpoint or gw-gateway	ingress-issuer	
gww6-manager-endpoint or gw-gateway-manager	ingress-issuer	The <code>gatewayManager</code> endpoint certificate. This is the server certificate on the gateway director endpoint, which the management subsystem communicates with. This certificate must be signed by the same CA as the <code>gateway-client-client</code> certificate on management subsystem
event-gateway-management-client	ingress-issuer	The <code>event-gateway-management-client</code> certificate exists only on Cloud Pak for Integration deployments.

Table 6. Intra-subsystem certificates

Certificate name	Issuer	Description
management-ca or mgmt-ca	selfsigning-issuer	The issuer for the management subsystems intra-subsystem certificates: management-client, management-server, postgres, and nats certificates. Communication between management subsystem pods fails if there is a problem with this certificate. This certificate is also used as the CA for REST API calls to the management subsystem from the other subsystems, when using <code>in-cluster</code> communication. See In-cluster service communication between subsystems
management-client or mgmt-client	management-ca	Client certificate used in communication between management subsystem pods. Communication between management subsystem pods fails if there is a problem with this certificate.
management-server or mgmt-server	management-ca	Server certificate used in communication between management subsystem pods. Communication between management subsystem pods fails if there is a problem with this certificate. Required DNS names in the certificate: * <code><namespace></code> * <code><namespace>.svc</code> * <code><instance name>-server.<namespace>.svc</code> <code><instance name>-server</code>
db-client-apicuser	management-ca	Intra-subsystem certificate for the management database subsystem.
db-client-pgbouncer	management-ca	Intra-subsystem certificate for the management database subsystem.
db-client-postgres	management-ca	Intra-subsystem certificate for the management database subsystem.
db-client-primaryuser	management-ca	Intra-subsystem certificate for the management database subsystem.
postgres	management-ca	Intra-subsystem certificate for the management database subsystem.
postgres-pgbouncer	management-ca	Intra-subsystem certificate for the management database subsystem.
postgres-operator	management-ca	Intra-subsystem certificate for the management database subsystem.
natscluster-mgmt	management-ca	Intra-subsystem certificate for the <code>nats</code> pods.
db-client-replicator	management-ca	2DCDR deployments only. Client certificate used by the <code><management_CR>-tunnel</code> pod to connect to the other data center's <code><management_CR>-tunnel</code> pod.
analytics-ca or a7s-ca	selfsigning-issuer	The issuer for the analytics-client and analytics-server certificates. Communication between analytics subsystem pods fails if there is a problem with this certificate. If this certificate is updated, restart the <code>storage</code> and <code>ingestion</code> pods for the update to take effect.
analytics-client or a7s-client	analytics-ca	Client certificate used in communication between analytics subsystem pods. Communication between analytics subsystem pods fails if there is a problem with this certificate. If this certificate is updated, restart the <code>storage</code> and <code>ingestion</code> pods for the update to take effect.
analytics-server or a7s-server	analytics-ca	Server certificate used in communication between analytics subsystem pods. Communication between analytics subsystem pods fails if there is a problem with this certificate. Required DNS names in the certificate: * <code><namespace></code> * <code><namespace>.svc</code> * <code><instance name>-server.<namespace>.svc</code> <code><instance name>-server</code> <code><instance name>-storage</code> If this certificate is updated, restart the <code>storage</code> and <code>ingestion</code> pods for the update to take effect.

Certificate name	Issuer	Description
portal-ca or ptl-ca	selfsigning-issuer	The issuer for the portal-client and portal-server certificates. Communication between portal subsystem pods fails if there is a problem with this certificate. V10.0.5.3 and previous releases: If this certificate is updated, then all portal pods must be manually restarted. In later releases, the restart is automatic.
portal-client or ptl-client	portal-ca	Client certificate used in communication between portal subsystem pods. Communication between portal subsystem pods fails if there is a problem with this certificate. V10.0.5.3 and previous releases: If this certificate is updated, then all portal pods must be manually restarted. In later releases, the restart is automatic.
portal-server or ptl-server	portal-ca	Server certificate used in communication between portal subsystem pods. Communication between portal subsystem pods fails if there is a problem with this certificate. Required DNS names in the certificate: <pre> *.<namespace> *.<namespace>.svc *.<instance name>-server.<namespace>.svc <instance name>-server *.<instance name>-<site name>-db-all.<namespace>.svc *.<instance name>-<site name>-www-all.<namespace>.svc *.<instance name>-<site name>-db-all.<namespace>.svc.cluster.local *.<instance name>-<site name>-www-all.<namespace>.svc.cluster.local *.<namespace>.svc.cluster.local <instance name>-db #<remote portal CR name>-db # For 2DCDR only. </pre> <instance name> and <remote portal CR name> are truncated if more than 15 characters. V10.0.5.3 and previous releases: If this certificate is updated, then all portal pods must be manually restarted. In later releases, the restart is automatic.

Troubleshooting API Connect

This section provides some general troubleshooting steps for use when encountering common problems with API Connect.

About

The following sections provide advice on diagnosing some common problems. This information can help you to identify whether a specific API Connect component is failing, whether it's an environmental problem, and whether you should raise a support request. Some advice includes reviewing specific log files so you can narrow down the source of the problem.

- [Unable to access Management UIs](#)
- [Unable to access the portal sites](#)
- [Login failure on Management UIs](#)
- [Login failure on Portal sites](#)
- [Management operations not reflected on Gateway or Portal](#)

Related tasks

- [Gathering post-mortem logs](#)
- [Gathering logs for a VMware environment](#)

Related information

- [IBM Support Service Requests and PMRs](#)

Unable to access Management UIs

If you are unable to access the UI login page, getting a blank page, an HTTP 404, or some other error.

When this happens it means that either the Management subsystem is down, or the access attempt is not reaching the Management subsystem due to a problem in the environment.

Note: If you are on VMware, some of the following checks involve running **kubectl** commands on your VMs. To access your VMs for running **kubectl** commands:

1. **SSH** to one of your subsystem VMs as the user 'apicadm', for example: `ssh apicadm@mgmt1.example.com`
2. **Sudo** to the root user: `sudo -i`
3. From here you can run **kubectl** commands, for example:

```

# kubectl get pods
NAME                                READY   STATUS    RESTARTS   AGE
abc-management-analytics-proxy-5f8bcd74c4-jbhch  1/1     Running   1 (97d ago)  113d
...
```

4. API Connect pods run in the default namespace on VMware, so you do not need to specify the namespace with `-n` in the **kubectl** commands.

Check the following:

- Is the access attempt actually reaching the Management subsystem? To confirm this, check what is in the logs of the `juhu` pods which run on the Management subsystem. The `juhu` pods are the entry point for all UI, REST, and CLI requests to the Management subsystem. For every access request there should be line logged by the `juhu` pod, for example: When the user attempts to access the admin UI login page, the following is logged by the `juhu` pod:

```
kubectl logs abc-management-juhu-fc8f6bb5d-jnw2q --since=5m
...
9.20.85.205 - - [27/May/2022:10:35:49 +0000] [675fa59030a1a68028712ad2fdb2fdb1] "GET /api/cloud/admin/identity-providers
HTTP/1.1" 200 301 "https://apimsvc20.hursley.ibm.com/auth/admin/sign-in/" "Mozilla/5.0 (Macintosh; Intel Mac OS X 10_15_7)
AppleWebKit/537.36 (KHTML, like Gecko) Chrome/101.0.4951.64 Safari/537.36" "9.145.13.216" [127.0.0.1:2000]
request_time=0.222 upstream_response_time=0.224
...
```

Note that the timestamp of these log records are not the time when the request arrived, but the time when the response to the request was sent back. To work out the arrival time you can subtract the `request_time=0.222` that appears later in the log message. If there is nothing logged in the `juhu` pods at the time the UI access is attempted, then check if you have any network problems between your browser and the Management subsystem. If you are on OVA then the `tcpdump` utility is available which you can use to confirm if traffic is reaching your Management VM, for example `tcpdump -i any src host 9.20.86.22 and dst port 443`

- Are the Management subsystem pods all up and running? Check this with `kubectl get ManagementCluster -n <namespace>`. If this does not show all pods running, then check which pods are failing: `kubectl get pods -n <namespace>`. If you are on OVA then gather postmortem logs and open a support case at this point. Otherwise it's worth checking the reasons why the pods are failing to start with `kubectl describe` as it might be something in your Kubernetes environment that you can fix. Note that on the Management subsystem the `postgres` pods will need to be running first, so if these are not running then most other Management pods will not start.
- Check the logs of the `apim` pods while attempting to access the UI. The `juhu` pods receive the requests from the UI, and send them on to the `apim` pods for processing. The logs of the `apim` pods may reveal some clues as to the cause of the problem. If nothing is logged in the `apim` pods at the time of the access attempt then it suggests a problem in the environment, the `juhu` pods unable to forward requests to `apim`.

Unable to access the portal sites

If you are unable to access the login page of a portal site, getting a blank page, an HTTP 404, or some other error.

A portal site outage can occur for one of the following reasons:

- The portal site is down.
- The portal subsystem is down (and so all sites are down).
- The access attempt is not reaching the portal due to a problem in the network or Kubernetes environment.

Note: If you are on VMware, some of the following checks involve running `kubectl` commands on your VMs. To access your VMs for running `kubectl` commands:

1. **SSH** to one of your subsystem VMs as the user 'apicadm', for example: `ssh apicadm@mgmt1.example.com`
2. **Sudo** to the root user: `sudo -i`
3. From here you can run `kubectl` commands, for example:

```
# kubectl get pods
NAME                                READY   STATUS    RESTARTS   AGE
abc-management-analytics-proxy-5f8bcd74c4-jbhch  1/1     Running   1 (97d ago)  113d
...
```

4. API Connect pods run in the default namespace on VMware, so you do not need to specify the namespace with `-n` in the `kubectl` commands.

Check for the following problems:

- Does the access attempt reach the portal subsystem?
To confirm that your browser is able to reach the portal site, check the `admin` container logs of the portal's `www` pods. The `nginx` process that runs in the `admin` container is the entry point for site access. For every attempt to access a portal site, the `admin` container logs the HTTP call, for example:

```
# kubectl logs abc-portal-site1-www-0 -c admin | grep nginx
...
[   nginx stdout] 584 ce6ce0:adad58:00580c 2022-05-27 12:57:38: "9.145.11.161, 9.20.85.206" portal.site1.example.com
"GET /providerorg1/sandbox/ HTTP/1.1" 200 5026 5315 5992 "-" "Mozilla/5.0 (Macintosh; Intel Mac OS X 10_15_7)
AppleWebKit/537.36 (KHTML, like Gecko) Chrome/101.0.4951.64 Safari/537.36" 0.330 "-"
...
```

Note: On v10.0.6, v10.0.5.4 and previous releases, the `nginx` logs are in the `web` container. Use the same command, but replace `-c admin` with `-c web`.

If the `admin` container logs nothing at the time the site access is attempted, then check for:

- Network problems between your browser and the portal subsystem.
- Problems with Kubernetes ingresses or OpenShift routes to the portal web endpoint.
- If you are on VMware, then the `tcpdump` utility is installed, and you can use it to confirm if traffic is reaching your portal VM. For example:

```
tcpdump -i any src host 9.20.86.22 and dst port 443
```

- Are the portal subsystem pods all up and running?
Run `kubectl get ptl` to check that your portal pods are running. If this does not show that all pods are running, then check which pods are failing: `kubectl get pods`. If you are on VMware, then gather postmortem logs and open a support case. If you are on Kubernetes or OpenShift, then check why the pods are failing to start with `kubectl describe <pod name>`. On the portal subsystem, the `-db-` pods must be running first; the other pods do not start until the `-db-` pods are running.
- If the `admin` container logs show that the access attempt is received, then check the `web` container logs to see whether there are any errors at the PHP level.

Login failure on Management UIs

If you are able to access the Management UIs login page, but the login attempt is failing.

Note: If you are on VMware, some of the following checks involve running `kubectl` commands on your VMs. To access your VMs for running `kubectl` commands:

1. **SSH** to one of your subsystem VMs as the user 'apicadm', for example: `ssh apicadm@mgmt1.example.com`
2. **Sudo** to the root user: `sudo -i`
3. From here you can run `kubectl` commands, for example:

```
# kubectl get pods
NAME                                READY   STATUS    RESTARTS   AGE
abc-management-analytics-proxy-5f8bcd74c4-jbhch  1/1     Running   1 (97d ago)  113d
...
```

4. API Connect pods run in the default namespace on VMware, so you do not need to specify the namespace with `-n` in the `kubectl` commands.

Check the logs of the `juhu` and `apim` pods at the time of the login attempt to confirm that the login attempt did reach the Management subsystem. For more information on the `juhu` logs see [Unable to access Management UIs](#). If the login attempt reached the Management subsystem, more details of the login failure for Local User Registry users can be found in the `lur` pod logs, and for LDAP users in the `ldap` pods. Example:

```
# kubectl logs abc-management-lur-8bbc47b54-9v18q --since=1m -f
...
2022-05-27T13:41:13.511Z audit [4d55be1800dcef18c64e0470484e6eac] START: >>>>>> [POST]: /user-login
2022-05-27T13:41:13.704Z lur:error [4d55be1800dcef18c64e0470484e6eac] Requested login, but user, not a user not found in user registry,
2022-05-27T13:41:13.706Z bhendi:error [4d55be1800dcef18c64e0470484e6eac] Error in POST post:/user-login (user.js:login)
- status : 401
...
```

- [Gathering logs for a VMware environment](#)

Related information

- [IBM Support Service Requests and PMRs](#)

Login failure on Portal sites

If you are able to access the Portal sites login page, but the login attempt is failing.

Note: If you are on VMware, some of the following checks involve running `kubectl` commands on your VMs. To access your VMs for running `kubectl` commands:

1. **SSH** to one of your subsystem VMs as the user 'apicadm', for example: `ssh apicadm@mgmt1.example.com`
2. **Sudo** to the root user: `sudo -i`
3. From here you can run `kubectl` commands, for example:

```
# kubectl get pods
NAME                                READY   STATUS    RESTARTS   AGE
abc-management-analytics-proxy-5f8bcd74c4-jbhch  1/1     Running   1 (97d ago)  113d
...
```

4. API Connect pods run in the default namespace on VMware, so you do not need to specify the namespace with `-n` in the `kubectl` commands.

All Portal users except for the site Admin user are ultimately authenticated by the Management subsystem, however Portal adds additional security controls such as IP banning and Flood control which should be first place to check for portal login issues: [Managing Developer Portal security](#).

If the login problem is with the Admin user, then check the logs of the `web` container in the `www` pod at the time of the attempt, for example:

```
# kubectl logs abc-portal-site1-www-0 -c web --since=1m
...
[ php-fpm stderr] 585 ce6ce0:adad58:c3852e 2022-05-27 14:16:49: WARNING: [pool www] child 1023 said into stderr: "WATCHDOG:
[NOTICE] [user] Login attempt failed for admin. | user: anonymous | uri:
https://provorg1.sandbox.portal.apimsvc21.hursley.ibm.com/provorg1/sandbox/user/login | referer:
https://portal.site1.example.com/provorg1/sandbox/user/login
...
```

If the Portal site itself is not rejecting the user login, then check the Management server logs during the login attempt: [Login failure on Management UIs](#). It may also be worth checking the logs of the `admin` container in the `www` pod, which manages the Portal end of the communications with the Management subsystem.

Every account in the Developer Portal, including across different user registries for the same site, must have a unique email address, including the site Admin account. For example, if you configure three different user registries for a particular Developer Portal site, the email address `alice@acme.com` can be used to log in to the site from only one of the user registries. The default email address for the Admin account is the email address of the Catalog owner. It is not possible to create a user account (and associated Consumer organization) with the same email address as the Admin account (or that of the Catalog owner if their email address is different). Any attempts to create an account with the same email address results in the new account not functioning correctly, and returning the following error message when trying to log in: **A user already exists with this email address.**

Management operations not reflected on Gateway or Portal

Where publishes or deletes executed on the Management subsystem are not reflected on the gateway or portal within a few minutes. These problems are often caused by a network failure between Management and the other subsystems, or due to TLS handshaking failures.

Note: If you are on VMware, some of the following checks involve running `kubectl` commands on your VMs. To access your VMs for running `kubectl` commands:

1. **SSH** to one of your subsystem VMs as the user `'apicadm'`, for example: `ssh apicadm@mgmt1.example.com`
2. **Sudo** to the root user: `sudo -i`
3. From here you can run `kubectl` commands, for example:

```
# kubectl get pods
NAME                                READY   STATUS    RESTARTS   AGE
abc-management-analytics-proxy-5f8bcd74c4-jbhch  1/1     Running   1 (97d ago)  113d
...
```

4. API Connect pods run in the default namespace on VMware, so you do not need to specify the namespace with `-n` in the `kubectl` commands.

For Gateway, the first place to check is the processing status page: [Reviewing a gateway's processing status](#)

For Portal and Gateway check the logs of the `taskmanager` pods at the time of the publish attempt. These pods send the publish operations to the gateway and portals via webhooks. If there is a network problem you may see socket timeout errors in the logs of these pods, or TLS errors if there is problem with your certificates. A common problem are load-balancers doing TLS termination instead of passthrough (where JWT security is not used, see [Using JWT instead of mTLS on Kubernetes and OpenShift](#), [Using JWT instead of mTLS on OVA](#)). If the logs suggest that the webhook was sent successfully then check the gateway director (`gwd`) logs on the Gateway, and the `www` pod `admin` container logs on the portal, for example:

```
kubectl logs abc-portal-site1-www-0 -c admin
```

Taskmanager pods execute 'send' tasks to publish operations to the gateways and portals. The taskmanager pods log messages about the progress of tasks, so there should be messages in a taskmanager pod for a send task soon after applying a change on the Management subsystem. A "send running in pod" message like the following example means the send task is running:

```
2023-05-05 14:02:37.270 management-taskmanager-f5d6fd77-dmnn taskmanager apim:taskmanager:info:taskProcessor [0d30189c-db39-4260-bb1f-a75a3ac5f1ba] task id: b3933261-5799-473d-9b83-9e29c245fde8 / kind: send running in pod: management-taskmanager-f5d6fd77-dmnn / containerId: cri-o://d5afe6d3960e333c1ea5d8f95b79564e769bc2ed5de9d8baebbd84b3f3ad4be 269ms after claimed
```

If the taskmanager logs an error containing 'dispatching task failed for task' (logged when attempting to start a task) or an error containing 'Stale claimed task' (logged 15 minutes later), API Connect might have a problem running tasks. A small number of these errors might be reported from time to time, and the system recovers automatically. But if the errors continue being reported, restart the `natscluster` pods (all together) and then restart the `taskmanager` pods to recover by running the following commands:

```
kubectl -n <namespace> delete po -l app.kubernetes.io/name=natscluster
kubectl -n <namespace> delete po -l app.kubernetes.io/name=taskmanager
```

When raising a support case be sure to include logs from both the Management subsystem and the affected subsystems gateway/portal, stating when the publish attempt was made.

Advanced maintenance operations

Topics covering advanced operations that are applicable to all supported platforms.

Management subsystem Postgres failover steps

If your Postgres leader pod is not the original Postgres leader, complete the failover steps to restore the original pod as leader.

Before you begin

This topic applies only to three replica deployments of API Connect.

Follow the steps in this topic if one or more of the following conditions are reported:

- If the **apicops version:pre-upgrade** command reports:

```
Current postgres leader is not the original leader
```

- Openshift and Cloud Pak for Integration only: Your API Connect cluster CR reports **Error** status, and the output of:

```
oc get apiconnectcluster -n <namespace> -o yaml
```

shows:

```
Original PostgreSQL primary is running as replica, please perform failover to original primary before attempting upgrade.  
Refer - https://ibm.biz/BdPLWU
```

- When you attempt to upgrade the management subsystem by editing the management CR to change the version and license and you see this error:

```
Original PostgreSQL primary is running as replica, please perform failover to original primary before attempting upgrade.  
Refer - https://ibm.biz/BdPLWU
```

About this task

The management subsystem uses Postgres as the database. A three replica API Connect deployment has a Postgres cluster that consists of 1 Postgres leader, and 2 Postgres replicas.

Note: In Kubernetes terminology, every pod in a cluster is called a "replica". In Postgres terminology, a Postgres cluster consists of "members", one of the members is designated as the leader, and the others are designated as "replicas". During normal operation, the Postgres cluster member that is the leader can change; one of the Postgres replicas can become the leader, and the original leader become a replica.

If the current Postgres cluster leader in your management deployment is not the original leader, then problems can occur during upgrade. To prevent upgrade problems, follow the steps in this topic to identify the original Postgres leader and assign it as the leader again.

Note: If you have an OVA deployment, run the steps that are documented in this topic from your management virtual appliance, as the root user: Login to your management virtual appliance with an SSH client and the username **apicadm**, then switch to the root user with **sudo**

-i.

Procedure

1. Assign your management subsystem namespace to a new environment variable called **\$NAMESPACE**

```
export NAMESPACE=<management namespace>
```

Note: On OVA deployments, set this to "default":

```
export NAMESPACE=default
```

2. Identify the original name of your Postgres cluster, and assign it to a new environment variable **\$PGCLUSTER_NAME**.

```
export PGCLUSTER_NAME=$(kubectl -n $NAMESPACE get pgcluster | awk 'NR==2{print $1}')
```

Confirm the variable is set correctly with:

```
echo $PGCLUSTER_NAME
```

3. Get a list of the PVCs whose names start with **\$PGCLUSTER_NAME** in your API Connect namespace.

```
kubectl -n $NAMESPACE get pvc $PGCLUSTER_NAME $PGCLUSTER_NAME-wal
```

NAME	STATUS	VOLUME	CAPACITY	ACCESS MODES	STORAGECLASS	AGE
m1-33253de3-postgres	Bound	local-pv-2b61c0bd	234Gi	RWO	local-storage	6h42m
m1-33253de3-postgres-wal	Bound	local-pv-bd893695	234Gi	RWO	local-storage	6h42m

Note: If no PVCs are returned then check the **apicops** error or management CR warning, if it says "The original primary PVC is not attached to any pods in this namespace", then do not proceed with these steps. Instead, to re-create your Postgres cluster with a new leader:

- a. Take a new management database backup [Backup and restore](#).
- b. Restore the management database from the new backup.

4. Get the names of all the Postgres pods.

```
kubectl get pods -n $NAMESPACE -l 'role in (master,replica)'
```

NAME	READY	STATUS	RESTARTS	AGE
m1-33253de3-postgres-dbd7966db-1tfhq	1/1	Running	0	61s
m1-33253de3-postgres-dxxx-c54776d87-wldgb	1/1	Running	0	26m
m1-33253de3-postgres-xwjf-8577b6c669-9chcp	1/1	Running	0	26m

5. Identify which pod was the original Postgres leader.

Describe each Postgres pod to see which one is using the two PVCs identified in step 3.

```
kubectl -n $NAMESPACE describe pod <pod-name> | grep 'ClaimName'
```

```
k describe pod m1-33253de3-postgres-dbd7966db-1tfhq | grep ClaimName  
ClaimName: m1-33253de3-postgres  
ClaimName: m1-33253de3-postgres-wal
```

```
k describe pod m1-33253de3-postgres-dxxx-c54776d87-wldgb | grep ClaimName  
ClaimName: m1-33253de3-postgres-dxxx  
ClaimName: m1-33253de3-postgres-dxxx-wal
```

```
k describe pod m1-33253de3-postgres-xwjf-8577b6c669-9chcp | grep ClaimName
ClaimName: m1-33253de3-postgres-xwjf
ClaimName: m1-33253de3-postgres-xwjf-wal
```

In this example, the highlighted pod `m1-33253de3-postgres-dbd7966db-1tfhq` is the pod that is using the PVCs identified in step 3. Set this pod to the environment variable `$ORIGINAL_POSTGRES_LEADER`:

```
export ORIGINAL_POSTGRES_LEADER=<pod-name>
```

Note: If none of the Postgres pods are using the PVCs identified in step 3, then do not proceed with these steps. Instead, to re-create your Postgres cluster with a new leader:

- a. Take a new management database backup [Backup and restore](#).
- b. Restore the management database from the new backup.

6. Run the `patronictl list` command in each Postgres pod and examine the output.

```
kubectl -n $NAMESPACE exec -it <postgres-pod> -- patronictl list
```

Example output for each Postgres pod:

```
Defaulted container "database" out of: database, set-libpq-certs (init)
+-----+-----+-----+-----+-----+-----+
| Member | Host | Role | State | TL | Lag in MB |
+-----+-----+-----+-----+-----+-----+
| Cluster: m1-33253de3-postgres (7039951359768572098) |
+-----+-----+-----+-----+-----+-----+
| m1-33253de3-postgres-dbd7966db-1tfhq | 192.168.51.112 | Replica | running | 8 | 0 |
| m1-33253de3-postgres-dxxx-c54776d87-wldgb | 192.168.112.17 | Replica | running | 8 | 0 |
| m1-33253de3-postgres-xwjf-8577b6c669-9chcp | 192.168.117.219 | Leader | running | 8 | |
+-----+-----+-----+-----+-----+-----+
```

Each Postgres pod should show the same output, although the order of the records might differ. The names in the `Member` column should match the names of the Postgres pods. Check the following:

- If the original Postgres pod that you identified in step 5 has a `Lag in MB` of zero and a `TL` the same as the `Leader` pod, then continue to step 7.
- If the pod labeled `Leader` shows a `TL` that is less than the other pods, or a non-null `Lag in MB`, then proceed no further and open a support case.
- If the original Postgres pod that you identified in step 5 shows a lower `TL` than the other pods, or a nonzero value in `Lag in MB`, then reinitialize that pod:

```
kubectl exec -it $ORIGINAL_POSTGRES_LEADER -n $NAMESPACE -- patronictl reinit <cluster name>
$ORIGINAL_POSTGRES_LEADER
```

where:

- `<cluster name>` is the name of the Postgres cluster that is shown in the `patronictl list` output:

```
+ Cluster: <cluster name> ...
```

Run `patronictl list` again to confirm that the `Lag in MB` is reducing. Do not proceed until it is zero. If it is not reducing, open a support case.

7. Make the pod that you identified in step 5 the `Leader`.

Run:

```
kubectl -n $NAMESPACE exec -it <postgres pod> -- patronictl failover
```

and select your `$ORIGINAL_POSTGRES_LEADER` as the candidate to failover to:

```
Candidate ['m1-33253de3-postgres-dbd7966db-1tfhq', 'm1-33253de3-postgres-dxxx-c54776d87-wldgb'] []: m1-33253de3-postgres-
dbd7966db-1tfhq

+-----+-----+-----+-----+-----+-----+
```

8. Run `patronictl list` to confirm that the pod that was identified in step 5 is the new leader, and that `TL` and `Lag in MB` are reported to be the same in each pod.

```
kubectl exec -it <postgres-pod> -n $NAMESPACE -- patronictl list
```

```
