   provider_password
   ```

   You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

   ```
   apic identity-providers:list --scope provider --server mgmt_endpoint_url --fields title,realm
   ```

   For example,

   ```
   apic identity-providers:list --scope provider --server myserver.com --fields title,realm
   total_results: 2
   results:
     - title: API Manager User Registry
       realm: provider/default-idp-2
     - title: Corporate LDAP user registry
       realm: provider/corporate-ldap
   ```

   The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default API Manager Local User Registry for login as a member of a provider organization is `default-idp-2`.
   For full details of the `apic login` command, see Logging in to a management server.

2. List all of the available Drupal config for a site.

```
apic --mode portaladmin drupal-config:list --server management_server --catalog catalogid/name --org orgid/name --format
format_type
```

- *management_server* is the endpoint URL of the management server (required).
- *catalogid/name* is the ID or name of the catalog that the site belongs to (required).
- *orgid/name* is the ID or name of the provider organization that the catalog belongs to (required).
- *format_type* is the output format. Can be `json`, `yaml`, `go-template=...`, `go-template-file=...`. Defaults to `yaml`.

For example:

```
apic --mode portaladmin drupal-config:list --server my.management.server.com --org ibm --catalog portal-test --format yaml
admin_toolbar_tools.settings:
  name: admin_toolbar_tools.settings
adminimal_admin_toolbar.settings:
  name: adminimal_admin_toolbar.settings
advagg.settings:
  name: advagg.settings
advagg_css_minify.settings:
  name: advagg_css_minify.settings
advagg_js_minify.settings:
  name: advagg_js_minify.settings
autologout.settings:
  name: autologout.settings
...
```

Note that the example has been reduced as the full response is very large.

3. List a specific Drupal config for a site.

```
apic --mode portaladmin drupal-config:list --server management_server --catalog catalogid/name --org orgid/name --prefix
config_prefix --format format_type
```

- *config_prefix* is the prefix of the Drupal config, for example `system`. If omitted, the command returns all config names in the system.

For example:

```
apic --mode portaladmin drupal-config:list --server my.management.server.com --org ibm --catalog portal-test --format yaml
--prefix system.theme
system.theme:
  name: system.theme
system.theme.global:
  name: system.theme.global
```

4. Update a Drupal config key value.

```
apic --mode portaladmin drupal-config:set -server management_server --catalog catalogid/name --org orgid/name  --
config_name config_name --config_key config_key --config_value config_value
```

- *config_name* is the name of the Drupal config object, for example `system.site` (required).
- *config_key* is the Drupal config key, for example `page.front` (required).
- *config_value* is the value to assign to the config key (required).

For example, to set the default theme to `claro`:

```
apic --mode portaladmin drupal-config:set --server my.management.server.com --org ibm --catalog portal-test --config_name
system.theme --config_key default --config_value claro
// Do you want to update default key in system.theme config?: yes.
```

5. Create a new Drupal config key and set the value.

```
apic --mode portaladmin drupal-config:set -server management_server --catalog catalogid/name --org orgid/name  --
config_name config_name --config_key new_config_key --config_value new_config_value
```

For example, to create a new config key and set the value in the `system.site` config object:

```
apic --mode portaladmin drupal-config:set --server my.management.server.com --org ibm --catalog portal-test --config_name
system.site --config_key new_key --config_value new_value
// new_key key does not exist in system.site config. Do you want to create a new config key?: yes.
```

6. Get all of the key values for a Drupal config object.

```
apic --mode portaladmin drupal-config:get --server management_server --catalog catalogid/name --org orgid/name  --format
format_type --config_name config_name
```

For example, to find out what themes are available:

```
apic --mode portaladmin drupal-config:get --server my.management.server.com --org ibm --catalog portal-test --format json
--config_name system.theme
{
    "admin": "seven",
    "default": "claro",
    "_core": {
        "default_config_hash": "fOjer9hADYYnbCJVZMFZIIM1azTFWyg84ZkFDHfAbUg"
    },
    "defaultplus": "bartisk"
}
```

7. Get the value of a specific key for a Drupal config object.

```
apic --mode portaladmin drupal-config:get --server management_server --catalog catalogid/name --org orgid/name  --format
format_type --config_name config_name --config_key config_key
```

For example, to find out what the default theme is:

```
apic --mode portaladmin drupal-config:get --server my.management.server.com --org ibm --catalog portal-test --format json
--config_name system.theme --config_key default
{
```

```
    "system.theme:default": "claro"
}
```

8. Delete a Drupal config object, or a specific config key and its value.

```
apic --mode portaladmin drupal-config:delete --server management_server --catalog catalogid/name --org orgid/name  --
config_name config_name --config_key config_key
```

   - *config_key* is the Drupal config key, for example `page.front` (optional).

   For example, to delete the config key `new_key` and its value:

```
apic --mode portaladmin drupal-config:delete --server my.management.server.com --org ibm --catalog portal-test --
config_name system.site --config_key new_key
The config object/value was successfully deleted.
```

Example

The following scenario gives an example of how to turn off CSS and JS aggregation to help with twig debug. However, on a production system aggregation should be enabled for performance reasons.

1. Check the settings for performance, which include settings for CSS and JS aggregation:

```
apic --mode portaladmin drupal-config:get --server management_server --catalog catalogid/name --org orgid/name --
config_name system.performance
```

2. Turn off CSS aggregation:

```
apic --mode portaladmin drupal-config:set --server management_server --catalog catalogid/name --org orgid/name --
config_name system.performance --config_key css.preprocess --config_value 0
```

3. Turn off JS aggregation:

```
apic --mode portaladmin drupal-config:set --server management_server --catalog catalogid/name --org orgid/name --
config_name system.performance --config_key js.preprocess --config_value 0
```

4. Then, rebuild the cache:

```
apic --mode portaladmin site:cache-rebuild  --server management_server --catalog catalogid/name --org orgid/name
```

When loading the site in a browser, you should now see CSS and JS aggregation is disabled when using development tools for site debug or customization.
Note:

- Disabling aggregation affects site performance, so if the site goes into production remember to turn aggregation back on again.
- Although the settings are shown as `true` or `false`, to set them by using the `drupal-config:set` command, you must apply a value of `1` for `true`, and `0` for `false`.

Using the drupal-state commands

You can use the **drupal-state** commands to store and retrieve information about the state of your Developer Portal system.

Information about the state of your Developer Portal system is stored in the Developer Portal database, and therefore this information is lost if the database is dropped, or the Developer Portal site is re-installed from configuration.

The **drupal-state** commands can be used to set, update, get, or delete a state key value. For example, you can use the **drupal-state** commands to enable and disable maintenance mode for your Developer Portal; for more information, see the scenario How to enable and disable maintenance mode on your Developer Portal.

Warning: Use the **drupal-state** command with caution. This command enables you to modify keys for your Developer Portal site state. Incorrect usage of this command can bring down your Developer Portal, and then require restoring it from a backup.

1. Log in as Provider org:

```
apic login --server management_server --realm provider/identity_provider --username provider_username --password
provider_password
```

   You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

```
apic identity-providers:list --scope provider --server mgmt_endpoint_url --fields title,realm
```

   For example,

```
apic identity-providers:list --scope provider --server myserver.com --fields title,realm
total_results: 2
results:
  - title: API Manager User Registry
    realm: provider/default-idp-2
  - title: Corporate LDAP user registry
    realm: provider/corporate-ldap
```

   The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default API Manager Local User Registry for login as a member of a provider organization is `default-idp-2`.
   For full details of the `apic login` command, see Logging in to a management server.

2. Create a new Drupal state key, or update an existing key, and set the value.

```
apic --mode portaladmin drupal-state:set -server management_server --catalog catalogid/name --org orgid/name  --
input_format input_format_type --state_key state_key_name --state_value state_value
```

Where:

- `management_server` is the endpoint URL of the management server (required).
- `catalogid/name` is the ID or name of the catalog that the site belongs to (required).
- `orgid/name` is the ID or name of the provider organization that the catalog belongs to (required).
- `input_format_type` is the input format of the value for the state key. Can be `string`, `integer`, `float`, `boolean`, `json`, or `yaml`. Defaults to `auto`, which means that you can omit this parameter, and the toolkit CLI will decide which format to use.
- `state_key_name` is the name of the state key, for example `system.cron_last` (required).
- `state_value` is the value to assign to the state key (required).
- `--format` is the output format. Can be `json`, `yaml`, `go-template=...`, `go-template-file=...`. Defaults to `yaml`.

For example, to create a new key called `testKey`, and set the value to `123`:

```
apic --mode portaladmin drupal-state:set -s my.management.server.com -o myorg -c dev-catalog --input_format yaml --
state_key testKey --state_value 123
Successfully set state testKey to the value of 123
```

3. Get the value for a particular Drupal state key.

```
apic --mode portaladmin drupal-state:get --server management_server --catalog catalogid/name --org orgid/name  --format
format_type --state_key state_key_name
```

For example, to get the value of the state key `testKey`:

```
apic --mode portaladmin drupal-state:get -s my.management.server.com -c dev-catalog -o myorg --format yaml --state_key
testKey
testKey: 123
```

4. Delete a specific Drupal state key and its value.

```
apic --mode portaladmin drupal-state:delete --server management_server --catalog catalogid/name --org orgid/name --
state_key state_key_name
```

For example, to delete the state key `testKey` and its value:

```
apic --mode portaladmin drupal-state:delete -s my.management.server.com -c dev-catalog -o myorg --state_key testKey
The key/value was successfully deleted.
```

Related tasks

- Toggling the site in and out of maintenance mode

Using the entity commands

You can use the **entity** commands to get the entity count on your Developer Portal service.

1. Log in as Provider org:

```
apic login --server management_server --realm provider/identity_provider --username provider_username --password
provider_password
```

You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

```
apic identity-providers:list --scope provider --server mgmt_endpoint_url --fields title,realm
```

For example,

```
apic identity-providers:list --scope provider --server myserver.com --fields title,realm
total_results: 2
results:
  - title: API Manager User Registry
    realm: provider/default-idp-2
  - title: Corporate LDAP user registry
    realm: provider/corporate-ldap
```

The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default API Manager Local User Registry for login as a member of a provider organization is `default-idp-2`.
For full details of the `apic login` command, see Logging in to a management server.

2. Get the entity count for a site.
For example,

```
apic --mode portaladmin entity:count --org orgid/name --server management_server --catalog name/id
```

Using the export-entity commands

You can use the **export-entity** commands to manage the export of content entities from your Developer Portal site.

About

The Developer Portal is based on the Drupal content management system. In Drupal, a content entity is an item of content data that is intended to be displayed to site users, such as text, images, and HTML markup. Content entities are grouped into entity types, and most of these entity types are also subdivided into entity subtypes, also known as bundles. The **export-entity** commands enable you to create a predefined list, called an export entity, of all of the content entities that you want to export. You can create multiple export entities, each one containing its own set of assorted entity types. Export entities persist, so you can add content and remove content as required.

If you want to export only one type of content entity, or all of the content entity types, at a time, you can use the **content** commands; see Using the content commands for more information. You also use these commands when you want to import your entity content.

Procedure

1. Log in as Provider org as seen in the following example.

   ```
   apic login --server management_server --realm provider/identity_provider --username provider_username --password
   provider_password
   ```

   You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

   ```
   apic identity-providers:list --scope provider --server mgmt_endpoint_url --fields title,realm
   ```

   For example,

   ```
   apic identity-providers:list --scope provider --server myserver.com --fields title,realm
   total_results: 2
   results:
     - title: API Manager User Registry
       realm: provider/default-idp-2
     - title: Corporate LDAP user registry
       realm: provider/corporate-ldap
   ```

   The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default API Manager Local User Registry for login as a member of a provider organization is `default-idp-2`.

   For full details of the `apic login` command, see Logging in to a management server.

   For a summary of the general-purpose commands and their use, see Developer Portal CLI commands.

2. Create an export entity by using the following `export-entity:create` command. This command creates a container for the entity content that you want to export.

   ```
   apic --mode portaladmin --server management_server --org orgid/name --catalog catalogid/name export-entity:create --
   export_entity_name "export_entity_name"
   ```

   Where:
   - *management_server* is the endpoint URL of the management server (required).
   - *orgid/name* is the ID or name of the provider organization that the catalog belongs to (required).
   - *catalogid/name* is the ID or name of the catalog that the site belongs to (required).
   - *export_entity_name* is the name of the export entity that you want to create. Note that this name is not a unique identifier.

   The command returns an ID for the newly created export entity. For example:

   ```
   apic --mode portaladmin --server my_management_server --org my_org --catalog my_catalog export-entity:create --
   export_entity_name "Main Content"
   [notice] Created new export entity Main Content, id 5
   ```

   Make a separate note of the ID number that is returned, as you will need this ID for future commands.
3. List all of the export entities that are available for your site by using the following `export-entity:list` command.

   ```
   apic --mode portaladmin --server management_server --org orgid/name --catalog catalogid/name export-entity:list
   ```

   The command returns a list of the available export entities, including their ID, and the date and time that they were created. For example:

   ```
   apic --mode portaladmin --server my_management_server --org my_org --catalog my_catalog export-entity:list
   -
     id: '5'
     name: 'Main Content'
     created_time: '2023-09-12 15:05:04'
   ```

4. Add content to an export entity by using the following `export-entity:add-content` command.

   ```
   apic --mode portaladmin --server management_server --org orgid/name --catalog catalogid/name export-entity:add-content --
   export_entity_id export_entity_id --entity_type entity_type_name --entity_ids entity_ids
   ```

   Where:
   - *export_entity_id* is the ID of the export entity (required).
   - *entity_type_name* is the type of content entity that you want to add to the export entity (required). You can use the `content:list-types` command to find out the type of content entities that are exportable from your site; see Using the content commands.
   - *entity_ids* is a comma separated list of the entity IDs that you want to add to the export entity (optional). If you want to add all of the content entities for a particular entity type, you don't need to set any entity IDs.

   The following example shows three different types of entity content being added to the export entity `5`:

   ```
   apic --mode portaladmin --server my_management_server --org my_org --catalog my_catalog export-entity:add-content --
   export_entity_id 5 --entity_type node --entity_ids 1,2
   [notice] Successfully added entity type node - "1, 2" to export entity 5

   apic --mode portaladmin --server my_management_server --org my_org --catalog my_catalog export-entity:add-content --
   export_entity_id 5 --entity_type block_content --entity_ids 1,2
   [notice] Successfully added entity type block_content - "1, 2" to export entity 5
   ```

```
apic --mode portaladmin --server my_management_server --org my_org --catalog my_catalog export-entity:add-content --
export_entity_id 5 --entity_type shortcut --entity_ids 1
[notice] Successfully added entity type shortcut - "1" to export entity 5
```

5. Delete content from an export entity by using the following **export-entity:remove-content** command.

```
apic --mode portaladmin --server management_server --org orgid/name --catalog catalogid/name export-entity:remove-content
--export_entity_id export_entity_id --entity_type entity_type_name --entity_ids entity_ids
```

Where:
- ***export_entity_id*** is the ID of the export entity (required).
- ***entity_type_name*** is the type of content entity that you want to remove (required).
- ***entity_ids*** is a comma separated list of the entity IDs that you want to remove (optional). If you want to remove all of the content entities for a particular entity type, you don't need to set any entity IDs.

For example, to remove entity ID **1** of the content entity type **shortcut** from the export entity **5**, you can run the following command:

```
apic --mode portaladmin --server my_management_server --org my_org --catalog my_catalog export-entity:remove-content --
export_entity_id 5 --entity_type shortcut --entity_ids 1
[notice] Successfully removed entity type shortcut - "1" from export entity 5
```

6. View the content details of an export entity by using the following **export-entity:get** command. This command returns a list of all of the content entities in a specific export entity ID, and is the entity content that will be exported if the **export-entity:launch** command is run on that ID.

```
apic --mode portaladmin --server management_server --org orgid/name --catalog catalogid/name export-entity:get --
export_entity_id export_entity_id
```

In the following example, export entity **5** contains four different content entities:

```
apic --mode portaladmin --server my_management_server --org my_org --catalog my_catalog export-entity:get --
export_entity_id 5
- bundle: basic
  id: "1"
  title: No Apps Found [en]
  type: block_content
- bundle: page
  id: "1"
  title: Terms of use
  type: node
- bundle: basic
  id: "2"
  title: No Apis Found [en]
  type: block_content
- bundle: page
  id: "2"
  title: Privacy Policy
  type: node
```

7. Export your content entities by running the following **export-entity:launch** command. This command launches an export entity polling task that creates a .tgz file of all of the entities that are contained in a specific export entity. By default, the command polls the status of the task every 30 seconds until the task is finished, at which point the export file is returned. If the command is run with the **--no-poll** option, the task doesn't return a .tgz file, but just returns the task ID.

```
apic --mode portaladmin --server management_server --org orgid/name --catalog catalogid/name export-entity:launch --
export_entity_id export_entity_id
```

Where:
- **--no-poll** is an optional flag meaning that the command won't poll the status of the task, but instead just returns the task ID. This task ID can then be used with the **export-entity:get-export** command to return the export file.

Note: The command continues to poll until the maximum polling time of 25 minutes is reached. At which point you can use the commands **export-entity:get_export_status** and **export-entity:get-export** to get the status and, if the task has finished, an artifact.
The **export-entity:launch** command can be run multiple times, and the content of the export entity updated as required by using the **export-entity:add-content** and **export-entity:remove-content** commands.

The following example exports the contents of export entity **5**:

```
apic --mode portaladmin --server my_management_server --org my_org --catalog my_catalog export-entity:launch --
export_entity_id 5
201 CREATED - TASK ID: saleo5261k5a2y

Response Code - 202:

Message(s) -
The status of this task is: QUEUED

Response Code - 200:

Message(s) -
The status of this task is: FINISHED and the artifact can now be streamed

Saving File (Large files may take a while)...
Incoming project saved to export_entity_launchExport-20230912165
```

The command saves the export to your running directory. The export .tgz file includes a root.json file that contains an index of all of the entities that are contained in the .tgz file, as well as a *content_entity_type*.json file for each content entity type exported. The *content_entity_type*.json file contains all of the information needed to be able to import those entities into a different Developer Portal site.

8. If you ran the **export-entity:launch** command with the **--no-poll** option, you can use the following commands to manage your entity export.
   - **export-entity:delete-launch-export**
     Cancels any currently running **export-entity:launch** tasks, and deletes any related artifacts. For example:

```
apic --mode portaladmin --server management_server --org orgid/name --catalog catalogid/name export-entity:delete-launch-export --task_id task_id
```

Where *task_id* is the ID of the export task on the queue.

- **export-entity:get-launch-export**
  Streams the content of a specific completed **export-entity:launch** task to a .tgz file. For example:

```
apic --mode portaladmin --server management_server --org orgid/name --catalog catalogid/name export-entity:get-launch-export --task_id task_id
```

- **export-entity:get-launch-export-status**
  Returns the status of a specific **export-entity:launch** task. For example:

```
apic --mode portaladmin --server management_server --org orgid/name --catalog catalogid/name export-entity:get-launch-export-status --task_id task_id
```

What to do next

You can import your export entity archive files by using the **content** commands; see Using the content commands for more information.

Related reference

- Using the content commands

Using the factory-reset command

You can use the **factory-reset** command to perform a factory reset of your Developer Portal, which will delete the portal service and all of its associated Developer Portal sites.

Warning: The **factory-reset** command is irreversible. You must ensure that you have backups created before running this command.

1. Log in as Cloud manager:

   ```
   apic login --server management_server --realm admin/identity_provider --username admin --password cloud_password
   ```

   You can determine which identity provider to use in the **--realm** parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

   ```
   apic identity-providers:list --scope admin --server mgmt_endpoint_url --fields title,realm
   ```

   For example:

   ```
   apic identity-providers:list --scope admin --server myserver.com --fields title,realm
   total_results: 2
   results:
     - title: Cloud Manager User Registry
       realm: admin/default-idp-1
     - title: Corporate LDAP user registry
       realm: admin/corporate-ldap
   ```

   The **title** value should enable you to determine which identity provider to use; you can then copy the corresponding **--realm** parameter directly from the displayed **realm** value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default Cloud Manager Local User Registry for login as a member of the cloud administration organization is **default-idp-1**.
   For full details of the **apic login** command, see Logging in to a management server.

2. Output a dry run status of a Developer Portal factory reset:

   ```
   apic --mode portaladmin factory-reset:delete --server management_server --portal_service_endpoint portal_endpoint
   ```

   - *management_server* is the endpoint URL of the management server.
   - *portal_endpoint* is the URL endpoint of the portal service.

   For example:

   ```
   apic --mode portaladmin factory-reset:delete --server api.stagingexample.com --portal_service_endpoint
   https://api.portal.mystack.com
   ```

3. Perform a factory reset of the Developer Portal, deleting the portal service and all of its associated Developer Portal sites:
   Warning: The **factory-reset** command is irreversible. You must ensure that you have backups created before running this command.

   ```
   apic --mode portaladmin factory-reset:delete --server management_server --portal_service_endpoint portal_endpoint --execute_reset true
   ```

   - **--execute_reset** must be set to **true** to trigger the Developer Portal reset.

   For example:

   ```
   apic --mode portaladmin factory-reset:delete --server api.stagingexample.com --portal_service_endpoint
   https://api.portal.mystack.com  --execute_reset true
   ```

Using the forums commands

You can use the **forums** commands to disable or enable the forums on your Developer Portal service.

1. Log in as Provider org:

   ```
   apic login --server management_server --realm provider/identity_provider --username provider_username --password
   provider_password
   ```

   You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

   ```
   apic identity-providers:list --scope provider --server mgmt_endpoint_url --fields title,realm
   ```

   For example,

   ```
   apic identity-providers:list --scope provider --server myserver.com --fields title,realm
   total_results: 2
   results:
     - title: API Manager User Registry
       realm: provider/default-idp-2
     - title: Corporate LDAP user registry
       realm: provider/corporate-ldap
   ```

   The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default API Manager Local User Registry for login as a member of a provider organization is `default-idp-2`.
   For full details of the `apic login` command, see Logging in to a management server.

2. Disable the Forum module on your Developer Portal site.
   This command deletes all of the taxonomy terms in the forum vocabulary, and then disables the Forum module.

   ```
   apic --mode portaladmin forums:disable --org orgid/name --server management_server --catalog name/id
   ```

   - *`orgid/name`* is the ID or name of the provider organization that the catalog belongs to (required).
   - *`management_server`* is the endpoint URL of the management server (required).
   - *`name/id`* is the ID or name of the catalog that the site belongs to (required).

   For example,

   ```
   apic --mode portaladmin forums:disable --org ibm --server api.stagingexample.com --catalog dev
   ```

3. Enable the Forum module on your Developer Portal site.

   ```
   apic --mode portaladmin forums:enable --org orgid/name --server management_server --catalog name/id
   ```

   For example,

   ```
   apic --mode portaladmin forums:enable --org ibm --server api.stagingexample.com --catalog dev
   ```

Using the ip-security-enabled command

You can use the **ip-security-enabled** commands to toggle IP security on your Developer Portal. When IP security is enabled, modules such as the Drupal Perimeter Defence module, or flood control, will block client IP addresses suspected of malicious behavior, as expected. Banned IP addresses can be cleared by using the `security:clear-bans` command. You might want to turn off IP security if you are performing penetration tests, or if you cannot pass through the client IP address from your external load balancer. Note that IP security is enabled by default on the Developer Portal.

1. Log in as Cloud manager:

   ```
   apic login --server management_server --realm admin/identity_provider --username admin --password cloud_password
   ```

   You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

   ```
   apic identity-providers:list --scope admin --server mgmt_endpoint_url --fields title,realm
   ```

   For example:

   ```
   apic identity-providers:list --scope admin --server myserver.com --fields title,realm
   total_results: 2
   results:
     - title: Cloud Manager User Registry
       realm: admin/default-idp-1
     - title: Corporate LDAP user registry
       realm: admin/corporate-ldap
   ```

   The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default Cloud Manager Local User Registry for login as a member of the cloud administration organization is `default-idp-1`.
   For full details of the `apic login` command, see Logging in to a management server.

2. Enable IP security on the Developer Portal:

   ```
   apic --mode portaladmin ip-security-enabled:update --server management_server --portal_service_name portal --enabled true
   ```

   - *`management_server`* is the endpoint URL of the management server.
   - *`portal`* is the name of the portal service.
   - `--enabled` is set to `true` to enable IP security. Can be set to `false` to disable IP security.

   For example:

   ```
   apic --mode portaladmin ip-security-enabled:update --server my.management.server.com --portal_service_name
   my_portal_service --enabled true
   IP security has been successfully set to true
   ```

3. Disable IP security on the Developer Portal:

```
apic --mode portaladmin ip-security-enabled:update --server management_server --portal_service_name portal --enabled false
```

Using the modules commands

You can use the **modules** commands to list, enable, disable and delete the modules on your Developer Portal service.

1. Log in as Provider org:

   ```
   apic login --server management_server --realm provider/identity_provider --username provider_username --password
   provider_password
   ```

   You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

   ```
   apic identity-providers:list --scope provider --server mgmt_endpoint_url --fields title,realm
   ```

   For example,

   ```
   apic identity-providers:list --scope provider --server myserver.com --fields title,realm
   total_results: 2
   results:
     - title: API Manager User Registry
       realm: provider/default-idp-2
     - title: Corporate LDAP user registry
       realm: provider/corporate-ldap
   ```

   The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default API Manager Local User Registry for login as a member of a provider organization is `default-idp-2`.
   For full details of the `apic login` command, see Logging in to a management server.

   For a summary of the general-purpose commands and their use, see Developer Portal CLI commands.

2. List the modules from a *packagename*.
   For example,

   ```
   apic --mode portaladmin modules:list --org orgid/name --server management_server --catalog name/id --package
   packagename1,packagename2
   ```

3. Enable the *modulename* module. You can upload this module by using the **custom-module:create-import** command. For more information, see Using the custom-module commands.
   For example,

   ```
   apic --mode portaladmin modules:enable --org orgid/name --server management_server --catalog name/id --modules modulename
   ```

   - `management_server` is the endpoint URL of the management server (required).
   - `catalogid/name` is the ID or name of the catalog that the site belongs to (required).
   - `orgid/name` is the ID or name of the provider organization that the catalog belongs to (required).
   - `--package` enables you to filter by project packages. You can use multiple comma separated values.
   - `--status` enables you to filter by extension status. Can be `_ enabled`, `disabled` and/or `'not installed'`. You can use multiple comma separated values.
   - `--custom` enables you to filter your results to only the modules that you have installed on your Developer Portal site.

4. Disable the *modulename* module. If you disable a module, you must also disable all its dependencies.
   For example,

   ```
   apic --mode portaladmin modules:disable --org orgid/name --server management_server --catalog name/id --modules
   modulename,module_lib
   ```

5. Delete the *modulename* module. The module and all its dependencies must be disabled before you can delete them.
   For example,

   ```
   apic --mode portaladmin modules:delete --org orgid/name --server management_server --catalog name/id --modules modulename
   ```

Note that if you want to manage the Forum module, you can use the `forums` commands. For more information, see Using the forums commands.

Using the php-memory commands

You can use the **php-memory** commands to list or update the PHP memory limits on your Developer Portal.

1. Log in as Cloud manager:

   ```
   apic login --server management_server --realm admin/identity_provider --username cloud_username --password cloud_password
   ```

   You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

   ```
   apic identity-providers:list --scope admin --server mgmt_endpoint_url --fields title,realm
   ```

   For example:

   ```
   apic identity-providers:list --scope admin --server myserver.com --fields title,realm
   total_results: 2
   ```

```
results:
  - title: Cloud Manager User Registry
    realm: admin/default-idp-1
  - title: Corporate LDAP user registry
    realm: admin/corporate-ldap
```

The **title** value should enable you to determine which identity provider to use; you can then copy the corresponding **--realm** parameter directly from the displayed **realm** value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default Cloud Manager Local User Registry for login as a member of the cloud administration organization is **default-idp-1**.
For full details of the **apic login** command, see Logging in to a management server.

2. Get the availability zone of the portal service's sites that you want to list:

```
apic availability-zones --org orgid/name --server management_server
```

3. List all the portal services in that availability zone:

```
apic portal-services:list --org orgid/name --server management_server --availability-zone availability_zone
```

4. Get the selected portal service's name:

```
apic portal-services:get --org orgid/name --server management_server --availability-zone availability_zone PORTAL-SERVICE-NAME
```

5. List the current PHP memory limits on the Developer Portal platform:

```
apic --mode portaladmin php-memory:list --server management_server --portal_service_name PORTAL-SERVICE-NAME
```

You receive output like this example:

```
Current web memory is set to: 768M
Current admin memory is set to: 768M
```

6. Update the current PHP memory limits on the Developer Portal platform:

```
apic --mode portaladmin php-memory:update --server management_server --portal_service_name PORTAL-SERVICE-NAME --memory_value 1024
```

You receive output like this example:

```
Setting php memory limit to 1024M within the database
Setting php memory limit to 1024M in /var/devportal/storenosync/php.ini
Setting php memory limit to 1024M in /web/local/php_config/php.ini
Done
```

Note: Consider the memory resource limits that are allocated to your Developer Portal pods before you set this value. Setting this value too high can result in the portal pods restarting because the containers request more memory than is allowed by Kubernetes. Setting the value too low can result in the internal portal processes failing because of lack of available memory.

Using the platforms commands

You can use the **platforms** commands to list the platforms on your Developer Portal service.

1. Log in as Cloud manager:

```
apic login --server management_server --realm admin/identity_provider --username cloud_username --password cloud_password
```

You can determine which identity provider to use in the **--realm** parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

```
apic identity-providers:list --scope admin --server mgmt_endpoint_url --fields title,realm
```

For example:

```
apic identity-providers:list --scope admin --server myserver.com --fields title,realm
total_results: 2
results:
  - title: Cloud Manager User Registry
    realm: admin/default-idp-1
  - title: Corporate LDAP user registry
    realm: admin/corporate-ldap
```

The **title** value should enable you to determine which identity provider to use; you can then copy the corresponding **--realm** parameter directly from the displayed **realm** value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default Cloud Manager Local User Registry for login as a member of the cloud administration organization is **default-idp-1**.
For full details of the **apic login** command, see Logging in to a management server.

2. Get the availability zone of the portal service's platforms that you want to list:

```
apic availability-zones --org orgid/name --server management_server
```

3. List all the portal services in that availability zone

```
apic portal-services:list --org orgid/name --server management_server --availability-zone availability_zone
```

4. Get the selected portal service's name

```
apic portal-services:get --org orgid/name --server management_server --availability-zone availability_zone PORTAL-SERVICE-NAME
```

5. List the platforms of the portal service

```
apic --mode portaladmin platforms:list --server management_server --portal_service_name PORTAL-SERVICE-NAME --format json
```

Using the product commands

You can use the **product** commands to get and list the products on your Developer Portal service.

1. Log in as Provider org as seen in the following example.

```
apic login --server management_server --realm provider/identity_provider --username provider_username --password
provider_password
```

You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

```
apic identity-providers:list --scope provider --server mgmt_endpoint_url --fields title,realm
```

For example,

```
apic identity-providers:list --scope provider --server myserver.com --fields title,realm
total_results: 2
results:
  - title: API Manager User Registry
    realm: provider/default-idp-2
  - title: Corporate LDAP user registry
    realm: provider/corporate-ldap
```

The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default API Manager Local User Registry for login as a member of a provider organization is `default-idp-2`.
For full details of the `apic login` command, see Logging in to a management server.

For a summary of the general-purpose commands and their use, see Developer Portal CLI commands.

2. Get a list of products from a site.

For example,

```
apic --mode portaladmin product:list --org orgid/name --server management_server --catalog catalogid/name
```

- *management_server* is the endpoint URL of the management server (required).
- *catalogid/name* is the ID or name of the catalog that the site belongs to (required).
- *orgid/name* is the ID or name of the provider organization that the catalog belongs to (required).
- *format_type* is the output format. Can be `json`, `yaml`, `go-template=...`, `go-template-file=...`. Defaults to `yaml`.

3. Get a product from a site by using the *id* or *name:version*.

For example,

```
apic --mode portaladmin product:get --org orgid/name --server management_server --catalog catalogid/name id/name:version
```

- *id/name:version* - The ID or name:version of a specific product (required). For example, `id-of-product-called-example-3` or `example:3.0.0`.

4. Get a specific entire product document from the portal of the provided organization and catalog by using the *id* or *name:version*.

```
apic --mode portaladmin product:get-document --org orgid/name --server management_server --catalog catalogid/name --format
format_type  id/name:version
```

For example,

```
apic --mode portaladmin product:get-document --org ibm --server my.management.server.com --catalog portal-test --format
yaml  intuiz-product:1.0.0
```

5. Add an attachment for your product within your Developer Portal.

For example,

```
apic --mode portaladmin product:add-attachment -s management_server --org orgid/name --catalog catalogid/name --
attachment_name attachment.txt --attachment_description "Product documentation" awesome-sleek-soft-chips-product:1.0.0
./attachment.txt
Loading File (Large files may take a while)...

Attachment successfully added to product awesome-sleek-soft-chips-product:1.0.0.
  This product now has 2 attachments.
```

- *attachment_name* is the name given to the attachment when it is uploaded (required).
- *attachment_description* is the description of the attachment that is displayed to the users.

6. Set an icon for your product within your Developer Portal.
For example,

```
apic --mode portaladmin product:set-icon -s management_server --org orgid/name --catalog catalogid/name --icon_description
"product icon" awesome-sleek-soft-chips-product:1.0.0 ./icon.png
Loading File (Large files may take a while)...

Icon successfully set for product awesome-sleek-soft-chips-product:1.0.0
```

- *icon_description* is the icon description to be displayed to users and it is used as an alt text for the image (required).

7. Add a tag (Category) for your product within your Developer Portal.
For example,

```
apic --mode portaladmin product:add-tag -s management_server--org orgid/name --catalog catalogid/name --tag_name
top_level_element/next_level_element/lower_level_element awesome-sleek-soft-chips-product:1.0.0
Successfully set taxonomy tag top_level_element/next_level_element/lower_level_element
  for product api-connect-cassin-llc-awesome-sleek-soft-chips-product:1.0.0
```

- ***tag_name*** is the tag name. For example, ***top_level_element/next_level_element*** (required).

Using the security command

You can use the **security** command to clear all of the banned user/IP addresses on a Developer Portal site.

1. Log in as Provider org:

   ```
   apic login --server management_server --realm provider/identity_provider --username provider_username --password
   provider_password
   ```

   You can determine which identity provider to use in the **--realm** parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

   ```
   apic identity-providers:list --scope provider --server mgmt_endpoint_url --fields title,realm
   ```

   For example,

   ```
   apic identity-providers:list --scope provider --server myserver.com --fields title,realm
   total_results: 2
   results:
     - title: API Manager User Registry
       realm: provider/default-idp-2
     - title: Corporate LDAP user registry
       realm: provider/corporate-ldap
   ```

   The **title** value should enable you to determine which identity provider to use; you can then copy the corresponding **--realm** parameter directly from the displayed **realm** value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default API Manager Local User Registry for login as a member of a provider organization is **default-idp-2**.
   For full details of the **apic login** command, see Logging in to a management server.

2. Clear all of the user and IP addresses that are currently banned on a particular portal site:

   ```
   apic --mode portaladmin security:clear-bans --server management_server --catalog catalogid/name --org orgid/name
   ```

   - ***management_server*** is the endpoint URL of the management server.
   - ***catalogid/name*** is the ID or name of the catalog that the site belongs to.
   - ***orgid/name*** is the ID or name of the provider organization that the catalog belongs to.

   For example:

   ```
   apic --mode portaladmin security:clear-bans --server my.management.server.com --catalog portal-test --org ibm
   [notice] All bans cleared.
   ```

Note: You can also manage banned IP addresses by using the Developer Portal UI. For more information, see Managing banned IP addresses.

Using the service command

You can use the **service** command to list the Developer Portal service from the Developer Portal database.

1. Log in as Cloud manager:

   ```
   apic login --server management_server --realm admin/identity_provider --username cloud_username --password cloud_password
   ```

   You can determine which identity provider to use in the **--realm** parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

   ```
   apic identity-providers:list --scope admin --server mgmt_endpoint_url --fields title,realm
   ```

   For example:

   ```
   apic identity-providers:list --scope admin --server myserver.com --fields title,realm
   total_results: 2
   results:
     - title: Cloud Manager User Registry
       realm: admin/default-idp-1
     - title: Corporate LDAP user registry
       realm: admin/corporate-ldap
   ```

   The **title** value should enable you to determine which identity provider to use; you can then copy the corresponding **--realm** parameter directly from the displayed **realm** value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default Cloud Manager Local User Registry for login as a member of the cloud administration organization is **default-idp-1**.
   For full details of the **apic login** command, see Logging in to a management server.

   For a summary of the general-purpose commands and their use, see Developer Portal CLI commands.

2. Get the availability zone of the portal service's sites that you want to list.

   ```
   apic availability-zones --org orgid/name --server management_server
   ```

   - **apic service:list** - List the Portal service currently installed.

- `-s, --server` *mgmt_endpoint_url*. Use the value of the platform API endpoint URL for this entry.
- `--org` *orgid*
- `--catalog` *catalog id*.
- `--debug`. If you need debug information.

3. List the installed Developer Portal service.

```
apic --mode portaladmin service:list -s management_server --portal_service_name PORTAL-SERVICE-NAME --format json
```

Using the service-ip-allowlist commands

You can use the **service-ip-allowlist** commands to add, remove, and list the IP addresses on your Developer Portal `allowlist`. IP addresses that are on the `allowlist` are exempt from being blocked by Developer Portal security checks, for example, load balancer and proxy IPs.

1. Log in as Cloud manager:

```
apic login --server management_server --realm admin/identity_provider --username admin --password cloud_password
```

You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

```
apic identity-providers:list --scope admin --server mgmt_endpoint_url --fields title,realm
```

For example:

```
apic identity-providers:list --scope admin --server myserver.com --fields title,realm
total_results: 2
results:
  - title: Cloud Manager User Registry
    realm: admin/default-idp-1
  - title: Corporate LDAP user registry
    realm: admin/corporate-ldap
```

The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default Cloud Manager Local User Registry for login as a member of the cloud administration organization is `default-idp-1`.
For full details of the `apic login` command, see Logging in to a management server.

2. Add one or more IP addresses to the `allowlist`:

```
apic --mode portaladmin service-ip-allowlist:add --server management_server --portal_service_name portal --ips
"list_of_ips"
```

- *`management_server`* is the endpoint URL of the management server.
- *`portal`* is the name of the portal service.
- *`list_of_ips`* is a comma separated list of the IP addresses that you want to add to the `allowlist`.

For example:

```
apic --mode portaladmin service-ip-allowlist:add --server my.management.server.com --portal_service_name my_portal_service
--ips "123.456.34.56,123.456.46.67"
Successfully added IP: 123.456.34.56.
Successfully added IP: 123.456.46.67.
```

3. Delete all of the IP addresses that are currently on the `allowlist`:

```
apic --mode portaladmin service-ip-allowlist:delete --server management_server --portal_service_name portal
```

4. List all of the IP addresses that are currently on the `allowlist`:

```
apic --mode portaladmin service-ip-allowlist:list --server management_server --portal_service_name portal
```

5. Remove one or more IP addresses from the `allowlist`:

```
apic --mode portaladmin service-ip-allowlist:remove --server management_server --portal_service_name portal --ips
"list_of_ips"
```

Using the site commands

You can use the **site** commands to check the site on your Developer Portal service, and to export and import an entire site configuration.

About

You can use the **site** commands to check the health of a portal site, rebuild the cache of a site, and display the login link for an admin account of a site. You can also use them to export the configuration settings for an entire Developer Portal site, and import those settings into another site. For example, you could use the export and import commands to replicate the configuration of a test site into a production site.
Important: If you want to import a site export configuration file, the export file must have been created on the same version of API Connect as the version that you want to import to.

1. Log in as Provider org:

```
apic login --server management_server --realm provider/identity_provider --username provider_username --password
provider_password
```

You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

```
apic identity-providers:list --scope provider --server mgmt_endpoint_url --fields title,realm
```

For example,

```
apic identity-providers:list --scope provider --server myserver.com --fields title,realm
total_results: 2
results:
  - title: API Manager User Registry
    realm: provider/default-idp-2
  - title: Corporate LDAP user registry
    realm: provider/corporate-ldap
```

The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default API Manager Local User Registry for login as a member of a provider organization is `default-idp-2`.
For full details of the `apic login` command, see Logging in to a management server.

For a summary of the general-purpose commands and their use, see Developer Portal CLI commands.

2. Check the site on your portal service. This command checks the file system, database, and API Manager on your portal site, which might identify platform-related problems on your portal site.

```
apic --mode portaladmin site:check  --server management_server --catalog catalogid/name --org orgid/name --format
format_type
```

   - *`management_server`* is the endpoint URL of the management server (required).
   - *`catalogid/name`* is the ID or name of the catalog that the site belongs to (required).
   - *`orgid/name`* is the ID or name of the provider organization that the catalog belongs to (required).
   - *`format_type`* is the output format. Can be `json`, `yaml`, `go-template=...`, `go-template-file=...`. Defaults to `yaml`.
3. Rebuild the cache of a specific portal site.

```
apic --mode portaladmin site:cache-rebuild  --server management_server --catalog catalogid/name --org orgid/name
```

   For example:

```
apic --mode portaladmin site:cache-rebuild --server management_server --org ibm --catalog portal-test
[success] Cache rebuild complete.
```

4. Display the state of a portal site associated with a particular organization and catalog. This command is useful as a general health check of the site.

```
apic --mode portaladmin site:state --server management_server --catalog catalogid/name --org orgid/name --format
format_type
```

```
apic --mode portaladmin site:state --server my.management.server.com --org ibm --catalog portal-test --format json
{
    "alias": "ibm.portal-test.my.management.server.com",
    "check_state": "OK: 200",
    "content_refresh_required": false,
    "known_to_apim": 1,
    "platform": "platform_devportal_9_x_10_99_99_99_20210922_2000",
    "snapshot_first_requested": "0000-00-00 00:00:00",
    "snapshots_failed_processing_since_last_success": 0,
    "snapshots_requested_since_last_received": 0,
    "state": "INSTALLED",
    "subscribed_to_webhooks": true,
    "url": "my.management.server.com/ibm/portal-test",
    "uuid": "cc0ad766-e372-4988-9d45-744eb8d381de.1cd9dc41-b08d-xyz"
}
```

5. Log in to your Developer Portal admin with a link. This command displays a one time login link for the admin account for your Developer Portal site that is specified by the catalog and organization.

```
 apic --mode portaladmin site:login-link  --server management_server --org ibm --catalog portal-test
sample output:
https://my.portal.server.com/ibm/portal-test/user/reset/1/12345678901/ABCde1f2gH3ijKL-
4M_NOPqrs5TU6VWxy7ZABCDEFg7h8/new/login
```

6. Export your entire site configuration by using the following `site:create-export` command. This command creates an export task that returns a .tgz file containing the site configuration. By default, the command polls the status of the task every 10 seconds until the task is finished, at which point the export file is returned. Note that exporting all of your site configuration can take a long time to complete.

```
apic --mode portaladmin --server management_server --org orgid/name --catalog catalogid/name site:create-export
```

   Where:
   - `--no-poll` is an optional flag meaning that the command won't poll the status of the task, but instead just returns the task ID. This task ID can then be used with the `site:get-export` command to return the export file.

   Note: The command continues to poll until the maximum polling time of 15 minutes is reached. At which point you can use the commands `site:get_export_status` and `site:get-export` to get the status and, if the task has finished, an artifact.
   For example:

```
apic --mode portaladmin --server my_management_server --org my_org --catalog my_catalog site:create-export
201 CREATED - Task ID: vfg6b8utjtw51

Response Code - 202:

Message(s) -
The status of this task is: QUEUED

Response Code - 202:
```

```
Message(s) -
The status of this task is: RUNNING

Response Code - 202:

Message(s) -
The status of this task is: RUNNING

Response Code - 200:

Message(s) -
The status of this task is: FINISHED and the artifact can now be streamed

Saving File (Large files may take a while)...
Incoming project saved to site_createExport-20231013154023.tgz
```

The command saves the export file to your running directory. The export .tgz file includes a site-content.tgz file, and a site-config.tgz file. The export file will also include a site-custom-themes.tgz, or a site-custom-modules.tgz file, or both, depending on whether the site contains any custom themes or custom modules.

7. If you ran the **site:create-export** command with the **--no-poll** option, you can use the following commands to manage your site export.
   - **site:delete-export**
     Cancels any currently running **site:create-export** tasks, and deletes any related artifacts. For example:

     ```
     apic --mode portaladmin --server management_server --org orgid/name --catalog catalogid/name site:delete-export --
     task_id task_id
     ```

     Where ***task_id*** is the ID of the export task on the queue.
   - **site:get-export**
     Streams the content of a specific completed export task to a .tgz file. For example:

     ```
     apic --mode portaladmin --server management_server --org orgid/name --catalog catalogid/name site:get-export --
     task_id task_id
     ```

   - **site:get-export-status**
     Returns the status of a specific export task. For example:

     ```
     apic --mode portaladmin --server management_server --org orgid/name --catalog catalogid/name site:get-export-status -
     -task_id task_id
     ```

8. Import your site configuration by using the **site:create-import** command. This command launches an import polling task that polls the status of the task every 10 seconds until the task is finished, at which point a summary of the import is returned. If the command is run with the **--no-poll** option, the task doesn't return the status of the task, but just returns the task ID.
   Important: If you want to import a site export configuration file, the export file must have been created on the same version of API Connect as the version that you want to import to.

   ```
   apic --mode portaladmin --server management_server --org orgid/name --catalog catalogid/name site:create-import
   export_file_name
   ```

   Where:
   - ***export_file_name*** is the name of the export file that you want to import. You can import .tgz files that were created by using the **site:create-export** command.
   - **--no-poll** is an optional flag meaning that the command won't poll the status of the task, but instead just returns the task ID. This task ID can then be used with the **site:get-import-status** command to get the status of the task.

   Note: The command continues to poll until the maximum polling time of 15 minutes is reached. At which point you can use the command **site:get-import-status** to get the status of the task.
   In the following example, the export file from Step 6 is imported into a production Developer Portal site on a different server:

```
apic --mode portaladmin --server my_management_server2 --org my_prod_org --catalog my_prod_catalog site:create-import
site_createExport-20231013154023.tgz
Loading File (Large files may take a while)...

2023-10-11 10:52:38: CLI task (site:import) completed successfully.
```

The message section provides detailed information about the import as the configuration is being imported.

9. If you ran the `site:create-import` command with the `--no-poll` option, you can use the following commands to manage your content import.
   - `site:delete-import`
     Cancels any currently running `site:create-import` tasks, and deletes any related artifacts. For example:

     ```
     apic --mode portaladmin --server management_server --org orgid/name --catalog catalogid/name site:delete-import --
     task_id task_id
     ```

     Where *`task_id`* is the ID of the import task on the queue.
   - `site:get-import-status`
     Returns the status of a specific import task. For example:

     ```
     apic --mode portaladmin --server management_server --org orgid/name --catalog catalogid/name site:get-import-status -
     -task_id task_id
     ```

Related information

- **`apic site`**

Using the site-config commands

You can use the **site-config** commands to create exports and imports, delete exports and imports, get the status of an export or import, and get an export, on your Developer Portal service.

1. Log in as Provider org:

   ```
   apic login --server management_server --realm provider/identity_provider --username cloud_username --password
   cloud_password
   ```

You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

```
apic identity-providers:list --scope provider --server mgmt_endpoint_url --fields title,realm
```

For example,

```
apic identity-providers:list --scope provider --server myserver.com --fields title,realm
total_results: 2
results:
  - title: API Manager User Registry
    realm: provider/default-idp-2
  - title: Corporate LDAP user registry
    realm: provider/corporate-ldap
```

The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default API Manager Local User Registry for login as a member of a provider organization is `default-idp-2`.
For full details of the `apic login` command, see Logging in to a management server.

2. Export your site configs.
The **site-config:create-export** command creates an export task against the portal of the specified `catalog` and `org`. The command then polls the status of the task until it has `FINISHED` and the artifacts are streamed back.
Note: The command continues to poll until the maximum polling time of 15 minutes is reached. At which point you can use the commands **site-config:get-export-status** and **site-config:get-export** to get the status and potentially an artifact.

```
apic --mode portaladmin site-config:create-export --catalog name/id --org orgid/name --server management_server
```

- The site config .tgz is saved to the directory in which you ran the command.
- The saved .tgz has the format `site_config_createExport-20200217134637.tgz`.
- You can save your exports into your change control management system.

For example,

```
apic --mode portaladmin site-config:create-export --catalog dev --org ibm --server api.stagingexample.com
```

3. Import your site configs.
The **site-config:create-import** command uses the supplied .tgz file to import the site configs into the portal of the specified `catalog` and `org`. The command then polls the status of the task until the task has either `FINISHED` successfully, or failed because of an error.
Note: The higher level folders of the archive can contain only these characters, a-z and 0-9.
Note: The command continues to poll until the maximum polling time of 15 minutes is reached. At which point you can use the command **site-config:get-import-status** to get the status of the import.

```
apic --mode portaladmin site-config:create-import --catalog name/id --org orgid/name --server management_server
/PATH/TO/SITE_CONFIG/TGZ
```

For example,

```
apic --mode portaladmin site-config:create-import --catalog prod --org ibm --server api.productionexample.com
C:/users/example/desktop/site_config_createExport-20200217134637.tgz
```

4. You can run the delete command to cancel any ongoing or recently created import or export tasks. Any temporarily created artifacts will be deleted from the portal filesystem.
For example,

```
apic --mode portaladmin site-config:delete-export --catalog name/id --org orgid/name --server management_server --format
json --task_id string
```

```
apic --mode portaladmin site-config:delete-import --catalog name/id --org orgid/name --server management_server --format
json --task_id string
```

Using the sites commands

You can use the **sites** commands to check and list the sites on your Developer Portal service.

1. Log in as Cloud manager:

```
apic login --server management_server --realm admin/identity_provider --username cloud_username --password cloud_password
```

You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

```
apic identity-providers:list --scope admin --server mgmt_endpoint_url --fields title,realm
```

For example:

```
apic identity-providers:list --scope admin --server myserver.com --fields title,realm
total_results: 2
results:
  - title: Cloud Manager User Registry
    realm: admin/default-idp-1
  - title: Corporate LDAP user registry
    realm: admin/corporate-ldap
```

The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default Cloud Manager Local User Registry for login as a member of the cloud administration organization is `default-idp-1`.
For full details of the `apic login` command, see Logging in to a management server.

2. Get the availability zone of the portal service's sites that you want to list.

   ```
   apic availability-zones --org orgid/name --server management_server
   ```

3. List all the portal services in that availability zone.

   ```
   apic portal-services:list --org orgid/name --server management_server --availability-zone availability_zone
   ```

4. Get the selected portal service's name.

   ```
   apic portal-services:get --org orgid/name --server management_server --availability-zone availability_zone PORTAL-SERVICE-NAME
   ```

5. Check the sites on your portal service. This command checks the file system, database, and API Manager on all your portal sites, which might identify platform-related problems on one or more of your portal sites.

   ```
   apic --mode portaladmin sites:check --server management_server --portal_service_name PORTAL-SERVICE-NAME --format yaml
   ```

6. List the sites of the portal service.

   ```
   apic --mode portaladmin sites:list --server management_server --portal_service_name PORTAL-SERVICE-NAME --format json
   ```

Using the themes commands

You can use the **themes** commands to list, enable, disable, delete, and set the default themes on your Developer Portal service.

1. Log in as Provider org:

   ```
   apic login --server management_server --realm provider/identity_provider --username provider_username --password provider_password
   ```

   You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

   ```
   apic identity-providers:list --scope provider --server mgmt_endpoint_url --fields title,realm
   ```

   For example,

   ```
   apic identity-providers:list --scope provider --server myserver.com --fields title,realm
   total_results: 2
   results:
     - title: API Manager User Registry
       realm: provider/default-idp-2
     - title: Corporate LDAP user registry
       realm: provider/corporate-ldap
   ```

   The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default API Manager Local User Registry for login as a member of a provider organization is `default-idp-2`.
   For full details of the `apic login` command, see Logging in to a management server.

   For a summary of the general-purpose commands and their use, see Developer Portal CLI commands.

2. List the themes from a *packagename*.
   For example,

   ```
   apic --mode portaladmin themes:list --org orgid/name --server management_server --catalog catalogid/name --package packagename1,packagename2
   ```

   - `management_server` is the endpoint URL of the management server (required).
   - `catalogid/name` is the ID or name of the catalog that the site belongs to (required).
   - `orgid/name` is the ID or name of the provider organization that the catalog belongs to (required).
   - `--package` enables you to filter by project packages. You can use multiple comma separated values.
   - `--status` enables you to filter by extension status. Can be `enabled`, `disabled` and/or `'not installed'`. You can use multiple comma separated values.
   - `--custom` enables you to filter your results to only the themes that you have installed on your Developer Portal site.

3. Enable the *themename* theme. You can upload this theme by using the **custom-theme:create-import** command. For more information, see Using the custom-theme commands.
   For example,

   ```
   apic --mode portaladmin themes:enable --org orgid/name --server management_server --catalog catalogid/name --themes themename
   ```

   - `--themes` is the name of the theme, and can be multiple comma separated values (required).

4. Disable the *themename* theme.
   For example,

   ```
   apic --mode portaladmin themes:disable --org orgid/name --server management_server --catalog catalogid/name --themes themename,theme_lib
   ```

5. Delete the *themename* theme. The theme and all its dependencies must be disabled before you can delete them.
   For example,

   ```
   apic --mode portaladmin themes:delete --org orgid/name --server management_server --catalog catalogid/name --themes themename
   ```

6. Set the *themename* theme to be the default theme. The theme must exist and be enabled for it to be set as a default theme.
   For example,

```
apic --mode portaladmin themes:set-default --org orgid/name --server management_server --catalog catalogid/name themename
```

- *themename* is the name of the theme to set as default.

Using the twig commands

You can use the **twig** commands to enable, disable, and check the state of twig debugging on a specific site on your Developer Portal service.

Note: Twig debugging should not be left enabled on production sites, as it causes performance issues, and can affect the caching on the site.

1. Log in as Provider org:

   ```
   apic login --server management_server --realm provider/identity_provider --username provider_username --password
   provider_password
   ```

   You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

   ```
   apic identity-providers:list --scope provider --server mgmt_endpoint_url --fields title,realm
   ```

   For example,

   ```
   apic identity-providers:list --scope provider --server myserver.com --fields title,realm
   total_results: 2
   results:
     - title: API Manager User Registry
       realm: provider/default-idp-2
     - title: Corporate LDAP user registry
       realm: provider/corporate-ldap
   ```

   The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default API Manager Local User Registry for login as a member of a provider organization is `default-idp-2`.
   For full details of the `apic login` command, see Logging in to a management server.

2. Enable twig debugging for a portal site.

   ```
   apic --mode portaladmin twig:debug-enable --server management_server --org orgid/name --catalog catalogid/name
   ```

   - `management_server` is the endpoint URL of the management server (required).
   - `orgid/name` is the ID or name of the provider organization that the catalog belongs to (required).
   - `catalogid/name` is the ID or name of the catalog that the site belongs to (required).

   For example:

   ```
   apic --mode portaladmin twig:debug-enable --server my.management.server.com --org ibm --catalog portal-test
   Setting twig debug to true for site my.management.server.com/ibm/portal-test.
   Rebuilding cache for my.management.server.com/ibm/portal-test so twig debug changes can take affect.
   ```

3. Disable twig debugging for a portal site.

   ```
   apic --mode portaladmin twig:debug-disable --server management_server --org orgid/name --catalog catalogid/name
   ```

   For example:

   ```
   apic --mode portaladmin twig:debug-disable --server my.management.server.com --org ibm --catalog portal-test
   Setting twig debug to false for site my.management.server.com/ibm/portal-test.
   Rebuilding cache for my.management.server.com/ibm/portal-test so twig debug changes can take affect.
   ```

4. Get the current state of twig debugging for a specific site.

   ```
   apic --mode portaladmin twig:debug-status --server management_server --org orgid/name --catalog catalogid/name
   ```

   For example:

   ```
   apic --mode portaladmin twig:debug-status --server my.management.server.com --org ibm --catalog portal-test
   The current state of twig debugging is true for my.management.server.com/ibm/portal-test.
   ```

Scenarios that use the Portal CLI

Here are some scenarios of how you can use the Portal commands in the toolkit CLI to accomplish tasks that are more complex to complete, or not possible in the Developer Portal UI.

- **Exporting and importing custom themes and site configuration**
  You can use the portal commands in the toolkit CLI to replicate changes from one Developer Portal instance to another. You might want to use these commands to copy your themes or a configuration change, from a staging environment to a production environment.
- **How to enable and disable maintenance mode on your Developer Portal**
  You can use the Portal commands in the toolkit CLI to enable and disable maintenance mode on your Developer Portal site.

Exporting and importing custom themes and site configuration

You can use the portal commands in the toolkit CLI to replicate changes from one Developer Portal instance to another. You might want to use these commands to copy your themes or a configuration change, from a staging environment to a production environment.

Before you begin

To complete this scenario, you must have a staging Developer Portal and a production Developer Portal enabled. You must have administrator access, and the permission `settings:manage`, to both to complete this scenario. The tutorial Creating the Portal explains how to enable the portal if you have not already done so.

About this scenario

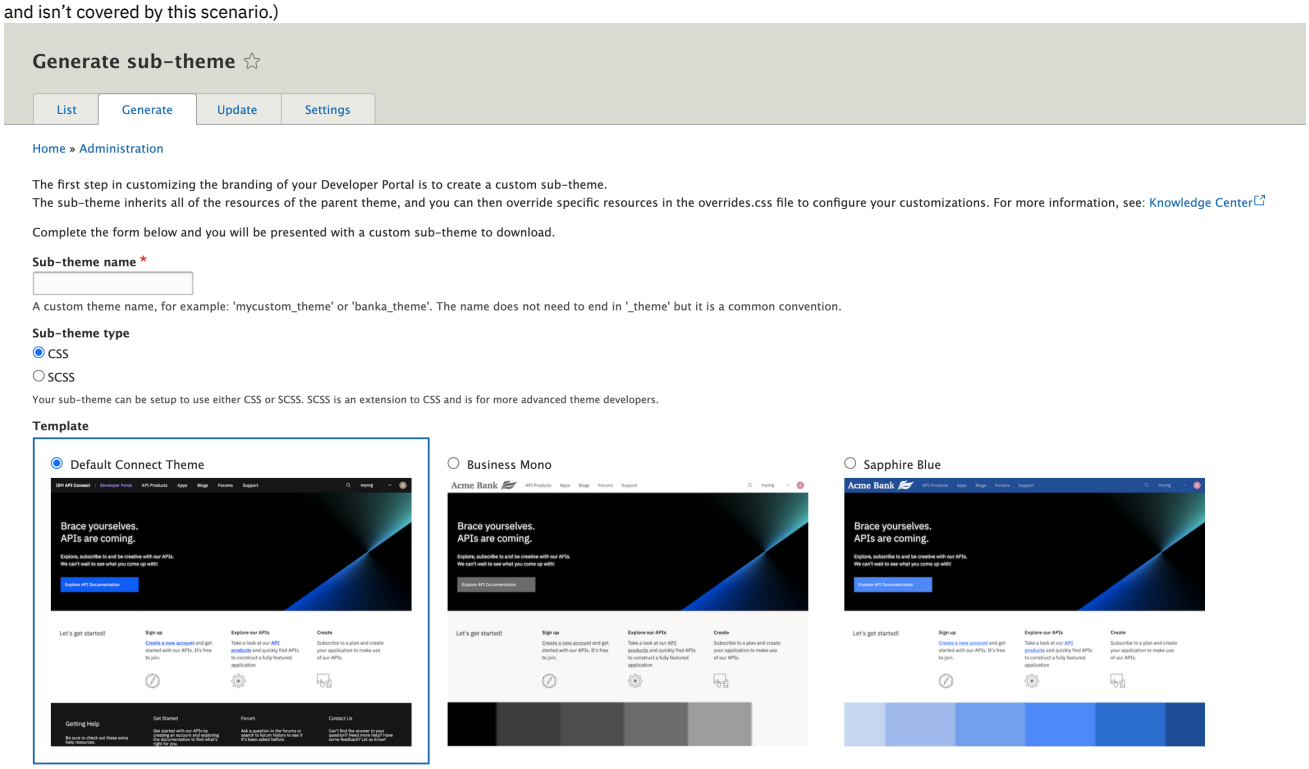
In this scenario, on your staging Developer Portal, you create a theme and make some configuration changes. Then, you use the toolkit CLI to replicate the changes on your production Developer Portal.

This scenario takes you through the following steps:

1. Create a custom theme on the staging Developer Portal.
2. Add a field to an application content type to change the `site-config` on the staging Developer Portal.
3. Use the `cli` to export the custom themes and `site-config` on the staging Developer Portal.
4. Use the `cli` to import the custom themes and `site-config` on the production Developer Portal.

Create a custom theme on the staging Developer Portal

1. Log in to your staging Developer Portal as an administrator.
2. If the administrator dashboard isn't displayed, click Manage to display it.
3. Click Appearance > Generate sub-theme. The `Generate sub-theme` window is displayed.
4. Enter a Sub-theme name, and select CSS for the Sub-theme type. (If you prefer, you can select SCSS, but this extension to CSS is for advanced theme developers, and isn't covered by this scenario.)



5. Select the Default template to base your `sub-theme` on. You can create a `sub-theme` based on a color template. However, for this scenario you use the default connect_theme template.
6. Click Generate.
7. Download the generated `sub-theme` to a location of your choice, and extract all the files from the .zip file.

On your computer, navigate to the files that you extracted. Find the overrides.css file in here banka_theme/banka_theme/css/overrides.css. You can now customize the overrides.css file.

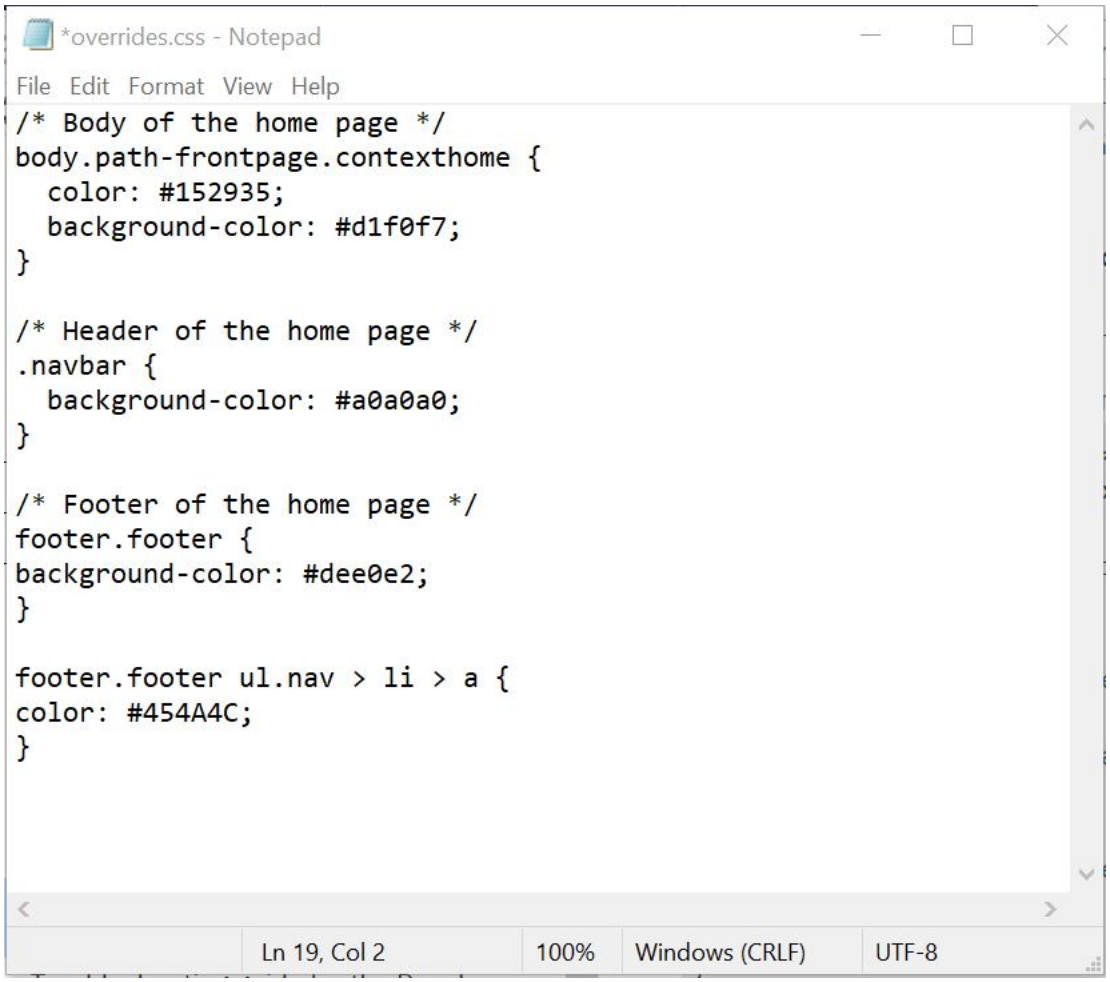
1. Open the overrides.css file in your chosen editor.
2. Customize your `sub-theme` by entering the following elements into the overrides.css file:

```
/* Body of the home page */
body.path-frontpage.contexthome {
  color: #152935;
  background-color: #d1f0f7;
}

/* Header of the home page */
.navbar {
  background-color: #a0a0a0;
}
```

```
/* Footer of the home page */
footer.footer {
background-color: #dee0e2;
}

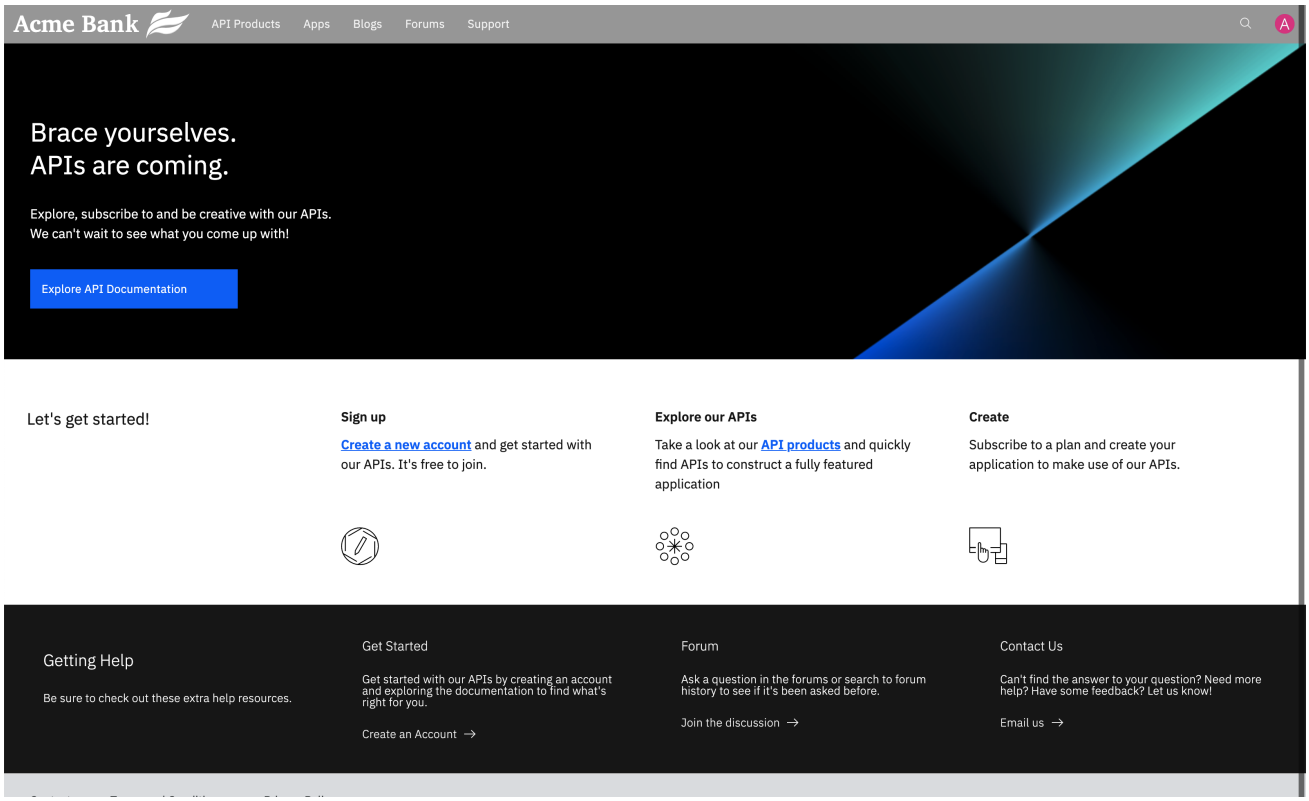
footer.footer ul.nav > li > a {
color: #454A4C;
}
```



3. Save the overrides.css file.

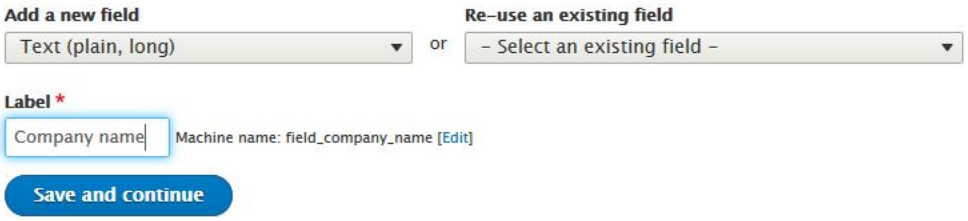
You can now install and enable your customized theme.

1. After you finish updating the overrides.css file, compress all the theme files back into the .zip **sub-theme** file that you downloaded originally.
2. In the Developer Portal, click Appearance > Install new theme. The **Install new theme** window is displayed.
3. In Upload a module or theme archive to install click Browse, and navigate to your newly updated compressed theme file.
4. Click Install to install the theme onto your site.
5. Click Enable newly added themes, and find your new theme in the list of **Disabled themes**. Click Enable and set as default to set your new custom **sub-theme** as the default theme for your site.
6. Return to the Developer Portal home page by clicking Back to site. You can now see your custom theme.



Add a field to an application content type to change the `site-config` on the staging Developer Portal

1. Log in to your staging Developer Portal as an administrator.
2. If the administrator dashboard isn't displayed, click Manage to display it.
3. Click Structure > Content types > Application > Manage fields.
4. Click + Add field.
5. In **`Add a new field`**, select Text (plain, long). Enter `Company name` as the label title.



6. Click Save and continue.
7. Leave the **`Allowed number of values`** set to 1 and click Save field settings.
8. Click Save field settings. You can now see your new field.

Use the toolkit CLI to export the custom themes and `site-config` on the staging Developer Portal

1. Log in to the management server.

   `apic login --server` ***`management_server`*** **`--realm`** ***`realm`*** **`--username`** ***`org_username`*** **`--password`** ***`org_password`***

   For example,

   `apic login -s api.stagingexample.com --realm provider/default-idp-2 --username ibm --password Qwerty123£`

   For more information about variable options, see Logging in to a management server.

2. Export your custom themes.
   The **custom-theme:create-export** command creates an export task against the portal of the specified **`catalog`** and **`org`**. The command then polls the status of the task until it has **`FINISHED`** and the artifacts are streamed back.
   Note: The command continues to poll until the maximum polling time of 15 minutes is reached. At which point you can use the commands **custom-theme:get-export-status** and **custom-theme:get-export** to get the status and potentially an artifact.

   `apic --mode portaladmin custom-theme:create-export --catalog` ***`name/id`*** **`--org`** ***`name/id`*** **`--server`** ***`management_server`***

- The theme .tgz is saved to the directory in which you ran the command.
- The saved .tgz has the format `custom_theme_createExport-20200217134637.tgz`.
- You can save your exports into your change control management system.

For example,

```
apic --mode portaladmin custom-theme:create-export --catalog dev --org ibm --server api.stagingexample.com
```

3. Export your site config.
   The **site-config:create-export** command creates an export task against the portal of the specified `catalog` and `org`, the command then polls the status of the task until it has `FINISHED` and the artifacts are streamed back.

```
apic --mode portaladmin site-config:create-export --catalog name/id --org name/id --server management_server
```

- The site config .tgz is saved to the directory in which you ran the command.
- The saved .tgz has the format `site_config_createExport-20200217134637.tgz`.
- You can save your exports into your change control management system.

For example,

```
apic --mode portaladmin site-config:create-export --catalog dev --org ibm --server api.stagingexample.com
```

Use the toolkit CLI to import the custom themes and `site-config` on the production Developer Portal

1. Log in to the management server.

```
apic login --server management_server --realm realm --username org_username --password org_password
```

For example,

```
apic login -s api.productionexample.com --realm provider/default-idp-2 --username ibm --password Qwerty123£
```

For more information about variable options, see Logging in to a management server.

2. Import your custom themes.
   The **custom-theme:create-import** command uses the supplied .tgz file to import the custom themes into the portal of the specified `catalog` and `org`. The command then polls the status of the task until the task has either `FINISHED` successfully, or failed because of an error.
   Note: The command continues to poll until the maximum polling time of 15 minutes is reached. At which point you can use the command **custom-theme:get-import-status** to get the status of the import.

```
apic --mode portaladmin custom-theme:create-import --catalog name/id --org name/id --server management_server
/PATH/TO/THEME/TGZ
```

For example,

```
apic --mode portaladmin custom-theme:create-import --catalog prod --org ibm --server api.productionexample.com
C:/users/example/desktop/custom_theme_createExport-20200217134637.tgz
```

3. Import your site config.
   The **site-config:create-import** command uses the supplied .tgz file to import the site config into the portal of the specified `catalog` and `org`. The command then polls the status of the task until the task has either `FINISHED` successfully, or failed because of an error.

```
apic --mode portaladmin site-config:create-import --catalog name/id --org name/id --server management_server
/PATH/TO/CONFIG/TGZ
```

For example,

```
apic --mode portaladmin site-config:create-import --catalog prod --org ibm --server api.productionexample.com
C:/users/example/desktop/site_config_createExport-20200217134637.tgz
```

What you did in this scenario

In this scenario, you created a theme and changed the configuration on your staging Developer Portal. Then, you used the toolkit CLI to replicate the changes on to your production Developer Portal.

You can now see the changes that you made on your production Developer Portal.

- **Exporting and importing custom themes and site configuration by using the Portal Admin API**
  The platform REST APIs for IBM® API Connect provide complete access to the capability of the platform. So, you can use the toolkit CLI to replicate changes from one Developer Portal instance to another. However, if the toolkit CLI was unavailable for some reason, you can use the Portal Admin API.

Exporting and importing custom themes and site configuration by using the Portal Admin API

The platform REST APIs for IBM® API Connect provide complete access to the capability of the platform. So, you can use the toolkit CLI to replicate changes from one Developer Portal instance to another. However, if the toolkit CLI was unavailable for some reason, you can use the Portal Admin API.

Before you begin

To complete this scenario, you must have a staging Developer Portal and a production Developer Portal enabled. You must have administrator access, or the permission `settings:manage`, to both to complete this scenario. The tutorial Creating the Portal explains how to enable the portal if you have not already done so.

Also, you must have downloaded and installed the toolkit. For more information, see Installing the toolkit.

About this scenario

In this scenario, you use the toolkit to obtain some authentication. Then, on your staging Developer Portal, you create a theme and make some configuration changes. Then, you use the Portal Admin API to replicate the changes on your production Developer Portal.

This scenario takes you through the following steps:

1. Obtaining the client ID and secret, and a bearer token.
2. Create a custom theme on the staging Developer Portal.
3. Add a field to an application content type to change the `site-config` on the staging Developer Portal.
4. Use the Portal Admin API to export the custom themes and `site-config` on the staging Developer Portal.
5. Use the Portal Admin API to import the custom themes and `site-config` on the production Developer Portal.

Obtaining the client ID and secret, and a bearer token.

From your toolkit:

1. Obtaining the client ID and secret.
   a. Obtain the list of administrator scoped providers to determine the correct realm to use:

      ```
      apic identity-providers:list --scope admin --server <management_server>
      ```

      For example,

      ```
      apic identity-providers:list --scope admin --server api.stagingexample.com
      ```

      Here is an example of some possible output:

      ```
      default-idp-1
      ```

   b. Run `apic login`, complete the details:

      ```
      apic login --server management_server --realm cloud_realm --username admin_username --password admin_password
      ```

      For example,

      ```
      apic login -s api.stagingexample.com --realm provider/default-idp-1 --username admin --password Qwerty123£
      ```

   c. Log in to cloud manager, and register an app. Make a new file locally and call it `app1.json`. Then, copy into it the following code snippet:

      ```
      {
        "name": "app1",
        "client_id": "app1id",
        "client_secret": "app1secret",
        "client_type": "toolkit"
      }
      ```

   d. Run the registration create command:

      ```
      apic registrations:create --server management_server app1.json
      ```

      For example,

      ```
      apic registrations:create --server api.stagingexample.com app1.json
      ```

      Here is an example of some possible output:

      ```
      app1    [state: enabled]   https://api.stagingexample.com/api/cloud/registrations/d2b7572f-3406-42a7-bdcc-
      85f177860df7
      ```

2. Now, you can get a bearer token from the provider org.
   a. To obtain a list of provider realms:

      ```
      apic identity-providers:list --scope provider --server management_server
      ```

      For example,

      ```
      apic identity-providers:list --scope provider --server api.stagingexample.com
      ```

      Here is an example of some possible output:

      ```
      default-idp-2
      ```

   b. Run `apic login`, complete the details:

      ```
      apic login --server management_server --realm provider_realm --username org_username --password org_password
      ```

      For example,

      ```
      apic login -s api.stagingexample.com --realm provider/default-idp-2 --username ibm --password Qwerty123£
      ```

   c. Create an HTTP request to obtain an access token:

      ```
      curl -k -X POST -d '{"username": "org_username", "password": "org_password", "realm": "provider/default-idp-2",
      "client_id": "app_id", "client_secret": "app_secret", "grant_type": "password"}' -H 'Content-Type: application/json'
      -H 'Accept: application/json' https://management_server/api/token
      ```

      For example,

```
curl -k -X POST -d '{"username": "steve", "password": "T****8", "realm": "provider/default-idp-2", "client_id":
"app1id", "client_secret": "app1secret", "grant_type": "password"}' -H 'Content-Type: application/json' -H 'Accept:
application/json' https://api.stagingexample.com/api/token
```

Here is an example of some possible output:

```
{
    "access_token":
"eyJhbGciOiJSUzI1NiIsInR5cCI6IkpXVCIsImtpZCI6IjBDQkI2Mjg5MkU4QUNFNEIzNDZCQzcyNDMxMUY0QzE4NTU2MUE4NjkifQ.eyJqdGkiOiJlN

a1-1EbqUB0sejwQoKvSYHMFwnh3K8Y97g2lbdjkAcSwVOk02FpUMIIz4aeInYqwlUdzqww",
    "token_type": "Bearer",
    "expires_in": 28800
}
```

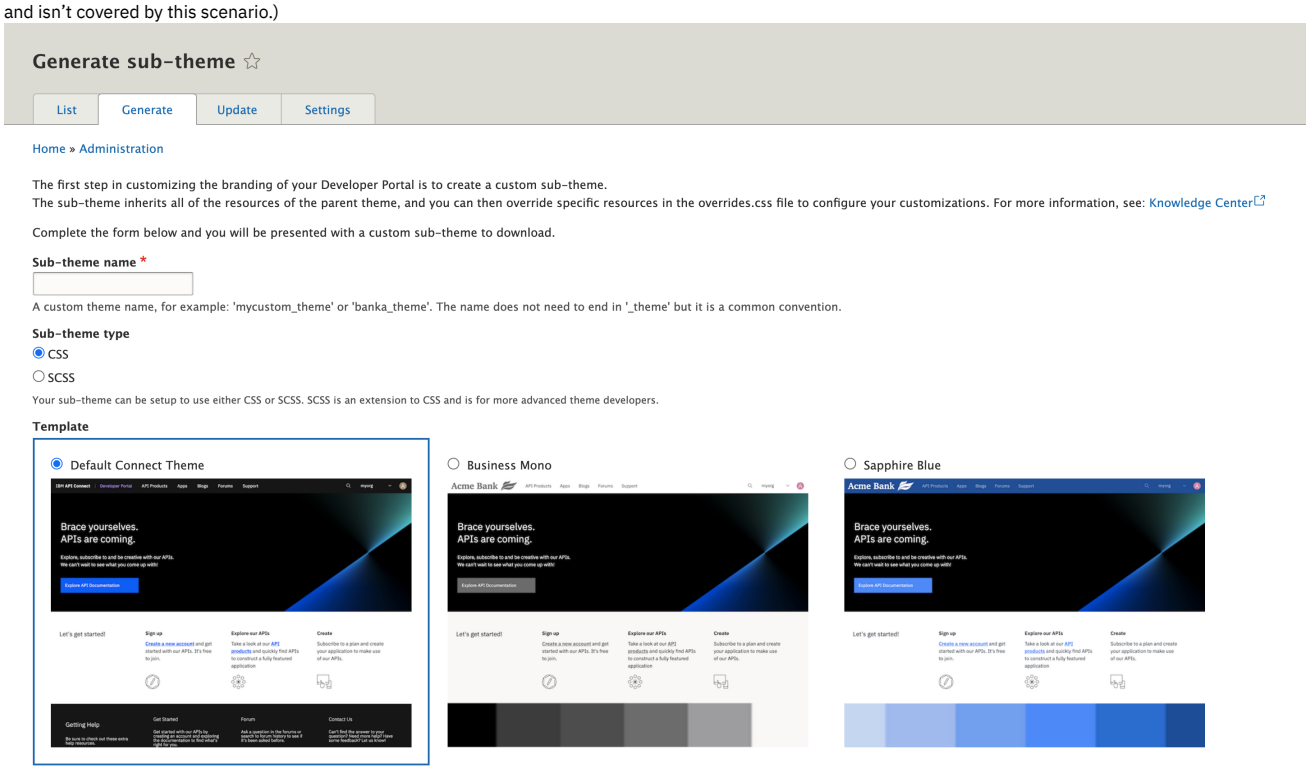
d. Save the token in a variable in your terminal:

```
TOKEN="<paste the access token that you obtained>"
```

You can now authenticate yourself when you invoke the toolkit CLI by using the REST API.

Create a custom theme on the staging Developer Portal

1. Log in to your staging Developer Portal as an administrator.
2. If the administrator dashboard isn't displayed, click Manage to display it.
3. Click Appearance > Generate sub-theme. The **Generate sub-theme** window is displayed.
4. Enter a Sub-theme name, and select CSS for the Sub-theme type. (If you prefer, you can select SCSS, but this extension to CSS is for advanced theme developers, and isn't covered by this scenario.)



5. Select the Default template to base your **sub-theme** on. You can create a **sub-theme** based on a color template. However, for this scenario you use the default connect_theme template.
6. Click Generate.
7. Download the generated **sub-theme** to a location of your choice, and extract all the files from the .zip file.

On your computer, navigate to the files that you extracted. Find the overrides.css file in here banka_theme/banka_theme/css/overrides.css. You can now customize the overrides.css file.

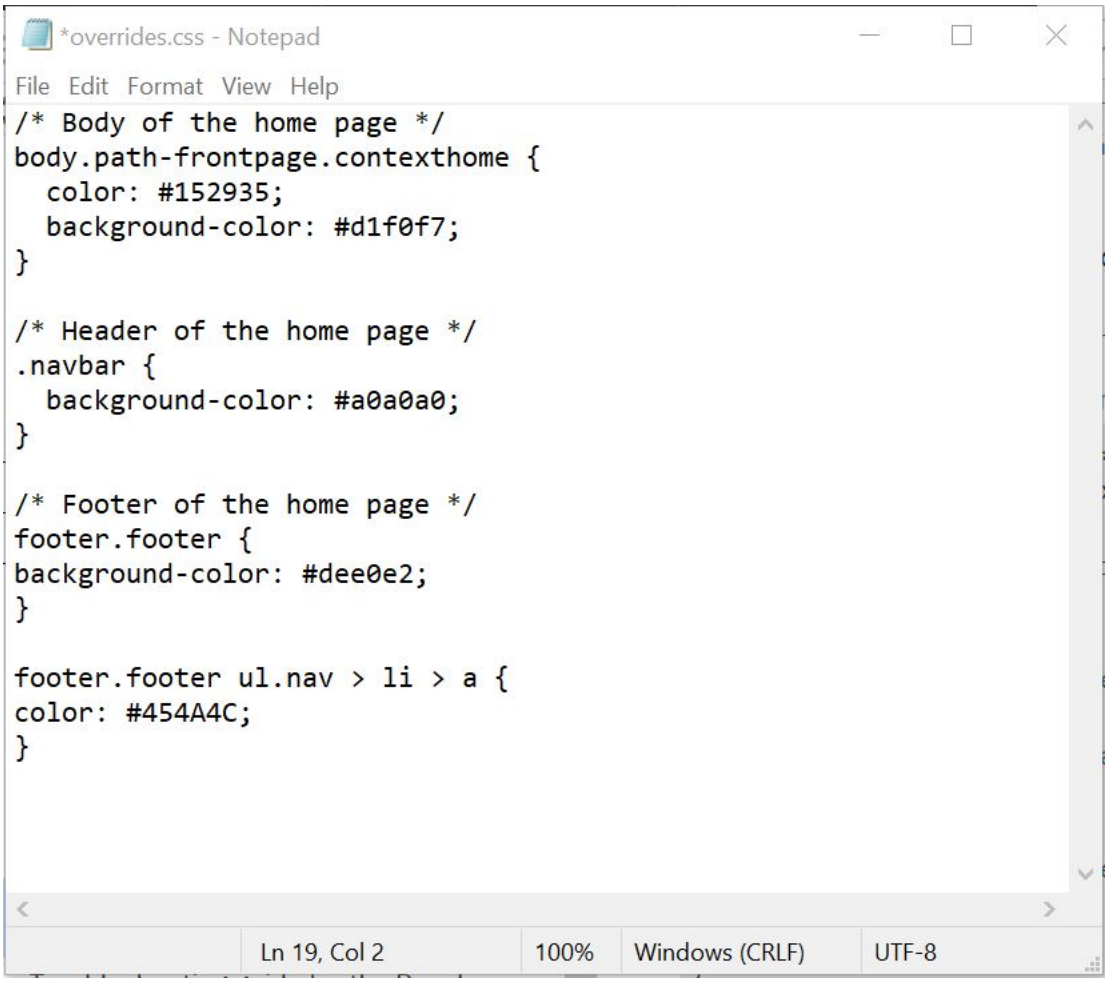
1. Open the overrides.css file in your chosen editor.
2. Customize your **sub-theme** by entering the following elements into the overrides.css file:

```
/* Body of the home page */
body.path-frontpage.contexthome {
  color: #152935;
  background-color: #d1f0f7;
}

/* Header of the home page */
.navbar {
  background-color: #a0a0a0;
}

/* Footer of the home page */
footer.footer {
background-color: #dee0e2;
}

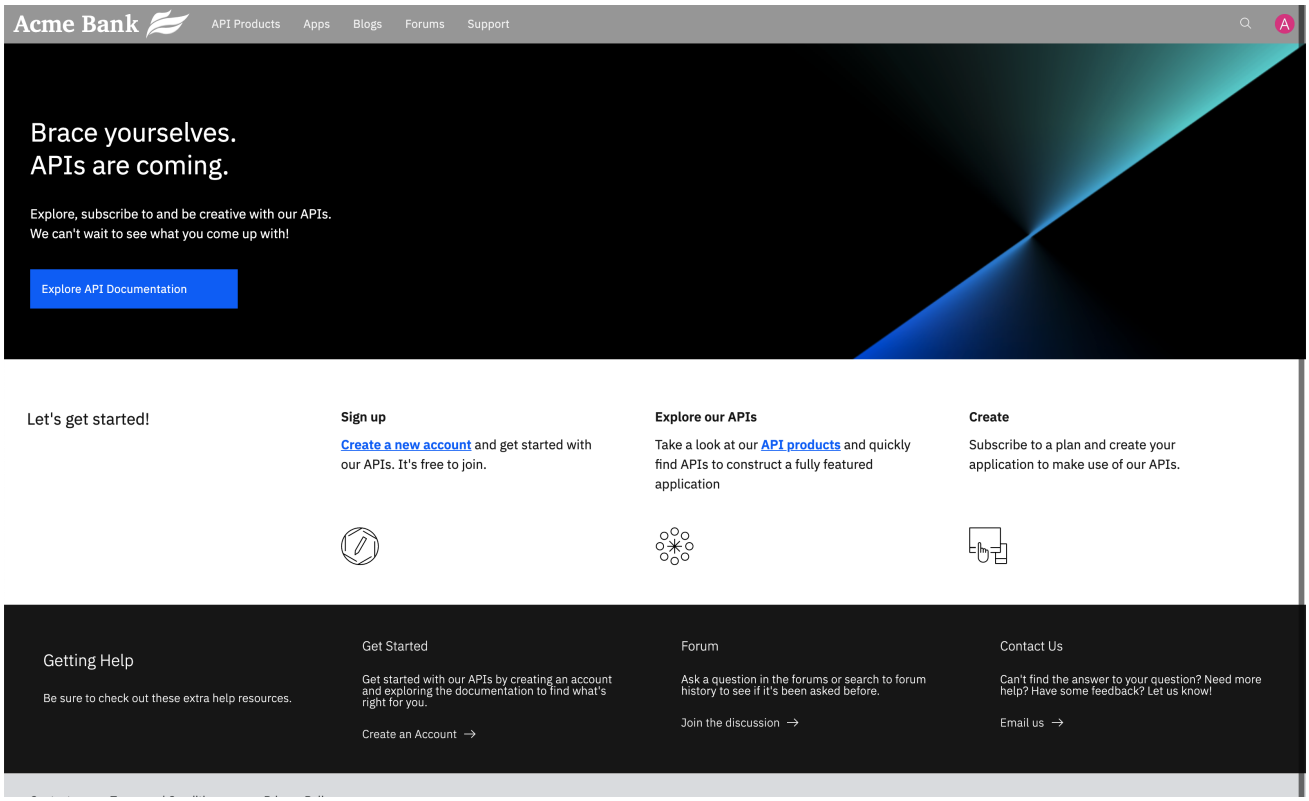
footer.footer ul.nav > li > a {
color: #454A4C;
}
```



3. Save the overrides.css file.

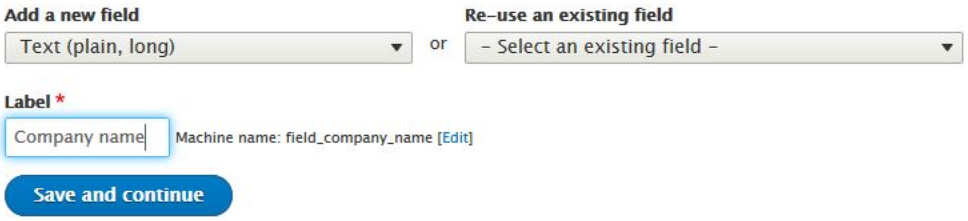
You can now install and enable your customized theme.

1. After you finish updating the overrides.css file, compress all the theme files back into the .zip **sub-theme** file that you downloaded originally.
2. In the Developer Portal, click Appearance > Install new theme. The **Install new theme** window is displayed.
3. In Upload a module or theme archive to install click Browse, and navigate to your newly updated compressed theme file.
4. Click Install to install the theme onto your site.
5. Click Enable newly added themes, and find your new theme in the list of **Disabled themes**. Click Enable and set as default to set your new custom **sub-theme** as the default theme for your site.
6. Return to the Developer Portal home page by clicking Back to site. You can now see your custom theme.



Add a field to an application content type to change the `site-config` on the staging Developer Portal

1. Log in to your staging Developer Portal as an administrator.
2. If the administrator dashboard isn't displayed, click Manage to display it.
3. Click Structure > Content types > Application > Manage fields.
4. Click + Add field.
5. In **`Add a new field`**, select Text (plain, long). Enter `Company name` as the label title.



6. Click Save and continue.
7. Leave the **`Allowed number of values`** set to 1 and click Save field settings.
8. Click Save field settings. You can now see your new field.

Use the Portal Admin API to export the custom themes and `site-config` on the staging Developer Portal

1. Export your custom themes.
   a. Create the export job by using this command:

```
curl -k -X 'POST' -H "Authorization: bearer $TOKEN" -H 'Accept: application/yaml'
'https://<management_server>/portal/catalogs/<org>/<catalog>/custom-theme/export'
```

   For example,

```
curl -k -X 'POST' -H "Authorization: bearer $TOKEN" -H 'Accept: application/yaml'
'https://api.stagingexample.com/portal/catalogs/ibm/staging/custom-theme/export'
```

   Here is an example of some possible output:

```
status: 201
message:
  stdout: >-
    /catalogs/75cfdc05-e818-408e-8ce6-fd3fd61c8756/f09602a2-a0e4-40dc-a82d-d1af326ad092/custom-
```

```
theme/export/85z2m39znojolv2s/status
  stderr: ''
errors: []
```

b. You can check the status of the export job by invoking the `/status` endpoint.

```
curl -k -X 'GET' -H "Authorization: bearer $TOKEN"  -H 'Accept: application/yaml'
'https://<management_server>/portal/catalogs/<org>/<catalog>/custom-theme/export/<task_id>/status'
```

For example,

```
curl -k -X 'GET' -H "Authorization: bearer $TOKEN" -H 'Accept: application/yaml'
'https://api.stagingexample.com/portal/catalogs/ibm/staging/custom-theme/export/85z2m39znojolv2s/status'
```

Here is an example of some possible output:

```
{
  "status": 200,
  "message": {
    "stdout": "The status of this task is: FINISHED and the artifact can now be streamed"
  },
  "errors": []
}
```

c. You can now download the custom theme file onto your machine.

```
curl -k -X 'GET' -H "Authorization: bearer $TOKEN" -H 'Accept: application/octet-stream'
'https://<management_server>/portal/catalogs/<org>/<catalog>/custom-theme/export/<task_id>' -o <theme_name>
```

For example,

```
curl -k -X 'GET' -H "Authorization: bearer $TOKEN" -H 'Accept: application/octet-stream'
'https://api.stagingexample.com/portal/catalogs/ibm/staging/custom-theme/export/85z2m39znojolv2s' -o mytheme.tgz
```

Note: When you use the `curl` commands to download files, if you do not specify an output with `-o`, it incorrectly prints the output as binary onto the terminal screen.

d. On Mac and Linux® machines, you can verify that you have a valid theme export `.tgz` file by invoking the tar `t --list` argument.

```
tar -tvf <theme_name>
```

For example,

```
tar -tvf mytheme.tgz
```

Here is an example of some possible output:

```
drwxrwsr-x  0 aegir  aegir       0  9 Jun 13:40 ./
drwxr-sr-x  0 aegir  aegir       0  9 Jun 13:40 emerald_theme_css/
-rw-r--r--  0 aegir  aegir       7  9 Jun 13:40 emerald_theme_css/emerald_theme_css.theme
-rw-r--r--  0 aegir  aegir   29224  9 Jun 13:40 emerald_theme_css/screenshot.png
-rw-r--r--  0 aegir  aegir     442  9 Jun 13:40 emerald_theme_css/composer.json
-rw-r--r--  0 aegir  aegir     599  9 Jun 13:40 emerald_theme_css/emerald_theme_css.info.yml
-rw-r--r--  0 aegir  aegir    1150  9 Jun 13:40 emerald_theme_css/favicon.ico
-rw-r--r--  0 aegir  aegir    5932  9 Jun 13:40 emerald_theme_css/logo.svg
-rw-r--r--  0 aegir  aegir      61  9 Jun 13:40 emerald_theme_css/emerald_theme_css.libraries.yml
drwxr-sr-x  0 aegir  aegir       0  9 Jun 13:40 emerald_theme_css/css/
-rw-r--r--  0 aegir  aegir   47249  9 Jun 13:40 emerald_theme_css/css/overrides.css
```

2. Export your site config.

a. Create the export job by using this command:

```
curl -k -X 'POST' -H "Authorization: bearer $TOKEN" -H 'Accept: application/json'
'https://<management_server>/portal/catalogs/<org>/<catalog>/config/export'
```

For example,

```
curl -k -X 'POST' -H "Authorization: bearer $TOKEN" -H 'Accept: application/json'
'https://api.stagingexample.com/portal/catalogs/ibm/staging/config/export'
```

Here is an example of some possible output:

```
{
    "status": 201,
    "message": {
        "stdout": "/catalogs/75cfdc05-e818-408e-8ce6-fd3fd61c8756/f09602a2-a0e4-40dc-a82d-
d1af326ad092/config/export/5cy1gk55ciiwn190/status",
        "stderr": ""
    },
    "errors": []
}
```

b. You can check the status of the export job by invoking the `/status` endpoint.

```
curl -k -X 'GET' -H "Authorization: bearer $TOKEN" -H 'Accept: application/json'
'https://<management_server>/portal/catalogs/<org>/<catalog>/config/export/<task_id>/status'
```

For example,

```
curl -k -X 'GET' -H "Authorization: bearer $TOKEN" -H 'Accept: application/json'
'https://api.stagingexample.com/portal/catalogs/ibm/staging/config/export/5cy1gk55ciiwn190/status'
```

Here is an example of some possible output:

```
{
  "status": 200,
  "message": {
    "stdout": "The status of this task is: FINISHED and the artifact can now be streamed"
  },
  "errors": []
}
```

c. You can now download the site-config file onto your machine.

```
curl -k -X 'GET' -H "Authorization: bearer $TOKEN" -H 'Accept: application/octet-stream'
'https://<management_server>/portal/catalogs/<org>/<catalog>/config/export/<task_id>' -o <config_name>
```

For example,

```
curl -k -X 'GET' -H "Authorization: bearer $TOKEN" -H 'Accept: application/octet-stream'
'https://api.stagingexample.com/portal/catalogs/ibm/staging/config/export/5cy1gk55ciiwn190' -o myconfig.tgz
```

Note: When you use the `curl` commands to download files, if you do not specify an output with `-o`, it incorrectly prints the output as binary onto the terminal screen.

d. On Mac and Linux machines, you can verify that you have a valid theme export `.tgz` file by invoking the tar `t --list` argument. The `head -n 10` option returns the first 10 lines of the result.

```
tar -tvf <config_name> | head -n 10
```

For example,

```
tar -tvf myconfig.tgz | head -n 10
```

Here is an example of some possible output, which should be a list of yaml files:

```
-rw-rw-r--  0 aegir  aegir 393 11 Jun 15:54 block.block.bartik_page_title.yml
-rw-rw-r--  0 aegir  aegir 577 11 Jun 15:54 filter.format.plain_text.yml
-rw-rw-r--  0 aegir  aegir 256 11 Jun 15:54 captcha.captcha_point.consumerorg_invite_user_form.yml
-rw-rw-r--  0 aegir  aegir 741 11 Jun 15:54 block.block.emerald_theme_css_account_menu.yml
-rw-rw-r--  0 aegir  aegir 488 11 Jun 15:54 field.field.node.application.apic_hostname.yml
-rw-rw-r--  0 aegir  aegir 460 11 Jun 15:54 field.storage.node.apic_catalog_id.yml
-rw-rw-r--  0 aegir  aegir 545 11 Jun 15:54 field.field.user.user.apic_user_registry_url.yml
-rw-rw-r--  0 aegir  aegir 427 11 Jun 15:54 language.content_settings.shortcut.default.yml
-rw-rw-r--  0 aegir  aegir 460 11 Jun 15:54 field.storage.node.api_soapversion.yml
-rw-rw-r--  0 aegir  aegir 148 11 Jun 15:54 captcha.captcha_point.node_product_form.yml
```

Use the Portal Admin API to import the custom themes and `site-config` on the production Developer Portal

Note: If you are importing your custom theme onto a new server, then before you continue, follow step 1 of this tutorial to obtain a new token to authenticate with your second server. If you are using the same server, and are importing the theme into a new catalog, then the current TOKEN remains valid for the rest of the steps.
Note: You must import the custom theme before you import the site config. This order is because the site config contains information about the default theme, and so your custom theme must exist on the portal when the site config is imported so that it can be set upon import.

1. Import your custom themes.
   a. On the production catalog, import the custom theme onto the production catalog `prod` by using this command:

```
curl -k -X 'POST' -H "Authorization: bearer $TOKEN" -H 'Accept: application/yaml' -H 'Content-Type:
application/octet-stream' 'https://<management_server>/portal/catalogs/<org>/<catalog>/custom-theme/import' --data-
binary @<path_to_theme_file>
```

For example,

```
curl -k -X 'POST' -H "Authorization: bearer $TOKEN" -H 'Accept: application/yaml' -H 'Content-Type:
application/octet-stream' 'https://api.productionexample.com/portal/catalogs/ibm/prod/custom-theme/import' --data-
binary @/Users/steve/PortaladminCLI/mytheme.tgz
```

Here is an example of some possible output:

```
status: 201
message:
  stdout: >-
    /catalogs/75cfdc05-e818-408e-8ce6-fd3fd61c8756/56f3d4ca-8be2-48f7-8f91-3d654c2b91f2/custom-
theme/import/vtscpucj08i0hfo6/status
  stderr: ''
errors: []
```

   b. You can check the status of the import job by invoking the `/status` endpoint on this command:

```
curl -k -X 'GET' -H "Authorization: bearer $TOKEN" -H 'Accept: application/yaml'
'https://<management_server>/portal/catalogs/<org>/<catalog>/custom-theme/import/<task_id>/status'
```

For example,

```
curl -k -X 'GET' -H "Authorization: bearer $TOKEN" -H 'Accept: application/yaml'
'https://api.productionexample.com/portal/catalogs/ibm/prod/custom-theme/import/vtscpucj08i0hfo6/status'
```

Here is an example of some possible output:

```
{
  "status": 200,
  "message": {
    "stdout": "2020-06-09 13:00:59: CLI task (custom_theme:import) starting.\n2020-06-09 13:00:59: Importing custom
theme emerald_theme_css\n2020-06-09 13:01:18: CLI task (custom_theme:import) completed successfully.",
    "stderr": ""
  },
```

```
  "errors": []
}
```

2. Import your site config.
   a. Import the existing site-config onto the production catalog `prod` by using this command:

```
curl -k -X 'POST' -H "Authorization: bearer $TOKEN" -H 'Accept: application/json' -H 'Content-Type:
application/octet-stream' 'https://<management_server>/portal/catalogs/<org>/<catalog>/config/import' --data-binary
@<path_to_config_import>
```

   For example,

```
curl -k -X 'POST' -H "Authorization: bearer $TOKEN" -H 'Accept: application/json' -H 'Content-Type:
application/octet-stream' 'https://api.productionexample.com/portal/catalogs/ibm/prod/config/import' --data-binary
@/Users/steve/PortaladminCLI/myconfig.tgz
```

   Here is an example of some possible output:

```
{
  "status": 201,
  "message": {
      "stdout": "/catalogs/75cfdc05-e818-408e-8ce6-fd3fd61c8756/56f3d4ca-8be2-48f7-8f91-
3d654c2b91f2/config/import/kzyozx4v5sfa8la5/status",
      "stderr": ""
  },
  "errors": []
}
```

   b. You can check the status of the config import job by invoking the `/status` endpoint:

```
curl -k -X 'GET' -H "Authorization: bearer $TOKEN" -H 'Accept: application/json'
'https://<management_server>/portal/catalogs/<org>/<catalog>/config/import/<task_id>/status'
```

   For example,

```
curl -k -X 'GET' -H "Authorization: bearer $TOKEN" -H 'Accept: application/json'
'https://api.productionexample.com/portal/catalogs/ibm/prod/config/import/kzyozx4v5sfa8la5/status'
```

   Here is an example of some possible output:

```
{
  "status": 200,
  "message": {
      "stdout": "2020-06-11 15:42:55: CLI task (site_config:import) starting.\n2020-06-11 15:43:29: CLI task
(site_config:import) completed successfully.",
      "stderr": ""
  },
  "errors": []
}
```

What you did in this scenario

In this scenario, you created a theme and changed the configuration on your staging Developer Portal. Then, you used the Portal Admin API to replicate the changes on to your production Developer Portal.

You can now see the changes that you made on your production Developer Portal.

How to enable and disable maintenance mode on your Developer Portal

You can use the Portal commands in the toolkit CLI to enable and disable maintenance mode on your Developer Portal site.

Before you begin

To complete this Portal CLI scenario, you must have a Developer Portal enabled. You must also have administrator access to this site, and the permission **`settings:manage`**, to complete this scenario. The tutorial Creating the Portal explains how to enable the portal if you haven't enabled it already.

For more information about using the toolkit CLI with the Developer Portal, see Getting started with the Portal CLI commands.

Important: Maintenance mode is designed for short-term site maintenance; it is not meant for long-term usage. While a site is in maintenance mode, the database is not updated with new content from API Manager.

About this scenario

In this scenario, you use the toolkit CLI to enable, and then disable, maintenance mode on your Developer Portal site.

The scenario takes you through the following steps:

1. Log in to the management server as a Provider organization by using the toolkit CLI
2. Use the toolkit CLI to enable maintenance mode
3. Use the toolkit CLI to disable maintenance mode

Log in to the management server as a Provider organization by using the toolkit CLI

- Log in to the toolkit CLI as a Provider org:

```
apic login --server management_server --realm provider/identity_provider --username provider_username --password
provider_password
```

You can determine which identity provider to use in the `--realm` parameter by entering the following command to see a list of all available identity providers (you do not need to be logged in to use this command):

```
apic identity-providers:list --scope provider --server mgmt_endpoint_url --fields title,realm
```

For example,

```
apic identity-providers:list --scope provider --server myserver.com --fields title,realm
total_results: 2
results:
  - title: API Manager User Registry
    realm: provider/default-idp-2
  - title: Corporate LDAP user registry
    realm: provider/corporate-ldap
```

The `title` value should enable you to determine which identity provider to use; you can then copy the corresponding `--realm` parameter directly from the displayed `realm` value. For any identity providers that were created by your administrator after API Connect was installed, the names will have been determined at creation time. The default API Manager Local User Registry for login as a member of a provider organization is `default-idp-2`.
For full details of the `apic login` command, see Logging in to a management server.

Use the toolkit CLI to enable maintenance mode

- Run the following command to enable maintenance mode on your Developer Portal:

```
apic --mode portaladmin drupal-state:set --server management_server --org orgid/name --catalog catalogid/name --state_key
system.maintenance_mode  --input_format integer --state_value 1
```

Where:
  - *`management_server`* is the endpoint URL of your management server (required).
  - *`catalogid/name`* is the ID or name of the catalog that your site belongs to (required).
  - *`orgid/name`* is the ID or name of the provider organization that the catalog belongs to (required).
  - `--state_key` is the name of the state key (required). Must be set to `system.maintenance_mode`.
  - `--input_format` is the input format of the value of the state key. Must be set to `integer` for configuring the maintenance mode.
  - `--state_value` is the value to assign to the state key (required). Set to `1` to enable maintenance mode.

For example, to enable maintenance mode for a Developer Portal in the `myOrg` organization, and in the `dev` catalog:

```
apic --mode portaladmin drupal-state:set --server my.management.server.com --org myOrg --catalog dev --state_key
system.maintenance_mode  --input_format integer --state_value 1
Successfully set state system.maintenance_mode to the value of 1.
```

The Developer Portal site is now inaccessible to everyone apart from an administrator. All other users who enter the site URL will see a maintenance message set by the administrator.

Use the toolkit CLI to disable maintenance mode

- Run the following command to disable maintenance mode on your Developer Portal:

```
apic --mode portaladmin drupal-state:set --server management_server --org orgid/name --catalog catalogid/name --state_key
system.maintenance_mode  --input_format integer --state_value 0
```

Where:
  - *`management_server`* is the endpoint URL of your management server (required).
  - *`catalogid/name`* is the ID or name of the catalog that your site belongs to (required).
  - *`orgid/name`* is the ID or name of the provider organization that the catalog belongs to (required).
  - `--state_key` is the name of the state key (required). Must be set to `system.maintenance_mode`.
  - `--input_format` is the input format of the value of the state key. Must be set to `integer` for configuring the maintenance mode.
  - `--state_value` is the value to assign to the state key (required). Set to `0` to disable maintenance mode.

For example, to disable maintenance mode for a Developer Portal in the `myOrg` organization, and in the `dev` catalog:

```
apic --mode portaladmin drupal-state:set --server my.management.server.com --org myOrg --catalog dev --state_key
system.maintenance_mode  --input_format integer --state_value 0
Successfully set state system.maintenance_mode to the value of 0.
```

Your Developer Portal site is now accessible to everyone again.

What you did in this scenario

In this scenario, you used the toolkit CLI to put your Developer Portal site into maintenance mode, and to turn maintenance mode off again.

Related tasks

- Toggling the site in and out of maintenance mode

Troubleshooting guide for the Developer Portal

Use this guide to help you diagnose and resolve Developer Portal issues in IBM® API Connect. For example, why is the Developer Portal not connecting to the Management server, why is my site not created, and why can't I log in?

About

The following sections provide advice about how to diagnose and resolve some common problems. This information can help you to identify whether a specific IBM API Connect Version 10 component is failing, whether it's an environmental problem, and whether you should raise a support request. Some advice includes reviewing specific log files so you can narrow down the source of the problem.

Note: In the Help page of the Cloud Manager, API Manager, and API Designer user interfaces, there's a Product information tile that you can click to find out information about your product versions, as well as Git information about the package versions being used. Note that the API Designer product information is based on its associated management server, but the Git information is based on where it was downloaded from.

1. Why is the Developer Portal not connecting to the Management server?
2. Why is my Developer Portal site not being created?
3. Why can't I register a user?
4. Why can't I login?
5. Why are changes to Products not appearing in the Developer Portal?
6. Why am I having problems with my Developer Portal user interface?
7. Why am I having problems with my Kubernetes system?
8. Why am I having problems with my Developer Portal backup?
9. Why am I having problems installing Drupal 8 based custom modules or sub-themes into the Drupal 9 based Developer Portal?

Why is the Developer Portal not connecting to the Management server?

Problems with connecting to the Management server can be due to connectivity or TLS issues. You should check the following areas:

- Can the Management server actually reach the Developer Portal?
- Is SSL passthrough enabled or required on any load balancer that sits between the Management server and the Developer Portal? For more information, see JWT security on Kubernetes and OpenShift, JWT security on OVA.

If you need to open a Service Request, include the following information:

- The IBM API Connect MustGather Information.
- Details of the date and time that the connection attempts were made.

Why is my Developer Portal site not being created?

If you are having problems creating a site, you should take the following actions to help diagnose the issue:

1. Tail the nginx container log to confirm that the site create request reached the portal, for example:

   ```
   kubectl logs rb93d4fb118-apic-portal-nginx-7c7b464fb6-vvx5m
   ```

2. Look in the container log for a site create request, for example:

   ```
   POST /portal-service-configuration-create HTTP/1.1" 200
   ```

   a. If you don't find a site create request in the log, then the create request is not reaching the Developer Portal from the Management. Follow the instructions in Why is the Developer Portal not connecting to the Management server? to diagnose the connectivity issues.
   b. If a site create request is in the log, then further diagnostics can be found in the admin pod log, for example:

   ```
   kubectl logs -f rb93d4fb118-apic-portal-www-p4bhj -c admin
   ```

   Look in the admin pod log for messages that refer to `create_site`, as well as the name of the site.

Why can't I register a user?

If you are having problems registering a user, take the following actions to help diagnose the issue:

- The user registration links in the emails are only valid for 24 hours, so check that the system time is correctly configured across all of the pods.
- If emails aren't being received, check that the email server is correctly configured; see Configuring an email server for notifications. Also, if possible, check whether other emails such as publish approval alerts or password reset emails are being received.

If you need to open a Service Request, please take the following steps:

1. Note which user registry type is being used, such as Local User Registry (LUR), or LDAP user registry.
2. Enable the debug REST server and method trace in the Developer Portal UI. Click Configuration > Development > IBM Development on the administrator dashboard. Then select the Enable method entry / exit trace and Enable API Manager REST interface debug check boxes. Click Save configuration.
3. Re-create the issue, making a note of the time, the username, and any messages displayed on the screen.
4. Gather the web container log for the www pod, for example:

   ```
   kubectl logs portal-apic-portal-www-zhqxf web > web.log
   ```

5. Gather all of the Management server logs and the logs for the user registry type that is being used; see IBM API Connect MustGather Information for details.

Why can't I login?

If users are having problems with logging in to the Developer Portal, please take the following steps before opening a Service Request:

1. Note which user registry type is being used, such as Local User Registry (LUR), or LDAP user registry.
2. Enable the debug REST server and method trace in the Developer Portal UI. Click Configuration > Development > IBM Development on the administrator dashboard. Then select the Enable method entry / exit trace and Enable API Manager REST interface debug check boxes. Click Save configuration.
3. Recreate the issue, making a note of the time, the username, and any messages printed to the screen.
4. Gather the web container log for the www pod, for example:

```
kubectl logs portal-apic-portal-www-zhqxf web > web.log
```

5. Gather all of the Management server logs and the logs for the user registry type that is being used; see IBM API Connect MustGather Information for details.

Why are changes to Products not appearing in the Developer Portal?

To determine whether the problem is with the Portal server (either the nginx or the www pod), the Management server, or the network, please make the following diagnostic checks.

Portal nginx pod

1. Tail the nginx pod log on the Portal, for example:

   ```
   kubectl logs -f portal-apic-portal-nginx-866c977c4c-n9gbf
   ```

2. Make a publish request to the Catalog (note that the request must be a Publish or Retire operation, not a Stage operation).
3. In the log being tailed, see if the following message appears:

   ```
   ...POST /event-create...
   ```

If the POST message appears in the nginx log, then the publish webhook that was sent from the Management server did arrive at the Portal. If there is an error message in place of a POST message, then the problem is likely to be with the nginx pod. If there is no message at all, then it's likely that the webhook from the Management server is not reaching the Portal and there is a network problem.

Portal www pod

1. Tail the www pod admin container log on the Portal, for example:

   ```
   kubectl logs -f portal-apic-portal-www-dtbzw -c admin
   ```

2. Make a publish request to the Catalog (note that the request must be a Publish or Retire operation, not a Stage operation).
3. In the log being tailed, see if the following message appears:

   ```
   Received webhook event 'product_lifecycle' for catalog
   ```

If no such message appears, it suggests that the webhook is either not arriving at the Portal, or not getting beyond the nginx pod (see the previous section Portal nginx pod). Any errors that the admin container has in processing the webhook will be logged in the www pod admin container log.

Management server apim pod

1. Tail the apim pod log on the Management server, for example:

   ```
   kubectl logs -f apiconnect-apim-v2-86b464c4f5-4cx6r
   ```

2. Make a publish request to the Catalog (note that the request must be a Publish or Retire operation, not a Stage operation).
3. In the log being tailed, see if there any error messages.

Search for the word 'sending', you should see the message `webhook: sending successful` if the webhook is sent, or error messages indicating why if the webhook is not sent.

Why am I having problems with my Developer Portal user interface?

If you are having user interface (UI) problems, make the following checks:

- Try clearing the cache from your browser, try using private browsing, and try using different browsers - see whether there are any differences in behavior.
- Check your browser window size and screen resolution, and try increasing and decreasing the settings.
- Investigate the browser developer tools console and network tabs, as they might provide some diagnostic clues.
- Try clearing the Drupal caches from within the Developer Portal; see Clearing the server caches for details.

If you need to open a Service Request, along with the IBM API Connect MustGather Information logs, also include details of the time and date when the problem was reproduced. In addition, an export of the browser developer tools console and network output would be helpful.

Why am I having problems with my Kubernetes system?

Kubernetes provides a DNS server as one of the pods in the kube-system namespace (unless you have configured your Kubernetes setup differently), and sometimes this DNS server can silently fail. When the Portal www or db pods restart, they check that their own hostname and IP address is in the service that is defined for the pod. If the DNS server is down, this check fails. An indication that the DNS server is down is seeing the following log lines printed endlessly in the admin or db containers:

```
[     admin stdout] 2cd141dc:2cd141dc:2cd141dc 2018-10-08 07:27:54: service-ready:
[     admin stdout] 2cd141dc:2cd141dc:2cd141dc 2018-10-08 07:27:54: service-all:
[     admin stdout] 2cd141dc:2cd141dc:2cd141dc 2018-10-08 07:27:54: Waiting for sleep in service all check. Pid(s) 352  Seconds
24
[     admin stdout] 2cd141dc:2cd141dc:2cd141dc 2018-10-08 07:27:59: Finished waiting for sleep in service all check. Pid(s)
352  Seconds 29
[     admin stdout] 2cd141dc:2cd141dc:2cd141dc 2018-10-08 07:28:01: WARNING 5: r4c09b98d02-apic-portal-admin-all doesn't
include this pod or r4c09b98d02-apic-portal-director does. Checking again in 5 seconds.
```

To fix this problem, delete the DNS pod in the kube-system namespace to force it to restart, for example:

```
kubectl -n kube-system delete pod kube-dns-b76db4f7f-n4lvt
```

Where *kube-dns-b76db4f7f-n4lvt* is the full name of the DNS pod.
Note: To find out the full name of the DNS pod in your Kubernetes system, run the following command:

```
kubectl -n kube-system get pods
```

This command will return data like the following example:

```
$ kubectl -n kube-system get pods
NAME READY STATUS RESTARTS AGE
default-http-backend-5bccfbdc8-mjnnb 1/1 Running 0 4d
etcd-minikube 1/1 Running 0 4d
kube-addon-manager-minikube 1/1 Running 0 4d
kube-apiserver-minikube 1/1 Running 0 4d
kube-controller-manager-minikube 1/1 Running 0 4d
kube-dns-6f4fd4bdf-7zslq 3/3 Running 0 4d
kube-proxy-mddmj 1/1 Running 0 4d
kube-registry-proxy-99qml 1/1 Running 0 4d
kube-registry-v0-zt8pv 1/1 Running 0 4d
kube-scheduler-minikube 1/1 Running 0 4d
kubernetes-dashboard-77d8b98585-dczcs 1/1 Running 0 4d
nginx-ingress-controller-57bcfc76d6-z775d 1/1 Running 0 4d
storage-provisioner 1/1 Running 0 4d
tiller-deploy-587df449fb-bpwhq 1/1 Running 0 4d
```

Why am I having problems with my Developer Portal backup?

If you attempt to back up your portal system or site:

```
apicup subsys exec <portal_subsystem> backup-system|backup-site|backup-all
```

You might encounter the following message:

```
curl: (6) Could not resolve host: apic-portal-apic-portal-director
```

This error is the result of a failure of the SFTP backup file transfer to the backup system, caused by missing authentication with the portal node. To correct this error, `ssh` from the backup system to the portal node, and accept the authentication key when prompted:

1. Enter the portal-www admin container, for example:

   ```
   kubectl exec -it WWW_POD_NAME -c admin bash
   ```

2. `ssh` to your backup server and accept any authentication prompts, for example:

   ```
   ssh BACKUP_SERVER_HOSTNAME
   ```

When you have successfully authenticated with your backup server, you can close the session. This action needs to be done only once. Portal backups can then run without any issues.

Why am I having problems installing Drupal 8 based custom modules or sub-themes into the Drupal 9 based Developer Portal?

From IBM API Connect 10.0.3.0, the Developer Portal is based on the Drupal 9 content management system. If you want to install Drupal 8 custom modules or sub-themes into the Drupal 9 based Developer Portal, you must ensure that they are compatible with Drupal 9, including any custom code that they contain, and not using any deprecated APIs, for example. There are tools available for checking your custom code, such as drupal_check on GitHub, which checks Drupal code for deprecations.

For example, any Developer Portal sites that contain modules or sub-themes that don't contain a Drupal 9 version declaration will fail to upgrade, and errors like the following output will be seen in the `admin` logs:

```
[     queue stdout] 14834 729319:355ec8:a7d29c 2021-09-04 20:34:49: check_d9_compat: Checking theme: emeraldgreen
[     queue stdout] 14834 729319:355ec8:a7d29c 2021-09-04 20:34:49: check_d9_compat: ERROR: Incompatible
core_version_requirement '' found for emeraldgreen

core_version_requirement '8.x' found for custom_mod_2
[     queue stdout] 14834 729319:355ec8:a7d29c 2021-09-04 20:44:49: check_d9_compat: ERROR: Found modules incompatible with
Drupal 9: emeraldgreen rubyred
[     queue stdout] 14834 729319:355ec8:a7d29c 2021-09-04 20:44:49: check_d9_compat: ERROR: site1.com is NOT Drupal 9
compatible
```

To fix version compatibility errors, all custom modules and sub-themes should declare a `core_version_requirement` key in their *.info.yml file that indicates Drupal 9 compatibility. For example:

```
name: Example module
type: module
description: Purely an example
core: 8.x
core_version_requirement: '^8 || ^9'
package: Example module

# Information added by Drupal.org packaging script on 2020-05-31
version: '8.x-1.3'
project: 'example_module'
datestamp: 1590905415
```

This example specifies that the module is compatible with all versions of Drupal 8 and 9. For more information, see Let Drupal know about your module with an .info.yml file on the drupal.org website.

If you have a backup of a site that you need to restore and are getting the version compatibility error, but the module or theme *.info.yml file cannot be changed easily, then you can modify the site backup.

To modify the site backup, extract the it, edit the relevant files inside it, and then tar the backup file again. Note that this procedure will overwrite the original backup file, so ensure that you keep a separate copy of the original file before you start the extraction. For example:

1. `mkdir /tmp/backup`
2. `cd /tmp/backup`
3. `tar xfz path_to_backup.tar.gz`
4. Edit the custom module and theme files to make them Drupal 9 compatible, and add the correct `core_version_requirement` setting.
5. `rm -f path_to_backup.tar.gz`
6. `tar cfz path_to_backup.tar.gz`
7. `cd /`
8. `rm -rf /tmp/backup`

Migrating your Developer Portal from Version 5 to Version 10

Guidance on how to migrate a Developer Portal site from IBM® API Connect Version 5, to IBM API Connect Version 10.

In IBM API Connect Version 10 the Developer Portal is based on the open source Drupal 9 content management software, which enables more advanced, flexible, and powerful customization capabilities. However, in IBM API Connect Version 5 the Developer Portal is based on Drupal 7. The migration tooling in Version 10 will create a new Developer Portal site, and migrate all of the associated APIs and Products, user information, and subscriptions over. However, customizations such as modules and themes cannot be automatically migrated, as the Drupal 9 baseline is very different to Drupal 7. For more information about upgrading from a Drupal 7 baseline to a Drupal 9 baseline, see Upgrading Drupal in the Drupal documentation.

The following sections take you through the migration process for the Developer Portal, and provide guidance on how to manually migrate any specific customizations to Drupal 9.

- Migration process for the Developer Portal
- Portal Delegated User Registries
- Custom themes
- Custom modules
- Custom Rules
- Custom content types and fields
- Advanced theme development
- Changing the page layout
- Changing the front page
- Features no longer available in the Developer Portal

Note: The ability to migrate is available only from IBM API Connect Version 5.0.8.7 onwards. If your deployment is at an earlier version, you must upgrade before migrating. See Upgrading your API Connect cloud for information about upgrading in Version 5. For more information about the supported versions for migration, see Migrating a Version 5 deployment.
Note: In Version 5, it was possible, though not recommended, to modify files on the Developer Portal server directly. For more information, see Developer Portal best practices for administrators. However, in Version 10, you should not make any system changes. Do not use the **kubectl exec** command to make changes inside the Developer Portal containers, and on OVA deployments do not make any modifications on the Developer Portal VM. Make any customizations on your Developer Portal by using the UI or CLI. Do not run a **kubectl exec** command on any Developer Portal containers unless asked to by IBM.

Migration process for the Developer Portal

The migration process for the Developer Portal migrates all of the following information to Version 10 for each site in your cluster:

- User information (if Portal Delegated User Registry is enabled, the process is slightly different; see Portal Delegated User Registries).
- Products and APIs.
- Consumer organizations.
- Applications.
- Subscriptions.

For information about the main migration process, see Migrating a Version 5 deployment.

Portal Delegated User Registries

In IBM API Connect Version 5, if Portal Delegated User Registry (PDUR) was selected for a Catalog, the user management was delegated from the management server to the Developer Portal. The site administrator within the Portal then performed the configuration of user registries, and the management server recorded that the delegation had taken place, and stored a record of the users that existed in the Catalog. However, the management service maintained no information about the configuration of the specific registries or how users mapped to them. In IBM API Connect Version 10, all user registry configuration takes place in the management server, and PDUR is no longer needed. Therefore, to migrate the PDUR user registries and users from v5 to v10, configuration information must be gathered from both the management server and the Portal node.

If your IBM API Connect Version 5 Developer Portal uses Portal Delegated User Registry (PDUR), you must first export the user information that is stored in the Version 5 Developer Portal local database. This user information can then be fed into the migration tooling so that the correct user registries can be created in the newer version of API Connect.

For more information about how to export the PDUR information from v5, see Exporting Portal Delegated User Registry user information. For more information about the migration process in v10, see Migration steps with PDUR.

Custom themes

If your Version 5 Developer Portal is using a custom theme, you'll need to create the custom theme again for the Drupal 9 baseline. Start by creating a sub-theme of the new Version 10 Developer Portal site by using the theme generator, and then manually customize the sub-theme to your specifications for Drupal 9 by using Cascading Style Sheets (CSS), or Sass CSS (SCSS). Note that using SCSS in your theme makes it far simpler to change colors. We've also added a color template theme generator, which means you can quickly generate a base color theme on which to build your customized site branding. For more information, see Creating a sub-theme.

Note, directly editing the API Connect theme is not permitted or supported, as edited versions of these files are overwritten when a fix pack or iFix is installed.

Other useful resources:

- Tutorial: Creating a custom theme for the Developer Portal - takes you through how to use the theme generator, customize a theme, and install a custom theme.
- Changing the site logo - how to change your site logo.
- Changing the shortcut icon - how to change the shortcut icon (favicon).
- Creating sub-themes - Drupal documentation about creating a sub-themes.
- Theming differences between Drupal 6, 7 & 8 - Drupal documentation about theming differences.

Custom modules

If your Version 5 Developer Portal is using any custom modules, you will need to create these custom modules again for the Drupal 9 baseline. For more information on writing custom modules, see Extend.

Other useful resources:

- Creating custom modules - Drupal documentation about creating custom modules.
- Getting started creating custom modules - Drupal documentation giving background information and prerequisites needed for custom module development.
- Understanding hooks - Drupal documentations about hooks.
- Drupal API hooks - Drupal documentation about the hooks that are available.

Custom Rules

If your Version 5 Developer Portal is using any custom Rules, you will need to create them as custom modules for the Drupal 9 baseline. You cannot export the Drupal 7 Rules, and then import them into the Drupal 9 baseline, as the events and actions are implemented in a different way. For more information about custom modules, see the Custom modules section.

Custom content types and fields

If your Version 5 Developer Portal is using any custom content, you will need to create this content again for the Drupal 9 baseline.

For information about creating custom content types, see the following topics:

- Creating content types
- Adding fields to content types
- Adding custom fields to user records

Advanced theme development

If your Version 5 Developer Portal is using modified content type templates, you must create these templates again for the Drupal 9 baseline. In Drupal 9 the templates are Twig files that define the actual HTML output for a particular piece of content. You can override a Twig template by copying the original template into the templates folder of your custom sub-theme, and then editing the template to your specification. The Developer Portal then uses your template in preference to the original one. For more information, see Applying a modified content type template, and Creating a sub-theme. You can also follow a guided example of how to create a new theme, see Tutorial: Creating a custom theme for the Developer Portal.

Note:
Modifying Twig templates allows very fine-grained control over the structure of pages. However, it also means you might miss new features and defect fixes that are made to the original templates, as your Developer Portal is using your overrides instead of the originals. So, if you override a template, it is your responsibility to check the templates in the latest API Connect Version 10 releases, and to ensure that any equivalent changes that are needed to your overrides to maintain functional equivalence are made.

Changing the page layout

If your Version 5 Developer Portal is using a different page layout, you will need to create this layout again for the Drupal 9 baseline. The page layout is defined by configuring which blocks appear in which regions. Blocks are controlled by using the Structure > Block layout options on the Developer Portal administrator dashboard.

For information about how to configure the page layout, see Adding and changing the blocks displayed on Developer Portal pages.

Changing the front page

If your Version 5 Developer Portal is using a different front page, you will need to create this front page again for the Drupal 9 baseline. The front page is configured from the Structure > Pages options on the Developer Portal administrator dashboard.

For information about how to configure the front page, see Configuring the front page, and Adding custom pages.

Further options that you might want to consider when designing your front page include:

- Change the banner block content or image: Changing the front page banner block.
- Display featured API Products by creating a featured content block: Changing the front page Featured Content block.
- Create custom blocks with your own HTML content: Adding and changing the blocks displayed on Developer Portal pages.
- Set up the social block to include your organization Twitter feed: Integrating X data into the social block.

Features no longer available in the Developer Portal

The following features that are available in IBM API Connect Version 5, are not available in IBM API Connect Version 10:

- Security questions - these can now be created inside an OpenID Connect provider.
- Two-factor authentication - this can now be performed inside an OpenID Connect provider.
- Support tickets - no Drupal 9 equivalent module is currently available.

Guidelines on upgrading your Developer Portal from Drupal 9 to Drupal 10

Information about the upgrade of the Developer Portal from Drupal 9 to Drupal 10.

The Developer Portal is based on the open source Drupal content management system. From API Connect 10.0.5.3, Drupal 9 is upgrading to Drupal 10, which also requires PHP 8.1. All existing Developer Portal sites will be upgraded to, and all new sites will be based on Drupal 10. Therefore, all modules and themes on your Developer Portal site must be compatible with Drupal 10 and PHP 8.1. The core modules and themes are automatically made compatible as part of the upgrade. However, if your Developer Portal sites contain any custom modules or themes, either written in-house or contributed by the Drupal community, it is your responsibility to ensure that they are Drupal 10 and PHP 8.1 compatible before the upgrade.

See the following topics for more detailed information about how to prepare your Developer Portal sites for the upgrade to Drupal 10.

- How to find your custom modules and themes on your Developer Portal.
- Prepare your Developer Portal for the update for Drupal 10.
- Upgrade your custom modules to be Drupal 10 and PHP 8.1 compliant.

Upgrading from older versions of API Connect v10

If you are upgrading to 10.0.5.3 from 10.0.1.7 or earlier, or coming from 10.0.5.0 or earlier, your Developer Portal sites will first be upgraded to Drupal 9.5 and then to Drupal 10. This is because upgrading to Drupal 10 requires your site to be on at least Drupal 9.4.4.

Note that if you are in the category where a double upgrade occurs, your Developer Portal sites are going to take double the time to upgrade compared to your normal experience, because upgrading from Drupal 9 to Drupal 10 is a major upgrade. Therefore, when you are planning your maintenance window for upgrading to 10.0.5.3, you need to be aware of the extended time frame. To shorten your upgrade window, consider removing the Developer Portal sites that you do not need.

How to find your custom modules and themes on your Developer Portal

Guidance on how to find what custom modules and themes you installed on your Developer Portal.

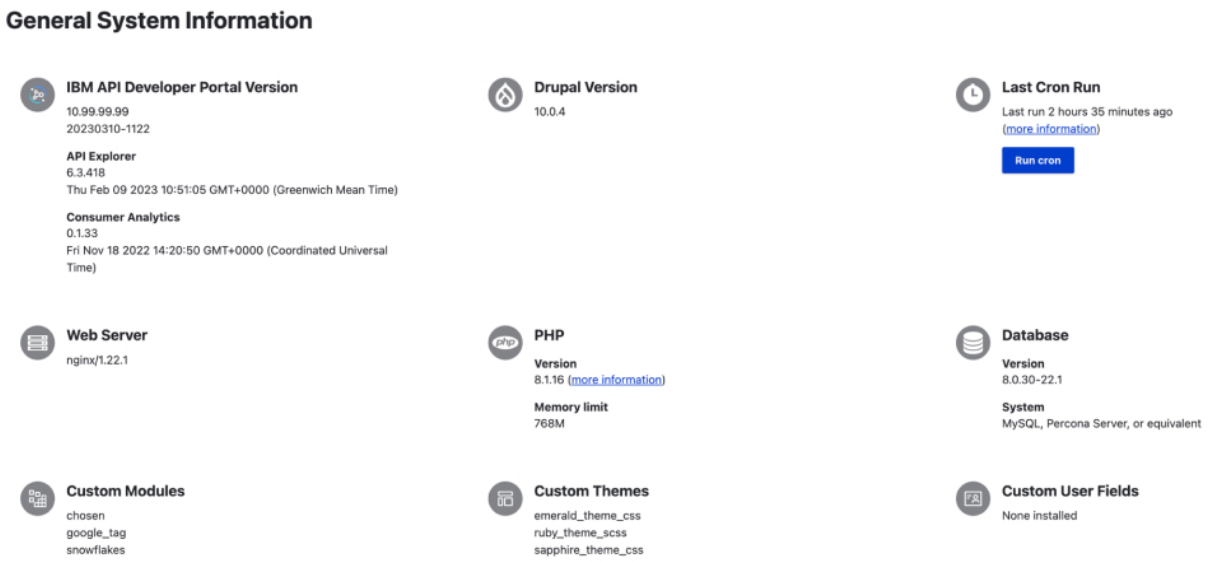
The Developer Portal within API Connect comes with built-in modules and themes that you can use to customize your site. You can extend your customizations by installing external custom modules and themes, or even ones written by yourself. If you are unsure which custom modules and themes are installed on your Developer Portal, you can use one of the following methods to find out.

1. Method 1. Developer Portal admin status report (recommended)
2. Method 2. Developer Portal toolkit CLI
3. Method 3. Developer Portal container

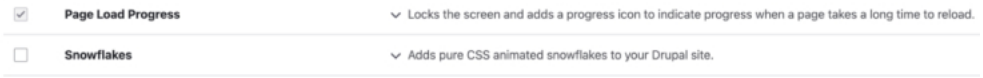
Method 1. Developer Portal admin status report (recommended)

1. Log in to your Developer Portal as the administrator.
2. If the administrator dashboard is not displayed, click Manage to display it.
3. Click Manage > Reports > Status report.

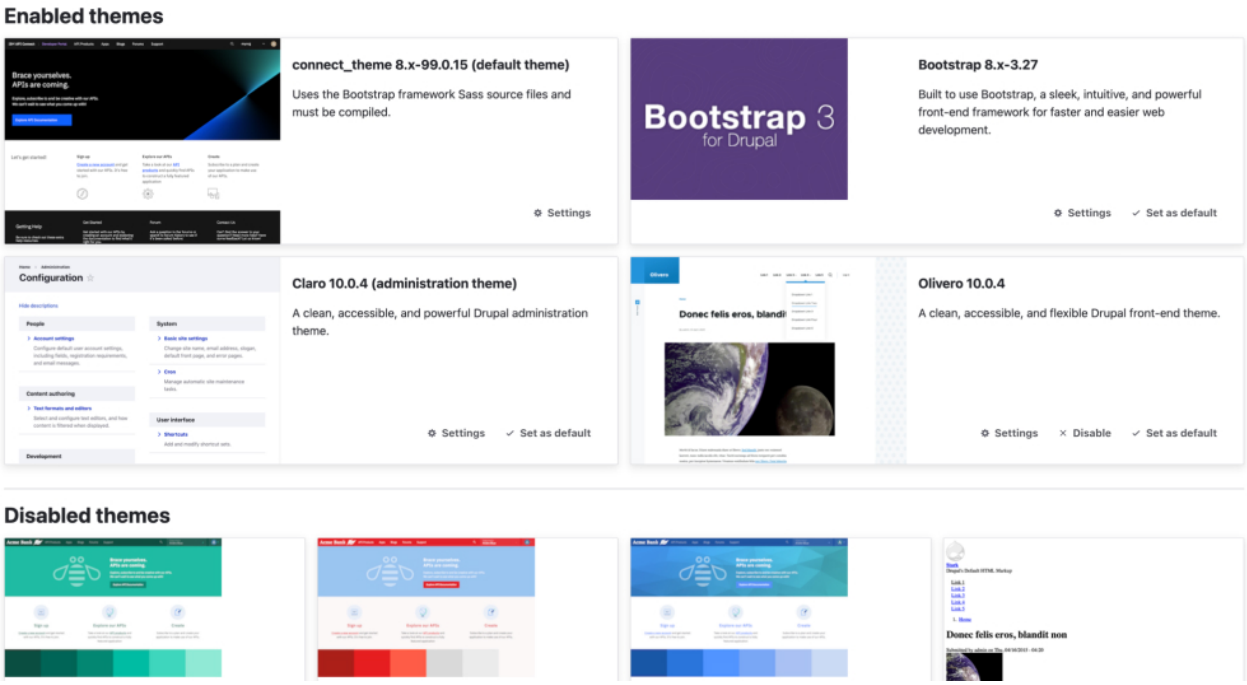
- The custom modules and themes are listed in the Custom Modules and Custom Themes sections at the end of the page.



4. Check which of your custom modules are enabled or disabled by clicking Manage > Extend.
   - The enabled modules are displayed with a selected checkbox, and the disabled ones are not selected as seen in the following example.



5. Check which of your custom themes are enabled or disabled by clicking Manage > Appearance.
   - Find your themes that are categorized into Enabled and Disabled sections.



Method 2. Developer Portal toolkit CLI

Use the **`custom-module:create-export`** and **`custom-theme:create-export`** commands to extract your custom modules and themes into a compressed file.

The compressed file includes a list of your custom modules and themes. For more information about using the Developer Portal toolkit CLI and all the other features it offers, see Overview of the Developer Portal command-line tool.

1. To list your modules, implement the following steps:
   a. Log in to the Developer Portal toolkit CLI as a provider organization.
   b. Run the following **`custom-module:create-export`** command against the Developer Portal.

```
apic custom-module:create-export --mode portaladmin [flags]
```

   c. Specify the appropriate **`org`** and **`catalog`** name.

For example,

```
❯ SERVER=myserver.ibm.com
❯ apic login -s $SERVER -r provider/default-idp-2 -u steve
```

```
Warning: Using default toolkit credentials.
Enter your API Connect credentials
Password?
Logged into myserver.ibm.com successfully

❯ apic -s $SERVER -m portaladmin custom-module:create-export -o ibm -c api-connect-catalog-1
201 CREATED - Task ID: x8jupowmktkf8f2r

Response Code - 202:

Message(s) -
The status of this task is: QUEUED

Response Code - 200:

Message(s) -
The status of this task is: FINISHED and the artifact can now be streamed

Saving File (Large files may take a while)...
Incoming project saved to custom_module_createExport-20230322143819.tgz
```

After the command has run, extract your compressed export to see the modules inside. Or use **tar** directly as shown in the following example.

```
❯ tar --exclude='*/*' -tvf custom_module_createExport-20230322143819.tgz
drwxr-sr-x aegir/aegir       0 2023-03-22 12:05 chosen/
drwxr-sr-x aegir/aegir       0 2023-03-22 12:05 google_tag/
drwxr-sr-x aegir/aegir       0 2023-03-22 12:05 snowflakes/
```

2. To check which one of your custom modules are enabled or disabled, implement the following steps:
   a. Run the following **modules:list** command to print the list of installed modules.

   ```
   apic modules:list --mode portaladmin [flags]
   ```

   b. Search for your custom modules from the result.
   For example,

   ```
   ❯ SERVER=myserver.ibm.com
   ❯ apic -s $SERVER -m portaladmin modules:list -o ibm -c api-connect-catalog-1 --no-core
   .
   .
   .
   chosen:
     package: 'User interface'
     display_name: 'Chosen (chosen)'
     status: Disabled
     version: 3.0.5
   google_tag:
     package: Statistics
     display_name: 'Google Tag Manager (google_tag)'
     status: Enabled
     version: 8.x-1.6
   snowflakes:
     package: 'User interface'
     display_name: 'Snowflakes (snowflakes)'
     status: Enabled
     version: 2.0.1
   .
   .
   ```

3. To list your custom themes, implement the following steps:
   a. Log in to the Developer Portal toolkit CLI as a provider organization.
   b. Run the following **custom-theme:create-export** command against the Developer Portal.

   ```
   apic custom-theme:create-export --mode portaladmin [flags]
   ```

   c. Specify the appropriate **org** and **catalog** name.
   For example,

   ```
   ❯ SERVER=myserver.ibm.com
   ❯ apic login -s $SERVER -r provider/default-idp-2 -u steve
   Warning: Using default toolkit credentials.
   Enter your API Connect credentials
   Password?
   Logged into api.fyre-ci-136264-master.fyre.ibm.com successfully

   ❯ apic -s $SERVER -m portaladmin custom-theme:create-export -o ibm -c api-connect-catalog-1
   201 CREATED - Task ID: oh595vuywxsz3526

   Response Code - 202:

   Message(s) -
   The status of this task is: QUEUED

   Response Code - 200:

   Message(s) -
   The status of this task is: FINISHED and the artifact can now be streamed

   Saving File (Large files may take a while)...
   Incoming project saved to custom_theme_createExport-20230322143856.tgz
   ```

   After the command has run, extract your compressed export to see the themes inside. Or use **tar** to view the contents directly as shown in the following example.

```
❯ tar --exclude='*/*' -tvf custom_theme_createExport-20230322143856.tgz
drwxr-sr-x aegir/aegir       0 2023-03-22 14:36 emerald_theme_css/
drwxr-sr-x aegir/aegir       0 2023-03-22 14:36 ruby_theme_scss/
drwxr-sr-x aegir/aegir       0 2023-03-22 14:36 sapphire_theme_css/
```

4. To check which of your custom themes are enabled or disabled, implement the following steps:
   a. Run the following **themes:list** command to print the list of installed themes.

   ```
   apic themes:list --mode portaladmin [flags]
   ```

   b. Search for your custom themes from the result.
   For example,

   ```
   ❯ SERVER=myserver.ibm.com
   ❯ apic -s $SERVER -m portaladmin themes:list -o ibm -c api-connect-catalog-1 --no-core
   bootstrap:
     package: Bootstrap
     display_name: 'Bootstrap (bootstrap)'
     status: Enabled
     version: 8.x-3.27
   .
   .
   .
   emerald_theme_css:
     package: Bootstrap
     display_name: 'emerald_theme_css (emerald_theme_css)'
     status: Disabled
     version: null
   ruby_theme_scss:
     package: Bootstrap
     display_name: 'ruby_theme_scss (ruby_theme_scss)'
     status: Disabled
     version: null
   sapphire_theme_css:
     package: Bootstrap
     display_name: 'sapphire_theme_css (sapphire_theme_css)'
     status: Disabled
     version: null
   ```

Method 3. Developer Portal container

If you are unable to access the Developer Portal settings or the Developer Portal toolkit CLI, check the Developer Portal container running within your Kubernetes or Red Hat OpenShift environment.

Note: You need access to the Developer Portal Kubernetes pods to be able to perform these steps.

1. Use **kubectl** or **oc** for Red Hat OpenShift environment to obtain a shell to the Developer Portal running container.

   Your Developer Portal sites are located within the **portal-www** pod in the **admin** container within the namespace that your Developer Portal subsystem is deployed to as seen in the following example.

   ```
   ❯ kubectl get pods -n apic | grep www
   portal-014179b4-www-0     2/2     Running     0          8d

   ❯ kubectl exec -n apic -it portal-014179b4-www-0 -c admin -- bash
   bash-4.4$
   ```

2. After you access the container, use the command **list_sites -a** to obtain the site alias for your Developer Portal. For example,

   ```
   bash-4.4$ list_sites -a
   daae4642-b1e2-4fd8-a5a7-77a68ed812ef.944dce4f-bbad-41ce-b166-aa2c9f8c4b17 => ibm.api-connect-catalog-1.portal.fyre-ci-
   136264-master.fyre.ibm.com (INSTALLED)
   daae4642-b1e2-4fd8-a5a7-77a68ed812ef.c560c004-852d-42c3-ae4e-797144a857af => ibm.api-connect-catalog-2.portal.fyre-ci-
   136264-master.fyre.ibm.com (INSTALLED)
   ```

   The Developer Portal **portal.fyre-ci-136264-master.fyre.ibm.com/ibm/api-connect-catalog-1** has the site alias **ibm.api-connect-catalog-1.portal.fyre-ci-136264-master.fyre.ibm.com**.

3. After you identify the Developer Portal that you want to look at, use the alias string within a **find** command to list your modules and themes, as shown in the following example.

   ```
   bash-4.4$ find /web/platforms/devportal*/sites/myserver.ibm.com/modules -mindepth 1 -maxdepth 1 -type d -exec basename {}
   \;
   chosen
   google_tag
   snowflake

   bash-4.4$ find /web/platforms/devportal*/sites/ibm.api-connect-catalog-1.portal.fyre-ci-136264-master.fyre.ibm.com/themes
   -mindepth 1 -maxdepth 1 -type d -exec basename {} \;
   emerald_theme_css
   ruby_theme_scss
   sapphire_theme_css
   ```

4. To check which of your custom modules and themes are enabled or disabled, implement the following sub-steps:
   a. Use the **drush** command-line tool within the container to print the list of installed modules and themes for your Developer Portal.
   b. Then, use the site alias that you obtained earlier to run the following **drush** command and find your custom modules and themes.

   ```
   bash-4.4$ drush @myserver.ibm.com pml --no-core
   Running: drush -y @daae4642-b1e2-4fd8-a5a7-77a68ed812ef-944dce4f-bbad-41ce-b166-aa2c9f8c4b17 pml --no-core
    ---------------------------------- ----------------------------------------------------------------------------------------------
   - ---------- ----------------
     Package                          Name
   ```

```
Status     Version
 ---------------------------------- ----------------------------------------------------------------------------------------------------
- ---------- -----------------
  User                              Account Field Split (account_field_split)
Enabled
  Access control                    ACL (acl)
Enabled
  .
  .
  .
  User interface                    Chosen (chosen)
Disabled   3.0.5
  Statistics                        Google Tag Manager (google_tag)
Disabled   8.x-1.6
  User interface                    Snowflakes (snowflakes)
Disabled   2.0.1

  Bootstrap                         Bootstrap (bootstrap)
Enabled    8.x-3.27
  Bootstrap                         connect_theme (connect_theme)
Enabled    8.x-99.0.15
  Bootstrap                         emerald_theme_css (emerald_theme_css)
Disabled
  Bootstrap                         ruby_theme_scss (ruby_theme_scss)
Disabled
  Bootstrap                         sapphire_theme_css (sapphire_theme_css)
Disabled
```

Results

By using one of the three methods discussed in the topic, you managed to successfully list the custom modules and themes installed on your Developer Portal. This also allowed you to see which of these custom modules and themes are enabled or disabled.

1. Method 1. Developer Portal admin status report (recommended)
2. Method 2. Developer Portal toolkit CLI
3. Method 3. Developer Portal container

Next steps

Ensure that you keep your custom modules and themes up to date, and remove deprecated code within your own written custom modules and themes. If you are not using a custom module or theme, consider removing it. This helps mitigate problems when you want to migrate or upgrade your Developer Portal.

Prepare your Developer Portal for the update for Drupal 10

Guidance on how to prepare your Developer Portal site from Drupal 9 to Drupal 10.

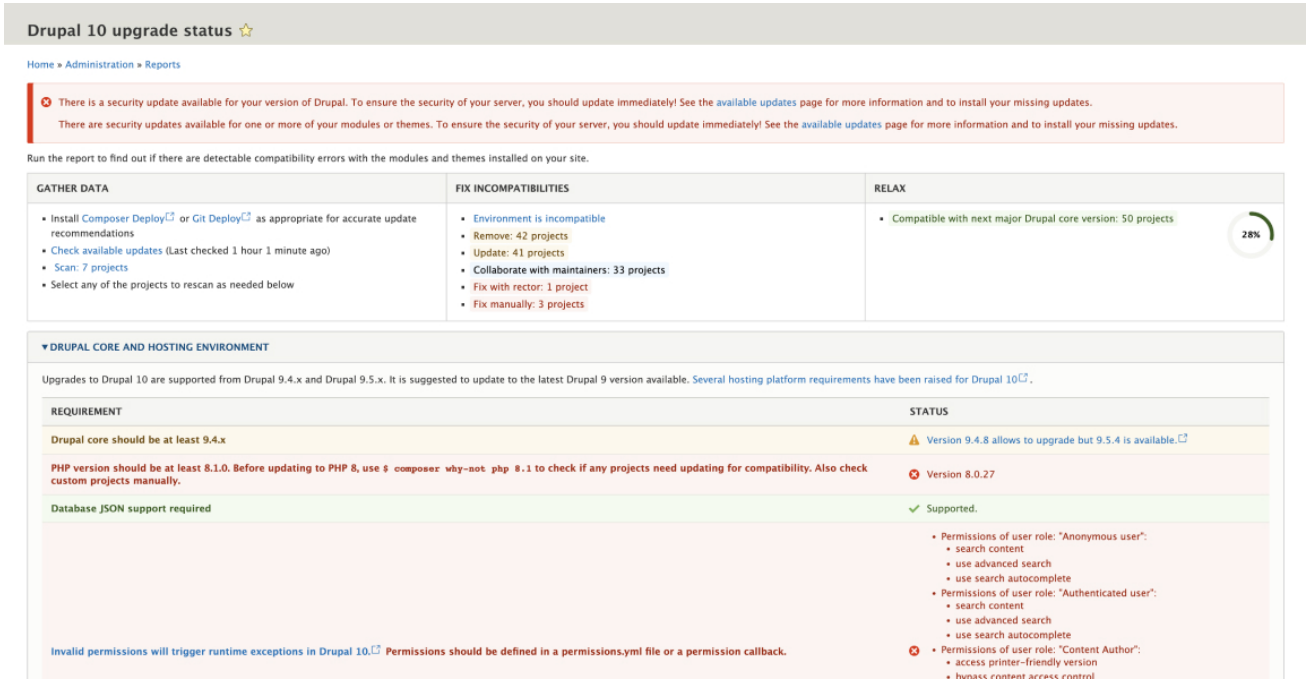
If your Developer Portal contains custom modules and themes that are written by yourself or downloaded from elsewhere, ensure that they are Drupal 10 compatible before you start the upgrade process. This action aims toward a seamless IBM® API Connect upgrade experience. To find more information about your modules and themes compatibility, download the Upgrade Status module available here.

Note: Before you start the upgrade, check the status of your modules and themes and if they are in use. Remove the ones that you do not use.
To learn more on how to prepare your Developer Portal for the Drupal 10 upgrade, check the following steps.

1. Installing the Upgrade Status module
2. Upgrading your module to be Drupal 10 compatible
3. Import your module into your Developer Portal
4. Verifying that your module is Drupal 10 compatible

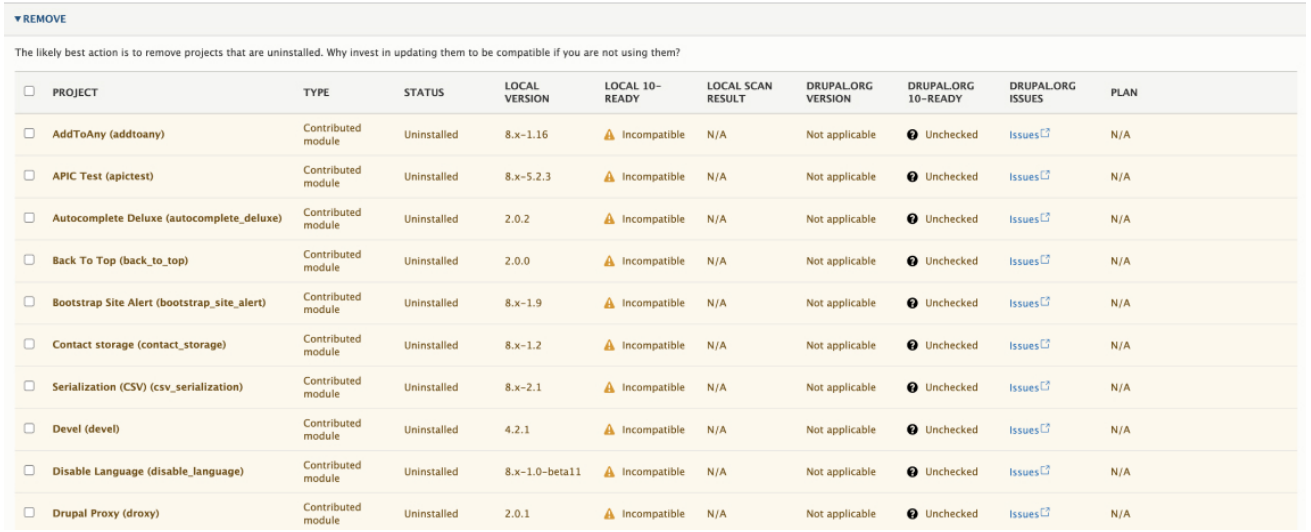
Installing the Upgrade Status module

1. Log in to your Developer Portal as the administrator.
2. If the administrator dashboard is not displayed, click Manage to display it.
3. Install the Upgrade Status module. For more information about how to install the Upgrade Status, see Installing custom modules.
4. When you finish your Upgrade Status installment, click Admin > Reports > Upgrade-status.

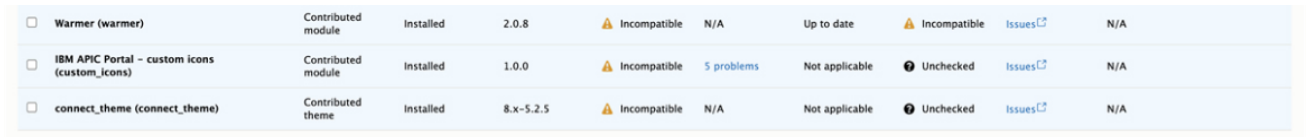


5. The DRUPAL CORE AND HOSTING ENVIRONMENT section can be ignored. This area is managed by IBM API Connect and gets resolved when you upgrade.
   Note: Your custom modules and themes must be PHP 8.1 compatible before you upgrade to Drupal 10, and you are responsible for doing the upgrade.
6. The list of projects further on the page are the ones that your Upgrade Status believes are not compatible with Drupal 10. These projects are categorized into sections, for example: REMOVE, UPDATE, COLLABORATE WITH MAINTAINERS.

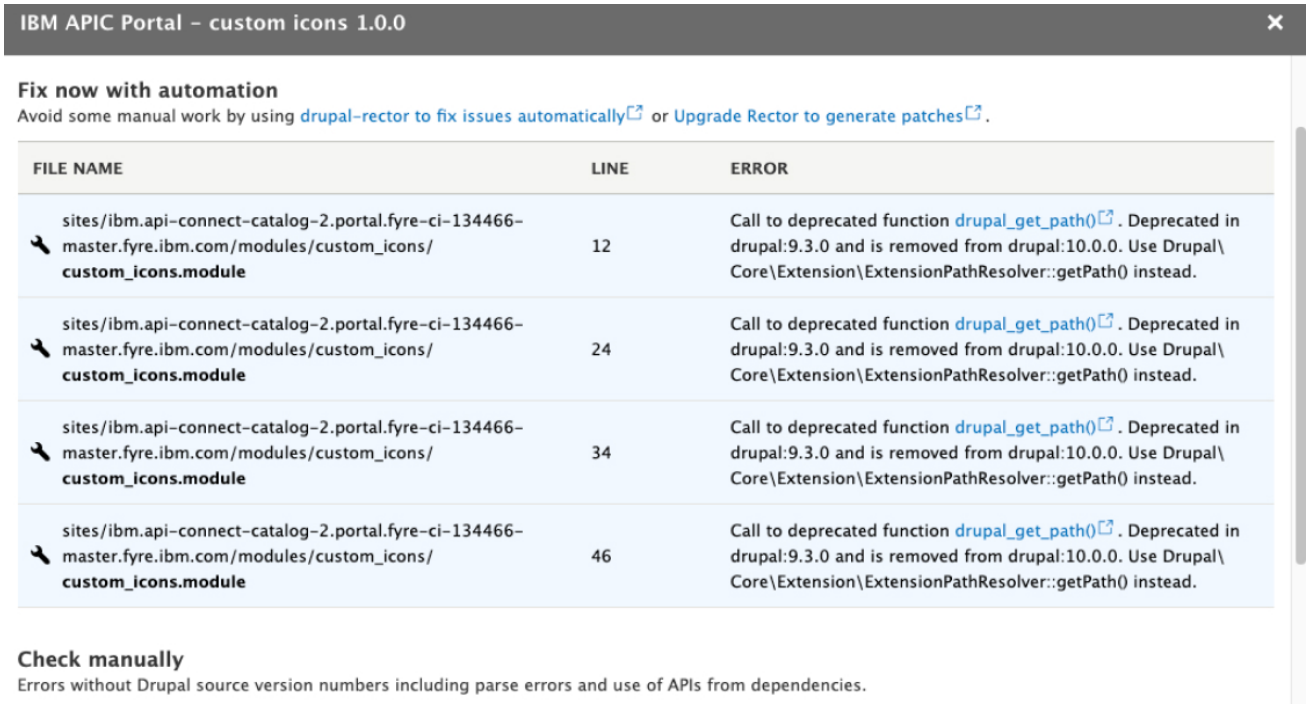
   When you upgrade IBM API Connect, the Drupal 10 compatibility is automatically given to the modules and themes that you have not created or installed manually.



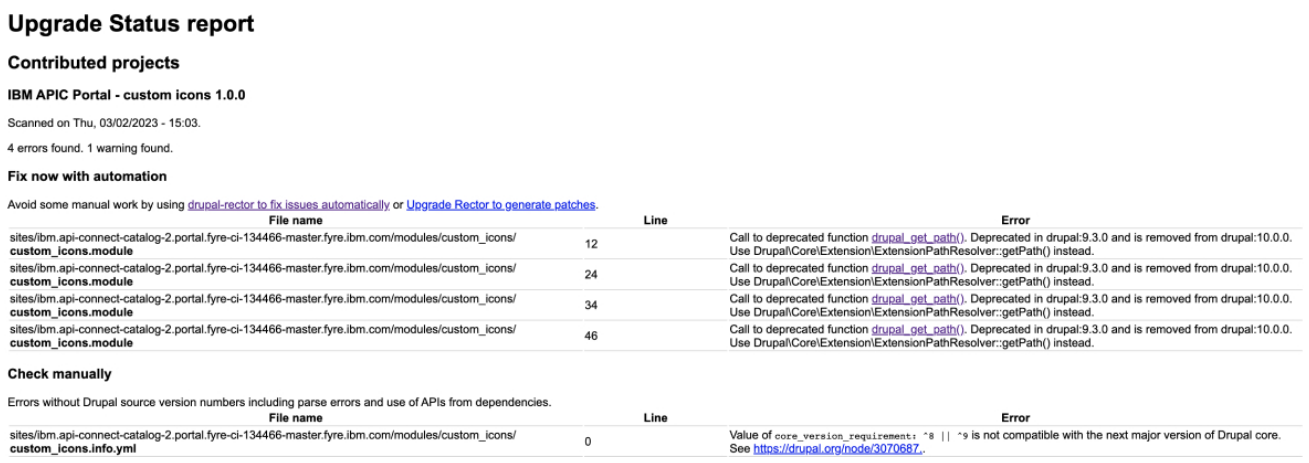
7. If you find your custom modules and themes there, you can scan them to reveal what changes are needed to make them Drupal 10 compatible. For instance, the following image demonstrates the process of scanning an installed custom module, named **`custom_icons`**.



8. Select your custom modules and themes and then click Scan selected. When completed, if your custom module or theme requires changes, you see a link on the row of them.
   Note: For Upgrade Status to identify all of the Drupal 10 compatibility issues in your custom modules and themes, you must have them enabled before scanning it.



9. Click export as HTML to see a clear view.



Upgrade Status report

Contributed projects

IBM APIC Portal - custom icons 1.0.0

Scanned on Thu, 03/02/2023 - 15:03.

4 errors found. 1 warning found.

Fix now with automation

Avoid some manual work by using drupal-rector to fix issues automatically or Upgrade Rector to generate patches.

File name	Line	Error

sites/ibm.api-connect-catalog-2.portal.fyre-ci-134466-master.fyre.ibm.com/modules/custom_icons/custom_icons.module	24	Call to deprecated function drupal_get_path(). Deprecated in drupal:9.3.0 and is removed from drupal:10.0.0. Use Drupal\Core\Extension\ExtensionPathResolver::getPath() instead.
sites/ibm.api-connect-catalog-2.portal.fyre-ci-134466-master.fyre.ibm.com/modules/custom_icons/custom_icons.module	34	Call to deprecated function drupal_get_path(). Deprecated in drupal:9.3.0 and is removed from drupal:10.0.0. Use Drupal\Core\Extension\ExtensionPathResolver::getPath() instead.
sites/ibm.api-connect-catalog-2.portal.fyre-ci-134466-master.fyre.ibm.com/modules/custom_icons/custom_icons.module	46	Call to deprecated function drupal_get_path(). Deprecated in drupal:9.3.0 and is removed from drupal:10.0.0. Use Drupal\Core\Extension\ExtensionPathResolver::getPath() instead.

Check manually

Errors without Drupal source version numbers including parse errors and use of APIs from dependencies.

File name	Line	Error
sites/ibm.api-connect-catalog-2.portal.fyre-ci-134466-master.fyre.ibm.com/modules/custom_icons/custom_icons.info.yml	0	Value of core_version_requirement: ^8 || ^9 is not compatible with the next major version of Drupal core. See https://drupal.org/node/3070687.

Upgrading your module to be Drupal 10 compatible

This module is an example of how you can read the report and fix your code to be compatible with Drupal 10.

1. The report shows that drupal_get_path() is deprecated, and the code must be changed to use the newer function **`getPath()`**. The following examples demonstrate the change to the newer extension type-specific version.

Before

```
 $name = preg_replace("/[^A-Za-z0-9]/", '', $returnValue);
  $returnValue = Url::fromUri('internal:/' . drupal_get_path('module', 'custom_icons') . '/images/' .
_custom_image_getRandomImageName($name))
    ->toString();
```

After

```
$name = preg_replace("/[^A-Za-z0-9]/", '', $returnValue);
  $iconPath = \Drupal::service('extension.list.module')->getPath('custom_icons');
  $returnValue = Url::fromUri('internal:/' . $iconPath . '/images/' . _custom_image_getRandomImageName($name))
    ->toString();
```

2. Add the new version into the **`info.yml`** file.
3. **`Drupal/Core/Extension/Extension List`** is still present in Drupal 8 and Drupal 9, so you can keep them, and add on support for Drupal 10.
4. Modify the version number when you make a new change to the module as seen in the following example.

Before

```
 name: 'IBM APIC Portal - custom icons'
type: module
description: 'IBM API Connect Developer Portal tutorial - Example of custom product icons'
package: 'Custom'
core_version_requirement: ^8 || ^9
```

```
version: 1.0.1
project: 'custom_icons'
dependencies:
  - ibm_apim

After

name: 'IBM APIC Portal - custom icons'
type: module
description: 'IBM API Connect Developer Portal tutorial - Example of custom product icons'
package: 'Custom'
core_version_requirement: ^8 || ^9 || ^10
version: 1.0.2
project: 'custom_icons'
dependencies:
  - ibm_apim
```

Import your module into your Developer Portal

Import the module by using the Developer Portal Toolkit CLI. For more information about how to use the Developer Portal CLI, see Getting started with the Portal CLI commands.

For example,

```
❯ apic login -s $SERVER -r provider/default-idp-2 -u steve
Warning: Using default toolkit credentials.
Enter your API Connect credentials
Password?
Logged into api.fyre-ci-134466-master.fyre.ibm.com successfully

❯ apic -s $SERVER -m portaladmin custom-module:create-import -o ibm -c api-connect-catalog-2 /tmp/custom_icons.zip
Loading File (Large files may take a while)...

2023-02-27 14:39:40: Importing custom module custom_icons
2023-02-27 14:40:25: CLI task (custom_module:import) completed successfully.
```

Alternatively, import your updated module by installing it again using the Developer Portal UI. For more information about how to install custom modules, see Installing custom modules.

Verifying that your module is Drupal 10 compatible

The updated module is now imported into the Developer Portal. Return to the Upgrade Status report page to rescan the module. When it becomes compatible with Drupal 10, it appears at the end of the page.

Workbench (workbench)	Contributed module	Installed	8.x-1.4	✓ Compatible	N/A	Up to date	✓ Compatible	Issues	N/A
IBM APIC Portal - custom icons (custom_icons)	Contributed module	Installed	1.0.0	✓ Compatible	No problems found	Not applicable	? Unchecked	Issues	N/A
Snowflakes (snowflakes)	Contributed module	Uninstalled	2.0.1	✓ Compatible	3 problems	Not applicable	? Unchecked	Issues	N/A

Results

You used the Upgrade Status module to identify and fix the Drupal 10 compatibility problems with your custom modules and themes. However, this process might not cover everything that you need to be ready for the upgrade to Drupal 10. Drupal 10 requires PHP 8.1, so you might need to change your custom modules and themes to support it. Remember to keep your custom modules and themes up to date, and to remove deprecated code within your own written custom modules and themes.

Upgrade your custom modules to be Drupal 10 and PHP 8.1 compliant

Guidance on how to upgrade your custom modules to be Drupal 10 and PHP 8.1 compliant.

The following sections provide examples of the most common updates that you might need to make. However, you must check the deprecation lists for Drupal and PHP to ensure that you cover all of the scenarios in your Developer Portal sites.

Notable changes the update brings

The following items are some of the key changes in Drupal 10.

- **`CKEditor4`** is removed and **`CKEditor5`** is now the default text editor.
- **`Claro`** is now the default theme for the Admin UI, which gives it a modern and refreshing look.
- Ensure that none of your custom modules depend on them as they will not be there after the upgrade.

  The following modules are uninstalled as they do not support Drupal 10:
  - ckeditor_media_embed
  - console
  - flood_unblock
  - message
  - message_notify
  - message_subscribe
  - video_embed_field
  - video_embed_html5
  - content_browser
  - entity_browser
  - entity_browser_enhanced
  - entity_embed
  - file_browser
  - editor_file
  - color
  - Unlimited_number
  - embed
  - ckeditor
  - quickedit
- The Drupal 10 upgrade comes with a major Symfony upgrade version. Drupal 9 used Symfony 4.4, and Drupal 10 now uses Symfony 6, so if you are using any Symfony ensure that they have not been deprecated. Symfony provides a guide at the following link https://symfony.com/doc/current/setup/upgrade_major.html.
- The default Drush version is now Drush 11. If you are writing Drush commands in your custom modules, you must ensure they are Drush 11 compatible. The following links provide examples on how you can achieve compatibility, https://www.specbee.com/blogs/writing-your-own-custom-drush-9-and-10-commands and https://www.drush.org/11.x/commands/.

PHP 8.1 deprecations

The following items are some of the key PHP 8.1 deprecations.

Passing null to non-nullable internal function parameters is deprecated
: There are multiple scenarios that require a fix with the possibility to pass a **`null`** to some PHP functions.
The following example is the most common PHP deprecation.
`Before:`

```
$redacted_url = $url;
if (strlen($redacted_url) > 0 && strpos($redacted_url, '/') !== 0) {
```

`After:`

```
$redacted_url = $url ?? '';
if (strlen($redacted_url) > 0 && strpos($redacted_url, '/') !== 0) {
```

Optional parameters specified before the required parameters
: Some functions in code have optional parameters before the required ones. However, in PHP 8.1, the required parameters come after the optional ones.

Improved type safety
: PHP 8.1 improves the type of safety, which can result in numerous warnings that might require changing functions and variable declarations.
The following example addresses the improved safety and the optional parameters before required parameters deprecations.
`Before:`

```
protected $id;

public function oldFunction($url = '', $data) {
  return $id;
}
```

`After:`

```

/**
 * Drupal entity ID
```

```
 *
 * @var string
 */
protected $id;

public function newFunction(someObject $data, string $url = ''): string {
  return $id;
}
```

Drupal 10 deprecations

The following items are some of the key PHP 8.1 deprecations.

Entity queries now require an `accessCheck`

If you have custom modules with entities, you must do an `accessCheck`. For more information about access checking, see https://www.drupal.org/node/3201242.
For example,
Before:

```
$query = \Drupal::entityQuery('node');
$query->condition('type', 'api');
$query->condition('status', 1);
$nids = $query->execute();
```

After:

```
$query = \Drupal::entityQuery('node');
$query->condition('type', 'api');
$query->condition('status', 1);
$nids = $query->accessCheck()->execute();
```

The `Once` function is removed from the jQuery library and added to its own core library

If you have any modules that use the `once`function in your JavaScript files, you need an update to pull in the new library. For more information about how to remove jQuery dependency, see https://www.drupal.org/node/3158256.
For more examples on how you might upgrade your code, see https://www.drupal.org/project/drupal/issues/3183149.
For example,
Before:

```
// ibm_apim.libraries.yml
validate_password:
  version: 1.x

// validate_password.js
(function($, Drupal, drupalSettings) {
  var $passwordInput = $(context).find('input.js-password-field').once('ibmApimValidatePassword');
})(jQuery, Drupal, drupalSettings);
```

After:

```
// ibm_apim.libraries.yml
validate_password:
  version: 1.x
  dependencies:
    - core/once

// validate_password.js
(function($, Drupal, drupalSettings, once) {
  var $passwordInput = $(once('ibmApimValidatePassword', context)).find('input.js-password-field');
})(jQuery, Drupal, drupalSettings, once);
```

The `app.root` and `site.path` services that are converted into container parameters

If you use the `app.root` and `site.path` services in your custom modules, you must ensure they are converted into container parameters.
For example,
Before:

```
 \Drupal::service('config.factory')
    ->getEditable('locale.settings')
    ->set('translation.use_source', 'local')
    ->set('translation.path', \Drupal::service('site.path') . '/translations')
    ->save();
```

After:

```
\Drupal::service('config.factory')
    ->getEditable('locale.settings')
    ->set('translation.use_source', 'local')
    ->set('translation.path', \Drupal::getContainer()->getParameter('site.path') . '/translations')
    ->save();
```

The parameters of some `Forms`are updated, so be aware if you are extending them.

If you are extending your `Forms`, note the parameters of some of them have changed. For more information about the updated parameters, see https://www.drupal.org/node/3251987.

Next steps

This topic covers the key upgrades you might need when upgrading your custom modules to be Drupal 10 and PHP 8.1 compliant. However, note that it is your responsibility to check the deprecation lists for Drupal and PHP to ensure that you cover all of the scenarios in your Developer Portal sites.

For more information about making your custom modules Drupal 10 and PHP 8.1 compliant, see the following links:

- Deprecation checking and correction tools.
- Deprecated modules and themes.
- List of APIs deprecated and now removed from Drupal 10.
- Whats new in PHP 8.1.
- Symfony Upgrade Guide.
- Drush 11 commands.

Developer Portal tutorials

Tutorials for using the Developer Portal.

The following guided examples help you through some of the most common user scenarios in the Developer Portal, as well as some of the more complex areas.

Developer Portal tutorials by category
For API consumers Create an Application
User authentication Adding a field to the sign up form Adding validation to a field on the sign up form Adding a field group to group fields in a content type
Getting started configuring the Developer Portal Creating the Portal Creating a private Portal site Customizing themes
Advanced customization Changing the front page Grouping products by category Adding a custom block to the front page Adding a custom block to a page other than the front page Using avatars Using image optimization Adding a Back to top button Creating a drop-down menu link Displaying blog posts on the front page Displaying tweets on the front page Changing the profile page to display firstname lastname, instead of username Using a custom weighting sort order on the product list page Configuring the RobotsTxt file Configuring the SecurityTxt file Synchronizing application credentials with an external server

Tutorial: Creating the Developer Portal

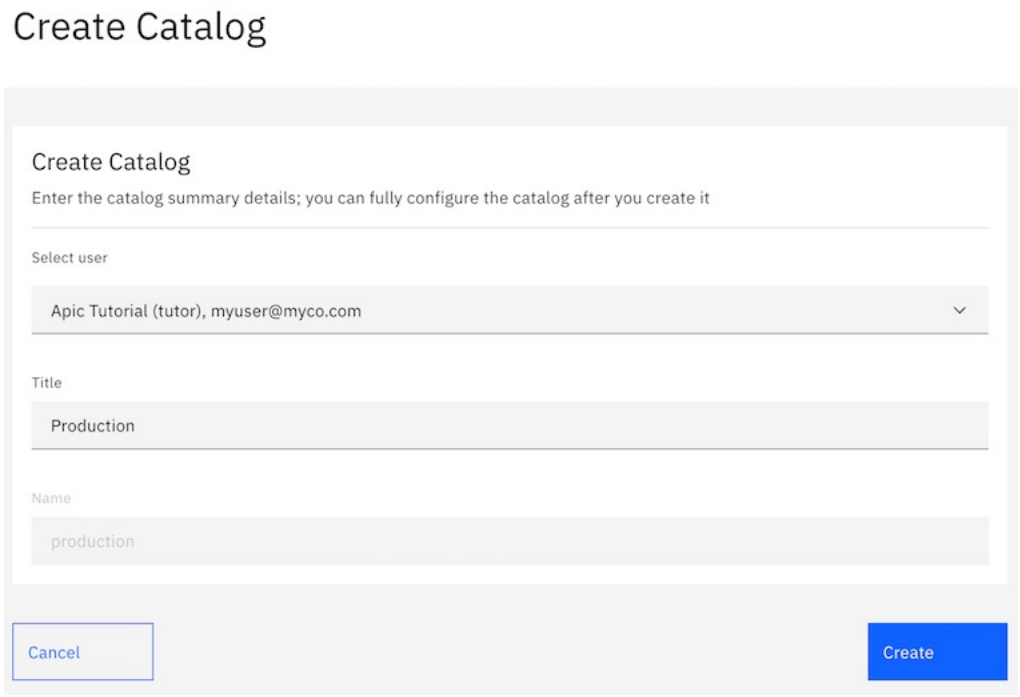
About this task

In this tutorial, you are going to complete the following lessons:

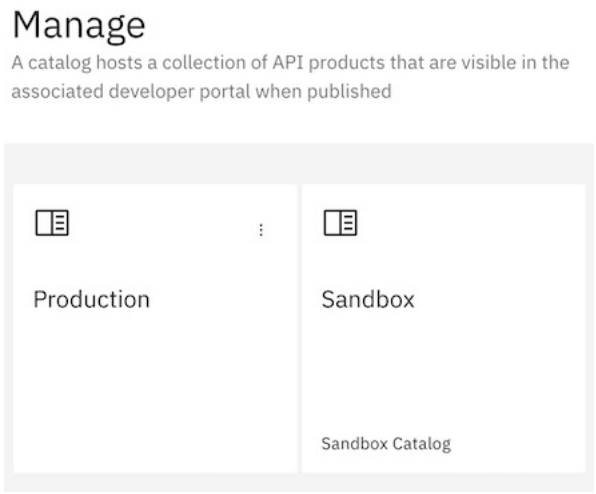
Enabling the Developer Portal through the API Manager

By proceeding with the following steps, you create an administrator account:

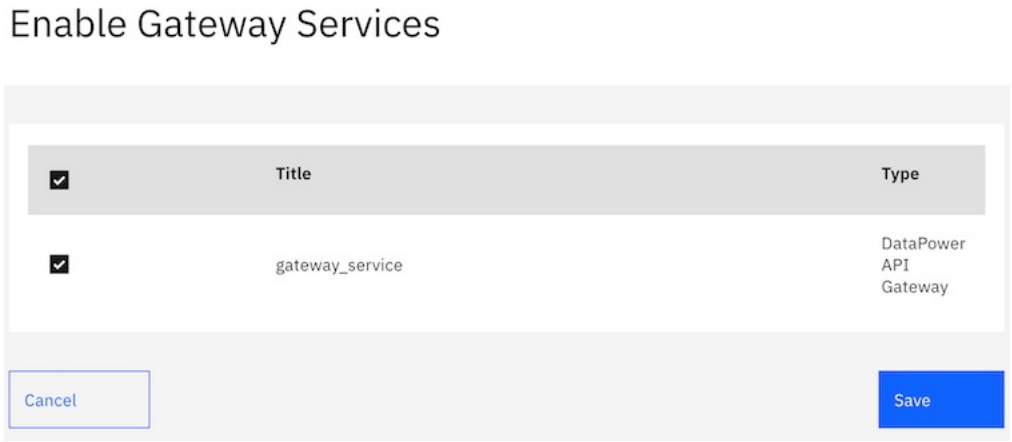
1. Log in to the API Manager
2. Click Manage, then click Add, and select Create catalog.
3. Select the owner from the **`Select user`** list, then enter a **`Title`** for your catalog, for example `Production`.



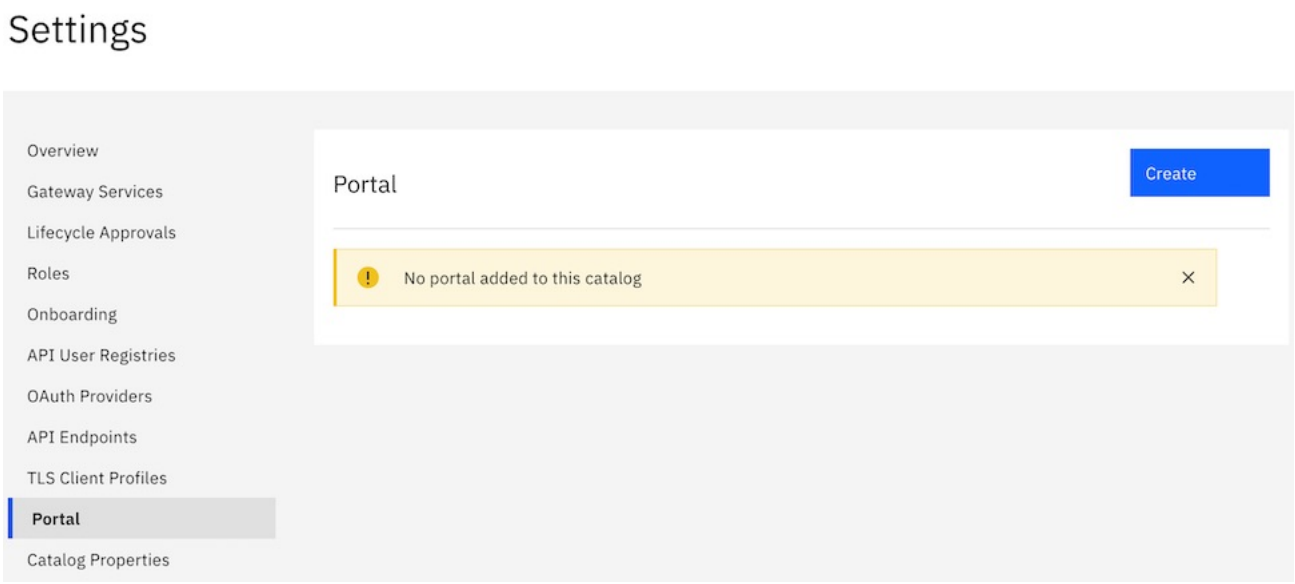
4. Click Create. The Manage page appears.



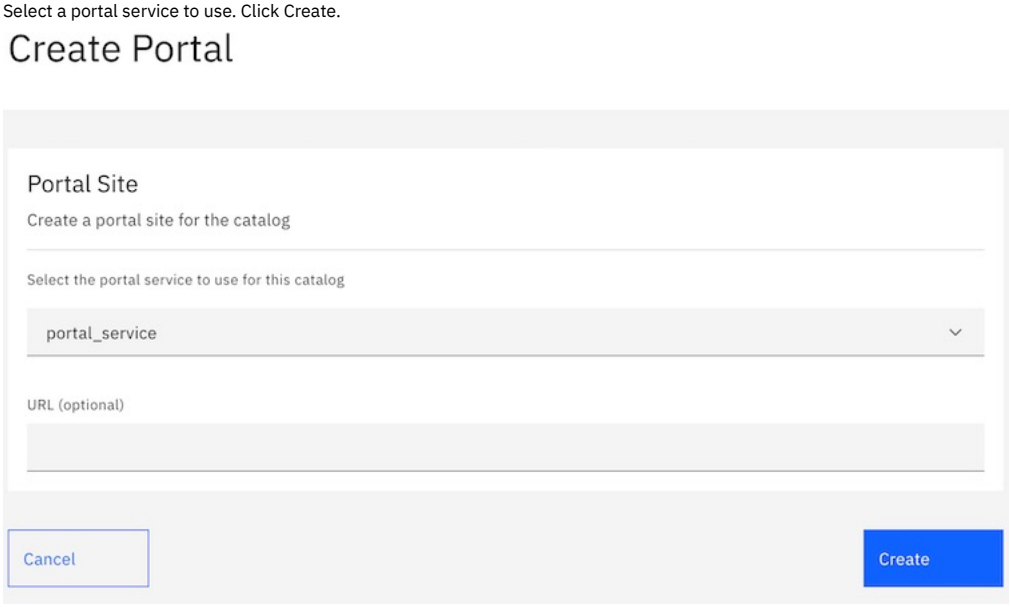
5. Click on the tile that corresponds to your new catalog, for example **`Production`**.
6. Click Catalog settings.
7. Click Gateway Services. If the message **`You currently don't have any gateway services`** is displayed, click Edit, select the configured gateway service, and click Save.



8. Click Portal.
9. Click Create.



10. Select a portal service to use. Click Create.



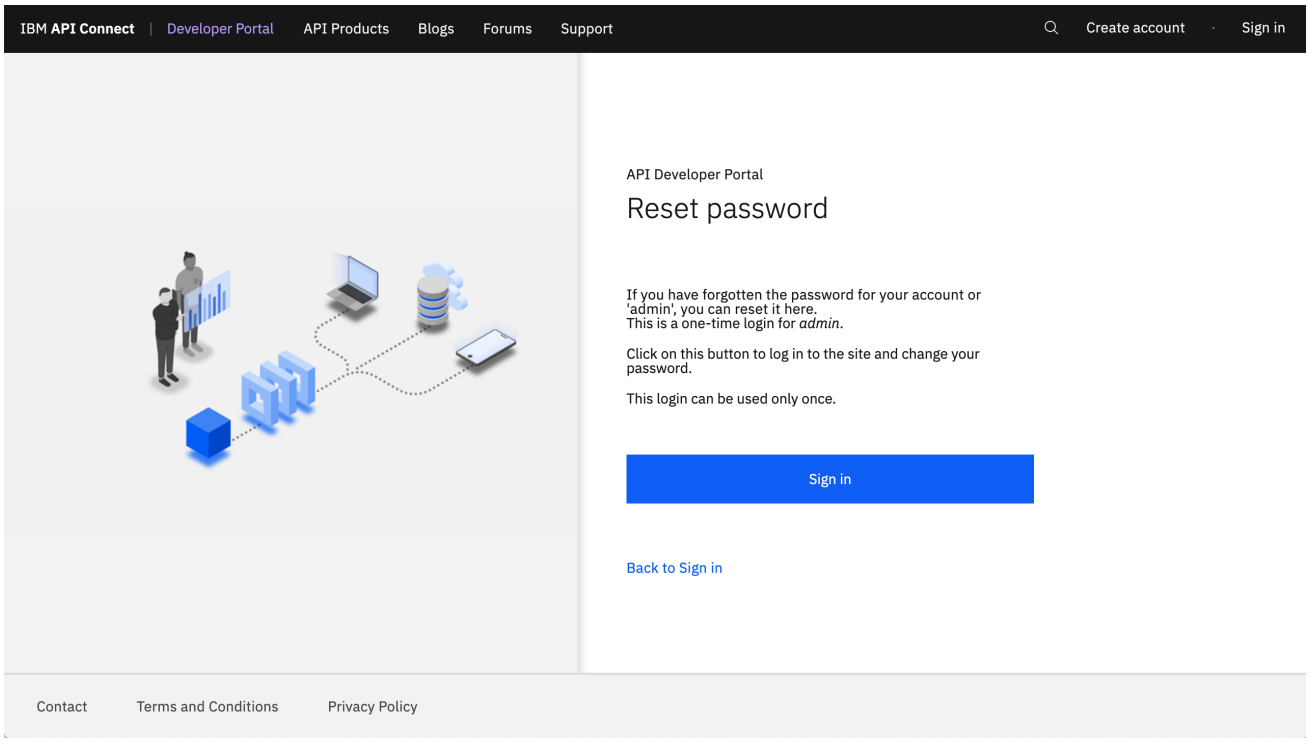
After a few minutes, you receive an email with a link to your Developer Portal site for that catalog. The link is a single use only link for the administrator account.

Administrator (admin),

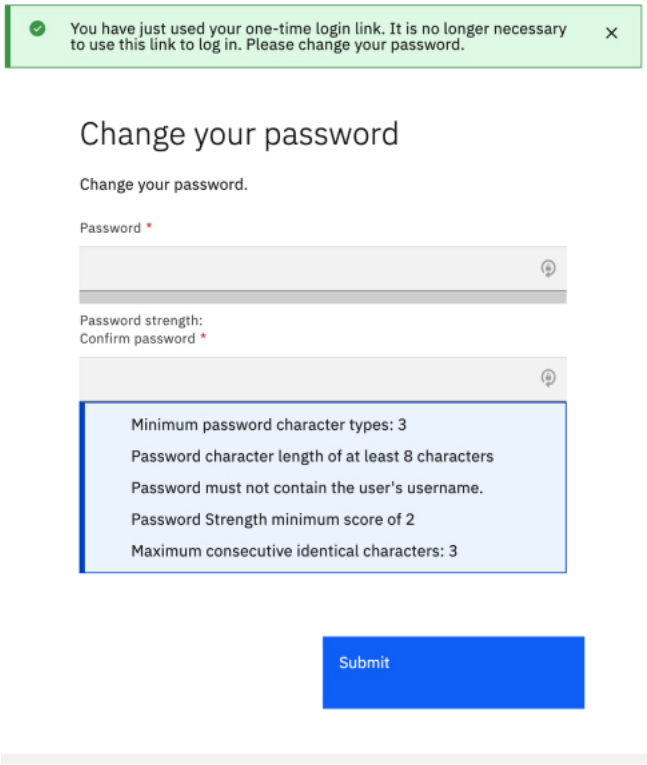
Your Developer Portal site has been created. You can log in as the 'admin' user by using the following one-time log in link. After you have logged in with the following link, you must change the password for the 'admin' user account immediately.

https://portal.apidemo.demo.ibm.com/tutorial/production/user/reset/1/1591727237/h26vxzf2e51UqqK7vf10LNbHiVEC5VQ_AZAoKCYH72C/new/login

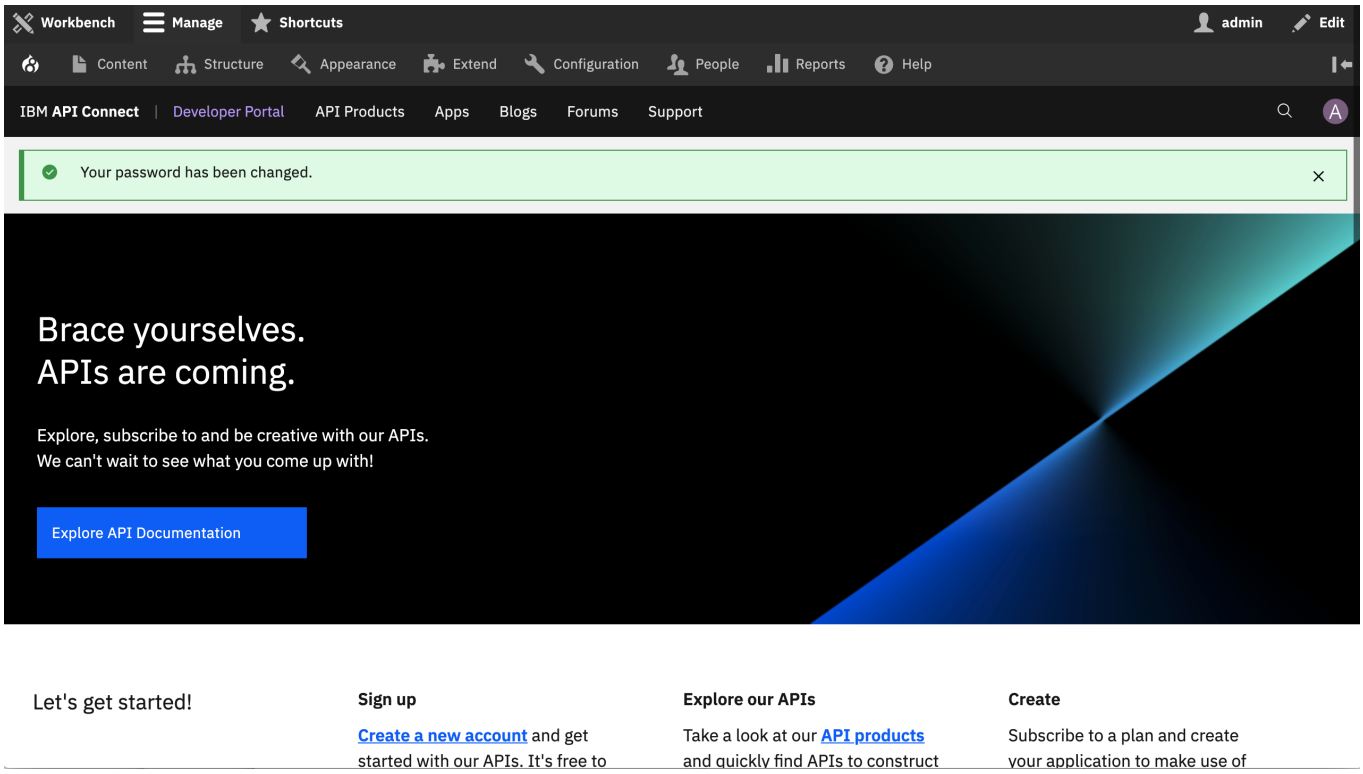
11. Click the email link. Click Sign in.



12. Change the password. Click Submit.



The portal site for the Production catalog is now active. The admin account cannot create applications or subscriptions. You must create a new account to complete those tasks.



What you did in this tutorial

In this tutorial, you completed the following activities:

- Enabled a Developer Portal site and created an administrator account.

Note: To ensure that your desired content is displayed, it is crucial to publish your product containing APIs to the appropriate catalog.

What to do next

- Create a Developer Account and Application

Related information

- Importing an API

Tutorial: Creating a private Developer Portal site

You can create a private version of the Developer Portal, so that authenticated users only can access content on the site. You might want to do this if you want to restrict public access to your content unless they are logged in.

Before you begin

You must have a Developer Portal enabled, and you must have administrator access to complete this tutorial. The tutorial Creating the Portal explains how to enable the portal if you have not already done so.

About this tutorial

In this tutorial, you are going to restrict access for all the content to authenticated users only. This gives access to all users from **`Content Author`** to **`Superuser`**, as they are all required to authenticate to access their roles. You will then add the login form to the home page, so that public users will be able to view the public home page that contains the login form only.

This tutorial takes you through the following steps:

1. Export your configuration settings.
2. Restrict all permissions to authenticated users.
3. Restrict blocks to authenticated users.
4. Add login form to the home page.

Export your configuration settings

In case you make an error, or want to revert all of the changes made during this tutorial, you can back up your configuration settings to your machine before you make any changes.

The tutorial Exporting and importing custom themes and site configuration provides further details on how to export your configuration settings using the Developer Portal CLI.

Restrict all permissions to authenticated users

1. If the administrator dashboard isn't displayed, click Manage to display it.
2. Navigate to People > Permissions.
3. Clear all check boxes that are associated with **ANONYMOUS USER**.
4. Click **Save permissions** at the end of the page.

Restrict blocks to authenticated users

1. If the administrator dashboard isn't displayed, click Manage to display it.
2. Navigate to Structure > Block layout.
3. Find the row that is labeled **Main menu** and click **Configure**.
4. Find the setting **Roles** under the category **Visibility**.
5. Check the box **Authenticated user**.
6. Click **Save block**.
7. Repeat from step 3 for the **Footer menu**.
8. Click **Save block**.

Add login form to the home page

1. If the administrator dashboard isn't displayed, click Manage to display it.
2. Navigate to Structure > Pages.
3. Click **Edit** on the **Welcome** page.
4. Navigate to Panels > Content.
5. Click **Add new block**.
6. Find and click **User login**, under the **FORMS** section.
7. Clear the **Display title** check box.
8. Click **Add block**.
9. Rearrange the new login block so that it is underneath the **Welcome Banner**.
10. Click **Update and save**.

What you did in this tutorial

On your Developer Portal, you restricted access for all the content to authenticated users only. Now when you access your home page as an unauthenticated user, you see that the login form appears underneath the welcome banner. Navigating to other URLs on the site presents an **unauthorized** page to appear.

When you log in, the login form disappears from the home page and you are able to access all of the pages that are visible to your role.

Tutorial: Creating Accounts and Applications on the Developer Portal

This tutorial shows you how to create a developer account and register an application on the Developer Portal.

Before you begin

You must have a Developer Portal installed, and created and published at least one API product.

If you do not have a Developer Portal available, complete the tutorial Creating a Developer Portal.

If you don't have an API product available, you can download one of the following APIs, and then import and activate it:

- If your Sandbox catalog uses a DataPower® Gateway (v5 compatible) (as one of the gateways, or as the only gateway), download the findbranch.txt file to your local filesystem. Rename this file `findbranch.yaml`.
- If your Sandbox catalog uses a DataPower API Gateway, download the findbranch_v6.txt file to your local filesystem. Rename this file `findbranch.yaml`.

For more information about importing an API, see Adding a REST API by importing an OpenAPI definition file.

About this task

In this tutorial you are going to complete the following lessons:

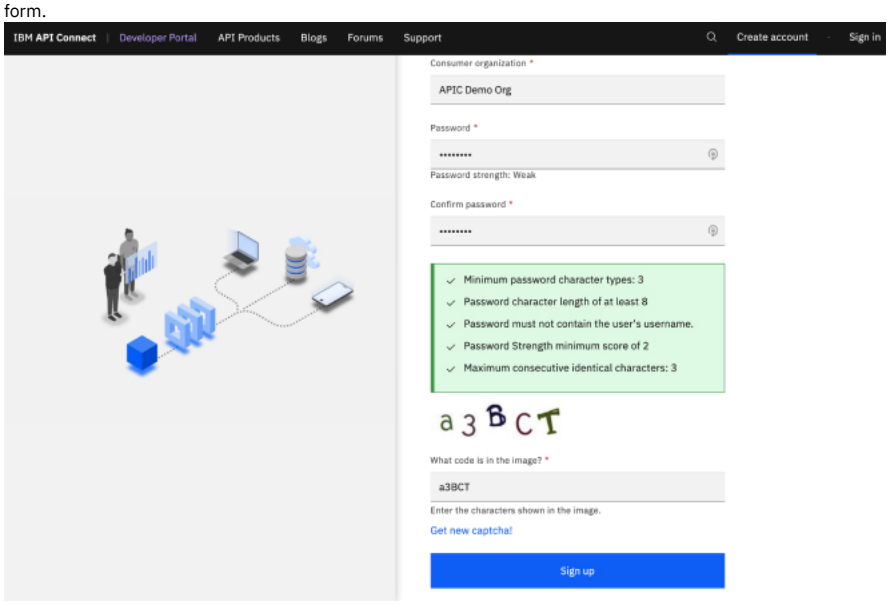
- Creating a developer account in the Developer Portal
- Creating a developer application in the Developer Portal
- Testing the Branches API in the Developer Portal

Note: The administrator account cannot create an App, or register to an App. To create or register to an App, you must have a developer account. A developer account that has been assigned administrator privileges can create and register Apps.

Creating a developer account in the Developer Portal

Take the following steps to create a developer account:

1. Follow the instructions provided on Creating a Developer Portal and open the Developer Portal.
2. Click Create account. If the Create account link is not visible, log out as Admin from the Developer Portal first, go to the home page of the Developer Portal, and click Create account.
   Note: Your email is used as your user name for the Developer Portal. The email address must be different from the address used for creating the administrator account.
3. Complete the sign up form. The email address you provide must be functional. Click Sign up. A confirmation message is sent to the email address provided in the form.

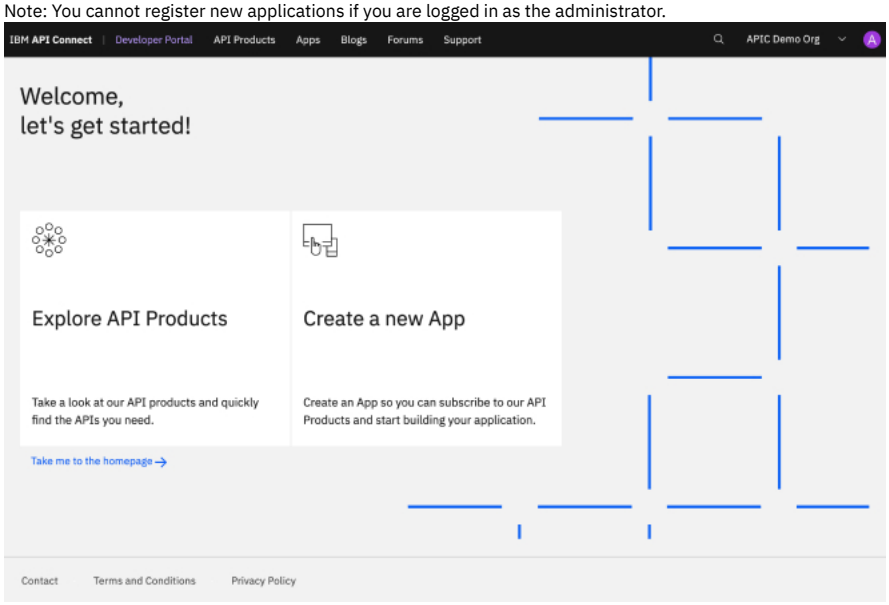


4. Click the account activation link in the confirmation email to activate your account.
5. To use the Developer Portal, click Sign in and sign in with the user credentials you specified.

Creating a Developer Portal Application

To create and register a new App:

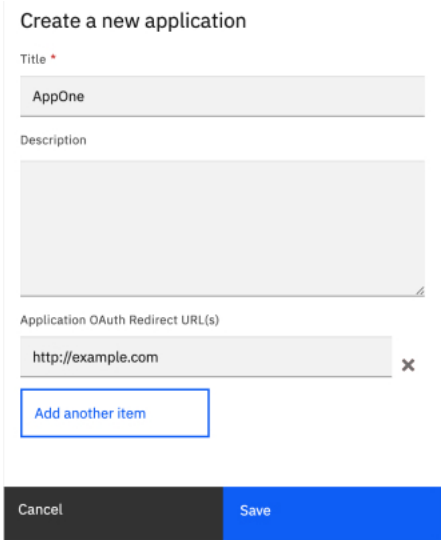
1. In the Developer Portal, click Create a new App.
   Note: You cannot register new applications if you are logged in as the administrator.



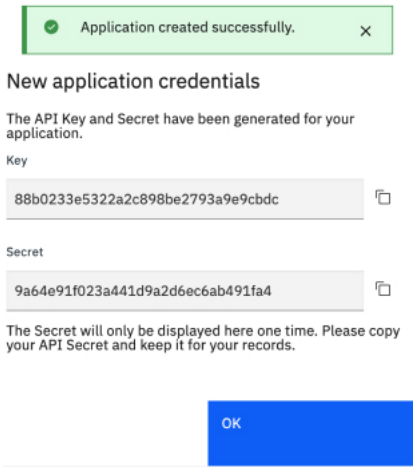
2. Enter the following values for the application that is being registered.

Table 1. Values for registering the application

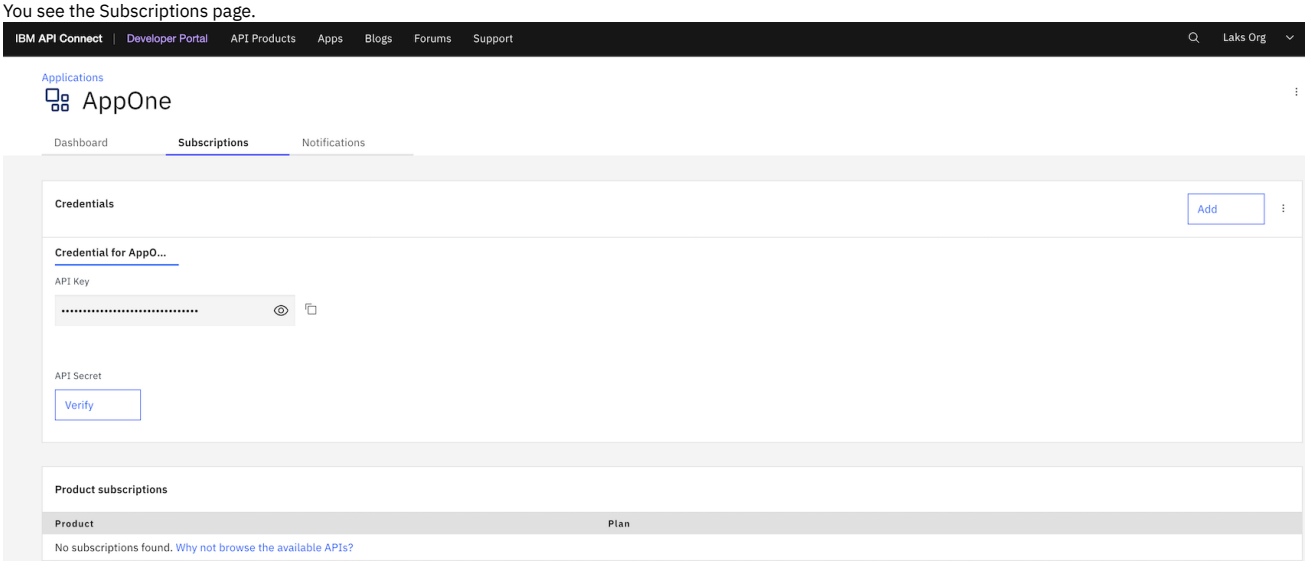
Field Name	Value
Title	`AppOne`
Application OAuth Redirect URL(s)	`http://example.com`



3. Click Save.
4. Copy the key and secret values for the new app. Click OK.



5. Click OK.
   You see the Subscriptions page.



Subscribing to an API in the Developer Portal

1. Click API Products.
2. In the Name field, enter `FindBranch` and click on the *product name* .
3. Under Plans, click Select.
4. Under the Application heading, click AppOne.
5. Under Subscribe, click Next to confirm the subscription.

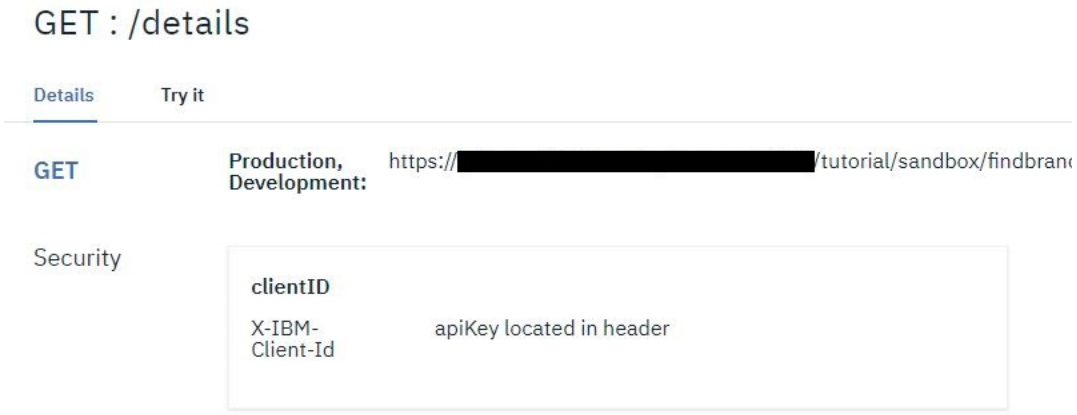
6. Under Summary, click Done after confirming the subscription details.

To view the current subscription details of your application, perform the following steps:

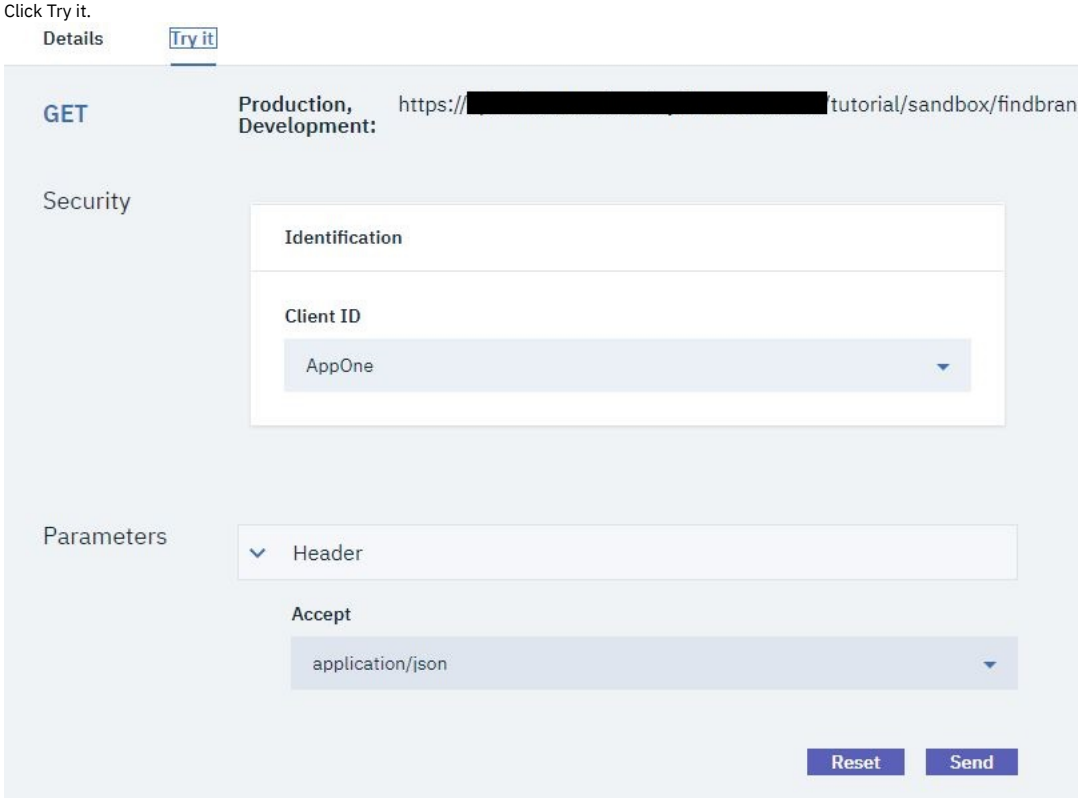
1. Under Apps, select AppOne.
2. Click Subscription.

Testing An API in the Developer Portal

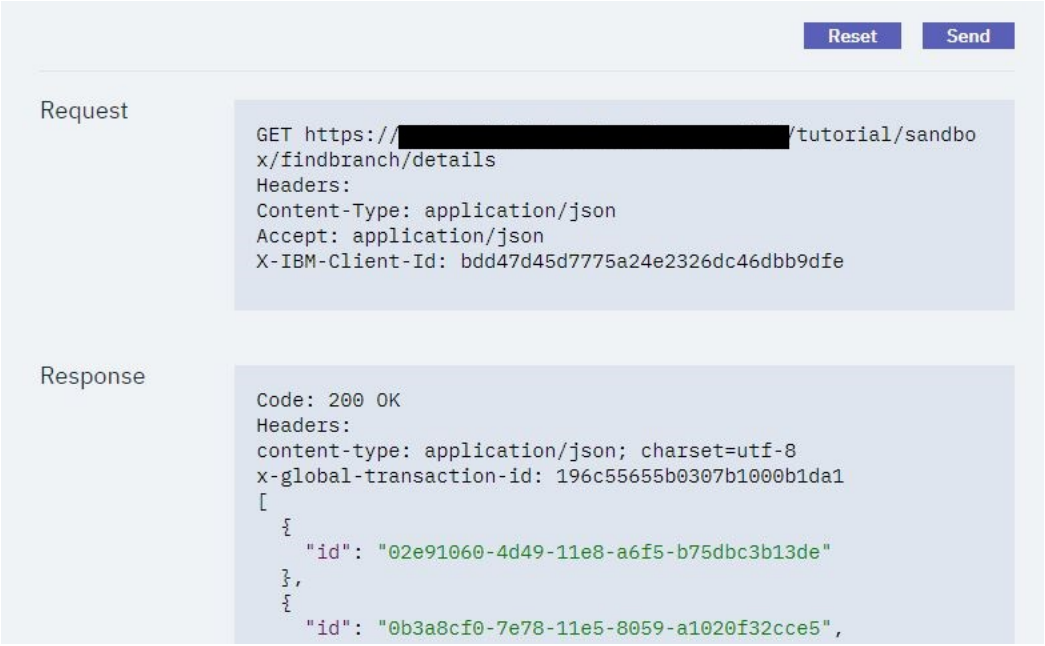
1. Click API Products in the Developer Portal dashboard.
2. Click a Product, such as FindBranch auto product , then select the FindBranch API from the list.
3. Click GET /details.



4. Click Try it.



5. Click Send.
   Note: If no response is received, navigate to the URL that is displayed at the beginning of the Try this operation section, in a new browser tab. Accept the security certificate, and then call the operation again.
6. A returned response of `200 OK` and the message body are displayed, indicating that the REST API operation call was successful.



What you did in this tutorial

In this tutorial, you completed the following activities:

- Created a developer account in the Developer Portal.
- Created and registered a new App, and subscribed it to a Plan.
- Tested an API in the Developer Portal.

Tutorial: Creating a custom theme for the Developer Portal

Customize the appearance of your Developer Portal home page, by generating a sub-theme, configuring the overrides.css file, and installing the newly customized theme.

Before you begin

You must have a Developer Portal enabled, and you must have administrator access to complete this tutorial. The tutorial Creating the Portal explains how to enable the portal if you have not already done so.
Important: You're not permitted to include any IBM® API Connect code within any custom themes that you create.

About this tutorial

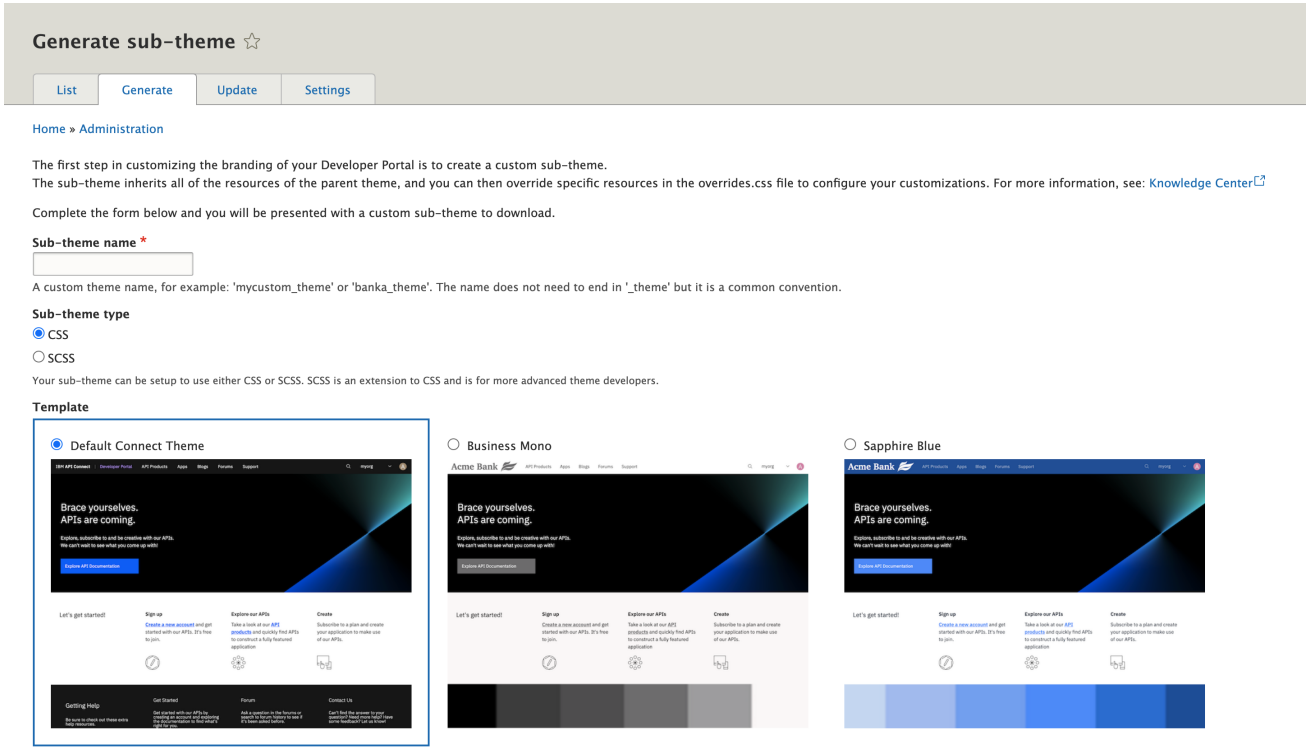
The way to create a custom theme is to create a custom sub-theme of the standard API Connect theme that the Developer Portal uses by default. The sub-theme inherits all of the resources of the parent theme, and you can then override specific resources to configure the required customizations.

This tutorial takes you through the following lessons:

1. Creating a sub-theme by using the theme generator.
2. Customizing the overrides.css file.
3. Installing and enabling your customized theme.

Creating a sub-theme

1. Log in to your Developer Portal as an administrator.
2. If the administrator dashboard isn't displayed, click Manage to display it.
3. Click Appearance > Generate sub-theme. The Generate sub-theme window is displayed.
4. Enter a Sub-theme name, and select CSS for the Sub-theme type. (If you prefer, you can select SCSS, but this extension to CSS is for advanced theme developers, and isn't covered by this tutorial.)



5. Select the Default template to base your **`sub-theme`** on. You can create a sub-theme based on a color template. However, for this tutorial you use the Default Connect Theme template.
6. Click Generate.
7. Download the generated sub-theme to a location of your choice, and extract all the files from the .zip file.

Customizing the overrides.css file

On your computer, navigate to the files that you extracted. Find the overrides.css file in here: <extract_folder>/css/overrides.css. You can now customize the overrides.css file.

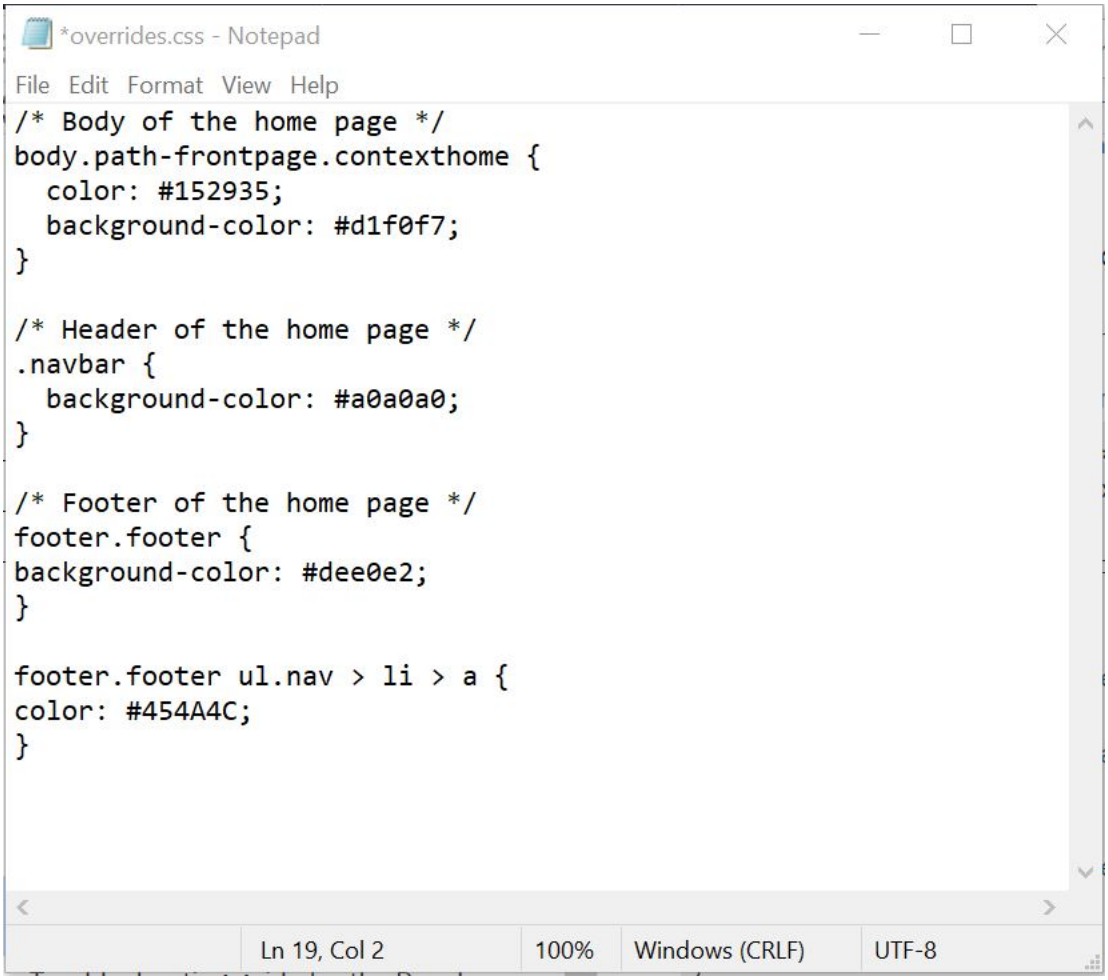
1. Open the overrides.css file in your chosen editor.
2. Customize your sub-theme by entering the following elements into the overrides.css file:

```
/* Body of the home page */
body.path-frontpage.contexthome {
  color: #152935;
  background-color: #d1f0f7;
}

/* Header of the home page */
.navbar {
  background-color: #a0a0a0;
}

/* Footer of the home page */
footer.footer {
background-color: #dee0e2;
}

footer.footer ul.nav > li > a {
color: #454A4C;
}
```

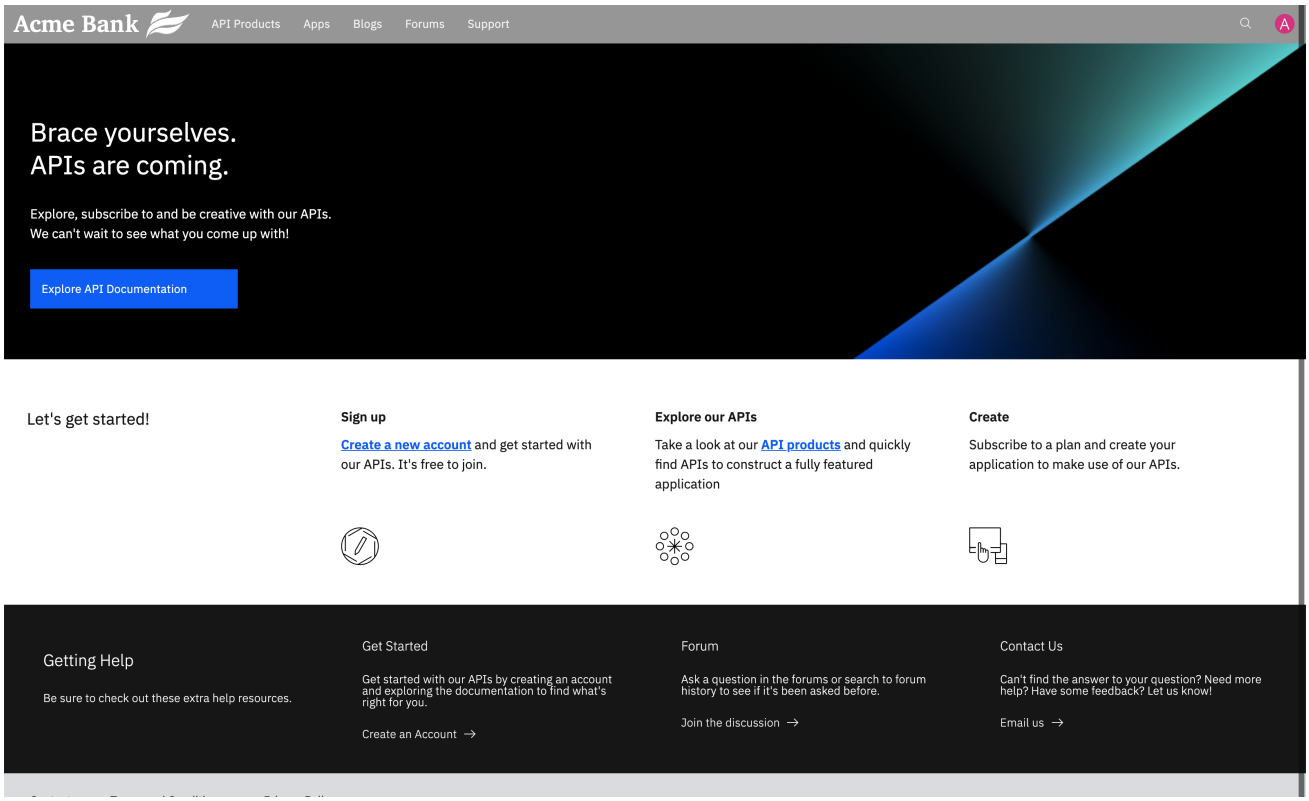


3. Save the overrides.css file.

Installing and enabling your customized theme

1. After you have finished updating the overrides.css file, compress all the theme files back into the .zip sub-theme file that you downloaded originally.
   Note that you can also include your own custom logo and favicon in your theme files, and these are then included as part of your theme when it is installed. These files must use the naming convention logo.svg, and favicon.ico, respectively. You can also change your logo and favicon at a later time, see Changing the site logo and Changing the shortcut icon.

2. In the Developer Portal, click Appearance > Install new theme. The **`Install new theme`** window is displayed.
3. In Upload a module or theme archive, click Browse, and navigate to your newly updated compressed theme file.
4. Click Continue to install the theme onto your site.
5. Click Enable newly added themes, and find your new theme in the list of Disabled themes. Click Enable and set as default to set your new custom sub-theme as the default theme for your site.
6. Return to the Developer Portal home page by clicking Back to site. You can now see your custom theme.



What you did in this tutorial

In this tutorial, you completed the following tasks:

- Created a sub-theme of your Developer Portal site by using the theme generator.
- Configured some customized home page elements in the overrides.css file of your sub-theme.
- Uploaded and installed your customized theme in your Developer Portal site.
- Successfully customized the appearance of your Developer Portal home page.

Tutorial: Using avatars

You can use an avatar generator to better represent the branding of your site, and add a sense of community for your users, than the default name initial that is provided in the Developer Portal.

Before you begin

You must have a Developer Portal enabled, and you must have administrator access to complete this tutorial. The tutorial Creating the Portal explains how to enable the portal if you have not already done so.

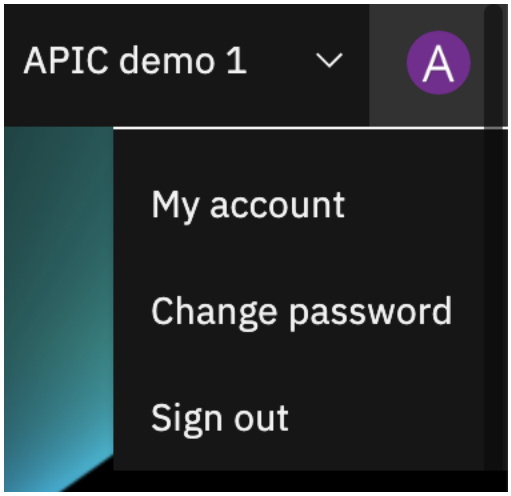
About this tutorial

In this task, you add the **Robohash** avatar generator to your Developer Portal site, and assign it as the primary avatar generator for all users.

This tutorial takes you through the following steps:

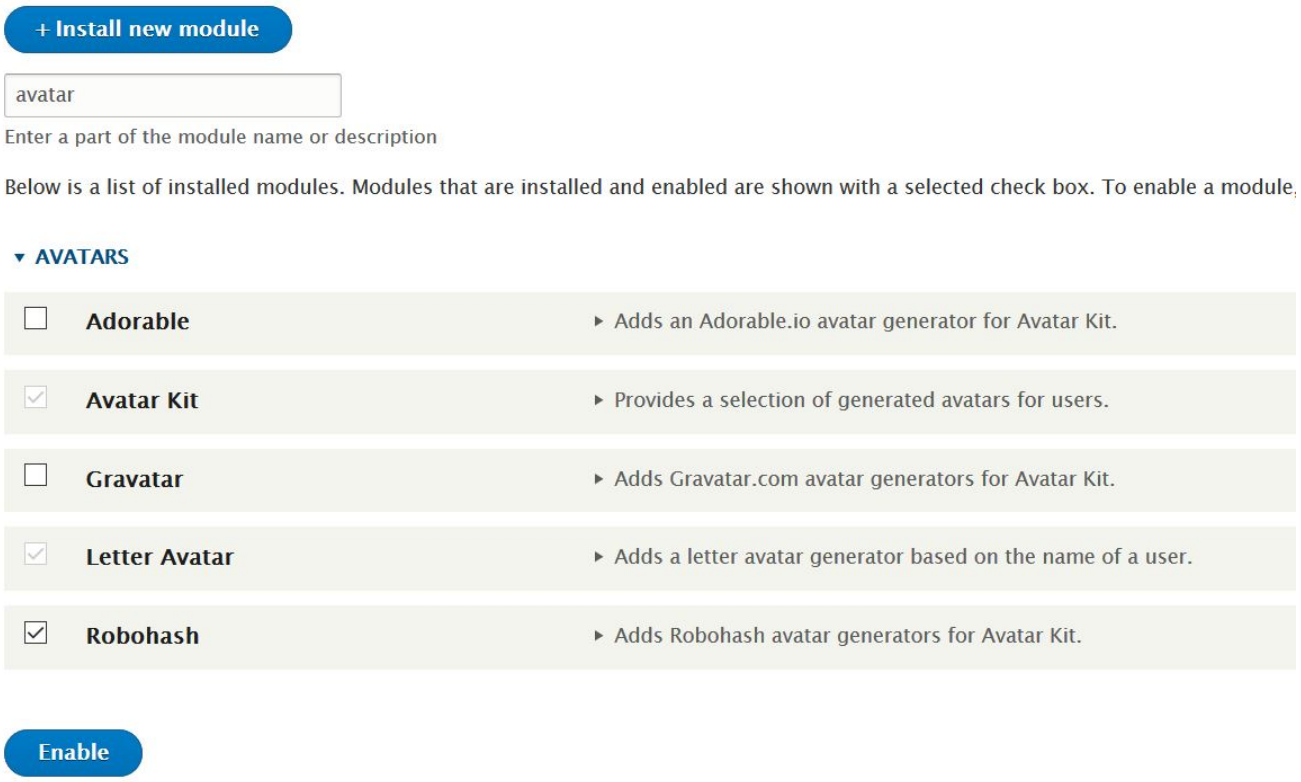
1. Install the **Robohash** avatar generator.
2. Set **Robohash** as the preferred avatar generator for your site.
3. Configure the permissions for the **Robohash** avatar generator.

The avatar of the admin user displays like this before the block is added.



Enable the `Robohash` avatar generator

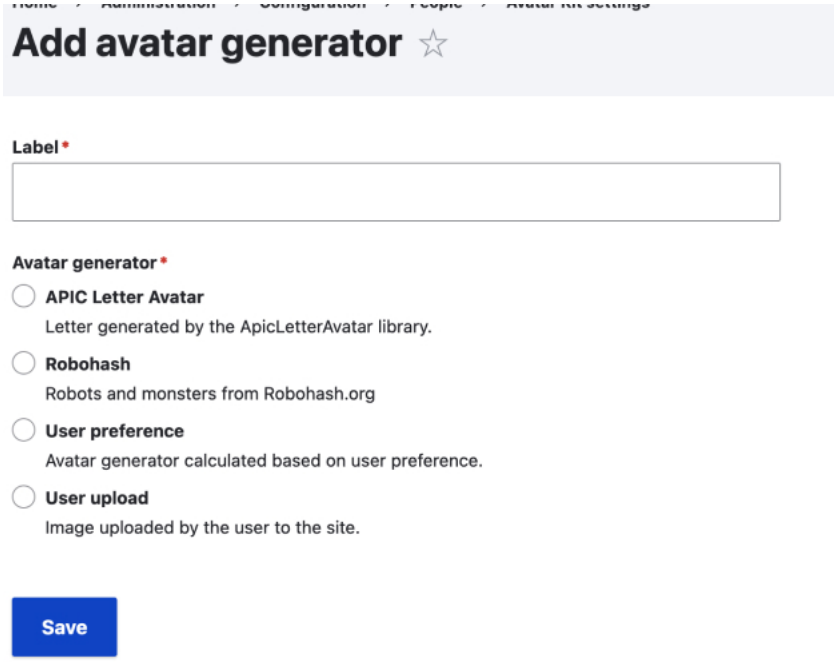
1. Log in to your Developer Portal as an administrator.
2. If the administrator dashboard isn't displayed, click Manage to display it.
3. Click Extend.
4. In the text box, enter `avatar` in the **`Block description`**.
5. Check the **`Robohash`** box, click Enable.



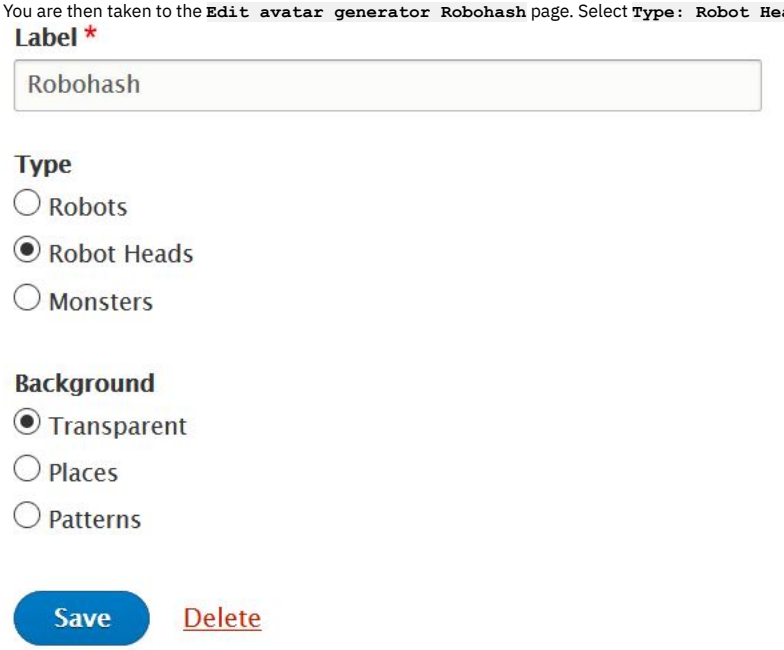
When the module is enabled, you receive a **`Module Robohash has been enabled`** message.

Set `Robohash` as the preferred avatar generator for your site

1. If the administrator dashboard isn't displayed, click Manage to display it.
2. Navigate to Configuration > People > Avatar settings.
3. Click **`+ Add avatar generator`**.
4. Enter `Robohash` as the label.
5. Check **`Robohash`** for the avatar generator.
6. Click Save



7. You are then taken to the **`Edit avatar generator Robohash`** page. Select **`Type: Robot Heads`** and **`Background: Transparent`**. Click Save.



8. You are now on the avatar generator page. Drag **`Robohash`** to be first in the list, and check **`Enabled`**, then click Save configuration.

You have now set **`Robohash`** as the preferred avatar generator for your site.

Configure the permissions for the `Robohash` avatar generator

The default setting for the **`Robohash`** avatar generator is to generate avatars for users with **`superuser`** access only. In this example, the permissions are changed so that all **`authenticated users`** can access **`Robohash`**.

1. If the administrator dashboard isn't displayed, click Manage to display it.
2. Navigate to People > Permissions.
3. Find **`Use Robohash`** under the permission type **`Avatar Kit`**.
4. Check **`AUTHENTICATED USER`** for **`Use Robohash`** to enable the generator for all authenticated users.
   Notice that all the boxes for this user type are then automatically checked because all of those users have the same permissions as an authenticated user, or higher.

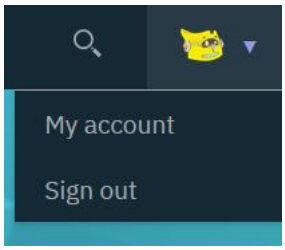
PERMISSION	ANONYMOUS USER	AUTHENTICATED USER	FORUM MODERATOR	CONTENT AUTHOR	ADMINISTRATOR	SUPERUSER
Change own logout threshold	☐	☐	☐	☐	☑	☑
Avatar Kit						
Administer Avatar Kit *Warning: Give to trusted roles only; this permission has security implications.* Manage settings for Avatar Kit.	☐	☐	☐	☐	☑	☑
Use *Letter Generator* User can select *Letter Generator* avatar generator.	☐	☑	☑	☑	☑	☑
Use *Robohash* User can select *Robohash* avatar generator.	☐	☑	☑	☑	☑	☑

5. Click Save permissions.

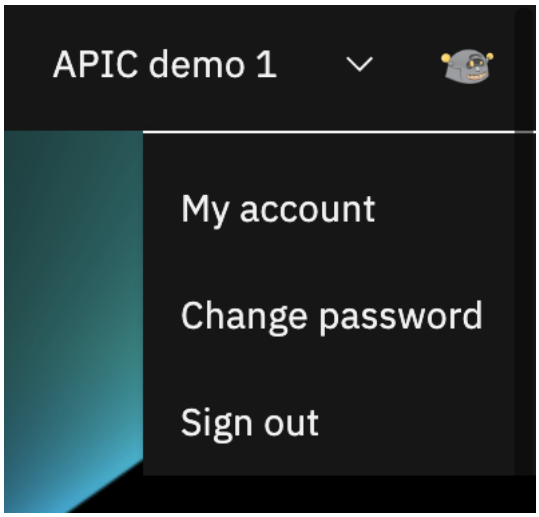
What you did in this tutorial

The avatars of all users now have the **robohash** avatar.

You can check that the avatar of the admin user has changed by looking at your site page.



You can check that the avatars of other users have changed by finding their published content and looking for their avatar. Or, you can navigate to Manage > People, click a user, and see their avatar on their profile page.



What to do next

You can disable the **robohash** avatar generator.

1. Navigating to Extend > Disable module.
2. Search for **avatar** in the filter text box.
3. Check **Robohash**, click Disable
4. Click Disable.

You can also disable the **robohash** avatar generator by clearing it within Configuration > People > Avatar settings, or, reducing its preference by dragging it to a different order in the list. Click Save configuration.

Tutorial: Using image optimization

You can use image optimization on your Developer Portal site to enhance the use of images.

Optimized images do not overload your website and significantly increase its performance compared to using the original images. Your customer satisfaction and brand reputation improve with fast-loading and trimmed visual assets. Automatic optimization can save time and effort on editing and content moderation.

Before you begin

You must have a Developer Portal enabled, and you must have administrator access to complete this tutorial. The tutorial Creating the Portal explains how to enable the portal if you have not already done so.

About this tutorial

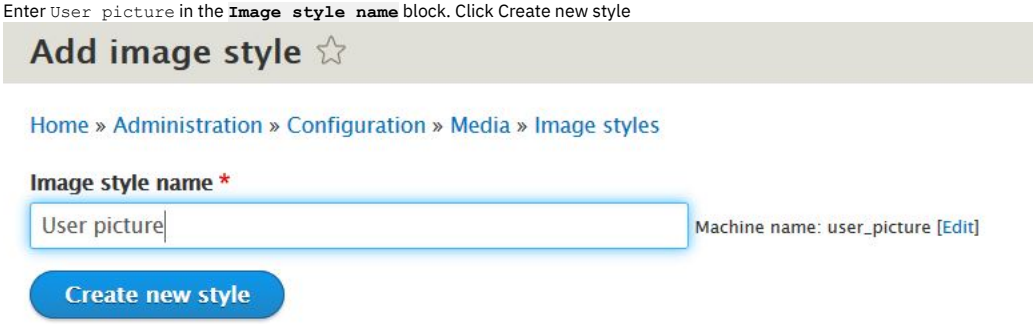
In this task, you create an image style that is called `User picture`, and give it a scale and crop effect. Then, use the `User picture` as the **`Picture`** field in the user account.

This tutorial takes you through the following steps:

1. Create the image style **`User picture`**.
2. Edit the image style **`User picture`**.
3. Assign **`User picture`** to the **`picture`** option in **`Account settings`**..

Create the image style `User picture`

1. Log in to your Developer Portal as an administrator.
2. If the administrator dashboard isn't displayed, click Manage to display it.
3. Navigate to Configuration > Media > Image styles.
4. Click + Add image style.
5. Enter `User picture` in the **`Image style name`** block. Click Create new style

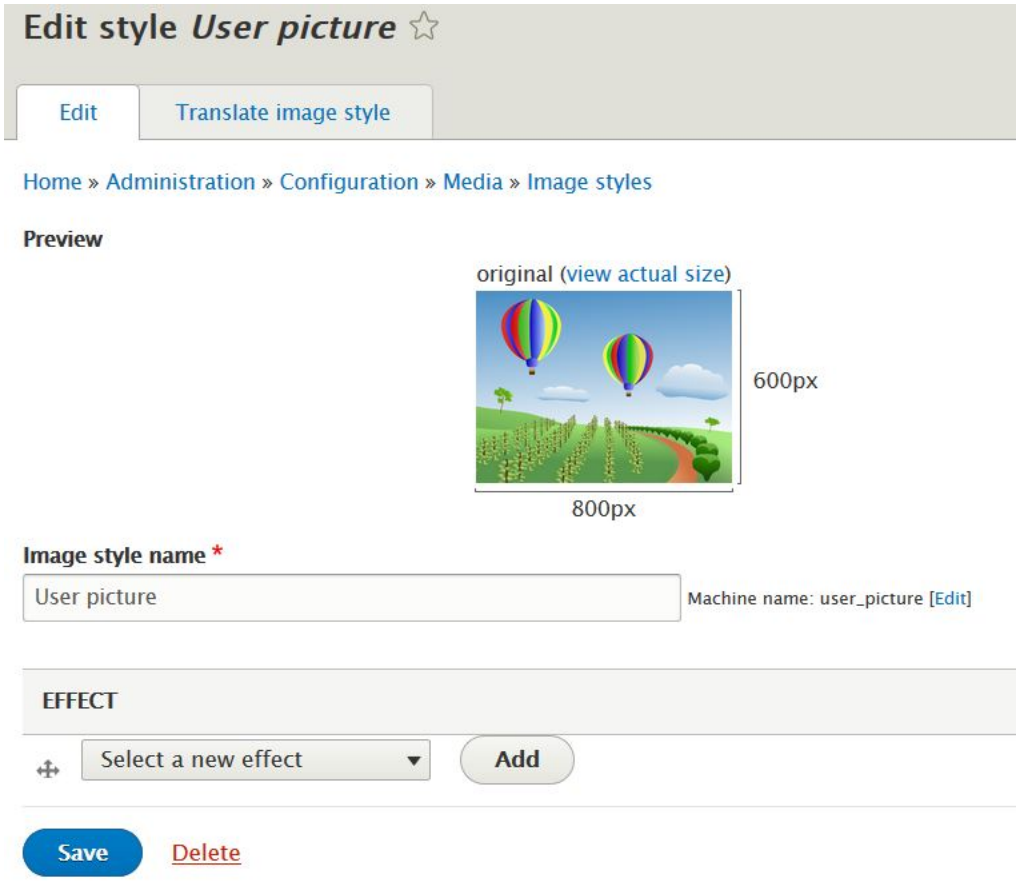


You created the image style **`User picture`**.

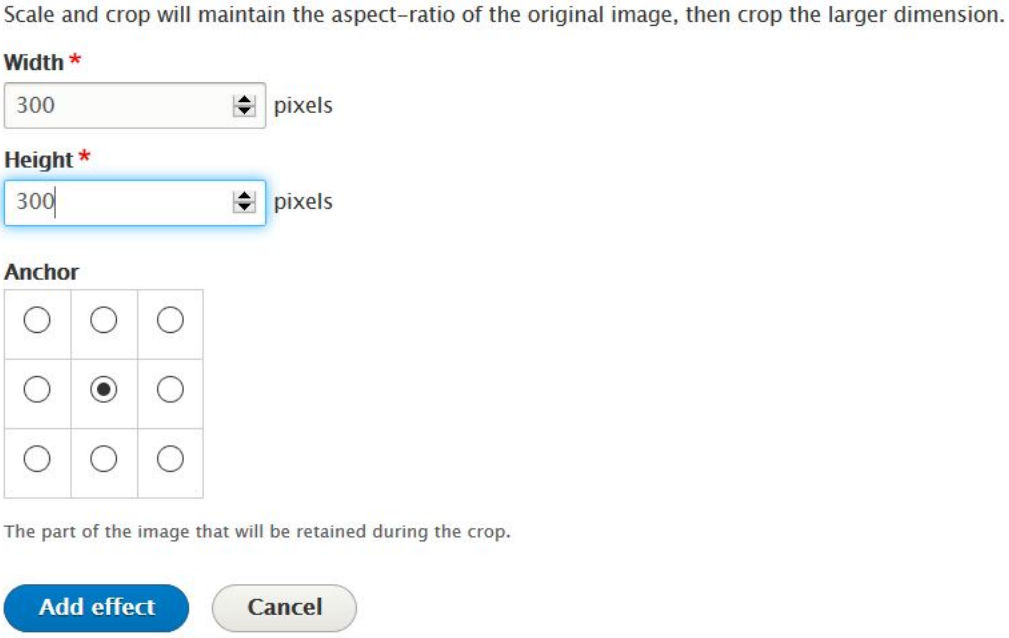
Edit the image style `User picture`

When you edit this style, you choose the width and height settings. Also, the part of the picture to retain during the crop, for example, the center.

1. If the administrator dashboard isn't displayed, click Manage to display it.
2. Navigate to Configuration > Media > Image styles.
3. Click Edit on the **`User picture`** style name.



4. Select **`Scale and crop`** from **`Select a new effect`**, then click Add.
5. Enter `300` in the **`Width`** and **`Height`** boxes. Leave the **`Anchor`** as the middle setting. Click Add effect.



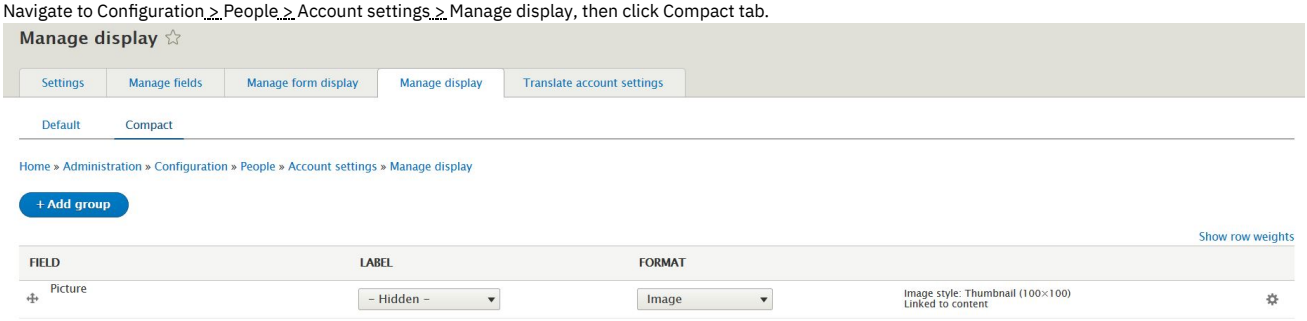
6. Click Save.

You edited the image style **`User picture`**.

Assign `User picture` to the `picture` option in `Account settings`

1. If the administrator dashboard isn't displayed, click Manage to display it.

2. Navigate to Configuration > People > Account settings > Manage display, then click Compact tab.



3. On the **`Picture`** row, click ⚙.
4. Select **`User picture`** from the **`Image style`** drop-down.
5. Click Update and Save.

You set the **`User picture`** image style for all accounts.

What you did in this tutorial

You changed your account settings so that if the user displays a picture it is within the limits of the image style **`User picture`**.

To check the picture used by a user, navigate to Manage > People, click a user, and see their picture on their profile page. Right-click the image, then click **`View image info`**, you can see that the dimensions are scaled.

Type:	JPEG Image
Size:	29.95 KB (30,667 bytes)
Dimensions:	620px × 413px (scaled to 240px × 160px)
Associated Text:	Profile picture for user apicdemo1

Tutorial: Adding a Back to top button

You might want to add a Back to top button, as a navigation enhancement to help your Developer Portal users get back to the top of the page that they are viewing, instead of scrolling.

Before you begin

You must have a Developer Portal enabled, and you must have administrator access to complete this tutorial.

About this tutorial

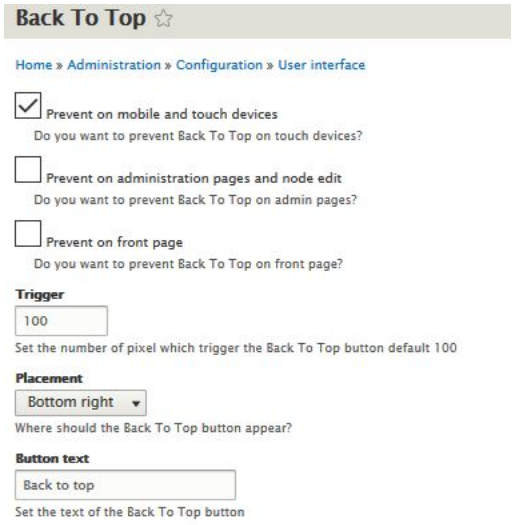
In this tutorial, you add a Back to top button to your Developer Portal.

Before you begin, ensure that the **`Back to top`** module is installed and enabled:

1. Log in to your Developer Portal as an administrator.
2. If the administrator dashboard isn't displayed, click Manage to display it.
3. Click Extend.
4. In the text box, enter `back to top` in the **`Block description`**.
5. Check the **`Back To Top`** box, click Enable.

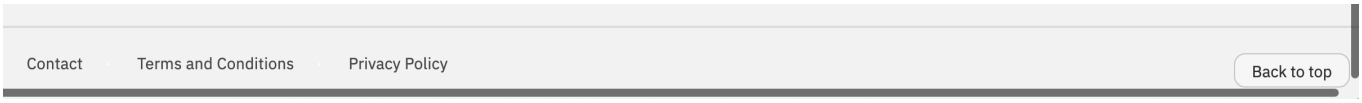
Configure the `Back to top` module

1. If the administrator dashboard isn't displayed, click Manage to display it.
2. Navigate to Configuration > User interface > Back to Top.



3. Change any settings as required, or keep the defaults.
4. Click Save configuration

You now have a Back to Top button.



What you did in this tutorial

You added a Back to Top button, as a navigation enhancement to help your users get back to the beginning of a page that they are viewing, instead of scrolling.

Tutorial: Creating a drop-down menu link

You can create and use drop-down menus, or nested menus, to enhance the use of your Developer Portal .

Before you begin

You must have a Developer Portal enabled, and you must have administrator access to complete this tutorial. The tutorial Creating the Portal explains how to enable the portal if you have not already done so.

About this tutorial

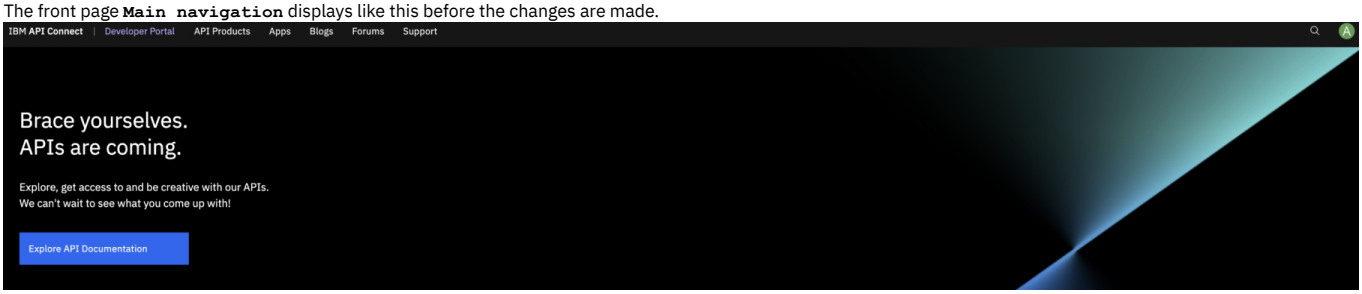
In this tutorial, you create a drop-down menu link on the **`Main navigation`** menu.

Note:
Although drop-down menu links can be created in the Developer portal, the drop-down menu doesn't expand by default. To make the drop-down menu expand, you need to use the **`Superfish`** module.

This tutorial takes you through the following steps:

1. Add menu links to the main navigation menu.
2. Make the drop-down menu expand by using the Superfish module.

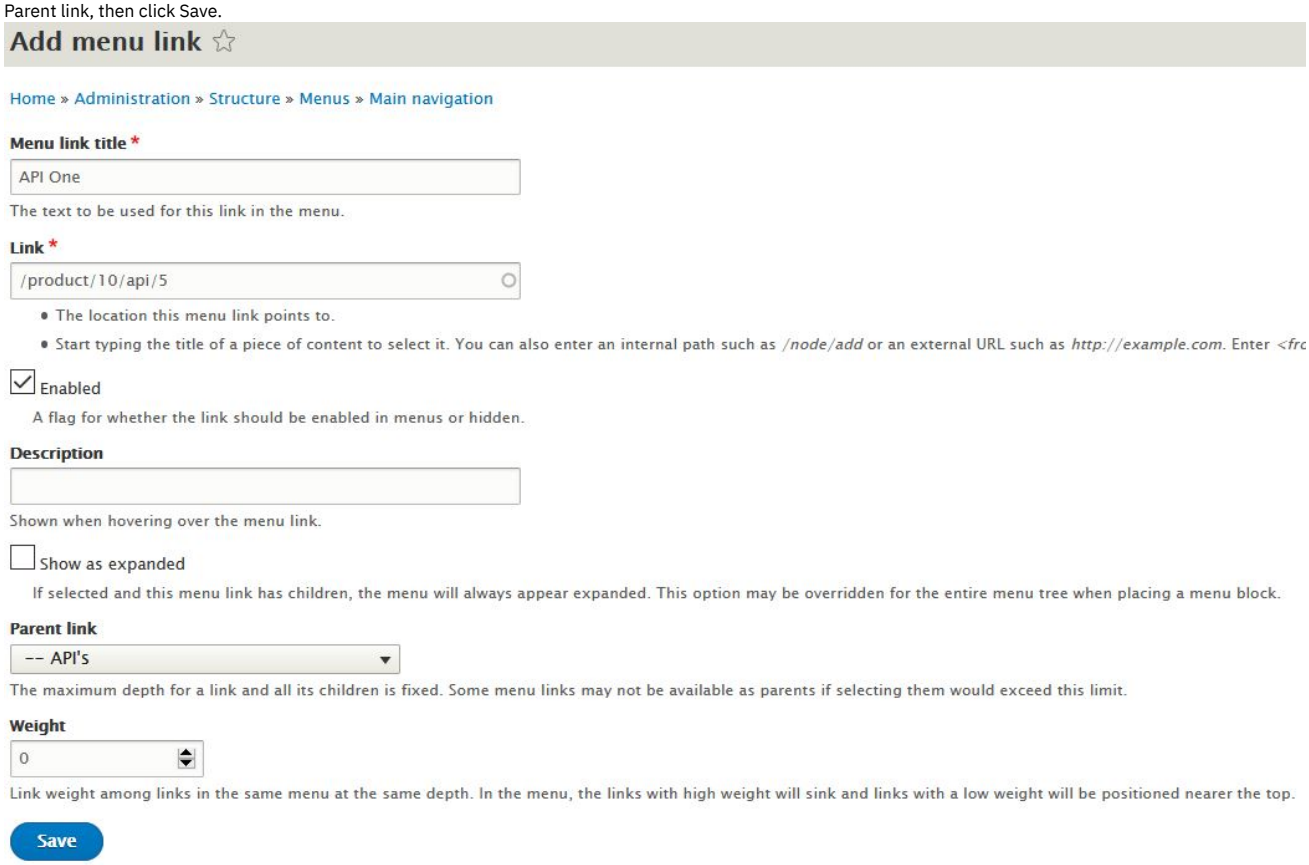
The front page **`Main navigation`** displays like this before the changes are made.



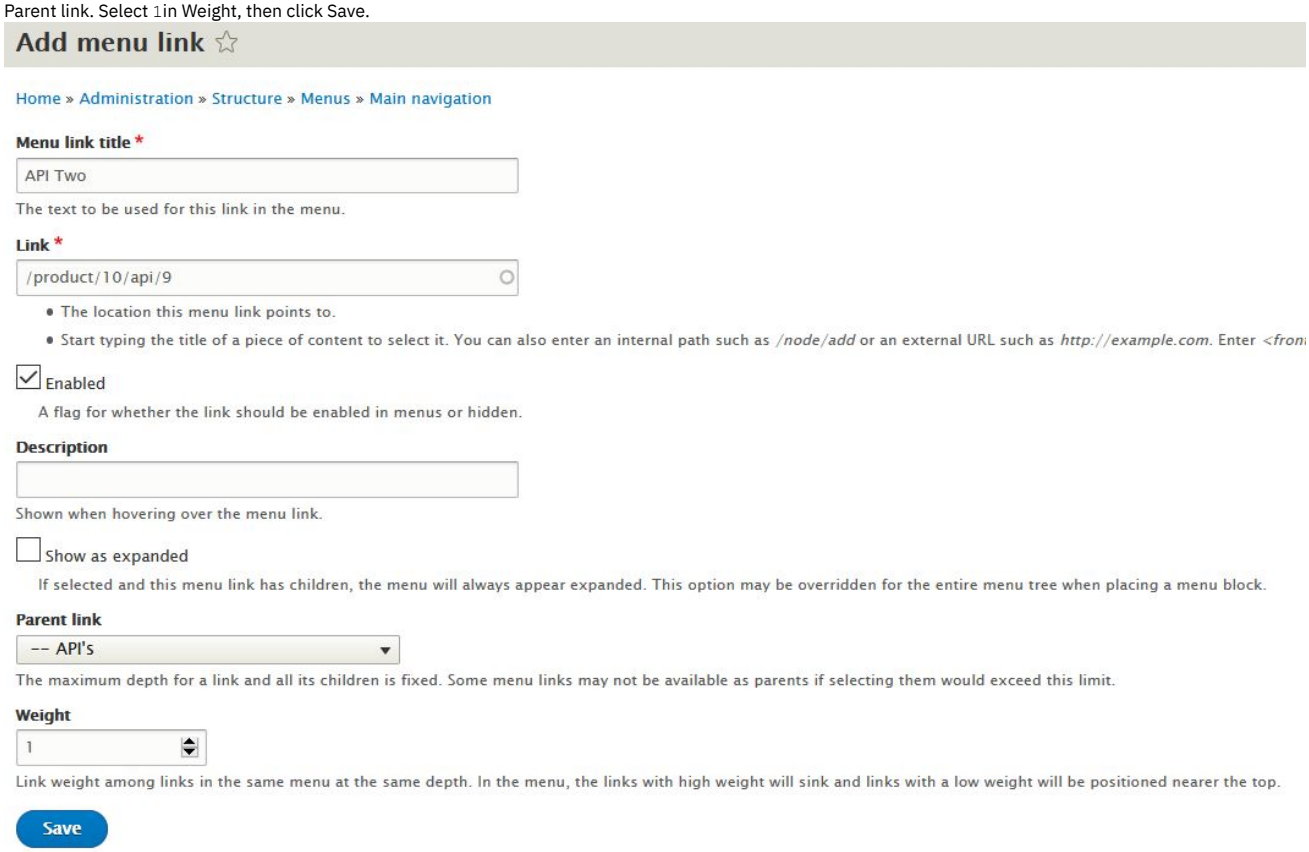
Add menu links to the main navigation menu

1. Log in to your Developer Portal as an administrator.
2. If the administrator dashboard isn't displayed, click Manage to display it.

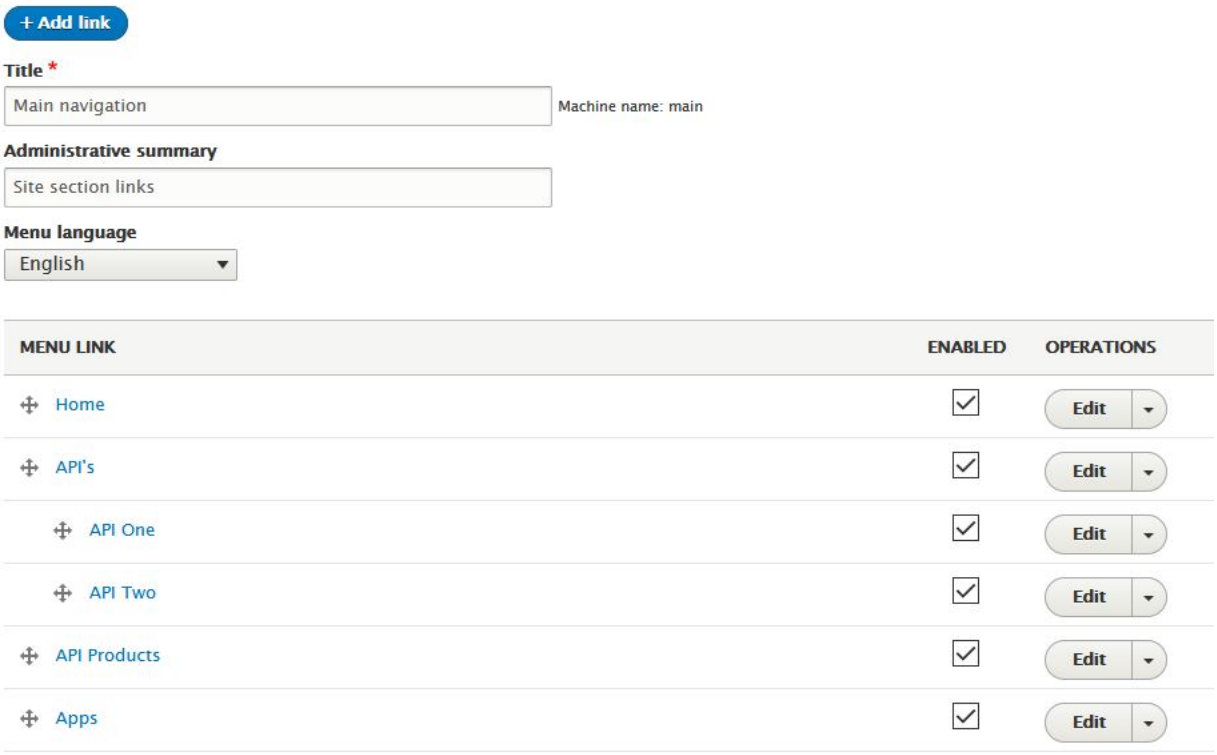
3. Navigate to Structure > Menus > Main navigation > Add link
4. Enter `API's` in the **`Menu link title`**. Enter `/api` in the **`Link`**. Check Show as expanded, then click Save.
   Note: Ensure Show as expanded is checked as this is the parent link for the submenu links.
5. Add another menu link to the main navigation menu. Enter `API One` in the **`Menu link title`**. Enter `/product/10/api/5` in the **`Link`**. Select -- API's in the Parent link, then click Save.



6. Add another menu link to the main navigation menu. Enter `API Two` in the **`Menu link title`**. Enter `/product/10/api/9` in the **`Link`**. Select -- API's in the Parent link. Select `1`in Weight, then click Save.



7. Navigate to Structure > Menus > Main navigation. The hierarchy of the menu links now looks like this:

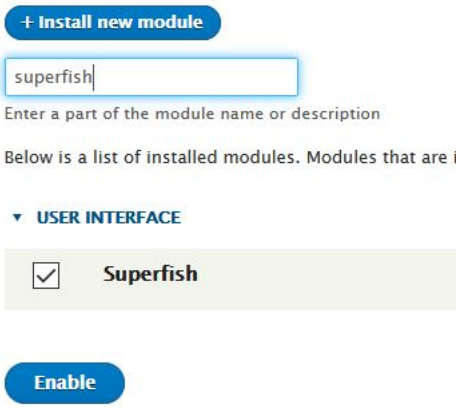


8. Navigate to the home page. The **`APIs`** menu link that you added to the main navigation menu does appear, but the submenus links don't expand when you hover over it.

Make the drop-down menu expand by using the Superfish module

To make the drop-down menu expand when you hover over it, you need to use the **`Superfish`** module and configure the **`Block Layout`**.

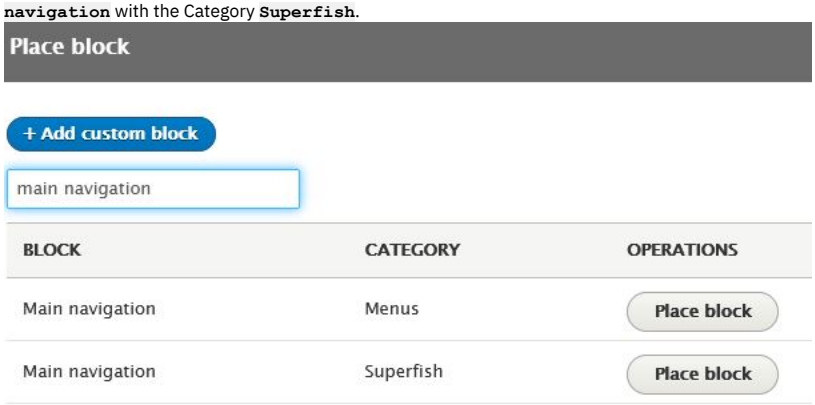
1. If the administrator dashboard isn't displayed, click Manage to display it.
2. Navigate to Extend. Search for **`superfish`**, check the **`Superfish`** box, click Enable.



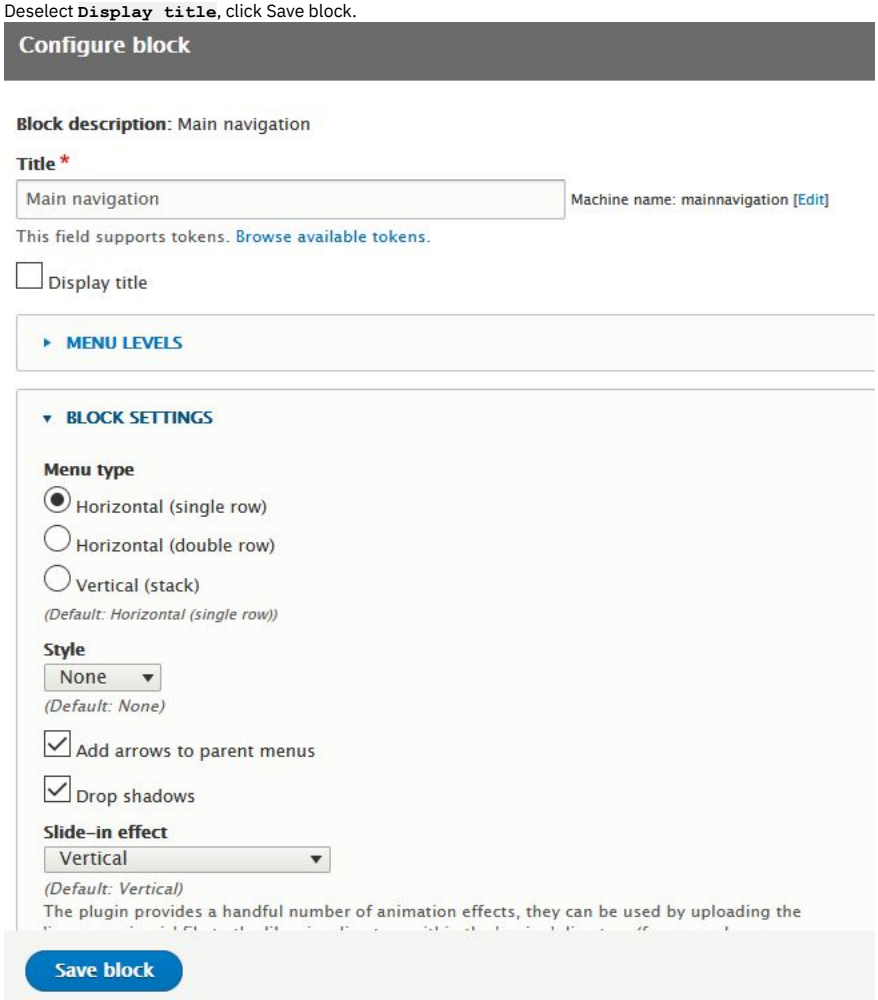
3. Navigate to Structure > Block layout.

4. Click Configure, and select Disable for the **`Main menu`** block.

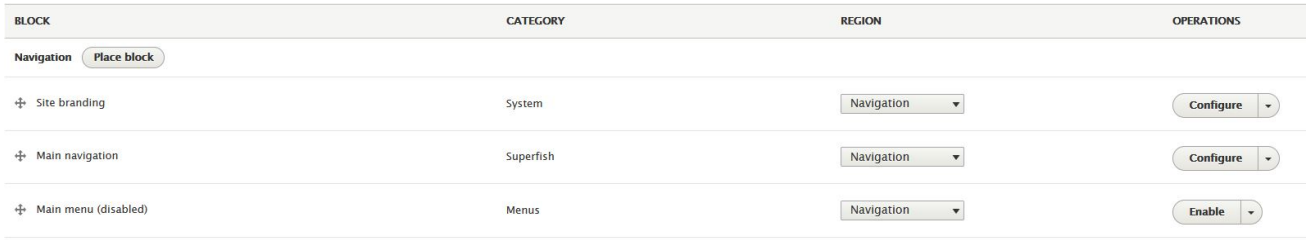
5. Click Place block for Navigation, Then search for `main navigation` in the box. The filtered results might show two or more options. Click Place block for the **`Main navigation`** with the Category **`Superfish`**.



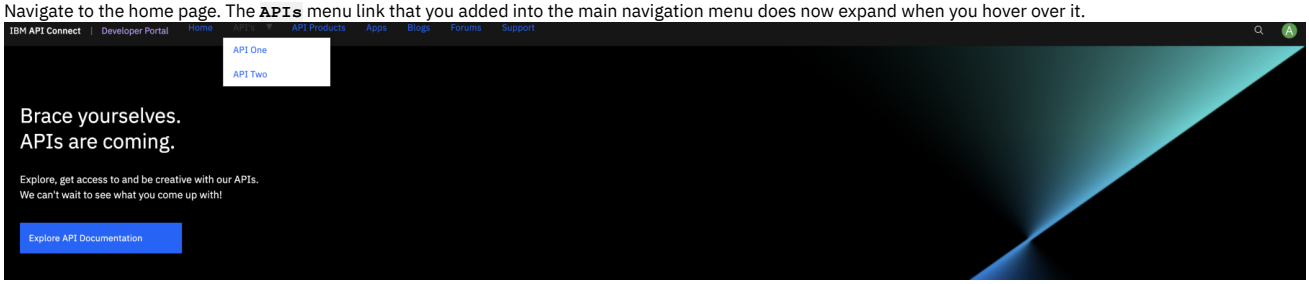
6. Deselect **`Display title`**, click Save block.



7. Drag **`Main navigation`** to be under **`Site branding`**.



8. Click Save blocks.
9. Navigate to the home page. The **`APIs`** menu link that you added into the main navigation menu does now expand when you hover over it.



What you did in this tutorial

You created a drop-down menu link on the **`Main navigation`** menu.

What to do next

You can consider any other uses of the drop-down menu to enhance your users experience on your Developer Portal.

Tutorial: Displaying blog posts on the front page

You can customize the appearance of the front page of your Developer Portal to display recent blog posts. You might use the blog posts to provide your users with information, such as service availability or marketing campaigns.

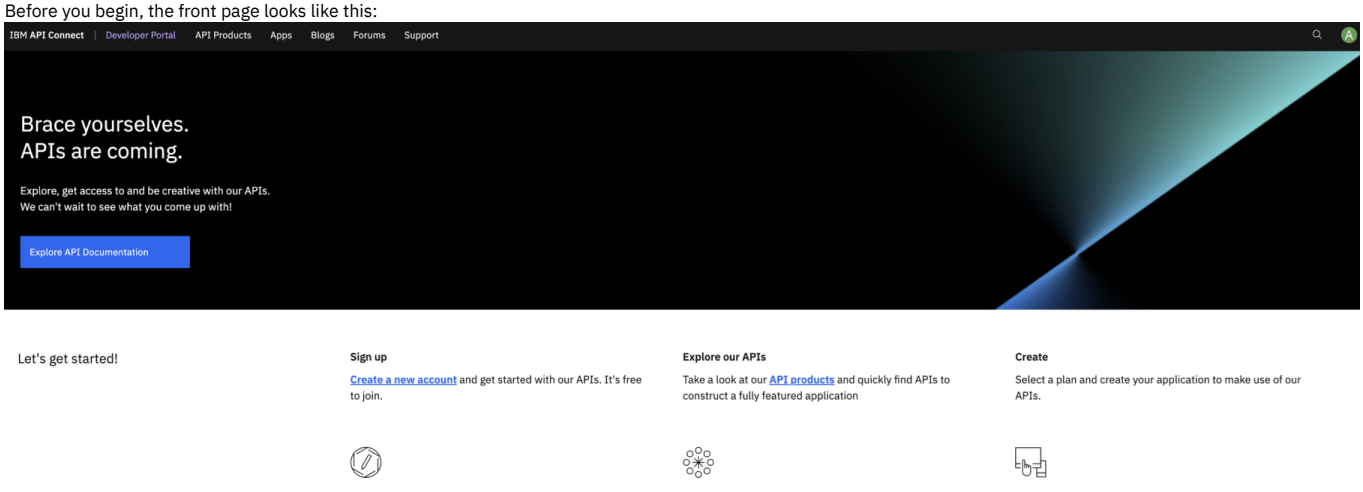
Before you begin

You must have a Developer Portal enabled, and you must have administrator access to complete this tutorial. The tutorial Creating the Portal explains how to enable the portal if you have not already done so.

About this tutorial

In this task, you create a view, customize that view to show blog posts, then embed that view on the front page of your Developer Portal site.

Before you begin, the front page looks like this:

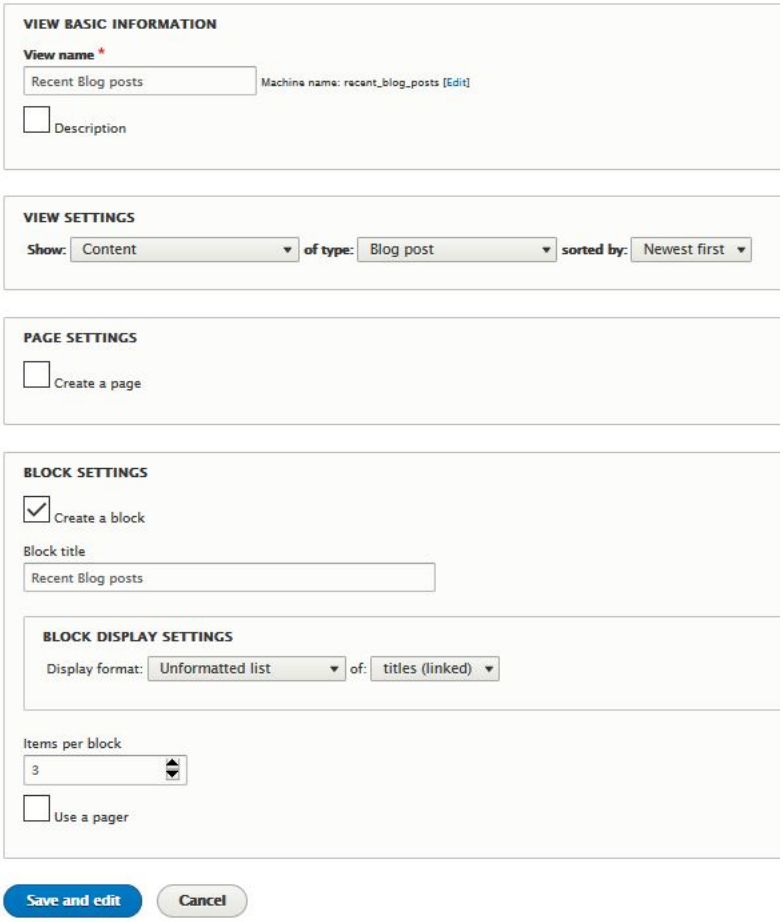


This tutorial takes you through the following steps:

1. Create a view.
2. Customize the view.
3. Embed the view on the front page of your Developer Portal.

Create a view

1. Log in to your Developer Portal as an administrator.
2. If the administrator dashboard isn't displayed, click Manage to display it.
3. Navigate to Structure > Views > Add view.
4. In the **View name** block, enter a name for your view, for example Recent Blog posts.
5. Under **VIEW SETTINGS**, show **Content** of type **Blog Post** sorted by **Newest first**.
6. Check **Create a block** in **BLOCK SETTINGS**, and choose the number of blog posts that you want to be displayed.



7. Click Save and edit.

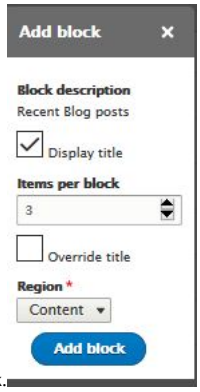
Customize the view

You are now on the page where you can edit your view.

1. If you are not on the edit view page, navigate to Structure > Views, find the name of the view that you created, and click Edit.
2. Click Unformatted list in the **Format** section.
3. Select **Bootstrap List Group**, then click Apply.
4. Select Content: Title in the **Title field** drop-down, then click Apply.
5. Click Save.

Embed the view on the front page of your Developer Portal

1. If the administrator dashboard isn't displayed, click Manage to display it.
2. Navigate to Structure > Pages.
3. Click **Edit** on the welcome page.
4. Click **Panels**, then **Content**.
5. Click +Add new block.
6. Select your new block, which is under **LISTS (VIEWS)**.



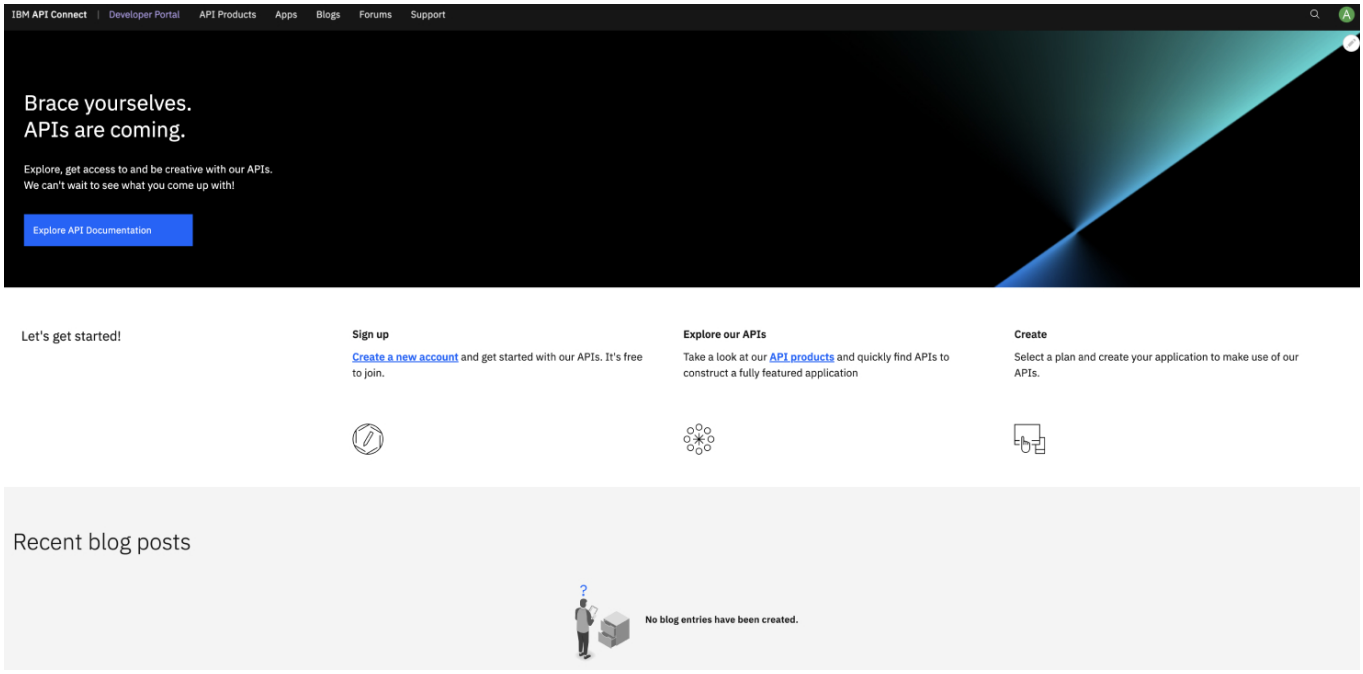
7. Select the number of **`Items per block`**, then click Add block.
8. You can now rearrange your view to be where you would like it on the front page.

LABEL	PLUGIN ID
Content	
Welcome Banner	block_content:2fcdb632-d4b9-44d9-b195-359e751966a1
Featured Content	featuredcontent
Recent Blog posts	views_block:recent_blog_posts-block_1
Getting Started	block_content:f2b7762b-97f4-4d51-b7dc-d6de5be6d0ce

9. Click Update and save.

What you did in this tutorial

You can check that the view you created appears on the front page of your site page.



What to do next

You can edit your view at any time by navigating to Structure > Views and selecting your view by its name. You can also modify or delete the view's layout on the front page by navigating back to the layout section of your page under Structure > Pages.

Tutorial: Displaying tweets on the front page

You can customize the appearance of the front page of your Developer Portal to display recent tweets. You might use the tweets to provide your users with information, such as service availability or marketing campaigns.

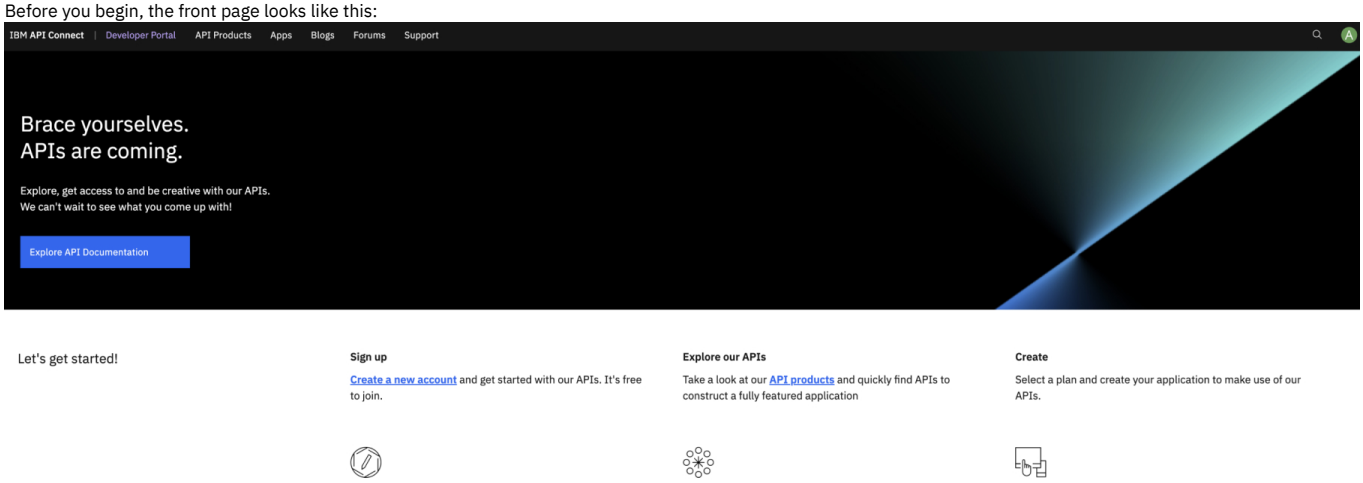
Before you begin

You must have a Developer Portal enabled, and you must have administrator access to complete this tutorial. The tutorial Creating the Portal explains how to enable the portal if you have not already done so.

About this tutorial

In this task, you create a view, customize that view to show tweets, then embed that view on the front page of your Developer Portal site.

Before you begin, the front page looks like this:

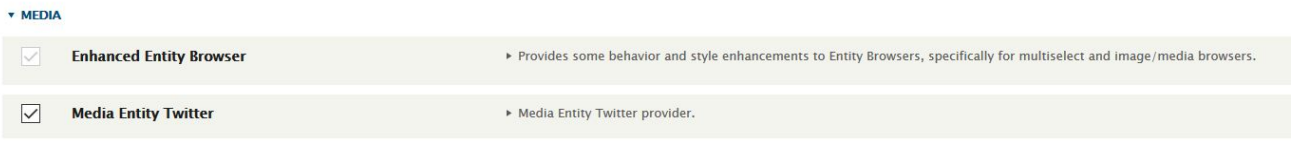


This tutorial takes you through the following steps:

1. Enable the Media entity Twitter module.
2. Create an entity called Twitter to store the tweets.
3. Add media items.
4. Create a carousel view.
5. Customize the carousel view.
6. Embed the carousel view on the front page of your Developer Portal.

Enable the `Media entity twitter` module

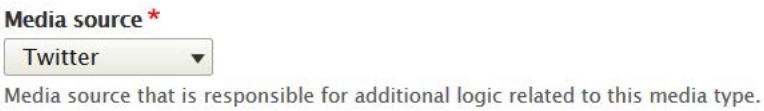
1. Log in to your Developer Portal as an administrator.
2. If the administrator dashboard isn't displayed, click Manage to display it.
3. Click Extend, enter media in the search bar.
4. Check Media Entity Twitter, under MEDIA.



5. Click Enable.

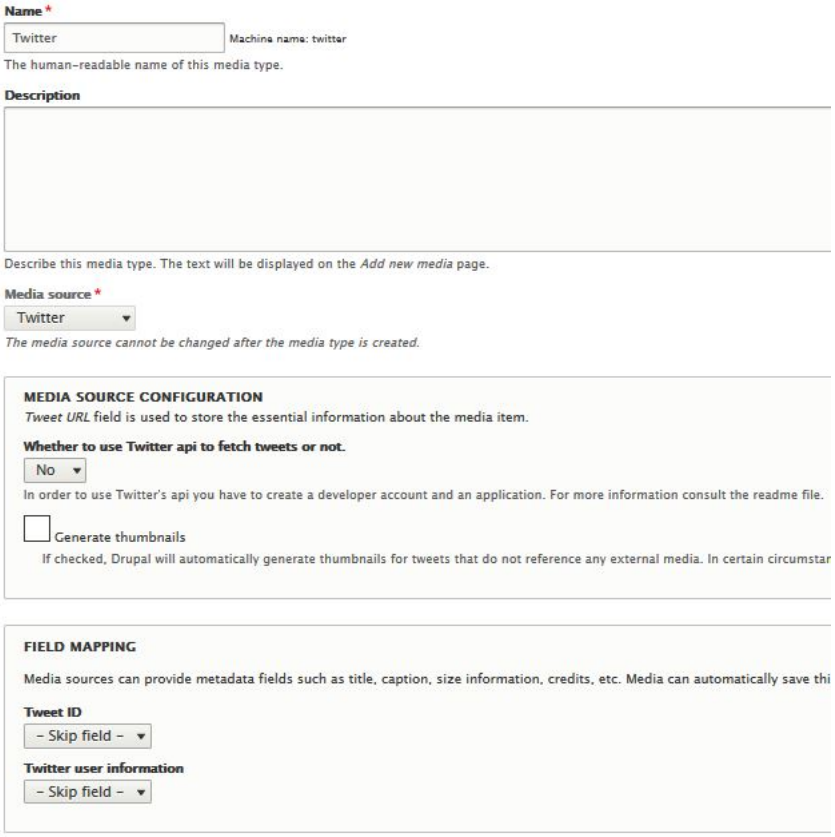
Create an entity called `Twitter` to store the tweets

1. Navigate to Structure > Media types > Add media type.
2. In the Name field, enter Twitter.

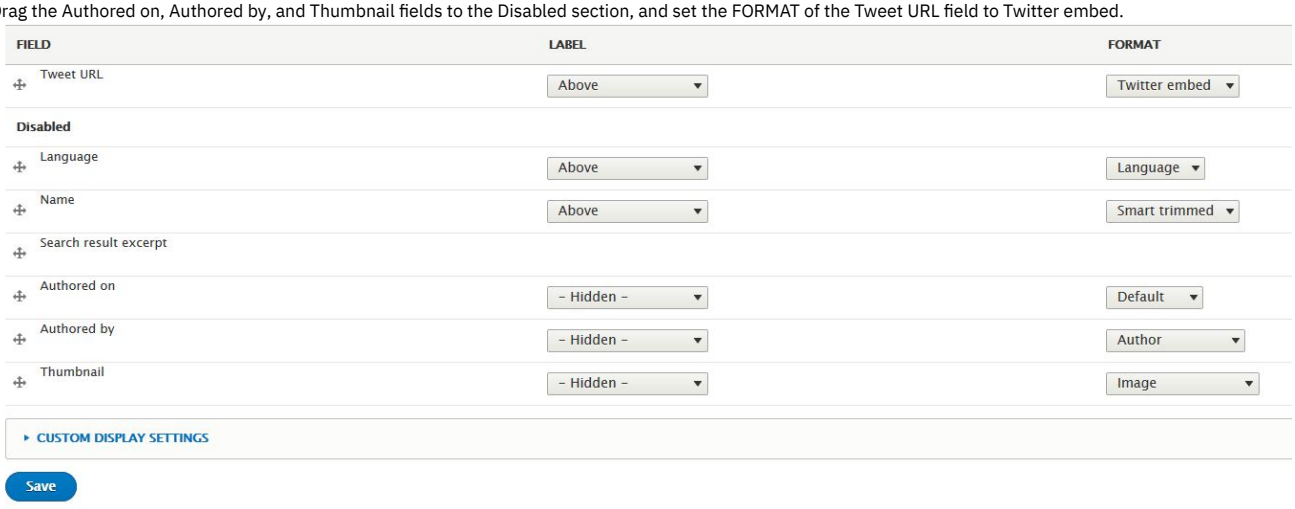


3. In the Media source drop-down, select Twitter.
4. Ensure that Whether to use Twitter api to fetch tweets or not value is set to No.

5. Ensure the values in the FIELD MAPPING section are set to - Skip field -.



6. Click Save.
7. Click Manage display from the Edit dropdown for the new `Twitter` media type.
8. Drag the Authored on, Authored by, and Thumbnail fields to the Disabled section, and set the FORMAT of the Tweet URL field to Twitter embed.

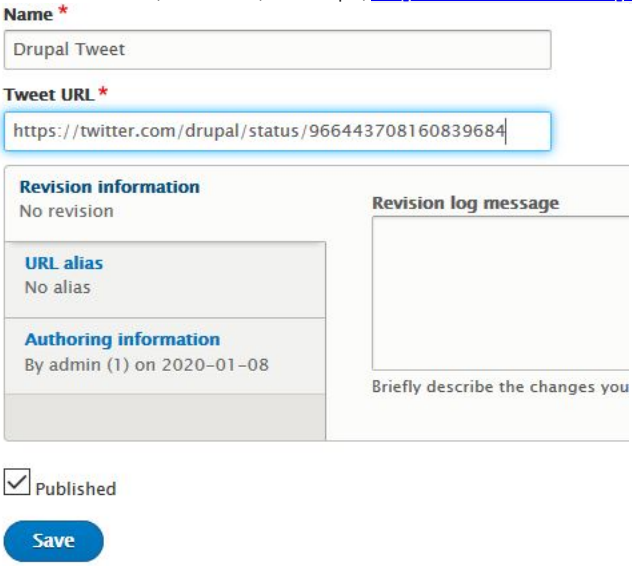


9. Click Save.

Add media items

1. Navigate to Content > Media > Add media > Twitter.
2. In the Name field, enter a name for the media, for example Drupal Tweet.

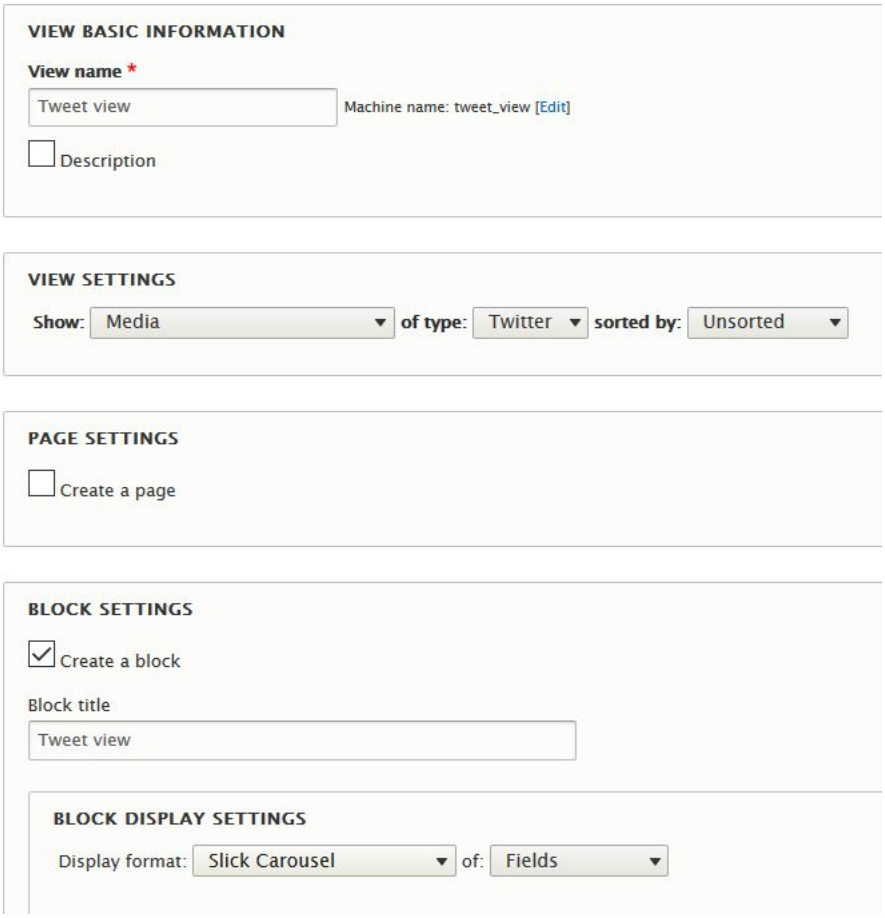
3. In the Tweet URL field, enter a URL, for example, https://twitter.com/drupal/status/966443708160839684.



4. Click Save.
5. Repeat these steps to add more tweets, you need at least 2 to make a carousel view.

Create a carousel view

1. Navigate to Structure > Views > Add view.
2. In the View name block, enter a name for your view, for example Tweet view.
3. Under VIEW SETTINGS, show Media of type Twitter sorted by Unsorted.
4. In the BLOCK SETTINGS, section check Create a block and ensure it is Display formatSlick Carousel of fields.

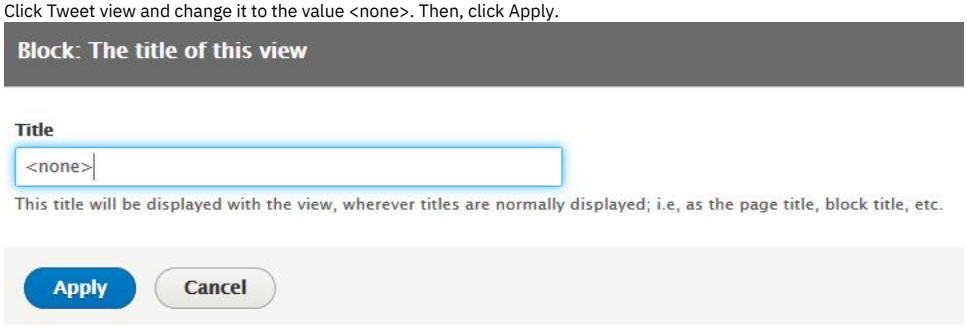


5. Click Save and edit.

Customize the carousel view

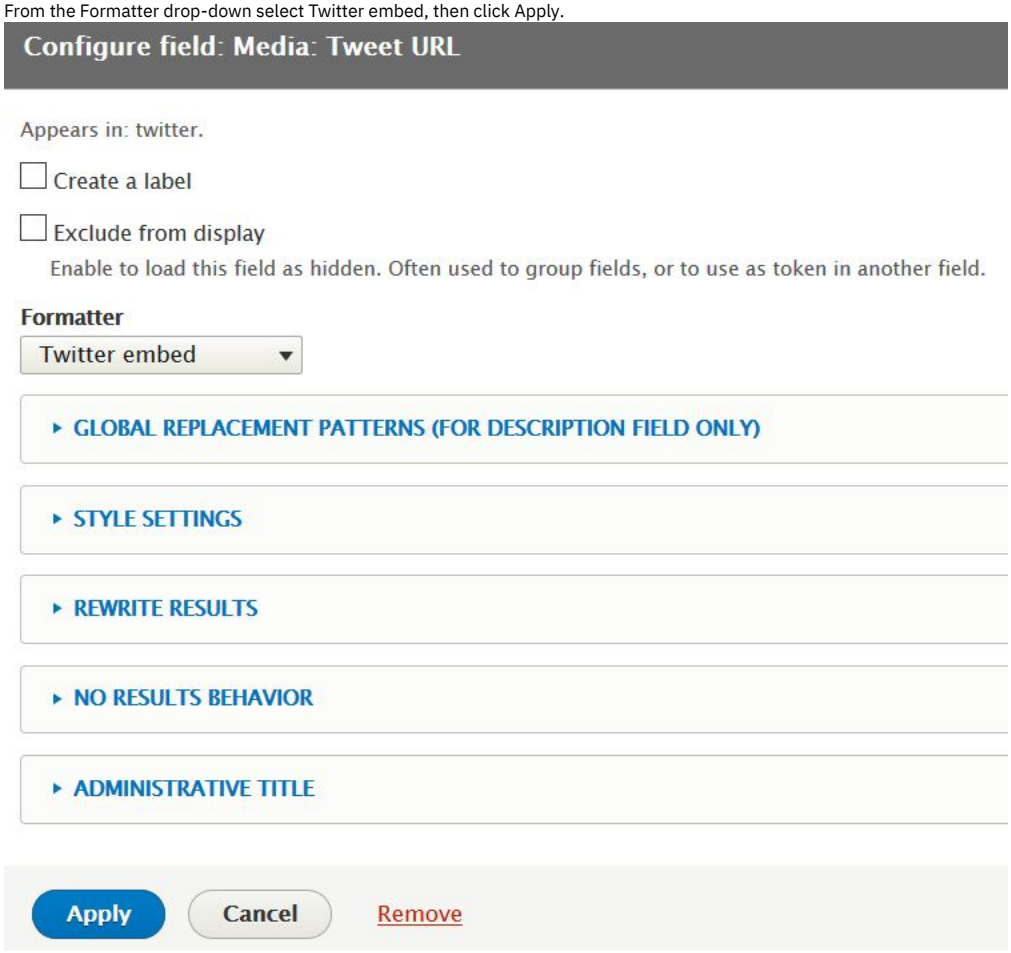
You are now on the page where you can edit your view.

1. If you are not the edit view page, navigate to Structure > Views, find the name of the view that you created, and click Edit.
2. Click Tweet view and change it to the value <none>. Then, click Apply.

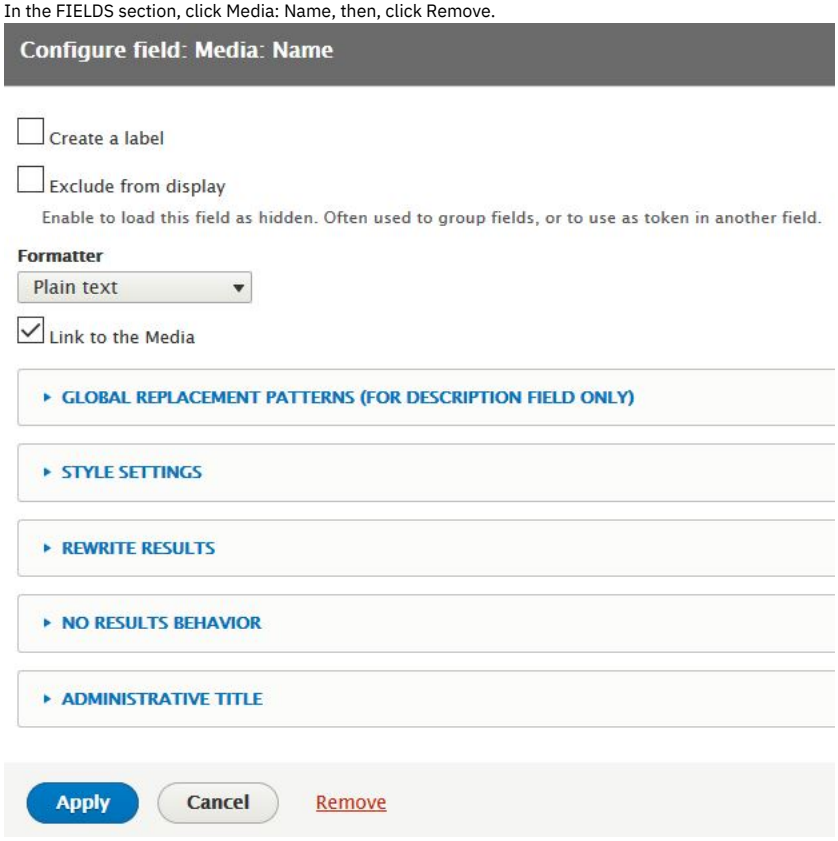


3. Click Add in the FIELDS section, then search for tweets, select the check box for Tweet URL. Then, click Add and configure fields.

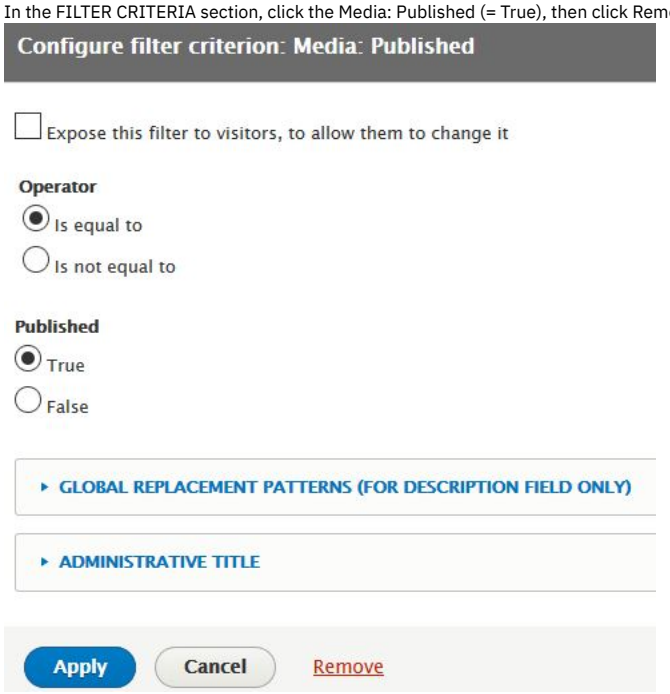
4. From the Formatter drop-down select Twitter embed, then click Apply.



5. In the FIELDS section, click Media: Name, then, click Remove.

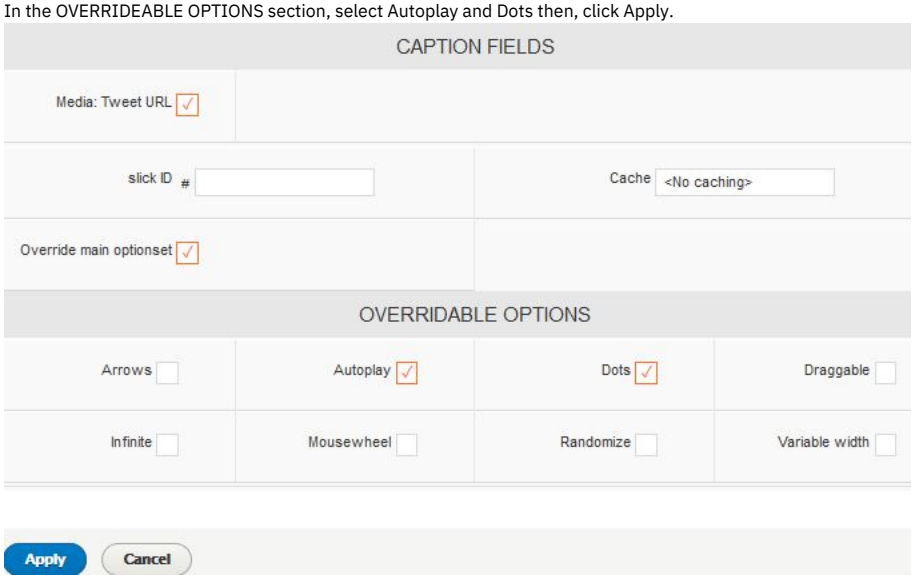


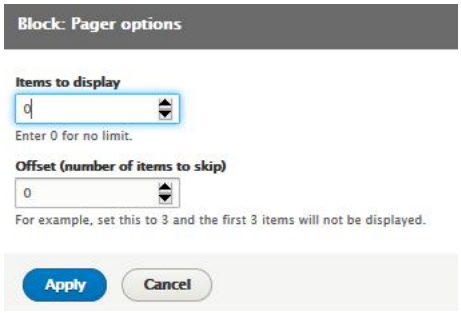
6. In the FILTER CRITERIA section, click the Media: Published (= True), then click Remove.



7. In the FORMAT section, click Settings next to Slick Carousel.
8. Set Skin Main to Default.
9. In the CAPTION FIELDS section, check Media: Tweet URL, and Override main optionset.

10. In the OVERRIDEABLE OPTIONS section, select Autoplay and Dots then, click Apply.

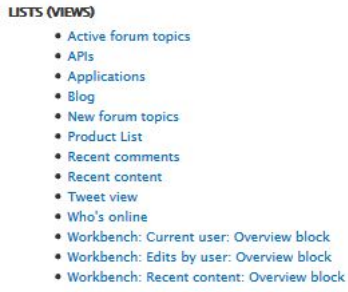




11. In the PAGER section, clickItems, set the field to 0 then, click Apply.
12. Click Save.

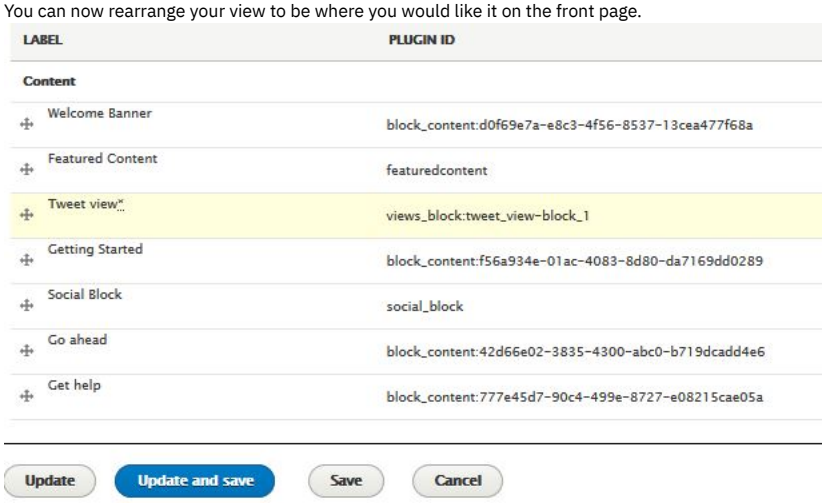
Embed the view on the front page of your Developer Portal

1. Navigate to Structure > Pages.
2. Click Edit on the welcome page.
3. Click Panels, then Content.
4. Click Add new block.



5. Select your new block, which is under LISTS(VIEWS).
6. Deselect Display title then, click Add block.

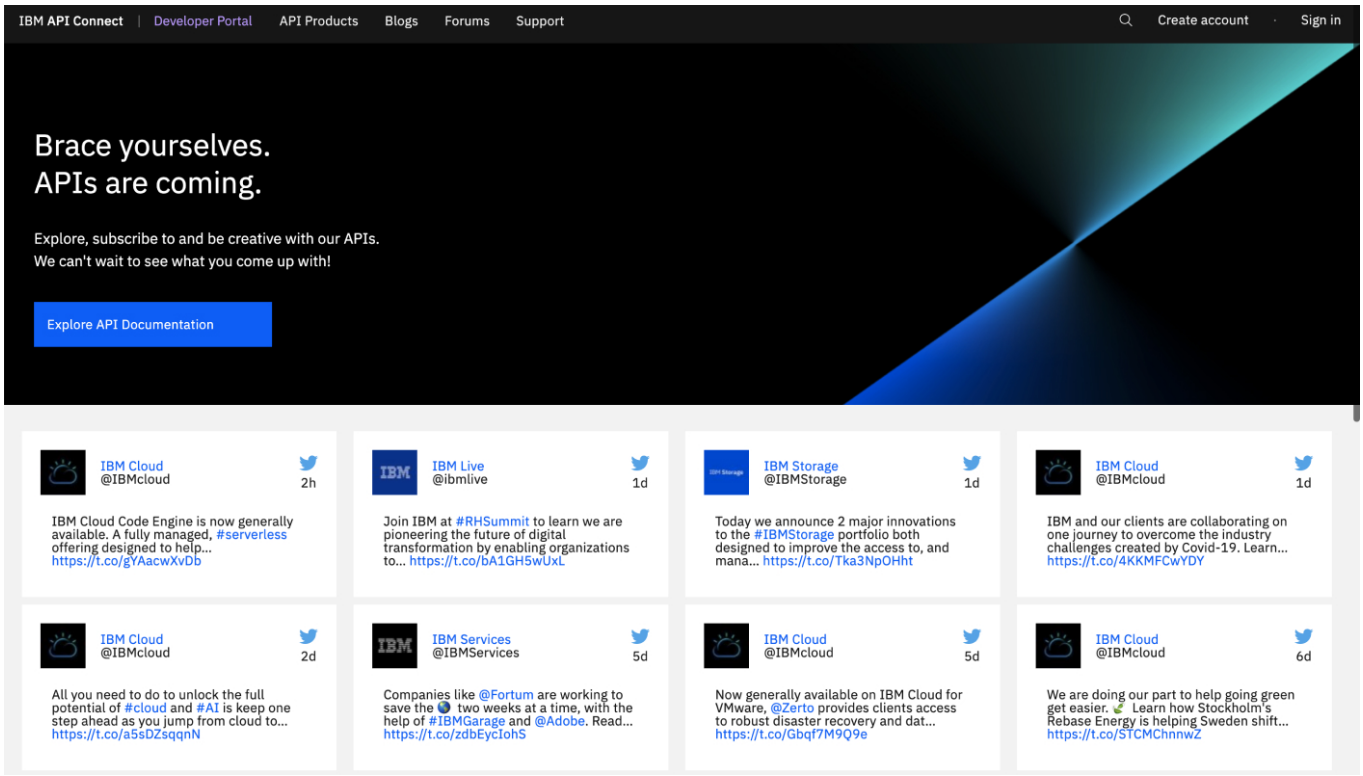
7. You can now rearrange your view to be where you would like it on the front page.



8. Click Update and save.

What you did in this tutorial

You can check that the view you created appears on the front page of your site page.



What to do next

You can edit your view at any time by navigating to Structure > Views and selecting your view by its name. You can also modify or delete the view's layout on the front page by navigating back to the layout section of your page under Structure > Pages.

You can also integrate your Twitter data dynamically. For more information, see the links below.

Tutorial: Changing the front page of your Developer Portal

You can create and arrange content in your Developer Portal to provide a front page that aligns with your brand, and helps your users discover your APIs.

Before you begin

You must have a Developer Portal enabled, and you must have administrator access to complete this tutorial. The tutorial Creating the Portal explains how to enable the portal if you have not already done so.

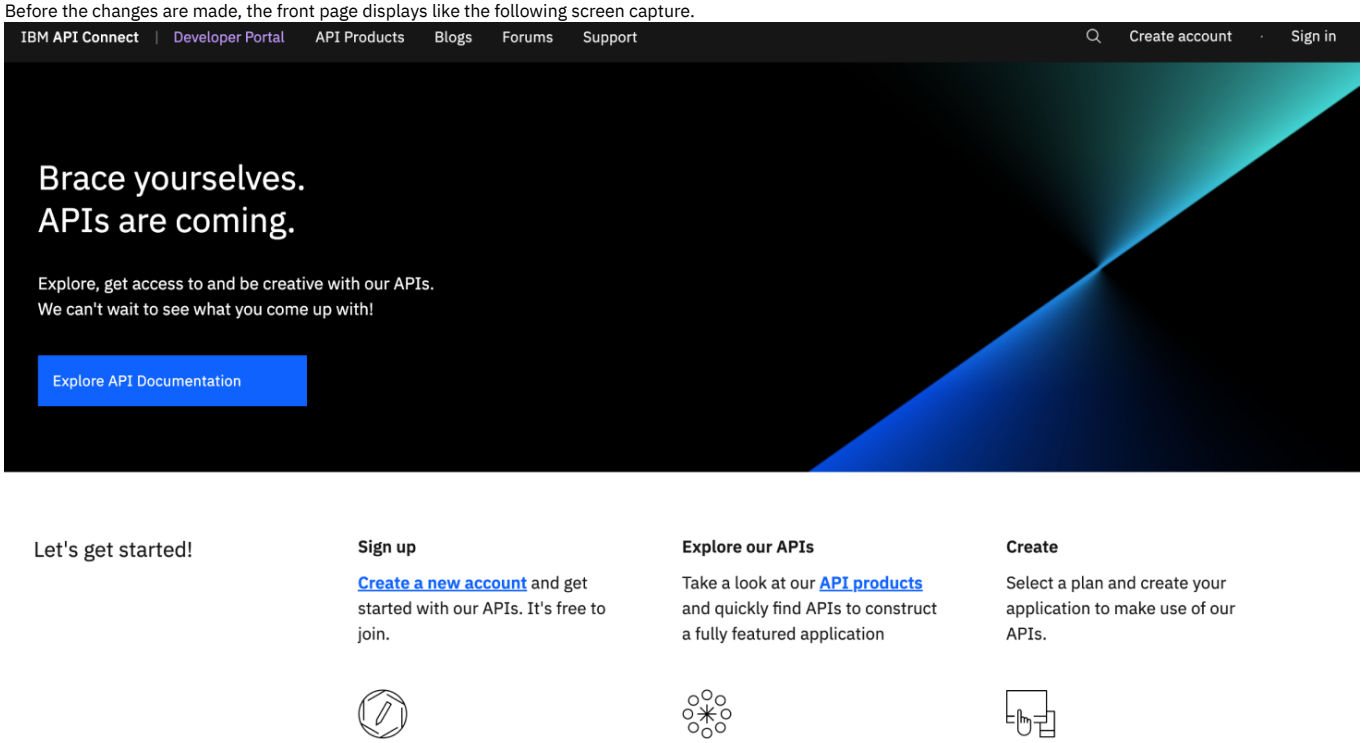
About this tutorial

In this tutorial, you create some content for a page, and then change the front page to be your new page.

This tutorial takes you through the following steps:

1. Creating some custom blocks.
2. Create and configure a page.
3. Adding the custom blocks to the page.
4. Changing the front page to be your new page.

Before the changes are made, the front page displays like the following screen capture.

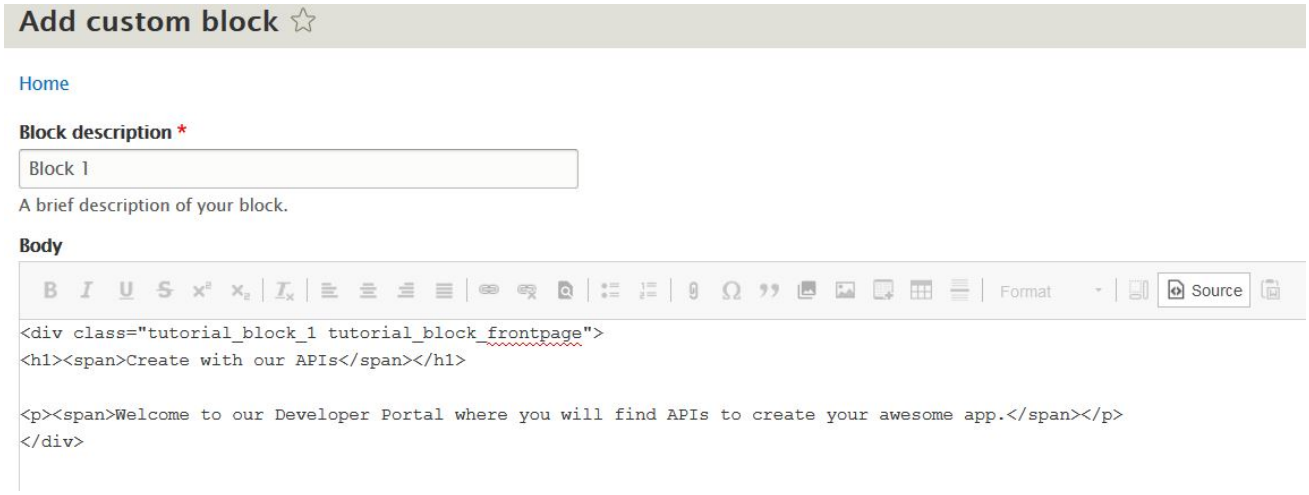


Creating some custom blocks

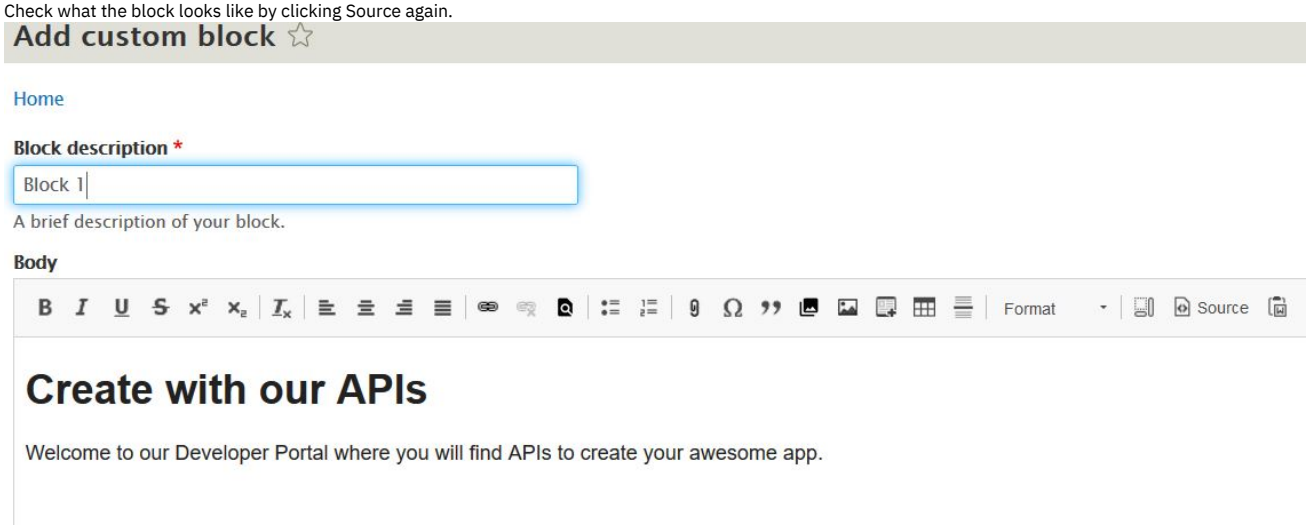
1. Log in to your Developer Portal as an administrator.
2. If the administrator dashboard isn't displayed, click Manage to display it.
3. Navigate to Structure > Block layout > Add custom block
4. Enter `Block 1` in theBlock description.
5. In the body area, click Source, then enter the following HTML:

```
<div class="tutorial_block_1 tutorial_block_frontpage">
<h1><span>Create with our APIs</span></h1>

<p><span>Welcome to our Developer Portal where you will find APIs to create your awesome app.</span></p>
</div>
```



6. Check what the block looks like by clicking Source again.



Note: This block uses no inline-styling, instead it allows your theme to decide how it is rendered. The advantage of this set up is that you can easily change the rendering without modifying existing content in the database. Any styling that is required can be added to a custom theme. For more information, see Tutorial: Creating a custom theme for the Developer Portal.

7. Click Save.
You have created `Block 1`, repeat steps 3 to 7 to create `Block 2`, `Block 3`, and `Block 4`.

8. Enter `Block 2` in the Block description. In the body area, click Source, then enter the following HTML:

```
<div class="tutorial_block_2 tutorial_block_frontpage">
<p class="text-align-center">Explore and subscribe to our APIs.<br />
See what you come up with!</p>

<p class="text-align-center"> </p>

<div class="bannerButtonRow text-align-center"><a class="button cta-btns--white__btn"
href="#_home_markdown_jenkins_workspace_Transform_in_SSMNED_v10cd_com.ibm.apic.devportal.doc_product">Explore API
Documentation</a></div>
</div>
```

9. Enter `Block 3` in the Block description. In the body area, click Source, then enter the following HTML:

```
<div class="tutorial_block_3">
<p class="text-align-center"><a
href="#_home_markdown_jenkins_workspace_Transform_in_SSMNED_v10cd_com.ibm.apic.devportal.doc_user_register">Create a new
account</a> and get started with our APIs. It's free to join.</p>
</div>
```

10. Enter `Block 4` in the Block description. In the body area, click Source, then enter the following HTML:

```
<div class="block-get-help">
<div class="get_help">
<div class="column col1">
<h3>Getting Help</h3>

<div>Be sure to check out these extra help resources.</div>
</div>

<div class="column col2">
<h4>Get Started</h4>

<div>Get started with our APIs by creating an account and exploring the documentation to find what's right for you.</div>
```

```

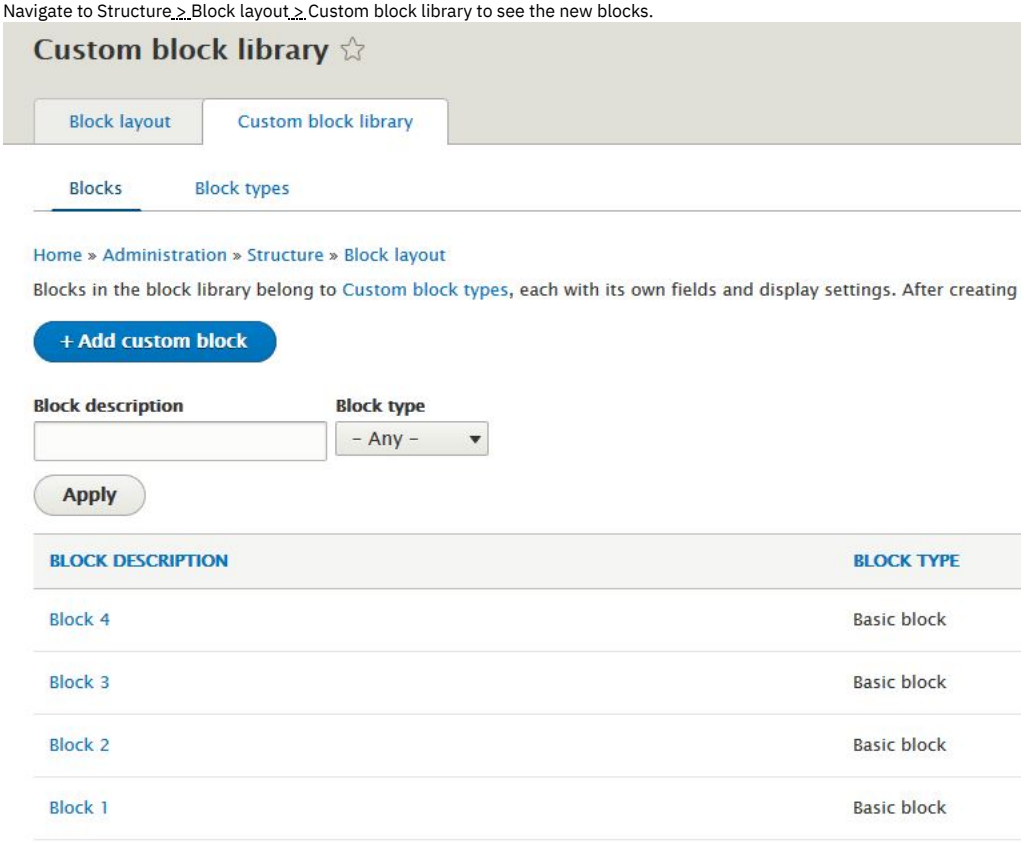
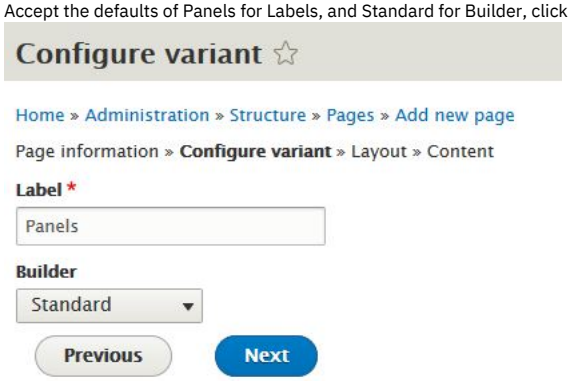
11. Navigate to Structure > Block layout > Custom block library to see the new blocks.



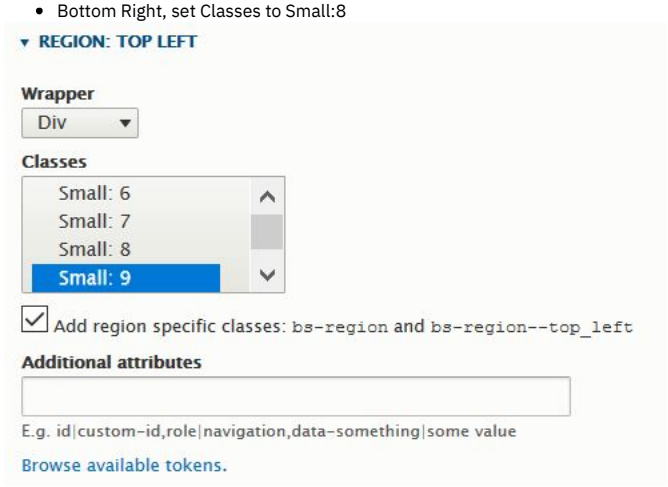
Create and configure a page

1. If the administrator dashboard isn't displayed, click Manage to display it.
2. Navigate to Structure > Pages, clickAdd page.

3. Enter `Portal home` in the Administrative title field.
4. Enter `newhome` in the Path field.
5. Select **`Panels`** in the Variant title drop-down.
6. Leave other fields clear.
7. Click Next.
8. Accept the defaults of Panels for Labels, and Standard for Builder, click Next.



9. Select Two column bricks from Layout drop-down. Click Next.
10. Keep all settings except for the following:
    - Top Left, set Classes to Small:9
    - Top Right, set Classes to Small:3
    - Bottom Left, set Classes to Small:4
    - Bottom Right, set Classes to Small:8

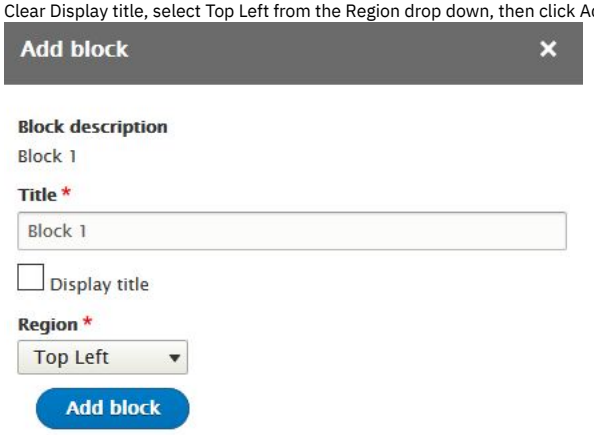


11. Click Next.

Adding the custom blocks to the page

1. Leaving Page title blank, click Add new block.
2. Select Block 1 from the Custom block list.

3. Clear Display title, select Top Left from the Region drop down, then click Add block.



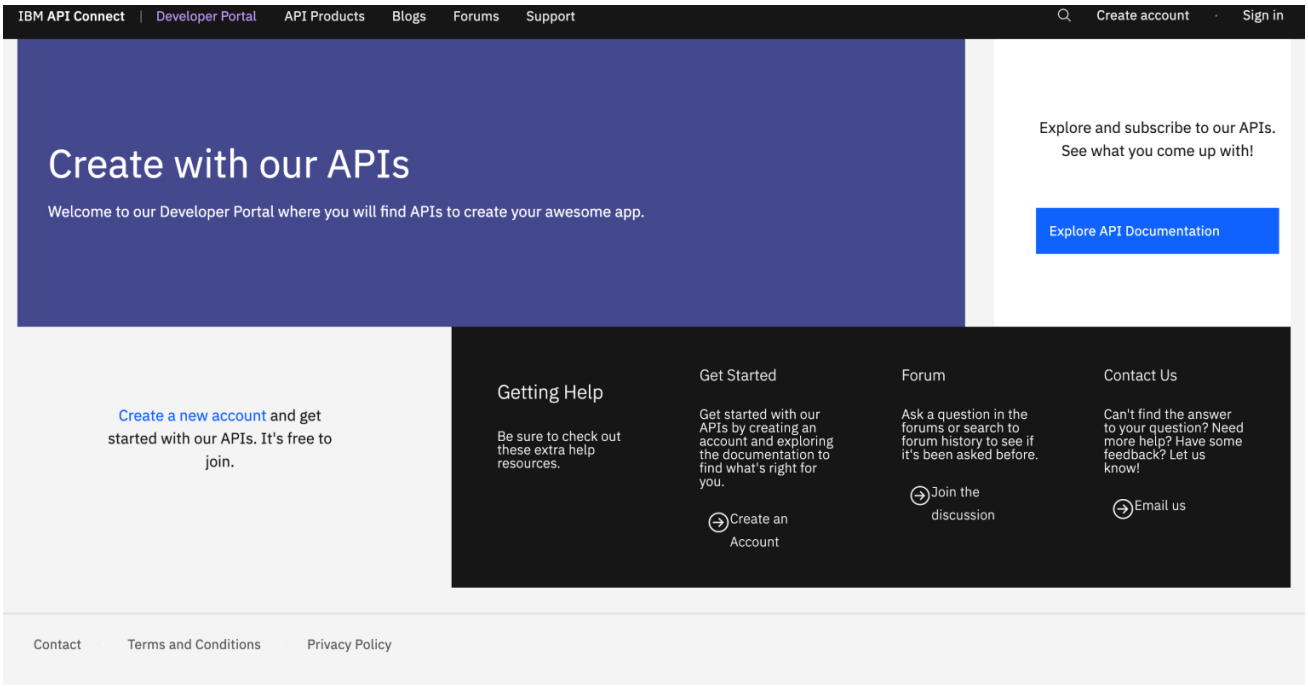
You added Block 1, repeat steps 1 to 3 to add Block 2, Block 3, and Block 4.

4. For Block 2 select region Top Right.
5. For Block 3 select region Bottom Left.
6. For Block 4 select region Bottom Right.
7. ClickFinish.
8. Click Update and save.

Changing the front page to be your new page

Note: In this tutorial, you create a new page and swap it with the default. If errors are made, the default page is still available as a backup.

1. Navigate to Structure > Pages.
2. Click the newhome URL link for your new Portal home page, check that your page looks as designed.



3. Navigate to Configuration > System > Basic site settings
4. In Front Page region set Default front page field tonewhome .
5. Click Save configuratoin.

What you did in this tutorial

The front page of your Developer Portal is now changed and laid out with the blocks of content that you specified.

What to do next

You can add further branding by adding content to your custom blocks such as images, or try to use one of the provided custom blocks such as the Featured Content Block. By default this block is English, you might want to consider adding versions in other languages.

Tutorial: Grouping products by category

You can configure the Developer Portal so that products are displayed in groups according to the category that they are tagged with.

You can use the **`Views`** module to fetch content from your Developer Portal site, such as lists of products, and present the content to users in different formats. You can combine multiple views on a new page to display whatever content you want.

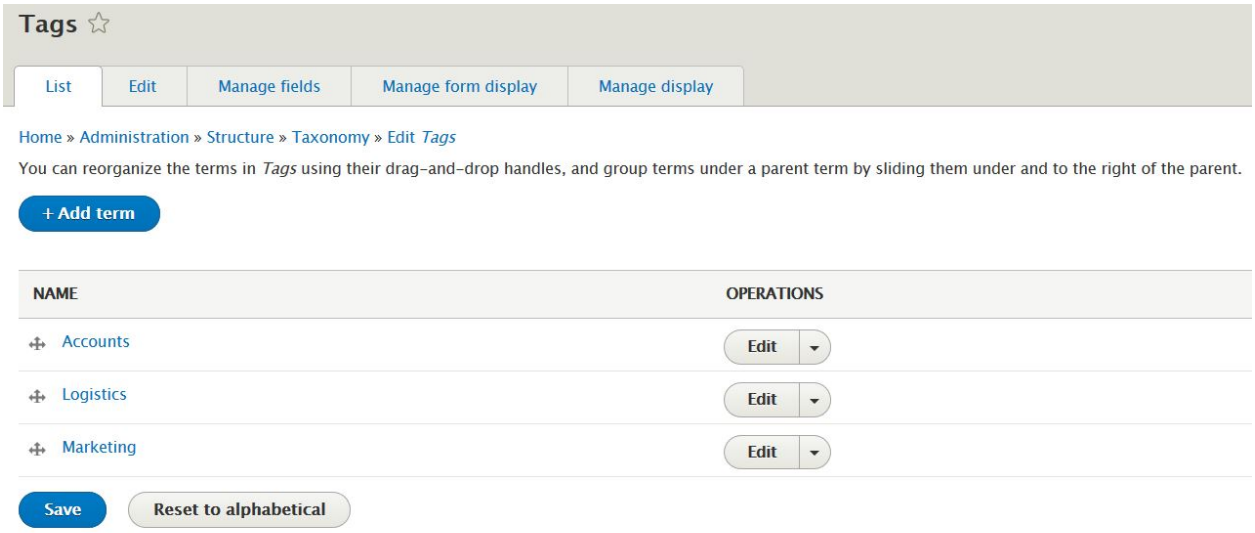
Before you begin

You must have a Developer Portal enabled, and you must have administrator access to complete this tutorial. The tutorial Creating the Portal explains how to enable the portal if you have not already done so.

About this tutorial

In this tutorial you create three views in the Developer Portal, each one is configured to display a list of products according to their category. You then create a new page to show the views, where you see products that are grouped by category.

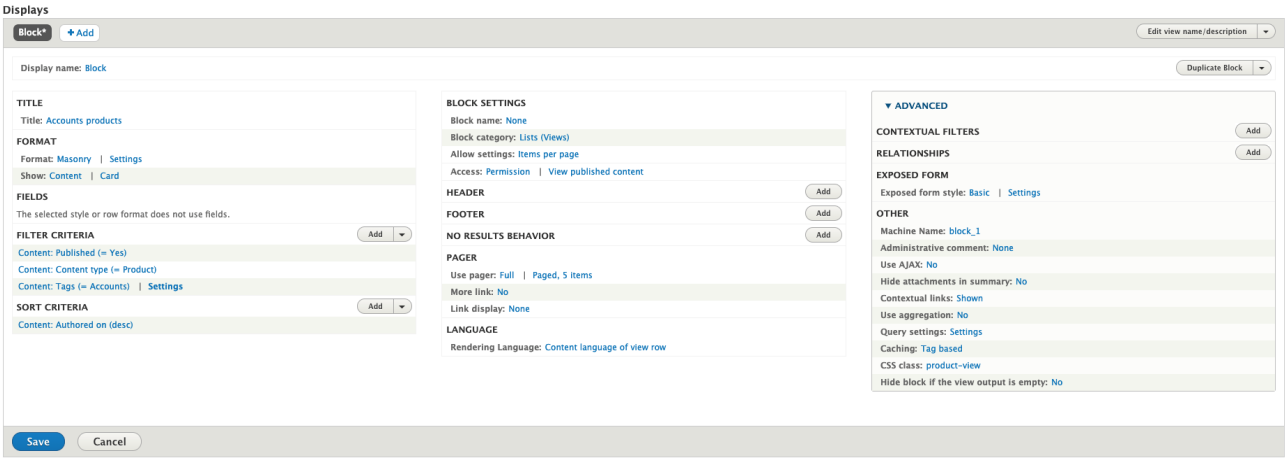
1. Log in to your Developer Portal as an administrator.
2. If the administrator dashboard isn't displayed, click Manage to display it.
3. Create three new taxonomy tags.
    a. Navigate to Structure > Taxonomy > Tags.
    b. Click **`Add term`**.
    c. Enter `Accounts` in the **`Name`** field and click **`Save`**.
    d. Enter `Logistics` in the **`Name`** field and click **`Save`**.
    e. Enter `Marketing` in the **`Name`** field and click **`Save`**.
    f. Navigate to Structure > Taxonomy > Tags to show the list of the new tags.



4. Create a view to display products with the **`Accounts`** category.
   a. Navigate to Structure > Views > Add new view.
   b. Enter `Accounts products` in the **`View name`** field.
   c. In **`View Settings`**, select **`Show`**: **`Content`**, **`of type`**: **`Product`**, **`sorted by`**: **`Newest first`**, from the drop-down lists.
   d. In **`Page settings`** leave the **`Create a page`** cleared.
   e. In **`Block settings`** select **`Create a block`** and enter `Accounts products` in the **`Block title`**.
   f. Ensure **`Block Display Settings`** has **`Display format`**: **`Masonry`**, **`of`**: **`tiles (linked)`**, and select **`Use a pager`**.

   g. Click **`Save and edit`**.
5. Configure the view block settings.
   a. Under the **`Format`** section click the **`Fields`** link next to the **`Show`** label.
   b. In the dialog box, select the **`Content`** radio button then click **`Apply`**.
   c. Select **`Card`** from the **`View mode`** drop-down list, then click **`Apply`**.
   d. Click **`Add`** next to the **`Filter Criteria`** section.

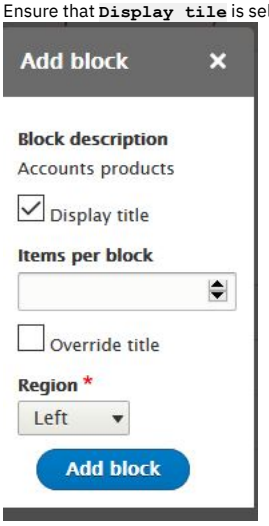
e. In the dialog box, search for `tag` then select the option **`Tags (apic_tags)`** from the list then click **`Add and configure filter criteria`**.
f. In the next dialog box, select the **`Tags`** radio button and the **`Client-side hierarchical`** then click **`Apply and continue`**.
g. Next set the **`Operator`** to **`Is all of`**, and from the **`Select terms from vocabulary Tags`** drop-down select **`Accounts`** and click **`Apply`**.
h. Under the **`Advanced`** options, click the **`None`** link next to the **`CSS class`** label.
i. If you are using the default API connect theme, then enter the CSS class name **`product-view`** and click **`Apply`**. If you have your own css class that you want to use, then enter its name in here instead.
j. Click **`Save`** to save all the changes.



6. Create a view for the Logistics products.
   a. Select Structure > Views.
   b. Navigate to the **`Accounts products`** view and select the **`Duplicate`** option.
   c. Give the duplicated view the name **`Logistics products`** and click **`Duplicate`**.
   d. Click the Title **`Accounts products`** and change it to **`Logistics products`** and click **`Apply`**.
   e. Under the **`Filter Criteria`** section click the **`Content: Tags: (=Accounts)`** link.
   f. Change the value in the **`Select terms from vocabulary Tags`** drop-down to **`Logistics`** and click **`Apply`**.
   g. Click **`Save`** to save all the changes.
7. Repeat step 6 for Marketing products.
8. Next, create a page to display the views.
   a. Select Structure > Pages.
   b. Click **`Add page`**.
   c. Enter `Products by category` in the **`Administrative title`**, and `products-by-category` in the **`Path`**. Select the **`Panels`** option from the **`Variant type`** drop-down list then click **`Next`**.

   d. Change the **`Label`** value to `Products grouped by category` and set the **`Builder`** to **`Standard`** then click **`Next`**.
   e. From the **`Layout`** drop-down list select the value **`Three column`** then click **`Next`**.
   f. Leave all the defaults on the next page and click **`Next`**.
   g. Click **`+Add new block`**.
   h. Select **`Accounts products`** from the **`Lists (views)`** section.

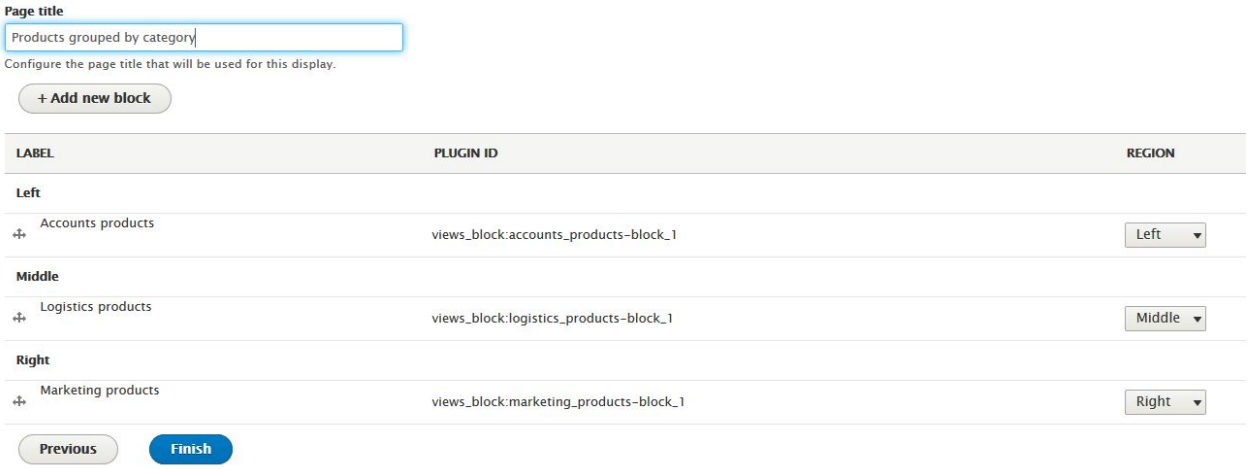
i. Ensure that **`Display tile`** is selected and **`Region`** is set to **`Left`**, click **`Add block`**.



j. Click **`Add new block`**. Select **`Logistics products`** view from the list and set the **`Region`** to **`Middle`**, click **`Add block`**.

k. Click **`Add new block`**. Select **`Marketing products`** view from the list and set the **`Region`** to **`Right`**, click **`Add block`**.

l. Enter `Products grouped by category` in the **`Page title`** field, and click **`Finish`**.



9. From your API Manager, create three new products, or update existing ones, to give each one a category value of either Accounts, Logistics, or Marketing. Publish each of the products to the catalog with the configured Developer Portal.
10. Check that the **`Products grouped by category`** page shows your published products by category.
    a. Select Structure > Pages.
    b. Click the **`/products-by-category`** path link.
    c. You are redirected to the **`/products-by-category`** page and can see the products that you assigned to these categories.

What you did in this tutorial

You created three new views in the Developer Portal, and configured each one to display a list of products according to their category. You then created a new page to show the views.

Tutorial: Adding a field to the sign up form

You might want to collect and store additional information about your Developer Portal users. For example, you might want to collect a department name, employee ID, or similar data when a user registers for an account on the portal.

Before you begin

You must have a Developer Portal enabled, and you must have administrator access to complete this tutorial. The tutorial Creating the Portal explains how to enable the portal if you have not already done so.

About this tutorial

In this tutorial, you will add a Department code field to the Sign up form. This field is required for all portal users.

This tutorial takes you through the following steps:

1. Adding a field to a user entity.
2. Adding the new field to the Sign up form.
3. Testing the new field.

Adding a field to a user entity

1. Log in to your Developer Portal as an administrator.
2. If the administrator dashboard isn't displayed, click Manage to display it.
3. Navigate to Configuration > People > Account settings > Manage fields

You are on the **`Manage fields`** tab.

1. Click **`+ Create a new field`**.
2. In the **`Select a field type`** dropdown, select **`Text (plain)`**.
3. In the **`Label`** field enter, **`Department code`**.
4. Click **`Save and continue`**.

You are on the **`Field settings`** tab.

1. Accept the defaults of **`Maximum length`** (255) and **`Allowed number of values`** (Limited:1).
2. Click **`Save field settings`**.

You are on the **`Edit`** tab.

1. Add some help text. This is information that is displayed to the user to assist them completing the field on a form. Examples or links to further information are useful here. We are going to add an example in this tutorial.
2. Add **`Example department code: DEP123.`** into the **`Help text`** field.
3. Check the **`Required field`**.
4. Click **`Save settings`**.

The field has now been created. You are back on the **`Manage fields`** tab.

1. Check that **`Department code`** is a listed field.

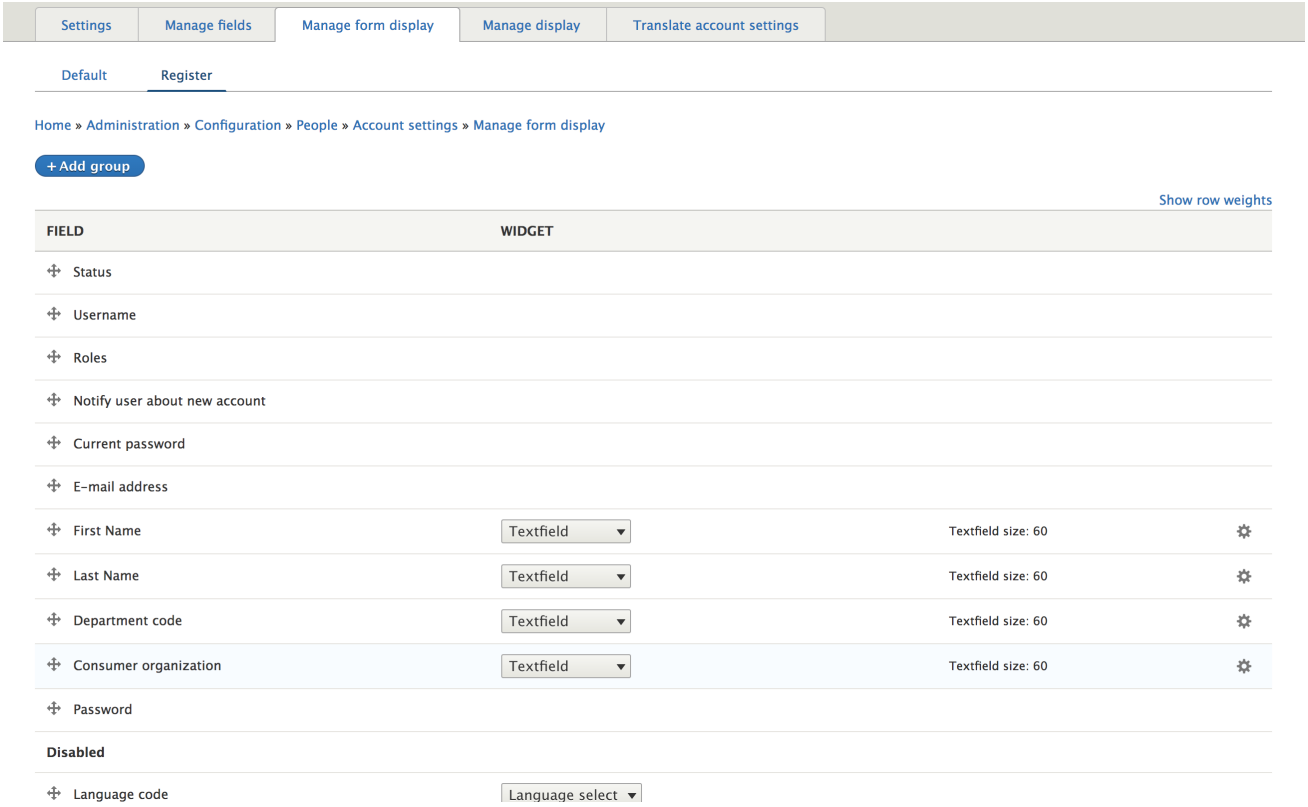
Adding the new field to the Sign up form

1. If the administrator dashboard isn't displayed, click Manage to display it.
2. Navigate to Configuration > People > Account settings > Manage form display

You are on the *Manage form display* tab. These tabs, one for each form, show the fields that are displayed from the user entity, and in which order.

1. Switch to the **`Register`** tab. Notice that initially the new **`Department code`** field is underneath the **`Disabled row`** in the page. This means that it isn't shown on the form.

2. Click the Department code icon and drag it so that it is between Last name and Consumer organization in the list.



3. Click Save.

Testing the new field

1. Sign out as the Admin user.
2. Click **`Create account`**.
3. Observe that the **`Department code`** field is now part of the sign up form.

What you did in this tutorial

You added a Department code field to the Sign up form, then tested the form to ensure that the **`Department code`** field is now part of the sign up form.

In reality, you would need to add this configuration in such a way that it is available for all sites. To achieve this you would include the configuration in your custom module. For more information, see this Drupal documentation.

You might want to add extra validation to the Department code field on the Sign up form. For more information, see Tutorial: Adding validation to a field on the sign-up form.

Tutorial: Adding validation to a field on the sign-up form

You might want to add extra validation to a field to help your Developer Portal users. For example, you might want to validate a department name, employee ID, or similar data when a user registers for an account on the portal.

Before you begin

You must have a Developer Portal enabled, and you must have administrator access to complete this tutorial. You must have completed the tutorial about Adding a field to the sign up form, where you added a Department code field to the Sign-up form.

About this tutorial

In this tutorial, you add some validation to the Department code field on the Sign-up form. This is a required field for all portal users and is a string of the format **`DEPnnn`**, where **`DEP`** is the string prefix and **`nnn`** is a three-digit number, for example, **`DEP123`**. The validation is done by using a custom module that is already available in IBM APIC Portal - addons. However, for more information, see Custom module development: creating a module skeleton.

This tutorial takes you through the following steps:

1. Cloning and packaging the validation module.
2. Installing and enabling the validation module.
3. Testing the validation in the sign up form.

Look at the files we will use in this link IBM APIC Portal - addons.

- user_field_example.info.yml - this is the metadata for the module, defining things like the name and version, and containing other important information that is required by Drupal to import and enable the module.

```
name: 'IBM APIC Portal - user field example'
type: module
description: 'IBM API Connect Developer Portal tutorial - Example of validating a custom user field'
package: 'Custom'
core_version_requirement: ^8 || ^9 || ^10
version: 1.0.0
project: 'user_field_example'
dependencies:
  - ibm_apim
  - auth_apic
```

- user_field_example.module - this contains a validation function and adds this to the Sign-up form by using the `hook_form_alter` function.

```
<?php
use Drupal\Core\Form\FormStateInterface;

/**
 * Implementation of hook_form_alter() to alter the Sign up form
 */
function user_field_example_form_alter(&$form, FormStateInterface $form_state, $form_id) {
  if ($form_id === 'user_register_form' ) {
      $form['#validate'][] = 'user_field_example_validate_department_code';
  }
}

/**
 * Validate the Department code field on the Sign up form.
 *
 * Valid entry = DEPnnn
 *   where n = single figure digit.
 */
function user_field_example_validate_department_code($form, &$form_state) {
  $dept_code = $form_state->getValue('field_department_code')[0]['value'];
  $valid = preg_match('/^DEP\d{3}$/', $dept_code);
  if (!$valid) {
    $form_state->setErrorByName('field_department_code', t('Invalid department code.'));
  }
}
```

Cloning and packaging the validation module

Validation is added to the **Department code** field on the Sign-up form by using a custom module.

1. Clone the custom module. Here is an example command if you are using Mac and Linux:

   ```
   git clone https://github.com/ibm-apiconnect/devportal-addons
   ```

2. Package up the custom module.

   ```
   cd devportal-addons/apic_v10/modules
   tar -czf user_field_example.tgz user_field_example/
   ```

Installing and enabling the validation module

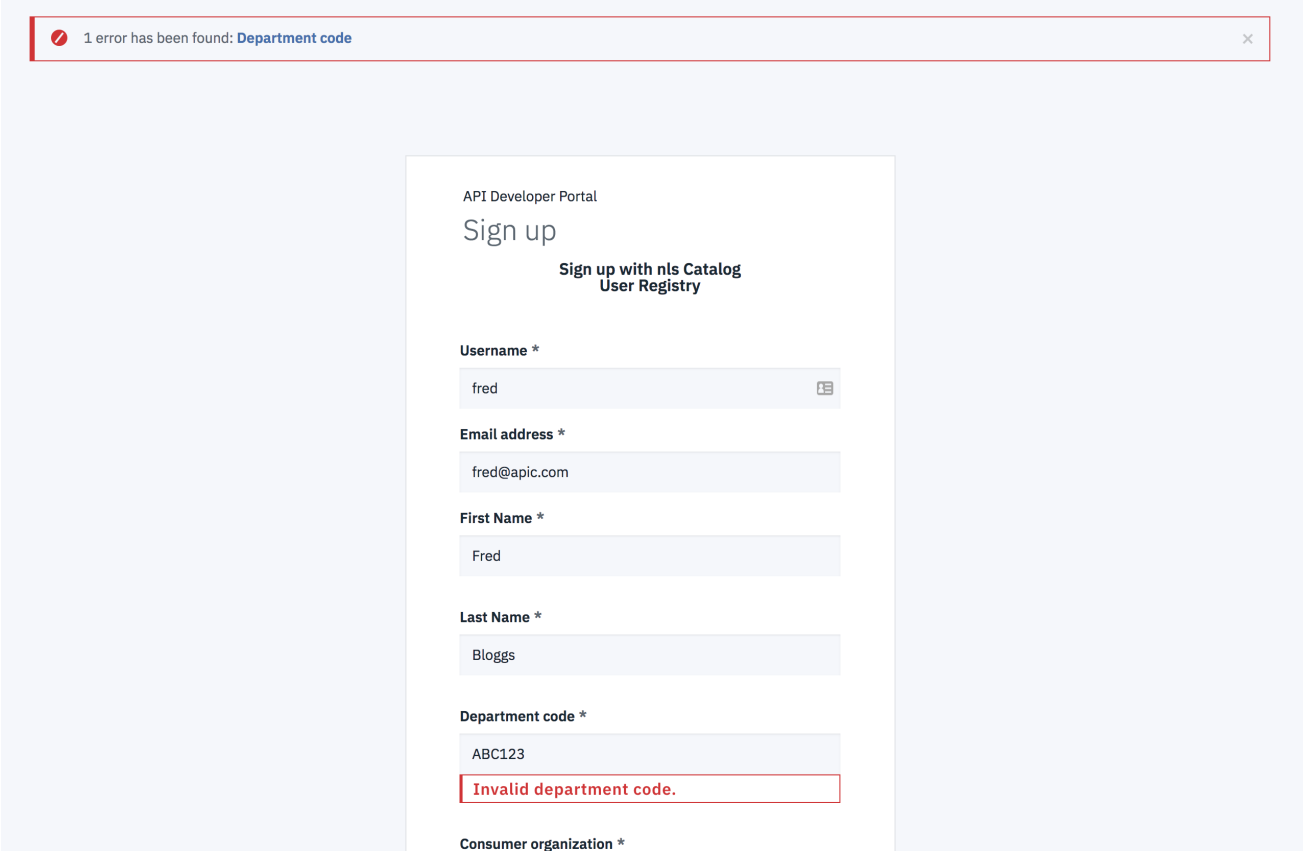
1. Log in to your Developer Portal as an administrator.
2. If the administrator dashboard isn't displayed, click Manage to display it.
3. Click Extend > Install new module.
4. Click **Browse file** from the **Upload a module or theme archive** section.
5. Browse to and select **user_field_example.tgz**, the packaged custom module that you created earlier. Click **Open**.
6. Click **Continue**.
7. Click the **Enable newly added modules** link.
8. Enter **IBM APIC Portal - user field example** in the filter box.
9. Check the checkbox next to **IBM APIC Portal - user field example**.
10. Click **Enable**.

The module is now installed and enabled.

Testing the validation in the sign-up form

1. Sign out as the Admin user.
2. Click **Create account**.
3. Complete all fields, set **Department code** to **ABC123**.
4. Click **Sign up**.

5. Observe the failure message and highlighting on the **`Department code`** field.



6. Change the **`Department code`** field to **`DEP245`**, reenter the password and click **`Sign up`** to see that a valid code is accepted.

What you did in this tutorial

You added some validation to the Department code field on the Sign-up form, then tested the form to ensure that the **`Department code`** field accepts only codes in the format of **`DEPnnn`**.

In reality, you would need to add this configuration in such a way that it is available for all sites. To achieve this availability, you would include the configuration in your custom module. For more information, see Drupal custom modules.

Tutorial: Adding a field group to group fields in a content type

You might want to change how your user account pages are displayed when you have lots of fields.

If you have many fields for one of your content types, for example, a user, then you might want to group some of these fields together when you display them to other users, or when these fields are being edited inside a user form.

Field groups allow you to create a parent field that contains other fields, set up as children, within that group. The **`Fieldgroup`** forms come with default HTML wrappers such as vertical tabs, horizontal tabs, accordions, fieldsets, or div wrappers.

Before you begin

You must have a Developer Portal enabled, and you must have administrator access to complete this tutorial.

About this tutorial

You will create field groups for various groups of user information. These groups can then be seen under the users own section on the account view and edit pages.

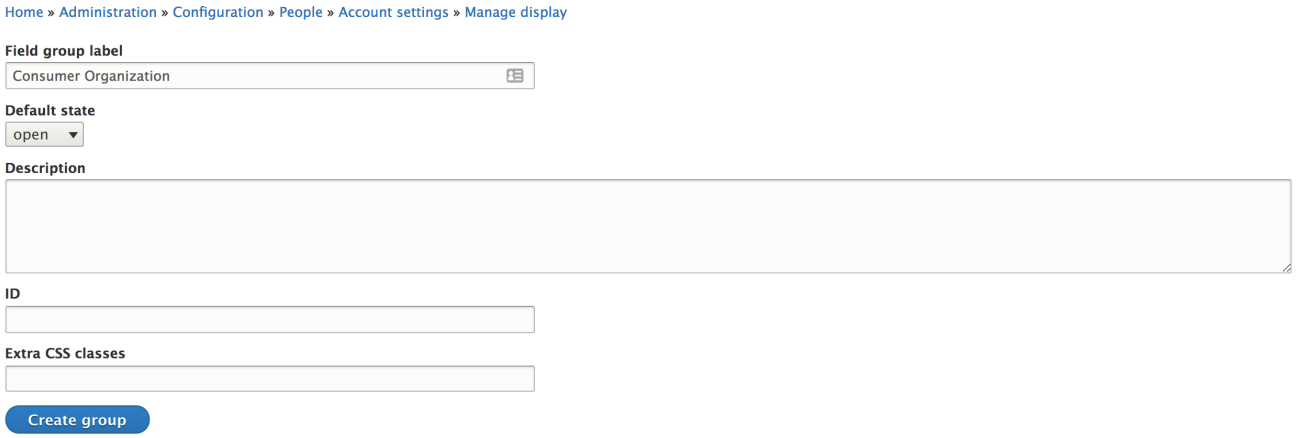
This tutorial takes you through the following steps:

1. Adding a field group called Consumer Organization to the user account display.
2. Adding a field group called Personal Details to the user form display.

Adding a field group called Consumer Organization to the user account display

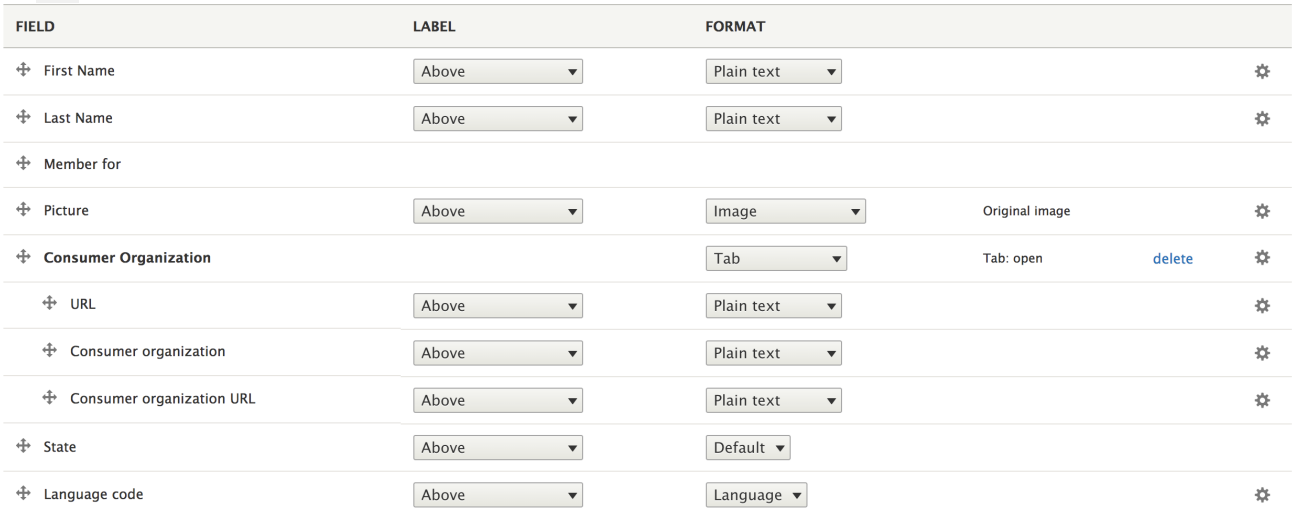
1. Log in to your Developer Portal as an administrator.
2. If the administrator dashboard isn't displayed, click Manage to display it.
3. Navigate to Configuration > People > Account settings > Manage display.
4. Click **`+ Add field group`**.

5. Select **tab** as your group type.
6. Enter **Consumer Organization** as the label.
7. Click **Save and continue**.
8. Set the default state to **open**. This sets the tab to be expanded by default.
9. Click **Create group**.

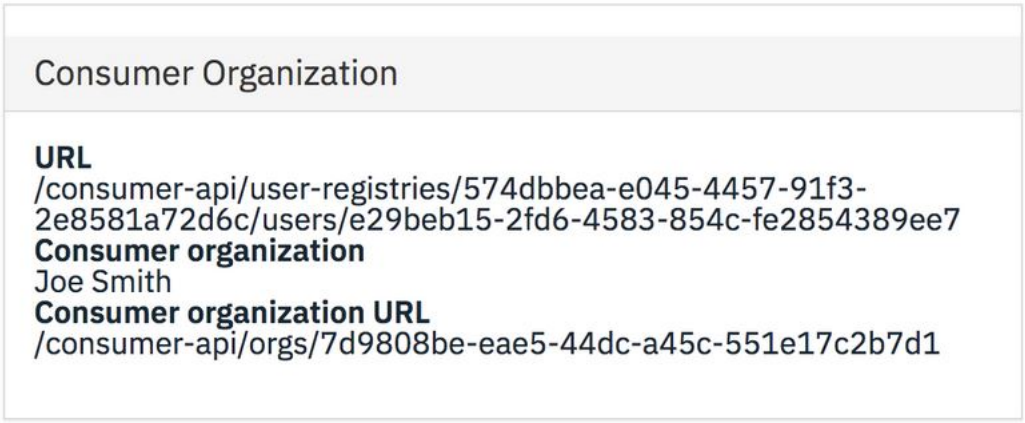


When the group is created, you can assign fields to that group and rearrange the group on the page. After you create the group, you are on the **Manage Display** page.

1. Drag your new group from the disable section up into the higher section, just underneath **Picture**.
2. Drag **URL**, **Consumer Organization**, and **Consumer Organization URL** underneath the **Consumer Organization** group row, and slightly to one side. It fixates itself underneath the parent, and this is now set as the child of that group.
3. Click **Save**.



You are now able to see the new group of fields on the account page of a user.



Adding a field group called Personal Details to the user form display

1. Navigate to Configuration > People > Account settings > Manage form display.

2. Click **Add field group**.
3. Select **tab** as your group type.
4. Enter **Personal Details** as the label.

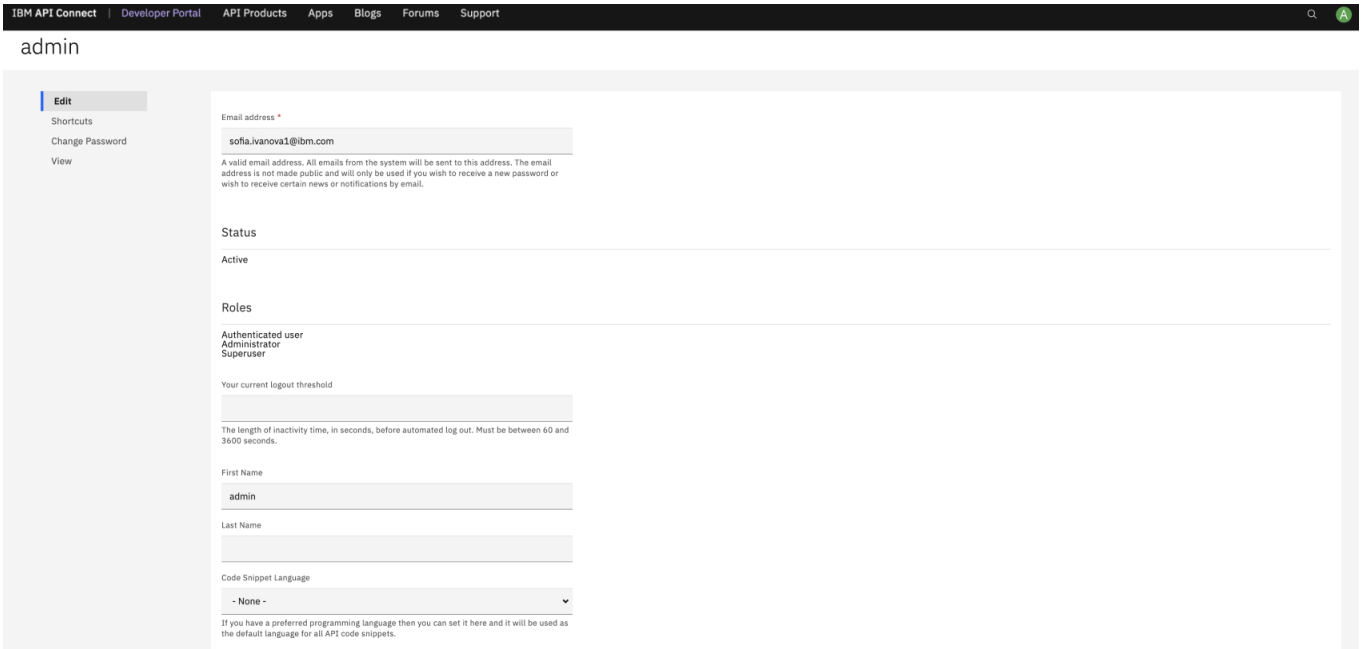
5. Click **Save and continue**.
6. Set the default state to **open**. This sets the tab to be expanded by default.
7. Click **Create group**.

Again, when the group is created, you can assign fields to that group and then rearrange the group on the page as you require. After you create the group, you are returned to the **Manage Display** page.

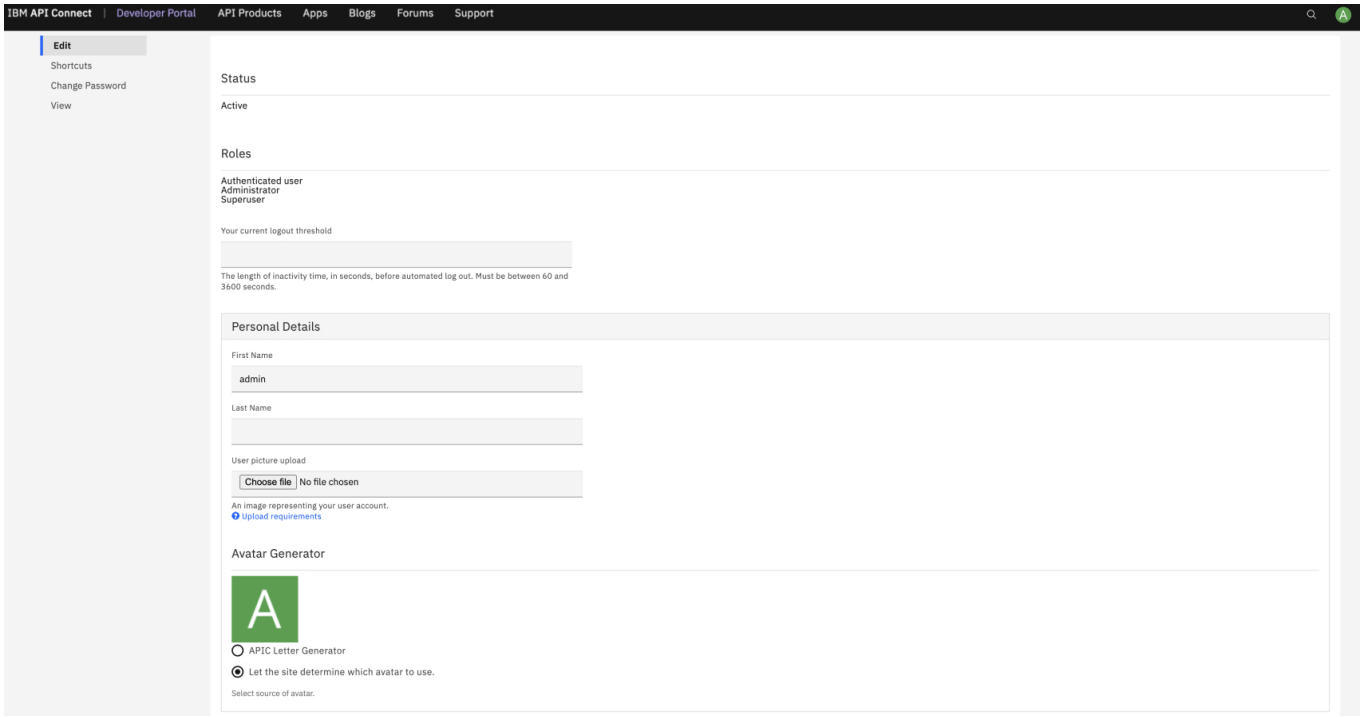
1. Drag your new group from the disabled section up into the higher section, onto the highest row.
2. Drag **First Name**, **Last Name**, **User picture upload**, and **Avatar Generator** to underneath the **Personal Details** group row. It fixates itself underneath the parent, and this is now set as the child of that group.
3. Click **Save**.

You and your user can now see the new grouped section when you edit their account.

Before:



After:



What you did in this tutorial

You have successfully created field groups for various groups of user information, and presented them to the user in its own section on the account view and edit pages.

You can check whether your field groups are applied, by viewing the profile of another user. Do this check by finding any other users published content and clicking the associated avatar. Or, from the administrator dashboard you can click People and then click a user. You can see the new Consumer Organization field group on their profile page. If you then click **`Edit`** for the user, you can see the Personal Details field group.

What to do next

You can edit the user displays anytime by navigating back to Configuration > People > Account settings > Manage display or Manage form display.

You can delete the field group by clicking the **`delete`** button in the field group row on either of these pages. You can also modify the type of group it is, for example, vertical tabs, horizontal tabs, accordions, and field sets.

Tutorial: Adding a custom block to the front page

You can customize the appearance of the front page of your Developer Portal by adding a custom block. Blocks are boxes of content that are rendered into an area, or region, of a web page such as the Products page or Apps page that can be displayed in regions, such as footer or sidebar, on your page.

Before you begin

You must have a Developer Portal enabled, and you must have administrator access to complete this tutorial. The tutorial Creating the Portal explains how to enable the portal if you have not already done so. The tutorial Adding a custom block to a page other than the front page explains how to add a custom block to any other page.

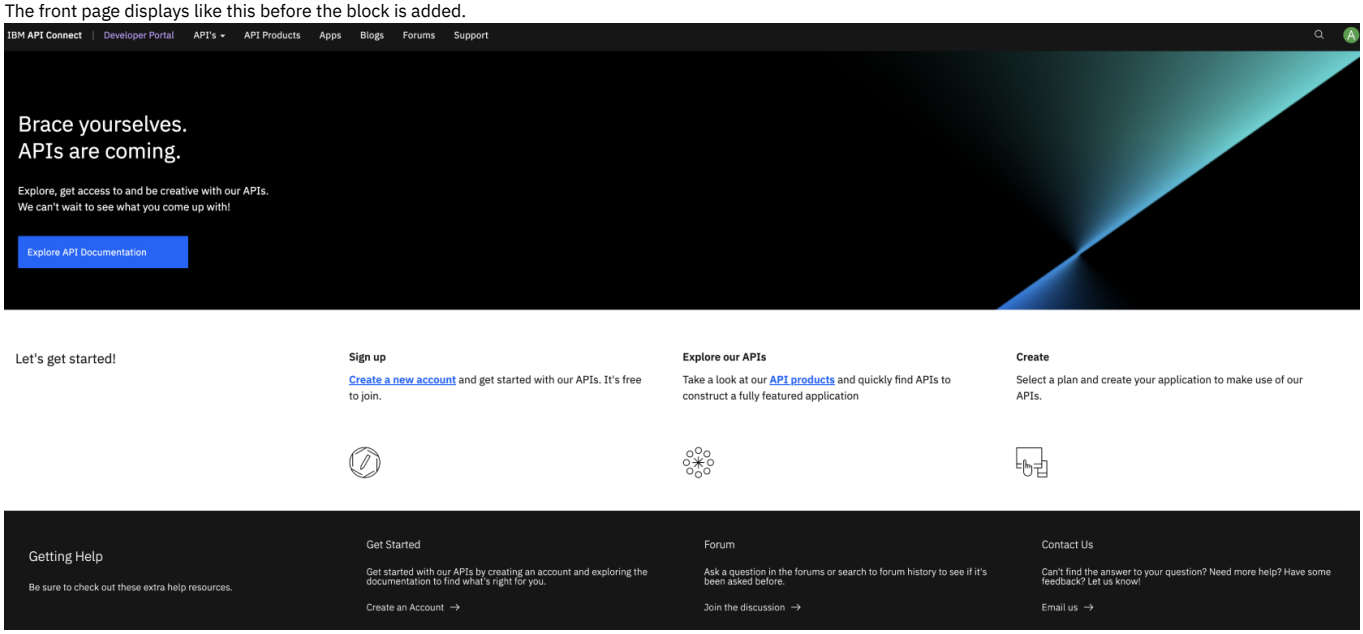
About this tutorial

In this tutorial, you create a block that contains a marketing announcement and add it to the front page of your Developer Portal.

This tutorial takes you through the following steps:

1. Creating a custom block.
2. Adding the custom block to the front page.

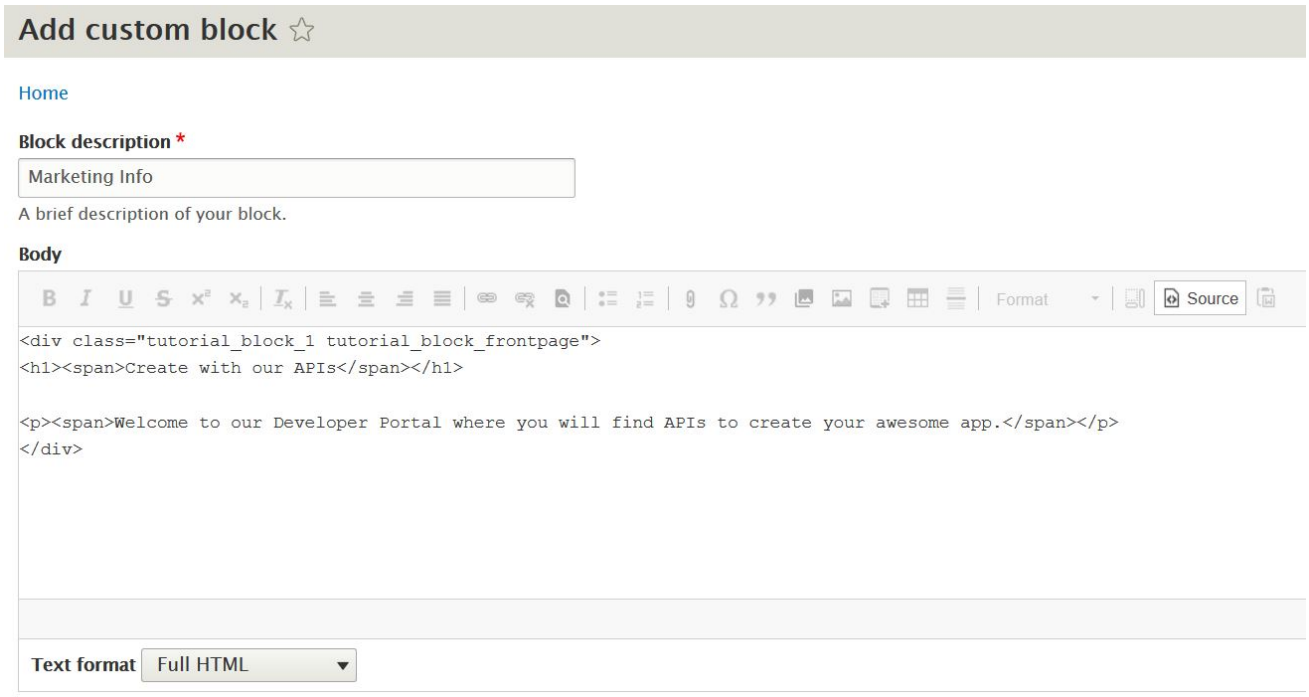
The front page displays like this before the block is added.



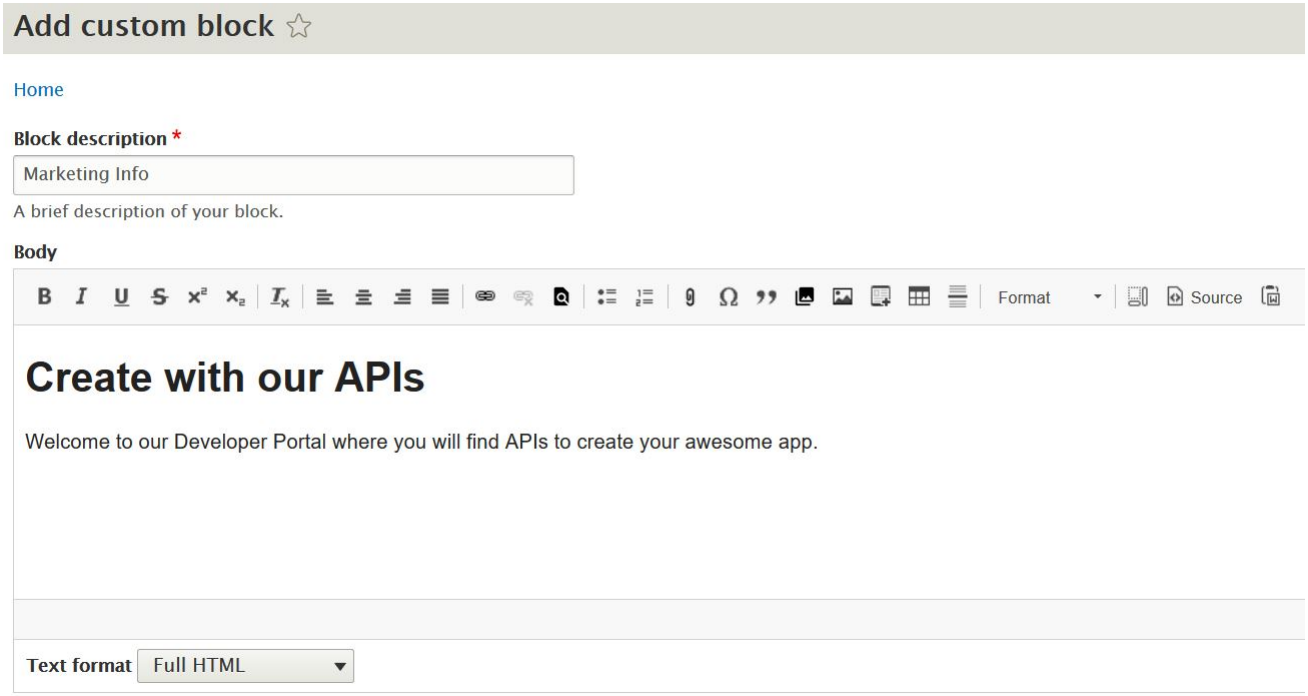
Creating a custom block

1. Log in to your Developer Portal as an administrator.
2. If the administrator dashboard isn't displayed, click Manage to display it.
3. Navigate to Structure > Block layout > Add custom block.
4. Enter `Marketing Info` in the **`Block description`**.
5. In the body area, click **`Source`**, then enter this HTML:

```
<div class="tutorial_block_1 tutorial_block_frontpage">
<h1><span>Create with our APIs</span></h1>
<p><span>Welcome to our Developer Portal where you will find APIs to create your awesome app.</span></p>
</div>
```



6. To see a preview of the block click **`Source`** again.



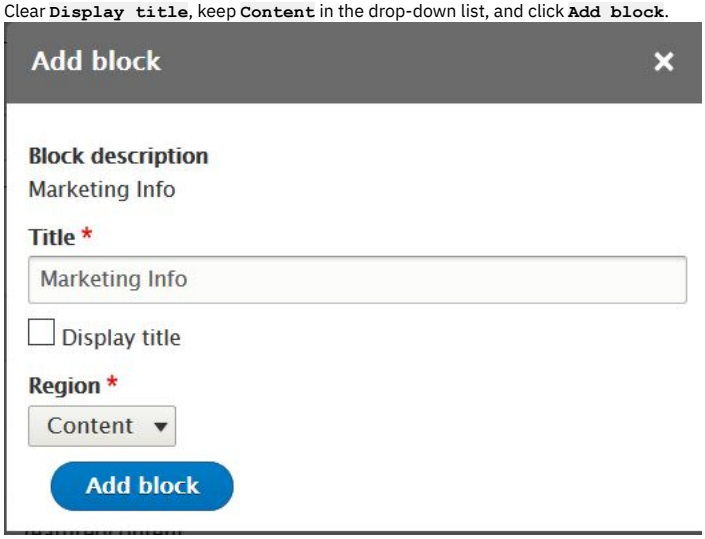
Note: This block uses almost no inline-styling, instead it allows your theme to decide how it is rendered. The advantage of this set up is that you can easily change the rendering without modifying existing content in the database. Any styling that is required can be added to a custom theme. For more information, see Tutorial: Creating a custom theme for the Developer Portal.

7. Click **`Save`**.

You have now created the custom block.

Adding the custom block to the front page

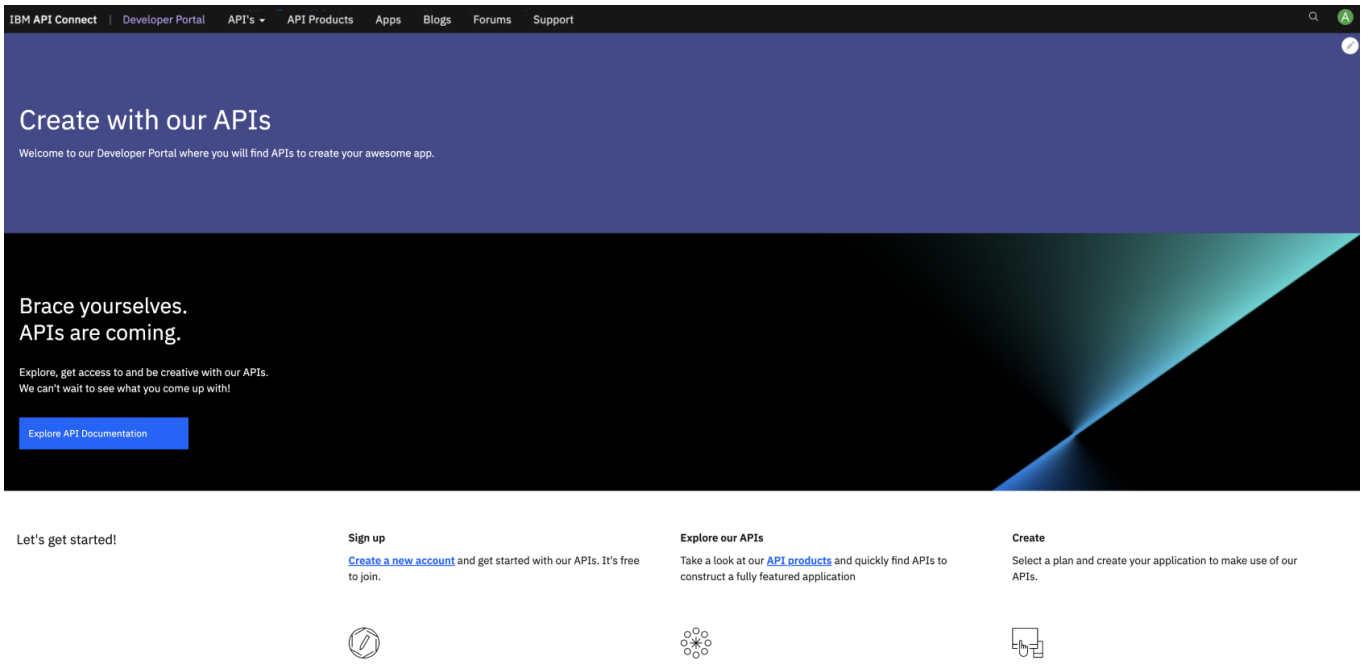
1. If the administrator dashboard isn't displayed, click Manage to display it.
2. Navigate to Structure > Pages.
3. Click **`Edit`** on the Welcome page label.
4. Click **`Panels`** in the **`Variants`** section.
5. Click **`Content`** on the expanded menu.
6. Click **`+ Add new block`**.
7. Click **`Marketing Info`** in the Custom list.
8. Clear **`Display title`**, keep **`Content`** in the drop-down list, and click **`Add block`**.



9. Drag **`Marketing Info`** to the order you want, in this example before the **`Welcome banner`** content.
10. Click **`Update and save`**.

What you did in this tutorial

The front page now has the new block with a marketing message.



What to do next

You can add further branding by adding content to your custom blocks such as images, or try using one of the provided custom blocks such as the Featured Content Block. Instead of using inline styling like that provided in the html, adopt best practice by adding class selectors and developing a custom theme. By default this block is English, you might want to consider adding translated versions.

Tutorial: Adding a custom block to a page other than the front page

You can customize the appearance of a page on your Developer Portal by adding a custom block. Blocks are boxes of content that are rendered into an area or region of a web page, such as the Products page or Apps page. Blocks can be displayed in regions, such as footer or sidebar, on your page.

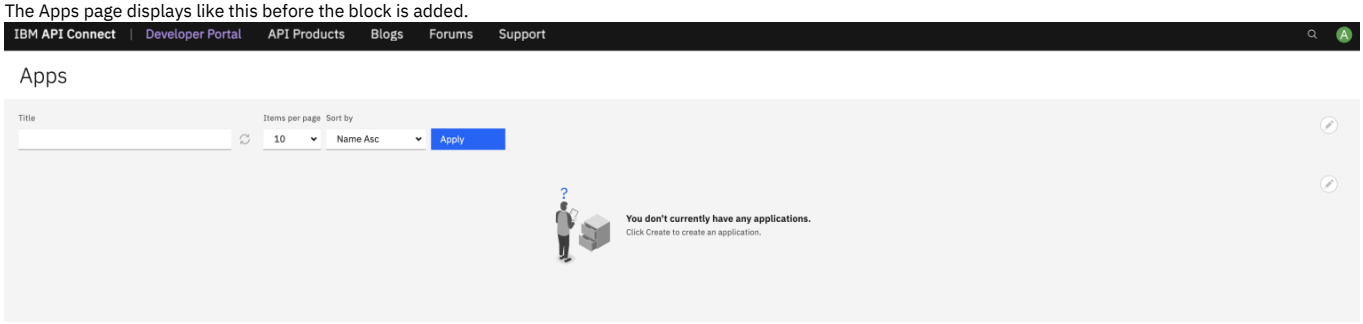
Before you begin

You must have a Developer Portal enabled, and you must have administrator access to complete this tutorial. The tutorial Creating the Portal explains how to enable the portal if you have not already done so. The tutorial Adding a custom block to the front page explains how to add a custom block to the front page.

About this tutorial

In this tutorial, you create a custom block that contains extra guidance on application creation and registration, and add that custom block to the Apps page of your Developer Portal.

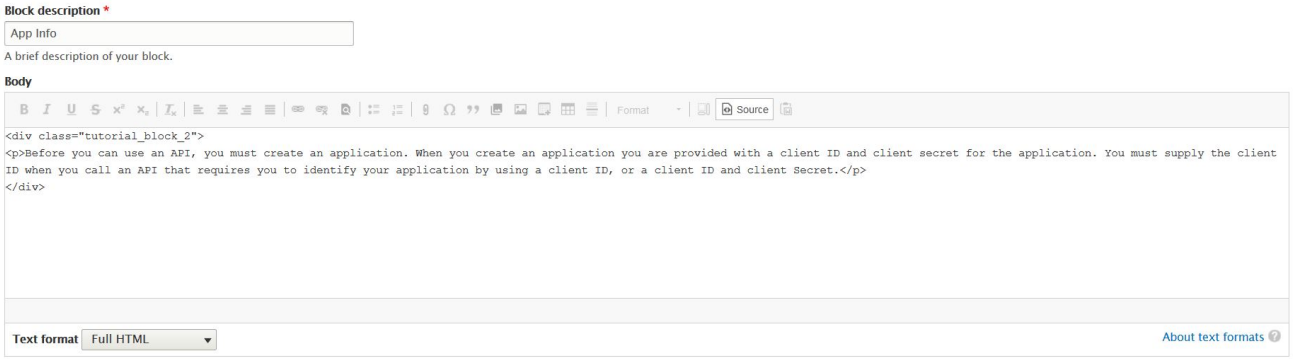
The Apps page displays like this before the block is added.



This tutorial takes you through creating a custom block, and configuring it to show on the Apps page.

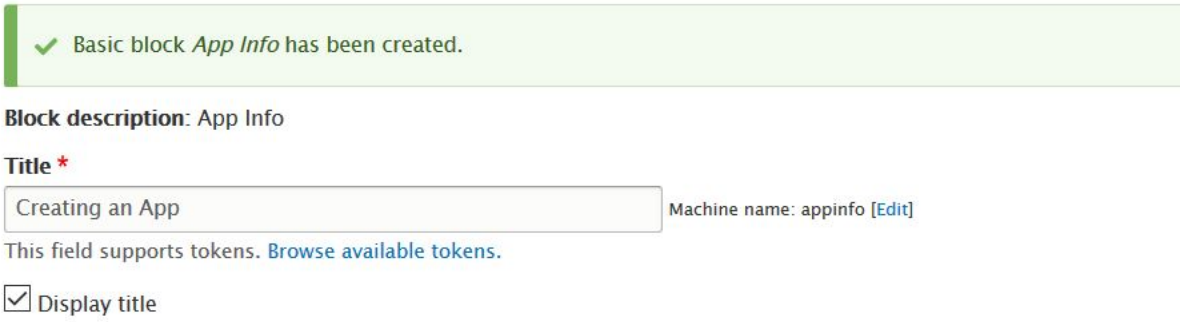
1. Log in to your Developer Portal as an administrator.
2. If the administrator dashboard isn't displayed, click Manage to display it.
3. Navigate to Structure > Block layout > Add custom block.
4. Enter `App Info` in the **`Block description`**.
5. In the body area, click **`Source`**, then enter this HTML:

```
<div class="tutorial_block_2">
<p>Before you can use an API, you must create an application. When you create an application you are provided with a client ID and client secret for the application. You must supply the client ID when you call an API that requires you to identify your application by using a client ID, or a client ID and client Secret.</p>
</div>
```



6. To see a preview of the block click **`Source`** again.

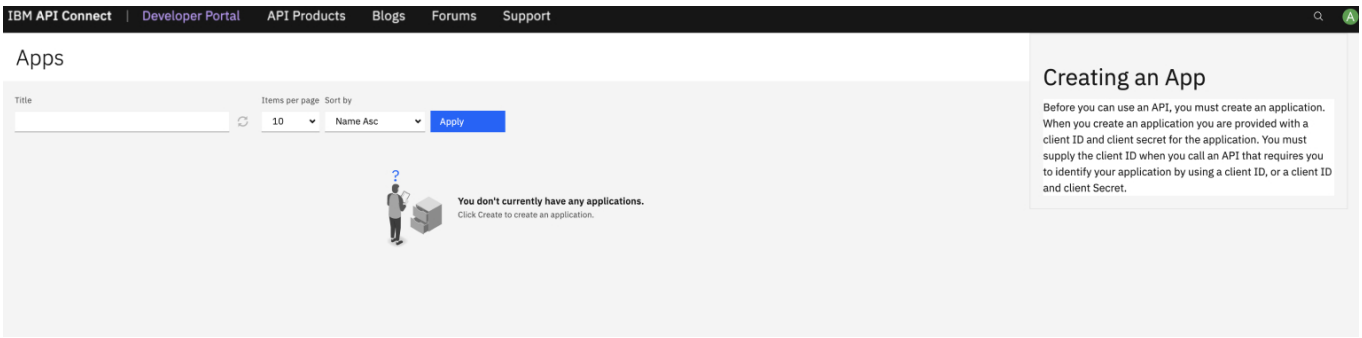
   Note: This block uses almost no inline-styling, instead it allows your theme to decide how it is rendered. The advantage of this set up is that you can easily change the rendering without modifying existing content in the database. Any styling that is required can be added to a custom theme. For more information, see Tutorial: Creating a custom theme for the Developer Portal.
7. Click **`Save`**.
8. Enter `Creating an App` in the **`Title`** box, keep the **`Display title`** selected.



9. Click **`Pages`** in the **`Visibility`** list.
10. Enter `/application` in the **`Pages`** text area, keep the **`Show for the listed pages`** selected.
11. Select **`Secondary`** from the **`Region`** drop-down menu.
12. Click **`Save block`**.
13. Click **`Save blocks`**.

What you did in this tutorial

The Apps page now has an additional block with a guidance message.



What to do next

Instead of using inline styling like that provided in the html, adopt best practice by adding class selectors and developing a custom theme. By default this block is English, so you might want to consider adding translated versions.

Tutorial: Configuring the RobotsTxt file

You can control the access of a visiting Web robot. You can configure the **`robots.txt`** file that exists on your web server, usually at the root level, to control access. Web robots are programs that crawl through the web to obtain web content for all the sites that are visited, and provide indexing for better performance of search engines. You can also specify separate rules for different robots.

Why would I want to edit Drupal's pre-existing robots.txt file?

Malicious robots might choose not to honor the **`robots.txt`** file, and by editing this file you are broadcasting which sites you do not want others to see. Therefore, you should not use this file to hide sensitive data. Instead, you might want to edit your **`robots.txt`** file to:

- Prevent duplicate information from being identified on your site
- Prevent internal pages from appearing in search engines
- Prevent private pages from appearing in search engines
- Prevent particular images, files, and so on, from bring crawled
- Specify a **`crawl-delay`** attribute to prevent robots from overloading your server at load time
- Exclude a particular robot

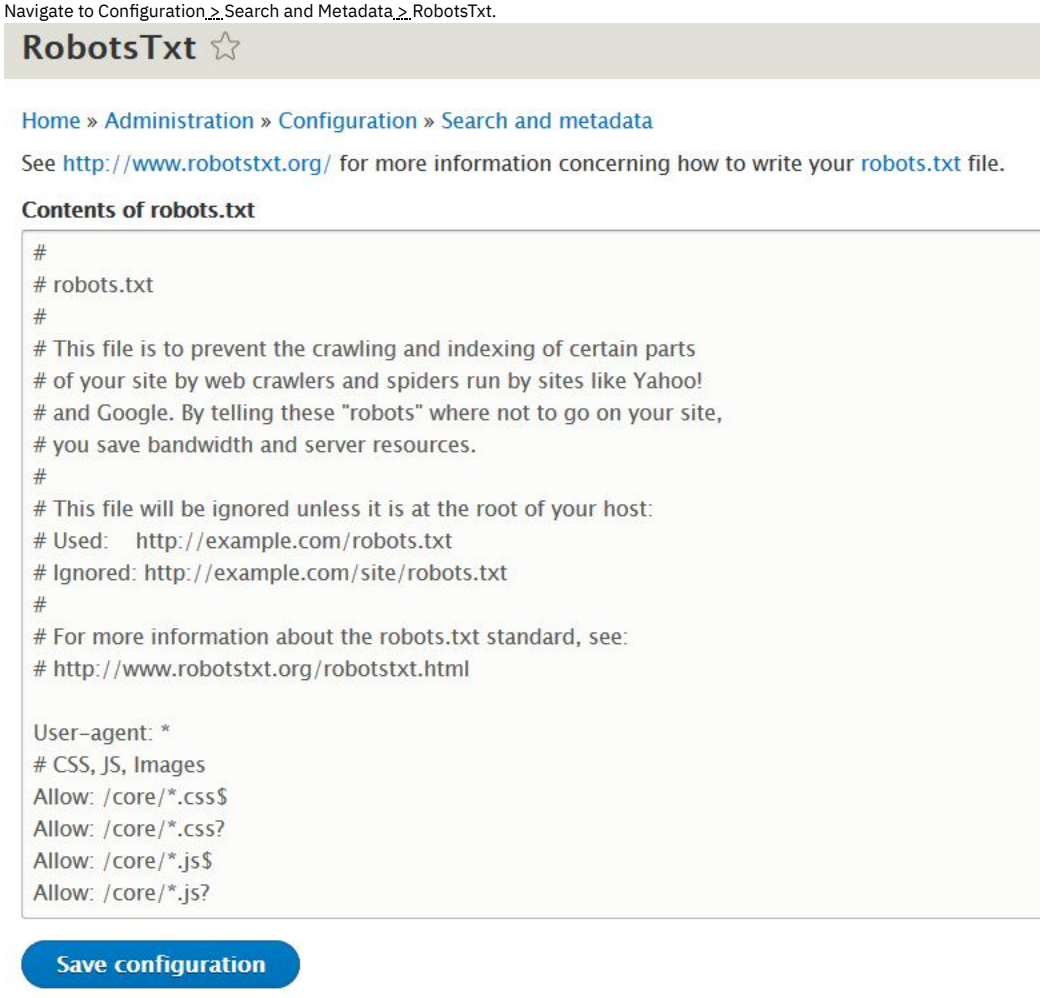
Before you begin

You must have a Developer Portal enabled, and you must have administrator access to complete this tutorial.

About this tutorial

You will edit the pre-existing **`robots.txt`** file and exclude access to a visiting robot called BadBot.

1. Log in to your Developer Portal as an administrator.
2. If the administrator dashboard isn't displayed, click Manage to display it.
3. Navigate to Configuration > Search and Metadata > RobotsTxt.



4. Enter the policy to exclude access to a robot called BadBot.

```
User-agent: BadBot
Disallow: /
```

5. Click **Save Configuration** to save your changes.

What you did in this tutorial

You have now successfully customized the **robots.txt** file. Robots now use this updated file to decide where they can crawl on your site. The BadBot robot is excluded access.

You can check whether your **robots.txt** file is successfully changed by navigating to your site and appending /robots.txt. You should see the content you entered into that file.

```
#
# robots.txt
#
# This file is to prevent the crawling and indexing of certain parts
# of your site by web crawlers and spiders run by sites like Yahoo!
# and Google. By telling these "robots" where not to go on your site,
# you save bandwidth and server resources.
#
# This file will be ignored unless it is at the root of your host:
# Used:    http://example.com/robots.txt
# Ignored: http://example.com/site/robots.txt
#
# For more information about the robots.txt standard, see:
# http://www.robotstxt.org/robotstxt.html

User-agent: BadBot
Disallow: /

User-agent: *
# CSS, JS, Images
Allow: /core/*.css$
Allow: /core/*.css?
Allow: /core/*.js$
Allow: /core/*.js?
```

For more information on how to edit your **robots.txt** file, see https://www.robotstxt.org/.

What to do next

You can edit the **robots.txt** at any time by navigating back to the page within the configuration settings. You might choose to duplicate this file across all of your sites, or choose different policies for different sites.

Tutorial: Configuring the SecurityTxt file

You can use the **security.txt** file to provide your users with a standard way to report security vulnerabilities with your site.

The **security.txt** file is a file format that is designed to help your users disclose any security vulnerability. For more information, see securitytxt.org or A File Format to Aid in Security Vulnerability Disclosure.

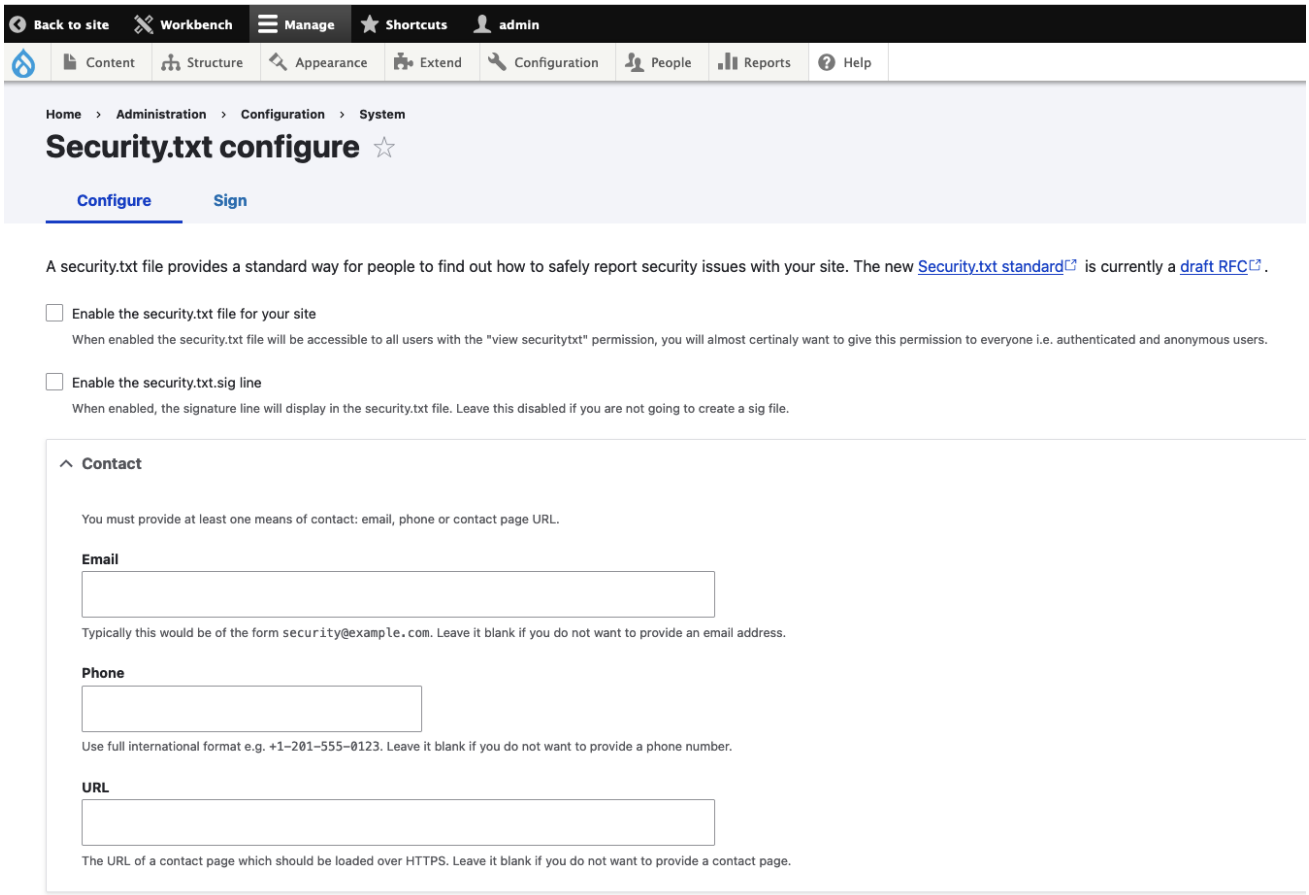
Before you begin

You must have a Developer Portal enabled, and you must have administrator access to complete this tutorial.

About this tutorial

You edit the **security.txt** file and provide information such as a URL of a contact page, for your customers to use if they have a security vulnerability.

1. Log in to your Developer Portal as an administrator.
2. If the administrator dashboard isn't displayed, click Manage to display it.
3. Navigate to Configuration > System > Security.txt.



4. Select the checkbox for **`Enable the security text file for your site`**.
5. Complete the form for your requirements.
6. Click Save Configuration to save your changes.

What you did in this tutorial

You successfully customized the **`security.txt`** file.

What to do next

You can edit the **`security.txt`** at any time by navigating back to the page within the configuration settings.

Tutorials for using custom modules in the Developer Portal

You can configure custom modules to complete specific actions in the Developer Portal.

Note: You must have administrator access to complete the tutorials.
You can configure rules for the following events that occur in the Developer Portal:

- Change the profile page to display **`firstname last name`**, instead of **`username`**.
- Add validation to a field on the sign up form.

Tutorial: Changing the profile page to display firstname lastname, instead of username

You might want to change the profile page of your users on your Developer Portal to display their **`firstname`** and **`lastname`** rather than their **`username`**.

Before you begin

You must have a Developer Portal enabled, and you must have administrator access to complete this tutorial.

About this tutorial

In this tutorial, you change the profile page of your users to display their **firstname** and **lastname** rather than their **username**. The change to the profile page is done by using the custom module **change account display** that is already available in IBM APIC Portal - addons. However, for more information, see Custom module development: creating a module skeleton.

This tutorial takes you through the following steps:

1. Cloning and packaging the **change account display** module.
2. Installing and enabling the **change account display** module.

Cloning and packaging the change account display module

1. Clone the custom module. Here is an example command if you are using Mac and Linux:

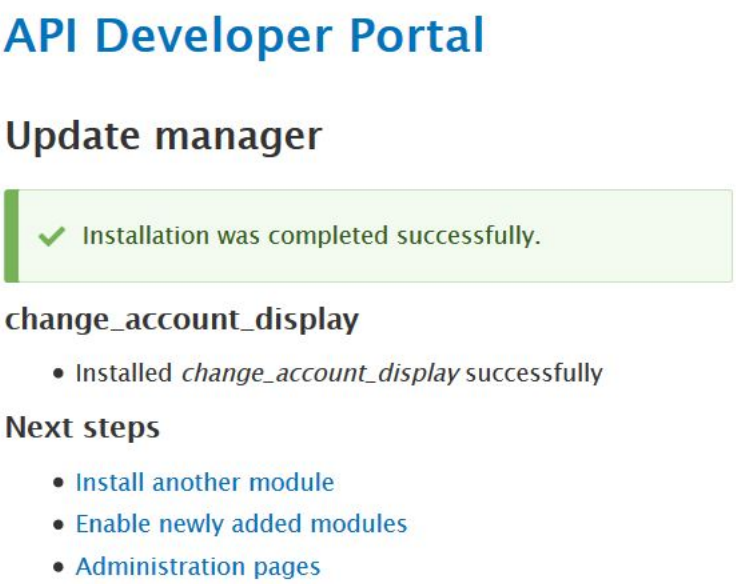
   ```
   git clone https://github.com/ibm-apiconnect/devportal-addons
   ```

2. Package up the custom module.

   ```
   cd devportal-addons/apic_v10/modules
   tar -czf change_account_display.tar.gz change_account_display/
   ```

Installing and enabling the change account display module

1. Log in to your Developer Portal as an administrator.
2. If the administrator dashboard isn't displayed, click Manage to display it.
3. Click Extend > Install new module.
4. Click **Browse** from the **Upload a module or theme archive to install** section.
5. Navigate to and select the packaged custom module that you created earlier. For example, **change_account_display.tgz**, then click **Open**.



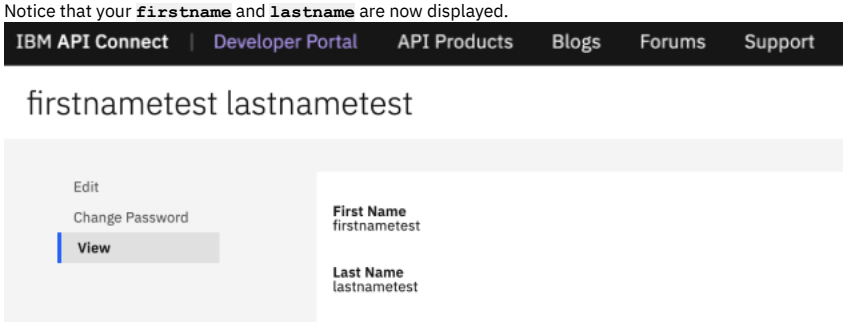
6. Click **Install**.
7. Click the **Enable newly added modules** link.
8. Enter **Change Account Display** in the filter box.
9. Check the check box next to **Change Account Display**.
10. Click **Enable**.

The module is now installed and enabled.

Test the profile page change

1. Sign out as the Admin user.
2. Sign in as a user of your Developer Portal.
3. Click **My account** from the drop down next to your **username**.

4. Notice that your **firstname** and **lastname** are now displayed.



What you did in this tutorial

You used a custom module to change the profile page display for the users of your Developer Portal.

Tutorial: Adding validation to a field on the sign-up form

You might want to add extra validation to a field to help your Developer Portal users. For example, you might want to validate a department name, employee ID, or similar data when a user registers for an account on the portal.

Before you begin

You must have a Developer Portal enabled, and you must have administrator access to complete this tutorial. You must have completed the tutorial about Adding a field to the sign up form, where you added a Department code field to the Sign-up form.

About this tutorial

In this tutorial, you add some validation to the Department code field on the Sign-up form. This is a required field for all portal users and is a string of the format **DEPnnn**, where **DEP** is the string prefix and **nnn** is a three-digit number, for example, **DEP123**. The validation is done by using a custom module that is already available in IBM APIC Portal - addons. However, for more information, see Custom module development: creating a module skeleton.

This tutorial takes you through the following steps:

1. Cloning and packaging the validation module.
2. Installing and enabling the validation module.
3. Testing the validation in the sign up form.

Look at the files we will use in this link IBM APIC Portal - addons.

- user_field_example.info.yml - this is the metadata for the module, defining things like the name and version, and containing other important information that is required by Drupal to import and enable the module.

```
name: 'IBM APIC Portal - user field example'
type: module
description: 'IBM API Connect Developer Portal tutorial - Example of validating a custom user field'
package: 'Custom'
core_version_requirement: ^8 || ^9 || ^10
version: 1.0.0
project: 'user_field_example'
dependencies:
  - ibm_apim
  - auth_apic
```

- user_field_example.module - this contains a validation function and adds this to the Sign-up form by using the **hook_form_alter** function.

```
<?php
use Drupal\Core\Form\FormStateInterface;

/**
 * Implementation of hook_form_alter() to alter the Sign up form
 */
function user_field_example_form_alter(&$form, FormStateInterface $form_state, $form_id) {
  if ($form_id === 'user_register_form' ) {
      $form['#validate'][] = 'user_field_example_validate_department_code';
  }
}

/**
 * Validate the Department code field on the Sign up form.
 *
 * Valid entry = DEPnnn
 *   where n = single figure digit.
 */
function user_field_example_validate_department_code($form, &$form_state) {
  $dept_code = $form_state->getValue('field_department_code')[0]['value'];
  $valid = preg_match('/^DEP\d{3}$/', $dept_code);
  if (!$valid) {
    $form_state->setErrorByName('field_department_code', t('Invalid department code.'));
```

```
  }
}
```

Cloning and packaging the validation module

Validation is added to the **Department code** field on the Sign-up form by using a custom module.

1. Clone the custom module. Here is an example command if you are using Mac and Linux:

   ```
   git clone https://github.com/ibm-apiconnect/devportal-addons
   ```

2. Package up the custom module.

   ```
   cd devportal-addons/apic_v10/modules
   tar -czf user_field_example.tgz user_field_example/
   ```

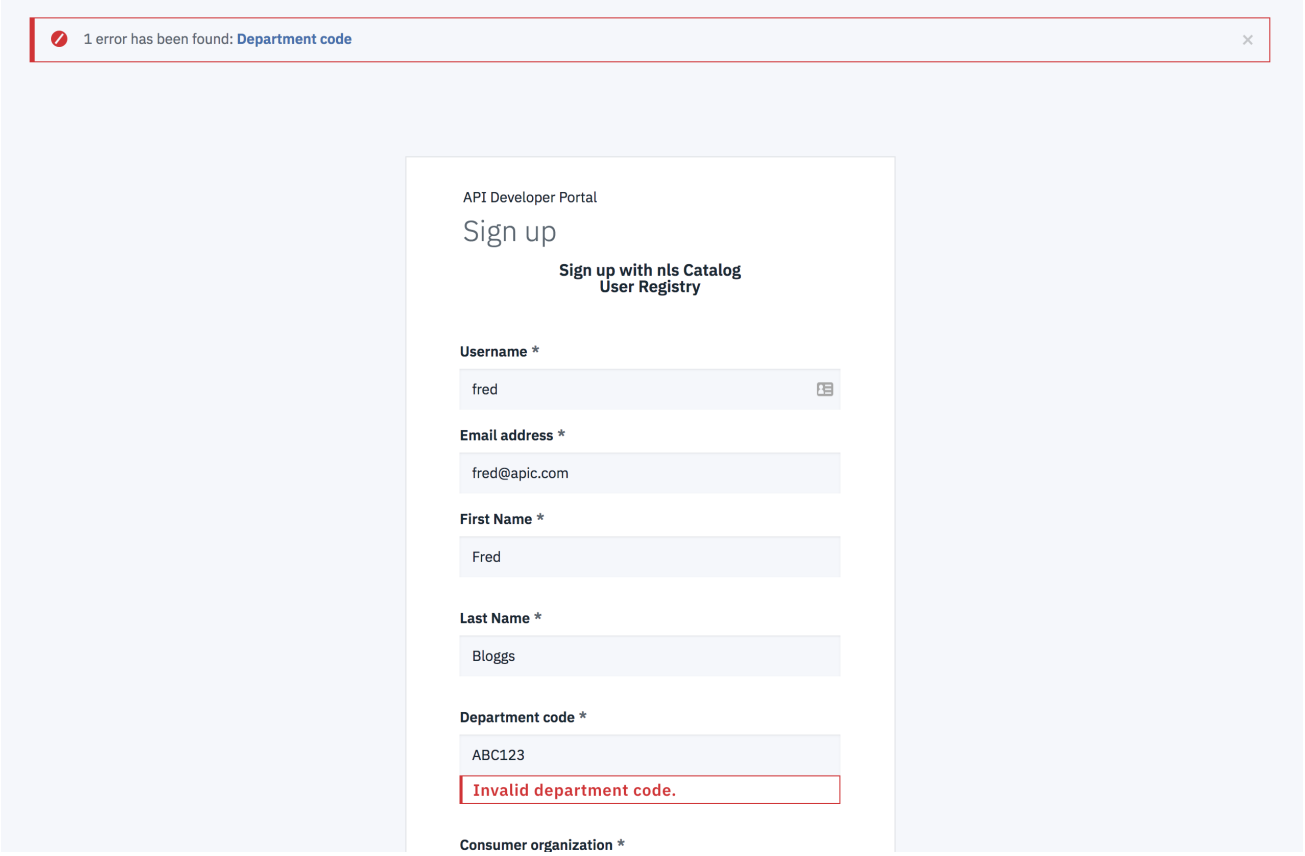
Installing and enabling the validation module

1. Log in to your Developer Portal as an administrator.
2. If the administrator dashboard isn't displayed, click Manage to display it.
3. Click Extend > Install new module.
4. Click **Browse file** from the **Upload a module or theme archive** section.
5. Browse to and select **user_field_example.tgz**, the packaged custom module that you created earlier. Click **Open**.
6. Click **Continue**.
7. Click the **Enable newly added modules** link.
8. Enter **IBM APIC Portal - user field example** in the filter box.
9. Check the checkbox next to **IBM APIC Portal - user field example**.
10. Click **Enable**.

The module is now installed and enabled.

Testing the validation in the sign-up form

1. Sign out as the Admin user.
2. Click **Create account**.
3. Complete all fields, set **Department code** to **ABC123**.
4. Click **Sign up**.
5. Observe the failure message and highlighting on the **Department code** field.



6. Change the **Department code** field to **DEP245**, reenter the password and click **Sign up** to see that a valid code is accepted.

What you did in this tutorial

You added some validation to the Department code field on the Sign-up form, then tested the form to ensure that the **`Department code`** field accepts only codes in the format of **`DEPnnn`**.

In reality, you would need to add this configuration in such a way that it is available for all sites. To achieve this availability, you would include the configuration in your custom module. For more information, see Drupal custom modules.

Tutorial: Using a custom weighting sort order on the product list page

You can use a custom weighting to sort your products on the API products list page of your Developer Portal.

Before you begin

You must have a Developer Portal enabled, and you must have administrator access to complete this tutorial. The tutorial Creating the Portal explains how to enable the portal if you have not already done so.

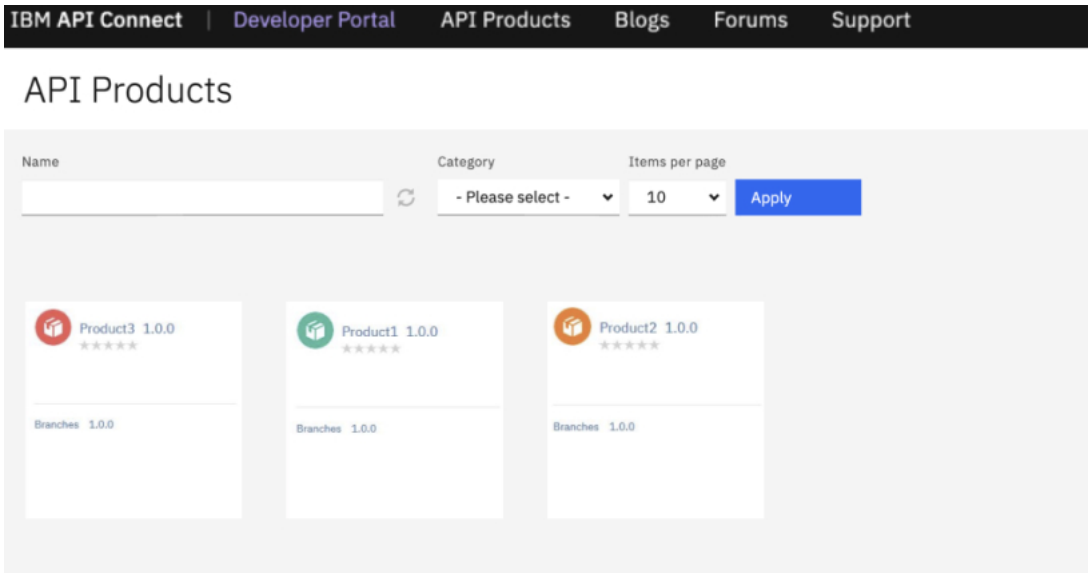
About this tutorial

In this task, you set up a weighting sort criteria and use it to list your products, on the API Products page, in a particular order. You set up the weightings so the order reads, Product3, Product1, and Product2.

This tutorial takes you through the following steps:

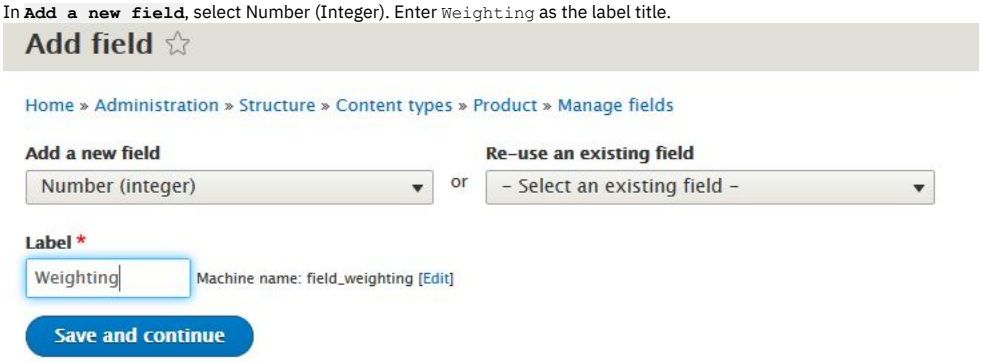
1. Add a custom integer field to the API content type.
2. Modify the Products view to change the sort order.
3. Add a weighting to each Product.

Note: To complete this tutorial, you will need to have API products.
For example, the following API Products page displays Product1, Product2, and Product3 in this order before the weightings are added.



Add a custom integer field to the API content type

1. Log in to your Developer Portal as an administrator.
2. If the administrator dashboard isn't displayed, click Manage to display it.
3. Click Structure > Content types > Product > Manage fields.
4. Click + Add field.
5. In **`Add a new field`**, select Number (Integer). Enter `Weighting` as the label title.

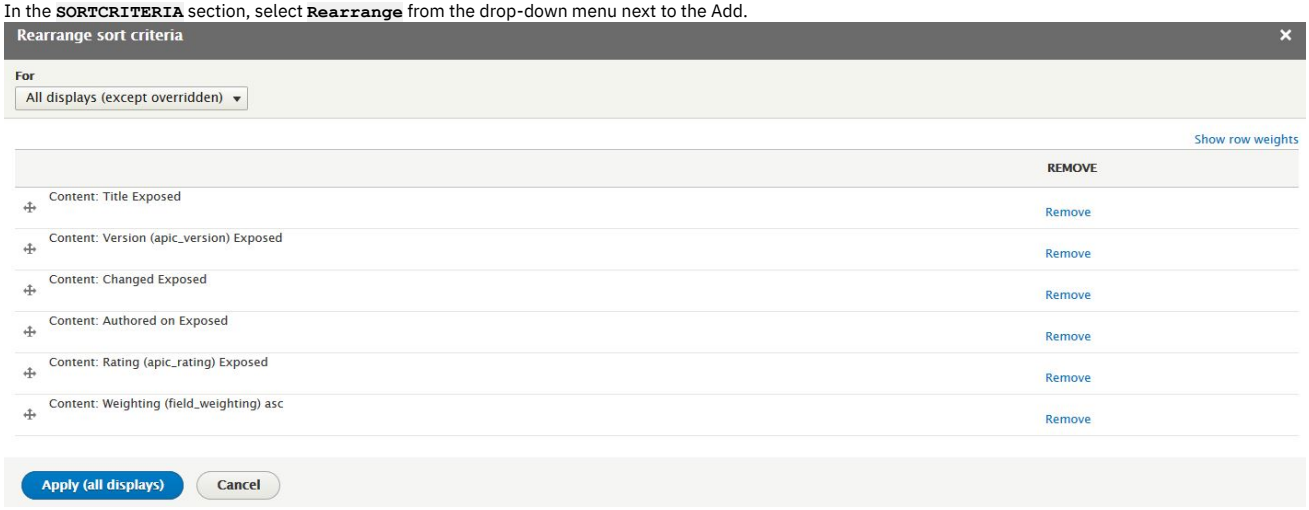


6. Click Save and continue.
7. Leave the **Allowed number of values** set to 1 and click Save field settings.
8. Enter 0 as the default value, click Save settings.
9. Click Save.

The **Weighting** field now shows in the **Manage fields** list.

Modify the Products view to change the sort order

1. If the administrator dashboard isn't displayed, click Manage to display it.
2. Navigate to Structure > Views, scroll down to the **Products** view and click Edit.
3. In the **SORT CRITERIA** section click Add.
4. Enter weight in the search box. Then, select **Weighting (field_weighting)**, and click Apply (all displays).
5. Leave the **Order** as **Sort ascending**, click Apply (all displays).
6. In the **SORTCRITERIA** section, select **Rearrange** from the drop-down menu next to the Add.

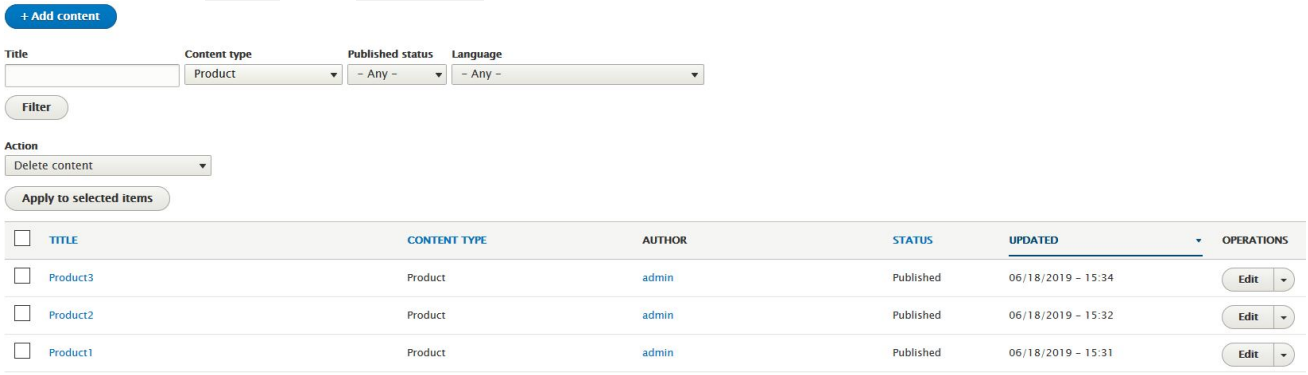


7. For all rows except **Weighting (field_weighting)**, click **Remove**.
8. Click Apply (all displays).

You modified the **Products** view to sort based on **Weighting (field_weighting)**.

Add a weighting to each Product

1. If the administrator dashboard isn't displayed, click Manage to display it.
2. Click Content, and select **Product** from the **Content type**, click Filter. A list of available Products on your site is displayed.

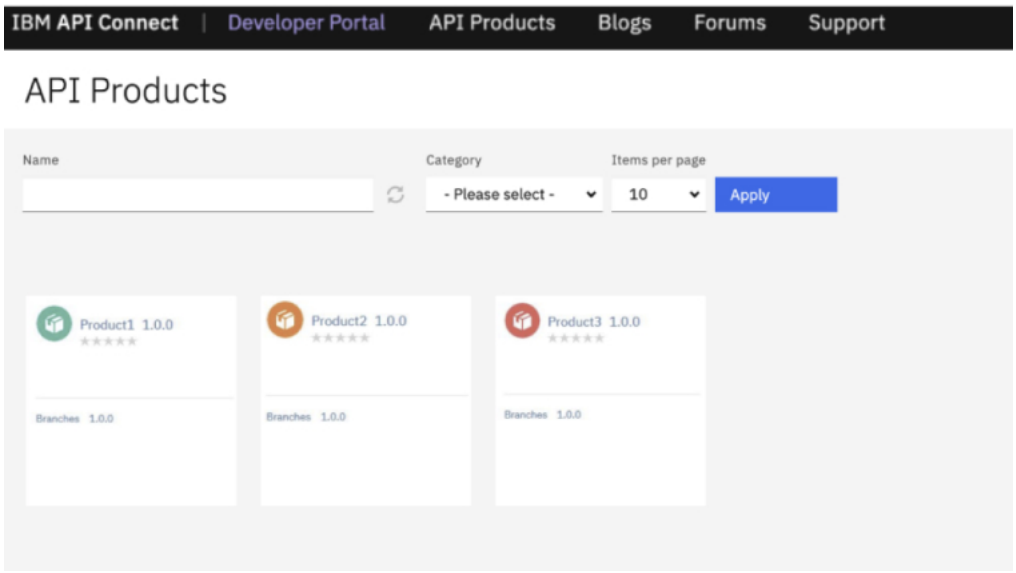


3. For Product1 click edit, in the **Weighting field**, select 2 as the value, click Save.
4. For Product2 click edit, in the **Weighting field**, select 3 as the value, click Save.
5. For Product3 click edit, in the **Weighting field**, select 1 as the value, click Save.

The API Products page displays Product3, Product1, and Product2 in this order after the weightings are added.

What you did in this tutorial

You changed the order that the API Products appear on the products page.



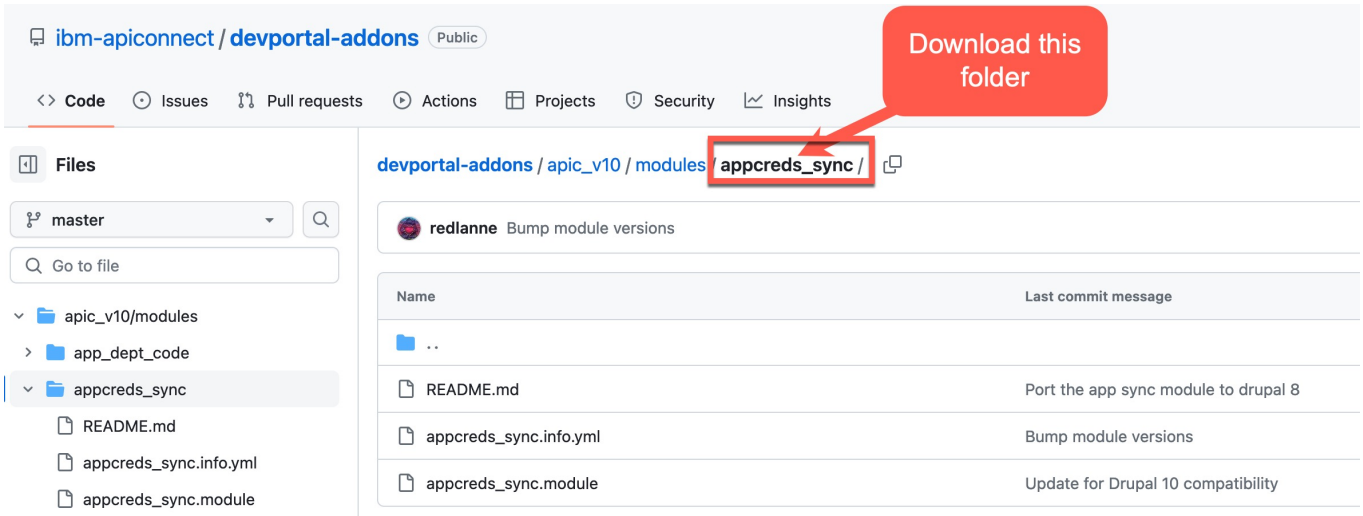
Tutorial: Synchronizing application credentials from the Developer Portal with an external server

You can synchronize application credentials from the Developer Portal with an external server.

Before you begin

You must have administrator access to complete this task.

Download the Application credential synchronization folder.



Perform the following steps:

1. Clone the custom module. Here is an example if you are using Mac and Linux:

   ```
   git clone https://github.com/ibm-apiconnect/devportal-addons
   ```

2. Navigate to the `appcreds_sync` folder:

   ```
   cd devportal-addons/apic_v10/modules/appcreds_sync
   ```

About this task

In this tutorial, you configure a custom module and install it in the Developer Portal to synchronize application credentials between the Developer Portal and an external credentials server.

The **`appcreds_sync`** folder that you downloaded is a custom module that contains multiple methods that can be configured with your REST endpoints, and any further specifications that you want to define, to synchronize your Developer Portal application credentials with an external credential server.

For more information, see Custom module development: background and prerequisites.

Procedure

To configure the custom module to synchronize application credentials:

1. In the appcreds_sync.module file, replace `example.com` with your REST endpoint for the following method types:
   - `http://example.com/app/create`
   - `http://example.com/app/delete`
   - `http://example.com/app/creds/create`
   - `http://example.com/app/creds/update`
   - `http://example.com/app/creds/delete`
   - `http://example.com/app/clientid/reset`
   - `http://example.com/app/clientsecret/reset`
2. Optional: Replace `username` and `password` with your username and password in the `_appcreds_sync_json_http_request` function:

   ```
   ('username' . ':' . 'password')
   ```

   Note: You can also configure the SSL settings if you need to.
3. Save the file, and package up the custom module:

   ```
   cd..
   tar -czf appcreds_sync.tar.gz appcreds_sync/
   ```

To install the configured custom module in the Developer Portal:

4. Log in to your Developer Portal as an administrator.
5. If the administrator dashboard does not display, click Manage.
6. Click Extend > Install new module.
7. In the Add from a URL field, enter a path to the module . Alternatively, upload the module in the Upload a module or theme archive section.
8. Click Continue.

To enable the module:

9. If the administrator dashboard does not display, click Manage.
10. Click Extend and search for the custom module just installed, for example, Synchronise Application Credentials.
11. Select the check box and click Enable.

Results

You have configured a custom module that synchronizes application credentials from the Developer Portal, installed that module in the Developer Portal, and enabled it. No further action or configuration is required.

Analytics: understand your API usage

Monitor your API usage with API Connect analytics.

API Connect provides the capability to filter, sort, and aggregate your API event data. This data is then presented within correlated charts, tables, and maps, to help you manage service levels, set rate limits, establish controls, set up security policies, manage communities, and analyze trends. API analytics is built on the OpenSearch open source real-time distributed search and analytics engine.

- **Key concepts of API Connect analytics**
  An overview of how API Connect analytics works.
- **Preinstallation planning**
  Review the analytics subsystem requirements and decide how you want to configure analytics for your environment.
- **Managing your analytics subsystem**
  Understand the architecture of the analytics subsystem and how to configure it.
- **Installing the analytics subsystem**
  Links to the installation steps for each platform.
- **Backup, restore, and disaster recovery**
  How to back up your analytics subsystem and restore after a disaster.
- **API event record field reference**
  Reference table and examples of the data that is stored in an API event record.
- **Advanced configuration options**
  Configure advanced features and settings such as offload, retention period, and dedicated storage.
- **Customize your analytics data**
  How to customize the data stored in your API event records.
- **Access your analytics data**
  How to view, analyze, and export your analytics data.
- **Troubleshooting analytics**
  How to diagnose and resolve common issues with the analytics subsystem.

Key concepts of API Connect analytics

An overview of how API Connect analytics works.

How the gateway and analytics services work together

When a user calls one of your published APIs, the gateway that processes the API call creates an API event record that contains details of the API call such as the application ID, current time, result code, etc. For a full list of all the data stored in an API event record, see API event record field reference. The gateway buffers API event records for each API call until a threshold of either number of events, or elapsed time is reached. When this threshold is reached, the API events are sent in bulk to the analytics subsystem.
Tip: If the analytics dashboards in your UIs are not showing the API events that you expect, the most common cause is a communication failure between your gateway and analytics subsystems. Check both the gateway and analytics subsystem logs.

You can deploy multiple gateway and analytics services in all API Connect deployment types except for OpenShift top-level CR. After you register a gateway service in the Cloud Manager UI, you associate an analytics service with that gateway service. All API event data that the gateway generates is sent to its associated analytics service. Multiple gateways can be associated with the same analytics service. You cannot associate multiple analytics services with the same gateway.

Each analytics service in your API Connect deployment stores API event data only from the gateways it is associated with. When you view analytics data, you must select which analytics service you want to view the data from. API Connect provides no aggregated view of all analytics data from all analytics services. If you have multiple analytics services and want to combine the data from all of them, you can export or offload the data and manually create your own reports.

If you use the top-level CR on OpenShift or Cloud Pak for Integration, then your API Connect deployment consists of one gateway service and one analytics service. All API calls in your API Connect deployment are handled by the one gateway service, and all API event records that are generated, are stored by the one analytics service.

Customizing the analytics data that is stored for your APIs

Note: What API consumer analytics are displayed in the Developer Portal depends on the visibility configuration settings. For more information, see Configuring analytics in the developer portal.
When you configure an API in the API Manager UI, you choose what data is stored in the API event records for calls to that API with the **`activity log`** property. The **`activity log`** property has separate settings for successful API calls, and for failed API calls. The activity log options are:

- none: API events are not logged.
- activity: Logs the API resource URI. **`activity`** is the default log setting for successful API calls.
- header: Logs the API resource URI and HTTP headers.
- payload: Logs API resource URI, HTTP headers, and request and response payloads. **`payload`** is the default log setting for failed API calls, since the response payload might have useful information on the cause of the failure.

The more detailed the **`activity log`** setting, the larger the API event records, and the greater the persistent storage requirements for the analytics subsystem. For more information about configuring activity logging, see Activity log policy.

If you want to make specific customizations to your API event data, two methods are available:

- Customize API event records as they arrive from the gateway, by using ingestion filters. Ingestion filters can be applied conditionally based on the data in the API event.
- Customize API event records as they are created on the gateway. Use a gateway script or the **`set-variable`** operation in the definitions of each API that you want to customize. See Customizing data with a gateway script or set-variable operation.

Retention and rollover of analytics data

API event data takes up persistent storage space on your analytics subsystem. To ensure that you do not run out of persistent storage space, API event data is summarized, and the oldest API event records are deleted. Analytics API event records are retained for 30 days on a one replica deployment, and 90 days on a three replica deployment. Summary analytics data that is created from the API event records is retained for 1 year. You can change how long the analytics data is stored with the Retention and rollover settings.

Accessing your analytics data

You can view your analytics data in the Cloud Manager, API Manager, and Developer Portal UIs.

- The cloud admin user can see total API call volumes and call volumes per gateway in the Cloud Manager UI. Provider organization owners can enable the cloud admin user to also see analytics data and individual API event data for their provider organization.
- In the API Manager UI, the provider organization owner can see analytics data for APIs that are published in their catalogs.
- In the Developer Portal UI, the API consumer can see analytics data for APIs published in their consumer organization.
  Note: If two gateway services are configured for a catalog that has a portal site, those two gateway services must be associated with the same analytics service. If they are associated with different analytics services, then no analytics data is displayed in the portal UI.
  This limitation means that analytics data is not available in the developer portal sites of a two data center disaster recovery deployment, where two analytics subsystems are deployed.

The maximum number of API events that can be accessed from the UIs is 10,000. The maximum number of event records that can be displayed per page in the UIs is 200.

Your analytics data can also be accessed by using the toolkit CLI or REST API.

You can manage user access to analytics data with User roles and permissions. For more information about user-based analytics data visibility, see Catalogs, spaces, and analytics

Exporting your analytics data

You can export analytics data from your UIs, however, UI export is not a practical method if you want to export more than 200 API event records. Use the toolkit CLI or REST API to export more than 200 API event records at a time. If you think that you might want to regularly export all your analytics data, then consider Offloading your analytics data to a third-party system.

Offloading your analytics data to a third-party system

The API event data that is received from your gateways can be directed to a third-party system, instead of or in addition to being stored by the analytics subsystem.

For more information about offloading, see Offload to third-party systems.

Preinstallation planning

Review the analytics subsystem requirements and decide how you want to configure analytics for your environment.

- **Estimating storage requirements**
  Estimate the persistent storage requirements for your analytics subsystem.
- **Kubernetes and OpenShift preinstallation planning**
  Review deployment profiles, storage, and analytics settings that must be decided before installation.
- **VMware preinstallation planning**
  Review deployment profiles and other analytics settings that must be decided before installation.

Estimating storage requirements

Estimate the persistent storage requirements for your analytics subsystem.

This information applies only to data that is stored in your API Connect analytics subsystem, and not to data that is offloaded to a third-party system. If you plan to disable local storage, you can skip this topic. The formula and guidelines are based on how the API Connect analytics subsystem stores data, and cannot be directly applied to any other storage system.

Warning: Increasing the analytics storage space after installation is not a simple operation, and it can require reinstallation of the analytics subsystem. If you do not have the information that is needed to make an estimate, then set your storage to at least 500Gi and monitor your usage closely. For an installation where you expect to store little or no analytics data, you can set the storage to 50Gi.
After installation, if you find you do not have enough space, then reduce the data retention period to keep less analytics data and stay within your persistent storage limit.

To understand the concepts that are required for estimating your storage requirements, first review the following pages:

- OpenSearch nodes, indices, shards, and replicas.
- Activity log policy.
- Retention and rollover.

Use the following guidelines to provide an estimate of the amount of persistent storage you need for your API Connect analytics subsystem.

Factors that determine persistent storage requirement

Number of copies of the analytics data
: The number of copies of the analytics data you store depends on your deployment profile:

  - Three replica profiles store 3 copies of your analytics data (one OpenSearch shard replica per analytics replica).
  - One replica profiles store 1 copy of your analytics data.

Number of days that API data is retained
: The default number of days your API event data is retained depends on your deployment profile:

  - Three replica profiles retain API event data for up to 90 days.
  - One replica profiles retain API event data for up to 30 days.

  API summary data is retained for 366 days by default on all deployment profiles.

  If you customized your retention and rollover settings, then use the updated retention periods in your calculations.

API event logging policy and customization
: The logging policy that you set for each API determines the size of the event records for that API. Typical sizes of API event records for each activity log policy are:

  - Activity logging: 1.5 Kb. This is the default log policy for successful API calls.
  - Header logging: 4 Kb.
  - Payload logging: 4 Kb plus size of expected request and response payloads. This is the default log policy for failed API calls.

  You can also Customize your analytics data to add, redact, or remove fields. If you add fields to your API events, calculate the average size of the new fields and add that number to your event size. If you remove fields, subtract this size only if you are also removing headers or payloads.

Percentage of each type of data
: Estimate the percentage of each type of log policy (activity, header, payload) for your published APIs. Use these percentages and your estimates of API event size to calculate you average API event size.
  Remember: API logging policy can be set differently for success and failure responses of the same API. The default is activity logging for successful API calls, and payload logging for failed calls. Consider the percentages of successful and failed calls that you expect in your calculations.

API calls per day
: Estimate the total number of API calls that you expect per day.

Calculating your persistent storage requirements

Calculate the expected size of your API event data with the following formula:

```
Storage required for API events = (average bytes per API event) * (API events per day) * (API event retention period) * (copies of data)
```

Calculate the expected size of your API summary data with the following formula:

```
Storage required for API summary data = (expected size of all API events with header logging) * (API events per day) * (summary data retention period) * (copies of data) * 0.1
```

Note: Ignore the percentages of different logging types you calculated for your APIs and assume that all your APIs are set to header logging. API summary data uses approximately 10% of the space of header-logged API event data per day. Remember that header logging includes everything that is logged by activity logging plus the API call headers.
Your analytics data must not use more than 70% of your persistent storage space. Add some buffer space in case your analytics data is larger than you expect. It is recommended that the persistent storage space you provide for your analytics subsystem is double the space that you calculated your data requires.

Example calculation, based on the following information:

```
Copies of data = 3
API event data retention = 90 days
API summary data retention = 366 days
Activity log bytes per call = 1500 bytes
Header log bytes per call = 15000 bytes
Payload log bytes per call = 30500 bytes
% of Activity log = 70%
% of Header log = 20%
% of Payload log = 10%
Calls per day = 100000
```

1. Calculate the average API event size:

   ```
   ( (70*1500) + (20*15000) + (10*30500) ) / 100 = 7100 bytes
   ```

2. Calculate the space needed for your API event data:

   ```
   7100 * 100000 * 90 * 3 = 178.5 Gi (191.7 Gb)
   ```

3. Calculate the space needed for your summary data:

   ```
   15000 * 100000 * 366 * 3 * 0.1 = 153 Gi (165 Gb)
   ```

4. Add API event data and summary data totals:

   ```
   153 Gi + 178.5 Gi = 331.5 Gi
   ```

5. Double the storage calculated in step 4 to get the storage size to allocate to your analytics subsystem:

   ```
   331.5 Gi * 2 = 663 Gi
   ```

Kubernetes and OpenShift preinstallation planning

Review deployment profiles, storage, and analytics settings that must be decided before installation.

Deployment profile

Decide which deployment **`profile`** you want to use, the available profiles are:

- For Kubernetes and OpenShift (individual subsystem) installations: Analytics deployment profiles.
- For Cloud Pak for Integration and OpenShift top-level CR installations: API Connect deployment profiles.

For a scalable analytics deployment, choose a three replica profile. If you do not expect a high API transaction rate and plan to keep a limited amount of analytics data, then a one replica profile is sufficient.

Storage class

Before you install analytics, you must choose a storage class. **`Ceph`**, **`Block`**, and **`Local Volume`** are all supported; however, **`Local Volume`** is the most suitable for analytics. The analytics subsystem provides internal data replication and HA support, so the additional HA capabilities that **`Ceph`** or **`Block`** storage might give you are not needed. In addition, analytics requires a high throughput of disk I/O operations to successfully handle the analytics data load from the gateway. **`Local Volume`** is the best-performing storage class for disk I/O.

Note: GlusterFS and NFS storage are not supported for analytics. If you use either of these storage classes, you might encounter severe performance degradation, and possibly loss of data.

Storage type

Note: Storage type selection is available on three replica deployments only.
To make an informed choice on which storage type is best for you, first read and understand the OpenSearch concepts that are described in OpenSearch nodes, indices, shards, and replicas.
API Connect provides two OpenSearch storage types:

- **Shared storage**
  A single pod provides data storage and OpenSearch cluster management. Shared storage is the default option, and the only option on a one replica deployment.

- **Dedicated storage**
  OpenSearch data storage and cluster management functions are split, and run in separate pods on each worker node:
  - The **`storage-os-master`** pod runs an OpenSearch "manager eligible" node that manages the OpenSearch cluster, but does not store any API event data.
  - The **`storage`** pod runs an OpenSearch "data" node that stores API event data.

Dedicated storage facilitates horizontal scaling to support greater analytics data storage and throughput. Add worker nodes and increase the number of **`storage`** pod replicas to scale horizontally (you do not need to increase the number of **`storage-os-master`** replicas). Dedicated storage also provides greater stability and allows some OpenSearch configuration changes to be made without downtime.
You can change storage type after installation, see Dedicated storage and scaling up.

Disabling internal storage

The analytics subsystem provides a complete solution for routing, storing, and viewing the analytics data. However, you might not need the internal storage and viewing solution if you are using a third-party system for data offloading. In this scenario, you can greatly reduce your CPU and memory costs by disabling the internal storage and viewing components.

When you disable internal storage for analytics data, the following microservices are disabled:

- `osinit`
- `storage`

Important:
If you disable local storage, the analytics views in your API Connect UIs remain accessible, but are empty.

Configure local storage disablement before installation. It is not possible to disable or re-enable internal storage after installation.

You can enable offload of analytics data to third-party systems after installation.

For the steps to disable internal storage, see Disable local storage.

Persistent storage space

Based on your expected API transaction rate, you can estimate how much storage space your analytics subsystem requires. See Estimating storage requirements.

Inter-subsystem communication security

By default the network communication from the management and gateway subsystems, to the analytics subsystem uses Kubernetes ingresses or OpenShift routes, and is secured with mTLS. You can configure alternative network communication options if your environment requires. For more information, see Network requirements for inter-subsystem communication.

Kubernetes operating map counts

When the analytics service is configured to store data, it uses OpenSearch, which requires map counts higher than the operating system defaults. The minimum recommended value is `262144`. Unless you plan to disable local storage, increase the default map count on every Kubernetes worker node:

1. To change the map counts on the live system, run the following command on every Kubernetes node:

   ```
   sudo sysctl -w vm.max_map_count=262144
   ```

2. To persist this change when node restarts occur, add the following setting to the /etc/sysctl.conf file:

   ```
   vm.max_map_count = 262144
   ```

For more information, see Important settings in the OpenSearch documentation.

PV requirements

The number of PVs needed depends on if you disable local storage.

Table 1. Analytics PV requirements

Deployment profile	Local storage enabled	Local storage disabled (ingestion only)
Single node (n1)	2	1
Three node (n3)	6	3

To understand how much storage capacity your analytics subsystem needs, see Estimating storage requirements.

Firewall requirements

The analytics firewall requirements are documented here: Firewall requirements

VMware preinstallation planning

Review deployment profiles and other analytics settings that must be decided before installation.

Deployment profile

The first decision that you must make is which `deployment-profile` you want to use. The available deployment profiles for analytics are: `n1xc2.m16`, `n1xc4.m32`, `n1xc6.m48`, `n3xc4.m16`, `n3xc4.m32`, `n3xc6.m48`, `n3xc8.m64`. For more information about deployment profiles, see Deployment profiles.

For a typical production deployment, choose a three replica profile. A one replica profile is only sufficient if you expect a low API transaction rate and do not plan to retain much analytics data.

Storage space

Based on your expected API transaction rate, you can estimate how much storage space your analytics subsystem requires. See Estimating storage requirements.

Firewall requirements

The analytics firewall requirements are documented here: Firewall requirments.

Inter-subsystem communication security

If your network infrastructure requires that load-balancers implement TLS termination, then mTLS between API Connect subsystems can be disabled and JSON Web Token (JWT) security can be used instead.
Note: Although mTLS is disabled, the network communication is still secured with standard TLS, which does not require passthrough to be enabled on load-balancers.
For more information about configuring JWT for network security, see: Enable JWT security.

Disabling internal storage

If you are offloading your analytics data to a third-party system, you can choose to not store your API event data in your API Connect analytics subsystem by disabling local analytics storage. With local storage disabled, the CPU, memory, and storage requirements of your analytics subsystem are greatly reduced, but you lose the ability to view your analytics data in the API Connect UIs.
Important: It is not possible to enable or disable local storage after installation.

Managing your analytics subsystem

Understand the architecture of the analytics subsystem and how to configure it.

- **API Connect on VMware**
  An overview of the analytics VM, and how to configure analytics features.
- **API Connect on Kubernetes, OpenShift, and Cloud Pak for Integration**
  Understand the Kubernetes artifacts that make up the analytics subsystem, and how to configure your AnalyticsCluster CR.
- **OpenSearch nodes, indices, shards, and replicas**
  Understand the main concepts of the OpenSearch database: nodes, indices, shards, and replicas.

API Connect on VMware

An overview of the analytics VM, and how to configure analytics features.

Analytics data storage

The disk size for analytics data is specified at installation when you deploy your analytics OVA file, see Deploying the analytics subsystem OVA file.

You can increase the space available for your analytics data by adding a disk, see Adding disk space to a VMware appliance.
Warning: Do not attempt to increase the size of the existing data disk. Changing the disk size corrupts your existing analytics data.

Managing the analytics subsystems VMs

Manage your analytics VMs with the **apicup** command from your project directory. Some analytics settings are specified directly as arguments to the **apicup** command, for example:

```
apicup subsys set <analytics subsystem> <key> <value>
```

Other analytics settings are configured in a YAML file that is called `analytics-extra-values.yaml`, see Analytics extra-values file.

Some maintenance operations require SSH access to your analytics VMs. To access you analytics VMs with SSH, follow these steps:

1. Use an SSH client to login as the `apicadm` user:

   ```
   ssh apicadm@<analytics VM FQDN>
   ```

2. If you need root user access, `sudo` to root:

   ```
   sudo -i
   ```

CAUTION:
Do not do any operations inside the analytics VM that are not described in the API Connect documentation or otherwise advised by IBM.

Analytics extra-values file

Create a file called analytics-extra-values.yaml to configure the following analytics features:

- Logstash persistent queue
- Offload to third-party systems
- Customizing data with ingestion filters
- Disable local storage
  Note: If you want to disable local storage, you must configure it **before** installation. You cannot change this setting after installation.

To create and apply the analytics-extra-values.yaml file, follow these steps:

1. Create a file called analytics-extra-values.yaml in your project directory.
2. The analytics-extra-values.yaml contains a single object called **spec**. Set the first line of the file to:

   ```
   spec:
   ```

   Define your analytics features inside the **spec** object. Use 2 spaces for indentation. For example, to disable local storage, set your analytics-extra-values.yaml as follows:

   ```
   spec:
     external:
       offload: # enable offload to third-party system
         enabled: true
         output: |
           http {
             url => "example.com"
             http_method => "post"
             codec => "json"
             content_type => "application/json"
             headers => {
               "x-acme-index" => "8"
               "x-acme-key" => "0d5d259f-b8c5-4398-9e58-77b05be67037"
             }
             id => "offload_http"
     storage:
       enabled: false # disable local storage
   ```

   Note: You can define one or more analytics features in the **spec** object. Do not leave the analytics-extra-values.yaml with an empty **spec** section.
3. Use the **apicup** command to assign your analytics-extra-values.yaml file to the **extra-values-file** property:

   ```
   apicup subsys set <analytics subsystem> extra-values-file analytics-extra-values.yaml
   ```

   Note: If **extra-values-file** is already set to analytics-extra-values.yaml, you do not need to rerun this command every time you edit analytics-extra-values.yaml.
4. Apply the analytics-extra-values.yaml file to your analytics subsystem with **apicup install**:

   ```
   apicup subsys install <analytics subsystem>
   ```

   Warning: Do not apply an empty analytics-extra-values.yaml file, or one that contains just the **spec:** line.

Firewall requirements

Your analytics VMs must be reachable on the ports that are described in API Connect firewall rerunquirements.

Analytics subsystem TLS certificates

No certificate-related sysadmin operations are normally required on your analytics VMs. The analytics subsystem has no user-facing certificates. For more information about certificates on VMware deployments, see API Connect TLS certificates best practices.

Extra values file reference

List of all the properties you can set in the **analytics-extra-values.yaml**.

Table 1. Fields that you can set in the **analytics-extra-values** file

Field	Type	Description	Comments
external: offload: filter	String	Filter configuration for external offload.	See Offload to third-party systems.
external: offload: enabled	Boolean	Enables analytics offload feature.	See Offload to third-party systems.
external: offload: output	String	Output configuration for external offload.	See Offload to third-party systems.
external: offload: passwordSecretName	String	The name of the secret that has the password to access the certificate keystore.	See Offload to third-party systems.
external: offload: secretName	String	The name of the secret that contains the certificates used for connecting to the offload target.	See Offload to third-party systems.
ingestion: filter	String	Filter to modify API event data that is stored internally (not offloaded).	See Customizing data with ingestion filters.
ingestion: queue: type	Object	Persistent queue settings. Default is **persisted**.	Set to **memory** if you want to disable the persistent queue. See Logstash persistent queue.
ingestion: queue: volumeClaimTemplate: volumeSize	String	Storage size for your persistent queue. Default is 50Gi.	Do not change this value. See Logstash persistent queue.

Field	Type	Description	Comments
`ingestion: queue: volumeClaimTemplate: storageClassName`	String	Storage class name for your persistent storage. **Must** be set to local-storage.	See Logstash persistent queue.
`ingestion: pipelineWorkers`	4 <= integer <= 128	Number of pipeline workers.	See Performance tuning with ingestion pipeline properties.
`ingestion: pipelineBatchSize`	10 <= integer <= 10000	Batch size of a pipeline worker.	See Performance tuning with ingestion pipeline properties.
`ingestion: pipelingBatchDelay`	10 <= integer <= 5000	Batch delay of a pipeline worker.	See Performance tuning with ingestion pipeline properties.
`ingestion: configReloadAutomatic`	Boolean	Whether to automatically reload the pipeline on configuration changes.	See Performance tuning with ingestion pipeline properties.
`ingestion: pipelineUnsafeShutdown`	Boolean	Whether to allow unsafe shutdown of the pipeline.	See Performance tuning with ingestion pipeline properties.
`storage: enabled`	Boolean	Set false to disable internal storage.	See Disable local storage.

API Connect on Kubernetes, OpenShift, and Cloud Pak for Integration

Understand the Kubernetes artifacts that make up the analytics subsystem, and how to configure your AnalyticsCluster CR.

The AnalyticsCluster Custom Resource (CR)

Your analytics subsystem is defined by a Custom Resource (CR) called `AnalyticsCluster`. Throughout this documentation, the `AnalyticsCluster` CR is also referred to as the "analytics CR".

Certain analytics features are configured in the `AnalyticsCluster` CR. How you edit the CR depends on your platform:

- **Kubernetes and OpenShift individual subsystem CRs:** Edit the `AnalyticsCluster` directly.
- **Cloud Pak for Integration and OpenShift top-level CR:** Edit the analytics section of the top-level CR. When saved, the changes to the top-level CR are applied to `AnalyticsCluster` CR. If you change the `AnalyticsCluster` CR directly, changes can be overwritten by the top-level CR.

Note: For convenience, the alias `a7s` can be used instead of `AnalyticsCluster` when you edit the CR. For example:

```
kubectl edit a7s
```

instead of:

```
kubectl edit AnalyticsCluster
```

The properties that you can configure in the `AnalyticsCluster` CR are listed in Analytics CR properties reference.

Ingresses

The analytics subsystem has one ingress, called the "ingestion endpoint". The ingestion endpoint serves requests coming from both the management subsystem and the gateway. The management subsystem communicates with the ingestion endpoint to query API event data stored by the analytics subsystem, and also to manage the analytics subsystem. The gateway sends API event data to the ingestion endpoint.

The ingestion endpoint is listed as `ai-endpoint` or `<instance name>-ai-endpoint` in the output of `kubectl get ingress`.

Note: In OpenShift, "routes" are used instead of ingresses. The functions of the ingestion endpoint are the same for both the Kubernetes `ai-endpoint` ingress and the OpenShift `ai-endpoint` route.

Pods

The following table shows the Kubernetes pods that make up an analytics subsystem:

Table 1. Analytics pods

Name	Description
`osinit`	OpenSearch initialization job. This pod is in `completed` state after installation.
`oscron`	Manages the jobs that transform API event data into summary data. Runs every 15 minutes.
`director`	Manages the analytics subsystem. The director pod serves all requests that come from the management subsystem, such as: initial subsystem registration, queries for analytics data, management of saved queries, and changes to retention settings.
`ingestion`	Logstash-based data pipeline that receives the API event data from the gateway, applies any ingestion filters that the user configures, and forwards the events to the storage pods and/or to third-party offload targets.
`mtls-gw`	Secures all communication that arrives on the analytics ingestion endpoint, forwarding communication from the management subsystem to the `director` pod, and communication from the gateway to the `ingestion` pod.

Name	Description
`storage`	The `storage` pods contain the OpenSearch database that stores all the analytics data. By default the storage pods also run the OpenSearch cluster management tasks. If dedicated storage is enabled the OpenSearch cluster management tasks are done by the `storage-os-master` pods, and the `storage` pods contain just the analytics data.
`storage-os-master`	The `storage-os-master` pod exists only on deployments where dedicated storage is enabled. The `storage-os-master` pods manage the OpenSearch cluster, while the `storage` pods are dedicated to the storage of the analytics data.

PersistentVolumeClaims (PVCs)

The following table describes the PVCs that are created for the analytics subsystem:

Table 2. Analytics PVCs

Name	Description
`data-analytics-storage-<integer>`	The PVC that stores your analytics data. A `data-analytics-storage-<integer>` PVC is created for each analytics `storage` pod. The `<integer>` is the replica number, starting from 0.
`data-analytics-storage-os-master-<integer>`	If dedicated storage is enabled, then the `storage-os-master` PVCs are created. Each `storage-os-master` PVC corresponds to a `storage-os-master` pod. The `<integer>` corresponds to the pod replica number, starting from 0. The PVC stores data that is related to the management of your OpenSearch cluster.
`data-analytics-ingestion-<integer>`	If the persistent queue feature is enabled, a `data-analytics-ingestion-<integer>` PVC is created for each `ingestion` pod. The `data-analytics-ingestion-<integer>` PVC stores API event data temporarily when the `ingestion` pod is unable to forward the data to the `storage` pods. The `<integer>` corresponds to the pod replica number, starting from 0.

Certificates

The following table describes the certificates that are used by the analytics subsystem:

Table 3. Analytics certificates

Certificate name	Issuer	Description
`analytics-ai-endpoint or a7s-ai-endpoint`	`ingress-issuer`	Server certificate used on the analytics ingestion endpoint, in the mtls-gw pod. Management and gateway subsystems communicate with the analytics subsystem on this endpoint. The client certificates that are used by the management and gateway subsystems must use the same CA certificate as the `analytics-ai-endpoint` certificate. If this certificate is updated, restart the `mtls-gw` pod for the update to take effect.
`analytics-ca or a7s-ca`	`selfsigning-issuer`	The issuer for the analytics-client and analytics-server certificates. Communication between analytics subsystem pods fails if there is a problem with this certificate. If this certificate is updated, restart the `storage` and `ingestion` pods for the update to take effect.
`analytics-client or a7s-client`	`analytics-ca`	Client certificate used in communication between analytics subsystem pods. Communication between analytics subsystem pods fails if there is a problem with this certificate. If this certificate is updated, restart the `storage` and `ingestion` pods for the update to take effect.

`analytics-server or a7s-server`	`analytics-ca`	Server certificate used in communication between analytics subsystem pods. Communication between analytics subsystem pods fails if there is a problem with this certificate.
		Required DNS names in the certificate:
		
		`*.<namespace>`
		`*.<namespace>.svc`
		`*.<instance name>-server.<namespace>.svc`
		`<instance name>-server`
		`<instance name>-storage`
		
		If this certificate is updated, restart the `storage` and `ingestion` pods for the update to take effect.

For more information about certificates in API Connect, see API Connect certificates.

Analytics CR properties reference

List of all the properties that can be configured in the analytics CR.

Note: If you have a VMware deployment, do not edit the analytics CR directly. Use the **apicup** command and analytics-extra-values.yaml file. See Analytics extra-values file.
The following properties must be defined in your analytics CR:

- `ingestion.endpoint`
- `ingestion.clientSubjectDN`

All other properties are optional.
Note: If you are using Cloud Pak for Integration or the top-level CR on OpenShift, then configure your analytics properties in the `analytics` section of the top-level CR. Do not edit the analytics CR directly. If the properties you want to set are missing from the top-level CR, then copy them from the analytics CR to the top-level CR.

Table 1. Analytics subsystem CR properties.

Property	Type	Default value	Description	Comments
`allowUpgrade`	Boolean	false	Legacy property for upgrade to v10.0 5 from previous releases.	The `allowUpgrade` property is not used in v10.0.6 and can be deleted from the analytics CR.
`databaseBackup:` `  host`	String		The URL to your S3 object store.	See Backup, restore, and disaster recovery.
`databaseBackup:` `  path`	String		The path to your S3 object store at the URL specified by `databaseBackup.host`.	See Backup, restore, and disaster recovery.

Property	Type	Default value	Description	Comments
`databaseBackup: schedule`	String		Specifies the frequency of automatic backups. Use any valid `cron` string.	See Backup, restore, and disaster recovery.
`databaseBackup: enableCompression`	Boolean	`true`	Specifies whether to compress the backups.	See Backup, restore, and disaster recovery.
`databaseBackup: credentials`	String		The name of your S3 object store authentication secret.	See Backup, restore, and disaster recovery.
`databaseBackup: backupCerts`	String		The name of the secret that contains your S3 server certificate.	See Backup, restore, and disaster recovery.
`databaseBackup: chunkSize`	String	`1gb`	Specifies the size of large file chunks. Format is lower case and no spaces, for example: `1gb`, `50mb`, `800kb`.	See Backup, restore, and disaster recovery.
`databaseBackup: enableServerSideEncryption`	Boolean	`true`	Specifies whether metadata files are stored in compressed format.	See Backup, restore, and disaster recovery.
`external: offload: filter`	String		Filter configuration for external offload.	See Offload to third-party systems.
`external: offload: enabled`	Boolean	`false`	Enables analytics offload feature.	See Offload to third-party systems.
`external: offload: output`	String		Output configuration for external offload.	See Offload to third-party systems.
`external: offload: passwordSecretName`	String		The name of the secret that has the password to access the certificate keystore.	See Offload to third-party systems.
`external: offload: secretName`	String		The name of the secret that contains the certificate that is used for connecting to the offload target.	See Offload to third-party systems.
`ingestion: endpoint`	Object		FQDN and TLS Secrets for client endpoint.	The external endpoint of the analytics subsystem. Both the gateway and management subsystems use the ingestion endpoint to communicate with your analytics subsystem. The gateway sends API event data to the ingestion endpoint.
`ingestion: clientSubjectDN`	String		Subject DN (distinguished name) for authenticating with ingestion endpoint (RFC 2253).	
`ingestion: filter`	String		Filter to modify API event data before it is sent for local storage (not offloaded).	See Customizing data with ingestion filters.
`ingestion: queue`	Object		Persistent queue settings.	See Logstash persistent queue.
`ingestion: queue: type`	String		Persistent queue settings. Default is `persisted`.	Set to `memory` if you want to disable the persistent queue. See Logstash persistent queue.
`ingestion: queue: volumeClaimTemplate: volumeSize`	String		Storage size for your persistent queue. Default is 50Gi.	Do not change this value. See Logstash persistent queue.
`ingestion: queue: volumeClaimTemplate: storageClassName`	String		Storage class name for your persistent storage.	See Logstash persistent queue.
`ingestion: pipelineWorkers`	4 <= integer <= 128	24	Number of pipeline workers.	See Performance tuning with ingestion pipeline properties.
`ingestion: pipelineBatchSize`	10 <= integer <= 10000	250	Batch size of a pipeline worker.	See Performance tuning with ingestion pipeline properties.

Property	Type	Default value	Description	Comments
`ingestion: pipelineBatchDelay`	10 <= integer <= 5000	50	Batch delay of a pipeline worker.	See Performance tuning with ingestion pipeline properties.
`ingestion: configReloadAutomatic`	Boolean	true	Whether to automatically reload the pipeline on configuration changes.	See Performance tuning with ingestion pipeline properties.
`ingestion: pipelineUnsafeShutdown`	Boolean	false	Whether to allow unsafe shutdown of the pipeline.	See Performance tuning with ingestion pipeline properties.
`longTermDataEnabled`	Boolean	true	Enables the collection of long-term summary data that is required for reports and leaderboards.	If you set `longTermDataEnabled` to false, no long-term summary data is generated, however the `oscron` job still runs. Long-term summary data is only generated when local storage is not disabled.
`standaloneCluster`	Boolean	false	Legacy property related to Zen endpoints.	The `standaloneCluster` property is not used in v10.0.6 and can be deleted from the analytics CR.
`storage: type`	String	`shared`	Type of storage deployment.	Shared or dedicated. See Storage type.
`storage: shared: volumeClaimTemplate: storageClassName`	String	cluster default	Storage class name.	Name of the storage class for your analytics data. See Storage class.
`storage: shared: volumeClaimTemplate: volumeSize`	String	`50Gi`	Volume size.	Size of the volume used for data storage. See Estimating storage requirements.

OpenSearch nodes, indices, shards, and replicas

Understand the main concepts of the OpenSearch database: nodes, indices, shards, and replicas.

OpenSearch do not use the term "database", but "search and analytics suite". For simplicity, in API Connect the terms "analytics database" or "OpenSearch database" are used instead of "search and analytics suite".

The term OpenSearch "cluster" is used when referring to the analytics subsystem of a multi-replica API Connect deployment.

Nodes

An OpenSearch cluster is made up of separate OpenSearch nodes. On Kubernetes, an analytics storage pod replica runs a single OpenSearch node. On VMware, a deployed analytics VM runs a single OpenSearch node.
You control the number of OpenSearch nodes that you have when you select your API Connect deployment profile: A one replica deployment has one OpenSearch node. A three replica deployment has three OpenSearch nodes.

If you installed a three replica deployment on Kubernetes or OpenShift, you can enable the dedicated storage feature to increase your number of OpenSearch nodes above three.

Indices

Your analytics API event data is stored in OpenSearch indices. The creation and management of your analytics indices is time-based. By default, your OpenSearch database creates a new index each day to be used for storing the API events that arrive that day; so on the day of installation your analytics subsystem has 1 index for API event data, and after 10 days your subsystem has 10 API event data indices. On a one replica API Connect deployment, API event indices are kept for 30 days. On a three replica installation, API event indices are kept for 90 days.
API Connect also creates indices for shared queries and for API summary data. By default API summary indices are kept for 1 year.

You can configure the retention and rollover periods for API event and summary data to suit your requirements and available storage space.

Shards

To efficiently distribute the data in OpenSearch indices across a cluster, the indices are subdivided into what are called "shards", which can be stored in different nodes of the cluster.

Replicas

In a three node OpenSearch deployment, each shard (known as the "primary shard") has 2 replica shards that contain a copy of the data that is in the primary shard. OpenSearch stores the primary shard and each replica on different nodes to ensure that all data is available on all nodes, and to provide high-availability if one node fails.

A single node OpenSearch deployment has no replica shards, since no other nodes are available to store them.

Installing the analytics subsystem

Links to the installation steps for each platform.

For all features and settings that must be decided and configured before installation, see Preinstallation planning.

It is recommended configure your backup settings after installation. See backup and disaster recovery.

Follow the installation steps for your platform:

- Kubernetes
- OpenShift and Cloud Pak for Integration
- VMware one-replica deployment
- VMware three-replica deployment

Backup, restore, and disaster recovery

How to back up your analytics subsystem and restore after a disaster.

An analytics subsystem backup consists of:

Analytics infrastructure configuration backup
: Your infrastructure configuration backup contains information such as endpoints, offload configuration, remote backup site credentials.
The infrastructure configuration backup is also referred to as the "config backup".

  On VMware deployments, the config backup includes everything that you configure with the **apicup** command, and typically consists of the contents of your project directory. On Kubernetes and OpenShift, the config backup consists of YAML file backups of your analytics CR and certificates.

  Your config backup is needed for disaster recovery, where you must redeploy your analytics subsystem.

Analytics database backup
: Your database backup contains all your API event data, summary data, and shared queries. Database backups are automatically created and stored on an S3 object store. The configuration of your database backups, such as S3 object store credentials, are defined in your analytics infrastructure configuration. Therefore, to restore an analytics database backup after a disaster, you must first restore your config backup.
Your analytics database backups are intended for use in two scenarios:

  - Disaster recovery: Your entire analytics subsystem fails. You redeploy the subsystem (use your config backup to ensure that the same config settings and certificates are defined) and then restore your most recent database backup.
  - Corrupted index recovery: One or more analytics indices are corrupted, so you restore just those indices from a backup that contains them.

  Analytics database backups are not intended for long-term storage of your analytics data. If you require long-term storage, use the offload or export features.
  Note: When you restore a database backup, any indices in the backup that are older than your retention period, are restored. However, the daily retention and rollover job will delete these old indices the next time that it runs.

Review the backup, restore, and disaster recovery documentation for your platform:

- **Kubernetes, OpenShift, and Cloud Pak for Integration**
  How to configure analytics backups and recover from a disaster in Kubernetes, OpenShift, and Cloud Pak for Integration environments.
- **VMware**
  How to configure analytics backups and recover from a disaster in a VMware environment.

Kubernetes, OpenShift, and Cloud Pak for Integration

How to configure analytics backups and recover from a disaster in Kubernetes, OpenShift, and Cloud Pak for Integration environments.

The analytics subsystem backup consists of:

- Analytics infrastructure configuration backup:
  - Backup of your analytics CR YAML file.
  - Backup of any custom certificates you configured. For example, the certificates that secure your communication with your remote object-store, and any certificates used for connecting to third-party systems for analytics offload.

  The infrastructure configuration backup is also referred to as the "config backup".

  If you have a disaster, your config backup is essential for restoring your analytics subsystem.

- Analytics database backup. Analytics database backups must be stored on an S3 compatible object-store, for example, IBM Cloud Object Storage.
  Note:
  - Only host-style S3 backups are supported. Path-style S3 backups are not supported.
  - If you are using a self-managed S3 backup server, check that you have a DNS hostname entry and matching TLS certificate for your S3 backup endpoint.

Analytics subsystem backups are intended for restoration in the same environment where they were taken, or a different environment that has the same network configuration, endpoints, and deployment profile.

- **Taking an analytics infrastructure configuration backup**
  How to backup your analytics subsystem deployment configuration.
- **Configuring analytics database backups**
  Configure scheduled database backups of your analytics subsystem.
- **Running an on-demand analytics database backup**
  Deploy the `AnalyticsBackup` CR to initiate a backup of the analytics database.
- **Restoring the analytics database**
  Deploy the `AnalyticsRestore` CR to initiate restoration of an analytics database backup.
- **Recovering from a disaster**
  Reinstall your analytics subsystem, restore your analytics CR, secrets, and your database backup.
- **Deleting old backups**
  Manage the retention of your analytics backups.

- **Updating your S3 object store credentials**
  Update the secret that secures your analytics backups in your S3 object store.
- **Troubleshooting backup and restore**
  Troubleshooting steps for problems with backup and restore of the analytics database.

Taking an analytics infrastructure configuration backup

How to backup your analytics subsystem deployment configuration.

About this task

The analytics infrastructure configuration backup consists of:

- Backup of your analytics CR YAML file.
- Backup of any custom certificates you configured. For example, the certificates that secure your communication with your remote S3 object-store, and any certificates used for connecting to third-party systems for analytics offload.

Note: Every time that you update the analytics subsystem CR or any custom analytics certificates, take a new analytics infrastructure configuration backup.
The infrastructure configuration backup is also referred to as the "config backup".

If you have a disaster, your config backup is essential for restoring your analytics subsystem.

Note: For OpenShift users: The steps that are detailed in this topic use the Kubernetes `kubectl` command. On OpenShift, use the equivalent `oc` command in its place.

Procedure

1. Backup your analytics CR to a file called analytics-subsystem-cr-backup.yaml:

   ```
   kubectl get a7s -o yaml > analytics-subsystem-cr-backup.yaml
   ```

2. Backup your analytics database backup secret to a file called analytics-backup-secret_backup.yaml:

   ```
   kubectl get secret analytics-backup-secret -o yaml > analytics-backup-secret_backup.yaml
   ```

   The backup secret is created when you configure analytics database backups: Configuring analytics database backups. If database backups are not yet configured, ensure that this secret is backed up when it is configured.

3. If you are using the analytics offload feature, then backup any custom offload certificates that are used:

   ```
   kubectl get secret <offload secret name> -o yaml > analytics-offload-secret_backup.yaml
   ```

   For more information about offload certificates, see Offload to third-party systems.

4. If your S3 object store has a self-signed CA certificate, then backup the secret that contains this certificate:

   ```
   kubectl get secret <S3 CA secret name> -o yaml > analytics-S3-CA-secret_backup.yaml
   ```

   For more information about S3 CA certificates, see Creating the S3 CA secret.

5. If you manually created or customized any other analytics subsystem certificates, then take a backup of them:
   To identify all the secrets in your analytics namespace, run:

   ```
   kubectl get secrets
   ```

   For each secret that you want to backup, use the following command:

   ```
   kubectl get secret <secret name> -o yaml > <backup filename>
   ```

   You do not need to backup any secrets that cert-manager created and maintains. For more information about analytics TLS certificates, see API Connect TLS certificates.

6. Copy all the backup files that were created in the previous steps to a safe location.

Configuring analytics database backups

Configure scheduled database backups of your analytics subsystem.

Procedure

1. Create the analytics backup secret for your S3 object-store.
   a. Follow the documentation of your S3 provider to obtain an access key and secret. Documentation links for some common S3 providers:
      - IBM Cloud Object Storage
      - AWS
   b. Create a Kubernetes secret called `analytics-backup-secret` that contains your access key and secret, in the same namespace as your analytics subsystem:

      ```
      kubectl -n <namespace> create secret generic analytics-backup-secret --from-literal=access_key='<your access key>' --from-literal=secret_key='<your access secret>'
      ```

Note: If you change your access key and secret, then you must create a new secret that has a different name. For more information about updating your backup secret, see Updating your S3 object store credentials.

2. Open the analytics CR for editing.
   On Kubernetes and OpenShift individual subsystem installations, edit your analytics CR directly:

   ```
   kubectl edit a7s
   ```

   On Cloud Pak for Integration and OpenShift top-level CR installations, edit the `APIConnectCluster` CR:

   ```
   kubectl edit APIConnectCluster
   ```

3. Add the `databaseBackup` configuration.
   On Kubernetes and OpenShift individual subsystem installations, add `databaseBackup` to the `spec` section of the analytics CR. On Cloud Pak for Integration and OpenShift top-level CR installations, add `databaseBackup` to the `spec.analytics` section of the `APIConnectCluster` CR.

   ```
   databaseBackup:
     credentials: analytics-backup-secret
     host: <S3 host endpoint>
     path: <S3 path>
     backupCerts: <S3 server CA secret>
     schedule: <cron formatted schedule> # "0 2 * * *"
     enableCompression: true
     chunkSize: 1gb
     enableServerSideEncryption: false
   ```

   where:

   - *<S3 host endpoint>* is the S3 endpoint with the corresponding S3 region. Examples:
     - Region provided in the FQDN:

       `s3.s3region.s3domain`

     - Region provided in the path:

       `s3.s3domain/s3region`

     - If the endpoint has no region:

       `s3.s3domain`

     Note: A path-style host value is not supported for AWS:

     `s3.region-code.amazonaws.com/bucket-name`

     In the preceding example, the *bucket-name* is interpreted as the region. With AWS, use only host style, where the bucket-name is in the hostname:

     `bucket-name.s3.amazonaws.com/region-code`

   - *<S3 path>* is a combination of the S3 bucket and the base path within the bucket. Use the format: `bucket_name/path`
   - *<S3 server CA secret>* is the name of a secret that contains your S3 server certificate. This property is only required if your S3 server has a self-signed root certificate, see Creating the S3 CA secret. If your S3 server does not have a self-signed root certificate then you can delete this line.
   - *<cron formatted schedule>* is the schedule that determines how often backups are run. The format for the schedule is any valid `cron` string. The time zone for backups is that of the `kube-controller-manager`.
     Tip: To temporarily disable scheduled backups, but keep the rest of your backup configuration, comment out the `schedule` property.
   - Optional: `enableCompression` determines whether metadata files are stored in compressed format. The default value is true.
   - Optional: `chunkSize` specifies how files are stored. Large files can be stored as chunks when the snapshot is created. This setting specifies the size of the chunks. Format is lowercase and no spaces, for example: `1gb`, `50mb`, `800kb`.
   - Optional: `enableServerSideEncryption` determines whether files are encrypted. When set to true, files are encrypted on the server side with AES256. The default value is false.

What to do next

After your backup settings are configured in your analytics CR, take a new config backup to capture the updated CR settings and backup secrets.

- **Updating the analytics database backup secret**
  Update the secret that secures your analytics database backup.

Creating the S3 CA secret

Configure your analytics subsystem to trust your S3 object-store.

If your S3 object store presents a self-signed public server certificate, create a Kubernetes secret that contains the certificate, and specify the secret in your analytics CR.

1. Create a file called `ca.crt` that contains your S3 object store public server certificate.
   Note: If the certificate includes intermediate certificates, then provide the entire chain in the `ca.crt` file, for example:

   ```
   intermediate-certificate-1
   intermediate-certificate-2
   . . .
   intermediate-certificate-n
   root-certificate
   ```

   where the first certificate in the `ca.crt` (intermediate-certificate-1) is the issuer of the S3/object-store server certificate, and each subsequent certificate is the issuer of the preceding certificate.
2. Encode your certificate in base64 and remove any newline characters:

```
base64 <path to ca.crt file> | tr -d '\n'
```

3. Create a file that is called custom_s3_ca.yaml and paste in the following text:

```
apiVersion: v1
data:
  ca.crt: <base64 encoded certificate>
kind: Secret
metadata:
  name: custom-s3-server-ca
type: generic
```

   where *<base64 encoded certificate>* is the encoded string from step 2.
4. Apply the custom_s3_ca.yaml file to create your Kubenetes secret:

```
kubectl -n <namespace> apply -f custom_s3_ca.yaml
```

5. Specify your new secret in your analytics CR:

```
  databaseBackup:
    ...
    backupCerts: custom-s3-server-ca
    ...
```

Note: Remember to keep a backup of your S3 secret: Taking an analytics infrastructure configuration backup.

Updating the analytics database backup secret

Update the secret that secures your analytics database backup.

About this task

When you configure S3 storage for backing up analytics data, you encrypt the S3 provider's access key and save it as a Kubernetes secret for your analytics deployment. If the S3 access key or your Kubernetes secret is compromised, obtain a new key from the S3 provider and use it to generate a new Kubernetes secret.

Important: When you invalidate a key, be sure to save a copy of it with a notation listing the dates when it was used. If you need to restore a backup that was created with the invalidated key, you will need to use that key to access the data. One method of saving the key is to create a new version of the CR every time you change the key, so that you can easily refer to the settings and key that were used for each backup.
This task assumes that you have already configured the backup settings for your analytics subsystem and now want to replace the Kubernetes secret that is specified as the **analytics-backup-secret** in the analytics CR.

Procedure

1. Update the secret for your S3 storage:
   a. Obtain a new access key and corresponding access key secret from your S3 provider.
   b. Invalidate the previous credentials that were specified in the analytics CR.
2. Delete the invalidated Kubernetes secret by running the following command:

```
kubectl -n namespace delete secret name
```

   where:

   - ***namespace*** is the namespace where analytics is deployed.
   - ***name*** is the name of the current (invalidated) Kubernetes secret, which is specified in the **credentials** setting in the **databaseBackup** section of the analytics CR. Every time you update the secret, you must assign it a new name.
3. Create a new Kubernetes secret by running the following command and filling in your access key, access key secret, and namespace:

```
kubectl -n namespace create secret generic new_secret_name --from-literal=access_key='S3_access_key' --from-
literal=secret_key='S3_access_key_secret'
```

   where:

   - ***namespace*** is the namespace where analytics is deployed.
   - ***new_secret_name*** is a new name for storing the new Kubernetes secret. Every time you update the secret, you must assign it a new name.
   - ***S3_access_key*** and ***S3_access_key_secret*** are the values that you received from the S3 provider.
4. Edit the analytics CR file and replace the invalidated secret with the new secret.
   a. In the CR, locate the **credentials** setting in the **databaseBackup** section.
   b. Replace the invalidated secret name with the name of the new secret that you just generated.
   c. Save and close the CR file.
5. Run the following command to apply the updated CR so that the new secret takes effect:

```
kubectl -n namespace apply -f path/to/analytics-cr
```

   where:

   - ***namespace*** is the namespace where analytics is deployed.
   - ***path/to/analytics-cr*** is the path and file name of the analytics CR.

Running an on-demand analytics database backup

Deploy the **AnalyticsBackup** CR to initiate a backup of the analytics database.

Before you begin

Configure your backup settings in your analytics CR: Configuring analytics database backups.

About this task

An on-demand backup is triggered by creating an **AnalyticsBackup** CR. The API Connect operator detects the presence of the backup CR and runs the backup job.

Note: You can run only one backup or restore process at a time.

Procedure

1. Create a file called analyticsbackup_cr.yaml and paste in the following contents:

```
apiVersion: analytics.apiconnect.ibm.com/v1beta1
kind: AnalyticsBackup
metadata:
  generateName: <backup prefix>
spec:
  name: <backup name>
  crType: create
  comment: <comment>
```

   where:
   - *<backup prefix>* is prefix for the name of your backup. The remainder of the name is automatically generated. Keep the prefix short, 8 characters or less.
   - Optional: *<backup name>*. If you don't want an autogenerated backup name with a prefix, you can specify the complete backup name here and remove the **metadata.generateName** property.
   - *<comment>* is an optional comment that you can give your backup, for example "load test backup".

   Advanced settings in this CR that you can configure are:
   - **indices:** specify the indices that you want to include in the backup. Options are: **all|apievents|ui|summary**, or the names of individual indices. **all** includes **apievents**, **ui**, and **summary** indices.
   - **enableIgnoreUnavailable:** set to **true** if you want the backup to continue even if some of the indices you specified in the **indices:** property are not found in your analytics database.
2. Deploy your CR by running the following command to create it in the namespace of your analytics subsystem:

```
kubectl -n <namespace> create -f analyticsbackup_cr.yaml
```

3. To see the progress of your backup, run the following command:

```
kubectl  -n <namespace> get analyticsbackup
```

```
NAME                  STATUS   ID                                     CR TYPE   INDICES          AGE   COMMENT
<backup name>         Running                                         create    [all]            12s   <comment>
```

   When the backup is complete the status changes from **Running** to **Ready**.
4. Display the details for your backup by running the following command:

```
kubectl  -n <namespace> get analyticsbackup <backup name> -o yaml
```

```
apiVersion: analytics.apiconnect.ibm.com/v1beta1
kind: AnalyticsBackup
metadata:
  creationTimestamp: "2020-05-20T16:18:05Z"
  generateName: a7s-bup-
  generation: 1
  name: a7s-bup-gb6s5
  namespace: my-namespace
  resourceVersion: "867329"
  uid: f43b8400-733d-411a-9e9a-de2166bbfb0a
spec:
  indices:
  - all
status:
  conditions:
  - lastTransitionTime: "2022-06-30T16:18:24Z"
    message: SUCCESS
    status: Complete
    type: Ready
  details: |
    {Name:my-backup-id
    Version:5.6.16
    Indices:[...]
    StartTime:2022-06-30T16:18:09.698Z
    EndTime:2022-06-30T16:18:16.082Z
    State:SUCCESS
    Failures:[]
    Shards:{Failed:0
    Successful:1}}
  id: my-backup-id
```

Restoring the analytics database

Deploy the **AnalyticsRestore** CR to initiate restoration of an analytics database backup.

Before you begin

Analytics database backups are intended for restoration of the complete analytics database after a disaster, or the recovery of specific analytics indices that are identified as corrupted on your existing deployment. If you are restoring from backup to recover a specific index or indices, ensure that you are familiar with the OpenSearch concepts.
Note: The analytics database uses time-based indexing so that each day of API event data has its own analytics index. Before your restore a backup, understand the following points:

- The analytics database backup consists of separate backups of each OpenSearch index. You can restore all indices in the backups, or just some of them.
- The restore process does not touch existing indices that are not in the backup. So, if you restore an analytics backup that you took yesterday, your API event data from today remains because your backup contains no API event index from today.
- The restore process does not by default overwrite analytics indices that exist in the backup and in your current analytics database. You can force the restore to overwrite existing indices with **enableOverride**.
- Indices in the backup that are older than your retention period are restored, but are later deleted when the daily retention and rollover job runs. Check your available persistent storage space before you attempt to restore an old backup. For example, if you have a retention period of 30 days, and your storage is 80% used, if you attempt to restore a backup that is 10 days old it is likely that the restore uses up the rest or your storage, and fails. Filling analytics persistent storage to 100% can lead to corrupted analytics indices and an analytics subsystem outage.
- If you are restoring an analytics backup that you took today, and you set **enableOverride** to true, any API event data that was generated since the backup was taken is lost.

About this task

Analytics database backups are restored by creating an **AnalyticsRestore** CR. The API Connect operator detects the presence of the restore CR, and triggers a restore of the backup that is specified in the CR.

Note: You can run only one backup or restore process at a time.

Procedure

1. Get a list of available backups by running the following command:

   ```
   kubectl -n namespace get analyticsbackup | grep record
   ```

   ```
   NAME                  STATUS   ID                                        CR TYPE   INDICES                AGE   COMMENT
   analytics-bup-kxwq5   Ready    analytics-all-2020-09-07t03:49:15utc   record    [all]                  34h
   analytics-bup-p29z8   Ready    analytics-all-2020-09-07t18:04:03utc   record    [all]                  20h
   ```

   Note the ID of the backup that you want to restore.
   Note: You cannot restore backups that have **CR TYPE** of **create**.
2. Create a file called analyticsrestore_cr.yaml and paste in the following text:

   ```
   apiVersion: analytics.apiconnect.ibm.com/v1beta1
   kind: AnalyticsRestore
   metadata:
     generateName: a7s-restore-
   spec:
     indices:
     - all
     backupID: <backup ID>
     enableIgnoreUnavailable: false
     enableOverride: true
   ```

   set *<backup ID>* to the name of the backup that you want to restore, identified in step 1.
   Note: The restore CR has some advanced properties that you can set. The advanced properties are:
   - **generateName** is the prefix for the name of the restore instance that is created.
   - **indices** is a list of index names or keywords, indicating which indices you want to restore. Options are: **all|apievents|ui|summary**, or the names of individual indices. **all** includes **apievents**, **ui**, and **summary** indices. If no indices are specified, then all indices in the backup are restored. For more information about selecting individual indices for restore, see Identifying specific indices to restore.
   - **enableIgnoreUnavailable** specifies whether the restore aborts if an index that is listed in the **indices** property is not found. If set to **true** any missing indices are ignored and the restore continues.
   - **enableOverride** specifies if the restore should overwrite any existing indices that you have in your analytics database. Set **enableOverride** to **false** if you want the restore to fail if it finds you already have the same indices in your current analytics database.
3. Deploy your CR by running the following command to create it in the namespace of your analytics subsystem:

   ```
   kubectl -n <namespace> create -f analyticsrestore_cr.yaml
   ```

4. To monitor your restore, run the following command:

   ```
   kubectl -n <namespace> get analyticsrestore
   ```

   ```
   NAME               STATUS     ID                                        AGE
   a7s-restore-9z4fr Ready      analytics-all-2022-07-01t04:49:15utc              1h
   ```

   When the restore is successfully started, **STATUS** shows **Running**. The status that is shown for completed restores depends on your deployment profile:
   - On a three replica deployment, **STATUS** shows **Complete**.
   - On a one replica deployment, **STATUS** shows **Warning**. Review step 5 for information on checking restore status.
5. Display the details for a particular restore by running the following command:

   ```
   kubectl -n <namespace> get analyticsrestore <restore name> -o yaml
   ```

   where *<restore name>* is the name of your restore, that you identified in step 4.
   Example output for a one replica deployment where the restore is complete:

```
apiVersion: analytics.apiconnect.ibm.com/v1beta1
kind: AnalyticsRestore
metadata:
  creationTimestamp: "2022-07-01T04:06:03Z"
  generateName: a7s-restore-
  generation: 1
  name: a7s-restore-9z4fr
  namespace: my-namespace
  resourceVersion: "975152"
  uid: fdda9105-17ab-44ac-83de-852620a4dcde
spec:
  backupID: analytics-all-2022-07-01t03:49:15utc
  enableIgnoreUnavailable: false
  enableOverride: true
  indices:
  - all
status:
  conditions:
  - lastTransitionTime: "2022-07-01T04:08:03Z"
    message: WARNING
    status: Warning
    type: Ready
  details: |
    &{NumberOfDataNodes:1
    Status:yellow
    ActivePrimaryShards:23
    ActiveShards:23
    RelocatingShards:0
    InitializingShards:0
    UnassignedShards:40
    PendingTasks:0}
  id: analytics-all-2022-07-01t04:49:15utc
```

The **Warning** status can be ignored on a one replica deployment, it is due to there not being other nodes to store replica shards on. Restore is complete when **status.details.Status** is yellow, and **status.details.InitializingShards** is zero.

6. When restore is complete, delete the **AnalyticsRestore** CR:

   ```
   kubectl -n <namespace> delete analyticsrestore <restore name>
   ```

   Note: If your restore failed, and you want to investigate why, do not delete the **AnalyticsRestore** CR, it is needed for problem analysis.

Identifying specific indices to restore

How to identify specific indices and restore only those indices from an analytics database backup.

Because the analytics database stores analytics data in separate indices for each day, database corruption is often limited to just a few indices. You can save time on an analytics database restore by just restoring the corrupted indices. To understand more about how analytics data storage works, see OpenSearch concepts.
Note: Only follow the steps in this topic if IBM has identified that you have corrupted analytics indices. OpenSearch indices can sometimes show a status of "Red" when a communication problem between OpenSearch nodes occurs, and when the communication problem is resolved the status returns to "Yellow" or "Green".
To identify corrupted indices in your analytics subsystem, use the toolkit CLI:

1. Setup the toolkit CLI so you can run analytics CLI operations: Analytics CLI.
2. Get a list of your analytics indices with the **clustermgmt:catIndices** command:

   ```
   apic -m analytics clustermgmt:catIndices --analytics-service "<analytics service name>" -s <platform api endpoint> --
   format=json
   ```

   ```
   {
       "data": [
           {
               "health": "red",
               "status": "open",
               "index": "apic-api-2023.06.21-000007",
               "uuid": "pCaolBNoRWivgzGvv1kvLQ",
   ...
   ```

   corrupted indices have a health status of "red". The index property is the name of the index, in this example, the index name is "apic-api-2023.06.21-000007".

To restore indices from your analytics database backup, follow these steps:

1. Get a list of available backups by running the following command:

   ```
   kubectl -n namespace get analyticsbackup | grep record
   ```

   ```
   NAME                  STATUS   ID                                        CR TYPE   INDICES                AGE   COMMENT
   analytics-bup-kxwq5   Ready    analytics-all-2020-09-07t03:49:15utc   record    [all]                  34h
   analytics-bup-p29z8   Ready    analytics-all-2020-09-07t18:04:03utc   record    [all]                  20h
   ```

   Note the name and ID of the backup that you want to restore.
2. Describe the backup that you want to restore to see the list of indices in the backup:

   ```
   kubectl -n namespace describe analyticsbackup <backup name>
   ```

   where *<backup name>* is the name of the backup you identified in step 1.
   The indices in the backup are listed in the describe output:

   ```
   Indices:[apic-api-2023.06.21-000007
   apic-api-2023.06.30-000016
   ...
   ```

```
apic-api-2023.06.25-000011
apic-query-000001]
```

3. Follow the restore steps, but use the `indices` property to specify the indices that you want to restore, and set `enableOverride` to true so that any existing indices you have of the same name are overwritten, for example:

```
apiVersion: analytics.apiconnect.ibm.com/v1beta1
kind: AnalyticsRestore
metadata:
  generateName: a7s-restore-
spec:
  indices: apic-api-2023.06.30-000016,apic-api-2023.06.25-000011
  enableOverride: true
...
```

Note: The wildcard character * is supported in the indices list, so to restore all indices from the first 9 days of June, you can use:

```
indices: apic-api-2023.06.0*
```

Recovering from a disaster

Reinstall your analytics subsystem, restore your analytics CR, secrets, and your database backup.

About this task

Analytics subsystem backups can be restored in the same environment where they were taken, or in a different environment that has the same network configuration, endpoints, and deployment profile. You cannot restore an analytics subsystem backup in a different network environment, form factor, or deployment profile. If you want to move your API Connect deployment to a different form factor or change endpoints, see Migrating from v10 to v10 on a different form factor.

Procedure

1. Install the replacement analytics subsystem, configuring the same `ai-endpoint` as your original installation.
   Follow the installation procedures for your platform:
   - Kubernetes
   - OpenShift and Cloud Pak for Integration

   Refer to your infrastructure configuration backup to check the `ai-endpoint`. Also, if you disabled local storage, you must configure this in your analytics CR before installation.

2. Update the analytics CR on your replacement installation with the analytics backup settings and any other analytics features you configured in your previous installation.
   Your previous analytics settings are in your infrastructure configuration backup. If you are installed on Cloud Pak for Integration or OpenShift with the top-level CR, then add these settings to the `spec.analytics` section of your `APIConnectCluster` CR.
3. Re-create the analytics secrets that you backed up in your infrastructure configuration backup:
   a. Create the backup credential secret from your backup file: analytics-backup-secret_backup.yaml.

   ```
   kubectl -n <analytics namespace> apply -f analytics-backup-secret_backup.yaml
   ```

   b. If you are using the analytics offload feature, then create the offload secret from your backup file: analytics-offload-secret_backup.yaml.

   ```
   kubectl -n <analytics namespace> apply -f analytics-offload-secret_backup.yaml
   ```

   c. If your S3 object store has a self-signed CA certificate, then create the secret that contains the certificate from your backup file.

   ```
   kubectl -n <analytics namespace> apply -f analytics-S3-CA-secret_backup.yaml
   ```

   d. If you manually created or customized any other analytics subsystem certificates, then restore those secrets from their backup files.

   ```
   kubectl -n <analytics namespace> apply -f <backup filename>
   ```

4. Restore the analytics database: Restoring the analytics database.

Deleting old backups

Manage the retention of your analytics backups.

Warning: Do not delete backups directly from the active backup path of your S3 object store. Your analytics backups are incremental so deleting any of the files in the backup path can break all backups in that path.
To delete backups, change your S3 backup path to a new path, then delete the backup files from the old path:

1. Edit your `AnalyticsCluster` CR:

   ```
   kubectl -n <namespace> edit a7s
   ```

   If you are installed on Cloud Pak for Integration or OpenShift with the top-level CR then edit the `spec.analytics` section of your `APIConnectCluster` CR:

   ```
   kubectl -n <namespace> edit APIConnectCluster
   ```

2. Update your backup path:

   ```
     databaseBackup:
   ```

```
...
    path: <S3 path>
...
```

<S3 path> is a combination of the S3 bucket and the base path within the bucket. Use the format: `bucket_name/path`.

3. Save and exit.
4. The next scheduled backup is stored in the new S3 path.
5. Delete old backups from your original S3 path.

Updating your S3 object store credentials

Update the secret that secures your analytics backups in your S3 object store.

About this task

When you configure you analytics backups, you create a Kubernetes secret that contains credentials for your S3 object store. If your S3 credentials change, or you want to invalidate your existing credentials and create new ones, then follow the steps in this procedure.

This task assumes that you have already configured analytics backups and want to replace the `analytics-backup-secret` that is specified in the analytics CR.

Procedure

1. Refer to your S3 provider's documentation to obtain new access credentials and invalidate your previous ones.
2. Delete your existing analytics backup secret:

   ```
   kubectl -n <namespace> delete secret <secret name>
   ```

   where:
   - *<namespace>* is you analytics namespace.
   - *<secret name>* is the name of you existing secret, which is specified in the `databaseBackup.credentials` section of your analytics CR:

     ```
     spec:
       databaseBackup:
         credentials: analytics-backup-secret
     ...
     ```

     Note: Do not reuse the secret name for your replacement secret.
3. Create a new analytics backup secret:

   ```
   kubectl -n <namespace> create secret generic <new secret name> --from-literal=access_key='<S3 access key>' --from-literal=secret_key='<S3 access key secret>'
   ```

   where:
   - *<namespace>* is your analytics namespace.
   - *<new secret name>* is a new name for your analytics backup secret. Do not use the same name as your previous secret.
   - *<S3 access key>* and *<S3 access key secret>* are provided by your S3 provider.
4. **Kubernetes and OpenShift individual subsystem installations:** Edit your analytics CR:

   ```
   kubectl -n <namespace> edit a7s
   ```

   Your backup settings are in the `spec:` section.
5. **Cloud Pak for Integration and OpenShift top-level CR installations:** Edit your `APIConnectCluster` CR:

   ```
   kubectl -n <namespace> edit APIConnectCluster
   ```

   Your backup settings are in the `spec.analytics` section.
6. Replace the `databaseBackup.credentials` with your new secret:

   ```
     databaseBackup:
       credentials: <new analytics backup secret>
   ...
   ```

   After you save the updated CR, your analytics pods restart automatically.

Troubleshooting backup and restore

Troubleshooting steps for problems with backup and restore of the analytics database.

Check the CR status

List the analytics backup jobs:

```
kubectl -n <namespace> get analyticsbackup -n <namespace>
```

```
NAME                STATUS   ID                                      CR TYPE   INDICES              AGE   COMMENT
<backup name>       Ready                                            create    [all]                <age>   <comment>
```

check the status of the backup that you are interested in:

```
kubectl -n <namespace> get analyticsbackup <backup name> -o yaml
```

List the analytics restore jobs:

```
kubectl get analyticsrestore -n <namespace>
```

```
NAME              STATUS     ID                                          AGE
<restore name>    Ready      analytics-all-2022-07-01t04:49:15utc              1h
```

check the status of the restore job you are interested in:

```
kubectl -n <namespace> get analyticsrestore <restore name> -o yaml
```

Check the logs

Check for backup or restore related errors in the logs of the API Connect operator pod:

1. Identify the API Connect operator pod `ibm-apiconnect` by running the following command:

   ```
   kubectl -n <namespace> get pods
   ```

   Note: *<namespace>* might not be the same namespace as your analytics subsystem. On a default OpenShift deployment, the API Connect operator runs in a global namespace called `openshift-operators`.
2. View the API Connect operator pod logs with:

   ```
   kubectl -n <namespace> logs <ibm-apiconnect pod name>
   ```

Check for messages with the "error" label that contain the words "analytics", "backup", or "restore".

Common problems with backup and restore

These are some frequent issues that can cause backup or restore to fail:

- Invalid login credentials for your remote backup server. Check that the username and password that you configured in your subsystem database backup settings is correct.
- The user does not have write permissions on the backup server. Check that the username you configured in your subsystem database backup settings has write permission to the specified backup path.
- Remote backup server storage full. Check your remote backup server and if the storage is full either extend the storage space or delete older backups.
- No network access to the remote backup server. Check that you can communicate with your remote backup server from your API Connect environment.
- TLS handshaking failure with the remote backup server. If your remote backup server has a self-signed CA certificate, check that this certificate is trusted by your API Connect deployment, see the database backup configuration steps for your subsystem for more information.

VMware

How to configure analytics backups and recover from a disaster in a VMware environment.

Analytics subsystem backups are intended for restoration in the same environment where they were taken, or a different environment that has the same network configuration, endpoints, and deployment profile.

- **Backing up your analytics subsystem**
  Backup your project directory and configure scheduled database backups.
- **Running an on-demand database backup**
  Run a backup of the analytics database outside the scheduled time.
- **Restoring an analytics database backup**
  Restore an analytics database backup.
- **Recovering from a disaster**
  Recover the analytics subsystem in a VMware environment.

Backing up your analytics subsystem

Backup your project directory and configure scheduled database backups.

Project directory backups

The original project directory that was created with the `apicup` command during the initial product installation is essential for disaster recovery, see: First steps for deploying in a VMware environment. The project directory contains the YAML files that describe your deployment, encryption keys, and deployment ISO files. It is not possible to restore the analytics database on a deployment that uses a new or different project directory.

Take a new backup of your project directory every time you make any configuration changes with the `apicup` command. Store your project directory backups at a remote location.

Ensure that a backup is kept of your Analytics extra-values file, if this file is not located in your project directory.

Analytics database backups

The analytics database backups require a remote S3 object store; for example, IBM Cloud Object Storage.
Note:

- Only host-style S3 backup endpoint names are supported. Path-style names are not supported.
- If you are using a self-managed S3 backup server, check that you have a DNS hostname entry and matching TLS certificate for your S3 backup endpoint.

Use the **apicup** command to configure backup settings for the analytics database.

1. Configure the backup settings with the **apicup** command:

   ```
   apicup subsys set <analytics subsystem> <key> <value>
   ```

   The configurable backup settings are:

   Table 1. Analytics backup settings

Key	Default value	Description
`analytics-backup-auth-pass`		S3 object store password.
`analytics-backup-auth-user`		S3 object store username.

`analytics-backup-host`		The S3 endpoint with the corresponding S3 region. Examples:
		• Region provided in the FQDN:
		`s3.s3region.s3domain`
		• Region provided in the path:
		`s3.s3domain/s3region`
		• If the endpoint has no region:
		`s3.s3domain`
		Note: A path-style host value is not supported for AWS:
		`s3.region-code.amazonaws.com/bucket-name`
		In the preceding example, the *bucket-name* is interpreted as the region. With AWS, use only host style, where the bucket-name is in the hostname:
		`bucket-name.s3.amazonaws.com/region-code`

`analytics-backup-certs`		The name of the Kubernetes secret inside your analytics subsystem that contains the S3 CA certificate. Follow the steps on Creating the S3 CA secret to create and assign this secret.
`analytics-backup-path`		A combination of the S3 bucket and the base path within the bucket, with the format: `bucket_name/path`
`analytics-backup-chunk-size`	1gb	(Optional) Specifies the size of large file chunks. Format is lowercase and no spaces, for example: `1gb`, `50mb`, `800kb`.
`analytics-backup-schedule`	0 2 * * *	(Optional) Determines how often backups are run. The format for the schedule is any valid `cron` string. The time zone for backups is Coordinated Universal Time.
`analytics-enable-compression`	True	(Optional) Determines whether metadata files are stored in compressed format.
`analytics-enable-server-side-encryption`	False	(Optional) Determines whether files are encrypted. When set to true, files are encrypted on the server side with AES256.

2. Validate the backup settings:

   ```
   apicup subsys get <analytics subsystem> --validate
   ```

3. Apply the updated backup settings:

   ```
   apicup subsys install <analytics subsystem>
   ```

4. Run the health check to confirm that the subsystem handled the update successfully :

   ```
   apicup subsys health-check <analytics subsystem>
   ```

   No output is returned if no problems are detected.

Snapshots

Take a virtual machine (VM) snapshot of all your analytics VMs; see Using VM snapshots for infrastructure backup and disaster recovery. Taking snapshots does require a brief outage while all the VMs in the subsystem cluster are shut down - do not take snapshots of running VMs, as they might not restore successfully. VM snapshots can provide faster recovery when compared to redeploying OVAs and restoring from normal backups.

Important: VM snapshots are not an alternative to the standard API Connect backups that are described in the previous step. Do not rely solely on VM snapshots for your backups.

Creating the S3 CA secret

Configure your analytics subsystem to trust your S3 object store.

If your S3 object store presents a self-signed public server certificate, create a Kubernetes secret that contains the certificate, and specify the secret in your analytics CR.

1. Use an SSH client to login to your analytics VM as the `apicadm` user:

   ```
   ssh apicadm@<analytics VM FQDN>
   ```

   If you have a three replica deployment, you can login to any one of the VMs. You do not need to repeat these steps on all VMs.
2. Switch to the root user:

   ```
   sudo -i
   ```

3. Create a file called `ca.crt` that contains your S3 object store public server certificate:

   ```
   echo "<certificate>" > ca.crt
   ```

   where *<certificate>* contains the full chain of your S3 CA certificate, for example:

   ```
   intermediate-certificate-1
   intermediate-certificate-2
   . . .
   intermediate-certificate-n
   root-certificate
   ```

4. Encode your certificate in base64 and remove any newline characters:

   ```
   base64 ca.crt | tr -d '\n'
   ```

5. Create a file that is called custom_s3_ca.yaml and paste in the following text:

   ```
   apiVersion: v1
   data:
     ca.crt: <base64 encoded certificate>
   kind: Secret
   metadata:
     name: custom-s3-server-ca
   type: generic
   ```

   where *<base64 encoded certificate>* is the encoded string from step 4.
6. Apply the custom_s3_ca.yaml file to create your Kubenetes secret:

   ```
   kubectl apply -f custom_s3_ca.yaml
   ```

7. Verify that the secret is created:

   ```
   kubectl get secrets
   ```

   expected output is:

   ```
   NAME                                                      TYPE                  DATA   AGE
   ...
   custom-s3-server-ca                                       generic               1      7s
   ...
   ```

8. Take a backup of the new secret. Run:

   ```
   kubectl get secret custom-s3-server-ca -o yaml
   ```

   and copy the output to a new file in your project directory called custom-s3-server-ca.yaml.
9. Exit from your VM SSH session.
10. Set your `analytics-backup-certs` property to the Kubernetes secret that you created:

    ```
    apicup subsys set <analytics subsystem> analytics-backup-certs custom-s3-server-ca
    ```

Running an on-demand database backup

Run a backup of the analytics database outside the scheduled time.

About this task

You can take an analytics backup at any time, you do not need to wait for the scheduled database backups to run. However, avoid running multiple backups at the same time, or triggering an on-demand backup at the same time as the scheduled backup runs.

Procedure

1. Confirm that your analytics subsystem is working correctly:

   ```
   apicup subsys health-check <analytics subsystem>
   ```

   if successful, the command returns silently with exit code 0.
2. Start the backup by running the following command and including the appropriate flags:

   ```
   apicup subsys backup <analytics subsystem>
   ```

   Note: Run the backup command with `--help` to see the advanced backup options:

   ```
   Backup analytics subsystem

   Usage:
     backup SUBSYS [flags]

   Flags:
         --comment string          Comment to add to the backup CR before creation
         --debug                   Enable debug logging
     -h, --help                    help for backup
         --ignore-unavailable      If false, the backup will fail if an index is missing. If true, missing indices will be
   skipped and the backup will continue.
         --indices strings         Indice(s) you'd like to backup (all/apievents/ui/summary). It can be set to any
   combination of indices (e.g. ui or ui,apievents).
   ```

```
      --wait                    Wait for the operation to complete or fail.
      --wait-timeout duration   Command timeout in seconds. (default 40s)
```

The `--indices` flag can be set to `all|apievents|ui|summary`, or the names of individual indexes. `all` includes `apievents`, `ui`, and `summary` indices. Multiple values can be supplied with a comma-separated list. For example, to backup all UI data and all data from August of 2022:

```
--indices ui, "apic-api-2022.08*"
```

If you provide a list of indices in the `--indices` property, then set the `--ignore-unavailable` property to define what happens if one or more of the indices in your list are not found in the backup.

3. Monitor the progress of your backup with:

```
apicup subsys list-backups <analytics subsystem>
```

```
NAME                  STATUS   ID                                          CR TYPE   INDICES              AGE   COMMENT
a7s-backup-bsbft      Ready                                                create    ["all"]              13m
analytics-bup-dcxqh   Ready    defanalytics-all-2023-06-29t09:29:53utc     record    ["apievents","ui"]   13m
```

When the backup is complete the status changes from `Running` to `Ready`.

Restoring an analytics database backup

Restore an analytics database backup.

Procedure

1. Retrieve a list of available backups that have the `CR TYPE` of `record`:

```
apicup subsys list-backups <analytics subsystem> | grep record
```

```
NAME                  STATUS   ID                                          CR TYPE   INDICES              AGE   COMMENT
analytics-bup-dcxqh   Ready    defanalytics-all-2023-06-29t09:29:53utc     record    ["apievents","ui"]   60m
```

The response includes the ID of each backup. Note the ID of the backup that you want to restore.

2. Restore the backup that you identified in step 1:

```
apicup subsys restore <analytics_subsystem> --id "<backup ID>"
```

Note: Run the restore command with `--help` to see the advanced restore options:

```
Restore analytics subsystem

Usage:
   restore SUBSYS [flags]

Flags:
      --debug                   Enable debug logging
  -h, --help                    help for restore
      --id string               ID of the backup to restore
      --ignore-unavailable      If false, the restore will fail if an index is missing. If true, missing indices will be
skipped and the restore will continue.
      --indices strings         Indice(s) you'd like to restore (all/apievents/ui). It can be set to any combination of
indice(s) (eg. ui or ui,apievents) (default [all])
      --override                If set to true, then the restore operation will override existing indices.
      --wait                    Wait for the operation to complete or fail.
      --wait-timeout duration   Command timeout in seconds. (default 40s)
```

- `--id`: the backup ID provided must be enclosed in double quotation marks.
- `--indices` can be set to `all|apievents|ui|summary`, or the names of individual indices. `all` includes `apievents`, `ui`, and `summary` indices. Multiple values can be supplied with a comma-separated list. For example, to restore all UI data and all data from August of 2022:

  ```
  --indices "ui,apic-api-2022.08*"
  ```

- `--ignore-unavailable`: If you provide a list of indices in the `--indices` property, then set the `--ignore-unavailable` property to define what happens if one or more of the indices in your list are not found in your backup.
- `--override`: Specifies whether any indices that already exist in your database are overwritten by indices of the same name from the backup. The default value is `false` to prevent you from accidentally replacing existing indices.

3. To monitor the progress of your restore:

```
apicup subsys list-restores <analytics subsystem>
```

```
NAME                STATUS    ID                                          AGE
a7s-restore-9bwfv   Running   defanalytics-all-2023-06-29t09:29:53utc     9s
```

When the restore is successfully started, `STATUS` shows `Running`. The status that is shown for completed restorations depends on your deployment profile:

- On a three replica deployment, `STATUS` shows `Complete`.
- On a one replica deployment, `STATUS` shows `Warning`. SSH into your analytics VM and review the Kubernetes platform restore steps to confirm restore status.

Recovering from a disaster

Recover the analytics subsystem in a VMware environment.

Recovering the analytics subsystem involves re-creating your analytics ISO files, redeploying you analytics VMs with the new ISO files, and then restoring the analytics database from your backup.

In a clustered deployment, if any one VM is corrupted then all the VMs in the cluster must be redeployed. You cannot replace just a single corrupted VM in a cluster.

Use the same project directory that you used for your original deployment, or a restore of your project directory backup.

1. Create your ISO files:

   ```
   apicup subsys install <install subsystem name> --out <output directory>
   ```

   The ISO files are created in the directory that is specified in *<output directory>*.
   Note: If your original ISO files are still available and you did not upgrade from the original installation, you can reuse them. However, if you upgraded your original deployment, you must create new ISO files by using the version of **apicup** that corresponds to the version your API Connect installation was on at the time of the disaster. For example, do not attempt to deploy v10.0.6.x OVAs with ISO files that were created with **apicup** v10.0.5.3.
2. Deploy your new analytics VMs. See Deploying the Analytics subsystem OVA file.
3. Verify your new analytics deployment. See Verifying deployment of the Analytics subsystem.
4. Restore your analytics database backup: Restoring an analytics database backup.

API event record field reference

Reference table and examples of the data that is stored in an API event record.

When a user calls one of your published APIs, the gateway that processes the API call creates an API event record. Each API event record contains details of the API call such as the application ID, current time, result code, etc. Table 1 shows all the data that can be contained in an API event record.

Activity log settings

The contents of API event records depends on the activity log setting for each API, and any custom gateway scripts and ingestion filters that are configured. To find out more about activity logging and customizing API event contents, see Customize your analytics data.

API event record fields

Table 1. API event record fields

Field name	Type	Description
@timestamp	Date	A timestamp that records when the Logstash data collection engine (which feeds data into OpenSearch) wrote the record.
api_id	String	The API identifier.
api_name	String	The name of the API.
api_resource_id	String	Field format is: **api_name:api_version:method:path**. Only available on API Gateway v10.5.3 or higher.
api_version	String	The version number of the API.
app_id	String	The identifier for the registered application.
app_name	String	The name of the registered application. Note: The property is set to **undefined** when a client ID is not used or is invalid on the API. The gateway needs a client ID to determine which app was invoking the API. From this app, the gateway can determine what plan the app is subscribed to on the product that contains the API. Without a client ID, the gateway is unable to determine what plan, product, or app was invoked, because a single API can belong to multiple products (each of which have multiple plans and apps that are subscribed to those plans with client IDs).
app_type	String	The application type, with a value of **Production** or **Development**.
bytes_received	Number	The number of bytes received from the consumer in the request.
bytes_sent	Number	The number of bytes sent to the consumer in the response.
client_geoip.area_code	Number	The public switched telephone network (PSTN) area code of the client, as identified from its IP address.
client_geoip.asn	Number	Autonomous system number of client IP address.
client_geoip.as_org	String	
client_geoip.city_name	String	The city name of the client, as identified from its IP address.
client_geoip.continent_name	String	The continent name of the client, as identified from its IP address.
client_geoip.continent_code	String	The two-letter continent code of the client, as identified from its IP address.
client_geoip.country_code2	String	The two-letter country code of the client, as identified from its IP address.
client_geoip.country_code3	String	The three-letter country code of the client, as identified from its IP address.
client_geoip.country_name	String	The country name of the client, as identified from its IP address.
client_geoip.dma_code	Number	The Designated Market Area (DMA) code of the client, as identified from its IP address.
client_geoip.domain	String	The domain of the client IP address.
client_geoip.ip	String	The IP address of the client.
client_geoip.isp	String	The internet service provider of the client.

Field name	Type	Description
client_geoip.latitude	Number	The latitude of the client location, as identified from its IP address.
client_geoip.location	String	The longitude and latitude of the client location (separated by a comma), as identified from its IP address.
client_geoip.location.lat	Number	The latitude of the client location, as identified from its IP address.
client_geoip.location.long	Number	The longitude of the client location, as identified from its IP address.
client_geoip.longitude	Number	The longitude of the client location, as identified from its IP address.
client_geoip.organization	String	The client's organization, as identified from its IP address.
client_geoip.postal_code	String	The postal code of the client, as identified from its IP address.
client_geoip.region_iso_code	String	The ISO code of the client's region, as identified from its IP address.
client_geoip.region_name	String	The abbreviated form of the region that corresponds to the IP address of the client.
client_geoip.timezone	String	The time zone of the client, as identified from its IP address.
client_id	String	The unique ID of the client that is attached to the API request.
custom_data	Array map	Custom data can be added to this field.
datetime	Date	A timestamp that records when the API was invoked. The timestamp is always shown in Coordinated Universal Time.
developer_org_id	String	The identifier for the consumer organization that owns the application.
developer_org_name	String	The name of the consumer organization that owns the application.
endpoint_url	String	When the request failed, **`endpoint_url`** identifies the proxy or invoke target URL on which the request failed. It is not included with a successful request.
env_id	String	The catalog identifier.
env_name	String	The name of the catalog.
event_id	String	Unique ID assigned to the event by the gateway.
gateway_geoip.area_code	Number	The public switched telephone network (PSTN) area code of the gateway, as identified from its IP address.
gateway_geoip.asn	Number	Autonomous system number of client IP address.
gateway_geoip.as_org	String	
gateway_geoip.city_name	String	The city name of the gateway, as identified from its IP address.
gateway_geoip.continent_code	String	The two-letter continent code of the gateway, as identified from its IP address.
gateway_geoip.continent_name	String	The continent name of the gateway, as identified from its IP address.
gateway_geoip.country_code2	String	The two-letter country code of the gateway, as identified from its IP address.
gateway_geoip.country_code3	String	The three-letter country code of the gateway, as identified from its IP address.
gateway_geoip.country_name	String	The country name of the gateway, as identified from its IP address.
gateway_geoip.dma_code	Number	The Designated Market Area (DMA) code of the gateway, as identified from its IP address.
gateway_geoip.domain	String	The domain of the gateway IP address.
gateway_geoip.ip	String	The IP address of the gateway.
gateway_geoip.isp	String	The internet service provider of the gateway.
gateway_geoip.latitude	Number	The latitude of the gateway location, as identified from its IP address.
gateway_geoip.location	String	The longitude and latitude of the gateway location (separated by a comma), as identified from its IP address.
gateway_geoip.longitude	Number	The longitude of the gateway location, as identified from its IP address.
gateway_geoip.organization	String	The gateway's organization, as identified from its IP address.
gateway_geoip.postal_code	String	The postal code of the gateway, as identified from its IP address.
gateway_geoip.region_name	String	The abbreviated form of the region that corresponds to the IP address of the gateway.
gateway_geoip.region_iso_code	String	The ISO code of the gateway's region, as identified from its IP address.

Field name	Type	Description
gateway_geoip.timezone	String	The time zone of the gateway, as identified from its IP address.
gateway_ip	String	The IP address of the gateway.
gateway_service_name	String	The name of the API Connect gateway service. Configured by the cloud admin user when registering the gateway service. Only available on API Gateway v10.5.3 or higher.
global_transaction_id	String	The DataPower global transaction ID. See https://www.ibm.com/docs/en/datapower-gateway/latest?topic=variables-varserviceglobal-transaction-id-servicevarsglobaltransactionid.
graphql_request_field_cost	Number	GraphQL APIs only. The maximum cost of all fields accessed in the query. The cost of each field access is configured in the schema.
graphql_request_max_nesting	Number	GraphQL APIs only. The maximum nesting depth found in the query by the assembly validate action. The schema configuration is used to determine which types are nested, so this value might be less than the nesting depth found by the assembly parse action.
graphql_request_top_field_counts	Object	GraphQL APIs only. The maximum number of times that a query can retrieve each field. This number is equal to the number of times that the resolver is required to run. This field is stored in JSON format and is not indexed, so it is not available for visualizations. A limited number of query requests and responses are stored for each entry, based on the amount of data that each contains. The maximum amount of data that can be stored is subject to change.
graphql_request_top_type_counts	Object	GraphQL APIs only. The maximum number of times that a query can retrieve an object of each type. This field is stored in JSON format and is not indexed, so it is not available for visualizations. A limited number of query requests and responses are stored for each entry, based on the amount of data that each contains. The maximum amount of data that can be stored is subject to change.
graphql_request_type_cost	Number	GraphQL APIs only. The maximum cost of all types retrieved in the query. The cost of each type is configured in the schema.
graphql_response_field_cost	Number	GraphQL APIs only. The cost of all fields accessed in the query. The cost of each field access is configured in the schema.
graphql_response_max_nesting	Number	GraphQL APIs only. The nesting depth found in the query by the assembly validate action. The schema configuration is used to determine which types are considered nested, so this value might be less than the nesting depth found by the assembly parse action.
graphql_response_top_field_counts	Object	GraphQL APIs only. The number of times that each field was retrieved by the query. This number is equal to the number of times that the resolver is required to run. This field is stored in JSON format and is not indexed, so it is not available for visualizations. A limited number of query requests and responses are stored for each entry, based on the amount of data that each contains. The maximum amount of data that can be stored is subject to change.
graphql_response_top_type_counts	Object	GraphQL APIs only. The number of times that an object of each type was retrieved by the query. This field is stored in JSON format and is not indexed, so it is not available for visualizations. A limited number of query requests and responses are stored for each entry, based on the amount of data that each contains. The maximum amount of data that can be stored is subject to change.
graphql_response_type_cost	Number	GraphQL APIs only. The cost of all types that were retrieved in the query. The cost of each type is configured in the schema.
headers.*field_name*	String	Internal information that is related to analytics ingestion. headers.*field_name* is not related to the API call or its response, see **`request_http_headers`** for that information.
host	String	The hostname or IP address of the ingestion node that received the API event.
http_user_agent	String	The value of the User Agent header on the inbound request.
immediate_client_ip	String	The client IP address that is directly in front of the gateway. Usually **`immediate_client_ip`** is the IP of a load balancer.
latency_info.started	Number	The time delay (in milliseconds) between when the request was received and when the gateway started the corresponding task. Starting a task comprises multiple steps to prepare for executing an API; for example, completing the TCP/TLS handshake, verifying an app's client ID and secret, and matching the request URI to a catalog, API, and Plan. When the gateway receives a request, the "Start" duration is set to 0. The duration of each step within the Start task is then added up, and the total represents the duration of the Start task.
latency_info.task	String	The API transaction that was processed.
log_policy	String	The defined logging policy. Values include none, event, headers, and payload.
org_id	String	The identifier for the provider organization that owns the API and associated Products.
org_name	String	The name of the provider organization that owns the API and associated Products.
plan_id	String	The Plan identifier.
plan_name	String	The name of the Plan. Note: The property is set to **`undefined`** when a client ID is not used or is invalid on the API. The gateway needs a client id to determine which app was invoking the API. From this app, the gateway can determine what plan the app is subscribed to on the product that contains the API. Without a client ID, the gateway is unable to determine what plan, product, or app was invoked because a single API can belong to multiple products (each of which have multiple plans and apps that are subscribed to those plans with client IDs).
plan_version	String	The version number of the Plan.
product_name	String	The Product name. Note: The property is set to **`undefined`** when a client ID is not used or is invalid on the API. The gateway needs a client ID to determine which app was invoking the API. From this app, the gateway can determine what plan the app is subscribed to on the product that contains the API. Without a client ID, the gateway is unable to determine what plan, product, or app wasinvoked because a single API can belong to multiple products (each of which have multiple plans and apps that are subscribed to those plans with client IDs).
product_title	String	The title of the Product.
product_version	String	The version number of the Product.
query_string	String	The URL query string value on the inbound request.
rate_limit.count	Number	The number of API calls remaining in the specified rate limit time window.
rate_limit.limit	Number	The maximum number of requests an application is allowed to make to the API during a specified time window.

Field name	Type	Description
rate_limit.period	Number	The time window that is used to set a rate limit for API calls.
rate_limit.reject	String	An indication of whether calls that exceed the specified rate limit are rejected. If true, the API call is rejected with a 429 status code. If false, a record is created in the Activity log.
rate_limit.shared	String	An indication of whether the rate limit is shared at a Plan level by all operations, or whether a rate limit is specified on indivIDual operations.
request_body	String	The body of the inbound request.
request_http_headers.*field_name*	String	A component of the HTTP header section of the inbound request; for example, the acceptable encodings, the identification string for the user agent, or the proxies through which the request was sent. Note: The following types of headers are considered sensitive and do not show in analytics data for security reasons: • Any secret key configured in the API security • Any header that contains `secret` • Any header that contains `Authorization`
request_method	String	The method of the inbound request.
request_protocol	String	The protocol of the inbound request.
resource	String	The name of the operation.
resource_id	String	The operation identifier.
resource_path	String	The operation path.
response_body	String	The body of the outbound response.
response_http_headers.*field_name*	String	A component of the HTTP header section of the outbound response; for example, the MIME type of the content or the data and time when the message was sent.
status_code	String	The status code set on the outbound response.
time_to_serve_request	Number	The time elapsed (in milliseconds) from when the backend application received the request to when it sent a response.
transaction_id	String	The identifier for the API transaction. See https://www.ibm.com/docs/en/datapower-gateway/latest?topic=variables-varservicetransaction-id-servicevarstransactionid.
uri_path	String	The URI path on the inbound request.

Example API event record with payload logging set

Advanced configuration options

Configure advanced features and settings such as offload, retention period, and dedicated storage.

- **Dedicated storage and scaling up**
  Use dedicated storage for improved performance, stability, and scalability. Available on Kubernetes and OpenShift. Not available on VMware.
- **Retention and rollover**
  Manage how long your analytics subsystem stores data.
- **Logstash persistent queue**
  Enable the persistent queue feature to provide enhanced reliability in your API event data pipeline.
- **Offload to third-party systems**
  Offload your API event data for storage on a third-party system.
- **Disable local storage**
  If you are offloading you API event data to a third-party system, you can disable local storage to reduce subsystem resource requirements.
- **Shutting down the analytics subsystem**
  Disable the analytics service and shutdown the analytics subsystem.
- **Restarting analytics pods**
  How to restart the analytics pods in your API Connect deployment.
- **Change deployment profile**
  Change your deployment profile to switch between one replica and three replica deployments, or to change the computing resources available for your subsystem.
- **Performance tuning with ingestion pipeline properties**
  Fine tune your ingestion pipeline settings for optimal performance.

Dedicated storage and scaling up

Use dedicated storage for improved performance, stability, and scalability. Available on Kubernetes and OpenShift. Not available on VMware.

Note: Storage type selection is available on three replica deployments only.
To make an informed choice on which storage type is best for you, first read and understand the OpenSearch concepts that are described in OpenSearch nodes, indices, shards, and replicas.

API Connect provides two OpenSearch storage types:

- **Shared storage**
  A single pod provides data storage and OpenSearch cluster management. Shared storage is the default option, and the only option on a one replica deployment.
- **Dedicated storage**
  OpenSearch data storage and cluster management functions are split, and run in separate pods on each worker node:
  - The `storage-os-master` pod runs an OpenSearch "manager eligible" node that manages the OpenSearch cluster, but does not store any API event data.
  - The `storage` pod runs an OpenSearch "data" node that stores API event data.

Dedicated storage facilitates horizontal scaling to support greater analytics data storage and throughput. Add worker nodes and increase the number of `storage` pod replicas to scale horizontally (you do not need to increase the number of `storage-os-master` replicas). Dedicated storage also provides greater stability and allows some OpenSearch configuration changes to be made without downtime.
Note: For OpenShift users: The example steps in this topic use the Kubernetes `kubectl` command. On OpenShift, use the equivalent `oc` command in its place. If you are using a top-level CR you must edit the `APIConnectCluster` CR (the top-level CR), instead of directly in the subsystem CRs. If the subsystem section is not included in the top-level CR, copy and paste the section from the subsystem CR to the `APIConnectCluster` CR.
The storage type is defined in the analytics CR, in the `spec.storage.type` section as follows:

- Shared storage:

```
  storage:
    type: shared
    shared:
      volumeClaimTemplate:
        storageClassName: $STORAGE_CLASS
        volumeSize: $DATA_VOLUME_SIZE
```

- Dedicated storage:

```
  storage:
    type: dedicated
    shared:
      volumeClaimTemplate:
        storageClassName: $STORAGE_CLASS
        volumeSize: $DATA_VOLUME_SIZE
    master:
      volumeClaimTemplate:
        storageClassName: $STORAGE_CLASS
```

Changing from shared to dedicated storage

1. Edit your analytics CR:

   ```
   kubectl -n <namespace> edit a7s
   ```

2. Change storage type to dedicated:

   ```
     storage:
       type: dedicated
   ```

3. If your environment does not have a default storage class, or want to use a different storage class for your `storage-os-master` pods, then also add the `spec.storage.master` section to specify the storage class, for example:

   ```
     storage:
       type: dedicated
   ...
       master:
         volumeClaimTemplate:
           storageClassName: local_storage
   ```

Changing from dedicated to shared storage

1. Edit your analytics CR:

   ```
   kubectl -n <namespace> edit a7s
   ```

2. Change storage type to shared:

   ```
     storage:
       type: shared
   ```

3. Wait until all of your `storage` pods restart and are in the `Ready` state.
4. Edit your analytics CR and remove the `spec.storage.master` section.
5. Delete the `data-analytics-storage-os-master` PVCs:

   ```
   kubectl -n <namespace> delete pvc data-analytics-storage-os-master-<integer>
   ```

Horizontal scaling with dedicated storage

To take advantage of the horizontal scaling options with dedicated storage, see Horizontal scaling of storage pods.

Horizontal scaling of storage pods

Scale your storage pod replicas for increased API event data storage and throughput.

To take advantage of storage pod scaling, you must have a three replica deployment, and be using dedicated storage, see Dedicated storage and scaling up.

Note:

- The term "replica" when used with "data storage pod" refers to the Kubernetes storage pod, not OpenSearch replicas. OpenSearch replica settings are not configurable in API Connect.
- The OpenSearch term "node" refers to OpenSearch data storage nodes. OpenSearch nodes have a one-to-one relationship with the API Connect storage pod replicas, and have the same name.

This operation requires the use of the Analytics CLI.

Increase number of storage pod replicas

1. Edit your analytics CR:

   ```
   kubectl -n <namespace> edit a7s
   ```

2. Add the following to the `spec:` section:

   ```
     template:
     - name: storage
       replicaCount: <new replica count>
   ```

   where *<new replica count>* must be less than or equal to the number of worker nodes you have available.
3. Wait for the new storage pod replicas to start on your new worker nodes, and for the analytics cluster to rebalance your API event data to use your new replicas. The time the rebalancing takes depends on the size of your API event data and the network transmission speed between worker nodes. You can check the rebalancing status with the CLI health command:

   ```
   apic --mode analytics clustermgmt:getHealth  --server <platform api endpoint> --analytics-service <analytics service name>
   --format json
   ```

   where:
   - `<platform api endpoint>` is the platform API endpoint.
   - `<analytics service name>` is the name of the analytics service as configured in the Cloud Manager UI.

   When rebalancing is complete, the `number_of_data_nodes` matches your updated `replicaCount`, and the highlighted `_shards` properties are all zero, as shown:

   ```
   {
      "cluster_name":"apic-analytics-cluster",
      "status":"green",
      "timed_out":false,
      "number_of_nodes":8,
      "number_of_data_nodes":5,
      "discovered_master":true,
      "discovered_cluster_manager":true,
      "active_primary_shards":8,
      "active_shards":24,
      "relocating_shards":0,
      "initializing_shards":0,
      "unassigned_shards":0,
      "delayed_unassigned_shards":0,
      "number_of_pending_tasks":0,
      "number_of_in_flight_fetch":0,
      "task_max_waiting_in_queue_millis":0,
      "active_shards_percent_as_number":100
   }
   ```

Note: If in the past you increased and then reduced the number of data storage replicas in your deployment, you might have an OpenSearch exclude list that contains the names of the previous replicas you removed. New storage pod replicas cannot be created if their name is in the OpenSearch exclude list. To empty the OpenSearch exclude list, follow the same steps that you used to create it: Create exclude list, but set `persistent.cluster.routing.allocation.exclude._name` to an empty string.

Reduce number of storage pod replicas

1. Verify that your analytics cluster health is green. Use the analytics CLI health command:

   ```
   apic --mode analytics clustermgmt:getHealth  --server <platform api endpoint> --analytics-service <analytics service name>
   --format json
   ```

   where:
   - `<platform api endpoint>` is the platform API endpoint.
   - `<analytics service name>` is the name of the analytics service as configured in the Cloud Manager UI.

   Check that the status property is green:

   ```
   {
      "cluster_name":"apic-analytics-cluster",
      "status":"green",
      "timed_out":false,
      "number_of_nodes":8,
      "number_of_data_nodes":5,
      "discovered_master":true,
      "discovered_cluster_manager":true,
      "active_primary_shards":8,
      "active_shards":24,
      "relocating_shards":0,
      "initializing_shards":0,
      "unassigned_shards":0,
      "delayed_unassigned_shards":0,
      "number_of_pending_tasks":0,
   ```

```
   "number_of_in_flight_fetch":0,
   "task_max_waiting_in_queue_millis":0,
   "active_shards_percent_as_number":100
}
```

Do not proceed if the status is not green.

2. Replicas are removed by reducing the Kubernetes **replicaCount** in the analytics CR. When **replicaCount** is reduced, the replicas that are deleted are always the highest numbered replicas. For example:

```
kubectl get pods | grep storage
```

```
NAME                                  READY   STATUS      RESTARTS   AGE
analytics-storage-0                   1/1     Running     0          140d
analytics-storage-1                   1/1     Running     0          140d
analytics-storage-2                   1/1     Running     0          140d
analytics-storage-3                   1/1     Running     0          140d
analytics-storage-4                   1/1     Running     0          140d
```

If you reduce **replicaCount** from 5 to 3, the two replicas that are deleted are **analytics-storage-3** and **analytics-storage-4**.
Before you reduce the **replicaCount**, you must ensure that replicas to be deleted contain no API event data. To make OpenSearch relocate all API event data to the replicas you are keeping, add the replicas that you want to delete to the OpenSearch exclude list:

a. Export the current analytics cluster settings to a JSON file:

```
apic -m analytics clustermgmt:getSettings --server <platform api endpoint> --analytics-service <analytics service
name> --format json > a7s_cluster_settings.json
```

This command creates a file called a7s_cluster_settings.json in your current directory.

b. Edit the a7s_cluster_settings.json file, and set the **persistent.cluster.routing.allocation.exclude._name** property to a comma-separated list of replicas you plan to remove. For example:

```
{
    "persistent": {
        "cluster": {
            "routing": {
                "allocation": {
                    "exclude": {
                        "_name": "analytics-storage-3,analytics-storage-4"
                    }
                }
            }
        },
        "plugins": {
            "index_state_management": {
                "metadata_migration": {
                    "status": "1"
                },
                "template_migration": {
                    "control": "-1"
                },
                "history": {
                    "enabled": "false"
                }
            }
        }
    },
    "transient": {}
}
```

You might need to add the **cluster.routing.allocation.exclude** structure if this property has not been set before.

c. Apply the updated a7s_cluster_settings.json file:

```
apic -m analytics clustermgmt:putSettings --server <platform api endpoint> --analytics-service <analytics service
name> a7s_cluster_settings.json --format json
```

3. Wait for your analytics cluster to remove all data from the replicas you want to delete, which you specified in step 2. You can check that the data rebalancing is complete with the **clustermgmt:catAllocation** CLI command:

```
apic -m analytics clustermgmt:catAllocation --server <platform api endpoint> --analytics-service <analytics service name>
--format json --return_format json
```

Replicas that don't have data appear as entries with a **shards** value of zero in the output (you can ignore the **disk.*** properties):

```
[
  {
    "shards": "5",
    "disk.indices": "113.3kb",
    "disk.used": "27.3gb",
    "disk.avail": "222.5gb",
    "disk.total": "249.8gb",
    "disk.percent": "10",
    "host": "192.168.87.226",
    "ip": "192.168.87.226",
    "node": "analytics-storage-0"
  },
  {
    "shards": "0",
    "disk.indices": "0",
    "disk.used": "36.9kb",
    "disk.avail": "212.9kb",
    "disk.total": "249.8kb",
    "disk.percent": "1",
    "host": "192.168.64.225",
```

```
    "ip": "192.168.64.225",
    "node": "analytics-storage-3"
  },
  {
    "shards": "5",
    "disk.indices": "16.8kb",
    "disk.used": "28.2gb",
    "disk.avail": "221.6gb",
    "disk.total": "249.8gb",
    "disk.percent": "11",
    "host": "192.168.112.227",
    "ip": "192.168.112.227",
    "node": "analytics-storage-1"
  },
  {
    "shards": "5",
    "disk.indices": "23.3kb",
    "disk.used": "29.3gb",
    "disk.avail": "220.4gb",
    "disk.total": "249.8gb",
    "disk.percent": "11",
    "host": "192.168.24.102",
    "ip": "192.168.24.102",
    "node": "analytics-storage-2"
  },
  {
    "shards": "0",
    "disk.indices": "0",
    "disk.used": "35.4kb",
    "disk.avail": "214.4kb",
    "disk.total": "249.8kb",
    "disk.percent": "1",
    "host": "192.168.91.149",
    "ip": "192.168.91.149",
    "node": "analytics-storage-4"
  }
]
```

The time rebalancing takes depends on the size of your API event data and the network transmission speed between pod replicas.
Note: The value in the **node** property of the **clustermgmt:catAllocation** output is the same as the names of the Kubernetes storage pod replicas.

4. Verify that your analytics cluster health is green. Use the analytics CLI health command:

```
apic --mode analytics clustermgmt:getHealth  --server <platform api endpoint> --analytics-service <analytics service name>
--format json
```

where:

- ***<platform api endpoint>*** is the platform API endpoint.
- ***<analytics service name>*** is the name of the analytics service as configured in the Cloud Manager UI.

Check that the status property is green:

```
{
   "cluster_name":"apic-analytics-cluster",
   "status":"green",
   "timed_out":false,
   "number_of_nodes":8,
   "number_of_data_nodes":5,
   "discovered_master":true,
   "discovered_cluster_manager":true,
   "active_primary_shards":8,
   "active_shards":24,
   "relocating_shards":0,
   "initializing_shards":0,
   "unassigned_shards":0,
   "delayed_unassigned_shards":0,
   "number_of_pending_tasks":0,
   "number_of_in_flight_fetch":0,
   "task_max_waiting_in_queue_millis":0,
   "active_shards_percent_as_number":100
}
```

Do not proceed if the status is not green.

5. Edit your analytics CR:

```
kubectl -n <namespace> edit a7s
```

6. Update the **replicaCount**:

```
  template:
  - name: storage
    replicaCount: <new replica count>
```

where *<new replica count>* is the reduced number of replicas that you want.
Note: If the **replicaCount** property does not exist in the analytics CR, check that you are not attempting to reduce **replicaCount** to 2. Reducing **replicaCount** to less than 3 is not a supported operation.

7. Monitor the health status of your analytics cluster with the CLI health command:

```
apic --mode analytics clustermgmt:getHealth  --server <platform api endpoint> --analytics-service <analytics service name>
--format json
```

where:

- ***<platform api endpoint>*** is the platform API endpoint.
- ***<analytics service name>*** is the name of the analytics service as configured in the Cloud Manager UI.

Confirm that the **status** is **green**, the **number_of_data_nodes** matches your updated **replicaCount**, and that the highlighted shard properties are all zero:

```
{
   "cluster_name":"apic-analytics-cluster",
   "status":"green",
   "timed_out":false,
   "number_of_nodes":6,
   "number_of_data_nodes":3,
   "discovered_master":true,
   "discovered_cluster_manager":true,
   "active_primary_shards":8,
   "active_shards":24,
   "relocating_shards":0,
   "initializing_shards":0,
   "unassigned_shards":0,
   "delayed_unassigned_shards":0,
   "number_of_pending_tasks":0,
   "number_of_in_flight_fetch":0,
   "task_max_waiting_in_queue_millis":0,
   "active_shards_percent_as_number":100
}
```

Retention and rollover

Manage how long your analytics subsystem stores data.

Each API event is recorded as a document in an OpenSearch index. When this index reaches a maximum size or age it is archived, and a new index is created for recording new API events. This is known as index rollover. When an archived index reaches a maximum age, which is known as the data retention maximum, it is deleted. You can specify the index rollover size and the data retention period in the Cloud Manager UI.

To learn more about OpenSearch indices, see OpenSearch nodes, indices, shards, and replicas.

The index rollover settings determine how long an index accumulates data before it "rolls over" and a new index is created. You can control the duration of an index two ways: by setting a maximum age for the index (default is 1 day), or by setting a maximum number of documents that can be recorded in the index (default is 25 million documents). When the rollover occurs, a new index is created for new API events to be stored in, while the previous index is archived and kept until its age exceeds the data retention setting. If you change the rollover settings, consider both the amount of data to be stored within each index and the total number of indices. Allowing indices to grow too large, or storing too many indices, can cause performance problems.

The data retention setting determines how long the stored indices are retained. When an index's creation date exceeds the retention period, that index and all its data is deleted.
Note: It is the creation date of the index that is used to determine retention, not the age of the newest record in the index.
The default retention period is 30 days for a one replica deployment, and 90 days for a three replica deployment. Reasons for changing this setting might include storage constraints, and the data retention requirements for your organization. You might want to set this value to be less than the default if you have a high transaction load and limited persistent storage space, especially if payload logging is enabled on many of your APIs.

The most recently created index (the index that is currently being written to) is not deleted, even if you set the retention period as small as 1 hour. If you regularly need to delete data quickly, adjust the index rollover so that a new index is rolled over to sooner, and the old index can be deleted.

Before an index is deleted, the API event data in the index is summarized and stored in a separate summary index to provide long-term data. The summary index has a separate retention setting, which is set to one year by default.

Note: The rollover and retention settings have a significant impact on the memory that is required by the analytics subsystem. If you have rollover set to one day (1d), then to maintain an acceptable level of performance the following retention settings are recommended for each deployment profile:

- **`n1xc2.m16`**: This profile provides 3 GB of heap memory for storage on one node. Recommended retention is four days or less.
- **`n1xc4.m32`**: This profile provides 11 GB of heap memory for storage on one node. Recommended retention is 15 days or less.
- **`n1xc6.m48`**: This profile provides 19 GB of heap memory for storage on one node. Recommended retention is 25 days or less.
- **`n3xc4.m16`**: This profile provides 3 GB of heap memory for storage on three nodes. Recommended retention is 12 days or less.
- **`n3xc4.m32`**: This profile provides 11 GB of heap memory for storage on three nodes. Recommended retention is 45 days or less.
- **`n3xc6.m48`**: This profile provides 19 GB of heap memory for storage on three nodes. Recommended retention is 76 days or less.
- **`n3xc8.m64`**: This profile provides 27 GB of heap memory for storage on three nodes. Recommended retention is 108 days or less.

If rollover is set to higher than one day, then more analytics data can be stored before a performance deterioration is observed. However, a higher rollover setting has the disadvantage that more data is deleted when an index reaches the retention age. For example, if you set your rollover period to seven days and you have the default 90-day retention period, then when your oldest index reaches the 90 days since it was created, it is deleted and you are left with 83 days of API event data.
To view and update the rollover and retention settings, use the Cloud Manager UI.

1. From the Cloud Manager UI, click Topology.
2. Select the Analytics Service you want to view or edit.
3. Click Advanced settings.

Alternative method using the Analytics CLI.

1. View the current retention and rollover settings by using the **`clustermgmt:getStorageSettings`** analytics CLI command:

   ```
   apic -m analytics clustermgmt:getStorageSettings --server <platform api endpoint> --analytics-service <analytics service name> --format json
   ```

   - ***`<platform api endpoint>`*** is the platform API endpoint.
   - ***`<analytics service name>`*** is the name of analytics service as configured in the Cloud Manager UI.
2. To update the retention and rollover settings create a JSON file that is called **`retention_and_rollover_settings.json`**, paste in the output from step 1 and set the retention and rollover setting as required. Apply these new settings with: **`clustermgmt:putStorageSettings`**

   ```
   apic -m analytics clustermgmt:putStorageSettings --server <platform api endpoint> --analytics-service <analytics service name> retention_and_rollover_settings.json
   ```

- `<platform api endpoint>` is the platform API endpoint.
- `<analytics service name>` is the name of analytics service as configured in the Cloud Manager UI.

Logstash persistent queue

Enable the persistent queue feature to provide enhanced reliability in your API event data pipeline.

Note: From v10.0.7 the persistent queue feature is enabled by default.
If you want to disable this feature, set the `ingestion.queue.type` property to "memory". If you plan to re-enable this feature in the future, then leave the `volumeClaimTemplate` section as it is. If you do not expect to enable this feature again, then delete the `volumeClaimTemplate` section, and the associated PVC.

The Logstash persistent queue provides enhanced reliability in the data pipeline. The ingestion pod buffers incoming API event data to persistent storage so that no events are lost if the downstream local storage pods or offload targets are temporarily unavailable.

For example, when you restart the analytics storage pods they take a few seconds to be able to receive API event data. While the storage pods are restarting, incoming API events are held in the persistent queue until the storage pods are available again. If the storage pods are unavailable and persistent queue is not enabled, then new API event data is lost during the storage pod outage.

Another benefit of the persistent queue feature is better handling of unexpected traffic spikes. The only disadvantage of the persistent queue feature is greater computing resource requirements for the ingestion pods.

Enable persistent queue on Kubernetes, OpenShift and Cloud Pak for Integration

1. **Kubernetes and OpenShift individual subsystem installations:**
   a. Edit your analytics CR:

   ```
   kubectl -n <namespace> edit a7s
   ```

   b. Add the persistent queue settings to the `spec.ingestion` section:

   ```
     queue:
       type: persisted
       volumeClaimTemplate:
         storageClassName: <storage-class-name>
         volumeSize: 50Gi # Do not change this value
   ```

   where *<storage-class-name>* is the Kubernetes storage class that is defined for persistent volumes. For example, `local-storage`.
2. **Cloud Pak for Integration and OpenShift top-level CR installations:**
   a. Get the contents of your analytics CR:

   ```
   kubectl -n <namespace> get a7s -o yaml
   ```

   b. Copy the `spec.ingestion` section to a text editor, and indent each line by two extra spaces. For example:

   ```
     ingestion:
       clientAuthEnabled: true
       clientSubjectDN: CN=a7s-ing-client
       configReloadAutomatic: true
       enabled: true
       endpoint:
         annotations:
           cert-manager.io/issuer: instname-ingress-issuer
         hosts:
         - name: instname-a7s-ai-endpoint-apic.apps.iaintlcr.cp.fyre.ibm.com
           secretName: instname-a7s-ai-endpoint
       pipelineBatchDelay: 10
       pipelineBatchSize: 2000
       pipelineWorkers: 4
   ```

   c. Add the persistent queue settings to the ingestion section in your text editor:

   ```
     ingestion:
       clientAuthEnabled: true
       clientSubjectDN: CN=a7s-ing-client
       configReloadAutomatic: true
       enabled: true
       endpoint:
         annotations:
           cert-manager.io/issuer: instname-ingress-issuer
         hosts:
         - name: instname-a7s-ai-endpoint-apic.apps.iaintlcr.cp.fyre.ibm.com
           secretName: instname-a7s-ai-endpoint
       pipelineBatchDelay: 10
       pipelineBatchSize: 2000
       pipelineWorkers: 4
       queue:
         type: persisted
         volumeClaimTemplate:
           storageClassName: <storage-class-name>
           volumeSize: 50Gi # Do not change this value
   ```

   where *<storage-class-name>* is the Kubernetes storage class that is defined for persistent volumes. For example, `local-storage`.
   d. Edit your `APIConnectCluster` CR:

   ```
   kubectl -n <namespace> edit APIConnectCluster
   ```

e. Copy the updated ingestion section from your text editor to your `APIConnectCluster` CR.

3. Save you changes to the CR. The ingestion pods restart automatically.

Enable persistent queue on OVA

Configure the persistent queue in the analytics-extra-values.yaml file.

1. From your project directory, open the analytics-extra-values.yaml file for editing. If this file does not exist, then create it: Analytics extra-values file.
2. Add the following text to the file, inside the `spec` object:

```
ingestion:
  queue:
     type: persisted
     volumeClaimTemplate:
        storageClassName: local-storage
        volumeSize: 50Gi
```

3. Ensure that your `extra-values-file` property is set to point to your analytics-extra-values.yaml file:

```
apicup subsys set <analytics subsystem> extra-values-file analytics-extra-values.yaml
```

4. Apply the analytics-extra-values.yaml to your analytics subsystem:

```
apicup subsys install <analytics subsystem>
```

Offload to third-party systems

Offload your API event data for storage on a third-party system.

The analytics event data that is sent from the gateway to analytics can be offloaded to a third-party system in real time. The third-party system can provide enhanced monitoring, alerting, storage, and analysis, in addition to what the built-in analytics subsystem provides. Multiple target systems are supported, and the data can be modified before offloading.

APIC supports offloading analytics data to the following third-party systems:

- HTTP endpoints
- OpenSearch
- Elasticsearch
- Apache Kafka
- Syslog servers

If you do not need internal storage and want to use only the third-party system for working with your analytics data, consider disabling internal storage entirely as explained in Disable local storage.

- **Configuring offload on Kubernetes and OpenShift**
  Configure your analytics subsystem to offload API event data to a third-party system.
- **Configuring offload on VMware**
  Configure your VMware analytics subsystem to offload API event data to a third-party system.
- **Sample output plugins for offloading data**
  Review sample output plugins to see how to code your own plugins for offloading data from API Connect analytics.
- **Using offloaded analytics data to train AI models**
  How to use API Connect analytics data to train AI models.
- **Troubleshooting offload**
  Checks to help determine the cause of offload failure.

Configuring offload on Kubernetes and OpenShift

Configure your analytics subsystem to offload API event data to a third-party system.

Procedure

1. Edit your analytics CR:

```
kubectl edit a7s
```

Note: If you are using the OpenShift top-level CR deployment, edit your `APIConnectCluster` CR instead. Updates should be made in the `spec.analytics` section.

2. Set `spec.external.offload` to true, and add the offload plugin configuration:
The following example shows an HTTP output plugin:

```
  external:
    offload:
      enabled: true
      output: |
        http {
          url => "https://example.com"
          http_method => "post"
          ssl_verification_mode => "none"
          id => "API Connect analytics event data"
        }
```

In this example, the URL points to an HTTPS endpoint, but verification of the endpoint's server certificate is disabled by setting `ssl_verification_mode` to "none". If you want your analytics subsystem to verify the endpoint server certificate, then see Configuring offload server certificates on Kubernetes and OpenShift.

The `id` property is not mandatory, but it is recommended.

For more information about the HTTP output plugin configuration, see the Logstash HTTP plugin documentation.

3. Optional: Add a `filter` after the output plugin configuration to modify data before it is sent to the offload target.
The following example filter removes the `query_string` field:

```
external:
  offload:
    enabled: true
    output: |
      http {
        ...
      }
    filter: |
      ruby {
        remove_field => ["query_string"]
      }
```

For information about modifying offloaded data, see Customizing data with ingestion filters.
4. Save the changes to your analytics CR. The ingestion pods restart automatically.
5. Update your analytics subsystem infrastructure backup with your updated analytics CR. See Backup, restore, and disaster recovery.

- **Configuring offload server certificates on Kubernetes and OpenShift**
Configure your analytics subsystem to trust your offload endpoint.
- **Configuring offload client certificates on Kubernetes and OpenShift**
Configuring client keys for analytics offload.

Configuring offload server certificates on Kubernetes and OpenShift

Configure your analytics subsystem to trust your offload endpoint.

Before you begin

You must have the offload target's server certificate in either of these formats:

- Base64 encoded `pem` file.
- JKS file. If you are using a JKS file, encode the contents in Base64:

```
cat <JKS certificate filename> | base64
```

About this task

The ingestion pod of your analytics subsystem sends your API event data to your offload target. If your offload target uses TLS, then your ingestion pod must be configured to trust the offload target. The steps in this procedure insert the server certificate in the ingestion pod's offload certificates directory, so that the ingestion pod can validate the certificate it receives from the offload endpoint.

Procedure

1. Create a file called analytics_offload_certificates.yaml, and paste in the following contents:
   - If you are using a JKS file, then in the `data` section of the secret, paste the encoded JKS string as shown:

```
apiVersion: v1
kind: Secret
metadata:
  name: offload-certificates
data:
  keystore.jks: "<base64 encoded JKS string>"
```

   - If you are using a PEM file, then in the `stringData.cacert` section paste the contents of the PEM file.

```
apiVersion: v1
kind: Secret
metadata:
  name: offload-certificates
stringData:
  cacert: |-
    -----BEGIN CERTIFICATE-----
    MIIDIDCCAomgAwIBAgIENd70zzANBgkqhkiG9w0BAQUFADBOMQswCQYDVQQGEwJVUzEQMA4GA1UE
    ChMHRXF1aWZheDEtMCsGA1UECxMkRXF1aWZheCBTZWN1cmUgQ2VydGlmaWNhdGUgQXV0aG9yaXR5
    MB4XDTk4MDgyMjE2NDE1MVoXDTE4MDgyMjE2NDE1MVowTjELMAkGA1UEBhMCVVMxEDAOBgNVBAoT
    B0VxdWlmYXgxLTArBgNVBAsTJEVxdWlmYXggU2VjdXJlIENlcnRpZmljYXRlIEF1dGhvcml0eTCB

    Af8wGgYJKoZIhvZ9B0EABA0wCxsFVjMuMGMDAgbAMA0GCSqGSIb3DQEBBQUAA4GBAFjOKer89961
    zgK5F7WF0bnj4JXMJTENAKaSbn+2kmOeUJXRmm/kEd5jhW6Y7qj/WsjTVbJmcVfewCHrPSqnI0kB
```

```
    BIZCe/zuf6IWUrVnZ9NA2zsmWLIodz2uFHdh1voqZiegDfqnc1zqcPGUIWVEX/r87yloqaKHee95
    70+sB3c4
    -----END CERTIFICATE-----
```

2. Create the `offload-secret` in your analytics namespace, from the analytics_offload_certificates.yaml file.

   ```
   kubectl -n <namespace> apply -f analytics_offload_certificates.yaml
   ```

   Verify that the `offload-secret` was created:

   ```
   kubectl -n <namespace> get secrets
   ```

3. Edit your analytics CR:

   ```
   kubectl edit a7s
   ```

   Note: If you are using the OpenShift top-level CR deployment, edit your `APIConnectCluster` CR instead. Updates should be made in the `spec.analytics` section.
4. Add the new property `spec.external.offload.secretName`, and set it to `offload-secret` (the secret you created in step 2).

   ```
   offload:
     enabled: true
     secretName: offload-secret
     output: |
       ...
   ```

   When your ingestion pod restarts, it copies the contents of the offload-secret into its /etc/velox/external_certs/offload directory.

5. Update your plugin properties to include the path to the server certificate. The property name for the endpoint server certificate depends on your output target. For HTTP the property name is `ssl_certificate_authorities`. Consult the Logstash documentation to confirm the property name used by other plugin types such as Syslog and Elasticsearch.
   Example HTTP output plugin:

   ```
   ...
         output: |
           http {
             url => "https://example.com"
             http_method => "post"
             id => "API Connect analytics event data"
             ssl_certificate_authorities => "/etc/velox/external_certs/offload/<certname>"
           }
   ```

   where *<certname>* is the name that you specified in the analytics_offload_certificates.yaml file in step 1, either `cacert` or `keystore.jks` depending on the format of certificate used.
6. Save the updated analytics CR.
   When you save the updated CR, your ingestion pod restarts itself automatically and detects the new `secretName` in the CR. On startup, the ingestion pod copies the certificate from the specified `secretName` to its /etc/velox/external_certs/offload directory. You can verify that the certificate was successfully imported with:

   ```
   kubectl exec -ti <ingestion pod> -- bash -ic "ls /etc/velox/external_certs/offload"
   ```

   This command should return the certificate name that you specified in the analytics_offload_certificates.yaml file, either `cacert` or `keystore.jks` depending on the format of certificate used.
   When your ingestion pod communicates with your HTTPS endpoint, it verifies the server certificate that the endpoint returns against the certificate that is stored in /etc/velox/external_certs/offload.

7. Ensure that you take a backup of your offload secret and your updated analytics CR. For more information about backups, see Backup, restore, and disaster recovery

Configuring offload client certificates on Kubernetes and OpenShift

Configuring client keys for analytics offload.

The topic Configuring offload server certificates on Kubernetes and OpenShift covers how to configure your ingestion pod to trust your offload endpoint server certificate. This topic covers how to configure mTLS client certificates to be used when your ingestion pod communicates with the offload endpoint.

To configure client certificates, follow the same steps as Configuring offload server certificates on Kubernetes and OpenShift, but add your client certificate and key to the analytics_offload_certificates.yaml file.

For example:

```
apiVersion: v1
kind: Secret
metadata:
  name: offload-certificates
stringData:
  cacert: |-
    -----BEGIN CERTIFICATE-----
    ...
  clientcert: |-
    -----BEGIN CERTIFICATE-----
    ...
  clientkey: |-
    -----BEGIN CERTIFICATE-----
    ...
```

All certificates added to the `offload-certificates` secret are created as individual files in the ingestion pod's /etc/velox/external_certs/offload directory. You can confirm that the certificate files were created with this command:

```
kubectl exec -ti <ingestion pod> -- bash -ic "ls /etc/velox/external_certs/offload"
```

In this example, the command output that is returned shows the three certificate files corresponding to the ones specified in analytics_offload_certificates.yaml:

```
cacert  clientcert  client
```

Update the offload plugin configuration in your analytics CR to reference the certificates in /etc/velox/external_certs/offload as required.

Example HTTP plugin that specifies client certificates:

```
  external:
    offload:
      enabled: true
      output: |
        http {
          url => "https://example.com"
          http_method => "post"
          ssl_certificate_authorities => "/etc/velox/external_certs/offload/cacert"
          ssl_certificate => "/etc/velox/external_certs/offload/clientcert"
          ssl_key => "/etc/velox/external_certs/offload/clientkey"
          id => "API Connect analytics event data"
        }
```

For other plugin types the TLS property names might differ, check the Logstash documentation.
Important: After updating your offload configuration, take a new analytics infrastructure configuration backup to ensure that you have backups of your analytics_offload_certificates.yaml file, your offload secret, and your analytics CR. See Backup, restore, and disaster recovery.

Configuring offload on VMware

Configure your VMware analytics subsystem to offload API event data to a third-party system.

Procedure

1. From your project directory, open the analytics-extra-values.yaml file for editing. If this file does not exist, then create it: Analytics extra-values file.
2. Add the following text to the file, inside the **spec** section:

   ```
   spec:
   ...
     external:
       offload:
         enabled: true
         output: |
           <output definition>
   ```

   where *<output definition>* is the configuration for the chosen output plugin that will send data to the target third-party system.The following example enables offloading to HTTP:

   ```
   spec:
     external:
       offload:
         enabled: true
         output: |
           http {
             url => "https://example.com"
             http_method => "post"
             ssl_verification_mode => "none"
             id => "API Connect analytics event data"
           }
   ```

   In this example, the URL points to an HTTPS endpoint, but verification of the endpoint's server certificate is disabled by setting **ssl_verification_mode** to "none". If you want your analytics subsystem to verify the endpoint server certificate, then see Configuring offload server certificates on VMware.

   The **id** property is not mandatory, but it is recommended.

   For more information about the HTTP output plugin configuration, see the Logstash HTTP plugin documentation.

3. Optional: Add a **filter** after the output plugin to modify data before it is sent to the offload target.
   The following example filter removes the **query_string** field:

   ```
   spec:
     external:
       offload:
         enabled: true
         output: |
           http {
             url => "example.com"
             http_method => "post"
             id => "offload_http"
           }
         filter: |
           ruby {
             remove_field => ["query_string"]
           }
   ```

   For information about modifying offloaded data, see Customizing data with ingestion filters.

4. Save the analytics-extra-values.yaml file.
5. Ensure that your `extra-values-file` property is set to point to your analytics-extra-values.yaml file:

   ```
   apicup subsys set <analytics subsystem> extra-values-file analytics-extra-values.yaml
   ```

6. Apply the analytics-extra-values.yaml to your analytics subsystem:

   ```
   apicup subsys install <analytics subsystem>
   ```

7. Take a backup of your updated analytics-extra-values.yaml file. For more information about backups, see Backup, restore, and disaster recovery.

- **Configuring offload server certificates on VMware**
  Configure your analytics subsystem to trust your offload endpoint.
- **Configuring offload client certificates on VMware**
  Configuring client keys for analytics offload.

Configuring offload server certificates on VMware

Configure your analytics subsystem to trust your offload endpoint.

Before you begin

You must have the offload target's server certificate in either of these formats:

- Base64 encoded `pem` file.
- JKS file. If you are using a JKS file, encode the contents in Base64:

  ```
  cat <JKS certificate filename> | base64
  ```

Procedure

1. SSH to your analytics VM, or one of the VMs if you have a three replica deployment.

   ```
   ssh apicadm@<analytics VM FQDN>
   ```

2. Switch to the root user:

   ```
   sudo -i
   ```

3. If you are using a JKS file, create a file to contain your certificate.

   ```
   echo "<certificate>" > <certificate filename>
   ```

4. Follow the steps for Configuring offload server certificates on Kubernetes and OpenShift.
   When you follow Kubernetes steps on VMware, run all operations as the root user. You do not need to specify a namespace when running **kubectl** commands on VMware. For example if a step has the command:

   ```
   kubectl -n <namespace> apply -f analytics_offload_certificates.yaml
   ```

   you can omit the `-n <namespace>`.
   To identify the ingestion pod, run:

   ```
   kubectl get pods
   ```

5. Keep a backup of the server certificate as part of your analytics infrastructure backup. For more information about backups, see Backup, restore, and disaster recovery.

Configuring offload client certificates on VMware

Configuring client keys for analytics offload.

Procedure

1. SSH to your analytics VM, or one of the VMs if you have a three replica deployment.

   ```
   ssh apicadm@<analytics VM FQDN>
   ```

2. Switch to the root user:

   ```
   sudo -i
   ```

3. Refer to the Kubernetes steps documented in Configuring offload client certificates on Kubernetes and OpenShift.
   When you follow Kubernetes steps on VMware, run all operations as the root user. You do not need to specify a namespace when running **kubectl** commands on VMware. For example if a step has the command:

   ```
   kubectl -n <namespace> apply -f analytics_offload_certificates.yaml
   ```

   you can omit the `-n <namespace>`.
   To identify the ingestion pod, run:

```
kubectl get pods
```

4. Keep a backup of your client certificates as part of your analytics infrastructure backup. For more information about backups, see Backup, restore, and disaster recovery.

Sample output plugins for offloading data

Review sample output plugins to see how to code your own plugins for offloading data from API Connect analytics.

For complete details of output plugin syntax, see the Logstash output plugins documentation.

HTTP

Example HTTP output plug-in:

```
http {
   url => "example.com"
   http_method => "post"
   codec => "json"
   content_type => "application/json"
   headers => {
      "x-acme-index" => "8"
      "x-acme-key" => "0d5d259f-b8c5-4398-9e58-77b05be67037"
   }
   id => "offload_http"
}
```

Example HTTP output plug-in that references a custom certificate for accessing the third-party endpoint:

```
http {
   url => "https://example.com:443"
   http_method => "post"
   codec => "json"
   content_type => "application/json"
   headers => {
      "x-acme-index" => "8"
      "x-acme-key" => "0d5d259f-b8c5-4398-9e58-77b05be67037"
   }
   id => "offload_http"
   ssl_certificate_authorities => "/etc/velox/external_certs/offload/cacert"
}
```

For more information about offloading to HTTP, refer to the HTTP output plugin documentation.

Elasticsearch

To configure data offload to an Elasticsearch cluster, you must specify the following properties:

- One or more server Elasticsearch server URLs.
- A dynamically configured name to define how indices are created.
- The number of primary shards for storing the indexed documents.
- The number of replica shards for redundancy.
- Server authentication credentials (if requried).

The naming syntax that you specify for your indices determines how many indices are created and how they are characterized. For example, you can define indices that are created based on a date pattern, or indices that are created to store data by provider organization or by API name.

Example Elasticsearch output plugin:

```
elasticsearch {
      hosts => "https://example.com:443"
      index => "apiconnect"
      ssl  => true
      cacert => "/etc/velox/external_certs/offload/cacert"
}
```

For more information about offloading to Elasticsearch, refer to the Elasticsearch output plugin documentation.

Apache Kafka

To configure data offload to a Kafka cluster, provide host and port connection details for one or more servers, and the name of the Kafka topic. To be able to identify API Connect data, include the string identifier `id`.

Example Kafka output plug-in:

```
kafka {
      topic_id => "api_events"
      bootstrap_servers => "example.com:9093"
      codec => "json"
      id => "apic_kafka_offload"
      ssl_truststore_location => "/usr/share/logstash/jdk/lib/security/cacerts"
      ssl_truststore_password => "changeit"
      ssl_truststore_type => "JKS"
      security_protocol => SSL
}
```

For more information on offloading to Apache Kafka, refer to the Kafka output plugin documentation.

Syslog

To configure data offload to Syslog, you must provide host and port connection details for the server.

Restriction: Syslog does not support the use of chained client certificates for TLS profiles.
Example Syslog output plug-in:

```
syslog {
  host => "example.com"
  port => 601
  protocol => "ssl-tcp"
  id => "offload_syslog"
  appname => "apiconnect"
  msgid => "%{org_id}"
  facility => "user-level"
  severity => "informational"
  codec => "json"
  ssl_cacert => "/etc/velox/external_certs/offload/cacert"
}
```

Attention: Due to a third-party issue with Logstash, most of the facility values are not set correctly on the offload server. As a temporary workaround, set the facility to "user-level" to ensure that the corresponding value is correctly sent to the offload server. When Logstash corrects this problem, you must update the offload configuration to change the value to a more appropriate setting.
For more information about offloading to Syslog, refer to the Syslog output plugin documentation.

OpenSearch

To configure data offload to OpenSearch, see the Ship to OpenSearch documentation.

Noname

To configure data offload to Noname, see the Noname documentation.

Example Noname offload plugin:

```
http {
  url => "https://<ENGINE_URL>/engine?structure=ibm-apiconnect"
  http_method => "post"
  codec => "json"
  content_type => "application/json"
  headers => ["x-nn-source-index", "<INDEX>", "x-nn-source-key", "<KEY>"]
  id => "noname-offload"
  ssl_certificate_authorities => "/etc/velox/external_certs/offload/cacert"
}
```

Combining offload configuration with filters

The following examples show how to use filters to control what data is offloaded.

Offload events from `catalog1` only:

```
   offload:
     enabled: true
     if  [catalog_name] == "catalog1" {
          http {
            url => "http://offloadhost.example.com/offload"
            http_method => "post"
            codec => "json"
            content_type => "application/json"
            id => "offload_http"
          }
        }
```

Offload to different locations based on catalog name:

```
offload:
  enabled: true
  output: |
    if  [catalog_name] == "catalog1" {
      http {
        url => "http://offloadhost.example.com /offload1"
        http_method => "post"
        codec => "json"
        content_type => "application/json"
        id => "offload1_http"
      }
    }
    else if  [catalog_name] == "catalog2" {
      http {
        url => "http://offloadhost2.example.com /offload2"
        http_method => "post"
        codec => "json"
        content_type => "application/json"
        id => "offload2_http"
      }
    }
```

Use the catalog name as a variable in the offload location:

```
offload:
  enabled: true
  http {
    url => "http://offloadhost.example.com /%{[catalog_name]}"
    http_method => "post"
    codec => "json"
    content_type => "application/json"
    id => "offload_http"
  }
```

Do not offload events from `apic` and `sandbox` catalogs:

```
offload:
  enabled: true
  if  [catalog_name] !~ /sandbox|apic/ {
    http {
      url => "http://offloadhost.example.com /%{[catalog_name]}"
      http_method => "post"
      codec => "json"
      content_type => "application/json"
      id => "offload_http"
    }
  }
```

Using offloaded analytics data to train AI models

How to use API Connect analytics data to train AI models.

API Connect analytics holds full information on all of your API events. This information can prove invaluable in training AI models by using machine learning. Possible use cases include training data for automated tests or for security anomaly detection.

IBM Cloud Pak for Data (CP4D) includes the means to train AI models with data from various data sources. It is not possible for CP4D to pull data directly from API Connect's internal analytics database because the database is secured with no external access. However, you can offload your analytics data to an external database, and then configure CP4D to load data from that external database. You can use any external database that both API Connect analytics offload and CP4D support. The simplest option might be an external ELK stack (Elasticsearch Logstash Kibana). A list of supported data sources for CP4D can be found here: https://www.ibm.com/docs/en/cloud-paks/cp-data/latest?topic=data-supported-sources.

Documentation on how to configure Cloud Pak for Data to access Elasticsearch can be found here: https://www.ibm.com/docs/en/cloud-paks/cp-data/latest?topic=catalogs-elasticsearch-connection.

When your analytics data is offloaded to an external database, you can use it to train your AI model. Here is an example of how to create and train an AI model in CP4D using IBM Watson Machine Learning: https://www.ibm.com/docs/en/cloud-paks/cp-data/latest?topic=deploying-managing-ai-assets.

Troubleshooting offload

Checks to help determine the cause of offload failure.

- Check the ingestion pod logs for error messages that are related to offload:
  - Kubernetes, OpenShift, and Cloud Pak for Integration:

    ```
    kubectl -n <namespace> logs <analytics ingestion pod name>
    ```

  - VMware: Find the ingestion pod logs in Gathering logs for a VMware environment.

  A common problem is TLS handshaking errors, such as untrusted or expired certificates.
- Check logs on your third-party system.
- Verify that the specified URL or the host and port values for the target system are accurate.
- Verify that the server or cluster of servers in the target system are running and reachable. If applicable, also verify that firewall settings are not causing connection problems.
- If offloading data to an Elasticsearch or Kafka target, verify that your configuration settings are valid; for example, the user credentials for authenticating to Elasticsearch or the Kafka topic name.

Disable local storage

If you are offloading you API event data to a third-party system, you can disable local storage to reduce subsystem resource requirements.

The analytics subsystem provides a complete solution for routing, storing, and viewing the analytics data. However, you might not need the internal storage and viewing solution if you are using a third-party system for data offloading. In this scenario, you can greatly reduce your CPU and memory costs by disabling the internal storage and viewing components.

Important:
If you disable local storage, the analytics views in your API Connect UIs remain accessible, but are empty.

Configure local storage disablement before installation. It is not possible to disable or re-enable internal storage after installation.

You can enable offload of analytics data to third-party systems after installation.

Disabling local storage on Kubernetes, OpenShift and Cloud Pak for Integration

When you disable internal storage for analytics data, the following microservices are disabled:

- `osinit`
- `storage`

During the API Connect installation process, set `storage.enabled` to false in the CR:

```
storage:
  enabled: false
```

The relevant installation pages for each platform are:

- Kubernetes analytics install
- OpenShift analytics subsystem install
- OpenShift top-level CR install.
- Cloud Pak for Integration: Use the YAML tab to edit the CR before installation, see *API management deployment* in https://www.ibm.com/docs/en/cloud-paks/cp-integration.

Disabling local storage on VMware

During installation of the analytics subsystem, create the analytics extra-values file, and insert:

```
storage:
  enabled: false
```

Do not create your analytics subsystem ISO files before the `extra-values-file` property is set:

```
apicup subsys set <analytics subsystem> extra-values-file analytics-extra-values.yaml
```

Shutting down the analytics subsystem

Disable the analytics service and shutdown the analytics subsystem.

About this task

This operation requires the use of the analytics CLI.

Disabling the analytics subsystem stops the collection and storage of data and makes the subsystem inaccessible.

Procedure

1. Backup your analytics data as explained in Backup, restore, and disaster recovery.
2. Setup the toolkit CLI so you can run analytics CLI operations: Analytics CLI.
3. Optional: Disable shard allocation.
   Disable shard allocation to prevent new shards from being created for replication when a node is unavailable. For more information about shards, see OpenSearch nodes, indices, shards, and replicas.

   a. Create a JSON file called `analytics_persistent_settings.json` and insert the contents:

   ```
   {"persistent":{"cluster.routing.allocation.enable":"none"}}
   ```

   b. Run the following analytics CLI command:

   ```
   apic --mode analytics clustermgmt:putSettings --server <platform api endpoint> --analytics-service <analytics service name> --format json analytics_persistent_settings.json
   ```

   where:
   - *<platform api endpoint>* is the platform API endpoint.
   - *<analytics service name>* is the name of analytics service as configured in the Cloud Manager UI.

   Expected output:

   ```
   {"acknowledged":true,"persistent":{"cluster":{"routing":{"allocation":{"enable":"none"}}}},"transient":{}}
   ```

4. Optional: Run a synced flush of storage.
   The synced flush operation flushes all current index operations synchronously and writes all in-flight transactions to disk.

   ```
   apic --mode analytics clustermgmt:postFlush --server <platform api endpoint> --analytics-service <analytics service name> --format json
   ```

   where:
   - *<platform api endpoint>* is the platform API endpoint.
   - *<analytics service name>* is the name of analytics service as configured in the Cloud Manager UI.

   When you flush storage, the response looks like the following example, with the *failed* count set to zero:

   ```
   {
       "_shards": {
           "total": 16,
           "successful": 6,
           "failed": 0
   ```

```
    }
}
```

This operation occasionally fails, but it is safe to rerun it multiple times until it passes and the "failed" count is zero.

5. Unassociate the analytics service from all gateway services.
   a. In Cloud Manager, click Topology.
   b. In the section for the Availability Zone that contains the analytics service, locate the Gateway service that the analytics service is associated with.
   c. Click ⋮ and select Unassociate.

   For more information, see Associating an analytics service with a gateway service.

6. Unregister the analytics service from Cloud Manager:
   a. In Cloud Manager, click Topology.
   b. In the section for the Availability Zone that contains the analytics service, locate the analytics service and click Delete.

   For more information, see Registering an analytics service.

7. **Kubernetes, OpenShift, and Cloud Pak for Integration only:** Set replicas to zero for the analytics pods by editing the Deployments and StatefulSets that manage them: `director`, `mtls-gw`, `ingestion`, and `storage`:

   ```
   kubectl -n <namespace> edit deploy analytics-director
   kubectl -n <namespace> edit deploy analytics-mtls-gw
   kubectl -n <namespace> edit sts analytics-ingestion
   kubectl -n <namespace> edit sts analytics-storage
   ```

   Note: The Deployments and StatefulSets on Cloud Pak for Integration and OpenShift with the top-level CR have the name format *<instance name>-a7s-...*
   Set *replicas* to zero:

   ```
   spec:
     ...
     replicas: 0
     ...
   ```

   The analytics `director`, `mtls-gw`, `ingestion`, and `storage` pods all terminate.
8. **VMware only:** Shutdown your analytics VMs from your VMware console.

Reenabling the analytics subsystem

9. **Kubernetes, OpenShift, and Cloud Pak for Integration only:** Repeat step 7 but in reverse order and setting the *replicas* value back to what it was before.
   The pods all start:

   ```
   kubectl get deploy -n <namespace>
   analytics-director                          1/1     1            1           7h10m
   analytics-mtls-gw                           1/1     1            1           7h6m

   kubectl get sts -n <namespace>
   analytics-ingestion   1/1     7h10m
   analytics-storage     1/1     7h12m
   ```

10. **VMware only:** Start your analytics VMs from your VMware console.
11. Reregister the analytics service: Registering an analytics service.
12. Reassociate your analytics service with your gateways Associate new analytics service(s) with gateway(s).
13. Enable shard allocation by following these steps:
    Note: If you did not disable shard allocation in step 3, skip this step.
    a. Create a JSON file called `analytics_persistent_settings.json` and insert the contents:

    ```
    {"persistent":{"cluster.routing.allocation.enable":"all"}}
    ```

    b. Run the following analytics CLI command:

    ```
    apic --mode analytics clustermgmt:putSettings --server <platform api endpoint> --analytics-service <analytics service name> --format json analytics_persistent_settings.json
    ```

    where:
    - *<platform api endpoint>* is the platform API endpoint.
    - *<analytics service name>* is the name of analytics service as configured in the Cloud Manager UI.

    When you enable shard allocation, the response looks like the following example:

    ```
    {"acknowledged":true,"persistent":{"cluster":{"routing":{"allocation":{"enable":"all"}}}},"transient":{}}
    ```

Restarting analytics pods

How to restart the analytics pods in your API Connect deployment.

About this task

Certain scenarios might require you to restart your analytics subsystem pods. To restart your analytics pods, follow the steps in this topic.

Procedure

1. **VMware users only:** Log in to your analytics VM and switch to the root user:

   ```
   ssh apicadm@<vm hostname>

   sudo -i
   ```

2. Restart the analytics pods.
   - **Kubernetes and OpenShift:** Run the following command:

     ```
     kubectl -n <namespace> delete pod -l app.kubernetes.io/instance=<analytics CR>
     ```

   - **VMware:** Run the following command:

     ```
     kubectl delete pods --all
     ```

3. Verify that all analytics pods restart successfully:

   ```
   kubectl -n <namespace> get pods
   ```

   where *<namespace>* is the namespace where the analytics subsystem is installed. VMware users can omit `-n <namespace>`.

Change deployment profile

Change your deployment profile to switch between one replica and three replica deployments, or to change the computing resources available for your subsystem.

- **Change deployment profile on Kubernetes and OpenShift**
  Update your analytics CR to change your deployment profile.
- **Change deployment profile on VMware**
  Use the **apicup** command and deploy new VMs to change your deployment profile.

Change deployment profile on Kubernetes and OpenShift

Update your analytics CR to change your deployment profile.

Note: This topic covers Kubernetes and OpenShift individual subsystem installations. For other platforms see:

- Changing deployment profile on Cloud Pak for Integration
- Changing deployment profile on OpenShift, top-level CR

Note: If you have a three replica profile, and want to change to one replica, you must first change your analytics configuration to shared storage. Dedicated storage is not supported on the one replica profile.

1. Verify that subsystem is in `Running` state.

   ```
   kubectl -n <namespace> get a7s
   ```

2. Edit the analytics CR:

   ```
   kubectl -n <namespace> edit a7s
   ```

   Change `spec.profile` value to the new profile that you want to use: Analytics deployment profiles.

3. Monitor you analytics pods to confirm the expected number of replicas are running:

   ```
   kubectl -n <namespace> get pods
   ```

4. Verify that subsystem is in `Running` state.

   ```
   kubectl -n <namespace> get a7s
   ```

Change deployment profile on VMware

Use the **apicup** command and deploy new VMs to change your deployment profile.

For information about the available deployment profiles, see Planning your deployment topology and profiles.
Note:
The procedures to change deployment profile do not permit the endpoints to be changed.

If you want to change a one replica deployment to a three replica deployment, and you used the hostname of your original VM in your endpoints, you cannot change these endpoints. In this scenario, you must configure load-balancers and logical DNS records so that your original VM hostname routes to the new VMs of your three replica deployment.

If you want to change endpoints, you can use the form-factor migration process.

Moving to a profile that has the same number of VMs

Complete the following steps to change your deployment profile:

1. Take backups of your analytics configuration and database: VMware analytics backup.
2. Shutdown your analytics VMs.
3. Update the CPU and memory resources for your analytics VMs in your VMware console, as required for your new profile.
4. Restart your VMs.
5. In your project directory, update your deployment profile:

```
apicup subsys set <subsystem name> deployment-profile=<new profile>
```

6. Apply the new profile:

```
apicup subsys install <subsystem name>
```

If for any reason you are not able to change the CPU or memory on your VMs, redeploy them following the disaster recovery process: Recovering from a disaster.

Moving from a one replica to a three replica deployment profile

1. Take backups of your analytics configuration and database: VMware analytics backup.
   Note: You do not need to take VMware snapshots, since your existing VM is deleted and replaced when you change deployment profile.
2. In your project directory, update your deployment profile:

```
apicup subsys set <analytics subsystem name> deployment-profile=<three replica profile>
```

3. Define the hostname and network interfaces for the two new analytics VMs. Use the `apicup hosts create` and `apicup iface create` commands. For more information, see Configuring the Analytics subsystem.
4. Shutdown your existing analytics VM.
5. Follow the disaster recovery steps: Recovering from a disaster, but note that you must create a new ISO file for your original single analytics VM. Do not attempt to reuse the previous ISO file in your new three replica deployment.
6. When disaster recovery steps are complete and your new deployment is verified, delete your original VM (which you shutdown in step 4).

Moving from a three replica to a one replica deployment profile

1. Take backups of your analytics configuration and database: VMware analytics backup.
   Note: You do not need to take VMware snapshots, since your existing VMs are deleted and replaced when you change deployment profile.
2. In your project directory, update your deployment profile:

```
apicup subsys set <subsystem name> deployment-profile=<one replica profile>
```

3. Delete two of your three VMs from your configuration with the `apicup hosts delete` command.
4. Shutdown your existing API Connect VMs.
5. Follow the disaster recovery steps: Recovering from a disaster, but note that you must create a new ISO file for your analytics VM. Do not attempt to reuse a previous ISO file in your new one replica deployment.
6. When disaster recovery steps are complete and your new deployment is verified, delete your original VMs (which you shutdown in step 4).

Performance tuning with ingestion pipeline properties

Fine tune your ingestion pipeline settings for optimal performance.

Table 1.

Field	Type	Default value	Description	Comments
`ingestion: pipelineWorkers`	4 <= integer <= 128	24	Number of pipeline workers.	More workers mean more CPU and memory requirements, but gives you the benefit of extra threads to pull data off the ingestion HTTP interface and process it for storage. Increasing the number of pipeline workers excessively results in diminishing returns. `pipelineWorkers` should usually be a multiple of the number of cores of your hardware. Adjust with caution.
`ingestion: pipelineBatchSize`	10 <= integer <= 10000	250	Batch size of a pipeline worker.	Pulling more or less data off the HTTP interface per worker can have benefits. Recommended values are `125`, `250`, and `500`. Increasing the value requires more memory.
`ingestion: pipelineBatchDelay`	10 <= integer <= 5000	50	Batch delay of a pipeline worker.	How long to wait for the batch size to fill before leaving the HTTP interface to process for storage. Having threads wait too long causes idle threads in your system; however, setting this value too low decreases performance. Adjust with caution.
`ingestion: configReloadAutomatic`	Boolean	true	Whether to automatically reload the pipeline on configuration changes.	Typically, when the underlying files for the pipeline are modified, the pipeline process automatically reloads and picks up the changes. However, in Kubernetes environments where the pipeline is mapped to ConfigMaps, this is unreliable. Ingestion pod restarts are usually required.
`ingestion: pipelineUnsafeShutdown`	Boolean	false	Whether to allow unsafe shutdown of the pipeline.	Typically, the pipeline attempts to empty all workers' batches before shutdown to prevent data loss. You might need to enable this setting if the pipeline is badly configured and refuses to respond to shut down requests (uncommon). Adjust with caution.

Customize your analytics data

How to customize the data stored in your API event records.

- **Activity log policy**
  Configure the activity log policy to manage the level of detail of the data stored in API events.
- **Customizing data with a gateway script or set-variable operation**
  Customize your API event records on the gateway before they are sent to your analytics subsystem.

- **Customizing data with ingestion filters**
  Customize you API event records as they are received from the gateway.

Activity log policy

Configure the activity log policy to manage the level of detail of the data stored in API events.

When you configure an API in the API Manager UI, you choose what data is stored in the API event records for calls to that API with the **activity log** property. The **activity log** property has separate settings for successful API calls, and for failed API calls. The activity log options are:

- none: API events are not logged.
- activity: Logs the API resource URI. **activity** is the default log setting for successful API calls.
- header: Logs the API resource URI and HTTP headers.
- payload: Logs API resource URI, HTTP headers, and request and response payloads. **payload** is the default log setting for failed API calls, since the response payload might have useful information on the cause of the failure.

Note:
If your gateway is configured to authenticate all API calls with an OAuth provider, the data that is related to the OAuth call is only included in the API event data when the OAuth call fails. Successful OAuth authentication is not recorded in the API event data.

Defining log setting in the API Manager UI

1. In the API Manager UI Develop view, select the API that you want to work with. If you are not familiar with the API Manager UI Develop view, see Working with API definitions.
2. Select the Gateway tab, expand Gateway and portal settings, then select Activity Log.
3. Select Enabled, then select the preferred log setting for Success Content and Error Content:
   - none: API events are not logged.
   - activity: Logs the API resource URI. **activity** is the default log setting for successful API calls.
   - header: Logs the API resource URI and HTTP headers.
   - payload: Logs API resource URI, HTTP headers, and request and response payloads. **payload** is the default log setting for failed API calls, since the response payload might have useful information on the cause of the failure.
4. Click Save to save your changes.

Defining log setting in source for DataPower® API Gateway

Use the **activity-log** extension to configure your logging preferences.

```
activity-log:
  success-content: <success log setting: none, activity, header, payload>
  error-content: <failure log setting: none, activity, header, payload>
  enabled: <if activity logging is enabled: true or false>
```

Note: If payload logging is enabled, for the gateway to capture payloads buffering must also be enabled.

```
activity-log:
  success-content: <success log setting: none, activity, header, payload>
  error-content: <failure log setting: none, activity, header, payload>
  enabled: <if activity logging is enabled: true or false>
buffering: true
```

Examples:

No logging of successful calls, header logging for failed calls

```
activity-log:
    success-content: none
    error-content: header
    enabled: true
```

Disable activity logging

```
activity-log:
    enabled: false
```

Defining log setting in source for DataPower Gateway (v5 compatible)

The activity-log policy has the following format:

```
- activity-log:
  version: <version>
  title: <title>
  description: <description>
  content: <success log setting: none, activity, header, payload>
  error-content: <failure log setting: none, activity, header, payload>
```

where:

- *<version>* is the policy version number. Set version to 1.0.0.
- *<title>* is a title for the policy.
- *<description>* is a description for the policy.

Apply this policy by adding an assembly extension with an execute field to your OpenAPI definition file.

Note: If payload logging is enabled, for the gateway to capture payloads buffering must also be enabled.

```
activity-log:
  success-content: activity_to_log_if_call_successful
  error-content: activity_to_log_if_call_unsuccessful
  enabled: is_activity_logging_enabled
buffering: true
```

Examples:

Maintain default log behavior

Do not specify **content** or **error-content**:

```
- activity-log:
  version: 1.0.0
  title: default activity logging
```

No logging of successful calls, activity logging for failed calls

```
- activity-log:
  version: 1.0.0
  title: no logging for successful calls
  content: none
  error-content: activity
```

Customizing data with a gateway script or set-variable operation

Customize your API event records on the gateway before they are sent to your analytics subsystem.

Before you begin

Ensure that you are familiar with the API Manager UI, and working with API definitions.
Note: This feature is not available with DataPower® Gateway (v5 compatible).

About this task

During API execution, the activity data is stored in the **log** context variable, which populates the API event record on completion of the API execution. For more information about **log** context variables, see API activity logging context variables.

The analytics subsystem stores analytics data as individual API event records. The API event record fields are documented here: API event record field reference. It is possible to customize the API event records for specific APIs. You can modify the contents of existing API event fields, and add new custom fields by using a gateway script or the **set-variable** operation.
Note: If you want to make updates to all incoming API event data, rather than specific APIs, you can use ingestion filters instead.

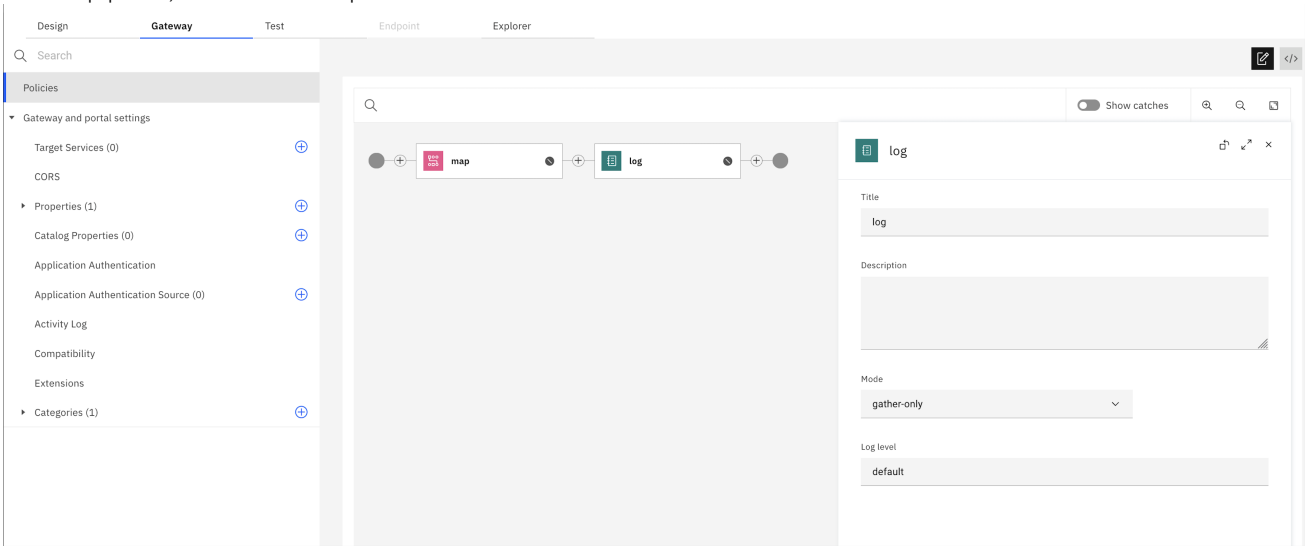
Procedure

1. In the API Manager UI, click the Develop APIs and products tile, select the APIs tab, click Add, select API.
2. Select New OpenAPI, give the API the title of "Hello World", and click Next. Click Next again to accept the security defaults, and then click Edit API.
3. Select the YAML source view </>. Replace the generated YAML with the following YAML and click Save:

```
swagger: '2.0'
info:
  title: Hello World
  x-ibm-name: hello-world-rest
  version: 1.0.0
schemes:
  - https
basePath: /hello-world
security:
  - {}
securityDefinitions:
  clientID:
    type: apiKey
    in: header
    name: X-IBM-Client-Id
x-ibm-configuration:
  phase: realized
  testable: true
  enforced: true
  properties:
    target-url:
      value: http://example.com/operation-name
      description: The URL of the target service
      encoded: false
  cors:
    enabled: true
  activity-log:
    enabled: true
    error-content: header
    success-content: activity
  application-authentication:
    certificate: false
  assembly:
    execute:
      - map:
```

```
        version: 2.0.0
        title: map
        inputs:
          name:
            schema:
              type: string
            variable: request.parameters.name
        outputs:
          response:
            schema:
              $ref: '#/definitions/Result'
            variable: message.body
        actions:
          - set: response.hello
            from: name
            value: '''Hello '' +$(name)'
    catch: []
    finally: []
  gateway: datapower-api-gateway
  categories:
    - /tests
  type: rest
definitions:
  Result:
    type: object
    additionalProperties: false
    properties:
      hello:
        type: string
paths:
  /hello:
    get:
      parameters:
        - name: name
          in: query
          required: false
          type: string
      responses:
        '200':
          description: OK Response
          schema:
            $ref: '#/definitions/Result'
    parameters: []
```

4. Click the Form icon to switch to the Form view and select the Gateway tab.
5. Ensure that Policies is selected.
6. On the canvas, click the plus icon at the last position in the flow. The palette listing the available elements to build the assembly flow appears.
7. From the palette, add the Log policy element onto the canvas by clicking it. Set the log policy Mode drop-down to Gather-only. This step is so that the "log" context variable is populated, for use in the next step.

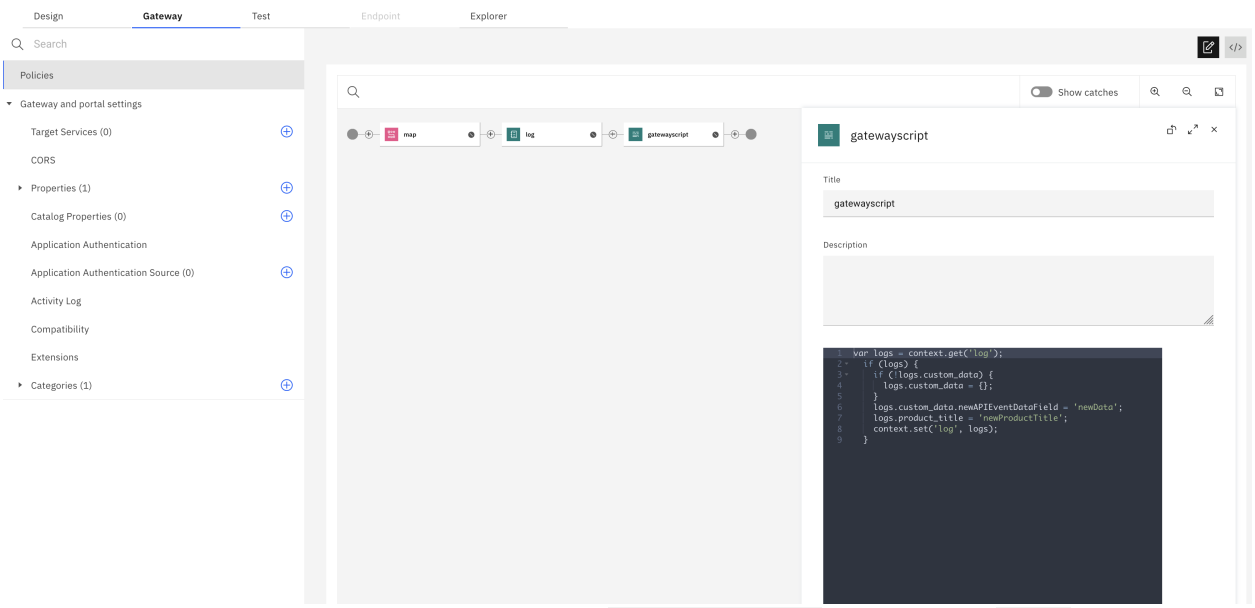


8. Modify API event data or add custom data either with a gateway script or by using the set-variable operation.

   Gateway script method

   Add a gateway script policy to the assembly flow and paste in the following script code:

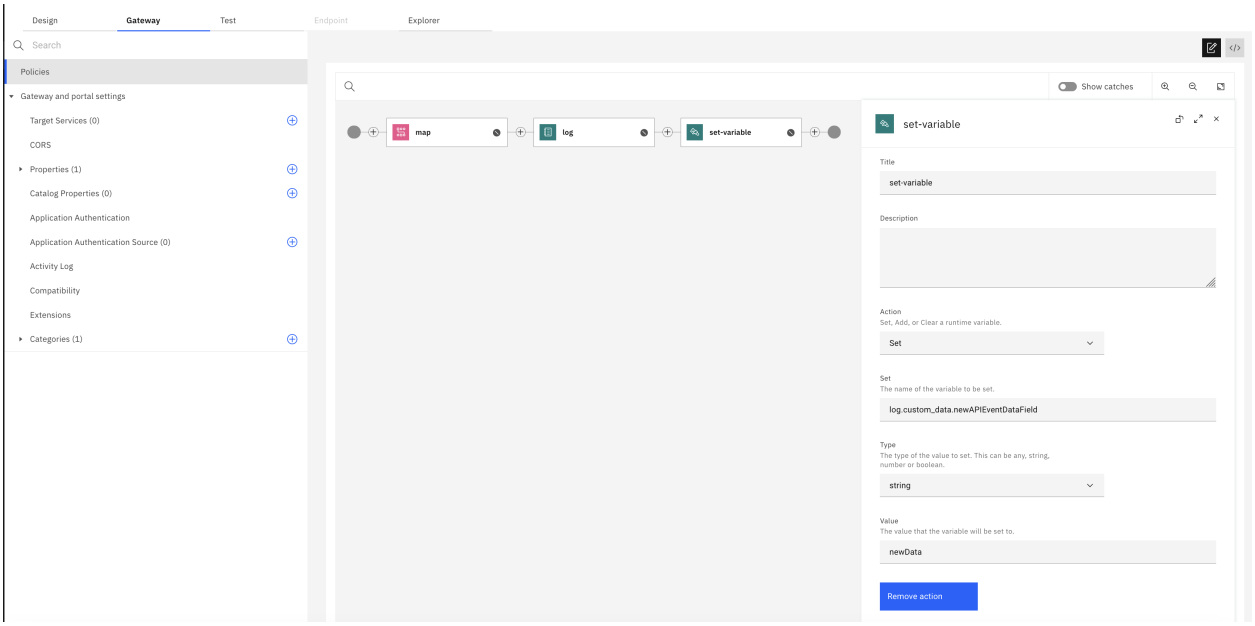
```
var logs = context.get('log');
  if (logs) {
    if (!logs.custom_data) {
      logs.custom_data = {};
    }
    logs.custom_data.newAPIEventDataField = 'newData';
    logs.product_title = 'newProductTitle';
    context.set('log', logs);
  }
```



In this example, the new field that is added to the API event record is called **`newAPIEventDataField`** and its value is set to **`newData`**. The value of the existing field **`product_title`** is changed to **`newProductTitle`**.

Set-variable method

If you cannot or do not want to use a gateway script, then you can use a set-variable policy instead. Add a set-variable policy to the assembly flow, and set it as follows:



In this example, the new field that is added to the API event record is called **`newAPIEventDataField`** and its value is set to **`newData`**

The YAML code for set-variable is:

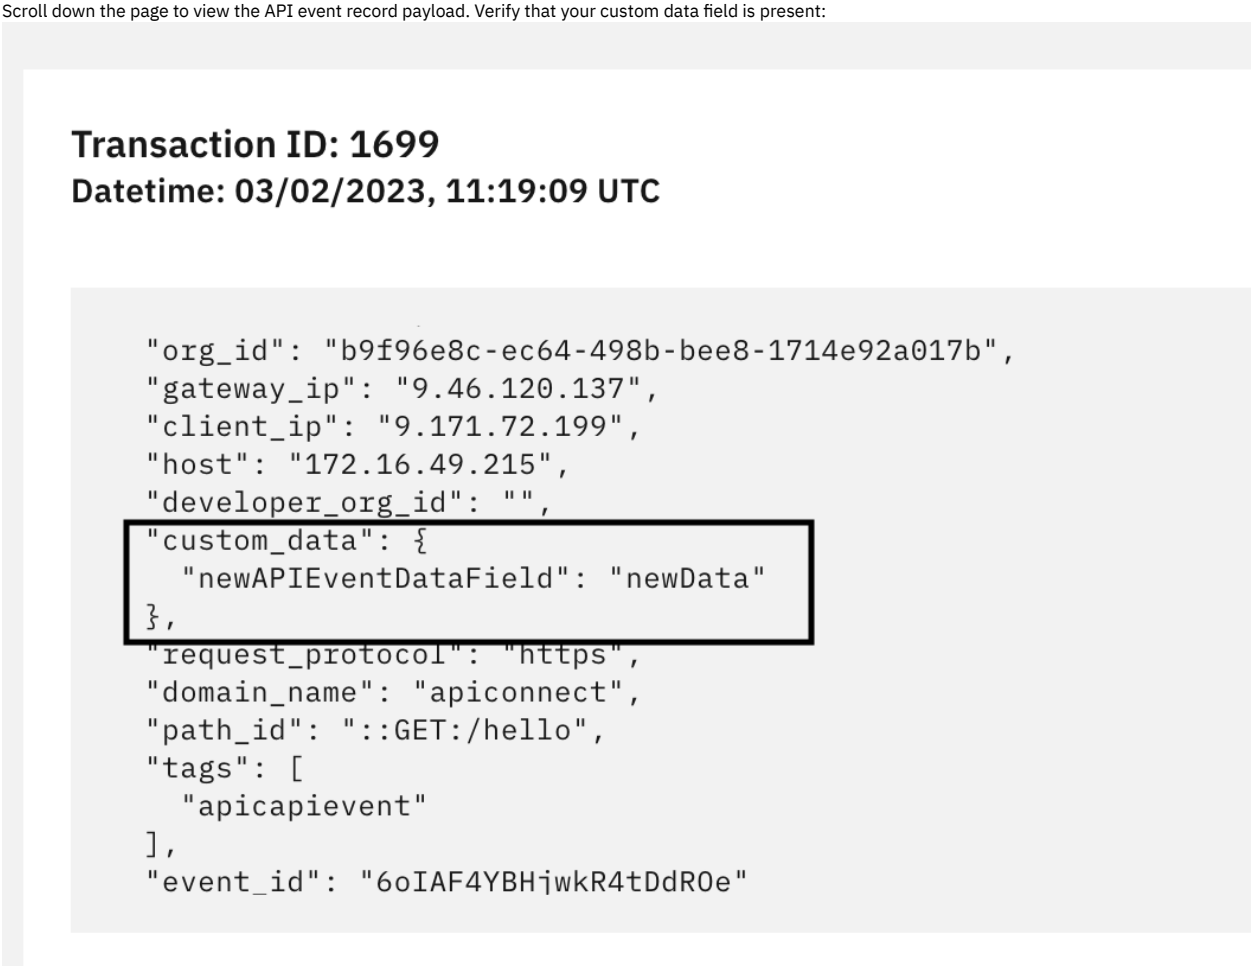
```
    - set-variable:
        version: 2.0.0
        title: set-variable
        actions:
          - set: log.custom_data.newAPIEventDataField
            value: newData
            type: string
          - set: log.product_title
            value: newProductTitle
            type: string
```

Note: **`context.log.custom_data`** supports the addition of primitive typed values such as strings and integers, no limit is enforced on how many you can add. Add data only to the **`context.log.custom_data`** object. Do not add data to **`context.log`**.

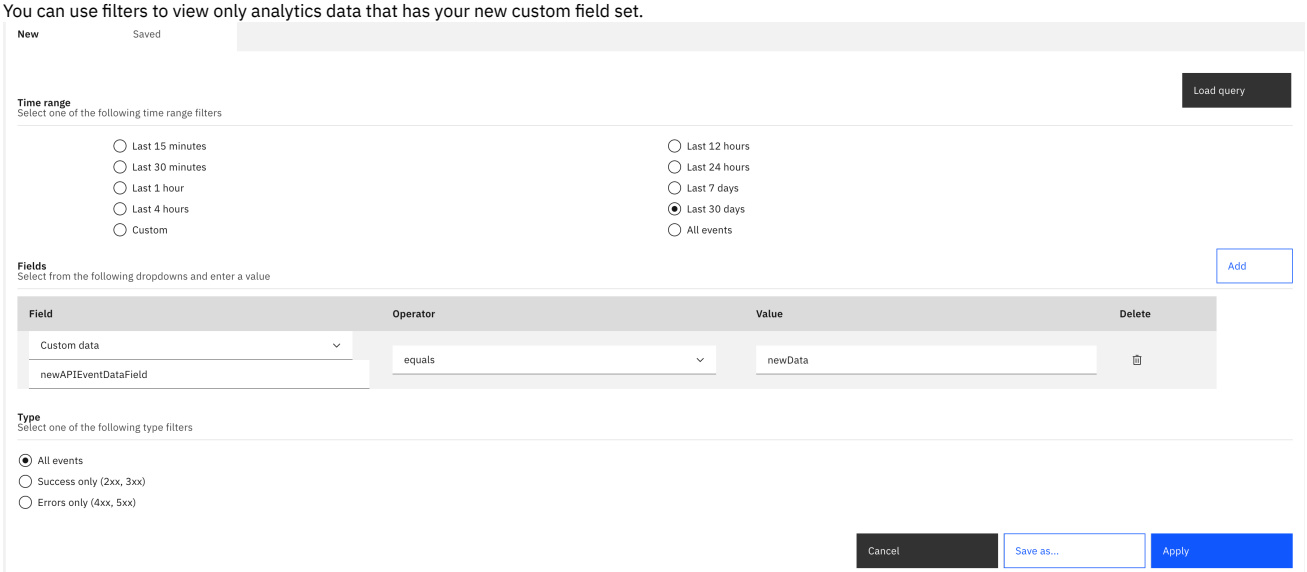
The type of existing fields cannot be changed. For example, **`product_title`** is a string and cannot be changed to an integer. Do not attempt to assign a different type to an API event field.

9. Publish your "Hello World" API to a catalog.
10. Make a test call to the API and verify that the new custom data is set.
    a. From the Analytics view, select Discover and click the API event record corresponding to your test call:

b. Scroll down the page to view the API event record payload. Verify that your custom data field is present:



11. You can use filters to view only analytics data that has your new custom field set.



12. To use new data with REST API calls, use the custom_data query parameter:

```
/cloud/events?custom_data[newAPIEventDataField]=newData
```

Customizing data with ingestion filters

Customize you API event records as they are received from the gateway.

Create ingestion filters to customize the analytics API event records as they are received from the gateway and before they are sent on to internal storage or offloaded to a third-party system. Filters enable you to add new fields, modify existing fields, or remove fields from the API event record. Filters are applied to all incoming API events, but you can include a conditional check in your filter syntax if you want a filter to apply to specific APIs only.

Ingestion filters use Logstash plug-ins. For more information about Logstash plug-ins, see the Logstash documentation.

All fields in the API event record are modifiable with ingestion filters, but to avoid problems you must adhere to the following restrictions:

- Do not modify the following fields:
  - org_id
  - catalog_id
  - space_id
  - developer_org_id
  - datetime
  - @timestamp
- Do not change the data type of existing fields. Create a new field that has the type you want and copy the contents to this field.
- If you want to sanitize data, it is more efficient to delete fields entirely than delete their contents.

To review all the fields in the API event record, see API event record field reference.

For examples of ingestion filters, see Example ingestion filters.

The steps for configuring ingestion filters depend on your platform:

- **Kubernetes and OpenShift individual subsystem installations**
  Define ingestion filters to customize API event data before it is stored or offloaded.
- **Cloud Pak for Integration and OpenShift top-level CR**
  Define ingestion filters to customize API event data before it is stored or offloaded.
- **VMware**
  Define ingestion filters to customize API event data before it is stored or offloaded.

Kubernetes and OpenShift individual subsystem installations

Define ingestion filters to customize API event data before it is stored or offloaded.

Procedure

1. Edit your `AnalyticsCluster` CR:

   ```
   kubectl -n <namespace> edit a7s
   ```

2. Filters for API events that are offloaded to a third-party system are defined in the `external.offload` section. Filters for API events that are stored in the API Connect OpenSearch database are defined in the `ingestion` section.

   Ingestion filters - for API event data stored by API Connect
   Add the filter definition to the `ingestion` section:

   ```
   ingestion:
     ...
     filter: |
       if [api_name] == "test-api" {
         mutate {
           remove_field => ["query_string"]
         }
       }
   ```

   In this example, a conditional filter is used to apply the change to API event records where the API name is `test-api`.

   Offload filters - for API event data that is sent to a third-party system.
   Add the filter definition to the `external.offload` section:

   ```
   external:
     offload:
       filter: |
         mutate {
           remove_field => ["query_string"]
         }
   ```

   In this example, no conditional filter is used; the change is applied to all APIs.

   For more examples, see Example ingestion filters.

3. Optional: Include geoIP fields in your analytics data, for both stored and offloaded data, by inserting `geoIPEnabled: true` in the ingestion section:

   ```
   ingestion:
     ...
     geoIPEnabled: true
   ```

   By default the `client_geoip` and `gateway_geoip` fields are not included in the analytics data. You do not need to add `geoIPEnabled` to the `external.offload` section. Enabling geoIP in the `ingestion` section enables it for both data routes.

   Note:
   To ensure the value in the `client_geoip` field is accurate, the gateway must receive the `X-Forwarded-For` header in all API calls. Check with the administrator of your deployment environment to ensure that the `X-Forwarded-For` header is passed to your gateways. For example, in a Kubernetes environment where NINGX ingresses are used, configure the NGINX ingress that is used by your gateway to use the `X-Forwarded-For` header: NGINX Configuration "use-forwarded-headers".

   The geoIP feature is useful with internet routable IP addresses only. For instance, 192.168.x.x and 10.x.x.x IP addresses, being internal private IP addresses, cannot be resolved to a geographical location.

4. Save the changes. Updates to filters take effect after approximately 30 seconds.

Cloud Pak for Integration and OpenShift top-level CR

Define ingestion filters to customize API event data before it is stored or offloaded.

About this task

Procedure

1. Edit your **APIConnectCluster** CR:

   ```
   oc -n <namespace> edit APIConnectCluster
   ```

2. In the **analytics.spec** section, add your ingestion filter.
   Filters for API events that are offloaded to a third-party system are defined in the **external.offload** section. Filters for API events that are stored in the API Connect OpenSearch database are defined in the **ingestion** section.

   Ingestion filters - for API event data stored by API Connect
   Add the filter definition to the **ingestion** section:

   ```
   ingestion:
     ...
     filter: |
       if [api_name] == "test-api" {
         mutate {
           remove_field => ["query_string"]
         }
       }
   ```

   In this example, a conditional filter is used to apply the change to API event records where the API name is **test-api**.
   Offload filters - for API event data that is sent to a third-party system.
   Add the filter definition to the **external.offload** section:

   ```
   external:
     offload:
       filter: |
         mutate {
           remove_field => ["query_string"]
         }
   ```

   In this example, no conditional filter is used; the change is applied to all APIs.

   For more examples, see Example ingestion filters.

3. Optional: Include geoIP fields in your analytics data, for both stored and offloaded data, by inserting **geoIPEnabled: true** in the ingestion section:

   ```
   ingestion:
     ...
     geoIPEnabled: true
   ```

   By default the **client_geoip** and **gateway_geoip** fields are not included in the analytics data. You do not need to add **geoIPEnabled** to the **external.offload** section. Enabling geoIP in the **ingestion** section enables it for both data routes.

   Note:
   To ensure the value in the **client_geoip** field is accurate, the gateway must receive the **X-Forwarded-For** header in all API calls. Check with the administrator of your deployment environment to ensure that the **X-Forwarded-For** header is passed to your gateways. For example, in a Kubernetes environment where NINGX ingresses are used, configure the NGINX ingress that is used by your gateway to use the **X-Forwarded-For** header: NGINX Configuration "use-forwarded-headers".

   The geoIP feature is useful with internet routable IP addresses only. For instance, 192.168.x.x and 10.x.x.x IP addresses, being internal private IP addresses, cannot be resolved to a geographical location.

4. Save the changes. Updates to filters take effect after approximately 30 seconds.

VMware

Define ingestion filters to customize API event data before it is stored or offloaded.

About this task

Procedure

1. From your project directory, open the analytics-extra-values.yaml file for editing. If this file does not exist, then create it: Analytics extra-values file.
2. Inside the **spec** object of your analytics-extra-values.yaml file, define your ingestion filters.
   Filters for API events that are offloaded to a third-party system are defined in the **external.offload** section. Filters for API events that are stored in the API Connect OpenSearch database are defined in the **ingestion** section.

   Ingestion filters - for API event data stored by API Connect
   Add the filter definition to the **ingestion** section:

```
ingestion:
  ...
  filter: |
    if [api_name] == "test-api" {
      mutate {
        remove_field => ["query_string"]
      }
    }
```

In this example, a conditional filter is used to apply the change to API event records where the API name is `test-api`.

Offload filters - for API event data that is sent to a third-party system.

Add the filter definition to the `external.offload` section:

```
external:
  offload:
    filter: |
      mutate {
        remove_field => ["query_string"]
      }
```

In this example, no conditional filter is used; the change is applied to all APIs.

For more examples, see Example ingestion filters.

3. Optional: Include geoIP fields in your analytics data, for both stored and offloaded data, by inserting `geoIPEnabled: true` in the ingestion section:

```
ingestion:
    ...
    geoIPEnabled: true
```

By default the `client_geoip` and `gateway_geoip` fields are not included in the analytics data. You do not need to add `geoIPEnabled` to the `external.offload` section. Enabling geoIP in the `ingestion` section enables it for both data routes.

Note:
To ensure the value in the `client_geoip` field is accurate, the gateway must receive the `X-Forwarded-For` header in all API calls. Check with the administrator of your deployment environment to ensure that the `X-Forwarded-For` header is passed to your gateways. For example, in a Kubernetes environment where NINGX ingresses are used, configure the NGINX ingress that is used by your gateway to use the `X-Forwarded-For` header: NGINX Configuration "use-forwarded-headers".

The geoIP feature is useful with internet routable IP addresses only. For instance, 192.168.x.x and 10.x.x.x IP addresses, being internal private IP addresses, cannot be resolved to a geographical location.

4. Ensure that your `extra-values-file` property is set to point to your analytics-extra-values.yaml file:

```
apicup subsys set <analytics subsystem> extra-values-file analytics-extra-values.yaml
```

5. Apply the analytics-extra-values.yaml to your analytics subsystem:

```
apicup subsys install <analytics subsystem>
```

Example ingestion filters

Review example ingestion filters to see how to add, modify, and delete fields from API event records.

You can use these example filters in the `ingestion.filter` and the `external.offload.filter` configurations. For more information about the filter syntax, see the Logstash documentation: https://www.elastic.co/guide/en/logstash/current/filter-plugins.html.

Add a field

You can add custom data to API event data by adding a field.

To avoid naming conflicts with future or current analytics fields, include a prefix that ensures your new field name is unique. For example, instead of naming the field `employee_num` you might name it `x_mycompany_employee_num`.

The following example copies the contents of the `X-Employee-Num` field from the request header and adds it to the `x_mycompany_employee_num` field.

```
if [request_http_headers] {
  ruby {
    code => "event.get('[request_http_headers]').collect {|i| event.set('[x_mycompany_employee_Num]', i['X-Employee-Num']) if
i.has_key?('X-Employee-Num')}"
  }
}
```

Modifying an existing field

Sometimes you don't want to remove a field entirely from your data, but you want to redact sensitive information such as IDs. You can modify the contents of a field and replace information with symbols or a message.

Remember: The following fields must not be modified if the data is being written to internal analytics storage: `org_id`, `catalog_id`, `space_id`, `developer_org_id`, `datetime`, and `@timestamp`.
The following example replaces sensitive information in the `X-Employee-Name` and `X-Employee-ID` request headers with the string: `*******sanitized*******`.

```
if [request_http_headers] {
  ruby {
    code => "headers=['X-Employee-Name','X-Employee-ID']; newHeaders = event.get('[request_http_headers]').collect {|i|
```

```
headers.each {|header| i[header] = '********sanitized********' if i.has_key?(header)}; i}; event.set('[request_http_headers]',
newHeaders)"
  }
}
```

Removing an existing field

Use the mutate **remove_field** operation to delete a field. To remove multiple fields, delimit the field names with commas.

The following example removes multiple fields (**request_http_headers**, **response_http_headers**, **request_body**, **response_body**, and **query_string**) from the API event record:

```
mutate {
  remove_field => ["request_http_headers", "response_http_headers", "request_body", "response_body", "query_string"]
}
```

Drop API event records

If you want certain API events to not be stored at all, use the **drop** syntax.

Do not store events from the **apic** and **sandbox** catalogs:

```
if  [catalog_name] =~ /sandbox|apic/ {
  drop { }
}
```

Access your analytics data

How to view, analyze, and export your analytics data.

- **API Connect UIs**
  View, query, and export your analytics data from the API Connect UIs.
- **Counting total API calls for your analytics service**
  Count the API calls for the analytics subsystem and see the total categorized by response status.
- **Export your analytics data**
  Export your analytics data with either the toolkit CLI or the REST API.
- **Allowing API Connect cloud admin users to view provider organization analytics data**
  The owner of a provider organization can enable or disable the sharing of analytics data with API Connect cloud administrators.
- **Analytics CLI**
  How to access your analytics data with the toolkit CLI.
- **Analytics REST API**
  How to access your analytics data with the REST API.

API Connect UIs

View, query, and export your analytics data from the API Connect UIs.

- **Accessing analytics in the Cloud Manager UI**
  How to view, analyze, and export your analytics data from the Cloud Manager UI.
- **Accessing analytics in the API Manager UI**
  How to view, analyze, and export your analytics data from the API Manager UI.
- **Accessing analytics in the Developer Portal**
  How to view your analytics data from the Developer Portal.

Accessing analytics in the Cloud Manager UI

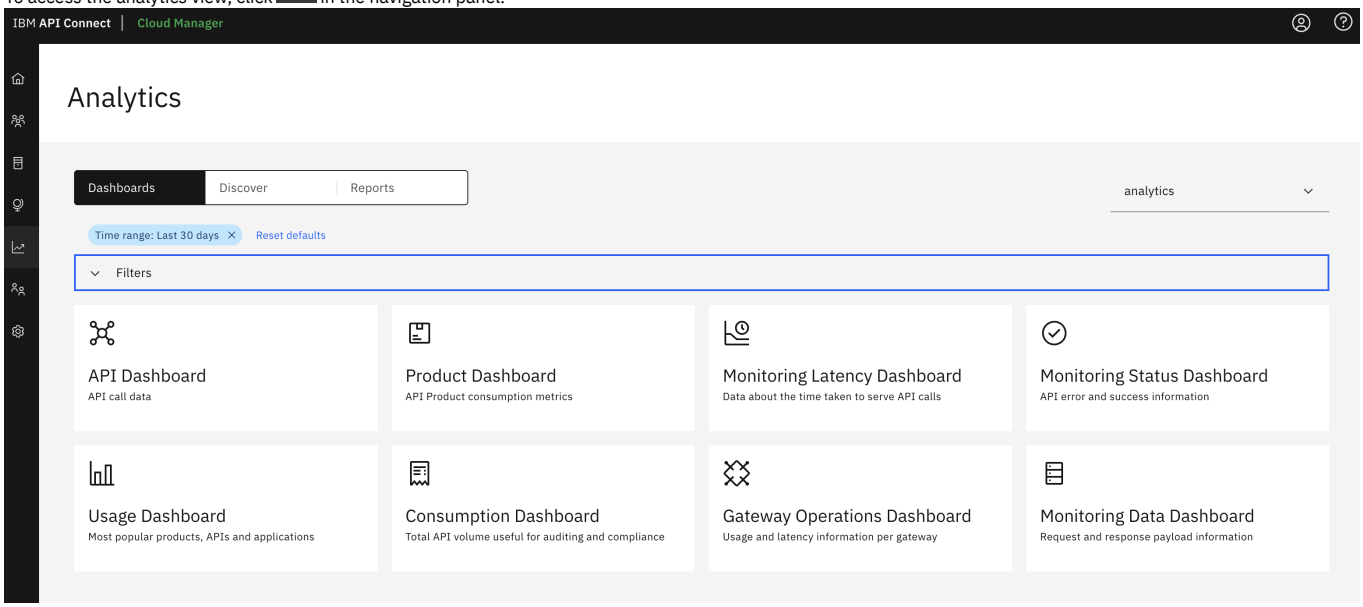
How to view, analyze, and export your analytics data from the Cloud Manager UI.

The Cloud Manager UI analytics view shows total API call volume data, and total call volumes per gateway.

The Cloud Manager UI analytics view also shows analytics data for provider organizations where the organization owner allows sharing of this data. For more information about analytics data sharing, see Allowing API Connect cloud admin users to view provider organization analytics data.
Note: If no provider organization owners enable data sharing with the cloud admin user, then the only analytics data you can see are on the following dashboards:

- Consumption Dashboard - contains charts that show total API consumption in your cloud.
- Gateway Operations Dashboard - contains charts that show API usage and latency by gateway.

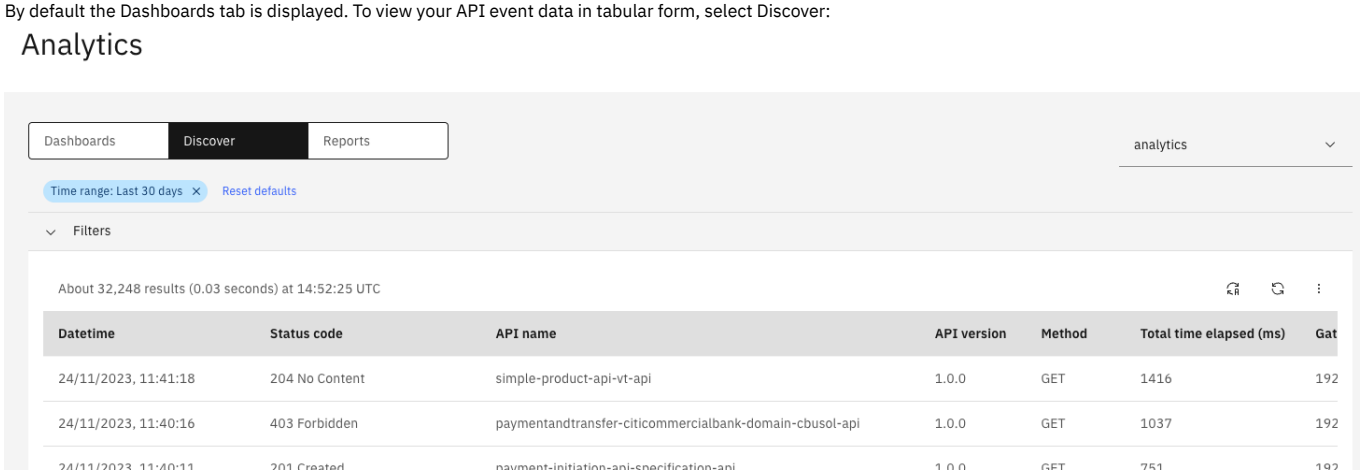
To access the analytics view, click in the navigation panel:



If you have multiple analytics services, use the list to select the analytics service whose API event data you want to view.

Discover view

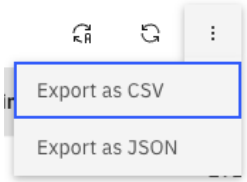
By default the Dashboards tab is displayed. To view your API event data in tabular form, select Discover:



The maximum number of API events that can be accessed from the UI is 10,000. The maximum number of event records that can be displayed per page on the Discover view is 200.

You can customize the columns displayed in the Filters section.

You can export the API event data from this view by clicking Actions at the upper right:



Note: When you export from the Discover view, only the data that is displayed on the current page of results is exported. If you want to export the data from all pages, you must export separately from each page. To export all your analytics data, do not use the UI, see Export your analytics data.
If you see unexpected HTTP OPTIONS events in the Discover view, these events are due to CORS requests from browser-based API test tools. For more information about test tools and the OPTIONS call, see Testing an API.

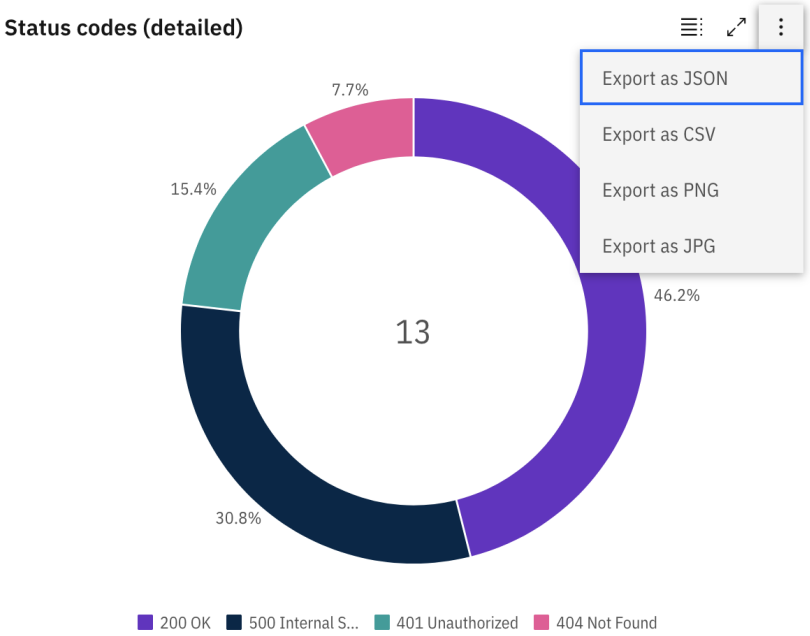
Dashboards view

Eight dashboards are available:

- API Dashboard- contains charts that summarize total API calls, response codes, and response times.
- Product Dashboard - contains charts that show total API calls and application subscriptions per plan.
- Monitoring Latency Dashboard - contains charts that provide response time statistics and data usage.

- Monitoring Status Dashboard - contains charts that show the response codes and success/failure rates of API calls.
- Usage Dashboard - contains charts that show the top 20 APIs, products, and apps.
- Consumption Dashboard - contains charts that show total API consumption in your cloud.
- Gateway Operations Dashboard - contains charts that show API usage and latency by gateway.
- Monitoring Data Dashboard - contains charts that show the APIs, plans, consumer organizations, and applications that send and receive the most data.

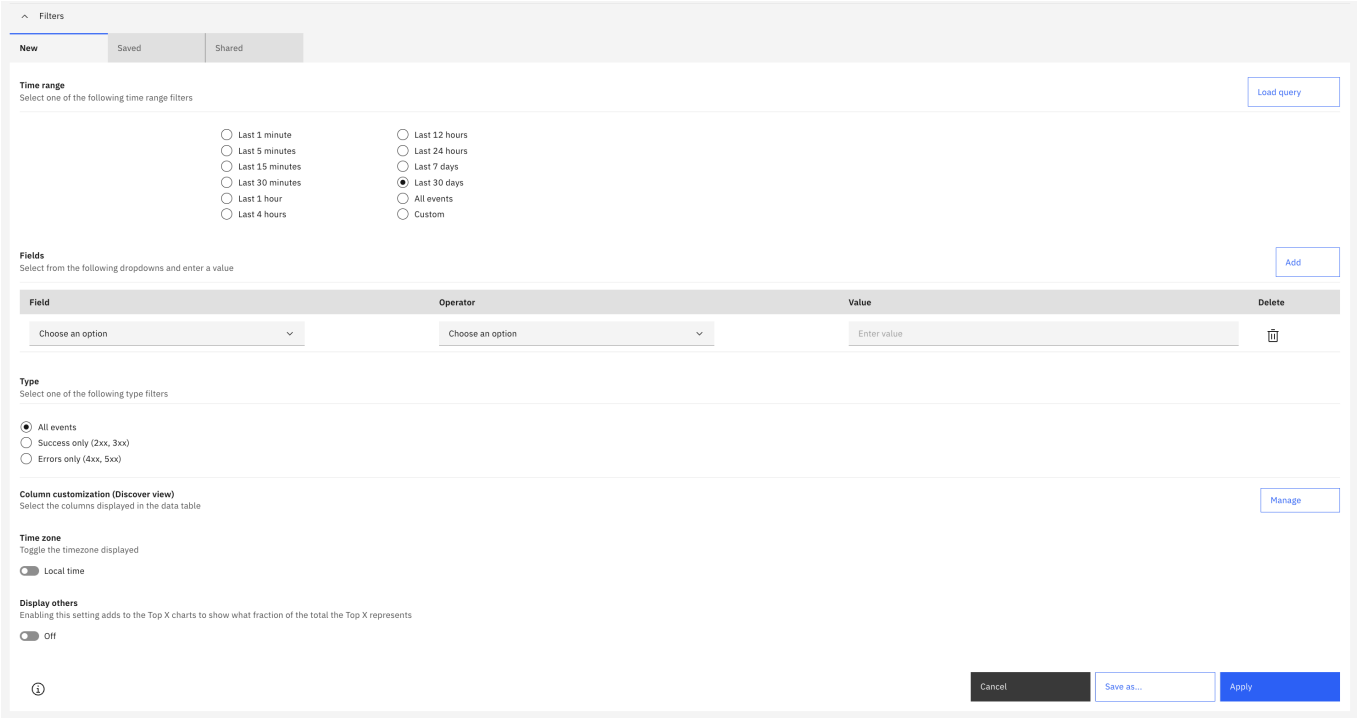
Each chart in a dashboard can be exported as a PNG or JPG image. The source data for each chart can be exported as a JSON or CSV file. To export a chart, click Actions at the upper right:



It is also possible to enlarge the chart to full-screen by clicking . To see the source data in tabular form click .

Filtering displayed data

You can filter the data that is displayed in the Dashboards and Discover view by defining filters (also called "queries"). Expand the Filters section to view, define, and apply queries to your displayed data:

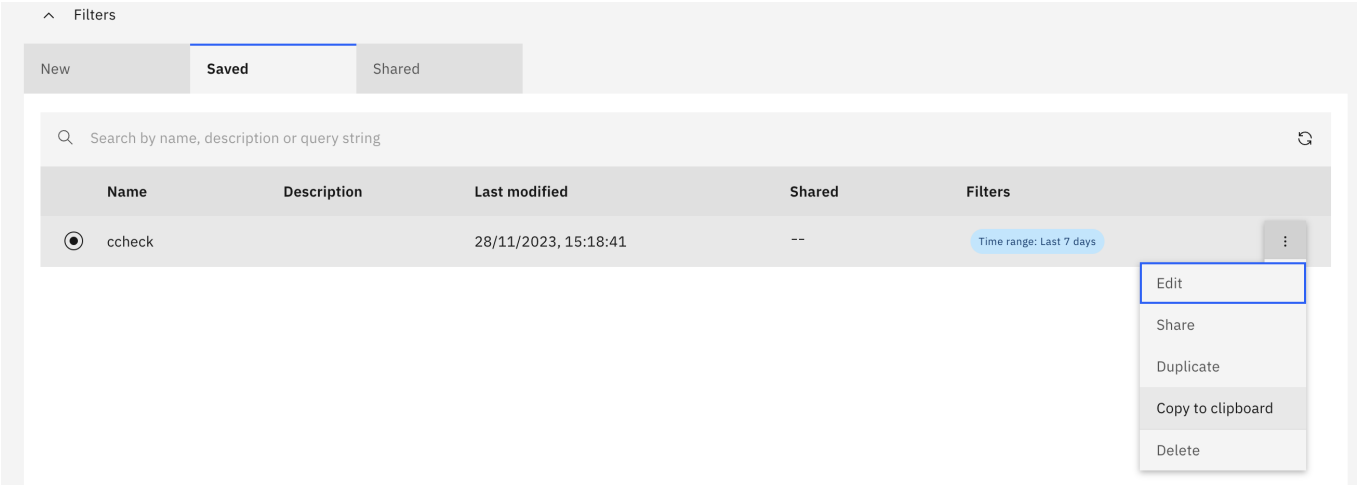


You can save and share the queries that you define:

- Shared queries are visible to all users at the same scope. They are not visible to users in a different scope. For example, a query that Cloud Manager UI users shares is not visible to an API Manager UI user. Within the API Manager UI, a query that is created at catalog scope is not visible to users who are viewing analytics data at

provider organization scope.
- Other users cannot edit or delete queries that you share, but they can create a duplicate query, which they can edit and share.
- All queries have a name and an optional description. The name does not need to be unique.

Saved queries can be exported as strings for use in REST API and toolkit CLI queries, for example:

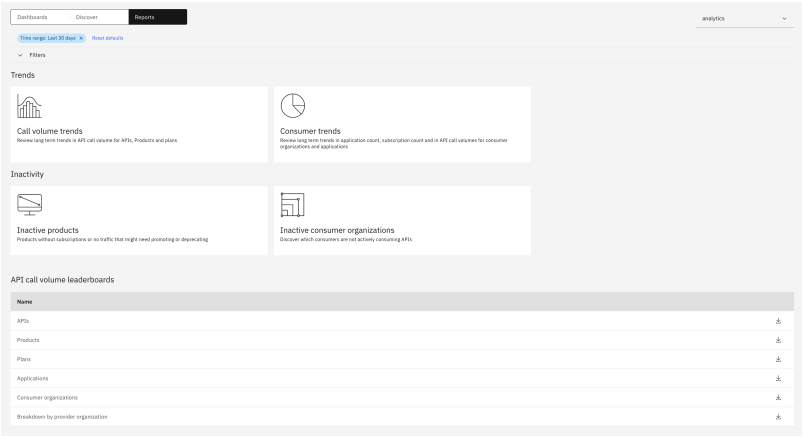


copies the following string to the clipboard:

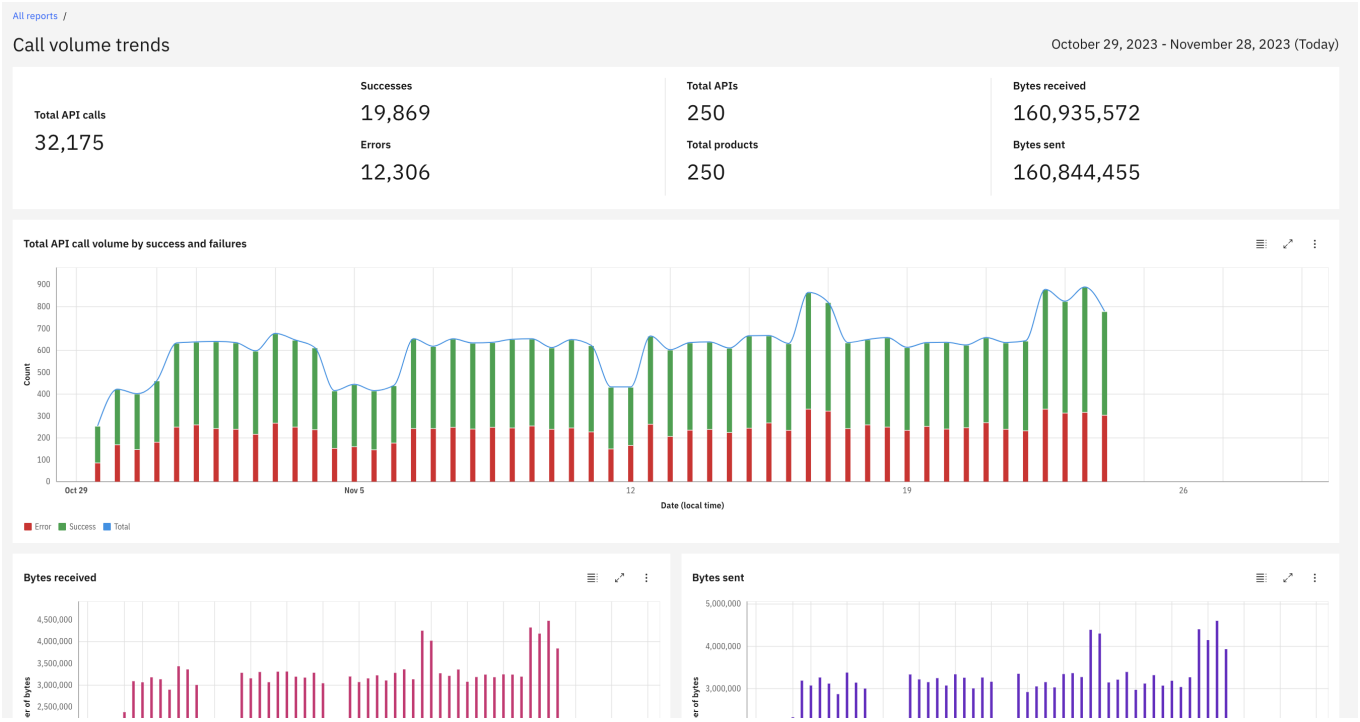
```
timeframe=last7days
```

Reports view

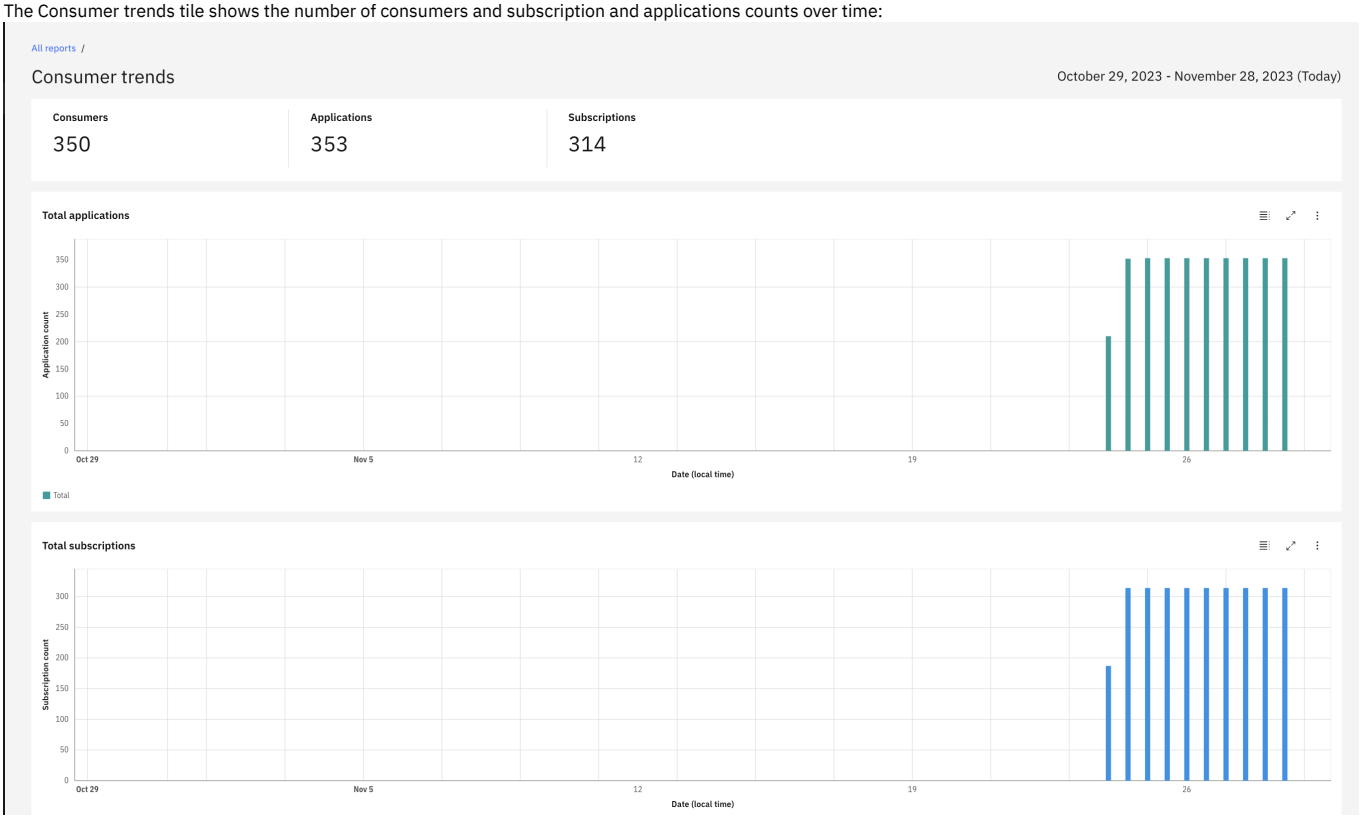
The reports view displays long-term summary data rather than individual API events.
Note: The reports view was introduced in v10.0.6, and does not include data that was generated before upgrade to v10.0.6.
The reports view contains 4 tiles and an API call volume leaderboard



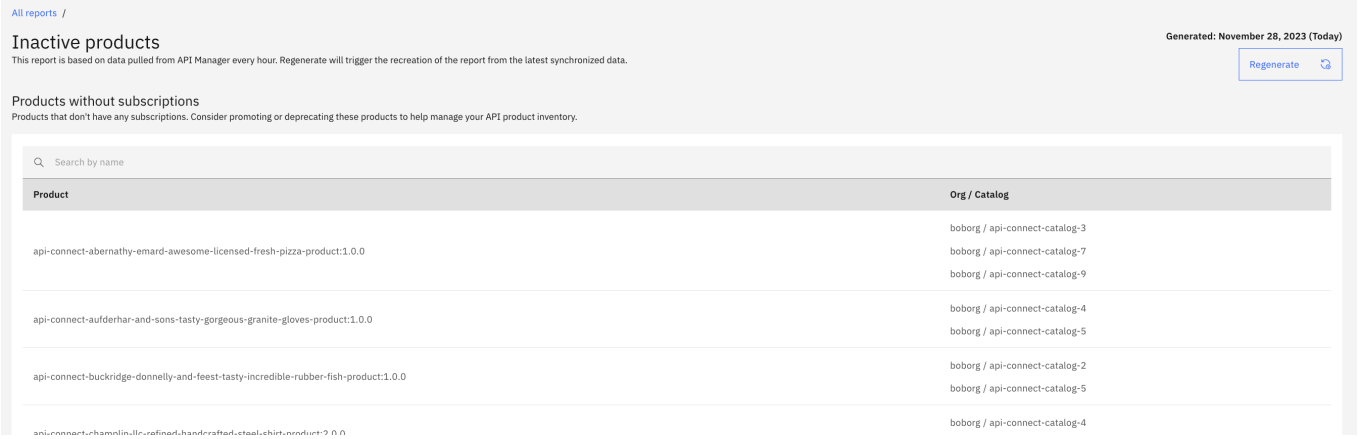
Call volume trends shows your most and least active APIs, total successful and failed API calls, total bytes sent and received, and totals based on scope.



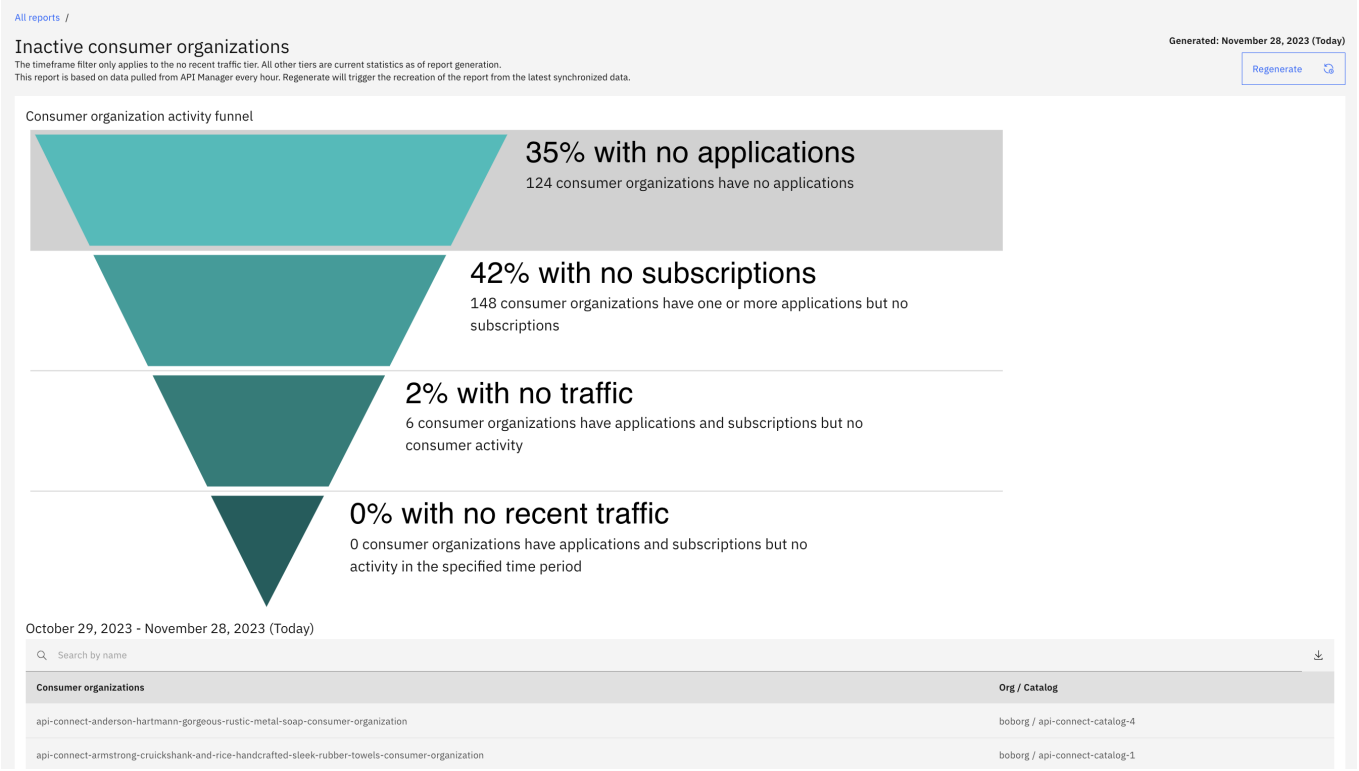
The Consumer trends tile shows the number of consumers and subscription and applications counts over time:



Inactive products shows products that have no subscriptions, and products that have no traffic.



Inactive consumer organizations shows consumer organizations that have no applications, subscriptions, recent traffic, or no traffic at all.



API call volume leaderboards shows leaderboards for APIs, Products, Plans, Applications, Consumer organizations. Click in the name column to see the data for each item.

Accessing analytics in the API Manager UI

How to view, analyze, and export your analytics data from the API Manager UI.

Analytics data is displayed in dashboards in the API Manager UI. Dashboards are scoped at the provider organization, catalog, and space level.

The ability to access analytics data at a catalog or space level depends on your assigned roles and permissions. For more information about catalogs and spaces, see Working with Catalogs and Using syndication in API Connect.

To access the analytics dashboard, complete the following steps:

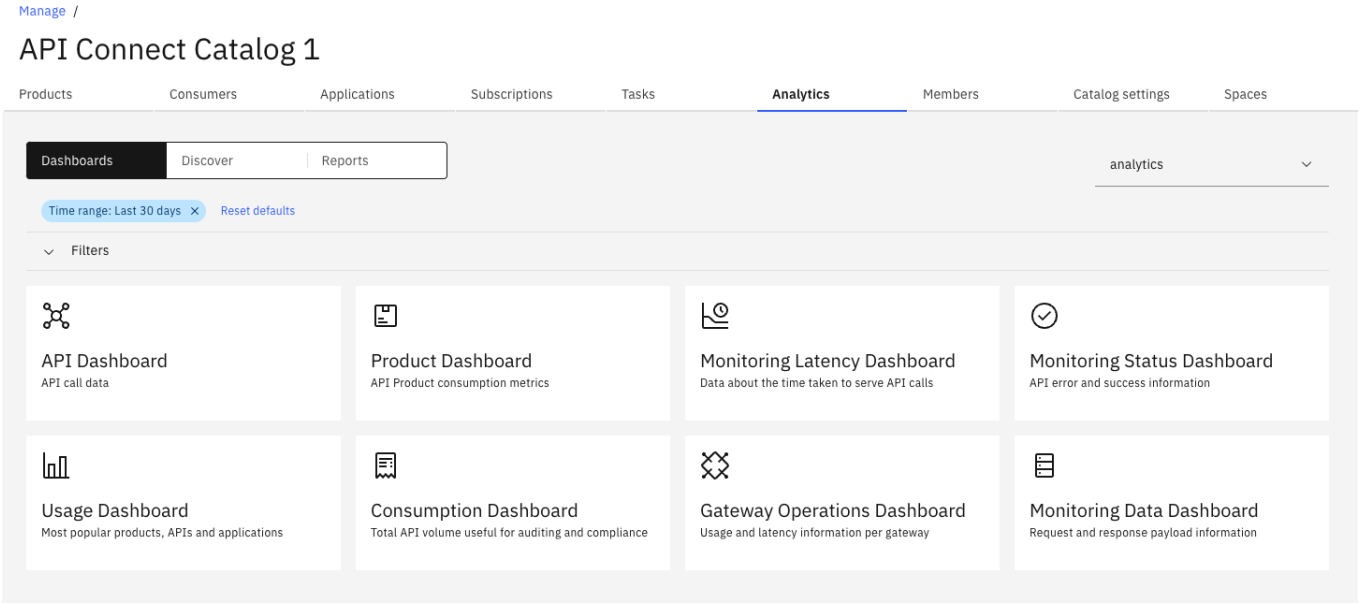
1. In the API Manager UI, select Manage in the navigation panel.
2. From the list of available catalogs in the API Manager Dashboard, select the required catalog.
3. If spaces are enabled and want to see analytics at the scope of a space, then:
    a. Click the Spaces tab.
    b. Select the space that you want to view.
4. Click the Analytics tab.

Analytics dashboards

The analytics dashboards in the API Manager UI show the API event data at the scopes of provider organization, catalog, and space.

The provider organization scoped dashboards are accessed from the analytics icon in the navigation panel.

Catalog scoped dashboards are accessed from the Analytics tab when viewing the catalog:

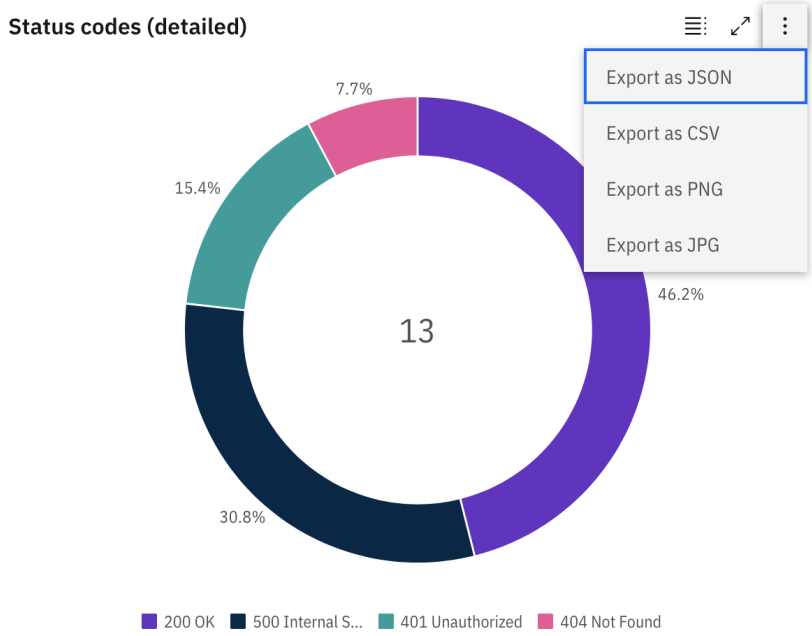


The space scoped dashboards are accessed from the Analytics tab when viewing the space.

Eight dashboards are available:

- API Dashboard- contains charts that summarize total API calls, response codes, and response times.
- Product Dashboard - contains charts that show total API calls and application subscriptions per plan.
- Monitoring Latency Dashboard - contains charts that provide response time statistics and data usage.
- Monitoring Status Dashboard - contains charts that show the response codes and success/failure rates of API calls.
- Usage Dashboard - contains charts that show the top 20 APIs, products, and apps.
- Consumption Dashboard - contains charts that show total API consumption in your cloud.
- Gateway Operations Dashboard - contains charts that show API usage and latency by gateway.
- Monitoring Data Dashboard - contains charts that show the APIs, plans, consumer organizations, and applications that send and receive the most data.

Each chart in a dashboard can be exported as a PNG or JPG image. The source data for each chart can be exported as a JSON or CSV file. To export a chart, click Actions at

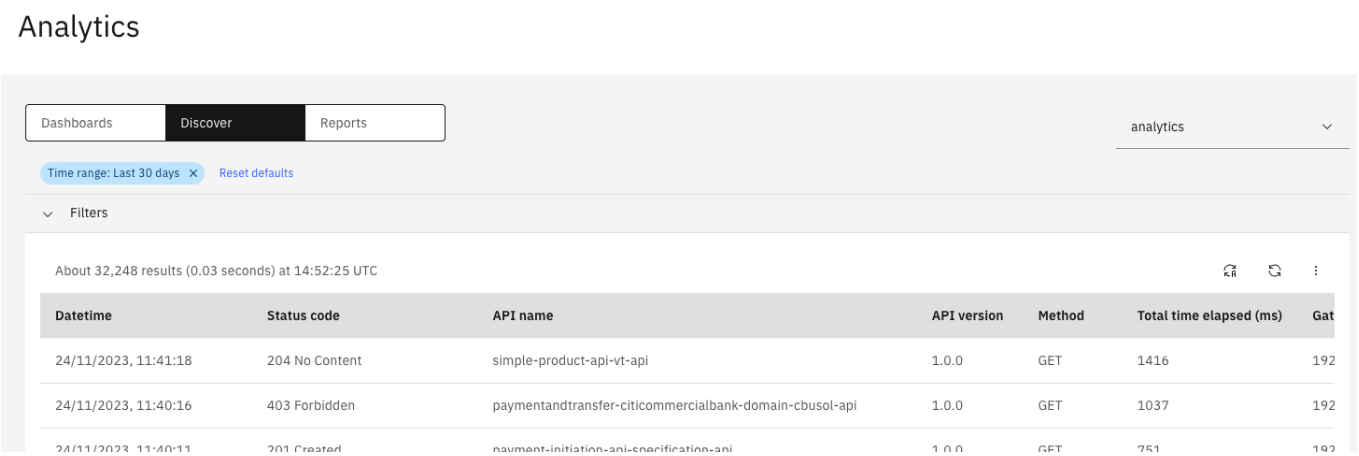


the upper right:

It is also possible to enlarge the chart to full-screen by clicking . To see the source data in tabular form click .

Discover view

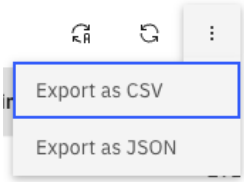
By default the Dashboards tab is displayed. To view your API event data in tabular form, select Discover:



The maximum number of API events that can be accessed from the UI is 10,000. The maximum number of event records that can be displayed per page on the Discover view is 200.

You can customize the columns displayed in the Filters section.

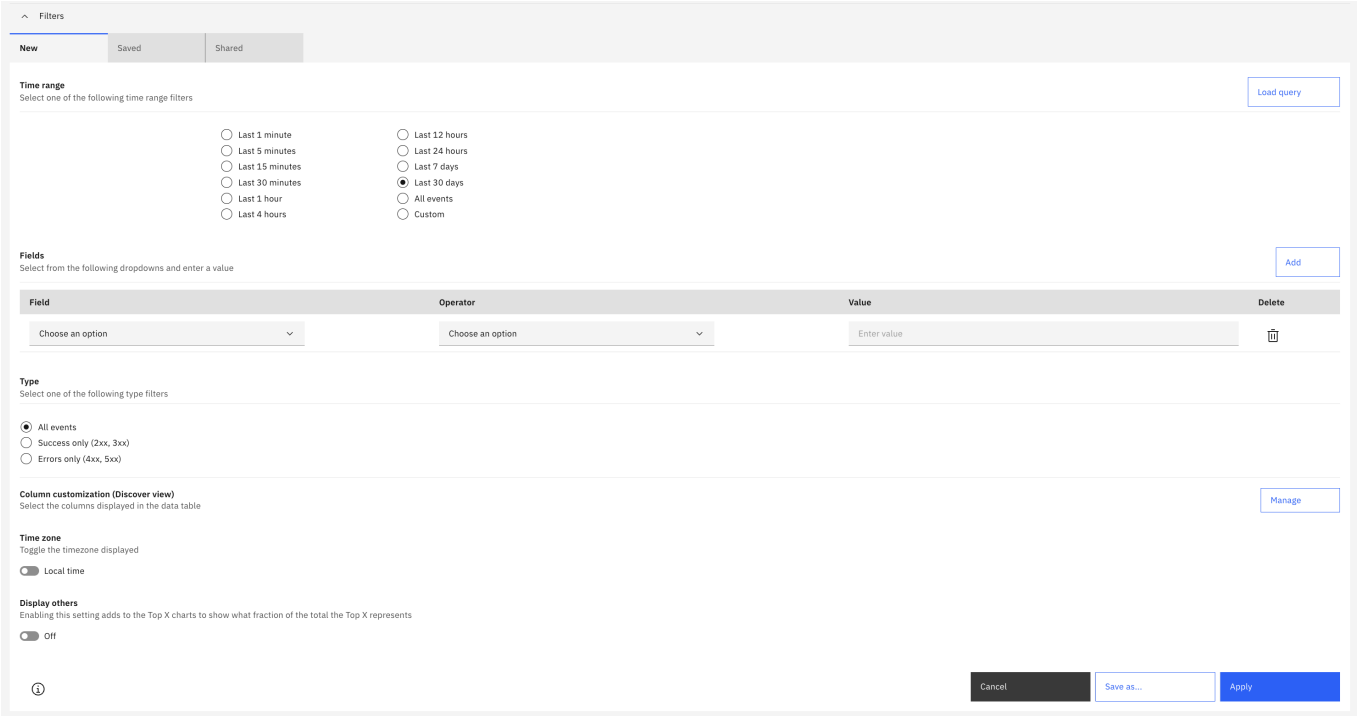
You can export the API event data from this view by clicking Actions at the upper right:



Note: When you export from the Discover view, only the data that is displayed on the current page of results is exported. If you want to export the data from all pages, you must export separately from each page. To export all your analytics data, do not use the UI, see Export your analytics data.
If you see unexpected HTTP OPTIONS events in the Discover view, these events are due to CORS requests from browser-based API test tools. For more information about test tools and the OPTIONS call, see Testing an API.

Filtering displayed data

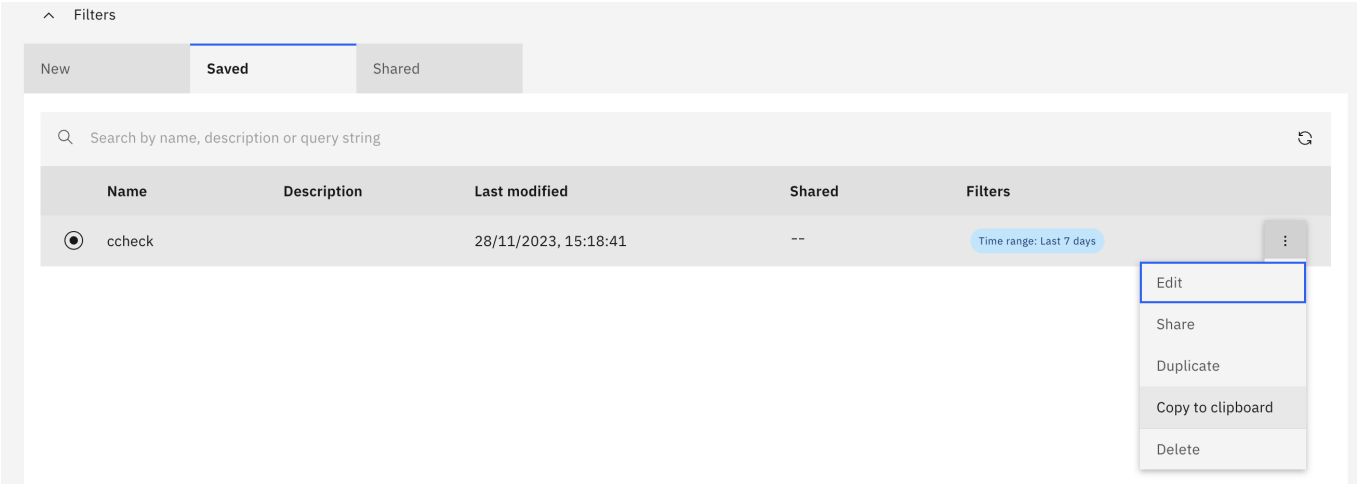
You can filter the data that is displayed in the Dashboards and Discover view by defining filters (also called "queries"). Expand the Filters section to view, define, and apply queries to your displayed data:



You can save and share the queries that you define:

- Shared queries are visible to all users at the same scope. They are not visible to users in a different scope. For example, a query that Cloud Manager UI users shares is not visible to an API Manager UI user. Within the API Manager UI, a query that is created at catalog scope is not visible to users who are viewing analytics data at provider organization scope.
- Other users cannot edit or delete queries that you share, but they can create a duplicate query, which they can edit and share.
- All queries have a name and an optional description. The name does not need to be unique.

Saved queries can be exported as strings for use in REST API and toolkit CLI queries, for example:

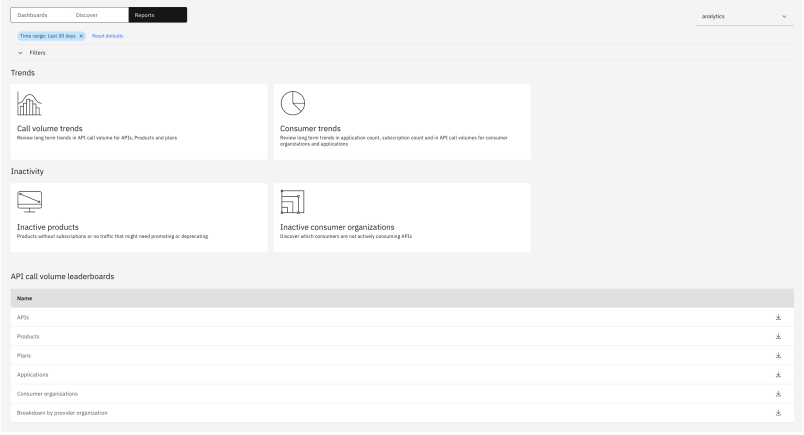


copies the following string to the clipboard:

```
timeframe=last7days
```

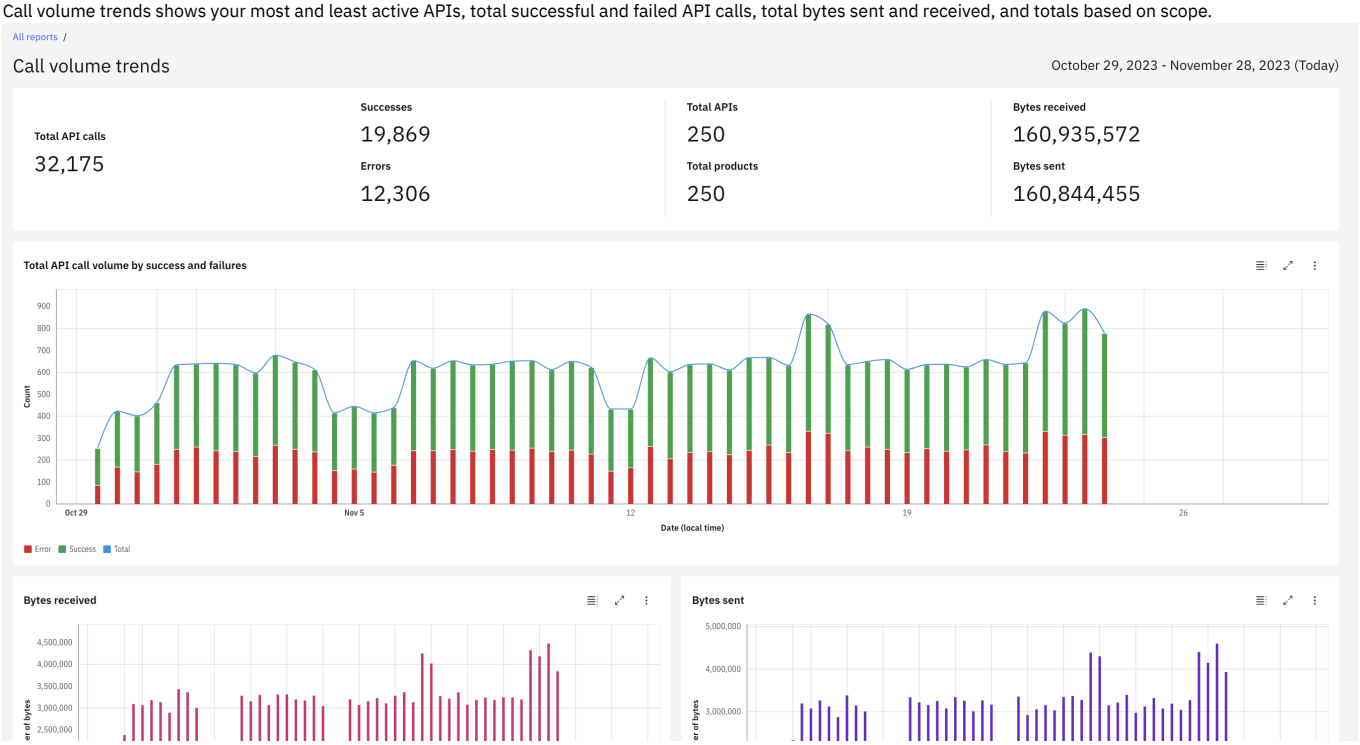
Reports view

The reports view displays long-term summary data rather than individual API events.

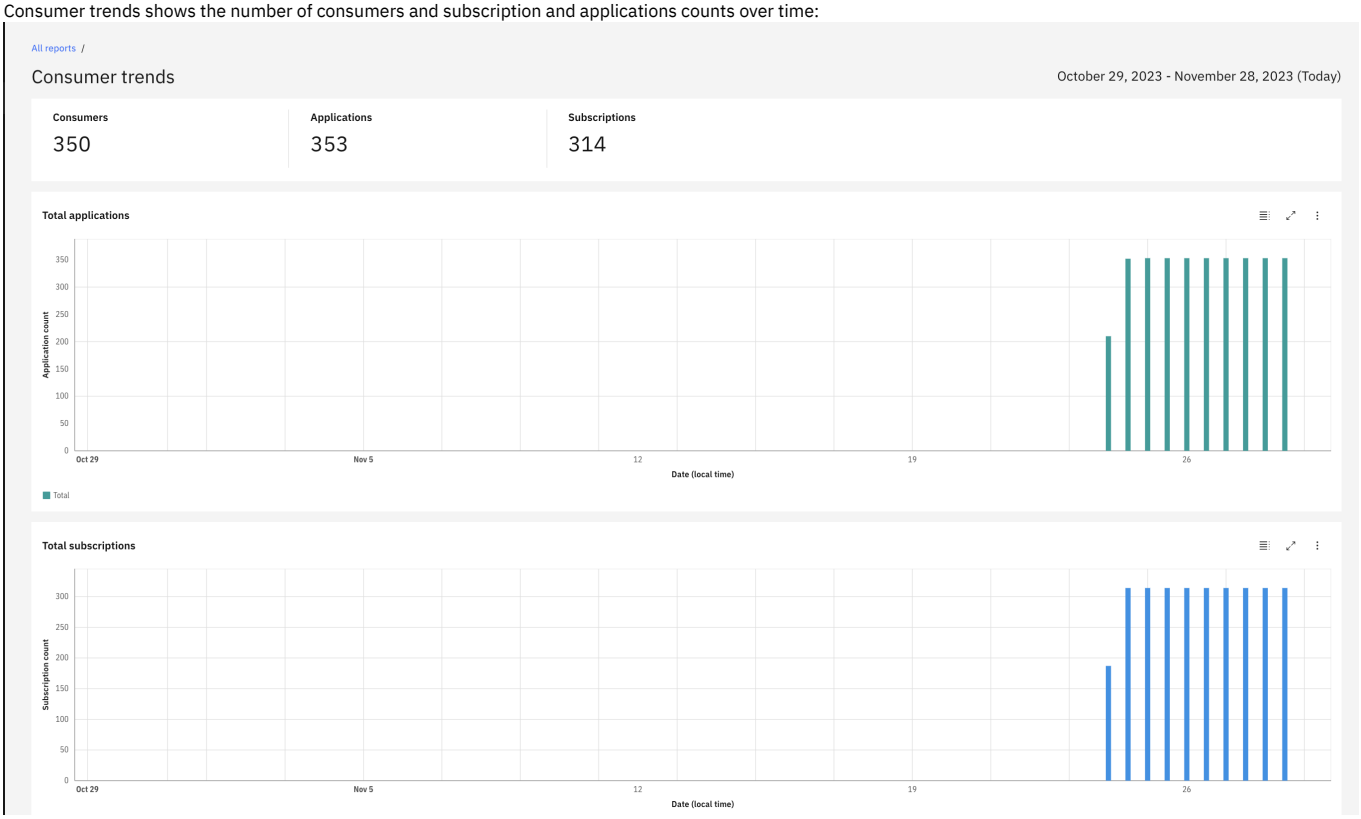


Note: The reports view was introduced in v10.0.6, and does not include data that was generated before upgrade to v10.0.6.

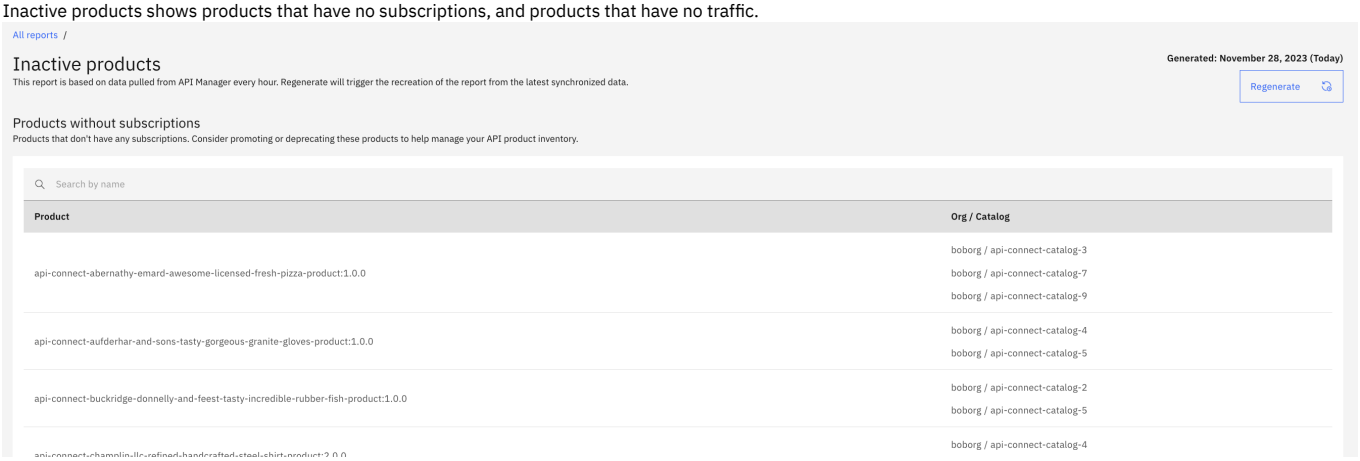
Call volume trends shows your most and least active APIs, total successful and failed API calls, total bytes sent and received, and totals based on scope.



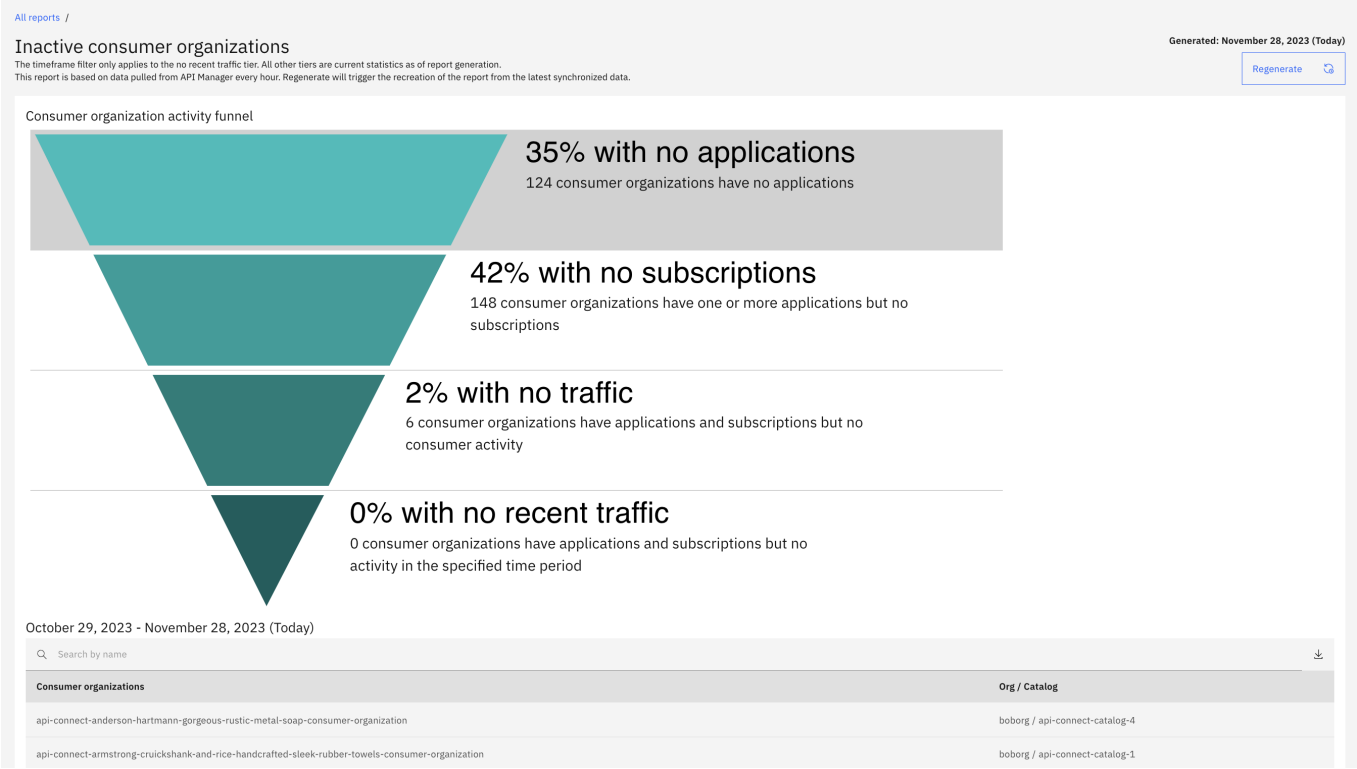
Consumer trends shows the number of consumers and subscription and applications counts over time:



Inactive products shows products that have no subscriptions, and products that have no traffic.



Inactive consumer organizations shows consumer organizations that have no applications, subscriptions, recent traffic, or no traffic at all.



The API call volume leaderboards section shows leaderboards for APIs, Products, Plans, Applications, Consumer organizations. Click in the name column to see the data for each item.

Related concepts

- Catalogs, spaces, and analytics

Accessing analytics in the Developer Portal

How to view your analytics data from the Developer Portal.

Restriction: The Developer Portal sites show analytics data from the analytics service that is associated with the gateways that are used by the catalog. If a Developer Portal site's catalog uses more than one gateway service, then those gateway services must be associated with the **same** analytics service. If multiple analytics services are used by a catalog's gateways, then no analytics data is shown in the portal site corresponding to that catalog. Analytics services are associated with gateway services in the Cloud Manager UI, see Associating an analytics service with a gateway service.

Viewing organization scoped analytics data

1. Click the arrow next to your consumer organization name on the Developer Portal home page, and click My organization.
2. Click the Analytics tab.

From the Analytics tab, you can see your organization analytics, which include: API stats, total calls, and total errors.

Viewing application scoped analytics data

1. Click Apps from the Developer Portal dashboard.
2. Click the name of the application for which you want to view analytics data.

From the Dashboard tab, you can see your application analytics, which include: API stats, total calls, and total errors.

Counting total API calls for your analytics service

Count the API calls for the analytics subsystem and see the total categorized by response status.

Note: If your API Connect bases costs on usage, you can use the following methods to track this information so that you can accurately report it. If your organization did not deploy the analytics subsystem, then this feature is not available. If you deployed analytics but offload your data and disabled local storage, then you must capture usage information from the third-party system where you offload data.
You can see the total API calls over time for each analytics service in the consumption dashboard. To see the consumption dashboard, navigate to the Cloud Manager UI analytics view: Accessing analytics in the Cloud Manager UI.

Alternatively, the Analytics CLI can be used to get your API count:

1. Login as the cloud admin user:

   ```
   apic login --server <platform api endpoint> --username admin --realm admin/default-idp-1
   ```

2. Use the following CLI command to retrieve a count of all analytics events recorded by the analytics service:

   ```
   apic -m analytics events:cloudCount --server <platform api endpoint> --analytics-service <analytics service name> --format
   json
   ```

   where *<analytics service name>* is the name of analytics service as configured in the Cloud Manager UI.
3. If required, additional filters can be applied to the results. For example, `--timeframe last12hours`. See the `help` output from: `apic -m analytics events:cloudCount -h` for more details.

Export your analytics data

Export your analytics data with either the toolkit CLI or the REST API.

The analytics export function in the UIs export just the data that is displayed in the UI, and is limited to 200 API events per page.

To export up to 10,000 API event records, use the toolkit CLI.

To export all your analytics data, use the REST API.
Note: If you plan to export you API event data regularly, consider using the offload feature instead. See Offload to third-party systems.

Exporting with the toolkit CLI

1. Follow the steps to install and configure the toolkit CLI.
2. Login with the correct user for the scope of analytics data you want to export. For example, to export all API event from a provider organization called `prod`, login as a member of that organization:

   ```
   apic login --server <platform api endpoint> --username <provider org member> --realm provider/default-idp-2
   ```

3. Use the `events` command to export your analytics data. For example, to export the events for a provider organization:

   ```
   apic -m analytics events:orgList --server <platform api endpoint> --analytics-service <analytics service name> --org <org
   name> --format=json
   {
       "total": 200,
       "search_time": 7,
       "events": [
           {
               "log_policy": "activity",
   ...
   ```

   Note: Data is returned as a JSON array, each element is a single API event record.

Exporting with the REST API

1. Follow the steps to get started with the Analytics REST API.
2. Use the `events` API to export your data. For example, to get all analytics API event records from a provider organization, specify the organization's API path:

   ```
   curl -v -k -H 'Accept: application/json' -H 'Authorization: Bearer <bearer_token>' -X GET --url
   'https://<management_server_api_endpoint>/analytics/<analytics_service>/orgs/<provider_organization>/events'

   {
       "total": 45543,
       "search_time": 36,
       "events": [...]
   ```

To get just the events for a catalog, specify the catalog in the API path; for example:

`/analytics/<analytics_service>/catalogs/<provider_organization>/<catalog>/events`

Allowing API Connect cloud admin users to view provider organization analytics data

The owner of a provider organization can enable or disable the sharing of analytics data with API Connect cloud administrators.

About this task

In previous releases of API Connect, all analytics data from provider organizations was available to cloud admin users by default. Beginning with version 10.0.7.0, the data is not shared with cloud admins by default; the owner of a provider organization must enable the sharing of analytics data with cloud admins.

This setting does not apply to total API call volume data. Cloud admins can always see the total volume of API calls across all provider organizations and for specific gateways. The setting applies only to analytics data that identifies the provider organization.

Procedure

To enable sharing of analytics data with cloud administrators, complete the following steps.

1. In API Manager, click Settings > Analytics > Share analytics data.
2. Click the slider to set it to On.

Analytics CLI

How to access your analytics data with the toolkit CLI.

About this task

The toolkit CLI provides commands for viewing your analytics data, and also for configuring analytics storage settings. To view organization scoped event data, login to the toolkit CLI with provider organization user credentials. To view cloud scoped event data and analytics storage settings, login to the toolkit CLI as the cloud admin user.

Procedure

1. Install the toolkit: Setting up the API Connect toolkit
2. Log in with the CLI.
   For example:

   ```
   apic login --server <platform api endpoint> --username <username> --realm <realm>
   ```

   Where:
   - `<platform api endpoint>` is the FQDN or base URL of your platform API endpoint, for example: `platform.example.com` or `https://platform.example.com`
   - `<username>` is the provider org owner. To access cloud scoped data, login as the admin user.
   - `<realm>` is the user registry realm for the specified `<username>`. By default the realm for provider organization owners is `provider/default-idp-2`. The realm for cloud admin users is `admin/default-idp-1`.

   For more information, see: Toolkit CLI Login.
3. View the available toolkit analytics commands by using `-m analytics -h`. Example:

   ```
   apic -m analytics -h
   ...
   Available Commands:

     Creating applications and artifacts
        config                                  Manage configuration variables

     Publishing to the cloud
        clustermgmt                             Clustermgmt operations
        dashboards                              Dashboards operations
        events                                  Events operations
        filterparams                            Filterparams operations

     Other commands
        licenses                                Review the license for API Connect
        validate                                Validate an API or product definition
        version                                 Get the APIConnect toolkit version
   ...
   ```

4. View your analytics events by using the `events` commands:

   ```
   apic -m analytics events -h
   Type "apic [command] --help" for help on the following related commands:
         events:catalogCount  Count events at catalog scope.
         events:catalogGet    Get specific event at catalog scope.
         events:catalogList   List events at catalog scope.
         events:cloudCount    Count events at cloud scope.
         events:cloudGet      Get specific event at cloud scope.
         events:cloudList     List events at cloud scope.
         events:orgCount      Count events at organization scope.
         events:orgGet        Get specific event at organization scope.
         events:orgList       List events at organization scope.
         events:spaceCount    Count events at space scope.
         events:spaceGet      Get specific event at space scope.
         events:spaceList     List events at space scope.

   # To get a count of all API events at cloud level:
   apic -m analytics events:cloudCount --analytics-service <analytics service name> --server <management server api endpoint>
   ```

```
--format=json
{
    "total": 200
}

# To get all the cloud level events:
apic -m analytics events:cloudList --analytics-service <analytics service name> --server <management server api endpoint>
--format=json
{
    "total": 200,
    "search_time": 7,
    "events": [
        {
            "log_policy": "activity",
...
```

Analytics REST API

How to access your analytics data with the REST API.

Before you begin

API Connect REST API calls are authenticated by using a bearer token in the authorization header. Use the toolkit credentials to request a bearer token. Toolkit credentials can be found in the API Manager UI:

1. Log in to the API Manager UI.
2. From the home page, click the Download toolkit tile.
3. Download the Toolkit credentials.
4. Open the downloaded `credentials.json` file:

```
...
  "toolkit": {
    "endpoint": "https://mgmt.api.example.com/api",
    "client_id": "7409693f-f726-48b4-8909-7c0d26f13e81",
    "client_secret": "5feeb0be-17f8-41a4-96d6-d40f33d69ef6"
  },
...
```

Take note of the `toolkit.client_id`, `toolkit.client_secret`, and `toolkit.endpoint` from this file. You use these values to get your bearer token.

Procedure

1. Use your credentials to request a bearer token:

```
curl -v -k -X POST -d '{"username": "<username>", "password": "<password>", "realm": "<realm>", "client_id": "
<client_id>", "client_secret": "<client_secret>", "grant_type": "password"}' -H 'Content-Type: application/json' -H
'Accept: application/json' https://<platform api endpoint>/token
```

   Where:
   - *<username>* is the provider org owner. To access cloud scoped data, login as the admin user.
   - *<password>* is the password for the specified *<username>*.
   - *<realm>* is the user registry realm for the specified *<username>*. By default the realm for provider organization owners is `provider/default-idp-2`. The realm for cloud admin users is `admin/default-idp-1`.
   - *<client_id>* is the client ID from the "toolkit" section of the `credentials.json` file, or as provided by your API Connect cloud administrator.
   - *<client_secret>* is the client secret from the "toolkit" section of the `credentials.json` file, or as provided by your API Connect cloud administrator.
   - *<platform api endpoint>* is the platform API endpoint from the "toolkit" section of the `credentials.json` file, or as provided by your API Connect cloud administrator. It might have the path "api" appended to it, so full string is: `https://<platform api endpoint>/api/token`

   The bearer token is returned in the access_token property:

```
{
    "access_token": "<bearer_token>",
    "token_type": "Bearer",
    "expires_in": 28800
}
```

   Note the `expires_in` value, which is the number of seconds before the token expires. After expiry, you must request a new bearer token.

2. Use the returned bearer token to call the analytics REST API:

```
# This call to /orgs/<provider_organization>/events requires a bearer token that was requested with provider org
credentials:
curl -v -k -H 'Accept: application/json' -H 'Authorization: Bearer <bearer_token>' -X GET --url 'https://<platform api
endpoint>/analytics/<analytics_service>/orgs/<provider_organization>/events'

{
    "total": 300,
    "search_time": 3,
    "events": [...]
}

# This call to /cloud/events requires a bearer token that was requested with admin credentials:
curl -v -k -H 'Accept: application/json' -H 'Authorization: Bearer <bearer_token>' -X GET --url 'https://<platform api
endpoint>/analytics/<analytics_service>/cloud/events'

{
    "total": 45543,
```

```
    "search_time": 36,
    "events": [...]
```

Where:

- ***<platform api endpoint>*** is the **toolkit.endpoint**, but with the **/api** at the end replaced with **/analytics** to access the analytics APIs.
- ***<analytics_service>*** is the name of the analytics service.
- *<bearer_token>* is the token from step 1. Do not wrap the token with quotation marks.

What to do next

Complete documentation of the analytics REST API is here: Analytics REST API.

Troubleshooting analytics

How to diagnose and resolve common issues with the analytics subsystem.

- **No analytics data in UIs**
  How to check that your analytics subsystem is receiving API event data from the gateways.
- **Running out of storage space**
  Actions that you can take if your analytics data is using more persistent storage space than you expected.
- **Offload failure**
  What to check if offload to a third-party system is failing.
- **Gathering postmortem logs**
  The logs to gather for upload to a support case.

No analytics data in UIs

How to check that your analytics subsystem is receiving API event data from the gateways.

Note: **VMware users:** The operations to confirm API event data is arriving from the gateways must be run from inside the analytics VM. To access your analytics VM:

1. Use an SSH client to login as the **apicadm** user:

   ```
   ssh apicadm@<analytics VM FQDN>
   ```

2. **sudo** to root:

   ```
   sudo -i
   ```

The **kubectl** commands in these operations specify a *<namespace>* argument. On VMware, replace *<namespace>* with "default". Alternatively you can omit **-n *<namespace>*** from the commands completely.

1. The **mtls-gw** is the pod that receives the API events from the gateway. Identify the name of your **mtls-gw** pod or pods with:

   ```
   kubectl get pods -n <namespace>
   ```

   Expected output:

   ```
   NAME                                                              READY   STATUS      RESTARTS   AGE
   ...
   analyt-mtls-gw-7665f5d445-4cx4n                                     1/1     Running     0          3d19h
   ```

2. For each **mtls-gw** pod, run the following command to see the logs of that pod:

   ```
   kubectl logs <mtls-gw pod name> -n <namespace>
   ```

3. The gateway sends API event data to the **mtls-gw** pod as an HTTP POST call to the path **/x2020/v1/apievent/_bulk**.
   Every time that the **mtls-gw** pod receives API event data from the gateway, it logs the following message, known as a **_bulk** message:

   ```
   10.254.6.1 - - [22/Sep/2021:18:05:54 +0000] "POST /x2020/v1/apievent/_bulk HTTP/1.1" 200 2 "-""-" 2841 0.072 0.070
   ```

   Check the **mtls-gw** pod logs for recent **_bulk** messages.

   If you find no **_bulk** messages in the **mtls-gw** logs, then the analytics subsystem is not receiving API event data from the gateway. Check the network connection between your gateway and analytics subsystems, and review *Analytics endpoints* in the gateway documentation.

   The HTTP return code is shown in the **mtls-gw** log messages. In the example, this code is 200, which means the API event data was received successfully by the analytics subsystem. Whatever the return code is, if your **mtls-gw** pod logs contain recent "_bulk" messages and you do not see any analytics data for this time period in the UI, then gather postmortem logs and open an IBM support case.

Running out of storage space

Actions that you can take if your analytics data is using more persistent storage space than you expected.

Reduce retention period

The simplest remedy to running out of storage space is to reduce the data retention period.

By default, API event records are retained for 30 days on a one replica deployment, and 90 days on a three replica deployment.

If your analytics subsystem was deployed more recently than your retention period (for example, less that 30 days ago for a default one replica deployment), and you are running out of storage space, then there is a risk that your persistent storage fills up before the retention period is reached. Check in the Cloud Manager UI how many days back your API event data goes, and set the retention period to a lower number. For example, if you see API event records from 15 days ago, reduce your storage requirement by one-third by setting your retention period to 10 days. For more information about data retention, see Retention and rollover.

VMware users: add extra disk

You can increase the space available for your analytics data by adding a disk, see Adding disk space to a VMware appliance.
Warning: Do not attempt to increase the size of the existing data disk. Changing the disk size corrupts your existing analytics data.

Kubernetes and Openshift users: Reinstall with larger PVCs

It is not possible to increase PVC size after installation. If you require more space for your analytics data, the analytics subsystem must be reinstalled. Follow these steps:

1. Take a backup of your analytics subsystem: Kubernetes, OpenShift, and Cloud Pak for Integration.
2. Reinstall your analytics subsystem with a larger PVC size:
   - Kubernetes
   - OpenShift and Cloud Pak for Integration
3. Restore your analytics data from your backup: Recovering from a disaster.

Reduce space used by new API event data

To reduce the storage required for new analytics data, update the activity log settings of your APIs: Activity log policy.
Tip: If you're not able to update the activity log setting for your APIs, you can disable response payload logging for all APIs with ingestion filters. For example:

```
filter {
  if "apicapievent" in [tags] {
     mutate {
           remove_field => ["response_body"]
        }
  }
}
```

What to do if your storage is 100% full

If your storage space is 100% full, your analytics subsystem might be unresponsive, so reducing the retention period is not possible. In this scenario, follow the disaster recovery steps: Recovering from a disaster.

Offload failure

What to check if offload to a third-party system is failing.

- Check the ingestion pod logs for error messages that are related to offload:
  - Kubernetes, OpenShift, and Cloud Pak for Integration:

    ```
    kubectl -n <namespace> logs <analytics ingestion pod name>
    ```

  - VMware: Find the ingestion pod logs in Gathering logs for a VMware environment.

  A common problem is TLS handshaking errors, such as untrusted or expired certificates.
- Check logs on your third-party system.
- Verify that the specified URL or the host and port values for the target system are accurate.
- Verify that the server or cluster of servers in the target system are running and reachable. If applicable, also verify that firewall settings are not causing connection problems.
- If offloading data to an Elasticsearch or Kafka target, verify that your configuration settings are valid; for example, the user credentials for authenticating to Elasticsearch or the Kafka topic name.

Gathering postmortem logs

The logs to gather for upload to a support case.

The generate_postmortem.sh script

The generate_postmortem.sh script when run with the `--diagnostic-analytics` argument gathers all the information that is typically needed for an analytics problem. The script output includes:

- The analytics pod logs.
- YAML files that describe all the analytics subsystem Kubernetes artifacts.
- The OpenSearch cluster status.

Use the generate_postmortem.sh script, as described for your platform:

- Gathering logs for a VMware environment
- Gathering logs on Kubernetes and OpenShift

Ensure that you use the `--diagnostic-analytics` argument when you run generate_postmortem.sh.

Gathering the pod logs

If the generate_postmortem.sh script fails, the pod logs can be gathered manually:

- **VMware:** SSH into your analytics VM and run **apic logs**:
  1. Use an SSH client to login as the `apicadm` user:

     ```
     ssh apicadm@<analytics VM FQDN>
     ```

  2. `sudo` to root:

     ```
     sudo -i
     ```

  3. Run the **apic logs** command:

     ```
     apic logs
     ```

  4. Two compressed files are created: appliance-logs, and node-logs. Copy both files off the VM and upload to the support case.
- **Kubernetes and Openshift:** Get the logs from all analytics pods in your environment. Use the command:

  ```
  kubectl -n <namespace> logs <analytics pod name> > <analytics pod name>.log
  ```

  where:
  - *<namespace>* is the namespace of your analytics subsystem.
  - *<analytics pod name>* is the name of the analytics pod. See the list of analytics pods.

  The logs for each pod are written to the file *<analytics pod name>*.log. Upload all the generated logs to the support case.

Getting the OpenSearch cluster status

If the generate_postmortem.sh script fails you can use the toolkit CLI to get the status of your OpenSearch cluster, and a list of the indices.

1. Follow the steps to install and configure the toolkit CLI.
2. Login to the CLI as the cloud admin user:

   ```
   apic login --server <platform api endpoint> --username admin --realm provider/default-idp-1
   ```

3. Get the OpenSearch cluster status with:

   ```
   apic --mode analytics clustermgmt:catIndices --server <platform api endpoint> --analytics-service <analytics service name>
   --format json
   ```

4. Get the details of the OpenSearch indices with:

   ```
   apic --mode analytics clustermgmt:catIndices --server <platform api endpoint> --analytics-service <analytics service name>
   --format json
   ```

Upload the cluster status and indices output to the support case.

Reference information

Reference information for IBM® API Connect, including summary reference material for the developer toolkit command-line tool (CLI), a link to the API Connect Version 10.x Whitepaper, and information about the API Connect platform REST APIs.

Reference item	Description
Command-line tool reference for the developer toolkit	Summary reference material for each of the available commands for the developer toolkit command-line tool (CLI). (For more detailed information about how to use the command-line tool, see Using the developer toolkit command-line tool.)
Command-line tool reference for the Developer Portal	Summary reference material for each of the available commands for the Developer Portal command-line tool (CLI). (For more detailed information about how to use the command-line tool, see Using the Developer Portal command-line tool.)
API Connect REST APIs	The platform REST APIs that can be used to manage the API Connect cloud configuration, access the API provider capability, and use the consumer API microservice.
API Connect v10.x Whitepaper	A comprehensive technical guide to best practices, considerations, and deployment options for API Connect. The whitepaper covers the major components of API Connect, as well as considerations for configuring different clouds and environments, to help users with their API strategies. The target audience for the whitepaper are solution and integration architects.

APIConnect toolkit 8796fc7789531c914ecbd402c6ff51ca96248b06 (Built 2023-12-05T21:51:07Z)

Synopsis

APIConnect toolkit 8796fc7789531c914ecbd402c6ff51ca96248b06 (Built 2023-12-05T21:51:07Z)

```
apic [flags]
```

Options

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
  -h, --help                   Help for apic
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic activations

Activations operations

Synopsis

Activations operations

```
apic activations [flags]
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --fields string    List of field names to return
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for activations
      --limit int32      Maximum number of items to return
      --offset int32     Offset item number from list to begin return
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
      --scope string     scope
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic activations:clear

Activations clear operations

Synopsis

Activations clear operations

```
apic activations:clear [flags]
```

Possible Usages

```
    apic activations:clear [flags] --scope org
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --confirm string   Confirmation for critical updates (required)
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for activations:clear
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
      --scope string     scope
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic activations:delete

Activations delete operations

Synopsis

Activations delete operations

```
apic activations:delete [flags]
```

Possible Usages

```
apic activations:delete [flags] --scope org ACTIVATION
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for activations:delete
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
      --scope string     scope
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic activations:get

Activations get operations

Synopsis

Activations get operations

```
apic activations:get [flags]
```

Possible Usages

```
apic activations:get [flags] --scope org ACTIVATION
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --fields string    List of field names to return
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for activations:get
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, use - for STDOUT. (default: cwd)
      --scope string     scope
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic activations:list

Activations list operations

Synopsis

Activations list operations

```
apic activations:list [flags]
```

Possible Usages

```
      apic activations:list [flags] --scope org
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --fields string    List of field names to return
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for activations:list
      --limit int32      Maximum number of items to return
      --offset int32     Offset item number from list to begin return
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
      --scope string     scope
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic analytics

Analytics operations

Synopsis

Analytics operations

```
apic analytics [flags]
```

Options

```
  -h, --help   Help for analytics
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic analytics:create

Analytics create operations

Synopsis

Analytics create operations

```
apic analytics:create [flags]
```

Possible Usages

```
      apic analytics:create [flags] --scope space ANALYTICS_FILE
      apic analytics:create [flags] --scope catalog ANALYTICS_FILE
```

Options

```
      --analytics-service string   Analytics Service name or id (required)
  -c, --catalog string             Catalog name or id (required)
      --format string              Output format. One of [json yaml octet-stream go-template=... go-template-file=...],
defaults to yaml.
  -h, --help                       Help for analytics:create
  -o, --org string                 Organization name or id (required)
      --output string              Write file(s) to directory, instead of STDOUT (default "-")
      --query string               Add query to request
      --scope string               scope
  -s, --server string              management server endpoint (required)
      --space string               Space name or id (required)
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic analytics-services

Analytics Services operations

Synopsis

Analytics Services operations

```
apic analytics-services [flags]
```

Options

```
      --availability-zone string   Availability Zone name or id (required)
  -c, --catalog string             Catalog name or id (required)
      --fields string              List of field names to return
      --format string              Output format. One of [json yaml octet-stream go-template=... go-template-file=...],
defaults to yaml.
  -h, --help                       Help for analytics-services
      --limit int32                Maximum number of items to return
      --offset int32               Offset item number from list to begin return
  -o, --org string                 Organization name or id (required)
      --output string              Write file(s) to directory, instead of STDOUT (default "-")
      --scope string               scope
  -s, --server string              management server endpoint (required)
      --space string               Space name or id (required)
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic analytics-services:clear

Clear the Analytics Service objects

Synopsis

Clear the Analytics Service objects

```
apic analytics-services:clear [flags]
```

Possible Usages

```
    apic analytics-services:clear [flags]
```

Options

```
      --availability-zone string   Availability Zone name or id (required)
      --confirm string             Confirmation for critical updates (required)
      --format string              Output format. One of [json yaml octet-stream go-template=... go-template-file=...],
defaults to yaml.
  -o, --org string                 Organization name or id (required)
      --output string              Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string              management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic analytics-services:create

Create a Analytics Service object

Synopsis

Create a Analytics Service object

```
      Fields not allowed:
      - gateway_service_urls
      - ingestion_endpoint
      - client_endpoint

      Fields allowed but ignored:
      - id
      - type
      - api_version
      - scope
      - created_at
      - updated_at
      - url
      - org_url
      - availability_zone_url
```

```
apic analytics-services:create [flags]
```

Possible Usages

```
      apic analytics-services:create [flags] ANALYTICS_SERVICE_FILE
```

Options

```
      --availability-zone string   Availability Zone name or id (required)
      --format string              Output format. One of [json yaml octet-stream go-template=... go-template-file=...],
defaults to yaml.
  -o, --org string                 Organization name or id (required)
      --output string              Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string              management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic analytics-services:delete

Delete the Analytics Service object by name or id

Synopsis

Delete the Analytics Service object by name or id

```
apic analytics-services:delete [flags]
```

Possible Usages

```
      apic analytics-services:delete [flags] ANALYTICS_SERVICE
```

Options

```
      --availability-zone string   Availability Zone name or id (required)
      --format string              Output format. One of [json yaml octet-stream go-template=... go-template-file=...],
defaults to yaml.
  -o, --org string                 Organization name or id (required)
      --output string              Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string              management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic analytics-services:get

Get the Analytics Service object by name or id

Synopsis

Get the Analytics Service object by name or id

```
apic analytics-services:get [flags]
```

Possible Usages

```
      apic analytics-services:get [flags] --scope space ANALYTICS_SERVICE
      apic analytics-services:get [flags] --scope org ANALYTICS_SERVICE
      apic analytics-services:get [flags] --scope catalog ANALYTICS_SERVICE
      apic analytics-services:get [flags] ANALYTICS_SERVICE
```

Options

```
      --availability-zone string   Availability Zone name or id (required)
      --fields string              List of field names to return
      --format string              Output format. One of [json yaml octet-stream go-template=... go-template-file=...],
defaults to yaml.
  -o, --org string                 Organization name or id (required)
      --output string              Write file(s) to directory, use - for STDOUT. (default: cwd)
  -s, --server string              management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic analytics-services:list

List the Analytics Service objects

Synopsis

List the Analytics Service objects

```
apic analytics-services:list [flags]
```

Possible Usages

```
      apic analytics-services:list [flags] --scope space
      apic analytics-services:list [flags] --scope org
      apic analytics-services:list [flags] --scope catalog
      apic analytics-services:list [flags]
```

Options

```
      --availability-zone string   Availability Zone name or id (required)
      --fields string              List of field names to return
      --format string              Output format. One of [json yaml octet-stream go-template=... go-template-file=...],
defaults to yaml.
      --limit int32                Maximum number of items to return
      --offset int32               Offset item number from list to begin return
  -o, --org string                 Organization name or id (required)
      --output string              Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string              management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic analytics-services:update

Update the Analytics Service object by name or id

Synopsis

Update the Analytics Service object by name or id

```
      Fields not allowed to be null:
      - ingestion_endpoint_tls_client_profile_url
      - client_endpoint_tls_client_profile_url

      Fields not allowed:
      - endpoint
      - ingestion_endpoint
      - client_endpoint

      Fields allowed but ignored:
      - id
      - type
      - api_version
      - scope
      - created_at
      - updated_at
      - url
      - org_url
      - availability_zone_url
```

```
apic analytics-services:update [flags]
```

Possible Usages

```
      apic analytics-services:update [flags] ANALYTICS_SERVICE ANALYTICS_SERVICE_FILE
```

Options

```
      --availability-zone string   Availability Zone name or id (required)
      --format string              Output format. One of [json yaml octet-stream go-template=... go-template-file=...],
defaults to yaml.
  -o, --org string                 Organization name or id (required)
      --output string              Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string              management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic api-keys

Api Keys operations

Synopsis

Api Keys operations

```
apic api-keys [flags]
```

Options

```
      --fields string   List of field names to return
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help            Help for api-keys
      --limit int32     Maximum number of items to return
      --offset int32    Offset item number from list to begin return
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic api-keys:create

Create a API Key object

Synopsis

Create a API Key object

```
      Required fields:
      - client_type
      - description

      Fields allowed but ignored:
      - id
      - type
      - api_version
      - scope
      - created_at
      - updated_at
      - url
```

```
apic api-keys:create [flags]
```

Possible Usages

```
      apic api-keys:create [flags] API_KEY_FILE
```

Options

```
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic api-keys:delete

Delete the API Key object by name or id

Synopsis

Delete the API Key object by name or id

```
apic api-keys:delete [flags]
```

Possible Usages

```
      apic api-keys:delete [flags] API_KEY
```

Options

```
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic api-keys:get

Get the API Key object by name or id

Synopsis

Get the API Key object by name or id

```
apic api-keys:get [flags]
```

Possible Usages

```
apic api-keys:get [flags] API_KEY
```

Options

```
      --fields string   List of field names to return
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
      --output string   Write file(s) to directory, use - for STDOUT. (default: cwd)
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic api-keys:list

List the API Key objects

Synopsis

List the API Key objects

```
apic api-keys:list [flags]
```

Possible Usages

```
apic api-keys:list [flags]
```

Options

```
      --fields string   List of field names to return
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
      --limit int32     Maximum number of items to return
      --offset int32    Offset item number from list to begin return
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic apis

Apis operations

Synopsis

Apis operations

```
apic apis [flags]
```

Options

```
      --api_type string    The type of api (asyncapi, rest, graphql, wsdl_to_rest, or wsdl)
      --base_path string   Base path of the API
  -c, --catalog string     Catalog name or id (required)
      --enforced           Whether the API is enforced or not
      --expand string      List of transient field to expand
      --fields string      List of field names to return
      --format string      Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
  -h, --help               Help for apis
      --limit int32        Maximum number of items to return
      --metadata string    List of metadata fields in the api to filter on
```

```
      --offset int32        Offset item number from list to begin return
  -o, --org string          Organization name or id (required)
      --output string       Write file(s) to directory, instead of STDOUT (default "-")
      --scope string        scope
  -s, --server string       management server endpoint (required)
      --space string        Space name or id (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic apis:clone

Apis clone operations

Synopsis

Apis clone operations

```
apic apis:clone [flags]
```

Possible Usages

```
apic apis:clone [flags] --scope space
apic apis:clone [flags] --scope catalog
```

Options

```
      --api_type string    The type of api (asyncapi, rest, graphql, wsdl_to_rest, or wsdl)
      --base_path string   Base path of the API
  -c, --catalog string     Catalog name or id (required)
      --enforced           Whether the API is enforced or not
      --expand string      List of transient field to expand
      --fields string      List of field names to return
      --format string      Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
  -h, --help               Help for apis:clone
      --limit int32        Maximum number of items to return
      --metadata string    List of metadata fields in the api to filter on
      --offset int32       Offset item number from list to begin return
  -o, --org string         Organization name or id (required)
      --output string      Write file(s) to directory, use - for STDOUT. (default: cwd)
      --scope string       scope
  -s, --server string      management server endpoint (required)
      --space string       Space name or id (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic apis:document

Apis document operations

Synopsis

Apis document operations

```
apic apis:document [flags]
```

Possible Usages

```
apic apis:document [flags] --id --scope space ID
apic apis:document [flags] --id --scope catalog ID
apic apis:document [flags] --scope space NAME:VERSION
apic apis:document [flags] --scope catalog NAME:VERSION
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for apis:document
      --id               id
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
      --scope string     scope
  -s, --server string    management server endpoint (required)
      --space string     Space name or id (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic apis:get

Apis get operations

Synopsis

Apis get operations

```
apic apis:get [flags]
```

Possible Usages

```
    apic apis:get [flags] --id --scope space ID
    apic apis:get [flags] --id --scope catalog ID
    apic apis:get [flags] --scope space NAME:VERSION
    apic apis:get [flags] --scope catalog NAME:VERSION
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --fields string    List of field names to return (default "add(wsdl,api)")
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for apis:get
      --id               id
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, use - for STDOUT. (default: cwd)
      --scope string     scope
  -s, --server string    management server endpoint (required)
      --space string     Space name or id (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic apis:list

Apis list operations

Synopsis

Apis list operations

```
apic apis:list [flags]
```

Possible Usages

```
    apic apis:list [flags] --scope space API_NAME
    apic apis:list [flags] --scope catalog API_NAME
```

Options

```
      --api_type string    The type of api (asyncapi, rest, graphql, wsdl_to_rest, or wsdl)
      --base_path string   Base path of the API
  -c, --catalog string     Catalog name or id (required)
```

```
      --enforced            Whether the API is enforced or not
      --expand string       List of transient field to expand
      --fields string       List of field names to return
      --format string       Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
  -h, --help                Help for apis:list
      --limit int32         Maximum number of items to return
      --metadata string     List of metadata fields in the api to filter on
      --offset int32        Offset item number from list to begin return
  -o, --org string          Organization name or id (required)
      --output string       Write file(s) to directory, instead of STDOUT (default "-")
      --scope string        scope
  -s, --server string       management server endpoint (required)
      --space string        Space name or id (required)
```

Options inherited from parent commands

```
      --accept-license          Accept the license for API Connect
      --debug                   Enable debug output
      --debug-output string     Write debug output to file
      --live-help               Enable or disable tracking of limited usage information
  -m, --mode string             Toolkit operation mode (default "apim")
```

apic apis:list-all

Apis list-all operations

Synopsis

Apis list-all operations

```
apic apis:list-all [flags]
```

Possible Usages

```
      apic apis:list-all [flags] --scope space
      apic apis:list-all [flags] --scope catalog
```

Options

```
      --api_type string     The type of api (asyncapi, rest, graphql, wsdl_to_rest, or wsdl)
      --base_path string    Base path of the API
  -c, --catalog string      Catalog name or id (required)
      --enforced            Whether the API is enforced or not
      --expand string       List of transient field to expand
      --fields string       List of field names to return
      --format string       Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
  -h, --help                Help for apis:list-all
      --limit int32         Maximum number of items to return
      --metadata string     List of metadata fields in the api to filter on
      --offset int32        Offset item number from list to begin return
  -o, --org string          Organization name or id (required)
      --output string       Write file(s) to directory, instead of STDOUT (default "-")
      --scope string        scope
  -s, --server string       management server endpoint (required)
      --space string        Space name or id (required)
```

Options inherited from parent commands

```
      --accept-license          Accept the license for API Connect
      --debug                   Enable debug output
      --debug-output string     Write debug output to file
      --live-help               Enable or disable tracking of limited usage information
  -m, --mode string             Toolkit operation mode (default "apim")
```

apic apis:update

Apis update operations

Synopsis

Apis update operations

```
apic apis:update [flags]
```

Possible Usages

```
      apic apis:update [flags] --id --scope space ID API_FILE
      apic apis:update [flags] --id --scope catalog ID API_FILE
      apic apis:update [flags] --scope space NAME:VERSION API_FILE
      apic apis:update [flags] --scope catalog NAME:VERSION API_FILE
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for apis:update
      --id               id
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
      --scope string     scope
  -s, --server string    management server endpoint (required)
      --space string     Space name or id (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic apis:wsdl

Apis wsdl operations

Synopsis

Apis wsdl operations

```
apic apis:wsdl [flags]
```

Possible Usages

```
      apic apis:wsdl [flags] --id --scope space ID
      apic apis:wsdl [flags] --id --scope catalog ID
      apic apis:wsdl [flags] --scope space NAME:VERSION
      apic apis:wsdl [flags] --scope catalog NAME:VERSION
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for apis:wsdl
      --id               id
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, use - for STDOUT. (default: cwd)
      --scope string     scope
  -s, --server string    management server endpoint (required)
      --space string     Space name or id (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic apps

Apps operations

Synopsis

Apps operations

```
apic apps [flags]
```

Options

```
  -c, --catalog string        Catalog name or id (required)
      --consumer-org string   Consumer Organization name or id (required)
```

```
      --expand string          List of transient field to expand
      --fields string          List of field names to return
      --format string          Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
  -h, --help                   Help for apps
      --limit int32            Maximum number of items to return
      --offset int32           Offset item number from list to begin return
  -o, --org string             Organization name or id (required)
      --output string          Write file(s) to directory, instead of STDOUT (default "-")
      --scope string           scope
  -s, --server string          management server endpoint (required)
      --space string           Space name or id (required)
      --space-initiated        space-initiated
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic apps:clear

Clear the Application objects

Synopsis

Clear the Application objects

```
apic apps:clear [flags]
```

Possible Usages

```
      apic apps:clear [flags] --space-initiated
      apic apps:clear [flags]
```

Options

```
  -c, --catalog string         Catalog name or id (required)
      --confirm string         Confirmation for critical updates (required)
      --consumer-org string    Consumer Organization name or id (required)
      --format string          Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
  -o, --org string             Organization name or id (required)
      --output string          Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string          management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic apps:create

Create a Application object

Synopsis

Create a Application object

```
      Fields allowed but ignored:
      - id
      - type
      - api_version
      - scope
      - created_at
      - updated_at
      - url
      - org_url
      - catalog_url
      - consumer_org_url
```

```
apic apps:create [flags]
```

Possible Usages

```
      apic apps:create [flags] --space-initiated APP_FILE
      apic apps:create [flags] APP_FILE
```

Options

```
  -c, --catalog string         Catalog name or id (required)
      --consumer-org string    Consumer Organization name or id (required)
      --format string          Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
  -o, --org string             Organization name or id (required)
      --output string          Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string          management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic apps:delete

Delete the Application object by name or id

Synopsis

Delete the Application object by name or id

```
apic apps:delete [flags]
```

Possible Usages

```
      apic apps:delete [flags] --space-initiated APP
      apic apps:delete [flags] APP
```

Options

```
  -c, --catalog string         Catalog name or id (required)
      --consumer-org string    Consumer Organization name or id (required)
      --format string          Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
  -o, --org string             Organization name or id (required)
      --output string          Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string          management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic apps:get

Get the Application object by name or id

Synopsis

Get the Application object by name or id

```
apic apps:get [flags]
```

Possible Usages

```
      apic apps:get [flags] --space-initiated APP
      apic apps:get [flags] APP
```

Options

```
  -c, --catalog string         Catalog name or id (required)
      --consumer-org string    Consumer Organization name or id (required)
      --fields string          List of field names to return
      --format string          Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
  -o, --org string             Organization name or id (required)
      --output string          Write file(s) to directory, use - for STDOUT. (default: cwd)
  -s, --server string          management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic apps:list

List the Application objects

Synopsis

List the Application objects

```
apic apps:list [flags]
```

Possible Usages

```
      apic apps:list [flags] --space-initiated
      apic apps:list [flags] --scope space
      apic apps:list [flags] --scope catalog
      apic apps:list [flags]
```

Options

```
  -c, --catalog string         Catalog name or id (required)
      --consumer-org string    Consumer Organization name or id (required)
      --fields string          List of field names to return
      --format string          Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
      --limit int32            Maximum number of items to return
      --offset int32           Offset item number from list to begin return
  -o, --org string             Organization name or id (required)
      --output string          Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string          management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic apps:update

Update the Application object by name or id

Synopsis

Update the Application object by name or id

```
      Fields allowed but ignored:
      - id
      - type
      - api_version
      - scope
      - created_at
      - updated_at
      - url
      - org_url
      - catalog_url
      - consumer_org_url
```

```
apic apps:update [flags]
```

Possible Usages

```
      apic apps:update [flags] --space-initiated APP APP_FILE
      apic apps:update [flags] APP APP_FILE
```

Options

```
  -c, --catalog string         Catalog name or id (required)
      --consumer-org string    Consumer Organization name or id (required)
      --format string          Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
  -o, --org string             Organization name or id (required)
      --output string          Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string          management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic associates

Associates operations

Synopsis

Associates operations

```
apic associates [flags]
```

Options

```
  -c, --catalog string         Catalog name or id (required)
      --consumer-org string    Consumer Organization name or id (required)
      --fields string          List of field names to return
      --format string          Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
  -h, --help                   Help for associates
      --limit int32            Maximum number of items to return
      --offset int32           Offset item number from list to begin return
  -o, --org string             Organization name or id (required)
      --output string          Write file(s) to directory, instead of STDOUT (default "-")
      --scope string           scope
  -s, --server string          management server endpoint (required)
      --space string           Space name or id (required)
      --space-initiated        space-initiated
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic associates:get

Associates get operations

Synopsis

Associates get operations

```
apic associates:get [flags]
```

Possible Usages

```
      apic associates:get [flags] --scope consumer-org --space-initiated ASSOCIATE
      apic associates:get [flags] --scope org ASSOCIATE
      apic associates:get [flags] --scope consumer-org ASSOCIATE
```

Options

```
  -c, --catalog string         Catalog name or id (required)
      --consumer-org string    Consumer Organization name or id (required)
```

```
      --fields string          List of field names to return
      --format string          Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
  -h, --help                   Help for associates:get
  -o, --org string             Organization name or id (required)
      --output string          Write file(s) to directory, use - for STDOUT. (default: cwd)
      --scope string           scope
  -s, --server string          management server endpoint (required)
      --space string           Space name or id (required)
      --space-initiated        space-initiated
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic associates:list

Associates list operations

Synopsis

Associates list operations

```
apic associates:list [flags]
```

Possible Usages

```
      apic associates:list [flags] --scope consumer-org --space-initiated
      apic associates:list [flags] --scope org
      apic associates:list [flags] --scope consumer-org
```

Options

```
  -c, --catalog string         Catalog name or id (required)
      --consumer-org string    Consumer Organization name or id (required)
      --fields string          List of field names to return
      --format string          Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
  -h, --help                   Help for associates:list
      --limit int32            Maximum number of items to return
      --offset int32           Offset item number from list to begin return
  -o, --org string             Organization name or id (required)
      --output string          Write file(s) to directory, instead of STDOUT (default "-")
      --scope string           scope
  -s, --server string          management server endpoint (required)
      --space string           Space name or id (required)
      --space-initiated        space-initiated
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic availability-zones

Availability Zones operations

Synopsis

Availability Zones operations

```
apic availability-zones [flags]
```

Options

```
      --fields string   List of field names to return
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help            Help for availability-zones
      --limit int32     Maximum number of items to return
      --offset int32    Offset item number from list to begin return
  -o, --org string      Organization name or id (required)
```

```
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic availability-zones:clear

Clear the Availability Zone objects

Synopsis

Clear the Availability Zone objects

```
apic availability-zones:clear [flags]
```

Possible Usages

```
      apic availability-zones:clear [flags]
```

Options

```
      --confirm string   Confirmation for critical updates (required)
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic availability-zones:create

Create a Availability Zone object

Synopsis

Create a Availability Zone object

```
      Fields allowed but ignored:
      - id
      - type
      - api_version
      - scope
      - created_at
      - updated_at
      - url
      - org_url
```

```
apic availability-zones:create [flags]
```

Possible Usages

```
      apic availability-zones:create [flags] AVAILABILITY_ZONE_FILE
```

Options

```
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -o, --org string      Organization name or id (required)
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic availability-zones:delete

Delete the Availability Zone object by name or id

Synopsis

Delete the Availability Zone object by name or id

```
apic availability-zones:delete [flags]
```

Possible Usages

```
      apic availability-zones:delete [flags] AVAILABILITY_ZONE
```

Options

```
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -o, --org string      Organization name or id (required)
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic availability-zones:get

Get the Availability Zone object by name or id

Synopsis

Get the Availability Zone object by name or id

```
apic availability-zones:get [flags]
```

Possible Usages

```
      apic availability-zones:get [flags] AVAILABILITY_ZONE
```

Options

```
      --fields string   List of field names to return
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -o, --org string      Organization name or id (required)
      --output string   Write file(s) to directory, use - for STDOUT. (default: cwd)
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic availability-zones:list

List the Availability Zone objects

Synopsis

List the Availability Zone objects

```
apic availability-zones:list [flags]
```

Possible Usages

```
apic availability-zones:list [flags]
```

Options

```
      --fields string   List of field names to return
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
      --limit int32     Maximum number of items to return
      --offset int32    Offset item number from list to begin return
  -o, --org string      Organization name or id (required)
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic availability-zones:update

Update the Availability Zone object by name or id

Synopsis

Update the Availability Zone object by name or id

```
Fields allowed but ignored:
- id
- type
- api_version
- scope
- created_at
- updated_at
- url
- org_url
```

```
apic availability-zones:update [flags]
```

Possible Usages

```
apic availability-zones:update [flags] AVAILABILITY_ZONE AVAILABILITY_ZONE_FILE
```

Options

```
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -o, --org string      Organization name or id (required)
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic billings

Billings operations

Synopsis

Billings operations

```
apic billings [flags]
```

Options

```
      --fields string   List of field names to return
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help            Help for billings
      --limit int32     Maximum number of items to return
      --offset int32    Offset item number from list to begin return
  -o, --org string      Organization name or id (required)
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic billings:clear

Clear the Billing objects

Synopsis

Clear the Billing objects

```
apic billings:clear [flags]
```

Possible Usages

```
      apic billings:clear [flags]
```

Options

```
      --confirm string   Confirmation for critical updates (required)
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic billings:delete

Delete the Billing object by name or id

Synopsis

Delete the Billing object by name or id

```
apic billings:delete [flags]
```

Possible Usages

```
      apic billings:delete [flags] BILLING
```

Options

```
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -o, --org string      Organization name or id (required)
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
```

```
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic billings:get

Get the Billing object by name or id

Synopsis

Get the Billing object by name or id

```
apic billings:get [flags]
```

Possible Usages

```
      apic billings:get [flags] BILLING
```

Options

```
      --fields string   List of field names to return
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -o, --org string      Organization name or id (required)
      --output string   Write file(s) to directory, use - for STDOUT. (default: cwd)
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic billings:list

List the Billing objects

Synopsis

List the Billing objects

```
apic billings:list [flags]
```

Possible Usages

```
      apic billings:list [flags]
```

Options

```
      --fields string   List of field names to return
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
      --limit int32     Maximum number of items to return
      --offset int32    Offset item number from list to begin return
  -o, --org string      Organization name or id (required)
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic billings:update

Update the Billing object by name or id

Synopsis

Update the Billing object by name or id

```
      Fields not allowed to be null:
      - integration_url

      Fields not allowed:
      - job_queue_status

      Fields allowed but ignored:
      - id
      - type
      - api_version
      - scope
      - created_at
      - updated_at
      - url
```

```
apic billings:update [flags]
```

Possible Usages

```
      apic billings:update [flags] BILLING BILLING_FILE
```

Options

```
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -o, --org string      Organization name or id (required)
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic catalog-settings

Catalog Settings operations

Synopsis

Catalog Settings operations

```
apic catalog-settings [flags]
```

Options

```
  -h, --help   Help for catalog-settings
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic catalog-settings:get

Get the Catalog Setting object

Synopsis

Get the Catalog Setting object

```
apic catalog-settings:get [flags]
```

Possible Usages

```
      apic catalog-settings:get [flags]
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --fields string    List of field names to return
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, use - for STDOUT. (default: cwd)
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic catalog-settings:update

Update the Catalog Setting object

Synopsis

Update the Catalog Setting object

```
      Fields allowed but ignored:
      - name
      - type
      - api_version
      - scope
      - created_at
      - updated_at
      - url
      - org_url
      - catalog_url
```

```
apic catalog-settings:update [flags]
```

Possible Usages

```
      apic catalog-settings:update [flags] CATALOG_SETTING_FILE
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --force            Force the operation
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic catalogs

Catalogs operations

Synopsis

Catalogs operations

```
apic catalogs [flags]
```

Options

```
      --fields string   List of field names to return
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help            Help for catalogs
      --limit int32     Maximum number of items to return
      --my              my
      --offset int32    Offset item number from list to begin return
  -o, --org string      Organization name or id (required)
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic catalogs:clear

Clear the Catalog objects

Synopsis

Clear the Catalog objects

```
apic catalogs:clear [flags]
```

Possible Usages

```
      apic catalogs:clear [flags]
```

Options

```
      --confirm string   Confirmation for critical updates (required)
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic catalogs:create

Create a Catalog object

Synopsis

Create a Catalog object

```
      Fields allowed but ignored:
      - id
      - type
      - api_version
      - scope
      - created_at
      - updated_at
      - url
      - org_url
```

```
apic catalogs:create [flags]
```

Possible Usages

```
      apic catalogs:create [flags] CATALOG_FILE
```

Options

```
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -o, --org string      Organization name or id (required)
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
```

```
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic catalogs:delete

Delete the Catalog object by name or id

Synopsis

Delete the Catalog object by name or id

```
apic catalogs:delete [flags]
```

Possible Usages

```
      apic catalogs:delete [flags] CATALOG
```

Options

```
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -o, --org string      Organization name or id (required)
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic catalogs:email-to-owners

Send email to owners of consumer organizations

Synopsis

Send email to owners of consumer organizations, given consumer org and consumer group urls. For consumer group, email owners of all consumer orgs in the group.

```
apic catalogs:email-to-owners [flags]
```

Possible Usages

```
      apic catalogs:email-to-owners [flags] CATALOG EMAIL_TO_OWNERS_FILE
```

Options

```
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -o, --org string      Organization name or id (required)
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic catalogs:get

Get the Catalog object by name or id

Synopsis

Get the Catalog object by name or id

```
apic catalogs:get [flags]
```

Possible Usages

```
      apic catalogs:get [flags] CATALOG
```

Options

```
      --fields string   List of field names to return
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -o, --org string      Organization name or id (required)
      --output string   Write file(s) to directory, use - for STDOUT. (default: cwd)
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic catalogs:list

List the Catalog objects

Synopsis

List the Catalog objects

```
apic catalogs:list [flags]
```

Possible Usages

```
      apic catalogs:list [flags] --my
      apic catalogs:list [flags]
```

Options

```
      --fields string   List of field names to return
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
      --limit int32     Maximum number of items to return
      --offset int32    Offset item number from list to begin return
  -o, --org string      Organization name or id (required)
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic catalogs:transfer-owner

Transfer owner to an associate

Synopsis

Transfer owner to an associate

```
apic catalogs:transfer-owner [flags]
```

Possible Usages

```
      apic catalogs:transfer-owner [flags] CATALOG TRANSFER_OWNER_FILE
```

Options

```
      --cascade            Cascade the behavior
      --delete_old_owner   Delete old owner
      --format string      Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
  -o, --org string         Organization name or id (required)
```

```
      --output string      Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string      management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic catalogs:update

Update the Catalog object by name or id

Synopsis

Update the Catalog object by name or id

```
      Fields not allowed:
      - name

      Fields allowed but ignored:
      - id
      - type
      - api_version
      - scope
      - created_at
      - updated_at
      - url
      - org_url
```

```
apic catalogs:update [flags]
```

Possible Usages

```
      apic catalogs:update [flags] CATALOG CATALOG_FILE
```

Options

```
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -o, --org string      Organization name or id (required)
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic client-creds

Manage the client configuration parameters. Client ID and Client Secret.

Synopsis

Manage the client configuration parameters. Client ID and Client Secret.

```
apic client-creds [flags]
```

Options

```
  -g, --global   list the global configuration variables
  -h, --help     Help for client-creds
  -l, --local    list the local application configuration variables
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic client-creds:clear

clear the set client credentials.

Synopsis

clear the set client credentials.

```
apic client-creds:clear [flags]
```

Examples

```
$ apic client-creds:clear
Deleted client credentials.
```

Options

```
  -g, --global   list the global configuration variables
  -h, --help     Help for client-creds:clear
  -l, --local    list the local application configuration variables
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic client-creds:list

List the set clientID/secret parameters.

Synopsis

List the set clientID/secret parameters.

```
apic client-creds:list [flags]
```

Examples

```
$ apic client-creds:list
```

Options

```
  -g, --global   list the global configuration variables
  -h, --help     Help for client-creds:list
  -l, --local    list the local application configuration variables
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic client-creds:set

Set the client configuration parameters. ClientID and Client Secret.

Synopsis

Set the client configuration parameters. ClientID and Client Secret.

```
apic client-creds:set /path/to/creds/json ... [flags]
```

Examples

```
$ apic client-creds:set /Users/local_user/credential.json
```

Options

```
  -g, --global   list the global configuration variables
  -h, --help     Help for client-creds:set
  -l, --local    list the local application configuration variables
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic cloud-emails

Cloud Emails operations

Synopsis

Cloud Emails operations

```
apic cloud-emails [flags]
```

Options

```
  -h, --help   Help for cloud-emails
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic cloud-emails:send-to-owners

Email provider org owners

Synopsis

Send an email to owners of provider orgs

```
apic cloud-emails:send-to-owners [flags]
```

Possible Usages

```
    apic cloud-emails:send-to-owners [flags] EMAIL_PROVIDER_ORG_OWNERS_FILE
```

Options

```
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic cloud-settings

Cloud Settings operations

Synopsis

Cloud Settings operations

```
apic cloud-settings [flags]
```

Options

```
  -h, --help   Help for cloud-settings
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic cloud-settings:about

Return information about the cloud

Synopsis

Return public information about the cloud. You MUST supply the --format option when using this command from the API Connect toolkit.

```
apic cloud-settings:about [flags]
```

Possible Usages

```
      apic cloud-settings:about [flags]
```

Options

```
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic cloud-settings:audit-endpoint-test-connection

Test an audit endpoint connection

Synopsis

Test an audit endpoint connection

```
apic cloud-settings:audit-endpoint-test-connection [flags]
```

Possible Usages

```
      apic cloud-settings:audit-endpoint-test-connection [flags] ENDPOINT
```

Options

```
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic cloud-settings:designer-credentials-list

List credential for designer

Synopsis

List credential for designer

```
apic cloud-settings:designer-credentials-list [flags]
```

Possible Usages

```
      apic cloud-settings:designer-credentials-list [flags]
```

Options

```
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic cloud-settings:get

Get the Cloud Setting object

Synopsis

Get the Cloud Setting object

```
apic cloud-settings:get [flags]
```

Possible Usages

```
      apic cloud-settings:get [flags]
```

Options

```
      --fields string   List of field names to return
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
      --output string   Write file(s) to directory, use - for STDOUT. (default: cwd)
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic cloud-settings:info

Return public information about the cloud deployment

Synopsis

Return public information about the cloud deployment

```
apic cloud-settings:info [flags]
```

Possible Usages

```
      apic cloud-settings:info [flags]
```

Options

```
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic cloud-settings:mail-server-configured

Return true or false based on if mail server is configured or not

Synopsis

Return true or false based on if mail server is configured or not. You MUST supply the --format option when using this command from the API Connect toolkit.

```
apic cloud-settings:mail-server-configured [flags]
```

Possible Usages

```
    apic cloud-settings:mail-server-configured [flags]
```

Options

```
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic cloud-settings:oauth2-certs

Support JWKS_URI endpoint, conform to OIDC specification

Synopsis

Return JWKS that is used to issue token. You MUST supply the --format option when using this command from the API Connect toolkit.

```
apic cloud-settings:oauth2-certs [flags]
```

Possible Usages

```
    apic cloud-settings:oauth2-certs [flags]
```

Options

```
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic cloud-settings:toolkit-credentials-list

List credential for toolkit, consumer toolkit, governance, and discovery toolkit

Synopsis

List credential for toolkit, consumer toolkit, governance, and discovery toolkit

```
apic cloud-settings:toolkit-credentials-list [flags]
```

Possible Usages

```
apic cloud-settings:toolkit-credentials-list [flags]
```

Options

```
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic cloud-settings:topology

Return the topology of the cloud for governance

Synopsis

Return the topology of the cloud for governance. You MUST supply the --format option when using this command from the API Connect toolkit.

```
apic cloud-settings:topology [flags]
```

Possible Usages

```
apic cloud-settings:topology [flags]
```

Options

```
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic cloud-settings:update

Update the Cloud Setting object

Synopsis

Update the Cloud Setting object

```
Fields not allowed to be null:
- email_sender
- tls_client_profile_default_url

Fields not allowed:
- service_type
- cloud_id
- ibm_cloud

Fields allowed but ignored:
- name
- type
- api_version
```

```
      - scope
      - created_at
      - updated_at
      - url
```

```
apic cloud-settings:update [flags]
```

Possible Usages

```
      apic cloud-settings:update [flags] CLOUD_SETTING_FILE
```

Options

```
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic config

Manage configuration variables

Synopsis

Manage configuration variables

```
apic config [flags]
```

Options

```
  -g, --global   list the global configuration variables
  -h, --help     Help for config
  -l, --local    list the local application configuration variables
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic config:clear

Delete all configuration variables

Synopsis

Delete all configuration variables

```
apic config:clear [flags]
```

Examples

```
$ apic config:clear
Deleted config catalog
Deleted config org
Deleted config space

$ apic config:clear --global
Deleted config catalog
```

Options

```
  -g, --global   list the global configuration variables
  -h, --help     Help for config:clear
  -l, --local    list the local application configuration variables
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic config:delete

Delete a configuration variable

Synopsis

Configuration variables:

catalog The catalog configuration variable should be set to the URI of an API Connect catalog. The value of the catalog provides the default identity of a catalog for all the commands that are used to manage aspects of a catalog. The default values defined by the catalog's URI can be overridden using the --server, --organization, and --catalog command line options. The catalog URI has the form: https://MANAGEMENT_SERVER/api/catalogs/ORGANIZATION_NAME/CATALOG_NAME

org The default value of org defined by the app's or catalog's URI can be set using the org URI. The org URI has the form: https://MANAGEMENT_SERVER/api/orgs/ORGANIZATION_NAME

space The space configuration variable should be set to the URI of an API Connect space. The value of the space provides the default identity of a space for all the commands that are used to manage aspects of a space. The default values defined by the spaces's URI can be overridden using the --server, --organization, --catalog, and --space command line options. The space URI has the form: https://MANAGEMENT_SERVER/api/spaces/ORGANIZATION_NAME/CATALOG_NAME/SPACE_NAME

consumer The consumer configuration variable should be set to the URI of an API Connect consumer. The value of the consumer-org provides the default identity of a consumer. The default values defined by the consumer URI can be overridden using the --server, --organization, --catalog, and --consumer command line options. The consumer URI has the form: https://MANAGEMENT_SERVER/api/consumer-orgs/ORGANIZATION_NAME/CATALOG_NAME/CONSUMER_ORG_NAME

cloud The cloud configuration variable should be set to the management server URI. The value of the cloud variable provides default server URI for cloud admin commands. It can be overridden using the --server and --mode command line options. The cloud URI has the form: https://MANAGEMENT_SERVER/api/

mode The value of mode configruation variable defines the toolkit operation mode. It can be overridden using the --mode command line option. The value can be set to apim or consumer

template-path List of places to look for handlebar templates

template-default-api Defines the default api template

template-default-product Defines the default product template

```
apic config:delete NAME... [flags]
```

Examples

```
$ apic config:delete catalog
Deleted config catalog

$ apic config:delete org
Deleted config org

$ apic config:delete template-path
Deleted config template-path
```

Options

```
  -g, --global   list the global configuration variables
  -h, --help     Help for config:delete
  -l, --local    list the local application configuration variables
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic config:get

Get a configuration variable

Synopsis

Configuration variables:

catalog The catalog configuration variable should be set to the URI of an API Connect catalog. The value of the catalog provides the default identity of a catalog for all the commands that are used to manage aspects of a catalog. The default values defined by the catalog's URI can be overridden using the --server, --organization, and --catalog command line options. The catalog URI has the form: https://MANAGEMENT_SERVER/api/catalogs/ORGANIZATION_NAME/CATALOG_NAME

org The default value of org defined by the app's or catalog's URI can be set using the org URI. The org URI has the form: https://MANAGEMENT_SERVER/api/orgs/ORGANIZATION_NAME

space The space configuration variable should be set to the URI of an API Connect space. The value of the space provides the default identity of a space for all the commands that are used to manage aspects of a space. The default values defined by the spaces's URI can be overridden using the --server, --organization, --catalog, and --space command line options. The space URI has the form: https://MANAGEMENT_SERVER/api/spaces/ORGANIZATION_NAME/CATALOG_NAME/SPACE_NAME

consumer The consumer configuration variable should be set to the URI of an API Connect consumer. The value of the consumer-org provides the default identity of a consumer. The default values defined by the consumer URI can be overridden using the --server, --organization, --catalog, and --consumer command line options. The consumer URI has the form: https://MANAGEMENT_SERVER/api/consumer-orgs/ORGANIZATION_NAME/CATALOG_NAME/CONSUMER_ORG_NAME

cloud The cloud configuration variable should be set to the management server URI. The value of the cloud variable provides default server URI for cloud admin commands. It can be overridden using the --server and --mode command line options. The cloud URI has the form: https://MANAGEMENT_SERVER/api/

mode The value of mode configruation variable defines the toolkit operation mode. It can be overridden using the --mode command line option. The value can be set to apim or consumer

template-path List of places to look for handlebar templates

template-default-api Defines the default api template

template-default-product Defines the default product template

```
apic config:get NAME [flags]
```

Examples

```
$ apic config:get catalog
catalog: https://mgmnthost.com/api/catalogs/climbon/sb

$ apic config:get org
org: https://mgmnthost.com/api/orgs/climbon

$ apic config:get template-path
template-path: /etc/templates
```

Options

```
  -g, --global   list the global configuration variables
  -h, --help     Help for config:get
  -l, --local    list the local application configuration variables
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic config:list

List the application and global configuration variables

Synopsis

Configuration variables:

catalog The catalog configuration variable should be set to the URI of an API Connect catalog. The value of the catalog provides the default identity of a catalog for all the commands that are used to manage aspects of a catalog. The default values defined by the catalog's URI can be overridden using the --server, --organization, and --catalog command line options. The catalog URI has the form: https://MANAGEMENT_SERVER/api/catalogs/ORGANIZATION_NAME/CATALOG_NAME

org The default value of org defined by the app's or catalog's URI can be set using the org URI. The org URI has the form: https://MANAGEMENT_SERVER/api/orgs/ORGANIZATION_NAME

space The space configuration variable should be set to the URI of an API Connect space. The value of the space provides the default identity of a space for all the commands that are used to manage aspects of a space. The default values defined by the spaces's URI can be overridden using the --server, --organization, --catalog, and --space command line options. The space URI has the form: https://MANAGEMENT_SERVER/api/spaces/ORGANIZATION_NAME/CATALOG_NAME/SPACE_NAME

consumer The consumer configuration variable should be set to the URI of an API Connect consumer. The value of the consumer-org provides the default identity of a consumer. The default values defined by the consumer URI can be overridden using the --server, --organization, --catalog, and --consumer command line options. The consumer URI has the form: https://MANAGEMENT_SERVER/api/consumer-orgs/ORGANIZATION_NAME/CATALOG_NAME/CONSUMER_ORG_NAME

cloud The cloud configuration variable should be set to the management server URI. The value of the cloud variable provides default server URI for cloud admin commands. It can be overridden using the --server and --mode command line options. The cloud URI has the form: https://MANAGEMENT_SERVER/api/

mode The value of mode configruation variable defines the toolkit operation mode. It can be overridden using the --mode command line option. The value can be set to apim or consumer

template-path List of places to look for handlebar templates

template-default-api Defines the default api template

template-default-product Defines the default product template

```
apic config:list [flags]
```

Examples

```
$ apic config
catalog: https://mgmnthost.com/api/catalogs/climbon/sb
org: https://mgmnthost.com/api/orgs/climbon

$ apic config --global
catalog: https://mgmnthost.com/api/catlogs/climbon/sb
```

Options

```
  -g, --global   list the global configuration variables
  -h, --help     Help for config:list
  -l, --local    list the local application configuration variables
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic config:set

Set or update configuration variables

Synopsis

Configuration variables:

catalog The catalog configuration variable should be set to the URI of an API Connect catalog. The value of the catalog provides the default identity of a catalog for all the commands that are used to manage aspects of a catalog. The default values defined by the catalog's URI can be overridden using the --server, --organization, and --catalog command line options. The catalog URI has the form: https://MANAGEMENT_SERVER/api/catalogs/ORGANIZATION_NAME/CATALOG_NAME

org The default value of org defined by the app's or catalog's URI can be set using the org URI. The org URI has the form: https://MANAGEMENT_SERVER/api/orgs/ORGANIZATION_NAME

space The space configuration variable should be set to the URI of an API Connect space. The value of the space provides the default identity of a space for all the commands that are used to manage aspects of a space. The default values defined by the spaces's URI can be overridden using the --server, --organization, --catalog, and --space command line options. The space URI has the form: https://MANAGEMENT_SERVER/api/spaces/ORGANIZATION_NAME/CATALOG_NAME/SPACE_NAME

consumer The consumer configuration variable should be set to the URI of an API Connect consumer. The value of the consumer-org provides the default identity of a consumer. The default values defined by the consumer URI can be overridden using the --server, --organization, --catalog, and --consumer command line options. The consumer URI has the form: https://MANAGEMENT_SERVER/api/consumer-orgs/ORGANIZATION_NAME/CATALOG_NAME/CONSUMER_ORG_NAME

cloud The cloud configuration variable should be set to the management server URI. The value of the cloud variable provides default server URI for cloud admin commands. It can be overridden using the --server and --mode command line options. The cloud URI has the form: https://MANAGEMENT_SERVER/api/

mode The value of mode configruation variable defines the toolkit operation mode. It can be overridden using the --mode command line option. The value can be set to apim or consumer

template-path List of places to look for handlebar templates

template-default-api Defines the default api template

template-default-product Defines the default product template

```
apic config:set NAME=VALUE ... [flags]
```

Examples

```
$ apic config:set catalog=https://mgmnthost.com/api/catalogs/climbon/sb
catalog: https://mgmnthost.com/api/catalogs/climbon/sb

$ apic config:set org=https://mgmnthost2.com/api/orgs/hikeon
org: https://mgmnthost2.com/api/orgs/hikeon

$ apic config:set --global template-path="/etc/templates"
template-path: /etc/templates
```

Options

```
  -g, --global   list the global configuration variables
  -h, --help     Help for config:set
  -l, --local    list the local application configuration variables
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic configured-api-user-registries

Configured Api User Registries operations

Synopsis

Configured Api User Registries operations

```
apic configured-api-user-registries [flags]
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --fields string    List of field names to return
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for configured-api-user-registries
      --limit int32      Maximum number of items to return
      --offset int32     Offset item number from list to begin return
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
      --scope string     scope
  -s, --server string    management server endpoint (required)
      --space string     Space name or id (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic configured-api-user-registries:clear

Configured Api User Registries clear operations

Synopsis

Configured Api User Registries clear operations

```
apic configured-api-user-registries:clear [flags]
```

Possible Usages

```
    apic configured-api-user-registries:clear [flags] --scope space
    apic configured-api-user-registries:clear [flags] --scope catalog
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --confirm string   Confirmation for critical updates (required)
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for configured-api-user-registries:clear
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
      --scope string     scope
  -s, --server string    management server endpoint (required)
      --space string     Space name or id (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic configured-api-user-registries:create

Configured Api User Registries create operations

Synopsis

Configured Api User Registries create operations

```
apic configured-api-user-registries:create [flags]
```

Possible Usages

```
      apic configured-api-user-registries:create [flags] --scope space CONFIGURED_API_USER_REGISTRY_FILE
      apic configured-api-user-registries:create [flags] --scope catalog CONFIGURED_API_USER_REGISTRY_FILE
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for configured-api-user-registries:create
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
      --scope string     scope
  -s, --server string    management server endpoint (required)
      --space string     Space name or id (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic configured-api-user-registries:delete

Configured Api User Registries delete operations

Synopsis

Configured Api User Registries delete operations

```
apic configured-api-user-registries:delete [flags]
```

Possible Usages

```
      apic configured-api-user-registries:delete [flags] --scope space CONFIGURED_API_USER_REGISTRY
      apic configured-api-user-registries:delete [flags] --scope catalog CONFIGURED_API_USER_REGISTRY
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for configured-api-user-registries:delete
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
      --scope string     scope
  -s, --server string    management server endpoint (required)
      --space string     Space name or id (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic configured-api-user-registries:get

Configured Api User Registries get operations

Synopsis

Configured Api User Registries get operations

```
apic configured-api-user-registries:get [flags]
```

Possible Usages

```
apic configured-api-user-registries:get [flags] --scope space CONFIGURED_API_USER_REGISTRY
apic configured-api-user-registries:get [flags] --scope catalog CONFIGURED_API_USER_REGISTRY
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --fields string    List of field names to return
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for configured-api-user-registries:get
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, use - for STDOUT. (default: cwd)
      --scope string     scope
  -s, --server string    management server endpoint (required)
      --space string     Space name or id (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic configured-api-user-registries:list

Configured Api User Registries list operations

Synopsis

Configured Api User Registries list operations

```
apic configured-api-user-registries:list [flags]
```

Possible Usages

```
apic configured-api-user-registries:list [flags] --scope space
apic configured-api-user-registries:list [flags] --scope catalog
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --fields string    List of field names to return
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for configured-api-user-registries:list
      --limit int32      Maximum number of items to return
      --offset int32     Offset item number from list to begin return
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
      --scope string     scope
  -s, --server string    management server endpoint (required)
      --space string     Space name or id (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic configured-billings

Configured Billings operations

Synopsis

Configured Billings operations

```
apic configured-billings [flags]
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --fields string    List of field names to return
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for configured-billings
      --limit int32      Maximum number of items to return
      --offset int32     Offset item number from list to begin return
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic configured-billings:clear

Clear the Configured Billing objects

Synopsis

Clear the Configured Billing objects

```
apic configured-billings:clear [flags]
```

Possible Usages

```
    apic configured-billings:clear [flags]
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --confirm string   Confirmation for critical updates (required)
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic configured-billings:create

Create a Configured Billing object

Synopsis

Create a Configured Billing object

```
    Required fields:
    - billing_url

    Fields allowed but ignored:
    - id
    - type
    - api_version
    - scope
    - created_at
```

```
      - updated_at
      - url
      - org_url
      - catalog_url
```

```
apic configured-billings:create [flags]
```

Possible Usages

```
      apic configured-billings:create [flags] CONFIGURED_BILLING_FILE
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic configured-billings:delete

Delete the Configured Billing object by name or id

Synopsis

Delete the Configured Billing object by name or id

```
apic configured-billings:delete [flags]
```

Possible Usages

```
      apic configured-billings:delete [flags] CONFIGURED_BILLING
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic configured-billings:get

Get the Configured Billing object by name or id

Synopsis

Get the Configured Billing object by name or id

```
apic configured-billings:get [flags]
```

Possible Usages

```
      apic configured-billings:get [flags] CONFIGURED_BILLING
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --fields string    List of field names to return
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, use - for STDOUT. (default: cwd)
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic configured-billings:list

List the Configured Billing objects

Synopsis

List the Configured Billing objects

```
apic configured-billings:list [flags]
```

Possible Usages

```
      apic configured-billings:list [flags]
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --fields string    List of field names to return
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
      --limit int32      Maximum number of items to return
      --offset int32     Offset item number from list to begin return
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic configured-catalog-user-registries

Configured Catalog User Registries operations

Synopsis

Configured Catalog User Registries operations

```
apic configured-catalog-user-registries [flags]
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --fields string    List of field names to return
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for configured-catalog-user-registries
      --limit int32      Maximum number of items to return
      --offset int32     Offset item number from list to begin return
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
```

```
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic configured-catalog-user-registries:create

Create a Configured Catalog User Registry object

Synopsis

Create a Configured Catalog User Registry object

```
      Required fields:
      - user_registry_url

      Fields allowed but ignored:
      - id
      - type
      - api_version
      - scope
      - created_at
      - updated_at
      - url
      - org_url
      - catalog_url
      - user_registry_url
```

```
apic configured-catalog-user-registries:create [flags]
```

Possible Usages

```
      apic configured-catalog-user-registries:create [flags] CONFIGURED_CATALOG_USER_REGISTRY_FILE
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic configured-catalog-user-registries:delete

Delete the Configured Catalog User Registry object by name or id

Synopsis

Delete the Configured Catalog User Registry object by name or id

```
apic configured-catalog-user-registries:delete [flags]
```

Possible Usages

```
      apic configured-catalog-user-registries:delete [flags] CONFIGURED_CATALOG_USER_REGISTRY
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
```

```
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic configured-catalog-user-registries:get

Get the Configured Catalog User Registry object by name or id

Synopsis

Get the Configured Catalog User Registry object by name or id

```
apic configured-catalog-user-registries:get [flags]
```

Possible Usages

```
      apic configured-catalog-user-registries:get [flags] CONFIGURED_CATALOG_USER_REGISTRY
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --fields string    List of field names to return
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, use - for STDOUT. (default: cwd)
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic configured-catalog-user-registries:list

List the Configured Catalog User Registry objects

Synopsis

List the Configured Catalog User Registry objects

```
apic configured-catalog-user-registries:list [flags]
```

Possible Usages

```
      apic configured-catalog-user-registries:list [flags]
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --fields string    List of field names to return
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
      --limit int32      Maximum number of items to return
      --offset int32     Offset item number from list to begin return
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect

apic configured-oauth-providers

Configured Oauth Providers operations

Synopsis

Configured Oauth Providers operations

```
apic configured-oauth-providers [flags]
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --fields string    List of field names to return
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for configured-oauth-providers
      --limit int32      Maximum number of items to return
      --offset int32     Offset item number from list to begin return
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
      --scope string     scope
  -s, --server string    management server endpoint (required)
      --space string     Space name or id (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic configured-oauth-providers:clear

Configured Oauth Providers clear operations

Synopsis

Configured Oauth Providers clear operations

```
apic configured-oauth-providers:clear [flags]
```

Possible Usages

```
    apic configured-oauth-providers:clear [flags] --scope space
    apic configured-oauth-providers:clear [flags] --scope catalog
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --confirm string   Confirmation for critical updates (required)
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for configured-oauth-providers:clear
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
      --scope string     scope
  -s, --server string    management server endpoint (required)
      --space string     Space name or id (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic configured-oauth-providers:create

Configured Oauth Providers create operations

Synopsis

Configured Oauth Providers create operations

```
apic configured-oauth-providers:create [flags]
```

Possible Usages

```
      apic configured-oauth-providers:create [flags] --scope space CONFIGURED_OAUTH_PROVIDER_FILE
      apic configured-oauth-providers:create [flags] --scope catalog CONFIGURED_OAUTH_PROVIDER_FILE
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for configured-oauth-providers:create
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
      --scope string     scope
  -s, --server string    management server endpoint (required)
      --space string     Space name or id (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic configured-oauth-providers:delete

Configured Oauth Providers delete operations

Synopsis

Configured Oauth Providers delete operations

```
apic configured-oauth-providers:delete [flags]
```

Possible Usages

```
      apic configured-oauth-providers:delete [flags] --scope space CONFIGURED_OAUTH_PROVIDER
      apic configured-oauth-providers:delete [flags] --scope catalog CONFIGURED_OAUTH_PROVIDER
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for configured-oauth-providers:delete
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
      --scope string     scope
  -s, --server string    management server endpoint (required)
      --space string     Space name or id (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic configured-oauth-providers:get

Configured Oauth Providers get operations

Synopsis

Configured Oauth Providers get operations

```
apic configured-oauth-providers:get [flags]
```

Possible Usages

```
apic configured-oauth-providers:get [flags] --scope space CONFIGURED_OAUTH_PROVIDER
apic configured-oauth-providers:get [flags] --scope catalog CONFIGURED_OAUTH_PROVIDER
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --fields string    List of field names to return
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for configured-oauth-providers:get
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, use - for STDOUT. (default: cwd)
      --scope string     scope
  -s, --server string    management server endpoint (required)
      --space string     Space name or id (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic configured-oauth-providers:list

Configured Oauth Providers list operations

Synopsis

Configured Oauth Providers list operations

```
apic configured-oauth-providers:list [flags]
```

Possible Usages

```
apic configured-oauth-providers:list [flags] --scope space
apic configured-oauth-providers:list [flags] --scope catalog
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --fields string    List of field names to return
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for configured-oauth-providers:list
      --limit int32      Maximum number of items to return
      --offset int32     Offset item number from list to begin return
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
      --scope string     scope
  -s, --server string    management server endpoint (required)
      --space string     Space name or id (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic configured-tls-client-profiles

Configured Tls Client Profiles operations

Synopsis

Configured Tls Client Profiles operations

```
apic configured-tls-client-profiles [flags]
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --fields string    List of field names to return
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for configured-tls-client-profiles
      --limit int32      Maximum number of items to return
      --offset int32     Offset item number from list to begin return
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
      --scope string     scope
  -s, --server string    management server endpoint (required)
      --space string     Space name or id (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic configured-tls-client-profiles:clear

Configured Tls Client Profiles clear operations

Synopsis

Configured Tls Client Profiles clear operations

```
apic configured-tls-client-profiles:clear [flags]
```

Possible Usages

```
    apic configured-tls-client-profiles:clear [flags] --scope space CONFIGURED_TLS_CLIENT_PROFILE_NAME
    apic configured-tls-client-profiles:clear [flags] --scope catalog CONFIGURED_TLS_CLIENT_PROFILE_NAME
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --confirm string   Confirmation for critical updates (required)
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for configured-tls-client-profiles:clear
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
      --scope string     scope
  -s, --server string    management server endpoint (required)
      --space string     Space name or id (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic configured-tls-client-profiles:clear-all

Configured Tls Client Profiles clear-all operations

Synopsis

Configured Tls Client Profiles clear-all operations

```
apic configured-tls-client-profiles:clear-all [flags]
```

Possible Usages

```
    apic configured-tls-client-profiles:clear-all [flags] --scope space
    apic configured-tls-client-profiles:clear-all [flags] --scope catalog
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --confirm string   Confirmation for critical updates (required)
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for configured-tls-client-profiles:clear-all
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
      --scope string     scope
  -s, --server string    management server endpoint (required)
      --space string     Space name or id (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic configured-tls-client-profiles:create

Configured Tls Client Profiles create operations

Synopsis

Configured Tls Client Profiles create operations

```
apic configured-tls-client-profiles:create [flags]
```

Possible Usages

```
    apic configured-tls-client-profiles:create [flags] --scope space CONFIGURED_TLS_CLIENT_PROFILE_FILE
    apic configured-tls-client-profiles:create [flags] --scope catalog CONFIGURED_TLS_CLIENT_PROFILE_FILE
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for configured-tls-client-profiles:create
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
      --scope string     scope
  -s, --server string    management server endpoint (required)
      --space string     Space name or id (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic configured-tls-client-profiles:delete

Configured Tls Client Profiles delete operations

Synopsis

Configured Tls Client Profiles delete operations

```
apic configured-tls-client-profiles:delete [flags]
```

Possible Usages

```
    apic configured-tls-client-profiles:delete [flags] --id --scope space ID
    apic configured-tls-client-profiles:delete [flags] --id --scope catalog ID
    apic configured-tls-client-profiles:delete [flags] --scope space NAME:VERSION
    apic configured-tls-client-profiles:delete [flags] --scope catalog NAME:VERSION
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for configured-tls-client-profiles:delete
      --id               id
  -o, --org string       Organization name or id (required)
```

```
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
      --scope string     scope
  -s, --server string    management server endpoint (required)
      --space string     Space name or id (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic configured-tls-client-profiles:get

Configured Tls Client Profiles get operations

Synopsis

Configured Tls Client Profiles get operations

```
apic configured-tls-client-profiles:get [flags]
```

Possible Usages

```
      apic configured-tls-client-profiles:get [flags] --id --scope space ID
      apic configured-tls-client-profiles:get [flags] --id --scope catalog ID
      apic configured-tls-client-profiles:get [flags] --scope space NAME:VERSION
      apic configured-tls-client-profiles:get [flags] --scope catalog NAME:VERSION
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --fields string    List of field names to return
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for configured-tls-client-profiles:get
      --id               id
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, use - for STDOUT. (default: cwd)
      --scope string     scope
  -s, --server string    management server endpoint (required)
      --space string     Space name or id (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic configured-tls-client-profiles:list

Configured Tls Client Profiles list operations

Synopsis

Configured Tls Client Profiles list operations

```
apic configured-tls-client-profiles:list [flags]
```

Possible Usages

```
      apic configured-tls-client-profiles:list [flags] --scope space CONFIGURED_TLS_CLIENT_PROFILE_NAME
      apic configured-tls-client-profiles:list [flags] --scope catalog CONFIGURED_TLS_CLIENT_PROFILE_NAME
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --fields string    List of field names to return
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for configured-tls-client-profiles:list
      --limit int32      Maximum number of items to return
      --offset int32     Offset item number from list to begin return
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
```

```
      --scope string     scope
  -s, --server string    management server endpoint (required)
      --space string     Space name or id (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic configured-tls-client-profiles:list-all

Configured Tls Client Profiles list-all operations

Synopsis

Configured Tls Client Profiles list-all operations

```
apic configured-tls-client-profiles:list-all [flags]
```

Possible Usages

```
      apic configured-tls-client-profiles:list-all [flags] --scope space
      apic configured-tls-client-profiles:list-all [flags] --scope catalog
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --fields string    List of field names to return
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for configured-tls-client-profiles:list-all
      --limit int32      Maximum number of items to return
      --offset int32     Offset item number from list to begin return

      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic consumer-org-settings

Consumer Org Settings operations

Synopsis

Consumer Org Settings operations

```
apic consumer-org-settings [flags]
```

Options

```
  -h, --help   Help for consumer-org-settings
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic consumer-org-settings:delete

Delete the Consumer Organization Setting object

Synopsis

Delete the Consumer Organization Setting object

```
apic consumer-org-settings:delete [flags]
```

Possible Usages

```
      apic consumer-org-settings:delete [flags] --space-initiated
      apic consumer-org-settings:delete [flags]
```

Options

```
  -c, --catalog string         Catalog name or id (required)
      --consumer-org string    Consumer Organization name or id (required)
      --format string          Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
  -o, --org string             Organization name or id (required)
      --output string          Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string          management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic consumer-org-settings:get

Get the Consumer Organization Setting object

Synopsis

Get the Consumer Organization Setting object

```
apic consumer-org-settings:get [flags]
```

Possible Usages

```
      apic consumer-org-settings:get [flags] --space-initiated
      apic consumer-org-settings:get [flags]
```

Options

```
  -c, --catalog string         Catalog name or id (required)
      --consumer-org string    Consumer Organization name or id (required)
      --fields string          List of field names to return
      --format string          Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
  -o, --org string             Organization name or id (required)
      --output string          Write file(s) to directory, use - for STDOUT. (default: cwd)
  -s, --server string          management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic consumer-org-settings:update

Update the Consumer Organization Setting object

Synopsis

Update the Consumer Organization Setting object

```
      Fields allowed but ignored:
      - name
```

```
      - type
      - api_version
      - scope
      - created_at
      - updated_at
      - url
```

```
apic consumer-org-settings:update [flags]
```

Possible Usages

```
      apic consumer-org-settings:update [flags] --space-initiated CONSUMER_ORG_SETTING_FILE
      apic consumer-org-settings:update [flags] CONSUMER_ORG_SETTING_FILE
```

Options

```
  -c, --catalog string         Catalog name or id (required)
      --consumer-org string    Consumer Organization name or id (required)
      --format string          Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
  -o, --org string             Organization name or id (required)
      --output string          Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string          management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic consumer-orgs

Consumer Orgs operations

Synopsis

Consumer Orgs operations

```
apic consumer-orgs [flags]
```

Options

```
  -c, --catalog string     Catalog name or id (required)
      --expand string      List of transient field to expand
      --fields string      List of field names to return
      --format string      Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
  -h, --help               Help for consumer-orgs
      --limit int32        Maximum number of items to return
      --offset int32       Offset item number from list to begin return
  -o, --org string         Organization name or id (required)
      --output string      Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string      management server endpoint (required)
      --space string       Space name or id (required)
      --space-initiated    space-initiated
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic consumer-orgs:clear

Clear the Consumer Organization objects

Synopsis

Clear the Consumer Organization objects

```
apic consumer-orgs:clear [flags]
```

Possible Usages

```
      apic consumer-orgs:clear [flags] --space-initiated
      apic consumer-orgs:clear [flags]
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --confirm string   Confirmation for critical updates (required)
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic consumer-orgs:create

Create a Consumer Organization object

Synopsis

Create a Consumer Organization object

```
      Required fields:
      - owner_url

      Fields allowed but ignored:
      - id
      - type
      - api_version
      - scope
      - created_at
      - updated_at
      - url
      - org_url
      - catalog_url
```

```
apic consumer-orgs:create [flags]
```

Possible Usages

```
      apic consumer-orgs:create [flags] --space-initiated CONSUMER_ORG_FILE
      apic consumer-orgs:create [flags] CONSUMER_ORG_FILE
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic consumer-orgs:delete

Delete the Consumer Organization object by name or id

Synopsis

Delete the Consumer Organization object by name or id

```
apic consumer-orgs:delete [flags]
```

Possible Usages

```
apic consumer-orgs:delete [flags] --space-initiated CONSUMER_ORG
apic consumer-orgs:delete [flags] CONSUMER_ORG
```

Options

```
-c, --catalog string   Catalog name or id (required)
    --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-o, --org string       Organization name or id (required)
    --output string    Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
    --accept-license        Accept the license for API Connect
    --debug                 Enable debug output
    --debug-output string   Write debug output to file
    --live-help             Enable or disable tracking of limited usage information
-m, --mode string           Toolkit operation mode (default "apim")
```

apic consumer-orgs:get

Get the Consumer Organization object by name or id

Synopsis

Get the Consumer Organization object by name or id

```
apic consumer-orgs:get [flags]
```

Possible Usages

```
apic consumer-orgs:get [flags] --space-initiated CONSUMER_ORG
apic consumer-orgs:get [flags] CONSUMER_ORG
```

Options

```
-c, --catalog string   Catalog name or id (required)
    --fields string    List of field names to return
    --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-o, --org string       Organization name or id (required)
    --output string    Write file(s) to directory, use - for STDOUT. (default: cwd)
-s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
    --accept-license        Accept the license for API Connect
    --debug                 Enable debug output
    --debug-output string   Write debug output to file
    --live-help             Enable or disable tracking of limited usage information
-m, --mode string           Toolkit operation mode (default "apim")
```

apic consumer-orgs:list

List the Consumer Organization objects

Synopsis

List the Consumer Organization objects

```
apic consumer-orgs:list [flags]
```

Possible Usages

```
apic consumer-orgs:list [flags] --space-initiated
apic consumer-orgs:list [flags]
```

Options

```
-c, --catalog string   Catalog name or id (required)
    --expand string    List of transient field to expand
    --fields string    List of field names to return
    --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
```

```
      --limit int32      Maximum number of items to return
      --offset int32     Offset item number from list to begin return
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic consumer-orgs:transfer-owner

Transfer owner to an associate

Synopsis

Transfer owner to an associate

```
apic consumer-orgs:transfer-owner [flags]
```

Possible Usages

```
      apic consumer-orgs:transfer-owner [flags] --space-initiated CONSUMER_ORG TRANSFER_OWNER_FILE
      apic consumer-orgs:transfer-owner [flags] CONSUMER_ORG TRANSFER_OWNER_FILE
```

Options

```
      --cascade             Cascade the behavior
  -c, --catalog string      Catalog name or id (required)
      --delete_old_owner    Delete old owner
      --format string       Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
  -o, --org string          Organization name or id (required)
      --output string       Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string       management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic consumer-orgs:update

Update the Consumer Organization object by name or id

Synopsis

Update the Consumer Organization object by name or id

```
      Fields allowed but ignored:
      - id
      - type
      - api_version
      - scope
      - created_at
      - updated_at
      - url
      - org_url
      - catalog_url

apic consumer-orgs:update [flags]
```

Possible Usages

```
      apic consumer-orgs:update [flags] --space-initiated CONSUMER_ORG CONSUMER_ORG_FILE
      apic consumer-orgs:update [flags] CONSUMER_ORG CONSUMER_ORG_FILE
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --fields string    List of field names to return
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic create

Create an API or product definition

Synopsis

Create an API or product definition

```
apic create [flags]
```

Options

```
  -h, --help          Help for create
  -i, --interactive   use interactive mode
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic create:api

Create an OpenAPI (Swagger) definition

Synopsis

Create an OpenAPI (Swagger) definition

```
apic create:api [flags]
```

Examples

```
Create an API
  $ apic create:api --title Routes
  Created routes.yaml API definition [routes:1.0.0]

Create an API and generate a product referencing the API
  $ apic create:api --title Routes --product "Climb On"
  Created routes.yaml API definition [routes:1.0.0]
  Created climb-on.yaml product definition [climb-on:1.0.0]

Create an API interactively
  $ apic create:api
  Title: Routes
  Name (routes): routes
  File (routes.yaml): routes.yaml
  Template: ()
  Basepath (/routes): /routes
  Hostname ($(catalog.host)): $(catalog.host)
  Schemes:
  Target url: ()
  Create product [true]: true
  Product title (Routes Product): Climb On
  Product name (climb-on): climb-on
  Product file (climb-on.yaml): climb-on.yaml
  Created routes.yaml API definition [routes:1.0.0]
  Created climb-on.yaml product definition [climb-on:1.0.0]

Create an API from a WSDL document
  $ apic create:api --wsdl globalweather.wsdl
  Created globalweather.yaml API definition [globalweather.yaml:1.0.0]
```

```
Create an API using APIC's default OAuth 2 provider template
  $ apic create:api --title "OAuth2 Provider" --template oauth2
  Created oauth2-provider.yaml API definition [oauth2-provider:1.0.0]

Create an API using one of your templates
  $ apic config:set --global template-path="/etc/templates"
  $ ls /etc/templates
  proxy.hbs staging.hbs
  $ apic create:api --title "Proxy Provider" --template proxy
  Created proxy-provider.yaml API definition [proxy-provider:1.0.0]

Create an API using your default template
  $ apic config:set --global template-path="/etc/templates"
  $ ls /etc/templates
  proxy.hbs staging.hbs
  $ apic config:set --global template-default-api=staging
  $ apic create:api --title "Staging Provider"
  Created staging-provider.yaml API definition [staging-provider:1.0.0]
```

Options

```
      --api_type string        The type of api (rest, wsdl-to-rest, or wsdl) (default "wsdl")
      --basepath string        basepath value (default derived from name)
      --disable_ws_security    Disable generation of WS-Security definitions in api
      --filename string        filename (default derived from name)
      --gateway-type string    The type of the gateway (datapower-gateway, datapower-api-gateway, event-gateway) (default
"datapower-gateway")
  -h, --help                   Help for create:api
      --hostname string        host value (default $(catalog.host)
  -i, --interactive            use interactive mode
      --name string            x-ibm-name value (default derived from title)
      --product string         generate a product definition referencing the API
      --schemes string         list of schemes (valid options are http, https, ws and wss)
      --services string        service names separated by space
      --target-url string      target url
      --template string        use a provider template (if empty defaults to apic template)
      --title string           title value (required)
  -v, --version string         version value (default "1.0.0")
      --wsdl string            wsdl file to use as the source (required authentication via apic login)
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic create:product

Create a product definition

Synopsis

Create a product definition

```
apic create:product [flags]
```

Examples

```
Create a product
  $ apic create:product --title "Climb On"
  Created climb-on.yaml product definition [climb-on:1.0.0]
Create a product interactively
  $ apic create:product
  ? Title: Climb On
  ? Name: climb-on
  ? File: climb-on.yaml
  ? Template:
  ? API Files:
  Created climb-on.yaml product definition [climb-on:1.0.0]
Create a product referencing existing APIs
  $ apic create:product --title "Climb On" --apis "routes.yaml ascents.yaml"
  Created climb-on.yaml product definition [climb-on:1.0.0]
Create an product using one of your templates
  $ apic config:set --global template-path="/etc/templates"
  $ ls /etc/templates
  proxy-product.hbs staging-product.hbs
  $ apic create:product --title "Proxy Product" --template proxy
  Created proxy-product.yaml product definition [proxy-product:1.0.0]
Create a product using your default template
  $ apic config:set --global template-path="/etc/templates"
  $ ls /etc/templates
  proxy-product.hbs staging-product.hbs
  $ apic config:set --global template-default-product=staging
```

```
  $ apic create:product --title "Staging Product"
  Created staging-product.yaml product definition [staging-product:1.0.0]
```

Options

```
      --apis string            api file names separated by a space
      --filename string        filename (default derived from name)
      --gateway-type string    The type of the gateway (datapower-gateway, datapower-api-gateway, event-gateway) (default
"datapower-gateway")
  -h, --help                   Help for create:product
  -i, --interactive            use interactive mode
      --name string            x-ibm-name value (default derived from title)
      --template string        use a provider template (if empty defaults to apic template)
      --title string           title value (required)
  -v, --version string         version value (default "1.0.0")
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic credentials

Credentials operations

Synopsis

Credentials operations

```
apic credentials [flags]
```

Options

```
  -a, --app string             Application name or id (required)
  -c, --catalog string         Catalog name or id (required)
      --consumer-org string    Consumer Organization name or id (required)
      --fields string          List of field names to return
      --format string          Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
  -h, --help                   Help for credentials
      --limit int32            Maximum number of items to return
      --offset int32           Offset item number from list to begin return
  -o, --org string             Organization name or id (required)
      --output string          Write file(s) to directory, instead of STDOUT (default "-")
      --scope string           scope
  -s, --server string          management server endpoint (required)
      --space string           Space name or id (required)
      --space-initiated        space-initiated
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic credentials:clear

Credentials clear operations

Synopsis

Credentials clear operations

```
apic credentials:clear [flags]
```

Possible Usages

```
    apic credentials:clear [flags] --space-initiated
```

Options

```
  -a, --app string             Application name or id (required)
  -c, --catalog string         Catalog name or id (required)
      --confirm string         Confirmation for critical updates (required)
      --consumer-org string    Consumer Organization name or id (required)
      --format string          Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
  -h, --help                   Help for credentials:clear
  -o, --org string             Organization name or id (required)
      --output string          Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string          management server endpoint (required)
      --space string           Space name or id (required)
      --space-initiated        space-initiated
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic credentials:create

Create a Application Credential object

Synopsis

Create a Application Credential object

```
      Fields allowed but ignored:
      - id
      - type
      - api_version
      - scope
      - created_at
      - updated_at
      - url
      - org_url
      - catalog_url
      - consumer_org_url
      - app_url
```

```
apic credentials:create [flags]
```

Possible Usages

```
      apic credentials:create [flags] --space-initiated CREDENTIAL_FILE
      apic credentials:create [flags] CREDENTIAL_FILE
```

Options

```
  -a, --app string             Application name or id (required)
  -c, --catalog string         Catalog name or id (required)
      --consumer-org string    Consumer Organization name or id (required)
      --format string          Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
  -o, --org string             Organization name or id (required)
      --output string          Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string          management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic credentials:delete

Delete the Application Credential object by name or id

Synopsis

Delete the Application Credential object by name or id

```
apic credentials:delete [flags]
```

Possible Usages

```
      apic credentials:delete [flags] --space-initiated CREDENTIAL
      apic credentials:delete [flags] CREDENTIAL
```

Options

```
  -a, --app string             Application name or id (required)
  -c, --catalog string         Catalog name or id (required)
      --consumer-org string    Consumer Organization name or id (required)
      --format string          Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
  -o, --org string             Organization name or id (required)
      --output string          Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string          management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic credentials:get

Get the Application Credential object by name or id

Synopsis

Get the Application Credential object by name or id

```
apic credentials:get [flags]
```

Possible Usages

```
      apic credentials:get [flags] --space-initiated CREDENTIAL
      apic credentials:get [flags] CREDENTIAL
```

Options

```
  -a, --app string             Application name or id (required)
  -c, --catalog string         Catalog name or id (required)
      --consumer-org string    Consumer Organization name or id (required)
      --fields string          List of field names to return
      --format string          Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
  -o, --org string             Organization name or id (required)
      --output string          Write file(s) to directory, use - for STDOUT. (default: cwd)
  -s, --server string          management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic credentials:list

List the Application Credential objects

Synopsis

List the Application Credential objects

```
apic credentials:list [flags]
```

Possible Usages

```
      apic credentials:list [flags] --space-initiated
      apic credentials:list [flags] --scope space
      apic credentials:list [flags] --scope catalog
      apic credentials:list [flags]
```

Options

```
  -a, --app string             Application name or id (required)
  -c, --catalog string         Catalog name or id (required)
      --consumer-org string    Consumer Organization name or id (required)
      --fields string          List of field names to return
      --format string          Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
      --limit int32            Maximum number of items to return
      --offset int32           Offset item number from list to begin return
  -o, --org string             Organization name or id (required)
      --output string          Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string          management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic credentials:reset-client-secret

Reset the client secret

Synopsis

Reset the client secret

```
apic credentials:reset-client-secret [flags]
```

Possible Usages

```
    apic credentials:reset-client-secret [flags] --space-initiated CREDENTIAL
    apic credentials:reset-client-secret [flags] CREDENTIAL
```

Options

```
  -a, --app string             Application name or id (required)
  -c, --catalog string         Catalog name or id (required)
      --consumer-org string    Consumer Organization name or id (required)
      --format string          Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
  -o, --org string             Organization name or id (required)
      --output string          Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string          management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic credentials:reset

Reset the client id and client secret

Synopsis

Reset the client id and client secret

```
apic credentials:reset [flags]
```

Possible Usages

```
    apic credentials:reset [flags] --space-initiated CREDENTIAL
    apic credentials:reset [flags] CREDENTIAL
```

Options

```
  -a, --app string             Application name or id (required)
  -c, --catalog string         Catalog name or id (required)
```

```
      --consumer-org string   Consumer Organization name or id (required)
      --format string         Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
  -o, --org string            Organization name or id (required)
      --output string         Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string         management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic credentials:update

Update the Application Credential object by name or id

Synopsis

Update the Application Credential object by name or id

```
      Fields not allowed to be null:
      - client_id

      Fields allowed but ignored:
      - id
      - type
      - api_version
      - scope
      - created_at
      - updated_at
      - url
      - org_url
      - catalog_url
      - consumer_org_url
      - app_url
```

```
apic credentials:update [flags]
```

Possible Usages

```
      apic credentials:update [flags] --space-initiated CREDENTIAL CREDENTIAL_FILE
      apic credentials:update [flags] CREDENTIAL CREDENTIAL_FILE
```

Options

```
  -a, --app string            Application name or id (required)
  -c, --catalog string        Catalog name or id (required)
      --consumer-org string   Consumer Organization name or id (required)
      --format string         Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
  -o, --org string            Organization name or id (required)
      --output string         Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string         management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic credentials:verify-client-secret

Verify the client secret

Synopsis

Verify the client secret

```
apic credentials:verify-client-secret [flags]
```

Possible Usages

```
      apic credentials:verify-client-secret [flags] --space-initiated CREDENTIAL CREDENTIAL_FILE
      apic credentials:verify-client-secret [flags] CREDENTIAL CREDENTIAL_FILE
```

Options

```
  -a, --app string             Application name or id (required)
  -c, --catalog string         Catalog name or id (required)
      --consumer-org string    Consumer Organization name or id (required)
      --format string          Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
  -o, --org string             Organization name or id (required)
      --output string          Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string          management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic draft-apis

Draft Apis operations

Synopsis

Draft Apis operations

```
apic draft-apis [flags]
```

Options

```
      --fields string    List of field names to return
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for draft-apis
      --limit int32      Maximum number of items to return
      --offset int32     Offset item number from list to begin return
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic draft-apis:clear-all

Clear all Draft API objects in all collections

Synopsis

Clear all Draft API objects in all collections

```
apic draft-apis:clear-all [flags]
```

Possible Usages

```
      apic draft-apis:clear-all [flags]
```

Options

```
      --confirm string   Confirmation for critical updates (required)
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic draft-apis:clear

Clear the Draft API objects

Synopsis

Clear the Draft API objects

```
apic draft-apis:clear [flags]
```

Possible Usages

```
      apic draft-apis:clear [flags] DRAFT_API_NAME
```

Options

```
      --confirm string   Confirmation for critical updates (required)
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic draft-apis:clone

Clone the draft-api objects

Synopsis

Clone the draft-api objects

```
apic draft-apis:clone [flags]
```

Possible Usages

```
      apic draft-apis:clone [flags]
```

Options

```
      --fields string   List of field names to return
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
      --limit int32     Maximum number of items to return
      --offset int32    Offset item number from list to begin return
  -o, --org string      Organization name or id (required)
      --output string   Write file(s) to directory, use - for STDOUT. (default: cwd)
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic draft-apis:create

Create a Draft API object

Synopsis

Create a Draft API object

```
      Fields allowed but ignored:
      - id
      - type
      - api_version
      - scope
      - created_at
      - updated_at
      - url
      - org_url
```

```
apic draft-apis:create [flags]
```

Possible Usages

```
      apic draft-apis:create [flags] DRAFT_API_FILE
```

Options

```
      --api_type string         The type of api (asyncapi, rest, graphql, wsdl_to_rest, or wsdl)
      --assembly_type string    The type of the assembly to generate (rest_to_proxy)
      --disable_ws_security     Disable generation of WS-Security definitions in api
      --format string           Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
      --gateway_type string     The type of the gateway (datapower-gateway, datapower-api-gateway, event-gateway)
  -o, --org string              Organization name or id (required)
      --output string           Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string           management server endpoint (required)
      --wsdl_service string     Name of WSDL service to create the OpenAPI definition from
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic draft-apis:delete

Delete a Draft API

Synopsis

Delete a Draft API

```
apic draft-apis:delete [flags]
```

Possible Usages

```
      apic draft-apis:delete [flags] --id ID
      apic draft-apis:delete [flags] NAME:VERSION
```

Options

```
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -o, --org string      Organization name or id (required)
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic draft-apis:document

Get the Draft API document by name and version

Synopsis

Get the Draft API document by name and version

```
apic draft-apis:document [flags]
```

Possible Usages

```
      apic draft-apis:document [flags] --id ID
      apic draft-apis:document [flags] NAME:VERSION
```

Options

```
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -o, --org string      Organization name or id (required)
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic draft-apis:get

Get the Draft API object by name and version

Synopsis

Get the Draft API object by name and version

```
apic draft-apis:get [flags]
```

Possible Usages

```
      apic draft-apis:get [flags] --id ID
      apic draft-apis:get [flags] NAME:VERSION
```

Options

```
      --fields string   List of field names to return (default "add(wsdl,draft_api)")
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -o, --org string      Organization name or id (required)
      --output string   Write file(s) to directory, use - for STDOUT. (default: cwd)
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic draft-apis:list

List the Draft API objects

Synopsis

List the Draft API objects

```
apic draft-apis:list [flags]
```

Possible Usages

```
      apic draft-apis:list [flags] DRAFT_API_NAME
```

Options

```
      --fields string   List of field names to return
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
      --limit int32     Maximum number of items to return
      --offset int32    Offset item number from list to begin return
  -o, --org string      Organization name or id (required)
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic draft-apis:list-all

List all Draft API objects in all collections

Synopsis

List all Draft API objects in all collections

```
apic draft-apis:list-all [flags]
```

Possible Usages

```
      apic draft-apis:list-all [flags]
```

Options

```
      --fields string   List of field names to return
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
      --limit int32     Maximum number of items to return
      --offset int32    Offset item number from list to begin return
  -o, --org string      Organization name or id (required)
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic draft-apis:update

Update the Draft API object by name and version

Synopsis

Update the Draft API object by name and version

```
      Fields allowed but ignored:
      - id
      - type
      - api_version
      - scope
      - created_at
      - updated_at
      - url
      - org_url
```

```
apic draft-apis:update [flags]
```

Possible Usages

```
      apic draft-apis:update [flags] --id ID DRAFT_API_FILE
      apic draft-apis:update [flags] NAME:VERSION DRAFT_API_FILE
```

Options

```
      --api_type string       The type of api (asyncapi, rest, graphql, wsdl_to_rest, or wsdl)
      --disable_ws_security   Disable generation of WS-Security definitions in api
      --format string         Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
  -o, --org string            Organization name or id (required)
      --output string         Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string         management server endpoint (required)
      --wsdl_service string   Name of WSDL service to create the OpenAPI definition from
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic draft-apis:update-wsdl

Update with a new wsdl

Synopsis

Update with a new wsdl

```
apic draft-apis:update-wsdl [flags]
```

Possible Usages

```
      apic draft-apis:update-wsdl [flags] --id ID DRAFT_APIS_FILE
      apic draft-apis:update-wsdl [flags] NAME:VERSION DRAFT_APIS_FILE
```

Options

```
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -o, --org string      Organization name or id (required)
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic draft-apis:validate

Validate the draft api

Synopsis

Validate the draft api

```
apic draft-apis:validate [flags]
```

Possible Usages

```
      apic draft-apis:validate [flags] --id ID
      apic draft-apis:validate [flags] NAME:VERSION
```

Options

```
      --catalog_name string             Name of a catalog
      --format string                   Output format. One of [json yaml octet-stream go-template=... go-template-file=...],
defaults to yaml.
      --gateway_service_names string    Names of Gateway Services
  -o, --org string                      Organization name or id (required)
      --output string                   Write file(s) to directory, instead of STDOUT (default "-")
      --scope string                    scope
  -s, --server string                   management server endpoint (required)
      --space_name string               Name of a space
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic draft-apis:wsdl

Get the Draft API wsdl document by name and version

Synopsis

Get the Draft API wsdl document by name and version

```
apic draft-apis:wsdl [flags]
```

Possible Usages

```
      apic draft-apis:wsdl [flags] --id ID
      apic draft-apis:wsdl [flags] NAME:VERSION
```

Options

```
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -o, --org string      Organization name or id (required)
      --output string   Write file(s) to directory, use - for STDOUT. (default: cwd)
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic draft-products

Draft Products operations

Synopsis

Draft Products operations

```
apic draft-products [flags]
```

Options

```
      --fields string   List of field names to return
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help            Help for draft-products
      --limit int32     Maximum number of items to return
      --offset int32    Offset item number from list to begin return
  -o, --org string      Organization name or id (required)
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic draft-products:clear-all

Clear all Draft Product objects in all collections

Synopsis

Clear all Draft Product objects in all collections

```
apic draft-products:clear-all [flags]
```

Possible Usages

```
apic draft-products:clear-all [flags]
```

Options

```
      --confirm string   Confirmation for critical updates (required)
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic draft-products:clear

Clear the Draft Product objects

Synopsis

Clear the Draft Product objects

```
apic draft-products:clear [flags]
```

Possible Usages

```
apic draft-products:clear [flags] DRAFT_PRODUCT_NAME
```

Options

```
      --confirm string   Confirmation for critical updates (required)
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic draft-products:clone

Clone the draft-product objects

Synopsis

Clone the draft-product objects

```
apic draft-products:clone [flags]
```

Possible Usages

```
apic draft-products:clone [flags]
```

Options

```
      --fields string   List of field names to return
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
      --limit int32     Maximum number of items to return
      --offset int32    Offset item number from list to begin return
  -o, --org string      Organization name or id (required)
```

```
      --output string   Write file(s) to directory, use - for STDOUT. (default: cwd)
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic draft-products:create

Create a Draft Product object

Synopsis

Create a Draft Product object

```
      Fields allowed but ignored:
      - id
      - type
      - api_version
      - scope
      - created_at
      - updated_at
      - url
      - org_url
```

```
apic draft-products:create [flags]
```

Possible Usages

```
      apic draft-products:create [flags] DRAFT_PRODUCT_FILE
```

Options

```
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -o, --org string      Organization name or id (required)
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
      --product-only    Upload only the product document
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic draft-products:delete

Delete a Draft Product

Synopsis

Delete a Draft Product

```
apic draft-products:delete [flags]
```

Possible Usages

```
      apic draft-products:delete [flags] --id ID
      apic draft-products:delete [flags] NAME:VERSION
```

Options

```
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -o, --org string      Organization name or id (required)
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic draft-products:document

Get the Draft Product document by name and version

Synopsis

Get the Draft Product document by name and version

```
apic draft-products:document [flags]
```

Possible Usages

```
      apic draft-products:document [flags] --id ID
      apic draft-products:document [flags] NAME:VERSION
```

Options

```
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -o, --org string      Organization name or id (required)
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic draft-products:get

Get the Draft Product object by name and version

Synopsis

Get the Draft Product object by name and version

```
apic draft-products:get [flags]
```

Possible Usages

```
      apic draft-products:get [flags] --id ID
      apic draft-products:get [flags] NAME:VERSION
```

Options

```
      --fields string   List of field names to return (default "add(draft_product,url)")
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -o, --org string      Organization name or id (required)
      --output string   Write file(s) to directory, use - for STDOUT. (default: cwd)
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic draft-products:list-all

List all Draft Product objects in all collections

Synopsis

List all Draft Product objects in all collections

```
apic draft-products:list-all [flags]
```

Possible Usages

```
apic draft-products:list-all [flags]
```

Options

```
      --fields string   List of field names to return
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
      --limit int32     Maximum number of items to return
      --offset int32    Offset item number from list to begin return
  -o, --org string      Organization name or id (required)
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic draft-products:list

List the Draft Product objects

Synopsis

List the Draft Product objects

```
apic draft-products:list [flags]
```

Possible Usages

```
apic draft-products:list [flags] DRAFT_PRODUCT_NAME
```

Options

```
      --fields string   List of field names to return
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
      --limit int32     Maximum number of items to return
      --offset int32    Offset item number from list to begin return
  -o, --org string      Organization name or id (required)
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic draft-products:publish

Publish a draft product by url reference

Synopsis

Publish a draft product by url reference

```
apic draft-products:publish [flags]
```

Possible Usages

```
apic draft-products:publish [flags] --stage --scope space DRAFT_PRODUCT_PUBLISH_FILE
apic draft-products:publish [flags] --stage DRAFT_PRODUCT_PUBLISH_FILE
```

```
      apic draft-products:publish [flags] --scope space DRAFT_PRODUCT_PUBLISH_FILE
      apic draft-products:publish [flags] DRAFT_PRODUCT_PUBLISH_FILE
```

Options

```
  -c, --catalog string             Catalog name or id (required)
      --format string              Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults
to yaml.
      --gateway_services string    The list of gateway service names to support partial publishing
      --migrate_subscriptions      Migrate subscription when republish product
  -o, --org string                 Organization name or id (required)
      --output string              Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string              management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic draft-products:update

Update the Draft Product object by name and version

Synopsis

Update the Draft Product object by name and version

```
      Fields allowed but ignored:
      - id
      - type
      - api_version
      - scope
      - created_at
      - updated_at
      - url
      - org_url
```

```
apic draft-products:update [flags]
```

Possible Usages

```
      apic draft-products:update [flags] --id ID DRAFT_PRODUCT_FILE
      apic draft-products:update [flags] NAME:VERSION DRAFT_PRODUCT_FILE
```

Options

```
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic draft-products:validate

Validate the draft product

Synopsis

Validate the draft product

```
apic draft-products:validate [flags]
```

Possible Usages

```
      apic draft-products:validate [flags] --id ID
      apic draft-products:validate [flags] NAME:VERSION
```

Options

```
      --catalog_name string            Name of a catalog
      --format string                  Output format. One of [json yaml octet-stream go-template=... go-template-file=...],
defaults to yaml.
      --gateway_service_names string   Names of Gateway Services
  -o, --org string                     Organization name or id (required)
      --output string                  Write file(s) to directory, instead of STDOUT (default "-")
      --scope string                   scope
  -s, --server string                  management server endpoint (required)
      --space_name string              Name of a space
      --validate_apis                  Whether to validate APIs also
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic drafts

Drafts operations

Synopsis

Drafts operations

```
apic drafts [flags]
```

Options

```
      --fields string   List of field names to return
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help            Help for drafts
      --limit int32     Maximum number of items to return
      --offset int32    Offset item number from list to begin return
  -o, --org string      Organization name or id (required)
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic drafts:clear

Clear the Draft objects

Synopsis

Clear the Draft objects

```
apic drafts:clear [flags]
```

Possible Usages

```
    apic drafts:clear [flags]
```

Options

```
      --confirm string   Confirmation for critical updates (required)
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic drafts:list

List the Draft objects

Synopsis

List the Draft objects

```
apic drafts:list [flags]
```

Possible Usages

```
      apic drafts:list [flags]
```

Options

```
      --fields string   List of field names to return
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
      --limit int32     Maximum number of items to return
      --offset int32    Offset item number from list to begin return
  -o, --org string      Organization name or id (required)
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic entries

Entries operations

Synopsis

Entries operations

```
apic entries [flags]
```

Options

```
      --fields string       List of field names to return
      --format string       Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
  -h, --help                Help for entries
      --limit int32         Maximum number of items to return
      --offset int32        Offset item number from list to begin return
  -o, --org string          Organization name or id (required)
      --output string       Write file(s) to directory, instead of STDOUT (default "-")
      --scope string        scope
  -s, --server string       management server endpoint (required)
      --truststore string   Truststore name or id (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic entries:clear

Entries clear operations

Synopsis

Entries clear operations

```
apic entries:clear [flags]
```

Possible Usages

```
      apic entries:clear [flags] --scope truststore
```

Options

```
      --confirm string      Confirmation for critical updates (required)
      --format string       Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
  -h, --help                Help for entries:clear
  -o, --org string          Organization name or id (required)
      --output string       Write file(s) to directory, instead of STDOUT (default "-")
      --scope string        scope
  -s, --server string       management server endpoint (required)
      --truststore string   Truststore name or id (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic entries:create

Entries create operations

Synopsis

Entries create operations

```
apic entries:create [flags]
```

Possible Usages

```
      apic entries:create [flags] --scope truststore ENTRY_FILE
```

Options

```
      --format string       Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
  -h, --help                Help for entries:create
  -o, --org string          Organization name or id (required)
      --output string       Write file(s) to directory, instead of STDOUT (default "-")
      --scope string        scope
  -s, --server string       management server endpoint (required)
      --truststore string   Truststore name or id (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic entries:delete

Entries delete operations

Synopsis

Entries delete operations

```
apic entries:delete [flags]
```

Possible Usages

```
      apic entries:delete [flags] --scope truststore ENTRY
```

Options

```
      --format string       Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
  -h, --help                Help for entries:delete
  -o, --org string          Organization name or id (required)
      --output string       Write file(s) to directory, instead of STDOUT (default "-")
      --scope string        scope
  -s, --server string       management server endpoint (required)
      --truststore string   Truststore name or id (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic entries:get

Entries get operations

Synopsis

Entries get operations

```
apic entries:get [flags]
```

Possible Usages

```
      apic entries:get [flags] --scope truststore ENTRY
```

Options

```
      --fields string       List of field names to return
      --format string       Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
  -h, --help                Help for entries:get
  -o, --org string          Organization name or id (required)
      --output string       Write file(s) to directory, use - for STDOUT. (default: cwd)
      --scope string        scope
  -s, --server string       management server endpoint (required)
      --truststore string   Truststore name or id (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic entries:list

Entries list operations

Synopsis

Entries list operations

```
apic entries:list [flags]
```

Possible Usages

```
      apic entries:list [flags] --scope truststore
```

Options

```
      --fields string       List of field names to return
      --format string       Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
  -h, --help                Help for entries:list
```

```
      --limit int32          Maximum number of items to return
      --offset int32         Offset item number from list to begin return
  -o, --org string           Organization name or id (required)
      --output string        Write file(s) to directory, instead of STDOUT (default "-")
      --scope string         scope
  -s, --server string        management server endpoint (required)
      --truststore string    Truststore name or id (required)
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic entries:update

Entries update operations

Synopsis

Entries update operations

```
apic entries:update [flags]
```

Possible Usages

```
      apic entries:update [flags] --scope truststore ENTRY ENTRY_FILE
```

Options

```
      --format string        Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
  -h, --help                 Help for entries:update
  -o, --org string           Organization name or id (required)
      --output string        Write file(s) to directory, instead of STDOUT (default "-")
      --scope string         scope
  -s, --server string        management server endpoint (required)
      --truststore string    Truststore name or id (required)
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic extensions

Extensions operations

Synopsis

Extensions operations

```
apic extensions [flags]
```

Options

```
      --availability-zone string            Availability Zone name or id (required)
  -c, --catalog string                      Catalog name or id (required)

  -s, --server string                       management server endpoint (required)
      --space string                        Space name or id (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic extensions:list

Extensions list operations

Synopsis

Extensions list operations

```
apic extensions:list [flags]
```

Possible Usages

```
      apic extensions:list [flags] --scope space EXTENSION_NAME
      apic extensions:list [flags] --scope org EXTENSION_NAME
      apic extensions:list [flags] --scope catalog EXTENSION_NAME
```

Options

```
      --availability-zone string            Availability Zone name or id (required)
  -c, --catalog string                      Catalog name or id (required)
      --configured-gateway-service string   Configured Gateway Service name or id (required)
      --fields string                       List of field names to return
      --format string                       Output format. One of [json yaml octet-stream go-template=... go-template-
file=...], defaults to yaml.
      --gateway-service string              Gateway Service name or id (required)
  -h, --help                                Help for extensions:list
      --limit int32                         Maximum number of items to return
      --offset int32                        Offset item number from list to begin return
  -o, --org string                          Organization name or id (required)
      --output string                       Write file(s) to directory, instead of STDOUT (default "-")
      --scope string                        scope
  -s, --server string                       management server endpoint (required)
      --space string                        Space name or id (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic extensions:list-all

Extensions list-all operations

Synopsis

Extensions list-all operations

```
apic extensions:list-all [flags]
```

Possible Usages

```
     apic extensions:list-all [flags] --scope space
     apic extensions:list-all [flags] --scope org
     apic extensions:list-all [flags] --scope catalog
```

Options

```
      --availability-zone string            Availability Zone name or id (required)
  -c, --catalog string                      Catalog name or id (required)
      --configured-gateway-service string   Configured Gateway Service name or id (required)
      --fields string                       List of field names to return
      --format string                       Output format. One of [json yaml octet-stream go-template=... go-template-
file=...], defaults to yaml.
      --gateway-service string              Gateway Service name or id (required)
  -h, --help                                Help for extensions:list-all
      --limit int32                         Maximum number of items to return
      --offset int32                        Offset item number from list to begin return
  -o, --org string                          Organization name or id (required)
      --output string                       Write file(s) to directory, instead of STDOUT (default "-")
      --scope string                        scope
  -s, --server string                       management server endpoint (required)
      --space string                        Space name or id (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic extensions:update

Extensions update operations

Synopsis

Extensions update operations

```
apic extensions:update [flags]
```

Possible Usages

```
      apic extensions:update [flags] --id --scope space ID EXTENSION_FILE
      apic extensions:update [flags] --id --scope catalog ID EXTENSION_FILE
      apic extensions:update [flags] --scope space NAME:VERSION EXTENSION_FILE
      apic extensions:update [flags] --scope catalog NAME:VERSION EXTENSION_FILE
```

Options

```
  -c, --catalog string                       Catalog name or id (required)
      --configured-gateway-service string    Configured Gateway Service name or id (required)
      --format string                        Output format. One of [json yaml octet-stream go-template=... go-template-
file=...], defaults to yaml.
  -h, --help                                 Help for extensions:update
      --id                                   id
  -o, --org string                           Organization name or id (required)
      --output string                        Write file(s) to directory, instead of STDOUT (default "-")
      --scope string                         scope
  -s, --server string                        management server endpoint (required)
      --space string                         Space name or id (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic gateway-extensions

Gateway Extensions operations

Synopsis

Gateway Extensions operations

```
apic gateway-extensions [flags]
```

Options

```
  -h, --help   Help for gateway-extensions
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file

  -m, --mode string           Toolkit operation mode (default "apim")
```

apic gateway-extensions:create

Gateway Extensions create operations

Synopsis

Gateway Extensions create operations

```
apic gateway-extensions:create [flags]
```

Possible Usages

```
      apic gateway-extensions:create [flags] --scope org GATEWAY_EXTENSIONS_FILE
```

Options

```
      --availability-zone string   Availability Zone name or id (required)
      --format string              Output format. One of [json yaml octet-stream go-template=... go-template-file=...],
defaults to yaml.
      --gateway-service string     Gateway Service name or id (required)
  -h, --help                       Help for gateway-extensions:create
  -o, --org string                 Organization name or id (required)
      --output string              Write file(s) to directory, instead of STDOUT (default "-")
      --scope string               scope
  -s, --server string              management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic gateway-extensions:delete

Gateway Extensions delete operations

Synopsis

Gateway Extensions delete operations

```
apic gateway-extensions:delete [flags]
```

Possible Usages

```
      apic gateway-extensions:delete [flags] --scope org
```

Options

```
      --availability-zone string   Availability Zone name or id (required)
      --format string              Output format. One of [json yaml octet-stream go-template=... go-template-file=...],
defaults to yaml.
      --gateway-service string     Gateway Service name or id (required)
  -h, --help                       Help for gateway-extensions:delete
  -o, --org string                 Organization name or id (required)
      --output string              Write file(s) to directory, instead of STDOUT (default "-")
      --scope string               scope
  -s, --server string              management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic gateway-extensions:get

Gateway Extensions get operations

Synopsis

Gateway Extensions get operations

```
apic gateway-extensions:get [flags]
```

Possible Usages

```
      apic gateway-extensions:get [flags] --scope org
```

Options

```
      --availability-zone string   Availability Zone name or id (required)
      --fields string              List of field names to return
      --format string              Output format. One of [json yaml octet-stream go-template=... go-template-file=...],
defaults to yaml.
      --gateway-service string     Gateway Service name or id (required)
  -h, --help                       Help for gateway-extensions:get
  -o, --org string                 Organization name or id (required)
      --output string              Write file(s) to directory, use - for STDOUT. (default: cwd)
      --scope string               scope
  -s, --server string              management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
```

```
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic gateway-extensions:implementation

Get the Gateway Extension implementation document

Synopsis

Get the Gateway Extension implementation document

```
apic gateway-extensions:implementation [flags]
```

Possible Usages

```
      apic gateway-extensions:implementation [flags]
```

Options

```
      --availability-zone string   Availability Zone name or id (required)
      --format string              Output format. One of [json yaml octet-stream go-template=... go-template-file=...],
defaults to yaml.
      --gateway-service string     Gateway Service name or id (required)
  -o, --org string                 Organization name or id (required)
      --output string              Write file(s) to directory, use - for STDOUT. (default: cwd)

      --scope string               scope
  -s, --server string              management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic gateway-services

Gateway Services operations

Synopsis

Gateway Services operations

```
apic gateway-services [flags]
```

Options

```
      --availability-zone string   Availability Zone name or id (required)
      --fields string              List of field names to return
      --format string              Output format. One of [json yaml octet-stream go-template=... go-template-file=...],
defaults to yaml.
  -h, --help                       Help for gateway-services
      --limit int32                Maximum number of items to return
      --offset int32               Offset item number from list to begin return
  -o, --org string                 Organization name or id (required)
      --output string              Write file(s) to directory, instead of STDOUT (default "-")
      --scope string               scope
  -s, --server string              management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic gateway-services:clear

Clear the Gateway Service objects

Synopsis

Clear the Gateway Service objects

```
apic gateway-services:clear [flags]
```

Possible Usages

```
      apic gateway-services:clear [flags]
```

Options

```
      --availability-zone string   Availability Zone name or id (required)
      --confirm string             Confirmation for critical updates (required)
      --format string              Output format. One of [json yaml octet-stream go-template=... go-template-file=...],
defaults to yaml.
  -o, --org string                 Organization name or id (required)
      --output string              Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string              management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic gateway-services:create

Create a Gateway Service object

Synopsis

Create a Gateway Service object

```
      Required fields:
      - endpoint
      - api_endpoint_base
      - sni

      Fields not allowed:
      - owned
```

```
      Fields allowed but ignored:
      - id
      - type
      - api_version
      - scope
      - created_at
      - updated_at
      - url
      - org_url
      - availability_zone_url
```

```
apic gateway-services:create [flags]
```

Possible Usages

```
      apic gateway-services:create [flags] GATEWAY_SERVICE_FILE
```

Options

```
      --availability-zone string   Availability Zone name or id (required)
      --format string              Output format. One of [json yaml octet-stream go-template=... go-template-file=...],
defaults to yaml.
  -o, --org string                 Organization name or id (required)
      --output string              Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string              management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic gateway-services:delete

Delete the Gateway Service object by name or id

Synopsis

Delete the Gateway Service object by name or id

```
apic gateway-services:delete [flags]
```

Possible Usages

```
      apic gateway-services:delete [flags] GATEWAY_SERVICE
```

Options

```
      --availability-zone string   Availability Zone name or id (required)
      --format string              Output format. One of [json yaml octet-stream go-template=... go-template-file=...],
defaults to yaml.
  -o, --org string                 Organization name or id (required)
      --output string              Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string              management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic gateway-services:get

Get the Gateway Service object by name or id

Synopsis

Get the Gateway Service object by name or id

```
apic gateway-services:get [flags]
```

Possible Usages

```
      apic gateway-services:get [flags] --scope org GATEWAY_SERVICE
      apic gateway-services:get [flags] GATEWAY_SERVICE
```

Options

```
      --availability-zone string   Availability Zone name or id (required)
      --fields string              List of field names to return
      --format string              Output format. One of [json yaml octet-stream go-template=... go-template-file=...],
defaults to yaml.
  -o, --org string                 Organization name or id (required)
      --output string              Write file(s) to directory, use - for STDOUT. (default: cwd)
  -s, --server string              management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic gateway-services:list

List the Gateway Service objects

Synopsis

List the Gateway Service objects

```
apic gateway-services:list [flags]
```

Possible Usages

```
      apic gateway-services:list [flags] --scope org
      apic gateway-services:list [flags]
```

Options

```
      --availability-zone string   Availability Zone name or id (required)
      --fields string              List of field names to return
      --format string              Output format. One of [json yaml octet-stream go-template=... go-template-file=...],
defaults to yaml.
      --limit int32                Maximum number of items to return
      --offset int32               Offset item number from list to begin return
  -o, --org string                 Organization name or id (required)
      --output string              Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string              management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic gateway-services:reset-oauth-secret

Reset the oauth shared crypto material

Synopsis

Reset the oauth shared crypto material

```
apic gateway-services:reset-oauth-secret [flags]
```

Possible Usages

```
      apic gateway-services:reset-oauth-secret [flags] GATEWAY_SERVICE
```

Options

```
      --availability-zone string   Availability Zone name or id (required)
      --format string              Output format. One of [json yaml octet-stream go-template=... go-template-file=...],
defaults to yaml.
  -o, --org string                 Organization name or id (required)
      --output string              Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string              management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic gateway-services:update

Update the Gateway Service object by name or id

Synopsis

Update the Gateway Service object by name or id

```
      Fields not allowed to be null:
      - endpoint
      - api_endpoint_base
      - sni

      Fields not allowed:
      - owned
      - endpoint
      - integration_url
      - gateway_service_type
      - api_endpoint_base

      Fields allowed but ignored:
      - id
      - type
      - api_version
      - scope
      - created_at
      - updated_at
      - url
      - org_url
      - availability_zone_url
```

```
apic gateway-services:update [flags]
```

Possible Usages

```
      apic gateway-services:update [flags] GATEWAY_SERVICE GATEWAY_SERVICE_FILE
```

Options

```
      --availability-zone string   Availability Zone name or id (required)
      --format string              Output format. One of [json yaml octet-stream go-template=... go-template-file=...],
defaults to yaml.
  -o, --org string                 Organization name or id (required)
      --output string              Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string              management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic global-policies

Global Policies operations

Synopsis

Global Policies operations

```
apic global-policies [flags]
```

Options

```
  -c, --catalog string                        Catalog name or id (required)
      --configured-gateway-service string     Configured Gateway Service name or id (required)
      --fields string                         List of field names to return
      --format string                         Output format. One of [json yaml octet-stream go-template=... go-template-
file=...], defaults to yaml.
  -h, --help                                  Help for global-policies
      --limit int32                           Maximum number of items to return
      --offset int32                          Offset item number from list to begin return
  -o, --org string                            Organization name or id (required)
      --output string                         Write file(s) to directory, instead of STDOUT (default "-")
      --scope string                          scope
  -s, --server string                         management server endpoint (required)
      --space string                          Space name or id (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic global-policies:clear

Global Policies clear operations

Synopsis

Global Policies clear operations

```
apic global-policies:clear [flags]
```

Possible Usages

```
    apic global-policies:clear [flags] --scope space GLOBAL_POLICY_NAME
    apic global-policies:clear [flags] --scope catalog GLOBAL_POLICY_NAME
```

Options

```
  -c, --catalog string                        Catalog name or id (required)
      --configured-gateway-service string     Configured Gateway Service name or id (required)
      --confirm string                        Confirmation for critical updates (required)
      --format string                         Output format. One of [json yaml octet-stream go-template=... go-template-
file=...], defaults to yaml.
  -h, --help                                  Help for global-policies:clear
  -o, --org string                            Organization name or id (required)
      --output string                         Write file(s) to directory, instead of STDOUT (default "-")
      --scope string                          scope
  -s, --server string                         management server endpoint (required)
      --space string                          Space name or id (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic global-policies:clear-all

Global Policies clear-all operations

Synopsis

Global Policies clear-all operations

```
apic global-policies:clear-all [flags]
```

Possible Usages

```
    apic global-policies:clear-all [flags] --scope space
    apic global-policies:clear-all [flags] --scope catalog
```

Options

```
  -c, --catalog string                        Catalog name or id (required)

apic global-policy-errors

Global Policy Errors operations

Synopsis

Global Policy Errors operations

```
apic global-policy-errors [flags]
```

Options

```
  -h, --help   Help for global-policy-errors
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic global-policy-errors:create

Global Policy Errors create operations

Synopsis

Global Policy Errors create operations

```
apic global-policy-errors:create [flags]
```

Possible Usages

```
      apic global-policy-errors:create [flags] --scope space GLOBAL_POLICY_ERROR_FILE
      apic global-policy-errors:create [flags] --scope catalog GLOBAL_POLICY_ERROR_FILE
```

Options

```
  -c, --catalog string                       Catalog name or id (required)
      --configured-gateway-service string    Configured Gateway Service name or id (required)
      --format string                        Output format. One of [json yaml octet-stream go-template=... go-template-
file=...], defaults to yaml.
  -h, --help                                 Help for global-policy-errors:create
  -o, --org string                           Organization name or id (required)
      --output string                        Write file(s) to directory, instead of STDOUT (default "-")
      --scope string                         scope
  -s, --server string                        management server endpoint (required)
      --space string                         Space name or id (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic global-policy-errors:delete

Global Policy Errors delete operations

Synopsis

Global Policy Errors delete operations

```
apic global-policy-errors:delete [flags]
```

Possible Usages

```
      apic global-policy-errors:delete [flags] --scope space
      apic global-policy-errors:delete [flags] --scope catalog
```

Options

```
  -c, --catalog string                       Catalog name or id (required)
      --configured-gateway-service string    Configured Gateway Service name or id (required)
      --format string                        Output format. One of [json yaml octet-stream go-template=... go-template-
file=...], defaults to yaml.
  -h, --help                                 Help for global-policy-errors:delete
  -o, --org string                           Organization name or id (required)
      --output string                        Write file(s) to directory, instead of STDOUT (default "-")
      --scope string                         scope
  -s, --server string                        management server endpoint (required)
      --space string                         Space name or id (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic global-policy-errors:get

Global Policy Errors get operations

Synopsis

Global Policy Errors get operations

```
apic global-policy-errors:get [flags]
```

Possible Usages

```
      apic global-policy-errors:get [flags] --scope space
      apic global-policy-errors:get [flags] --scope catalog
```

Options

```
  -c, --catalog string                      Catalog name or id (required)
      --configured-gateway-service string   Configured Gateway Service name or id (required)
      --fields string                       List of field names to return
      --format string                       Output format. One of [json yaml octet-stream go-template=... go-template-
file=...], defaults to yaml.
  -h, --help                                Help for global-policy-errors:get
  -o, --org string                          Organization name or id (required)
      --output string                       Write file(s) to directory, use - for STDOUT. (default: cwd)
      --scope string                        scope
  -s, --server string                       management server endpoint (required)
      --space string                        Space name or id (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic global-policy-errors:update

Global Policy Errors update operations

Synopsis

Global Policy Errors update operations

```
apic global-policy-errors:update [flags]
```

Possible Usages

```
      apic global-policy-errors:update [flags] --scope space GLOBAL_POLICY_ERROR_FILE
      apic global-policy-errors:update [flags] --scope catalog GLOBAL_POLICY_ERROR_FILE
```

Options

```
  -c, --catalog string                      Catalog name or id (required)
      --configured-gateway-service string   Configured Gateway Service name or id (required)
      --format string                       Output format. One of [json yaml octet-stream go-template=... go-template-
file=...], defaults to yaml.
  -h, --help                                Help for global-policy-errors:update
  -o, --org string                          Organization name or id (required)
      --output string                       Write file(s) to directory, instead of STDOUT (default "-")
      --scope string                        scope
  -s, --server string                       management server endpoint (required)
      --space string                        Space name or id (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic global-policy-posthooks

Global Policy Posthooks operations

Synopsis

Global Policy Posthooks operations

```
apic global-policy-posthooks [flags]
```

Options

```

```

apic iam-apikey

Log in to an IBM API Connect cloud Reserved Instance using an IBM Cloud API key

Synopsis

Log in to an IBM API Connect cloud Reserved Instance using an IBM Cloud API key

```
apic iam-apikey [flags]
```

Examples

```
Interactive iam-apikey login
$ apic iam-apikey
Enter your IBM Cloud details
? Server: mgmnthost.com
? IBM Cloud API Key?: my-apikey
 Logged into mgmnthost.com successfully

Non-interactive
$ apic iam-apikey --apiKey <apikey> --server mgmnthost.com
Logged into mgmnthost.com successfully
```

Options

```
      --apiKey string           IBM cloud api key
  -h, --help                    Help for iam-apikey
  -s, --server string           management server endpoint
      --tokenendpoint string    iam server endpoint (default: iam.cloud.ibm.com)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic identity-providers

Identity Providers operations

Synopsis

Identity Providers operations

```
apic identity-providers [flags]
```

Options

```
      --fields string   List of field names to return
      --format string   Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help            Help for identity-providers
      --limit int32     Maximum number of items to return
      --offset int32    Offset item number from list to begin return
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
      --scope string    scope
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic identity-providers:list

Identity Providers list operations

Synopsis

Identity Providers list operations

```
apic identity-providers:list [flags]
```

Options

```
      --fields string   List of field names to return
      --format string   Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help            Help for identity-providers:list
      --limit int32     Maximum number of items to return
      --offset int32    Offset item number from list to begin return
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
      --scope string    scope
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic integrations

Integrations operations

Synopsis

Integrations operations

```
apic integrations [flags]
```

Options

```
      --fields string   List of field names to return
      --format string   Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help            Help for integrations
      --limit int32     Maximum number of items to return

  -s, --server string       management server endpoint (required)
      --space string        Space name or id (required)
      --space-initiated     space-initiated
```

Options inherited from parent commands

```
      --accept-license          Accept the license for API Connect
      --debug                   Enable debug output
      --debug-output string     Write debug output to file
      --live-help               Enable or disable tracking of limited usage information
  -m, --mode string             Toolkit operation mode (default "apim")
```

apic invitations:clear

Invitations clear operations

Synopsis

Invitations clear operations

```
apic invitations:clear [flags]
```

Options

```
  -c, --catalog string      Catalog name or id (required)
      --confirm string      Confirmation for critical updates (required)
      --format string       Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help                Help for invitations:clear
  -o, --org string          Organization name or id (required)
      --output string       Write file(s) to directory, instead of STDOUT (default "-")
      --scope string        scope
  -s, --server string       management server endpoint (required)
```

```
      --space string      Space name or id (required)
      --space-initiated   space-initiated
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic invitations:create

Invitations create operations

Synopsis

Invitations create operations

```
apic invitations:create [flags]
```

Options

```
  -c, --catalog string    Catalog name or id (required)
      --format string     Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help              Help for invitations:create
  -o, --org string        Organization name or id (required)
      --output string     Write file(s) to directory, instead of STDOUT (default "-")
      --scope string      scope
  -s, --server string     management server endpoint (required)
      --space string      Space name or id (required)
      --space-initiated   space-initiated
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic invitations:delete

Invitations delete operations

Synopsis

Invitations delete operations

```
apic invitations:delete [flags]
```

Options

```
  -c, --catalog string    Catalog name or id (required)
      --format string     Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help              Help for invitations:delete
  -o, --org string        Organization name or id (required)
      --output string     Write file(s) to directory, instead of STDOUT (default "-")
      --scope string      scope
  -s, --server string     management server endpoint (required)
      --space string      Space name or id (required)
      --space-initiated   space-initiated
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic invitations:get

Invitations get operations

Synopsis

Invitations get operations

```
apic invitations:get [flags]
```

Options

```
  -c, --catalog string    Catalog name or id (required)
      --fields string     List of field names to return
      --format string     Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help              Help for invitations:get
  -o, --org string        Organization name or id (required)
      --output string     Write file(s) to directory, use - for STDOUT. (default: cwd)
      --scope string      scope
  -s, --server string     management server endpoint (required)
      --space string      Space name or id (required)
      --space-initiated   space-initiated
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic invitations:list

Invitations list operations

Synopsis

Invitations list operations

```
apic invitations:list [flags]
```

Options

```
  -c, --catalog string    Catalog name or id (required)
      --fields string     List of field names to return
      --format string     Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help              Help for invitations:list
      --limit int32       Maximum number of items to return
      --offset int32      Offset item number from list to begin return
  -o, --org string        Organization name or id (required)
      --output string     Write file(s) to directory, instead of STDOUT (default "-")
      --scope string      scope
  -s, --server string     management server endpoint (required)
      --space string      Space name or id (required)
      --space-initiated   space-initiated
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic invitations:update

Invitations update operations

Synopsis

Invitations update operations

```
apic invitations:update [flags]
```

Options

```
  -c, --catalog string    Catalog name or id (required)
      --format string     Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help              Help for invitations:update
  -o, --org string        Organization name or id (required)
```

```
      --output string     Write file(s) to directory, instead of STDOUT (default "-")
      --scope string      scope
  -s, --server string     management server endpoint (required)
      --space string      Space name or id (required)
      --space-initiated   space-initiated
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic jobs

Jobs operations

Synopsis

Jobs operations

```
apic jobs [flags]
```

Options

```
      --billing string   Billing name or id (required)
      --fields string    List of field names to return
      --format string    Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for jobs
      --limit int32      Maximum number of items to return
      --offset int32     Offset item number from list to begin return
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic jobs:clear

Clear the Job objects

Synopsis

Clear the Job objects

```
apic jobs:clear [flags]
```

Options

```
      --billing string   Billing name or id (required)
      --confirm string   Confirmation for critical updates (required)
      --format string    Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for jobs:clear
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic jobs:delete

Delete the Job object by name or id

Synopsis

Delete the Job object by name or id

```
apic jobs:delete [flags]
```

Options

```
      --billing string   Billing name or id (required)
      --format string    Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for jobs:delete
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic jobs:get

Get the Job object by name or id

Synopsis

Get the Job object by name or id

```
apic jobs:get [flags]
```

Options

```
      --billing string   Billing name or id (required)
      --fields string    List of field names to return
      --format string    Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for jobs:get
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, use - for STDOUT. (default: cwd)
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic jobs:list

List the Job objects

Synopsis

List the Job objects

```
apic jobs:list [flags]
```

Options

```
      --billing string   Billing name or id (required)
      --fields string    List of field names to return
      --format string    Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for jobs:list
      --limit int32      Maximum number of items to return
      --offset int32     Offset item number from list to begin return
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic jobs:retry

Re-attempt blocked or failed job

Synopsis

Re-attempt blocked or failed job

```
apic jobs:retry [flags]
```

Options

```
      --billing string   Billing name or id (required)
      --confirm string   Confirmation for critical updates (required)
      --format string    Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for jobs:retry
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic keystores

Keystores operations

Synopsis

Keystores operations

```
apic keystores [flags]
```

Options

```
      --fields string   List of field names to return
      --format string   Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help            Help for keystores
      --limit int32     Maximum number of items to return
      --offset int32    Offset item number from list to begin return
  -o, --org string      Organization name or id (required)
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic keystores:clear

Clear the Keystore objects

Synopsis

Clear the Keystore objects

```
apic keystores:clear [flags]
```

Options

```
      --confirm string   Confirmation for critical updates (required)
      --format string    Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for keystores:clear
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic keystores:create

Create a Keystore object

Synopsis

Create a Keystore object Required fields:\ - keystore Fields allowed but ignored:\ - id - type - api_version - scope - created_at - updated_at - url

```
apic keystores:create [flags]
```

Options

```
      --format string   Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help            Help for keystores:create
  -o, --org string      Organization name or id (required)
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic keystores:delete

Delete the Keystore object by name or id

Synopsis

Delete the Keystore object by name or id

```
apic keystores:delete [flags]
```

Options

```
      --format string   Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help            Help for keystores:delete
  -o, --org string      Organization name or id (required)
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic keystores:get

Get the Keystore object by name or id

Synopsis

Get the Keystore object by name or id

```
apic keystores:get [flags]
```

Options

```
      --fields string   List of field names to return
      --format string   Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help            Help for keystores:get
  -o, --org string      Organization name or id (required)
      --output string   Write file(s) to directory, use - for STDOUT. (default: cwd)
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic keystores:list

List the Keystore objects

Synopsis

List the Keystore objects

```
apic keystores:list [flags]
```

Options

```
      --fields string   List of field names to return
      --format string   Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help            Help for keystores:list
      --limit int32     Maximum number of items to return
      --offset int32    Offset item number from list to begin return
  -o, --org string      Organization name or id (required)
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic keystores:update

Update the Keystore object by name or id

Synopsis

Update the Keystore object by name or id Fields allowed but ignored:\ - id - type - api_version - scope - created_at - updated_at - url

```
apic keystores:update [flags]
```

Options

```
      --format string   Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help            Help for keystores:update
  -o, --org string      Organization name or id (required)
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic licenses

Review the license for API Connect

Synopsis

Review the license for API Connect

```
apic licenses [flags]
```

Options

```
  -h, --help              Help for licenses
      --non-ibm-license   Display the non IBM license files.
      --notices           Display the notices file
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic log-spec

Log Spec operations

Synopsis

Log Spec operations

```
apic log-spec [flags]
```

Options

```
  -h, --help   Help for log-spec
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic log-spec:get

Get the Log Spec object

Synopsis

Get the Log Spec object

```
apic log-spec:get [flags]
```

Options

```
      --fields string   List of field names to return
      --format string   Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help            Help for log-spec:get
      --output string   Write file(s) to directory, use - for STDOUT. (default: cwd)
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic log-spec:update

Update the Log Spec object

Synopsis

Update the Log Spec object Fields allowed but ignored:\ - name - type - api_version - scope - created_at - updated_at - url

```
apic log-spec:update [flags]
```

Options

```
      --format string   Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help            Help for log-spec:update
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic login

Log in to an IBM API Connect cloud

Synopsis

Log in to an IBM API Connect cloud

```
apic login [flags]
```

Examples

```
Interactive login
$ apic login
Enter your API Connect credentials
? Server: mgmnthost.com
? Realm: company/realm
? Username: tommy
? Password: password
Logged into mgmnthost.com successfully

Non-interactive login
$ apic login --username tommy --password password --server mgmnthost.com --realm company/realm
Logged into mgmnthost.com successfully
```

Options

```
      --apiKey string     apiKey
      --context string    context
  -h, --help              Help for login
  -p, --password string   password
  -r, --realm string      realm
  -s, --server string     management server endpoint
      --sso               sso
  -u, --username string   user name
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic logout

Log out of an IBM API Connect cloud

Synopsis

Log out of an IBM API Connect cloud

```
apic logout [flags]
```

Examples

```
Clear the local authentication credentials for mgmnthost.com
$ apic logout --server mgmnthost.com
Logged out of server mgmnthost.com
```

Options

```
  -h, --help            Help for logout
  -s, --server string   management server endpoint
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic mail-servers

Mail Servers operations

Synopsis

Mail Servers operations

```
apic mail-servers [flags]
```

Options

```
      --fields string   List of field names to return
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help            Help for mail-servers
      --limit int32     Maximum number of items to return
      --offset int32    Offset item number from list to begin return
  -o, --org string      Organization name or id (required)
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic mail-servers:clear

Clear the Mail Server objects

Synopsis

Clear the Mail Server objects

```
apic mail-servers:clear [flags]
```

Possible Usages

```
    apic mail-servers:clear [flags]
```

Options

```
      --confirm string   Confirmation for critical updates (required)
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic mail-servers:create

Create a Mail Server object

Synopsis

Create a Mail Server object

```
      Fields allowed but ignored:
      - id
      - type
      - api_version
      - scope
      - created_at
      - updated_at
      - url
```

```
apic mail-servers:create [flags]
```

Possible Usages

```
      apic mail-servers:create [flags] MAIL_SERVER_FILE
```

Options

```
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -o, --org string      Organization name or id (required)
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic mail-servers:delete

Delete the Mail Server object by name or id

Synopsis

Delete the Mail Server object by name or id

```
apic mail-servers:delete [flags]
```

Possible Usages

```
      apic mail-servers:delete [flags] MAIL_SERVER
```

Options

```
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -o, --org string      Organization name or id (required)
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic mail-servers:get

Get the Mail Server object by name or id

Synopsis

Get the Mail Server object by name or id

```
apic mail-servers:get [flags]
```

Possible Usages

```
      apic mail-servers:get [flags] MAIL_SERVER
```

Options

```
      --fields string   List of field names to return
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -o, --org string      Organization name or id (required)
      --output string   Write file(s) to directory, use - for STDOUT. (default: cwd)
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic mail-servers:list

List the Mail Server objects

Synopsis

List the Mail Server objects

```
apic mail-servers:list [flags]
```

Possible Usages

```
      apic mail-servers:list [flags]
```

Options

```
      --fields string   List of field names to return
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
      --limit int32     Maximum number of items to return
      --offset int32    Offset item number from list to begin return
  -o, --org string      Organization name or id (required)
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic mail-servers:test-connection

Test a Mail Server connection

Synopsis

Test a Mail Server connection

```
apic mail-servers:test-connection [flags]
```

Possible Usages

```
      apic mail-servers:test-connection [flags] --test-config-only MAIL_SERVER_PROVIDED_TEST_CONNECTION_FILE
      apic mail-servers:test-connection [flags] MAIL_SERVER MAIL_SERVER_SAVED_TEST_CONNECTION_FILE
```

Options

```
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -o, --org string      Organization name or id (required)
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic mail-servers:update

Update the Mail Server object by name or id

Synopsis

Update the Mail Server object by name or id

```
      Fields allowed but ignored:
      - id
      - type
      - api_version
      - scope
      - created_at
      - updated_at
      - url
```

```
apic mail-servers:update [flags]
```

Possible Usages

```
      apic mail-servers:update [flags] MAIL_SERVER MAIL_SERVER_FILE
```

Options

```
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -o, --org string      Organization name or id (required)
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic me

Me operations

Synopsis

Me operations

```
apic me [flags]
```

Options

```
  -h, --help   Help for me
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic me:change-password

Change my password

Synopsis

Change my password

```
apic me:change-password [flags]
```

Possible Usages

```
      apic me:change-password [flags] CHANGE_PASSWORD_FILE
```

Options

```
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic me:delete

Delete the Me object

Synopsis

Delete the Me object

```
apic me:delete [flags]
```

Possible Usages

```
      apic me:delete [flags]
```

Options

```
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic me:get

Get the Me object

Synopsis

Get the Me object

```
apic me:get [flags]
```

Possible Usages

```
      apic me:get [flags]
```

Options

```
      --context string   user's login context admin/manager
      --fields string    List of field names to return
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
      --output string    Write file(s) to directory, use - for STDOUT. (default: cwd)
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic me:update

Update the Me object

Synopsis

Update the Me object

```
      Fields allowed but ignored:
      - name
      - type
      - api_version
      - scope
      - created_at
      - updated_at
      - url
```

```
apic me:update [flags]
```

Possible Usages

```
      apic me:update [flags] ME_FILE
```

Options

```
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic member-invitations

Member Invitations operations

Synopsis

Member Invitations operations

```
apic member-invitations [flags]
```

Options

```
  -c, --catalog string          Catalog name or id (required)
      --consumer-org string     Consumer Organization name or id (required)
      --fields string           List of field names to return
      --format string           Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
  -h, --help                    Help for member-invitations
      --limit int32             Maximum number of items to return
      --offset int32            Offset item number from list to begin return
  -o, --org string              Organization name or id (required)
      --output string           Write file(s) to directory, instead of STDOUT (default "-")
      --scope string            scope
  -s, --server string           management server endpoint (required)
      --space string            Space name or id (required)
      --space-initiated         space-initiated
```

Options inherited from parent commands

```
      --accept-license          Accept the license for API Connect
      --debug                   Enable debug output
      --debug-output string     Write debug output to file
      --live-help               Enable or disable tracking of limited usage information
  -m, --mode string             Toolkit operation mode (default "apim")
```

apic member-invitations:clear

Member Invitations clear operations

Synopsis

Member Invitations clear operations

```
apic member-invitations:clear [flags]
```

Possible Usages

```
    apic member-invitations:clear [flags] --scope consumer-org --space-initiated
    apic member-invitations:clear [flags] --scope space
    apic member-invitations:clear [flags] --scope org
    apic member-invitations:clear [flags] --scope consumer-org
    apic member-invitations:clear [flags] --scope catalog
```

Options

```
  -c, --catalog string          Catalog name or id (required)
      --confirm string          Confirmation for critical updates (required)
      --consumer-org string     Consumer Organization name or id (required)
      --format string           Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
  -h, --help                    Help for member-invitations:clear
  -o, --org string              Organization name or id (required)
      --output string           Write file(s) to directory, instead of STDOUT (default "-")
      --scope string            scope
  -s, --server string           management server endpoint (required)
      --space string            Space name or id (required)
      --space-initiated         space-initiated
```

Options inherited from parent commands

```
      --accept-license          Accept the license for API Connect
      --debug                   Enable debug output
      --debug-output string     Write debug output to file
      --live-help               Enable or disable tracking of limited usage information
  -m, --mode string             Toolkit operation mode (default "apim")
```

apic member-invitations:create

Member Invitations create operations

Synopsis

Member Invitations create operations

```
apic member-invitations:create [flags]
```

Possible Usages

```
      apic member-invitations:create [flags] --scope consumer-org --space-initiated MEMBER_INVITATION_FILE
      apic member-invitations:create [flags] --scope space MEMBER_INVITATION_FILE
      apic member-invitations:create [flags] --scope org MEMBER_INVITATION_FILE
      apic member-invitations:create [flags] --scope consumer-org MEMBER_INVITATION_FILE
      apic member-invitations:create [flags] --scope catalog MEMBER_INVITATION_FILE
```

Options

```
  -c, --catalog string         Catalog name or id (required)
      --consumer-org string    Consumer Organization name or id (required)
      --format string          Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
  -h, --help                   Help for member-invitations:create
  -o, --org string             Organization name or id (required)
      --output string          Write file(s) to directory, instead of STDOUT (default "-")
      --scope string           scope
  -s, --server string          management server endpoint (required)
      --space string           Space name or id (required)
      --space-initiated        space-initiated
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic member-invitations:delete

Member Invitations delete operations

Synopsis

Member Invitations delete operations

```
apic member-invitations:delete [flags]
```

Possible Usages

```
      apic member-invitations:delete [flags] --scope consumer-org --space-initiated MEMBER_INVITATION
      apic member-invitations:delete [flags] --scope space MEMBER_INVITATION
      apic member-invitations:delete [flags] --scope org MEMBER_INVITATION
      apic member-invitations:delete [flags] --scope consumer-org MEMBER_INVITATION
      apic member-invitations:delete [flags] --scope catalog MEMBER_INVITATION
```

Options

```
  -c, --catalog string         Catalog name or id (required)
      --consumer-org string    Consumer Organization name or id (required)
      --format string          Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
  -h, --help                   Help for member-invitations:delete
  -o, --org string             Organization name or id (required)
      --output string          Write file(s) to directory, instead of STDOUT (default "-")
      --scope string           scope

```

apic member-invitations:get

Member Invitations get operations

Synopsis

Member Invitations get operations

```
apic member-invitations:get [flags]
```

Possible Usages

```
      apic member-invitations:get [flags] --scope consumer-org --space-initiated MEMBER_INVITATION
      apic member-invitations:get [flags] --scope space MEMBER_INVITATION
      apic member-invitations:get [flags] --scope org MEMBER_INVITATION
      apic member-invitations:get [flags] --scope consumer-org MEMBER_INVITATION
      apic member-invitations:get [flags] --scope catalog MEMBER_INVITATION
```

Options

```
  -c, --catalog string         Catalog name or id (required)
      --consumer-org string    Consumer Organization name or id (required)
      --fields string          List of field names to return
      --format string          Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
  -h, --help                   Help for member-invitations:get
  -o, --org string             Organization name or id (required)
      --output string          Write file(s) to directory, use - for STDOUT. (default: cwd)
      --scope string           scope
  -s, --server string          management server endpoint (required)
      --space string           Space name or id (required)
      --space-initiated        space-initiated
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic member-invitations:list

Member Invitations list operations

Synopsis

Member Invitations list operations

```
apic member-invitations:list [flags]
```

Possible Usages

```
      apic member-invitations:list [flags] --scope consumer-org --space-initiated
      apic member-invitations:list [flags] --scope space

  -m, --mode string           Toolkit operation mode (default "apim")
```

apic oauth-providers:clear

Clear the Oauth Provider objects

Synopsis

Clear the Oauth Provider objects

```
apic oauth-providers:clear [flags]
```

Possible Usages

```
    apic oauth-providers:clear [flags]
```

Options

```
      --confirm string   Confirmation for critical updates (required)
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic oauth-providers:create

Create a Oauth Provider object

Synopsis

Create a Oauth Provider object

```
      Fields allowed but ignored:
      - id
      - type
      - api_version
      - scope
      - created_at
      - updated_at
      - url
      - org_url
```

```
apic oauth-providers:create [flags]
```

Possible Usages

```
      apic oauth-providers:create [flags] OAUTH_PROVIDER_FILE
```

Options

```
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -o, --org string      Organization name or id (required)
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic oauth-providers:delete

Delete the Oauth Provider object by name or id

Synopsis

Delete the Oauth Provider object by name or id

```
apic oauth-providers:delete [flags]
```

Possible Usages

```
      apic oauth-providers:delete [flags] OAUTH_PROVIDER
```

Options

```
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -o, --org string      Organization name or id (required)
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic oauth-providers:get

Get the Oauth Provider object by name or id

Synopsis

Get the Oauth Provider object by name or id

```
apic oauth-providers:get [flags]
```

Possible Usages

```
apic oauth-providers:get [flags] OAUTH_PROVIDER
```

Options

```
      --fields string   List of field names to return
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -o, --org string      Organization name or id (required)
      --output string   Write file(s) to directory, use - for STDOUT. (default: cwd)
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic oauth-providers:list

List the Oauth Provider objects

Synopsis

List the Oauth Provider objects

```
apic oauth-providers:list [flags]
```

Possible Usages

```
apic oauth-providers:list [flags]
```

Options

```
      --fields string   List of field names to return
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
      --limit int32     Maximum number of items to return
      --offset int32    Offset item number from list to begin return
  -o, --org string      Organization name or id (required)
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic oauth-providers:update

Update the Oauth Provider object by name or id

Synopsis

Update the Oauth Provider object by name or id

```
Fields allowed but ignored:
- id
- type
- api_version
- scope
- created_at
- updated_at
- url
- org_url
```

```
apic oauth-providers:update [flags]
```

Possible Usages

```
apic oauth-providers:update [flags] OAUTH_PROVIDER OAUTH_PROVIDER_FILE
```

Options

```
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -o, --org string      Organization name or id (required)
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic org-settings

Org Settings operations

Synopsis

Org Settings operations

```
apic org-settings [flags]
```

Options

```
  -h, --help   Help for org-settings
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic org-settings:get

Get the Organization Setting object

Synopsis

Get the Organization Setting object

```
apic org-settings:get [flags]
```

Possible Usages

```
    apic org-settings:get [flags]
```

Options

```
      --fields string   List of field names to return
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -o, --org string      Organization name or id (required)
      --output string   Write file(s) to directory, use - for STDOUT. (default: cwd)
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic org-settings:update

Update the Organization Setting object

Synopsis

Update the Organization Setting object

```
      Fields allowed but ignored:
      - name
      - type
      - api_version
      - scope
      - created_at
      - updated_at
      - url

apic org-settings:update [flags]
```

Possible Usages

```
      apic org-settings:update [flags] ORG_SETTING_FILE
```

Options

```
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -o, --org string      Organization name or id (required)
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic orgs

Orgs operations

Synopsis

Orgs operations

```
apic orgs [flags]
```

Options

```
      --expand string     List of transient field to expand
      --fields string     List of field names to return
      --format string     Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
  -h, --help              Help for orgs
      --limit int32       Maximum number of items to return
      --my                my
      --offset int32      Offset item number from list to begin return
      --org_type string   Type of orgs to return
      --output string     Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string     management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic orgs:clear

Clear the Organization objects

Synopsis

Clear the Organization objects

```
apic orgs:clear [flags]
```

Possible Usages

```
      apic orgs:clear [flags]
```

Options

```
      --confirm string   Confirmation for critical updates (required)
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic orgs:create

Create an Organization object

Synopsis

Create an Organization object

```
      Required fields:
      - owner_url

      Fields allowed but ignored:
      - id
      - type
      - api_version
      - scope
      - created_at
      - updated_at
      - url
```

```
apic orgs:create [flags]
```

Possible Usages

```
      apic orgs:create [flags] ORG_FILE
```

Options

```
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic orgs:delete

Delete the Organization object by name or id

Synopsis

Delete the Organization object by name or id

```
apic orgs:delete [flags]
```

Possible Usages

```
      apic orgs:delete [flags] ORG
```

Options

```
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic orgs:get

Get the Organization object by name or id

Synopsis

Get the Organization object by name or id

```
apic orgs:get [flags]
```

Possible Usages

```
      apic orgs:get [flags] ORG
```

Options

```
      --expand string   List of transient field to expand
      --fields string   List of field names to return
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
      --output string   Write file(s) to directory, use - for STDOUT. (default: cwd)
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic orgs:list

List the Organization objects

Synopsis

List the Organization objects

```
apic orgs:list [flags]
```

Possible Usages

```
      apic orgs:list [flags] --my
      apic orgs:list [flags]
```

Options

```
      --expand string     List of transient field to expand
      --fields string     List of field names to return
      --format string     Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
      --limit int32       Maximum number of items to return
      --offset int32      Offset item number from list to begin return
      --org_type string   Type of orgs to return
      --output string     Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string     management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
```

```
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic orgs:transfer-owner

Transfer owner to an associate

Synopsis

Transfer owner to an associate

```
apic orgs:transfer-owner [flags]
```

Possible Usages

```
      apic orgs:transfer-owner [flags] ORG TRANSFER_OWNER_FILE
```

Options

```
      --cascade             Cascade the behavior
      --delete_old_owner    Delete old owner
      --format string       Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
      --output string       Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string       management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic orgs:update

Update the Organization object by name or id

Synopsis

Update the Organization object by name or id

```
      Fields not allowed:
      - name
      - org_type

      Fields allowed but ignored:
      - id
      - type
      - api_version
      - scope
      - created_at
      - updated_at
      - url
```

```
apic orgs:update [flags]
```

Possible Usages

```
      apic orgs:update [flags] ORG ORG_FILE
```

Options

```
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic payment-methods

Payment Methods operations

Synopsis

Payment Methods operations

```
apic payment-methods [flags]
```

Options

```
  -c, --catalog string         Catalog name or id (required)
      --consumer-org string    Consumer Organization name or id (required)
      --fields string          List of field names to return
      --format string          Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
  -h, --help                   Help for payment-methods
      --limit int32            Maximum number of items to return
      --offset int32           Offset item number from list to begin return
  -o, --org string             Organization name or id (required)
      --output string          Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string          management server endpoint (required)
      --space string           Space name or id (required)
      --space-initiated        space-initiated
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic payment-methods:create

Create a Payment Method object

Synopsis

Create a Payment Method object

```
      Fields allowed but ignored:
      - id
      - type
      - api_version
      - scope
      - created_at
      - updated_at
      - url
      - consumer_org_url
```

```
apic payment-methods:create [flags]
```

Possible Usages

```
      apic payment-methods:create [flags] --space-initiated PAYMENT_METHOD_FILE
      apic payment-methods:create [flags] PAYMENT_METHOD_FILE
```

Options

```
  -c, --catalog string         Catalog name or id (required)
      --consumer-org string    Consumer Organization name or id (required)
      --format string          Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
  -o, --org string             Organization name or id (required)
      --output string          Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string          management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic payment-methods:delete

Delete the Payment Method object by name or id

Synopsis

Delete the Payment Method object by name or id

```
apic payment-methods:delete [flags]
```

Possible Usages

```
      apic payment-methods:delete [flags] --space-initiated PAYMENT_METHOD
      apic payment-methods:delete [flags] PAYMENT_METHOD
```

Options

```
  -c, --catalog string         Catalog name or id (required)
      --consumer-org string    Consumer Organization name or id (required)
      --format string          Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
  -o, --org string             Organization name or id (required)
      --output string          Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string          management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic payment-methods:get

Get the Payment Method object by name or id

Synopsis

Get the Payment Method object by name or id

```
apic payment-methods:get [flags]
```

Possible Usages

```
      apic payment-methods:get [flags] --space-initiated PAYMENT_METHOD
      apic payment-methods:get [flags] PAYMENT_METHOD
```

Options

```
  -c, --catalog string         Catalog name or id (required)

      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic payment-methods:update

Update the Payment Method object by name or id

Synopsis

Update the Payment Method object by name or id

```
      Fields allowed but ignored:
      - id
      - type
      - api_version
      - scope
      - created_at
      - updated_at
      - url
      - consumer_org_url
```

```
apic payment-methods:update [flags]
```

Possible Usages

```
      apic payment-methods:update [flags] --space-initiated PAYMENT_METHOD PAYMENT_METHOD_FILE
      apic payment-methods:update [flags] PAYMENT_METHOD PAYMENT_METHOD_FILE
```

Options

```
  -c, --catalog string         Catalog name or id (required)
      --consumer-org string    Consumer Organization name or id (required)
      --format string          Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
  -o, --org string             Organization name or id (required)
      --output string          Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string          management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic permissions

Permissions operations

Synopsis

Permissions operations

```
apic permissions [flags]
```

Options

```
      --fields string   List of field names to return
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help            Help for permissions
      --limit int32     Maximum number of items to return
      --offset int32    Offset item number from list to begin return
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic permissions:get

Permissions get operations

Synopsis

Permissions get operations

```
apic permissions:get [flags]
```

Possible Usages

```
      apic permissions:get [flags] --subcollection provider PERMISSION
      apic permissions:get [flags] --subcollection org PERMISSION
      apic permissions:get [flags] --subcollection deployment PERMISSION
      apic permissions:get [flags] --subcollection consumer PERMISSION
      apic permissions:get [flags] --subcollection cloud PERMISSION
```

Options

```
      --fields string          List of field names to return
      --format string          Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
  -h, --help                   Help for permissions:get
      --output string          Write file(s) to directory, use - for STDOUT. (default: cwd)
  -s, --server string          management server endpoint (required)
      --subcollection string   subcollection
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic permissions:list

Permissions list operations

Synopsis

Permissions list operations

```
apic permissions:list [flags]
```

Possible Usages

```
      apic permissions:list [flags] --subcollection provider
      apic permissions:list [flags] --subcollection org
      apic permissions:list [flags] --subcollection deployment
      apic permissions:list [flags] --subcollection consumer
      apic permissions:list [flags] --subcollection cloud
      apic permissions:list [flags] --my
```

Options

```
      --fields string          List of field names to return
      --format string          Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
  -h, --help                   Help for permissions:list
      --limit int32            Maximum number of items to return
      --my                     my
      --offset int32           Offset item number from list to begin return
      --output string          Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string          management server endpoint (required)
      --subcollection string   subcollection
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic permissions:list-all

List all Permission objects in all collections

Synopsis

List all Permission objects in all collections

```
apic permissions:list-all [flags]
```

Possible Usages

```
      apic permissions:list-all [flags]
```

Options

```
      --fields string   List of field names to return
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
      --limit int32     Maximum number of items to return
      --offset int32    Offset item number from list to begin return
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic policies

Policies operations

Synopsis

Policies operations

```
apic policies [flags]
```

Options

```
      --availability-zone string            Availability Zone name or id (required)
  -c, --catalog string                      Catalog name or id (required)
      --configured-gateway-service string   Configured Gateway Service name or id (required)
      --fields string                       List of field names to return
      --format string                       Output format. One of [json yaml octet-stream go-template=... go-template-
```

```
file=...], defaults to yaml.
      --gateway-service string              Gateway Service name or id (required)
  -h, --help                                Help for policies
      --limit int32                         Maximum number of items to return
      --offset int32                        Offset item number from list to begin return
  -o, --org string                          Organization name or id (required)
      --output string                       Write file(s) to directory, instead of STDOUT (default "-")
      --scope string                        scope
  -s, --server string                       management server endpoint (required)
      --space string                        Space name or id (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic policies:clear

Policies clear operations

Synopsis

Policies clear operations

```
apic policies:clear [flags]
```

Possible Usages

```
      apic policies:clear [flags] --scope space POLICY_NAME
      apic policies:clear [flags] --scope catalog POLICY_NAME
```

Options

```
  -c, --catalog string                      Catalog name or id (required)
      --configured-gateway-service string   Configured Gateway Service name or id (required)
      --confirm string                      Confirmation for critical updates (required)
      --format string                       Output format. One of [json yaml octet-stream go-template=... go-template-
file=...], defaults to yaml.
  -h, --help                                Help for policies:clear
  -o, --org string                          Organization name or id (required)
      --output string                       Write file(s) to directory, instead of STDOUT (default "-")
      --scope string                        scope
  -s, --server string                       management server endpoint (required)
      --space string                        Space name or id (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic policies:clear-all

Policies clear-all operations

Synopsis

Policies clear-all operations

```
apic policies:clear-all [flags]
```

Possible Usages

```
      apic policies:clear-all [flags] --scope space
      apic policies:clear-all [flags] --scope catalog
```

Options

```
  -c, --catalog string                      Catalog name or id (required)
      --configured-gateway-service string   Configured Gateway Service name or id (required)
      --confirm string                      Confirmation for critical updates (required)
```

```
      --format string                         Output format. One of [json yaml octet-stream go-template=... go-template-
file=...], defaults to yaml.
  -h, --help                                  Help for policies:clear-all
  -o, --org string                            Organization name or id (required)
      --output string                         Write file(s) to directory, instead of STDOUT (default "-")
      --scope string                          scope
  -s, --server string                         management server endpoint (required)
      --space string                          Space name or id (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic policies:clone

Policies clone operations

Synopsis

Policies clone operations

```
apic policies:clone [flags]
```

Possible Usages

```
      apic policies:clone [flags] --scope space
      apic policies:clone [flags] --scope org
      apic policies:clone [flags] --scope catalog
```

Options

```
      --availability-zone string            Availability Zone name or id (required)
  -c, --catalog string                      Catalog name or id (required)
      --configured-gateway-service string   Configured Gateway Service name or id (required)
      --fields string                       List of field names to return
      --format string                       Output format. One of [json yaml octet-stream go-template=... go-template-
file=...], defaults to yaml.
      --gateway-service string              Gateway Service name or id (required)
  -h, --help                                Help for policies:clone
      --limit int32                         Maximum number of items to return
      --offset int32                        Offset item number from list to begin return
  -o, --org string                          Organization name or id (required)
      --output string                       Write file(s) to directory, use - for STDOUT. (default: cwd)
      --scope string                        scope
  -s, --server string                       management server endpoint (required)
      --space string                        Space name or id (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic policies:create

Policies create operations

Synopsis

Policies create operations

```
apic policies:create [flags]
```

Possible Usages

```
      apic policies:create [flags] --scope space POLICIES_FILE
      apic policies:create [flags] --scope catalog POLICIES_FILE
```

Options

```
  -c, --catalog string                        Catalog name or id (required)
      --configured-gateway-service string     Configured Gateway Service name or id (required)
      --format string                         Output format. One of [json yaml octet-stream go-template=... go-template-
file=...], defaults to yaml.
  -h, --help                                  Help for policies:create
  -o, --org string                            Organization name or id (required)
      --output string                         Write file(s) to directory, instead of STDOUT (default "-")
      --policy-file string                    Policy document override
      --scope string                          scope
  -s, --server string                         management server endpoint (required)
      --space string                          Space name or id (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic policies:delete

Policies delete operations

Synopsis

Policies delete operations

```
apic policies:delete [flags]
```

Possible Usages

```
      apic policies:delete [flags] --id --scope space ID
      apic policies:delete [flags] --id --scope catalog ID
      apic policies:delete [flags] --scope space NAME:VERSION
      apic policies:delete [flags] --scope catalog NAME:VERSION
```

Options

```
  -c, --catalog string                        Catalog name or id (required)
      --configured-gateway-service string     Configured Gateway Service name or id (required)
      --format string                         Output format. One of [json yaml octet-stream go-template=... go-template-
file=...], defaults to yaml.
  -h, --help                                  Help for policies:delete
      --id                                    id
  -o, --org string                            Organization name or id (required)
      --output string                         Write file(s) to directory, instead of STDOUT (default "-")
      --scope string                          scope
  -s, --server string                         management server endpoint (required)
      --space string                          Space name or id (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic policies:document

Policies document operations

Synopsis

Policies document operations

```
apic policies:document [flags]
```

Possible Usages

```
      apic policies:document [flags] --id --scope space ID
      apic policies:document [flags] --id --scope org ID
      apic policies:document [flags] --id --scope catalog ID
      apic policies:document [flags] --scope space NAME:VERSION
      apic policies:document [flags] --scope org NAME:VERSION
      apic policies:document [flags] --scope catalog NAME:VERSION
```

Options

```
      --availability-zone string            Availability Zone name or id (required)
  -c, --catalog string                      Catalog name or id (required)
      --configured-gateway-service string   Configured Gateway Service name or id (required)
      --format string                       Output format. One of [json yaml octet-stream go-template=... go-template-
file=...], defaults to yaml.
      --gateway-service string              Gateway Service name or id (required)
  -h, --help                                Help for policies:document
      --id                                  id
  -o, --org string                          Organization name or id (required)
      --output string                       Write file(s) to directory, instead of STDOUT (default "-")
      --scope string                        scope
  -s, --server string                       management server endpoint (required)
      --space string                        Space name or id (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic policies:get

Policies get operations

Synopsis

Policies get operations

```
apic policies:get [flags]
```

Possible Usages

```
      apic policies:get [flags] --id --scope space ID
      apic policies:get [flags] --id --scope org ID
      apic policies:get [flags] --id --scope catalog ID
      apic policies:get [flags] --scope space NAME:VERSION
      apic policies:get [flags] --scope org NAME:VERSION
      apic policies:get [flags] --scope catalog NAME:VERSION
```

Options

```
      --availability-zone string            Availability Zone name or id (required)
  -c, --catalog string                      Catalog name or id (required)
      --configured-gateway-service string   Configured Gateway Service name or id (required)
      --fields string                       List of field names to return (default "add(policy,implementation)")
      --format string                       Output format. One of [json yaml octet-stream go-template=... go-template-
file=...], defaults to yaml.
      --gateway-service string              Gateway Service name or id (required)
  -h, --help                                Help for policies:get
      --id                                  id
  -o, --org string                          Organization name or id (required)
      --output string                       Write file(s) to directory, use - for STDOUT. (default: cwd)
      --scope string                        scope
  -s, --server string                       management server endpoint (required)
      --space string                        Space name or id (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic policies:implementation

Policies implementation operations

Synopsis

Policies implementation operations

```
apic policies:implementation [flags]
```

Possible Usages

```
      apic policies:implementation [flags] --id --scope space ID
      apic policies:implementation [flags] --id --scope catalog ID
      apic policies:implementation [flags] --scope space NAME:VERSION
      apic policies:implementation [flags] --scope catalog NAME:VERSION
```

Options

```
  -c, --catalog string                        Catalog name or id (required)
      --configured-gateway-service string     Configured Gateway Service name or id (required)
      --format string                         Output format. One of [json yaml octet-stream go-template=... go-template-
file=...], defaults to yaml.
  -h, --help                                  Help for policies:implementation
      --id                                    id
  -o, --org string                            Organization name or id (required)
      --output string                         Write file(s) to directory, use - for STDOUT. (default: cwd)
      --scope string                          scope
  -s, --server string                         management server endpoint (required)
      --space string                          Space name or id (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic policies:list

Policies list operations

Synopsis

Policies list operations

```
apic policies:list [flags]
```

Possible Usages

```
      apic policies:list [flags] --scope space POLICY_NAME
      apic policies:list [flags] --scope org POLICY_NAME
      apic policies:list [flags] --scope catalog POLICY_NAME
```

Options

```
      --availability-zone string            Availability Zone name or id (required)
  -c, --catalog string                      Catalog name or id (required)
      --configured-gateway-service string   Configured Gateway Service name or id (required)
      --fields string                       List of field names to return
      --format string                       Output format. One of [json yaml octet-stream go-template=... go-template-
file=...], defaults to yaml.
      --gateway-service string              Gateway Service name or id (required)
  -h, --help                                Help for policies:list
      --limit int32                         Maximum number of items to return
      --offset int32                        Offset item number from list to begin return
  -o, --org string                          Organization name or id (required)
      --output string                       Write file(s) to directory, instead of STDOUT (default "-")
      --scope string                        scope
  -s, --server string                       management server endpoint (required)
      --space string                        Space name or id (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic policies:list-all

Policies list-all operations

Synopsis

Policies list-all operations

```
apic policies:list-all [flags]
```

Possible Usages

```
      apic policies:list-all [flags] --scope space
      apic policies:list-all [flags] --scope org
      apic policies:list-all [flags] --scope catalog
```

Options

```
      --availability-zone string             Availability Zone name or id (required)
  -c, --catalog string                       Catalog name or id (required)
      --configured-gateway-service string    Configured Gateway Service name or id (required)
      --fields string                        List of field names to return
      --format string                        Output format. One of [json yaml octet-stream go-template=... go-template-
file=...], defaults to yaml.
      --gateway-service string               Gateway Service name or id (required)
  -h, --help                                 Help for policies:list-all
      --limit int32                          Maximum number of items to return
      --offset int32                         Offset item number from list to begin return
  -o, --org string                           Organization name or id (required)
      --output string                        Write file(s) to directory, instead of STDOUT (default "-")
      --scope string                         scope
  -s, --server string                        management server endpoint (required)
      --space string                         Space name or id (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic policies:update

Policies update operations

Synopsis

Policies update operations

```
apic policies:update [flags]
```

Possible Usages

```
      apic policies:update [flags] --id --scope space ID POLICY_FILE [ POLICY-YAML ]
      apic policies:update [flags] --id --scope catalog ID POLICY_FILE [ POLICY-YAML ]
      apic policies:update [flags] --scope space NAME:VERSION POLICY_FILE [ POLICY-YAML ]
      apic policies:update [flags] --scope catalog NAME:VERSION POLICY_FILE [ POLICY-YAML ]
```

Options

```
  -c, --catalog string                       Catalog name or id (required)
      --configured-gateway-service string    Configured Gateway Service name or id (required)
      --format string                        Output format. One of [json yaml octet-stream go-template=... go-template-
file=...], defaults to yaml.
  -h, --help                                 Help for policies:update
      --id                                   id
  -o, --org string                           Organization name or id (required)
      --output string                        Write file(s) to directory, instead of STDOUT (default "-")
      --scope string                         scope
  -s, --server string                        management server endpoint (required)
      --space string                         Space name or id (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic portal-services

Portal Services operations

Synopsis

Portal Services operations

```
apic portal-services [flags]
```

Options

```
      --availability-zone string   Availability Zone name or id (required)
      --fields string              List of field names to return
      --format string              Output format. One of [json yaml octet-stream go-template=... go-template-file=...],
defaults to yaml.
  -h, --help                       Help for portal-services
      --limit int32                Maximum number of items to return
      --offset int32               Offset item number from list to begin return
  -o, --org string                 Organization name or id (required)
      --output string              Write file(s) to directory, instead of STDOUT (default "-")
      --scope string               scope
  -s, --server string              management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic portal-services:clear

Clear the Portal Service objects

Synopsis

Clear the Portal Service objects

```
apic portal-services:clear [flags]
```

Possible Usages

```
      apic portal-services:clear [flags]
```

Options

```
      --availability-zone string   Availability Zone name or id (required)
      --confirm string             Confirmation for critical updates (required)
      --force                      Force the operation
      --format string              Output format. One of [json yaml octet-stream go-template=... go-template-file=...],
defaults to yaml.
  -o, --org string                 Organization name or id (required)
      --output string              Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string              management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic portal-services:create

Create a Portal Service object

Synopsis

Create a Portal Service object

```
      Required fields:
      - endpoint
      - web_endpoint_base

      Fields not allowed:
```

```
      - owned

      Fields allowed but ignored:
      - id
      - type
      - api_version
      - scope
      - created_at
      - updated_at
      - url
      - org_url
      - availability_zone_url
```

```
apic portal-services:create [flags]
```

Possible Usages

```
      apic portal-services:create [flags] PORTAL_SERVICE_FILE
```

Options

```
      --availability-zone string   Availability Zone name or id (required)
      --format string              Output format. One of [json yaml octet-stream go-template=... go-template-file=...],
defaults to yaml.
  -o, --org string                 Organization name or id (required)
      --output string              Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string              management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic portal-services:delete

Delete the Portal Service object by name or id

Synopsis

Delete the Portal Service object by name or id

```
apic portal-services:delete [flags]
```

Possible Usages

```
      apic portal-services:delete [flags] PORTAL_SERVICE
```

Options

```
      --availability-zone string   Availability Zone name or id (required)
      --force                      Force the operation
      --format string              Output format. One of [json yaml octet-stream go-template=... go-template-file=...],
defaults to yaml.
  -o, --org string                 Organization name or id (required)
      --output string              Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string              management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic portal-services:get

Get the Portal Service object by name or id

Synopsis

Get the Portal Service object by name or id

```
apic portal-services:get [flags]
```

Possible Usages

```
      apic portal-services:get [flags] --scope org PORTAL_SERVICE
      apic portal-services:get [flags] PORTAL_SERVICE
```

Options

```
      --availability-zone string   Availability Zone name or id (required)
      --fields string              List of field names to return
      --format string              Output format. One of [json yaml octet-stream go-template=... go-template-file=...],
defaults to yaml.
  -o, --org string                 Organization name or id (required)
      --output string              Write file(s) to directory, use - for STDOUT. (default: cwd)
  -s, --server string              management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic portal-services:list

List the Portal Service objects

Synopsis

List the Portal Service objects

```
apic portal-services:list [flags]
```

Possible Usages

```
      apic portal-services:list [flags] --scope org
      apic portal-services:list [flags]
```

Options

```
      --availability-zone string   Availability Zone name or id (required)
      --fields string              List of field names to return
      --format string              Output format. One of [json yaml octet-stream go-template=... go-template-file=...],
defaults to yaml.
      --limit int32                Maximum number of items to return
      --offset int32               Offset item number from list to begin return
  -o, --org string                 Organization name or id (required)
      --output string              Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string              management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic portal-services:update-credentials

Update the Portal Service configuration

Synopsis

Update the Portal Service configuration

```
apic portal-services:update-credentials [flags]
```

Possible Usages

```
      apic portal-services:update-credentials [flags] PORTAL_SERVICE
```

Options

```
      --availability-zone string   Availability Zone name or id (required)
      --format string              Output format. One of [json yaml octet-stream go-template=... go-template-file=...],
defaults to yaml.
  -o, --org string                 Organization name or id (required)
      --output string              Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string              management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic portal-services:update

Update the Portal Service object by name or id

Synopsis

Update the Portal Service object by name or id

```
      Fields not allowed to be null:
      - endpoint_tls_client_profile_url
      - web_endpoint_base

      Fields not allowed:
      - owned
      - endpoint

      Fields allowed but ignored:
      - id
      - type
      - api_version
      - scope
      - created_at
      - updated_at
      - url
      - org_url
      - availability_zone_url
```

```
apic portal-services:update [flags]
```

Possible Usages

```
      apic portal-services:update [flags] PORTAL_SERVICE PORTAL_SERVICE_FILE
```

Options

```
      --availability-zone string   Availability Zone name or id (required)
      --format string              Output format. One of [json yaml octet-stream go-template=... go-template-file=...],
defaults to yaml.
  -o, --org string                 Organization name or id (required)
      --output string              Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string              management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic primary-events

Primary Events operations

Synopsis

Primary Events operations

```
apic primary-events [flags]
```

Options

```
      --availability-zone string            Availability Zone name or id (required)
  -c, --catalog string                      Catalog name or id (required)
      --configured-gateway-service string   Configured Gateway Service name or id (required)
      --fields string                       List of field names to return
      --format string                       Output format. One of [json yaml octet-stream go-template=... go-template-
file=...], defaults to yaml.
      --gateway-service string              Gateway Service name or id (required)
  -h, --help                                Help for primary-events
      --limit int32                         Maximum number of items to return
      --offset int32                        Offset item number from list to begin return
  -o, --org string                          Organization name or id (required)
      --output string                       Write file(s) to directory, instead of STDOUT (default "-")
      --portal-service string               Portal Service name or id (required)
      --scope string                        scope
  -s, --server string                       management server endpoint (required)
      --state string                        State for a webhook event in subscriber queue
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic primary-events:get

Primary Events get operations

Synopsis

Primary Events get operations

```
apic primary-events:get [flags]
```

Possible Usages

```
      apic primary-events:get [flags] --scope portal-service PRIMARY_EVENT
      apic primary-events:get [flags] --scope gateway-service PRIMARY_EVENT
      apic primary-events:get [flags] --scope configured-gateway-service PRIMARY_EVENT
      apic primary-events:get [flags] --scope cloud PRIMARY_EVENT
      apic primary-events:get [flags] --scope catalog PRIMARY_EVENT
```

Options

```
      --availability-zone string            Availability Zone name or id (required)
  -c, --catalog string                      Catalog name or id (required)
      --configured-gateway-service string   Configured Gateway Service name or id (required)
      --fields string                       List of field names to return
      --format string                       Output format. One of [json yaml octet-stream go-template=... go-template-
file=...], defaults to yaml.
      --gateway-service string              Gateway Service name or id (required)
  -h, --help                                Help for primary-events:get
  -o, --org string                          Organization name or id (required)
      --output string                       Write file(s) to directory, use - for STDOUT. (default: cwd)
      --portal-service string               Portal Service name or id (required)
      --scope string                        scope
  -s, --server string                       management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic primary-events:list

Primary Events list operations

Synopsis

Primary Events list operations

```
apic primary-events:list [flags]
```

Possible Usages

```
      apic primary-events:list [flags] --scope portal-service
      apic primary-events:list [flags] --scope gateway-service
      apic primary-events:list [flags] --scope configured-gateway-service
      apic primary-events:list [flags] --scope cloud
      apic primary-events:list [flags] --scope catalog
```

Options

```
      --availability-zone string            Availability Zone name or id (required)
  -c, --catalog string                      Catalog name or id (required)
      --configured-gateway-service string   Configured Gateway Service name or id (required)
      --fields string                       List of field names to return
      --format string                       Output format. One of [json yaml octet-stream go-template=... go-template-
file=...], defaults to yaml.
      --gateway-service string              Gateway Service name or id (required)
  -h, --help                                Help for primary-events:list
      --limit int32                         Maximum number of items to return
      --offset int32                        Offset item number from list to begin return
  -o, --org string                          Organization name or id (required)
      --output string                       Write file(s) to directory, instead of STDOUT (default "-")
      --portal-service string               Portal Service name or id (required)
      --scope string                        scope
  -s, --server string                       management server endpoint (required)
      --state string                        State for a webhook event in subscriber queue
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic products

Products operations

Synopsis

Products operations

```
apic products [flags]
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --expand string    List of transient field to expand
      --fields string    List of field names to return
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for products
      --limit int32      Maximum number of items to return
      --offset int32     Offset item number from list to begin return
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
      --scope string     scope
  -s, --server string    management server endpoint (required)
      --space string     Space name or id (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic products:clear

Products clear operations

Synopsis

Products clear operations

```
apic products:clear [flags]
```

Possible Usages

```
    apic products:clear [flags] --scope space PRODUCT_NAME
    apic products:clear [flags] --scope catalog PRODUCT_NAME
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --confirm string   Confirmation for critical updates (required)
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for products:clear
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
      --scope string     scope
  -s, --server string    management server endpoint (required)
      --space string     Space name or id (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic products:clear-all

Products clear-all operations

Synopsis

Products clear-all operations

```
apic products:clear-all [flags]
```

Possible Usages

```
    apic products:clear-all [flags] --scope space
    apic products:clear-all [flags] --scope catalog
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --confirm string   Confirmation for critical updates (required)
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for products:clear-all
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
      --scope string     scope
  -s, --server string    management server endpoint (required)
      --space string     Space name or id (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic products:clone

Products clone operations

Synopsis

Products clone operations

```
apic products:clone [flags]
```

Possible Usages

```
    apic products:clone [flags] --scope space
    apic products:clone [flags] --scope catalog
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --expand string    List of transient field to expand
      --fields string    List of field names to return
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for products:clone
      --limit int32      Maximum number of items to return
      --offset int32     Offset item number from list to begin return
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, use - for STDOUT. (default: cwd)
      --scope string     scope
  -s, --server string    management server endpoint (required)
      --space string     Space name or id (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic products:delete

Products delete operations

Synopsis

Products delete operations

```
apic products:delete [flags]
```

Possible Usages

```
    apic products:delete [flags] --id --scope space ID
    apic products:delete [flags] --id --scope catalog ID
    apic products:delete [flags] --scope space NAME:VERSION
    apic products:delete [flags] --scope catalog NAME:VERSION
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for products:delete
      --id               id
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
      --scope string     scope
  -s, --server string    management server endpoint (required)
      --space string     Space name or id (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic products:document

Products document operations

Synopsis

Products document operations

```
apic products:document [flags]
```

Possible Usages

```
    apic products:document [flags] --id --scope space ID
    apic products:document [flags] --id --scope catalog ID
    apic products:document [flags] --scope space NAME:VERSION
    apic products:document [flags] --scope catalog NAME:VERSION
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for products:document
      --id               id
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
      --scope string     scope
  -s, --server string    management server endpoint (required)
      --space string     Space name or id (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic products:execute-migration-target

Products execute-migration-target operations

Synopsis

Products execute-migration-target operations

```
apic products:execute-migration-target [flags]
```

Possible Usages

```
    apic products:execute-migration-target [flags] --id --scope space ID
    apic products:execute-migration-target [flags] --id --scope catalog ID
    apic products:execute-migration-target [flags] --scope space NAME:VERSION
    apic products:execute-migration-target [flags] --scope catalog NAME:VERSION
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for products:execute-migration-target
      --id               id
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
      --scope string     scope
  -s, --server string    management server endpoint (required)
      --space string     Space name or id (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file

```

apic products:get

Products get operations

Synopsis

Products get operations

```
apic products:get [flags]
```

Possible Usages

```
    apic products:get [flags] --id --scope space ID
    apic products:get [flags] --id --scope catalog ID
    apic products:get [flags] --scope space NAME:VERSION
    apic products:get [flags] --scope catalog NAME:VERSION
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --fields string    List of field names to return (default "add(catalog_product)")
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for products:get
      --id               id
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, use - for STDOUT. (default: cwd)
      --scope string     scope
  -s, --server string    management server endpoint (required)
      --space string     Space name or id (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic products:list

Products list operations

Synopsis

Products list operations

```
apic products:list [flags]
```

Possible Usages

```
    apic products:list [flags] --scope space PRODUCT_NAME
    apic products:list [flags] --scope catalog PRODUCT_NAME
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --expand string    List of transient field to expand
      --fields string    List of field names to return
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for products:list
      --limit int32      Maximum number of items to return
      --offset int32     Offset item number from list to begin return
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
      --scope string     scope
  -s, --server string    management server endpoint (required)
      --space string     Space name or id (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic products:list-all

Products list-all operations

Synopsis

Products list-all operations

```
apic products:list-all [flags]
```

Possible Usages

```
    apic products:list-all [flags] --scope space
    apic products:list-all [flags] --scope catalog
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --expand string    List of transient field to expand
```

```
      --fields string    List of field names to return
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for products:list-all
      --limit int32      Maximum number of items to return
      --offset int32     Offset item number from list to begin return
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
      --scope string     scope
  -s, --server string    management server endpoint (required)
      --space string     Space name or id (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic products:migrate-subscriptions

Products migrate-subscriptions operations

Synopsis

Products migrate-subscriptions operations

```
apic products:migrate-subscriptions [flags]
```

Possible Usages

```
    apic products:migrate-subscriptions [flags] --id --scope space ID MIGRATE_SUBSCRIPTION_SUBSET_FILE
    apic products:migrate-subscriptions [flags] --id --scope catalog ID MIGRATE_SUBSCRIPTION_SUBSET_FILE
    apic products:migrate-subscriptions [flags] --scope space NAME:VERSION MIGRATE_SUBSCRIPTION_SUBSET_FILE
    apic products:migrate-subscriptions [flags] --scope catalog NAME:VERSION MIGRATE_SUBSCRIPTION_SUBSET_FILE
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for products:migrate-subscriptions
      --id               id
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
      --scope string     scope
  -s, --server string    management server endpoint (required)
      --space string     Space name or id (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic products:publish

Publish the product

Synopsis

Publish the product

```
apic products:publish [flags]
```

Possible Usages

```
    apic products:publish [flags] --stage --scope space PRODUCTS_FILE
    apic products:publish [flags] --stage PRODUCTS_FILE
    apic products:publish [flags] --scope space PRODUCTS_FILE
    apic products:publish [flags] PRODUCTS_FILE
```

Options

```
  -c, --catalog string             Catalog name or id (required)
      --format string              Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults
to yaml.
      --gateway_services string    The list of gateway service names to support partial publishing
      --migrate_subscriptions      Migrate subscription when republish product
  -o, --org string                 Organization name or id (required)
      --output string              Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string              management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic products:replace

Products replace operations

Synopsis

Products replace operations

Create a mapping file

if you are replacing a Product, the mapping file specifies the Product that you want to replace, and the mapping of the Plans from the source Product to the target Product.

The PRODUCT_PLAN_MAPPING_FILE takes the following form:

```
product_url: https:/server/api/catalogs/{id}/products/{id}
plans:
- source: {source_plan_name_1}
  target: {target_plan_name_1}
- source: {source_plan_name_2}
  target: {target_plan_name_2}
                          .
                          .
                          .
```

`Hot-replace` version 1.0.0 with 1.0.1

```
apic products:replace climbon:1.0.1 PRODUCT_PLAN_MAPPING_FILE
```

The Product specified on the command line is the replacement Product. For example, if you are replacing climbon:1.0.0 with climbon:1.0.1 then the Product specified on the command line is climbon:1.0.1, and the product_url property inside the plan mapping file specifies the URL of climbon:1.0.0.

```
apic products:replace [flags]
```

Possible Usages

```
      apic products:replace [flags] --id --scope space ID PRODUCT_PLAN_MAPPING_FILE
      apic products:replace [flags] --id --scope catalog ID PRODUCT_PLAN_MAPPING_FILE
      apic products:replace [flags] --scope space NAME:VERSION PRODUCT_PLAN_MAPPING_FILE
      apic products:replace [flags] --scope catalog NAME:VERSION PRODUCT_PLAN_MAPPING_FILE
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for products:replace
      --id               id
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
      --scope string     scope
  -s, --server string    management server endpoint (required)
      --space string     Space name or id (required)
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic products:set-migration-target

Products set-migration-target operations

Synopsis

Products set-migration-target operations

```
apic products:set-migration-target [flags]
```

Possible Usages

```
apic products:set-migration-target [flags] --id --scope space ID PRODUCT_PLAN_MAPPING_FILE
apic products:set-migration-target [flags] --id --scope catalog ID PRODUCT_PLAN_MAPPING_FILE
apic products:set-migration-target [flags] --scope space NAME:VERSION PRODUCT_PLAN_MAPPING_FILE
apic products:set-migration-target [flags] --scope catalog NAME:VERSION PRODUCT_PLAN_MAPPING_FILE
```

Options

```
-c, --catalog string   Catalog name or id (required)
    --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help             Help for products:set-migration-target
    --id               id
-o, --org string       Organization name or id (required)
    --output string    Write file(s) to directory, instead of STDOUT (default "-")
    --scope string     scope
-s, --server string    management server endpoint (required)
    --space string     Space name or id (required)
```

Options inherited from parent commands

```
    --accept-license        Accept the license for API Connect
    --debug                 Enable debug output
    --debug-output string   Write debug output to file
    --live-help             Enable or disable tracking of limited usage information
-m, --mode string           Toolkit operation mode (default "apim")
```

apic products:supersede

Products supersede operations

Synopsis

Products supersede operations

```
apic products:supersede [flags]
```

Possible Usages

```
apic products:supersede [flags] --id --scope space ID PRODUCT_PLAN_MAPPING_FILE
apic products:supersede [flags] --id --scope catalog ID PRODUCT_PLAN_MAPPING_FILE
apic products:supersede [flags] --scope space NAME:VERSION PRODUCT_PLAN_MAPPING_FILE
apic products:supersede [flags] --scope catalog NAME:VERSION PRODUCT_PLAN_MAPPING_FILE
```

Options

```
-c, --catalog string   Catalog name or id (required)
    --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
-h, --help             Help for products:supersede
    --id               id
-o, --org string       Organization name or id (required)
    --output string    Write file(s) to directory, instead of STDOUT (default "-")
    --scope string     scope
-s, --server string    management server endpoint (required)
    --space string     Space name or id (required)
```

Options inherited from parent commands

```
    --accept-license        Accept the license for API Connect
    --debug                 Enable debug output
    --debug-output string   Write debug output to file
    --live-help             Enable or disable tracking of limited usage information
-m, --mode string           Toolkit operation mode (default "apim")
```

apic products:update

Products update operations

Synopsis

Products update operations

```
apic products:update [flags]
```

Possible Usages

```
apic products:update [flags] --id --scope space ID PRODUCT_FILE
apic products:update [flags] --id --scope catalog ID PRODUCT_FILE
apic products:update [flags] --scope space NAME:VERSION PRODUCT_FILE
apic products:update [flags] --scope catalog NAME:VERSION PRODUCT_FILE
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for products:update
      --id               id
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
      --scope string     scope
  -s, --server string    management server endpoint (required)
      --space string     Space name or id (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic properties

Properties operations

Synopsis

Properties operations

```
apic properties [flags]
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --fields string    List of field names to return
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for properties
      --limit int32      Maximum number of items to return
      --offset int32     Offset item number from list to begin return
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
      --scope string     scope
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic properties:clear

Properties clear operations

Synopsis

Properties clear operations

```
apic properties:clear [flags]
```

Possible Usages

```
      apic properties:clear [flags] --scope catalog
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --confirm string   Confirmation for critical updates (required)
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for properties:clear
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
      --scope string     scope
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic properties:create

Properties create operations

Synopsis

Properties create operations

```
apic properties:create [flags]
```

Possible Usages

```
      apic properties:create [flags] --scope catalog NAME_VALUE_PAIRS_FILE
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for properties:create
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
      --scope string     scope
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic properties:delete

Properties delete operations

Synopsis

Properties delete operations

```
apic properties:delete [flags]
```

Possible Usages

```
      apic properties:delete [flags] --scope catalog PROPERTY_NAME
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for properties:delete
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
```

```
      --scope string     scope
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic properties:get

Properties get operations

Synopsis

Properties get operations

```
apic properties:get [flags]
```

Possible Usages

```
      apic properties:get [flags] --scope catalog PROPERTY_NAME
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --fields string    List of field names to return
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for properties:get
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, use - for STDOUT. (default: cwd)
      --scope string     scope
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic properties:list

Properties list operations

Synopsis

Properties list operations

```
apic properties:list [flags]
```

Possible Usages

```
      apic properties:list [flags] --scope catalog
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --fields string    List of field names to return
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for properties:list
      --limit int32      Maximum number of items to return
      --offset int32     Offset item number from list to begin return
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
      --scope string     scope
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
```

```
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic properties:update

Properties update operations

Synopsis

Properties update operations

```
apic properties:update [flags]
```

Possible Usages

```
      apic properties:update [flags] --scope catalog PROPERTY_NAME PROPERTY_FILE
```

Options

```
  -c, --catalog string    Catalog name or id (required)
      --format string     Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help              Help for properties:update
  -o, --org string        Organization name or id (required)
      --output string     Write file(s) to directory, instead of STDOUT (default "-")
      --scope string      scope
  -s, --server string     management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic registrations

Registrations operations

Synopsis

Registrations operations

```
apic registrations [flags]
```

Options

```
      --fields string   List of field names to return
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help            Help for registrations
      --limit int32     Maximum number of items to return
      --offset int32    Offset item number from list to begin return
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic registrations:clear

Clear the Registration objects

Synopsis

Clear the Registration objects

```
apic registrations:clear [flags]
```

Possible Usages

```
apic registrations:clear [flags]
```

Options

```
      --confirm string   Confirmation for critical updates (required)
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic registrations:create

Create a Registration object

Synopsis

Create a Registration object

```
Fields allowed but ignored:
- id
- type
- api_version
- scope
- created_at
- updated_at
- url
```

```
apic registrations:create [flags]
```

Possible Usages

```
apic registrations:create [flags] REGISTRATION_FILE
```

Options

```
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic registrations:delete

Delete the Registration object by name or id

Synopsis

Delete the Registration object by name or id

```
apic registrations:delete [flags]
```

Possible Usages

```
apic registrations:delete [flags] REGISTRATION
```

Options

```
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic registrations:get

Get the Registration object by name or id

Synopsis

Get the Registration object by name or id

```
apic registrations:get [flags]
```

Possible Usages

```
      apic registrations:get [flags] REGISTRATION
```

Options

```
      --fields string   List of field names to return
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
      --output string   Write file(s) to directory, use - for STDOUT. (default: cwd)
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic registrations:list

List the Registration objects

Synopsis

List the Registration objects

```
apic registrations:list [flags]
```

Possible Usages

```
      apic registrations:list [flags]
```

Options

```
      --fields string   List of field names to return
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
      --limit int32     Maximum number of items to return
      --offset int32    Offset item number from list to begin return
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic registrations:update

Update the Registration object by name or id

Synopsis

Update the Registration object by name or id

```
      Fields allowed but ignored:
      - id
      - type
      - api_version
      - scope
      - created_at
      - updated_at
      - url
```

```
apic registrations:update [flags]
```

Possible Usages

```
      apic registrations:update [flags] REGISTRATION REGISTRATION_FILE
```

Options

```
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic role-defaults

Role Defaults operations

Synopsis

Role Defaults operations

```
apic role-defaults [flags]
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --fields string    List of field names to return
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for role-defaults
      --limit int32      Maximum number of items to return
      --offset int32     Offset item number from list to begin return
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
      --scope string     scope
  -s, --server string    management server endpoint (required)
      --space string     Space name or id (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic role-defaults:clear

Role Defaults clear operations

Synopsis

Role Defaults clear operations

```
apic role-defaults:clear [flags]
```

Possible Usages

```
      apic role-defaults:clear [flags] --scope cloud --subcollection provider
```

Options

```
      --confirm string          Confirmation for critical updates (required)
      --format string           Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
  -h, --help                    Help for role-defaults:clear
      --output string           Write file(s) to directory, instead of STDOUT (default "-")
      --scope string            scope
  -s, --server string           management server endpoint (required)
      --subcollection string    subcollection
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic role-defaults:create

Role Defaults create operations

Synopsis

Role Defaults create operations

```
apic role-defaults:create [flags]
```

Possible Usages

```
      apic role-defaults:create [flags] --scope cloud --subcollection provider ROLE_DEFAULT_FILE
```

Options

```
      --format string           Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
  -h, --help                    Help for role-defaults:create
      --output string           Write file(s) to directory, instead of STDOUT (default "-")
      --scope string            scope
  -s, --server string           management server endpoint (required)
      --subcollection string    subcollection
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic role-defaults:delete

Role Defaults delete operations

Synopsis

Role Defaults delete operations

```
apic role-defaults:delete [flags]
```

Possible Usages

```
      apic role-defaults:delete [flags] --scope cloud --subcollection provider ROLE_DEFAULT
```

Options

```
      --format string           Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
  -h, --help                    Help for role-defaults:delete
      --output string           Write file(s) to directory, instead of STDOUT (default "-")
      --scope string            scope
  -s, --server string           management server endpoint (required)
      --subcollection string    subcollection
```

Options inherited from parent commands

```
      --accept-license          Accept the license for API Connect
      --debug                   Enable debug output
      --debug-output string     Write debug output to file
      --live-help               Enable or disable tracking of limited usage information
  -m, --mode string             Toolkit operation mode (default "apim")
```

apic role-defaults:get

Role Defaults get operations

Synopsis

Role Defaults get operations

```
apic role-defaults:get [flags]
```

Possible Usages

```
      apic role-defaults:get [flags] --scope space --subcollection consumer ROLE_DEFAULT
      apic role-defaults:get [flags] --scope cloud --subcollection provider ROLE_DEFAULT
      apic role-defaults:get [flags] --scope cloud --subcollection consumer ROLE_DEFAULT
      apic role-defaults:get [flags] --scope catalog --subcollection consumer ROLE_DEFAULT
```

Options

```
  -c, --catalog string          Catalog name or id (required)
      --fields string           List of field names to return
      --format string           Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
  -h, --help                    Help for role-defaults:get
  -o, --org string              Organization name or id (required)
      --output string           Write file(s) to directory, use - for STDOUT. (default: cwd)
      --scope string            scope
  -s, --server string           management server endpoint (required)
      --space string            Space name or id (required)
      --subcollection string    subcollection
```

Options inherited from parent commands

```
      --accept-license          Accept the license for API Connect
      --debug                   Enable debug output
      --debug-output string     Write debug output to file
      --live-help               Enable or disable tracking of limited usage information
  -m, --mode string             Toolkit operation mode (default "apim")
```

apic role-defaults:list

Role Defaults list operations

Synopsis

Role Defaults list operations

```
apic role-defaults:list [flags]
```

Possible Usages

```
      apic role-defaults:list [flags] --scope space --subcollection consumer
      apic role-defaults:list [flags] --scope cloud --subcollection provider
      apic role-defaults:list [flags] --scope cloud --subcollection consumer
      apic role-defaults:list [flags] --scope catalog --subcollection consumer
```

Options

```
  -c, --catalog string          Catalog name or id (required)
      --fields string           List of field names to return
      --format string           Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
  -h, --help                    Help for role-defaults:list
      --limit int32             Maximum number of items to return
      --offset int32            Offset item number from list to begin return
  -o, --org string              Organization name or id (required)
      --output string           Write file(s) to directory, instead of STDOUT (default "-")
      --scope string            scope
  -s, --server string           management server endpoint (required)
      --space string            Space name or id (required)
      --subcollection string    subcollection
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic role-defaults:list-all

Role Defaults list-all operations

Synopsis

Role Defaults list-all operations

```
apic role-defaults:list-all [flags]
```

Possible Usages

```
    apic role-defaults:list-all [flags] --scope space
    apic role-defaults:list-all [flags] --scope cloud
    apic role-defaults:list-all [flags] --scope catalog
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --fields string    List of field names to return
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for role-defaults:list-all
      --limit int32      Maximum number of items to return
      --offset int32     Offset item number from list to begin return
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
      --scope string     scope
  -s, --server string    management server endpoint (required)
      --space string     Space name or id (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic role-defaults:update

Role Defaults update operations

Synopsis

Role Defaults update operations

```
apic role-defaults:update [flags]
```

Possible Usages

```
    apic role-defaults:update [flags] --scope cloud --subcollection provider ROLE_DEFAULT ROLE_DEFAULT_FILE
```

Options

```
      --format string          Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
  -h, --help                   Help for role-defaults:update
      --output string          Write file(s) to directory, instead of STDOUT (default "-")
      --scope string           scope
  -s, --server string          management server endpoint (required)
      --subcollection string   subcollection
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic roles

Roles operations

Synopsis

Roles operations

```
apic roles [flags]
```

Options

```
  -c, --catalog string         Catalog name or id (required)
      --consumer-org string    Consumer Organization name or id (required)
      --fields string          List of field names to return
      --format string          Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
  -h, --help                   Help for roles
      --limit int32            Maximum number of items to return
      --offset int32           Offset item number from list to begin return
  -o, --org string             Organization name or id (required)
      --output string          Write file(s) to directory, instead of STDOUT (default "-")
      --scope string           scope
  -s, --server string          management server endpoint (required)
      --space string           Space name or id (required)
      --space-initiated        space-initiated
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic roles:clear

Roles clear operations

Synopsis

Roles clear operations

```
apic roles:clear [flags]
```

Possible Usages

```
      apic roles:clear [flags] --scope org
```

Options

```
      --confirm string   Confirmation for critical updates (required)
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for roles:clear
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
      --scope string     scope
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic roles:create

Roles create operations

Synopsis

Roles create operations

```
apic roles:create [flags]
```

Possible Usages

```
      apic roles:create [flags] --scope org ROLE_FILE
```

Options

```
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help            Help for roles:create
  -o, --org string      Organization name or id (required)
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
      --scope string    scope
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic roles:delete

Roles delete operations

Synopsis

Roles delete operations

```
apic roles:delete [flags]
```

Possible Usages

```
      apic roles:delete [flags] --scope org ROLE
```

Options

```
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help            Help for roles:delete
  -o, --org string      Organization name or id (required)
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
      --scope string    scope
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic roles:get

Roles get operations

Synopsis

Roles get operations

```
apic roles:get [flags]
```

Possible Usages

```
      apic roles:get [flags] --scope consumer-org --space-initiated ROLE
      apic roles:get [flags] --scope space ROLE
      apic roles:get [flags] --scope org ROLE
      apic roles:get [flags] --scope consumer-org ROLE
      apic roles:get [flags] --scope catalog ROLE
```

Options

```
  -c, --catalog string          Catalog name or id (required)
      --consumer-org string     Consumer Organization name or id (required)
      --fields string           List of field names to return
      --format string           Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
  -h, --help                    Help for roles:get
  -o, --org string              Organization name or id (required)
      --output string           Write file(s) to directory, use - for STDOUT. (default: cwd)
      --scope string            scope
  -s, --server string           management server endpoint (required)
      --space string            Space name or id (required)
      --space-initiated         space-initiated
```

Options inherited from parent commands

```
      --accept-license          Accept the license for API Connect
      --debug                   Enable debug output
      --debug-output string     Write debug output to file
      --live-help               Enable or disable tracking of limited usage information
  -m, --mode string             Toolkit operation mode (default "apim")
```

apic roles:list

Roles list operations

Synopsis

Roles list operations

```
apic roles:list [flags]
```

Possible Usages

```
      apic roles:list [flags] --scope consumer-org --space-initiated
      apic roles:list [flags] --scope space
      apic roles:list [flags] --scope org
      apic roles:list [flags] --scope consumer-org
      apic roles:list [flags] --scope catalog
```

Options

```
  -c, --catalog string          Catalog name or id (required)
      --consumer-org string     Consumer Organization name or id (required)
      --fields string           List of field names to return
      --format string           Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
  -h, --help                    Help for roles:list
      --limit int32             Maximum number of items to return

  -s, --server string           management server endpoint (required)
      --space string            Space name or id (required)
      --space-initiated         space-initiated
```

Options inherited from parent commands

```
      --accept-license          Accept the license for API Connect
      --debug                   Enable debug output
      --debug-output string     Write debug output to file
      --live-help               Enable or disable tracking of limited usage information
  -m, --mode string             Toolkit operation mode (default "apim")
```

apic roles:update

Roles update operations

Synopsis

Roles update operations

```
apic roles:update [flags]
```

Possible Usages

```
apic roles:update [flags] --scope space ROLE ROLE_FILE
apic roles:update [flags] --scope org ROLE ROLE_FILE
apic roles:update [flags] --scope catalog ROLE ROLE_FILE
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for roles:update
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
      --scope string     scope
  -s, --server string    management server endpoint (required)
      --space string     Space name or id (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic services

Services operations

Synopsis

Services operations

```
apic services [flags]
```

Options

```
  -c, --catalog string                       Catalog name or id (required)
      --configured-gateway-service string    Configured Gateway Service name or id (required)
      --fields string                        List of field names to return
      --format string                        Output format. One of [json yaml octet-stream go-template=... go-template-
file=...], defaults to yaml.

  -m, --mode string           Toolkit operation mode (default "apim")
```

apic space-settings:get

Get the Space Setting object

Synopsis

Get the Space Setting object

```
apic space-settings:get [flags]
```

Possible Usages

```
      apic space-settings:get [flags]
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --fields string    List of field names to return
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, use - for STDOUT. (default: cwd)
  -s, --server string    management server endpoint (required)
      --space string     Space name or id (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic space-settings:update

Update the Space Setting object

Synopsis

Update the Space Setting object

```
      Fields allowed but ignored:
      - name
      - type
      - api_version
      - scope
      - created_at
      - updated_at
      - url
      - org_url
      - catalog_url
      - space_url
```

```
apic space-settings:update [flags]
```

Possible Usages

```
      apic space-settings:update [flags] SPACE_SETTING_FILE
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string    management server endpoint (required)
      --space string     Space name or id (required)
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic spaces

Spaces operations

Synopsis

Spaces operations

```
apic spaces [flags]
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --fields string    List of field names to return
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for spaces
      --limit int32      Maximum number of items to return
      --my               my
      --offset int32     Offset item number from list to begin return
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic spaces:clear

Clear the Space objects

Synopsis

Clear the Space objects

```
apic spaces:clear [flags]
```

Possible Usages

```
      apic spaces:clear [flags]
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --confirm string   Confirmation for critical updates (required)
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic spaces:create

Create a Space object

Synopsis

Create a Space object

```
      Fields allowed but ignored:
      - id
      - type
      - api_version
      - scope
      - created_at
      - updated_at
      - url
      - org_url
      - catalog_url
```

```
apic spaces:create [flags]
```

Possible Usages

```
      apic spaces:create [flags] SPACE_FILE
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic spaces:delete

Delete the Space object by name or id

Synopsis

Delete the Space object by name or id

```
apic spaces:delete [flags]
```

Possible Usages

```
      apic spaces:delete [flags] SPACE
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic spaces:email-to-owners

Send email to owners of consumer organizations

Synopsis

Send email to owners of consumer organizations, given consumer org and consumer group urls. For consumer group, email owners of all consumer orgs in the group.

```
apic spaces:email-to-owners [flags]
```

Possible Usages

```
apic spaces:email-to-owners [flags] SPACE EMAIL_TO_OWNERS_FILE
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic spaces:get

Get the Space object by name or id

Synopsis

Get the Space object by name or id

```
apic spaces:get [flags]
```

Possible Usages

```
apic spaces:get [flags] SPACE
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --fields string    List of field names to return
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, use - for STDOUT. (default: cwd)
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic spaces:list

List the Space objects

Synopsis

List the Space objects

```
apic spaces:list [flags]
```

Possible Usages

```
apic spaces:list [flags] --my
apic spaces:list [flags]
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --fields string    List of field names to return
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
      --limit int32      Maximum number of items to return
      --offset int32     Offset item number from list to begin return
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic spaces:transfer-owner

Transfer owner to an associate

Synopsis

Transfer owner to an associate

```
apic spaces:transfer-owner [flags]
```

Possible Usages

```
    apic spaces:transfer-owner [flags] SPACE TRANSFER_OWNER_FILE
```

Options

```
      --cascade             Cascade the behavior
  -c, --catalog string      Catalog name or id (required)
      --delete_old_owner    Delete old owner
      --format string       Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
  -o, --org string          Organization name or id (required)
      --output string       Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string       management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic spaces:update

Update the Space object by name or id

Synopsis

Update the Space object by name or id

```
    Fields allowed but ignored:
    - id
    - type
    - api_version
    - scope
    - created_at
    - updated_at
    - url
    - org_url
    - catalog_url
```

```
apic spaces:update [flags]
```

Possible Usages

```
    apic spaces:update [flags] SPACE SPACE_FILE
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic subscriber-events

Subscriber Events operations

Synopsis

Subscriber Events operations

```
apic subscriber-events [flags]
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --fields string    List of field names to return
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for subscriber-events
      --limit int32      Maximum number of items to return
      --offset int32     Offset item number from list to begin return
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
      --scope string     scope
  -s, --server string    management server endpoint (required)
      --state string     State for a webhook event in subscriber queue
      --webhook string   Webhook name or id (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic subscriber-events:get

Subscriber Events get operations

Synopsis

Subscriber Events get operations

```
apic subscriber-events:get [flags]
```

Possible Usages

```
    apic subscriber-events:get [flags] --scope cloud SUBSCRIBER_EVENT
    apic subscriber-events:get [flags] --scope catalog SUBSCRIBER_EVENT
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --fields string    List of field names to return
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for subscriber-events:get
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, use - for STDOUT. (default: cwd)
      --scope string     scope
  -s, --server string    management server endpoint (required)
      --webhook string   Webhook name or id (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic subscriber-events:list

Subscriber Events list operations

Synopsis

Subscriber Events list operations

```
apic subscriber-events:list [flags]
```

Possible Usages

```
      apic subscriber-events:list [flags] --scope cloud
      apic subscriber-events:list [flags] --scope catalog
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --fields string    List of field names to return
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for subscriber-events:list
      --limit int32      Maximum number of items to return
      --offset int32     Offset item number from list to begin return
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
      --scope string     scope
  -s, --server string    management server endpoint (required)
      --state string     State for a webhook event in subscriber queue
      --webhook string   Webhook name or id (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic subscriptions

Subscriptions operations

Synopsis

Subscriptions operations

```
apic subscriptions [flags]
```

Options

```
  -a, --app string                Application name or id (required)
  -c, --catalog string            Catalog name or id (required)
      --consumer-org string       Consumer Organization name or id (required)
      --consumer_org_url string   Consumer Org Url
      --expand string             List of transient field to expand
      --fields string             List of field names to return
      --format string             Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults
to yaml.
  -h, --help                      Help for subscriptions
      --limit int32               Maximum number of items to return
      --offset int32              Offset item number from list to begin return
  -o, --org string                Organization name or id (required)
      --output string             Write file(s) to directory, instead of STDOUT (default "-")
      --plan string               Plan Name
      --product_url string        Product Url
      --scope string              scope
  -s, --server string             management server endpoint (required)
      --space string              Space name or id (required)
      --space-initiated           space-initiated
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic subscriptions:clear

Clear the Subscription objects

Synopsis

Clear the Subscription objects

```
apic subscriptions:clear [flags]
```

Possible Usages

```
      apic subscriptions:clear [flags] --space-initiated
      apic subscriptions:clear [flags]
```

Options

```
  -a, --app string            Application name or id (required)
  -c, --catalog string        Catalog name or id (required)
      --confirm string        Confirmation for critical updates (required)
      --consumer-org string   Consumer Organization name or id (required)
      --format string         Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
  -o, --org string            Organization name or id (required)
      --output string         Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string         management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic subscriptions:create

Create a Subscription object

Synopsis

Create a Subscription object

```
      Required fields:
      - product_url
      - plan

      Fields allowed but ignored:
      - id
      - type
      - api_version
      - scope
      - created_at
      - updated_at
      - url
      - org_url
      - catalog_url
      - consumer_org_url
      - app_url
```

```
apic subscriptions:create [flags]
```

Possible Usages

```
      apic subscriptions:create [flags] --space-initiated SUBSCRIPTION_FILE
      apic subscriptions:create [flags] SUBSCRIPTION_FILE
```

Options

```
  -a, --app string            Application name or id (required)
  -c, --catalog string        Catalog name or id (required)
      --consumer-org string   Consumer Organization name or id (required)
```

```
      --format string          Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
  -o, --org string             Organization name or id (required)
      --output string          Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string          management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic subscriptions:delete

Delete the Subscription object by name or id

Synopsis

Delete the Subscription object by name or id

```
apic subscriptions:delete [flags]
```

Possible Usages

```
      apic subscriptions:delete [flags] --space-initiated SUBSCRIPTION
      apic subscriptions:delete [flags] SUBSCRIPTION
```

Options

```
  -a, --app string             Application name or id (required)
  -c, --catalog string         Catalog name or id (required)
      --consumer-org string    Consumer Organization name or id (required)
      --format string          Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
  -o, --org string             Organization name or id (required)
      --output string          Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string          management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic subscriptions:get

Get the Subscription object by name or id

Synopsis

Get the Subscription object by name or id

```
apic subscriptions:get [flags]
```

Possible Usages

```
      apic subscriptions:get [flags] --space-initiated SUBSCRIPTION
      apic subscriptions:get [flags] SUBSCRIPTION
```

Options

```
  -a, --app string             Application name or id (required)
  -c, --catalog string         Catalog name or id (required)
      --consumer-org string    Consumer Organization name or id (required)
      --fields string          List of field names to return
      --format string          Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
  -o, --org string             Organization name or id (required)
      --output string          Write file(s) to directory, use - for STDOUT. (default: cwd)
  -s, --server string          management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic subscriptions:list

List the Subscription objects

Synopsis

List the Subscription objects

```
apic subscriptions:list [flags]
```

Possible Usages

```
      apic subscriptions:list [flags] --space-initiated
      apic subscriptions:list [flags] --scope space
      apic subscriptions:list [flags] --scope catalog
      apic subscriptions:list [flags]
```

Options

```
  -a, --app string            Application name or id (required)
  -c, --catalog string        Catalog name or id (required)
      --consumer-org string   Consumer Organization name or id (required)
      --fields string         List of field names to return
      --format string         Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
      --limit int32           Maximum number of items to return
      --offset int32          Offset item number from list to begin return
  -o, --org string            Organization name or id (required)
      --output string         Write file(s) to directory, instead of STDOUT (default "-")
      --plan string           Plan Name
      --product_url string    Product Url
  -s, --server string         management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic subscriptions:update

Update the Subscription object by name or id

Synopsis

Update the Subscription object by name or id

```
      Fields not allowed:
      - billing_identifiers
      - plan_title

      Fields allowed but ignored:
      - id
      - type
      - api_version
      - scope
      - created_at
      - updated_at
      - url
      - org_url
      - catalog_url
      - consumer_org_url
      - app_url
```

```
apic subscriptions:update [flags]
```

Possible Usages

```
      apic subscriptions:update [flags] --space-initiated SUBSCRIPTION SUBSCRIPTION_FILE
      apic subscriptions:update [flags] SUBSCRIPTION SUBSCRIPTION_FILE
```

Options

```
  -a, --app string             Application name or id (required)
  -c, --catalog string         Catalog name or id (required)
      --consumer-org string    Consumer Organization name or id (required)
      --format string          Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
  -o, --org string             Organization name or id (required)
      --output string          Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string          management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect

      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for tasks:get
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, use - for STDOUT. (default: cwd)
      --scope string     scope
  -s, --server string    management server endpoint (required)
      --space string     Space name or id (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic tasks:list

Tasks list operations

Synopsis

Tasks list operations

```
apic tasks:list [flags]
```

Possible Usages

```
      apic tasks:list [flags] --scope space
      apic tasks:list [flags] --scope catalog
      apic tasks:list [flags] --originated
      apic tasks:list [flags] --my
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --fields string    List of field names to return
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for tasks:list
      --limit int32      Maximum number of items to return
      --my               my
      --offset int32     Offset item number from list to begin return
  -o, --org string       Organization name or id (required)
      --originated       originated
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
      --scope string     scope
```

```
  -s, --server string    management server endpoint (required)
      --space string     Space name or id (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic tasks:update

Tasks update operations

Synopsis

Tasks update operations

```
apic tasks:update [flags]
```

Possible Usages

```
      apic tasks:update [flags] --scope space TASK TASK_FILE
      apic tasks:update [flags] --scope catalog TASK TASK_FILE
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for tasks:update
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
      --scope string     scope
  -s, --server string    management server endpoint (required)
      --space string     Space name or id (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic test

Runs a test and returns

Synopsis

apic-test is a CLI for testing your APIs

```
apic test [flags]
```

Options

```
  -h, --help            Help for test
      --output string   ATM test
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic tls-client-profiles

Tls Client Profiles operations

Synopsis

Tls Client Profiles operations

```
apic tls-client-profiles [flags]
```

Options

```
      --fields string   List of field names to return
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help            Help for tls-client-profiles
      --limit int32     Maximum number of items to return
      --offset int32    Offset item number from list to begin return
  -o, --org string      Organization name or id (required)
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic tls-client-profiles:clear

Clear the TLS Client Profile objects

Synopsis

Clear the TLS Client Profile objects

```
apic tls-client-profiles:clear [flags]
```

Possible Usages

```
    apic tls-client-profiles:clear [flags] TLS_CLIENT_PROFILE_NAME
```

Options

```
      --confirm string   Confirmation for critical updates (required)
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic tls-client-profiles:clear-all

Clear all TLS Client Profile objects in all collections

Synopsis

Clear all TLS Client Profile objects in all collections

```
apic tls-client-profiles:clear-all [flags]
```

Possible Usages

```
    apic tls-client-profiles:clear-all [flags]
```

Options

```
      --cascade          Cascade the behavior
      --confirm string   Confirmation for critical updates (required)
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
```

```
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic tls-client-profiles:create

Create a TLS Client Profile object

Synopsis

Create a TLS Client Profile object

```
      Fields not allowed:
      - owned

      Fields allowed but ignored:
      - id
      - type
      - api_version
      - scope
      - created_at
      - updated_at
      - url
      - org_url
```

```
apic tls-client-profiles:create [flags]
```

Possible Usages

```
      apic tls-client-profiles:create [flags] TLS_CLIENT_PROFILE_FILE
```

Options

```
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -o, --org string      Organization name or id (required)
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic tls-client-profiles:delete

Delete a TLS Client Profile

Synopsis

Delete a TLS Client Profile

```
apic tls-client-profiles:delete [flags]
```

Possible Usages

```
      apic tls-client-profiles:delete [flags] --id ID
      apic tls-client-profiles:delete [flags] NAME:VERSION
```

Options

```
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -o, --org string      Organization name or id (required)
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic tls-client-profiles:get

Get the TLS Client Profile object by name and version

Synopsis

Get the TLS Client Profile object by name and version

```
apic tls-client-profiles:get [flags]
```

Possible Usages

```
      apic tls-client-profiles:get [flags] --id ID
      apic tls-client-profiles:get [flags] NAME:VERSION
```

Options

```
      --fields string    List of field names to return
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, use - for STDOUT. (default: cwd)
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic tls-client-profiles:list

List the TLS Client Profile objects

Synopsis

List the TLS Client Profile objects

```
apic tls-client-profiles:list [flags]
```

Possible Usages

```
      apic tls-client-profiles:list [flags] TLS_CLIENT_PROFILE_NAME
```

Options

```
      --fields string    List of field names to return
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
      --limit int32      Maximum number of items to return
      --offset int32     Offset item number from list to begin return
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic tls-client-profiles:list-all

List all TLS Client Profile objects in all collections

Synopsis

List all TLS Client Profile objects in all collections

```
apic tls-client-profiles:list-all [flags]
```

Possible Usages

```
apic tls-client-profiles:list-all [flags]
```

Options

```
      --fields string   List of field names to return
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
      --limit int32     Maximum number of items to return
      --offset int32    Offset item number from list to begin return
  -o, --org string      Organization name or id (required)
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic tls-client-profiles:update

Update the TLS Client Profile object by name and version

Synopsis

Update the TLS Client Profile object by name and version

```
Fields not allowed:
- owned

Fields not allowed to be null:
- ciphers
- protocols

Fields allowed but ignored:
- id
- type
- api_version
- scope
- created_at
- updated_at
- url
- org_url
```

```
apic tls-client-profiles:update [flags]
```

Possible Usages

```
apic tls-client-profiles:update [flags] --id ID TLS_CLIENT_PROFILE_FILE
apic tls-client-profiles:update [flags] NAME:VERSION TLS_CLIENT_PROFILE_FILE
```

Options

```
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -o, --org string      Organization name or id (required)
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic tls-server-profiles

Tls Server Profiles operations

Synopsis

Tls Server Profiles operations

```
apic tls-server-profiles [flags]
```

Options

```
      --fields string   List of field names to return
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help            Help for tls-server-profiles
      --limit int32     Maximum number of items to return
      --offset int32    Offset item number from list to begin return
  -o, --org string      Organization name or id (required)
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic tls-server-profiles:clear

Clear the TLS Server Profile objects

Synopsis

Clear the TLS Server Profile objects

```
apic tls-server-profiles:clear [flags]
```

Possible Usages

```
      apic tls-server-profiles:clear [flags] TLS_SERVER_PROFILE_NAME
```

Options

```
      --cascade           Cascade the behavior
      --confirm string    Confirmation for critical updates (required)
      --format string     Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -o, --org string        Organization name or id (required)
      --output string     Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string     management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic tls-server-profiles:clear-all

Clear all TLS Server Profile objects in all collections

Synopsis

Clear all TLS Server Profile objects in all collections

```
apic tls-server-profiles:clear-all [flags]
```

Possible Usages

```
      apic tls-server-profiles:clear-all [flags]
```

Options

```
      --cascade           Cascade the behavior
      --confirm string    Confirmation for critical updates (required)
      --format string     Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -o, --org string        Organization name or id (required)
      --output string     Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string     management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic tls-server-profiles:create

Create a TLS Server Profile object

Synopsis

Create a TLS Server Profile object

```
      Fields allowed but ignored:
      - id
      - type
      - api_version
      - scope
      - created_at
      - updated_at
      - url
```

```
apic tls-server-profiles:create [flags]
```

Possible Usages

```
      apic tls-server-profiles:create [flags] TLS_SERVER_PROFILE_FILE
```

Options

```
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -o, --org string      Organization name or id (required)
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic tls-server-profiles:delete

Delete a TLS Server Profile

Synopsis

Delete a TLS Server Profile

```
apic tls-server-profiles:delete [flags]
```

Possible Usages

```
      apic tls-server-profiles:delete [flags] --id ID
      apic tls-server-profiles:delete [flags] NAME:VERSION
```

Options

```
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -o, --org string      Organization name or id (required)
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic tls-server-profiles:get

Get the TLS Server Profile object by name and version

Synopsis

Get the TLS Server Profile object by name and version

```
apic tls-server-profiles:get [flags]
```

Possible Usages

```
      apic tls-server-profiles:get [flags] --id ID
      apic tls-server-profiles:get [flags] NAME:VERSION
```

Options

```
      --fields string   List of field names to return
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -o, --org string      Organization name or id (required)
      --output string   Write file(s) to directory, use - for STDOUT. (default: cwd)
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic tls-server-profiles:list

List the TLS Server Profile objects

Synopsis

List the TLS Server Profile objects

```
apic tls-server-profiles:list [flags]
```

Possible Usages

```
      apic tls-server-profiles:list [flags] TLS_SERVER_PROFILE_NAME
```

Options

```
      --fields string   List of field names to return
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
      --limit int32     Maximum number of items to return
      --offset int32    Offset item number from list to begin return
  -o, --org string      Organization name or id (required)
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic tls-server-profiles:list-all

List all TLS Server Profile objects in all collections

Synopsis

List all TLS Server Profile objects in all collections

```
apic tls-server-profiles:list-all [flags]
```

Possible Usages

```
      apic tls-server-profiles:list-all [flags]
```

Options

```
      --fields string   List of field names to return
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
      --limit int32     Maximum number of items to return
      --offset int32    Offset item number from list to begin return
  -o, --org string      Organization name or id (required)
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic tls-server-profiles:update

Update the TLS Server Profile object by name and version

Synopsis

Update the TLS Server Profile object by name and version

```
      Fields allowed but ignored:
      - id
      - type
      - api_version
      - scope
      - created_at
      - updated_at
      - url
```

```
apic tls-server-profiles:update [flags]
```

Possible Usages

```
      apic tls-server-profiles:update [flags] --id ID TLS_SERVER_PROFILE_FILE
      apic tls-server-profiles:update [flags] NAME:VERSION TLS_SERVER_PROFILE_FILE
```

Options

```
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -o, --org string      Organization name or id (required)
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic truststores

Truststores operations

Synopsis

Truststores operations

```
apic truststores [flags]
```

Options

```
      --fields string   List of field names to return
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help            Help for truststores
      --limit int32     Maximum number of items to return
      --offset int32    Offset item number from list to begin return
  -o, --org string      Organization name or id (required)
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic truststores:clear

Clear the Truststore objects

Synopsis

Clear the Truststore objects

```
apic truststores:clear [flags]
```

Possible Usages

```
apic truststores:clear [flags]
```

Options

```
      --confirm string   Confirmation for critical updates (required)
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic truststores:create

Create a Truststore object

Synopsis

Create a Truststore object

```
Fields allowed but ignored:
- id
- type
- api_version
- scope
- created_at
- updated_at
- url
```

```
apic truststores:create [flags]
```

Possible Usages

```
apic truststores:create [flags] TRUSTSTORE_FILE
```

Options

```
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -o, --org string      Organization name or id (required)
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic truststores:delete

Delete the Truststore object by name or id

Synopsis

Delete the Truststore object by name or id

```
apic truststores:delete [flags]
```

Possible Usages

```
apic truststores:delete [flags] TRUSTSTORE
```

Options

```
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -o, --org string      Organization name or id (required)
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic truststores:get

Get the Truststore object by name or id

Synopsis

Get the Truststore object by name or id

```
apic truststores:get [flags]
```

Possible Usages

```
apic truststores:get [flags] TRUSTSTORE
```

Options

```
      --fields string   List of field names to return
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -o, --org string      Organization name or id (required)
      --output string   Write file(s) to directory, use - for STDOUT. (default: cwd)
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic truststores:list

List the Truststore objects

Synopsis

List the Truststore objects

```
apic truststores:list [flags]
```

Possible Usages

```
      apic truststores:list [flags]
```

Options

```
      --fields string   List of field names to return
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
      --limit int32     Maximum number of items to return
      --offset int32    Offset item number from list to begin return
  -o, --org string      Organization name or id (required)
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic truststores:update

Update the Truststore object by name or id

Synopsis

Update the Truststore object by name or id

```
      Fields allowed but ignored:
      - id
      - type
      - api_version
      - scope
      - created_at
      - updated_at
      - url
```

```
apic truststores:update [flags]
```

Possible Usages

```
      apic truststores:update [flags] TRUSTSTORE TRUSTSTORE_FILE
```

Options

```
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -o, --org string      Organization name or id (required)
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic user-registries

User Registries operations

Synopsis

User Registries operations

```
apic user-registries [flags]
```

Options

```
      --fields string   List of field names to return
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help            Help for user-registries
      --limit int32     Maximum number of items to return
      --offset int32    Offset item number from list to begin return
  -o, --org string      Organization name or id (required)
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic user-registries:clear

Clear the User Registry objects

Synopsis

Clear the User Registry objects

```
apic user-registries:clear [flags]
```

Possible Usages

```
apic user-registries:clear [flags]
```

Options

```
      --confirm string   Confirmation for critical updates (required)
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic user-registries:create

Create a User Registry object

Synopsis

Create a User Registry object

```
Required fields:
- integration_url

Fields not allowed:
- owned
```

```
      Fields allowed but ignored:
      - id
      - type
      - api_version
      - scope
      - created_at
      - updated_at
      - url
      - org_url
```

```
apic user-registries:create [flags]
```

Possible Usages

```
      apic user-registries:create [flags] USER_REGISTRY_FILE
```

Options

```
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -o, --org string      Organization name or id (required)
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic user-registries:delete

Delete the User Registry object by name or id

Synopsis

Delete the User Registry object by name or id

```
apic user-registries:delete [flags]
```

Possible Usages

```
      apic user-registries:delete [flags] USER_REGISTRY
```

Options

```
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -o, --org string      Organization name or id (required)
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic user-registries:execute

Execute a User Registry operation

Synopsis

Execute a User Registry operation

```
apic user-registries:execute [flags]
```

Possible Usages

```
      apic user-registries:execute [flags] --test-config-only USER_REGISTRY_EXECUTE_FILE
      apic user-registries:execute [flags] USER_REGISTRY
```

Options

```
      --format string       Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
      --operation string    Operation to perform on the user registry (get_base_dn_list, validate_password) (required)
  -o, --org string          Organization name or id (required)
      --output string       Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string       management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic user-registries:get

Get the User Registry object by name or id

Synopsis

Get the User Registry object by name or id

```
apic user-registries:get [flags]
```

Possible Usages

```
      apic user-registries:get [flags] USER_REGISTRY
```

Options

```
      --fields string   List of field names to return
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -o, --org string      Organization name or id (required)
      --output string   Write file(s) to directory, use - for STDOUT. (default: cwd)
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic user-registries:list

List the User Registry objects

Synopsis

List the User Registry objects

```
apic user-registries:list [flags]
```

Possible Usages

```
      apic user-registries:list [flags]
```

Options

```
      --fields string   List of field names to return
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
      --limit int32     Maximum number of items to return
      --offset int32    Offset item number from list to begin return
  -o, --org string      Organization name or id (required)
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic user-registries:search

Search for users in the user registry

Synopsis

Search for users in the user registry

```
apic user-registries:search [flags]
```

Possible Usages

```
      apic user-registries:search [flags] USER_REGISTRY USER_SEARCH_FILE
```

Options

```
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
      --limit int32     Maximum number of items to return
      --offset int32    Offset item number from list to begin return
  -o, --org string      Organization name or id (required)
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic user-registries:test-connection

Test a User Registry connection

Synopsis

Test a User Registry connection

```
apic user-registries:test-connection [flags]
```

Possible Usages

```
      apic user-registries:test-connection [flags] --test-config-only USER_REGISTRY_TEST_CONNECTION_FILE
      apic user-registries:test-connection [flags] USER_REGISTRY TEST_CONNECTION_CREDENTIALS_FILE
```

Options

```
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -o, --org string      Organization name or id (required)
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic user-registries:update

Update the User Registry object by name or id

Synopsis

Update the User Registry object by name or id

```
      Fields not allowed:
      - owned
      - registry_type
      - user_registry_managed
      - correlation_data
      - integration_url

      Fields allowed but ignored:
      - id
      - type
      - api_version
      - scope
      - created_at
      - updated_at
      - url
      - org_url
```

```
apic user-registries:update [flags]
```

Possible Usages

```
      apic user-registries:update [flags] USER_REGISTRY USER_REGISTRY_FILE
```

Options

```
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -o, --org string      Organization name or id (required)
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic user-registry-settings

User Registry Settings operations

Synopsis

User Registry Settings operations

```
apic user-registry-settings [flags]
```

Options

```
  -h, --help   Help for user-registry-settings
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic user-registry-settings:get

Get the User Registry Setting object

Synopsis

Get the User Registry Setting object

```
apic user-registry-settings:get [flags]
```

Possible Usages

```
      apic user-registry-settings:get [flags]
```

Options

```
      --fields string   List of field names to return
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
      --output string   Write file(s) to directory, use - for STDOUT. (default: cwd)
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic user-registry-settings:update

Update the User Registry Setting object

Synopsis

Update the User Registry Setting object

```
      Fields allowed but ignored:
      - name
      - type
      - api_version
      - scope
      - created_at
      - updated_at
      - url
```

```
apic user-registry-settings:update [flags]
```

Possible Usages

```
      apic user-registry-settings:update [flags] USER_REGISTRY_SETTING_FILE
```

Options

```
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic users

Users operations

Synopsis

Users operations

```
apic users [flags]
```

Options

```
      --fields string          List of field names to return
      --format string          Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
  -h, --help                   Help for users
      --limit int32            Maximum number of items to return
      --offset int32           Offset item number from list to begin return
  -o, --org string             Organization name or id (required)
      --output string          Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string          management server endpoint (required)
      --user-registry string   User Registry name or id (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic users:clear

Clear the User objects

Synopsis

Clear the User objects

```
apic users:clear [flags]
```

Possible Usages

```
      apic users:clear [flags]
```

Options

```
      --confirm string          Confirmation for critical updates (required)
      --format string           Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
  -o, --org string              Organization name or id (required)
      --output string           Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string           management server endpoint (required)
      --user-registry string    User Registry name or id (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic users:create

Create a User object

Synopsis

Create a User object

```
      Required fields:
      - username

      Fields allowed but ignored:
      - id
      - type
      - api_version
      - scope
      - created_at
      - updated_at
      - url
      - org_url
      - user_registry_url
```

```
apic users:create [flags]
```

Possible Usages

```
      apic users:create [flags] USER_FILE
```

Options

```
      --format string           Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
  -o, --org string              Organization name or id (required)
      --output string           Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string           management server endpoint (required)
      --user-registry string    User Registry name or id (required)
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic users:delete

Delete the User object by name or id

Synopsis

Delete the User object by name or id

```
apic users:delete [flags]
```

Possible Usages

```
      apic users:delete [flags] USER
```

Options

```
      --format string           Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
  -o, --org string              Organization name or id (required)
      --output string           Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string           management server endpoint (required)
      --user-registry string    User Registry name or id (required)
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic users:get

Get the User object by name or id

Synopsis

Get the User object by name or id

```
apic users:get [flags]
```

Possible Usages

```
      apic users:get [flags] USER
```

Options

```
      --fields string           List of field names to return
      --format string           Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
  -o, --org string              Organization name or id (required)
      --output string           Write file(s) to directory, use - for STDOUT. (default: cwd)
  -s, --server string           management server endpoint (required)
      --user-registry string    User Registry name or id (required)
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic users:list

List the User objects

Synopsis

List the User objects

```
apic users:list [flags]
```

Possible Usages

```
apic users:list [flags]
```

Options

```
      --fields string           List of field names to return
      --format string           Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
      --limit int32             Maximum number of items to return
      --offset int32            Offset item number from list to begin return
  -o, --org string              Organization name or id (required)
      --output string           Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string           management server endpoint (required)
      --user-registry string    User Registry name or id (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic users:request-password-reset

Send reset password link

Synopsis

Send reset password link

```
apic users:request-password-reset [flags]
```

Possible Usages

```
apic users:request-password-reset [flags] REQUEST_PASSWORD_RESET_FILE
```

Options

```
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic users:search-provider

Users search-provider operations

Synopsis

Users search-provider operations

```
apic users:search-provider [flags]
```

Possible Usages

```
apic users:search-provider [flags] --scope org USER_SEARCH_FILE
```

Options

```
      --format string   Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help            Help for users:search-provider
      --limit int32     Maximum number of items to return
      --offset int32    Offset item number from list to begin return
  -o, --org string      Organization name or id (required)
      --output string   Write file(s) to directory, instead of STDOUT (default "-")
      --scope string    scope
  -s, --server string   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic users:update

Update the User object by name or id

Synopsis

Update the User object by name or id

```
      Fields not allowed:
      - identity_provider
      - username
      - salt
      - correlation_data
      - force_password_change
      - last_login_at

      Fields allowed but ignored:
      - id
      - type
      - api_version
      - scope
      - created_at
      - updated_at
      - url
      - org_url
      - user_registry_url
```

```
apic users:update [flags]
```

Possible Usages

```
      apic users:update [flags] USER USER_FILE
```

Options

```
      --format string          Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
  -o, --org string             Organization name or id (required)
      --output string          Write file(s) to directory, instead of STDOUT (default "-")
  -s, --server string          management server endpoint (required)
      --user-registry string   User Registry name or id (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic validate

Validate an API or product definition

Synopsis

Validate an API or product definition

```
apic validate [FILE] [flags]
```

Examples

```
Validate an API definition
  $ apic validate routes.yaml
  Validated routes.yaml API definition [routes:1.0]
Validate an API definition without IBM extensions
  $ apic validate --no-extensions routes.yaml
  Validated routes.yaml API definition [routes:1.0]
Validate a product definition and its referenced APIs
  $ apic validate climb-on.yaml
  Validated climb-on.yaml product definition [climb-on:1.0.0]
  Validated routes.yaml API definition [valid:1.0]
Validate a product definition without validating its referenced APIs
  $ apic validate --product-only climb-on.yaml
  Validated climb-on.yaml product definition [climb-on:1.0.0]
```

Options

```
  -h, --help             Help for validate
      --no-extensions    for API definitions, do not validate against IBM Swagger extensions
  -p, --product-only     for products definitions, do not validate referenced APIs
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic version

Get the APIConnect toolkit version

Synopsis

Get the APIConnect toolkit version

```
apic version [flags]
```

Options

```
  -h, --help             Help for version
  -s, --server string    management server endpoint
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic webhooks

Webhooks operations

Synopsis

Webhooks operations

```
apic webhooks [flags]
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --fields string    List of field names to return
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for webhooks
      --limit int32      Maximum number of items to return
      --offset int32     Offset item number from list to begin return
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
      --scope string     scope
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic webhooks:get

Webhooks get operations

Synopsis

Webhooks get operations

```
apic webhooks:get [flags]
```

Possible Usages

```
      apic webhooks:get [flags] --scope cloud WEBHOOK
      apic webhooks:get [flags] --scope catalog WEBHOOK
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --fields string    List of field names to return
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for webhooks:get
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, use - for STDOUT. (default: cwd)
      --scope string     scope
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic webhooks:list

Webhooks list operations

Synopsis

Webhooks list operations

```
apic webhooks:list [flags]
```

Possible Usages

```
      apic webhooks:list [flags] --scope cloud
      apic webhooks:list [flags] --scope catalog
      apic webhooks:list [flags] --scope all
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --fields string    List of field names to return
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for webhooks:list
      --limit int32      Maximum number of items to return
      --offset int32     Offset item number from list to begin return
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
      --scope string     scope
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
```

```
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic webhooks:update

Webhooks update operations

Synopsis

Webhooks update operations

```
apic webhooks:update [flags]
```

Possible Usages

```
      apic webhooks:update [flags] --scope cloud WEBHOOK WEBHOOK_FILE
      apic webhooks:update [flags] --scope catalog WEBHOOK WEBHOOK_FILE
```

Options

```
  -c, --catalog string   Catalog name or id (required)
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for webhooks:update
  -o, --org string       Organization name or id (required)
      --output string    Write file(s) to directory, instead of STDOUT (default "-")
      --scope string     scope
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic wsdl

Introspect WSDL files

Synopsis

Introspect a WSDL file displaying all its services $ apic wsdl WSDL_FILE $ apic wsdl:introspect WSDL_FILE

```
apic wsdl [flags]
```

Options

```
  -h, --help   Help for wsdl
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic wsdl:introspect

Introspect a WSDL file displaying all its services

Synopsis

Introspect a WSDL file displaying all its services

```
apic wsdl:introspect WSDL_FILE [flags]
```

Options

```
  -h, --help   Help for wsdl:introspect
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic

APIConnect toolkit 61bd16316ae32e02b6cd8e72d4b18e02560de16f (Built 2020-09-23T09:51:50Z)

Synopsis

APIConnect toolkit 61bd16316ae32e02b6cd8e72d4b18e02560de16f (Built 2020-09-23T09:51:50Z)

```
apic [flags]
```

Options

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
  -h, --help                  Help for apic
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic api

Api operations

Synopsis

Api operations

```
apic api --mode portaladmin [flags]
```

Options

```
  -c, --catalog string   Name or ID of the catalog that the site belongs to. (required)
      --format string    Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for api
  -o, --org string       Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic api:add-attachment

Add an attachment for the given api.

Synopsis

Add an attachment for a api within the developer portal of the provided org and catalog. A api can hold 10 attachments. The id or name:version of a specific api needs to be provided. e.g. 'id-of-api-called-example-3' or 'example:3.0.0'.

```
apic api:add-attachment --mode portaladmin [flags]
```

Options

```
      --attachment_description string   A description of the attachment to be displayed to users.
      --attachment_name string          The name given to the attachment once it has been uploaded e.g. my-file.txt (required)
  -c, --catalog string                  Name or ID of the catalog that the site belongs to. (required)
      --format string                   Output format. One of [json yaml go-template=... go-template-file=...], defaults to
```

```
yaml.
  -h, --help                            Help for api:add-attachment
  -o, --org string                      Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string                   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic api:add-tag

Add a tag for the given api.

Synopsis

Add a tag for a api within the developer portal of the provided org and catalog. The id or name:version of a specific api needs to be provided. e.g. 'id-of-api-called-example-3' or 'example:3.0.0'.

```
apic api:add-tag --mode portaladmin [flags]
```

Options

```
  -c, --catalog string    Name or ID of the catalog that the site belongs to. (required)
      --format string     Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help              Help for api:add-tag
  -o, --org string        Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string     management server endpoint (required)
      --tag_name string   The tag name e.g. top_level_element/next_level_element (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic api:get

Get a specific api from a developer portal.

Synopsis

Get a specific api from the developer portal of the provided org and catalog. The id or name:version of a specific api needs to be provided. e.g. 'id-of-api-called-example-3' or 'example:3.0.0'.

```
apic api:get --mode portaladmin [flags]
```

Options

```
  -c, --catalog string   Name or ID of the catalog that the site belongs to. (required)
      --format string    Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for api:get
  -o, --org string       Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic api:get-document

Get a specific entire api document from a portal.

Synopsis

Get a specific entire api document from the portal of the provided organization and catalog. The id or name:version of a specific api needs to be provided. For example, 'id-of-api-called-example-3' or 'example:3.0.0'.

```
apic api:get-document --mode portaladmin [flags]
```

Options

```
  -c, --catalog string   Name or ID of the catalog that the site belongs to. (required)
      --format string    Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for api:get-document
  -o, --org string       Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic api:list

Shows a list of apis from a site.

Synopsis

Show a list of apis of the provided org and catalog.

```
apic api:list --mode portaladmin [flags]
```

Options

```
  -c, --catalog string   Name or ID of the catalog that the site belongs to. (required)
      --format string    Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for api:list
  -o, --org string       Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic api:set-icon

Set an icon image for the given api.

Synopsis

Set an icon image for a api within the developer portal of the provided org and catalog. The existing icon will be overwritten. The id or name:version of a specific api needs to be provided. e.g. 'id-of-api-called-example-3' or 'example:3.0.0'.

```
apic api:set-icon --mode portaladmin [flags]
```

Options

```
  -c, --catalog string            Name or ID of the catalog that the site belongs to. (required)
      --format string             Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help                      Help for api:set-icon
      --icon_description string   A description of the icon to be displayed to users. Used as alt text for the image.
(required)
  -o, --org string                Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string             management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
```

```
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic apic-config

Apic Config operations

Synopsis

Apic Config operations

```
apic apic-config --mode portaladmin [flags]
```

Options

```
  -h, --help   Help for apic-config
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic apic-config:get

Get the configuration object that the developer portal holds.

Synopsis

Get the configuration object that the developer portal holds that was sent by APIM.

```
apic apic-config:get --mode portaladmin [flags]
```

Options

```
  -c, --catalog string   Name or ID of the catalog that the site belongs to. (required)
      --format string    Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for apic-config:get
  -o, --org string       Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic application

Application operations

Synopsis

Application operations

```
apic application --mode portaladmin [flags]
```

Options

```
  -c, --catalog string   Name or ID of the catalog that the site belongs to. (required)
      --format string    Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for application
  -o, --org string       Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic application:get

Get a specific application from a developer portal.

Synopsis

Get a specific application from the developer portal of the provided org and catalog. The id of a specific consumer organization needs to be provided.

```
apic application:get --mode portaladmin [flags]
```

Options

```
  -c, --catalog string   Name or ID of the catalog that the site belongs to. (required)
      --format string    Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for application:get
  -o, --org string       Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic application:list

Shows a list of applications from a site.

Synopsis

Show a list of applications of the provided org and catalog.

```
apic application:list --mode portaladmin [flags]
```

Options

```
  -c, --catalog string   Name or ID of the catalog that the site belongs to. (required)
      --format string    Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for application:list
  -o, --org string       Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic backups

Backups operations

Synopsis

Backups operations

```
apic backups --mode portaladmin [flags]
```

Options

```
      --format string               Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help                        Help for backups
```

```
      --portal_service_name string   The name of the portal service (required)
  -s, --server string                management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic backups:list

List the backups present on the remote backup server.

Synopsis

Lists all the backups that are currently present on the remote backup server, if one has been set.

```
apic backups:list --mode portaladmin [flags]
```

Options

```
      --format string                Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help                         Help for backups:list
      --portal_service_name string   The name of the portal service (required)
  -s, --server string                management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic config

Manage configuration variables

Synopsis

Manage configuration variables

```
apic config --mode portaladmin [flags]
```

Options

```
  -g, --global   list the global configuration variables
  -h, --help     Help for config
  -l, --local    list the local application configuration variables
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic config:clear

Delete all configuration variables

Synopsis

Delete all configuration variables

```
apic config:clear --mode portaladmin [flags]
```

Examples

```
$ apic config:clear --mode consumer
Deleted config catalog
Deleted config org
Deleted config space

$ apic config:clear --global --mode consumer
Deleted config catalog
```

Options

```
  -g, --global   list the global configuration variables
  -h, --help     Help for config:clear
  -l, --local    list the local application configuration variables
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic config:delete

Delete a configuration variable

Synopsis

Configuration variables:

catalog The catalog configuration variable should be set to the URI of an API Connect catalog. The value of the catalog provides the default identity of a catalog for all the commands that are used to manage aspects of a catalog. The default values defined by the catalog's URI can be overridden using the --server, --organization, and --catalog command line options. The catalog URI has the form: https://MANAGEMENT_SERVER/consumer-api/catalogs/CONSUMER_ORG_NAME/CATALOG_NAME

org The default value of org defined by the app's or catalog's URI can be set using the org URI. The org URI has the form: https://MANAGEMENT_SERVER/consumer-api/orgs/CONSUMER_ORG_NAME

space The space configuration variable should be set to the URI of an API Connect space. The value of the space provides the default identity of a space for all the commands that are used to manage aspects of a space. The default values defined by the spaces's URI can be overridden using the --server, --organization, --catalog, and --space command line options. The space URI has the form: https://MANAGEMENT_SERVER/consumer-api/spaces/CONSUMER_ORG_NAME/CATALOG_NAME/SPACE_NAME

cloud The cloud configuration variable should be set to the management server URI. The value of the cloud variable provides default server URI for cloud admin commands. It can be overridden using the --server and --mode command line options. The cloud URI has the form: https://MANAGEMENT_SERVER/consumer-api/

mode The value of mode configruation variable defines the toolkit operation mode. It can be overridden using the --mode command line option. The value can be set to apim or consumer

template-path List of places to look for handlebar templates

template-default-api Defines the default api template

template-default-product Defines the default product template

```
apic config:delete NAME... --mode portaladmin [flags]
```

Examples

```
$ apic config:delete catalog --mode consumer
Deleted config catalog

$ apic config:delete org --mode consumer
Deleted config org
```

Options

```
  -g, --global   list the global configuration variables
  -h, --help     Help for config:delete
  -l, --local    list the local application configuration variables
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic config:get

Get a configuration variable

Synopsis

Configuration variables:

catalog The catalog configuration variable should be set to the URI of an API Connect catalog. The value of the catalog provides the default identity of a catalog for all the commands that are used to manage aspects of a catalog. The default values defined by the catalog's URI can be overridden using the --server, --organization, and --catalog command line options. The catalog URI has the form: https://MANAGEMENT_SERVER/consumer-api/catalogs/CONSUMER_ORG_NAME/CATALOG_NAME

org The default value of org defined by the app's or catalog's URI can be set using the org URI. The org URI has the form: https://MANAGEMENT_SERVER/consumer-api/orgs/CONSUMER_ORG_NAME

space The space configuration variable should be set to the URI of an API Connect space. The value of the space provides the default identity of a space for all the commands that are used to manage aspects of a space. The default values defined by the spaces's URI can be overridden using the --server, --organization, --catalog, and --space command line options. The space URI has the form: https://MANAGEMENT_SERVER/consumer-api/spaces/CONSUMER_ORG_NAME/CATALOG_NAME/SPACE_NAME

cloud The cloud configuration variable should be set to the management server URI. The value of the cloud variable provides default server URI for cloud admin commands. It can be overridden using the --server and --mode command line options. The cloud URI has the form: https://MANAGEMENT_SERVER/consumer-api/

mode The value of mode configruation variable defines the toolkit operation mode. It can be overridden using the --mode command line option. The value can be set to apim or consumer

template-path List of places to look for handlebar templates

template-default-api Defines the default api template

template-default-product Defines the default product template

```
apic config:get NAME --mode portaladmin [flags]
```

Examples

```
$ apic config:get catalog --mode consumer
catalog: https://mgmnthost.com/consumer-api/catalogs/climbon/sb

$ apic config:get org --mode consumer
org: https://mgmnthost.com/consumer-api/orgs/climbon
```

Options

```
  -g, --global   list the global configuration variables
  -h, --help     Help for config:get
  -l, --local    list the local application configuration variables
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic config:list

List the application and global configuration variables

Synopsis

Configuration variables:

catalog The catalog configuration variable should be set to the URI of an API Connect catalog. The value of the catalog provides the default identity of a catalog for all the commands that are used to manage aspects of a catalog. The default values defined by the catalog's URI can be overridden using the --server, --organization, and --catalog command line options. The catalog URI has the form: https://MANAGEMENT_SERVER/consumer-api/catalogs/CONSUMER_ORG_NAME/CATALOG_NAME

org The default value of org defined by the app's or catalog's URI can be set using the org URI. The org URI has the form: https://MANAGEMENT_SERVER/consumer-api/orgs/CONSUMER_ORG_NAME

space The space configuration variable should be set to the URI of an API Connect space. The value of the space provides the default identity of a space for all the commands that are used to manage aspects of a space. The default values defined by the spaces's URI can be overridden using the --server, --organization, --catalog, and --space command line options. The space URI has the form: https://MANAGEMENT_SERVER/consumer-api/spaces/CONSUMER_ORG_NAME/CATALOG_NAME/SPACE_NAME

cloud The cloud configuration variable should be set to the management server URI. The value of the cloud variable provides default server URI for cloud admin commands. It can be overridden using the --server and --mode command line options. The cloud URI has the form: https://MANAGEMENT_SERVER/consumer-api/

mode The value of mode configruation variable defines the toolkit operation mode. It can be overridden using the --mode command line option. The value can be set to apim or consumer

template-path List of places to look for handlebar templates

template-default-api Defines the default api template

template-default-product Defines the default product template

```
apic config:list --mode portaladmin [flags]
```

Examples

```
$ apic config --mode consumer
catalog: https://mgmnthost.com/consumer-api/catalogs/climbon/sb
org: https://mgmnthost.com/consumer-api/orgs/climbon

$ apic config --global --mode consumer
catalog: https://mgmnthost.com/consumer-api/catalogs/climbon/sb
```

Options

```
  -g, --global   list the global configuration variables
  -h, --help     Help for config:list
  -l, --local    list the local application configuration variables
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic config:set

Set or update configuration variables

Synopsis

Configuration variables:

catalog The catalog configuration variable should be set to the URI of an API Connect catalog. The value of the catalog provides the default identity of a catalog for all the commands that are used to manage aspects of a catalog. The default values defined by the catalog's URI can be overridden using the --server, --organization, and --catalog command line options. The catalog URI has the form: https://MANAGEMENT_SERVER/consumer-api/catalogs/CONSUMER_ORG_NAME/CATALOG_NAME

org The default value of org defined by the app's or catalog's URI can be set using the org URI. The org URI has the form: https://MANAGEMENT_SERVER/consumer-api/orgs/CONSUMER_ORG_NAME

space The space configuration variable should be set to the URI of an API Connect space. The value of the space provides the default identity of a space for all the commands that are used to manage aspects of a space. The default values defined by the spaces's URI can be overridden using the --server, --organization, --catalog, and --space command line options. The space URI has the form: https://MANAGEMENT_SERVER/consumer-api/spaces/CONSUMER_ORG_NAME/CATALOG_NAME/SPACE_NAME

cloud The cloud configuration variable should be set to the management server URI. The value of the cloud variable provides default server URI for cloud admin commands. It can be overridden using the --server and --mode command line options. The cloud URI has the form: https://MANAGEMENT_SERVER/consumer-api/

mode The value of mode configruation variable defines the toolkit operation mode. It can be overridden using the --mode command line option. The value can be set to apim or consumer

template-path List of places to look for handlebar templates

template-default-api Defines the default api template

template-default-product Defines the default product template

```
apic config:set NAME=VALUE ... --mode portaladmin [flags]
```

Examples

```
$ apic config:set --mode consumer catalog=https://mgmnthost.com/consumer-api/catalogs/climbon/sb
catalog: https://mgmnthost.com/consumer-api/catalogs/climbon/sb

$ apic config:set --mode consumer org=https://mgmnthost2.com/consumer-api/orgs/hikeon
org: https://mgmnthost2.com/consumer-api/orgs/hikeon
```

Options

```
  -g, --global   list the global configuration variables
  -h, --help     Help for config:set
  -l, --local    list the local application configuration variables
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic consumer-org

Consumer Org operations

Synopsis

Consumer Org operations

```
apic consumer-org --mode portaladmin [flags]
```

Options

```
  -c, --catalog string   Name or ID of the catalog that the site belongs to. (required)
      --format string    Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for consumer-org
  -o, --org string       Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic consumer-org:get

Get a specific consumer org from a developer portal.

Synopsis

Get a specific consumer org from the developer portal of the provided org and catalog. The id of a specific consumer organization needs to be provided.

```
apic consumer-org:get --mode portaladmin [flags]
```

Options

```
  -c, --catalog string   Name or ID of the catalog that the site belongs to. (required)
      --format string    Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for consumer-org:get
  -o, --org string       Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic consumer-org:list

Shows a list of consumer orgs from a site.

Synopsis

Show a list of consumer orgs of the provided org and catalog.

```
apic consumer-org:list --mode portaladmin [flags]
```

Options

```
  -c, --catalog string   Name or ID of the catalog that the site belongs to. (required)
      --format string    Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for consumer-org:list
  -o, --org string       Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic content

Content operations

Synopsis

Content operations

```
apic content --mode portaladmin [flags]
```

Options

```
      --bundle string        The bundle type for a given entity type. E.g. "page" for the "node" entity type.
  -c, --catalog string       Name or ID of the catalog that the site belongs to. (required)
      --entity_type string   Type of entity you want to perform this operation on. To find out entity/content types see the
content list-types route. (required)
      --format string        Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
  -h, --help                 Help for content
  -o, --org string           Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string        management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic content:create-export

Create a task that exports a tgz containing the site content.

Synopsis

Creates a task that exports a tgz containing the site content. You can export specific entity types and specific ids or you can generate a tar containing all content. Depending on your site's content please be advised that an export all can take a long time to complete. If called via the toolkit CLI, it will automatically poll the response every 30 seconds up to 25 minutes.

```
apic content:create-export --mode portaladmin [flags]
```

Options

```
  -c, --catalog string       Name or ID of the catalog that the site belongs to. (required)
      --entity_ids string    A comma separated list of entity ids.
      --entity_type string   Type of entity you want to perform this operation on. To find out entity/content types see the
content list-types route. (required)
      --format string        Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
  -h, --help                 Help for content:create-export
      --no-poll              Do not poll the created task and just return the task ID
  -o, --org string           Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string        management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic content:create-import

Create a task that imports an archive of site content.

Synopsis

Creates a task that imports an archive of site content. The status of this task can be tracked with the /content/TASK_ID/status route. Depending on your site's content please be advised that an import can take a long time to complete. If called via the toolkit CLI, it will automatically poll the response every 30 seconds up to 25 minutes.

```
apic content:create-import --mode portaladmin [flags]
```

Options

```
  -c, --catalog string   Name or ID of the catalog that the site belongs to. (required)
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for content:create-import
      --no-poll          Do not poll the created task and just return the task ID
  -o, --org string       Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic content:delete-export

If running, cancels a content export task.

Synopsis

Cancels any currently running content export tasks, and deletes any related artifacts that have been generated.

```
apic content:delete-export --mode portaladmin [flags]
```

Options

```
  -c, --catalog string   Name or ID of the catalog that the site belongs to. (required)
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for content:delete-export
  -o, --org string       Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string    management server endpoint (required)
      --task_id string   ID of the task created on the queue. (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic content:delete-import

If running, cancels a content import task.

Synopsis

Cancels any currently running content import tasks, and deletes any related artifacts that have been generated.

```
apic content:delete-import --mode portaladmin [flags]
```

Options

```
  -c, --catalog string   Name or ID of the catalog that the site belongs to. (required)
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for content:delete-import
  -o, --org string       Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string    management server endpoint (required)
      --task_id string   ID of the task created on the queue. (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic content:get-export-status

Returns information about the status of this task.

Synopsis

Returns information related to the task id that is provided in the arguments.

```
apic content:get-export-status --mode portaladmin [flags]
```

Options

```
  -c, --catalog string   Name or ID of the catalog that the site belongs to. (required)
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for content:get-export-status
  -o, --org string       Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string    management server endpoint (required)
      --task_id string   ID of the task created on the queue. (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic content:get-export

When ready, streams a content export artifact.

Synopsis

When ready, streams a content export artifact back to the related task id that is provided in the arguments.

```
apic content:get-export --mode portaladmin [flags]
```

Options

```
  -c, --catalog string   Name or ID of the catalog that the site belongs to. (required)
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for content:get-export
  -o, --org string       Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string    management server endpoint (required)
      --task_id string   ID of the task created on the queue. (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic content:get-import-status

Returns information about the status of this task.

Synopsis

Returns information related to the task id that is provided in the arguments.

```
apic content:get-import-status --mode portaladmin [flags]
```

Options

```
  -c, --catalog string   Name or ID of the catalog that the site belongs to. (required)
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for content:get-import-status
  -o, --org string       Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string    management server endpoint (required)
      --task_id string   ID of the task created on the queue. (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic content:list

Lists all of the entities in your site for the given entity type and bundle.

Synopsis

Lists all of the entities in your site for the given entity type and bundle.

```
apic content:list --mode portaladmin [flags]
```

Options

```
      --bundle string        The bundle type for a given entity type. E.g. "page" for the "node" entity type.
  -c, --catalog string       Name or ID of the catalog that the site belongs to. (required)
      --entity_type string   Type of entity you want to perform this operation on. To find out entity/content types see the
content list-types route. (required)
      --format string        Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to
yaml.
  -h, --help                 Help for content:list
  -o, --org string           Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string        management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic content:list-types

Lists the exportable content types on your site.

Synopsis

Lists the content types that are exportable from your site.

```
apic content:list-types --mode portaladmin [flags]
```

Options

```
  -c, --catalog string   Name or ID of the catalog that the site belongs to. (required)
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for content:list-types
  -o, --org string       Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license   Accept the license for API Connect
      --debug            Enable debug output
```

```
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic custom-module

Custom Module operations

Synopsis

Custom Module operations

```
apic custom-module --mode portaladmin [flags]
```

Options

```
  -h, --help   Help for custom-module
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic custom-module:create-export

Create a task that exports an archive that contains the custom modules of a site.

Synopsis

You can create a task to export an archive of the custom modules of a site. You can then use that archive to quickly and simply override the custom modules on another site.

```
apic custom-module:create-export --mode portaladmin [flags]
```

Options

```
  -c, --catalog string   Name or ID of the catalog that the site belongs to. (required)
      --format string    Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for custom-module:create-export
      --no-poll          Do not poll the created task and just return the task ID
  -o, --org string       Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic custom-module:create-import

Create a task that imports an archive that contains the custom modules of a site.

Synopsis

You can create a task to import an archive of the custom modules of a site. You can use the imported archive to quickly and simply override the custom modules for the specified site.

```
apic custom-module:create-import --mode portaladmin [flags]
```

Options

```
  -c, --catalog string   Name or ID of the catalog that the site belongs to. (required)
      --format string    Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for custom-module:create-import
      --no-poll          Do not poll the created task and just return the task ID
```

```
  -o, --org string       Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic custom-module:delete-export

If running, cancels a custom module export task.

Synopsis

If running, cancels the custom module export task and deletes any related artifacts that have been generated.

```
apic custom-module:delete-export --mode portaladmin [flags]
```

Options

```
  -c, --catalog string   Name or ID of the catalog that the site belongs to. (required)
      --format string    Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for custom-module:delete-export
  -o, --org string       Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string    management server endpoint (required)
      --task_id string   ID of the task created on the queue. (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic custom-module:delete-import

If running, cancels a custom module import task.

Synopsis

If running, cancels the custom module import task and deletes any related artifacts that have been generated.

```
apic custom-module:delete-import --mode portaladmin [flags]
```

Options

```
  -c, --catalog string   Name or ID of the catalog that the site belongs to. (required)
      --format string    Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for custom-module:delete-import
  -o, --org string       Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string    management server endpoint (required)
      --task_id string   ID of the task created on the queue. (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic custom-module:get-export

When ready, streams a custom module export artifact.

Synopsis

When ready, streams a custom module export artifact back to the related task id that is provided in the arguments.

```
apic custom-module:get-export --mode portaladmin [flags]
```

Options

```
  -c, --catalog string   Name or ID of the catalog that the site belongs to. (required)
      --format string    Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for custom-module:get-export
  -o, --org string       Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string    management server endpoint (required)
      --task_id string   ID of the task created on the queue. (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic custom-module:get-export-status

Returns information about the status of this task.

Synopsis

Returns information related to the task id that is provided in the arguments.

```
apic custom-module:get-export-status --mode portaladmin [flags]
```

Options

```
  -c, --catalog string   Name or ID of the catalog that the site belongs to. (required)
      --format string    Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for custom-module:get-export-status
  -o, --org string       Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string    management server endpoint (required)
      --task_id string   ID of the task created on the queue. (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic custom-module:get-import-status

Get the result of the custom module import task.

Synopsis

Get the result of the custom module import task. If the import task has completed on the portal system, this command returns the result of the command. If the import task has not completed on the portal system, it returns the current status of the task.

```
apic custom-module:get-import-status --mode portaladmin [flags]
```

Options

```
  -c, --catalog string   Name or ID of the catalog that the site belongs to. (required)
      --format string    Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for custom-module:get-import-status
  -o, --org string       Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string    management server endpoint (required)
      --task_id string   ID of the task created on the queue. (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic custom-theme

Custom Theme operations

Synopsis

Custom Theme operations

```
apic custom-theme --mode portaladmin [flags]
```

Options

```
  -h, --help   Help for custom-theme
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic custom-theme:create-export

Create a task that exports an archive that contains the custom themes of a site.

Synopsis

You can create a task to export an archive of the custom themes of a site. You can then use that archive to quickly and simply override the custom themes on another site.

```
apic custom-theme:create-export --mode portaladmin [flags]
```

Options

```
  -c, --catalog string   Name or ID of the catalog that the site belongs to. (required)
      --format string    Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for custom-theme:create-export
      --no-poll          Do not poll the created task and just return the task ID
  -o, --org string       Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic custom-theme:create-import

Create a task that imports an archive that contains the custom themes of a site.

Synopsis

You can create a task to import an archive of the custom themes of a site. You can use the imported archive to quickly and simply override the custom themes for the specified site.

```
apic custom-theme:create-import --mode portaladmin [flags]
```

Options

```
  -c, --catalog string   Name or ID of the catalog that the site belongs to. (required)
      --format string    Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for custom-theme:create-import
      --no-poll          Do not poll the created task and just return the task ID
  -o, --org string       Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic custom-theme:delete-export

If running, cancels a custom theme export task.

Synopsis

If running, cancels the custom theme export task and deletes any related artifacts that have been generated. This does not delete any custom themes.

```
apic custom-theme:delete-export --mode portaladmin [flags]
```

Options

```
  -c, --catalog string   Name or ID of the catalog that the site belongs to. (required)
      --format string    Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for custom-theme:delete-export
  -o, --org string       Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string    management server endpoint (required)
      --task_id string   ID of the task created on the queue. (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic custom-theme:delete-import

Cancels a running custom theme import task.

Synopsis

Cancels the custom theme import task and deletes any generated artifacts.

```
apic custom-theme:delete-import --mode portaladmin [flags]
```

Options

```
  -c, --catalog string   Name or ID of the catalog that the site belongs to. (required)
      --format string    Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for custom-theme:delete-import
  -o, --org string       Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string    management server endpoint (required)
      --task_id string   ID of the task created on the queue. (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic custom-theme:get-export

When ready, streams a custom theme export artifact.

Synopsis

When ready, streams a custom theme export artifact back to the related task id that is provided in the arguments.

```
apic custom-theme:get-export --mode portaladmin [flags]
```

Options

```
  -c, --catalog string   Name or ID of the catalog that the site belongs to. (required)
      --format string    Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for custom-theme:get-export
  -o, --org string       Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string    management server endpoint (required)
      --task_id string   ID of the task created on the queue. (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic custom-theme:get-export-status

Returns information about the status of this task.

Synopsis

Returns information related to the task id that is provided in the arguments.

```
apic custom-theme:get-export-status --mode portaladmin [flags]
```

Options

```
  -c, --catalog string   Name or ID of the catalog that the site belongs to. (required)
      --format string    Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for custom-theme:get-export-status
  -o, --org string       Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string    management server endpoint (required)
      --task_id string   ID of the task created on the queue. (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic custom-theme:get-import-status

Get the result of the custom theme import task.

Synopsis

Get the result of the custom theme import task. If the import task has completed on the portal system, this command returns the result of the command. If the import task has not completed on the portal system, it returns the current status of the task.

```
apic custom-theme:get-import-status --mode portaladmin [flags]
```

Options

```
  -c, --catalog string   Name or ID of the catalog that the site belongs to. (required)
      --format string    Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for custom-theme:get-import-status
  -o, --org string       Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string    management server endpoint (required)
      --task_id string   ID of the task created on the queue. (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic custom-translation

Custom Translation operations

Synopsis

Custom Translation operations

```
apic custom-translation --mode portaladmin [flags]
```

Options

```
  -h, --help   Help for custom-translation
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic custom-translation:create-export

Create a task that exports an archive that contains the custom translation of a site.

Synopsis

You can create a task to export an archive of the custom translation of a site. You can then use that archive to quickly and simply override the custom translations on another site.

```
apic custom-translation:create-export --mode portaladmin [flags]
```

Options

```
  -c, --catalog string     Name or ID of the catalog that the site belongs to. (required)
      --format string      Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help               Help for custom-translation:create-export
      --langcodes string   A comma separated list of language codes e.g. "es,zh-hans"
      --no-poll            Do not poll the created task and just return the task ID
  -o, --org string         Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string      management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic custom-translation:create-import

Create a task that imports an archive that contains the custom translations of a site.

Synopsis

You can create a task to import an archive of the custom translations of a site. You can use the imported archive to simply override the custom translations for the specified site. This command may take several minutes to complete.

```
apic custom-translation:create-import --mode portaladmin [flags]
```

Options

```
  -c, --catalog string   Name or ID of the catalog that the site belongs to. (required)
      --format string    Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for custom-translation:create-import
      --no-poll          Do not poll the created task and just return the task ID
  -o, --org string       Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic custom-translation:delete-export

If running, cancels a custom translation export task.

Synopsis

If running, cancels the custom translation export task and deletes any related artifacts that have been generated. This does not delete any custom translations.

```
apic custom-translation:delete-export --mode portaladmin [flags]
```

Options

```
  -c, --catalog string   Name or ID of the catalog that the site belongs to. (required)
      --format string    Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for custom-translation:delete-export
  -o, --org string       Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string    management server endpoint (required)
      --task_id string   ID of the task created on the queue. (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic custom-translation:delete-import

If running, cancels a custom translation import task.

Synopsis

If running, cancels the custom translation import task and deletes any related artifacts that have been generated. This does not delete any custom translations.

```
apic custom-translation:delete-import --mode portaladmin [flags]
```

Options

```
  -c, --catalog string   Name or ID of the catalog that the site belongs to. (required)
      --format string    Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for custom-translation:delete-import
  -o, --org string       Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string    management server endpoint (required)
      --task_id string   ID of the task created on the queue. (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic custom-translation:get-export

When ready, streams a custom translation export artifact.

Synopsis

When ready, streams a custom translation export artifact back to the related task id that is provided in the arguments.

```
apic custom-translation:get-export --mode portaladmin [flags]
```

Options

```
  -c, --catalog string   Name or ID of the catalog that the site belongs to. (required)
      --format string    Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for custom-translation:get-export
  -o, --org string       Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string    management server endpoint (required)
      --task_id string   ID of the task created on the queue. (required)
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic custom-translation:get-export-status

Returns information about the status of this task.

Synopsis

Returns information related to the task id that is provided in the arguments.

```
apic custom-translation:get-export-status --mode portaladmin [flags]
```

Options

```
  -c, --catalog string    Name or ID of the catalog that the site belongs to. (required)
      --format string     Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help              Help for custom-translation:get-export-status
  -o, --org string        Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string     management server endpoint (required)
      --task_id string    ID of the task created on the queue. (required)
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic custom-translation:get-import-status

Get the result of the custom translation import task.

Synopsis

Get the result of the custom translation import task. If the import task has completed on the portal system, this command returns the result of the command. If the import task has not completed on the portal system, it returns the current status of the task.

```
apic custom-translation:get-import-status --mode portaladmin [flags]
```

Options

```
  -c, --catalog string    Name or ID of the catalog that the site belongs to. (required)
      --format string     Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help              Help for custom-translation:get-import-status
  -o, --org string        Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string     management server endpoint (required)
      --task_id string    ID of the task created on the queue. (required)
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic custom-webserver-page

Custom Web Server Page operations

Synopsis

Custom Web Server Page operations

```
apic custom-webserver-page --mode portaladmin [flags]
```

Options

```
  -h, --help   Help for custom-webserver-page
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic custom-webserver-page:delete

Delete the custom HTML for a web server page.

Synopsis

Delete the custom web server HTML content of a specific web server page (index, 404, 40x, 50x). (Will fallback to a default.)

```
apic custom-webserver-page:delete --mode portaladmin [flags]
```

Options

```
      --format string                Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help                         Help for custom-webserver-page:delete
      --page_type string             The page type you want to run this command against. Values: index, 404, 40x, 50x
(required)
      --portal_service_name string   The name of the portal service (required)
  -s, --server string                management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic custom-webserver-page:get

Get the HTML for a web server page.

Synopsis

Get the web server HTML content of a specific web server page (index, 404, 40x, 50x).

```
apic custom-webserver-page:get --mode portaladmin [flags]
```

Options

```
      --format string                Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help                         Help for custom-webserver-page:get
      --page_type string             The page type you want to run this command against. Values: index, 404, 40x, 50x
(required)
      --portal_service_name string   The name of the portal service (required)
  -s, --server string                management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic custom-webserver-page:set

Set a custom HTML page for a web server page type.

Synopsis

Set the custom web server HTML content of a specific web server page (index, 404, 40x, 50x). Maximum size of 8 MB.

```
apic custom-webserver-page:set --mode portaladmin [flags]
```

Options

```
      --format string                Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help                         Help for custom-webserver-page:set
      --page_type string             The page type you want to run this command against. Values: index, 404, 40x, 50x
(required)
      --portal_service_name string   The name of the portal service (required)
  -s, --server string                management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic drupal-config

Drupal Config operations

Synopsis

Drupal Config operations

```
apic drupal-config --mode portaladmin [flags]
```

Options

```
  -c, --catalog string   Name or ID of the catalog that the site belongs to. (required)
      --format string    Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for drupal-config
  -o, --org string       Name or ID of the organization that the catalog belongs to. (required)
      --prefix string    The config prefix. For example, "system". No prefix will return all names in the system.
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic drupal-config:delete

Delete the Config object.

Synopsis

Delete the Config object or a specific config key.

```
apic drupal-config:delete --mode portaladmin [flags]
```

Options

```
  -c, --catalog string        Name or ID of the catalog that the site belongs to. (required)
      --config_name string    The config object name, for example "system.site". (required)
      --format string         Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help                  Help for drupal-config:delete
      --config_key string     A config key, for example "page.front".
  -o, --org string            Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string         management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic drupal-config:get

Get the Config object

Synopsis

Get the Config object or a specific config key value.

```
apic drupal-config:get --mode portaladmin [flags]
```

Options

```
  -c, --catalog string       Name or ID of the catalog that the site belongs to. (required)
      --config_key string    A config key, for example "page.front".
      --config_name string   The config object name, for example "system.site". (required)
      --format string        Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help                 Help for drupal-config:get
  -o, --org string           Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string        management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license       Accept the license for API Connect
      --debug                Enable debug output
      --debug-output string  Write debug output to file
      --live-help            Enable or disable tracking of limited usage information
  -m, --mode string          Toolkit operation mode (default "apim")
```

apic drupal-config:list

List the config names by prefix

Synopsis

List the config names by prefix or provide no prefix to see all.

```
apic drupal-config:list --mode portaladmin [flags]
```

Options

```
  -c, --catalog string   Name or ID of the catalog that the site belongs to. (required)
      --format string    Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for drupal-config:list
  -o, --org string       Name or ID of the organization that the catalog belongs to. (required)
      --prefix string    The config prefix. For example, "system". No prefix will return all names in the system.
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license       Accept the license for API Connect
      --debug                Enable debug output
      --debug-output string  Write debug output to file
      --live-help            Enable or disable tracking of limited usage information
  -m, --mode string          Toolkit operation mode (default "apim")
```

apic drupal-config:set

Set a config value.

Synopsis

Can set a new config value or update an already existing key-value.

```
apic drupal-config:set --mode portaladmin [flags]
```

Options

```
  -c, --catalog string        Name or ID of the catalog that the site belongs to. (required)
      --config_key string     A config key, for example "page.front". (required)
      --config_name string    The config object name, for example "system.site". (required)
      --config_value string   The value to assign to the config key. (required)
      --format string         Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help                  Help for drupal-config:set
```

```
  -o, --org string            Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string         management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic drupal-state

Drupal State operations

Synopsis

Drupal State operations

```
apic drupal-state --mode portaladmin [flags]
```

Options

```
  -h, --help   Help for drupal-state
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic drupal-state:delete

Delete the State key.

Synopsis

Delete the specific state key.

```
apic drupal-state:delete --mode portaladmin [flags]
```

Options

```
  -c, --catalog string     Name or ID of the catalog that the site belongs to. (required)
      --format string      Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help               Help for drupal-state:delete
  -o, --org string         Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string      management server endpoint (required)
      --state_key string   The state key, for example "system.cron_last". (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic drupal-state:get

Get the State key

Synopsis

Get the State key value.

```
apic drupal-state:get --mode portaladmin [flags]
```

Options

```
  -c, --catalog string     Name or ID of the catalog that the site belongs to. (required)
      --format string      Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help               Help for drupal-state:get
  -o, --org string         Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string      management server endpoint (required)
      --state_key string   The state key, for example "system.cron_last". (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic drupal-state:set

Set a state key value.

Synopsis

Can set a new state value or update an already existing key-value.

```
apic drupal-state:set --mode portaladmin [flags]
```

Options

```
  -c, --catalog string         Name or ID of the catalog that the site belongs to. (required)
      --format string          Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help                   Help for drupal-state:set
      --input_format string    The input format of the value for the state key. Values: string, integer, float, boolean, json,
yaml. [default: auto]
  -o, --org string             Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string          management server endpoint (required)
      --state_key string       The state key, for example "system.cron_last". (required)
      --state_value string     The value to assign to the state key. (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic drupal-state

Drupal State operations

Synopsis

Drupal State operations

```
apic drupal-state --mode portaladmin [flags]
```

Options

```
  -h, --help   Help for drupal-state
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic drupal-state:delete

Delete the State key.

Synopsis

Delete the specific state key.

```
apic drupal-state:delete --mode portaladmin [flags]
```

Options

```
  -c, --catalog string     Name or ID of the catalog that the site belongs to. (required)
      --format string      Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help               Help for drupal-state:delete
  -o, --org string         Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string      management server endpoint (required)
      --state_key string   The state key, for example "system.cron_last". (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic drupal-state:get

Get the State key

Synopsis

Get the State key value.

```
apic drupal-state:get --mode portaladmin [flags]
```

Options

```
  -c, --catalog string     Name or ID of the catalog that the site belongs to. (required)
      --format string      Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help               Help for drupal-state:get
  -o, --org string         Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string      management server endpoint (required)
      --state_key string   The state key, for example "system.cron_last". (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic drupal-state:set

Set a state key value.

Synopsis

Can set a new state value or update an already existing key-value.

```
apic drupal-state:set --mode portaladmin [flags]
```

Options

```
  -c, --catalog string         Name or ID of the catalog that the site belongs to. (required)
      --format string          Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help                   Help for drupal-state:set
      --input_format string    The input format of the value for the state key. Values: string, integer, float, boolean, json,
yaml. [default: auto]
  -o, --org string             Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string          management server endpoint (required)
      --state_key string       The state key, for example "system.cron_last". (required)
      --state_value string     The value to assign to the state key. (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
```

```
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic entity

Entity operations

Synopsis

Entity operations

```
apic entity --mode portaladmin [flags]
```

Options

```
  -h, --help   Help for entity
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic entity:count

Shows a count of entities from a site.

Synopsis

Show a count of entities of the provided org and catalog.

```
apic entity:count --mode portaladmin [flags]
```

Options

```
  -c, --catalog string   Name or ID of the catalog that the site belongs to. (required)
      --format string    Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for entity:count
  -o, --org string       Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic export-entity

Export Entity operations

Synopsis

Export Entity operations

```
apic export-entity --mode portaladmin [flags]
```

Options

```
  -c, --catalog string   Name or ID of the catalog that the site belongs to. (required)
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for export-entity
  -o, --org string       Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic export-entity:add-content

Add content to an export entity

Synopsis

Add content to an existing export entity. Provide the content type and IDs that you wish to add to this export entity.

```
apic export-entity:add-content --mode portaladmin [flags]
```

Options

```
  -c, --catalog string             Name or ID of the catalog that the site belongs to. (required)
      --entity_ids string          A comma separated list of entity ids.
      --entity_type string         Type of entity you want to perform this operation on. To find out entity/content types see
the content list-types route. (required)
      --export_entity_id string    ID of the export entity (required)
      --format string              Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults
to yaml.
  -h, --help                       Help for export-entity:add-content
  -o, --org string                 Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string              management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic export-entity:create

Create an export entity

Synopsis

Create a new export entity. This export entity can be populated with content which can subsequently be exported.

```
apic export-entity:create --mode portaladmin [flags]
```

Options

```
  -c, --catalog string              Name or ID of the catalog that the site belongs to. (required)
      --export_entity_name string   name of the export entity
      --format string               Output format. One of [json yaml octet-stream go-template=... go-template-file=...],
defaults to yaml.
  -h, --help                        Help for export-entity:create
  -o, --org string                  Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string               management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic export-entity:delete-launch-export

If running, cancels a export entity launch export task.

Synopsis

If running, cancels a export entity launch export task and deletes any related artifacts that have been generated.

```
apic export-entity:delete-launch-export --mode portaladmin [flags]
```

Options

```
  -c, --catalog string   Name or ID of the catalog that the site belongs to. (required)
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for export-entity:delete-launch-export
  -o, --org string       Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string    management server endpoint (required)
      --task_id string   ID of the task created on the queue. (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic export-entity:delete

Delete an export entity

Synopsis

Delete an export entity by its ID.

```
apic export-entity:delete --mode portaladmin [flags]
```

Options

```
  -c, --catalog string            Name or ID of the catalog that the site belongs to. (required)
      --export_entity_id string   ID of the export entity (required)
      --format string             Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults
to yaml.
  -h, --help                      Help for export-entity:delete
  -o, --org string                Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string             management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic export-entity:get-launch-export-status

Returns information about the status of this task.

Synopsis

Returns information related to the task id that is provided in the arguments.

```
apic export-entity:get-launch-export-status --mode portaladmin [flags]
```

Options

```
  -c, --catalog string   Name or ID of the catalog that the site belongs to. (required)
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for export-entity:get-launch-export-status
  -o, --org string       Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string    management server endpoint (required)
      --task_id string   ID of the task created on the queue. (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic export-entity:get-launch-export

When ready, streams a content export artifact generated from an export entity.

Synopsis

When ready, streams a content export artifact generated from an export entity back to the related task id that is provided in the arguments.

```
apic export-entity:get-launch-export --mode portaladmin [flags]
```

Options

```
  -c, --catalog string   Name or ID of the catalog that the site belongs to. (required)
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for export-entity:get-launch-export
  -o, --org string       Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string    management server endpoint (required)
      --task_id string   ID of the task created on the queue. (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic export-entity:get

Get an export entity

Synopsis

Get an export entity by its ID, which will list the content that will be exported as part of this export entity.

```
apic export-entity:get --mode portaladmin [flags]
```

Options

```
  -c, --catalog string            Name or ID of the catalog that the site belongs to. (required)
      --export_entity_id string   ID of the export entity (required)
      --format string             Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults
to yaml.
  -h, --help                      Help for export-entity:get
  -o, --org string                Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string             management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic export-entity:launch

Launch a export entity

Synopsis

Launch an export entity which will create an export tgz of all the entities contained in the export. If called via the toolkit CLI, it will automatically poll the response every 30 seconds up to 25 minutes.

```
apic export-entity:launch --mode portaladmin [flags]
```

Options

```
  -c, --catalog string            Name or ID of the catalog that the site belongs to. (required)
      --export_entity_id string   ID of the export entity (required)
      --format string             Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults
to yaml.
  -h, --help                      Help for export-entity:launch
      --no-poll                   Do not poll the created task and just return the task ID
  -o, --org string                Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string             management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic export-entity:list

List export entities

Synopsis

List export entities within your Developer Portal. Export Entities contain a defined list of content to be exported when launched.

```
apic export-entity:list --mode portaladmin [flags]
```

Options

```
  -c, --catalog string   Name or ID of the catalog that the site belongs to. (required)
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for export-entity:list
  -o, --org string       Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic export-entity:remove-content

Remove content from an export entity

Synopsis

Remove content from an export entity. Provide the content type and IDs that you wish to remove from this export entity.

```
apic export-entity:remove-content --mode portaladmin [flags]
```

Options

```
  -c, --catalog string            Name or ID of the catalog that the site belongs to. (required)
      --entity_ids string         A comma separated list of entity ids.
      --entity_type string        Type of entity you want to perform this operation on. To find out entity/content types see
the content list-types route. (required)
      --export_entity_id string   ID of the export entity (required)
      --format string             Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults
to yaml.
  -h, --help                      Help for export-entity:remove-content
  -o, --org string                Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string             management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic factory-reset

Factory Reset operations

Synopsis

Factory Reset operations

```
apic factory-reset --mode portaladmin [flags]
```

Options

```
  -h, --help   Help for factory-reset
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic factory-reset:delete

Factory resets the Developer Portal.

Synopsis

Performs a factory reset of the Developer Portal, deleting the portal service and all portal sites. WARNING: This command is irreversible - please ensure you have backups configured.

```
apic factory-reset:delete --mode portaladmin [flags]
```

Options

```
      --execute_reset string              Set to true to trigger the Developer Portal reset
      --format string                     Output format. One of [json yaml go-template=... go-template-file=...], defaults to
yaml.
  -h, --help                              Help for factory-reset:delete
      --portal_service_endpoint string    The URL endpoint of the portal service (required)
  -s, --server string                     Management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic forums

Forums operations

Synopsis

Forums operations

```
apic forums --mode portaladmin [flags]
```

Options

```
  -h, --help   Help for forums
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic forums:disable

Disable the forum module for a given site

Synopsis

Removes all forums vocabulary taxonomy terms before disabling the forum module for a given site.

```
apic forums:disable --mode portaladmin [flags]
```

Options

```
  -c, --catalog string   Name or ID of the catalog that the site belongs to. (required)
      --format string    Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for forums:disable
  -o, --org string       Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic forums:enable

Enable the forum module for a given site

Synopsis

Enables the forum module for a given site.

```
apic forums:enable --mode portaladmin [flags]
```

Options

```
  -c, --catalog string   Name or ID of the catalog that the site belongs to. (required)
      --format string    Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for forums:enable
  -o, --org string       Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic ip-security-enabled

IP Security Enabled operations.

Synopsis

IP Security Enabled operations. Toggle the IP security on your Developer Portal between enabled and disabled. IP security is enabled by default.

```
apic ip-security-enabled --mode portaladmin [flags]
```

Options

```
  -h, --help   Help for ip-security-enabled
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic ip-security-enabled:update

Enable or disable IP security functionality within the Developer Portal.

Synopsis

Enable or disable IP security functionality within the Developer Portal. IP security is enabled by default.

```
apic ip-security-enabled:update --mode portaladmin [flags]
```

Options

```
      --enabled string                Set to true or false to enable or disable IP security (required)
      --format string                 Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help                          Help for ip-security-enabled:update
      --portal_service_name string   The name of the portal service (required)
  -s, --server string                 Management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic licenses

Review the license for API Connect

Synopsis

Review the license for API Connect

```
apic licenses --mode portaladmin [flags]
```

Options

```
  -h, --help              Help for licenses
      --non-ibm-license   Display the non IBM license files.
      --notices           Display the notices file
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic modules

Modules operations

Synopsis

Modules operations

```
apic modules --mode portaladmin [flags]
```

Options

```
  -c, --catalog string   Name or ID of the catalog that the site belongs to. (required)
      --core             Filter out extensions that are not in drupal core.
      --format string    Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for modules
      --no-core          Filter out extensions that are provided by drupal core.
  -o, --org string       Name or ID of the organization that the catalog belongs to. (required)
      --package string   Filter by project packages. You can use multiple comma separated values.
  -s, --server string    management server endpoint (required)
      --status string    Filter by extension status. Choices _ enabled, disabled and/or 'not installed'. You can use multiple
comma separated values.
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
```

```
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic modules:delete

Deletes one or more modules.

Synopsis

Deletes one or more modules. The provided list of modules must be comma separated.

```
apic modules:delete --mode portaladmin [flags]
```

Options

```
  -c, --catalog string   Name or ID of the catalog that the site belongs to. (required)
      --format string    Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for modules:delete
      --modules string   A list of modules separated by a comma. (required)
  -o, --org string       Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic modules:disable

Disable one or more modules and their dependent modules.

Synopsis

Disable one or more modules and their dependent modules. The provided list of modules must be comma separated.

```
apic modules:disable --mode portaladmin [flags]
```

Options

```
  -c, --catalog string   Name or ID of the catalog that the site belongs to. (required)
      --format string    Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for modules:disable
      --modules string   A list of modules separated by a comma. (required)
  -o, --org string       Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic modules:enable

Enable one or more module.

Synopsis

Enable one or more module by providing a comma separated list.

```
apic modules:enable --mode portaladmin [flags]
```

Options

```
  -c, --catalog string         Name or ID of the catalog that the site belongs to. (required)
      --format string          Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help                   Help for modules:enable
```

```
      --modules string          A list of modules separated by a comma. (required)
  -o, --org string              Name or ID of the organization that the catalog belongs to. (required)
      --resolve-dependencies    Attempt to download any missing dependencies. At the moment, only works when the module name is
the same as the project name.
  -s, --server string           management server endpoint (required)
      --skip                    Skip automatic downloading of libraries (c.f. devel).
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic modules:list

Shows a list of available modules.

Synopsis

Show a list of modules for the portal of the provided org and catalog.

```
apic modules:list --mode portaladmin [flags]
```

Options

```
  -c, --catalog string   Name or ID of the catalog that the site belongs to. (required)
      --core             Filter out extensions that are not in drupal core.
      --format string    Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for modules:list
      --no-core          Filter out extensions that are provided by drupal core.
  -o, --org string       Name or ID of the organization that the catalog belongs to. (required)
      --package string   Filter by project packages. You can use multiple comma separated values.
  -s, --server string    management server endpoint (required)
      --status string    Filter by extension status. Choices _ enabled, disabled and/or 'not installed'. You can use multiple
comma separated values.
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic php-memory

Php Memory operations

Synopsis

Php Memory operations

```
apic php-memory --mode portaladmin [flags]
```

Options

```
      --format string                Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help                         Help for php-memory
      --portal_service_name string   The name of the portal service (required)
  -s, --server string                management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic php-memory:list

List the PHP memory limit on the platform.

Synopsis

Lists the PHP memory_limit setting on the portal platform.

```
apic php-memory:list --mode portaladmin [flags]
```

Options

```
      --format string                Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help                         Help for php-memory:list
      --portal_service_name string   The name of the portal service (required)
  -s, --server string                management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic php-memory:update

Set the PHP memory limit on the portal platform.

Synopsis

Sets the PHP memory limit on the portal platform for both admin and web containers

```
apic php-memory:update --mode portaladmin [flags]
```

Options

```
      --format string                Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help                         Help for php-memory:update
      --memory_value string          The memory value in megabytes (mb) (required)
      --portal_service_name string   The name of the portal service (required)
  -s, --server string                management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic platforms

Platforms operations

Synopsis

Platforms operations

```
apic platforms --mode portaladmin [flags]
```

Options

```
      --format string                Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help                         Help for platforms
      --portal_service_name string   The name of the portal service (required)
  -s, --server string                management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic platforms:list

List the platforms present on the portal service.

Synopsis

Lists all the platforms that are currently present on the Portal service.

```
apic platforms:list --mode portaladmin [flags]
```

Options

```
      --format string                Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help                         Help for platforms:list
      --portal_service_name string   The name of the portal service (required)
  -s, --server string                management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic product

Product operations

Synopsis

Product operations

```
apic product --mode portaladmin [flags]
```

Options

```
  -c, --catalog string   Name or ID of the catalog that the site belongs to. (required)
      --format string    Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for product
  -o, --org string       Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic product:add-attachment

Add an attachment for the given product.

Synopsis

Add an attachment for a product within the developer portal of the provided org and catalog. A product can hold 10 attachments. The id or name:version of a specific product needs to be provided. e.g. 'id-of-product-called-example-3' or 'example:3.0.0'.

```
apic product:add-attachment --mode portaladmin [flags]
```

Options

```
      --attachment_description string   A description of the attachment to be displayed to users.
      --attachment_name string          The name given to the attachment once it has been uploaded e.g. my-file.txt (required)
  -c, --catalog string                  Name or ID of the catalog that the site belongs to. (required)
      --format string                   Output format. One of [json yaml go-template=... go-template-file=...], defaults to
yaml.
  -h, --help                            Help for product:add-attachment
  -o, --org string                      Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string                   management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic product:add-tag

Add a tag for the given product.

Synopsis

Add a tag for a product within the developer portal of the provided org and catalog. The id or name:version of a specific product needs to be provided. e.g. 'id-of-product-called-example-3' or 'example:3.0.0'.

```
apic product:add-tag --mode portaladmin [flags]
```

Options

```
  -c, --catalog string    Name or ID of the catalog that the site belongs to. (required)
      --format string     Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help              Help for product:add-tag
  -o, --org string        Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string     management server endpoint (required)
      --tag_name string   The tag name e.g. top_level_element/next_level_element (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic product:get

Get a specific product from a developer portal.

Synopsis

Get a specific product from the developer portal of the provided org and catalog. The id or name:version of a specific api needs to be provided. e.g. 'id-of-api-called-example-3' or 'example:3.0.0'.

```
apic product:get --mode portaladmin [flags]
```

Options

```
  -c, --catalog string   Name or ID of the catalog that the site belongs to. (required)
      --format string    Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for product:get
  -o, --org string       Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic product:get-document

Get a specific entire product document from a portal.

Synopsis

Get a specific entire product document from the portal of the provided organization and catalog. The id or name:version of a specific api needs to be provided. For example, 'id-of-api-called-example-3' or 'example:3.0.0'.

```
apic product:get-document --mode portaladmin [flags]
```

Options

```
  -c, --catalog string   Name or ID of the catalog that the site belongs to. (required)
      --format string    Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for product:get-document
  -o, --org string       Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic product:list

Shows a list of products from a site.

Synopsis

Show a list of products of the provided org and catalog.

```
apic product:list --mode portaladmin [flags]
```

Options

```
  -c, --catalog string   Name or ID of the catalog that the site belongs to. (required)
      --format string    Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for product:list
  -o, --org string       Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic product:set-icon

Set an icon image for the given product.

Synopsis

Set an icon image for a product within the developer portal of the provided org and catalog. The existing icon will be overwritten. The id or name:version of a specific product needs to be provided. e.g. 'id-of-product-called-example-3' or 'example:3.0.0'.

```
apic product:set-icon --mode portaladmin [flags]
```

Options

```
  -c, --catalog string            Name or ID of the catalog that the site belongs to. (required)
      --format string             Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help                      Help for product:set-icon
      --icon_description string   A description of the icon to be displayed to users. Used as alt text for the image.
(required)
  -o, --org string                Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string             management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic security

Security operations

Synopsis

Security operations

```
apic security --mode portaladmin [flags]
```

Options

```
  -h, --help   Help for security
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic security:clear-bans

Clear all user/IP bans for a site.

Synopsis

Clear any existing user/IP bans.

```
apic security:clear-bans --mode portaladmin [flags]
```

Options

```
  -c, --catalog string   Name or ID of the catalog that the site belongs to. (required)
      --format string    Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for security:clear-bans
  -o, --org string       Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string    Management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic service

Service operations

Synopsis

Service operations

```
apic service --mode portaladmin [flags]
```

Options

```
      --format string                Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help                         Help for service
      --portal_service_name string   The name of the portal service (required)
  -s, --server string                management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
```

```
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic service:list

List the Portal service.

Synopsis

Lists the Portal service currently installed.

```
apic service:list --mode portaladmin [flags]
```

Options

```
      --format string                Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help                         Help for service:list
      --portal_service_name string   The name of the portal service (required)
  -s, --server string                management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic service-ip-allowlist

Service IP Allowlist operations.

Synopsis

Service IP Allowlist operations. The allowlist service enables specific IPs to be exempt from being blocked by portal security checks, for example, load balancer and proxy IPs.

```
apic service-ip-allowlist --mode portaladmin [flags]
```

Options

```
      --format string                Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help                         Help for service-ip-allowlist
      --portal_service_name string   The name of the portal service (required)
  -s, --server string                Management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license         Accept the license for API Connect
      --debug                  Enable debug output
      --debug-output string    Write debug output to file
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic service-ip-allowlist:add

Add IP(s) to the allowlist.

Synopsis

Add specific IP(s) to the allowlist.

```
apic service-ip-allowlist:add --mode portaladmin [flags]
```

Options

```
      --format string                Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help                         Help for service-ip-allowlist:add
      --ips string                   Comma separated list of IPs (required)
      --portal_service_name string   The name of the portal service (required)
  -s, --server string                Management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic service-ip-allowlist:delete

Delete all IPs from the allowlist.

Synopsis

Delete all of the IPs from the allowlist.

```
apic service-ip-allowlist:delete --mode portaladmin [flags]
```

Options

```
      --format string                Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help                         Help for service-ip-allowlist:delete
      --portal_service_name string   The name of the portal service (required)
  -s, --server string                Management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic service-ip-allowlist:list

List IP(s) currently on the allowlist.

Synopsis

List all of the IP(s) that are currently on the allowlist.

```
apic service-ip-allowlist:list --mode portaladmin [flags]
```

Options

```
      --format string                Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help                         Help for service-ip-allowlist:list
      --portal_service_name string   The name of the portal service (required)
  -s, --server string                Management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic service-ip-allowlist:remove

Remove specific IP(s) from the allowlist.

Synopsis

Remove one or more specific IP(s) from the allowlist.

```
apic service-ip-allowlist:remove --mode portaladmin [flags]
```

Options

```
      --format string                Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help                         Help for service-ip-allowlist:remove
      --ips string                   Comma separated list of IPs (required)
      --portal_service_name string   The name of the portal service (required)
  -s, --server string                Management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic site

Site operations

Synopsis

Site operations

```
apic site --mode portaladmin [flags]
```

Options

```
  -h, --help   Help for site
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic site:cache-rebuild

Rebuilds the cache of a specific portal site.

Synopsis

Clears the existing cache and rebuilds a new one for a specific portal site.

```
apic site:cache-rebuild --mode portaladmin [flags]
```

Options

```
  -c, --catalog string   Name or ID of the catalog that the site belongs to. (required)
      --format string    Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for site:cache-rebuild
  -o, --org string       Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic site:check

Run a platform check against a portal site

Synopsis

Performs filesystem, database and API Manager checks against a portal site. This command is useful when trying to identify platform related problems if you are having issues with your portal site.

```
apic site:check --mode portaladmin [flags]
```

Options

```
  -c, --catalog string   Name or ID of the catalog that the site belongs to. (required)
      --format string    Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for site:check
  -o, --org string       Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic site:create-export

Create a task that exports an archive that contains the entire make-up of a site.

Synopsis

You can create a task to export an archive of the entire make-up of a site. You can then use that archive to quickly and simply override another site's content and configuration to make them identical.

```
apic site:create-export --mode portaladmin [flags]
```

Options

```
  -c, --catalog string   Name or ID of the catalog that the site belongs to. (required)
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for site:create-export
      --no-poll          Do not poll the created task and just return the task ID
  -o, --org string       Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic site:create-import

Create a task that imports an archive that contains the make-up of a site.

Synopsis

You can create a task to import an archive of the make-up of a site. You can use the imported archive to quickly and simply override the site config, content and custom modules and themes for the specified site.

```
apic site:create-import --mode portaladmin [flags]
```

Options

```
  -c, --catalog string   Name or ID of the catalog that the site belongs to. (required)
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for site:create-import
      --no-poll          Do not poll the created task and just return the task ID
  -o, --org string       Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic site:delete-export

If running, cancels a site export task.

Synopsis

If running, cancels the site export task and deletes any related artifacts that have been generated.

```
apic site:delete-export --mode portaladmin [flags]
```

Options

```
  -c, --catalog string   Name or ID of the catalog that the site belongs to. (required)
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for site:delete-export
  -o, --org string       Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string    management server endpoint (required)
      --task_id string   ID of the task created on the queue. (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic site:delete-import

If running, cancels a site import task.

Synopsis

If running, cancels the site import task and deletes any related artifacts that have been generated.

```
apic site:delete-import --mode portaladmin [flags]
```

Options

```
  -c, --catalog string   Name or ID of the catalog that the site belongs to. (required)
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for site:delete-import
  -o, --org string       Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string    management server endpoint (required)
      --task_id string   ID of the task created on the queue. (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic site:get-export-status

Returns information about the status of this task.

Synopsis

Returns information related to the task id that is provided in the arguments.

```
apic site:get-export-status --mode portaladmin [flags]
```

Options

```
  -c, --catalog string   Name or ID of the catalog that the site belongs to. (required)
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for site:get-export-status
  -o, --org string       Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string    management server endpoint (required)
      --task_id string   ID of the task created on the queue. (required)
```

Options inherited from parent commands

```
      --accept-license   Accept the license for API Connect
      --debug            Enable debug output
```

```
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic site:get-export

When ready, streams a site export artifact.

Synopsis

When ready, streams a site export artifact back to the related task id that is provided in the arguments.

```
apic site:get-export --mode portaladmin [flags]
```

Options

```
  -c, --catalog string   Name or ID of the catalog that the site belongs to. (required)
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for site:get-export
  -o, --org string       Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string    management server endpoint (required)
      --task_id string   ID of the task created on the queue. (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic site:get-import-status

Get the result of the site import task.

Synopsis

Get the result of the site import task. If the import task has completed on the portal system, this command returns the result of the command. If the import task has not completed on the portal system, it returns the current status of the task.

```
apic site:get-import-status --mode portaladmin [flags]
```

Options

```
  -c, --catalog string   Name or ID of the catalog that the site belongs to. (required)
      --format string    Output format. One of [json yaml octet-stream go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for site:get-import-status
  -o, --org string       Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string    management server endpoint (required)
      --task_id string   ID of the task created on the queue. (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic site:login-link

Gets an admin login link for a specific Portal site.

Synopsis

Returns a one time login link for the Drupal admin account for the site specified by org and catalog parameters

```
apic site:login-link --mode portaladmin [flags]
```

Options

```
  -c, --catalog string   Name or ID of the catalog that the site belongs to. (required)
      --format string    Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for site:login-link
  -o, --org string       Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic site:state

Obtain the current state of a portal site.

Synopsis

Returns the state of a portal site. This command is useful as a general health check analysis of the portal site.

```
apic site:state --mode portaladmin [flags]
```

Options

```
  -c, --catalog string   Name or ID of the catalog that the site belongs to. (required)
      --format string    Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for site:state
  -o, --org string       Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic site-config

Site Config operations

Synopsis

Site Config operations

```
apic site-config --mode portaladmin [flags]
```

Options

```
  -h, --help   Help for site-config
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic site-config:create-export

Create a task that exports an archive that contains the configuration of a site.

Synopsis

You can create a task to export an archive of the configuration of a site. You can then use that archive to quickly and simply override the configuration on another site.

```
apic site-config:create-export --mode portaladmin [flags]
```

Options

```
  -c, --catalog string   Name or ID of the catalog that the site belongs to. (required)
      --format string    Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for site-config:create-export
      --no-poll          Do not poll the created task and just return the task ID
  -o, --org string       Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic site-config:create-import

Create a task that imports an archive that contains the configuration of a site.

Synopsis

You can create a task to import an archive of the configuration of a site. You can use the imported archive to quickly and simply override the configuration for the specified site.

```
apic site-config:create-import --mode portaladmin [flags]
```

Options

```
  -c, --catalog string   Name or ID of the catalog that the site belongs to. (required)
      --format string    Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for site-config:create-import
      --no-poll          Do not poll the created task and just return the task ID
  -o, --org string       Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic site-config:delete-export

If running, cancels a site configuration export task.

Synopsis

If running, cancels the site configuration export task and deletes any related artifacts that have been generated.

```
apic site-config:delete-export --mode portaladmin [flags]
```

Options

```
  -c, --catalog string   Name or ID of the catalog that the site belongs to. (required)
      --format string    Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for site-config:delete-export
  -o, --org string       Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string    management server endpoint (required)
      --task_id string   ID of the task created on the queue. (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic site-config:delete-import

Cancels a running site configuration import task.

Synopsis

Cancels the site configuration import task and deletes any generated artifacts.

```
apic site-config:delete-import --mode portaladmin [flags]
```

Options

```
  -c, --catalog string   Name or ID of the catalog that the site belongs to. (required)
      --format string    Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for site-config:delete-import
  -o, --org string       Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string    management server endpoint (required)
      --task_id string   ID of the task created on the queue. (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic site-config:get-export

When ready, streams a site configuration export artifact.

Synopsis

When ready, streams a site configuration export artifact back to the related task id that is provided in the arguments.

```
apic site-config:get-export --mode portaladmin [flags]
```

Options

```
  -c, --catalog string   Name or ID of the catalog that the site belongs to. (required)
      --format string    Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for site-config:get-export
  -o, --org string       Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string    management server endpoint (required)
      --task_id string   ID of the task created on the queue. (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic site-config:get-export-status

Returns information about the status of this task.

Synopsis

Returns information related to the task id that is provided in the arguments.

```
apic site-config:get-export-status --mode portaladmin [flags]
```

Options

```
  -c, --catalog string   Name or ID of the catalog that the site belongs to. (required)
      --format string    Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for site-config:get-export-status
  -o, --org string       Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string    management server endpoint (required)
      --task_id string   ID of the task created on the queue. (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
```

```
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic site-config:get-import-status

Get the result of the site configuration import task.

Synopsis

Get the result of the site configuration import task. If the import task has completed on the portal system, this command returns the result of the command. If the import task has not completed on the portal system, it returns the current status of the task.

```
apic site-config:get-import-status --mode portaladmin [flags]
```

Options

```
  -c, --catalog string   Name or ID of the catalog that the site belongs to. (required)
      --format string    Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for site-config:get-import-status
  -o, --org string       Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string    management server endpoint (required)
      --task_id string   ID of the task created on the queue. (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic sites

Sites operations

Synopsis

Sites operations

```
apic sites --mode portaladmin [flags]
```

Options

```
      --format string                Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help                         Help for sites
      --portal_service_name string   The name of the portal service (required)
  -s, --server string                management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic sites:check

Run a platform check against all portal sites present on a portal service.

Synopsis

Performs filesystem, database and API Manager checks against all portal sites on a given portal service. This command is useful when trying to identify platform related problems on one of more of your portal sites.

```
apic sites:check --mode portaladmin [flags]
```

Options

```
      --format string   Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help            Help for sites:check
```

```
      --portal_service_name string   The name of the portal service (required)
  -s, --server string                management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic sites:list

List the sites present on the Portal service.

Synopsis

Lists all the sites that are currently present on the Portal service.

```
apic sites:list --mode portaladmin [flags]
```

Options

```
      --format string               Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help                        Help for sites:list
      --portal_service_name string   The name of the portal service (required)
  -s, --server string                management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic themes

Themes operations

Synopsis

Themes operations

```
apic themes --mode portaladmin [flags]
```

Options

```
  -c, --catalog string   Name or ID of the catalog that the site belongs to. (required)
      --core             Filter out extensions that are not in drupal core.
      --format string    Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for themes
      --no-core          Filter out extensions that are provided by drupal core.
  -o, --org string       Name or ID of the organization that the catalog belongs to. (required)
      --package string   Filter by project packages. You can use multiple comma separated values.
  -s, --server string    management server endpoint (required)
      --status string    Filter by extension status. Choices _ enabled, disabled and/or 'not installed'. You can use multiple
comma separated values.
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic themes:delete

Deletes one or more themes.

Synopsis

Deletes one or more themes. The provided list of themes must be comma separated.

```
apic themes:delete --mode portaladmin [flags]
```

Options

```
  -c, --catalog string   Name or ID of the catalog that the site belongs to. (required)
      --format string    Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for themes:delete
  -o, --org string       Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string    management server endpoint (required)
      --themes string    A list of themes separated by a comma. (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic themes:disable

Disable one or more themes.

Synopsis

Disable one or more themes and their dependent modules. The provided list of themes must be comma separated.

```
apic themes:disable --mode portaladmin [flags]
```

Options

```
  -c, --catalog string   Name or ID of the catalog that the site belongs to. (required)
      --format string    Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for themes:disable
  -o, --org string       Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string    management server endpoint (required)
      --themes string    A list of themes separated by a comma. (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic themes:enable

Enable one or more theme.

Synopsis

Enable one or more theme by providing a comma separated list.

```
apic themes:enable --mode portaladmin [flags]
```

Options

```
  -c, --catalog string          Name or ID of the catalog that the site belongs to. (required)
      --format string           Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help                    Help for themes:enable
  -o, --org string              Name or ID of the organization that the catalog belongs to. (required)
      --resolve-dependencies    Attempt to download any missing dependencies. At the moment, only works when the module name is
the same as the project name.
  -s, --server string           management server endpoint (required)
      --skip                    Skip automatic downloading of libraries (c.f. devel).
      --themes string           A list of themes separated by a comma. (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
```

```
      --live-help              Enable or disable tracking of limited usage information
  -m, --mode string            Toolkit operation mode (default "apim")
```

apic themes:list

Shows a list of available themes.

Synopsis

Show a list of themes for the portal of the provided org and catalog.

```
apic themes:list --mode portaladmin [flags]
```

Options

```
  -c, --catalog string   Name or ID of the catalog that the site belongs to. (required)
      --core             Filter out extensions that are not in drupal core.
      --format string    Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for themes:list
      --no-core          Filter out extensions that are provided by drupal core.
  -o, --org string       Name or ID of the organization that the catalog belongs to. (required)
      --package string   Filter by project packages. You can use multiple comma separated values.
  -s, --server string    management server endpoint (required)
      --status string    Filter by extension status. Choices _ enabled, disabled and/or 'not installed'. You can use multiple
comma separated values.
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic themes:set-default

Set a portal's default theme.

Synopsis

Set a portal's default theme. The theme provided must be one that is already enabled.

```
apic themes:set-default --mode portaladmin [flags]
```

Options

```
  -c, --catalog string   Name or ID of the catalog that the site belongs to. (required)
      --format string    Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for themes:set-default
  -o, --org string       Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic twig

Twig operations.

Synopsis

Twig operations.

```
apic twig --mode portaladmin [flags]
```

Options

```
  -h, --help   Help for twig
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic twig:debug-disable

Disable twig debugging on a specific portal site.

Synopsis

Disable twig debugging on a specific portal site. Twig debugging helps locate twig template issues.

```
apic twig:debug-disable --mode portaladmin [flags]
```

Options

```
  -c, --catalog string   Name or ID of the catalog that the site belongs to. (required)
      --format string    Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for twig:debug-disable
  -o, --org string       Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic twig:debug-enable

Enables twig debugging on a specific portal site.

Synopsis

Enables twig debugging on a specific portal site. Twig debugging helps locate twig template issues.

```
apic twig:debug-enable --mode portaladmin [flags]
```

Options

```
  -c, --catalog string   Name or ID of the catalog that the site belongs to. (required)
      --format string    Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for twig:debug-enable
  -o, --org string       Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic twig:debug-status

Shows the current state of twig debugging on a specific portal site.

Synopsis

View the current state of twig debugging on a specific portal site, if you are unsure whether it is enabled or disabled.

```
apic twig:debug-status --mode portaladmin [flags]
```

Options

```
  -c, --catalog string   Name or ID of the catalog that the site belongs to. (required)
      --format string    Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
  -h, --help             Help for twig:debug-status
  -o, --org string       Name or ID of the organization that the catalog belongs to. (required)
  -s, --server string    management server endpoint (required)
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

apic version

Get the APIConnect toolkit version

Synopsis

Get the APIConnect toolkit version

```
apic version --mode portaladmin [flags]
```

Options

```
  -h, --help   Help for version
```

Options inherited from parent commands

```
      --accept-license        Accept the license for API Connect
      --debug                 Enable debug output
      --debug-output string   Write debug output to file
      --live-help             Enable or disable tracking of limited usage information
  -m, --mode string           Toolkit operation mode (default "apim")
```

API Connect REST APIs

The API Connect platform REST APIs provide complete access to the capability of the platform.

The API Connect platform REST APIs can be used for the following actions:

- Automate the administration of the platform.
- Implement scripts and tools to support a continuous integration environment for API development and publishing.
- Manage catalogs of APIs, and their subscribers.

Note: To authenticate with the API Connect Platform REST APIs, generate an API Key and then exchange it for an access token to use when calling the APIs. You can exchange it for an access token with the following example:

```
curl -v -k -X POST -d '{"api_key": "****", "client_id": "client-id", "client_secret": "client-secret", "grant_type":
"api_key"}' -H 'Content-Type: application/json' -H 'Accept: application/json' https://platform-api.
{{region}}.apiconnect.automation.ibm.com/api/token
```

The operations provided in the REST APIs also correspond directly with the commands in the developer toolkit command-line tool (CLI).

You can use the URL to navigate directly to specific APIs and operations in the OpenAPI Explorer Documentation for the API Connect REST APIs. You can also select the APIs for a specific version by using the drop-down menu in the header bar.

For descriptions of the platform APIs, see the API Connect REST API documentation.

Example: Using the platform REST APIs to publish a product containing a SOAP API

Review this sample scenario to see how you can use the API Connect platform REST APIs to publish a product that contains a SOAP API.

This example demonstrates how to format a request to publish the product, and includes sample files that illustrate the product definition, the API definition, and the SOAP API's WSDL description.

Using the `Catalogs` API

Publish the product using the API Connect platform **`Catalogs`** API:

- To publish a product to a catalog, use the following syntax:

`POST catalogs/{org}/{catalog}/publish`

- To publish a product to a space within a catalog, additionally specify the space with the following syntax:

  `POST catalogs/{org}/{catalog}/{space}/publish`

The payload in both cases is a multipart, form-encoded body containing three required parts and one optional part:

- (Required) A part named **product** with media type **application/yaml** or **application/json**, containing the yaml or JSON source for the product to be published.
- (Required) One or more occurrences of a part named **openapi** with media type **application/yaml** or **application/json**, containing the YAML or JSON source for each API in the product.
- (Required for SOAP APIs) One or more occurrences of a part named **wsdl** with media type **application/wsdl**, **application/wsdl+xml**, **text/xml**, or **application/zip** containing the WSDL definitions (and referenced XSD files if applicable) associated with the API content.
- (Optional) A part named **gateway_service_urls** with media type **application/yaml** or **application/json** which is a YAML or JSON array of URLs to specify a subset of the configured gateway services within the catalog or space as publish targets. These URLs can be obtained using the following calls:
  - For a catalog:

    `GET /api/catalogs/{org}/{catalog}/configured-gateway-services`

  - For a space:

    `GET /spaces/{org}/{catalog}/{space}/configured-gateway-services`

Within the **product** content, the form of the references to APIs in the **apis** section is significant. Each API reference must use the **name** property instead of the **$ref** form that may appear in other situations. Here is an example showing a product that refers to the API **globalweather** version **1.0.0** in the correct form:

```
info:
  version: 1.0.0
  title: GlobalWeatherProduct
  name: globalweatherproduct
plans:
  ...
apis:
  globalweather1.0.0:
    name: globalweather:1.0.0
...
```

Example publish operation using cURL

This example publishes a product containing a SOAP API to the *Sandbox* catalog of the *onlinebanking* provider organization, using the **curl -F** option to create a set of form-encoded payload parts and the **@** prefix to read the content for each part from a file. Note the part name (**product**, **openapi**, **wsdl**) and the content type of each part given by the **type=** value.

In this example, the access token has been retrieved earlier and placed in an environment variable named **TOKEN**. The command is split onto multiple lines for ease of reading but must be entered as a single line.

Request:

```
curl -v -k
  -F "product=@globalweatherproduct_1.0.0.yaml;type=application/yaml"
  -F "openapi=@globalweather_1.0.0.yaml;type=application/yaml"
  -F "wsdl=@globalweather.wsdl;type=application/wsdl"
  -H "Authorization: Bearer $TOKEN"
  -H 'Content-Type: multipart/form-data'
  -H 'Accept: */*' https://dev.apic.example.com/api/catalogs/onlinebanking/sandbox/publish
```

Response:

```

```

The request specifies three files, which are included with this example for reference:

- Product definition `-F "product=@globalweatherproduct_1.0.0.yaml;type=application/yaml"`
- API definition `-F "openapi=@globalweather_1.0.0.yaml;type=application/yaml"`
- WSDL description `-F "wsdl=@globalweather.wsdl;type=application/wsdl"`

Example Product file: globalweatherproduct_1.0.0.yaml

The following code sample contains a Product definition.

The Product definition file globalweatherproduct_1.0.0.yaml is referenced by the example scenario in Example: Using the platform REST APIs to publish a product containing a SOAP API.

```
info:
  version: 1.0.0
  title: GlobalWeatherProduct
  name: globalweatherproduct
gateways:
  - datapower-api-gateway
plans:
  default-plan:
    title: Default Plan
    description: Default Plan
    rate-limits:

API Connect TLS certificates

Details of all Kubernetes TLS certificate objects that are created and used in a default installation of API Connect.

Overview

TLS is used to secure communications between API Connect pods, subsystems, external services, and users. The TLS certificates that are used by API Connect are created automatically during the installation of API Connect. The certificates are managed by an open source product called cert-manager.

The certificates that are described in this topic all exist as Kubernetes certificate objects in the API Connect namespace where the subsystem that uses the certificate is installed. Run `kubectl get certs -n <namespace>` to see the certificates in your environment. Some of the API Connect Kubernetes certificates are also stored in the management subsystem database. These certificates can be seen in the Cloud Manager UI, in the truststores and keystores of the subsystem default TLS profiles. When the management subsystem `apim` pod is restarted, the certificates in the management database are reloaded from the Kubernetes certificates.

This topic does not cover additional TLS profiles and certificates that API Connect administrators and provider organization owners can create and configure in the Cloud Manager and API Manager UIs. These certificates are stored in the management subsystem database only and do not exist in the Kubernetes environment.
Note: The API invocation certificate that callers to the published APIs on your gateways see is configured in the Cloud Manager UI when you register your gateway services. For more information about API invocation certificates, see Registering a gateway service and TLS profiles overview.
The certificates that are created and used by API Connect are categorized as follows:

- CA certificates - API Connect creates self-signed CA certificates to sign all the API Connect end-entity certificates. The CA certificates are:
  - `ingress-ca` - used by the ingress-issuer. The ingress-ca signs all user-facing and inter-subsystem certificates.
  - `management-ca` - signs all the management intra-subsystem certificates.
  - `portal-ca` - signs all the portal intra-subsystem certificates.
  - `analytics-ca` - signs all the analytics intra-subsystem certificates.

  CA certificates have a default duration of 10 years. All the end-entity certificates have a default duration of 2 years.
- Ingress certificates - API Connect creates a self-signed issuer that is called the ingress-issuer. Ingress certificates are the API Connect certificates that are issued by the ingress-issuer. Ingress certificates are divided into two types:
  - Inter-subsystem certificates - certificates that are used for communication between API Connect subsystems, for example between the management subsystem and gateway. By default, communication between most subsystems uses mTLS. From v10.0.5.3, it is possible to use JWT instead of mTLS: Using JWT instead of mTLS on Kubernetes and OpenShift, Using JWT instead of mTLS on OVA.
  - User-facing certificates - certificates that API Connect users see when they interact with the API Connect UIs and REST API.
- Intra-subsystem certificates - certificates that are used between pods in the same subsystem. Intra-subsystem certificates are signed by a subsystem specific CA certificate: `management-ca`, `portal-ca`, `analytics-ca`. The gateway subsystem is a single pod, and has no intra-subsystem certificates.

On OVA deployments, certificate management is done with the `apicup` command, see API Connect TLS certificate best practices. Do not login to your VMs by `ssh` and attempt to modify certificates directly, unless advised by IBM.

Note: On Cloud Pak for Integration, and OpenShift top-level CR deployments, some certificate names are contracted and prefixed with the `APIConnectCluster` instance name. For example, the certificate `managment-ca` is called `<apic instance name>-mgmt-ca`.

Customizing certificates

It is possible to customize certificates with ones from your own organization. However it is recommended to customize only the user-facing certificates, which are the certificates that your users see when they access the API Connect UIs, CLI, and the REST API.

All other certificates are used internally between API Connect microservices.
Note: The inter and intra-subsystem certificates use of a self-signed root CA presents no security risk. For internal communications with a limited number of predefined endpoints, use of locally generated self-signed CA certificates can be more secure than external CA certificates, as certificates are only ever issued for the known components and the domain of trust is kept as small as possible.

Renewing certificates

Cert-manager handles the renewal of expired certificates so that the user does not need to monitor or manually renew any of the certificates. However, there are scenarios where the renewal of certificates must be triggered manually. Every API Connect certificate has a corresponding Kubernetes secret object of the same name, deleting this secret triggers cert-manager to re-create the secret with a new TLS certificate. For more information about certificate renewal, see Renewing TLS certificates.
Remember: The Kubernetes certificate objects do not contain the TLS certificates themselves, they are pointers to Kubernetes secrets that contain the TLS certificate. See Key Concepts: Cert-manager, Issuers, and Secrets.
For most of the certificates, when they are renewed, the pods that use those certificates are automatically restarted so that they pick up the updated certificate. The minority of certificates that require manual pod restarts after renewal are identified in the reference tables.

If you renew a CA certificate, any end-entity certificates that use this CA certificate must also be renewed. The following command identifies and renews all certificates that are signed by `ingress-ca` in the specified namespace:

```
kubectl get secrets -n <namespace> -o custom-columns='NAME:.metadata.name,ISSUER:.metadata.annotations.cert-manager\.io/issuer-name' --no-headers=true | grep ingress-issuer | awk '{ print $1 }' | xargs kubectl delete secret -n <namespace>
```

Warning: Cert-manager automatically renews the `ingress-ca` 30 days before it expires. The automatic renewal of `ingress-ca` does not trigger the renewal of the end-entity certificates that are signed by `ingress-ca`. When `ingress-ca` is automatically renewed, you must manually renew all end-entity certificates.

Reference tables

The tables show all the API Connect certificates that are created in all possible deployment configurations.

Each table corresponds to a subsystem, and shows the certificates that are used by that subsystem.

Note: On Cloud Pak for Integration or top-level CR deployments, some of the certificates have a shortened name. Where two names for a certificate are shown in the tables, the second name is the name that is used on Cloud Pak for Integration or top-level CR deployments. For example, **`management-ca or mgmt-ca`**.

Table 1. Management certificates

Certificate name	Issuer	Description
`-ingress-ca`	**`selfsigning-issuer`**	The CA and issuer of all API Connect inter-subsystem and user-facing certificates. If there is a problem with this certificate, then all API Connect subsystems are inaccessible and unable to sync with each other. Update this certificate with **kubectl**. When updated, all child certificates must also be updated by deleting their corresponding secrets. See ingress-ca renewal. The ingress-ca certificate is also stored in the management subsystem database. It is visible from the Cloud Manager UI, in the truststores of the analytics, gateway, event gateway, and portal default TLS client profiles. When the management subsystem **`apim`** pod is restarted the certificate is reloaded into the database from the Kubernetes ingress-ca certificate. Do not attempt to update this certificate from the Cloud Manager UI. In 2DCDR deployments, and when you have subsystems in different namespaces, it is necessary to manually copy the ingress-ca certificate from the management subsystem to the other subsystems. Steps are provided in the 2DCDR and multi-namespace install sections of this documentation. If this certificate is updated, and you have a portal deployed, then restart the **`portal-www`** pods for the update to take effect.
`management-ca or mgmt-ca`	**`selfsigning-issuer`**	The issuer for the management subsystems intra-subsystem certificates: management-client, management-server, postgres, and nats certificates. Communication between management subsystem pods fails if there is a problem with this certificate. This certificate is also used as the CA for REST API calls to the management subsystem from the other subsystems, when using **`in-cluster`** communication. See In-cluster service communication between subsystems
`management-client or mgmt-client`	**`management-ca`**	Client certificate used in communication between management subsystem pods. Communication between management subsystem pods fails if there is a problem with this certificate.
`management-server or mgmt-server`	**`management-ca`**	Server certificate used in communication between management subsystem pods. Communication between management subsystem pods fails if there is a problem with this certificate. Required DNS names in the certificate: **`*.<namespace>`** **`*.<namespace>.svc`** **`*.<instance name>-server.<namespace>.svc`** **`<instance name>-server`**
`analytics-client-client or a7s-cl-client`	**`ingress-issuer`**	Legacy certificate from pre-v10.0.5 releases. Not used for anything and safe to delete. In v10.0.5, communication with the analytics subsystem uses the **`analytics-ingestion-client`** certificate.
`analytics-ingestion-client or a7s-ing-client`	**`ingress-issuer`**	Client certificate used for communication with the analytics subsystem on the ingestion endpoint. This certificate must have: • The same CA as the server certificate **`analytics-ai-endpoint`** on the analytics subsystem. • The common name must match the **`spec.clientSubjectDN`** in the analytics CR: **`kubectl describe cert analytics-admin-client`** **`Spec:`** **`  Common Name:  a7s-ing-client`** **`kubectl get a7s -o yaml`** **`  spec:`** **`    clientSubjectDN: CN=a7s-ing-client`** For a two data center disaster recovery deployment, both data centers must have an identical subject name. For example, both data centers subject name could be **`CN=a7s-ingestion-client`**, or they could both be **`CN=a7s-ingestion-client, O=cert-manager`**, but they must be identical. To update this certificate, use kubectl. Restart the **`apim`**, **`taskmanager`**, and **`analytics-proxy`** pods after the update. This certificate is also used by the gateways for sending API events to the analytics subsystem. The updated certificate is sent by the management subsystem to the gateways, it is not necessary to restart any gateway pods.
`portal-admin-client or ptl-adm-client`	**`ingress-issuer`**	Client certificate used for communication with the portal subsystem on the **`portalAdminEndpoint`**. This certificate must have: • The same CA as the server certificate **`portal-admin or ptl-director`** on the portal subsystem. • The common name must match the **`spec.adminClientSubjectDN`** in the portal CR: **`kubectl describe cert portal-admin-client`** **`Spec:`** **`  Common Name:  ptl-adm-client`** **`kubectl get ptl -o yaml`** **`  spec:`** **`    adminClientSubjectDN: CN=ptl-adm-client`** For a two data center disaster recovery deployment, both data centers must have an identical subject name. For example, both data centers subject name could be **`CN=portal-admin-client`**, or they could both be **`CN=ptl-adm-client, O=cert-manager`**, but they must be identical.
`gateway-client-client or gw-dr-client`	**`ingress-issuer`**	Client certificate for communications with the gateway service. Restart the **`apim`**, and **`taskmanager`** pods after update. This certificate must have the same CA as the **`gwv6-manager-endpoint or gw-gateway-manager`** certificate on the gateway.
`api-endpoint or mgmt-platform-api`	**`ingress-issuer`**	Platform API endpoint server certificate. The certificate that is presented to callers of the platform REST API, and to the toolkit CLI.

Certificate name	Issuer	Description
`consumer-endpoint or mgmt-consumer-api`	`ingress-issuer`	Consumer API endpoint server certificate. The certificate presented that is presented to callers of the consumer REST API, and to the toolkit CLI.
`apim-endpoint or mgmt-api-manager`	`ingress-issuer`	API Manager UI server certificate.
`cm-endpoint or mgmt-admin`	`ingress-issuer`	Cloud Manager UI server certificate.
`db-client-apicuser`	`management-ca`	Intra-subsystem certificate for the management database subsystem.
v10.0.6 only `db-client-pgbouncer`	`management-ca`	Intra-subsystem certificate for the management database subsystem.
`db-client-postgres`	`management-ca`	Intra-subsystem certificate for the management database subsystem.
v10.0.6 only `db-client-primaryuser`	`management-ca`	Intra-subsystem certificate for the management database subsystem.
`postgres`	`management-ca`	Intra-subsystem certificate for the management database subsystem.
v10.0.6 only `postgres-pgbouncer`	`management-ca`	Intra-subsystem certificate for the management database subsystem.
v10.0.6 only `postgres-operator`	`management-ca`	Intra-subsystem certificate for the management database subsystem.
`natscluster-mgmt`	`management-ca`	Intra-subsystem certificate for the `nats` pods.
v10.0.6 only `db-client-replicator`	`management-ca`	2DCDR deployments only. Client certificate used by the `<management_CR>-tunnel` pod to connect to the other data center's `<management_CR>-tunnel` pod.
`mgmt-replication-client`	`ingress-issuer`	2DCDR deployments only. Client certificate used in the warm-standby data center's `<remote-sitename>-postgres` pod to connect to the active data center.
`mgmt-replication-server`	`ingress-issuer`	2DCDR deployments only. Server certificate used in the active data center's `<management_CR>-tunnel` pod. This certificate must contain the DNS Subject Alternative Name of this data center's hostname and must be valid for the `spec.multiSiteHA.replicationEndpoint` defined in the management CR.
`hub-endpoint`	`ingress-issuer`	Used by the Automated API behavior testing application. User-facing server certificate for the `hub-endpoint`. If there is a problem with this certificate, then the user's browser shows a warning or error message.
`turnstile-endpoint`	`ingress-issuer`	Used by the Automated API behavior testing application. User-facing server certificate for the `turnstile-endpoint`. If there is a problem with this certificate, then the user's browser shows a warning or error message.

Table 2. Analytics certificates

Certificate name	Issuer	Description
`analytics-ai-endpoint or a7s-ai-endpoint`	`ingress-issuer`	Server certificate used on the analytics ingestion endpoint, in the mtls-gw pod. Management and gateway subsystems communicate with the analytics subsystem on this endpoint. The client certificates that are used by the management and gateway subsystems must use the same CA certificate as the `analytics-ai-endpoint` certificate. If this certificate is updated, restart the `mtls-gw` pod for the update to take effect.
`analytics-ca or a7s-ca`	`selfsigning-issuer`	The issuer for the analytics-client and analytics-server certificates. Communication between analytics subsystem pods fails if there is a problem with this certificate. If this certificate is updated, restart the `storage` and `ingestion` pods for the update to take effect.
`analytics-client or a7s-client`	`analytics-ca`	Client certificate used in communication between analytics subsystem pods. Communication between analytics subsystem pods fails if there is a problem with this certificate. If this certificate is updated, restart the `storage` and `ingestion` pods for the update to take effect.

`analytics-server or a7s-server`	`analytics-ca`	Server certificate used in communication between analytics subsystem pods. Communication between analytics subsystem pods fails if there is a problem with this certificate.
		Required DNS names in the certificate:
		
		`*.<namespace>`
		`*.<namespace>.svc`
		`*.<instance name>-server.<namespace>.svc`
		`<instance name>-server`
		`<instance name>-storage`
		
		If this certificate is updated, restart the `storage` and `ingestion` pods for the update to take effect.

Table 3. Portal certificates

Certificate name	Issuer	Description
`portal-ca or ptl-ca`	`selfsigning-issuer`	The issuer for the portal-client and portal-server certificates. Communication between portal subsystem pods fails if there is a problem with this certificate. This certificate is used by all portal pods.
`portal-client or ptl-client`	`portal-ca`	Client certificate used in communication between portal subsystem pods. Communication between portal subsystem pods fails if there is a problem with this certificate. This certificate is used by all portal pods.

Certificate name	Issuer	Description

`portal-server or ptl-server`	`portal-ca`	Server certificate used in communication between portal subsystem pods. Communication between portal subsystem pods fails if there is a problem with this certificate.
		
		Required DNS names in the certificate:
		
		`*.<namespace>`
		`*.<namespace>.svc`
		`*.<instance name>-server.<namespace>.svc`
		`<instance name>-server`
		`*.<instance name>-<site name>-db-all.<namespace>.svc`
		`*.<instance name>-<site name>-www-all.<namespace>.svc`
		`*.<instance name>-<site name>-db-all.<namespace>.svc.cluster.local`
		`*.<instance name>-<site name>-www-all.<namespace>.svc.cluster.local`
		`*.<namespace>.svc.cluster.local`
		`<instance name>-db`
		`#<remote portal CR name>-db # For 2DCDR only.`
		
		<instance name> and *<remote portal CR name>* are truncated if more than 15 characters.
		This certificate is used by all portal pods.

`portal-admin or ptl-director`	`ingress-issuer`	Server certificate used on the `portalAdminEndpoint`. The management subsystem communicates with the portal subsystem on this endpoint. The corresponding client certificate used in the management to portal communication is the `portal-admin-client` certificate. This certificate must have the same CA as the `portal-admin-client` certificate on the management subsystem. This certificate is used by the `portal-nginx` pod.
`portal-web`	`ingress-issuer`	The server certificate used on the `portalUIEndpoint`. It is the server certificate that is presented to portal site users, and which their browser authenticates. If there is a problem with this certificate, then users see an error message about an invalid or insecure certificate in their browser when they access a portal site. The default `portal-web` certificate is issued by the `ingress-issuer`, which has a self-signed root certificate. Portal users might see a browser warning about use of a self-signed certificate. This certificate is used by the `portal-web` ingress (`portal-web` route on OpenShift).
`ptl-replication-client`	`ingress-issuer`	2DCDR deployments only. Client certificate that is used in the warm-standby data center's `<remote-sitename>-www` and `<remote-sitename>-db` pods to connect to the active data center. This certificate is used by all the portal pods related to 2DCDR replication: `portal-db-remote`, `portal-www-remote`, and `portal-tunnel`.
`ptl-replication-server`	`ingress-issuer`	2DCDR deployments only. Server certificate used in the active data center's `<portal_CR>-tunnel` pod, the counterpart to the `ptl-replication-client` certificate. This certificate must contain the DNS Subject Alternative Name of this data center's hostname and must be valid for the `spec.multiSiteHA.replicationEndpoint` defined in the portal CR. This certificate is used by all the portal pods related to 2DCDR replication: `portal-db-remote`, `portal-www-remote`, and `portal-tunnel`.

Table 4. Gateway certificates

Certificate name	Issuer	Description
`gateway-peering or gw-peer`	`ingress-issuer`	This certificate secures the communication between gateways in your gateway cluster.
`gateway-service or gw-svc`	`ingress-issuer`	Legacy certificate that is not used.
`gwv6-endpoint or gw-gateway`	`ingress-issuer`	Legacy certificate that is not used.
`gwv6-manager-endpoint or gw-gateway-manager`	`ingress-issuer`	The `gatewayManager` endpoint certificate. This is the server certificate on the gateway director endpoint, which the management subsystem communicates with. This certificate must be signed by the same CA as the `gateway-client-client` certificate on management subsystem

Note: The API invocation certificate that callers to the published APIs on your gateways see is configured in the Cloud Manager UI when you register your gateway services. For more information about API invocation certificates, see Registering a gateway service and TLS profiles overview.

Table 5. Event gateway certificates -Cloud Pak for Integration only

Certificate name	Issuer	Description
`event-gateway-management-client`	`ingress-issuer`	The `event-gateway-management-client` certificate exists only on Cloud Pak for Integration deployments.

TLS certificates organized by usage

Table of API Connect certificates organized by where they are used.

Table 1. Management to gateway communication

Certificate name	Issuer	Description

Certificate name	Issuer	Description
`-ingress-ca`	`selfsigning-issuer`	The CA and issuer of all API Connect inter-subsystem and user-facing certificates. If there is a problem with this certificate, then all API Connect subsystems are inaccessible and unable to sync with each other. Update this certificate with **kubectl**. When updated, all child certificates must also be updated by deleting their corresponding secrets. See ingress-ca renewal. The ingress-ca certificate is also stored in the management subsystem database. It is visible from the Cloud Manager UI, in the truststores of the analytics, gateway, event gateway, and portal default TLS client profiles. When the management subsystem `apim` pod is restarted the certificate is reloaded into the database from the Kubernetes ingress-ca certificate. Do not attempt to update this certificate from the Cloud Manager UI. In 2DCDR deployments, and when you have subsystems in different namespaces, it is necessary to manually copy the ingress-ca certificate from the management subsystem to the other subsystems. Steps are provided in the 2DCDR and multi-namespace install sections of this documentation. If this certificate is updated, and you have a portal deployed, then restart the `portal-www` pods for the update to take effect.
`gateway-client-client or gw-dr-client`	`ingress-issuer`	Client certificate for communications with the gateway service. Restart the `apim`, and `taskmanager` pods after update. This certificate must have the same CA as the `gwv6-manager-endpoint or gw-gateway-manager` certificate on the gateway.
`gwv6-manager-endpoint or gw-gateway-manager`	`ingress-issuer`	The `gatewayManager` endpoint certificate. This is the server certificate on the gateway director endpoint, which the management subsystem communicates with. This certificate must be signed by the same CA as the `gateway-client-client` certificate on management subsystem

Table 2. Management to portal communication

Certificate name	Issuer	Description
`-ingress-ca`	`selfsigning-issuer`	The CA and issuer of all API Connect inter-subsystem and user-facing certificates. If there is a problem with this certificate, then all API Connect subsystems are inaccessible and unable to sync with each other. Update this certificate with **kubectl**. When updated, all child certificates must also be updated by deleting their corresponding secrets. See ingress-ca renewal. The ingress-ca certificate is also stored in the management subsystem database. It is visible from the Cloud Manager UI, in the truststores of the analytics, gateway, event gateway, and portal default TLS client profiles. When the management subsystem `apim` pod is restarted the certificate is reloaded into the database from the Kubernetes ingress-ca certificate. Do not attempt to update this certificate from the Cloud Manager UI. In 2DCDR deployments, and when you have subsystems in different namespaces, it is necessary to manually copy the ingress-ca certificate from the management subsystem to the other subsystems. Steps are provided in the 2DCDR and multi-namespace install sections of this documentation. If this certificate is updated, and you have a portal deployed, then restart the `portal-www` pods for the update to take effect.

`portal-admin-client or ptl-adm-client`	`ingress-issuer`	Client certificate used for communication with the portal subsystem on the `portalAdminEndpoint`. This certificate must have:
		
		• The same CA as the server certificate `portal-admin or ptl-director` on the portal subsystem.
		• The common name must match the `spec.adminClientSubjectDN` in the portal CR:
		
		`kubectl describe cert portal-admin-client`
		
		`Spec:`
		`  Common Name:  ptl-adm-client`
		
		`kubectl get ptl -o yaml`
		
		`  spec:`
		`    adminClientSubjectDN: CN=ptl-adm-client`
		
		For a two data center disaster recovery deployment, both data centers must have an identical subject name. For example, both data centers subject name could be `CN=portal-admin-client`, or they could both be `CN=ptl-adm-client, O=cert-manager`, but they must be identical.

`portal-admin or ptl-director`	`ingress-issuer`	Server certificate used on the `portalAdminEndpoint`. The management subsystem communicates with the portal subsystem on this endpoint. The corresponding client certificate used in the management to portal communication is the `portal-admin-client` certificate. This certificate must have the same CA as the `portal-admin-client` certificate on the management subsystem. This certificate is used by the `portal-nginx` pod.

Table 3. Management and gateway to analytics communication

Certificate name	Issuer	Description

Certificate name	Issuer	Description
`-ingress-ca`	`selfsigning-issuer`	The CA and issuer of all API Connect inter-subsystem and user-facing certificates. If there is a problem with this certificate, then all API Connect subsystems are inaccessible and unable to sync with each other. Update this certificate with **kubectl**. When updated, all child certificates must also be updated by deleting their corresponding secrets. See ingress-ca renewal. The ingress-ca certificate is also stored in the management subsystem database. It is visible from the Cloud Manager UI, in the truststores of the analytics, gateway, event gateway, and portal default TLS client profiles. When the management subsystem `apim` pod is restarted the certificate is reloaded into the database from the Kubernetes ingress-ca certificate. Do not attempt to update this certificate from the Cloud Manager UI. In 2DCDR deployments, and when you have subsystems in different namespaces, it is necessary to manually copy the ingress-ca certificate from the management subsystem to the other subsystems. Steps are provided in the 2DCDR and multi-namespace install sections of this documentation. If this certificate is updated, and you have a portal deployed, then restart the `portal-www` pods for the update to take effect.

`analytics-ingestion-client or a7s-ing-client`	`ingress-issuer`	Client certificate used for communication with the analytics subsystem on the ingestion endpoint. This certificate must have:
		
		• The same CA as the server certificate `analytics-ai-endpoint` on the analytics subsystem.
		• The common name must match the `spec.clientSubjectDN` in the analytics CR:
		
		`kubectl describe cert analytics-admin-client`
		
		`Spec:`
		`  Common Name:  a7s-ing-client`
		
		`kubectl get a7s -o yaml`
		
		`  spec:`
		`    clientSubjectDN: CN=a7s-ing-client`
		
		For a two data center disaster recovery deployment, both data centers must have an identical subject name. For example, both data centers subject name could be `CN=a7s-ingestion-client`, or they could both be `CN=a7s-ingestion-client, O=cert-manager`, but they must be identical.
		
		To update this certificate, use kubectl. Restart the `apim`, `taskmanager`, and `analytics-proxy` pods after the update. This certificate is also used by the gateways for sending API events to the analytics subsystem. The updated certificate is sent by the management subsystem to the gateways, it is not necessary to restart any gateway pods.

`analytics-ai-endpoint or a7s-ai-endpoint`	`ingress-issuer`	Server certificate used on the analytics ingestion endpoint, in the mtls-gw pod. Management and gateway subsystems communicate with the analytics subsystem on this endpoint. The client certificates that are used by the management and gateway subsystems must use the same CA certificate as the `analytics-ai-endpoint` certificate. If this certificate is updated, restart the `mtls-gw` pod for the update to take effect.

Table 4. User-facing certificates

Certificate name	Issuer	Description
`api-endpoint or mgmt-platform-api`	`ingress-issuer`	Platform API endpoint server certificate. The certificate that is presented to callers of the platform REST API, and to the toolkit CLI.
`consumer-endpoint or mgmt-consumer-api`	`ingress-issuer`	Consumer API endpoint server certificate. The certificate presented that is presented to callers of the consumer REST API, and to the toolkit CLI.
`apim-endpoint or mgmt-api-manager`	`ingress-issuer`	API Manager UI server certificate.
`cm-endpoint or mgmt-admin`	`ingress-issuer`	Cloud Manager UI server certificate.
`portal-web`	`ingress-issuer`	The server certificate used on the `portalUIEndpoint`. It is the server certificate that is presented to portal site users, and which their browser authenticates. If there is a problem with this certificate, then users see an error message about an invalid or insecure certificate in their browser when they access a portal site. The default `portal-web` certificate is issued by the `ingress-issuer`, which has a self-signed root certificate. Portal users might see a browser warning about use of a self-signed certificate. This certificate is used by the `portal-web` ingress (`portal-web` route on OpenShift).
`hub-endpoint`	`ingress-issuer`	Used by the Automated API behavior testing application. User-facing server certificate for the `hub-endpoint`. If there is a problem with this certificate, then the user's browser shows a warning or error message.
`turnstile-endpoint`	`ingress-issuer`	Used by the Automated API behavior testing application. User-facing server certificate for the `turnstile-endpoint`. If there is a problem with this certificate, then the user's browser shows a warning or error message.

Table 5. Inter-subsystem certificates

Certificate name	Issuer	Description

Certificate name	Issuer	Description
`-ingress-ca`	`selfsigning-issuer`	The CA and issuer of all API Connect inter-subsystem and user-facing certificates. If there is a problem with this certificate, then all API Connect subsystems are inaccessible and unable to sync with each other. Update this certificate with **kubectl**. When updated, all child certificates must also be updated by deleting their corresponding secrets. See ingress-ca renewal. The ingress-ca certificate is also stored in the management subsystem database. It is visible from the Cloud Manager UI, in the truststores of the analytics, gateway, event gateway, and portal default TLS client profiles. When the management subsystem `apim` pod is restarted the certificate is reloaded into the database from the Kubernetes ingress-ca certificate. Do not attempt to update this certificate from the Cloud Manager UI. In 2DCDR deployments, and when you have subsystems in different namespaces, it is necessary to manually copy the ingress-ca certificate from the management subsystem to the other subsystems. Steps are provided in the 2DCDR and multi-namespace install sections of this documentation. If this certificate is updated, and you have a portal deployed, then restart the `portal-www` pods for the update to take effect.

`analytics-ingestion-client or a7s-ing-client`	`ingress-issuer`	Client certificate used for communication with the analytics subsystem on the ingestion endpoint. This certificate must have:
		
		• The same CA as the server certificate `analytics-ai-endpoint` on the analytics subsystem.
		• The common name must match the `spec.clientSubjectDN` in the analytics CR:
		
		`kubectl describe cert analytics-admin-client`
		
		`Spec:`
		`  Common Name:  a7s-ing-client`
		
		`kubectl get a7s -o yaml`
		
		`  spec:`
		`    clientSubjectDN: CN=a7s-ing-client`
		
		For a two data center disaster recovery deployment, both data centers must have an identical subject name. For example, both data centers subject name could be `CN=a7s-ingestion-client`, or they could both be `CN=a7s-ingestion-client, O=cert-manager`, but they must be identical.
		
		To update this certificate, use kubectl. Restart the `apim`, `taskmanager`, and `analytics-proxy` pods after the update. This certificate is also used by the gateways for sending API events to the analytics subsystem. The updated certificate is sent by the management subsystem to the gateways, it is not necessary to restart any gateway pods.

`portal-admin-client or ptl-adm-client`	`ingress-issuer`	Client certificate used for communication with the portal subsystem on the `portalAdminEndpoint`. This certificate must have:
		
		• The same CA as the server certificate `portal-admin or ptl-director` on the portal subsystem.
		• The common name must match the `spec.adminClientSubjectDN` in the portal CR:
		
		`kubectl describe cert portal-admin-client`
		
		`Spec:`
		`  Common Name:  ptl-adm-client`
		
		`kubectl get ptl -o yaml`
		
		`  spec:`
		`    adminClientSubjectDN: CN=ptl-adm-client`
		
		For a two data center disaster recovery deployment, both data centers must have an identical subject name. For example, both data centers subject name could be `CN=portal-admin-client`, or they could both be `CN=ptl-adm-client, O=cert-manager`, but they must be identical.

`gateway-client-client or gw-dr-client`	`ingress-issuer`	Client certificate for communications with the gateway service. Restart the `apim`, and `taskmanager` pods after update. This certificate must have the same CA as the `gwv6-manager-endpoint or gw-gateway-manager` certificate on the gateway.
`api-endpoint or mgmt-platform-api`	`ingress-issuer`	Platform API endpoint server certificate. The certificate that is presented to callers of the platform REST API, and to the toolkit CLI.
`consumer-endpoint or mgmt-consumer-api`	`ingress-issuer`	Consumer API endpoint server certificate. The certificate presented that is presented to callers of the consumer REST API, and to the toolkit CLI.
`apim-endpoint or mgmt-api-manager`	`ingress-issuer`	API Manager UI server certificate.
`cm-endpoint or mgmt-admin`	`ingress-issuer`	Cloud Manager UI server certificate.
`mgmt-replication-client`	`ingress-issuer`	2DCDR deployments only. Client certificate used in the warm-standby data center's `<remote-sitename>-postgres` pod to connect to the active data center.
`mgmt-replication-server`	`ingress-issuer`	2DCDR deployments only. Server certificate used in the active data center's `<management_CR>-tunnel` pod. This certificate must contain the DNS Subject Alternative Name of this data center's hostname and must be valid for the `spec.multiSiteHA.replicationEndpoint` defined in the management CR.
`hub-endpoint`	`ingress-issuer`	Used by the Automated API behavior testing application. User-facing server certificate for the `hub-endpoint`. If there is a problem with this certificate, then the user's browser shows a warning or error message.
`turnstile-endpoint`	`ingress-issuer`	Used by the Automated API behavior testing application. User-facing server certificate for the `turnstile-endpoint`. If there is a problem with this certificate, then the user's browser shows a warning or error message.

Certificate name	Issuer	Description
`analytics-ai-endpoint or a7s-ai-endpoint`	`ingress-issuer`	Server certificate used on the analytics ingestion endpoint, in the mtls-gw pod. Management and gateway subsystems communicate with the analytics subsystem on this endpoint. The client certificates that are used by the management and gateway subsystems must use the same CA certificate as the **`analytics-ai-endpoint`** certificate. If this certificate is updated, restart the **`mtls-gw`** pod for the update to take effect.
`portal-admin or ptl-director`	`ingress-issuer`	Server certificate used on the **`portalAdminEndpoint`**. The management subsystem communicates with the portal subsystem on this endpoint. The corresponding client certificate used in the management to portal communication is the **`portal-admin-client`** certificate. This certificate must have the same CA as the **`portal-admin-client`** certificate on the management subsystem. This certificate is used by the **`portal-nginx`** pod.
`portal-web`	`ingress-issuer`	The server certificate used on the **`portalUIEndpoint`**. It is the server certificate that is presented to portal site users, and which their browser authenticates. If there is a problem with this certificate, then users see an error message about an invalid or insecure certificate in their browser when they access a portal site. The default **`portal-web`** certificate is issued by the **`ingress-issuer`**, which has a self-signed root certificate. Portal users might see a browser warning about use of a self-signed certificate. This certificate is used by the **`portal-web`** ingress (**`portal-web`** route on OpenShift).
`ptl-replication-client`	`ingress-issuer`	2DCDR deployments only. Client certificate that is used in the warm-standby data center's **`<remote-sitename>-www`** and **`<remote-sitename>-db`** pods to connect to the active data center. This certificate is used by all the portal pods related to 2DCDR replication: **`portal-db-remote`**, **`portal-www-remote`**, and **`portal-tunnel`**.
`ptl-replication-server`	`ingress-issuer`	2DCDR deployments only. Server certificate used in the active data center's **`<portal_CR>-tunnel`** pod, the counterpart to the **`ptl-replication-client`** certificate. This certificate must contain the DNS Subject Alternative Name of this data center's hostname and must be valid for the **`spec.multiSiteHA.replicationEndpoint`** defined in the portal CR. This certificate is used by all the portal pods related to 2DCDR replication: **`portal-db-remote`**, **`portal-www-remote`**, and **`portal-tunnel`**.
`gateway-peering or gw-peer`	`ingress-issuer`	This certificate secures the communication between gateways in your gateway cluster.
`gwv6-endpoint or gw-gateway`	`ingress-issuer`	Legacy certificate that is not used.
`gwv6-manager-endpoint or gw-gateway-manager`	`ingress-issuer`	The **`gatewayManager`** endpoint certificate. This is the server certificate on the gateway director endpoint, which the management subsystem communicates with. This certificate must be signed by the same CA as the **`gateway-client-client`** certificate on management subsystem
`event-gateway-management-client`	`ingress-issuer`	The **`event-gateway-management-client`** certificate exists only on Cloud Pak for Integration deployments.

Table 6. Intra-subsystem certificates

Certificate name	Issuer	Description
`management-ca or mgmt-ca`	`selfsigning-issuer`	The issuer for the management subsystems intra-subsystem certificates: management-client, management-server, postgres, and nats certificates. Communication between management subsystem pods fails if there is a problem with this certificate. This certificate is also used as the CA for REST API calls to the management subsystem from the other subsystems, when using **`in-cluster`** communication. See In-cluster service communication between subsystems
`management-client or mgmt-client`	`management-ca`	Client certificate used in communication between management subsystem pods. Communication between management subsystem pods fails if there is a problem with this certificate.
`management-server or mgmt-server`	`management-ca`	Server certificate used in communication between management subsystem pods. Communication between management subsystem pods fails if there is a problem with this certificate. Required DNS names in the certificate: **`*.<namespace>`** **`*.<namespace>.svc`** **`*.<instance name>-server.<namespace>.svc`** **`<instance name>-server`**
`db-client-apicuser`	`management-ca`	Intra-subsystem certificate for the management database subsystem.
v10.0.6 only `db-client-pgbouncer`	`management-ca`	Intra-subsystem certificate for the management database subsystem.
`db-client-postgres`	`management-ca`	Intra-subsystem certificate for the management database subsystem.
v10.0.6 only `db-client-primaryuser`	`management-ca`	Intra-subsystem certificate for the management database subsystem.
`postgres`	`management-ca`	Intra-subsystem certificate for the management database subsystem.
v10.0.6 only `postgres-pgbouncer`	`management-ca`	Intra-subsystem certificate for the management database subsystem.
v10.0.6 only `postgres-operator`	`management-ca`	Intra-subsystem certificate for the management database subsystem.
`natscluster-mgmt`	`management-ca`	Intra-subsystem certificate for the **`nats`** pods.

Certificate name	Issuer	Description
v10.0.6 only `db-client-replicator`	`management-ca`	2DCDR deployments only. Client certificate used by the `<management_CR>-tunnel` pod to connect to the other data center's `<management_CR>-tunnel` pod.
`analytics-ca or a7s-ca`	`selfsigning-issuer`	The issuer for the analytics-client and analytics-server certificates. Communication between analytics subsystem pods fails if there is a problem with this certificate. If this certificate is updated, restart the `storage` and `ingestion` pods for the update to take effect.
`analytics-client or a7s-client`	`analytics-ca`	Client certificate used in communication between analytics subsystem pods. Communication between analytics subsystem pods fails if there is a problem with this certificate. If this certificate is updated, restart the `storage` and `ingestion` pods for the update to take effect.

`analytics-server or a7s-server`	`analytics-ca`	Server certificate used in communication between analytics subsystem pods. Communication between analytics subsystem pods fails if there is a problem with this certificate.
		Required DNS names in the certificate:
		
		`*.<namespace>`
		`*.<namespace>.svc`
		`*.<instance name>-server.<namespace>.svc`
		`<instance name>-server`
		`<instance name>-storage`
		
		If this certificate is updated, restart the `storage` and `ingestion` pods for the update to take effect.

`portal-ca or ptl-ca`	`selfsigning-issuer`	The issuer for the portal-client and portal-server certificates. Communication between portal subsystem pods fails if there is a problem with this certificate. This certificate is used by all portal pods.
`portal-client or ptl-client`	`portal-ca`	Client certificate used in communication between portal subsystem pods. Communication between portal subsystem pods fails if there is a problem with this certificate. This certificate is used by all portal pods.

`portal-server or ptl-server`	`portal-ca`	Server certificate used in communication between portal subsystem pods. Communication between portal subsystem pods fails if there is a problem with this certificate.
		
		Required DNS names in the certificate:
		
		`*.<namespace>`
		`*.<namespace>.svc`
		`*.<instance name>-server.<namespace>.svc`
		`<instance name>-server`
		`*.<instance name>-<site name>-db-all.<namespace>.svc`
		`*.<instance name>-<site name>-www-all.<namespace>.svc`
		`*.<instance name>-<site name>-db-all.<namespace>.svc.cluster.local`
		`*.<instance name>-<site name>-www-all.<namespace>.svc.cluster.local`
		`*.<namespace>.svc.cluster.local`
		`<instance name>-db`
		`#<remote portal CR name>-db # For 2DCDR only.`
		
		<instance name> and *<remote portal CR name>* are truncated if more than 15 characters.
		This certificate is used by all portal pods.

Troubleshooting API Connect

This section provides some general troubleshooting steps for use when encountering common problems with API Connect.

About

The following sections provide advice on diagnosing some common problems. This information can help you to identify whether a specific API Connect component is failing, whether it's an environmental problem, and whether you should raise a support request. Some advice includes reviewing specific log files so you can narrow down the source of the problem.

- Unable to access Management UIs
- Unable to access the portal sites
- Login failure on Management UIs
- Login failure on Portal sites
- Management operations not reflected on Gateway or Portal

Related tasks

- Gathering post-mortem logs
- Gathering logs for a VMware environment

Related information

- IBM Support Service Requests and PMRs

Unable to access Management UIs

If you are unable to access the UI login page, getting a blank page, an HTTP 404, or some other error.

When this happens it means that either the Management subsystem is down, or the access attempt is not reaching the Management subsystem due to a problem in the environment.

Note: If you are on VMware, some of the following checks involve running **kubectl** commands on your VMs. To access your VMs for running **kubectl** commands:

1. **SSH** to one of your subsystem VMs as the user 'apicadm', for example: `ssh apicadm@mgmt1.example.com`
2. **Sudo** to the root user: `sudo -i`
3. From here you can run `kubectl` commands, for example:

```
# kubectl get pods
NAME                                                      READY   STATUS      RESTARTS      AGE
abc-management-analytics-proxy-5f8bcd74c4-jbhch           1/1     Running     1 (97d ago)   113d
...
```

4. API Connect pods run in the default namespace on VMware, so you do not need to specify the namespace with `-n` in the **kubectl** commands.

Check the following:

- Is the access attempt actually reaching the Management subsystem? To confirm this, check what is in the logs of the `juhu` pods which run on the Management subsystem. The `juhu` pods are the entry point for all UI, REST, and CLI requests to the Management subsystem. For every access request there should be line logged by the `juhu`pod, for example: When the user attempts to access the admin UI login page, the following is logged by the juhu pod:

  ```
  kubectl logs abc-management-juhu-fc8f6bb5d-jnw2q --since=5m
  ...
  9.20.85.205 - - [27/May/2022:10:35:49 +0000] [675fa59030a1a68028712ad2fdb2fdb1] "GET /api/cloud/admin/identity-providers
  HTTP/1.1" 200 301 "https://apimsvc20.hursley.ibm.com/auth/admin/sign-in/" "Mozilla/5.0 (Macintosh; Intel Mac OS X 10_15_7)
  AppleWebKit/537.36 (KHTML, like Gecko) Chrome/101.0.4951.64 Safari/537.36" "9.145.13.216" [127.0.0.1:2000]
  request_time=0.222 upstream_response_time=0.224
  ...
  ```

  Note that the timestamp of these log records are not the time when the request arrived, but the time when the response to the request was sent back. To work out the arrival time you can subtract the `request_time=0.222` that appears later in the log message. If there is nothing logged in the `juhu` pods at the time the UI access is attempted, then check if you have any network problems between your browser and the Management subsystem. If you are on OVA then the tcpdump utility is available which you can use to confirm if traffic is reaching your Management VM, for example `tcpdump -i any src host 9.20.86.22 and dst port
  443`
- Are the Management subsystem pods all up and running? Check this with `kubectl get ManagementCluster -n <namespace>`. If this does not show all pods running, then check which pods are failing: `kubectl get pods -n <namespace>`. If you are on OVA then gather postmortem logs and open a support case at this point. Otherwise it's worth checking the reasons why the pods are failing to start with `kubectl describe` as it might be something in your kubernetes environment that you can fix. Note that on the Management subsystem the `postgres` pods will need to be running first, so if these are not running then most other Management pods will not start.
- Check the logs of the `apim` pods while attempting to access the UI. The `juhu` pods receive the requests from the UI, and send them on to the `apim` pods for processing. The logs of the `apim` pods may reveal some clues as to the cause of the problem. If nothing is logged in the `apim` pods at the time of the access attempt then it suggests a problem in the environment, the `juhu` pods unable to forward requests to `apim`.

Unable to access the portal sites

If you are unable to access the login page of a portal site, getting a blank page, an HTTP 404, or some other error.

A portal site outage can occur for one of the following reasons:

- The portal site is down.
- The portal subsystem is down (and so all sites are down).
- The access attempt is not reaching the portal due to a problem in the network or Kubernetes environment.

Note: If you are on VMware, some of the following checks involve running **kubectl** commands on your VMs. To access your VMs for running **kubectl** commands:

1. **SSH** to one of your subsystem VMs as the user 'apicadm', for example: `ssh apicadm@mgmt1.example.com`
2. **Sudo** to the root user: `sudo -i`
3. From here you can run `kubectl` commands, for example:

```
# kubectl get pods
NAME                                                      READY   STATUS      RESTARTS      AGE
abc-management-analytics-proxy-5f8bcd74c4-jbhch           1/1     Running     1 (97d ago)   113d
...
```

4. API Connect pods run in the default namespace on VMware, so you do not need to specify the namespace with `-n` in the **kubectl** commands.

Check for the following problems:

- Does the access attempt reach the portal subsystem?

To confirm that your browser is able to reach the portal site, check the `admin` container logs of the portal's `www` pods. The `nginx` process that runs in the `admin` container is the entry point for site access. For every attempt to access a portal site, the `admin` container logs the HTTP call, for example:

```
# kubectl logs abc-portal-site1-www-0 -c admin | grep nginx
...
[     nginx stdout]   584 ce6ce0:adad58:00580c 2022-05-27 12:57:38: "9.145.11.161, 9.20.85.206" portal.site1.example.com
"GET /providerorg1/sandbox/ HTTP/1.1" 200 5026 5315 5992 "-" "Mozilla/5.0 (Macintosh; Intel Mac OS X 10_15_7)
AppleWebKit/537.36 (KHTML, like Gecko) Chrome/101.0.4951.64 Safari/537.36" 0.330 "-"
...
```

Note: On v10.0.6, v10.0.5.4 and previous releases, the `nginx` logs are in the `web` container. Use the same command, but replace "`-c admin`" with "`-c web`".
If the `admin` container logs nothing at the time the site access is attempted, then check for:

- Network problems between your browser and the portal subsystem.
- Problems with Kubernetes ingresses or OpenShift routes to the portal web endpoint.
- If you are on VMware, then the `tcpdump` utility is installed, and you can use it to confirm if traffic is reaching your portal VM. For example:

  ```
  tcpdump -i any src host 9.20.86.22 and dst port 443
  ```

- Are the portal subsystem pods all up and running?
  Run `kubectl get ptl` to check that your portal pods are running. If this does not show that all pods are running, then check which pods are failing: `kubectl get pods`. If you are on VMware, then gather postmortem logs and open a support case. If you are on Kubernetes or OpenShift, then check why the pods are failing to start with `kubectl describe <pod name>`. On the portal subsystem, the `-db-` pods must be running first; the other pods do not start until the `-db-` pods are running.

- If the `admin` container logs show that the access attempt is received, then check the `web` container logs to see whether there are any errors at the PHP level.

Related tasks

- Gathering post-mortem logs
- Gathering logs for a VMware environment

Related information

- IBM Support Service Requests and PMRs

Login failure on Management UIs

If you are able to access the Management UIs login page, but the login attempt is failing.

Note: If you are on VMware, some of the following checks involve running **kubectl** commands on your VMs. To access your VMs for running **kubectl** commands:

1. **SSH** to one of your subsystem VMs as the user 'apicadm', for example: `ssh apicadm@mgmt1.example.com`
2. **Sudo** to the root user: `sudo -i`
3. From here you can run `kubectl` commands, for example:

   ```
   # kubectl get pods
   NAME                                                              READY   STATUS      RESTARTS      AGE
   abc-management-analytics-proxy-5f8bcd74c4-jbhch                   1/1     Running     1 (97d ago)   113d
   ...
   ```

4. API Connect pods run in the default namespace on VMware, so you do not need to specify the namespace with `-n` in the **kubectl** commands.

Check the logs of the `juhu` and `apim` pods at the time of the login attempt to confirm that the login attempt did reach the Management subsystem. For more information on the `juhu` logs see Unable to access Management UIs. If the login attempt reached the Management subsystem, more details of the login failure for Local User Registry users can be found in the `lur` pod logs, and for LDAP users in the `ldap` pods. Example:

```
# kubectl logs abc-management-lur-8bbc47b54-9vl8q --since=1m -f
...
2022-05-27T13:41:13.511Z audit [4d55be1800dcef18c64e0470484e6eac] START: >>>>>>>> [POST]: /user-login
2022-05-27T13:41:13.704Z lur:error [4d55be1800dcef18c64e0470484e6eac] Requested login, but user, notauser not found in user

Login failure on Portal sites

If you are able to access the Portal sites login page, but the login attempt is failing.

Note: If you are on VMware, some of the following checks involve running **kubectl** commands on your VMs. To access your VMs for running **kubectl** commands:

1. **SSH** to one of your subsystem VMs as the user 'apicadm', for example: `ssh apicadm@mgmt1.example.com`
2. **Sudo** to the root user: `sudo -i`
3. From here you can run `kubectl` commands, for example:

```
# kubectl get pods
NAME                                                              READY   STATUS      RESTARTS      AGE
abc-management-analytics-proxy-5f8bcd74c4-jbhch                   1/1     Running     1 (97d ago)   113d
...
```

4. API Connect pods run in the default namespace on VMware, so you do not need to specify the namespace with `-n` in the **kubectl** commands.

All Portal users except for the site Admin user are ultimately authenticated by the Management subsystem, however Portal adds additional security controls such as IP banning and Flood control which should be first place to check for portal login issues: Managing Developer Portal security.

If the login problem is with the Admin user, then check the logs of the `web` container in the `www` pod at the time of the attempt, for example:

```
# kubectl logs abc-portal-site1-www-0 -c web --since=1m
...
[   php-fpm stderr]   585 ce6ce0:adad58:c3852e 2022-05-27 14:16:49: WARNING: [pool www] child 1023 said into stderr: "WATCHDOG:
[NOTICE] [user] Login attempt failed for admin. | user: anonymous | uri:
https://provorg1.sandbox.portal.apimsvc21.hursley.ibm.com/provorg1/sandbox/user/login | referer:
https://portal.site1.example.com/provorg1/sandbox/user/login
...
```

If the Portal site itself is not rejecting the user login, then check the Management server logs during the login attempt: Login failure on Management UIs. It may also be worth checking the logs of the `admin` container in the `www` pod, which manages the Portal end of the communications with the Management subsystem.

Every account in the Developer Portal, including across different user registries for the same site, must have a unique email address, including the site Admin account. For example, if you configure three different user registries for a particular Developer Portal site, the email address *alice@acme.com* can be used to log in to the site from only one of the user registries. The default email address for the Admin account is the email address of the Catalog owner. It is not possible to create a user account (and associated Consumer organization) with the same email address as the Admin account (or that of the Catalog owner if their email address is different). Any attempts to create an account with the same email address results in the new account not functioning correctly, and returning the following error message when trying to log in: `A user already exists with this email address`.

Management operations not reflected on Gateway or Portal

Where publishes or deletes executed on the Management subsystem are not reflected on the gateway or portal within a few minutes. These problems are often caused by a network failure between Management and the other subsystems, or due to TLS handshaking failures.

Note: If you are on VMware, some of the following checks involve running **kubectl** commands on your VMs. To access your VMs for running **kubectl** commands:

1. **SSH** to one of your subsystem VMs as the user 'apicadm', for example: `ssh apicadm@mgmt1.example.com`
2. **Sudo** to the root user: `sudo -i`
3. From here you can run `kubectl` commands, for example:

```
# kubectl get pods
NAME                                                              READY   STATUS      RESTARTS      AGE
abc-management-analytics-proxy-5f8bcd74c4-jbhch                   1/1     Running     1 (97d ago)   113d
...
```

4. API Connect pods run in the default namespace on VMware, so you do not need to specify the namespace with `-n` in the **kubectl** commands.

For Gateway, the first place to check is the processing status page: Reviewing a gateway's processing status

For Portal and Gateway check the logs of the `taskmanager` pods at the time of the publish attempt. These pods send the publish operations to the gateway and portals via webhooks. If there is a network problem you may see socket timeout errors in the logs of these pods, or TLS errors if there is problem with your certificates. A common problem are load-balancers doing TLS termination instead of passthrough (where JWT security is not used, see Using JWT instead of mTLS on Kubernetes and OpenShift, Using JWT instead of mTLS on OVA). If the logs suggest that the webhook was sent successfully then check the gateway director (gwd) logs on the Gateway, and the `www` pod `admin` container logs on the portal, for example:

```
kubectl logs abc-portal-site1-www-0 -c admin
```

Taskmanager pods execute "send" tasks to publish operations to the gateways and portals. The taskmanager pods log messages about the progress of tasks, so there should be messages in a taskmanager pod for a send task soon after applying a change on the Management subsystem. A "send running in pod" message like the following example means the send task is running:

```
2023-05-05 14:02:37.270 management-taskmanager-f5d6fd77-dmnnt taskmanager apim:taskmanager:info:taskProcessor [0d30189c-db39-
4260-bb1f-a75a3ac5f1ba] task id: b3933261-5799-473d-9b83-9e29c245fde8 / kind: send running in pod: management-taskmanager-
f5d6fd77-dmnnt / containerId: cri-o://d5afe6d3960e333c1ea5d8f95b79564e769bc2ed5de9d8baebebd84b3f3ad4be 269ms after claimed
```

If the taskmanager logs an error containing "dispatching task failed for task"(logged when attempting to start a task) or an error containing "Stale claimed task" (logged 15 minutes later), API Connect might have a problem running tasks. A small number of these errors might be reported from time to time, and the system recovers automatically. But if the errors continue being reported, restart the natscluster pods (all together) and then restart the taskmanager pods to recover by running the following commands:

```
kubectl -n <namespace> delete po -l app.kubernetes.io/name=natscluster
kubectl -n <namespace> delete po -l app.kubernetes.io/name=taskmanager
```

When raising a support case, be sure to include logs from both the Management subsystem and the affected subsystems gateway/portal, stating when the publish attempt was made.

Management subsystem Postgres failover steps V10.0.6.0

V10.0.6 only: If your Postgres leader pod is not the original Postgres leader, complete the failover steps to restore the original pod as leader.

Before you begin

This topic applies only to three replica deployments of API Connect.

Follow the steps in this topic if one or more of the following conditions are reported:

- If the **apicops version:pre-upgrade** command reports:

  ```
  Current postgres leader is not the original leader
  ```

- Openshift and Cloud Pak for Integration only: Your API Connect cluster CR reports `Error` status, and the output of:

  ```
  oc get apiconnectcluster -n <namespace> -o yaml
  ```

  shows:

  ```
  Original PostgreSQL primary is running as replica, please perform failover to original primary before attempting upgrade.
  Refer - https://ibm.biz/BdPLWU
  ```

- When you attempt to upgrade the management subsystem by editing the management CR to change the version and license and you see this error:

  ```
  Original PostgreSQL primary is running as replica, please perform failover to original primary before attempting upgrade.
  Refer - https://ibm.biz/BdPLWU
  ```

About this task

The management subsystem uses Postgres as the database. A three replica API Connect deployment has a Postgres cluster that consists of 1 Postgres leader, and 2 Postgres replicas.
Note: In Kubernetes terminology, every pod in a cluster is called a "replica". In Postgres terminology, a Postgres cluster consists of "members", one of the members is designated as the leader, and the others are designated as "replicas". During normal operation, the Postgres cluster member that is the leader can change; one of the Postgres replicas can become the leader, and the original leader become a replica.
If the current Postgres cluster leader in your management deployment is not the original leader, then problems can occur during upgrade. To prevent upgrade problems, follow the steps in this topic to identify the original Postgres leader and assign it as the leader again.
Note: If you have an OVA deployment, run the steps that are documented in this topic from your management virtual appliance, as the root user: Login to your management virtual appliance with an SSH client and the username `apicadm`, then switch to the root user with `sudo -i`.

Procedure

1. Assign your management subsystem namespace to a new environment variable called `$NAMESPACE`

   ```
   export NAMESPACE=<management namespace>
   ```

   Note: On OVA deployments, set this to "default":

   ```
   export NAMESPACE=default
   ```

2. Identify the original name of your Postgres cluster, and assign it to a new environment variable `$PGCLUSTER_NAME`.

   ```
   export PGCLUSTER_NAME=$(kubectl -n $NAMESPACE get pgcluster | awk 'NR==2{print $1}')
   ```

   Confirm the variable is set correctly with:

   ```
   echo $PGCLUSTER_NAME
   ```

3. Get a list of the PVCs whose names start with `$PGCLUSTER_NAME` in your API Connect namespace.

   ```
   kubectl -n $NAMESPACE get pvc $PGCLUSTER_NAME $PGCLUSTER_NAME-wal
   ```

   ```
   NAME                          STATUS   VOLUME              CAPACITY   ACCESS MODES   STORAGECLASS     AGE
   ```

```
m1-33253de3-postgres       Bound    local-pv-2b61c0bd   234Gi      RWO            local-storage   6h42m
m1-33253de3-postgres-wal   Bound    local-pv-bd893695   234Gi      RWO            local-storage   6h42m
```

Note: If no PVCs are returned then check the **apicops** error or management CR warning, if it says "The original primary PVC is not attached to any pods in this namespace", then do not proceed with these steps. Instead, to re-create your Postgres cluster with a new leader:

a. Take a new management database backup Backup and restore.

b. Restore the management database from the new backup.

4. Get the names of all the Postgres pods.

```
kubectl get pods -n $NAMESPACE -l 'role in (master,replica)'
```

```
NAME                                          READY   STATUS    RESTARTS   AGE
m1-33253de3-postgres-dbd7966db-ltfhq          1/1     Running   0          61s
m1-33253de3-postgres-dxxx-c54776d87-wldgb     1/1     Running   0          26m
m1-33253de3-postgres-xwjf-8577b6c669-9chcp    1/1     Running   0          26m
```

5. Identify which pod was the original Postgres leader.
Describe each Postgres pod to see which one is using the two PVCs identified in step 3.

```
kubectl -n $NAMESPACE describe pod <pod-name> | grep 'ClaimName'
```

```
k describe pod m1-33253de3-postgres-dbd7966db-ltfhq | grep ClaimName
    ClaimName:  m1-33253de3-postgres
    ClaimName:  m1-33253de3-postgres-wal

k describe pod m1-33253de3-postgres-dxxx-c54776d87-wldgb | grep ClaimName
    ClaimName:  m1-33253de3-postgres-dxxx
    ClaimName:  m1-33253de3-postgres-dxxx-wal

k describe pod m1-33253de3-postgres-xwjf-8577b6c669-9chcp | grep ClaimName
    ClaimName:  m1-33253de3-postgres-xwjf
    ClaimName:  m1-33253de3-postgres-xwjf-wal
```

In this example, the highlighted pod **m1-33253de3-postgres-dbd7966db-ltfhq** is the pod that is using the PVCs identified in step 3.
Set this pod to the environment variable *$ORIGINAL_POSTGRES_LEADER*:

```
export ORIGINAL_POSTGRES_LEADER=<pod-name>
```

Note: If none of the Postgres pods are using the PVCs identified in step 3, then do not proceed with these steps. Instead, to re-create your Postgres cluster with a new leader:

a. Take a new management database backup Backup and restore.

b. Restore the management database from the new backup.

6. Run the **patronictl list** command in each Postgres pod and examine the output.

```
kubectl -n $NAMESPACE exec -it <postgres-pod> -- patronictl list
```

Example output for each Postgres pod:

```
Defaulted container "database" out of: database, set-libpq-certs (init)
+-----------------------------------------+-----------------+---------+---------+----+-----------+
| Member                                  | Host            | Role    | State   | TL | Lag in MB |
+ Cluster: m1-33253de3-postgres (7039951359768572098) ---------+---------+---------+----+-----------+
| m1-33253de3-postgres-dbd7966db-ltfhq    | 192.168.51.112  | Replica | running |  8 |         0 |
| m1-33253de3-postgres-dxxx-c54776d87-wldgb  | 192.168.112.17  | Replica | running |  8 |         0 |
| m1-33253de3-postgres-xwjf-8577b6c669-9chcp | 192.168.117.219 | Leader  | running |  8 |           |
+-----------------------------------------+-----------------+---------+---------+----+-----------+
```

Each Postgres pod should show the same output, although the order of the records might differ. The names in the **Member** column should match the names of the Postgres pods. Check the following:

- If the original Postgres pod that you identified in step 5 has a **Lag in MB** of zero and a **TL** the same as the **Leader** pod, then continue to step 7.
- If the pod labeled **Leader** shows a **TL** that is less than the other pods, or a non-null **Lag in MB**, then proceed no further and open a support case.
- If the original Postgres pod that you identified in step 5 shows a lower **TL** than the other pods, or a nonzero value in **Lag in MB**, then reinitialize that pod:

  ```
  kubectl exec -it $ORIGINAL_POSTGRES_LEADER -n $NAMESPACE -- patronictl reinit <cluster name>
  $ORIGINAL_POSTGRES_LEADER
  ```

  where:

  - *<cluster name>* is the name of the Postgres cluster that is shown in the **patronictl list** output:

    ```
    + Cluster: <cluster name> ...
    ```

  Run **patronictl list** again to confirm that the **Lag in MB** is reducing. Do not proceed until it is zero. If it is not reducing, open a support case.

7. Make the pod that you identified in step 5 the **Leader**.
Run:

```
kubectl -n $NAMESPACE exec -it <postgres pod> -- patronictl failover
```

and select your $ORIGINAL_POSTGRES_LEADER as the candidate to failover to:

```
Candidate ['m1-33253de3-postgres-dbd7966db-ltfhq', 'm1-33253de3-postgres-dxxx-c54776d87-wldgb'] []: m1-33253de3-postgres-
dbd7966db-ltfhq
Current cluster topology
+-----------------------------------------+-----------------+---------+---------+----+-----------+
| Member                                  | Host            | Role    | State   | TL | Lag in MB |
+ Cluster: m1-33253de3-postgres (7039951359768572098) ---------+---------+---------+----+-----------+
| m1-33253de3-postgres-dbd7966db-ltfhq    | 192.168.51.112  | Replica | running |  8 |         0 |
| m1-33253de3-postgres-dxxx-c54776d87-wldgb  | 192.168.112.17  | Replica | running |  8 |         0 |
| m1-33253de3-postgres-xwjf-8577b6c669-9chcp | 192.168.117.219 | Leader  | running |  8 |           |
+-----------------------------------------+-----------------+---------+---------+----+-----------+
Are you sure you want to failover cluster m1-33253de3-postgres, demoting current master m1-33253de3-postgres-xwjf-
8577b6c669-9chcp? [y/N]: y
```

```
2021-12-10 22:07:02.15154 Successfully failed over to "m1-33253de3-postgres-dbd7966db-ltfhq"
+-----------------------------------------+-----------------+---------+---------+----+-----------+
| Member                                  | Host            | Role    | State   | TL | Lag in MB |
+ Cluster: m1-33253de3-postgres (7039951359768572098) ---------+---------+---------+----+-----------+
| m1-33253de3-postgres-dbd7966db-ltfhq    | 192.168.51.112  | Leader  | running |  8 |           |
| m1-33253de3-postgres-dxxx-c54776d87-wldgb  | 192.168.112.17  | Replica | running |  8 |         0 |
| m1-33253de3-postgres-xwjf-8577b6c669-9chcp | 192.168.117.219 | Replica | stopped |    |   unknown |
+-----------------------------------------+-----------------+---------+---------+----+-----------+
```

8. Run **patronictl list** to confirm that the pod that was identified in step 5 is the new leader, and that `TL` and `Lag in MB` are reported to be the same in each pod.

```
kubectl exec -it <postgres-pod> -n $NAMESPACE -- patronictl list
```

```
+-----------------------------------------+-----------------+---------+---------+----+-----------+
| Member                                  | Host            | Role    | State   | TL | Lag in MB |
+ Cluster: m1-33253de3-postgres (7039951359768572098) ---------+---------+---------+----+-----------+
| m1-33253de3-postgres-dbd7966db-ltfhq    | 192.168.51.112  | Leader  | running |  9 |           |
| m1-33253de3-postgres-dxxx-c54776d87-wldgb  | 192.168.112.17  | Replica | running |  9 |         0 |
| m1-33253de3-postgres-xwjf-8577b6c669-9chcp | 192.168.117.219 | Replica | running |  9 |         0 |
+-----------------------------------------+-----------------+---------+---------+----+-----------+
```

Management database changes V10.0.7.0

V10.0.7.0 supports only S3 backups for the management subsystem.

In V10.0.7.0, the Crunchy Postgres operator is replaced with a different operator called EDB. The Postgres database itself remains the same, but the Kubernetes pods and jobs that manage the Postgres database are new.

The change in Postgres operator results in new CR status outputs, and new backup requirements and settings, which are explained in this topic.

Management upgrade warning

When you upgrade the API Connect operator to V10.0.7.0, the management CR reports a `Warning` state until the management subsystem is also upgraded to V10.0.7.0. The reason for the warning is that due to the database operator change in V10.0.7.0 the management subsystem must not be left on V10.0.6.0 while the operator is on V10.0.7.0.

S3 backup settings automatically updated

If your management subsystem is already configured for S3 backups, then no extra pre-upgrade steps are required. The upgrade process converts the existing S3 backup settings for the new management database in V10.0.7.0.

When you upgrade to V10.0.7.0 with S3 backups configured, an extra backup path folder /edb is appended to your backup path. The /edb path is to distinguish new V10.0.7.0 backups, from your previous V10.0.6.0 backups.

Update backup settings before upgrade

V10.0.7.0 supports only backups to an S3 object-store for the management database. If your V10.0.6.0 deployment uses SFTP or local backups, then you must reconfigure your management backup settings to use an S3 object-store.

Upgrade to V10.0.7.0 is blocked if management database backups are not configured to use an S3 object-store. To update your backup settings, see the topic for your platform:

- Reconfigure management backup settings on Kubernetes.
- Reconfigure management backup settings on OpenShift.
- Reconfigure management backup settings on VMware.
  Ensure that you use the **apicup** command from your source version when you reconfigure the backup settings. Do not use the V10.0.7.0 **apicup** command to update backup settings on your V10.0.6.0 deployment.

If you do not require management database backups, you can enable an opt-out parameter to override the upgrade block:

- VMware:
  Set `accept-no-backups` to `true`

  ```
  apicup subsys set <subsystem name> accept-no-backups=true
  ```

- Kubernetes and OpenShift individual subsystem installations: Add the following annotation to your management CR:

  ```
  metadata:
    annotations:
      apiconnect-operator/backups-not-configured: "true"
  ```

- Cloud Pak for Integration and OpenShift top-level CR installations: Add the following annotation to your APIConnectCluster CR:

  ```
  metadata:
    annotations:
      apiconnect-operator/backups-not-configured: "true"
  ```

Restore blocked on 2DCDR deployments

V10.0.7.0 and later. Management database restore is blocked on two data center disaster recovery deployments.

From V10.0.7.0, you cannot restore the management database on an API Connect two data center disaster recovery deployment. You must remove the 2DCDR configuration before you can restore the management database. For more information, see the 2DCDR backup and restore documentation for your platform:

- 2DCDR backup and restore considerations on Kubernetes, OpenShift, and Cloud Pak for Integration.
- 2DCDR backup and restore considerations on VMware
