Search is available from any page in API Manager and can be accessed by typing in the search field in the page banner, or by clicking  Search in the navigation list.

### This feature is provided as a Technical Preview

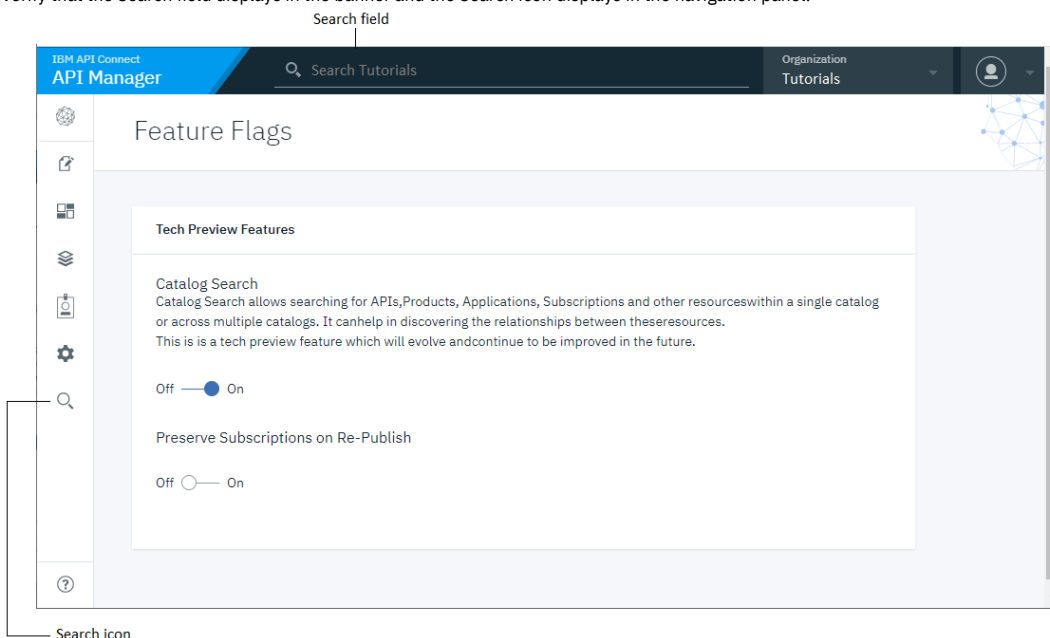

As such, the feature might not be fully functional in your environment and support is limited. In addition, the feature's appearance and functionality are subject to change both in this release (V2018) and in later releases of API Connect. Review the following disclaimer before enabling the Search technical preview:

Notice: Technology Preview Code (TPC) may be included or distributed with the Program or updates to it but are not part of the Program. TPC is licensed under the same terms as the Program, except as provided below. TPC will be identified as such in the Notices File (or in an updated Notices File accompanying the updates). Some or all of the TPC may not be made generally available by IBM as or in a product. Licensee is permitted to use TPC only for internal use for evaluation purposes and not for use in a production environment. The Notices File may limit this evaluation use to an evaluation period. If so, at the end of such evaluation period Licensee must cease using and uninstall the TPC. IBM provides the TPC without obligation of support and "AS IS," WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESS OR IMPLIED, INCLUDING, WITHOUT LIMITATION, THE WARRANTY OF TITLE, NON-INFRINGEMENT OR NON-INTERFERENCE AND ANY IMPLIED WARRANTIES AND CONDITIONS OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE.

### Enabling Search

Enable Search for your API Connect user account by completing the following steps:

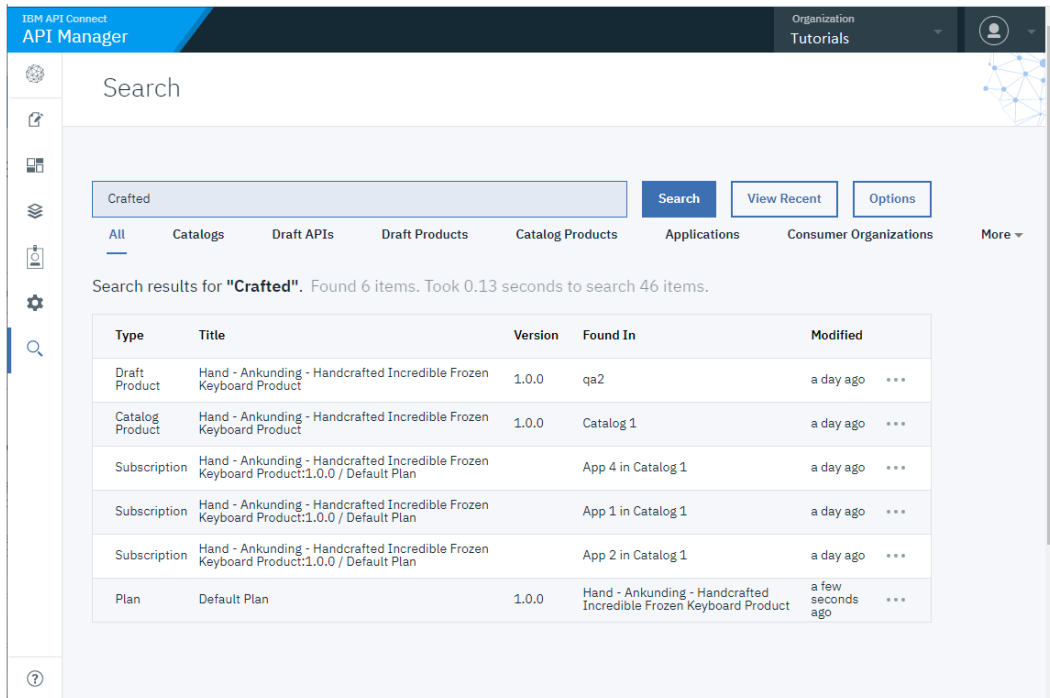

1. Log in to API Manager.
2. In the browser's address bar, append `/ff` to the URL and press Enter to display the Feature Flags page.  
For example: `https://example.com/my-org/ff`
3. On the Feature Flags page, click the Off - On toggle for the "Catalog Search" option to set it to On.
4. When the "Enable Catalog Search" message displays, click Confirm.
5. Verify that the Search field displays in the banner and the Search icon displays in the navigation panel.

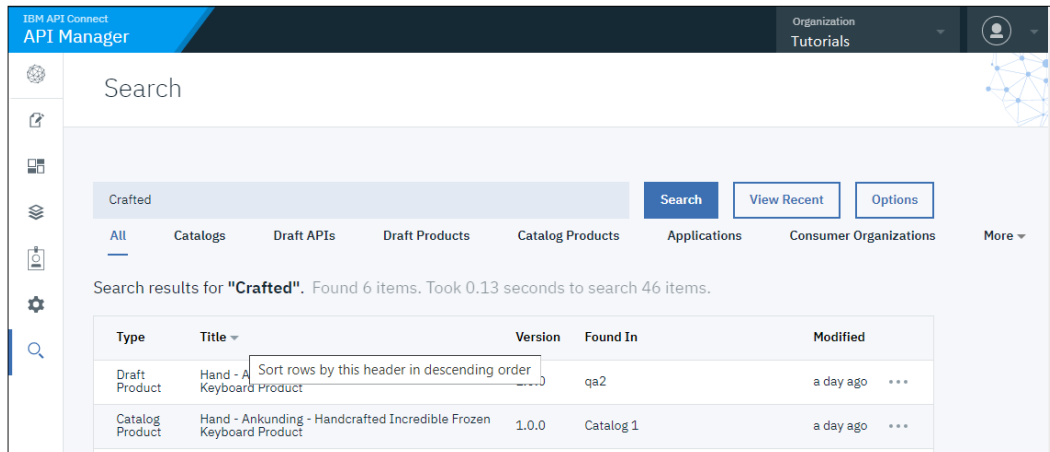

### Using Search

The Search feature is available on all pages of the API Manager. To start searching, just type a string into the Search field and press Enter. Whenever you press Enter in the Search field, the Search page displays with results and additional options. If you press Enter in an empty Search field, or click  Search in the navigation list, then the Search page displays a list all items. If you type a string before pressing Enter, the page displays the results from the corresponding search.

Search results include all items that contain the search string in a text field. For example, suppose you searched for "Crafted". The results might look like the following image, with items that don't match the search string exactly, but do include the string in a text field such as a title or a name:

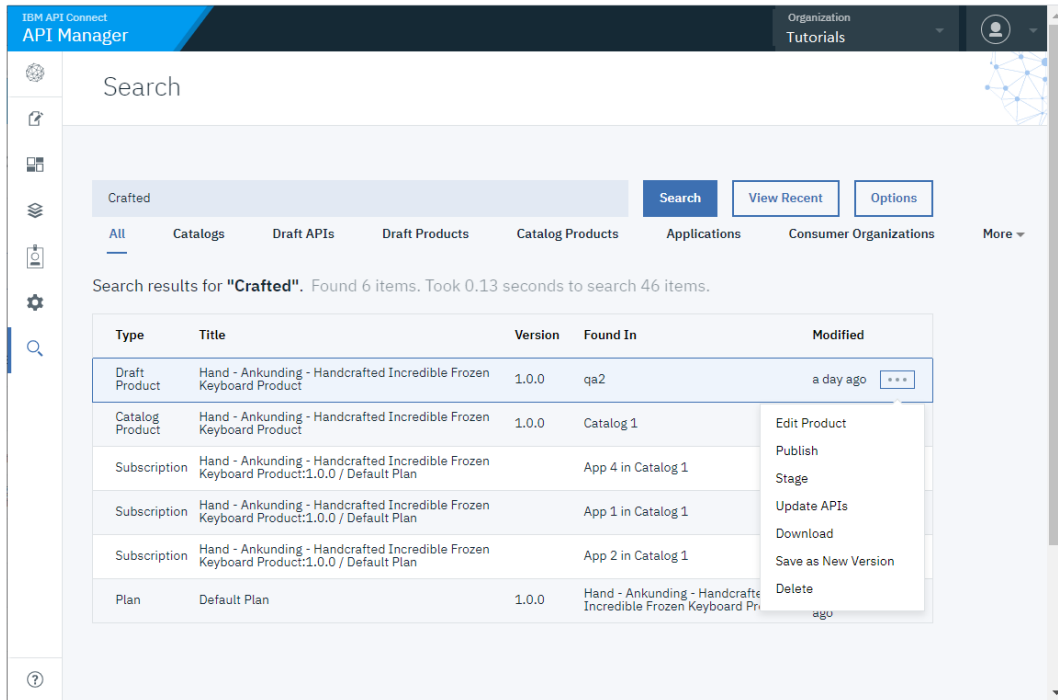

By default, the search returns all types of items that contain the string. Sort results on a particular column by clicking the column header.

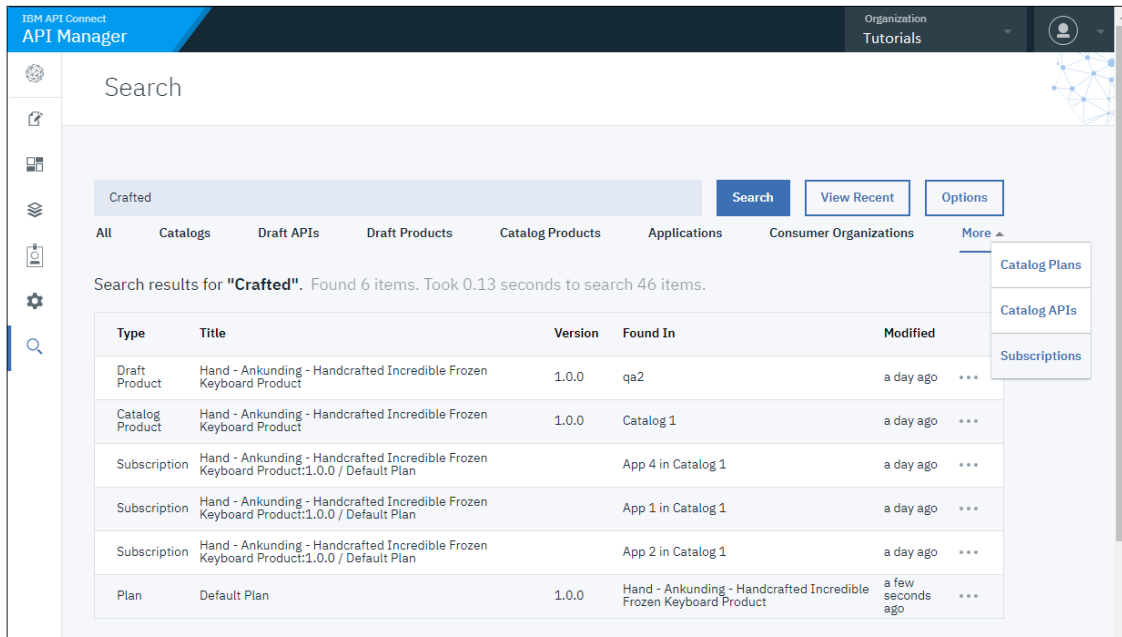

When you find an item you want to work with, click the ... actions menu next to the item's "Modified" date to see what you can do. The list of possible actions depends on the item's type.

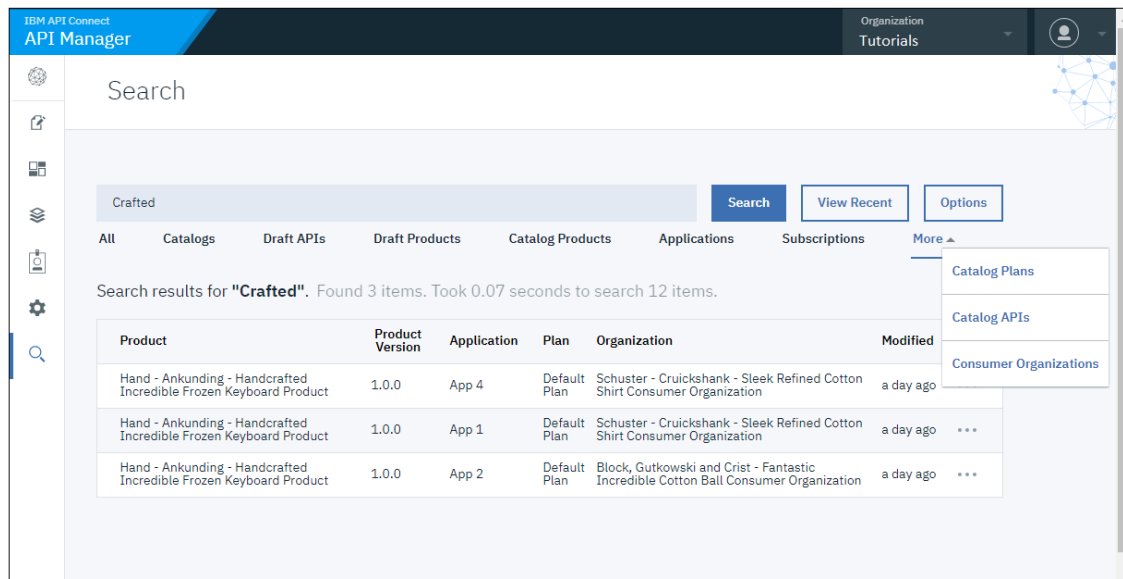

You can limit the search results by selecting an item type from the list that displays before the results. Click More to view additional types. If you select a type from the More menu, it replaces a type in the list.

In the following example, the results of the search for "Crafted" are filtered with the Subscriptions type.

Notice that "Subscriptions" now displays in the default list, and that "Consumer Organizations" moved to More menu.

If you want to refine the search further, click Options. On the Options panel, click Catalogs to Search and select which catalogs to search (the default is all catalogs). You can select up to 5 catalogs for a limited search.

You can also choose whether only exact matches (the complete string) are included in results, or items containing similar strings are also included.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details. For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Working with API definitions

An API definition specifies the complete configuration for an API. You can create and configure your APIs either by using either the API Designer UI application, or by using the browser based API Manager UI.

The following topics provide full details for creating and configuring your APIs.

- [Creating an API definition](#)  
You can create API definitions by using the API Manager or the command line interface in IBM® API Connect.
- [Editing an API definition](#)  
Use this topic to specify configuration settings for an API. You can do this when you create the initial definition, or you can do it later by editing an existing definition.
- [Activating an API](#)  
After you have created an API definition you can activate it to make it available for testing.
- [Testing an API with the assembly test tool](#)  
IBM API Connect provides a test environment for you to ensure that your APIs are defined and implemented correctly.
- [Testing an API with the Local Test Environment](#)  
Use the Local Test Environment to test APIs on your local machine, without the need to connect to an API Connect management server. The Local Test Environment is a lightweight API Manager running on your local machine. It allows you to rapidly test APIs locally.
- [Staging an API](#)  
The graphical wizard provides an option that adds the API to a Product and stages the Product in a Catalog. When a Product is in the staged state, it is not yet visible to, or subscribable by, any developers. The syndication feature in IBM API Connect means that if Spaces are enabled for a Catalog, Products can be staged only to a Space within that Catalog.
- [Publishing an API](#)  
The graphical wizard provides an option that adds the API to a Product and publishes the Product in a Catalog. Publishing a draft Product makes the APIs in that Product visible on the Developer Portal for use by application developers. The syndication feature in IBM API Connect means that if Spaces are enabled for a Catalog, Products can be published only to a Space within that Catalog.
- [Downloading an API definition](#)  
You can download the details of your API definitions so that you can store them for later recovery.
- [Deleting an API definition](#)  
You can delete an API definition that is no longer required.
- [Using an options file when importing a WSDL service](#)  
When you create an API definition, or add a target WSDL service to an API definition, by importing a .zip file, you can specify additional directives by including an options file in the .zip file.
- [API policies and logic constructs](#)  
Policies and logic constructs are pieces of configuration that control a specific aspect of processing in the Gateway server during the handling of an API invocation at run time.
- [Tags in API Connect](#)  
There are a number of forms of tagging in IBM API Connect.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details. For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Creating an API definition

You can create API definitions by using the API Manager or the command line interface in IBM® API Connect.

### Before you begin

---

An API is a set of functions that provide some business or technical capability and can be called by applications by using a defined protocol. Applications are typically mobile or web applications, and they use the HTTP protocol. An API definition is composed of paths, and can be one of the following types:

#### REST API definition

A REST API is a defined set of interactions that uses the HTTP protocol, typically by using JSON or XML as the data format that is exchanged. For example, a data request might use an HTTP GET method, and a data record might use an HTTP POST method. The choice of data format depends on the type of application that is calling the API. JSON is commonly used for web pages or mobile applications that present a user interface (by using JavaScript or HTML), whereas XML is often used for machine-to-machine scenarios.

You can create REST APIs by using LoopBack® functions to create models and data sources. These are then used by your REST API definition and exposed to your users.

Alternatively, you can expose and secure your existing APIs by using a [Proxy](#) or [Invoke](#) policy.

In either case, you can configure your API definition either by using the API Manager, or by writing an OpenAPI definition file and publishing it using either API Manager or the command line interface.

#### SOAP API

You can create SOAP API definitions that are based on an existing Web Services Description Language (WSDL) file. You can use this facility to benefit from the capabilities that are provided by API Connect, which include analytics and mapping between variables. You can also expose the API by using the Developer Portal for any existing SOAP services in your organization, including any SOAP services that are part of a service-oriented architecture (SOA) or Enterprise Service Bus (ESB) infrastructure.

You can create SOAP API definitions through either the command line interface, or through API Manager.

### About this task

---

You can create definitions for REST APIs or SOAP APIs.

- In the API Manager, you can add a REST API definition either by composing the API definition, and its operations, from scratch, or by importing an OpenAPI definition file. You can also use the tooling to quickly create a proxy API that calls an existing endpoint.
- If you have an existing SOAP service that you want to expose more widely, you can add a SOAP API to IBM® API Connect. You can use the Developer Portal to publicize the SOAP service to the developers. If a developer wants to use the SOAP API, you can use API Connect to manage their sign-up and access to the service, and track the usage of that API.

### Procedure

---

1. Quickly create an API definition by using one of the following wizards:

- [Creating a REST proxy API from a target service](#)
- [Creating a REST proxy API from an existing OpenAPI service](#)
- [Creating a new REST OpenAPI definition](#)
- [Creating a REST proxy API from an existing WSDL service](#)
- [Adding a REST API by importing an OpenAPI definition file](#)
- [Creating a SOAP proxy API from an existing WSDL service](#)

2. After you create your API definition, you can define it in more detail by following the instructions in [Editing an API definition](#).

#### • [Creating a REST proxy API from a target service](#)

If you have an existing REST service that you want to expose through an IBM API Connect API definition, you can create a proxy API and specify the target endpoint by using the API Manager.

#### • [Creating a REST proxy API from an existing OpenAPI service](#)

If you have an existing OpenAPI described target service that you want to expose through an IBM API Connect API definition, you can create a proxy API and specify the target endpoint.

#### • [Creating a REST proxy API from an existing WSDL service](#)

If you have a SOAP service defined in a WSDL file, you can use the WSDL file to create an API Connect REST proxy API that calls that SOAP service.

#### • [Creating a SOAP proxy API from an existing WSDL service](#)

If you have a SOAP service defined in a WSDL file, you can use the WSDL file to create an API Connect SOAP proxy API that calls that SOAP service.

#### • [Creating a new REST OpenAPI definition](#)

You can create and edit draft REST API definitions by using the API Manager or the API Designer user interface in IBM API Connect.

#### • [Adding a REST API by importing an OpenAPI definition file](#)

You can use an OpenAPI definition file to import a REST API into IBM API Connect.

#### • [Adding a SOAP API by importing a zip file](#)

You can use an OpenAPI definition file to import a SOAP API into IBM API Connect.

## Creating a REST proxy API from a target service

If you have an existing REST service that you want to expose through an IBM® API Connect API definition, you can create a proxy API and specify the target endpoint by using the API Manager.

### About this task

You can complete this task either by using either the API Designer UI application, or by using the browser based API Manager UI.

To complete this task, you must be assigned a role that has the **Api-Drafts:Edit**, **Settings:View**, and **App:View** permissions. The pre-supplied Developer role has these permissions by default; if you are assigned a custom role it must have these permissions. For more information, see [Creating custom roles](#).

Create proxy REST APIs in minutes by using the API Manager tool to create an API from target service. This procedure creates a REST proxy that routes all traffic to a target REST API or service endpoint.

### Procedure

To compose a proxy API from a target service, complete the following steps.

1. In the navigation pane, click  Develop, and then click Add  API.  
The Add API: Create screen is displayed.
2. Select From target service, and click Next.
3. Click Next. Specify the API summary in the Info screen. You can fine-tune the API after it is created.
  - The Title can include special characters but should be kept short so that it can be easily displayed in the user interface.
  - The Name is entered automatically. The value in the Name field is a single string that is used to identify the Product in developer toolkit CLI commands. To view the CLI commands to manage draft APIs, see [apic draft-apis](#).
  - The Version corresponds to the value of the `info.version` property of the API's OpenAPI definition. The `version.release.modification` version numbering scheme is recommended; for example `1.0.0`.
  - The Base path is the URL segment of the API and does not include the host name or any additional segments for paths or operations. The base path cannot include special characters and must begin with a "/" character even if it is otherwise empty.
  - The optional Description helps to identify the API.
4. Specify the existing REST API endpoint that you want to call in the Target Service URL field.
5. Click Next. In the Secure section, configure the API security that you require.
  - Secure using Client ID - Select this option to require an Application to provide a Client ID (API Key). This causes the `x-IBM-Client-Id` parameter to be included in the request header for the API. If selected, you can then select whether to limit the API calls on a per key (per Client ID) basis:
    - Limit API calls on a per key basis - If selected, you must configure the rate limit that you require. Rate limits control the maximum number of calls allowed within a time period (hour, minute, month or day). For example, 100 calls per hour.  
For information about security options in IBM API Connect, see [Configuring API security](#).
  - CORS - Select this option to enable cross-origin resource sharing (CORS) support for your API. This allows your API to be accessed from another domain.
6. Click Next to create your API definition.  
The Summary panel displays messages as the definition is created, and the selected security options and rate limits are enforced.
7. Select one of the following options:
  - To further configure your API, click Edit API. For details, see [Editing an API definition](#).
  - If you do not want to configure your API further at this time, click the left arrow icon  to return to the APIs and Products page; you can then move on immediately to another task. For details on how to configure your API later, see [Editing an API definition](#).

### Results

You created a proxy API from an existing target service.

### What to do next

APIs are made available to application developers by including them in a Product, and then publishing that Product to a Catalog. For more information, see [Working with Products](#) and [Working with Catalogs](#).

---

## Creating a REST proxy API from an existing OpenAPI service

If you have an existing OpenAPI described target service that you want to expose through an IBM® API Connect API definition, you can create a proxy API and specify the target endpoint.

### About this task

---

You can complete this task either by using either the API Designer UI application, or by using the browser based API Manager UI.

To complete this task, you must be assigned a role that has the **Api-Drafts:Edit**, **Settings:View**, and **App:View** permissions. The pre-supplied Developer role has these permissions by default; if you are assigned a custom role it must have these permissions. For more information, see [Creating custom roles](#).

Create proxy REST APIs in minutes by using the API Manager tool to create an API from existing OpenAPI service. This procedure creates a REST proxy that routes all traffic to a target REST API or service endpoint.

### Procedure

---

To compose a proxy API from an existing OpenAPI service, complete the following steps.

1. In the navigation pane, click  Develop, and then click Add  API.  
The Add API: Create screen is displayed.
2. Select From existing OpenAPI service, and click Next.
3. To upload the service information from an OpenAPI file, you can either drag and drop your file, or browse and select the file that you want to use. Valid file types are YAML, YML, etc.
  - Click Browse and browse for the OpenAPI file.
  - Drag and drop the file into the active area.

After you upload the file, the OpenAPI specification is evaluated and a message displays whether it is valid.

4. Click Next. Specify the API summary in the Info screen. You can fine-tune the API after it is created.
  - The Title can include special characters but should be kept short so that it can be easily displayed in the user interface.
  - The Name is entered automatically. The value in the Name field is a single string that is used to identify the Product in developer toolkit CLI commands. To view the CLI commands to manage draft APIs, see [apic draft-apis](#).
  - The Version corresponds to the value of the **info.version** property of the API's OpenAPI definition. The **version.release.modification** version numbering scheme is recommended; for example 1.0.0.
  - The Base path is the URL segment of the API and does not include the host name or any additional segments for paths or operations. The base path cannot include special characters and must begin with a "/" character even if it is otherwise empty.
  - The optional Description helps to identify the API.
5. Click Next. In the Secure section, configure the API security that you require.
  - Secure using Client ID - Select this option to require an Application to provide a Client ID (API Key). This causes the **X-IBM-Client-Id** parameter to be included in the request header for the API. If selected, you can then select whether to limit the API calls on a per key (per Client ID) basis:
    - Limit API calls on a per key basis - If selected, you must configure the rate limit that you require. Rate limits control the maximum number of calls allowed within a time period (hour, minute, month or day). For example, 100 calls per hour.For information about security options in IBM API Connect, see [Configuring API security](#).
  - CORS - Select this option to enable cross-origin resource sharing (CORS) support for your API. This allows your API to be accessed from another domain.
6. Optional: (API Manager UI only) Select Activate API if you want to immediately use the API for further development and testing.

Note:

- When you select the Activate API option, API Connect automatically completes the following actions:
    - Creates a draft Product, adds the API to the Product, and publishes the Product to the Sandbox Catalog so that the API is available to be called. The Product has the title *api\_title* auto product. Note that if you later want to delete the draft Product, you cannot delete it directly; instead, delete the API and the draft Product is deleted together with the API; see [Deleting an API definition](#). If you want to remove the Product from any Catalogs to which it is published, you must do this separately; see [Removing a Product from a Catalog](#)
    - Subscribes the Sandbox test application to the Product so that you can immediately test the API in the test environment. For information on testing an API, see [Testing an API with the assembly test tool](#).
  - You cannot use the Activate API option if lifecycle approval is enabled in the Sandbox Catalog for the Stage, Publish, or Replace actions. If any such lifecycle approvals are enabled, then to be able to use the Activate API option they must be disabled; for information on lifecycle approval settings, see [Creating and configuring Catalogs](#).
  - To use the Activate API option, you must be assigned a role that has the **Product:Manage** and **Subscription:Manage** permissions. The pre-supplied Developer role has these permissions by default; if you are assigned a custom role it must have these permissions. For more information, see [Creating custom roles](#).
7. Click Next to create your API definition.  
The Summary panel displays messages as the definition is created, and the selected security options and rate limits are enforced.  
  
If you selected Activate API, the wizard populates an API Endpoint URL that you can use in testing. If you have also selected Secure using Client ID, the wizard displays a Client ID and Client Secret you can use.
  8. Select one of the following options:
    - To further configure your API, click Edit API. For details, see [Editing an API definition](#).
    - If you do not want to configure your API further at this time, click the left arrow icon  to return to the APIs and Products page; you can then move on immediately to another task. For details on how to configure your API later, see [Editing an API definition](#).

### Results

---

You created a proxy API from an existing OpenAPI service.

## What to do next

APIs are made available to application developers by including them in a Product, and then publishing that Product to a Catalog. For more information, see [Working with Products](#) and [Working with Catalogs](#).

## Related tasks

# Creating a REST proxy API from an existing WSDL service

If you have a SOAP service defined in a WSDL file, you can use the WSDL file to create an API Connect REST proxy API that calls that SOAP service.

## About this task

You can complete this task either by using either the API Designer UI application, or by using the browser based API Manager UI.

To complete this task, you must be assigned a role that has the **Api-Drafts:Edit**, **Settings:View**, and **App:View** permissions. The pre-supplied Developer role has these permissions by default; if you are assigned a custom role it must have these permissions. For more information, see [Creating custom roles](#).

If the WSDL file is a stand-alone file with no external dependencies, you can load the .wsdl file from a directory to create the REST API definition.

If the WSDL file references other WSDL files or references XSD files containing XML schema definitions, you must create a .zip archive of the WSDL file and its dependent documents, and then load the .zip file from a directory to add the REST API definition.

## Procedure

To add a REST API definition by loading a WSDL file, complete the following steps:

1. In the navigation pane, click  Develop, and then click Add API.  
The Add API: Create screen is displayed.
2. On the Add API pane, select From existing WSDL service (REST Proxy). Click Next.  
The Create API from Existing WSDL Service (REST Proxy) window opens.
3. To upload the service information from a stand-alone .wsdl file, or a .zip file that contains a WSDL file and its dependent documents, you can either drag and drop your file, or browse and select the file that you want to use.  
After you upload the file, the WSDL is evaluated and a message displays whether the WSDL is valid.  
  
If you upload a .zip file, you can include in the .zip file an options file to specify additional directives. For details, see [Using an options file when importing a WSDL service](#).
4. Click Next. At the Select Service panel, select a WSDL service from the imported file.
5. Click Next. Specify the API summary in the Info screen. You can fine-tune the API after it is created.
  - The Title can include special characters but should be kept short so that it can be easily displayed in the user interface.
  - The Name is entered automatically. The value in the Name field is a single string that is used to identify the Product in developer toolkit CLI commands. To view the CLI commands to manage draft APIs, see [apic draft-apis](#).
  - The Version corresponds to the value of the `info.version` property of the API's OpenAPI definition. The `version.release.modification` version numbering scheme is recommended; for example `1.0.0`.
  - The Base path is the URL segment of the API and does not include the host name or any additional segments for paths or operations. The base path cannot include special characters and must begin with a "/" character even if it is otherwise empty.
  - The optional Description helps to identify the API.
6. Click Next. In the Secure section, configure the API security that you require.
  - Secure using Client ID - Select this option to require an Application to provide a Client ID (API Key). This causes the `x-IBM-Client-Id` parameter to be included in the request header for the API. If selected, you can then select whether to limit the API calls on a per key (per Client ID) basis:
    - Limit API calls on a per key basis - If selected, you must configure the rate limit that you require. Rate limits control the maximum number of calls allowed within a time period (hour, minute, month or day). For example, 100 calls per hour.  
For information about security options in IBM® API Connect, see [Configuring API security](#).
    - CORS - Select this option to enable cross-origin resource sharing (CORS) support for your API. This allows your API to be accessed from another domain.
7. Optional: (API Manager UI only) Select Activate API if you want to immediately use the API for further development and testing.

Note:

- When you select the Activate API option, API Connect automatically completes the following actions:
  - Creates a draft Product, adds the API to the Product, and publishes the Product to the Sandbox Catalog so that the API is available to be called. The Product has the title `api_title` auto product. Note that if you later want to delete the draft Product, you cannot delete it directly; instead, delete the API and the draft Product is deleted together with the API; see [Deleting an API definition](#). If you want to remove the Product from any Catalogs to which it is published, you must do this separately; see [Removing a Product from a Catalog](#)

- Subscribes the Sandbox test application to the Product so that you can immediately test the API in the test environment. For information on testing an API, see [Testing an API with the assembly test tool](#).
  - You cannot use the Activate API option if lifecycle approval is enabled in the Sandbox Catalog for the Stage, Publish, or Replace actions. If any such lifecycle approvals are enabled, then to be able to use the Activate API option they must be disabled; for information on lifecycle approval settings, see [Creating and configuring Catalogs](#).
  - To use the Activate API option, you must be assigned a role that has the **Product:Manage** and **Subscription:Manage** permissions. The pre-supplied Developer role has these permissions by default; if you are assigned a custom role it must have these permissions. For more information, see [Creating custom roles](#).
8. Click Next to create your API definition.  
The Summary panel displays messages as the definition is created, and the selected security options and rate limits are enforced.
- If you selected Activate API, the wizard populates an API Endpoint URL that you can use in testing. If you have also selected Secure using Client ID, the wizard displays a Client ID and Client Secret you can use.
9. Select one of the following options:
- To further configure your API, click Edit API. For details, see [Editing an API definition](#).
  - If you do not want to configure your API further at this time, click the left arrow icon  to return to the APIs and Products page; you can then move on immediately to another task. For details on how to configure your API later, see [Editing an API definition](#).

## Results

---

You created a REST API definition by using an existing WSDL file.

## What to do next

---

APIs are made available to application developers by including them in a Product, and then publishing that Product to a Catalog. For more information, see [Working with Products](#) and [Working with Catalogs](#).

You can also manage the Product lifecycle, and control who can see and subscribe to your Product, by opening the Sandbox Catalog associated with your API in the Manage page of the API Manager UI.

# Creating a SOAP proxy API from an existing WSDL service

If you have a SOAP service defined in a WSDL file, you can use the WSDL file to create an API Connect SOAP proxy API that calls that SOAP service.

## About this task

---

You can complete this task either by using either the API Designer UI application, or by using the browser based API Manager UI.

To complete this task, you must be assigned a role that has the **Api-Drafts:Edit**, **Settings:View**, and **App:View** permissions. The pre-supplied Developer role has these permissions by default; if you are assigned a custom role it must have these permissions. For more information, see [Creating custom roles](#).

You can add a SOAP API to expose an existing SOAP service by supplying the WSDL file that defines that existing service in one of the following ways:

- If the WSDL file is a stand-alone file with no external dependencies, you can load the .wsdl file from a directory to create the SOAP API definition.
- You can provide one or more WSDL files in a single .zip file that contains the WSDL files and any necessary schemas.  
If the WSDL file references other WSDL files or references XSD files containing XML schema definitions, you must create a .zip archive of the WSDL file and its dependent documents, and then load the .zip file from a directory to add the SOAP API definition.

The service must support Web Services Basic Profile Version 1.1 - Second Edition.

## Procedure

---

To add a SOAP API definition by loading a WSDL file, complete the following steps:

1. In the navigation pane, click  Develop, and then click Add API.  
The Add API: Create screen is displayed.
2. Select From existing WSDL service (SOAP Proxy). Click Next.  
The Create API from Existing WSDL Service (SOAP Proxy) window opens.
3. To upload the service information from a stand-alone .wsdl file, or a .zip file that contains a WSDL file and its dependent documents, you can either drag and drop your file, or browse and select the file that you want to use.  
After you upload the file, the WSDL is evaluated and a message displays whether the WSDL is valid.

If you upload a .zip file, you can include in the .zip file an options file to specify additional directives. For details, see [Using an options file when importing a WSDL service](#).

4. Click Next. At the Select Service panel, select a WSDL service from the imported file.
5. Click Next. Specify the API summary in the Info screen. You can fine-tune the API after it is created.
  - The Title can include special characters but should be kept short so that it can be easily displayed in the user interface.
  - The Name is entered automatically. The value in the Name field is a single string that is used to identify the Product in developer toolkit CLI commands. To view the CLI commands to manage draft APIs, see [apic draft-apis](#).
  - The Version corresponds to the value of the `info.version` property of the API's OpenAPI definition. The `version.release.modification` version numbering scheme is recommended; for example 1.0.0.
  - The Base path is the URL segment of the API and does not include the host name or any additional segments for paths or operations. The base path cannot include special characters and must begin with a "/" character even if it is otherwise empty.
  - The optional Description helps to identify the API.
6. Click Next. In the Secure section, configure the API security that you require.
  - Secure using Client ID - Select this option to require an Application to provide a Client ID (API Key). This causes the `X-IBM-Client-Id` parameter to be included in the request header for the API. If selected, you can then select whether to limit the API calls on a per key (per Client ID) basis:
    - Limit API calls on a per key basis - If selected, you must configure the rate limit that you require. Rate limits control the maximum number of calls allowed within a time period (hour, minute, month or day). For example, 100 calls per hour.For information about security options in IBM® API Connect, see [Configuring API security](#).
  - CORS - Select this option to enable cross-origin resource sharing (CORS) support for your API. This allows your API to be accessed from another domain.
7. Optional: (API Manager UI only) Select Activate API if you want to immediately use the API for further development and testing.

Note:

- When you select the Activate API option, API Connect automatically completes the following actions:
    - Creates a draft Product, adds the API to the Product, and publishes the Product to the Sandbox Catalog so that the API is available to be called. The Product has the title `api_title` auto product. Note that if you later want to delete the draft Product, you cannot delete it directly; instead, delete the API and the draft Product is deleted together with the API; see [Deleting an API definition](#). If you want to remove the Product from any Catalogs to which it is published, you must do this separately; see [Removing a Product from a Catalog](#).
    - Subscribes the Sandbox test application to the Product so that you can immediately test the API in the test environment. For information on testing an API, see [Testing an API with the assembly test tool](#).
  - You cannot use the Activate API option if lifecycle approval is enabled in the Sandbox Catalog for the Stage, Publish, or Replace actions. If any such lifecycle approvals are enabled, then to be able to use the Activate API option they must be disabled; for information on lifecycle approval settings, see [Creating and configuring Catalogs](#).
  - To use the Activate API option, you must be assigned a role that has the `Product:Manage` and `Subscription:Manage` permissions. The pre-supplied Developer role has these permissions by default; if you are assigned a custom role it must have these permissions. For more information, see [Creating custom roles](#).
8. Click Next to create your API definition.  
The Summary panel displays messages as the definition is created, and the selected security options and rate limits are enforced.  
  
If you selected Activate API, the wizard populates an API Endpoint URL that you can use in testing. If you have also selected Secure using Client ID, the wizard displays a Client ID and Client Secret you can use.
  9. Select one of the following options:
    - To further configure your API, click Edit API. For details, see [Editing an API definition](#).
    - If you do not want to configure your API further at this time, click the left arrow icon  to return to the APIs and Products page; you can then move on immediately to another task. For details on how to configure your API later, see [Editing an API definition](#).

## Results

---

You created a SOAP API definition by using an existing WSDL file.

## What to do next

---

APIs are made available to application developers by including them in a Product, and then publishing that Product to a Catalog. For more information, see [Working with Products](#) and [Working with Catalogs](#).

You can also manage the Product lifecycle, and control who can see and subscribe to your Product, by opening the Sandbox Catalog associated with your API in the  Manage page of the API Manager UI.

---

## Creating a new REST OpenAPI definition

You can create and edit draft REST API definitions by using the API Manager or the API Designer user interface in IBM® API Connect.

### About this task

You can complete this task either by using either the API Designer UI application, or by using the browser based API Manager UI.

**API Manager UI only:** To complete this task you must be assigned a role that has the **Api-Drafts:Edit** permission. The pre-supplied Developer role has this permission by default; if you are assigned a custom role it must have this permission. For more information, see [Creating custom roles](#).

### Procedure

To create a new REST OpenAPI definition, complete the following steps.

1. In the navigation pane, click  Develop, and then click Add  API.  
The Add API: Create screen is displayed.
2. Select New OpenAPI .
3. Click Next. Specify the API summary in the Info screen. You can fine-tune the API after it is created.
  - The Title can include special characters but should be kept short so that it can be easily displayed in the user interface.
  - The Name is entered automatically. The value in the Name field is a single string that is used to identify the Product in developer toolkit CLI commands. To view the CLI commands to manage draft APIs, see [apic draft-apis](#).
  - The Version corresponds to the value of the `info.version` property of the API's OpenAPI definition. The `version.release.modification` version numbering scheme is recommended; for example `1.0.0`.
  - The Base path is the URL segment of the API and does not include the host name or any additional segments for paths or operations. The base path cannot include special characters and must begin with a "/" character even if it is otherwise empty.
  - The optional Description helps to identify the API.
4. Click Next. In the Secure section, configure the API security that you require.
  - Secure using Client ID - Select this option to require an Application to provide a Client ID (API Key). This causes the `X-IBM-Client-Id` parameter to be included in the request header for the API. If selected, you can then select whether to limit the API calls on a per key (per Client ID) basis:
    - Limit API calls on a per key basis - If selected, you must configure the rate limit that you require. Rate limits control the maximum number of calls allowed within a time period (hour, minute, month or day). For example, 100 calls per hour.  
For information about security options in IBM API Connect, see [Configuring API security](#).
  - CORS - Select this option to enable cross-origin resource sharing (CORS) support for your API. This allows your API to be accessed from another domain.
5. Click Next to create your API definition.  
The Summary panel displays messages as the definition is created, and the selected security options and rate limits are enforced.
6. Select one of the following options:
  - To further configure your API, click Edit API. For details, see [Editing an API definition](#).
  - If you do not want to configure your API further at this time, click the left arrow icon  to return to the APIs and Products page; you can then move on immediately to another task. For details on how to configure your API later, see [Editing an API definition](#).

### Results

You successfully created a REST API definition. For API Designer, the specifications for the APIs and Products are stored in the directory that you specified when you logged in. For API Manager, the specifications for the APIs and Products are stored on the management server.

### What to do next

APIs are made available to application developers by including them in a Product, and then publishing that Product to a Catalog. For more information, see [Working with Products](#) and [Working with Catalogs](#).

## Adding a REST API by importing an OpenAPI definition file

You can use an OpenAPI definition file to import a REST API into IBM® API Connect.

### Before you begin

---

Your file must conform to version 2.0 of the OpenAPI specification. The format of the file can be JSON or YAML.

Note: Products that contain an API with a Swagger property using **regex** that include lookahead assertions, such as "(?" cannot be validated or published. An error message is returned. For example:

```
Product has not been published!
The multipart 'openapi' field contains an OpenAPI definition with validation errors.
definitions.properties.pattern Does not match format 'regex' (context: (root).definitions.properties.pattern, line: 0, col:
0)
400
```

### About this task

---

You can complete this task either by using either the API Designer UI application, or by using the browser based API Manager UI.

**API Manager UI only:** To complete this task, you must be assigned a role that has the **Api-Drafts:Edit**, **Settings:View**, and **App:View** permissions. The pre-supplied Developer role has these permissions by default; if you are assigned a custom role it must have these permissions. For more information, see [Creating custom roles](#).

If you are using the API Designer UI and you want to use an OpenAPI definition file from elsewhere, downloaded from an external website for example, rather than created by using API Connect, use the import mechanism described here rather than copying the file into your local API Designer directory; the import operation adds API Connect specific sections that are required by API Designer.

### Procedure

---

To add a REST API by importing an OpenAPI file, complete the following steps:

1. In the navigation pane, click  Develop, and then click Add  API. The Add API: Create screen is displayed.
2. In the Import section, select Existing OpenAPI, and click Next.
3. To import a file from your local file system, you can either drag and drop your files, or click Browse and select the file that you want to use. The following file types are supported if they contain a valid OpenAPI definition: .json, .yaml, and .yaml. The wizard checks the validity of the YAML, and displays a message indicating successful validation.

Note:

- If you are using the API Manager UI, the import operation fails if the file defines an API that has the same name and version as an existing API definition. However, if you are using the API Designer UI, API definitions are uniquely identified by the file name in your local file system; therefore, if you import two different files that define the same API name and version, two API definitions with the same name and version are created in API Connect, with no error.
- Any validation error messages are displayed in English only, and are not translated.

4. Click Next.

5. Optional: (API Manager UI only) Select Activate API if you want to immediately use the API for further development and testing.

Note:

- When you select the Activate API option, API Connect automatically completes the following actions:
  - Creates a draft Product, adds the API to the Product, and publishes the Product to the Sandbox Catalog so that the API is available to be called. The Product has the title *api\_title* auto product. Note that if you later want to delete the draft Product, you cannot delete it directly; instead, delete the API and the draft Product is deleted together with the API; see [Deleting an API definition](#). If you want to remove the Product from any Catalogs to which it is published, you must do this separately; see [Removing a Product from a Catalog](#)
  - Subscribes the Sandbox test application to the Product so that you can immediately test the API in the test environment. For information on testing an API, see [Testing an API with the assembly test tool](#).
- You cannot use the Activate API option if lifecycle approval is enabled in the Sandbox Catalog for the Stage, Publish, or Replace actions. If any such lifecycle approvals are enabled, then to be able to use the Activate API option they must be disabled; for information on lifecycle approval settings, see [Creating and configuring Catalogs](#).
- To use the Activate API option, you must be assigned a role that has the **Product:Manage** and **Subscription:Manage** permissions. The pre-supplied Developer role has these permissions by default; if you are assigned a custom role it must have these permissions. For more information, see [Creating custom roles](#).

6. Click Next. The Import API Summary panel indicates that the YAML file is loaded and valid.

If you selected Activate API, the wizard populates an API Endpoint URL, and displays a Client ID and Client Secret that you can use.

7. Select one of the following options:

- To further configure your API, click Edit API. For details, see [Editing an API definition](#).
- If you do not want to configure your API further at this time, click the left arrow icon  to return to the APIs and Products page; you can then move on immediately to another task. For details on how to configure your API later, see [Editing an API definition](#).

### Results

---

When the API definition has been imported, it is shown in the list of API definitions in the APIs and Products page. For API Designer, the specifications for the APIs and Products are stored in the directory that you specified when you logged in. For API Manager, the specifications for the APIs and Products are stored on the management

server.

## What to do next

---

APIs are made available to application developers by including them in a Product, and then publishing that Product to a Catalog. For more information, see [Working with Products](#) and [Working with Catalogs](#).

## Adding a SOAP API by importing a zip file

You can use an OpenAPI definition file to import a SOAP API into IBM® API Connect.

### Before you begin

---

The format of the file must be .zip, and the file must contain the WSDL definition and the YAML file that defines the API. The YAML file must conform to version 2.0 of the OpenAPI specification.

Note: Products that contain an API with a Swagger property using **regex** that include lookahead assertions, such as "(?" cannot be validated or published. An error message is returned. For example:

```
Product has not been published!  
The multipart 'openapi' field contains an OpenAPI definition with validation errors.  
definitions.properties.pattern Does not match format 'regex' (context: (root).definitions.properties.pattern, line: 0, col:  
0)  
400
```

### About this task

---

You can complete this task either by using either the API Designer UI application, or by using the browser based API Manager UI.

**API Manager UI only:** To complete this task, you must be assigned a role that has the **Api-Drafts:Edit**, **Settings:View**, and **App:View** permissions. The pre-supplied Developer role has these permissions by default; if you are assigned a custom role it must have these permissions. For more information, see [Creating custom roles](#).

If you are using the API Designer UI and you want to use an OpenAPI definition file from elsewhere, downloaded from an external website for example, rather than created by using API Connect, use the import mechanism that is described here rather than copying the file into your local API Designer directory; the import operation adds API Connect specific sections that are required by API Designer.

For more information on how to create a .zip file, see [Downloading an API definition](#).

## Procedure

---

To add a SOAP API by importing a .zip file, complete the following steps:

1. In the navigation pane, click  Develop, and then click Add > API.  
The Add API: Create screen is displayed.
2. In the Import section, select Existing OpenAPI, then click Next.
3. To import a file from your local file system, you can either drag and drop your files, or click Browse and select the file that you want to use.  
The wizard checks the validity of the WSDL and YAML, and displays a message that indicates a successful validation.  
Note:
  - If you are using the API Manager UI, the import operation fails if the file defines an API that has the same name and version as an existing API definition. However, if you are using the API Designer UI, API definitions are uniquely identified by the file name in your local file system; therefore, if you import two different files that define the same API name and version, two API definitions with the same name and version are created in API Connect, with no error.
  - Any validation error messages are displayed in English only, and are not translated.
4. Click Next.
5. Optional: (API Manager UI only) Select Activate API if you want to immediately use the API for further development and testing.  
Note:
  - When you select the Activate API option, API Connect automatically completes the following actions:
    - Creates a draft Product, adds the API to the Product, and publishes the Product to the Sandbox Catalog so that the API is available to be called. The Product has the title *api\_title* auto product. Note that if you later want to delete the draft Product, you cannot delete it directly; instead, delete the API and the draft Product is deleted together with the API; see [Deleting an API definition](#). If you want to remove the Product from any Catalogs to which it is published, you must do this separately; see [Removing a Product from a Catalog](#)

- Subscribes the Sandbox test application to the Product so that you can immediately test the API in the test environment. For information on testing an API, see [Testing an API with the assembly test tool](#).
  - You cannot use the Activate API option if lifecycle approval is enabled in the Sandbox Catalog for the Stage, Publish, or Replace actions. If any such lifecycle approvals are enabled, then to be able to use the Activate API option they must be disabled; for information on lifecycle approval settings, see [Creating and configuring Catalogs](#).
  - To use the Activate API option, you must be assigned a role that has the **Product:Manage** and **Subscription:Manage** permissions. The pre-supplied Developer role has these permissions by default; if you are assigned a custom role it must have these permissions. For more information, see [Creating custom roles](#).
6. Click Next. The Import API Summary panel indicates that the file is loaded and valid.  
If you selected Activate API, the wizard populates an API Endpoint URL, and displays a Client ID and Client Secret that you can use.
7. Select one of the following options:
- To further configure your API, click Edit API. For details, see [Editing an API definition](#).
  - If you do not want to configure your API further at this time, click the left arrow icon  to return to the APIs and Products page; you can then move on immediately to another task. For details on how to configure your API later, see [Editing an API definition](#).

## Results

---

When the API definition has been imported, it is shown in the list of API definitions in the Develop page. For API Designer, the specifications for the APIs and Products are stored in the directory that you specified when you logged in. For API Manager, the specifications for the APIs and Products are stored on the management server.

## What to do next

---

APIs are made available to application developers by including them in a Product, and then publishing that Product to a Catalog. For more information, see [Working with Products](#) and [Working with Catalogs](#).

---

## Editing an API definition

---

Use this topic to specify configuration settings for an API. You can do this when you create the initial definition, or you can do it later by editing an existing definition.

## About this task

---

You can complete this task either by using either the API Designer UI application, or by using the browser based API Manager UI. During the initial creation of an API, the API wizard guides you to enter the minimum configuration settings, and then provides an Edit API icon. You can select it continue with advanced configuration, or click  to exit the configuration. When you click Edit API, you can use the API Setup page to specify additional configuration. This topic describes how to specify additional configuration.

When you select Edit API, the Design view of the Develop API editor is displayed. You can configure your definition by editing the different sections in the page navigation side bar of the Develop API editor. The following steps take you through these sections. You can also write your API directly in the source by using the Source view, and you can configure your policy assembly by using the Assemble view

**Note:** If you make an update in any section of the Develop API editor, you must click Save in that section to ensure that your changes are updated in the API definition.

## Procedure

---

1. Access the API Setup page in one of the following ways:
  - During the initial creation of an API, the API wizard guides you to enter the minimum configuration settings, and then provides an Edit API icon. When you select that icon, the API Setup page is displayed. Proceed to the next step.
  - When you want to edit an existing API, you can access the API settings by going to the navigation pane and clicking Develop. Select the API that you want to edit. The API Setup page is displayed.
2. In the API Setup tab, you can edit the following sections:
  - a. Optional: In the Info section, edit any or all of Title, Description, and Version.  
**Note:** If you change the Title or Version, when you save the API definition a new API definition is created, copying the current configuration.
  - b. Optional: In the Consumes section, select which types of media your API will accept when calls are made to it. In addition to JSON and XML, which are supported by API Connect, you can add other media types by using the Add Media Type field.  
**Note:** The configurations that you make become defaults for all of the operations in the API. However, you can override these media types for individual operations. For more information, see [Defining Paths for a REST API](#).
  - c. Optional: In the Produces section, select which types of media your API will return when calls are made to it. In addition to JSON and XML, which are supported by API Connect, you can add other media types by using the Add Media Type field.

Note: The configurations that you make become defaults for all of the operations in the API. However, you can override these media types for individual operations. For more information, see [Defining Paths for a REST API](#).

- d. Optional: If you want external developers on the portal to access your APIs by using a host address that is not the same as the API endpoints that are defined for the gateway services where your API will run, use the Address field in the Host section to define the host name that is to be used.
- Note: To enable this capability, you must additionally configure API vanity endpoints in the Catalog Settings for the Catalog to which the API is published. For information on configuring vanity endpoints, see [Creating and configuring Catalogs](#).
- e. Optional: In the Base Path section, you can change the path segment that is shared by all operations in your API. The base path is the initial URL segment of the API, and does not include the host name or any additional segments for paths or operations.
- f. In the Schemes section, select which transfer protocols you want your API to use. HTTPS is selected by default.
- Note: If your API is enforced by an API Connect gateway, only the HTTPS protocol is supported. See the following Lifecycle section for instructions about how to enable enforcement.
- g. In the Lifecycle section you can use the drop-down menu to change the phase of the lifecycle that your API is in.
- Realized (default) - The API is in the implementation phase.
  - Identified - The API is in the early conceptual phase and is neither fully designed nor implemented.
  - Specified - The API has been fully designed and passed an internal milestone but has not yet been implemented.

You can also edit the following options:

- Enforced - Select this option to enforce the API by using the API Connect Gateway. Clear this option if you are managing the API on a gateway other than an API Connect gateway. Although not published to a gateway by API Connect, an unenforced API is still available in the Developer Portal for subscription by application developers.
- Testable - Select this option to allow the API's operations to be tested using the test tool in the Developer Portal.  
Note: For the test tool to work, an API must be included in a Plan in a Product that is staged in a Catalog.
- CORS - Select this option to enable cross-origin resource sharing (CORS) access control for your API.
- Application authentication - Select this option to protect your API with a certificate, for example, by using TLS mutual authentication. When the API is called, an X509 client certificate must be supplied, either in the **X-Client-Certificate** HTTP header, or as a TLS client certificate from TLS mutual authentication. For any Developer Portal application that calls the API, the certificate must be entered in the Developer Portal user interface; for details, see [Registering an application](#).

The Gateway service to which the API is published can be configured to use TLS mutual authentication to secure API calls made to that Gateway service; for details, see [Configuring the initial Gateway service](#).

If you are using a load balancer, you must configure the load balancer to use the **X-Client-Certificate** HTTP header to relay the appropriate client certificate to the Gateway service after the load balancer terminates the TLS communication.

- **API Gateway only** Buffering - if you select this option, the API requests and responses are first buffered before being processed on the DataPower® API Gateway. If you clear this option, the gateway streams the API requests and responses byte by byte where possible. However, situations in which the gateway will buffer the requests and responses even if the Buffering option is cleared include the following:
  - The API policy assembly includes a **parse** policy; the **parse** policy buffers the message before reading it into the parse tree.
  - The API policy assembly includes policies that use GatewayScript functions that require the message to be buffered; for example, `context.message.body.readAsBuffer`, `context.message.body.readAsJSON`, `context.message.body.readAsXML`.
  - The API policy assembly includes policies that use the `apim.getvariable` GatewayScript function, which is backwardly compatible with the DataPower Gateway (v5 compatible); the gateway falls back to using buffering mode.
  - The **Content-Type** header of the incoming request is `application/x-www-form-urlencoded`; the gateway reads the message to populate the form parameters.
  - A WSDL API routes the request based on the name of the root element inside the SOAP body.
  - The API policy assembly includes a **map** policy; the gateway buffers the message before executing this policy.

h. Optional: In the Parameters section, add parameters that you want to be defined on all the Paths in the API; these parameters are inherited by all the Path definitions in the API. Click Add and complete the following fields:

  - Name - Provide a name for your parameter.
  - Located In - Select where the parameter is found in the call of your operation.
  - Type - Select the type of data that the parameter is expected to have when the call is received by API Connect. If you have set Located In to Body, then you can select a JSON schema that you have defined for your API in the Definitions section. For more information about creating JSON schemas, see [step 6](#).
  - Description - Provide a description of your parameter.
  - Required - Select this check box to specify that the parameter is required for a call to be valid.

i. Optional: In the Tags and External Documentation section, click Add to provide any tags and external documentation details that you want to refer users to. Tags added in this way appear in the OpenAPI definition of the API, but are not used by API Connect for any indexing.

j. Click Save to save your updates.

3. In the Security Definitions tab, you can specify the security definitions that might be used by the API or its operations. A security definition specifies all the settings for a particular aspect of API security; for example, the user registry that you use to authenticate access to the API. For more information, see [Configuring API security](#).

4. In the Security tab, select the security definitions that you want to apply to your API. Click Add to make your definitions appear in the list of security definitions. Click Save to save your updates.

To be available in the Security section, definitions must have been defined in the Security Definitions section.

5. In the Paths tab, you can add API Paths to your definition.

A Path is a unit of a REST API that can be called by applications. A Path comprises of one or more HTTP verb operations and a URL path that, when exposed, is combined with the base path of the API. By configuring the Path, you define how the API is exposed to your developers. For more information about Paths, operations, and adding tags to your operations, see [Defining Paths for a REST API](#) and [Configuring an operation](#).

6. In the Definitions tab, you can create schema definitions.

These definitions can then be referenced in an operation to provide developers with information about the request they should make, or the response they should expect to receive from the operation. Your schema definitions are made available to developers through the Developer Portal, but are not enforced in any calls to the API unless a [Validate - DataPower Gateway \(v5 compatible\)](#) policy is used.

a. Click Add.

The Edit Definitions page is displayed.

b. Complete the Name field for your definition.

c. From the Type drop-down list, select the type of your definition.

d. Optional: In the Description field for your definition, provide a description of what is defined by the definition.

e. If you want to allow the inclusion of properties that are not included in the definition, so that validation will not fail when a validate-rest policy is used on the request, select the Additional properties check box.

f. Click Save to complete the details of your definition's properties. Each property requires a name and type, and can also have an example and description.

g. Optional: You can add additional properties by clicking Add again.

Note:

- You can include more complex schema definitions in your API by using the Source view, and editing your API OpenAPI definition directly. For more information, see the [OpenAPI specification](#).
- If, for a schema definition property of type `long`, you specify a `minimum` or `maximum` parameter in the OpenAPI source, the highest value you can set is `9007199254740992`; if you exceed this value then, due to rounding behavior, an incorrect value might be saved.

Tip: You can click Edit schema in a definition to display the Add XML schema window. In this window, you can edit, upload, or infer an XML schema from a JSON schema.

7. In the Properties tab, you can define any API properties that you want to use. For more information, see [API properties](#).
8. In the Target Services tab, add any web services that you want to use in your API definition. Complete the following steps:
  - a. Click Add.
  - b. To upload the service information from a stand-alone .wsdl file, or a .zip file that contains a WSDL file and its dependent documents, you can either drag and drop your file, or browse and select the file that you want to use. After you upload the file, the WSDL is evaluated and a message displays whether the WSDL is valid.  
If you upload a .zip file, you can include in the .zip file an options file to specify additional directives. For details, see [Using an options file when importing a WSDL service](#).
  - c. In the Select Target Service pane, select the service that you want to add, then click Submit.  
The target services that you add are now available in the palette on the Assemble view for you to add to your API assembly flow; for more information, see [Including components in your assembly](#).
9. In the Categories tab, define any categories that you want to organize your APIs into. Click Save to save any updates.  
By organizing your APIs into categories, you can provide a hierarchical display for your APIs in the Developer Portal. For more information, see [Organizing your APIs and Products into categories](#).
10. If the gateway type associated with the API is the DataPower API Gateway, select the Activity Log tab to configure your logging preferences for the API activity that is stored in API Connect Analytics. By default, the content type that is collected and stored in API event records is activity for when API execution completes successfully, and payload for when API execution completes with an error code. For more information, see [Activity logging with the DataPower API Gateway](#). Click Save to save any updates.  
Note that if the gateway type associated with the API is the DataPower Gateway (v5 compatible), you can configure your logging preferences by applying an Activity Log policy in the Assemble view. For more information, see [Activity Log](#).  
  
The gateway type that is associated with the API by default when you first create it depends on the gateway services that are defined in the Sandbox Catalog. For more information, see [API Connect gateway types](#) and [Specifying the gateway type for an API definition](#).
11. Select the Assemble view to configure and test the policy assembly for your API. Click Save to save any updates.  
You can drag and drop policies and logic constructs onto the assembly canvas, and use the internal test tool to test your assembly. For more information, see [The Assemble view](#), and [API policies and logic constructs](#).

- **[Defining Paths for a REST API](#)**

A Path is a unit of a REST API that you can call. A Path comprises an HTTP verb and a URL path that, when exposed, is combined with the base path of the API. By configuring the Path, you define how the API is exposed to your developers.

- **[Organizing your APIs and Products into categories](#)**

You can organize your APIs and Products into categories. The APIs and Products that you categorize are displayed within the Developer Portal, in their defined categories.

- **[Activity logging with the DataPower API Gateway](#)**

If you're using the DataPower API Gateway, you can use the Activity Log tab in the API Manager UI to configure your logging preferences for the API activity that is stored in Analytics. The preferences that you specify will override the default settings for collecting and storing details of the API activity.

- **[The Assemble view](#)**

The API Manager of IBM API Connect features an Assemble view that you can use to create assemblies. With assemblies, you can readily tailor your APIs to include components such as activity logging and redaction of specific fields.

- **[Including components in your assembly](#)**

An assembly is formed of components that are applied to calls to and responses from operations in your API. Components can be either policies or logic constructs.

- **[Creating a new version of an API definition](#)**

You can create multiple versions of an API definition and edit the versions independently by using IBM API Connect.

- **[Specifying the gateway type for an API definition](#)**

An API definition is specific to one or other of the gateway types, DataPower API Gateway or DataPower Gateway (v5 compatible). A default gateway type is set when you create an API definition, but you can edit the API configuration to specify a different gateway type.

- **[Converting an API definition for deployment to the DataPower API Gateway](#)**

IBM API Connect provides two gateway types, DataPower Gateway (v5 compatible) and DataPower API Gateway. If you have an API definition that was developed for the DataPower Gateway (v5 compatible) and you want to port it to the DataPower API Gateway, you must make changes to convert it before deployment.

- **[API properties](#)**

Properties are used by the gateway to control behavior of certain policies. Typically, you provide properties, but the policy can also provide properties settings.

- **[Variable references in API Connect](#)**

In API Connect you can reference different variables in your API definition.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Defining Paths for a REST API

A Path is a unit of a REST API that you can call. A Path comprises an HTTP verb and a URL path that, when exposed, is combined with the base path of the API. By configuring the Path, you define how the API is exposed to your developers.

---

### About this task

You can complete this task either by using either the API Designer UI application, or by using the browser based API Manager UI.

## Procedure

---

To define a Path, complete the following steps:

1. In the navigation pane, click  Develop, then select the APIs tab.
2. Click the REST API definition that you want to work with.
3. Click Paths, then click Add.
4. In the Path name field, enter the name of the Path, using the format `/path_name`.

The path is appended to the base path to construct the full URI to access the APIs. The path must start, but not end, with the / character. A parameter at the end of the path can contain a qualifier to match one or more path levels.

If you specify just the name of the parameter, then one level of that path is matched. If you want to allow for multiple levels of the path, you can prefix the parameter with one of the following qualifiers:

- \* to indicate 0 or more occurrences
- + to indicate 1 or more occurrences

The + and \* qualifiers can only be used at the end of the path.

For example, the path:

```
/petstore/{type}/{*category}
```

matches the following paths, where only one type value is matched, but all (0 or more) categories are matched:

```
/petstore/cats  
/petstore/cats/supplies  
/petstore/cats/supplies/health  
/petstore/cats/supplies/health/medicines  
/petstore/cats/supplies/health/medicines/a/b/c
```

Note: The full API does not have to be unique across all Paths in your IBM® API Connect system. However, if it is not unique then you *must* specify that an application is required to identify itself with a client ID when it calls the operation; the client ID is used to uniquely determine which operation to call, according to which Plan the application is subscribed to.

For information on specifying application identification requirements, see [Creating an API key security definition](#).

5. To add one or more HTTP operations to your Path, complete the following steps:

- a. In the Operations section, click Add.
- b. Select the operations that you want to add.  
You can select from the following operations:

GET	Retrieves data from the server.
PUT	Updates data that is stored in the server.
POST	Sends data to the server for processing.
DELETE	Removes data from the server.
PATCH	Applies partial modifications to a path. Unlike the PUT method, the PATCH method applies an incremental change rather than replacing the entire operation. Note: If you want to use the PATCH operation, your API Connect gateway must be running DataPower® firmware Version 7.0.0 or later, otherwise the request is rejected by the gateway.
HEAD	Requests the same response as for a GET method call, but without the response body. This method is useful for retrieving information that is written in response headers, without having to transport the entire content.
OPTIONS	Retrieves the HTTP methods and other options that are supported by a web server or an operation, without implying a resource action or initiating an operation retrieval.

Note: For each Path, you can have only one of each type of operation.

- c. Click Add to confirm the addition of the selected Paths.

6. Optional: Add any parameters that you want to include for the Path and all of its operations, by completing the following steps:

- a. In the Path Parameters section, click Add.
- b. In the NAME field, provide a name for your parameter.  
Note: The query parameters `appId`, `client_id`, `client_secret`, and `appSecret` are reserved and cannot be used.

- c. In the LOCATED IN field, select where the parameter is located when your path operations are called.

- d. Optional: From the TYPE drop-down list, select the type of data that the parameter is expected to have when the call is received by API Connect. If you have set LOCATED IN to body then you can select a JSON schema that you have defined for your API. For more information about creating JSON schemas, see [Step 6 of Editing an API definition](#).

- e. Optional: In the DESCRIPTION field, provide a description of your parameter.

- f. Use the REQUIRED check box to specify whether the parameter is required for a call to be valid.

Note: If you specify that a parameter is required, the `required` field for the parameter in the OpenAPI definition file is set to `true`, so that the requirement is documented for consumers of the API. The requirement is not enforced by the IBM API Connect Gateway

However, the requirement is enforced by the [Developer Portal test tool](#), because the purpose of these tools is to explore the correct operation of the API.

7. Click Save to save your changes.

8. Configure your operations. For more information, see [Configuring an operation](#). You must provide at least one property or response for each operation, depending upon the operation type.

---

## Results

The Paths and operations for your REST API are defined.

## What to do next

---

Add your API to a Plan in a Product. When your API is part of a Product you can stage your Product to a Catalog to test the operations in your API. When you stage a Product, you can publish it to the Developer Portal for application developers to use your APIs and operations.

For more information about Products, see [Working with Products](#).

- [Configuring an operation](#)  
One or more HTTP operations together form a Path. These operations are different ways of interacting with an API and you can use GET, POST, PUT, DELETE, HEAD, PATCH, and OPTIONS operations.

## Related tasks

- [IBM API Connect overview](#)
- [API Manager](#)

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Configuring an operation

One or more HTTP operations together form a Path. These operations are different ways of interacting with an API and you can use GET, POST, PUT, DELETE, HEAD, PATCH, and OPTIONS operations.

## About this task

---

You can complete this task either by using either the API Designer UI application, or by using the browser based API Manager UI.  
An operation must have at least one success response defined.

## Procedure

---

To configure an operation, complete the following instructions:

1. In the navigation pane, click  Develop, then select the APIs tab.
2. Click the REST API definition that you want to work with.
3. Click Paths, click the required Path, then click the required operation.  
The details page for the operation opens.
4. Optional: In the Operation Id field, provide an identifier for your operation. The operation ID must not be shared by any other operations.
5. Optional: In the Summary field, provide a summary of your operation.
6. Optional: In the Tags field, add any tags that you want to associate your operation with.  
The tags are included in the OpenAPI definition file for the API, and can be used to group operations in the Developer Portal by using the filter options for the API.
7. Optional: In the Description field, provide a description of your operation.
8. Specify which security definitions to apply to your operation. By default, all the security definitions that have been configured for the API are applied to the operation. To select which of the API security definitions you want to apply to the operation, complete the following steps:
  - a. Select Override API Security Definitions.  
An Add button is displayed.
  - b. Click Add, then select the required security definitions.
9. Specify the media types that the operation produces. By default, the operation produces the same media types as those that have been defined for the API. To specify the required media types, select Override API Produce Types; you can select JSON and XML, which are supported by API Connect, and you can add another media type in the Add media Type field.
10. Specify the media types that the operation consumes. By default, the operation consumes the same media types as those that have been defined for the API. To specify the required media types, select Override API Consume Types; you can select JSON and XML, which are supported by API Connect, and you can add another media type in the Add media Type field.
11. Optional: Add any parameters that are specific to this operation, by completing the following steps:
  - a. In the Parameters section, click Add.
  - b. In the NAME field, provide a name for your parameter.  
**Note:** The query parameters `appId`, `client_id`, `client_secret`, and `appSecret` are reserved and cannot be used.
  - c. In the LOCATED IN field, select where the parameter is located when your operation is called.
  - d. Optional: From the TYPE drop-down list, select the type of data that the parameter is expected to have when the call is received by API Connect. If you have set LOCATED IN to body then you can select a JSON schema that you have defined for your API. For more information about creating JSON schemas, see [Step 6 of Editing an API definition](#).
  - e. Optional: In the DESCRIPTION field, provide a description of your parameter.
  - f. Use the REQUIRED check box to specify whether the parameter is required for a call to be valid.  
**Note:** If you specify that a parameter is required, the `required` field for the parameter in the OpenAPI definition file is set to `true`, so that the requirement is documented for consumers of the API. The requirement is not enforced by the IBM® API Connect Gateway  
However, the requirement is enforced by the [Developer Portal test tool](#), because the purpose of these tools is to explore the correct operation of the API.

12. Add or edit any responses that you want to include.

These responses are only for the OpenAPI definition of your API that is provided to developers and are not used for any purposes other than documentation.

a. In the Response section, click Add.

b. In the STATUS field, provide the HTTP status code that might be returned.

c. Optional: If you have defined any JSON schemas for your API, you can select to reference one of them from the SCHEMA drop-down list. For more information on creating JSON schemas, see Step 6 of [Editing an API definition](#).

d. In the DESCRIPTION field, provide text to be returned for the specified status code.

13. Click Save to save your changes.

---

## Results

You have configured your operation and can add more operations to your Path.

---

## Related tasks

# Organizing your APIs and Products into categories

You can organize your APIs and Products into categories. The APIs and Products that you categorize are displayed within the Developer Portal, in their defined categories.

---

## Before you begin

Your role must have the necessary permissions to stage and publish Products.

---

## About this task

You can complete this task either by using either the API Designer UI application, or by using the browser based API Manager UI.

By organizing your APIs and Products into categories, you can provide a hierarchical display for your APIs and Products in the Developer Portal.

Note: Organizing APIs and Products into a hierarchical view in the API Manager or API Manager UI is different to tagging in the Developer Portal.

---

## Procedure

1. In the navigation pane, click  Develop.
2. Click the title of the API or Product that you want to work with.
3. Click Categories.
4. In the Categories text box, enter the hierarchical taxonomy path that you want your API or Product to follow, in the following format:

```
top_level_element / next_level_element / x_level_element
```

For example:

```
Animals / Fluffy / Cat
```

5. After you have completed entering the category specifications for the API or Product, click Save.
6. In the API Manager UI, publish the Product that you have staged by following the steps in [Publishing a new Product](#).

---

## What to do next

- Publish the Product; see [Publishing a new Product](#).
- After publishing the Product, you can, in the Developer Portal, display the APIs and Products in the categories that you have defined. For more information, see [Displaying APIs and Products in categories](#).

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

# Activity logging with the DataPower API Gateway

If you're using the DataPower® API Gateway, you can use the Activity Log tab in the API Manager UI to configure your logging preferences for the API activity that is stored in Analytics. The preferences that you specify will override the default settings for collecting and storing details of the API activity.

You can complete this task either by using either the API Designer UI application, or by using the browser based API Manager UI.

## About

An API event record exists for each API execution event in the Gateway server. By default, the content type that is collected and stored in API event records is **activity** for when API execution completes successfully, and **payload** for when API execution completes with an error code. When you compose your API definition, you can change the type of content to log in these API event records. During API execution, the activity data is stored in the **log** context variable, which populates the API event record on completion of the API execution; for more information, see [API activity logging context variables](#).

Activity logging can be configured in the API Manager by using the Activity Log tab, in the Design view of the Develop API editor. Or you can edit the source directly (see the [Example source](#) section for details).

Note that if you're using the DataPower Gateway (v5 compatible), you can configure your logging preferences by applying an Activity Log policy in the Assemble view. For more information, see [Activity Log](#).

Note:

Activity logging that calls for logging of Analytics data upon success doesn't apply for the OAuth provider. The OAuth provider logs Analytics data for failure cases, but doesn't log successful cases.

## Properties

The following table lists the activity log properties in the API Manager UI, indicates whether a property is required, specifies the valid and default values for input, and specifies the data type of the values.

Table 1. Activity log properties

Property label	Required	Description	Data type
Activity Log	Yes	Indicates whether activity logging is enabled or disabled. Use the slider control to turn activity logging On or Off. The default value is On.	string
Content	Yes	Defines the type of content to be logged when the operation is successful. Valid values: <ul style="list-style-type: none"><li><b>none</b>: Indicates that no logging occurs. Restriction: This option disables notifications for application developers who use your Developer Portal.</li><li><b>activity</b>: Logs invocation only (only the resource URI is recorded).</li><li><b>header</b>: Logs activity and header.</li><li><b>payload</b>: Logs activity, header, and payload (the original request, if any, and the final response).</li></ul> The default value is <b>activity</b> .	string
Content on error	Yes	Indicates what content to log when an error occurs. Valid values: <ul style="list-style-type: none"><li><b>none</b>: Indicates that no logging occurs. Restriction: This option disables notifications for application developers who use your Developer Portal.</li><li><b>activity</b>: Logs invocation only (only the resource URI is recorded).</li><li><b>header</b>: Logs activity and header.</li><li><b>payload</b>: Logs activity, header, and payload (the original request, if any, and the final response).</li></ul> The default value is <b>payload</b> .	string

## Example source

The following examples show how the OpenAPI for the activity log configuration looks in the source code.

Example one shows the default activity log preferences:

```
activity-log:  
  success-content: activity  
  error-content: payload  
  enabled: true
```

Example two shows activity logging that has been turned off:

```
activity-log:  
  enabled: false
```

## Related tasks

---

## The Assemble view

The API Manager of IBM® API Connect features an Assemble view that you can use to create assemblies. With assemblies, you can readily tailor your APIs to include components such as activity logging and redaction of specific fields.

You can access the Assemble view by clicking the Assemble tab at the top of the Develop API editor. This view includes a palette, which lists the available components, a property sheet, which is used to configure a component, and a canvas, which is used to arrange and visualize the assembly's components.

---

## The palette

The palette, shown on the left side of the Assemble view, is a list of different components that you can include in your assembly. The palette can be hidden by clicking the Show/hide policy palette icon  in the upper left corner.

---

## The canvas

You can use the canvas to create a graphical representation of the assembly flow. You can drag various components from the palette on the left to the appropriate location on the canvas on the right. When you drag a component, valid positions are shown by dashed boxes.

Note: You must click Save in the Assemble view to save your assembly updates, and to make them appear in the Source view. API calls are made at the left, unfilled, circle, and returned at the right, filled, circle. You can insert components between the two circles to modify the data received from the call, or returned by the response. To add a component, select it in the palette and drag it across to one of the dashed boxes that appear when you move the component over the canvas.

You can use the Show catches toggle, in the upper right corner of the page, to show and hide error catches in the palette. A catch is a section of the assembly that is applied when an API call results in the corresponding HTTP status code being returned. Click the catch section to open the property sheet for all your catches.

You can zoom the view of your canvas in and out by clicking the + and - icons. To fit the canvas to the screen size, click the Zoom to fit icon .

You can filter the canvas to show only the parts of it that will apply to a specific operation by clicking the Filter by operation icon  and then selecting the operation from the drop-down list. Click the Clear operation filter icon  to remove the filter.

---

## The property sheet

When you select a component that is in the assembly by clicking it, details about the component are displayed in the property sheet on the right. In this pane, you can configure the component's properties. The options available to you in the property sheet are specific to the type of component you are working with. For some components, you can add and remove properties by clicking Object Properties and selecting the property from the drop-down menu.

You can release the property sheet by clicking the Close icon .

## Including components in your assembly

An assembly is formed of components that are applied to calls to and responses from operations in your API. Components can be either policies or logic constructs.

---

## About this task

In the Assemble view of IBM® API Connect, you can add and configure components in your assembly. You can also directly add components to the OpenAPI definition of your API.

- [Adding components to your assembly](#)  
Create your API assembly by using the Assemble view in the API Manager.
- [Handling errors in the assembly](#)  
Use the catch section of the assembly to describe the handling of errors thrown during the assembly execution.
- [OpenAPI and assembly components](#)  
An assembly in IBM API Connect is formed of one or more components that are applied to calls to an API. These components can be part of the OpenAPI specification or extensions to the specification that are specific to API Connect.
- [The behavior of an assembly](#)  
The assembly runs policies in order and acts on different contexts of the API call.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Adding components to your assembly

Create your API assembly by using the Assemble view in the API Manager.

### About this task

---

You can complete this task either by using either the API Designer UI application, or by using the browser based API Manager UI.

You can use the assembly tool in the UI to create assemblies that are used to manipulate requests made to or responses made by any of your API's operations.

Alternatively, you can use the Source view to edit the source of your API definition, in which case the syntax is as described in [execute OpenAPI extension](#).

For more information about the use of the assembly tool, see [The Assemble view](#).

### Procedure

---

To add components to your assembly using the assembly tool, complete the following steps:

1. In the navigation pane, click  Develop.  
The Develop: APIs and Products tab opens.
2. Click the API definition that you want to work with.
3. Use the Assemble view to add a component.
  - a. Click the Assemble tab at the top of the Develop API editor.
  - b. Find the component that you want to add in the palette on the left. For a list of components and the categories to which they belong, see [OpenAPI and assembly components](#).
  - c. Drag the component onto the canvas; dashed boxes are displayed. Drop the component in a dashed box to insert it into that position in the assembly.  
Note:
    - Components are applied in order from the left, unfilled, circle to the right, filled, circle.
    - Unless an Operation Switch component is used, the whole assembly applies to every operation in the API.
  - d. Add and edit properties of the component by clicking the component and using the property sheet that is shown on the right.  
For some components, you can add and remove properties by clicking Object Properties and selecting the property from the drop-down list. For information about the properties of policy components, see [API policies and logic constructs](#). For information about the properties of logic constructs, see [Logic Constructs](#).
4. Optional: Repeat Steps [3.b](#) to [3.d](#) for any additional components that you want to add.
5. Click Save to save your changes.

### Results

---

You have added one or more components to your assembly.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Handling errors in the assembly

Use the catch section of the assembly to describe the handling of errors thrown during the assembly execution.

### About this task

---

You can complete this task either by using either the API Designer UI application, or by using the browser based API Manager UI.

The catch section of the assembly is used to implement an assembly in the instance that an error is thrown during the assembly execution. For example, the assembly could contain a throw component, the API caller could fail to authenticate, or a policy could fail to execute correctly. Each error can be handled with a different catch and each catch can handle multiple status errors.

### Procedure

---

To create a catch and include components in it, complete the following steps:

1. In the navigation pane, click  Develop.  
The Develop: APIs and Products tab opens.
2. Click the API definition that you want to apply a catch to, and then click the Assemble tab at the top of the Develop API editor.
3. Set the Show catches toggle in the menu bar above the canvas to the Show position.

4. Click Catch at the bottom of the canvas, or a Catch icon  if one is displayed.  
The property sheet for the API's catches opens.
5. To add a default catch that is executed when an otherwise uncaught error is thrown, click + Default.  
Note: If you have a default catch above another catch in precedence, the default catch will activate even when the other catch's error is thrown.
6. To add a new catch, click + Catch.
7. To specify which errors the catch applies to, type the name of a custom error and press Enter, or use the search errors field to search for the appropriate error.
8. Optional: To remove an error case from a catch, click the corresponding cross.
9. Optional: To change the precedence of your catches, use the Move up  or Move down  icons.  
If an error case is handled by multiple catches, the catch at the top of the list is applied.
10. To add a component to a catch, drag the component over the dashed, gray box that appears in the flow from the Catch icon  for the catch that you want to apply the component to.
11. Click Save to save your changes.

## What to do next

If you added a catch for `ConnectionError`, `SOAPError`, or `OperationError`, you must add the same error to the Stop on error setting for the Invoke policy in your assembly, otherwise if the error occurs during the execution of the Invoke policy, it is not caught, the policy execution is allowed to complete, and the assembly flow continues. For details on configuring an Invoke policy, see [Invoke](#).

- [Error cases supported by assembly catches](#)  
Several error cases that can be returned by the assembly are available to the catch function.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Error cases supported by assembly catches

Several error cases that can be returned by the assembly are available to the catch function.

### ConnectionError

An error occurred while establishing a connection to another URL.

### JavaScriptError

An error occurred while executing JavaScript or GatewayScript in a policy.

### PropertyError

An error occurred due to an incorrect property during an invoke call or during the execution of a set-variable policy when an action was not set, add, or clear.

### RedactionError

An error occurred during the redaction of a field as part of a redact policy.

### TransformError

An error occurred during a transformation policy.

### RuntimeError

An otherwise unspecified error occurred.

### BadRequestError

An error occurred while trying to access the request.

### UnauthorizedError

The API cannot be invoked based on the client ID and/or client secret provided, or id/secret were specified in the wrong location.

### ForbiddenError

The application making the API request has been disabled or is not active.

### ValidateError

An error occurred while trying to schema validate a message payload.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## OpenAPI and assembly components

An assembly in IBM® API Connect is formed of one or more components that are applied to calls to an API. These components can be part of the OpenAPI specification or extensions to the specification that are specific to API Connect.

The full OpenAPI specification can be found at the [OpenAPI website](#).

For draft APIs with an OpenAPI definition file, the API Manager UI performs validation on it. Any warnings or errors that are highlighted will not prevent further editing of the API, or prevent it from being saved. Further validation occurs when the API is staged, as part of a Product, to a Catalog. For more information, see [Staging a Product](#).

## API Connect policies and logic constructs

To provide additional functions, API Connect uses various extensions to the OpenAPI specification. For more information, see [API policies and logic constructs](#).

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## The behavior of an assembly

The assembly runs policies in order and acts on different contexts of the API call.

When an API call is made, security and rate limits are enforced before the assembly is executed. During the assembly, the flow can branch or be thrown and caught, according to the policies contained in it. The message context can be thought to flow through the assembly, being used and altered by various policies. In addition to the message, other contexts can be accessed and created.

## Security and rate limiting

Before the assembly is executed, security and then rate limits are enforced.

First, security definitions and CORS access control are used to authenticate an API call. Any API Key security definitions are used to identify applications that have subscriptions to a Product containing the API. If a security definition does not allow access, the API call is rejected.

If an application is identified by its client ID or client secret, a rate limit can be enforced based on the Plan or operation called.

## The assembly

The assembly is executed in order from the initial, filled, circle to the final, unfilled, circle. However, there is room for branching, when if and operation-switch logic constructs are used, or for the remaining assembly to be ignored when a throw policy is executed.

The message is the context that is acted upon by any policy that isn't otherwise configured. At the beginning of the API call, the message is empty and, at the end of the API call, the message is used as the response.

The request context contains the information that is sent by the API caller and varies with the type of operation called and the configuration of that operation. For example, a GET operation can never have a populated `request.body`, and you can configure an operation to have `request.parameters` (query parameters). The first policy in an assembly acts on the request and produces the first instance of the message. If there are no policies, the request is returned to the caller.

## Managing contexts

Because the message can be overwritten, it can be useful to create and reference new contexts where possible so that they are saved and reusable during the API call.

- Use the map policy to overwrite the message context when you need to execute a policy that only acts on the message.
- Use the request context when you want to use the original request made to the API.
- Use the map, invoke, and proxy policies to create new contexts when you want to save your message.

Note: When you create a new context, unless you are also mapping to the message, the message is overwritten with an empty object.

For example, an invoke policy is the first policy in the assembly and its response overwrites the request as the message. The message is then acted upon by a validate policy, and a map policy then saves the message as a new context, ready for a second invoke policy to overwrite the message without losing the first invoke policy's output.

You can also access contexts outside of the message or your custom contexts, but these cannot be written to. For a list of contexts, see [API Connect context variables](#).

## Branches and catches

Using logic constructs, such as operation-switch or if, you can execute different sections of the assembly when certain conditions are fulfilled. When the assembly branches, the subsection of the assembly contained by the construct is executed in the same manner as a complete assembly. However, contexts are shared with the complete assembly.

When a catch is triggered, either by an error occurring during the execution of a policy, or because a throw policy is encountered, the rest of the assembly flow is ignored. All contexts are shared by the catch being executed and when the end of the catch is reached, the API call is completed. There is no way to return from a catch to the rest of the assembly.

## Creating a new version of an API definition

You can create multiple versions of an API definition and edit the versions independently by using IBM® API Connect.

### About this task

---

You can complete this task either by using either the API Designer UI application, or by using the browser based API Manager UI.

Note: If you want to publish a modified API to a production Catalog, you **must** create a new version of the API. You cannot publish an API to a production Catalog if there is already a published API with the same name and version.

### Procedure

---

To create a new version of an API definition, complete the following instructions:

1. In the navigation pane, click  Develop, then select the APIs tab.
2. You can create a new version of an API definition either from the APIs and Products page, or from within the API definition itself.
  - a. To create a new version of an API definition from the APIs and Products page, complete the following steps:
    - i. Alongside the API version that you want to work with, click the options icon , then click Save as a new version. The Save API as a new version window opens.
    - ii. Enter your new version number, then click Save.
  - b. To create a new version of an API definition from within the API definition itself, complete the following steps:
    - i. Click the API definition that you want to create a new version of. The details of your API definition are displayed, and the API name and version are shown; for example:  

    - ii. Click the down arrow alongside the version, then select create new version. The Create New API Version window opens.
    - iii. Enter your new version number, then click Create.

Note: The version corresponds to the `info.version` property value of the API's OpenAPI definition. The `version.release.modification` version numbering scheme is recommended, for example 1.0.0.

### Results

---

You have created a new version of your API definition, which you can now edit independently of other versions. Each version of the API definition is listed separately on the APIs and Products page.

## Specifying the gateway type for an API definition

An API definition is specific to one or other of the gateway types, DataPower® API Gateway or DataPower Gateway (v5 compatible). A default gateway type is set when you create an API definition, but you can edit the API configuration to specify a different gateway type.

### About this task

---

DataPower Gateway (v5 compatible) has been available with IBM® API Connect for a number of years. The DataPower API Gateway is a new gateway that has been designed with APIs in mind, and with the same security focus as DataPower Gateway (v5 compatible).

For more information on how to choose which gateway type to use, see [API Connect gateway types](#).

You can complete this task either by using either the API Designer UI application, or by using the browser based API Manager UI.

You must specify which type of gateway each API uses. APIs can use only one type of gateway.

When you create an API, the gateway type defaults to that which matches the Gateway Service configuration for your Sandbox Catalog. If your Sandbox Catalog does not have a Gateway Service configured, or if the Sandbox Catalog has both types of Gateway Services configured, the gateway type defaults to DataPower Gateway (v5 compatible). You can use the user interface to update this setting.

Note that when you modify your API definitions to use a specific gateway type, you must ensure that each policy and policy version in the API are supported by the gateway type. DataPower Gateway (v5 compatible) and DataPower API Gateway each support policies that the other gateway type does not. In some cases, the same policy is supported by both gateway types, but with a different version number.

For example, DataPower Gateway (v5 compatible) supports version **1.0.0** of the `invoke` policy, but DataPower API Gateway requires version **2.0.0**.

For information on policies, see [execute](#).

For information on policy versions, see the documentation for each individual policy. For example, to review the **invoke** policy, see [invoke](#).

## Procedure

1. In the navigation pane, click  Develop, then select the APIs tab.
2. Click the API you want to update.
3. On the API Setup page, scroll to the Gateway Type section.
4. Select the type:
  - DataPower Gateway (v5 compatible)
  - DataPower API Gateway
5. Click Save to retain the changes.
6. Click the Assemble tab to ensure that your API uses policies that are supported by the gateway type you selected.

Policies in an existing API that are not supported by the new gateway type are grayed out and flagged with a red exclamation point: .

Some policies are supported by only one gateway type. Some policies are supported by both gateway types, but require a different version of the policy for each gateway type.

## Converting an API definition for deployment to the DataPower API Gateway

IBM® API Connect provides two gateway types, DataPower® Gateway (v5 compatible) and DataPower API Gateway. If you have an API definition that was developed for the DataPower Gateway (v5 compatible) and you want to port it to the DataPower API Gateway, you must make changes to convert it before deployment.

### About this task

DataPower Gateway (v5 compatible) has been available with IBM API Connect for a number of years. The DataPower API Gateway is a new gateway that has been designed with APIs in mind, and with the same security focus as DataPower Gateway (v5 compatible).

To convert an API for deployment to the DataPower API Gateway, you must, as a minimum, change the gateway type setting on the API definition, and ensure that each policy and policy version in the API are supported by the DataPower API Gateway; DataPower Gateway (v5 compatible) and DataPower API Gateway each support policies that the other gateway type does not. In some cases, the same policy is supported by both gateway types, but with a different version number.

In addition, depending on the specific policies in your API assembly, some policies might require modification to adapt them for use with the DataPower API Gateway.

The following procedure provides instructions for converting your API definition:

## Procedure

1. Set the gateway type for the API to DataPower API Gateway, and ensure policy type and version compatibility. For details, see [Specifying the gateway type for an API definition](#).
2. Refer to the [DataPower API Gateway porting notes](#) for detailed instructions on how to convert your API definition.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## API properties

Properties are used by the gateway to control behavior of certain policies. Typically, you provide properties, but the policy can also provide properties settings.

In IBM® API Connect, you can create API properties that consist of Catalog-specific values to eliminate the need for source code modifications. You can then reference the properties elsewhere in your API definition.

Pre-supplied API properties for various policies are shown in the tables.

A list of invoke related API properties that control the behavior of the invoke policy.

Table 1. Properties controlling the invoke policy

Property	Required	Description	Data type
 x-ibm-gateway-decode-request-params	No	If set to a value of <b>true</b> , any request parameters that are referenced by a variable definition on an invoke target-url are URL-decoded. The default behavior is to not decode any parameters, thereby sending them to the target URL without alteration.	Boolean

Property	Required	Description	Data type
<small>DataPower Gateway (v5 compatible) only</small> x-ibm-gateway- invoke- suppress- clientid	No	When set with a value of <b>true</b> , or not specified, the X-IBM-Client-Id HTTP header (if specified on the API request) is suppressed from being sent to the invoke target URL. When set with a value of <b>false</b> , the X-IBM-Client-Id HTTP header is no longer suppressed from being sent to the invoke target URL. This property is supported only by the DataPower® Gateway (v5 compatible). If you are using the DataPower API Gateway then to achieve the same functionality add a <b>header-control</b> property to the <b>invoke</b> policy configuration in the OpenAPI definition for your API, as in the following examples.  Suppress the <b>X-Client-ID</b> header as follows: <pre>- invoke:   target-url: http://myhostname/mypath   header-control:     type: blacklist     values:       - ^X-Client-ID\$</pre> Suppress the <b>userId</b> query parameter as follows: <pre>- invoke:   target-url: http://myhostname/mypath   parameter-control:     type: blacklist     values:       - ^userId\$</pre>	Boolean
<small>DataPower Gateway (v5 compatible) only</small> x-ibm-gateway- optimize-invoke	No	If set to <b>false</b> , prevents the replacement of the last invoke in a policy with proxy. Any value other than <b>false</b> (case insensitive) will result in the last invoke in a policy possibly being replaced by proxy when the API is executed in the gateway.	Boolean
<small>DataPower Gateway (v5 compatible) only</small> x-ibm-gateway- queryparam- encode-plus- char	No	If set to a value of <b>true</b> , all "+" characters in the query parameter values of the target-url of the Invoke and Proxy policies are encoded to "%2F". The default value is <b>false</b> .	Boolean
<small>DataPower Gateway (v5 compatible) only</small> x-ibm-gateway- api-enforce- response-limits	No	If set to a value of <b>true</b> , allows the JSON parser to be enforced on the response rule. If the response body size is higher than the JSON parser limit set in the DataPower domain, a status code of 500 is returned. Note: The x-ibm-gateway-api-enforce-response-limits property is supported by the DataPower Gateway (v5 compatible) but not by the DataPower API Gateway. However, if you are using the DataPower API Gateway, consider using a <a href="#">Parse</a> policy in your API assembly to enforce these limits. For information on the different types of gateway, see <a href="#">API Connect gateway types</a> .	Boolean
<small>DataPower Gateway (v5 compatible) only</small> x-ibm-gateway- invoke-emulate- v4-soap-error	No	IBM API Management Version 4.0 initiates a DataPower error when a SOAP fault is returned from a web service. IBM API Connect provides a mechanism to catch SOAP errors and does not initiate a DataPower error. For compatibility with APIs developed in IBM API Management Version 4.0, set this property to <b>true</b> only in the case where a gateway extension is expecting to handle a SOAP error in a post error rule. The default value is <b>false</b> .  Note: This property is deprecated in favor of x-ibm-gateway-invoke-emulate-v4-invoke-error.	Boolean
<small>DataPower Gateway (v5 compatible) only</small> x-ibm-gateway- invoke-keep- payload	No	If set to a value of <b>true</b> , the invoke policy sends a payload on an HTTP DELETE method. This property is available for use with IBM DataPower Gateway version 7.7.1.1 and later. The default value is <b>false</b> .	Boolean
<small>DataPower Gateway (v5 compatible) only</small> x-ibm-gateway- invoke-emulate- v4-invoke-error	No	IBM API Management Version 4.0 initiates a DataPower error when a backend server error is returned, either a SOAP fault returned from a web service or a JSON or XML (non-SOAP) error from a restful service. IBM API Connect provides a mechanism to catch SOAP errors and operation errors and does not initiate a DataPower error when they occur. If no catch policy is configured, a generic error message is generated. For compatibility with APIs developed in IBM API Management Version 4.0, set this property to <b>true</b> only in the case where a gateway extension is expecting to handle a backend server error in a gateway extension post error rule or if the client of the API is expecting the backend server error to be returned. The default value is <b>false</b> .	Boolean

A list of map-related API properties that control the behavior of the map policy.

Table 2. Properties controlling the map policy

Property	Required	Description	Data type
<small>DataPower Gateway (v5 compatible) only</small> x-ibm-gateway- map-array-first- element-value	No	In IBM API Management Version 4.0, if a mapping source value is from an array then only the first value is output. In API Connect, the default behavior is to return an array of all array element values. To maintain compatibility with IBM API Management Version 4.0, set this API property to <b>true</b> to only return the first array element value.	Boolean
<small>DataPower Gateway (v5 compatible) only</small> x-ibm-gateway- map-resolve- apic-variables	No	By default, any API Connect variable that is found in the map configuration is resolved. For example, <b>\$(request.headers.content-type)</b> resolves to the request's content type header. Because searching for variables in every map property can be CPU intensive, you can choose not to resolve variables by setting this API property to <b>false</b> . If this property is not configured or is set to any other value, the existing behavior to search for these variables continues. Note that variable usage within a map value JavaScript snippet is not changed provided that the variables that are referenced come from a configured map input.	Boolean
<small>DataPower Gateway (v5 compatible) only</small> x-ibm-gateway- map-create- empty-array	No	This property controls how the map policy handles the output of an empty array; it can have the following values: <ul style="list-style-type: none"> <li><b>all</b>: Output all empty arrays, including empty children arrays. This is the default value if the property is not configured or has an invalid value.</li> <li><b>parent</b>: Output only the current property's empty array value. Children map actions of this property are not attempted.</li> <li><b>none</b>: Prevent any empty output array values from being produced.</li> </ul>	String

Property	Required	Description	Data type
<small>DataPower Gateway (5.5 compatible only)</small> x-ibm-gateway-optimize-schema-definition	No	Set the value of this property to <b>true</b> to provide a performance improvement to the map policy when a very complex schema definition is referenced by a policy output definition; for example, some very complex schemas that are generated by importing a very complex WSDL schema. The map policy builds a schema from an API definition when a referenced definition is provided as the value of the schema. If the schema does not have references that generate a circular reference, setting this property to <b>true</b> might provide a performance benefit while generating the same schema as would otherwise have been generated. However, in cases where the schema is very complex, with many potentially circular references, the generated schema could be different because the enhanced schema handling processes circular references differently. In such cases therefore, you should examine the resulting output to determine if the performance benefit gained is not at the expense of a change in the map policy output.  The default value of this property, is <b>false</b> , maintaining the existing behavior and performance.	Boolean
<small>DataPower Gateway (5.5 compatible only)</small> x-ibm-gateway-map-null-value	No	Set the value of this API property to <b>true</b> to allow a property from a map policy's input data with a value of <b>null</b> to be mapped to the output document. By default, a property from a map policy's input data with a value of <b>null</b> is not mapped to the output document.	Boolean
<small>DataPower Gateway (5.5 compatible only)</small> x-ibm-gateway-map-resolve-xmlinput-datatypes	No	XML input elements with numeric or boolean data have no metadata to indicate whether this data should be mapped as a string value or as the specific data type. If you set the value of this property to <b>false</b> , XML input elements are always mapped as a string. If you set the value to <b>true</b> , numeric or boolean XML input elements are mapped as the corresponding data type from the input schema. The default value is <b>false</b> .	Boolean
<small>DataPower Gateway (5.5 compatible only)</small> x-ibm-gateway-map-xml-empty-element	No	This property controls how the map policy handles XML input empty elements and impacts JSON output when the input document is XML; it can have the following values: <ul style="list-style-type: none"> <li>• <b>string</b>: The value for an empty XML element is considered to be an empty string. This is the default value if the property is not configured or has an invalid value.</li> <li>• <b>null</b>: The value for an empty XML element is considered to be null. A mapping of this element to a JSON output property does not occur unless the API property x-ibm-gateway-map-null-value is also specified with a value of <b>true</b>.</li> <li>• <b>none</b>: The empty XML element is ignored.</li> <li>• <b>string-badgerfish</b>: The value for an empty XML element is considered to be an empty string. The empty string value will be placed into a JSON badgerfish value property.</li> <li>• <b>null-badgerfish</b>: The value for an empty XML element is considered to be null. The null value will be placed into a JSON badgerfish value property. A mapping of this element to a JSON output property does not occur unless the API property x-ibm-gateway-map-null-value is also specified with a value of <b>true</b>.</li> </ul>	Boolean
<small>DataPower Gateway (5.5 compatible only)</small> x-ibm-gateway-schema-definition-reference-limit	No	Set the value of this property to an integer value that specifies the maximum allowed number of iterations of a circular schema definition. The default value is 1, which means that circular schema definitions are not followed. The maximum possible value is 5. If you specify a value greater than 5, a value of 5 is assumed. If you specify a non-numeric value, a value of 1 is assumed.	String

Property	Required	Description	Data type
<small>DataPower Gateway (v5 compatible) only</small> x-ibm-gateway-map-emulate-v4-default-required-properties	No	<p>Set this property to true to have default values generated in the output for required properties that are either not mapped, or for which there is no input data present, in the following specific cases:</p> <ul style="list-style-type: none"> <li>An array consists of objects that contain one or more required properties.</li> <li>An object which is optional has one or more child properties that are required.</li> </ul> <p>By default, these required properties are not present in the output. If you set the <b>x-ibm-gateway-map-emulate-v4-default-required-properties</b> API property to <b>true</b>, these required properties will be present in the output. If the output schema defines a <b>default</b> property for the output property then the specified default value is used, otherwise a default value is assigned dependent on the data type, as follows:</p> <ul style="list-style-type: none"> <li>String: empty string ("")</li> <li>Number: 0</li> <li>Boolean: false</li> <li>Object: empty object</li> <li>Array: empty array</li> </ul> <p>Example 1 The input data has the following array of objects:</p> <pre>[{"a": "value1"}, {"a": "value2"}, {"b": "value3"}]</pre> <p>The output schema defines the output object as having two properties, <b>a</b> and <b>b</b>, of which <b>b</b> is required. The map policy defines the following mappings:</p> <ul style="list-style-type: none"> <li><b>input.array.a</b> to <b>output.array.a</b></li> <li><b>input.array.b</b> to <b>output.array.b</b></li> </ul> <p>If the <b>x-ibm-gateway-map-emulate-v4-default-required-properties</b> API property is set to <b>true</b>, and <b>b</b> is either not mapped or has no input data present, then <b>b</b> is assigned a default value of an empty string, and the output is as follows:</p> <pre>[{"a": "value1", "b": ""}, {"a": "value2", "b": "value3"}]</pre> <p>Example 2 The output schema defines the following structure:</p> <pre>{"a" : {"b" : {"c" : "value1", "d" : "value2"} } }</pre> <p>Property <b>b</b> is optional but property <b>d</b> within <b>b</b> is required.</p> <p>The map policy defines a mapping to <b>output.a.b.c</b>.</p> <p>If the <b>x-ibm-gateway-map-emulate-v4-default-required-properties</b> API property is set to <b>true</b>, and <b>d</b> is not mapped, then <b>d</b> is assigned a default value of an empty string, and the output is as follows:</p> <pre>{"a" : {"b" : {"c" : "value1", "d" : ""} } }</pre> <p>If the <b>x-ibm-gateway-map-emulate-v4-default-required-properties</b> API property is not specified or does not have a value of <b>true</b>, these required properties are <b>not</b> created in the output with their default values.</p>	Boolean
<small>DataPower Gateway (v5 compatible) only</small> ibm-gateway-map-post-process-json-output	No	<p>Set the value of this property to <b>true</b> to enable post processing of mapped JSON output. The post processing of JSON output will use the output schema to ensure that property values are of the same data type as that defined in the schema. It will also normalize output property values that have a Badgerfish JSON syntax due to object mapping of an XML input. Set the value to <b>false</b> for no post processing of mapped JSON output. The default value is <b>false</b>.</p>	Boolean
<small>DataPower Gateway (v5 compatible) only</small> x-ibm-gateway-map-emulate-v4-empty-json-object	No	<p>If a mapping fails because its input is not present and there is no default mapping configured, the default behavior is to not to make any change to the output mapping. Set the value of this property to <b>true</b> to create an empty object for the parent of the target mapping, emulating the behavior of IBM API Management Version 4.0.</p> <p>Example The map policy defines a mapping to <b>output.a.b.c</b>. If input data is present, the output is as follows:</p> <pre>{   "a": {     "b": {       "c": "inputvalue"     }   } }</pre> <p>If there is no input data, and the <b>x-ibm-gateway-map-emulate-v4-empty-json-object</b> API property is set to <b>true</b>, the output is as follows:</p> <pre>{   "a": {     "b": {     }   } }</pre> <p>Properties <b>a</b> and <b>b</b> are created but the value of <b>b</b> is an empty object. The default value is <b>false</b>.</p>	Boolean

DataPower Gateway (v5 compatible) only

A list of proxy-related API properties that control the behavior of the proxy policy.

Table 3. Properties controlling the proxy policy

Property	Required	Description	Data type
x-ibm-gateway-proxy-suppress-clientid	No	<p>A setting of <code>false</code> activates the injection of the X-IBM-Client-Id HTTP header (if it is specified on the API request), or the <code>client_id</code> query parameter in the request URL, to the proxy target-url. If not specified, or set with a value of <code>true</code>, suppresses the sending of this parameter to the proxy target-url.</p> <p>This property is supported only by the DataPower Gateway (v5 compatible). If you are using the DataPower API Gateway then to achieve the same functionality add a <code>header-control</code> property to the <code>invoke</code> policy configuration in the OpenAPI definition for your API, as in the following examples.</p> <p>Suppress the <code>X-Client-ID</code> header as follows:</p> <pre>- proxy:   target-url: http://myhostname/mypath   header-control:     type: blacklist     values:       - ^X-Client-ID\$</pre> <p>Suppress the <code>userId</code> query parameter as follows:</p> <pre>- proxy:   target-url: http://myhostname/mypath   parameter-control:     type: blacklist     values:       - ^userId\$</pre>	Boolean
x-ibm-gateway-optimize-invoke	No	If set to <code>false</code> , prevents the replacement of the last invoke in a policy with proxy. Any value other than <code>false</code> (case insensitive) will result in the last invoke in a policy possibly being replaced by proxy when the API is executed in the gateway.	Boolean
x-ibm-gateway-queryparam-encode-plus-char	No	If set to a value of <code>true</code> , all "+" characters in the query parameter values of the target-url of Invoke and Proxy policies are encoded to "%2F". The default value is <code>false</code> .	Boolean
x-ibm-gateway-api-enforce-response-limits	No	If set to a value of <code>true</code> , allows the JSON parser to be enforced on the response rule. If the response body size is higher than the JSON parser limit set in the DataPower domain, a status code of 500 is returned.	Boolean

A list of API properties that control the behavior of the rate limit policy.

Table 4. Properties controlling the rate limit policy

Property	Required	Description	Data type
x-ibm-gateway-emulate-v4-plan-rate-limit	No	By default in IBM API Connect Version 2018, if you configure a rate limit only for a Plan and not for the API operations within the Plan then a single rate limit threshold is set for the API as a whole, regardless of which operation in the API is requested. This behavior differs from IBM API Management Version 4.0 where the rate limit is set <b>individually</b> for <b>each</b> operation in the API. To change the Version 2018 behavior to emulate the Version 4.0 behavior, set this API property to a value of <code>true</code> .	Boolean

A list of API properties that control the behavior of multiple policies, or API behavior in general.

Table 5. Properties controlling multiple policies, or API behavior in general

Property	Required	Description	Data type
<small>DataPower Gateway (v5 compatible) only</small> x-ibm-gateway-sourcecode-resolve-apic-variables	No	<p>If set to <code>true</code>, API Connect variable references are resolved. Set to <code>false</code> if you want the policy to ignore API Connect variable references.</p> <p>The default value is <code>true</code>.</p> <p>This property applies to the following policies:</p> <ul style="list-style-type: none"> <li>Map</li> <li>GatewayScript</li> <li>XSLT</li> <li>if</li> <li>switch</li> </ul> <p>Note: This property setting is overridden by the x-ibm-gateway-map-resolve-apic-variables API property setting for the Map policy.</p>	Boolean
<small>DataPower Gateway (v5 compatible) only</small> x-ibm-gateway-api-json-parse-error-handling	No	<p>If an API request or response payload includes valid JSON content that contains characters that cannot be represented in the JSON XML internal syntax that is used by the DataPower Gateway, set this property to <code>escape-unicode</code> to allow the payload to be accepted without parsing errors. If this property is not configured or is set to any other value, the payload is rejected as invalid JSON.</p> <p>This property applies to the API request payload, and to the API response payload when <code>x-ibm-gateway-api-enforce-response-limits</code> is enabled.</p>	String
<small>DataPower Gateway (v5 compatible) only</small> x-ibm-gateway-framework-preserve-escaped-reverse-solidus	No	By default, the string <code>\\</code> in a policy property is converted to a single <code>\</code> character. Set this property to <code>true</code> to preserve the string <code>\\</code> .	Boolean

Property	Required	Description	Data type
<small>DataPower Gateway (v5 compatible) only</small> x-ibm-gateway-inspect-request-headers	No	Causes an inspection of the HTTP headers in the API request to check for characters in the header values that are illegal XML characters; it can have the following values: <ul style="list-style-type: none"> <li><b>default:</b> There is no inspection for these characters in the header values. If one is present, the API request fails with an HTTP 500 Internal Server Error.</li> <li><b>sanitize:</b> Any illegal XML characters in header values are replaced with a ? character. The API processing will continue. Any API that attempts to read <code>request.headers.&lt;headername&gt;</code> will see the ? character in the value. However, the original protocol headers representing <code>message.headers</code> will still have the original character, which will be sent to an invoke or proxy backend server.</li> <li><b>bad-request:</b> There will be an inspection for these characters in the header values. If one is present, the API request fails with an HTTP 400 Bad Request.</li> </ul> <p>The default value is <b>default</b>.</p>	Boolean
x-ibm-gateway-cors-allow-credentials-when-no-cors-policy	No	<b>From API Connect version 2018.4.1.17 onward:</b> By default, when CORS is enabled for an API, every response to a CORS request contains the following header:  <b>Access-Control-Allow-Credentials: true</b>  However, the inclusion of this header does not provide optimal security. To prevent this header from being returned, set the x-ibm-gateway-cors-allow-credentials-when-no-cors-policy property to the value <b>off</b> . If the property is not present, or is present with any other value, the header is returned.	String

A list of API properties that control the behavior of custom policies.

Table 6. Properties controlling custom policies

Property	Required	Description	Data type
<small>DataPower Gateway (v5 compatible) only</small> x-ibm-gateway-custom-policy-with-gws-action	No	If set to <b>true</b> , the <code>request.body</code> and <code>message.body</code> context variables will be populated for access by an <code>apim.getvariable('request.body')</code> or <code>apim.getvariable('message.body')</code> function call in a GatewayScript action of a custom policy. If the custom policy does not use a GatewayScript action that requires these variables to be populated, set this property to <b>false</b> or do not specify it.  The default value is <b>false</b> .	Boolean

- [Setting API properties](#)

In addition to the pre-supplied API properties that you can use to control the behavior of API Connect policies, you can define your own API properties. The properties that you define can be referenced in your API definitions.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Setting API properties

In addition to the pre-supplied API properties that you can use to control the behavior of API Connect policies, you can define your own API properties. The properties that you define can be referenced in your API definitions.

## About this task

You can complete this task either by using either the API Designer UI application, or by using the browser based API Manager UI.

API properties include property name, value, and, optionally a specific Catalog to which a property value applies. For a list of pre-supplied API properties relating to various policies, see [API properties](#).

Note: Once defined, an API property is read only.

For information on how to reference a property in an API definition, see [Variable references in API Connect](#).

It is also possible to define properties that are specific to a Catalog and can be referenced by any of the APIs in that Catalog; for more information, see [Creating and configuring Catalogs](#). Note that if you define a Catalog property of the same name as an API property, the API property takes precedence over the Catalog property.

Tip: If you add or change an API property on an API that is already staged or published, you must re-stage or re-publish the Product that contains the updated API for the change to take effect.

## Procedure

To set API properties, complete the following steps:

1. In the navigation pane, click  Develop, then select the APIs tab.
2. Click the title of the API definition that you want to work with.
3. Click Properties, then click Add.
4. Enter a property Name and, optionally, a Default value and a Description. The following character set is supported for the Name of an API property: `[A-Za-z0-9_-]+`. No spaces are allowed.
  - Note: If you publish the API to the DataPower® Gateway (v5 compatible) the property name must begin with either a letter or a \_ (underscore) character. This restriction does not apply if you publish the API to the DataPower API Gateway. For information on the different types of gateway, see [API Connect gateway types](#).
5. Select Encoded if you want to hide the property values, or protect user passwords from casual observance.
  - Note: If you encode a property value, it is saved in Base64 encoded form; it is **not** encrypted. If you subsequently clear the Encoded check box, the original property value is restored in its unencoded form.
6. To define a property value that is specific to a particular Catalog, complete the following steps:

- a. In the Define catalog specific values for this property section, select the required Catalog and enter the corresponding value.
- Note: The Catalogs that you can select from are those that are defined for the management server and provider organization that you are connected to. If you are using the API Manager user interface, the connection details are determined by the API Manager URL that you open, and the user ID with which you log in. If you are using the API Designer user interface, you provide the management server details and user ID in the login window that opens when you first launch API Designer; see [Logging into API Connect Designer](#).

For details of how to create a Catalog in a provider organization, see [Creating and configuring Catalogs](#).

- b. To define further Catalog/value pairs, click Add.
7. Click Save when done.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details. For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Variable references in API Connect

In API Connect you can reference different variables in your API definition.

When defining an API, creating a custom policy, or configuring another policy or logic construct, you can include references to context variables and properties.

Variable references are resolved either when the API is staged in a Product, for static variables that are fixed upon staging, or when the API is called, for variables that can change with each API call.

## Types of variables

### Context variables

A context variable is a variable relevant during an API call, for example, the input of the call, the path of the call, or the message during the call. A context variable is one of the variables that makes up that particular context.

Context variables can consist of more than one part, for example, `request.headers`.

For a list of available context variables, see [API Connect context variables](#).

### API properties

An API property is a variable in an API where its value depends upon the Catalog in which the API is staged or published. By referencing an API property, you can use the same API definition in different Catalogs where there are small differences between the instances of the API between the Catalogs. For example, an assembly could contain an `if` construct that executes its case when a particular Catalog is used, determined from the value of the API property. API properties can also be used to hide a value such as a password by encoding the value.

API properties are referenced by name.

For a list of API properties, see [API properties](#)

For more information, see [Setting API properties](#).

Note: Once defined, an API property is read only.

### Catalog properties

A Catalog property is specific to a Catalog, and can be referenced in any of the API definitions in that Catalog. For more information, see [Creating and configuring Catalogs](#).

Note:

- If you change the value of a Catalog property, any API that references that property must be republished for it use the new value.
- Catalog properties and API properties are not supported with global policies. Therefore, if you use such properties in a global policy, they are **not** replaced with the values specified in the Catalog or API property definitions.

## Methods of referencing variables

You can get or set the value for a referenced variable.

- Get the value for a variable in either of the following ways:
  - Through the [GatewayScript](#) policy, run the `apim.getvariable()` API.
  -  Through the [GatewayScript](#) policy, use the `context.get()` function; for more information, see [Using context variables in GatewayScript and XSLT policies with the DataPower API Gateway](#).
  - Through the [XSLT](#) policy, run a stylesheet that uses the `apim:getVariable` extension function.
  - In an assembly policy field that supports variable references, use the following syntax:  

```
$(variable)
```
- Set the value for a variable in either of the following ways:
  - Through the [Set Variable](#) policy.
  - Through the [GatewayScript](#) policy, use the `apim.setvariable()` API.
  -  Through the [GatewayScript](#) policy, use the `context.set()` function; for more information, see [Using context variables in GatewayScript and XSLT policies with the DataPower API Gateway](#).
  - Through the [XSLT](#) policy, run a stylesheet that uses the `apim:setVariable` extension element.

## GatewayScript references

When you want to reference a variable in a GatewayScript context, use one of the following methods:

```
apim.getvariable(variable)
```

where *variable* is the name of the context variable or API property that you want to reference.

```
apim.setvariable(variable, value, action)
```

where

- *variable* is the name of the context variable or API property that you want to reference.
- *value* is the string value that you want to set the variable to. This can be a literal value, or another variable. For example, to set your named variable to the value of the Content-Type header in a request, use the following code:

```
var contentType = apim.getvariable('request.headers.content-type');
apim.setvariable(variable, contentType, 'set');
```

This property is required only when **set** or **add** is specified as the action.

- *action* is the action that you want to apply to the variable. Valid options are:
  - **set**
  - **add**
  - **clear**

If no option is set, the default option of **set** is applied.

Use the **getvariable** method to retrieve the value of a context variable or API property, and the **setvariable** method to change one.

Some of the situations where you would use this type of reference are:

- GatewayScript policies. -For more information, see [GatewayScript](#).
- **if** logic constructs. For more information, see [if](#).
- User-defined policies. For more information, see [Authoring policies](#).

## Stylesheet references

You can reference a variable by using functions and elements in an XSLT policy with the following syntax:

```
<xsl:variable name="variable_name" select="apim:getVariable(variable)" />
```

where *variable* is a literal value, another variable, or a valid XSLT XPath statement.

```
<xsl:call-template name="apim:setVariable">
  <xsl:with-param name="varName" select="variable"/>
  <xsl:with-param name="value" select="value"/>
  <xsl:with-param name="action" select="action"/>
</xsl:call-template>
```

where

- *variable* is the name of the context variable or API property that you want to reference. This can be a literal value, another variable, or a valid XSLT XPath statement.
- *value* is the string value that you want to set the variable to. This can be a literal value, another variable, or a valid XSLT XPath statement. This property is required only when **set** or **add** is specified as the action.
- *action* is the action that you want to apply to the variable. This can be a literal value, another variable, or a valid XSLT XPath statement. Valid options are:
  - **set**
  - **add**
  - **clear**

If no option is set, the default option of **set** is applied.

The following example sets a named variable to the value of the Content-Type header in a request:

```
<xsl:variable name="contentType" select="apim:getVariable('request.headers.content-type')" />
<xsl:call-template name="apim:setVariable">
  <xsl:with-param name="varName" select="'variable'"/>
  <xsl:with-param name="value" select="$contentType"/>
  <xsl:with-param name="action" select="'set'"/>
</xsl:call-template>
```

## Inline references

In many situations you can make a simpler reference, by using the following syntax:

```
$(variable)
```

where *variable* is the name of the context variable or API property that you want to reference.

Some of the situations where you would use this type of reference are:

- The URL called by an Invoke or Proxy policy. For more information about the policies, see [Invoke](#) or [Proxy](#).
- A Map policy. For more information, see [Map](#).

Note: The map policy can reference the following variables inline:

- Variables that are defined as inputs to the map policy and specified in the from field of a mapping.
- Context variable or API properties, provided that the **x-ibm-gateway-map-resolve-apic-variables** API property is not set to **false**. If an inline reference in a map policy resolves to a context variable or API property, it is immediately replaced by the corresponding value. For more information on the **x-ibm-gateway-map-resolve-apic-variables** API property, see [Properties controlling the map policy](#).

For more information on the use of inline references, and examples, see the following [About inline references](#) section.

## About inline references

When you use an inline reference for a property value in an assembly policy, the variable reference is replaced with the corresponding string value at run time, before the property is evaluated. For example, consider the following incoming request, which has two headers and two query parameters (a `curl` command is used to illustrate the request):

```
curl --data-binary @request.json \  
-H 'Content-Type: application/json' \  
-H 'X-Environment: test' \  
http://apiserver/org/catalog/petstore/getPetDetails?petid=285&storeid=z03
```

If an `invoke` policy is configured as follows:

```
invoke:  
target-url: https://backend/GetPetInfo/$(request.parameters.storeid)/$(request.parameters.petid)
```

then the value of the `target-url` property is evaluated as `https://backend/GetPetInfo/z03/285`, and this is therefore the URL to which the `invoke` policy sends its request.

[DataPower Gateway \(v5 compatible\) only](#) You can also use an inline reference in the `condition` property of a `switch` policy. Consider the following example:

```
- switch:  
  case:  
    - condition: "$(request.headers.X-Environment)" == "production"  
      execute:  
        - invoke:  
            http://www.finance.com/base/stockquote  
    - condition: "$(request.headers.X-Environment)" == "test"  
      execute:  
        - invoke:  
            http://testserver1.finance.com/stockquote
```

Using the incoming request referred to previously, the value of the `X-Environment` header is `"test"`. The inline references are first evaluated, then the conditions are evaluated as JavaScript. Therefore, the first condition is evaluated as `"test" == "production"`, returning `false`, and the second condition is evaluated as `"test" == "test"`, returning `true`, so the `invoke` policy sends its request to `http://testserver1.finance.com/stockquote`.

Important: This example, which encloses the inline references inside double quotes, assumes that the API is deployed to the DataPower API Gateway. If you deploy the API to the DataPower Gateway (v5 compatible), then the double quotes are added implicitly when the inline references are evaluated, and you must therefore omit them from the `condition` property; the two conditions in this example would therefore be

```
condition: $(request.headers.X-Environment) == "production"
```

and

```
condition: $(request.headers.X-Environment) == "test"
```

However, as an alternative to using an inline reference in a `condition`, you can instead use pure JavaScript, as follows:

```
- switch:  
  case:  
    - condition: request.headers["X-Environment"] == "production"  
      execute:  
        - invoke:  
            http://www.finance.com/base/stockquote  
    - condition: request.headers["X-Environment"] == "test"  
      execute:  
        - invoke:  
            http://testserver1.finance.com/stockquote
```

in which case the policy configuration will work correctly as-is in both types of gateway.

For more information on the types of gateway, see [API Connect gateway types](#).

In addition to single strings, you can use an inline reference for a complete object. Consider the following example, which uses an inline reference in a `set-variable` policy:

```
- set-variable:  
  actions:  
    - set: saved.reqHdrs  
      value: $(request.headers)  
      type: string
```

Here, the `request.headers` structured JSON object is substituted with its corresponding string representation, and a variable named `reqHdrs` is therefore created, under the `saved` object, with a string value of `{"Content-Type": "application/json", "X-Environment": "test", ...}`. However, if you are using the DataPower API Gateway, you can specify `type: any`, in which case the `set-variable` policy copies the value as-is, and `saved.reqHdrs` is created as a JSON object rather than a string:

```
- set-variable:  
  actions:  
    - set: saved.reqHdrs  
      value: $(request.headers)  
      type: any
```

You can reference a property in a JSON or XML request directly by name, by using the following syntax:

```
$(request.body.property_name)
```

For example, if the request contains `{ "account-number": 123 }` or `<account-number>123</account-number>` you can retrieve the value `123` by using the following inline reference:

```
$(request.body.account-number)
```

If the property value is within a nested property structure, you can reference it by concatenating the property names. For example, if the request contains `{ "account": { "balance": 123 } }` or `<account><balance>123</balance></account>` you can retrieve the value `123` by using the following inline reference:

```
$(request.body.account.balance)
```

Similarly, you can reference a property in a JSON or XML response by using the following syntax:

`$(message.body.property_name)`

Restriction: If you are using the DataPower API Gateway, you can reference properties in this way only if the format of the request or response is JSON; the mechanism is **not** supported with XML request or response formats. If the you are using the DataPower Gateway (v5 compatible) the mechanism is supported with both JSON and XML formats.

## Related concepts

- [The behavior of an assembly](#)

## Related reference

- [API Connect context variables](#)

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#), for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Activating an API

After you have created an API definition you can activate it to make it available for testing.

### About this task

You can complete this task either by using either the API Designer UI application, or by using the browser based API Manager UI.

When you activate an API, API Connect automatically completes the following actions:

- Creates a draft Product, adds the API to the Product, and publishes the Product to the Sandbox Catalog so that the API is available to be called. The Product has the title `api_title` auto product. Note that if you later want to delete the draft Product, you cannot delete it directly; instead, delete the API and the draft Product is deleted together with the API; see [Deleting an API definition](#). If you want to remove the Product from any Catalogs to which it is published, you must do this separately; see [Removing a Product from a Catalog](#)
- Subscribes the Sandbox test application to the Product so that you can immediately test the API in the test environment. For information on testing an API, see [Testing an API with the assembly test tool](#).

To activate an API, you must be assigned a role that has the `Product:Manage` and `Subscription:Manage` permissions. The pre-supplied Developer role has these permissions by default; if you are assigned a custom role it must have these permissions. For more information, see [Creating custom roles](#).

Note:

- The API activation will not complete successfully if lifecycle approval is enabled in the Sandbox Catalog for the Stage, Publish, or Replace actions. If any such lifecycle approvals are enabled, then to be able to activate and API they must be disabled; for information on lifecycle approval settings, see [Creating and configuring Catalogs](#).
- To activate an API from the API Designer user interface, you must be connected to a Management server; API activation is not available with API Designer in offline mode.
- Products that contain an API with a Swagger property using `regex` that include lookahead assertions, such as "(?)" cannot be validated or published. An error message is returned. For example:

```
Product has not been published!  
The multipart 'openapi' field contains an OpenAPI definition with validation errors.  
definitions.properties.pattern Does not match format 'regex' (context: (root).definitions.properties.pattern, line: 0,  
col: 0)  
400
```

## Procedure

To activate an API, complete the following steps:

1. In the navigation pane, click  Develop, then select the APIs tab.
2. Click the API definition that you want to work with.
3. Click the Publish this API to the Sandbox catalog icon:

## Results

On successful completion, the API is shown as Running:

You can stop the API by clicking the Stop running this API icon:

If you stop an API, the application subscription is deleted, and the auto Product is removed from the Sandbox Catalog. You can republish a running API by clicking the republish icon:

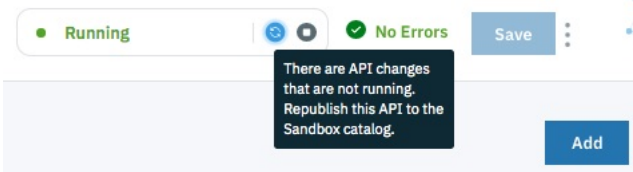

The republish icon changes color to indicate whether you have made changes that require the API to be republished:

- Republish not required:

- Republish required:

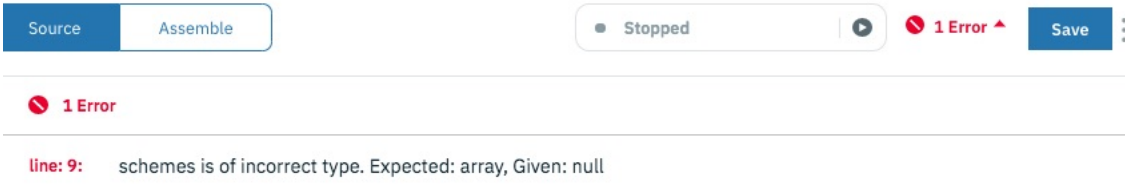

The error indicator shows whether there are validation errors in the OpenAPI source for the API definition. If there are errors, click the icon for more details:

- No validation errors:

- Validation error:

You can also activate an API during the creation process, and on the API test page; see [Creating an API definition](#) and [Testing an API with the assembly test tool](#).

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details. For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Testing an API with the assembly test tool

IBM® API Connect provides a test environment for you to ensure that your APIs are defined and implemented correctly.

### Before you begin

If you want to test an API offline, API Connect provides the following options:

- Call the API in the Local Test Environment with a cURL command, as described in [Testing an API with the Local Test Environment](#).
- Invoke the API from the locally installed API Designer UI application running in Online mode as described in the following sections.

### About this task

You can complete this task either by using either the API Designer UI application, or by using the browser based API Manager UI.

Note:

- If you are testing an API that contains references to API properties, only those references that are defined inside the API assembly are resolved and replaced with their corresponding values when you invoke the API in the assembly test tool; property references that are defined outside of the API assembly are not resolved. For more information on API properties, see [Setting API properties](#).
- Due to Cross-Origin Resource Sharing (CORS) restrictions, the assembly test tool cannot be used with the Chrome or Safari browsers on the macOS Catalina platform.

## Procedure

---

To test an API, complete the following steps.

1. If you are using API Designer, set the mode to Online using the Options menu  on the main page.
2. In the navigation pane, click  Develop, then select the APIs tab.
3. Click the API definition that you want to work with.
4. Click Assemble to open the Assemble view, then click the Test icon .
5. If you are testing the API for the first time and, when you created the API definition, you selected the Activate API option, your test setup will already be configured and you can proceed immediately to the next step to test your API. Otherwise, click Activate API to have your test setup configured.  
Note: If you are retesting your API after making changes, click Republish product to make your changes available.
6. In the Operation section, select the API operation that you want to test, then click Invoke.  
The API response is displayed in the Response section.  
Note: If you receive a message relating to an untrusted certificate, click the link provided, accept the certificate, then return to the test environment and click Invoke again. The message also mentions a lack of CORS support on the server, but this is just one possible cause for the connection failing.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Testing an API with the Local Test Environment

Use the Local Test Environment to test APIs on your local machine, without the need to connect to an API Connect management server. The Local Test Environment is a lightweight API Manager running on your local machine. It allows you to rapidly test APIs locally.

Note: A later version of the Local Test Environment is available. For details, see the [IBM® API Connect Version 10 Local Test Environment documentation](#).  
API Connect provides the following methods for testing an API on your local machine:

- Invoke the API from the API Designer UI application running in Online mode as described in [Testing an API with the assembly test tool](#).
- Call the API in the Local Test Environment with a cURL command, as described in the following sections.

Important: The current version of the Local Test Environment is a beta release.

## Prerequisites

---

- The API Connect developer toolkit, including the API Designer user interface, installed. For installation and running instructions, see [Installing the toolkit](#).
- The Local Test Environment and the API Designer must be downloaded from the same API Connect release page on [IBM Fix Central](#), in order for them to work together. For example, for API Connect Version 2018.4.1.7, use the distributions of Local Test Environment and API Designer from <https://www.ibm.com/support/pages/ibm-api-connect-v2018417-ifix15-available>.
- Docker installed.  
Note: The Local Test Environment is not supported with Docker Version 18.09.x.
- A minimum of 4 GB of RAM available to Docker if a single gateway type is used, or 6 GB if both the DataPower® API Gateway and DataPower Gateway (v5 compatible) are used.  
Note: As you increase the number of APIs that are published to your gateways, you will need to allocate further memory to Docker. You will also need to start the Local Test Environment with a larger database; see [apic-lte start](#).
- If you are using Windows, ensure that your C: drive (or the drive on which your HOME directory is located, if different), is enabled as a shared drive so that the Local Test Environment files are accessible to the Docker containers.

## Installing the Local Test Environment

---

There are two options for installing the Local Test Environment:

- Each user downloads the Local Test Environment images to their local machine and installs the Local Test Environment from there.
- One user downloads the Local Test Environment images and uploads them to a private Docker registry, from where any user can install the Local Test Environment.

To install the Local Test Environment from your local machine, complete the following steps:

1. Download the `apic-lte-version.zip` file from IBM Fix Central, and extract the contents, which are as follows:
  - `apic-lte-images.tar.gz`, which contains all required Docker images.
  - Separate `apic-lte` binary files for the Mac OS X, Linux®, and Windows platforms, in respective subfolders.
2. Load the Docker images into your local Docker image repository by entering the following command:

```
docker load < apic-lte-images.tar.gz
```

To upload the Local Test Environment images to a private Docker registry, complete the following steps:

1. Download the `apic-lte-version.zip` file as described in step [1](#).
2. Distribute the appropriate `apic-lte` binary file to all users.
3. Upload the Local Test Environment to your private Docker registry; enter the following command:

```
apic-lte registry-upload apic-lte-images.tar.gz registry_host
```

where `registry_host` is the host name or IP address of your private Docker registry. Now, any user can install and run the Local Test Environment as follows:  
a. If the private Docker registry requires authentication, log in by entering the following command:

```
docker login registry_host
```

b. Load the Docker images into your local Docker image repository by entering the following command:

```
apic-lte init registry_host
```

## Starting the Local Test Environment

1. Start the Docker images by entering the following command:

```
apic-lte start
```

Note:

- By default, the `apic-lte start` command starts only a DataPower API Gateway. To also start a DataPower Gateway (v5 compatible), enter the following command:

```
apic-lte start --datapower-gateway-enabled --datapower-api-gateway-enabled
```

- The Local Test Environment might fail to start with an error message that includes the strings `Error: certificate is not yet valid` and `CERT_NOT_YET_VALID`. The most likely cause is that the date and time setting is incorrect on the machine that is running the Local Test Environment. Ensure that the date and time setting is correct, before attempting the start command again. If you are using Docker for Windows, the clock in the Docker containers can become out of sync with the system clock, especially after a machine has been put in sleep mode. In this case, restarting Docker should fix the clock discrepancy; for more information, see <https://github.com/docker/for-win/issues/4526>.

2. Verify that the Local Test Environment is installed and running correctly by entering the following commands:

a. `apic-lte status`

This output from this command shows the status of all components, and provides endpoint and authentication details, and should be similar to the following:

```
Container          Status
-----
apic-lte-apim      Up 3 minutes
apic-lte-datapower-gateway Not Running
apic-lte-datapower-api-gateway Up 2 minutes
apic-lte-db        Up 3 minutes
apic-lte-juhu      Up 3 minutes
apic-lte-lur       Up 3 minutes

- Platform API url: https://localhost:2000
- Admin user: username=admin, password=7iron-hide
- 'localtest' org owner: username=shavon, password=7iron-hide
- 'localtest' org sandbox test app credentials client id: 80963e74076afe50d346d76401c3c08a
- Datapower API Gateway API base url: https://localhost:9444/localtest/sandbox/
```

b. `apic login --server localhost:2000 --username shavon --password 7iron-hide --realm provider/default-idp-2`

This command confirms that you can log in to the management server, and the response should be as follows:

```
Logged into localhost:2000 successfully
```

## Preparing an API for testing in the Local Test Environment

To prepare an API for testing in the Local Test Environment, you must publish it to the Sandbox Catalog in the Local Test Environment. If you want to test an API that you already published, proceed to [Testing an API in the Local Test Environment](#), otherwise, complete the following steps:

- Launch the API Designer user interface.
- Open the required local directory; this is the directory in which your API and Product definition files will be stored.
- Connect to the Local Test Environment. If you haven't previously connected to the Local Test Environment, click Add Another Cloud, then complete the following steps:

- In the HOST URL field, enter `https://localhost:2000`, then click Next..
- In the Username field, enter `shavon`, in the Password field enter `7iron-hide`, then click Sign in.

If you have previously connected to the Local Test Environment, click the existing tile to log in immediately.

The API Designer welcome page opens.

- Click Develop APIs and Products, then click the API that you want to test. For details on how to configure an API definition, see [Developing your APIs and applications](#).
- Click the Publish this API to the Sandbox catalog icon:

When the publish operation completes, your API is ready for testing.

Note: Whenever you make any changes to an API, you must republish it before retesting.

## Testing an API in the Local Test Environment.

To test an API in the Local Test Environment, issue a REST API call to the following URL:

```
https://localhost:9444/localtest/sandbox/basepath/operation_path?client_id=lte_client_id
```

where:

- `basepath` is the base path that is configured in the API definition.

- `operation_path` is the path for the operation that you want to invoke, as configured in the API definition.
- `lte_client_id` is the client ID for the test application in the local test environment, as returned by the `apic-lte status` command in step 2.

The following example show how to test the API that is created in the tutorial [Creating a proxy REST API definition](#), by using the `curl` utility; the API returns the details of bank branches:

```
curl -k https://localhost:9444/localtest/sandbox/branches/details?client_id=80963e74076afe50d346d76401c3c08a
[{"id": "0b3a8cf0-7e78-11e5-8059-a1020f32cce5", "type": "atm", "address": {"street1": "600 Anton Blvd.", "street2": "Floor
5", "city": "Costa Mesa", "state": "CA", "zip_code": "92626"}},
{"id": "9d72ece0-7e7b-11e5-9038-55f9f9c08c06", "type": "atm", "address": {"street1": "4660 La Jolla Village Drive", "street2": "Suite
300", "city": "San Diego", "state": "CA", "zip_code": "92122"}},
{"id": "ae648760-7e77-11e5-8059-a1020f32cce5", "type": "atm", "address": {"street1": "New Orchard
Road", "city": "Armonk", "state": "NY", "zip_code": "10504"}},
{"id": "c23397f0-7e76-11e5-8059-a1020f32cce5", "type": "branch", "phone": "512-286-5000", "address": {"street1": "11400 Burnet
Rd.", "city": "Austin", "state": "TX", "zip_code": "78758-3415"}},

Street", "city": "Cambridge", "state": "MA", "zip_code": "02142"}]}
```

## Local Test Environment commands

The following table summarizes the Local Test Environment commands; use the `help` command to get full usage details for any command.

Table 1. Local Test Environment command summary

Command	Description
<code>apic-lte help command</code>	Display help information for any command.
<code>apic-lte init</code>	Download the Local Test Environment Docker images.
<code>apic-lte start</code>	Start the Local Test Environment Docker images. Use the <code>--database-max-heap-size</code> parameter to set the size of the Local Test Environment database, in bytes; for example:  <pre>apic-lte start --database-max-heap-size 4096M apic-lte start --database-max-heap-size 1G apic-lte start --database-max-heap-size 1048576K apic-lte start --database-max-heap-size 1073741824</pre> <p>The default value is <b>1024M</b>. Tip: By default, the <code>apic-lte start</code> command deletes all previous data and re-initializes the Local Test Environment configuration, so all your previous configuration, including published Products, is deleted. To retain the previous configuration, and to apply the same command parameters that were used in the previous <code>apic-lte start</code> command, supply the <code>--keep-config</code> parameter.</p>
<code>apic-lte status</code>	Display status information for the Local Test Environment components, and endpoint and authentication details.
<code>apic-lte stop</code>	Stop the Local Test Environment Docker images.
<code>apic-lte version</code>	Display Local Test Environment version information.

## Troubleshooting the Local Test Environment

You can consult the log file for each Local Test Environment microservice or database by using the following command:

```
docker logs container-name
```

where `container-name` is one of the following:

- `apic-lte-juhu`: the authentication gateway
- `apic-lte-apim`: the API Management service
- `apic-lte-lur`: the Local User Registry
- `apic-lte-db`: the Cassandra database of the API Management service
- `apic-lte-datapower-api-gateway`: the DataPower API Gateway
- `apic-lte-datapower-gateway`: the DataPower Gateway (v5 compatible)

You can access the gateway logs in either of the following ways:

- Use the gateway administration web UI:
  1. Open the page `https://localhost:web_ui_port` in a browser; for details of the required port value, see [Local Test Environment port values](#).
  2. Select the apiconnect domain and the WebGUI interface, and log in with user name `admin` and password `admin`.
  3. Click View Logs.
- Use the gateway administration CLI:
  1. Open an SSH connection by using the following command:

```
ssh -p gateway-ssh-port localhost
```

For details of the required port value, see [Local Test Environment port values](#). The user name is `admin` and the password is `admin`.

2. Enter the command `switch domain apiconnect`.
3. To view the gateway log, enter the command `show log`.
4. To view the log for the communication between the gateway and the API management system, enter the command `show logging gwd-log`.

## Local Test Environment port values

If any of the default port values for the Local Test Environment components conflict with ports already in use on your system, you can change them when you start the Local Test Environment by passing one or more `--component port_value` parameters to the `apic-lte start` command, where:

- `component` is the Local Test Environment component whose port value you want to change.
- `port_value` is the required value.

For example:

```
apic-lte start --datapower-api-gateway-api-port 9445
```

The following table lists the components, together with the corresponding `component` parameters, and the default port values:

Component	component parameter	Default port value
DataPower API Gateway API port	<code>datapower-api-gateway-api-port</code>	9444
DataPower API Gateway API Connect service port	<code>datapower-api-gateway-apic-service-port</code>	3001
DataPower API Gateway SSH port	<code>datapower-api-gateway-ssh-port</code>	9023
DataPower API Gateway administration web UI	<code>datapower-api-gateway-web-gui-port</code>	9091
DataPower Gateway (v5 compatible) API port	<code>datapower-gateway-api-port</code>	9443
DataPower Gateway (v5 compatible) service port	<code>datapower-gateway-apic-service-port</code>	3000
DataPower Gateway (v5 compatible) SSH port	<code>datapower-gateway-ssh-port</code>	9022
DataPower Gateway (v5 compatible) administration web UI	<code>datapower-gateway-web-gui-port</code>	9090

## Related information

- [Creating TLS Client Profile in the Local Test Environment](#)

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Staging an API

The graphical wizard provides an option that adds the API to a Product and stages the Product in a Catalog. When a Product is in the staged state, it is not yet visible to, or subscribable by, any developers. The syndication feature in IBM® API Connect means that if Spaces are enabled for a Catalog, Products can be staged only to a Space within that Catalog.

## Before you begin

Ensure that you have a Catalog to stage to in the API Manager or API Designer user interfaces (UI). For more information, see [Creating and configuring Catalogs](#).

Ensure that the Catalog has at least one gateway service configured.

Note: All references in this topic to a Catalog can also be applied to Spaces in a Catalog, unless specified otherwise. For more information about Spaces, see [Using syndication in IBM API Connect®](#).

To complete the Product management tasks that are described in this topic, you must either be the owner of the API provider organization, or be assigned Product > Stage permission for the target Catalog or Space. For information on configuring Product management permissions for a Catalog or Space, see [Creating and configuring Catalogs](#) or [Managing user access in a Space](#).

## About this task

You can complete this task either by using either the API Designer UI application, or by using the browser based API Manager UI. Staging is not available when working offline in API Designer.

A Catalog is a staging target, and behaves as a logical partition of the DataPower® Gateway, and the Developer Portal.

Validation of the API OpenAPI definition file occurs during the staging or publishing process. The following validation occurs:

- Validation against the OpenAPI specification schema
- Validation against IBM extension properties
- Semantic validation, which includes the following types of validation:
  - Ensuring that if an API is enforced by an API Connect Gateway, then the scheme must be HTTPS, or the parameter name for an API key security scheme in the header must be either `X-IBM-Client-Id` or `X-IBM-Client-Secret`.
  - Ensuring that if the API is not enforced by an API Connect Gateway, then a "host" must be provided

Note: If the OpenAPI file that defines your API uses a `$ref` field to reference a fragment of OpenAPI code that is defined in a separate file, the `$ref` field is replaced with the contents of the target file before the product that contains the API is staged or published (the `$ref` field is supported only if you are using the API Connect for IBM Cloud developer toolkit). For more information, see [Using \\$ref to reuse code fragments in your OpenAPI files](#).

## Procedure

1. In the navigation pane, click  Develop.

The Develop: APIs and Products tab opens.

- Optional:** If you have accounts on multiple provider organizations, you can select a new provider organization for staging and publishing from the Organization menu.
- You can stage an API either from the APIs and Products listing page, or from within the API definition itself.
  - To stage an API from the APIs and Products listing page, click the options menu icon  alongside the required API, and then select Stage.
  - To stage an API from within the API definition, complete the following steps:
    - Click the API definition that you want to work with.
    - Click the options menu icon:

iii. Click Stage.

4. Choose one of the following actions:

- To stage the API by adding it to a new Product:
  - Select New Product - Publish using a new product.
  - When prompted, enter a Title and Version.
  - The Product Name is automatically entered. The Name is the used to refer to the product in CLI commands. See [apic products](#).
  - Click Next.
- To stage the API by adding it to an existing Product:
  - Select Existing Product - Publish using an existing product
  - Select the Product you want to use.
  - Click Next.

5. On the Stage To page, select the Catalog to which you want to stage the Product.

Note: The Catalogs that you can select from are those that are defined for the management server and provider organization that you are connected to.

If you are using the API Manager user interface, the connection details are determined by the API Manager URL that you open, and the user ID with which you log in. If you are using the API Designer user interface, you provide the management server details and user ID in the login window that opens when you first launch API Designer; see [Logging into API Connect Designer](#).

For details of how to create a Catalog in a provider organization, see [Creating and configuring Catalogs](#).

6. If, when the staged Product is subsequently published, you want it to be published only to selected gateway services, select Publish to specific gateway services, then select the required gateway services. Only the gateway services whose type matches the gateway type setting for the Product are listed. For information on gateway types, see [API Connect gateway types](#).

7. Click Stage.

## Results

Your Product is staged to a Catalog. You can view the state of the Product in the Catalog in API Manager. If you staged the product from API Designer, ensure you are logged into API Manager with the same user name and password that you used for API Designer. Click  Manage in the API Manager UI, then select the required Catalog. The Product is shown with a state of Staged.

For information about the lifecycle of a product, see [The Product lifecycle](#).

If approval is required to stage Products in the Catalog, an approval request is sent, and the Product moves to the Pending state; the Product is staged when the request is approved. If approval is not required, the Product is staged immediately.

For information on configuring Product lifecycle approvals for a Catalog, see [Creating and configuring Catalogs](#). For information on approving requests, see [Approving Product lifecycle and subscription requests](#).

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Publishing an API

The graphical wizard provides an option that adds the API to a Product and publishes the Product in a Catalog. Publishing a draft Product makes the APIs in that Product visible on the Developer Portal for use by application developers. The syndication feature in IBM® API Connect means that if Spaces are enabled for a Catalog, Products can be published only to a Space within that Catalog.

## Before you begin

Ensure that you have a Catalog to stage to in the API Manager or API Designer user interfaces (UI). For more information, see [Creating and configuring Catalogs](#).

Ensure that the Catalog has at least one gateway service configured.

Note: All references in this topic to a Catalog can also be applied to Spaces in a Catalog, unless specified otherwise. For more information about Spaces, see [Using syndication in IBM API Connect®](#).

To complete the Product management tasks that are described in this topic, you must either be the owner of the API provider organization, or be assigned Product<sub>z</sub> Manage permission for the target Catalog or Space. For information on configuring Product management permissions for a Catalog or Space, see [Creating and configuring Catalogs](#) or [Managing user access in a Space](#).

## About this task

You can complete this task either by using either the API Designer UI application, or by using the browser based API Manager UI. Publishing is not available when working offline in API Designer.

Validation of the API OpenAPI definition file occurs during the staging or publishing process. The following validation occurs:

- Validation against the OpenAPI specification schema
- Validation against IBM extension properties
- Semantic validation, which includes the following types of validation:
  - Ensuring that if an API is enforced by an API Connect Gateway, then the scheme must be HTTPS, or the parameter name for an API key security scheme in the header must be either `X-IBM-Client-Id` or `X-IBM-Client-Secret`.
  - Ensuring that if the API is not enforced by an API Connect Gateway, then a "host" must be provided

Note: Products that contain an API with a Swagger property using `regex` that include lookahead assertions, such as "(?" cannot be validated or published. An error message is returned. For example:

```
Product has not been published!
The multipart 'openapi' field contains an OpenAPI definition with validation errors.
definitions.properties.pattern Does not match format 'regex' (context: (root).definitions.properties.pattern, line: 0, col:
0)
400
```

Note: If the OpenAPI file that defines your API uses a `$ref` field to reference a fragment of OpenAPI code that is defined in a separate file, the `$ref` field is replaced with the contents of the target file before the product that contains the API is staged or published (the `$ref` field is supported only if you are using the API Connect for IBM Cloud developer toolkit). For more information, see [Using \\$ref to reuse code fragments in your OpenAPI files](#).

## Procedure

1. In the navigation pane, click  Develop.  
The Develop: APIs and Products tab opens.
2. **Optional:** If you have accounts on multiple provider organizations, you can select a new provider organization for staging and publishing from the Organization menu.
3. You can publish an API either from the APIs and Products listing page, or from within the API definition itself.
  - a. To publish an API from the APIs and Products listing page, click the options menu icon  alongside the required API, and then select Publish.
  - b. To publish an API from within the API definition, complete the following steps:
    - i. Click the API definition that you want to work with.
    - ii. Click the options menu icon:

- iii. Click Publish.
4. Choose one of the following actions:
    - To publish the API by adding it to a new Product:
      - Select New Product - Publish using a new product.
      - When prompted, enter a Title and Version.
      - The Product Name is automatically entered. The Name is the used to refer to the product in CLI commands. See [apic products](#).
      - Click Next.
    - To publish the API by adding it to an existing Product:
      - Select Existing Product - Publish using an existing product
      - Select the Product you want to use.
      - Click Next.
  5. Select the Catalog to which you want to publish the Product.
  6. If Spaces have been enabled in the selected Catalog, select the Space that you require.  
Note: The Catalogs that you can select from are those that are defined for the management server and provider organization that you are connected to.  
If you are using the API Manager user interface, the connection details are determined by the API Manager URL that you open, and the user ID with which you log in. If you are using the API Designer user interface, you provide the management server details and user ID in the login window that opens when you first launch API Designer; see [Logging into API Connect Designer](#).  
For details of how to create a Catalog in a provider organization, see [Creating and configuring Catalogs](#).
  7. If you want to publish the Product only to selected gateway services, select Publish to specific gateway services, then select the required gateway services. Only the gateway services whose type matches the gateway type setting for the Product are listed. For information on gateway types, see [API Connect gateway types](#).
  8. Click Publish.

## Results

Your Product is published to a Catalog. You can view the state of the Product in the Catalog in API Manager. If you published the product from API Designer, ensure you are logged into API Manager with the same user name and password that you used for API Designer. Click  Manage in the API Manager UI, then select the required Catalog. The Product is shown with a state of Published.

For information about the lifecycle of a product, see [The Product lifecycle](#).

If approval is required to publish Products in the Catalog, a publish approval request is sent, and the Product moves to the Pending state; the Product is published in the Catalog when the request is approved. If approval is not required, the Product is published immediately.

Note: If approval is required to stage Products to the Catalog, a stage approval request is sent. When the request is approved, the Product moves to the staged state and must be separately published in the Catalog. For information on publishing a staged Product in a Catalog, see [Publishing a Product](#).  
For information on configuring Product lifecycle approvals for a Catalog, see [Creating and configuring Catalogs](#). For information on approving requests, see [Approving Product lifecycle and subscription requests](#).

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Downloading an API definition

You can download the details of your API definitions so that you can store them for later recovery.

### Before you begin

To complete this task, you must have created an API definition. For more information, see [Creating an API definition](#).

### About this task

You can complete this task either by using either the API Designer UI application, or by using the browser based API Manager UI.

**API Manager UI only:** To complete this task, you must be assigned a role that has the **Drafts:View** permission. The pre-supplied Developer role has this permission by default; if you are assigned a custom role it must have this permission. For more information, see [Creating custom roles](#).

You can download REST APIs that were created by using [Creating a REST proxy API from a target service](#) for example. This download creates a .yaml file that defines the API.

You can download SOAP APIs that were created by using [Creating a REST proxy API from an existing WSDL service](#), or [Creating a SOAP proxy API from an existing WSDL service](#) for example. This download creates a .zip file that contains the WSDL definition and the YAML file that defines the API.

You can use the downloaded .yaml and .zip files to re-create your API. For information about creating an API from a .yaml file, see [Adding a REST API by importing an OpenAPI definition file](#). For information about creating an API from a .zip file, see [Adding a SOAP API by importing a zip file](#).

### Procedure

To download a .yaml, or .zip file that contains the details of your API, complete the following steps:

1. In the navigation pane, click  Develop.
2. Alongside the API version that you want to work with, click the options icon  and then click Download.
3. Save the file to the required location.

### Results

You have downloaded a .yaml representation of your API.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Deleting an API definition

You can delete an API definition that is no longer required.

### About this task

You can complete this task either by using either the API Designer UI application, or by using the browser based API Manager UI.

**API Manager UI only:** To complete this task, you must be assigned a role that has the **Api-Drafts:Edit** permission. The pre-supplied Developer role has this permission by default; if you are assigned a custom role it must have this permission. For more information, see [Creating custom roles](#).

### Procedure

1. In the navigation pane, click  Develop.
2. Alongside the API version that you want to delete, click the options icon  and then click Delete.  
Note: If a Product was previously generated automatically from the API, by using the Activate API option, that Product will be deleted together with the API; such Products have the title *api\_title* auto product.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Using an options file when importing a WSDL service

When you create an API definition, or add a target WSDL service to an API definition, by importing a .zip file, you can specify additional directives by including an options file in the .zip file.

You can use an options file when importing a .zip file while performing any of the following tasks:

- Creating a REST proxy API; see [Creating a REST proxy API from an existing WSDL service](#).
- Creating a SOAP proxy API; see [Creating a SOAP proxy API from an existing WSDL service](#).
- Adding a target WSDL service to an API definition; see [Editing an API definition](#).

The options file is a YAML file, and must have the file name apiconnect.yaml.

You can include the following fields in the file:

Table 1. Fields that can be included in the apiconnect.yaml file

Field name	Value	Default	Description
<code>suppressExamples</code>	true or false	false	Suppress auto-generation of examples.
<code>wssecurity</code>	true or false	true	Enable generation of definitions for WS-Security headers.
<code>implicitHeaderFiles</code>	Array of XSD file locations		Additional schema files, not referenced in the WSDL, that are used to define additional SOAP headers.
<code>port</code>	The <code>name</code> attribute for a <code>wsdl:port</code> in a <code>wsdl:service</code> definition.		Create the API by using the information for the specified port. If the specified port does not exist, or refers to a REST/XML port rather than a SOAP port, the API creation fails.  If no <code>port</code> field is present in the options file, API Connect creates the API by using the first SOAP port that it finds in the <code>wsdl:service</code> definition.

## Example

```
suppressExamples: true
wssecurity: false
implicitHeaderFiles:
  - xsdDir/schema1.xsd
  - xsdDir/schema2.xsd
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## API policies and logic constructs

Policies and logic constructs are pieces of configuration that control a specific aspect of processing in the Gateway server during the handling of an API invocation at run time.

Policies are the building blocks of assembly flows, and they provide the means to configure capability, such as security, logging, routing of requests to target services, and transformation of data from one format to another. Policies can be configured in the context of an API or in the context of a Plan.

Logic constructs behave in a similar way to policies, but they affect how and which parts of the assembly are implemented without modifying the data flow of the assembly.

IBM® API Connect provides the following ways that you can create, configure, and apply policies and logic constructs:

### Policies associated with a Plan

A Plan provides a mechanism for grouping API operations or subsets of operations from one or more APIs. You can set rate limiting policies on a Plan to specify how many requests an application is allowed to make during a specified time interval. You can also configure a policy for each operation that is included in a Plan. For more information, see [Working with Products](#).

### Built-in policies

A built-in policy enables you to apply a pre-configured policy statement to an assembly to control processing capabilities in the Gateway server. Built-in policies are applied by using the API Manager assembly editor to add a built-in policy to your assembly and to configure the properties for that policy. For more information, see [Built-in policies](#).

Note: You can also apply built-in policies to your APIs by adding an `assembly` extension to your OpenAPI definition file. For more information, see [IBM extensions to the OpenAPI specification](#).

### Logic constructs

A logic construct enables you to control the flow of data through your assembly during an API call. Like policies, logic constructs are applied to an API by using the API Manager assembly editor to add a logic construct to your assembly and to configure the behavior of the construct. For more information, see [Logic Constructs](#).

Note: You can also apply logic constructs to your APIs by adding an `assembly` extension to your OpenAPI definition file. For more information, see [IBM extensions to the OpenAPI specification](#).

### User-defined policies

A user-defined policy enables you to create your own policies to control extra processing features in the Gateway server, such as security, or routing of requests. User-defined policies are created outside of API Connect and then imported into one or more Catalogs, so they can be applied to an operation in the same way as built-in policies. For more information, see [Importing a user-defined policy into a Catalog](#).

#### • [Logic Constructs](#)

IBM API Connect includes a number of logic constructs that you can use to apply preconfigured logic to an assembly to control the flow of data through your assembly when the API is called.

#### • [Using context variables in GatewayScript and XSLT policies with the DataPower API Gateway](#)

In the code for GatewayScript and XSLT policies in your API assemblies, you can use API context variables to work with the messages that are generated when an API is called.

## Related reference

- [execute](#)

## Related information

- [Working with API definitions](#)
- [Including components in your assembly](#)

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Built-in policies

IBM® API Connect includes a number of built-in policies that you can use to apply preconfigured policy statements to an operation to control an aspect of processing in the Gateway server when an API is invoked.

Note: Although some built-in policies can be used with both the DataPower® Gateway (v5 compatible) and the DataPower API Gateway, some policies are restricted to a particular Gateway. The following icons indicate which Gateway each policy can be used with:

-  Indicates that the policy can be run on the DataPower Gateway (v5 compatible).
-  Indicates that the policy can be run on the DataPower API Gateway.

For details of the two types of gateway, see [API Connect gateway types](#).

Built-in policies are configured in the context of an API. You can use the API Manager assembly editor to add a built-in policy to an API and to configure the properties for that policy.

You can also add built-in policies to an API by creating an OpenAPI definition file. For more information, see [Creating an OpenAPI definition file](#).

The following table shows the list of built-in policies that are available. The table contains links to configuration information for both the built-in policy definitions, and the OpenAPI policy definitions. The policies are the same, but they are created in different ways.

Table 1. Built-in policies

Built-in policy	OpenAPI policy	Description		
<a href="#">Activity Log</a>	<a href="#">activity-log</a>	Use the Activity Log policy to configure your logging preferences for the API activity that is stored in IBM API Connect analytics. The preferences that you specify will override the default settings for collecting and storing details of the API activity. Note: The Activity Log policy is not supported in the assembly for an API whose gateway type is DataPower API Gateway. Instead, you configure activity logging in the API design settings. For details, see <a href="#">Activity logging with the DataPower API Gateway</a> .	✓	✓ Functionality provided in the API design; see <a href="#">Activity logging with the DataPower API Gateway</a> .
<a href="#">Client Security</a>	<a href="#">client-security</a>	Provides a range of options for authenticating client access to your APIs, extending the capabilities of the OpenAPI specification.	✗	✓ Available from V2018.4.1.5
<a href="#">GatewayScript</a>	<a href="#">gatewayscript</a>	Use the gatewayscript policy to execute a specified DataPower GatewayScript program.	✓	✓ Available from V2018.4.1.0
<a href="#">Generate JWT</a>	<a href="#">jwt-generate</a>	Use the Generate JWT security policy in IBM API Connect to generate a JSON Web Token (JWT).	✓	✓
<a href="#">Validate JWT</a>	<a href="#">jwt-validate</a>	Use the Validate JWT security policy to enable the validation of a JSON Web Token (JWT) in a request before allowing access to the APIs.	✓	✓
<a href="#">if</a>	<a href="#">if</a>	Use the if policy to apply a section of the assembly when a condition is fulfilled.	✓	✓ Available from V2018.4.1.0; functionality provided by <a href="#">switch</a>
<a href="#">Invoke</a>	<a href="#">invoke</a>	Apply the Invoke policy to call another service from within your assembly. The response from the backend is stored either in the variable <code>message.body</code> or in the response object variable if it is defined. The policy can be used with JSON or XML data, and can be applied multiple times within your assembly.	✓	✓
<a href="#">JSON to XML</a>	<a href="#">json-to-xml</a>	Use the JSON to XML policy to convert the context payload of your API from the JavaScript Object Notation (JSON) format to the extensible markup language (XML) format.	✓	✓
<a href="#">Log</a>	<a href="#">log</a>	Use the Log policy to customize or override the default activity logging configuration for an API.	✗	✓ Available from V2018.4.1.7
<a href="#">Map</a>	<a href="#">map</a>	Use the Map policy to apply transformations to your assembly flow and specify relationships between variables.	✓	✓

Built-in policy	OpenAPI policy	Description	DataPower Gateway	API Gateway
<a href="#">operation-switch</a>	<a href="#">operation-switch</a>	Use the operation-switch policy to apply a section of the assembly to a specific operation.	✓	✓ Available from V2018.4.1.0; functionality provided by <a href="#">switch</a>
<a href="#">OAuth</a>	<a href="#">oauth</a>	Use the OAuth policy to policy to perform OAuth processing based on defined OAuth provider settings.	✗	✓
<a href="#">Parse</a>	<a href="#">parse</a>	Use the Parse policy to control the parsing of an input document. When the input document is a JSON string, the string is parsed instead of copied over.	✗	✓
<a href="#">Proxy</a>	<a href="#">proxy</a>	Apply the Proxy policy to invoke another API within your assembly, particularly if the separate API contains a large payload. The response from the backend is stored in the <code>message.body</code> and in the response object variable if it is defined. Only one policy is permitted to be run per unique assembly flow.	✓	✓ Functionality provided by <a href="#">Invoke</a>
<a href="#">Rate Limit</a>	<a href="#">ratelimit</a>	Use the Rate Limit policy to apply one or more rate or burst limits at any point in your API assembly flow. Rate and burst limits restrict the number of calls that an application can make to an API in a specified time period.	✗	✓ Available from V2018.4.1.7
Redaction <a href="#">Redaction - DataPower API Gateway</a> <a href="#">Redaction - DataPower Gateway (v5 compatible)</a>	<a href="#">redact - DataPower API Gateway</a> <a href="#">redact - DataPower Gateway (v5 compatible)</a>	Use the Redaction policy to completely remove or to redact specified fields from the Request body, the Response body, and the activity logs. You might find this policy useful for removing or blocking out sensitive data (for example, credit card details) for legal, security, or other reasons.	✓	✓ Available from V2018.4.1.7
<a href="#">Set Variable</a>	<a href="#">set-variable</a>	Use the Set Variable policy to set the value of a runtime variable, or to clear a runtime variable, or to add a header variable.	✓	✓ Available from V2018.4.1.0
<a href="#">switch</a>	<a href="#">switch</a>	Use the switch policy to execute one of a number of sections of the assembly based on which specified condition is fulfilled.	✓	✓ Available from V2018.4.1.0
<a href="#">throw</a>	<a href="#">throw</a>	Use the throw policy to throw an error when it is reached during the execution of an assembly flow.	✓	✓ Available from V2018.4.1.0
<a href="#">User Security</a>	<a href="#">user-security</a>	Use the user-security policy to extract a user's credentials, authenticate those credentials, and obtain authorization from the user.	✗	✓
Validate <a href="#">Validate - DataPower API Gateway</a> <a href="#">Validate - DataPower Gateway (v5 compatible)</a>	<a href="#">validate - DataPower API Gateway</a> <a href="#">validate - DataPower Gateway (v5 compatible)</a>	Use the Validate policy to validate the payload in an assembly flow against a JSON or an XML schema.	✓	✓ Available from V2018.4.1.0
<a href="#">Validate Username Token</a>	<a href="#">validate-username-token</a>	Use the Validate Username Token policy to validate a Web Services Security (WS-Security) UsernameToken in a SOAP payload before allowing access to the protected resource.	✓	✗
<a href="#">XML to JSON</a>	<a href="#">xml-to-json</a>	Use the XML to JSON policy to convert the context payload of your API from the extensible markup language (XML) format to JavaScript Object Notation (JSON).	✓	✓
<a href="#">XSLT</a>	<a href="#">xslt</a>	Use the XSLT policy to apply an XSLT transform to the payload of the API definition.	✓	✓ Available from V2018.4.1.0

## Related tasks

- [Including components in your assembly.](#)

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Activity Log

Use the Activity Log policy to configure your logging preferences for the API activity that is stored in IBM® API Connect analytics. The preferences that you specify will override the default settings for collecting and storing details of the API activity.

## Gateway support

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® Gateway (v5 compatible)	1.0.0

This topic describes how to configure the policy in the assembly user interface; for details on how to configure the policy in your OpenAPI source, see [activity-log](#).

Note that if you are using the DataPower API Gateway, you can configure your logging preferences by using the Activity Log tab, in the Design view of the Develop API editor of the API Manager UI. For more information, see [Activity logging with the DataPower API Gateway](#).

## About

An API event record exists for each API execution event in the Gateway server. By default, the content type that is collected and stored in API event records is **activity** for when API execution completes successfully, and **payload** for when API execution completes with an error code. Apply the Activity Log policy to your assembly to change the type of content to log in these API event records. For more information about API event records, see [API event record fields](#).

You can attach this policy to the following API flows:

- REST
- SOAP

Note:

Activity log policies that call for logging of Analytics data upon success do not apply for the OAuth provider. The OAuth provider logs Analytics data for failure cases, but does not log successful cases.

## Properties

The following table lists the policy properties, indicates whether a property is required, specifies the valid and default values for input, and specifies the data type of the values.

Table 2. Activity Log policy properties

Property label	Required	Description	Data type
Title	Yes	A title for the policy is required, but a default value, <b>activity-log</b> is provided.	string
Description	No	A description of the policy.	string
Content	Yes	Defines the type of content to be logged when the operation is successful. Valid values: <ul style="list-style-type: none"> <li>• <b>none</b>: Indicates that no logging occurs. Restriction: This option disables notifications for application developers who use your Developer Portal.</li> <li>• <b>activity</b>: Logs invocation only (only the resource URI is recorded).</li> <li>• <b>header</b>: Logs activity and header.</li> <li>• <b>payload</b>: Logs activity, header, and payload (the original request, if any, and the final response).</li> </ul> The default value is <b>activity</b> .	string
Error content	No	Indicates what content to log if an error occurs. Valid values: <ul style="list-style-type: none"> <li>• <b>none</b>: Indicates that no logging occurs. Restriction: This option disables notifications for application developers who use your Developer Portal.</li> <li>• <b>activity</b>: Logs invocation only (only the resource URI is recorded).</li> <li>• <b>header</b>: Logs activity and header.</li> <li>• <b>payload</b>: Logs activity, header, and payload (the original request, if any, and the final response).</li> </ul> The default value is <b>payload</b> .	string

## Client Security

The Client Security policy provides a range of options for authenticating client access to your APIs, extending the capabilities of the OpenAPI specification.

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® API Gateway, policy available from V2018.4.1.5	2.0.0

This topic describes how to configure the policy in the assembly user interface; for details on how to configure the policy in your OpenAPI source, see [client-security](#).

## About

You use the Client Security policy in an API assembly to define how clients that call the API must supply authentication credentials.

## Properties

The following table lists the policy properties, indicates whether a property is required, specifies the valid and default values for input, and specifies the data type of the values.

Table 2. Client Security policy properties

Property label	Required	Description	Data type
Title	No	The title of the policy. The default value is <b>client-security</b> .	string
Description	No	A description of the policy.	string
Stop on Error	Yes	If this setting is enabled, assembly processing stops if client security fails, and an error is returned. The check box is selected by default.	boolean
Secret Required	Yes	If this setting is enabled, the client secret must be sent in the request. The secret is compared to the registered secret on the application that is identified by the client ID. The check box is selected by default.	boolean
Credential Extraction Method	Yes	Select one of the following options to define how the calling application authenticates: <ul style="list-style-type: none"> <li>Header: client ID and client secret credentials must be supplied in the request header.</li> <li>Query: client ID and client secret credentials must be supplied as query parameters in the request URL.</li> <li>Form: client ID and client secret credentials must be supplied as form data sent in a POST request.</li> <li>Cookie: client ID and client secret credentials must be supplied in a header called <b>Cookie</b>.</li> <li>HTTP: the calling application must authenticate by using basic authentication.</li> <li>Context Variable: the credentials that are used for authenticating the client are obtained from context variables that you set in the assembly flow prior to the Client Security policy, by using a <a href="#">GatewayScript</a> policy for example. The names of these context variables are determined by the values that you supply in the ID Name and Secret Name properties of the Client Security policy.</li> </ul> The default value is Header.	string
ID Name	Yes, unless the selected value of Credential Extraction Method is HTTP	The name of the parameter whose value specifies the client ID. For all Credential Extraction Method options other than Context Variable and HTTP, the calling application must supply a parameter with this name, in the location defined by the Credential Extraction Method option. For the Context Variable option, this property specifies the name of a context variable. This property does not apply if the Credential Extraction Method is HTTP.	string
Secret Name	Yes, if Secret Required is enabled and the selected value of Credential Extraction Method is other than HTTP	The name of the parameter whose value specifies the client secret. For all Credential Extraction Method options other than Context Variable and HTTP, the calling application must supply a parameter with this name, in the location defined by the Credential Extraction Method option. For the Context Variable option, this property specifies the name of a context variable. This property does not apply if the Credential Extraction Method is HTTP.	string
HTTP Type	Yes, if the selected value of Credential Extraction Method is HTTP	The authentication type. Currently, the only available option is Basic.	
Authenticate Client Method	Yes	Select one of the following options: <ul style="list-style-type: none"> <li>Native: only client ID and client secret are used to authenticate the client. If the selected value of Credential Extraction Method is HTTP then the calling application must supply the client ID for the user name, and the client secret for the password.</li> <li>Third party: a user registry is used to authenticate the client. If the selected value of Credential Extraction Method is other than HTTP then the calling application must supply the user name for the client ID, and the password for the client secret.</li> </ul> The default value is Native.	string
User Registry Name	Yes, if the selected value of Authenticate Client Method is Third party	Select the user registry that will be used to authenticate the client. The supported registry types are LDAP and authentication URL.	string

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## GatewayScript

Use the `gatewayscript` policy to execute a specified DataPower® GatewayScript program.

## Gateway support

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower Gateway (v5 compatible)	1.0.0
DataPower API Gateway, policy available from V2018.4.1.0	2.0.0

This topic describes how to configure the policy in the assembly user interface; for details on how to configure the policy in your OpenAPI source, see [gatewayscript](#).

## About

You can attach this policy to the following API flows:

- REST
- SOAP

The gatewayscript policy gives you built-in access to the DataPower Gateway module via variable `apim`.

## Properties

The following table lists the policy properties, indicates whether a property is required, specifies the valid and default values for input, and specifies the data type of the values.

Table 2. gatewayscript policy properties

Property label	Required	Description	Data type
Title	No	The title of the policy. The default value is <code>gatewayscript</code> .	string
Description	No	A description of the policy.	string
Source	Yes	The GatewayScript source code to execute. For example: <pre>var message = [ 'Hello', 'World!' ]; console.debug(message.join(' '));</pre>	string

## Examples

The following examples show how the full OpenAPI for the policy looks in the source code.

Example one:

```
gatewayscript:  
  title: writes message to DataPower log  
  source: console.debug('Hello World!');
```

Example two:

```
gatewayscript:  
  title: script written in multiple lines  
  source: |  
    var message = [ 'Hello', 'World!' ];  
    console.debug(message.join(' '));
```

For more code examples, see [GatewayScript code examples](#) and, if you are using the DataPower API Gateway, [Using context variables in GatewayScript and XSLT policies with the DataPower API Gateway](#).

For general information on using GatewayScript, see the following topics in the DataPower product documentation:

- [GatewayScript APIs for API management](#)
- [Accessing and manipulating a variable in the API context](#)
- [OAuth context variables](#)

## Errors

The following error can be thrown while the policy is being executed:

- `JavaScriptError` - a generic error that captures all errors that occur during the execution of the policy.

## Related tasks

- [Creating a new REST OpenAPI definition](#)

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## GatewayScript code examples

Example GatewayScript code snippets to help the creation of a gatewayscript policy.

Note:

- The GatewayScript functions that are listed here use the common name `apim` to call the methods. However, you can change the common name to one of your choice by using one or other of the following function calls depending on your gateway type:

```
DataPower Gateway (v5 compatible) var name = require('./apim.custom.js');
API Gateway var name = require('apim');
```

where `name` is your chosen name; for example:

```
var apim = require('apim');
```

- The mechanisms described here for interacting with the API Connect context are compatible with Version 5. However, if you are writing new GatewayScript policy, XSLT policy, or user-defined policy code, the preferred mechanisms, which provide better performance, are as described on [Using context variables in GatewayScript and XSLT policies with the DataPower API Gateway](#).

## Access the assembly context

The following code snippets show examples of how to access the assembly context.

Example one returns the `request` context:

```
apim.getvariable('request');
```

Example two returns the header named `foo`:

```
apim.getvariable('request.headers.foo');
```

Example three shows how to set, add, or clear a context variable, in this case a message header:

```
apim.setvariable('message.headers.name', value, action)
```

where

- `name` is the name of the message header that you want to set, add, or clear.
- `value` is the string value that you want to set the variable to. This can be a literal value, or another variable. For example, to set your named variable to the value of the Content-Type header in a request, you would specify the `value` as `request.headers.content-type`. This property is only required when `set` or `add` is specified as the action.
- `action` is the action that you want to apply to the variable. Valid options are:
  - `set`
  - `add`
  - `clear`

If no option is set, the default option of `set` is applied.

For a complete list of context variables, see [API Gateway context variables](#), and for more information about how to reference context variables in IBM API Connect see [Variable references in API Connect](#). If you are using the DataPower® API Gateway, see also [Using context variables in GatewayScript and XSLT policies with the DataPower API Gateway](#).

## Read input synchronously

The following code snippets show examples of how to read input synchronously by using the `apim.getvariable()` function to read data direct from a context. JSON input is returned as a JavaScript object. XML data is returned as a NodeList object (DOM).

Example one returns a synchronous read of the original request body into the variable that is called `json`:

```
var json = apim.getvariable('request.body');
```

Example two returns a synchronous read of the current message into the variable that is called `xml`:

```
var xml = apim.getvariable('message.body');
```

Note: If the content type of the data is neither XML nor JSON, the `apim.getvariable()` function returns a NodeList object consisting of one binary node, which must be converted to a string. If the content really is XML or JSON, you must then parse this string, as illustrated in the following example:

```
var data = apim.getvariable('request.body');

// if a nodelist was returned and the type is 13 (BLOB/Binary Node), convert it
// to a Buffer, which can then be converted to a string
if ((data.item && data.length > 0 && data.item(0).nodeType === 13)) {
  data = data.item(0).toBuffer().toString();
}

// if the string really is XML or JSON, then now add code to parse it with
// the appropriate XML or JSON parse function
.
.
.
```

## Read input asynchronously

The following code snippets show the `apim.readInput()` calls that you can use to perform a JavaScript callback function to read input data asynchronously into a variable. JSON input is returned as a JavaScript object. XML data is returned as a NodeList object (DOM). Other types of input are returned as a Buffer object.

```
apim.readInput(callback(err, input) {});
apim.readInputAsJSON(callback(err, json) {});
```

```
apim.readInputAsXML(callback(err,nodelist) {});
apim.readInputAsBuffer(callback(err,buffer) {});
```

Note: The `apim.readInput()` function attempts to determine the input data type and call the appropriate `apim.readInputAsType()` function in order to return the data in the correct format. However, to ensure that the correct data type is returned, use the `apim.readInputAsType()` function.

The `apim.readInputAsType()` function reads the data from either the INPUT context (for example `session.INPUT`), or from a policy output context (for example `policy.output`), depending on whether a previous policy had been called that had written output to a policy output context. This function then calls the underlying IBM DataPower GatewayScript `readAsType` method on the relevant context to read the data, and then use JavaScript callbacks to return the data to a variable. For more information about DataPower methods, see [APIs for methods](#).

The following is an example of how to use the `apim.readInputAsJSON()` callback function to get data into a variable that is called `json`:

```
apim.readInputAsJSON(function (error, json) {
  if (error)
  {
    // handle error
  }
  else
  {
    // the json parameter will contain the json data that has been read
    // process the json object in some way and write to the output context
    if (json.test=='true')
    {
      // if json data contains a variable called test that is set to true, then also add some test data
      json.data = 'This is my test data'
    }
    session.output.write(json);
    // write to the output context
  }
});
```

## Configure error information

The following code block shows an example of how to configure the policy implementation to produce error information by using the `apim.error()` function. In this example, `MyError` is thrown to the assembly flow. If there is a catch handler it catches this error, otherwise the assembly skips the execution of the flow and sends a `500 Internal Error` response.

```
apim.error('MyError', 500, 'Internal Error', 'Some error message');
```

where:

- `MyError` is the name of the error.
- `500` is the HTTP code of the required error message.
- `Internal Error` is the HTTP reason phrase for the error.
- `Some error message` is the suggested action for the user.

## Accessing the caught exception in a catch block

The following example shows how, in the `catch` block of an API assembly, you can obtain the details of the current caught exception. A possible use would be to create a custom error response using the details of the caught exception.

```
let exception = apim.getError();
```

The function returns a JSON object; for example:

```
{
  "name": "OperationError",
  "message": "This is a thrown Operation Error",
  "policyTitle": "Throw Operation Error",
  "status": {
    "code": "500",
    "reason": "Internal Server Error"
  }
}
```

## Write output

The following example shows how to write data into the output, in this case the JSON data `{ "status": "created" }`, by using the `session.output.write` variable:

```
session.output.write('{ "status": "created" }');
```

The `session.output.write` variable is a standard GatewayScript method that writes data to the output context. For more information, see [Contexts and sessions](#). Use the following function to set the format of the content that is written to the `session.output` variable:

```
apim.output('application/type');
```

For example, if you were creating a policy that called:

```
session.output.write('<test>this is some xml data</test>');
```

the policy would write XML data to the output context. You would need to configure the policy to also call

```
apim.output('application/xml');
```

to tell the system that the output is XML. It can cause issues in the processing of the policy if the actual output context format, and the format that is specified in `apim.output`, are different.

Note: If you use `apim.setvariable` to manipulate `message.body`, you must immediately follow the `apim.setvariable` function call with an `apim.output` function call that specifies the content type of the payload that was written to `message.body` by `apim.setvariable`.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Generate JWT

Use the Generate JWT security policy in IBM® API Connect to generate a JSON Web Token (JWT).

## Gateway support

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® Gateway (v5 compatible)	1.0.0
DataPower API Gateway	2.0.0

This topic describes how to configure the policy in the assembly user interface; for details on how to configure the policy in your OpenAPI source, see [jwt-generate](#).

## About

JSON Web Token (JWT) is a compact, URL-safe way of representing claims that are to be transferred between two parties. The Generate JWT policy enables you to generate claims and configure whether they are to be used as the payload of a JSON Web Signature (JWS) structure, or as the plain text of a JSON Web Encryption (JWE) structure. Specifying the cryptographic material for both the JWS and the JWE produces a nested JWT that is both digitally signed and encrypted. The JWT is then assigned to the Authorization header as a Bearer token (the default option), or to the runtime variable in the JSON Web Token (JWT) property, if specified.

You can attach this policy to the following API flows:

- REST
- SOAP

Note:

- For algorithm types HS256, HS384, and HS512 the cryptographic objects referenced must be a Shared Secret Key.
- For algorithm types RS256, RS384, RS512, ES256, ES384, ES512, PS256, PS384, PS512 the cryptographic objects referenced must be a Crypto Key (private key).
- The cryptographic material can be provided through a JSON Web Key (JWK).
- If both a cryptographic object and a JWK are specified, the cryptographic object is used to sign the JWT.

## Prerequisites

The following prerequisites apply:

- If you are using one or more cryptographic objects, they must be located in the API Connect domain on the DataPower appliance. The cryptographic objects must reference the Shared Secret Key or certificate that is needed to encrypt or sign the JWT contents.
- If a JSON Web Key (JWK) is being used, it must be referenced by a runtime variable.

## Properties

The following table lists the policy properties, indicates whether a property is required, specifies the valid and default values for input, and specifies the data type of the values.

Table 2. Generate JWT policy properties

Property label	Required	Description	Data type
Title	No	The title of the policy. The default value is <code>jwt-generate</code> .	string
Description	No	A description of the policy.	string
JSON Web Token (JWT)	No	Runtime variable in which to place the JWT that is generated. The default value is: <code>generated.jwt</code> . However, if not set, the JWT that is generated is written to the Authorization Header as a Bearer token.	string
JWT ID Claim	No	Indicates whether a JWT ID (jti) claim should be added to the JWT. If selected, the property is set to <code>true</code> , and a UUID is generated and set as the JTI claim value.	boolean
Issuer Claim	Yes	Runtime variable from which the Issuer (iss) claim string can be retrieved. This claim represents the Principal that issued the JWT. The default value is: <code>iss.claim</code>	string

Property label	Required	Description	Data type
Subject Claim	No	Runtime variable from which the Subject (sub) claim string can be retrieved.	string
Audience Claim	No	Runtime variable from which the Audience (aud) claim string can be retrieved. Multiple variables are set by using a comma-separated string.	string
Validity Period	Yes	The length of time (in seconds), that is added to the current date and time, in which the JWT is considered valid. The default value is <b>3600</b> .	integer
Private Claims	No	Runtime variable from which a valid set of JSON claims can be retrieved. These claims are added to any set of claims specified previously.	string
Sign JWK variable name	No	Runtime variable that contains the JWK that is used to sign the JWT. <sup>1</sup>	string
Cryptographic Algorithm	No	The cryptographic algorithm to use. Valid values are: <ul style="list-style-type: none"> <li>• HS256</li> <li>• HS384</li> <li>• HS512</li> <li>• RS256</li> <li>• RS384</li> <li>• RS512</li> <li>• ES256</li> <li>• ES384</li> <li>• ES512</li> <li>• PS256</li> <li>• PS384</li> <li>• PS512</li> </ul>	string
Sign Crypto Object	No	The cryptographic object to use to sign the JWT. <sup>1</sup>	string
Encryption Algorithm	No	The encryption algorithm to use. Valid values are: <ul style="list-style-type: none"> <li>• A128CBC-HS256</li> <li>• A192CBC-HS384</li> <li>• A256CBC-HS512</li> </ul>	string
Encrypt JWK variable name	No	Runtime variable that contains the JWK to use to encrypt the JWT.	string
Key Encryption Algorithm	No	The key encryption algorithm to use. Valid values are: <ul style="list-style-type: none"> <li>• RSA1_5</li> <li>• RSA-OAEP</li> <li>• RSA-OAEP-256</li> <li>• dir</li> <li>• A128KW</li> <li>• A192KW</li> <li>• A256KW</li> </ul>	string
Encrypt Crypto Object	No	The cryptographic object to use to encrypt the claim.	string

## Example

```
- jwt-generate:
  version: 1.0.0
  title: jwt-generate
  iss-claim: iss.claim
  exp-claim: 3600
  jwt: generated.jwt
  jti-claim: true
  sub-claim: sub.claim
  aud-claim: aud.claim
  private-claims: private.claims
  jws-jwk: jws.jwk
  jws-alg: HS256
  jws-crypto: jwsCryptoObjectName
  jwe-enc: A128CBC-HS256
  jwe-jwk: jwe.jwk
  jwe-alg: A128KW
  jwe-crypto: jweCryptoObjectName
```

## Errors

The following error can be thrown while the policy is being executed:

- **RuntimeError** - a generic error that captures all errors that occur during the execution of the policy. Upon failure, the detailed error message that is received from the underlying JOSE module is written to the default system log as an error message. This detailed error message is also assigned to the runtime variable `jwt-generate.error-message`, so it can be retrieved via `catch`.

If a `catch` is not configured, in the case of a failure the Generate JWT policy returns an HTTP code 500 **Invalid-JWT-Generate** failure. The detailed error message from the underlying JOSE module can be found in the system log.

Attention: If you are an API developer who is troubleshooting a failure that one of your customers had with your API, consider the security risks before sending a customer the exact content of the log message. You can avoid the possibility of someone launching an attack based on the information that they receive from the log message by sending the customer only general information about the message.

## Related information

- [Introduction to JSON Web Tokens](#)

<sup>1</sup> A JWK and a Crypto Object are both valid ways of providing the cryptographic data necessary to sign the JWT. However, if both data types are specified, only the Crypto Object is used.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Validate JWT

Use the Validate JWT security policy to enable the validation of a JSON Web Token (JWT) in a request before allowing access to the APIs.

## Gateway support

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® Gateway (v5 compatible)	1.0.0
DataPower API Gateway	2.0.0

This topic describes how to configure the policy in the assembly user interface; for details on how to configure the policy in your OpenAPI source, see [jwt-validate](#).

## About

JSON Web Token (JWT) is a compact, URL-safe way of representing claims that are to be transferred between two parties. The Validate JWT policy enables you to secure access to your APIs by using JWT validation. For example, when an input request that contains a JWT in the header is received, the Validate JWT policy extracts the token, verifies, and decrypts (if appropriate) the signature, and validates the claim. If valid, the claim is put in a runtime variable (for subsequent use if required), and access is allowed to the API. If the claim is not valid, access is denied.

All claims that are specified in the Validate JWT policy are validated, but this is not necessarily all the claims that are contained in the JWT. Not all claims that are in the JWT must be validated, but if any one of the claims that are specified in the Validate JWT policy fail, the whole validation fails. If the validation succeeds, the full set of claims that are contained in the JWT are written to the runtime variable specified in the Output Claims property. Thereby allowing any subsequent action to use this runtime variable to further validate the full set of claims that were in the JWT, as necessary.

You can attach this policy to the following API flows:

- REST
- SOAP

Note:

- If the original message was signed with a Shared Secret Key, the cryptographic object that is specified must also be a Shared Secret Key.
- If the original message was signed with a Private Key, the cryptographic object that is specified must be a Crypto Certificate (public certificate).
- The cryptographic material can be provided through a JSON Web Key (JWK).
- If a JWK header parameter is included in the header of the JWT, the parameter must match the JWK or cryptographic object that is specified in the policy, or the JWT validation will fail.
- If both a cryptographic object and a JWK are specified, the cryptographic object is used to decrypt or verify the JWT.
- The JWT validate action on the DataPower API Gateway can verify a JWT by using either a single JWK, or a JWK set.

## Prerequisites

The following prerequisites apply:

- IBM® DataPower V7.5 with the Application Optimization (AO) option.
- If you are using one or more cryptographic objects, they must be located in the IBM API Connect domain on the DataPower appliance. The cryptographic objects must reference the Shared Secret Key or public certificate that is needed to decrypt the JWT contents or verify the signature.
- If a JSON Web Key (JWK), or a JWK set, is being used, it must be referenced by a runtime variable.

## Properties

The following table lists the policy properties, indicates whether a property is required, specifies the valid and default values for input, and specifies the data type of the values.

Table 2. Validate JWT policy properties

Property label	Required	Description	Data type
Title	Yes	The title of the policy. The default value is <code>jwt-validate</code> .	string
Description	No	A description of the policy.	string

Property label	Required	Description	Data type
JSON Web Token (JWT)	Yes	Context or runtime variable that contains the JWT to be validated. The default value is: <code>request.headers.authorization</code> . However, if this property is not set, the policy looks for the JWT in the <code>request.headers.authorization</code> location by default.  Note: The format of the authorization header must be:  <code>"Authorization: Bearer jwt-token"</code>  where <code>jwt-token</code> is the encoded JWT.	string
Output Claims	Yes	Runtime variable to which the full set of claims that are contained in the JWT is assigned. The default value is: <code>decoded.claims</code> .	string
Issuer Claim	No	The Perl Compatible Regular Expressions (PCRE) to use to validate the Issuer (iss) claim.	string
Audience Claim	No	The PCRE to use to validate the Audience (aud) claim.	string
Decrypt Crypto Object	No	The cryptographic object (a shared key or certificate) to use to decode the claim. <sup>1</sup>	string
Decrypt Crypto JWK variable name	No	Runtime variable that contains the JWK to use to decrypt the JWT. <sup>1</sup>	string
Verify Crypto Object	No	The cryptographic object (a shared key or certificate) to use to verify the signature. <sup>2</sup>	string
Verify Crypto JWK variable name	No	Runtime variable that contains the JWK, or JWK set, to use to verify the signature. <sup>2</sup>	string

## Example

```
- jwt-validate:
  version: 1.0.0
  title: jwt-validate
  jwt: request.headers.authorization
  output-claims: decoded.claims
  iss-claim: "'^data.*'"
  aud-claim: "'^id.*'"
  jwe-crypto: jweCryptoObjectName
  jwe-jwk: jwe.jwk
  jws-crypto: jwsCryptoObjectName
  jws-jwk: jws.jwk
```

## Errors

The following error can be thrown while the policy is being executed:

- **RuntimeError** - a generic error that captures all errors that occur during the execution of the policy. Upon a validation failure, the detailed error message that is received from the underlying JOSE module is written to the default system log as an error message. This detailed error message is also assigned to the runtime variable `jwt-validate.error-message`, so it can be retrieved via `catch`.

If a `catch` is not configured, in the case of a validation failure the Validate JWT policy returns an HTTP code 500 `Invalid-JWT-Validate` failure. The detailed error message from the underlying JOSE module can be found in the system log.

Attention: If you are an API developer who is troubleshooting a failure that one of your customers had with your API, consider the security risks before sending a customer the exact content of the log message. You can avoid the possibility of someone launching an attack based on the information that they receive from the log message by sending the customer only general information about the message.

For examples, see [jwt-validate](#).

## Related information

- [Introduction to JSON Web Tokens](#)

<sup>1</sup> A JWK and a Crypto Object are both valid ways of providing the cryptographic data necessary to decrypt the JWT. However, if both data types are specified, only the Crypto Object is used.

<sup>2</sup> A JWK, or JWK set, and a Crypto Object are both valid ways of providing the cryptographic data necessary to verify the JWT. However, if both data types are specified, only the Crypto Object is used.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Invoke

Apply the Invoke policy to call another service from within your assembly. The response from the backend is stored either in the variable `message.body` or in the response object variable if it is defined. The policy can be used with JSON or XML data, and can be applied multiple times within your assembly.

## Gateway support

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® Gateway (v5 compatible)	1.0.0
DataPower API Gateway	2.0.0

This topic describes how to configure the policy in the assembly user interface; for details on how to configure the policy in your OpenAPI source, see [invoke](#).

## About

You can attach this policy to the following API flows:

- REST
- SOAP

Users might notice that the last invoke in their policy is replaced by a proxy. The replacement is sometimes done automatically by the IBM® API Connect DataPower Gateway to improve performance. The proxy is functionally equivalent to the invoke, but the API caller might notice the following differences when proxy is used.

- If the HTTP request made by the invoke or proxy gets a redirect (3xx) response:
  - invoke returns the response from following the redirect response.
  - proxy does not follow 3xx responses, and the redirect response is returned.
- The IBM API Connect test tool shows that proxy was used, but invoke appears in the Analytics latency records.
- The response from the proxy can contain different whitespace or escaping than a response from invoke. Despite the differences in the response, it is still valid.

If you want to prevent replacement of the last invoke in the assembly with proxy, you can set the API property `api.properties.x-ibm-gateway-optimize-invoke` to `false`. For more information, see [API properties](#)

Note:

- The Invoke policy does not support responses with multipart form data, that is, when the response is set to `Content-Type: multipart/related`.
- The Invoke policy always uses chunked encoding, which is not supported by the HTTP 1.0 protocol.

## Properties

The following table lists the policy properties, indicates whether a property is required, specifies the valid and default values for input, and specifies the data type of the values.

Table 2. Invoke policy properties

Property label	Required	Description	Data type
Title	Yes	The title of the policy. The default value is <code>invoke</code> .	string
Description	No	A description of the policy.	string
URL	Yes	Specifies a URL for the target service. For a SOAP API, a URL is added by default. Where possible, the Invoke URL value is pre-supplied from information that is defined in the imported WSDL.	string
TLS profile	No	Specifies a TLS profile to use for the secure transmission of data.	string
Timeout	Yes	The time to wait before a reply back from the endpoint (in seconds). The default value is <code>60</code> .	integer
Username	No	The username to use for HTTP Basic authentication.	string
Password	No	The password to use for HTTP Basic authentication.	string
HTTP Method	Yes	The HTTP method to use for the Invoke. Valid values are: <ul style="list-style-type: none"> <li>• Keep</li> <li>• GET</li> <li>• POST</li> <li>• PUT</li> <li>• DELETE</li> <li>• PATCH</li> <li>• HEAD</li> <li>• OPTIONS</li> </ul> The default value is <code>GET</code> . However, if set to <code>Keep</code> , or the property is removed from the source, the HTTP method from the incoming request is used.	string
Compression	No	Select this check box to enable Content-Encoding compression on upload. The check box is cleared by default.	boolean

Property label	Required	Description	Data type
Cache Type	No	<p>The cache type determines whether to cache documents, honoring or overriding the HTTP Cache Control directives received in the response from the target URL. This property takes effect only when a response is received, otherwise the policy always returns the non-expired response that was previously saved in cache. Valid values are:</p> <p><b>Protocol</b> The cache behavior is determined by the Cache-Control headers on the response, in accordance with RFC 7234. To optimize performance, if the gateway receives more than one request for a resource that is not in the cache but could be cached when the response from the target URL is received, the gateway sends only one request to the target URL; the remaining requests are not processed until the response from the first request has been received and the cache behavior has been determined from this response. If the response indicates that caching is possible, the gateway responds to all waiting requests with the cached resource. If the response indicates that caching is not possible, the gateway sends all waiting requests to the target URL.</p> <p>Use this option only if you expect that responses from the target URL can be cached, in which case it should improve performance and limit the demand on the target URL. If, however, the target URL never indicates that the gateway should cache its response, performance might be impaired when compared to the No Cache option.</p> <p><b>No Cache</b> Responses from the target URL are not cached on the gateway regardless of any caching headers returned. In this case, every request from the client is sent to the target URL. Use this option if you do not want to cache any of the backend responses on the gateway, or if it is unlikely that a response from the target URL will allow caching through the Cache-Control header settings.</p> <p><b>Time to Live</b> This option is similar to the Protocol option except it allows you to specify the amount of time that you want the successful response from the invoke or proxy to remain in the cache. Use this option only if you expect that responses from the target URL can be cached.</p> <p>The default value is Protocol.</p>	string
Time to Live	No	Specifies the amount of time in seconds that the response stays in the cache. Applies only if the property Cache type is set to <b>Time to Live</b> . Enter a value in the range 5 - 31708800. The default value is 900.	integer
Cache key	No	Specifies the unique identifier of the document cache entry. If omitted, the entire URL string is used as the key.	string
<input type="checkbox"/> API Gateway only Inject proxy headers	No	If you select this check box, the <b>invoke</b> policy injects the <b>X-Forwarded-For</b> , <b>X-Forwarded-To</b> , <b>X-Forwarded-Host</b> , and <b>X-Forwarded-Proto</b> headers to the request that is sent to the target URL. The check box is cleared by default.	boolean
<input type="checkbox"/> API Gateway only Decode Request Params	No	If you select this check box, any request parameters that are referenced by a variable definition on the target URL of the invoke policy are URL-decoded. The check box is cleared by default.	boolean
<input type="checkbox"/> API Gateway only Queryparam Encode	No	If you select this check box, all "+" characters in the query parameter values of the target URL are encoded to %2F. The check box is cleared by default.	boolean
<input type="checkbox"/> API Gateway only Keep Payload	No	If you select this check box, the invoke policy sends a payload on an <b>HTTP DELETE</b> method. The check box is cleared by default.	boolean
<input type="checkbox"/> API Gateway only Restrict to HTTP 1.0 (policy version 2.0.0 only)	No	If you select this check box, HTTP transactions are restricted to version 1.0. The check box is cleared by default.	boolean
<input type="checkbox"/> API Gateway only Allow chunked uploads	No	<p>If you select this check box, chunked-encoded documents are sent to the server. When the HTTP 1.1 protocol is used, the body of the document can be delimited by either <b>Content-Length</b> or chunked encoding. While all servers can interpret <b>Content-Length</b>, many applications fail to understand chunked-encoded documents. For this reason, <b>Content-Length</b> is the standard method.</p> <p>The use of <b>Content-Length</b> interferes with the ability of the DataPower Gateway to fully stream. If you must stream full documents to the target server, enable this property.</p> <p>When enabled, the server must be RFC 2616 compatible. Unlike all other HTTP 1.1 features that can be negotiated down at run time, you must know beforehand that the target server is RFC 2616 compatible.</p> <p>The check box is selected by default.</p> <p>Note: Chunked encoding is not supported by the HTTP 1.0 protocol.</p>	boolean

Property label	Required	Description	Data type
<div style="border: 1px solid green; padding: 2px;">API Gateway only</div> Header control	No	<p>Specifies the headers in <code>message.headers</code> that you want to copy to the target URL.</p> <p>To prevent headers from being copied, complete the following steps:</p> <ol style="list-style-type: none"> <li>1. Select Blacklist.</li> <li>2. Click Add blacklist.</li> <li>3. In the empty field that is displayed, enter the header name.</li> <li>4. To add further headers, repeat the previous steps.</li> </ol> <p>To specify headers that you want to be copied, complete the following steps:</p> <ol style="list-style-type: none"> <li>1. Select Whitelist.</li> <li>2. Click Add whitelist.</li> <li>3. In the empty field that is displayed, enter the header name.</li> <li>4. To add further headers, repeat the previous steps.</li> </ol> <p>The values that you specify are in regular expression format. For example, to specify the Content-Type header, enter <code>^Content-Type\$</code></p> <p>By default, Blacklist is selected, with no blacklist entries, meaning that <b>all</b> headers are copied.</p>	string
<div style="border: 1px solid green; padding: 2px;">API Gateway only</div> Parameter control	No	<p>Specifies the parameters in the incoming request that you want to be copied to the target URL.</p> <p>To prevent parameters from being copied, complete the following steps:</p> <ol style="list-style-type: none"> <li>1. Select Blacklist.</li> <li>2. Click Add blacklist.</li> <li>3. In the empty field that is displayed, enter the parameter name.</li> <li>4. To add further parameters, repeat the previous steps.</li> </ol> <p>To specify parameters that you want to be copied, complete the following steps:</p> <ol style="list-style-type: none"> <li>1. Select Whitelist.</li> <li>2. Click Add whitelist.</li> <li>3. In the empty field that is displayed, enter the parameter name.</li> <li>4. To add further parameters, repeat the previous steps.</li> </ol> <p>The values that you specify are in regular expression format.</p> <p>For example, if the incoming request is</p> <pre>http://apigw/org/sandbox/petstore/base?petid=100&amp;display=detailed</pre> <p>and you specify a white list entry of <code>^petid\$</code>, the target URL at run time will be</p> <pre>http://myhost/mypath?storeid=3&amp;petid=100</pre> <p>By default, Whitelist is selected, with no whitelist entries, meaning that <b>no</b> parameters are copied.</p>	string
Stop on error	No	<p>Select the errors that, if thrown during the policy execution, cause the assembly flow to stop. If there is a <b>catch</b> flow configured for the error, it is triggered to handle the error thrown. If an error is thrown and there are no errors selected for the Stop on error setting, or if the error thrown is not one of the selected errors, the policy execution is allowed to complete, and the assembly flow continues.</p>	string
Response object variable	No	<p>The name of a variable that will be used to store the response data from the request. By default, the invoke response, that is the body, headers, statusCode and statusMessage, is saved in the variable <code>message</code>. Use this property to specify an alternate location to store the invoke response. This variable can then be referenced in other actions, such as <a href="#">Map</a>.</p> <p>Note: If you want the response to be saved in <code>message</code>, leave the Response object variable property blank, do <b>not</b> supply the value <code>message</code>.</p>	string

## Example

```
- invoke:
  version: 2.0.0
  title: get the account status
  target-url: https://example.com/accounts/{id}?status={status}
  cache-response: time-to-live
  cache-putpost-response: true
  tls-profile: MyTLSProfile
  verb: POST
  timeout: 60
  compression: false
  username: MyUser
  password: MyPassword
  stop-on-error:
    - ConnectionError
    - OperationError
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#), for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## JSON to XML

Use the JSON to XML policy to convert the context payload of your API from the JavaScript Object Notation (JSON) format to the extensible markup language (XML) format.

### Gateway support

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® Gateway (v5 compatible)	1.0.0
DataPower API Gateway	2.0.0

This topic describes how to configure the policy in the assembly user interface; for details on how to configure the policy in your OpenAPI source, see [json-to-xml](#).

### About

The JSON to XML policy uses a simple convention, based on BadgerFish, to convert your API context payload from JSON to XML. The policy expects the JSON input to be in the same format as the BadgerFish convention, so the structure can be rebuilt in XML. No additional configuration is required. For more information about the BadgerFish convention, see [BadgerFish](#).

Note: The JSON to XML policy does convert the JSON structure { "a" : "hello" } (which is not BadgerFish convention) into `<a>hello</a>`.

You can attach this policy to the following API flows:

- REST
- SOAP

Use the IBM® API Connect API Manager assembly view when you are creating your API definition to add a built-in policy to the flow.

The policy must be attached to the flow at the point at which you require the conversion to be performed. For example, if you need to convert a JSON-formatted request into an XML-formatted request, the policy must be attached to the request flow.

The policy reads input from the `message.body`, if that context exists, otherwise from the `request.body`, and then writes the output to the `message.body`.

Note: If you are using the DataPower API Gateway, the input to the JSON to XML policy must be parsed data. One way to produce parsed data is to use a [Parse](#) policy before a JSON to XML policy in your assembly flow, which provides explicit control of the parse action.

### Properties

The following table lists the policy properties, indicates whether a property is required, specifies the valid and default values for input, and specifies the data type of the values.

Table 2. Policy properties

Property label	Required	Description	Data type
Title	Yes	The title of the policy. The default value is <code>json-to-xml</code> .	string
Description	No	A description of the policy.	string
 Input	No	The input message to convert. Specify the name of a variable in the API context. <code>variableName.body</code> , the message payload, represents the JSON input to convert. The default value of the variable is <code>message</code> and <code>message.body</code> is the default input.	string
 Output	No	The output message to store the conversion result. Specify the name of a variable in the API context. <code>variableName.body</code> represents the result of conversion from JSON format to XML format. When the specified input message is the default message, the default output is <code>message.body</code> . Otherwise, when the input message is the variable <code>my-message-variable</code> , for example, the default output is <code>my-message-variable.body</code> . The variable cannot be any read-only in the API context.	string
 Conversion type	No	The conversion type that determines the target format of the output. The following options are available: <ul style="list-style-type: none"> <li>• None: No conversion of the output takes place.</li> <li>• badgerFish: BadgerFish convention is used to determine the target conversion format of the output.</li> </ul>	string
Root XML Element Name	Yes	The root element name of the resultant XML document. This property is used only if the input JSON document is not hierarchical and has more than one top-level property, or if the Always output the root element check box is selected. The default value is <code>json</code> .	string
Always output the root element	Yes	Select this check box if you always want the policy to output the root element, even if it is not required to make the XML document well formed. The default value is <code>false</code> .	boolean
Element name for JSON array elements	No	The XML element name to be used for JSON array elements.	string

## Examples

For example, the following simple JSON object

```
{ "a": { "$" : "hello" } }
```

becomes

```
<a>hello</a>
```

The following JSON object with an attribute

```
{ "a": { "$" : "hello", "@type" : "world" } }
```

becomes

```
<a type="world">hello</a>
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Log

Use the Log policy to customize or override the default activity logging configuration for an API.

## Gateway support

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® API Gateway, policy available from V2018.4.1.7	2.0.0

This topic describes how to configure the policy in the assembly user interface; for details on how to configure the policy in your OpenAPI source, see [log](#).

## About

By default, the logging of activity when an API is called, and the sending of the log data to the analytics server, is determined by the settings in the API definition, as described in [Activity logging with the DataPower API Gateway](#). However, you can customize activity logging by adding a Log policy to the API assembly flow.

The Log policy enables you to gather all API analytics data for processing in your assembly, and to control what activity log data is sent to the analytics server. Here are some examples of the ways in which you can use the Log policy to customize API activity logging:

- Gather activity log data, use a Redaction policy to redact sensitive fields in the data, then send to the analytics server.
- Send different levels of analytics data depending on certain conditions; for example, the API operation that was called.
- Configure custom activity logging in a global policy that is applied to every API in a Catalog. For more information on global policies, see [Working with global policies](#).

## Properties

The following table lists the policy properties, indicates whether a property is required, specifies the valid and default values for input, and specifies the data type of the values.

Table 2. Log policy properties

Property label	Required	Description	Data type
Title	No	The title of the policy. The default value is <b>log</b> .	string
Description	No	A description of the policy.	string
Mode	Yes	Select one of the following options: <ul style="list-style-type: none"><li>• Gather-only: gather all analytics data and write it to the <b>log</b> context variable, which populates the API event record on completion of the API execution. For more information on the fields in the <b>log</b> context variable, and the consequent API event record, see <a href="#">API event record fields</a>.</li><li>• Send-only: perform the following actions:<ul style="list-style-type: none"><li>◦ Read the data from the <b>log</b> context variable.</li><li>◦ Truncate all message payloads and convert to a textual representation.</li><li>◦ Send the data to the analytics server.</li></ul></li><li>• Gather-and-send: perform a <b>gather-only</b> operation, immediately followed by a <b>send-only</b> operation.</li></ul> <p>If you use the Send-only or Gather-and-send option, data is buffered and sent to the analytics server in batches according to the time interval configured for the Analytics Endpoint on the DataPower API Gateway. For more information, see <a href="#">Configuring an analytics endpoint</a> in the DataPower knowledge center.</p> <p>Note: If you are offloading to a third party analytics server, you can redact any aspect of the event data. If you are using API Connect analytics, you can redact only request and response payloads.</p>	string

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Map

Use the Map policy to apply transformations to your assembly flow and specify relationships between variables.

### Gateway support

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® Gateway (v5 compatible)	1.0.0
DataPower API Gateway	2.0.0

This topic describes how to configure the policy in the assembly user interface; for details on how to configure the policy in your OpenAPI source, see [map](#).

### About

Be aware that MAP decodes all parameter values to an ASCII character equivalent. If a MAP parameter contains entries such as %nn, the MAP output contains decoded values.

For information about the structure of a Map policy and its behavior, see [The Map policy structure](#).

For information about configuring a Map policy by using the user interface, see [Configuring the Map policy in the user interface](#).

For examples of YAML representations of different Map policy configurations, see [Map policy examples](#).

You can attach this policy to the following API flows:

- REST
- SOAP

### Properties

The following table lists the policy properties, indicates whether a property is required, specifies the valid and default values for input, and specifies the data type of the values.

Table 2. Map policy properties

Property label	Required	Description	Data type
Title	No	The title of the policy. The field is visible when editing inputs. The default value is <b>map</b> .	string
Description	No	A description of the policy. The field is visible when editing inputs.	string
Inputs	Yes	A list of variables that are inputs of the policy.	array (string)
Outputs	Yes	A list of variables that are outputs of the policy.	array (string)
Value	Yes	A GatewayScript program to be performed by the policy in order to map its inputs to its outputs, or to set the value of outputs.	string

Note: The map policy has other properties that are not displayed in the user interface. For a complete list of properties, see [map](#).

### Related tasks

- [Creating a new REST OpenAPI definition](#)

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## The Map policy structure

The Map policy uses a structure within its OpenAPI definition to specify the behavior of the policy.

This topic contains the following sections:

- [Structure](#)
- [Input and output definitions](#)
- [Actions](#)
- [Script](#)
- [Fields](#)

- [References to inputs and outputs](#)
- [Accessing other contexts](#)

For map policy examples, see [Map policy examples](#).

Note: If you deploy your API to the DataPower® Gateway (v5 compatible) then, with the exception of client ID and client secret, the passing of form input as a parameter into an API is not supported. This restriction does not apply if you deploy your API to the DataPower API Gateway.

## Structure

In addition to its title and description, a Map policy has the following four main sections:

### inputs

A list of variables that form the input of the Map policy. Each input has a context variable in which the input variable is found, the variable's name within the Map policy, the content type of the variable, and the definition of the variable or a schema defining its structure.

### outputs

A list of variables that form the output of the Map policy. These include a context variable where the output variable is found or should be created, the variable's name at output, and the definition of the variable or a schema defining its structure.

### action

An array containing details of the actions to be performed in order. Each entry includes either a **set** or **create** field, which specifies the output variable or variables that are part of the action. An action can also contain a **from** field, which specifies the input variable or variables that are part of the action.

Each action also contains either a **value** field, when the output is set or created, or a **foreach** field and a new **actions** section, when further actions are nested within the first to set or create elements in a nested array.

### options

The following property options are available for you to select:

- Include empty. If the check box is selected (the default option), empty XML elements are included in the output of the map policy. Clear the check box if you do not want empty XML elements to be included in the output of the map policy.
- Namespace inheritance. If the check box is selected (the default option), XML namespaces are inherited from the parent element. Clear the check box if you want the map policy to use explicit namespaces.
- Namespace inlining. If the check box is selected (the default option), XML namespaces will be inserted into the document where they are first used. Clear the check box if you want namespaces to all be defined on the root element.
- API Gateway only Resolve XML input data type. If the check box is selected, XML elements whose schema is configured as type boolean or numeric will be converted to that data type. Clear the check box (the default option) if you want all XML element values to be returned as a string.
- API Gateway only Empty XML element handling. This property controls how the map policy handles the output of an empty XML element. The following choices are available:
  - String (the default option): An empty XML element is handled as an empty string.
  - Null: An empty XML element is handled as a null value.
  - None: The data is ignored.
  - API Gateway only String Badgerfish: The value for an empty XML element is considered to be an empty string. The empty string value will be placed into a JSON badgerfish value property.
  - API Gateway only Null Badgerfish: The value for an empty XML element is considered to be null. The null value will be placed into a JSON badgerfish value property. A mapping of this element to a JSON output property does not occur unless the Allow null value option is selected.
- API Gateway only Use only first array element. If the check box is selected, if an array is encountered in the traversal of the input, only the first element is used. Clear the check box (the default option) if you want the map policy to use all array elements.
- API Gateway only Resolve API Connect variable references. If the check box is selected (the default option), API Connect variable references found in the map properties are resolved. Clear the check box if you want the map policy to ignore API Connect variable references in the map properties.
- API Gateway only Allow null value. If the check box is selected, an input property value with a null value is mapped to the output document. Clear this check box (the default option) if you want the map policy to ignore null input values.
- API Gateway only Optimize schema definition. If the check box is selected, complex schema types evaluation handles circular type references in an optimized manner. Clear this check box (the default option) to evaluate these schema types in a standard manner.
- API Gateway only Create required child properties for array objects and mapped optional objects. If the check box is selected, default values are generated in the output for required properties that are either not mapped, or for which there is no input data present, in the following specific cases:
  - An array consists of objects that contain one or more required properties.
  - An object which is optional has one or more child properties that are required.
 By default, these required properties are not present in the output. If you select this option, these required properties will be present in the output. If the output schema defines a **default** property for the output property then the specified default value is used, otherwise a default value is assigned dependent on the data type, as follows:
  - String: empty string ("")
  - Number: 0
  - Boolean: false
  - Object: empty object
  - Array: empty array

#### Example 1

The input data has the following array of objects:

```
[{"a": "value1"}, {"a": "value2", "b": "value3"}]
```

The output schema defines the output object as having two properties, **a** and **b**, of which **b** is required. The map policy defines the following mappings:

- `input.array.a` to `output.array.a`
- `input.array.b` to `output.array.b`

If the check box is selected, and **b** is either not mapped or has no input data present, then **b** is assigned a default value of an empty string, and the output is as follows:

```
[{"a": "value1", "b": ""}, {"a": "value2", "b": "value3"}]
```

#### Example 2

The output schema defines the following structure:

```
{"a" : {"b" : {"c" : "value1", "d" : "value2"} } }
```

Property **b** is optional but property **d** within **b** is required.

The map policy defines a mapping to `output.a.b.c`.

If the check box is selected, and **d** is not mapped, then **d** is assigned a default value of an empty string, and the output is as follows:

```
{"a" : {"b" : {"c" : "value1", "d" : ""} } }
```

If the check box is not selected, these required properties are **not** created in the output with their default values.

- API Gateway only** Empty JSON array handling. This property controls how the map policy handles the output of an empty array. The following choices are available:
  - All (The default value): Output all empty arrays, including empty children arrays.
  - Parent: Output only the current property's empty array value. Children map actions of this property are not attempted.
  - None: Prevent any empty output array values from being produced.
- API Gateway only** Enable JSON post processing. Select this check box to enable post processing of mapped JSON output. The post processing of JSON output will use the output schema to ensure that property values are of the same data type as that defined in the schema. It will also normalize output property values that have a Badgerfish JSON syntax due to object mapping of an XML input. The check box is cleared by default, meaning that there is no post processing of mapped JSON output.
- API Gateway only** Schema definition circular reference limit. Set the value of this property to an integer value that specifies the maximum allowed number of iterations of a circular schema definition. The default value is 1, which means that circular schema definitions are not followed. The maximum possible value is 5.
- Severity level for input data log messages; This property specifies the severity level for log messages that relate to input data. The following choices are available:
  - error
  - warn
  - info
- API Gateway only** Create empty parent object for failed mapping. If a mapping fails because its input is not present and there is no default mapping configured, the default behavior is to not to make any change to the output mapping. Select this check box to create an empty object for the parent of the target mapping, emulating the behavior of IBM® API Management Version 4.0.

#### Example

The map policy defines a mapping to `output.a.b.c`.

If input data is present, the output is as follows:

```
{
  "a": {
    "b": {
      "c": "inputvalue"
    }
  }
}
```

If there is no input data, and the Create empty parent object for failed mapping option is selected, the output is as follows:

```
{
  "a": {
    "b": {
    }
  }
}
```

Properties **a** and **b** are created but the value of **b** is an empty object.

The check box is cleared by default.

## Input and output definitions

You define the inputs and outputs of your Map policy in their own sections. Each input or output is an element in the array inputs or outputs and is defined by a name, a schema definition or reference, and a variable within the context from which it should be read or to which it should be written. After they have been defined, inputs and outputs are referenced by the name provided in the definition, not by the name of the variable.

The following example shows the inputs and outputs sections of a Map policy.

```
inputs:
  input_string:
    schema:
      type: string
      variable: request.parameters.name_in
  input_integer:
    schema:
      type: integer
      variable: request.parameters.age_in
outputs:
  output:
    schema:
```

```
$ref: '#/definitions/output'
variable: message.body
```

The schema field specifies the schema that describes the variable and can be a simple type, a reference to a definition, or an inline schema definition.

The variable field describes the variable and the context that should be assigned to the input or output variable during the execution of the map policy.

## Actions

The fields included in the **actions** section are used in the following ways:

### set

Use the **set** field when you want to assign the result of the **value** field to the output variable specified in the **set** field, replacing the existing value of the output variable. You can specify only one output variable, although this variable can be an array or object.

### create

Use the **create** field when you want to use the result of the **value** field to create a new entry for the output array specified in the **create** field, appending it to the array. You can specify only one output variable, although this variable can be an array or object.

### from

Specify which variables are used in the action as either a single variable or an array of variables, where a variable can be an array or an object. The **from** field is not included if no inputs are used.

### value

Use GatewayScript to provide a script that produces output variables. When a single input is mapped to a single output, the **value** field can be omitted and the variable in **from** is set or created as the variable in **set** or **create** respectively.

### default

Provide a static value, or an inline variable reference, to be applied to the output when no input value is provided. For information on inline variable references, see [Inline references](#).

### foreach

Specify a variable if you want to execute the associated **actions** field for each entry of the array. The variable can be from the input or output of the Map policy.

### actions

Use the **actions** field to nest actions within an action. Because another action could achieve the same result if applied only once, it is primarily for use with the **foreach** field.

## Script

In a **value** or **default** field, use GatewayScript to write the behavior of the action to which the **value** field belongs.

Include the script in single quotation marks. For example: `'4 + 5'` or `'variable_1.toUpperCase()'`.

For information about GatewayScript, see [Gateway programming model and GatewayScript](#)

## Fields

### from, set, and create

Each action must have a single **set** or **create** field that specifies the output variable to which the action is applied. Each action can also have a **from** field containing one or more entries that are used to specify the input variable or variables that are used in the action.

The **set** and **create** fields are both used to assign values to the output variable.

- **set** replaces the current value of the output variable or creates the variable if it does not already exist.
- **create** appends a new array entry to the output variable.

For **set** and **create**, use **output\_variable\_name.variable\_name** to specify which of your defined output variables to use, where **output\_variable\_name** is as defined in the outputs section of the Map policy and **variable\_name** refers to an optional field that belongs to the output variable.

For **from**, use **input\_variable\_name.variable\_name** to specify which of your defined output variables to use, where **input\_variable\_name** is as defined in the outputs section of the Map policy and **variable\_name** refers to an optional field that belongs to the output variable.

### foreach

Use the **foreach** field to specify an input array for which the following **actions** or **value** field will be executed for each entry of the array.

For example:

```
foreach: input.in
actions:
  actions
```

where **input.in** is an input variable that is an array and **actions** is one or more actions in the same format as the parent section. In this example the instructions specified in **actions** are executed once for each array entry of **input.in**.

Referencing the input variable specified in the **foreach** field references the array entry that the current iteration corresponds to.

If a single variable is used in the **foreach** field instead of an array, the following **actions** or **value** field will be applied to or based upon the single variable once and then the loop will terminate.

## References to inputs and outputs

Reference variables from the **from** field either by name or by using a number preceded by a '\$' and enclosed in parentheses. The variables are numbered from 1, where 1 is the first variable in the array, or the only variable when the **from** field lists only a single variable. For example:

```
value: '$(1) + $(2)'
```

or

```
value: '$(variable_1) + $(variable_2)'
```

where each *variable* is a variable that is included in the **from** field.

During a **foreach** loop, you can reference **\$(0)**. The **\$(0)** variable begins a **foreach** loop empty but, after an iteration, becomes equivalent to the output of the iteration and can then be referenced again. In this manner, you can apply an array to a single value. For example:

```
- set: out.total
from: in.input
foreach: in.input
value: '$(0) + $(in.input)'
```

where *out.total* is referenced by **\$(0)**. In each iteration, the current value of *out.total* and the current array entry of *in.input* are summed, and the value of *out.total* is set as this summation.

When using a **foreach** to operate on an array, if the elements of the array do not have named fields, you can use **\$(this)** to reference the current level of nesting.

## Accessing other contexts

At any point within your Map policy's **value** or **default** fields, you can access the context of the API call using the syntax **\$(context.variable)**.

Alternatively, you can include the variables from other contexts when you define an input to your map policy and then reference it as you would any other input variable.

For a list of available context variables, see [API Connect context variables](#).

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Configuring the Map policy in the user interface

The assemble view in API Manager provides a visual representation of the relations between the inputs and outputs of your Map policy.

### Procedure

To configure your Map policy, complete the following steps:

1. Click the Map policy in the canvas of the Assemble view.  
The property sheet opens.

2. Click the Edit inputs icon  in the Input column.

3. Add an input variable.

- a. Click + input.

- b. In the Context variable field for an input, provide the location of your input variable in the context of the assembly. For a list of context variables, see [API Connect context variables](#).

- c. In the Name field for an input, provide a name for your input for use within only the Map policy.

Note:

You must ensure that the name that you provide does not exactly match the value of the Context variable field, or the result might be unpredictable.

- d. Optional: In the Content type field, specify the type of your input. If None is selected, the content type is treated as JSON.

- e. In the Definition field for an input, provide the type of the variable.

The type can be one from a standard set of types, a definition that you have created for your API, or you can select Inline schema to provide a schema as one of the following options:

- YAML
- JSON
- Generate from sample JSON
- Generate from sample XML

If you select Object or Array, you can create a schema through the user interface after you have clicked Done and returned to the main view of the property sheet.

4. Optional: To remove a variable, click the corresponding Remove input icon .

5. After you have added all of your input variables, click Done.

6. Click the Edit outputs icon  in the Output column.

7. Add an output variable.

- a. Click + output.

- b. In the Context variable field for an output, provide the location of your output. This location can be a new context or one already established during the assembly. For a list of context variables, see [API Connect context variables](#).

- c. In the Name field for an output, provide a name for your variable to use within the Map policy and when it is included in its context at output.

Note:

You must ensure that the name that you provide does not exactly match the value of the Context variable field, or the result might be unpredictable.

- d. Optional: In the Content type field, specify the type of your input. If None is selected, the content type is treated as JSON.

- e. In the Definition field for an output, provide the type of the variable.

The type can be one from a standard set of types, a definition that you have created for your API, or you can select Inline schema to provide a schema as one of the following options:

- YAML
- JSON
- Generate from sample JSON
- Generate from sample XML

If you select Object or Array, you can create a schema through the user interface after you have clicked Done and returned to the main view of the property sheet.

8. Optional: To remove a variable, click the corresponding Remove output icon .
  9. After you have added all of your output variables, click Done.
  10. Optional: If you selected Object or Array for the type of an input or output, create an inline schema definition through the user interface by completing the following steps:
    - a. For an Array, click add item. Provide a type for the item and then click the Add icon .
    - b. For an Object, click add property. Provide a name and type for the property and then click the Add icon .
- For objects and arrays created in this manner, you can continue to add items and properties, which can themselves be objects and arrays.
11. To connect an input variable to an output variable, click the circle that is directly on the right of the input variable and then click the circle that is directly on the left of the output variable.

A green line is drawn, linking the two variables together. You can connect multiple inputs to a single output, and a single input can be connected to multiple outputs.
  12. To configure an output, whether it has inputs connected to it or not, click the circle directly to the left of the output variable without first clicking on a circle for an input variable.

The Configure mapping window opens.
  13. Optional: In the Mapped from section of the window, you can view which inputs are mapped to the output you are editing. To remove an input, click the Remove input icon  beside the input.

If the output is part of an array, further configuration options are available. The array, or levels of array in the case of a multidimensional array, can be created by iterating over arrays on the input side of the mapping. For each level of your array, select which array on the input side is to be iterated over. In the Value field, you can use `$(this)` to reference elements of an array that are not named within the array.
  14. Optional: In the Value field, use GatewayScript to configure how any inputs are transformed to produce the output.

For more information about valid code, see the [Script](#) section of the [The Map policy structure](#) topic.
  15. Optional: In the Default field, provide a static value, or an inline variable reference, to be applied to the output when no input value is provided. For information on inline variable references, see [Inline references](#).
  16. Optional: To delete all mappings to the output, click Delete.
  17. When you have configured your outputs, click OK.
  18. Optional: Click the Settings icon in the Map column.
    - a. Optional: Provide a Title and Description for your Map policy.
    - b. To control the XML output of the map policy, select the following options as required:

#### Include empty

If the check box is selected (the default option), empty XML elements are included in the output of the map policy. Clear the check box if you do not want empty XML elements to be included in the output of the map policy.

#### Namespace inheritance

If the check box is selected (the default option), XML namespaces are inherited from the parent element. Clear the check box if you want the map policy to use explicit namespaces.

#### Namespace inlining

If the check box is selected (the default option), XML namespaces will be inserted into the document where they are first used. Clear the check box if you want namespaces to all be defined on the root element.

#### API Gateway only

#### Resolve XML input data type

If the check box is selected, XML elements whose schema is configured as type boolean or numeric will be converted to that data type. Clear the check box (the default option) if you want all XML element values to be returned as a string.

Note: These options effect the XML output only and have no effect on the JSON data.

#### API Gateway only

- c. From the Empty XML element handling list, select one of the following options to control how the map policy handles the output of an empty XML element:
  - String (the default option): An empty XML element is handled as an empty string.
  - Null: An empty XML element is handled as a null value.
  - None: The data is ignored.
  - **API Gateway only** String Badgerfish: The value for an empty XML element is considered to be an empty string. The empty string value will be placed into a JSON badgerfish value property.
  - **API Gateway only** Null Badgerfish: The value for an empty XML element is considered to be null. The null value will be placed into a JSON badgerfish value property. A mapping of this element to a JSON output property does not occur unless the Allow null value option is selected.
- d. **API Gateway only** Select the following general configuration options as required:

#### Use only first array element

If the check box is selected, then if an array is encountered in the traversal of the input, only the first element is used. Clear the check box (the default option) if you want the map policy to use all array elements.

#### Resolve API Connect variable references

If the check box is selected (the default option), API Connect variable references found in the map properties are resolved. Clear the check box if you want the map policy to ignore API Connect variable references in the map policies.

#### Allow null value

If the check box is selected (the default option), an input property value with a null value is mapped to the output document. Clear this check box (the default option) if you want the map policy to ignore null input values.

#### Optimize schema definition

If the check box is selected, complex schema types evaluation handles circular type references in an optimized manner. Clear this check box (the default option) to evaluate these schema types in a standard manner.

#### API Gateway only

#### Enable JSON post processing

If the check box is selected, post processing of mapped JSON output is enabled. The post processing of JSON output will use the output schema to ensure that property values are of the same data type as that defined in the schema. It will also normalize output property values that have a Badgerfish JSON syntax due to object mapping of an XML input. The check box is cleared by default, meaning that there is no post processing of mapped JSON output.

API Gateway only

Create empty parent object for failed mapping

API Gateway only

Use this setting to control the behavior if a mapping fails because its input is not present and there is no default mapping configured.

The default behavior is to make no change to the output, but if you select this check box an empty object is created for the parent of the target mapping, emulating the behavior of IBM API Management Version 4.0.

#### Example

The map policy defines a mapping to `output.a.b.c`.

If input data is present, the output is as follows:

```
{
  "a": {
    "b": {
      "c": "inputvalue"
    }
  }
}
```

If there is no input data, and the Create empty parent object for failed mapping option is selected, the output is as follows:

```
{
  "a": {
    "b": {
    }
  }
}
```

Properties `a` and `b` are created but the value of `b` is an empty object.

The check box is cleared by default.

#### Create required child properties for array objects and mapped optional objects

If the check box is selected, default values are generated in the output for required properties that are either not mapped, or for which there is no input data present, in the following specific cases:

- An array consists of objects that contain one or more required properties.
- An object which is optional has one or more child properties that are required.

By default, these required properties are not present in the output. If you select this option, these required properties will be present in the output. If the output schema defines a `default` property for the output property then the specified default value is used, otherwise a default value is assigned dependent on the data type, as follows:

- String: empty string ("")
- Number: 0
- Boolean: false
- Object: empty object
- Array: empty array

#### Example 1

The input data has the following array of objects:

```
[{"a": "value1"}, {"a": "value2", "b": "value3"}]
```

The output schema defines the output object as having two properties, `a` and `b`, of which `b` is required. The map policy defines the following mappings:

- `input.array.a` to `output.array.a`
- `input.array.b` to `output.array.b`

If the check box is selected, and `b` is either not mapped or has no input data present, then `b` is assigned a default value of an empty string, and the output is as follows:

```
[{"a": "value1", "b": ""}, {"a": "value2", "b": "value3"}]
```

#### Example 2

The output schema defines the following structure:

```
{"a" : {"b" : {"c" : "value1", "d" : "value2"} } }
```

Property `b` is optional but property `d` within `b` is required.

The map policy defines a mapping to `output.a.b.c`.

If the check box is selected, and `d` is not mapped, then `d` is assigned a default value of an empty string, and the output is as follows:

```
{"a" : {"b" : {"c" : "value1", "d" : ""} } }
```

If the check box is not selected, these required properties are **not** created in the output with their default values.

API Gateway only

e. From the Empty JSON array handling list, select one of the following options to control how the map policy handles the output of an empty array:

- All (the default option): Output all empty arrays, including empty children arrays.
- Parent: Output only the current property's empty array value. Children map actions of this property are not attempted.
- None: Prevent any empty output array values from being produced.

f. From the Severity level for input data log messages list, select one of the following options to specify the severity level for log messages that relate to input data:

- error
- warn
- info

- g. API Gateway only Set the Schema definition circular reference limit field to an integer value that specifies the maximum allowed number of iterations of a circular schema definition. The default value is 1, which means that circular schema definitions are not followed. The maximum possible value is 5.
- h. Click Save when done.

## Results

---

You have configured a Map policy to transform and map variables in your assembly flow.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Map policy examples

Examples of the OpenAPI definitions of Map policies.

- [One to one mapping](#)
- [Many to one mapping](#)
- [A simple transformation using the value field](#)
- [Mapping from multiple contexts into a new context](#)
- [Mapping to an inline schema definition](#)
- [Mapping with a default value](#)
- [Mapping an array into a single value](#)
- [Mapping array elements to an array](#)
- [Using the advanced XML options](#)

## One to one mapping

---

The following example:

- maps parameters from the request's query to an object in the message body.
- maps one strings directly to a single string.
- maps one integer directly to a single integer.

The referenced definition, `output`, defines an object containing a string, name, and an integer, age.

```
- map:
  title: 1-1 map
  inputs:
    input_string:
      schema:
        type: string
        variable: request.parameters.name_in # the location of the variable, named "name_in" and found in the query
parameters of the request
    input_integer:
      schema:
        type: integer
        variable: request.parameters.age_in # another variable in the query parameters of the request
  outputs:
    output:
      schema:
        $ref: '#/definitions/output' # a schema definition reference to use for the output. The schema is for the
whole of the message body.
        variable: message.body
  actions:
    - set: output.name_out # in the actions section, variables are referenced by their name within the map policy
      from: input_string # if a value field is not used, the mapping is direct with the input value used for the
output variable
    - set: output.age_out # because the 'output' variable is itself an object, further references are made to
variables that it contains
      from: input_integer
```

## Many to one mapping

---

The following example:

- maps parameters from the request's query to an object in the message body.
- maps two strings to a single string by concatenating them.
- maps two integers to a single integer by summing them.

The referenced definition, `output`, defines an object containing a string and an integer.

```
- map:
  title: many-1 map
  inputs:
    input_string_1:
      schema:
        type: string
        variable: request.parameters.first_name
    input_string_2:
      schema:
```

```

    type: string
    variable: request.parameters.last_name
input_integer_1:
  schema:
    type: integer
    variable: request.parameters.balance_1
input_integer_2:
  schema:
    type: integer
    variable: request.parameters.balance_2
outputs:
  output:
    schema:
      $ref: '#/definitions/output'
      variable: message.body
actions:
- set: output.full_name
  from:
    - input_string_1
    - input_string_2
  value: |
    var retValue = undefined;
    if ($(input_string_1) !== undefined && $(input_string_2) !== undefined) {
      retValue = $(input_string_1).toUpperCase() + ' ' + $(input_string_2).toUpperCase()
    }
    retValue;
- set: output.total_balance
  from:
    - input_integer_1
    - input_integer_2
  value: |
    var i1 = 0;
    var i2 = 0;
    if ($(input_integer_1) !== undefined) i1 = $(input_integer_1);
    if ($(input_integer_2) !== undefined) i2 = $(input_integer_2);
    i1 + i2;

```

## A simple transformation using the value field

The following example:

- maps a parameter from the request's query to an object in the message body.
- maps one string featuring lowercase characters to a single string containing only uppercase characters.

The referenced definition, `output`, defines an object containing a single string.

```

- map:
  title: Uppercase map
  inputs:
    input_lowercase:
      schema:
        type: string
        variable: request.parameters.name_in
  outputs:
    output_uppercase:
      schema:
        $ref: '#/definitions/output'
        variable: message.body
  actions:
    - set: output_uppercase.name_out
      from: input_lowercase
      value: $(input_lowercase).toUpperCase() # the input variable is referenced and calls the toUpperCase method to
produce a value for the output variable

```

## Mapping from multiple contexts into a new context

The following example:

- maps an integer from the request's header to an integer in a new message body.
- maps a string from the message's body to the body of a new custom context, named `new_context`.

```

- map:
  title: Context map
  inputs:
    input_integer:
      schema:
        type: integer
        variable: request.headers.age_in # the 'age_in' header of the request is used as an input
    input_string:
      schema:
        type: string
        variable: message.body.name_in # as is the 'name_in' field of the request body
  outputs:
    output_integer:
      schema:
        type: integer
        variable: message.body.age_out
    output_string:
      schema:
        type: string
        variable: new_context.body.name_internal # the context named 'new_context' is created by the map policy and
exists only while the assembly is processed

```

```

actions:
  - set: output_string
    from: input_string
  - set: output_integer
    from: input_integer

```

## Mapping to an inline schema definition

The following example:

- maps parameters from the request's headers to an object in the message body, which is defined within the map policy.
- maps one string directly to a single string.
- maps one integer directly to a single integer.

```

- map:
  title: Inline schema map
  inputs:
    input_integer:
      schema:
        type: integer
        variable: request.headers.age_in
    input_string:
      schema:
        type: string
        variable: request.headers.name_in
  outputs:
    output:
      schema: # instead of a simple type or a reference to a definition, an inline YAML definition
        type: object
        properties:
          name_out:
            type: string
            name: name_out
          age_out:
            type: integer
            format: int32
            name: age_out
        title: output
        variable: message.body
  actions:
    - set: output.age_out
      from: input_integer
    - set: output.name_out
      from: input_string

```

## Mapping with a default value

The following example:

- maps one string directly to a single string.
- provides a default value for the output string if a valid input string is not provided.

```

- map:
  title: Default Map
  inputs:
    input_string:
      schema:
        type: string
        variable: request.headers.name_in
  outputs:
    output_string:
      schema:
        type: string
        variable: message.body.name_out
  actions:
    - set: output_string
      from: input_string
      default: John Smith # the default field is specified in the same way as a value, in this case

```

providing a fixed value

## Mapping an array into a single value

The following map policy:

- maps a single array of integers into a single integer.
- sums the integers in the array.
- \$ (0) represents the accumulated output because map evaluates all array element values.

```

- map:
  title: Summation map
  inputs:
    input:
      schema:
        $ref: '#/definitions/balance_array_in'
        variable: request.body
  outputs:
    output:
      schema:
        type: integer

```

```

        variable: message.body.total_balance_out # instead of using a full schema definition of the message body, a
single variable in the message body is specified
    actions:
    - set: output
      from: input
      foreach: input # the foreach field specifies that each value of the array 'input' is to be iterated over
      value: $(0)+$(input) # the $(0) reference is the accumulated value of the 'output' variable

```

## Mapping array elements to an array

The following map policy:

- maps an array, whose elements are objects containing two integers, to an array, whose entries contain a single integer field.
- maps an array to an array of the same length.
- takes the difference of the values of the integers in each array element to create a single integer in each array element.

```

- map:
  title: Array summation
  inputs:
  input:
    schema:
      $ref: '#/definitions/balance_and_credit_array'
    variable: request.body
  outputs:
  output_array:
    schema:
      type: array
      variable: message.body
  actions:
  - create: output_array
    from: input
    foreach: input
    actions:
    - set: total_balance_out
      from: # inside the actions section, variables inside the array elements being
iterated over are used
        - integer_in_1
        - integer_in_2
      value: $(integer_in_1)-$(integer_in_2) # the difference of the variables is taken for each array entry
of 'input'

```

## Using the advanced XML options

The following example:

- does not include empty elements in the output of the map policy.
- uses explicit name spaces rather than inheriting name spaces from the parent element
- indicates that all namespace declarations will be placed on the root XML element.
- uses all array elements rather than only the first
- ignores API Connect variable references
- maps input property values with a null value to the output document
- handles circular type references in an optimized manne

```

actions:
- set: output, two
  from: input, one
options:
includeEmptyXMLElements: false
namespaceInheritance: false
inlineNamespaces: false
mapArrayFirstElementValue: false
mapResolveApicVariables: false
mapNullValue: true
mapOptimizeSchemaDefinition: true
mapCreateEmptyArray: parent

```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## OAuth

An OAuth policy performs the requested OAuth processing based on the defined OAuth provider settings.

## Gateway support

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
---------	----------------

Gateway	Policy version
DataPower® API Gateway	2.0.0

This topic describes how to configure the policy in the assembly user interface; for details on how to configure the policy in your OpenAPI source, see [oauth](#).

## About

By adding an assembly OAuth policy, you specify the OAuth provider settings to use to perform the requested OAuth processing and the supported OAuth processing components.

Note: You add an OAuth policy to the assembly in a native OAuth provider. For more information, see the following topics:

- [Editing the native OAuth provider configuration using the API Editor](#) (Cloud Manager UI)
- [Editing the native OAuth provider configuration using the API Editor](#) (API Manager UI)

You can specify the settings through one or more of the following methods.

- URL reference
- Literal configuration
- Object reference

When you use more than one method to specify the same aspect of the OAuth provider settings, the following precedence rules apply to enforce the settings dynamically for the incoming transactions.

- URL reference takes precedence over any existing literal configuration or object reference.
- Literal configuration takes precedence over any existing object reference.

You can configure the policy to support one or more of the following processing components:

Validate request

Validates the authorization request from the client.

Generate authorization code

Generates the authorization code for the client, which represents the resource owner's authorization that grants access to the requested resource.

Verify authorization code

Verifies the authorization code from the client.

Verify refresh token

Verifies the refresh token that is presented by the client.

Generate access token

Generates the access token to the client when the authorization code or refresh token is verified.

Introspect token

Introspects the token to determine its state and, when active, its metadata.

When the policy does not support a processing component but that processing is requested, the unsupported component is not run.

You can include multiple OAuth policies in your OAuth provider assembly. For example, your assembly might include the following flow:

1. OAuth policy that validates the request.
2. GatewayScript policy.
3. OAuth policy that generates authorization code.

For more information, see [Example - using multiple OAuth policies in an OAuth provider assembly](#) and [OAuth context variables](#).

## Properties

The following table lists the policy properties, indicates whether a property is required, specifies the valid and default values for input, and specifies the data type of the values.

Table 2. OAuth policy properties

Property label	Required	Description	Data type
Title	No	The title of the policy. The default value is <code>oauth</code> .	string
Description	No	A description of the policy	string
Default OAuth Provider Settings Object	Yes	The name of an existing OAuth provider that defines the required settings.	string
Dynamic OAuth configuration from a URL	No	A URL to a document that contains serialized XML or JSON properties that defines OAuth token generate settings.	string
Dynamic OAuth configuration from a literal string	No	A literal string that contains serialized XML or JSON properties that defines OAuth token generate settings.	string
Supported OAuth components	No	Select the OAuth components that are supported by this policy.	string

## Overriding the default OAuth provider settings

You can use either the Dynamic OAuth configuration from a literal string property or the Dynamic OAuth configuration from a URL property to dynamically override any OAuth provider configuration settings defined by the Default OAuth Provider Settings Object property.

For example, to override the access token expiration time with a value of 200 seconds, include the following configuration in either the literal string or the document at the specified URL:

```
<OAuthProviderSettings><APICAccessTokenTTL>200</APICAccessTokenTTL></OAuthProviderSettings>
```

For a list of all OAuth provider settings, refer to the `OAuthProviderSettings` management schema, defined in the `xml-mgmt.xsd` file located in the store: directory on the DataPower API Gateway.

If you are using the API Manager user interface, the connection details are determined by the API Manager URL that you open, and the user ID with which you log in. If you are using the API Designer user interface, you provide the management server details and user ID in the login window that opens when you first launch API Designer; see [Logging into API Connect Designer](#).

## Related reference

- [API Connect context variables](#)

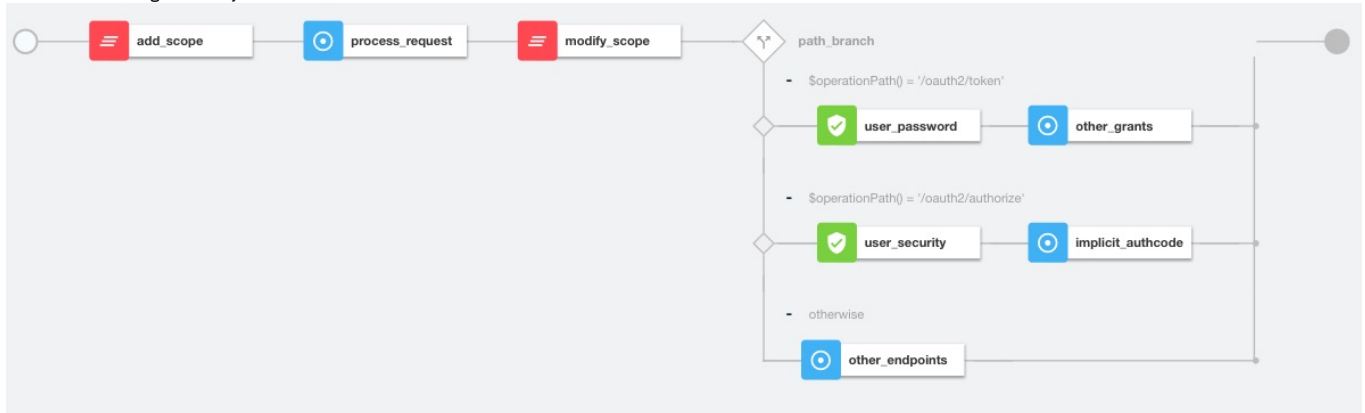

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Example - using multiple OAuth policies in an OAuth provider assembly

This example demonstrates the use of multiple OAuth policies in the assembly flow for a native OAuth provider.

The example is based on the default assembly that is generated when you create a native OAuth provider, and is customized with the addition of `gatewayscript` policies that use [OAuth context variables](#) to manipulate the OAuth flow. For details on creating a native OAuth provider, see [Configuring a native OAuth provider](#).

It has the following assembly flow:

The following sections describe the OpenAPI source code that underlies each of the policies in the assembly; for the complete assembly code, download [multiple\\_oauth\\_policies.txt](#).

## Sample policy to add a custom scope

The `add_scope` policy is a `gatewayscript` policy that adds a custom scope to the request.

The underlying OpenAPI source YAML is as follows:

```
- gatewayscript:
  version: 2.0.0
  title: add_scope
  source: |-
    // Add another custom scope to the request
    let scope = context.get("request.parameters.scope.values[0]");
    if (scope)
      context.set("oauth.processing.scope", scope + " custom");
```

## Validate the initial OAuth request

The first `process_request` policy is an `oauth` policy that processes the initial request and verifies that the request is valid. The result of the processing is stored automatically in the `oauth.processing` context variables for use, as required, by the next OAuth policy in the assembly flow.

The underlying OpenAPI source YAML is as follows:

```
- oauth:
  title: process_request
  version: 2.0.0
  description: >-
    This oauth policy performs all OAuth/OpenID Connect protocol steps
    that are needed for OAuth Validation by default. The inputs and
    outputs of each of the steps are driven by documented context
    variables. Add or remove the Supported OAuth Components as required.
  oauth-provider-settings-ref:
    default: custom-form
```

```
supported-oauth-components:
- OAuthValidateRequest
```

## Sample policy to modify the scope

---

The `modify_scope` policy is a `gatewayscript` policy that modifies the scope depending on the calling application.

The underlying OpenAPI source YAML is as follows:

```
- gatewayscript:
  version: 2.0.0
  title: modify_scope
  source: |-
    let admin_id = '1f1a2aa4-db9f-4423-b2f1-e2572b12123a';

    // Check application and modify the scope
    let app = context.get("oauth.processing.client_id");
    let scope = context.get("oauth.processing.scope");
    if (app === admin_id) {
      context.set("oauth.processing.scope", scope + " admin");
    } else {
      context.set("oauth.processing.scope", scope + " customer");
    }
  }
```

## Branch conditionally according to the OAuth path

---

The `path_branch` policy is a `switch` policy that branches according to the different OAuth paths to process the resource owner.

The underlying OpenAPI source YAML is as follows:

```
- switch:
  version: 2.0.0
  title: path_branch
  case:
    - condition: ($operationPath() = '/oauth2/token')
      execute:
        .
        .
        .
        definition of the user_security and other_grants policies
        .
        .
        .
    - condition: ($operationPath() = '/oauth2/authorize')
      execute:
        .
        .
        .
        definition of the user_password and implicit_authcode policies
        .
        .
        .
    - otherwise:
      .
      .
      .
      definition of the other_endpoints policy
      .
      .
      .
```

## Process the user name and password, and enable grant type component

---

The following two policies operate on the token endpoint.

- The `user_password` policy for password grant type processes the user name and password from the `x-www-form-urlencoded` body. The authentication method is derived from the User Security settings in the OAuth provider; see [Configuring user security for a native OAuth provider](#).
- The `other_grants` policy is an `oauth` policy that enables the `OAuthGenerateAccessToken`, `OAuthVerifyAZCode`, `OAuthVerifyRefreshToken`, and `OAuthCollectMetadata` components to perform the operations for client credentials, authorization code, refresh token, and password grant types.

The underlying OpenAPI source YAML is as follows:

```
- user-security:
  title: user_password
  version: 2.0.0
  description: ''
  factor-id: default
  extract-identity-method: context-var
  user-context-var: request.parameters.username.values
  pass-context-var: request.parameters.password.values
  ei-stop-on-error: false
  user-auth-method: auth-url
  au-stop-on-error: false
  auth-url: 'http://httpbin.org/basic-auth/user/pass'
  user-az-method: authenticated
  az-stop-on-error: true
  auth-response-headers-pattern: (?x-api*
  auth-response-header-credential: X-API-Authenticated-Credential
- oauth:
  title: other_grants
```

```

version: 2.0.0
description: >-
  This oauth policy performs all OAuth/OpenID Connect
  protocol steps that are needed for token path by default.
  The inputs and outputs of each of the steps are driven by
  documented context variables. Add or remove the Supported
  OAuth Components as required.
oauth-provider-settings-ref:
  default: custom-form
supported-oauth-components:
  - OAuthGenerateAccessToken
  - OAuthVerifyAZCode
  - OAuthVerifyRefreshToken
  - OAuthCollectMetadata

```

## Perform authorization checks, and enable grant type components

---

These following two policies operate on the authorize endpoint.

- The `user_security` policy configuration is derived from the User Security settings in the OAuth provider; see [Configuring user security for a native OAuth provider](#).
- The `implicit_authcode` policy is an `oauth` policy that enables the `OAuthGenerateAZCode`, `OAuthGenerateAccessToken`, and `OAuthCollectMetadata` components to perform the operations for the implicit and authorization code grant types.

The underlying OpenAPI source YAML is as follows:

```

- user-security:
  title: user_security
  version: 2.0.0
  description: >-
    This user security policy performs EI(basic) and AU(auth
    url) check for oauth assembly. Change the security check
    method as required
  factor-id: default
  extract-identity-method: basic
  ei-stop-on-error: true
  user-auth-method: auth-url
  au-stop-on-error: true
  user-az-method: authenticated
  az-stop-on-error: true
  auth-response-headers-pattern: (?)*x-api*
  auth-response-header-credential: X-API-Authenticated-Credential
  auth-url: 'http://httpbin.org/basic-auth/user/pass'
- oauth:
  title: implicit_authcode
  version: 2.0.0
  description: >-
    This oauth policy performs all OAuth/OpenID Connect
    protocol steps that are needed for az code path by
    default. The inputs and outputs of each of the steps are
    driven by documented context variables. Add or remove the
    Supported OAuth Components as required.
  oauth-provider-settings-ref:
    default: custom-form
  supported-oauth-components:
    - OAuthGenerateAZCode
    - OAuthGenerateAccessToken
    - OAuthCollectMetadata

```

## Process all other endpoints

---

The `otherwise` condition catches all other endpoints such as the introspect and revoke endpoints. The `other_endpoints` policy in the `otherwise` condition is an `oauth` policy that enables the `OAuthIntrospectToken`, and `OAuthRevokeTokencomponents` components to perform the operations for introspect and revoke.

The underlying OpenAPI source YAML is as follows:

```

- oauth:
  title: other_endpoints
  version: 2.0.0
  description: >-
    This oauth policy performs all OAuth/OpenID Connect
    protocol steps that are needed for all other paths by
    default. The inputs and outputs of each of the steps are
    driven by documented context variables. Add or remove the
    Supported OAuth Components as required.
  oauth-provider-settings-ref:
    default: custom-form
  supported-oauth-components:
    - OAuthIntrospectToken
    - OAuthRevokeToken

```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Parse

Use the Parse policy to control the parsing of an input document.

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® API Gateway	2.0.0

This topic describes how to configure the policy in the assembly user interface; for details on how to configure the policy in your OpenAPI source, see [parse](#).

## About

When the input document is a JSON string, the string is parsed instead of copied over. You can re-parse a JSON string as any of the allowed doc types (**detect**, **xml**, **json**, **binary**). For example, suppose that the JSON string "`<a></b></a>`" is parsed. You can re-parse it using doc type **xml** to extract the XML from that string.

With the parse policy, you can retrieve parse settings by using the following methods in increasing order of precedence:

- Specify a valid parse settings configuration from which to retrieve its properties as the default parse settings.  
Note: If you change the default name, you **must** separately configure a corresponding ParseSettings object on the DataPower API Gateway.
- Specify a literal string as serialized XML or JSON properties as parse settings. These properties take precedence over any existing default properties. The literal string must be XML or JSON formatted.
  - The XML format is "`<ParseSettings><propertyName>propertyValue</propertyName></ParseSettings>`".
  - The JSON format is "`{ \"ParseSettings\" : { \"propertyName\" : propertyValue } }`".
- A URL that represents a named context from which to retrieve the serialized XML or JSON properties as parse settings. These properties take precedence over any existing literal or default properties.

## Properties

The following table lists the policy properties, indicates whether a property is required, specifies the valid and default values for input, and specifies the data type of the values.

Table 2. Parse policy properties

Property label	Required	Description	Data type
Title	No	The title of the policy. The default value is <b>parse</b> .	string
Description	No	A description of the policy.	string
Use Content Type	No	If this setting is enabled and the parse setting is configured to detect the document type, the parse action uses the <b>Content-Type</b> specified in the request headers. If this setting is enabled and the document type in the parse setting is configured for either JSON or XML, the parse action uses the <b>Content-Type</b> specified in the request headers and fails if the <b>Content-Type</b> in the request headers does not match the parse setting.  Enabling this setting is applicable only when the expected <b>Content-Type</b> is either JSON or XML.  If this setting is not enabled, the parse action uses either the document type that is specified in the parse setting, or the detected document type if the parse setting is configured to detect the document type.  The check box is cleared by default.	boolean
Parse settings object reference	No	An existing valid object from which to retrieve default property values for the dynamic object.	string
Parse settings literal configuration	No	A literal string as serialized XML or JSON properties that are merged into the dynamic object. The literal property overrides any existing default properties.	string
Parse settings URL reference	No	A URL that represents a named context from which to retrieve the serialized XML or JSON properties that are merged into the dynamic object. These properties override any existing literal or default properties.	string
Message for parsing	No	The name of a variable in the API context. The content of the <b>body</b> field of the variable is the input to the policy. The default variable name is <b>message</b> .	string
Message for resulting parsed data	No	The name of a variable in the API context. The content of the body field of the variable is the output of the parse operation. The parse metrics of the parsed document can be stored in a different part of the message. The default variable name is the same as the input name, so by default the input message is overwritten by the output message.	string

For examples, see [parse](#).

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
 For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Proxy

Apply the Proxy policy to invoke another API within your assembly, particularly if the separate API contains a large payload. The response from the backend is stored in the `message.body` and in the response object variable if it is defined. Only one policy is permitted to be run per unique assembly flow.

## Gateway support

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® Gateway (v5 compatible)	1.0.0
DataPower API Gateway, functionality provided by <a href="#">Invoke</a>	

This topic describes how to configure the policy in the assembly user interface; for details on how to configure the policy in your OpenAPI source, see [proxy](#).

## About

You can attach this policy to the following API flows:

- REST
- SOAP

Only one Proxy policy is permitted to be run per unique flow of your assembly. More than one Proxy policy can be applied, if they are contained in mutually exclusive branches of the assembly.

You can use the Proxy policy to return multipart form data, that is, when the response is set to `Content-Type: multipart/related`. However, Proxy must be the last policy in the assembly, otherwise the response that is received can be manipulated during subsequent steps, thereby causing the multipart form data to be lost.

The proxy policy, if inside a conditional policy, must be the **final** policy to be executed in the API. If you need further processing afterward, use the [invoke](#) policy rather than the proxy policy.

## Properties

The following table lists the policy properties, indicates whether a property is required, specifies the valid and default values for input, and specifies the data type of the values.

Table 2. Proxy policy properties

Property label	Required	Description	Data type
Title	Yes	The title of the policy. The default value is <b>proxy</b> .	string
Description	No	A description of the policy.	string
Invoke URL	Yes	Specifies a URL for the target service. For a SOAP API, a URL is added by default. Where possible, the Proxy URL value is pre-supplied from information that is defined in the imported WSDL.	string
TLS profile	No	Specifies a TLS profile to use for the secure transmission of data.	string
Timeout	Yes	The time to wait before a reply back from the endpoint (in seconds). The default value is <b>60</b> .	integer
Username	No	The username to use for HTTP Basic authentication.	string
Password	No	The password to use for HTTP Basic authentication.	string
HTTP Method	Yes	The HTTP method to use for the proxy. Valid values are: <ul style="list-style-type: none"> <li>• Keep</li> <li>• GET</li> <li>• POST</li> <li>• PUT</li> <li>• DELETE</li> <li>• PATCH</li> <li>• HEAD</li> <li>• OPTIONS</li> </ul> The default value is <b>Keep</b> . By using <b>Keep</b> , or removing the property from the source, the HTTP method from the incoming request is used.	string
Compression	No	Select this check box to enable Content-Encoding compression on upload. The check box is cleared by default.	boolean

Property label	Required	Description	Data type
Cache Type	No	<p>The cache type determines whether to cache documents, honoring or overriding the HTTP Cache Control directives received in the response from the target URL. This property takes effect only when a response is received, otherwise the policy always returns the non-expired response that was previously saved in cache. Valid values are:</p> <p><b>Protocol</b> The cache behavior is determined by the Cache-Control headers on the response, in accordance with RFC 7234. To optimize performance, if the gateway receives more than one request for a resource that is not in the cache but could be cached when the response from the target URL is received, the gateway sends only one request to the target URL; the remaining requests are not processed until the response from the first request has been received and the cache behavior has been determined from this response. If the response indicates that caching is possible, the gateway responds to all waiting requests with the cached resource. If the response indicates that caching is not possible, the gateway sends all waiting requests to the target URL.</p> <p>Use this option only if you expect that responses from the target URL can be cached, in which case it should improve performance and limit the demand on the target URL. If, however, the target URL never indicates that the gateway should cache its response, performance might be impaired when compared to the No Cache option.</p> <p><b>No Cache</b> Responses from the target URL are not cached on the gateway regardless of any caching headers returned. In this case, every request from the client is sent to the target URL. Use this option if you do not want to cache any of the backend responses on the gateway, or if it is unlikely that a response from the target URL will allow caching through the Cache-Control header settings.</p> <p><b>Time to Live</b> This option is similar to the Protocol option except it allows you to specify the amount of time that you want the successful response from the invoke or proxy to remain in the cache. Use this option only if you expect that responses from the target URL can be cached.</p> <p>The default value is Protocol.</p>	string
Time to Live	No	Specifies the amount of time in seconds that the response stays in the cache. Applies only if the property Cache type is set to <b>Time to Live</b> . Enter a value in the range 5 - 31708800. The default value is 900.	integer
Cache key	No	Specifies the unique identifier of the document cache entry. If omitted, the entire URL string is used as the key.	string
Stop on error	No	Select the errors that, if thrown during the policy execution, cause the assembly flow to stop. If there is a <b>catch</b> flow configured for the error, it is triggered to handle the error thrown. If an error is thrown and there are no errors selected for the Stop on error setting, or if the error thrown is not one of the selected errors, the policy execution is allowed to complete, and the assembly flow continues.	string
Response object variable	No	The name of a variable that will be used to store the response data from the request. This variable can then be referenced in other actions, such as 'Map'.	string
<b>X-Forwarded</b> header	No	<p>This header can be provided by</p> <ol style="list-style-type: none"> <li>If <b>X-Forwarded-Host</b> exists, processing continues. If it does not exist prior to calling the proxy policy, it is set with the value of the <b>Host</b> header.</li> <li>The <b>X-Forwarded-For</b> header is always set, in all cases. This header maintains breadcrumbs, showing a comma-separated list of IPs, from the client through any preceding proxy.</li> <li>If all three of <b>X-Forwarded-Host</b>, <b>X-Forwarded-Port</b>, and <b>X-Forwarded-Proto</b> headers are missing at the time of calling the proxy policy, they are set automatically. To prevent this, set <b>X-Forwarded-Host</b> header to some value before calling the proxy policy.</li> </ol>	string

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#), for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Rate Limit

Use the Rate Limit policy to apply one or more rate or burst limits at any point in your API assembly flow. Rate and burst limits restrict the number of calls made to an API in a specified time period.

## Gateway support

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® API Gateway, policy available from V2018.4.1.7	2.0.0

This topic describes how to configure the policy in the assembly user interface; for details on how to configure the policy in your OpenAPI source, see [ratelimit](#).

## About

The defined rate and burst limits are applied to whatever follows in the assembly flow. For example, if a Rate Limit policy is placed before an Invoke policy, and the call made by the Invoke policy exceeds the limits defined by the Rate Limit policy, the API call itself fails.

Note: For information about rate limits and burst limits in API Connect, see [Understanding rate limits for APIs and Plans](#).

## Properties

The following table lists the policy properties, indicates whether a property is required, specifies the valid and default values for input, and specifies the data type of the values.

Table 2. Rate Limit policy properties

Property label	Required	Description	Data type
Title	No	The title of the policy. The default value is <code>ratelimit</code> .	string
Description	No	A description of the policy.	string
Source	Yes	The location of all the rate limit and burst limit definitions that are included in this policy. Select one of the following options: <ul style="list-style-type: none"> <li>• Catalog by Name: the limits to be applied are defined in the appropriate <code>api-collection</code> object on the DataPower API Gateway, which is the object that represents your API Connect Catalog in the gateway configuration. For details of how to configure a rate or burst limit in the <code>api-collection</code> object, see <a href="#">Configuring a rate or burst limit on the DataPower API Gateway</a>.</li> <li>• Plan Default: the rate and burst limits that are applied are the default ones configured in the Plan to which the calling application is subscribed. For details on how to configure default Plan rate and burst limits, see <a href="#">Editing a draft Product</a>.</li> </ul>	string
Rate Limit Name	Yes <sup>1</sup>	The name of a rate limit as defined in the DataPower API Gateway configuration. To display the Rate Limit Name field, click Add Rate Limit; you can add as many rate limits as you want. <sup>1</sup> You must provide at least one rate limit or at least one burst limit.	string
Burst Limit Name	Yes <sup>2</sup>	The name of a burst limit as defined in the DataPower API Gateway configuration. To display the Burst Limit Name field, click Add Burst Limit; you can add as many burst limits as you want. <sup>2</sup> You must provide at least one rate limit or at least one burst limit.	string

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#), for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Configuring a rate or burst limit on the DataPower API Gateway

If you want to include a rate limiting policy in your API assembly flow, you must first configure the required rate and burst limits on the Gateway. Rate and burst limits restrict the number of calls that an application can make to API in specified time period.

## About this task

You configure rate and burst limits on the DataPower® API Gateway by defining them in one or more configuration files that you package and then add to the Gateway as a Gateway extension.

You define the rate and burst limits in the appropriate **api-collection** object on the DataPower API Gateway, which is the object that represents your API Connect Catalog in the gateway configuration. The defined rate and burst limits will be available to be included in the assembly flows of all the APIs that are published to that Catalog.

Note: Only one Gateway extension can be in use at any one time, so you should package all required rate and burst limits in a single Gateway extension.

## Procedure

1. Create a .cfg file that includes the DataPower API Gateway CLI commands that define the rate or burst limit.

For example:

```
top; config;
switch apiconnect;

api-collection myorg_mycatalog_collection
  assembly-rate-limit 30perlmin 30 1 minute on off on on off off ""
exit
```

In this example, the **assembly-rate-limit** command specifies a rate limit name, and the API call limits that you want to impose, 30 calls per minute in this case. To define a burst limit, use the **assembly-burst-limit** command. For details of the command parameters, see [assembly-rate-limit](#) and [assembly-burst-limit](#) in the DataPower product documentation.

The **api-collection** command specifies the **api-collection** object in which you want to configure the rate or burst limits. The name of the **api-collection** object has the following format:

```
org_catalog_collection
```

where:

- *org* is the name of the provider organization that contains your Catalog.
- *catalog* is the name of the Catalog.

This **api-collection** object name is assigned automatically by the Gateway the first time that a Product is published to the Catalog.

2. Package the .cfg file in a .zip file.  
You can package multiple .cfg files in a single .zip file if you want; the .cfg files must all be at the root of the .zip file.
3. Add the .zip file to the DataPower API Gateway as a Gateway extension; for details, see [Configuring your Gateway server extensions](#).

## What to do next

Apply the rate or burst limit to an API by adding a [Rate Limit](#) policy to the API assembly flow.

## Related information

- [Gateway extension guidelines - DataPower API Gateway](#).

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Redaction - DataPower API Gateway

Use the Redaction policy to completely remove or to redact specified fields from the Request body, the Response body, and the activity logs. You might find this policy useful for removing or blocking out sensitive data (for example, credit card details) for legal, security, or other reasons.

## Gateway support

Note: This page describes the Redaction policy implementation in the DataPower® API Gateway. If you are using the DataPower Gateway (v5 compatible), see [Redaction - DataPower Gateway \(v5 compatible\)](#).

For information on the different types of gateway, see [API Connect gateway types](#).

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower API Gateway, policy available from V2018.4.1.7	2.0.0

This topic describes how to configure the policy in the assembly user interface; for details on how to configure the policy in your OpenAPI source, see [redact - DataPower API Gateway](#).

Note: With the DataPower API Gateway, the input to the Redaction policy must be parsed data. One way to produce parsed data is to use a [Parse](#) policy before a Redaction policy in your assembly flow, which provides explicit control of the parse action.

## Properties

The following table lists the policy properties, indicates whether a property is required, specifies the valid and default values for input, and specifies the data type of the values.

Table 2. Redaction policy properties

Property label	Required	Description	Data type
Title	No	The title of the policy. The default value is <b>redact</b> .	string
Description	No	A description of the policy.	string
Root	No	Specifies the data source that contains the content to redact or remove. If no value is entered in the Root field, the action is applied to the entire API context. You can use any supported JSONata path expression.  If you want to apply the action to either request or response data, specify a value of <code>message.body</code> . The actual content to which the action is applied then depends on the positioning of the Redaction policy in the overall assembly flow; for example: <ul style="list-style-type: none"><li>• If positioned at the beginning, the action is applied to the client request.</li><li>• If positioned after an Invoke policy, the action is applied to the response from the back end.</li><li>• If positioned at the end, the action is applied to the response that is returned to the client.</li></ul> If, in your assembly flow, the Redaction policy is used after a <a href="#">Log</a> policy that specifies Gather-only mode, specify a Root value of <code>log.request_body</code> for the logged request payload, or <code>log.response_body</code> for the logged response payload.	string
Path	Yes	Specifies a JSONata path expression that identifies the content to redact or remove from the source. For more information, see <a href="#">Constructing JSONata expressions to redact fields</a> .	string
Action	No	Specifies whether you want to remove or redact the content. Choose one of the following options: <ul style="list-style-type: none"><li>• Remove: Completely removes the specified fields.</li><li>• Redact: Redacts (obfuscates with "*"s) the fields to block out the data.</li></ul> The default value is Redact.  Note: If a numerical value is being redacted, the redacted value is depicted as <b>*****</b> and the type is changed to <b>string</b> .	string

Tip: You can optionally click Add action to specify JSONata expressions for additional fields that you want to remove or redact from the specified content source.

Note: IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

API Gateway only

## Constructing JSONata expressions to redact fields

To define a field for redaction or removal when using the Redaction policy with the DataPower® API Gateway, you supply a JSONata expression that defines the path to the field that you want to redact or remove.

The following JSONata functions are supported:

- Aggregation functions:
  - `$average(array)`
  - `$max(array)`
  - `$min(array)`
  - `$sum(array)`
- Array functions:
  - `$append(array1, array2)`
  - `$count(array)`
  - `$reverse(array)`
  - `$sort(array [, function])`
  - `$zip(array1, ...)`
- Boolean functions:
  - `$boolean(arg)`
  - `$exists(arg)`
  - `$not(arg)`
- Numeric functions:
  - `$abs(number)`
  - `$ceil(number)`
  - `$floor(number)`
  - `$formatBase(number [, radix])`
  - `$number(arg)`
  - `$power(base, exponent)`
  - `$round(number [, precision])`
  - `$sqrt(number)`
- Object functions:

- `$keys(object)`
- `$lookup(object, key)`
- `$merge(array<object>)`
- `$spread(object)`
- String functions:
  - `$contains(str, pattern)`
  - `$join(array[, separator])`
  - `$length(str)`
  - `$lowercase(str)`
  - `$match(str, pattern [, limit])`
  - `$pad(str, width [, char])`
  - `$replace(str, pattern, replacement [, limit])`
  - `$split(str, separator [, limit])`
  - `$substring(str, start[, length])`
  - `$substringAfter(str, chars)`
  - `$substringBefore(str, chars)`
  - `$trim(str)`
  - `$uppercase(str)`

You can use the following JSONata numeric operators:

- `+` (addition)
- `-` (subtraction)
- `*` (multiplication)
- `/` (division)
- `%` (modulo)

You can use the following JSONata comparison operators for number values or strings:

- `=`
- `!=`
- `<`
- `>`
- `<=`
- `>=`

You can define the path in either of the following ways:

- [Use a JSONata expression](#)
- [Use the `\$xpath\(\)` JSONata extension](#)

## Using a JSONata expression

The path specified by the JSONata expression is relative to any value specified for the `root` property of the Redaction policy. If the `root` property has no value or is absent, begin the expression with the absolute content path. If the `root` property has a value then you can either begin the expression with `$` to use the `root` path directly, or you can provide a sub-path relative to the `root` path.

JSONata expressions can be used with content that is in either JSON or XML format.

### Example 1

If the `root` property of the Redaction policy has no value or is absent, use the following expression to redact or remove all occurrences of the `price` field in the request and response data:

```
message.body.**.price
```

### Example 2

If the `root` property of the Redaction policy has the value `log.request_body`, use the following expression to redact or remove all occurrences of the `price` field, specifically within an `item` element, in the logged request payload:

```
$.item.price
```

### Example 3

If the `root` property of the Redaction policy has the value `log`, use the following expression to redact or remove all occurrences of the `price` field in the logged response payload:

```
response_body.**.price
```

The `**` descendant wildcard traverses all descendants at all hierarchical levels.

## Using the `$xpath()` JSONata extension

The `$xpath()` function has the following format:

```
$xpath(content_path, xpath_expression)
```

where:

- `content_path` is the path to the content that contains the field that you want to redact or remove.
- `xpath_expression` is the XPath expression that defines the field that you want to redact or remove.

The `content_path` is relative to any value specified for the `root` property of the Redaction policy. If the `root` property has no value or is absent, provide the absolute content path. If the `root` property has a value then you can either provide the value `$` for the `content_path` parameter to use the `root` path directly, or you can provide a sub-path relative to the `root` path.

The `$xpath()` function can be used only with content that is in XML format.

#### Example 1

If the `root` property of the Redaction policy has no value or is absent, use the following expression to redact or remove all occurrences of the `price` field in the request and response data:

```
$xpath(message.body, '//price')
```

#### Example 2

If the `root` property of the Redaction policy has the value `log.request_body`, use the following expression to redact or remove all occurrences of the `price` field, specifically within an `item` element, in the logged request payload:

```
$xpath($, 'item/price')
```

#### Example 3

If the `root` property of the Redaction policy has the value `log`, use the following expression to redact or remove all occurrences of the `price` field in the logged response payload:

```
$xpath(response_body, '//price')
```

The `//` expression in the second parameter selects all occurrences anywhere in the content.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details. For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

DataPower Gateway (v5 compatible)

## Redaction - DataPower Gateway (v5 compatible)

Use the Redaction policy to completely remove or to redact specified fields from the Request body, the Response body, and the activity logs. You might find this policy useful for removing or blocking out sensitive data (for example, credit card details) for legal, security, or other reasons.

### Gateway support

Note: This topic describes the Redaction policy implementation in the DataPower® Gateway (v5 compatible). If you are using the DataPower API Gateway, see [Redaction - DataPower API Gateway](#).

For information on the different types of gateway, see [API Connect gateway types](#).

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower Gateway (v5 compatible)	1.0.0

This topic describes how to configure the policy in the assembly user interface; for details on how to configure the policy in your OpenAPI source, see [redact - DataPower Gateway \(v5 compatible\)](#).

### About

You can attach this policy to the following API flows:

- REST
- SOAP

### Properties

The following table lists the policy properties, indicates whether a property is required, specifies the valid and default values for input, and specifies the data type of the values.

Table 2. Redaction policy properties

Property label	Required	Description	Data type
Title	No	The title of the policy. The default value is <b>redact</b> .	string
Description	No	A description of the policy.	string
Path	Yes	Specifies an XPath expression that defines the field to remove or redact. You can construct an XPath expression that is based on JSON or XML depending on whether your API requests and responses use a JSON or an XML format. If the payload is JSON, use the DataPower XML representation of the JSON content (JSONx) to construct the expression.  Note: Use a JSONx representation only to identify the XPath expressions for the fields to remove or redact. Do not change the format of any response bodies in API Manager. To learn more about constructing XPath expressions that are based on JSON or XML, see <a href="#">Constructing XPath expressions to redact fields</a> .	string

Property label	Required	Description	Data type
Action	Yes	<p>Specifies whether you want to remove or redact the field.</p> <p>Valid values:</p> <ul style="list-style-type: none"> <li><b>remove</b>: Completely removes the specified field.</li> <li><b>redact</b>: Redacts (obfuscates with "*"s) the field to block out the data.</li> </ul> <p>The default value is <b>redact</b>.</p> <p>Note: If a numerical value is being redacted, the redacted value is depicted as ***** and the type is changed to <b>string</b>.</p>	string
From	Yes	<p>Specifies where to remove or redact the specified field from.</p> <p>Valid values:</p> <ul style="list-style-type: none"> <li><b>all</b>: Removes or redacts the specified field from the Request body, the Response body, and the activity logs.</li> <li><b>request</b>: Removes or redacts the specified field from the Request body.</li> <li><b>response</b>: Removes or redacts the specified field from the Response body.</li> <li><b>logs</b>: Removes or redacts the specified field from the activity logs.</li> </ul> <p>The default value is <b>all</b>.</p> <p>Optionally click Add item to specify additional values.</p>	string

Tip: You can optionally click Add item to specify XPath expressions for additional fields that you want to remove or redact from the Request body, Response body, and logs.

DataPower Gateway (v5 compatible) only

## Constructing XPath expressions to redact fields

To define a field for redaction when using the DataPower® Gateway (v5 compatible), you supply an XPath expression that specifies the field that you want to redact. If your API requests and responses use XML format, you can base your XPath statements directly on the XML content. If your API requests and responses use JSON format, you must use the DataPower XML representation of the JSON content, JSONx, to construct your XPath expression.

## About this task

The following sections provide examples for constructing XPath expressions to redact a field; examples are provided for API responses in both XML and JSON format:

## XPaths for XML

Consider the following example of an XML response:

```
<xml>
  <primaryAddress>
    <streetAddress>21 2nd Street</streetAddress>
    <city>New York</city>
    <state>NY</state>
    <postalCode>10021</postalCode>
  </primaryAddress>
  <secondaryAddress>
    <streetAddress>412 Brooklyn Avenue</streetAddress>
    <city>New Jersey</city>
    <state>NJ</state>
    <postalCode>12302</postalCode>
  </secondaryAddress>
</xml>
```

To redact "streetAddress" in the preceding example the XPath expression would be: `//streetAddress` where the components of the expression have the following meaning:

Expression	Meaning
<code>//</code>	search anywhere in the XML structure
<code>//streetAddress</code>	search anywhere in the XML structure for an element of type "streetAddress"

The XML response that results from applying this XPath expression is as follows:

```
<?xml version="1.0" encoding="UTF-8"?>
<xml>
  <primaryAddress>
    <streetAddress>*****</streetAddress>
    <city>New York</city>
    <state>NY</state>
    <postalCode>10021</postalCode>
  </primaryAddress>
  <secondaryAddress>
    <streetAddress>*****</streetAddress>
    <city>New Jersey</city>
    <state>NJ</state>
    <postalCode>12302</postalCode>
  </secondaryAddress>
</xml>
```

Note: Both incidences of "streetAddress" have been redacted.

To redact one specific incidence of "streetAddress" in the initial example, the XPath expression would be: //secondaryAddress/streetAddress where the components of the expression have the following meaning:

Expression	Meaning
//secondaryAddress	search anywhere in the XML structure for an element of type "secondaryAddress"
//secondaryAddress/streetAddress	search under the preceding element for a child element of type "streetAddress"

The XML response that results from applying this XPath expression is as follows:

```
<?xml version="1.0" encoding="UTF-8"?>
<xml>
  <primaryAddress>
    <streetAddress>21 2nd Street</streetAddress>
    <city>New York</city>
    <state>NY</state>
    <postalCode>10021</postalCode>
  </primaryAddress>
  <secondaryAddress>
    <streetAddress>*****</streetAddress>
    <city>New Jersey</city>
    <state>NJ</state>
    <postalCode>12302</postalCode>
  </secondaryAddress>
</xml>
```

Note: Only the secondary address has been redacted.

XPaths for JSON

Consider the following example of a JSON response:

```
{
  "primaryAddress": {
    "streetAddress": "21 2nd Street",
    "city": "New York",
    "state": "NY",
    "postalCode": 10021
  },
  "secondaryAddress": {
    "streetAddress": "412 Brooklyn Avenue",
    "city": "New Jersey",
    "state": "NJ",
    "postalCode": 12302
  }
}
```

Unlike the preceding XML example, to construct an XPath for this example you must use the corresponding DataPower XML representation, JSONx. The JSONx equivalent of this JSON response is as follows:

```
<json:object xsi:schemaLocation="http://www.datapower.com/schemas/json jsonx.xsd"
xmlns:json="http://www.ibm.com/xmlns/prod/2009/jsonx" xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
  <json:object name="primaryAddress">
    <json:string name="streetAddress">21 2nd Street</json:string>
    <json:string name="city">New York</json:string>
    <json:string name="state">NY</json:string>
    <json:number name="postalCode">10021</json:number>
  </json:object>
  <json:object name="secondaryAddress">
    <json:string name="streetAddress">412 Brooklyn Avenue</json:string>
    <json:string name="city">New York</json:string>
    <json:string name="state">NY</json:string>
    <json:number name="postalCode">10021</json:number>
  </json:object>
</json:object>
```

To redact the element "streetAddress" from the preceding JSONx structure, the XPath expression would be: //\*[@name='streetAddress']

where the components of the expression have the following meaning:

Expression	Meaning
//*	find any element anywhere in the structure
[@name='streetAddress']	this element has a 'name' property with value "streetAddress"

The JSON response that results from applying this XPath expression is as follows:

```
{
  "primaryAddress": {
    "streetAddress": "*****",
    "city": "New York",
    "state": "NY",
    "postalCode": 10021
  }
}
```

```

    },
    "secondaryAddress": {
      "streetAddress": "*****",
      "city": "New York",
      "state": "NY",
      "postalCode": 10021
    }
  }
}

```

Note: All incidences of "streetAddress" have been redacted in the preceding JSON structure. To redact a specific occurrence of the "streetAddress" element, the XPath expression would be: `//*[ @name='secondaryAddress']/*[@name='streetAddress']` where the components of the expression have the following meaning:

Expression	Meaning
<code>/**</code>	find any element anywhere in the structure
<code>//*[ @name='secondaryAddress']</code>	find an element anywhere in the structure that is named "secondaryAddress"
<code>//*[ @name='secondaryAddress']/*[@name='streetAddress']</code>	find a child element of any type (/* ) where the child element has a name of "streetAddress"

The JSON response that results from applying this XPath expression is as follows:

```

{
  "primaryAddress": {
    "streetAddress": "21 2nd Street",
    "city": "New York",
    "state": "NY",
    "postalCode": 10021
  },
  "secondaryAddress": {
    "streetAddress": "*****",
    "city": "New York",
    "state": "NY",
    "postalCode": 10021
  }
}

```

Note: Only the street address for the secondary address has been redacted.

## What to do next

See [Including components in your assembly](#) to learn how to apply a redact policy using XPath. **Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details. For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Set Variable

Use the Set Variable policy to set the value of a runtime variable, or to clear a runtime variable, or to add a header variable.

## Gateway support

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® Gateway (v5 compatible)	1.0.0
DataPower API Gateway, policy available from V2018.4.1.0	2.0.0

This topic describes how to configure the policy in the assembly user interface; for details on how to configure the policy in your OpenAPI source, see [set-variable](#).

## About

You can attach this policy to the following API flows:

- REST
- SOAP

## Properties

The following table lists the policy properties, indicates whether a property is required, specifies the valid and default values for input, and specifies the data type of the values.

Table 2. Set Variable policy properties

Property label	Required	Description	Data type
Title	No	The title of the policy. The default value is <b>set-variable</b> .	string
Description	No	A description of the policy.	string

Property label	Required	Description	Data type
Action	Yes	<p>Defines what action to apply on a runtime variable. Choose one of the following values:</p> <ul style="list-style-type: none"> <li>Set: Indicates that you want to set a runtime variable to a string value. Can be used to set new headers or to override existing values.</li> <li>Add: Indicates that you want to add a header variable. Can be used only to set new headers or to append a new entry of the same header name.</li> <li>Clear: Indicates that you want to delete a runtime variable. Can be used to remove a header when the data is processed in the assembly flow.</li> </ul> <p>The default value is Set.</p>	string
Set, Add, or Clear	Yes	Specifies the name of the variable that you want to set , add or clear, depending on the selected Action.	string
Type	Yes	<p>Select the data type of the variable. Choose one of the following values:</p> <ul style="list-style-type: none"> <li> any</li> <li>string</li> <li>number</li> <li>boolean</li> </ul> <p>If you are using the DataPower API Gateway then, for all values other than any, the value is validated against the specified data type.</p>	string
Value	Yes*	<p>Allocates this value to the specified variable. Can be a literal value, or another variable. * Value is required only when <b>Set</b> or <b>Add</b> is specified as the action.</p> <p>For example, to <i>set</i> a named variable of <b>billing-hostname</b> to a literal value, you can specify the Value as <b>acme . com</b>.</p> <p>As another example, to <i>set</i> a named variable to the value of the Content-Type header in a request, you can specify the Value entry as <b>\$(request . headers . content-type)</b>.</p> <p>If the selected value of the Type field is boolean, select the Value check box to indicated a value of <b>true</b>.</p> <p>Note: You can only set single string elements. Values are retrieved as strings and therefore you cannot clone a complete nodeset.</p>	string

For examples, see [set-variable](#).

## User Security

Use the User Security policy to extract a user's credentials, authenticate those credentials, and obtain authorization from the user.

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® API Gateway	2.0.0

This topic describes how to configure the policy in the assembly user interface; for details on how to configure the policy in your OpenAPI source, see [user-security](#).

## About

When you define an assembly user security action, you can define the processing for identity-extraction, authentication, and authorization or you can selectively disable any of these this aspects of processing. When disabled, this processing aspect is skipped.

When identity-extraction is enabled, the following methods are supported.

- Use basic authentication, which requires no additional configuration.
- Use context variables. For this method, specify which variable contains the user name and password.
- Use a redirect. For this method, specify the URL fragment to redirect to, and the time allowed to process.
- Use an HTML login form. For this method, specify whether to use the default or custom form and the time allowed to submit the form. For a custom form, specify the location of the form and the TLS client profile to secure the connection to the remote server.

When authentication is enabled, the following methods are supported.

- Contact an LDAP server. For this method, specify which server to contact.
- Send a request to an authentication endpoint. For this method, specify the URL of the endpoint, the TLS client profile to secure the connection, the pattern to select which response header to add, and the response header that contains the authenticated credentials.

When authorization is enabled, the following methods are supported.

- Implicitly accept any previously authenticated users, which requires no additional configuration.
- Use an HTML authorization form. For this method, specify whether to use the default or custom form and the time allowed to submit the form. For a custom form, specify the location of the form and the TLS client profile to secure the connection to the remote server.

You can attach this policy to the REST API flow.

## Properties

The following table lists the policy properties, indicates whether a property is required, specifies the valid and default values for input, and specifies the data type of the values.

Table 2. User Security policy properties

Property label	Required	Description	Data type
Title	No	The title of the policy. The default value is <b>user-security</b> .	string
Description	No	A description of the policy.	string
Factor ID	No	The identity that identifies the results of factor-authentication in the API context.	string
Extract Identity Settings	Yes	<p>Select the method that is used to extract the user credentials. The following options are available:</p> <p><b>Basic</b> Use basic authentication; no additional configuration is required.</p> <p><b>Context Variable</b> The credentials are provided by API Connect context variables; specify the following properties:</p> <ul style="list-style-type: none"> <li>• Username content variable: the context variable that is used to obtain the user name.</li> <li>• password context variable: the context variable that is used to obtain the password.</li> </ul> <p><b>HTML Form</b> Use forms based identity-extraction. Select whether to use the default form or a custom form. For a custom form, specify the following properties:</p> <ul style="list-style-type: none"> <li>• Custom form endpoint: the location of the form.</li> <li>• Custom form TLS profile: the TLS client profile that is used to secure the connection to the remote server.</li> </ul> <p>In the HTML form time limit field, specify the time allowed to submit the form.</p> <p><b>Redirect</b> Use a redirect for identity-extraction; specify the following properties:</p> <ul style="list-style-type: none"> <li>• Redirect URL: the URL fragment to which to redirect the request to obtain user credentials.</li> <li>• Redirect time limit: the time allowed for the transaction to complete.</li> </ul> <p><b>Disabled</b> Identity-extraction is disabled; this aspect of processing is skipped.</p> <p>Select Stop on error to halt assembly processing in the event of identity-extraction failure.</p>	string
Authenticate User Settings	Yes	<p>Select the authentication method. The following options are available:</p> <p><b>Authentication URL</b> The credentials are authenticated by an external endpoint; specify the following properties:</p> <ul style="list-style-type: none"> <li>• Authentication URL: the URL of the authentication endpoint.</li> <li>• Authentication TLS profile: the TLS client profile that is used to secure the connection to the authentication endpoint.</li> <li>• Authentication response header pattern: the pattern that is used to select which response headers to add to the API context.</li> <li>• Authentication response header credential: the response header that contains the authenticated user credentials.</li> </ul> <p><b>LDAP</b> The credentials are authenticated by an LDAP user registry; from the LDAP registry list, select the required registry.</p> <p><b>Disabled</b> Authentication is disabled; this aspect of processing is skipped.</p> <p>Select Stop on error to halt assembly processing in the event of authentication failure.</p>	string

Property label	Required	Description	Data type
Authorize User Settings	Yes	<p>Select the authorization method. The following options are available:</p> <p>authenticated</p> <p>Implicitly accept any previously authenticated users; no additional configuration is required.</p> <p>HTML Form</p> <p>The user provides authorization through an HTML form. Select whether to use the default form or a custom form. For a custom form, specify the following properties:</p> <ul style="list-style-type: none"> <li>Custom form endpoint: the location of the form.</li> <li>Custom form TLS profile: the TLS client profile that is used to secure the connection to the remote server.</li> </ul> <p>In the Dynamic table entries field, enter the name of a context variable that specifies the scopes that are to be added automatically to the authorization consent form.</p> <p>In the HTML form time limit field, specify the time allowed to submit the form.</p> <p>Disabled</p> <p>Authorization is disabled; this aspect of processing is skipped.</p> <p>Select Stop on error to halt assembly processing in the event of authorization failure.</p>	string

## Validate - DataPower API Gateway

Use the Validate policy to validate the payload in an assembly flow against a JSON or an XML schema.

## Gateway support

Note: This page describes the Validate policy implementation in the DataPower® API Gateway. If you are using the DataPower Gateway (v5 compatible), see [Validate - DataPower Gateway \(v5 compatible\)](#).

For information on the different types of gateway, see [API Connect gateway types](#).

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower API Gateway, policy available from V2018.4.1.0	2.0.0

This topic describes how to configure the policy in the assembly user interface; for details on how to configure the policy in your OpenAPI source, see [validate - DataPower API Gateway](#).

## About

Position this policy where required in the assembly flow as follows:

- To validate the original input, position a Validate policy at the start of your flow.
- To validate an intermediate response that is returned from other invoke actions or tasks, position a Validate policy after those actions or tasks.
- To validate the response that is returned to the client application, position a Validate policy after the task that collates the response.

Note: With the DataPower API Gateway, the input to the Validate policy must be parsed data. One way to produce parsed data is to use a [Parse](#) policy before a Validate policy in your assembly flow, which provides explicit control of the parse action.

## Properties

The following table lists the policy properties, indicates whether a property is required, specifies the valid and default values for input, and specifies the data type of the values.

Table 2. Validate policy properties

Property label	Required	Description	Data type
----------------	----------	-------------	-----------

Property label	Required	Description	Data type
Title	Yes	The title of the policy. The default value is <b>validate</b> .	string
Description	No	A description of the policy.	string
Input	No	Specifies the name of a variable in the API context. The content of the <b>body</b> field of the variable, which is represented by <b>variable_name.body</b> , is the input data to validate. By default, the variable name is <b>message</b> .	string
Output	No	Specifies the name of a variable in the API context. <ul style="list-style-type: none"> <li>If the validation passes, the body field of the output variable, which is represented by <b>variable_name.body</b>, stores the output of the assembly validate action.</li> <li>If the schema to validate is a JSON schema, the validation also adds any default values that are missing from the payload.</li> <li>If the validation fails, no output is stored.</li> <li>If an output variable is not specified, the results of the assembly validate action are not saved.</li> </ul>	string
Validate against	Yes	Specifies the schema to be used for validating the payload. Select one of the following values: <ul style="list-style-type: none"> <li><b>definition</b>: Select this value if you want to use a previously defined schema to validate the payload that is returned from other invoke actions or tasks in the assembly flow. From the Definition Object list, select the required schema. For information on defining a schema for an API definition, see <a href="#">Editing an API definition</a>.</li> <li><b>url</b>: the schema is identified by a URL location. <ul style="list-style-type: none"> <li>In the JSON Schema URL field, enter the URL of the JSON schema to be used for validating a JSON payload.</li> <li>From the XML Validation Mode list, select how XML validation is to be performed: <ul style="list-style-type: none"> <li><b>None</b>: no XML payload validation is required.</li> <li><b>xsd</b>: an XML schema will be used to validate an XML payload. In the XML Schema URL field, enter the URL of the XML schema.</li> <li><b>wSDL</b>: a WSDL schema will be used to validate a SOAP payload. In the WSDL URL field, enter the URL of the WSDL schema.</li> <li><b>soap-body</b>: validate the body of a SOAP message against the XML schema only.</li> </ul> </li> </ul> </li> <li><b>wSDL</b>: use the XML schema in the WSDL file associated with the API operation or the API path.</li> <li><b>body-param</b>: validate the request input against the schema definition that is specified in the TYPE field for the request parameter for this operation. For information about how to create a request parameter, see <a href="#">Configuring an operation</a>.</li> <li><b>response-param</b>: validate the response to be returned to the client application, against the schema definition that is specified in the SCHEMA field for the response parameter for this operation. For information about how to create a response parameter, see <a href="#">Configuring an operation</a>.</li> </ul>	string

For examples, see [validate - DataPower API Gateway](#).

## Related tasks

- [Defining Paths for a REST API](#)
- [Creating a new REST OpenAPI definition](#)

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

DataPower Gateway (v5 compatible)

## Validate - DataPower Gateway (v5 compatible)

Use the Validate policy to validate the payload in an assembly flow against a JSON or an XML schema.

## Gateway support

Note: This topic describes the Validate policy implementation in the DataPower® Gateway (v5 compatible). If you are using the DataPower API Gateway, see [Validate - DataPower API Gateway](#).

For information on the different types of gateway, see [API Connect gateway types](#).

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower Gateway (v5 compatible)	1.0.0

This topic describes how to configure the policy in the assembly user interface; for details on how to configure the policy in your OpenAPI source, see [validate - DataPower Gateway \(v5 compatible\)](#).

Restriction:

- The schema that represents the XML can reference only one XML namespace.

- The schema cannot reference polymorphic XML elements.
- The validation works on the `message.body` variable and not any other output/context variable. If the invoke policy contains a configured response object variable, then `message.body` is not set, and validate is not able to act.
- If you use the `multipleOf` keyword in a schema definition for the API then, due to rounding behavior, the specified value must satisfy the following conditions, otherwise the validation fails when the API is called:
  - The value must not be less than `0.000009999999999999999848869`.
  - If the value is greater than 1, the amount before the decimal point must not be greater than `99999999999999934463`.

## About

You can attach this policy to the following API flow:

- REST

Position this policy where required in the assembly flow as follows:

- To validate the original input, position a Validate policy at the start of your flow.
- To validate an intermediate response that is returned from other invoke actions or tasks, position a Validate policy after those actions or tasks.
- To validate the response that is returned to the client application, position a Validate policy after the task that collates the response.

You can apply a different OpenAPI schema definition to each Validate policy either by choosing from the set of schema definitions that is specified at the API level, or the schema definition at the operation level.

## Properties

The following table lists the policy properties, indicates whether a property is required, specifies the valid and default values for input, and specifies the data type of the values.

Table 2. Validate policy properties

Property label	Required	Description	Data type
Title	Yes	The title of the policy. The default value is <code>validate</code> .	string
Description	No	A description of the policy.	string
Definition	Yes	Specifies the schema definition to be used for validating the payload. Valid values: <ul style="list-style-type: none"> <li>• <b>request</b>: Select this value to validate the request input against the schema definition that is specified in the TYPE field for the request parameter for this operation. For information about how to create a request parameter, see <a href="#">Configuring an operation</a>.</li> <li>• <b>response</b>: Select this value to validate the response to be returned to the client application, against the schema definition that is specified in the SCHEMA field for the response parameter for this operation. For information about how to create a response parameter, see <a href="#">Configuring an operation</a>.</li> <li>• <b>#/definitions/definition_name</b>: Select this value for a previously defined schema definition to be used to validate the payload that is returned from other invoke actions or tasks in the assembly flow. For information on defining a schema for an API definition, see <a href="#">Editing an API definition</a>.</li> </ul>	string

## Related tasks

- [Creating a new REST OpenAPI definition](#)

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Validate Username Token

Use the Validate Username Token policy to validate a Web Services Security (WS-Security) UsernameToken in a SOAP payload before allowing access to the protected resource.

## Gateway support

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® Gateway (v5 compatible)	1.0.0
	1.1.0 (IBM API Connect® Version 2018.4.1.4 or later)

This topic describes how to configure the policy in the assembly user interface; for details on how to configure the policy in your OpenAPI source, see [validate-username-token](#).

## About

A WS-Security UsernameToken enables a user identity to be passed securely over a multi-point message path. The Validate Username Token policy extracts the UsernameToken element from the request payload, authenticates the extracted username and password, and provides access to the protected resource based on the authentication result. The policy has two authentication methods: Lightweight Directory Access Protocol (LDAP) user registry, or Authentication URL.

The Validate Username Token policy supports both passwordText and passwordDigest types of password. When the authentication method is Authentication URL with a passwordDigest, a basic authentication header that contains a Base64 encoded username and passwordDigest is sent to the URL. In addition, a custom header named X-IBM-PasswordType is set with a value of digest. The following table shows the authentication process based on password type:

Table 2. Authentication URL process by password type

passwordText	passwordDigest
Authentication: Basic base64(username:password)	Authentication: Basic base64(username:passwordDigest) X-IBM-PasswordType: 'digest'

You can attach this policy to the following API flows:

- REST
- SOAP

Position this policy where required in the assembly flow as follows:

- To validate the original input, position a Validate Username Token policy at the start of your flow.
- To validate an intermediate response that is returned from other invoke actions or tasks, position a Validate Username Token policy after those actions or tasks.
- To validate the response that is returned to the client application, position a Validate Username Token policy after the task that collates the response.

## Properties

The following table lists the policy properties, indicates whether a property is required, specifies the valid and default values for input, and specifies the data type of the values.

Table 3. Validate Username Token policy properties

Property label	Required	Description	Data type
Title	Yes	The title of the policy. The default value is <b>validate-usernameToken</b> .	string
Description	No	A description of the policy.	string
Authentication type (policy version 1.0.0 only)	Yes	The authentication type to use to validate the UsernameToken. Valid values: <ul style="list-style-type: none"> <li>• <b>Authentication URL</b>: Select this value to validate the user credentials against an authentication URL.</li> <li>• <b>LDAP registry</b>: Select this value to validate the user credentials against an LDAP user registry.</li> </ul> The default value is: <b>Authentication URL</b> .	string
Authentication URL (policy version 1.0.0 only)	Yes	The authentication URL to use to validate the UsernameToken user credentials against. Note: This property is required only if Authentication type is set to <b>Authentication URL</b> .	string
TLS profile (policy version 1.0.0 only)	No	The TLS profile to use for the secure transmission of data to the authentication URL. Note: This property is available only if Authentication type is set to <b>Authentication URL</b> .	string
LDAP registry name (policy version 1.0.0 only)	Yes	The name of the LDAP user registry to validate the UsernameToken user credentials against. You can select a name from the drop-down list, or type a name manually. Note: This property is required only if Authentication type is set to <b>LDAP registry</b> .	string
User Registry Name (policy version 1.1.0 and later)	Yes	Select the LDAP or Authentication URL registry to use to validate the UsernameToken.	string
LDAP search attribute <sup>1</sup>	Yes	The name of the LDAP user password attribute. Note: This property is required only for an LDAP user registry.	string

## Examples

The following example shows an LDAP user registry authentication:

```
- validate-usernameToken:
  version: 1.0.0
  title: "validate-usernameToken"
  auth-type: "LDAP Registry"
  ldap-registry: "wstest"
  ldap-search-attribute: "userPassword"
```

The following example shows an Authentication URL definition:

```
- validate-usernameToken:
  version: 1.0.0
  title: "validate-usernameToken"
  auth-type: "Authentication URL"
  auth-url: "https://www.google.com"
  tls-profile: "default-ssl-profile"
```

## Errors

The policy returns an HTTP 200 status code when successful, and the input payload is copied to the output flow. For all failure types the policy returns an HTTP 500 status code, and the output contains the SOAP fault.

Tip: If there are authentication failures, try verifying the LDAP user registry configuration as follows:

- Ensure Search (DN) is set as the communication method.
- Ensure Authenticated Bind is set so that specific permissions are required to search the registry.
- Ensure the Admin DN and Password fields are correctly completed for the Distinguished Name (DN) of a user authorized to carry out searches in the LDAP directory.
- Ensure that a combination of Base DN, Prefix, and Suffix are set, such that they fully describe the user DN. For example:
  - For a user named: `cn=alice, dc=ibm, dc=com`

```
BaseDN: dc=ibm
Prefix: cn=alice
Suffix: dc=com
```

where the user DN is calculated as: Prefix + BaseDN + Suffix.

## Related concepts

- [LDAP authentication](#)

## Related tasks

- [Creating a new REST OpenAPI definition](#)

## Related information

- [Creating an LDAP registry](#)
- [Authenticating by using your enterprise user registry](#)

<sup>1</sup> When authenticating with LDAP and `passwordText`, the policy uses the username and password as LDAP bind credentials. However, when authenticating with LDAP and `passwordDigest`, the digest itself cannot be used for authentication. Instead, an LDAP search for the username is performed by using the administrator's distinguished name (DN) and password, and an attribute corresponding to the contents of the `ldap-search-attribute` is retrieved. A hash of the contents of this attribute (along with the `Nonce` and `Created` attributes, as in the WS-Security UsernameToken profile specification) is then compared to the `passwordDigest`.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## XML to JSON

Use the XML to JSON policy to convert the context payload of your API from the extensible markup language (XML) format to JavaScript Object Notation (JSON).

## Gateway support

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® Gateway (v5 compatible)	1.0.0
DataPower API Gateway	2.0.0

This topic describes how to configure the policy in the assembly user interface; for details on how to configure the policy in your OpenAPI source, see [xml-to-json](#).

## About

The XML to JSON policy uses a simple convention, based on BadgerFish, to convert your API context payload from XML to JSON. The XML content is preserved, including the attributes and namespaces. No additional configuration is required. For more information about the BadgerFish convention, including some examples, see [BadgerFish](#).

You can attach this policy to the following API flows:

- REST
- SOAP

Use the API Manager assembly view when you are creating your API definition to add a built-in policy to the flow.

The policy must be attached to the flow at the point at which you require the conversion to be performed. For example, if you need to convert an XML-formatted request into a JSON-formatted request, the policy must be attached to the request flow.

The policy reads input from the `message.body`, if that context exists, otherwise from the `request.body`, and then writes the output to the `message.body`.

**Note:** If you are using the DataPower API Gateway, the input to the XML to JSON policy must be parsed data. One way to produce parsed data is to use a [Parse](#) policy before an XML to JSON policy in your assembly flow, which provides explicit control of the parse action.

## Properties

The following table lists the policy properties, indicates whether a property is required, specifies the valid and default values for input, and specifies the data type of the values.

Table 2. Policy properties

Property label	Required	Description	Data type
----------------	----------	-------------	-----------

Property label	Required	Description	Data type
Title	Yes	The title of the policy. The default value is <code>xml-to-json</code> .	string
Description	No	A description of the policy.	string
<span style="border: 1px solid green; padding: 2px;">API Gateway only</span> Input	No	The input message to convert. Specify the name of a variable in the API context. <code>variableName.body</code> , the message payload, represents the XML input to convert. The default value of the variable is <code>message</code> and <code>message.body</code> is the default input.	string
<span style="border: 1px solid green; padding: 2px;">API Gateway only</span> Output	No	The output message to store the conversion result. Specify the name of a variable in the API context. <code>variableName.body</code> represents the result of conversion from XML format to JSON format. When the specified input message is the default message, the default output is <code>message.body</code> . Otherwise, when the input message is the variable <code>my-message-variable</code> , for example, the default output is <code>my-message-variable.body</code> . The variable cannot be any read-only in the API context.	string
<span style="border: 1px solid green; padding: 2px;">API Gateway only</span> Conversion type	No	The conversion type that determines the target format of the output. The following options are available: <ul style="list-style-type: none"> <li>badgerFish: BadgerFish convention is used to determine the target conversion format of the output.</li> <li>apicv5: apicv5 convention is used to determine the target conversion format of the output.</li> </ul>	string

## Examples

For example, the following simple XML object

```
<a>hello</a>
```

becomes

```
{ "a": { "$" : "hello" } }
```

The following XML object with an attribute

```
<a type="world">hello</a>
```

becomes

```
{ "a": { "$" : "hello", "@type" : "world" } }
```

For examples, see [xml-to-json](#).

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## XSLT

Use the XSLT policy to apply an XSLT transform to the payload of the API definition.

## Gateway support

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® Gateway (v5 compatible)	1.0.0
DataPower API Gateway, policy available from V2018.4.1.0	2.0.0

This topic describes how to configure the policy in the assembly user interface; for details on how to configure the policy in your OpenAPI source, see [xslt](#).

## About

You can attach this policy to the following API flows:

- REST
- SOAP

Note: If you are using the DataPower API Gateway, the input to the XSLT policy must be parsed data. One way to produce parsed data is to use a [Parse](#) policy before an XSLT policy in your assembly flow, which provides explicit control of the parse action.

## Properties

The following table lists the policy properties, indicates whether a property is required, specifies the valid and default values for input, and specifies the data type of the values.

Table 2. XSLT policy properties

Property label	Required	Description	Data type
Title	Yes	The title of the policy. The default value is <code>xml</code> .	string

Property label	Required	Description	Data type
Description	No	A description of the policy.	string
Use context current payload	No	Indicates whether this XSLT input document uses the context current payload, or if there is no input. The check box is cleared by default, which indicates that there is no input.	boolean
<span style="border: 1px solid green; padding: 2px;">API Gateway only</span> Serialize output	No	If you select this option, the output tree that is generated by the XSLT policy is serialized. The content of <code>message.body</code> is updated with the serialized binary data rather than the XML tree. The check box is cleared by default, which indicates that the output tree is not serialized.	boolean
Source	Yes	The XSLT transform source to execute.	string

For examples of the OpenAPI definitions of XSLT policies, see [XSLT policy examples](#).

For more examples of how to use XSLT to access and modify properties and context, see [Implementation code examples](#) and, if you are using the DataPower API Gateway, [Using context variables in GatewayScript and XSLT policies with the DataPower API Gateway](#).

## Errors

The following error can be thrown while the policy is being executed:

- **TransformError** - a generic error that captures all errors that occur during the execution of the policy.

## Related concepts

- [Variable references in API Connect](#)

## Related tasks

- [Creating a new REST OpenAPI definition](#)

## Related reference

- [API Connect context variables](#)

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## XSLT policy examples

Examples of the OpenAPI definitions of XSLT policies.

- [Simple example with no context current payload](#)
- [Concatenation and transformation](#)
- [Obtain query parameter values and refer to context variables](#)

Note: The XML specification <https://www.w3.org/TR/xml/> does not specify a preferred order for XML namespace (XMLNS) attributes. Best practice is to not rely upon the sequence of XMLNS attributes if you write custom parsing code.

## Simple example with no context current payload

The following is an example of where the XSLT input document does not use the context current payload (there is no input):

```
- xslt:
  title: example xslt
  source: |
    <xsl:stylesheet version="1.0" xmlns:xsl="http://www.w3.org/1999/XSL/Transform">
      <xsl:template match="/">
        <Hello>World!</Hello>
      </xsl:template>
    </xsl:stylesheet>
```

## Concatenation and transformation

The following example shows a more complex XSLT transform source, where the stylesheet concatenates two input strings and transforms the third input string to the IP address of the client:

```
- xslt:
  title: xslt
  input: true
  source: |
    <?xml version="1.0" encoding="UTF-8"?>
    <xsl:stylesheet
      xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
      xmlns:xalan="http://xml.apache.org/xslt"
      xmlns:fn="http://www.w3.org/2005/xpath-functions"
      xmlns:dp="http://www.datapower.com/extensions"

## Obtain query parameter values and refer to context variables

The following example shows a complete OpenAPI source file. The API includes an XSLT policy that obtains a query parameter value in XSLT, and also uses the `getvariable` method to retrieve the value of the context variable `request.headers.user-agent`.

```

```

For more examples of how to use XSLT to access and modify properties and context, see [Implementation code examples](#) and, if you are using the DataPower® API Gateway, [Using context variables in GatewayScript and XSLT policies with the DataPower API Gateway](#).

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Implementation code examples

Example XSLT and GatewayScript code snippets.

Note: If you are using GatewayScript, you must include one or other of the following commands depending on your gateway type:

```
DataPower Gateway (v5 compatible) var apic = require('./apim.custom.js');
API Gateway var apic = require('apim');
```

where *apic* is the common name used for the GatewayScript examples in this topic. However, *apic* could be any given name of your choice, for example you could use:

```
var apim = require('./apim.custom.js');
```

and then you would start your calls with **apim**.

- [Access to input properties code snippet](#)
- [Access to runtime context code snippet](#)
- [Access to input payload code snippet](#)
- [Access to HTTP headers code snippet](#)
- [Modify the payload code snippet](#)
- [Configure error information code snippet](#)
- [Accessing the caught exception in a catch block](#)
- [Set variables code snippet](#)

## Access to input properties code snippet

The following code block shows an example of how to access the input properties by using the XSLT `policyProperties()` function. The example defines a property that is named `a_property`, which is declared as an integer value, but is retrieved in XSLT as text.

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet version="1.0"
  xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:dp="http://www.datapower.com/extensions"
  xmlns:func="http://exslt.org/functions"
  xmlns:apim="http://www.ibm.com/apimanagement" extension-element-prefixes="dp func apim">

  <!-- Contains the APIM functions -->
  DataPower Gateway (v5 compatible) <xsl:import
href="#_home_markdown_jenkins_workspace_Transform_in_SSMNED_2018_com.ibm.apic.toolkit.doc_local:_isp_policy_apim.custom.xsl" />
  API Gateway <xsl:include
href="#_home_markdown_jenkins_workspace_Transform_in_SSMNED_2018_com.ibm.apic.toolkit.doc_store:_dp_apim.custom.xsl" />

  <xsl:template match="/">
    <xsl:variable name="p" select="apim:policyProperties()" />
    <xsl:message>
      The value of my input property is
      <xsl:value-of select="$p/a_property" />
    </xsl:message>
  </xsl:template>

</xsl:stylesheet>
```

If you are using GatewayScript, call the following function:

```
apic.getPolicyProperty(propertyName)
```

where *propertyName* is the name of the input property that you want to access. If the input property name is blank, the action will return all input properties.

## Access to runtime context code snippet

The following code block shows an example of how to access the runtime context by using the XSLT `getContext()` function.

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet version="1.0"
  xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:dp="http://www.datapower.com/extensions"
  xmlns:func="http://exslt.org/functions"
  xmlns:apim="http://www.ibm.com/apimanagement" extension-element-prefixes="dp func apim">

  <!-- Contains the APIM functions -->
  DataPower Gateway (v5 compatible) <xsl:import
href="#_home_markdown_jenkins_workspace_Transform_in_SSMNED_2018_com.ibm.apic.toolkit.doc_local:_isp_policy_apim.custom.xsl" />
```

```

    API Gateway <xsl:include
href="#_home_markdown_jenkins_workspace_Transform_in_SSMNED_2018_com.ibm.apic.toolkit.doc_store:_dp_apim.custom.xml" />

<xsl:template match="/">
  <xsl:variable name="client-id" select="apim:getContext('client.app.id') " />
  <xsl:message>
    The calling application is
    <xsl:value-of select="$client-id" />
  </xsl:message>
</xsl:template>

</xsl:stylesheet>

```

If you are using GatewayScript, call the following function:

```
apic.getContext(varName)
```

where `varName` is the name of the context variable that you want to access.

For a complete list of context variables, see [API Gateway context variables](#). If you are using the DataPower® API Gateway, see also [Using context variables in GatewayScript and XSLT policies with the DataPower API Gateway](#).

## Access to input payload code snippet

The following code block shows an example of how to access the input payload by using the XSLT `payloadRead()` function.

```

<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet version="1.0"
  xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:dp="http://www.datapower.com/extensions"
  xmlns:func="http://exslt.org/functions"
  xmlns:apim="http://www.ibm.com/apimanagement" extension-element-prefixes="dp func apim">

  <!-- Contains the APIM functions -->
  DataPower Gateway (v5 compatible) <xsl:import
href="#_home_markdown_jenkins_workspace_Transform_in_SSMNED_2018_com.ibm.apic.toolkit.doc_local:_isp_policy_apim.custom.xml" />
  API Gateway <xsl:include
href="#_home_markdown_jenkins_workspace_Transform_in_SSMNED_2018_com.ibm.apic.toolkit.doc_store:_dp_apim.custom.xml" />

  <xsl:template match="/">
    <xsl:variable name="input" select="apim:payloadRead()" />
    <xsl:message>
      The input payload is
      <xsl:copy-of select="$input" />
    </xsl:message>
  </xsl:template>

</xsl:stylesheet>

```

If you are using GatewayScript, call the following function:

```
apic.readInput(callback)
```

A callback is required because the actual payload read is asynchronous. The callback method is called when the payload is ready.

This function returns an XML node-set that contains the payload of the request. If the payload is in JSON format, a JSONx node-set is returned that can then be manipulated within an XSLT or GatewayScript stylesheet. If the payload is not in JSON or XML format, the node-set that is returned is empty.

The following example shows how to use the `payloadType()` function to determine what type of payload (XML or JSONx) will be returned by the XSLT `payloadRead()` function.

```

<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet version="1.0"
  xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:dp="http://www.datapower.com/extensions"
  xmlns:func="http://exslt.org/functions"
  xmlns:apim="http://www.ibm.com/apimanagement" extension-element-prefixes="dp func apim">

  <!-- Contains the APIM functions -->
  DataPower Gateway (v5 compatible) <xsl:import
href="#_home_markdown_jenkins_workspace_Transform_in_SSMNED_2018_com.ibm.apic.toolkit.doc_local:_isp_policy_apim.custom.xml" />
  API Gateway <xsl:include
href="#_home_markdown_jenkins_workspace_Transform_in_SSMNED_2018_com.ibm.apic.toolkit.doc_store:_dp_apim.custom.xml" />

  <xsl:template match="/">
    <xsl:variable name="payloadType" select="apim:payloadType()" />
    <xsl:message>
      <xsl:text>Payload type is [</xsl:text>
      <xsl:value-of select="$payloadType" />
      <xsl:text>]</xsl:text>
    </xsl:message>
  </xsl:template>

</xsl:stylesheet>

```

## Access to HTTP headers code snippet

The following code block shows an example of how to access the HTTP headers in XSLT by using the `getContext()` function.

```

<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet version="1.0"
  xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:dp="http://www.datapower.com/extensions"
  xmlns:func="http://exslt.org/functions"
  xmlns:apim="http://www.ibm.com/apimanagement" extension-element-prefixes="dp func apim">

  <!-- Contains the APIM functions -->
  <xsl:import
    href="#" home_markdown_jenkins_workspace_Transform_in_SSMNED_2018_com.ibm.apic.toolkit.doc_local:_isp_policy_apim.custom.xsl" />
  <xsl:include
    href="#" home_markdown_jenkins_workspace_Transform_in_SSMNED_2018_com.ibm.apic.toolkit.doc_store:_dp_apim.custom.xsl" />

  <xsl:template match="/">
    <xsl:variable name="content-type" select="apim:getContext('request.headers.content-type')"/>
    <xsl:message>
      The request content type is
      <xsl:value-of select="$content-type" />
    </xsl:message>
  </xsl:template>

</xsl:stylesheet>

```

If you are using GatewayScript, call the following function:

```
apic.getContext(request.headers.headerName)
```

where **headerName** maps to the name of the header you want to access.

Note: Access or modification of HTTP headers by using DataPower extensions, such as **dp:set-request-header**, is not advisable, as such actions might yield unexpected results when the policy is combined with other policies and assembly steps.

## Modify the payload code snippet

The output from a user-defined policy must be an XML node-set, which represents an XML or SOAP message, or a JSON message by using JSONx. The following code block shows an example of how to modify the payload in XSLT. To assist the API Gateway policy framework to accept the new or transformed message, call the **apim:output** template, as shown in the following example.

```

<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet version="1.0"
  xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:apim="http://www.ibm.com/apimanagement"
  xmlns:jsonx="http://www.ibm.com/xmlns/prod/2009/jsonx">

  <!-- Contains the APIM functions -->
  <xsl:import
    href="#" home_markdown_jenkins_workspace_Transform_in_SSMNED_2018_com.ibm.apic.toolkit.doc_local:_isp_policy_apim.custom.xsl" />
  <xsl:include
    href="#" home_markdown_jenkins_workspace_Transform_in_SSMNED_2018_com.ibm.apic.toolkit.doc_store:_dp_apim.custom.xsl" />

  <xsl:template match="/">
    <!-- Creates a JSON document (empty object is for simplicity) -->
    <jsonx:object>
    </jsonx:object>

    <!-- Indicates the media type of the output being produced -->

    <xsl:call-template name="apim:output">
      <xsl:with-param name="mediaType" select="'application/json'"/>
    </xsl:call-template>
  </xsl:template>

</xsl:stylesheet>

```

where **mediaType**:

- 'application/json' is when the output is written in JSONx format.
- 'application/xml' is when the output is written in XML format.

If you are using GatewayScript, call the following function:

```
apic.output(mediaType)
```

where **mediaType** is:

- **application/json** is when the output is written in JSONx format.
- **application/xml** is when the output is written in XML format.

Specifying the media type allows the next steps in the assembly flow to understand how to process the new payload.

Tip: The output from a user-defined policy must be XML or JSONx. JSONx is an IBM standard format to represent JSON as XML. One way to convert output GatewayScript JSON data into JSONx, is to add a **Convert Query Params to XML** action to follow the GatewayScript action within the same policy rule. The **Convert Query Params to**

**XML** action must have an **Input Conversion** with the **Default**

**Encoding** set to **JSON**. The output from the GatewayScript action must be the input for the **Convert Query Params to XML** action for JSONx to be produced.

## Configure error information code snippet

The following XSLT code block shows an example of how to configure the policy implementation to produce error information by calling the `apim-error` template.

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet version="1.0"
  xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:apim="http://www.ibm.com/apimanagement">

  <!-- Contains the APIM functions -->
  <xsl:import
    href="#_home_markdown_jenkins_workspace_Transform_in_SSMNED_2018_com.ibm.apic.toolkit.doc_local:_isp_policy_apim.custom.xsl" />
  <xsl:include
    href="#_home_markdown_jenkins_workspace_Transform_in_SSMNED_2018_com.ibm.apic.toolkit.doc_store:_dp_apim.custom.xsl" />

  <!-- Indicates this policy has a failure and provides
    additional information for the client application -->
  <xsl:template match="/">
    <xsl:call-template name="apim:error">
      <xsl:with-param name="httpCode" select="'401'" />
      <xsl:with-param name="httpReasonPhrase" select="'Unauthorized'" />
      <xsl:with-param name="errorMessage" select="'Please select a Plan'" />
    </xsl:call-template>
  </xsl:template>
</xsl:stylesheet>
```

where:

- `httpCode` is the code of the required error message.
- `httpReasonPhrase` is the reason for the error.
- `errorMessage` is the suggested action for the user.

If you are using GatewayScript, call the following function:

```
apic.error(name, httpCode, httpReasonPhrase, message)
```

where:

- `name` is the name of the error.
- `httpCode` is the code of the required error message.
- `httpReasonPhrase` is the reason for the error.
- `message` is the suggested action for the user.

## Accessing the caught exception in a catch block

The following XSLT code block shows an example of how, in the `catch` block of an API assembly, you can obtain the details of the current caught exception. A possible use would be to create a custom error response using the details of the caught exception.

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet version="1.0"
  xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:dp="http://www.datapower.com/extensions"
  xmlns:apim="http://www.ibm.com/apimanagement"
  xmlns:apigw="http://www.ibm.com/xmlns/datapower/2017/11/apigateway"
  extension-element-prefixes="dp"
  exclude-result-prefixes="dp apim">
  <xsl:output method="xml" />

  <!-- Contains the APIM functions -->
  <xsl:import
    href="#_home_markdown_jenkins_workspace_Transform_in_SSMNED_2018_com.ibm.apic.toolkit.doc_local:_isp_policy_apim.custom.xsl" />
  <xsl:include
    href="#_home_markdown_jenkins_workspace_Transform_in_SSMNED_2018_com.ibm.apic.toolkit.doc_store:_dp_apim.custom.xsl" />

  <xsl:template match="/">
    <xsl:variable name="exception" select="apim:getError()" />
    <xsl:variable name="exception" select="apigw:get-error()" />
    <!-- output desired error message based on the exception -->
    <myError>
      <errorReason><xsl:value-of select="$exception/error/message"/></errorReason>
    </myError>

    <!-- Propagate the HTTP status code and reason phrase from the exception -->
    <xsl:call-template name="apim:setVariable">
      <xsl:with-param name="varName" select="'message.status.code'" />
      <xsl:with-param name="value" select="$exception/error/status/code"/>
      <xsl:with-param name="action" select="'Set'" />
    </xsl:call-template>

    <xsl:call-template name="apim:setVariable">
      <xsl:with-param name="varName" select="'message.status.reason'" />
    </xsl:call-template>
  </xsl:template>
</xsl:stylesheet>
```

```

    <xsl:with-param name="value" select="$exception/error/status/reason"/>
    <xsl:with-param name="action" select="'Set'" />
  </xsl:call-template>
</xsl:template>

```

```
</xsl:stylesheet>
```

The `apim:getError()` and `apigw:get-error()` functions return an XML node set; for example:

```

<?xml version="1.0" encoding="UTF-8"?>
<error>
  <name>RuntimeException</name>
  <message>This is a thrown Runtime Error</message>
  <policyTitle>Throw Runtime Error</policyTitle>
  <status>
    <code>500</code>
    <reason>Internal Server Error</reason>
  </status>
</error>

```

If you are using GatewayScript, call the following function:

```
apim.getError()
```

which returns a JSON object; for example:

```

{
  "name": "OperationError",
  "message": "This is a thrown Operation Error",
  "policyTitle": "Throw Operation Error",
  "status": {
    "code": "500",
    "reason": "Internal Server Error"
  }
}

```

## Set variables code snippet

The following XSLT code block shows an example of how to set a runtime variable to a specified string value by calling the `setVariable` template.

```

<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet version="1.0"
  xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:dp="http://www.datapower.com/extensions"
  xmlns:func="http://exslt.org/functions"
  xmlns:apim="http://www.ibm.com/apimanagement" extension-element-prefixes="dp func apim">

  <!-- Contains the APIM functions -->
  <xsl:import href="#_home_markdown_jenkins_workspace_Transform_in_SSMNED_2018_com.ibm.apic.toolkit.doc_local_isp_policy_apim.custom.xsl" />
  <xsl:include href="#_home_markdown_jenkins_workspace_Transform_in_SSMNED_2018_com.ibm.apic.toolkit.doc_store_dp_apim.custom.xsl" />

  <xsl:template match="/">
    <xsl:call-template name="apim:setVariable">
      <xsl:with-param name="varName" select="'serviceEndpoint'" />
      <xsl:with-param name="value" select="'https://endpoint.host.com/data'" />
    </xsl:call-template>
    <xsl:message>
      <xsl:text>Variable [ </xsl:text>
      <xsl:value-of select="'serviceEndpoint'" />
      <xsl:text>] set to [ </xsl:text>
      <xsl:value-of select="'https://endpoint.host.com/data'" />
      <xsl:text>] </xsl:text>
    </xsl:message>
  </xsl:template>
</xsl:stylesheet>

```

where:

- `varName` is the name of the runtime variable that you want to set a value to.
- `value` is the string value that you want to set the variable to. This can be a literal value, or another variable. For example, to set your named variable to the value of the Content-Type header in a request, you would specify the `value` as `$(request.headers.content-type)`.

If you are using GatewayScript, call the following function:

```
apic.setvariable(varName, varValue, action)
```

where:

- `varName` is the name of the runtime variable that you want to set a value to, or that you want to add or clear.
- `varValue` is the string value that you want to set the variable to. This can be a literal value, or another variable. For example, to set your named variable to the value of the Content-Type header in a request, you would specify the `varValue` as `request.headers.content-type`. This property is only required when `set` or `add` is specified as the action.
- `action` is the action that you want to apply to the variable. Valid options are:
  - `set`
  - `add`
  - `clear`

If no option is set, the default option of `set` is applied.

The following XSLT example shows how to retrieve the value of a runtime variable by using the `getVariable()` function.

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet version="1.0"
  xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:dp="http://www.datapower.com/extensions"
  xmlns:func="http://exslt.org/functions"
  xmlns:apim="http://www.ibm.com/apimanager" extension-element-prefixes="dp func apim">

  <!-- Contains the APIM functions -->
  <include href="#_home_markdown_jenkins_workspace_Transform_in_SSMNED_2018_com.ibm.apic.toolkit.doc_local:_isp_policy_apim.custom.xsl" />
  <include href="#_home_markdown_jenkins_workspace_Transform_in_SSMNED_2018_com.ibm.apic.toolkit.doc_store:_dp_apim.custom.xsl" />

  <xsl:template match="/">
    <xsl:variable name="varValue" select="apim:getVariable('serviceEndpoint')" />
    <xsl:message>
      <xsl:text>Variable [ </xsl:text>
      <xsl:value-of select="'serviceEndpoint'" />
      <xsl:text>] = [ </xsl:text>
      <xsl:value-of select="$varValue" />
      <xsl:text>] </xsl:text>
    </xsl:message>
  </xsl:template>
</xsl:stylesheet>
```

where

- `varValue` is the name of the runtime variable that you want to retrieve a value for.

If you are using GatewayScript, call the following function:

```
apic.getvariable(varName)
```

where `varName` is the name of the runtime variable that you want to retrieve a value for.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Logic Constructs

IBM® API Connect includes a number of logic constructs that you can use to apply preconfigured logic to an assembly to control the flow of data through your assembly when the API is called.

Logic constructs are configured in the context of an API. You can use the API Manager assembly editor to add a logic construct to an API and to configure the properties for that construct.

The logic constructs are described in the following subtopics:

- [if](#)  
Use the if construct to apply a section of the assembly when a condition is fulfilled.
- [operation-switch](#)  
Use the operation-switch component to apply a section of the assembly to a specific operation.
- [switch](#)  
Use the switch component to execute one of a number of sections of the assembly based on which specified condition is fulfilled.
- [throw](#)  
Use the throw policy to throw an error when it is reached during the execution of an assembly flow.

---

## Related concepts

- [The Assemble view](#)

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## if

Use the if construct to apply a section of the assembly when a condition is fulfilled.

## Gateway support

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® Gateway (v5 compatible)	1.0.0
DataPower API Gateway, policy available from V2018.4.1.0, functionality provided by <a href="#">switch</a>	

This topic describes how to configure the policy in the assembly user interface; for details on how to configure the policy in your OpenAPI source, see [if](#).

An if construct provides a way to branch an API's assembly when a specified condition is fulfilled. Each if construct contains a section of the assembly that is only executed when the script within the construct returns a **true** value.

When using the assemble view's property sheet, use the Condition field to write your condition that returns **true** or **false**.

If you want one or more policies or constructs to be executed when the condition of the if construct is fulfilled, drag the new policy or construct onto one of the dashed boxes that are displayed within the if construct. Constructs and policies included in the if construct are part of the case that is executed when the condition of the if construct is returned as true.

For information about the OpenAPI implementation of an if construct, see [if](#).

In the Condition field, use the form `apim.getvariable('context.location.variable')` to reference your variables, where *context* is the context that you want to reference, *location* is the location of the variable within that context, and *variable* is the name of the variable.

## Construct property details

You can configure a construct's properties in the property sheet in the assemble view.

Table 2. The properties of an if construct

Property	Required	Description
Title	No	A custom title for your construct when it is displayed in the canvas. If a title is not specified, <b>if</b> is used by default.
Description	No	A description of your construct, it is not displayed on the canvas.
Condition	Yes	Use GatewayScript to provide conditions. A list of context variables that you can use to generate conditions can be found in <a href="#">API Connect context variables</a> .

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## operation-switch

Use the operation-switch component to apply a section of the assembly to a specific operation.

## Gateway support

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® Gateway (v5 compatible)	1.0.0
DataPower API Gateway, policy available from V2018.4.1.0, functionality provided by <a href="#">switch</a>	

This topic describes how to configure the policy in the assembly user interface; for details on how to configure the policy in your OpenAPI source, see [operation-switch](#).

An operation-switch component provides a way to branch an API's assembly depending on the operation that is called. For each case, a separate piece of the assembly is applied to the operations that belong to the case.

When using the assemble view's property sheet, click the Case field to view suggested operations. Type in the Case field to refine the list of suggested operations.

Each case behaves as an assembly. To add components to a case, drag the component from the palette to the area included in the operation-switch component. Dashed boxes are displayed where the component can be included in the case.

For information about the OpenAPI implementation of an operation-switch component, see [operation-switch](#).

Restriction: Nesting an operation-switch component inside an if or switch construct, or another operation-switch component, is **not** supported.

## Component property details

You can configure a component's properties in the property sheet in the assemble view.

Table 2. The properties of an operation-switch component

Property	Required	Description
Title	No	A custom title for your component when it is displayed in the canvas. If a title is not specified, <b>operation-switch</b> is used by default.
Description	No	A description of your component, it is not displayed on the canvas.
Case	Yes	Each case includes one or more operations to which the branch provided by the operation switch applies.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## switch

Use the switch component to execute one of a number of sections of the assembly based on which specified condition is fulfilled.

### Gateway support

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® Gateway (v5 compatible)	1.0.0
DataPower API Gateway, policy available from V2018.4.1.0	2.0.0

This topic describes how to configure the policy in the assembly user interface; for details on how to configure the policy in your OpenAPI source, see [switch](#).

A switch construct provides a way to branch an assembly based on multiple conditions. Each switch component contains multiple cases, each corresponding to a section of the assembly that is only executed when the condition or operation specified by the case is met or used. Additionally, an otherwise case executes when no other case is fulfilled.

Add new cases by clicking + Case and add an "otherwise" case by clicking + Otherwise.

If multiple cases are fulfilled, the highest priority case will be executed. Change the priority of cases by clicking the Move up  and Move down  icons.

To configure a case to be executed if a specific operation is called, use the search operations field and select your operation from the list. You can refine the results of the search by typing in the search operations field.

To configure a case to be executed based on a GatewayScript condition, click edit condition and enter your script in the "Condition editor" window. When you have supplied a script, you can edit your script either in the Condition field or by clicking edit condition.

If you are using the DataPower Gateway (v5 compatible), you enter your condition as GatewayScript directly in a code area in the Condition editor. If you are using DataPower API Gateway, the Condition editor provides a script builder to help you construct your condition script; for more information, see [Using the switch policy condition editor](#).

To delete a case, click the Remove case icon .

If you want one or more policies or constructs to be executed when the condition of a case is fulfilled, drag the new policy or construct onto one of the dashed boxes that are displayed within the case's section of the switch construct.

Note: A switch case **must** contain at least one policy, otherwise the Gateway server returns an error.

### Construct property details

You can configure a construct's properties in the property sheet in the assemble view.

Table 2. The properties of a switch construct

Property	Required	Description
Title	No	A custom title for your construct when it is displayed in the canvas. If a title is not specified, <b>switch</b> is used by default.
Description	No	A description of your construct, it is not displayed on the canvas.
case	Yes (one or more)	Specify one or more operations or write a script for a condition.  Use the Condition editor to construct your condition script. See <a href="#">Using the switch policy condition editor</a> .  Use GatewayScript to provide conditions. You can reference variables by using the form <code>apim.getvariable('context.location.variable')</code> , where <i>context</i> is the context that you want to reference, <i>location</i> is the location of the variable within that context, and <i>variable</i> is the name of the variable. A list of context variables that you can use to generate conditions can be found in <a href="#">API Connect context variables</a> .
otherwise	No	Add an otherwise case if you want to execute a section of the assembly when no other cases are fulfilled.

- [Using the switch policy condition editor](#)

The switch policy condition editor provides a user interface to help you build the conditions for the **case** clauses in a switch policy.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Using the switch policy condition editor

The switch policy condition editor provides a user interface to help you build the conditions for the `case` clauses in a switch policy.

You build a condition script by using the Add Group and Add Condition options, together with operator selections, and pre-supplied function selections. The Output field shows the resultant condition script, and updates dynamically as you build your condition.

### Adding conditions

When you open the policy condition editor, an initial condition is pre-supplied ready for you to configure.

Use the drop-down list to select the function that you want to begin your condition.

The following JSONata functions are supported:

- Aggregation functions:
  - `$average(array)`
  - `$max(array)`
  - `$min(array)`
  - `$sum(array)`
- Array functions:
  - `$append(array1, array2)`
  - `$count(array)`
  - `$reverse(array)`
  - `$sort(array [, function])`
  - `$zip(array1, ...)`
- Boolean functions:
  - `$boolean(arg)`
  - `$exists(arg)`
  - `$not(arg)`
- Numeric functions:
  - `$abs(number)`
  - `$ceil(number)`
  - `$floor(number)`
  - `$formatBase(number [, radix])`
  - `$number(arg)`
  - `$power(base, exponent)`
  - `$round(number [, precision])`
  - `$sqrt(number)`
- Object functions:
  - `$keys(object)`
  - `$lookup(object, key)`
  - `$merge(array<object>)`
  - `$spread(object)`
- String functions:
  - `$contains(str, pattern)`
  - `$join(array[, separator])`
  - `$length(str)`
  - `$lowercase(str)`
  - `$match(str, pattern [, limit])`
  - `$pad(str, width [, char])`
  - `$replace(str, pattern, replacement [, limit])`
  - `$split(str, separator [, limit])`
  - `$substring(str, start[, length])`
  - `$substringAfter(str, chars)`
  - `$substringBefore(str, chars)`
  - `$trim(str)`
  - `$uppercase(str)`

You can use the following JSONata numeric operators:

- `+` (addition)
- `-` (subtraction)
- `*` (multiplication)
- `/` (division)
- `%` (modulo)

You can use the following JSONata comparison operators for number values or strings:

- `=`
- `!=`
- `<`
- `>`
- `<=`
- `>=`

You can also use the following functional extensions to standard JSONata notation. Each extension corresponds to a part of the API context.

Extension	Variable	Description
-----------	----------	-------------

Extension	Variable	Description
<code>\$header (name)</code>	<code>message.headers.name</code>	Message header
<code>\$httpVerb ()</code>	<code>request.verb</code>	HTTP method of the request
<code>\$operationID ()</code>	<code>api.operation.id</code>	ID of the operation
<code>\$operationPath ()</code>	<code>api.operation.path</code>	Path of the operation
<code>\$queryParameter ('name')</code>	<ul style="list-style-type: none"> <li><code>request.parameters.name.locations</code></li> <li><code>request.parameters.name.values</code></li> </ul>	Returns the value of a request query parameter given the parameter name. The function searches the <code>request.parameters.name.locations</code> array for the index position of the value <code>query</code> , and returns <code>request.parameters.name.values [index]</code> , where <code>index</code> is the index position. Parameter values are not URL decoded.
<code>\$statusCode ()</code>	<code>message.status.code</code>	Status code
<code>\$storageType ([arg])</code>	<p><code>variable.body</code></p> <p>You can specify any variable in the API context. When no variable is specified, the default variable <code>message.body</code> is used.</p>	<p>Storage type of the message. The supported values are:</p> <ul style="list-style-type: none"> <li><code>binary</code></li> <li><code>json</code></li> <li><code>stream</code></li> <li><code>xml</code></li> </ul>
<code>\$urlParameter ('name')</code>	<ul style="list-style-type: none"> <li><code>request.parameters.name.locations</code></li> <li><code>request.parameters.name.values</code></li> </ul>	<p>Given a request parameter name, returns the parameter values for all occurrences of that parameter as a path parameter or query parameter.</p> <p>The function searches the <code>request.parameters.name.locations</code> array for the index positions of the values <code>path</code> and <code>query</code>, and returns, in a single array, the <code>request.parameters.name.values [index]</code> values for all identified index positions. When the URL contains both path and query parameter values, the array includes the path values first followed by the query values. The values of each parameter type are added in the order that they are received. Parameter values are URL decoded.</p> <p>For example, the following URL contains both path and query parameter values:</p> <pre>http://example.com/petstore/cats/adopt?breed=Sphynx&amp;breed=Siamese</pre> <p>The function call <code>\$urlParameter ('breed')</code> returns the following array of values:</p> <pre>[cats, adopt, Sphynx, Siamese]</pre> <p>In this example, the URL includes an API path that is configured as <code>/petstore/{breed}/{breed}</code>, where <code>breed</code> is configured to be a path parameter of the API path. As a result, <code>cats</code> and <code>adopt</code> are included in the output.</p>
<code>\$xpath (path, xpathExpression)</code>	You can specify any writable variable in the API context. The <code>xpathExpression</code> must be a literal string.	Allows use of XPath expressions

After you select the function, additional fields are displayed, depending on the selected function, so that you can complete the condition. For example, if you select the function `$httpVerb ()`, a comparison operator selection list is displayed (= or !=), together with a list of HTTP verbs to select on the right hand side of the expression (`GET`, `PUT`, `POST`, `DELETE`, `HEAD`, `OPTIONS`, or `PATCH`).

If you select NOT, your condition is negated with a `$not` function.

To add further conditions, click Add Condition; you then select whether to insert an `and` or an `or` operator between this condition and the preceding one.

To group two or more conditions inside parentheses, click Add Group, then add your conditions to the group; you then select whether to insert an `and` or an `or` operator between this group and the preceding condition or group.

To write your own condition from scratch, select Custom, then enter your script in the field provided.

## Example

To build the following condition:

```
($statusCode () != 200 and ($httpVerb () = 'GET' or $httpVerb () = 'PUT'))
```

complete these steps in the condition editor:

1. Select `$statusCode ()`, select != for the comparison operator, and enter `200` in the field on the right hand side of the condition.
2. Click Add Group.
3. In the new group sub pane that is displayed, click Add Condition.
4. Select `httpVerb ()`, leave the comparison operator as =, and select `GET` on the right hand side of the condition.
5. Click Add Condition in the group sub pane again.
6. Select `httpVerb ()`, leave the comparison operator as =, and select `PUT` on the right hand side of the condition.
7. For the comparison operator between the two conditions, select `or`.

## Simple condition statements

The following examples show conditions that use a single function.

This example uses the `$httpVerb ()` extension to specify the HTTP method of the request.

```
$httpVerb ()="GET"
```

This example uses the `$operationPath()` extension to specify the path of the operation.

```
$operationPath()="/base/path-2"
```

This example uses the `$operationID()` extension to specify the operation ID.

```
$operationID()="test-gatewayscript-GET"
```

This example uses the `$statusCode()` extension to specify the message status code.

```
$statusCode()=200
```

This example uses the `$header(name)` extension to specify the content type of the message header.

```
$header("Content-Type")="application/json"
```

## Combining conditions with logical operators

You can use `and` or `or` operators to combine multiple functions in a single condition.

This example specifies an HTTP GET request and an API operation path equal to `test-gatewayscript-GET`.

```
$httpVerb()="GET" and $operationPath()="test-gatewayscript-GET"
```

This example specifies either a `POST` or `PUT` request.

```
$httpVerb()="POST" or $httpVerb()="PUT"
```

This example specifies an API operation ID equal to `test-gatewayscript_POST` and a message status code equal to `200`, or an API operation ID equal to `test-gatewayscript-GET` and a message status code equal to `500`.

```
($operationID()="test-gatewayscript-POST" and $statusCode()=200) or ($operationID()="test-gatewayscript-GET" and $statusCode()=500)
```

This example specifies an API operation ID equal to `test-gatewayscript-POST` and a message status code equal to `200` with an API operation path equal to `/base/path-2`.

```
($operationID()="test-gatewayscript-POST" and $statusCode()=200) and $operationPath()="/base/path-2"
```

This example specifies a message header content type equal to `text/plain` and a message header length equal to `300`, or a message status code equal to `200`.

```
($header("Content-Type")="text/plain" and $header("Content-Length")=300) or $statusCode()=200
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## throw

Use the throw policy to throw an error when it is reached during the execution of an assembly flow.

## Gateway support

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® Gateway (v5 compatible)	1.0.0
DataPower API Gateway, policy available from V2018.4.1.0	2.0.0

This topic describes how to configure the policy in the assembly user interface; for details on how to configure the policy in your OpenAPI source, see [throw](#).

When the throw policy is encountered, the specified error and error message is produced.

If a catch has been configured that the error produced by the throw policy fulfills, the catch will be triggered.

If no catch is triggered by the thrown error, then a `500 Internal Server Error` is returned to the API caller.

## Component property details

You can configure a component's properties in the property sheet in the assemble view.

Table 2. The properties of a throw component

Property	Required	Description
Title	No	A custom title for your component when it is displayed in the canvas. If a title is not specified, <code>throw</code> is used by default.
Name	Yes	The error name that is thrown by the policy.
Message	Yes	The error message that is returned with the error name.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Using context variables in GatewayScript and XSLT policies with the DataPower API Gateway

In the code for GatewayScript and XSLT policies in your API assemblies, you can use API context variables to work with the messages that are generated when an API is called.

### Introduction

All API context variables are stored in a JSON-like tree; each context variable is a node in this tree. A non-leaf node can be either an object or an array, while a leaf node can be a number, string, boolean, or document; a document can contain an XML document, BLOB, Stream, or another JSON document.

Each context variable has a name and a value. You can access a context variable by name when using the GatewayScript and XSLT APIs. Dot notation is used to access a context variable, reflecting the position of the corresponding node in the JSON-like tree; for example, `request.headers.Host`. Where a node name contains special characters, bracket notation is supported; for example, `request.headers['Content-Type']`.

For the GatewayScript policy, all the APIs for the DataPower® API Gateway are in the `context` module, which is a global module. You can therefore access the `context` module directly, you do not need to use the `require()` function first.

For the XSLT policy, the APIs are in the `http://www.ibm.com/xmlns/datapower/2017/11/apigateway` namespace; to use these APIs you must declare this namespace.

Note: The mechanisms described here for interacting with the API Connect context are preferred if you are writing new GatewayScript policy, XSLT policy, or user-defined policy code, and provide the best performance. For mechanisms that are compatible with Version 5, see [GatewayScript code examples](#).

### Accessing context variables - examples

#### GatewayScript examples

To read the `client.app.id` context variable:

```
var clientID = context.get('client.app.id');
```

To set the value of a context variable:

```
context.set('my.vars.amount', 100);
```

The resulting tree has the following structure:

```
{ "my": { "vars": { "amount": 100 } } }
```

To delete the node `my.vars`, and all its child nodes:

```
context.clear('my.vars');
```

The resulting tree has the following structure:

```
{ "my": { } }
```

#### XSLT examples

To read the `client.app.id` context variable:

```
<xsl:variable name="clientID" select="apigw:get-variable('client.app.id')"/>
```

To set the value of a context variable:

```
<apigw:set-variable name="my.vars.amount" value="100"/>
```

The resulting tree has the following structure:

```
{ "my": { "vars": { "amount": 100 } } }
```

To delete the node `my.vars`, and all its child nodes:

```
<apigw:clear-variable name="my.vars"/>
```

The resulting tree has the following structure:

```
{ "my": { } }
```

### About payloads

When the assembly flow for an API call begins, the following two message objects are predefined in the API context tree:

- **request**: holds the information for the original payload; the **request** message is a read-only object.
- **message**: holds the information for the current payload.

Typically, a message object has **headers** and **body** properties. For the current payload, the **message** object might have **variables** and **status** properties, as well as other properties created during the execution of the assembly.

The following example shows the general structure of a typical message:

```

{
  "headers": {
    "Content-Type": "application/xml",
    "X-Client-ID": "1234567890"
  },
  "variables": {
    "amount": 123,
    "name": "xyz"
  },
  "status": {
    "code": 200,
    "reason": "OK"
  },
  "body": <XML/Blob/Stream/JSON Document>
}

```

## Manipulating the message headers - examples

Note: Do not attempt to use this method to add fields to Analytics data. Using an [Analytics filter](#) is the only supported way to add top-level Analytics fields.

GatewayScript examples

To delete a header:

```
context.message.header.remove('X-My-Header');
```

To read a header:

```
var reqType = context.request.header.get('Content-Type');
var currType = context.message.header.get('Content-Type');
```

To set a header:

```
context.message.header.set('Content-Type', 'application/json');
```

To iterate through the headers:

```
var reqHdrs = context.request.headers;
for (var h in reqHdrs) {
  console.log('>>> Reading the request header: ', h, '=', reqHdr[h]);
}

var currHdrs = context.message.headers;
for (var h in currHdrs) {
  console.log('>>> Reading the current header: ', h, '=', currHdr[h]);
}

```

To create a message context called `headersContext`, if one doesn't already exist, and add to it a boolean context variable called `HelloWorld`, with the value `true`:

```
var ctx = context.getMessage("headersContext") || context.createMessage("headersContext");
ctx.setVariable('HelloWorld', true);
```

The `setVariable` call writes the variable into `headersContext.variables>HelloWorld`; therefore a condition statement in any subsequent `switch` policy should check for `headersContext.variables>HelloWorld` rather than `headersContext>HelloWorld`.

To read the context variable in any subsequent `gatewayscript` policy, use the following call:

```
ctx.getVariable("HelloWorld")
```

Note: If you are either migrating an API from IBM® API Connect Version 5.0, or from the DataPower Gateway (v5 compatible), to the DataPower API Gateway, or you are configuring a new API for the DataPower API Gateway, creating a message context, rather than using the context variable mechanism described in [Accessing context variables - examples](#), is the preferred option. In the case of migration, it most closely matches the behavior of IBM API Connect Version 5.0, and `setVariable` and `getVariable` calls will continue to work without modification. Creating a message context is also the preferred option if you are creating a new API for the DataPower API Gateway because it most closely aligns the API context with the way that various native DataPower API Gateway policies process it.

XSLT examples

To delete a header:

```
<apigw:clear-header message="'message'" name="'X-My-Header'"/>
```

To read a header:

```
<xsl:variable name="reqType" select="apigw:get-header('request', 'Content-Type')"/>
<xsl:variable name="currType" select="apigw:get-header('message', 'Content-Type')"/>
```

To set a header:

```
<apigw:set-header name="'Content-Type'" value="'text/xml'"/>
```

To get all headers:

```
<xsl:variable name="allReqHdrs" select="apigw:all-headers('request')"/>
<xsl:variable name="allCurrHdrs" select="apigw:all-headers('message')"/>
```

## Manipulating the message status - examples

Note: Only the `message` object has the status property, not the `request` object.

GatewayScript examples

To read the status code and reason phrase:

```
var code = context.message.statusCode;
var reason = context.message.reasonPhrase;
```

To update the status code:

```
context.message.statusCode = 400; //integer, update the code, with default reason
```

To update the status code and reason phrase in a single operation:

```
context.message.statusCode = '200 Wonderful'; //string, update code along with customized reason
```

Note: The `context.message.reasonPhrase` context variable is read-only.

XSLT examples

To read the status code and reason phrase:

```
<xsl:variable name="code" select="apigw:get-variable('message.status.code')"/>
<xsl:variable name="reason" select="apigw:get-variable('message.status.reason')"/>

<apigw:set-variable name="message.status.code" value="200"/>
<apigw:set-variable name="message.status.reason" value="OK"/>
```

## Accessing the message body - examples

---

Note: The request body is read-only.

GatewayScript examples

To read the request body:

```
context.request.body.readAsJSON(function(error, json) {});
context.request.body.readAsXML(function(error, xml) {});
context.request.body.readAsBuffer(function(error, buffer) {});
```

To read the message body:

```
context.message.body.readAsJSON(function(error, json) {});
context.message.body.readAsXML(function(error, xml) {});
context.message.body.readAsBuffer(function(error, buffer) {});
```

To write the message body and update the content type accordingly:

```
// text response
context.message.body.write("Hello world.");
context.message.header.set('Content-Type', "text/plain");

// JSON response
var pet = { "kind": "dog", "age": 3, "color": "black" };
context.message.body.write(pet);
context.message.header.set('Content-Type', "application/json");

// XML response
var resp = "<order><id>100</id><timestamp>20181231</timestamp><status>fulfilled</status></order>";
context.message.body.write(resp);
context.message.header.set('Content-Type', "text/xml");
```

XSLT examples

Note:

- There is no XSLT API to write the message body; the output of the stylesheet transformation is used to update `message.body`.
- To read the request body or the message body, you must parse `message.body` with a [Parse](#) policy before the XSLT policy is executed. At the beginning of the assembly flow, `message.body` contains `request.body` so, after parsing `message.body`, you can then read the request from `message.body`.
- If the XSLT input document uses the context current payload, `message.body` is used for the input document `'/'` that can be accessed from the XSLT policy if `message.body` has been parsed as XML in advance; this is determined by the `input` property of the XSLT policy, see [xslt](#).

Read the message body:

```
<xsl:variable name="currentPayload" select="apigw:read-payload('message')"/>
```

Read the message body when the `input` property of the XSLT policy is set to `true`:

```
<xsl:variable name="currentPayload" select="/" />
```

## Rejecting the session - examples

---

Note: After the session is rejected, the API assembly flow is stopped and a fault response is returned, unless a catch handler is defined.

GatewayScript examples

To reject the session with an error name and message, and update the status reason and code:

```
context.reject('CustomError', 'You are not authorized to make this API call');
context.message.statusCode = '401 Unauthorized';
```

XSLT examples

To reject the session with an error name and message, and update the status reason and code:

```
<apigw:reject identifier="CustomError" status-code="401" reason="Unauthorized">You are not authorized to make this API call</apigw:reject>
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Tags in API Connect

There are a number of forms of tagging in IBM® API Connect.

- You can create tags in an API that are visible in its OpenAPI definition and can be used to filter operations in the Developer Portal.
- You can tag items in the Developer Portal so that they can be searched for.

---

## Tags within an API

The OpenAPI specification allows the inclusion of tags in an API definition, and you can create these tags through the API Manager user interface. You can assign tags to an operation within an API.

Tags that are assigned to an operation can be used to group the operations of an API in the Developer Portal, by using the filter options for the API. These tags are visible to anyone who can view any of the Products to which the API belongs.

For more information, see [Editing an API definition](#) and [Configuring an operation](#).

Note: Though you can tag the API itself in the API Setup section, by using this method the tag is not visible in the Developer Portal.

---

## Tags in the Developer Portal

An administrator can assign tags to items in the Developer Portal, which are then available through the API Products search function in the Developer Portal.

For more information, see [Editing tags for a specific item](#) and [Managing tags in the Developer Portal](#).

---

---

---

## Configuring API security

You configure security for an API by creating one or more security definitions by using IBM® API Connect that specify various aspects of security configuration. You then select which definitions you want to apply to your API, and to the operations in your API.

---

## About this task

By default, the security definitions that you apply to your API are also applied to the operations in the API, but for each API operation you can override the default setting by specifying the types of security definition that you want the operation to inherit from the containing API.

---

## Procedure

You configure API security by completing the following steps:

1. Create one or more security definitions.
2. Apply one or more of those security definitions to the API.
3. Optional: Specify the security definitions that you want each API operation to inherit.  
For details of configuring API security, see the following subtopics:

- [Creating a security definition](#)  
A security definition specifies all the settings for a particular aspect of API security; for example, the user registry that you use to authenticate access to the API.
- [Applying security definitions to an API](#)  
The security definition contains security settings that you enforce to define access control requirements for the operations in the API, by applying the security definition to an API.
- [Applying security definitions to an API operation](#)  
You can specify whether or not an API operation inherits the security definitions that have been created in the containing API.
- [Enabling CORS support for an API](#)  
You can enable cross-origin resource sharing (CORS) support for your API. CORS allows embedded scripts in a web page to call the API across domain boundaries.
- [LDAP authentication](#)  
The Lightweight Directory Access Protocol (LDAP) is an internet protocol for accessing and maintaining distributed directory information services over a network. If you rely on LDAP to authenticate users for web applications, take a minute to review the contents of this topic before beginning.

- [Authentication URL user registry](#)

You can use an Authentication URL user registry to specify a REST authentication service to manage user authentication, and to optionally provide additional metadata to be embedded in the token.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Creating a security definition

A security definition specifies all the settings for a particular aspect of API security; for example, the user registry that you use to authenticate access to the API.

### About this task

You can create security definitions of the following types:

Type	Description
Basic authentication	Use a basic authentication security definition to specify a user registry or an authentication URL to be used to authenticate access to the API.
API key	Use an API key security definition to specify what application credentials are required to call an API.
OAuth	Use an OAuth security definition to specify settings for OAuth token based authentication for your API.

The following subtopics describe how to create security definitions of each type:

- [Creating a basic authentication security definition](#)  
When you create a basic authentication security definition in an API, you provide details of a user registry to be used to authenticate access to the API operations.
- [Creating an API key security definition](#)  
When you create an API key security definition in an API, you specify the credentials that an application must provide to identify itself when calling the API operations.
- [Creating an OAuth security definition](#)  
When you create an OAuth security definition, you provide settings for controlling access to the API operations through the OAuth authorization standard.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Creating a basic authentication security definition

When you create a basic authentication security definition in an API, you provide details of a user registry to be used to authenticate access to the API operations.

### Before you begin

IBM® API Connect supports two types of user registries: Authentication URL user registry and LDAP user registry.

Before you can create a basic authentication security definition in an API, the user registry must exist. To create a user registry, you can use either API Manager or Cloud Manager. When you create a registry in API Manager, it is visible only to your provider organization. When you create a registry in Cloud Manager, you can make it visible to multiple provider organizations.

To create a user registry with API Manager, see [Working with user registries](#).

To create a user registry with Cloud Manager, see [User registries overview](#).

### About this task

You can complete this task either by using either the API Designer UI application, or by using the browser based API Manager UI.

When you use basic authentication, you require API users to provide a valid user name and password to access selected operations. The application developer must also provide an HTTP authorization header in requests that are sent to operations that require basic authentication.

When you use an authentication URL, the user credentials that are provided in the authorization header are validated by the endpoint specified in the URL. If the user is authenticated, IBM API Connect expects an authentication URL to return an HTTP 200 OK response status code. All other HTTP response status codes result in an authentication failure and access is denied.

You cannot apply more than one basic security definition to an API. If you apply a basic security definition, you cannot also apply an OAuth security definition. For information on applying security definitions, see [Applying security definitions to an API](#).

For more information about using an LDAP user registry for authentication, see [LDAP authentication](#).

For information about using an Authentication URL, see [Authentication URL user registry](#).

### Procedure

To create a basic authentication security definition, complete the following steps:

1. In the navigation pane, click  Develop, then select the APIs tab.
  2. To create the security definition in an existing API, click the API you want to work with. To create a new API to add the security definition to, see [Creating an API definition](#).
  3. Select Security Definitions and click Add.
  4. Enter a name for the security definition and an optional description.
  5. For Type, select Basic.
  6. Click Choose one... from the section Authenticate using User Registry (optional). Select a user registry.  
Note: The user registries that you can select from are those that are specified in the Sandbox Catalog for the management server and provider organization that you are connected to.  
If you are using the API Manager user interface, the connection details are determined by the API Manager URL that you open, and the user ID with which you log in. If you are using the API Designer user interface, you provide the management server details and user ID in the login window that opens when you first launch API Designer; see [Logging into API Connect Designer](#).  
If you are working offline in API Designer, you must type in the exact name of the user registry.  
You will need to specify the selected user registry in any Catalog to which the API is to be published.  
For details of how to specify the user registries for a Catalog, see [Creating and configuring Catalogs](#).
7. Click Save to save your changes.

## Results

---

A Basic security definition is now added to the Security Definitions.

## What to do next

---

Apply your security definition to the API, or to one or more API operations. For more information, see [Applying security definitions to an API](#) and [Applying security definitions to an API operation](#).

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Creating an API key security definition

When you create an API key security definition in an API, you specify the credentials that an application must provide to identify itself when calling the API operations.

## About this task

---

You can complete this task either by using either the API Designer UI application, or by using the browser based API Manager UI.

You can require that, when calling an API operation, an application must provide either a client ID, or a client ID and client secret; you create an API key security definition to specify a credentials requirement. If you require that an application must provide both a client ID and client secret, you must create two API key security definitions, one for each type of credentials.

## Procedure

---

To create an API key definition, complete the following steps:

1. In the navigation pane, click  Develop, then select the APIs tab.
2. To create the security definition in an existing API, click the API you want to work with. To create a new API to add the security definition to, see [Creating an API definition](#).
3. Select Security Definitions and click Add.
4. Enter a name for the security definition and an optional description.
5. For Type, select API Key.
6. Specify whether the credentials are sent in the request header, or as query parameters, by selecting one of the following Located In options:

### Header

The credentials are sent in the request header. This is the default setting.

### Query

The credentials are sent as query parameters. This method is less secure because the client secret could be exposed in a log file.

The selected option is enforced, and API calls fail if the credentials is included in the wrong location by the caller.

Note: You must specify the same location for the client ID and client secret, either Header or Query.

7. Optional:  Select the Key Type; the options are Client ID and Client Secret. Select the option that is applicable to the type of API key security definition you are creating.  
The field is mapped to the `x-key-type` property for the security definition in the OpenAPI source for the API, where the corresponding values are `client_id` and `client_secret`; use these values if you modify the OpenAPI source directly. If you do not select a value for the Key Type field, you instead use the Parameter name to specify the key type, as explained in step [8](#).

Important: The `client_id` is not confidential and functions as a "SecurityScheme" only in the meaning of the OpenAPI specification.

If you use only the `client_id` (without the `client_secret`) as your API Key, be aware that the `client_id` is not considered a confidential value in the API Manager UI; for example, it might be displayed to other authenticated members of the provider organization. The `client_id` is treated as a public identifier for apps and cannot be kept private.

If authentication of the identity of the app calling an API is needed, then the API Key should use both a `client_id` to identify the app, plus a `client_secret` to authenticate it. The `client_secret` is designed to be known only to the app and the authorization server, and it should be protected. IBM API Connect protects the `client_secret`: it is only available when first generated, it can be stored as a one-way hash to prevent retrieval or leaks, and it can be changed and reset without changing the corresponding `client_id`. When an API Key is not marked as a `client_secret`, it will not be protected in the API Manager UI.

8. Specify the Parameter name.

If your API is not enforced by the API Connect gateway, enter the parameter name required by your gateway.

If your API is enforced by the IBM® API Connect gateway, the required value depends on the gateway type setting for the API, as follows:

- DataPower API Gateway: if you did not select a value for the Key Type in step 7, then for a key of type client secret you must include the string "secret", ignoring case, in the value you specify in the Parameter name field; if the value does not contain the string "secret" then the key is assumed to be of type client ID.

If you did select a value for the Key Type then you can provide any value you like for the Parameter name field; the value is mapped to the `name` property for the security definition in the OpenAPI source for the API, allowing you set the `name` to any desired value while still retaining the required key type.

- DataPower Gateway (v5 compatible): the value must be as specified in the following table, depending on where the client credentials are located, and the type of credentials. The field is automatically populated, according to value you select in the Located In field in step 6, as follows:

- If there are no existing API key definitions of type client ID, the key type is assumed to be client ID.
- If there is an existing API key definition of type client ID, the key type is assumed to be client secret.

The value is mapped to the `name` property for the security definition directly in the OpenAPI source. If the pre-populated value is not what you require, modify the value of the `name` property directly in the OpenAPI source on the Source tab.

Table 1. Client ID and Client secret parameter name values for the DataPower® Gateway (v5 compatible)

Location of credentials	Type of credentials	Parameter name
Header	Client ID	X-IBM-Client-Id
Header	Client secret	X-IBM-Client-Secret
Query	Client ID	client_id
Query	Client secret	client_secret

When you first create an API, a default API key security definition, of type client ID, is provided.

For information about including API key parameters in an API call, see [Calling an API](#).

Note:

- You cannot apply more than two API key security definitions to an API.
- If you apply an API key security definition for client secret, you must also apply an API key security definition for client ID.
- If you require the application developer to supply both client ID and client secret, you must apply two separate API key security definitions.
- You can have at most one API key definition of type client ID, regardless of whether the client ID is sent in the request header or as a query parameter.
- You can have at most one API key definition of type client secret, regardless of whether the client secret is sent in the request header or as a query parameter.
- The client ID and client secret headers that are specified in the request when the API is called are **not** added automatically to the message context. If you need these headers in the message context for subsequent processing, include a `set-variable` policy in your API assembly that adds the headers to the message content, taking the values specified in the request; you can do this in either of the following ways:
  - In the Assemble tab, add a Set Variable policy to your API assembly that defines the appropriate actions; for example:

Table 2.

Action	Set	Type	Value
Set	message.headers.X-IBM-Client-Id	string	\$(request.headers.X-IBM-Client-Id)
Set	message.headers.X-IBM-Client-Secret	string	\$(request.headers.X-IBM-Client-Secret)

For more information on configuring a Set Variable policy, see [Set Variable](#).

- In the Source tab, add a `set-variable` policy directly to the assembly section in your OpenAPI source; for example:

```
assembly:
  execute:
    - set-variable:
      version: 2.0.0
      title: set-variable
      actions:
        - set: message.headers.X-IBM-Client-Id
          value: $(request.headers.X-IBM-Client-Id)
          type: string
        - set: message.headers.X-IBM-Client-Secret
          value: $(request.headers.X-IBM-Client-Secret)
          type: string
```

For more information on defining a `set-variable` policy in your OpenAPI source, see [set-variable](#).

You should position the `set-variable` before any policy that needs to access the API key headers; for example, an invoke policy that calls a back-end service that is required to identify the application that made the initial request.

9. Click Save to save your changes.

## What to do next

Apply your security definition to the API, or to one or more API operations. For more information, see [Applying security definitions to an API](#) and [Applying security definitions to an API operation](#).

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details. For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Creating an OAuth security definition

When you create an OAuth security definition, you provide settings for controlling access to the API operations through the OAuth authorization standard.

### Before you begin

---

Before you can create an OAuth security definition, you must:

1. Create an OAuth provider.
  - To use Cloud Manager, see [Configuring a native OAuth provider](#) or [Configuring a third-party OAuth provider](#).
  - To use API Manager, see [Configuring a native OAuth provider](#) or [Configuring a third-party OAuth provider](#).
2. Add the OAuth provider to a catalog. If you have not created any catalogs, use the Sandbox Catalog. See the [OAuth instructions step](#) in [Creating and configuring Catalogs](#).

### About this task

---

You can complete this task either by using either the API Designer UI application, or by using the browser based API Manager UI.

### Procedure

---

To create an OAuth security definition, complete the following steps:

1. In the navigation pane, click  Develop, then select the APIs tab.
2. To create the security definition in an existing API, click the API you want to work with. To create a new API to add the security definition to, see [Creating an API definition](#).
3. Select Security Definitions and click Add.
4. Enter a name for the security definition and an optional description.
5. For Type, select OAuth2.
6. From the OAuth Provider menu, select the provider that you want to use in this security definition.  
Note: The OAuth providers that you can select from are those that are specified in the Sandbox Catalog for the management server and provider organization that you are connected to.  
If you are using the API Manager user interface, the connection details are determined by the API Manager URL that you open, and the user ID with which you log in. If you are using the API Designer user interface, you provide the management server details and user ID in the login window that opens when you first launch API Designer; see [Logging into API Connect Designer](#).

If you are working in offline API Designer, you must you must type in the exact name of the OAuth provider.

You will need to specify the selected OAuth provider in any Catalog to which the API is to be published.

For details of how to specify the OAuth providers in a Catalog, see [Creating and configuring Catalogs](#).

7. From the Flow menu, select the grant type for the provider.  
The supported flow types are Application, Resource owner, Access Code, or Implicit. The values for the endpoints are automatically displayed in entries for Token URL and Authorization URL, as applicable to the flow type. For example:

Setting	Value
Flow	Application
Token URL	<a href="https://example.com/samplenative/oauth2/token">https://example.com/samplenative/oauth2/token</a>

Note: The Authorization URL and Token URL are maintained only for informative purposes, no validation or other action is applied to them by API Connect.

8. Optionally, specify additional scopes by clicking Add. For each additional scope, specify Name and Description.
9. Click Save to save your changes.

### What to do next

---

Apply your security definition to the API, or to one or more API operations. For more information, see [Applying security definitions to an API](#) and [Applying security definitions to an API operation](#).

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Applying security definitions to an API

The security definition contains security settings that you enforce to define access control requirements for the operations in the API, by applying the security definition to an API.

### Before you begin

---

Create one or more security definitions in your API. For more information, see [Creating a security definition](#).

## About this task

---

You can complete this task either by using either the API Designer UI application, or by using the browser based API Manager UI.

The following restrictions exist when you apply security definitions to an API:

- You cannot apply more than two API key security definitions to an API.
- If you apply an API key security definition for client secret, you must also apply an API key security definition for client ID.
- If you require the application developer to supply both client ID and client secret, you must apply two separate API key security definitions.
- You can have at most one API key definition of type client ID, regardless of whether the client ID is sent in the request header or as a query parameter.
- You can have at most one API key definition of type client secret, regardless of whether the client secret is sent in the request header or as a query parameter.
- You cannot apply more than one basic security definition to an API. If you apply a basic security definition, you cannot also apply an OAuth security definition.
- You can apply at most one OAuth security definition to an API.

## Procedure

---

To apply security definitions to an API, complete the following steps:

1. In the navigation pane, click  Develop, then select the APIs tab.
2. To apply the definitions to an existing API, click the API that you want to work with.  
To create a new API before you apply the definitions to it, see [Creating an API definition](#).

3. Navigate to the Security section.

4. In the Security section, select the security definitions that you want to apply.

When you apply a security definition to an API, the user interface presents the set of all existing security definitions. You can select one or more of the definitions from the set, to specify the exact combination of definitions that you want this API to satisfy.

In addition, you can specify multiple combinations of definitions. To specify a second combination, click Add again, and the interface presents a second set of all existing security definitions. Select the check box for each definition that you want included in the second combination. You can add additional sets, and specify additional combinations, until you've created all the valid combinations for the API.

An application can call your API if it satisfies any of the combinations you have defined.

Note: The following additional requirement applies to security definitions that will be used with an OAuth third party provider. If you select an OAuth security definition for protecting a consumer API, you must also include an API key security definition, as the `x-IBM-Client-Id` or `client_id` must be included in the security credentials so that the correct Plan configuration settings can be enforced.

The selected definitions are now applied to the API.

5. If the selected security definition is of type OAuth2, select the required scopes; the scopes available for selection are those that were specified in the security definition; for more information, see [Creating an OAuth security definition](#).  
Note: If you are using the DataPower® Gateway (v5 compatible), you must select at least one scope, and the scope sent in an API request must match one of the selected scopes, otherwise the call fails.  
If you are using the DataPower API Gateway, you only need select any scopes if Advanced scope check after token generation is not enabled in the native OAuth provider associated with the security definition. If a default scope has been set in the native OAuth provider and the API request doesn't contain any scope, the default scope is used; for more information, see [Configuring scopes for a native OAuth provider](#).
6. To remove a security definition so that it is no longer applied to the API, clear the selection for that security definition.
7. Click Save to save your changes.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Applying security definitions to an API operation

You can specify whether or not an API operation inherits the security definitions that have been created in the containing API.

## About this task

---

You can complete this task either by using either the API Designer UI application, or by using the browser based API Manager UI.

You can choose to inherit all the security definitions, or you can individually select the security definitions that you want to inherit.

For information on creating security definitions in an API, see [Creating a security definition](#).

## Procedure

---

To specify the security definition inheritance settings for an API operation by using IBM® API Connect, complete the following steps:

1. In the navigation pane, click  Develop, then select the APIs tab.
2. To specify the security definition inheritance settings for an operation in an existing API, click the API you want to work with.  
To create a new API and API operation before specifying the security definition inheritance settings, see [Creating an API definition](#) and [Defining Paths for a REST API](#).

3. Click Paths, and then click the required path.
4. In the **Operations** section, click the required operation to display its details.
5. Specify which security definitions to apply to your operation. By default, all the security definitions that have been configured for the API are applied to the operation. To select which of the API security definitions you want to apply to the operation, complete the following steps:
  - a. Select Override API Security Definitions.  
An Add button is displayed.
  - b. Click Add, then select the required security definitions.  
When you apply a security definition to an API operation, the user interface presents the set of all existing security definitions. You can select one or more of the definitions from the set, to specify the exact combination of definitions that you want this API operation to satisfy.  
  
In addition, you can specify multiple combinations of definitions. To specify a second combination, click Add again, and the interface presents a second set of all existing security definitions. Select the check box for each definition that you want included in the second combination. You can add additional sets, and specify additional combinations, until you've created all the valid combinations for the API operation.  
  
An application can call your API operation if it satisfies any of the combinations you have defined.
- c. If the selected security definition is of type OAuth2, select the required scopes; the scopes available for selection are those that were specified in the security definition; for more information, see [Creating an OAuth security definition](#).  
Note: If you are using the DataPower® Gateway (v5 compatible), you must select at least one scope, and the scope sent in an API request must match one of the selected scopes, otherwise the call fails.  
If you are using the DataPower API Gateway, you only need select any scopes if Advanced scope check after token generation is not enabled in the native OAuth provider associated with the security definition. If a default scope has been set in the native OAuth provider and the API request doesn't contain any scope, the default scope is used; for more information, see [Configuring scopes for a native OAuth provider](#).  
  
Note: The following additional requirement applies to security definitions that will be used with an OAuth third party provider. If you select an OAuth security definition for protecting a consumer API, you must also include an API key security definition, as the **x-IBM-Client-Id** or **client\_id** must be included in the security credentials so that the correct Plan configuration settings can be enforced.
6. Click Save to save your changes.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Enabling CORS support for an API

You can enable cross-origin resource sharing (CORS) support for your API. CORS allows embedded scripts in a web page to call the API across domain boundaries.

### About this task

You can complete this task either by using either the API Designer UI application, or by using the browser based API Manager UI.

### Procedure

To enable CORS support for an API, complete the following steps:

1. In the navigation pane, click  Develop, then select the APIs tab.
2. To enable CORS support for an existing API, click the API that you want to work with.  
To create a new API before enabling CORS, see [Creating an API definition](#).
3. Select API Setup. Scroll to the Lifecycle section, and select CORS.
4. Click Save to save your changes.
5. Optional: To implement your own CORS solution using custom OPTIONS operations, complete the following steps:
  - a. Add the following headers to your HTTP responses:

```
Access-Control-Allow-Origin: https://<portalhostname>  
Access-Control-Allow-Headers: Origin, X-Requested-With, Content-Type, Accept
```

Where <portalhostname> is your Developer Portal host name.

- b. Optional: You can proxy your API through API Connect as an enforced invoke API so that CORS is handled automatically.

Important:

- If you implement your own CORS solution, you **must** disable the CORS option described in step 3
- CORS preflight requests are sent by using the HTTP **OPTIONS** method. Therefore, if you require these requests to be handled by the API Connect gateway then you must enable the **OPTIONS** method for all APIs that will handle preflight requests; see [Defining Paths for a REST API](#).
- **OPTIONS** requests are counted as API calls against any configured rate limit. Note that you can apply rate limits to individual operations; see [Defining rate limits for an API operation](#).

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## LDAP authentication

The Lightweight Directory Access Protocol (LDAP) is an internet protocol for accessing and maintaining distributed directory information services over a network. If you rely on LDAP to authenticate users for web applications, take a minute to review the contents of this topic before beginning.

## Programming guidelines

When authenticating with LDAP, observe the following guidelines:

- Use only a LDAP interface -- Users can only be authenticated via a connection to an LDAP server.
- Active Directory -- Use of an Active Directory interface is prohibited, however, LDAP authentication with Active Directory is supported.
- Administrator properties -- The LDAP administrator must have access to all user's LDAP properties.

LDAP attributes read by IBM® API Connect are as follows:

Attribute	Definition
mail	User's SMTP email address.
cn	Used internally to determine user's common name.
sn	Used internally to determine user's last name or surname.
givenname	Used internally to determine user's first name.
Prefix from Search dn	Used as username.

## Using an LDAP Server for User Authentication

Every entry in an LDAP directory server has a distinguished name (DN). The DN is the name that uniquely identifies an entry in the directory. A DN is made up of **attribute=value** pairs, separated by commas. For example:

```
cn=Ben Gray,ou=editing,o=New York Times,c=US
cn=Lucille White,ou=editing,o=New York Times,c=US
cn=Tom Brown,ou=reporting,o=New York Times,c=US
```

Any of the attributes defined in the directory schema can be used to make up a DN. The order of the component attribute value pairs is important. The DN contains one component for each level of the directory hierarchy from the root down to the level where the entry resides. LDAP DNs begin with the most specific attribute (usually some sort of name) and continue with progressively broader attributes, often ending with a country attribute. The first component of the DN is referred to as the Relative Distinguished Name (RDN). It identifies an entry distinctly from any other entries that have the same parent. In the previous examples, the RDN "cn=Ben Gray" separates the first entry from the second entry, (with RDN "cn=Lucille White"). These two example DNs are otherwise equivalent. The attribute=value pair making up the RDN for an entry must also be present in the entry. (This is not true of the other components of the DN.)

## Examples

In the following examples, a user search is performed from Base DN. The search is done anonymously, or if authenticated bind is used, an authenticated user is used. Search DN appends the prefix, the given user name, and the suffix. If the prefix used is **(uid=** and the suffix used is **)**, **uid** becomes the user name attribute. The default search filter used is: **(|(cn={filter}\*)(sn={filter}\*)(mail={filter}\*)(givenName={filter}))** and attributes used for prefix are also added to the search filter. In this case, where **'uid=** is the prefix, when searching for users, the search filter becomes:

```
(|(cn={filter}*)(sn={filter}*)(mail={filter}*)(givenName={filter}*)(uid={filter}*))
```

where **{filter}** is replaced by actual text.

The authenticated bind DN is a user on the external LDAP server permitted to get base DNs and search the LDAP directory within the defined search base. It should also be able to read other user properties and be used if anonymous access to LDAP to get base DNs and to search and get access to user attributes is not allowed. When a search is performed for **Steve**, the LDAP query filter shown in the following example is used and search is done from base DN specified in UI. When the user's DN is returned, the DN and password are used to authenticate the user:

```
(|(cn=Steve*)(sn=Steve*)(mail=Steve*)(givenName=Steve*)(uid=Steve*))
```

For bind during login calls, the search string used is the prefix. For example, if the prefix is **'uid=**, the search string used to search for a user during log in becomes: **(uid=Steve)**.

Using the mail attribute as the user name

When you want to use an email address as the user name, (for example *steve@company.com*), you typically use the mail attribute as the prefix **'mail=**. In this case, use the following search string to perform the search internally (assuming **'mail=** as prefix):

```
(|(cn=steve@company.com*)(sn=steve@company.com*)(mail=steve@company.com*)(givenName=steve@company.com*)(mail=steve@company.com*))
```

In the previous example, if DN is found, the password is used with the DN to perform a bind. The first result is taken, so be sure to use a unique attribute for username. Next, the LDAP properties for the user are read (**cn, sn, mail, givenName**). If LDAP properties cannot be read using the logged-in user, they are read from the user's DN using authenticated bind credentials. If the user name attribute differs, it is also queried for. For example, if the prefix is **'uid=**, the **uid** attribute is also read from the user's DN object:

```
(|(cn={filter}*)(sn={filter}*)(mail={filter}*)(givenName={filter}*))
```

Note: The prefix and suffix cannot be used to get a user's DN directly. For example, the following attempt to directly get a user's DN fails:

```
Prefix: "uid=_home_markdown_jenkins_workspace_Transform_in_SSMNED_2018_com.ibm.apic.toolkit.doc_con_ldap_requirements_"
Suffix: ",ou=users,dc=company,dc=com"
```

## LDAP referrals

LDAP referrals allow a directory tree to be partitioned and distributed between multiple LDAP servers. An LDAP referral is a domain controller's way of indicating to a client application that it does not have a copy of a requested object, while giving the client a location that is more likely to hold the object. The client then uses the object as the basis for a DNS search for a domain controller.

API Connect support for LDAP referral includes:

- Searching for users that are part of multiple Active Directory trees and forests.
- Authenticating users in the Cloud Manager, API Manager and the Developer Portal.

Note: API Connect LDAP referral support is dependent on the following conditions:

- A single LDAP host/port is configured with administrator credentials and all users are referred to from the tree/server's base DN.
- As part of the user search following the LDAP referral, the same administrator credentials are used in the downstream trees/forests.
- LDAP API authentication does not support external LDAP referral. Internal LDAP referral is supported with IBM API Connect Version 2018.4.1.12 and later releases.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Authentication URL user registry

You can use an Authentication URL user registry to specify a REST authentication service to manage user authentication, and to optionally provide additional metadata to be embedded in the token.

This support can optionally enable any of the following:

- Providing the authenticated credential to IBM® API Connect. For example, the user logs-in with user name: `spoon`, and password: `fork`. When the user is authenticated, the credential becomes `cn=spoon,o=eatery`. The credential is kept in the OAuth `access_token` to represent the user.
- Providing metadata support. Allow extra metadata to be stored in the `access_token`.
- Overriding the `scope` that the application receives after a successful OAuth protocol processing. By responding with a specific header, the Authentication URL endpoint can replace the `scope` value that the application receives. For example, you can provide a specific resource owner an account number within the `scope` header response for use in future processing steps.

When you call the Authentication URL user registry, the API Connect gateway sends a GET request with HTTP headers and then processes any HTTP response from the URL. For authentication, a REST authentication service is expected at the Authentication URL.

The following response from the REST authentication service indicates that user authentication is successful and that API Connect will use `cn=spoon,o=eatery` as the user identity.

```
HTTP/1.1 200 OK
Server: example.org
X-API-Authenticated-Credential: cn=spoon,o=eatery
```

For information on how to configure a User Security policy in an API assembly for use with an Authentication URL user registry, see [User Security policy](#).

For an example of an OAuth provider configuration that uses an Authentication URL user registry, see [Example - using multiple OAuth policies in an OAuth provider assembly](#).

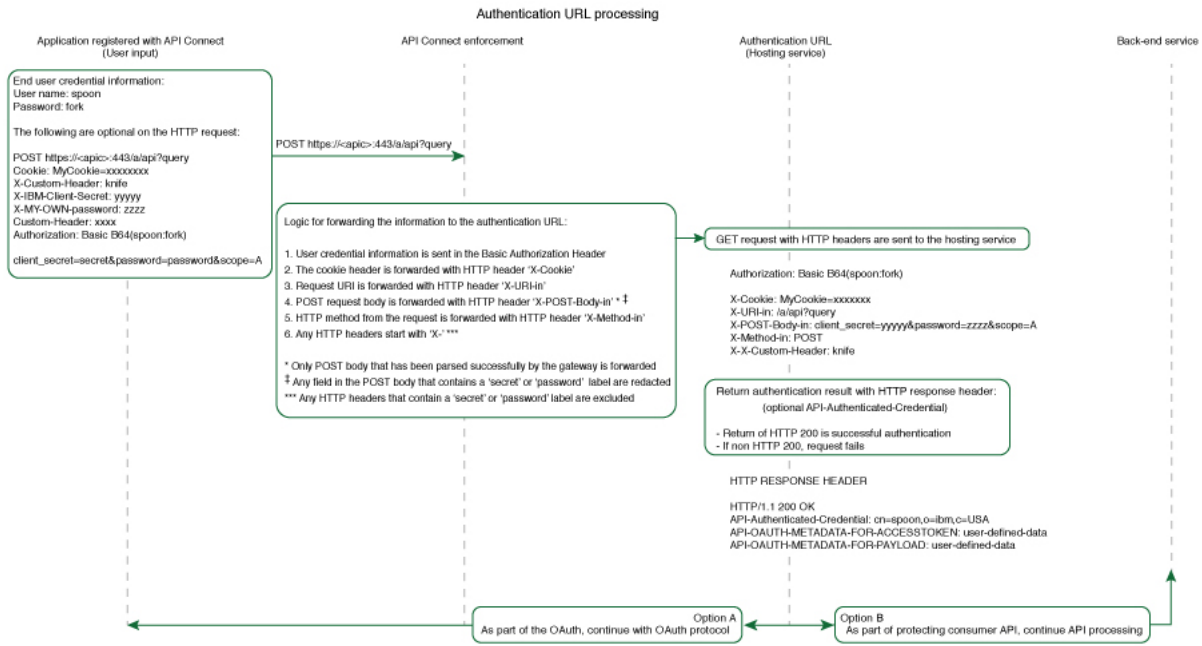

API Connect considers any non-200 HTTP response code a failed user authentication attempt.

When an Authentication URL user registry is invoked, two HTTP response headers are available that include metadata in the access token or the response payload that contains the access token. For more information, see [OAuth external URL and authentication URL](#). The two metadata response headers are:

```
API-OAUTH-METADATA-FOR-ACCESSTOKEN
API-OAUTH-METADATA-FOR-PAYLOAD
```

When an Authentication URL is invoked, an HTTP response header is available to override the requested `scope` from the application. For more information, see [Scope](#). The response header is:

```
x-selected-scope
```

If you are using the DataPower® API Gateway rather than the DataPower Gateway (v5 compatible), this diagram is provided for guidance only and is not fully accurate for this release.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

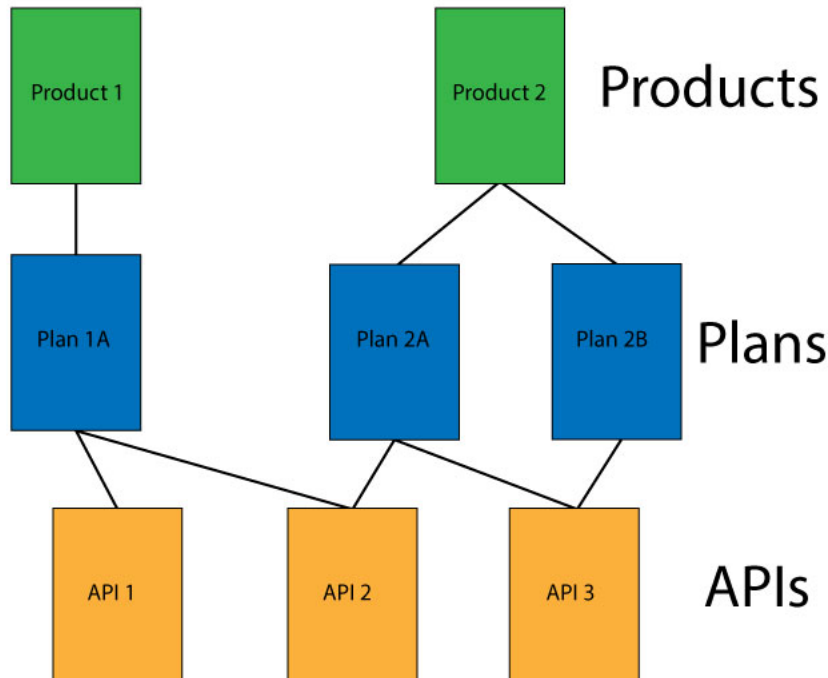

## Working with Products

In IBM® API Connect, Plans and APIs are grouped together in Products, with which you can manage the availability and visibility of APIs and Plans.

The following diagram demonstrates how Products, Plans, and APIs relate to one another.

Note: Plans belong to only one Product, but they can possess different APIs to other Plans within the same Product, and they can share APIs with Plans from any Product.

Figure 1. The hierarchy of Products, Plans, and APIs.

Products provide a method by which you can group APIs into a package that is intended for a particular use. Additionally, they contain Plans, which can be used to differentiate between different offerings. Plans can share APIs, but whether subscription approval is required depends upon the Plan itself. Additionally, you can enforce rate limits through these Plans, or through operations within the APIs of a Plan that override the rate limit of the Plan. You can also assign different subscription costs to your Plans to differentiate the rates of API calls.

To make an API available to an application developer, it must be included in a Plan. You can create Plans only within Products, and these Products are then published in a Catalog. A lifecycle manager can then control the availability and visibility of APIs and Plans through the API Manager. By using the API Manager, you can specify the Plans that an application developer is able to subscribe to through the Developer Portal. The application developer can only subscribe to one Plan from a specific Product. Multiple Plans within a single Product are useful in that they can fulfill similar purposes but with differing levels of performance and cost. For example, you can have a "Demo Plan", which makes a single API available free of charge, and a "Full Plan" which makes several APIs available with a monthly subscription cost.

As well as controlling which APIs an application developer can use, different Plans can be used to implement different rate limits. A rate limit can be implemented as a default rate that is shared across an entire Plan, or can be set for specific operations of an API within that Plan, exempting them from the shared Plan rate limit. Different Plans can have differing rate limits, both between operations and for the overall limit. This is useful for providing differing levels of service to customers. For example, a "Demo Plan" might enforce a rate limit of ten calls per minute, while a "Full Plan" might permit up to 1000 calls per second.

In addition, you can apply burst limits to your Plans, to prevent usage spikes that might damage infrastructure. Multiple burst limits can be set per Plan, at second and minute time intervals. You can also set multiple rate limits per Plan and per operation, at second, minute, hour, day, and week time intervals.

Note:

- Applying a rate limit at the Plan level creates a default rate limit that is shared across all the operations within the Plan. If you need to set specific rate limits for specific operations, you must set these within the operations themselves and these settings will override the setting at the Plan level.
- The test application that is used by the API Manager test tool is not subject to rate limits if you have enabled automatic subscriptions for the Catalog in which you are testing. For more information, see [Working with Catalogs](#)

API Connect also supports the implementation of multiple versions of Products. You can choose version numbers and use them to aid the development of your Products and Plans.

Note: The version for a Product is distinct from the version of any APIs that are contained in the associated Plans. Plans cannot themselves have their own version, they use the version of their parent Product.

- [Creating a draft Product](#)  
Create a draft Product to collect a set of APIs and Plans into one offering that you make available to your developers. A Plan includes rate limit settings that can be applied to the Plan as a whole, or specified for each operation in an API. Through Products and Plans, you have greater control over what APIs your developers have access to, and the subscription terms.
- [Downloading a draft Product](#)  
You can download the details of your draft Product so that you can store them for later recovery.
- [Importing a draft Product](#)  
You can create a Product by importing a Product definition in a .yaml file.
- [Editing a draft Product](#)  
After initially creating a draft Product, you can continue to further configure the Product, or you can make configuration changes later.
- [Staging a draft Product](#)  
Stage a draft Product to a Catalog to create a specific version of that Product, before publishing. When a Product is in the staged state, it is not yet visible to, or subscribable by, any developers.. The syndication feature in IBM API Connect means that if Spaces are enabled for a Catalog, Products can be staged only to a Space within that Catalog.
- [Publishing a draft Product](#)  
Publish a draft Product to make the APIs in that Product visible on the Developer Portal for use by application developers. The syndication feature in IBM API Connect means that if Spaces are enabled for a Catalog, Products can be published only to a Space within that Catalog.
- [Creating a new version of your Product](#)  
You can have multiple versions of a Product in IBM API Connect. These versions can occupy any of the lifecycle stages, which facilitates development.
- [Specifying the gateway type for a Product](#)  
You can edit the Product configuration to specify a gateway type.
- [Deleting a draft Product](#)  
You can delete draft Products that are no longer required.

## Related information

---

- [Working with Products in the API Manager](#)

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Creating a draft Product

Create a draft Product to collect a set of APIs and Plans into one offering that you make available to your developers. A Plan includes rate limit settings that can be applied to the Plan as a whole, or specified for each operation in an API. Through Products and Plans, you have greater control over what APIs your developers have access to, and the subscription terms.

## Before you begin

---

Define your APIs. For more information, see [Creating an API definition](#).

Tip: As well as using the method described in this task, you can also create a Product when you create an API. If you create an API by using the developer toolkit command line editor, a Product is automatically created for you. You can then change any of the Product settings by opening your new Product in the Products page of the API Manager.

## About this task

---

You can complete this task either by using either the API Designer UI application, or by using the browser based API Manager UI.

When you first create your Product, it has *draft* status. When you have finished configuring your draft Product, you stage it to a Catalog so that the APIs in the Product can be made available to your application developers.

## Procedure

---

To create a Product, complete the following steps:

1. In the navigation pane, click  Develop, then click Add > Product.  
The Add Product page opens.
2. Select New Product, then click Next.
3. On the Info page, complete the following steps:
  - a. Enter the Title and Version of the Product and, optionally, a description. A Name is entered automatically.  
Note: The value in the Name field is a single string that is used to identify the Product in developer toolkit CLI commands. The Title is used for display.  
To view the CLI commands to manage draft Products, see [apic draft-products](#).
  - b. Click Next.
4. On the APIs page, select the APIs that you want to include in the Product, then click Next.
5. On the Plans page, complete the following steps:
  - a. Optional: Change the Title, Description, or Rate limit settings for the default Plan.
  - b. Optional: To add further Plans, click Add, then scroll down and modify the Plan settings as required.
  - c. Click Next.
6. To have the Product published to the Sandbox Catalog automatically after creation, select Publish product.
7. In the Visibility section, specify the users that you want the Product to be visible to. You can choose Public to make the Product visible to all users, Authenticated to make the Product available to users who have successfully authenticated, or Custom to specify the consumer organizations and consumer organization groups that you want the Product to be visible to.  
If you select Custom, use the Type to add organizations field to search for the consumer organizations and consumer organization groups that can subscribe to the Plans in the Product. For information about how to create and manage consumer organizations and consumer organization groups, see [Administering Consumer organizations](#).
8. In the Subscribability section, specify the users that can subscribe to the Plans in the Product. You can choose Authenticated to make the Plans in the Product subscribable by users who have successfully authenticated, or Custom to specify the consumer organizations and consumer organization groups that can subscribe to the Plans in the Product.  
If you select Custom, use the Type to add organizations field to search for the consumer organizations and consumer organization groups that can subscribe to the Plans in the Product. If you selected custom visibility, only the consumer organizations and consumer organization groups selected there are available for adding to the custom subscribability list. For information about how to create and manage consumer organizations and consumer organization groups, see [Administering Consumer organizations](#).  
Note: If you select custom visibility or subscribability, the consumer organizations and consumer organization groups that you can choose from are those in the Sandbox Catalog for the management server and provider organization that you are connected to. If you want to specify consumer organizations or groups that are in another Catalog, or in a Space, publish the Product to that Catalog or Space, then configure the visibility or subscribability there; for details, see [Changing the availability of a Product](#).  
If you are using the API Manager user interface, the connection details are determined by the API Manager URL that you open, and the user ID with which you log in. If you are using the API Designer user interface, you provide the management server details and user ID in the login window that opens when you first launch API Designer; see [Logging into API Connect Designer](#).  
  
If you are working offline in API Designer, you must type in the exact name of the organization or group.  
  
For more information about consumer organizations in a Catalog, see [Administering Consumer organizations](#).
9. Click Next to create your Product.
  - a. To further configure your Product, click Edit Product.  
For details, see [Editing a draft Product](#)
  - b. If you do not want to configure your Product further at this time, click the left arrow icon  to return to the APIs and Products page; you can then move on immediately to another task.  
For details on how to configure your Product later, see [Editing a draft Product](#).

## Results

---

You have created a draft Product, and specified a set of APIs and Plans into one offering that you can now make available to your developers.

## What to do next

---

Stage your Product to a Catalog. For more information, see [Staging a draft Product](#).

## Related tasks

---

---

## Downloading a draft Product

You can download the details of your draft Product so that you can store them for later recovery.

### Before you begin

---

To complete this task, you must have created a draft Product. For more information, see [Creating a draft Product](#).

### About this task

---

You can complete this task either by using either the API Designer UI application, or by using the browser based API Manager UI.

**API Manager UI only:** To complete this task, you must be assigned a role that has the `Product-Drafts:Edit` permission. The pre-supplied Developer role has this permission by default; if you are assigned a custom role it must have this permission. For more information, see [Creating custom roles](#).

You can download the details of your Product as a .yaml file. This file can be used to re-create your Product, although it includes only references to APIs, not the API definitions themselves. This function does not provide a way to export an entire implementation. For information about creating a Product from a .yaml file, see [Importing a draft Product](#).

### Procedure

---

To download a .yaml file containing details of your Product, complete the following instructions:

1. In the navigation pane, click  Develop.
2. Alongside the Product version that you want to work with, click the options icon  and then click Download.
3. Save the file to the required location.

### Results

---

You have downloaded a .yaml representation of your Product.

### Related tasks

---

- [Importing a draft Product](#)

### Related information

---

- [Creating a Product](#)

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Importing a draft Product

You can create a Product by importing a Product definition in a .yaml file.

### Before you begin

---

To complete this task, you must have a .yaml representation of a Product. This can be created as described in the [Downloading a draft Product](#) task.

### About this task

---

You can complete this task either by using either the API Designer UI application, or by using the browser based API Manager UI.

You can import details of your Product as a .yaml file. This file can be used to re-create your Product, although it includes only references to APIs, not the API definitions themselves. This function does not provide a way to import an entire implementation.

You can import the file from your local file system.

## Procedure

---

To create a Product from a .yaml file, complete the following instructions:

1. In the navigation pane, click  Develop.
2. Click Add Product.
3. Select Existing Product, then click Next.
4. To import a file from your local file system, you can either drag and drop your files, or click Browse and select the file that you want to use. The wizard checks the validity of the YAML, and displays a message indicating successful validation.
5. Click Next.
6. To have the Product published to the Sandbox Catalog automatically after creation, select Publish product.
7. Click Next to create your Product.
  - a. To further configure your Product, click Edit Product.  
For details, see [Editing a draft Product](#)
  - b. If you do not want to configure your Product further at this time, click the left arrow icon  to return to the APIs and Products page; you can then move on immediately to another task.  
For details on how to configure your Product later, see [Editing a draft Product](#).

## Results

---

You have imported a Product from a .yaml file. If the same APIs and versions of APIs as referenced in the file are present, then they will be included in the Product.

Importing a Product in this way does not include the API definitions, only references to them.

## Related tasks

---

- [Downloading a draft Product](#)

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Editing a draft Product

After initially creating a draft Product, you can continue to further configure the Product, or you can make configuration changes later.

## About this task

---

You can complete this task either by using either the API Designer UI application, or by using the browser based API Manager UI.

During the initial creation of a Product, the Product creation wizard guides you to enter the minimum configuration settings, and then provides an Edit Product button. You have the option to specify additional configuration immediately, or to return to Product to edit it later. This topic describes how to specify additional configuration in either case.

## Procedure

---

To edit a draft Product, complete the following steps:

1. Access the Product Setup page in one of the following ways:
  - After completing the initial creation of the Product, click Edit Product.
  - In the navigation pane, click Develop, then click the name of the Product that you want to edit.
2. On the Product Setup page, you can make the following configuration changes:
  - a. In the Info section, change the Title, Version, or Summary.
  - b. Use the Contact, Terms of Service, and License sections to enter the corresponding details as required.
  - c. Change the gateway type. For more information, see [API Connect gateway types](#) and [Specifying the gateway type for a Product](#).
  - d. Click Save to save your changes.
3. Click Visibility, then make the following changes as required:
  - a. In the Visibility section, specify the users that you want the Product to be visible to. You can choose Public to make the Product visible to all users, Authenticated to make the Product available to users who have successfully authenticated, or Custom to specify the consumer organizations and consumer organization groups that you want the Product to be visible to.  
If you select Custom, use the Type to add organizations field to search for the consumer organizations and consumer organization groups that you want the Product to be visible to. For information about how to create and manage consumer organizations and consumer organization groups, see [Administering Consumer organizations](#).
  - b. In the Subscribability section, specify the users that can subscribe to the Plans in the Product. You can choose Authenticated to make the Plans in the Product subscribable by users who have successfully authenticated, or Custom to specify the consumer organizations and consumer organization groups that can subscribe to the Plans in the Product.  
If you select Custom, use the Type to add organizations field to search for the consumer organizations and consumer organization groups that can subscribe to the Plans in the Product. If you selected custom visibility, only the consumer organizations and consumer organization groups selected there are available for adding to the custom subscribability list. For information about how to create and manage consumer organizations and consumer organization groups, see [Administering Consumer organizations](#).  
Note: If you select custom visibility or subscribability, the consumer organizations and consumer organization groups that you can choose from are those in the Sandbox Catalog for the management server and provider organization that you are connected to. If you want to specify consumer organizations or

groups that are in another Catalog, or in a Space, publish the Product to that Catalog or Space, then configure the visibility or subscribability there; for details, see [Changing the availability of a Product](#).

If you are using the API Manager user interface, the connection details are determined by the API Manager URL that you open, and the user ID with which you log in. If you are using the API Designer user interface, you provide the management server details and user ID in the login window that opens when you first launch API Designer; see [Logging into API Connect Designer](#).

For more information about consumer organizations in a Catalog, see [Administering Consumer organizations](#).

- a. Click Save to save your changes.
4. To specify the APIs that you want to include in the Product, click APIs, then complete the following steps:
  - a. Click Edit.  
All draft APIs are listed.
  - b. Select the APIs that you want to include. You can include only APIs whose gateway type matches the gateway type of the Product; if you select an incompatible API, a warning message is displayed and you cannot save your changes until you clear the incompatible selection. For more information on gateway types, see [API Connect gateway types](#), [Specifying the gateway type for a Product](#), and [Specifying the gateway type for an API definition](#).
  - c. Click Save when done.  
The selected APIs are listed.

Note: To make an API available to application developers, you must include it in a Plan.

5. Optional: Add one or more Plans to the Product, or modify an existing Plan. Note that a default plan is automatically created for you, with a rate limit of 100 API calls per hour.
  - a. Click Plans.
  - b. To add a new Plan, click Add. To modify an existing Plan, click the options icon  alongside the required Plan, then click Edit.
  - c. Specify the Title of the Plan and, optionally, a description. A Name is entered automatically.  
Note: The value in the Name field is a single string that is used to identify the Plan in developer toolkit CLI commands. The Title is used for display.
  - d. Specify whether your Plan requires subscription approval. If you want subscriptions by developers to require approval, select the Approval check box; otherwise, ensure the check box is cleared.
  - e. In the Plan Rate Limits section, you can modify a rate limit, and click Add to add further rate limits. You can set multiple rate limits, at second, minute, hour, day, and week time intervals. To remove a rate limit, click the corresponding delete icon .  
Note: For information about rate limits and burst limits in API Connect, see [Understanding rate limits for APIs and Plans](#).
  - f. In the Plan Burst Limits section, you can modify a burst limit, and click Add to add further burst limits. You use burst limits to prevent usage spikes that might

damage infrastructure. You can set multiple burst limits, at second and minute intervals. To remove a burst limit, click the corresponding delete icon . Rate and burst limits work together to manage network traffic for the APIs covered under a Plan. A Plan can have multiple rate and burst limits, but it is recommended that each time interval be assigned only one set of limits. Adjust the rate and burst limits to allow for maximum traffic without overloading your network. The **rate limit** sets the maximum amount of sustainable, ongoing traffic for accessing the APIs on your network within a time interval (for example, one day). The **burst limit** sets the maximum short-term traffic volume for your network within a time interval (per second or minute).

The **burst limit** allows for short bursts of increased traffic. When the **burst limit** is exceeded, all subsequent API calls are rejected until the start of the next **burst limit interval**. The **burst limit counter** is reset to zero at the start of the next interval, which allows API calls to be accepted again. These API calls count toward the **rate limit counter**, but the resetting of the **burst limit counter** does not affect the **rate limit counter**.

The **rate limit** is the number of API calls allowed in a time interval, for example, 1000 calls per day. When the **rate limit** is exceeded, and Hard limit is enabled, all subsequent API calls will be rejected. The **rate limit counter** is reset to zero at the start of the next **rate limit interval**, which allows API calls to be accepted again. If Hard limit is disabled, all subsequent API calls are still accepted, and a message is logged stating that the **rate limit** has been exceeded. This is referred to as a "soft limit."

Hard limit affects only the **rate limit**, as illustrated by the following scenarios:

Scenario A

Table 1. Hard limit enabled

Hard limit	Burst limit	Rate limit
ON	100 calls/minute	1000 calls/day

- If a user calls an API 100 times in one minute, the **burst limit** is reached. The 101st call (and any subsequent calls) within the same minute will be rejected. Once the minute is up, the **burst limit counter** is reset. All API calls are tallied toward the **rate limit** of 1000 calls per day. The resetting of the **burst limit counter** does not affect the **rate limit counter**.
- If a user calls the API 99 times per minute, they will not hit the **burst limit**. They will eventually hit the 1000 calls per day rate limit, and the 1001st call will be rejected until the end of the same one day **rate limit interval**. During the period of time when API calls are rejected due to the daily **rate limit** being exceeded, the **burst limit** will not be activated since the calls are already rejected.
- Both **burst limits** and **rate limits** are applied per consumer.

Scenario B

Table 2. Hard limit disabled

Hard limit	Burst limit	Rate limit
OFF	100 calls/minute	1000 calls/day

- As in Scenario A, if a user calls the API 100 times in one minute, the 101st call within the same minute will be rejected, until that minute is up and the counter resets. These calls count toward the 1000 calls per day **rate limit** as well.
- If a user calls the API 99 times per minute, they will not hit the **burst limit**. They will eventually hit the 1000 calls per day **rate limit**, and the 1001st call will be accepted (since there is no hard limit). A message will be logged for each subsequent call until the time interval (one day) is up and the counter resets. During the remainder of the day, the **burst limit** will still be enforced, and calls will be rejected once the number of calls exceeds the 100 calls per minute within any given minute.
- Both burst limits and rate limits are applied per consumer.  
Note: When Hard limit is unchecked, the **rate limit** is considered a "soft limit." With a soft limit, calls are not rejected after the **rate limit** is reached. Instead, a message is recorded in the log file. With a soft limit, the **burst limit** still rejects API calls after it is exceeded.

- g. To include in the Plan all the APIs that were included in the Product in step 4, select Same as product in the Plan APIs section.
- h. To select the APIs, and API operations, that you want to include in the Plan, complete the following steps:
  - i. In the Plan APIs section, select Customize the plan API list, then click Edit. The Edit plan APIs window opens. The APIs that are available for selection are those that were included in the Product in step 4. Use the check boxes to specify the required APIs, then click Save when done.

- ii. To select specific API operations to include in the Plan, click the options icon  alongside the required API, then click Edit operation list. The Select operations you want to include window opens. Use the check boxes to specify the required operations, then click Save when done.
  - iii. To remove an API from the Plan, click the options icon  alongside the required API, then click Remove.
  - iv. To define rate limits for specific API operations, select Override plan rate limits for individual operation; for further details, see [Defining rate limits for an API operation](#).
  - i. Click Save to save your changes.
6. Optional: Click Categories, then define any categories that you want to organize your Product into. Click Save to save any updates. By organizing your Products into categories, you can provide a hierarchical display for your Products in the Developer Portal. For more information, see [Organizing your APIs and Products into categories](#).

---

## What to do next

Stage your Product to a Catalog. For more information, see [Staging a draft Product](#).

- [Defining rate limits for an API operation](#)  
For any Plan in a draft Product, you can apply one or more rate limits to a specific operation on any of the APIs in that Plan.

---

# Defining rate limits for an API operation

For any Plan in a draft Product, you can apply one or more rate limits to a specific operation on any of the APIs in that Plan.

---

## About this task

You can complete this task either by using either the API Designer UI application, or by using the browser based API Manager UI.

During the initial creation of a Product, the Product creation wizard guides you to enter the minimum configuration settings, and then provides an Edit Product button. You have the option to specify additional configuration immediately, or to return to Product to edit it later. This topic describes how to specify additional configuration in either case.

Note: For information about rate limits and burst limits in API Connect, see [Understanding rate limits for APIs and Plans](#).

---

## Procedure

1. Access the Product Setup page in one of the following ways:
  - After completing the initial creation of the Product, click Edit Product.
  - In the navigation pane, click Develop, then click the name of the Product that you want to edit.
2. Click Plans.
3. Click the options icon  alongside the required Plan, then click Edit.
4. Scroll down to the Plan APIs section, then select Override plan rate limits for individual operation. The Override Rate Limits section is displayed.
5. Click Add. The Override plan rate limits window opens.
6. Select the API, and the specific operation in that API, to which you want to apply rate limits. By default, calls to the operation are unlimited.
7. To apply one or more rate limits to the operation, select Rate Limits.
8. To define a rate limit, click Add.
9. Supply a name for the rate limit, and define the maximum number of calls allowed in a specified time period; for example, 100 calls per 1 minute. If you select HARD LIMIT and the limit is exceeded, subsequent calls are rejected, otherwise calls are still accepted and a message is logged.
10. Click Save when done. An entry for the operation is listed in the Override Rate Limits section.
11. To modify the rate limiting definition for an operation, click the options icon  alongside the required operation, then click Edit Operation; to delete it, click Remove.
12. Click Save to save your changes.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Staging a draft Product

Stage a draft Product to a Catalog to create a specific version of that Product, before publishing. When a Product is in the staged state, it is not yet visible to, or subscribable by, any developers. The syndication feature in IBM® API Connect means that if Spaces are enabled for a Catalog, Products can be staged only to a Space within that Catalog.

---

### Before you begin

Ensure that you have a Catalog to stage to in the API Manager or API Designer user interfaces (UI). For more information, see [Creating and configuring Catalogs](#).  
Note: All references in this topic to a Catalog can also be applied to Spaces in a Catalog, unless specified otherwise. For more information about Spaces, see [Using syndication in IBM API Connect®](#).

To complete the Product management tasks that are described in this topic, you must either be the owner of the API provider organization, or be assigned Product > Stage permission for the target Catalog or Space. For information on configuring Product management permissions for a Catalog or Space, see [Creating and configuring Catalogs](#) or [Managing user access in a Space](#).

---

### About this task

You can complete this task either by using either the API Designer UI application, or by using the browser based API Manager UI.  
Staging is not available when working offline in API Designer.

A Catalog is a staging target, and behaves as a logical partition of the DataPower® Gateway, and the Developer Portal.

You stage a Product so that the appropriate approvals, internally within the organization, can be given for it to then be published. For information on configuring Product lifecycle approvals for a Catalog, see [Creating and configuring Catalogs](#). For information on approving requests, see [Approving Product lifecycle and subscription requests](#). For information on publishing a Product, see [Publishing a Product](#).

You cannot re-stage an existing Product version to a production Catalog. If you update an API, you must create a new version of that API. Then, create a new version of the Product so that it includes the newer version of the API. For more information on creating new versions of APIs and Products, see [Creating a new version of an API definition](#) and [Creating a new version of your Product](#). If Spaces are enabled in a production Catalog, you cannot re-stage the same API or Product version to any Space in the Catalog.

You can, however, re-stage a Product version to the Sandbox Catalog, or other non-production Catalog, for ease of iterative testing. Note that when you re-stage a Product version to a non-production Catalog, any application subscriptions are deleted; this is done to facilitate scripted deployment in a continuous integration environment, where the re-creation of application subscriptions will be controlled by the scripts. If Spaces are enabled in a non-production Catalog and you re-stage a Product version to a different Space to the one in which it was previously staged, it is removed from the previous Space and staged to the newly specified Space.

Validation of the API OpenAPI definition file occurs during the staging or publishing process. The following validation occurs:

- Validation against the OpenAPI specification schema
- Validation against IBM extension properties
- Semantic validation, which includes the following types of validation:
  - Ensuring that if an API is enforced by an API Connect Gateway, then the scheme must be HTTPS, or the parameter name for an API key security scheme in the header must be either **X-IBM-Client-Id** or **X-IBM-Client-Secret**.
  - Ensuring that if the API is not enforced by an API Connect Gateway, then a "host" must be provided

Note: If the OpenAPI file that defines your API uses a `$ref` field to reference a fragment of OpenAPI code that is defined in a separate file, the `$ref` field is replaced with the contents of the target file before the product that contains the API is staged or published (the `$ref` field is supported only if you are using the API Connect for IBM Cloud developer toolkit). For more information, see [Using \\$ref to reuse code fragments in your OpenAPI files](#).

---

## Procedure

To stage a Product, complete the following steps:

1. In the navigation pane, click  Develop.  
The Develop: APIs and Products tab opens.
2. **Optional:** If you have accounts on multiple provider organizations, you can select a new provider organization for staging and publishing from the Organization menu.
3. Alongside the Product version that you want to work with, click the options icon  and then click Stage.  
If you have more than one version of the Product, ensure that you select the correct one.
4. Select the Catalog to which you want to stage the Product.
5. If Spaces have been enabled in the selected Catalog, select the Space that you require.  
Note: The Catalogs that you can select from are those that are defined for the management server and provider organization that you are connected to.  
If you are using the API Manager user interface, the connection details are determined by the API Manager URL that you open, and the user ID with which you log in. If you are using the API Designer user interface, you provide the management server details and user ID in the login window that opens when you first launch API Designer; see [Logging into API Connect Designer](#).

For details of how to create a Catalog in a provider organization, see [Creating and configuring Catalogs](#).

6. If, when the staged Product is subsequently published, you want it to be published only to selected gateway services, select Publish to specific gateway services, then select the required gateway services. Only the gateway services whose type matches the gateway type setting for the Product are listed. For information on gateway types, see [API Connect gateway types](#).

7. Click Stage.

## Results

---

Your Product is staged to a Catalog. You can view the state of the Product in the Catalog in API Manager. If you staged the product from API Designer, ensure you are logged into API Manager with the same user name and password that you used for API Designer. Click  Manage in the API Manager UI, then select the required Catalog. The Product is shown with a state of Staged.

For information about the lifecycle of a product, see [The Product lifecycle](#).

If approval is required to stage Products in the Catalog, an approval request is sent, and the Product moves to the Pending state; the Product is staged when the request is approved. If approval is not required, the Product is staged immediately.

For information on configuring Product lifecycle approvals for a Catalog, see [Creating and configuring Catalogs](#). For information on approving requests, see [Approving Product lifecycle and subscription requests](#).

## What to do next

---

- Publish your Product for application developers to access it in the Developer Portal. For more information, see [Publishing a Product](#).

## Related information

---

- [Managing your Products](#)
- [Removing a Product from a Catalog](#)
- [Working with Products in the API Manager](#)

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Publishing a draft Product

---

Publish a draft Product to make the APIs in that Product visible on the Developer Portal for use by application developers. The syndication feature in IBM® API Connect means that if Spaces are enabled for a Catalog, Products can be published only to a Space within that Catalog.

## Before you begin

---

Ensure that you have a Catalog to stage to in the API Manager or API Designer user interfaces (UI). For more information, see [Creating and configuring Catalogs](#).

Note: All references in this topic to a Catalog can also be applied to Spaces in a Catalog, unless specified otherwise. For more information about Spaces, see [Using syndication in IBM API Connect®](#).

To complete the Product management tasks that are described in this topic, you must either be the owner of the API provider organization, or be assigned Product Management permission for the target Catalog or Space. For information on configuring Product management permissions for a Catalog or Space, see [Creating and configuring Catalogs](#) or [Managing user access in a Space](#).

## About this task

---

You can complete this task either by using either the API Designer UI application, or by using the browser based API Manager UI. Publishing is not available when working offline in API Designer.

You cannot re-publish a Product version to a production Catalog, you must create a new version of the Product for publication; see [Creating a new version of your Product](#). If Spaces are enabled in a production Catalog, you cannot re-publish the same Product version to any Space in the Catalog, neither the same Space nor a different Space.

You can, however, re-publish a Product version to the Sandbox Catalog, or other non-production Catalog, for ease of iterative testing. Note that when you re-publish a Product version to a non-production Catalog, any application subscriptions are deleted; this is done to facilitate scripted deployment in a continuous integration environment, where the re-creation of application subscriptions will be controlled by the scripts. If Spaces are enabled in a non-production Catalog and you re-publish a Product version to a different Space to the one in which it was previously published, it is removed from the previous Space and published to the newly specified Space.

Validation of the API OpenAPI definition file occurs during the staging or publishing process. The following validation occurs:

- Validation against the OpenAPI specification schema
- Validation against IBM extension properties
- Semantic validation, which includes the following types of validation:
  - Ensuring that if an API is enforced by an API Connect Gateway, then the scheme must be HTTPS, or the parameter name for an API key security scheme in the header must be either **X-IBM-Client-Id** or **X-IBM-Client-Secret**.
  - Ensuring that if the API is not enforced by an API Connect Gateway, then a "host" must be provided

Note: If the OpenAPI file that defines your API uses a `$ref` field to reference a fragment of OpenAPI code that is defined in a separate file, the `$ref` field is replaced with the contents of the target file before the product that contains the API is staged or published (the `$ref` field is supported only if you are using the API Connect for IBM Cloud developer toolkit). For more information, see [Using \\$ref to reuse code fragments in your OpenAPI files](#).

## Procedure

---

To publish a Product, complete the following steps:

1. In the navigation pane, click  Develop.  
The Develop: APIs and Products tab opens.
  2. **Optional:** If you have accounts on multiple provider organizations, you can select a new provider organization for staging and publishing from the Organization menu.
  3. Alongside the Product version that you want to work with, click the options icon  and then click Publish.  
If you have more than one version of the Product, ensure that you select the correct one.
  4. Select the Catalog to which you want to publish the Product.
  5. If Spaces have been enabled in the selected Catalog, select the Space that you require.  
Note: The Catalogs that you can select from are those that are defined for the management server and provider organization that you are connected to.  
If you are using the API Manager user interface, the connection details are determined by the API Manager URL that you open, and the user ID with which you log in. If you are using the API Designer user interface, you provide the management server details and user ID in the login window that opens when you first launch API Designer; see [Logging into API Connect Designer](#).
- For details of how to create a Catalog in a provider organization, see [Creating and configuring Catalogs](#).
6. If you want to publish the Product only to selected gateway services, select Publish to specific gateway services, then select the required gateway services. Only the gateway services whose type matches the gateway type setting for the Product are listed. For information on gateway types, see [API Connect gateway types](#).
  7. Click Publish.

## Results

---

Your Product is published to a Catalog. You can view the state of the Product in the Catalog in API Manager. If you published the product from API Designer, ensure you are logged into API Manager with the same user name and password that you used for API Designer. Click  Manage in the API Manager UI, then select the required Catalog. The Product is shown with a state of Published.

For information about the lifecycle of a product, see [The Product lifecycle](#).

If approval is required to publish Products in the Catalog, a publish approval request is sent, and the Product moves to the Pending state; the Product is published in the Catalog when the request is approved. If approval is not required, the Product is published immediately.

Note: If approval is required to stage Products to the Catalog, a stage approval request is sent. When the request is approved, the Product moves to the staged state and must be separately published in the Catalog. For information on publishing a staged Product in a Catalog, see [Publishing a Product](#).  
For information on configuring Product lifecycle approvals for a Catalog, see [Creating and configuring Catalogs](#). For information on approving requests, see [Approving Product lifecycle and subscription requests](#).

---

## Creating a new version of your Product

You can have multiple versions of a Product in IBM® API Connect. These versions can occupy any of the lifecycle stages, which facilitates development.

### Before you begin

---

Create your Product and assign it a version. For more information, see [Creating a draft Product](#).

### About this task

---

You can complete this task either by using either the API Designer UI application, or by using the browser based API Manager UI.

You can create multiple versions of a Product, and these versions can be named according to your own preferences, and function as distinct Products when staged.

### Procedure

---

To create a new version of a Product, complete the following steps:

1. In the navigation pane, click  Develop.
2. Alongside the Product version that you want to work with, click the options icon , then click Save as a new version.  
The Save this product as a new version window opens.
3. Enter your new version number, then click Save.

## Results

---

Your Product is saved as a new version.

## Related information

- [Managing your Products](#)
- [Working with Products in the API Manager](#)

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Specifying the gateway type for a Product

You can edit the Product configuration to specify a gateway type.

### Before you begin

IBM® API Connect supports two gateway types: DataPower® Gateway (v5 compatible) and DataPower API Gateway.

DataPower Gateway (v5 compatible) has been available with IBM API Connect for a number of years. The DataPower API Gateway is a new gateway that has been designed with APIs in mind, and with the same security focus as DataPower Gateway (v5 compatible).

For more information on how to choose which gateway type to use, see [API Connect gateway types](#).

### About this task

You can complete this task either by using either the API Designer UI application, or by using the browser based API Manager UI.

You can specify the gateway type for a Product.

Products can use only one type of gateway, and the APIs in the Product must use the same type of gateway. See [Specifying the gateway type for an API definition](#).

When you create a new Product, the gateway type defaults according to the gateway types of the gateway services that are enabled in your Sandbox Catalog, as indicated in the following table.

Table 1. Default gateway type for a new Product

Gateway Service enablement in Sandbox Catalog	Default gateway type for new Product
No gateway services enabled	DataPower Gateway (v5 compatible)
At least one gateway service of each type enabled	DataPower Gateway (v5 compatible)
One or more gateway services only of type DataPower API Gateway enabled	DataPower API Gateway
One or more gateway services only of type DataPower Gateway (v5 compatible) enabled	DataPower Gateway (v5 compatible)

For details of how to enable gateway services in a Catalog, see [Creating and configuring Catalogs](#).

### Procedure

To specify the gateway type for a Product, complete the following steps:

1. Ensure that you know the type of gateway that your APIs are configured to use.
2. In the navigation pane, click  Develop, then click Products.
3. Click the Product you want to update.
4. On the Product Setup page, go to the Gateway Type section. Select the gateway type for your Product:
  - DataPower Gateway (v5 compatible)
  - DataPower API Gateway
5. Click Save to retain your changes.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Deleting a draft Product

You can delete draft Products that are no longer required.

### About this task

You can complete this task either by using either the API Designer UI application, or by using the browser based API Manager UI.

**API Manager UI only:** To complete this task, you must be assigned a role that has the `Product-Drafts:Edit` permission. The pre-supplied Developer role has this permission by default; if you are assigned a custom role it must have this permission. For more information, see [Creating custom roles](#).

Note:

- Deleting a draft Product does not remove it from any Catalogs to which it has been published. For details on how to remove a Product from a Catalog, see [Removing a Product from a Catalog](#).
- You cannot directly delete a Product that was generated automatically from an API with the Activate API option; these Products have the title `api_title` auto product. To delete such Products, delete the API from which it was generated; the Product is deleted together with the API. For more information, see [Deleting an API definition](#).

## Procedure

---

1. In the navigation pane, click  Develop.
2. Alongside the Product version that you want to delete, click the options icon  and then click Delete.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Creating and validating API and Product definitions by using the CLI

The developer toolkit of IBM® API Connect provides a command line interface that you can use to create and publish API and Product definitions, and also to validate YAML or JSON definitions.

The following topics explain how to use the command line interface to create an OpenAPI definition file, create a Product definition file, and validate a YAML or JSON definition.

- [Creating an OpenAPI definition file](#)  
APIs are defined in OpenAPI definition files, in YAML format. You can create a default OpenAPI definition file by using the `create` command and then modify it by using an editor of your choice.
- [Specifying a gateway type for an API definition](#)  
An API definition is specific to one or other of the gateway types, DataPower® API Gateway or DataPower Gateway (v5 compatible). API definitions must specify which type of gateway the API uses.
- [Referring to an extension in an API definition](#)  
To refer to an OpenAPI extension in your API definition YAML (or JSON) file, add an `extensions` key under `x-ibm-configuration`.
- [Using \\$ref to reuse code fragments in your OpenAPI files](#)  
If you deploy an API to an IBM API Connect Management server by using the developer toolkit command line, you can use the `$ref` field in your OpenAPI YAML and JSON API definition files to reference a fragment of OpenAPI code that is defined in a separate file. When API Connect processes the source API definition file, the `$ref` field is replaced with the contents of the target file.
- [Creating a Product definition file](#)  
You define a Product by creating a Product definition file.
- [Using x-ibm-languages to create multilingual API and Product documentation](#)  
Create multilingual API and Product documentation by using the `x-ibm-languages` extension in your API and Product OpenAPI definitions.
- [Using x-example to control the examples displayed in the Developer Portal](#)  
OpenAPI does not support the use of `example` attributes on parameters, only on request and response objects and their properties. To allow API Developers to be able to control the examples displayed in the portal you can use `x-example` in OpenAPI parameters.
- [Using x-embedded-doc to add additional documentation to products and APIs](#)  
You can use `x-embedded-doc` to add additional documentation to a product or an API as part of their definition.
- [Using x-pathalias to give consistent URLs for products and APIs](#)  
You can use `x-pathalias` to assign a URL to a product or an API.
- [Validating the YAML or JSON definition of an API or Product](#)  
You can validate a YAML or JSON definition by using the IBM API Connect developer toolkit.
- [Creating and using API and Product definitions templates](#)  
You can use template files when creating API and Product definitions. Template files are Handlebars templates containing variables of the form `{{variable-name}}` that are substituted with values when you create the API or Product definition.
- [OpenAPI 3.0 support in IBM API Connect](#)  
From Version 2018.4.1.4, IBM API Connect supports the OpenAPI 3.0 specification, with some limitations.

## Creating an OpenAPI definition file

APIs are defined in OpenAPI definition files, in YAML format. You can create a default OpenAPI definition file by using the `create` command and then modify it by using an editor of your choice.

You can stage or publish the API directly to a Catalog in API Manager by referencing the API in a Product definition file, and then using the `apic products:publish` command to publish the Product. You can also create a draft API in API Manager by using the `apic draft-apis:create` command.

You can create an API in the CLI by running `apic create:api`, and supplying additional arguments on the command line.

Another option is to create an API interactively in the command line by running `apic create:api` and following the prompts.

You can see further details and available options for the `apic create:api` command by running:

```
apic create:api --help
```

IBM provides an extension to the OpenAPI specification; this extension is described in [IBM extensions to the OpenAPI specification](#).

Note: Products that contain an API with a Swagger property using `regex` that include lookahead assertions, such as "(?" cannot be validated or published. An error message is returned. For example:

```
Product has not been published!
The multipart 'openapi' field contains an OpenAPI definition with validation errors.
  definitions.properties.pattern Does not match format 'regex' (context: (root).definitions.properties.pattern, line: 0, col:
0)
400
```

## Creating an API definition from a template

You can use a custom Handlebars template to create an API by using the following command:

```
apic create:api --template template_filename --title api_title
```

where *template\_filename* is the name of the Handlebars template to use, and *api\_title* is the title of your API.

An API template file must have a `.hbs` file name extension. You can create a template from scratch, or start with the example (default) API template provided in [API and Product definition template examples](#).

You can create multilingual API and Product documentation by using an `x-ibm-languages` extension directly in the OpenAPI definition. For more information, see [Using x-ibm-languages to create multilingual API and Product documentation](#).

- [IBM extensions to the OpenAPI specification](#)

You use the `x-ibm-configuration` object in your OpenAPI definition file to add extensions that are specific to IBM API Connect.

## Related reference

- [API development and management commands](#)

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## IBM extensions to the OpenAPI specification

You use the `x-ibm-configuration` object in your OpenAPI definition file to add extensions that are specific to IBM® API Connect.

The `x-ibm-configuration` extension has the following structure:

```
x-ibm-configuration:
  enforced: enforced_boolean
  phase: Phase
  testable: test_boolean
  cors:
    enabled: cors_boolean
  activity-log:
    activity_logging_extension
  assembly:
    execute:
      - assembly_component
  gateway: gateway_type
  type: api_type
  properties:
    properties_extension
  catalogs:
    catalogs_extension
```

The following table lists the various extensions used by API Connect, whether they are required, a description of their use and behavior, and their type.

Table 1. IBM extensions

Extension	Required	Description	Type
phase	Yes	Use the phase extension to describe the maturity of the API. It can take the following values: <ul style="list-style-type: none"><li>• <b>identified</b>: the API is in the early conceptual phase and is neither fully designed nor implemented.</li><li>• <b>specified</b>: the API has been fully designed and passed an internal milestone but has not yet been implemented.</li><li>• <b>realized</b>: the API is in the implementation phase.</li></ul>	String
testable	Yes	Use the <code>testable</code> extension to specify whether the API can be tested using the test tool in the Developer Portal.	Boolean

Extension	Required	Description	Type
enforced	Yes	Use the <b>enforced</b> extension to specify if the API Connect gateway is used to enforce the API. <ul style="list-style-type: none"> <li>• <b>true</b> indicates that the API Connect gateway is used to enforce the API.</li> <li>• <b>false</b> indicates that the API Connect gateway is not used to enforce the API.</li> </ul>	Boolean
cors	Yes	Use the <b>cors</b> extension to specify whether CORS access control is used for the API. The extension has an <b>enabled</b> field which is a Boolean.	Object (with a single Boolean field)
<span style="border: 1px solid green; padding: 2px;">API Gateway only</span> activity-log	No	Use the <b>activity-log</b> extension to configure your logging preferences for the API activity that is stored in Analytics. The preferences that you specify will override the default settings for collecting and storing details of the API activity.	Object
assembly	No	Use the <b>assembly</b> extension to describe the application of policies and logic to an API. It contains an <b>execute</b> field that contains an array of policies that are applied in order. It can contain a <b>catch</b> field that contains an array of error cases to be caught. For information about use of the <b>execute</b> field, see <a href="#">execute</a> . For information about use of the <b>catch</b> field, see <a href="#">catch</a> .	Object
gateway	No	Use the <b>gateway</b> extension to specify which type of gateway you want to use. If you are using the DataPower® Gateway (v5 compatible) or DataPower API Gateway, it must be included and take one of the following values: <ul style="list-style-type: none"> <li>• <code>datapower-gateway</code> (DataPower Gateway (v5 compatible))</li> <li>• <code>datapower-api-gateway</code> (DataPower API Gateway)</li> </ul> For information about types of gateways, see <a href="#">API Connect gateway types</a> .	String
type	No	The <b>type</b> extension takes one of the following values: <ul style="list-style-type: none"> <li>• <code>rest</code></li> <li>• <code>wSDL</code></li> </ul>	
properties	No	Use the <b>properties</b> extension to define properties for use in an API.	Object <a href="#">(properties)</a>
catalogs	No	Use the <b>catalogs</b> extension to define Catalog-specific values for properties defined in the <b>properties</b> extension.	Object <a href="#">(catalogs)</a>

The following example shows the **x-ibm-extension** section of an API that is enforced by API Connect, is in the realized state, is testable through the test tool in the Developer Portal, has CORS access control enabled, and has a simple assembly that invokes a URL and then redacts a field from the request or response.

```
x-ibm-configuration:
  enforced: true
  phase: realized
  testable: true
  cors:
    enabled: true
  assembly:
    execute:
      - invoke:
          title: Example Invoke
          target-url: 'https://example.com/api'
          description: Example description
      - redact:
          actions:
            - action: redact
              from:
                - request
                - response
              path: /**[@name='secondaryAddress']/**[@name='streetAddress']
  properties:
    ID:
      value: 1234
      description: An ID to be used for validating.
      encoded: false
  catalogs:
    Sandbox:
      properties:
        ID: 5678
```

- [catch](#)  
Use the **catch** extension to catch errors that occur during an API call.
- [properties](#)  
Use the **properties** extension to define properties for referencing in an API.
- [catalogs](#)  
Use the **catalogs** extension to assign catalog-specific values to properties defined in the **properties** section.
- [activity-log](#)  
If you're using the DataPower API Gateway, you can use the **activity-log** extension to configure your logging preferences for the API activity that is stored in Analytics. The preferences that you specify will override the default settings for collecting and storing details of the API activity.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## execute

The execute field of an assembly has the following structure:

```
execute:
- Policy_1
- Policy_2
```

Note: Although some built-in policies can be used with both the DataPower® Gateway (v5 compatible) and the DataPower API Gateway, some policies are restricted to a particular Gateway. The following icons indicate which Gateway each policy can be used with:

-  Indicates that the policy can be run on the DataPower Gateway (v5 compatible).
-  Indicates that the policy can be run on the DataPower API Gateway.

For details of the two types of gateway, see [API Connect gateway types](#).

The following table describes the possible policies and logic constructs that can be included in an execute field.

Table 1. execute properties

Property	Required	Description	Data Type		
activity-log	No	Use the activity-log policy to log information that relates to the calling of API operations.	object ( <a href="#">activity-log</a> )	✓	✓ Functionality provided by the <a href="#">activity-log</a> extension
client-security	No	Provides a range of options for authenticating client access to your APIs, extending the capabilities of the OpenAPI specification.	object ( <a href="#">client-security</a> )	✗	✓ Available from V2018.4.1.5
gatewayscript	No	Include a GatewayScript program.	object ( <a href="#">gatewayscript</a> )	✓	✓ Available from V2018.4.1.0
if	No	Use the if policy to execute a section of the assembly only when a condition is fulfilled.	object ( <a href="#">if</a> )	✓	✓ Available from V2018.4.1.0; functionality provided by <a href="#">switch</a>
invoke	No	Use the invoke policy to call an API. The last invoke in your policy might be replaced by a proxy automatically to improve performance. To disable this, see: <a href="#">API properties</a> .	object ( <a href="#">invoke</a> )	✓	✓
json-to-xml	No	Convert payload from JSON to XML.	object ( <a href="#">json-to-xml</a> )	✓	✓
jwt-generate	No	Generate a JSON Web Token (JWT).	object ( <a href="#">jwt-generate</a> )	✓	✓
jwt-validate	No	Validate a JSON Web Token (JWT).	object ( <a href="#">jwt-validate</a> )	✓	✓
log	No	Use the log policy to customize or override the default activity logging configuration for an API.	object ( <a href="#">log</a> )	✗	✓ Available from V2018.4.1.7
map	No	Use the map policy to transform variables.	object ( <a href="#">map</a> )	✓	✓
operation-switch	No	Use the operation-switch policy when you want to execute alternative policy assemblies, conditional on the operation that is being called.	object ( <a href="#">operation-switch</a> )	✓	✓ Available from V2018.4.1.0; functionality provided by <a href="#">switch</a>
oauth	No	Use the oauth policy to policy to perform OAuth processing based on defined OAuth provider settings.	object ( <a href="#">oauth</a> )	✗	✓
parse	No	Use the parse policy to control the parsing of an input document. When the input document is a JSON string, the string is parsed instead of copied over.	object ( <a href="#">parse</a> )	✗	✓
proxy	No	Proxy a service.	object ( <a href="#">proxy</a> )	✓	✓ Functionality provided by <a href="#">invoke</a>
ratelimit	No	Use the ratelimit policy to apply one or more rate or burst limits at any point in your API assembly flow. Rate and burst limits restrict the number of calls that an application can make to an API in a specified time period.	object ( <a href="#">ratelimit</a> )	✗	✓ Available from V2018.4.1.7
redact	No	Use the redact policy to completely remove or to redact specified fields from the request body, the response body, and the activity logs. You might find this policy useful for removing or blocking out sensitive data (for example, credit card details) for legal, security, or other reasons.	object ( <a href="#">redact - DataPower API Gatewayredact - DataPower Gateway (v5 compatible)</a> )	✓	✓ Available from V2018.4.1.7
set-variable	No	Use the set-variable policy to set a runtime variable to a string value, or to add or clear a runtime variable.	object ( <a href="#">set-variable</a> )	✓	✓ Available from V2018.4.1.0

Property	Required	Description	Data Type	DataPower Gateway	API Gateway
switch	No	Use the switch policy to execute one of a number of sections of the assembly based on which specified condition is fulfilled.	object ( <a href="#">switch</a> )	✓	✓ Available from V2018.4.1.0
throw	No	Use the throw policy to specify points at which an error should be thrown.	object ( <a href="#">throw</a> )	✓	✓ Available from V2018.4.1.0
user-defined-policy	No	You can apply your own user-defined policies to your APIs.	object	✓	✗
user-security	No	Extract a user's credentials, authenticate those credentials, and obtain authorization from the user.	object ( <a href="#">user-security</a> )	✗	✓
validate	No	Use the Validate policy to validate the payload in an assembly flow against a JSON or an XML schema.	object ( <a href="#">validate - DataPower API Gateway, validate - DataPower Gateway (v5 compatible)</a> )	✓	✓ Available from V2018.4.1.0
validate-usertoken	No	Validate a WS-Security UsernameToken.	object ( <a href="#">validate-usertoken</a> )	✓	✗
xml-to-json	No	Convert payload from XML to JSON.	object ( <a href="#">xml-to-json</a> )	✓	✓
xslt	No	Apply an XSLT transform to the payload.	object ( <a href="#">xslt</a> )	✓	✓ Available from V2018.4.1.0

The following example shows an execute field for an assembly that invokes a URL and then redacts a field from the request or response.

```
execute:
- invoke:
  title: Example Invoke
  target-url: 'https://example.com/api'
  description: Example description
- redact:
  actions:
    - action: redact
      from:
        - request
        - response
      path: /**[@name='secondaryAddress']/**[@name='streetAddress']
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details. For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## activity-log

Use the Activity Log policy to configure your logging preferences for the API activity that is stored in IBM® API Connect analytics. The preferences that you specify will override the default settings for collecting and storing details of the API activity.

## Gateway support

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® Gateway (v5 compatible)	1.0.0

This topic describes how to configure the policy in your OpenAPI source; for details on how to configure the policy in the assembly user interface, see [Activity Log](#).

Note: If you are using the DataPower API Gateway, you configure your logging preferences by using the [activity-log](#) extension.

## About

The activity-log policy has the following format:

```
- activity-log:
  version: version
  title: title
  description: description
  content: activity_to_log_if_call_successful
  error-content: activity_to_log_if_call_unsuccessful
```

Apply this policy by adding an assembly extension with an execute field to your OpenAPI definition file.

You can also apply an activity-log policy by using the API Manager assembly editor to add a built-in policy to the API. For more information, see [Activity Log](#) in the built-in policies section.

## Properties

The following table describes the policy properties:

Table 2. Activity Log policy properties

Property	Required	Description	Data type
version	Yes	The policy version number	string
title	Yes	A title for the policy.	string
description	No	A description of the policy.	string
content	Yes	Defines the type of content to be logged when the operation is successful. Valid values: <ul style="list-style-type: none"> <li><b>none</b>: Indicates that no logging occurs. Restriction: This option disables notifications for application developers who use your Developer Portal.</li> <li><b>activity</b>: Logs invocation only (only the resource URI is recorded).</li> <li><b>header</b>: Logs activity and header.</li> <li><b>payload</b>: Logs activity, header, and payload (the original request, if any, and the final response).</li> </ul> The default value is <b>activity</b> .	string
error-content	No	Indicates what content to log if an error occurs. Valid values: <ul style="list-style-type: none"> <li><b>none</b>: Indicates that no logging occurs. Restriction: This option disables notifications for application developers who use your Developer Portal.</li> <li><b>activity</b>: Logs invocation only (only the resource URI is recorded).</li> <li><b>header</b>: Logs activity and header.</li> <li><b>payload</b>: Logs activity, header, and payload (the original request, if any, and the final response).</li> </ul> The default value is <b>payload</b> .	string

## Example 1

```
# use defaults
- activity-log:
  version: 1.0.0
  title: default activity logging
```

## Example 2

```
- activity-log:
  version: 1.0.0
  title: no logging for successful calls
  content: none
  error-content: activity
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## client-security

The client-security policy provides a range of options for authenticating client access to your APIs, extending the capabilities of the OpenAPI specification.

## Gateway support

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® API Gateway, policy available from V2018.4.1.5	2.0.0

This topic describes how to configure the policy in your OpenAPI source; for details on how to configure the policy in the assembly user interface, see [Client Security](#).

## About

You use the client-security policy in an API assembly to define how clients that call the API must supply authentication credentials.

The client-security policy has the following format:

```
- client-security:
  version: version
  title: title
  description: description
  stop-on-error: is_processing_stopped_on_client_security_failure
  secret-required: is_client_secret_required_in_request
  extract-credential-method: method_for_supplying_credentials
  id-name: parameter_that_specifies_client_id
  secret-name: parameter_that_specifies_client_secret
  http-type: authentication_type
  client-auth-method: method_for_client_authentication
```

## Properties

Table 2. client-security policy properties

Property	Required	Description	Data type
version	Yes	The policy version number.	string
title	No	The title of the policy.	string
description	No	A description of the policy.	string
stop-on-error	Yes	If set to <b>true</b> , assembly processing stops if client security fails, and an error is returned.	boolean
secret-required	Yes	If set to <b>true</b> , the client secret must be sent in the request. The secret is compared to the registered secret on the application that is identified by the client ID.	boolean
extract-credential-method	Yes	Specify one of the following values to define how the calling application authenticates: <ul style="list-style-type: none"> <li><b>header</b>: client ID and client secret credentials must be supplied in the request header.</li> <li><b>query</b>: client ID and client secret credentials must be supplied as query parameters in the request URL.</li> <li><b>form</b>: client ID and client secret credentials must be supplied as form data sent in a POST request.</li> <li><b>cookie</b>: client ID and client secret credentials must be supplied in a header called <b>Cookie</b>.</li> <li><b>http</b>: the calling application must authenticate by using basic authentication.</li> <li><b>context-var</b>: the credentials that are used for authenticating the client are obtained from context variables that you set in the assembly flow prior to the Client Security policy, by using a <a href="#">gatewayscript</a> policy for example. The names of these context variables are determined by the values that you supply in the id-name and secret-name properties of the client-security policy.</li> </ul>	string
id-name	Yes, unless extract-credential-method is set to <b>http</b>	The name of the parameter whose value specifies the client ID. For all values of extract-credential-method other than <b>context-var</b> and <b>http</b> , the calling application must supply a parameter with this name, in the location defined by the extract-credential-method setting. For <b>context-var</b> , this property specifies the name of a context variable. This option does not apply if the extract-credential-method property is set to <b>http</b> .	string
secret-name	Yes, if secret-required is set to <b>true</b> and extract-credential-method is other than <b>http</b>	The name of the parameter whose value specifies the client secret. For all values of extract-credential-method other than <b>context-var</b> and <b>http</b> , the calling application must supply a parameter with this name, in the location defined by the extract-credential-method setting. For <b>context-var</b> , this property specifies the name of a context variable. This option does not apply if the extract-credential-method property is set to <b>http</b> .	string
http-type	Yes, if extract-credential-method is set to <b>http</b>	The authentication type. Currently, this must be set to <b>basic</b> .	string
client-auth-method	Yes	Specify one of the following values: <ul style="list-style-type: none"> <li><b>native</b>: only client ID and client secret are used to authenticate the request. If extract-credential-method is set to <b>http</b> then the calling application must supply the client ID for the user name, and the client secret for the password.</li> <li><b>third-party</b>: a user registry is used to authenticate the client. If extract-credential-method is set to a value other than <b>http</b> then the calling application must supply the user name for the client ID, and the password for the client secret.</li> </ul>	string
user-registry	Yes, if the client-auth-method is set to <b>third-party</b>	Specify the value of the <b>name</b> property of the user registry that will be used to authenticate the client. The supported registry types are LDAP and authentication URL.	string

## client-security policy example

```
- client-security:
  version: 2.0.0
  title: client-security
  stop-on-error: true
  secret-required: true
  extract-credential-method: cookie
  id-name: my-client-id
  secret-name: my-client-secret
  client-auth-method: third-party
  user-registry: myauthurl
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details. For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## gatewayscript

Use the gatewayscript policy to execute a specified DataPower GatewayScript program.

## Gateway support

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® Gateway (v5 compatible)	1.0.0
DataPower API Gateway, policy available from V2018.4.1.0	2.0.0

This topic describes how to configure the policy in your OpenAPI source; for details on how to configure the policy in the assembly user interface, see [GatewayScript](#).

## About

The gatewayscript policy has the following structure:

```
- gatewayscript:  
  version: version  
  title: Title  
  description: Description  
  source: Script
```

## Properties

The following table describes the policy properties:

Table 2. gatewayscript policy properties

Property	Required	Description	Data type
version	Yes	The policy version number	string
title	No	The title of the policy.	string
description	No	A description of the policy.	string
source	Yes	The GatewayScript source code to execute.	string

## Example

The following is an example of a simple gatewayscript policy:

```
- gatewayscript:  
  version: 1.0.0  
  title: Example_GatewayScript  
  source: console.debug('Hello World!');  
  description: A simple GatewayScript policy.
```

For more information about how to use a gatewayscript policy, see [GatewayScript](#) in the built-in policies section.

For more code examples, see [GatewayScript code examples](#) and, if you are using the DataPower API Gateway, [Using context variables in GatewayScript and XSLT policies with the DataPower API Gateway](#).

For general information on using GatewayScript, see the following topics in the DataPower product documentation:

- [GatewayScript APIs for API management](#)
- [Accessing and manipulating a variable in the API context](#)
- [OAuth context variables](#)

## Related concepts

- [Variable references in API Connect](#)

## Related reference

- [GatewayScript code examples](#)
- [API Connect context variables](#)

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## if

Use the if construct when you want to execute a portion of your assembly only when a specific condition is fulfilled.

## Gateway support

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® Gateway (v5 compatible)	1.0.0
DataPower API Gateway, policy available from V2018.4.1.0, functionality provided by <a href="#">switch</a>	

This topic describes how to configure the policy in your OpenAPI source; for details on how to configure the policy in the assembly user interface, see [if](#).

## About

The if policy has the following format:

```
- if:
  version: version
  title: title
  description: description
  condition: 'condition_1'
  execute:
    policy_assembly_1 ...
```

In the condition field, use the form `apim.getvariable('context.location.variable')` to reference your variables, where *context* is the context that you want to reference, *location* is the location of the variable within that context, and *variable* is the name of the variable.

The **execute** section can define any policy assembly, including further if policies. For more information, see [execute](#).

## Properties

Table 2. if policy properties

Property	Required	Description	Data type
version	Yes	The policy version number	string
title	No	A title for the policy.	string
description	No	A policy description.	string
condition	Yes	A script that returns <b>true</b> or <b>false</b> . Use GatewayScript for a DataPower Gateway implementation. For information about the context variables you can use and how to reference them in your script, see <a href="#">API Connect context variables</a> .	string
execute	Yes	The policy assembly that you want to execute if the condition returns <b>true</b> . For more information, see <a href="#">execute</a> .	string

## Example

```
# carry out different redaction actions depending on the operation
```

```
- if:
  version: 1.0.0
  title: clear_region_and_set_body
  condition: 'apim.getvariable('request.body.secret') == true'
  execute:
    - redact:
      title: remove secret field
      actions:
        - action: remove
          from: all
          path: /document/user/secret
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## invoke

Use the invoke policy to call an API.

## Gateway support

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® Gateway (v5 compatible)	1.0.0
DataPower API Gateway	2.0.0

This topic describes how to configure the policy in your OpenAPI source; for details on how to configure the policy in the assembly user interface, see [Invoke](#).

## About

Note:

- The Invoke policy does not support responses with multipart form data, that is, when the response is set to `Content-Type: multipart/related`.
- The Invoke policy always uses chunked encoding, which is not supported by the HTTP 1.0 protocol.

The invoke policy has the following format:

```

- invoke:
  version: version
  title: title
  description: description
  target-url: URL_of_target_API
  tls-profile: TLS_profile_to_be_used
  verb: method_type
  timeout: timeout_value_in_seconds
  compression: is_data_to_be_compressed

```

## Properties

The following table describes the properties of the invoke policy.

Table 2. Invoke policy properties

Property	Required	Description	Data type
version	Yes	The policy version number	string
title	No	A title for the policy.	string
description	No	A policy description.	string
target-url	Yes	The URL of the target API.	string
tls-profile	No	The TLS profile to be used.	string
verb	No	The operation method type.  Valid values: <ul style="list-style-type: none"> <li>• GET</li> <li>• POST</li> <li>• PUT</li> <li>• DELETE</li> <li>• PATCH</li> <li>• HEAD</li> <li>• OPTIONS</li> </ul> The default value is <b>GET</b> . However, if the property is omitted from the source, the HTTP method from the incoming request is used.	string
timeout	No	The timeout value in seconds. The default value is <b>60</b> .	integer
compression	No	Specifies whether data is to be compressed by using compress before it is uploaded. The default value is <b>false</b> .	boolean
username	No	The user name, if authentication is required.	string
password	No	The password, if authentication is required.	string
output	No	The name of a variable that will be used to store the response data from the request. By default, the invoke response, that is the body, headers, statusCode and statusMessage, is saved in the variable <i>message</i> . Use this property to specify an alternate location to store the invoke response. This variable can then be referenced in other actions, such as <a href="#">map</a> . Note: If you want the response to be saved in <i>message</i> , leave the output property blank, do <b>not</b> supply the value <i>message</i> .	string
cache-key	No	Specifies the unique identifier of the document cache entry.	string

Property	Required	Description	Data type
cache-response	No	The cache response type. Valid values: <ul style="list-style-type: none"> <li><b>protocol</b>: The cache behavior is defined by the Cache-Control headers on the request and response.</li> <li><b>no-cache</b>: Specifies that there is no caching. However, if the document is already in the cache, the document is retrieved from the cache.</li> <li><b>time-to-live</b>: Specifies that the response stays in the cache for the specified time.</li> </ul> The default value is <b>protocol</b> .	string
cache-putpost-response	No	Specifies whether to cache the response from POST and PUT requests. Caching the response from POST and PUT requests can reduce server load and reduce latency in the response to the client request. The default value is <b>false</b> .	boolean
cache-ttl	No	Specifies the amount of time in seconds that the response stays in the cache. Applies only if the property cache-response is set to <b>time-to-live</b> . Enter a value in the range 5 - 31708800. The default value is <b>900</b> .	integer
<span style="border: 1px solid green; padding: 2px;">API Gateway only</span> inject-proxy-headers	No	When set to true, the <b>invoke</b> policy injects the <b>X-Forwarded-For</b> , <b>X-Forwarded-To</b> , <b>X-Forwarded-Host</b> , and <b>X-Forwarded-Proto</b> headers to the request that is sent to the <b>target-url</b> . The default value is <b>false</b> .	boolean
<span style="border: 1px solid green; padding: 2px;">API Gateway only</span> decode-request-params	No	When set to true, any request parameters that are referenced by a variable definition on the <b>target-url</b> of the <b>invoke</b> policy are URL-decoded. The default value is <b>false</b> .	boolean
<span style="border: 1px solid green; padding: 2px;">API Gateway only</span> encode-plus-char	No	When set to true, all "+" characters in the query parameter values of the <b>target-url</b> are encoded to %2F. The default value is <b>false</b> .	boolean
<span style="border: 1px solid green; padding: 2px;">API Gateway only</span> keep-payload	No	When set to true, the <b>invoke</b> policy sends a payload on an <b>HTTP DELETE</b> method. The default value is <b>false</b> .	boolean
<span style="border: 1px solid green; padding: 2px;">API Gateway only</span> use-http-10 (policy version 2.0.0 only)	No	When set to true, HTTP transactions are restricted to version 1.0. The default value is <b>false</b> .	boolean
<span style="border: 1px solid green; padding: 2px;">API Gateway only</span> chunked-uploads	No	If you set this property to <b>true</b> , chunked-encoded documents are sent to the server. When the HTTP 1.1 protocol is used, the body of the document can be delimited by either <b>Content-Length</b> or chunked encoding. While all servers can interpret <b>Content-Length</b> , many applications fail to understand chunked-encoded documents. For this reason, <b>Content-Length</b> is the standard method. The use of <b>Content-Length</b> interferes with the ability of the DataPower Gateway to fully stream. If you must stream full documents to the target server, enable this property.  When enabled, the server must be RFC 2616 compatible. Unlike all other HTTP 1.1 features that can be negotiated down at run time, you must know beforehand that the target server is RFC 2616 compatible.  The default value is <b>true</b> .  Note: Chunked encoding is not supported by the HTTP 1.0 protocol.	boolean
<span style="border: 1px solid green; padding: 2px;">API Gateway only</span> header-control: type values	No	Specifies the headers in <b>message.headers</b> that you want to copy to the target URL. If the <b>type</b> property is set to <b>blacklist</b> , the <b>values</b> property lists the headers that you don't want to be copied. If the <b>values</b> property is empty then all headers are copied.  If the <b>type</b> property is set to <b>whitelist</b> , the <b>values</b> property lists the headers that you want to be copied.  The items that are listed in the <b>values</b> property are in regular expression format. The values are not case-sensitive. The default value of the <b>header-control</b> property is  <b>header-control:</b> <b>type:</b> <b>blacklist</b> <b>values:</b> <b>[]</b>  See <a href="#">header-control examples</a>	string
<span style="border: 1px solid green; padding: 2px;">API Gateway only</span> parameter-control: type values	No	Specifies the parameters in the incoming request that you want to be copied to the target URL. If the <b>type</b> property is set to <b>blacklist</b> , the <b>values</b> property lists the parameters that you don't want to be copied.  If the <b>type</b> property is set to <b>whitelist</b> , the <b>values</b> property lists the parameters that you want to be copied. If the <b>values</b> property is empty then no parameters are copied.  The items that are listed in the <b>values</b> property are in regular expression format. The values are not case-sensitive. The default value of the <b>parameter-control</b> property is  <b>parameter-control:</b> <b>type:</b> <b>whitelist</b> <b>values:</b> <b>[]</b>  See <a href="#">parameter-control examples</a>	string
<span style="border: 1px solid green; padding: 2px;">API Gateway only</span> follow-redirect	No	Specifies the behavior if the back-end server returns the HTTP status code <b>301 Moved Permanently</b> . If this property is set to <b>true</b> , the <b>invoke</b> policy follows the URL redirection by making a further call to the URL specified in the <b>Location</b> header in the response. If this property is set to <b>false</b> , the <b>invoke</b> saves the <b>301</b> status code and the API call is considered to be complete. Note: The <b>follow-redirect</b> property is supported only by the DataPower API Gateway. If you are using the DataPower Gateway (v5 compatible), the <b>invoke</b> always follows the URL redirection; the <b>proxy</b> policy (not supported by the DataPower API Gateway) saves the <b>301</b> status code and completes the API call without following the URL redirection.	boolean

Property	Required	Description	Data type
stop-on-error	No	List the errors that, if thrown during the policy execution, cause the flow to stop. If there is a <code>catch</code> flow configured for the error, it is triggered to handle the error thrown. If an error is thrown and there are no errors specified for the Stop on error property, or if the error thrown is not one of the specified errors, the policy execution is allowed to complete, and the assembly flow continues.	string

## Example

```
- invoke:
  version: 2.0.0
  title: get the account status
  target-url: https://example.com/accounts/{id}?status={status}
  cache-response: time-to-live
  cache-putpost-response: true
  tls-profile: MyTLSProfile
  verb: POST
  timeout: 60
  compression: false
  username: MyUser
  password: MyPassword
  stop-on-error:
    - ConnectionError
    - OperationError
```

API Gateway only

## header-control examples

```
# copy all headers to the target URL

- invoke:
  target-url: http://myhost/mypath
  header-control:
    type: blacklist
    values: []

# copy all headers except X-Client-ID and Content-Type

- invoke:
  target-url: http://myhost/mypath
  header-control:
    type: blacklist
    values:
      - ^X-Client-ID$
      - ^Content-Type$

# copy no headers

- invoke:
  target-url: http://myhost/mypath
  header-control:
    type: whitelist
    values: []

# copy only the Content-Type header

- invoke:
  target-url: http://myhost/mypath
  header-control:
    type: whitelist
    values:
      - ^Content-Type$
```

API Gateway only

## parameter-control examples

```
# copy no request parameters to the target URL

- invoke:
  target-url: http://myhost/path?storeid=3
  parameter-control:
    type: whitelist
    values: []

# append the petid parameter to the target URL
# if the incoming request is http://apigw/org/sandbox/petstore/base?petid=100&display=detailed,
# the target URL at runtime will be http://myhost/mypath?storeid=3&petid=100

- invoke:
  target-url: http://myhost/path?storeid=3
  parameter-control:
    type: whitelist
    values:
      - ^petid$
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## json-to-xml

Use the json-to-xml policy to convert the context payload of your API from the JavaScript Object Notation (JSON) format to the extensible markup language (XML) format.

### Gateway support

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® Gateway (v5 compatible)	1.0.0
DataPower API Gateway	2.0.0

This topic describes how to configure the policy in your OpenAPI source; for details on how to configure the policy in the assembly user interface, see [JSON to XML](#).

### About

The json-to-xml policy has the following structure:

```
- json-to-xml:  
  version: version  
  title: Title  
  description: Description
```

Note: If you are using the DataPower API Gateway, the input to the json-to-xml policy must be parsed data. One way to produce parsed data is to use a [parse](#) policy before a json-to-xml policy in your assembly flow, which provides explicit control of the parse action.

### Properties

The following table describes the policy properties:

Table 2. Policy properties

Property	Required	Description	Data type
version	Yes	The policy version number	string
title	Yes	The title of the policy.	string
description	No	A description of the policy.	string
 input	No	The input message to convert. Specify the name of a variable in the API context. <b>variableName.body</b> , the message payload, represents the JSON input to convert. The default value of the variable is <b>message</b> and <b>message.body</b> is the default input.	string
 output	No	The output message to store the conversion result. Specify the name of a variable in the API context. <b>variableName.body</b> represents the result of conversion from JSON format to XML format. When the specified input message is the default message, the default output is <b>message.body</b> . Otherwise, when the input message is the variable <b>my-message-variable</b> , for example, the default output is <b>my-message-variable.body</b> . The variable cannot be any read-only in the API context.	string
 conversionType	No	The conversion type that determines the target format of the output. The following options are available: <ul style="list-style-type: none"><li>None: No conversion of the output takes place.</li><li>badgerFish: BadgerFish convention is used to determine the target conversion format of the output.</li></ul>	string
root-element-name	Yes	The root element name of the resultant XML document. This property is used only if the input JSON document is not hierarchical and has more than one top-level property, or if the always-output-root-element property is set to <b>true</b> .	
always-output-root-element	Yes	Select this property to <b>true</b> you always want the policy to output the root element, even if it is not required to make the XML document well formed.	boolean
unnamed-element-name	No	The XML element name to be used for JSON array elements.	string

### Example

The following is an example of a json-to-xml policy:

```
- json-to-xml:  
  version: 1.0.0  
  title: JSON to XML transform  
  description: Transforms JSON message body to XML format
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## jwt-generate

Use the Generate JWT security policy in IBM® API Connect to generate a JSON Web Token (JWT).

## Gateway support

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® Gateway (v5 compatible)	1.0.0
DataPower API Gateway	2.0.0

This topic describes how to configure the policy in your OpenAPI source; for details on how to configure the policy in the assembly user interface, see [Generate JWT](#).

## About

The jwt-generate policy has the following structure:

```
- jwt-generate:
  version: version
  title: title
  description: description
  jwt: json_web_token
  jti-claim: jwt_id_claim
  iss-claim: issuer_claim
  exp-claim: validity_period
  sub-claim: subject_claim
  aud-claim: audience_claim
  jws-jwk: sign_jwk_variable_name
  jws-alg: cryptographic_algorithm
  jws-crypto: sign_crypto_object
  jwe-enc: encryption_algorithm
  jwe-jwk: encrypt_jwk_variable_name
  jwe-alg: key_encryption_algorithm
  jwe-crypto: encrypt_crypto_object
```

## Properties

The following table describes the policy properties:

Table 2. Generate JWT policy properties

Property	Required	Description	Data type
version	Yes	The policy version number	string
title	No	The title of the policy.	string
description	No	A description of the policy.	string
jwt	No	Runtime variable in which to place the JWT that is generated. The default value is: <b>generated.jwt</b> . However, if not set, the JWT that is generated is written to the Authorization Header as a Bearer token.	string
jti-claim	No	Indicates whether a JWT ID (jti) claim should be added to the JWT. If selected, the property is set to <b>true</b> , and a UUID is generated and set as the JTI claim value.	boolean
iss-claim	Yes	Runtime variable from which the Issuer (iss) claim string can be retrieved. This claim represents the Principal that issued the JWT. The default value is: <b>iss.claim</b>	string
sub-claim	No	Runtime variable from which the Subject (sub) claim string can be retrieved.	string
aud-claim	No	Runtime variable from which the Audience (aud) claim string can be retrieved. Multiple variables are set by using a comma-separated string.	string
exp-claim	Yes	The length of time (in seconds), that is added to the current date and time, in which the JWT is considered valid. The default value is <b>3600</b> .	integer
private-claims	No	Runtime variable from which a valid set of JSON claims can be retrieved. These claims are added to any set of claims specified previously.	string
jws-jwk	No	Runtime variable that contains the JWK that is used to sign the JWT. A JWK and a Crypto Object are both valid ways of providing the cryptographic data necessary to sign the JWT. However, if both data types are specified, only the Crypto Object is used.	string
jws-alg	No	The cryptographic algorithm to use. Valid values are: <ul style="list-style-type: none"> <li>• HS256</li> <li>• HS384</li> <li>• HS512</li> <li>• RS256</li> <li>• RS384</li> <li>• RS512</li> <li>• ES256</li> <li>• ES384</li> <li>• ES512</li> <li>• PS256</li> <li>• PS384</li> <li>• PS512</li> </ul>	string
jws-crypto	No	The cryptographic object to use to sign the JWT. A JWK and a Crypto Object are both valid ways of providing the cryptographic data necessary to sign the JWT. However, if both data types are specified, only the Crypto Object is used.	string

Property	Required	Description	Data type
jwe-enc	No	The encryption algorithm to use. Valid values are: <ul style="list-style-type: none"> <li>A128CBC-HS256</li> <li>A192CBC-HS384</li> <li>A256CBC-HS512</li> </ul>	string
jwe-jwk	No	Runtime variable that contains the JWK to use to encrypt the JWT.	string
jwe-alg	No	The key encryption algorithm to use. Valid values are: <ul style="list-style-type: none"> <li>RSA1_5</li> <li>RSA-OAEP</li> <li>RSA-OAEP-256</li> <li>dir</li> <li>A128KW</li> <li>A192KW</li> <li>A256KW</li> </ul>	string
jwe-crypto	No	The cryptographic object to use to encrypt the claim.	string

## Example

The following is an example of a jwt-generate policy:

```
- jwt-generate:
  version: 1.0.0
  title: jwt-generate
  iss-claim: iss.claim
  exp-claim: 3600
  jwt: generated.jwt
  jti-claim: true
  sub-claim: sub.claim
  aud-claim: aud.claim
  private-claims: private.claims
  jws-jwk: jws.jwk
  jws-alg: HS256
  jws-crypto: jwsCryptoObjectName
  jwe-enc: A128CBC-HS256
  jwe-jwk: jwe.jwk
  jwe-alg: A128KW
  jwe-crypto: jweCryptoObjectName
```

For more information about how to use a jwt-generate security policy, see [Generate JWT](#) in the built-in policies section.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details. For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## jwt-validate

Use the Validate JWT security policy to enable the validation of a JSON Web Token (JWT) in a request before allowing access to the APIs.

## Gateway support

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® Gateway (v5 compatible)	1.0.0
DataPower API Gateway	2.0.0

This topic describes how to configure the policy in your OpenAPI source; for details on how to configure the policy in the assembly user interface, see [Validate JWT](#).

Note:

- If the original message was signed with a Shared Secret Key, the cryptographic object that is specified must also be a Shared Secret Key.
- If the original message was signed with a Private Key, the cryptographic object that is specified must be a Crypto Certificate (public certificate).
- The cryptographic material can be provided through a JSON Web Key (JWK).
- If a JWK header parameter is included in the header of the JWT, the parameter must match the JWK or cryptographic object that is specified in the policy, or the JWT validation will fail.
- If both a cryptographic object and a JWK are specified, the cryptographic object is used to decrypt or verify the JWT.
- The JWT validate action on the DataPower API Gateway can verify a JWT by using either a single JWK, or a JWK set.

## About

The jwt-validate policy has the following structure:

```
- jwt-validate:
  version: version
```

```

title: title
description: description
jwt: json_web_token
output-claims: output_full_set_of_jwt_claims
iss-claim: issuer_claim
aud-claim: audience_claim
jwe-crypto: decrypt_crypto_object
jwe-jwk: decrypt_crypto_jwk_variable_name
jws-crypto: verify_crypto_object
jws-jwk: verify_crypto_jwk_variable_name

```

## Properties

The following table describes the policy properties:

Table 2. Validate JWT policy properties

Property	Required	Description	Data type
version	Yes	The policy version number	string
title	Yes	The title of the policy.	string
description	No	A description of the policy.	string
jwt	Yes	Context or runtime variable that contains the JWT to be validated. The default value is: <code>request.headers.authorization</code> . However, if this property is not set, the policy looks for the JWT in the <code>request.headers.authorization</code> location by default.  Note: The format of the authorization header must be:  " <b>Authorization: Bearer <code>jwt-token</code></b> "  where <code>jwt-token</code> is the encoded JWT.	string
output-claims	Yes	Runtime variable to which the full set of claims that are contained in the JWT is assigned. The default value is: <code>decoded.claims</code> .	string
iss-claim	No	The Perl Compatible Regular Expressions (PCRE) to use to validate the Issuer (iss) claim.	string
aud-claim	No	The PCRE to use to validate the Audience (aud) claim.	string
jwe-crypto	No	The cryptographic object (a shared key or certificate) to use to decode the claim. A JWK and a Crypto Object are both valid ways of providing the cryptographic data necessary to decrypt the JWT. However, if both data types are specified, only the Crypto Object is used.	string
jwe-jwk	No	Runtime variable that contains the JWK to use to decrypt the JWT. A JWK and a Crypto Object are both valid ways of providing the cryptographic data necessary to decrypt the JWT. However, if both data types are specified, only the Crypto Object is used.	string
jws-crypto	No	The cryptographic object (a shared key or certificate) to use to verify the signature. A JWK, or JWK set, and a Crypto Object are both valid ways of providing the cryptographic data necessary to verify the JWT. However, if both data types are specified, only the Crypto Object is used.	string
jws-jwk	No	Runtime variable that contains the JWK, or JWK set, to use to verify the signature. A JWK, or JWK set, and a Crypto Object are both valid ways of providing the cryptographic data necessary to verify the JWT. However, if both data types are specified, only the Crypto Object is used.	string

## Example

The following is an example of a `jwt-validate` policy:

```

- jwt-validate:
  version: 1.0.0
  title: jwt-validate
  jwt: request.headers.authorization
  output-claims: decoded.claims
  iss-claim: "'^data.*'"
  aud-claim: "'^id.*'"
  jwe-crypto: jweCryptoObjectName
  jwe-jwk: jwe.jwk
  jws-crypto: jwsCryptoObjectName
  jws-jwk: jws.jwk

```

For more information about how to use a `jwt-validate` security policy, see [Validate JWT](#) in the built-in policies section.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## log

Use the log policy to customize or override the default activity logging configuration for an API.

## Gateway support

Table 1. Table showing which gateways support this policy, and the

corresponding policy version

Gateway	Policy version
DataPower® API Gateway, policy available from V2018.4.1.7	2.0.0

This topic describes how to configure the policy in your OpenAPI source; for details on how to configure the policy in the assembly user interface, see [Log](#).

## About

The log policy has the following format:

```
- log:  
  version: version  
  title: title  
  description: description  
  mode: activity_logging_actions
```

## Properties

The following table describes the properties of the log policy.

Table 2. log policy properties

Property	Required	Description	Data type
version	Yes	The policy version number	string
title	No	A title for the policy.	string
description	No	A policy description.	string
mode	Yes	<p>Specify one of the following values:</p> <ul style="list-style-type: none"><li><b>gather-only</b>: gather all analytics data and write it to the <code>log</code> context variable, which populates the API event record on completion of the API execution. For more information on the fields in the <code>log</code> context variable, and the consequent API event record, see <a href="#">API event record fields</a>.</li><li><b>send-only</b>: perform the following actions:<ul style="list-style-type: none"><li>Read the data from the <code>log</code> context variable.</li><li>Truncate all message payloads and convert to a textual representation.</li><li>Send the data to the analytics server.</li></ul></li><li><b>gather-and-send</b>: perform a <b>gather-only</b> operation, immediately followed by a <b>send-only</b> operation.</li></ul> <p>If you use the Send-only or Gather-and-send option, data is buffered and sent to the analytics server in batches according to the time interval configured for the Analytics Endpoint on the DataPower API Gateway. For more information, see <a href="#">Configuring an analytics endpoint</a> in the DataPower knowledge center.</p> <p>Note: If you are offloading to a third party analytics server, you can redact any aspect of the event data. If you are using API Connect analytics, you can redact only request and response payloads.</p>	string

## Example

```
- log:  
  version: 2.0.0  
  title: Gather activity log data for processing  
  mode: gather-only
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## map

Use the map policy to transform your assembly flow and specify relationships between variables.

## Gateway support

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® Gateway (v5 compatible)	1.0.0
DataPower API Gateway	2.0.0

This topic describes how to configure the policy in your OpenAPI source; for details on how to configure the policy in the assembly user interface, see [Map](#).

## About

For information about the use and structure of the map policy, see [The Map policy structure](#). For more information about API properties that affect the map policy, see [API properties](#).

The map policy has the following format:

```

- map
  version: version
  title: title
  description: description

  inputs:
  - input_1:
    variable: context_1
    $ref: '#/definitions/definition_1'
  - input_2
    variable: context_2
    type: type_2
    content: content_type

  outputs:
  - output_3
    variable: context_3
    type: type_3

  actions:
  - set: output_3.output_property_3
    from: input_1.input_property_1

  - set: output3.output_property_3
    from:
      - input1.input_property_1
      - input2.input_property_2
    value: 'script A'
    default: 'default A'

  - create: output3.output_property_3
    from: input1.input_property_1
    foreach: input1.input_property_1
    actions:
      - further_actions
  options:

## Properties

Table 2.

Property	Required	Description	Data type	Belongs to
version	Yes	The policy version number.	string	N/A
title	No	A title for the policy.	String	N/A
description	No	A policy description.	String	N/A
inputs	No	An array listing the inputs of the map policy.	Object	N/A
outputs	Yes	An array listing the outputs of the map policy.	Object	N/A
variable	Yes	A reference to the context variable that is the location of the input or output variable..	String	inputs or outputs
\$ref	Yes <sup>1</sup>	A reference to the definition of the type of the variable.	String	inputs or outputs
type	Yes <sup>1</sup>	The type of the variable.	String	inputs or outputs
content	No	The content type of the variable: <code>application/xml</code> or <code>application/json</code> . If <code>None</code> is selected, or the field is not included, then the type is treated as JSON.	String	inputs or outputs
actions	Yes	Lists actions to be performed by the map policy.	Object	N/A
set	Yes <sup>2</sup>	Specifies by name the output variable that is to be set to a value by the action.	String	actions
create	Yes <sup>2</sup>	Specifies by name the output variable that is to have a value appended to it by the action.	String	actions
from	No	Specifies by name any input variables used by the action.	String	actions
value	No	Contains a script that maps and transforms input variables into output variables.	String	actions
default	No	Contains a static value, or an inline variable reference, to be applied to the output when no input value is provided. For information on inline variable references, see <a href="#">inline references</a> .	String	actions
foreach	No	Specifies by name an array for which further actions should be performed for each element.	String	actions
includeEmptyXMLElements	No	If set to <code>true</code> , empty XML elements are included in the output of the map policy. Set to <code>false</code> if you do not want empty XML elements to be included in the output of the map policy. The default value is <code>true</code> .	Boolean	options
namespaceInheritance	No	If set to <code>true</code> , XML namespaces are inherited from the parent element. Set to <code>false</code> if you want the map policy to use explicit namespaces. The default value is <code>true</code> .	Boolean	options
inlineNamespaces	No	If set to <code>true</code> , XML namespaces will be inserted into the document where they are first used. Set to <code>false</code> if you want namespaces to all be defined on the root element. The default value is <code>true</code> .	Boolean	options
<span style="border: 1px solid green; padding: 2px;">API Gateway only</span> mapResolveXMLInputDataType	No	If set to <code>true</code> , XML elements whose schema is configured as type boolean or numeric will be converted to that data type. Set to <code>false</code> if you want all XML element values to be returned as a string.	Boolean	options

Property	Required	Description	Data type	Belongs to
<div style="border: 1px solid green; padding: 2px; display: inline-block;">API Gateway only</div> mapXMLEmptyElement	No	<p>This property controls how the map policy handles the output of an empty XML element. Specify one of the following values:</p> <ul style="list-style-type: none"> <li><b>string</b> (the default option): An empty XML element is handled as an empty string.</li> <li><b>null</b>: An empty XML element is handled as a null value.</li> <li><b>none</b>: The data is ignored.</li> <li><div style="border: 1px solid green; padding: 2px; display: inline-block;">API Gateway only</div> <b>string-badgerfish</b>: The value for an empty XML element is considered to be an empty string. The empty string value will be placed into a JSON badgerfish value property.</li> <li><div style="border: 1px solid green; padding: 2px; display: inline-block;">API Gateway only</div> <b>null-badgerfish</b>: The value for an empty XML element is considered to be null. The null value will be placed into a JSON badgerfish value property. A mapping of this element to a JSON output property does not occur unless the <b>mapNullValue</b> property is set to <b>true</b>.</li> </ul>	String	options
<div style="border: 1px solid green; padding: 2px; display: inline-block;">API Gateway only</div> mapArrayFirstElementValue	No	<p>If set to <b>true</b>, then if an array is encountered in the traversal of the input, only the first element is used. Set to <b>false</b> if you want the map policy to use all array elements. The default value is <b>false</b>.</p>	Boolean	options
<div style="border: 1px solid green; padding: 2px; display: inline-block;">API Gateway only</div> mapResolveApicVariables	No	<p>If set to <b>true</b>, API Connect variable references found in the map properties are resolved. Set to <b>false</b> if you want the map policy to ignore API Connect variable references in the map policies. The default value is <b>true</b>.</p>	Boolean	options
<div style="border: 1px solid green; padding: 2px; display: inline-block;">API Gateway only</div> mapNullValue	No	<p>If set to <b>true</b>, an input property value with a null value is mapped to the output document. Set to <b>false</b> if you want the map policy to ignore null input values. The default value is <b>false</b>.</p>	Boolean	options
<div style="border: 1px solid green; padding: 2px; display: inline-block;">API Gateway only</div> mapOptimizeSchemaDefinition	No	<p>If set to <b>true</b>, complex schema types evaluation handles circular type references in an optimized manner. Set to <b>false</b> to evaluate these schema types in a standard manner. The default value is <b>false</b>.</p>	Boolean	options
<div style="border: 1px solid green; padding: 2px; display: inline-block;">API Gateway only</div> mapEmulateV4DefaultRequiredProps	No	<p>If set to <b>true</b>, default values are generated in the output for required properties that are either not mapped, or for which there is no input data present, in the following specific cases:</p> <ul style="list-style-type: none"> <li>An array consists of objects that contain one or more required properties.</li> <li>An object which is optional has one or more child properties that are required.</li> </ul> <p>By default, these required properties are not present in the output. If you set this property to <b>true</b>, these required properties will be present in the output. If the output schema defines a <b>default</b> property for the output property then the specified default value is used, otherwise default value is assigned dependent on the data type, as follows:</p> <ul style="list-style-type: none"> <li>String: empty string ("")</li> <li>Number: 0</li> <li>Boolean: false</li> <li>Object: empty object</li> <li>Array: empty array</li> </ul> <p>Example 1</p> <p>The input data has the following array of objects:</p> <pre>[{"a": "value1"}, {"a": "value2", "b": "value3"}]</pre> <p>The output schema defines the output object as having two properties, <b>a</b> and <b>b</b>, of which <b>b</b> is required. The map policy defines the following mappings:</p> <ul style="list-style-type: none"> <li><b>input.array.a</b> to <b>output.array.a</b></li> <li><b>input.array.b</b> to <b>output.array.b</b></li> </ul> <p>If this property is set to <b>true</b>, and <b>b</b> is either not mapped or has no input data present, then <b>b</b> is assigned a default value of an empty string, and the output is as follows:</p> <pre>[{"a": "value1", "b": ""}, {"a": "value2", "b": "value3"}]</pre> <p>Example 2</p> <p>The output schema defines the following structure:</p> <pre>{"a" : {"b" : {"c" : "value1", "d" : "value2"} } }</pre> <p>Property <b>b</b> is optional but property <b>d</b> within <b>b</b> is required.</p> <p>The map policy defines a mapping to <b>output.a.b.c</b>.</p> <p>If this property is set to <b>true</b>, and <b>d</b> is not mapped, then <b>d</b> is assigned a default value of an empty string, and the output is as follows:</p> <pre>{"a" : {"b" : {"c" : "value1", "d" : ""} } }</pre> <p>If this property is set to <b>false</b>, these required properties are <b>not</b> created in the output with their default values.</p> <p>The default value is <b>false</b>.</p>	Boolean	options

Property	Required	Description	Data type	Belongs to
<span>API Gateway only</span> mapEnablePostProcessingJSON	No	If set to <b>true</b> , mapped JSON output is post processed. The post processing of JSON output will use the output schema to ensure that property values are of the same data type as that defined in the schema. It will also normalize output property values that have a Badgerfish JSON syntax due to object mapping of an XML input. Set to <b>false</b> if you want no post processing of mapped JSON output. The default value is <b>false</b> .	Boolean	options
<span>API Gateway only</span> mapCreateEmptyArray	No	This property controls how the map policy handles the output of an empty array. Specify one of the following values: <ul style="list-style-type: none"> <li><b>all</b>: Output all empty arrays, including empty children arrays.</li> <li><b>parent</b>: Output only the current property's empty array value. Children map actions of this property are not attempted.</li> <li><b>none</b>: Prevent any empty output array values from being produced.</li> </ul> The default value is <b>all</b> .	String	options
<span>API Gateway only</span> mapReferenceLimit	No	Set the value of this property to an integer value that specifies the maximum allowed number of iterations of a circular schema definition. The default value is 1, which means that circular schema definitions are not followed. The maximum possible value is 5. If you specify a value greater than 5, a value of 5 is assumed. If you specify a non-numeric value, a value of 1 is assumed.	String	options
messagesInputData	No	This property defines the severity level for log messages that relate to input data. Specify one of the following values: <ul style="list-style-type: none"> <li><b>error</b></li> <li><b>warn</b></li> <li><b>info</b></li> </ul>	String	options
<span>API Gateway only</span> mapEmulateV4EmptyJSONObject	No	If a mapping fails because its input is not present and there is no default mapping configured, the default behavior is to not to make any change to the output mapping. Set this property to <b>true</b> to create an empty object for the parent of the target mapping, emulating the behavior of IBM® API Management Version 4.0.  Example The map policy defines a mapping to <b>output.a.b.c</b> . If input data is present, the output is as follows: <pre> {   "a": {     "b": {       "c": "inputvalue"     }   } } </pre> If there is no input data, and the mapEmulateV4EmptyJSONObject option is set to <b>true</b> , the output is as follows: <pre> {   "a": {     "b": {     }   } } </pre> Properties <b>a</b> and <b>b</b> are created but the value of <b>b</b> is an empty object. The default value is <b>false</b> .	Boolean	options

<sup>1</sup> There must be one of \$ref or type in the description of a variable.

<sup>2</sup> There must be one of set or create in an actions field.

## Example

```

- map:
  version: 1.0.0
  title: Output mapping
  inputs:
    Monthly_cost:
      schema:
        type: double
      variable: loan_invoke.body.monthly_payment
      content: application/json
    Duration:
      schema:
        type: integer
      variable: request.parameters.duration
  outputs:
    Quote_Output:
      schema:
        $ref: '#/definitions/Quote_Output'
      variable: message.body
      content: application/json
  actions:
    - set: Quote_Output.monthly_repayment
      from: Monthly_cost

```

```

value: ''
- set: Quote_Output.total_cost
  from:
    - Duration
    - Monthly_cost
  value: '$(Duration)*$(Monthly_cost)'
description: Maps and transforms contexts to the operation output.
options:
  includeEmptyXMLElements: false
  namespaceInheritance: false
  inlineNamespaces: false
  API Gateway only mapResolveXMLInputDataType: true
  API Gateway only mapXMLEmptyElement: null
  API Gateway only mapArrayFirstElementValue: false
  API Gateway only mapResolveApicVariables: false
  API Gateway only mapNullValue: true
  API Gateway only mapOptimizeSchemaDefinition: true
  API Gateway only mapCreateEmptyArray: parent
  API Gateway only mapReferenceLimit: 5
messagesInputData: warn
mapEmulateV4EmptyJSONObject: true

```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details. For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## operation-switch

Use the operation-switch construct when you want to execute alternative policy assemblies, conditional on the operation that is being called.

## Gateway support

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® Gateway (v5 compatible)	1.0.0
DataPower API Gateway, policy available from V2018.4.1.0, functionality provided by <a href="#">switch</a>	

This topic describes how to configure the policy in your OpenAPI source; for details on how to configure the policy in the assembly user interface, see [operation-switch](#).

## About

An operation can be described with a **verb/path** pair, or with an **operationId**. The **operationIds** are strings, or names, that are defined in the OpenAPI document.

The operation-switch policy has the following format:

```

- operation-switch:
  version: version
  title: title
  description: description
  case:
    - operations:
      - verb: operation_verb_1_1
        path: operation_path_1_1
      - verb: operation_verb_1_2
        path: operation_path_1_2
      .
      .
      further verb/path combinations
      .
      .
    execute:
      policy_assembly_1 ...
    - operations:
      - verb: operation_verb_2_1
        path: operation_path_2_1
      - verb: operation_verb_2_2
        path: operation_path_2_2
      .
      .
      further verb/path combinations
      .
      .

```

```

execute:
  policy_assembly_2 ...
  .
  .
- operations:
- operationID_3_1
- operationID_3_2
- operationID_3_3
  .
  .
  further operationIDs
  .
  .
execute:
  policy_assembly_3 ...
  .
  .
  further operations sections
  .
  .

```

For each **operations:** section, if the operation that is being called matches any of the **verb/path** combinations or **operationId** strings listed in that **operations:** section, then the policy assembly that is defined in the **execute:** section is executed. Therefore, each **operations:** section defines execution of a policy assembly conditional on the operation that is being called.

You can have as many **operations:** sections as you want, and each **operations:** section can have one or more **verb/path** combinations or **operationId** strings.

The **execute:** section can define any policy assembly, including further operation-switch policies.

## Properties

Table 2. operation-switch policy properties

Property	Required	Description	Data type	
version	Yes	The policy version number	string	
title	No	A title for the policy.	string	N/A
description	No	A policy description.	string	N/A
case	Yes	An array containing different cases, each entry contains an operations and execute field.	array (object)	N/A
operations	Yes	The operations to which a case applies.	object	case
verb	No	An operation verb. Valid values: <ul style="list-style-type: none"><li>• GET</li><li>• POST</li><li>• PUT</li><li>• DELETE</li><li>• HEAD</li><li>• PATCH</li><li>• OPTIONS</li></ul>	string	operations
path	No	A relative path to an individual endpoint. For example, <code>/account_status</code> .	string	operations
operationID	No	The operation is defined in OpenAPI. The policy operation refers to the OpenAPI operation.	string	operations
execute	Yes	The policy assembly that you want to execute if the operation that is being called matches any one of the verb/path combinations. For more information, see <a href="#">execute</a> .	string	case

## Example

Example that defines match operations with **verb/path** combinations:

**# carry out different redaction actions depending on the operation**

```

- operation-switch:
  version: 1.0.0
  title: clear_region_and_set_body
  case:
  - operations:
    - verb: GET
      path: /account_details
      execute:
        - redact:
            title: remove secret field
            actions:
              - action: remove
                from: all
                path: /document/user/secret
  - operations:
    - verb: GET
      path: /account_status
      execute:
        - redact:

```

```

    title: redact address
    actions:
      - action: redact
        from: response
        path: /**[@name='secondaryAddress']/**[@name='streetAddress']

```

Example that defines match operation with `operationIDs`:

```

# match on operationIDs

- operation-switch:
  title: customer_actions
  case:
    - operations:
      - getCustomerByName
      - deleteCustomer
      - addACustomer
    execute:
      .
      .
      .

```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details. For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## oauth

Use the oauth policy to policy to perform OAuth processing based on defined OAuth provider settings.

## Gateway support

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® API Gateway	2.0.0

This topic describes how to configure the policy in your OpenAPI source; for details on how to configure the policy in the assembly user interface, see [OAuth](#).

## About

The oauth policy has the following format:

```

- oauth:
  version: version
  title: title
  description: description
  oauth-provider-settings-ref:
    .
    .
    .
  references_to_oauth_settings
    .
    .
    .
  supported-oauth-components:
    - oauth_component_1
    - oauth_component_2
    .
    .
    .

```

Note: You add an oauth policy to the OpenAPI source in a native OAuth provider. For more information, see the following topics:

- [Editing the native OAuth provider configuration using the API Editor](#) (Cloud Manager UI)
- [Editing the native OAuth provider configuration using the API Editor](#) (API Manager UI)

## Properties

Table 2. oauth policy properties

Property	Required	Description	Data type
version	Yes	The policy version number	string
title	No	A title for the policy.	string
description	No	A description of the policy.	string
oauth-provider-settings-ref: default	Yes	The name of an existing OAuth provider that defines the required settings.	string

Property	Required	Description	Data type
<code>oauth-provider-settings-ref:url</code>	No	A URL to a document that contains serialized XML or JSON properties that defines OAuth token generate settings. URL reference takes precedence over any existing literal configuration or object reference.	string
<code>oauth-provider-settings-ref:literal</code>	No	A literal string that contains serialized XML or JSON properties that defines OAuth token generate settings. Literal configuration takes precedence over any existing object reference.	string
<code>supported-oauth-components:</code> - <code>  oauth_component_1</code> - <code>  oauth_component_2</code> . .	Yes	Specify the OAuth components that are supported by this policy, as follows:  - OAuthValidateRequest Validates the authorization request from the client. - OAuthGenerateAZCode Generates the authorization code for the client, which represents the resource owner's authorization that grants access to the requested resource. - OAuthVerifyAZCode Verifies the authorization code from the client. - OAuthVerifyRefreshToken Verifies the refresh token that is presented by the client. - OAuthCollectMetadata Collects metadata about a client for later user interaction - OAuthGenerateAccessToken Generates the access token to the client when the authorization code or refresh token is verified. - OAuthIntrospectToken Introspects the token to determine its state and, when active, its metadata.	string

## Overriding default OAuth provider settings

You can use either the `literal` property or the `url` property to dynamically override any OAuth provider configuration settings to dynamically override any OAuth provider configuration settings defined by the `default` property.

For example, to override the access token expiration time with a value of 200 seconds, include the following configuration in either the literal string or the document at the specified URL:

```
<OAuthProviderSettings><APICAccessTokenTTL>200</APICAccessTokenTTL></OAuthProviderSettings>
```

For a list of all OAuth provider settings, refer to the `OAuthProviderSettings` management schema, defined in the `xml-mgmt.xsd` file located in the store: directory on the DataPower API Gateway.

If you are using the API Manager user interface, the connection details are determined by the API Manager URL that you open, and the user ID with which you log in. If you are using the API Designer user interface, you provide the management server details and user ID in the login window that opens when you first launch API Designer; see [Logging into API Connect Designer](#).

## oauth policy example

```
- oauth:
  version: 2.0.0
  title: my-oauth-policy
  oauth-provider-settings-ref:
    default: my-oauth
  supported-oauth-components:
    - OAuthGenerateAZCode
    - OAuthGenerateAccessToken
    - OAuthIntrospectToken
    - OAuthVerifyAZCode
    - OAuthVerifyRefreshToken
```

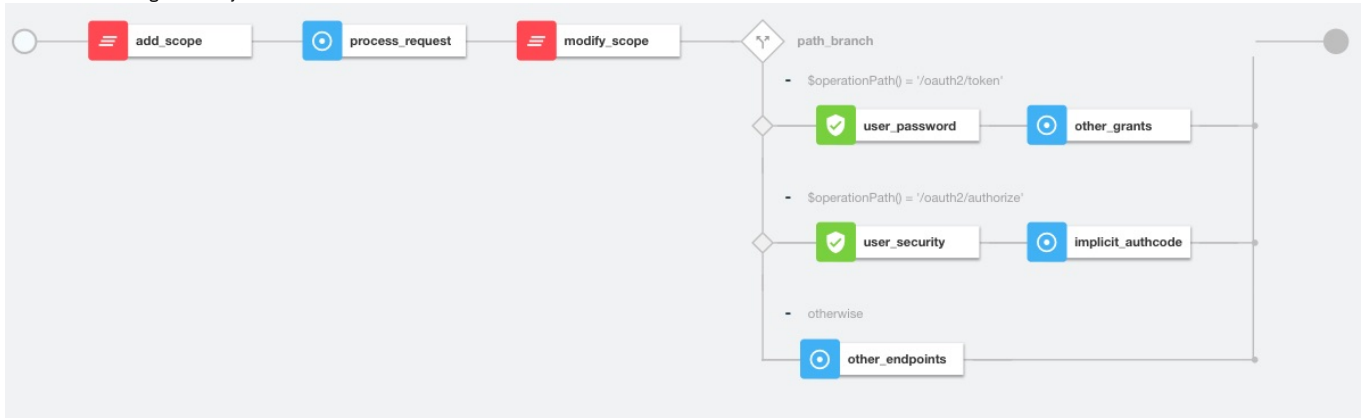

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details. For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Example - using multiple OAuth policies in an OAuth provider assembly

This example demonstrates the use of multiple OAuth policies in the assembly flow for a native OAuth provider.

The example is based on the default assembly that is generated when you create a native OAuth provider, and is customized with the addition of `gatewayscript` policies that use [OAuth context variables](#) to manipulate the OAuth flow. For details on creating a native OAuth provider, see [Configuring a native OAuth provider](#).

It has the following assembly flow:

The following sections describe the OpenAPI source code that underlies each of the policies in the assembly; for the complete assembly code, download [multiple\\_oauth\\_policies.txt](#).

## Sample policy to add a custom scope

The `add_scope` policy is a `gatewayscript` policy that adds a custom scope to the request.

The underlying OpenAPI source YAML is as follows:

```
- gatewayscript:
  version: 2.0.0
  title: add_scope
  source: |-
    // Add another custom scope to the request
    let scope = context.get("request.parameters.scope.values[0]");
    if (scope)
      context.set("oauth.processing.scope", scope + " custom");
```

## Validate the initial OAuth request

The first `process_request` policy is an `oauth` policy that processes the initial request and verifies that the request is valid. The result of the processing is stored automatically in the `oauth.processing` context variables for use, as required, by the next OAuth policy in the assembly flow.

The underlying OpenAPI source YAML is as follows:

```
- oauth:
  title: process_request
  version: 2.0.0
  description: >-
    This oauth policy performs all OAuth/OpenID Connect protocol steps
    that are needed for OAuth Validation by default. The inputs and
    outputs of each of the steps are driven by documented context
    variables. Add or remove the Supported OAuth Components as required.
  oauth-provider-settings-ref:
    default: custom-form
  supported-oauth-components:
    - OAuthValidateRequest
```

## Sample policy to modify the scope

The `modify_scope` policy is a `gatewayscript` policy that modifies the scope depending on the calling application.

The underlying OpenAPI source YAML is as follows:

```
- gatewayscript:
  version: 2.0.0
  title: modify_scope
  source: |-
    let admin_id = '1f1a2aa4-db9f-4423-b2f1-e2572b12123a';

    // Check application and modify the scope
    let app = context.get("oauth.processing.client_id");
    let scope = context.get("oauth.processing.scope");
    if (app === admin_id) {
      context.set("oauth.processing.scope", scope + " admin");
    } else {
      context.set("oauth.processing.scope", scope + " customer");
    }
  }
```

## Branch conditionally according to the OAuth path

The `path_branch` policy is a `switch` policy that branches according to the different OAuth paths to process the resource owner.

The underlying OpenAPI source YAML is as follows:

```

- switch:
  version: 2.0.0
  title: path_branch
  case:
    - condition: ($operationPath() = '/oauth2/token')
      execute:
        .
        .
        .
        definition of the user_security and other_grants policies
        .
        .
    - condition: ($operationPath() = '/oauth2/authorize')
      execute:
        .
        .
        .
        definition of the user_password and implicit_authcode policies
        .
        .
    - otherwise:
        .
        .
        .
        definition of the other_endpoints policy
        .
        .

```

## Process the user name and password, and enable grant type component

The following two policies operate on the token endpoint.

- The `user_password` policy for password grant type processes the user name and password from the `x-www-form-urlencoded` body. The authentication method is derived from the User Security settings in the OAuth provider; see [Configuring user security for a native OAuth provider](#).
- The `other_grants` policy is an `oauth` policy that enables the `OAuthGenerateAccessToken`, `OAuthVerifyAZCode`, `OAuthVerifyRefreshToken`, and `OAuthCollectMetadata` components to perform the operations for client credentials, authorization code, refresh token, and password grant types.

The underlying OpenAPI source YAML is as follows:

```

- user-security:
  title: user_password
  version: 2.0.0
  description: ''
  factor-id: default
  extract-identity-method: context-var
  user-context-var: request.parameters.username.values
  pass-context-var: request.parameters.password.values
  ei-stop-on-error: false
  user-auth-method: auth-url
  au-stop-on-error: false
  auth-url: 'http://httpbin.org/basic-auth/user/pass'
  user-az-method: authenticated
  az-stop-on-error: true
  auth-response-headers-pattern: (?)*x-api*
  auth-response-header-credential: X-API-Authenticated-Credential
- oauth:
  title: other_grants
  version: 2.0.0
  description: >-
    This oauth policy performs all OAuth/OpenID Connect
    protocol steps that are needed for token path by default.
    The inputs and outputs of each of the steps are driven by
    documented context variables. Add or remove the Supported
    OAuth Components as required.
  oauth-provider-settings-ref:
    default: custom-form
  supported-oauth-components:
    - OAuthGenerateAccessToken
    - OAuthVerifyAZCode
    - OAuthVerifyRefreshToken
    - OAuthCollectMetadata

```

## Perform authorization checks, and enable grant type components

These following two policies operate on the authorize endpoint.

- The `user_security` policy configuration is derived from the User Security settings in the OAuth provider; see [Configuring user security for a native OAuth provider](#).
- The `implicit_authcode` policy is an `oauth` policy that enables the `OAuthGenerateAZCode`, `OAuthGenerateAccessToken`, and `OAuthCollectMetadata` components to perform the operations for the implicit and authorization code grant types.

The underlying OpenAPI source YAML is as follows:

```

- user-security:
  title: user_security
  version: 2.0.0
  description: >-
    This user security policy performs EI(basic) and AU(auth

```

```

    url) check for oauth assembly. Change the security check
    method as required
    factor-id: default
    extract-identity-method: basic
    ei-stop-on-error: true
    user-auth-method: auth-url
    au-stop-on-error: true
    user-az-method: authenticated
    az-stop-on-error: true
    auth-response-headers-pattern: (?x-api*
    auth-response-header-credential: X-API-Authenticated-Credential
    auth-url: 'http://httpbin.org/basic-auth/user/pass'
- oauth:
  title: implicit_authcode
  version: 2.0.0
  description: >-
    This oauth policy performs all OAuth/OpenID Connect
    protocol steps that are needed for az code path by
    default. The inputs and outputs of each of the steps are
    driven by documented context variables. Add or remove the
    Supported OAuth Components as required.
  oauth-provider-settings-ref:
    default: custom-form
  supported-oauth-components:
    - OAuthGenerateAZCode
    - OAuthGenerateAccessToken
    - OAuthCollectMetadata

```

## Process all other endpoints

The **otherwise** condition catches all other endpoints such as the introspect and revoke endpoints. The **other\_endpoints** policy in the **otherwise** condition is an **oauth** policy that enables the **OAuthIntrospectToken**, and **OAuthRevokeTokencomponents** components to perform the operations for introspect and revoke.

The underlying OpenAPI source YAML is as follows:

```

- oauth:
  title: other_endpoints
  version: 2.0.0
  description: >-
    This oauth policy performs all OAuth/OpenID Connect
    protocol steps that are needed for all other paths by
    default. The inputs and outputs of each of the steps are
    driven by documented context variables. Add or remove the
    Supported OAuth Components as required.
  oauth-provider-settings-ref:
    default: custom-form
  supported-oauth-components:
    - OAuthIntrospectToken
    - OAuthRevokeToken

```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details. For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## parse

Use the parse policy to control the parsing of an input document.

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® API Gateway	2.0.0

This topic describes how to configure the policy in your OpenAPI source; for details on how to configure the policy in the assembly user interface, see [Parse](#).

## About

When the input document is a JSON string, the string is parsed instead of copied over. You can re-parse a JSON string as any of the allowed doc types (`detect`, `xml`, `json`, `binary`). For example, suppose that the JSON string "`<a></b></a>`" is parsed. You can re-parse it using doc type `xml` to extract the XML from that string.

The parse policy has the following format:

```
- parse:
  version: version
  title: title
  description: description
  use-content-type: request_header_usage_setting
  parse-settings-reference:
    .
    .
    .
    references_to_parse_settings
    .
    .
    .
  input: input_message
  output: output_message
```

## Properties

Table 2. parse policy properties

Property	Required	Description	Data type
version	Yes	The policy version number.	string
title	No	The title of the policy.	string
description	No	A description of the policy.	string
use-content-type	No	If this setting is enabled and the parse setting is configured to detect the document type, the parse action uses the <b>Content-Type</b> specified in the request headers. If this setting is enabled and the document type in the parse setting is configured for either JSON or XML, the parse action uses the <b>Content-Type</b> specified in the request headers and fails if the <b>Content-Type</b> in the request headers does not match the parse setting.  Enabling this setting is applicable only when the expected <b>Content-Type</b> is either JSON or XML.  If this setting is not enabled, the parse action uses either the document type specified in the parse setting, or the detected document type if the parse setting is configured to detect the document type.  The default value is <b>false</b> .	boolean
parse-settings-reference: default	No	An existing valid object from which to retrieve default property values for the dynamic object.	string
parse-settings-reference: literal	No	A literal string as serialized XML or JSON properties that are merged into the dynamic object. The literal property overrides any existing default properties.	string
parse-settings-reference: url	No	A URL that represents a named context from which to retrieve the serialized XML or JSON properties that are merged into the dynamic object. These properties override any existing literal or default properties.	string
input	No	The name of a variable in the API context. The content of the <b>body</b> field of the variable is the input to the policy. The default variable name is <b>message</b> .	string
output	No	The name of a variable in the API context. The content of the body field of the variable is the output of the parse operation. The parse metrics of the parsed document can be stored in a different part of the message. The default variable name is the same as the input name, so by default the input message is overwritten by the output message.	string

## parse policy example

```
- parse:
  version: 2.0.0
  title: my-parse-policy
  use-content-type: true
  parse-settings-reference:
    default: my-parse
  input: input-message
  output: output-message
```

## parse-settings-reference: literal example 1

In XML:

```
- parse:
  version: 2.0.0
  title: parse
  parse-settings-reference:
    default: apic-default-parsesettings
    literal: <ParseSettings><DocumentType>xml</DocumentType></ParseSettings>
```

In JSON:

```
- parse:
  version: 2.0.0
  title: parse
  parse-settings-reference:
  default: apic-default-parsesettings
  literal: { \"ParseSettings\" : { \"DocumentType\" : xml } }
```

## parse-settings-reference: literal example 2

You can use the literal to reduce the maximum allowed payload for a particular API by setting the DocumentSize value. By default, API Connect sets the maximum payload for an API to approximately 4.2 MB. The following example lowers the maximum to 2 MB (2000000 bytes):

In XML:

```
- parse:
  version: 2.0.0
  title: parse
  parse-settings-reference:
  default: apic-default-parsesettings
  literal: <ParseSettings><DocumentSize>2000000</DocumentSize></ParseSettings>
```

In JSON:

```
- parse:
  version: 2.0.0
  title: parse
  parse-settings-reference:
  default: apic-default-parsesettings
  literal: { \"ParseSettings\" : { \"DocumentSize\" : 2000000 } }
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details. For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## proxy

Apply the proxy policy to proxy another API within your operation, particularly if you need to call a large payload.

## Gateway support

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® Gateway (v5 compatible)	1.0.0
DataPower API Gateway, functionality provided by <a href="#">invoke</a>	

This topic describes how to configure the policy in your OpenAPI source; for details on how to configure the policy in the assembly user interface, see [Proxy](#).

## About

Keep the following considerations in mind regarding the proxy policy.

- Only one proxy policy is permitted to be called per assembly.
- More than one proxy policy can be applied, if they are contained in mutually exclusive branches of the assembly.
- You can use the proxy policy to return multipart form data, that is, when the response is set to Content-Type: multipart/related. However, proxy must be the final policy in the assembly, otherwise the response that is received is manipulated causing the multipart form data to be lost.
- The proxy policy, if inside a conditional policy, must be the **final** policy to be executed in the API. If you need further processing afterward, use the [invoke](#) policy rather than the proxy policy.
- The Proxy policy does not currently attempt to rewrite a Location header that is returned from the back end.

The proxy policy has the following structure:

```
- proxy:
  version: version
  title: title
  description: description
  target-url: URL_of_target_API
  tls-profile: TLS_profile_to_be_used
  verb: method_type
  http-version: HTTP_version
  timeout: timeout_value_in_seconds
  compression: is_data_to_be_compressed
  username: username_if_authentication_required
  password: password_if_authentication_required
  output: location_of_the_proxy_result
  cache-key: unique_identifier_of_the_document_cache_entry
  cache-response: cache_behavior
  cache-putpost-response: response_caching_behavior
```

```
cache-ttl: cache_time_to_live
stop-on-error: errors_that_stop_the_flow
```

## Properties

The table describes the properties of the proxy policy.

Table 2. Proxy policy properties

Property	Required	Description	Data type
version	Yes	The policy version number	string
title	No	A title for the policy.	string
description	No	A policy description.	string
target-url	Yes	The URL of the target API.	string
tls-profile	No	The TLS profile to be used.	string
verb	No	The operation method type.  Valid values: <ul style="list-style-type: none"> <li>• Keep</li> <li>• GET</li> <li>• POST</li> <li>• PUT</li> <li>• DELETE</li> <li>• PATCH</li> <li>• HEAD</li> <li>• OPTIONS</li> </ul> The default value is <b>Keep</b> .	string
http-version	No	The HTTP version. The default value is <b>1.1</b> .	string
timeout	No	The timeout value in seconds. The default value is <b>60</b> .	integer
compression	No	Specifies whether data is to be compressed by using <b>gzip</b> before it is uploaded. The default value is <b>false</b> .	boolean
username	No	The user name, if authentication is required.	string
password	No	The password, if authentication is required.	string
output	No	Specifies the location of the proxy result. By default, the proxy result, that is the body, headers, statusCode and statusMessage, is saved in the variable <b>context.message</b> . The assembly developers can specify an additional location to store the proxy result with the output property.	string
cache-key	No	Specifies the unique identifier of the document cache entry.	string
cache-response	No	The cache response type. Valid values: <ul style="list-style-type: none"> <li>• protocol: The cache behavior is defined by the Cache-Control headers on the request and response.</li> <li>• no-cache: Specifies that there is no caching. However, if the document is already in the cache, the document is retrieved from the cache.</li> <li>• time-to-live: Specifies that the response stays in the cache for the specified time.</li> </ul> The default value is <b>protocol</b> .	string
cache-putpost-response	No	Specifies whether to cache the response from POST and PUT requests. Caching the response from POST and PUT requests can reduce server load and reduce latency in the response to the client request. The default value is <b>false</b> .	boolean
cache-ttl	No	Specifies the amount of time in seconds that the response stays in the cache. Applies only if the property cache-response is set to <b>time-to-live</b> . Enter a value in the range 5 - 31708800. The default value is <b>900</b> .	integer
stop-on-error	No	List the errors that, if thrown during the policy execution, cause the flow to stop. If there is a <b>catch</b> flow configured for the error, it is triggered to handle the error thrown. If an error is thrown and there are no errors specified for the Stop on error property, or if the error thrown is not one of the specified errors, the policy execution is allowed to complete, and the assembly flow continues.	string

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

API Gateway only

## ratelimit

Use the ratelimit policy to apply one or more rate or burst limits at any point in your API assembly flow. Rate and burst limits restrict the number of calls made to an API in a specified time period.

## Gateway support

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® API Gateway, policy available from V2018.4.1.7	2.0.0

This topic describes how to configure the policy in your OpenAPI source; for details on how to configure the policy in the assembly user interface, see [Rate Limit](#).

## About

The defined rate and burst limits are applied to whatever follows in the assembly flow. For example, if a ratelimit policy is placed before an invoke policy, and the call made by the invoke policy exceeds the limits defined by the ratelimit policy, the API call itself fails.

The ratelimit policy has the following format:

```
- ratelimit:  
  version: version  
  title: title  
  description: description  
  source: rate_and_burst_limit_location  
  rate-limit: rate_limits_to_apply  
  burst-limit: burst_limits_to_apply
```

## Properties

The following table describes the properties of the ratelimit policy.

Table 2. ratelimit policy properties

Property	Required	Description	Data type
version	Yes	The policy version number	string
title	No	A title for the policy.	string
description	No	A policy description.	string
source	Yes	The location of all the rate limit and burst limit definitions that are included in this policy. Specify one of the following values: <ul style="list-style-type: none"><li><b>catalog-named:</b> the rate or burst limits to be applied are defined in the appropriate <b>api-collection</b> object on the DataPower API Gateway, which is the object that represents your API Connect Catalog in the gateway configuration. For details of how to configure a rate or burst limit in the <b>api-collection</b> object, see <a href="#">Configuring a rate or burst limit on the DataPower API Gateway</a>.</li><li><b>plan-default:</b> the rate and burst limits that are applied are the default ones configured in the Plan to which the calling application is subscribed. For details on how to configure default Plan rate and burst limits, see <a href="#">Editing a draft Product</a>.</li></ul>	string
rate-limit	Yes*	A list of rate limit names as defined in the DataPower API Gateway configuration. * You must provide at least one rate limit or at least one burst limit.	string
burst-limit	Yes*	A list of burst limit names as defined in the DataPower API Gateway configuration. * You must provide at least one rate limit or at least one burst limit.	string

## Example

```
- ratelimit:  
  version: 2.0.0  
  title: Apply rate and burst limits  
  source: catalog-named  
  rate-limit:  
    - 30perMinute  
    - 2000per3Hours  
  burst-limit:  
    - 5per10Seconds
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## redact - DataPower API Gateway

Use the redact policy to completely remove or to redact specified fields from the request body, the response body, and the activity logs. You might find this policy useful for removing or blocking out sensitive data (for example, credit card details) for legal, security, or other reasons.

## Gateway support

Note: This page describes the redact policy implementation in the DataPower® API Gateway. If you are using the DataPower Gateway (v5 compatible), see [redact - DataPower Gateway \(v5 compatible\)](#).

For information on the different types of gateway, see [API Connect gateway types](#).

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower API Gateway, policy available from V2018.4.1.7	2.0.0

This topic describes how to configure the policy in your OpenAPI source; for details on how to configure the policy in the assembly user interface, see [Redaction - DataPower API Gateway](#).

## About

The ratelimit policy has the following format:

```
- redact:
  version: version
  title: title
  description: description
  redactions:
    - action: remove_or_redact
      path: JSONata_expression_for_field_to_remove_or_redact
      .
      .
      .
  root: content_source
```

Note: With the DataPower API Gateway, the input to the redact policy must be parsed data. One way to produce parsed data is to use a [parse](#) policy before a redact policy in your assembly flow, which provides explicit control of the parse action.

## Properties

The following table describes the properties of the redact policy.

Table 2. redact policy properties

Property	Required	Description	Data type
version	Yes	The policy version number	string
title	No	A title for the policy.	string
description	No	A policy description.	string
root	No	Specifies the data source that contains the content to which the redact or remove action applies. If the root property is omitted, the action is applied to the entire API context. You can use any supported JSONata path expression.  If you want to apply the action to either request or response data, specify a value of <code>message.body</code> . The actual content to which the action is applied then depends on the positioning of the redact policy in the overall assembly flow; for example: <ul style="list-style-type: none"> <li>• If positioned at the beginning, the action is applied to the client request.</li> <li>• If positioned after an invoke policy, the action is applied to the response from the back end.</li> <li>• If positioned at the end, the action is applied to the response that is returned to the client.</li> </ul> If, in your assembly flow, the redact policy is used after a <a href="#">log</a> policy that specifies <code>gather-only</code> for the mode property, specify a root value of <code>log.request_body</code> for the logged request payload, or <code>log.response_body</code> for the logged response payload.	string
path	Yes	Specifies a JSONata path expression that identifies the fields to redact or remove from the source. For more information, see <a href="#">Constructing JSONata expressions to redact fields</a>	string
action	Yes	Specifies whether you want to remove or redact the content. Supply one of the following values: <ul style="list-style-type: none"> <li>• <code>remove</code>: Completely removes the specified fields.</li> <li>• <code>redact</code>: Redacts (obfuscates with "*"s) the fields to block out the data.</li> </ul> The default value is <code>redact</code> .  Note: If a numerical value is being redacted, the redacted value is depicted as <code>*****</code> and the type is changed to <code>string</code> .	string

## Example

# Specify separate remove and redact actions

```
- redact:
  version: 2.0.0
  title: remove price, redact author
  redactions:
    - action: remove
      path: xpath($, '//price')
    - action: redact
      path: $.**.author"
  root: message.body
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details. For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

# redact - DataPower Gateway (v5 compatible)

Use the redact policy to completely remove or to redact specified fields from the request body, the response body, and the activity logs. You might find this policy useful for removing or blocking out sensitive data (for example, credit card details) for legal, security, or other reasons.

## Gateway support

Note: This page describes the redact policy implementation in the DataPower® Gateway (v5 compatible). If you are using the DataPower API Gateway, see [redact - DataPower API Gateway](#).

For information on the different types of gateway, see [API Connect gateway types](#).

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower Gateway (v5 compatible)	1.0.0

This topic describes how to configure the policy in your OpenAPI source; for details on how to configure the policy in the assembly user interface, see [Redaction - DataPower Gateway \(v5 compatible\)](#).

## About

The redaction policy has the following format:

```
- redact:
  version: version
  title: title
  description: description
  actions:
    - action: remove_or_redact
      from:
        - where the redaction is to be applied
          path: XPath_expression_for_field_to_remove_or_redact
          .
          .
          further action/from/path combinations
          .
          .
```

You can specify as many **action/from/path** combinations as you want.

## Properties

The following table describes the policy properties:

Table 2. redact policy properties

Property	Required	Description	Data type
version	Yes	The policy version number	string
title	No	A title for the policy.	string
description	No	A policy description.	string
action	No	Specifies whether you want to remove or redact the fields. Valid values: <ul style="list-style-type: none"><li><b>remove</b>: Completely removes the specified fields.</li><li><b>redact</b>: Redacts (obfuscates with "*"s) the fields to block out the data.</li></ul> The default value is <b>redact</b> . Note: If a numerical value is being redacted, the redacted value is depicted as <b>*****</b> and the type is changed to <b>string</b> .	string
from	No	Determines where the redaction is to be applied. Valid values: <ul style="list-style-type: none"><li><b>all</b>: Apply the redaction to the request body, the response body, and the activity logs.</li><li><b>request</b>: Apply the redaction to the request body only.</li><li><b>response</b>: Apply the redaction to the response body only.</li><li><b>logs</b>: Apply the redaction to the activity logs only.</li></ul> You can supply one or more values. The default value is <b>all</b> .	string
path	Yes	Specifies an XPath expression that defines the fields to remove or redact. You can construct an XPath expression that is based on JSON or XML depending on whether your API requests and responses use a JSON or an XML format. If the payload is JSON, use the DataPower XML representation of the JSON content (JSONx) to construct the expression. Note: Use a JSONx representation only to identify the XPath expressions for the fields to remove or redact. Do not change the format of any response bodies in API Manager. To learn more about constructing XPath expressions that are based on JSON or XML, see <a href="#">Constructing XPath expressions to redact fields</a> .	string

## Example

```
# Specify separate remove and redact actions

- redact:
  version: 1.0.0
  title: remove secret field, redact address
  actions:
    - action: remove
      from:
        - all
      path: /document/user/secret
    - action: redact
      from:
        - request
        - response
      path: /**[@name='secondaryAddress']/*[@name='streetAddress']
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## set-variable

Use the set-variable policy to set the value of a runtime variable, or to add or clear a runtime variable.

## Gateway support

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® Gateway (v5 compatible)	1.0.0
DataPower API Gateway, policy available from V2018.4.1.0	2.0.0

This topic describes how to configure the policy in your OpenAPI source; for details on how to configure the policy in the assembly user interface, see [Set Variable](#).

## About

The set-variable policy has the following format:

```
- set-variable:
  version: version
  title: title
  description: description
  actions:
    - action_type: variable_name
      value: value
      type: data_type
```

## Properties

Table 2. set-variable policy properties

Property	Required	Description	Data type
version	Yes	The policy version number	string
title	No	A title for the policy.	string
description	No	A policy description.	string
actions	Yes	Lists the actions to be performed by the set-variable policy.	array
set	Yes <sup>1</sup>	For setting a variable. specifies the name of the variable that you want to set. <sup>1</sup> One of the properties set, add, or clear is required.	string
add	Yes <sup>2</sup>	For adding a variable. specifies the name of the variable that you want to add. <sup>2</sup> One of the properties set, add, or clear is required.	string
clear	Yes <sup>3</sup>	For clearing a variable. specifies the name of the variable that you want to clear. <sup>3</sup> One of the properties set, add, or clear is required.	string
value	Yes <sup>4</sup>	Allocates this value to the specified variable. Can be a literal value, or another variable. <sup>4</sup> value is required only when set or add is specified as the action.	string

Property	Required	Description	Data type
<b>API Gateway only</b> type	Yes	Specifies the data type of the variable. Valid values: <ul style="list-style-type: none"> <li>• any</li> <li>• string</li> <li>• number</li> <li>• boolean</li> </ul> For all values other than <b>any</b> , the value is validated against the specified data type. If the data type is specified as <b>boolean</b> , the value property must be set to <b>true</b> or <b>false</b> .	string

## Example 1

```
# clear a variable

set-variable:
  version: 1.0.0
  title: clear_region
  actions:
    - clear: message.headers.region
```

## Example 2

```
# set a variable to the value of an API Gateway context variable

set-variable:
  version: 2.0.0
  title: set content type
  actions:
    - set: message.headers.contenttype
      value: $(message.headers.content-type)
      type: string
```

## Example 3

```
# add a variable

assembly:
  execute:
    - set-variable:
        version: 2.0.0
        title: set-variable
        actions:
          - value: testing add
            add: message.headers.jja
            type: string
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## switch

Use the switch component to execute one of a number of sections of the assembly based on which specified condition is fulfilled.

## Gateway support

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® Gateway (v5 compatible)	1.0.0
DataPower API Gateway, policy available from V2018.4.1.0	2.0.0

This topic describes how to configure the policy in your OpenAPI source; for details on how to configure the policy in the assembly user interface, see [switch](#).

## About

The switch policy has the following format:

```
- switch:
  version: version
  title: switch
  description: 'Description'
  case:
    - condition: Script_1
```

```

execute:
  Assembly_Section_1
- condition: Script_2
  execute:
  Assembly_Section_2
- otherwise:
  Assembly_Section_3

```

The **execute**: section can define any policy assembly, including further switch policies. For more information, see [execute](#).

## Properties

Table 2. switch policy properties

Property	Required	Description	Data type
version	Yes	The policy version number	string
title	No	A title for the policy.	string
description	No	A policy description.	string
case	Yes	Contains the condition and execute pairs of the switch policy.	string
condition	Yes (one or more)	A script that returns <b>true</b> or <b>false</b> .  Use the JSONata expression language to define your condition. See <a href="#">Writing switch condition scripts - DataPower API Gateway</a> .  Use GatewayScript to define your condition. See <a href="#">Writing switch condition scripts - DataPower Gateway (v5 compatible)</a> .	string
execute	Yes (one per condition)	The policy assembly that you want to execute if the condition returns <b>true</b> . For more information, see <a href="#">execute</a> .	string
otherwise	No	The case you want to execute if no other cases are fulfilled. It functions in the same manner as an execute property. For more information, see <a href="#">execute</a> .	string

For examples, see one or other of the following topics, depending on which gateway type you are using:

- [Writing switch condition scripts - DataPower API Gateway](#)
- [Writing switch condition scripts - DataPower Gateway \(v5 compatible\)](#)

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
 For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Writing switch condition scripts - DataPower API Gateway

You write condition scripts for the switch policy in the DataPower® API Gateway by using the JSONata expression language.

The following JSONata functions are supported:

- Aggregation functions:
  - `$average (array)`
  - `$max (array)`
  - `$min (array)`
  - `$sum (array)`
- Array functions:
  - `$append (array1, array2)`
  - `$count (array)`
  - `$reverse (array)`
  - `$sort (array [, function])`
  - `$zip (array1, ...)`
- Boolean functions:
  - `$boolean (arg)`
  - `$exists (arg)`
  - `$not (arg)`
- Numeric functions:
  - `$abs (number)`
  - `$ceil (number)`
  - `$floor (number)`
  - `$formatBase (number [, radix])`
  - `$number (arg)`
  - `$power (base, exponent)`
  - `$round (number [, precision])`
  - `$sqrt (number)`
- Object functions:
  - `$keys (object)`
  - `$lookup (object, key)`
  - `$merge (array<object>)`
  - `$spread (object)`
- String functions:

- `$contains(str, pattern)`
- `$join(array[, separator])`
- `$length(str)`
- `$lowercase(str)`
- `$match(str, pattern [, limit])`
- `$pad(str, width [, char])`
- `$replace(str, pattern, replacement [, limit])`
- `$split(str, separator [, limit])`
- `$substring(str, start[, length])`
- `$substringAfter(str, chars)`
- `$substringBefore(str, chars)`
- `$trim(str)`
- `$uppercase(str)`

You can use the following JSONata numeric operators:

- + (addition)
- - (subtraction)
- \* (multiplication)
- / (division)
- % (modulo)

You can use the following JSONata comparison operators for number values or strings:

- =
- !=
- <
- >
- <=
- >=

You can also use the following functional extensions to standard JSONata notation. Each extension corresponds to a part of the API context.

Extension	Variable	Description
<code>\$header(name)</code>	<code>message.headers.name</code>	Message header
<code>\$httpVerb()</code>	<code>request.verb</code>	HTTP method of the request
<code>\$operationID()</code>	<code>api.operation.id</code>	ID of the operation
<code>\$operationPath()</code>	<code>api.operation.path</code>	Path of the operation
<code>\$queryParameter('name')</code>	<ul style="list-style-type: none"> <li>• <code>request.parameters.name.locations</code></li> <li>• <code>request.parameters.name.values</code></li> </ul>	Returns the value of a request query parameter given the parameter name. The function searches the <code>request.parameters.name.locations</code> array for the index position of the value <code>query</code> , and returns <code>request.parameters.name.values[index]</code> , where <code>index</code> is the index position. Parameter values are not URL decoded.
<code>\$statusCode()</code>	<code>message.status.code</code>	Status code
<code>\$storageType([arg])</code>	<p><code>variable.body</code></p> <p>You can specify any variable in the API context. When no variable is specified, the default variable <code>message.body</code> is used.</p>	Storage type of the message. The supported values are: <ul style="list-style-type: none"> <li>• <code>binary</code></li> <li>• <code>json</code></li> <li>• <code>stream</code></li> <li>• <code>xml</code></li> </ul>
<code>\$urlParameter('name')</code>	<ul style="list-style-type: none"> <li>• <code>request.parameters.name.locations</code></li> <li>• <code>request.parameters.name.values</code></li> </ul>	<p>Given a request parameter name, returns the parameter values for all occurrences of that parameter as a path parameter or query parameter.</p> <p>The function searches the <code>request.parameters.name.locations</code> array for the index positions of the values <code>path</code> and <code>query</code>, and returns, in a single array, the <code>request.parameters.name.values[index]</code> values for all identified index positions. When the URL contains both path and query parameter values, the array includes the path values first followed by the query values. The values of each parameter type are added in the order that they are received. Parameter values are URL decoded.</p> <p>For example, the following URL contains both path and query parameter values:</p> <pre>http://example.com/petstore/cats/adopt?breed=Sphynx&amp;breed=Siamese</pre> <p>The function call <code>\$urlParameter('breed')</code> returns the following array of values:</p> <pre>[cats, adopt, Sphynx, Siamese]</pre> <p>In this example, the URL includes an API path that is configured as <code>/petstore/{breed}/{breed}</code>, where <code>breed</code> is configured to be a path parameter of the API path. As a result, <code>cats</code> and <code>adopt</code> are included in the output.</p>
<code>\$xpath(path, xpathExpression)</code>	You can specify any writable variable in the API context. The <code>xpathExpression</code> must be a literal string.	Allows use of XPath expressions

## Simple condition statements

The following examples show conditions that use a single function.

This example uses the `$httpVerb()` extension to specify the HTTP method of the request.

```
$httpVerb()="GET"
```

This example uses the `$operationPath()` extension to specify the path of the operation.

```
$operationPath()="/base/path-2"
```

This example uses the `$operationID()` extension to specify the operation ID.

```
$operationID()="test-gatewayscript-GET"
```

This example uses the `$statusCode()` extension to specify the message status code.

```
$statusCode()=200
```

This example uses the `$header(name)` extension to specify the content type of the message header.

```
$header("Content-Type")="application/json"
```

## Combining conditions with logical operators

You can use `and` and `or` operators to combine multiple functions in a single condition.

This example specifies an HTTP GET request and an API operation path equal to `test-gatewayscript-GET`.

```
$httpVerb()="GET" and $operationPath()="test-gatewayscript-GET"
```

This example specifies either a `POST` or `PUT` request.

```
$httpVerb()="POST" or $httpVerb()="PUT"
```

This example specifies an API operation ID equal to `test-gatewayscript_POST` and a message status code equal to `200`, or an API operation ID equal to `test-gatewayscript-GET` and a message status code equal to `500`.

```
($operationID()="test-gatewayscript-POST" and $statusCode()=200) or ($operationID()="test-gatewayscript-GET" and $statusCode()=500)
```

This example specifies an API operation ID equal to `test-gatewayscript-POST` and a message status code equal to `200` with an API operation path equal to `/base/path-2`.

```
($operationID()="test-gatewayscript-POST" and $statusCode()=200) and $operationPath()="/base/path-2"
```

This example specifies a message header content type equal to `text/plain` and a message header length equal to `300`, or a message status code equal to `200`.

```
($header("Content-Type")="text/plain" and $header("Content-Length")=300) or $statusCode()= 200
```

## Example switch policy

```
- switch:
  version: 2.0.0
  title: switch
  case:
    - condition: ($statusCode() = 200)
      execute:
        - invoke:
            title: invoke
            timeout: 60
            verb: GET
            cache-response: protocol
            cache-ttl: 900
            target-url: 'https://example.com/1'
    - condition: ($statusCode() != 200 and ($httpVerb() = 'GET' or $httpVerb() = 'PUT'))
      execute:
        - invoke:
            title: invoke
            timeout: 60
            verb: GET
            cache-response: protocol
            cache-ttl: 900
            target-url: 'https://example.com/2'
    - otherwise:
      - set-variable:
          title: set-variable
          actions:
            - set: message.body
              value: Default result
              description: 'Set the default result for the otherwise case'
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

DataPower Gateway (v5 compatible) only

## Writing switch condition scripts - DataPower Gateway (v5 compatible)

You write condition scripts for the **switch** policy in the DataPower® Gateway (v5 compatible) by using GatewayScript.

To reference variables in your **switch** conditions, use the form `apim.getvariable('context.location.variable')`, where *context* is the context that you want to reference, *location* is the location of the variable within that context, and *variable* is the name of the variable.

to define a **switch** condition based on the operation called, use one of the following forms:

```
- condition: "((request.verb==='GET') && (api.operation.path===' /path-1'))"  
- condition: "((api.operation.id==='Operation_ID'))"
```

where the context variables `request.verb` and `api.operation.path` retrieve the HTTP verb and the path segment of the API and operation that you want your case to apply to, while `api.operation.id` retrieves the operation ID of your operation, if one has been specified.

For information about the context variables you can use and how to reference them in your script, see [API Connect context variables](#).

## Example switch policy

```
- switch:  
  version: 1.0.0  
  title: switch  
  case:  
    - condition: message.status.code===200  
      execute:  
        - invoke:  
          title: invoke  
          timeout: 60  
          verb: GET  
          cache-response: protocol  
          cache-ttl: 900  
          target-url: 'https://example.com/1'  
    - condition: ((request.verb==='GET') && (api.operation.path===' /path-2')) || ((request.verb==='GET') &&  
(api.operation.path===' /path-1'))  
      execute:  
        - invoke:  
          title: invoke  
          timeout: 60  
          verb: GET  
          cache-response: protocol  
          cache-ttl: 900  
          target-url: 'https://example.com/2'  
    - otherwise:  
      - set-variable:  
        title: set-variable  
        actions:  
          - set: message.body  
            value: Default result  
            description: Set the default result for the otherwise case
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## throw

Use the throw construct to throw an error when it is reached during an assembly flow, usually as a result of a condition being reached.

## Gateway support

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® Gateway (v5 compatible)	1.0.0
DataPower API Gateway, policy available from V2018.4.1.0	2.0.0

This topic describes how to configure the policy in your OpenAPI source; for details on how to configure the policy in the assembly user interface, see [throw](#).

## About

The throw policy has the following format:

```
- throw:  
  title: title  
  name: 'error_name'  
  message: error_message
```

When the throw policy is encountered, the specified error and error message is returned. If a catch has been configured that the error produced by the throw policy fulfills, the catch will be triggered.

## Properties

Table 2. operation-switch policy properties

Property	Required	Description	Data type
version	Yes	The policy version number	string
title	No	A title for the policy.	string
name	Yes	The name of the error to be thrown.	string
message	Yes	The message to accompany the error.	string

## Example

```
- throw:
  version: 1.0.0
  title: throw
  name: '404'
  message: Not found
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details. For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## user-security

Use the user-security policy to extract a user's credentials, authenticate those credentials, and obtain authorization from the user.

## Gateway support

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® API Gateway	2.0.0

This topic describes how to configure the policy in your OpenAPI source; for details on how to configure the policy in the assembly user interface, see [User Security](#).

## About

The user-security policy has the following format:

```
- user-security:
  version: version
  title: title
  description: description
  factor-id: factor ID
  extract-identity-method: method_used_to_extract_credentials
  .
  .
  .
  properties_specific_to_the_specified_identity_extraction_method
  .
  .
  .
  user-auth-method: authentication_method
  .
  .
  .
  properties_specific_to_the_specified_authentication_method
  .
  .
  .
  user-az-method: authorization_method
  .
  .
  .
  properties_specific_to_the_specified_authorization_method
  .
  .
  .
```

## Properties

Table 2. user-security policy properties

Property	Required	Description	Data type
version	Yes	The policy version number	string
title	No	The title of the policy.	string
description	No	A description of the policy.	string
factor-id	No	The identity that identifies the results of factor-authentication in the API context.	string

Property	Required	Description	Data type
extract-identity-method	Yes	<p>Select the method that is used to extract the user credentials. The following options are available:</p> <p><b>basic</b> Use basic authentication; no additional configuration is required.</p> <p><b>context-var</b> The credentials are provided by API Connect context variables; specify the following properties:</p> <ul style="list-style-type: none"> <li>• user-context-var: the context variable that is used to obtain the user name.</li> <li>• pass-context-var: the context variable that is used to obtain the password.</li> </ul> <p><b>html-form</b> Use forms based identity-extraction. You can use the default form or a custom form. To use the default form, specify <b>ei-default-form: true</b>. To use a custom form, specify <b>ei-default-form: false</b> and supply the following properties:</p> <ul style="list-style-type: none"> <li>• ei-custom-form: the location of the form.</li> <li>• ei-custom-form-tls-client-profile: the TLS client profile that is used to secure the connection to the remote server.</li> </ul> <p>Use the ei-form-time-limit property to specify the time allowed to submit the form.</p> <p><b>redirect</b> Use a redirect for identity-extraction; specify the following properties:</p> <ul style="list-style-type: none"> <li>• redirect-url: the URL fragment to which to redirect the request to obtain user credentials.</li> <li>• redirect-time-limit: the time allowed for the transaction to complete.</li> </ul> <p><b>disabled</b> Identity-extraction is disabled; this aspect of processing is skipped.</p> <p>Specify <b>ei-stop-on-error: true</b> to halt assembly processing in the event of identity-extraction failure. This field is required if identity extraction is not disabled.</p>	string
user-auth-method	Yes	<p>Select the authentication method. The following options are available:</p> <p><b>auth-url</b> The credentials are authenticated by an external endpoint; specify the following properties:</p> <ul style="list-style-type: none"> <li>• auth-url: the URL of the authentication endpoint.</li> <li>• auth-tls-client-profile: the TLS client profile that is used to secure the connection to the authentication endpoint.</li> <li>• auth-response-headers-pattern: the pattern that is used to select which response headers to add to the API context.</li> <li>• auth-response-header-credential: the response header that contains the authenticated user credentials.</li> </ul> <p><b>ldap</b> The credentials are authenticated by an LDAP user registry; use the ldap-registry property to specify the required registry.</p> <p><b>disabled</b> Authentication is disabled; this aspect of processing is skipped.</p> <p>Specify <b>au-stop-on-error: true</b> to halt assembly processing in the event of user authentication failure. This field is required if authentication is not disabled.</p>	string

Property	Required	Description	Data type
user-az-method	Yes	<p>Select the authorization method. The following options are available:</p> <p>authenticated Implicitly accept any previously authenticated users; no additional configuration is required.</p> <p>html-form The user provides authorization through an HTML form. You can use the default form or a custom form. To use the default form, specify <b>az-default-form: true</b>. To use a custom form, specify <b>az-default-form: false</b>.</p> <p>Supply the following properties:</p> <ul style="list-style-type: none"> <li>az-table-dynamic-entries: the name of a context variable that specifies the scopes that are to be added automatically to the authorization consent form.</li> <li>az-form-time-limit: the time allowed to submit the form.</li> </ul> <p>For a custom form, supply the following properties:</p> <ul style="list-style-type: none"> <li>az-custom-form: the location of the form.</li> <li>az-custom-form-tls-client-profile: the TLS client profile that is used to secure the connection to the remote server.</li> </ul> <p>disabled Authorization is disabled; this aspect of processing is skipped.</p> <p>Specify <b>az-stop-on-error: true</b> to halt assembly processing in the event of user authorization failure. This field is required if authorization is not disabled.</p>	string

## Example

```
# basic authentication with LDAP registry
```

```
- user-security:
  version: 2.0.0
  title: user-security
  factor-id: default
  extract-identity-method: basic
  ei-stop-on-error: true
  user-auth-method: ldap
  ldap-registry: corporate-ldap
  au-stop-on-error: true
  user-az-method: authenticated
  az-stop-on-error: true
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details. For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## validate - DataPower API Gateway

Use the validate policy to validate the payload in an assembly flow against a schema.

### Gateway support

Note: This page describes the validate policy implementation in the DataPower® API Gateway. If you are using the DataPower Gateway (v5 compatible), see [validate - DataPower Gateway \(v5 compatible\)](#).

For information on the different types of gateway, see [API Connect gateway types](#).

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower API Gateway, policy available from V2018.4.1.0	2.0.0

This topic describes how to configure the policy in your OpenAPI source; for details on how to configure the policy in the assembly user interface, see [Validate - DataPower API Gateway](#).

### About

The validate policy has the following format:

```
- validate:
  version: version
  title: title
  description: description
  validate-against: validation_mechanism
```

```
properties_specific_to_the_specified_validation_mechanism
```

Apply this policy by adding an assembly extension with an execute field to your OpenAPI definition file.

Note: With the DataPower API Gateway, the input to the validate policy must be parsed data. One way to produce parsed data is to use a [parse](#) policy before a validate policy in your assembly flow, which provides explicit control of the parse action.

## Properties

The following table describes the policy properties:

Table 2. validate policy properties

Property	Required	Description	Data type
version	Yes	The policy version number	string
title	No	A title for the policy.	string
description	No	A policy description.	string
input	No	Identifies a variable in the API context. The content of the <b>body</b> field of the variable, which is represented by <b>variable_name.body</b> , is the input data to validate. By default, the variable name is <b>message</b> .	string
output	No	Specifies the name of a variable in the API context. <ul style="list-style-type: none"><li>If the validation passes, the body field of the output variable, which is represented by <b>variable_name.body</b>, stores the output of the assembly validate action.</li><li>If the schema to validate is a JSON schema, the validation also adds any default values that are missing from the payload.</li><li>If the validation fails, no output is stored.</li><li>If an output variable is not specified, the results of the assembly validate action are not saved.</li></ul>	string
validate-against	Yes	Specifies the schema to be used for validating the payload. Valid values: <ul style="list-style-type: none"><li><b>definition</b>: A previously defined schema will be used to validate the payload that is returned from other invoke actions or tasks in the assembly flow. In addition, supply a <b>definition</b> property to specify the required schema.</li><li><b>url</b>: the schema is identified by a URL location. In addition, supply the following properties:<ul style="list-style-type: none"><li><b>json-schema</b> field: the URL of the JSON schema to be used for validating a JSON payload.</li><li><b>xml-validation-mode</b>, specify one of the following values to define how an XML payload is validated:<ul style="list-style-type: none"><li><b>xsd</b>: use an XML schema; in addition, supply an <b>xml-schema</b> property that specifies the URL of the XML schema.</li><li><b>wSDL</b>: use a WSDL schema; in addition, supply an <b>xml-schema</b> property that specifies the URL of the WSDL schema to be used for validating a SOAP payload..</li><li><b>soap-body</b>: validate the body of a SOAP message against the XML schema only.</li></ul></li></ul></li><li><b>wSDL</b>: use the XML schema in the WSDL file associated with the API operation or the API path.</li><li><b>body-param</b>: validate the request input against the schema definition that is specified in the <b>schema</b> property for the request parameter for this operation.</li><li><b>response-param</b>: validate the response to be returned to the client application, against the schema definition that is specified in the <b>schema</b> property for the response parameter for this operation.</li></ul>	string

You can also apply a validate policy by using the API Manager assembly editor to add a built-in policy to the API. For more information, see [Validate - DataPower API Gateway](#) in the built-in policies section.

## Example 1

```
- validate:
  version: 2.0.0
  title: 'validate, response parameter schema'
  validate-against: response-param
```

## Example 2

```
- validate:
  version: 2.0.0
  title: 'validate, predefined schema'
  validate-against: definition
  definition: '#/definitions/RouteOutput'
```

## Example 3

```
- validate:
  version: 2.0.0
  title: 'validate, JSON and XML schema URLs'
  validate-against: url
  json-schema: 'https://my.json.schema'
```

```
xml-validation-mode: xsd
xml-schema: 'https://my.xml.schema'
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#), for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

DataPower Gateway (v5 compatible)

## validate - DataPower Gateway (v5 compatible)

Use the validate policy to validate the payload in an assembly flow against a schema.

### Gateway support

Note: This page describes the validate policy implementation in the DataPower® Gateway (v5 compatible). If you are using the DataPower API Gateway, see [validate - DataPower API Gateway](#).

For information on the different types of gateway, see [API Connect gateway types](#).

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower Gateway (v5 compatible)	1.0.0

This topic describes how to configure the policy in your OpenAPI source; for details on how to configure the policy in the assembly user interface, see [Validate - DataPower Gateway \(v5 compatible\)](#).

Restriction:

- The schema that represents the XML can reference only one XML namespace.
- The schema cannot reference polymorphic XML elements.
- The validation works on the `message.body` variable and not any other output/context variable. If the invoke policy contains a configured response object variable, then `message.body` is not set, and validate is not able to act.
- If you use the `multipleOf` keyword in a schema definition for the API then, due to rounding behavior, the specified value must satisfy the following conditions, otherwise the validation fails when the API is called:
  - The value must not be less than `0.0000009999999999999999848869`.
  - If the value is greater than 1, the amount before the decimal point must not be greater than `999999999999999934463`.

### About

The validate policy has the following format:

```
- validate:
  version: version
  title: title
  description: description
  definition: swagger_schema_definition_to_be_used
```

Apply this policy by adding an assembly extension with an execute field to your OpenAPI definition file.

### Properties

The following table describes the policy properties:

Table 2. validate policy properties

Property	Required	Description	Data type
version	Yes	The policy version number	string
title	No	A title for the policy.	string
description	No	A policy description.	string
definition	Yes	The schema to be used to validate the payload. Valid values: <ul style="list-style-type: none"><li>• <b>request:</b> Select this value to validate the request input against the schema definition that is specified in the Type field for the request parameter for this operation. For information about how to create a request parameter, see <a href="#">Configuring an operation</a>.</li><li>• <b>response:</b> Select this value to validate the response to be returned to the client application, against the schema definition that is specified in the Schema field for the response parameter for this operation. For information about how to create a response parameter, see <a href="#">Configuring an operation</a>.</li><li>• The name of a schema definition, in the following format: <pre>#/definitions/schema_name</pre> The schema must be defined in the <code>definitions:</code> section of your OpenAPI file.</li></ul>	string

You can also apply an validate policy by using the API Manager assembly editor to add a built-in policy to the API. For more information, see [Validate - DataPower Gateway \(v5 compatible\)](#) in the built-in policies section.

## Example 1

```
validate:
  version: 1.0.0
  title: validate the response
  definition: #/definitions/RouteOutput
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## validate-username-token

Use the Validate Username Token policy to validate a Web Services Security (WS-Security) UsernameToken in a SOAP payload before allowing access to the protected resource.

## Gateway support

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® Gateway (v5 compatible)	1.0.0 1.1.0 (IBM API Connect® Version 2018.4.1.4 or later)

This topic describes how to configure the policy in your OpenAPI source; for details on how to configure the policy in the assembly user interface, see [Validate Username Token](#).

## About

The validate-username-token policy has the following format:

```
- validate-username-token:
  version: version
  title: title
  description: description
  auth-type: Authentication URL or LDAP Registry (policy version 1.0.0 only)
  auth-url: authentication_url_to_use (policy version 1.0.0 only)
  tls-profile: tls_profile_to_use (policy version 1.0.0 only)
  ldap-registry: name_of_the_ldap_user_registry (policy version 1.0.0 only)
  registry: name_of_the_ldap_or_authurl_user_registry (policy version 1.1.0 and later)
  ldap-search-attribute: name_of_the_ldap_user_password_attribute
```

## Properties

The following table describes the policy properties:

Table 2. Validate Username Token policy properties

Property	Required	Description	Data type
version	Yes	The policy version number	string
title	Yes	The title of the policy.	string
description	No	A description of the policy.	string
auth-type (policy version 1.0.0 only)	Yes	The authentication type to use to validate the UsernameToken. Valid values: <ul style="list-style-type: none"><li>• <b>Authentication URL</b>: Specify this value to validate the user credentials against an authentication URL.</li><li>• <b>LDAP registry</b>: Specify this value to validate the user credentials against an LDAP user registry.</li></ul> The default value is: <b>Authentication URL</b> .	string
auth-url (policy version 1.0.0 only)	Yes	The authentication URL to use to validate the UsernameToken user credentials against. Note: This property is required only if Authentication type is set to <b>Authentication URL</b> .	string
tls-profile (policy version 1.0.0 only)	No	The TLS profile to use for the secure transmission of data to the authentication URL. Note: This property is available only if Authentication type is set to <b>Authentication URL</b> .	string
ldap-registry (policy version 1.0.0 only)	Yes	The name of the LDAP user registry to validate the UsernameToken user credentials against. Note: This property is required only if Authentication type is set to <b>LDAP registry</b> .	string
registry (policy version 1.1.0 and later)	Yes	The name of the LDAP or Authentication URL registry to use to validate the UsernameToken.	string
ldap-search-attribute	Yes	The name of the LDAP user password attribute. Note: This property is required only for an LDAP user registry.	string

## Examples

The following example shows an LDAP user registry authentication:

```
- validate-usnametoken:
  version: 1.0.0
  title: "validate-usnametoken"
  auth-type: "LDAP Registry"
  ldap-registry: "wstest"
  ldap-search-attribute: "userPassword"
```

The following example shows an Authentication URL definition:

```
- validate-usnametoken:
  version: 1.0.0
  title: "validate-usnametoken"
  auth-type: "Authentication URL"
  auth-url: "https://www.google.com"
  tls-profile: "default-ssl-profile"
```

For more information about how to use a validate-usnametoken security policy, see [Validate Username Token](#) in the built-in policies section.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## xml-to-json

Use the xml-to-json policy to convert the context payload of your API from the extensible markup language (XML) format to JavaScript Object Notation (JSON).

## Gateway support

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® Gateway (v5 compatible)	1.0.0
DataPower API Gateway	2.0.0

This topic describes how to configure the policy in your OpenAPI source; for details on how to configure the policy in the assembly user interface, see [XML to JSON](#).

## About

The xml-to-json policy has the following structure:

```
- xml-to-json:
  version: version
  title: Title
  description: Description
```

Note: If you are using the DataPower API Gateway, the input to the xml-to-json policy must be parsed data. One way to produce parsed data is to use a [parse](#) policy before an xml-to-json policy in your assembly flow, which provides explicit control of the parse action.

## Properties

The following table describes the policy properties:

Table 2. Policy properties

Property	Required	Description	Data type
version	Yes	The policy version number	string
title	Yes	The title of the policy.	string
description	No	A description of the policy.	string
 input	No	The input message to convert. Specify the name of a variable in the API context. <b>variableName.body</b> , the message payload, represents the JSON input to convert. The default value of the variable is <b>message</b> and <b>message.body</b> is the default input.	string
 output	No	The output message to store the conversion result. Specify the name of a variable in the API context. <b>variableName.body</b> represents the result of conversion from JSON format to XML format. When the specified input message is the default message, the default output is <b>message.body</b> . Otherwise, when the input message is the variable <b>my-message-variable</b> , for example, the default output is <b>my-message-variable.body</b> . The variable cannot be any read-only in the API context.	string
 conversionType	No	The conversion type that determines the target format of the output. The following options are available: <ul style="list-style-type: none"> <li>badgerFish: BadgerFish convention is used to determine the target conversion format of the output.</li> <li>apicv5: apicv5 convention is used to determine the target conversion format of the output.</li> </ul>	string

## Example

The following is an example of a xml-to-json policy:

```
- xml-to-json:
  version: 1.0.0
```

**title:** XML to JSON transform  
**description:** Transforms XML message body to JSON format

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#), for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## xslt

Use the xslt policy to apply an XSLT transform to the payload of the API definition.

## Gateway support

Table 1. Table showing which gateways support this policy, and the corresponding policy version

Gateway	Policy version
DataPower® Gateway (v5 compatible)	1.0.0
DataPower API Gateway, policy available from V2018.4.1.0	2.0.0

This topic describes how to configure the policy in your OpenAPI source; for details on how to configure the policy in the assembly user interface, see [XSLT](#).

## About

The xslt policy has the following structure:

```
- xslt:  
  version: version  
  title: Title  
  description: Description  
  input: Input True False  
  source: Transform
```

**Note:** If you are using the DataPower API Gateway, the input to the xslt policy must be parsed data. One way to produce parsed data is to use a [parse](#) policy before an xslt policy in your assembly flow, which provides explicit control of the parse action.

## Properties

The following table describes the policy properties:

Table 2. xslt policy properties

Property	Required	Description	Data type
version	Yes	The policy version number	string
title	Yes	The title of the policy.	string
description	No	A description of the policy.	string
input	No	Indicates whether this XSLT input document uses the context current payload, or if there is no input. The default value is <b>false</b> .	boolean
<span style="border: 1px solid green; padding: 2px;">API Gateway only</span> serialize-output	No	If set to <b>true</b> , the output tree that is generated by the XSLT policy is serialized. The content of <b>message.body</b> is updated with the serialized binary data rather than the XML tree. The default value is <b>false</b> .	boolean
source	Yes	The XSLT transform source to execute.	string

You can also apply an xslt policy by using the API Manager assembly editor to add a built-in policy to the API. For more information, see [XSLT](#) in the built-in policies section.

For examples of the OpenAPI definitions of xslt policies, see [XSLT policy examples](#) in the built-in policies section.

For more examples of how to use XSLT to access and modify properties and context, see [Implementation code examples](#) and, if you are using the DataPower API Gateway, [Using context variables in GatewayScript and XSLT policies with the DataPower API Gateway](#).

## Related concepts

- [Variable references in API Connect](#)

## Related reference

- [XSLT](#)
- [API Connect context variables](#)

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#), for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## catch

Use the `catch` extension to catch errors that occur during an API call.

The `catch` extension takes the following form:

```
catch:
  - errors:
    - Error_1
    - Error_2
  - execute:
    assembly_1
  - errors:
    - Error_3
  - execute:
    assembly_2
  - default:
    assembly_3
```

The following table shows the properties of the `catch` extension:

Table 1. The properties of the `catch` extension

Property	Required	Description	Type
<code>errors</code>	Yes	The errors for which the catch will activate. For a list of errors, see <a href="#">Error cases supported by assembly catches</a> .	Array (String)
<code>execute</code>	Yes	The section of the assembly that will execute when the catch is activated.	Array (Object)
<code>default</code>	No	The section of the assembly that will execute when an error does not trigger other catches. It behaves in the same manner and has the same structure as <code>execute</code>	Array (Object)

The following is an example of a `catch` extension:

```
catch:
  - errors:
    - ConnectionError
    - JavaScriptError
  execute:
    - activity-log:
      title: activity-log
      content: activity
      error-content: payload
  - default:
    - activity-log:
      title: activity-log
      content: activity
      error-content: payload
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## properties

Use the `properties` extension to define properties for referencing in an API.

The `properties` extension has the following structure:

```
properties:
  property_1:
    value: default_value_1
    description: description_1
    encoded: encoded_boolean_1
  property_2:
    value: default_value_2
    description: description_2
    encoded: encoded_boolean_2
```

The following table lists the fields found in the `properties` extension:

Table 1. The properties extension

Property	Required	Description	Data type
<code>property</code>	Yes	The name of the property. It is used when referencing the property. Note that this is the field name, not the contents of the field.	Object
<code>value</code>	No	The default value that the property takes. It can be empty.	String
<code>description</code>	No	The description of the property. It can be empty.	String
<code>encoded</code>	No	Specifies whether to encode the value of this property.	Boolean

The following example shows a sample `properties` field:

```
properties:
  ID:
    value: 1234
    description: An ID to be used for validating.
    encoded: false
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
 For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## catalogs

Use the `catalogs` extension to assign catalog-specific values to properties defined in the `properties` section.

The `catalogs` section has the following structure:

```
catalogs:
  catalog_name_1:
    properties:
      property_name_1: value_1
      property_name_2: value_2
  catalog_name_2:
    properties:
      property_name_1: value_3
```

The following table lists the fields found in the `catalogs` extension:

Table 1. Catalogs properties

Property	Required	Description	Data type
<code>catalog_name</code>	Yes	The name of the catalog. It must match a catalog in API Manager. Note that this is the field name, not the contents of the field.	Object
<code>properties</code>	Yes	This field contains any properties that are to be set.	Object
<code>property_name</code>	Yes	The field name is the property to be set and must match a property defined in the <code>properties</code> extension. It contains the value of the property for the catalog to which the field belongs. If, in the <code>properties</code> extension, it has been specified as encoded, this will be encoded when saved or staged by IBM® API Connect.	String

The following is an example of a `catalogs` extension:

```
catalogs:
  Sandbox:
    properties:
      ID: 5678
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
 For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## activity-log

If you're using the DataPower® API Gateway, you can use the `activity-log` extension to configure your logging preferences for the API activity that is stored in Analytics. The preferences that you specify will override the default settings for collecting and storing details of the API activity.

An API event record exists for each API execution event in the Gateway server. By default, the content type that is collected and stored in API event records is `activity` for when API execution completes successfully, and `payload` for when API execution completes with an error code. When you compose your API definition, you can change the type of content to log in these API event records. For more information about API event records, see [API event record fields](#).

Note that if you're using the DataPower Gateway (v5 compatible), you can configure your logging preferences by using an `activity-log` policy in your API assembly. For more information, see [activity-log](#).

The `activity-log` extension takes the following form:

```
activity-log:
  success-content: activity_to_log_if_call_successful
  error-content: activity_to_log_if_call_unsuccessful
  enabled: is_activity_logging_enabled
```

The following table shows the properties of the `activity-log` extension:

Table 1. The properties of the activity-log extension

Property	Required	Description	Type
<code>success-content</code>	No	Defines the type of content to be logged when the operation is successful. Valid values: <ul style="list-style-type: none"> <li><code>none</code>: Indicates that no logging occurs. Restriction: This option disables notifications for application developers who use your Developer Portal.</li> <li><code>activity</code>: Logs invocation only (only the resource URI is recorded).</li> <li><code>header</code>: Logs activity and header.</li> <li><code>payload</code>: Logs activity, header, and payload (the original request, if any, and the final response).</li> </ul> The default value is <code>activity</code> .	String

Property	Required	Description	Type
<code>error-content</code>	No	Indicates what content to log when an error occurs. Valid values: <ul style="list-style-type: none"> <li><b>none</b>: Indicates that no logging occurs. Restriction: This option disables notifications for application developers who use your Developer Portal.</li> <li><b>activity</b>: Logs invocation only (only the resource URI is recorded).</li> <li><b>header</b>: Logs activity and header.</li> <li><b>payload</b>: Logs activity, header, and payload (the original request, if any, and the final response).</li> </ul> The default value is <b>payload</b> .	String
<code>enabled</code>	No	Indicates whether activity logging is enabled or disabled.	Boolean

## Example 1

Override the default activity logging settings:

```
activity-log:
  success-content: none
  error-content: header
  enabled: true
```

## Example 2

Turn off activity logging:

```
activity-log:
  enabled: false
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Specifying a gateway type for an API definition

An API definition is specific to one or other of the gateway types, DataPower® API Gateway or DataPower Gateway (v5 compatible). API definitions must specify which type of gateway the API uses.

### Before you begin

IBM® API Connect supports two gateway types: DataPower Gateway (v5 compatible) and DataPower API Gateway.

DataPower Gateway (v5 compatible) has been available with IBM API Connect for a number of years. The DataPower API Gateway is a new gateway that has been designed with APIs in mind, and with the same security focus as DataPower Gateway (v5 compatible).

For more information on how to choose which gateway type to use, see [API Connect gateway types](#).

### About this task

You must specify which type of gateway each API uses. APIs can use only one type of gateway.

When you modify your API definitions to use a specific gateway type, you must ensure that each policy and policy version in the API are supported by the gateway type. DataPower Gateway (v5 compatible) and DataPower API Gateway each support policies that the other gateway type does not. In some cases, the same policy is supported by both gateway types, but with a different version number.

For example, DataPower Gateway (v5 compatible) supports version **1.0.0** of the **invoke** policy, but DataPower API Gateway requires version **2.0.0**.

For information on policies, see [execute](#).

For information on policy versions, see the documentation for each individual policy. For example, to review the **invoke** policy, see [invoke](#).

### Procedure

- Edit the API definition YAML file and add the gateway type. For example:
  - DataPower Gateway (v5 compatible):

```
gateway: datapower-gateway
```
  - DataPower API Gateway

```
gateway: datapower-api-gateway
```
- Ensure that the policies, including policy versions, in your APIs are supported by the gateway type. Review the list of policies on the [execute](#) page. If necessary, review the individual policy pages to determine the supported version number.
- Ensure that any Product that uses this API is configured to use the same gateway type. See [Specifying a gateway type for your Product](#).

## Related information

- [DataPower API Gateway porting notes](#)

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Referring to an extension in an API definition

To refer to an OpenAPI extension in your API definition YAML (or JSON) file, add an `extensions` key under `x-ibm-configuration`.

## Before you begin

Add the OpenAPI extension to any Catalogs that the API is to be published to, by importing its definition file; for details, see [Working with OpenAPI extensions](#). If the target Catalog does not contain the OpenAPI extension then attempts to publish the API to it will fail.

## About this task

The following example shows an extension definition file that defines a bank branch, in YAML format:

```
extension: '1.0.0'

info:
  title: Banking services
  name: banking
  version: 1.0.0
  description: Banking extensions
  contact:
    name: IBM API Connect
    url: https://apiconnect.ibm.com/
    email: myname@ibm.com

portal-visible: true

properties:
  title: "Branch"
  type: "object"
  properties:
    Branch type:
      type: "string"
      enum:
        - "ATM"
        - "Walk in"
    location:
      type: "object"
      title: "Location"
      properties:
        city:
          type: "string"
          default: "San Francisco"
        state:
          type: "string"
          default: "CA"
        citystate:
          type: "string"
          description: "This is generated automatically from the previous two fields"
          template: "{{city}}, {{state}}"
          watch:
            city: "location.city"
            state: "location.state"
      required:
        - Branch type
```

## Procedure

1. Edit the API definition YAML file and add the reference. For example:

```
x-ibm-configuration:
  .
  .
  .
  extensions:
    banking: 1.0.0
```

2. In your API definition file, add a property whose name must begin with `x-` and references the name of the extension you created. Specify the values of the properties that were defined in the OpenAPI extension YAML file.  
The following example uses the banking extension:

```
.
.
```

```
x-banking:
  Branch type: ATM
  location:
    city: San Francisco
    state: CA
    citystate: 'San Francisco, CA'
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Using \$ref to reuse code fragments in your OpenAPI files

If you deploy an API to an IBM® API Connect Management server by using the developer toolkit command line, you can use the `$ref` field in your OpenAPI YAML and JSON API definition files to reference a fragment of OpenAPI code that is defined in a separate file. When API Connect processes the source API definition file, the `$ref` field is replaced with the contents of the target file.

Use the following syntax in your source YAML file:

```
$ref: path_to_file_containing_code_fragment
```

Use the following syntax in your source JSON file:

```
{
  $ref: path_to_file_containing_code_fragment
}
```

For example:

```
$ref: ./code_fragments/my_fragment.yaml

{
  "$ref": "./code_fragments/my_fragment.json"
}
```

The replacement of the `$ref` field with the target code fragment occurs when you perform any of the following actions on the API defined by the source API definition file:

- Stage or publish an API to an API Connect Management server by using the `apic publish` command. For more information, see [Publishing APIs and applications](#).
- Validate the API definition YAML file by using the `apic validate` command. For more information, see [Validating the YAML or JSON definition of an API or Product](#).

Important: You cannot insert a `$ref` field at the root level of your OpenAPI file.

---

## Example

A source YAML file contains the following OpenAPI code:

```
swagger: '2.0'
info:
  version: 1.0.0
  title: Branches
  x-ibm-name: Branches
  description: Provides operations relating to BankA branch information.
basePath: /branches
paths:
  $ref: ./code_fragments/paths.yaml
  .
  .
  .
```

The file `paths.yaml` contains the following OpenAPI code fragment:

```
/details:
  get:
    responses:
      '200':
        description: 200 OK defined in $ref file
        schema:
          $ref: '#/definitions/branch'
    summary: Branch details
    description: Retrieve details of the current branches of BankA.
```

When API Connect processes the source YAML file, the `$ref` field is replaced with the target code fragment, yielding the following OpenAPI code:

```
swagger: '2.0'
info:
  version: 1.0.0
  title: Branches
  x-ibm-name: Branches
  description: Provides operations relating to BankA branch information.
basePath: /branches
paths:
  /details:
    get:
      responses:
        '200':
```

```
description: 200 OK
schema:
  $ref: '#/definitions/branch'
summary: Branch details
description: Retrieve details of the current branches of BankA.
.
.
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Creating a Product definition file

You define a Product by creating a Product definition file.

### About this task

---

You can create a Product definition file in either of the following ways:

- Create the file in an editor of your choice.
- Create a Product definition file by using the `apic create:product` command and then modify it. You can base your Product definition file on the default Product template or on your own custom template.

This topic describes the syntax that is needed for both options and also the structure needed when the file is created in the editor. For details on what you can include in the product definition file, see [Product definition schema](#).

You can create a Product in the CLI by running `apic create:product` and supplying additional arguments on the command line. For example, you can enter the following text in a single command:

```
apic create:product --name product_name --title product_title --filename product_file_name.yaml
--apis "filename_of_api1.yaml filename_of_api2.yaml"
```

where:

- `product_name` is the name for your new Product.
- `product_title` is the title of your new Product.
- `product_file_name.yaml` is the name of the yaml file that is created for your new Product.
- `filename_of_api1.yaml` is the file name of one of the APIs that is used within the new Product.
- `filename_of_api2.yaml` is the file name of one of the APIs that is used within the new Product.

Another option is to create a Product interactively in the command line by running `apic create:product` and following the prompts.

You can see further details and available options for the `apic create:product` command by entering the command:

```
apic create:product --help
```

You can also create a Product from a custom Handlebars template by using the following command:

```
apic create:product --template template_filename --title product_title
```

where `template_filename` is the name of the Handlebars template to use, and `product_title` is the title of your Product. A Product template file must have a `.hbs` file name extension. You can create a template from scratch, or start with the example (default) Product template provided in [API and Product definition template examples](#).

A Product definition file contains the following sections:

- The specification version
- An information section
- A visibility section
- An APIs section
- A Plans section

In this topic, YAML is used, but the instructions can be adapted to use JSON. Both `.yaml` and `.yml` file extensions are supported, but the use of the `.yaml` file extension is recommended by [yaml.org](#).

**Note:** All keys and enumeration values that are specified in this topic are case-sensitive.

## Procedure

---

Structure your Product definition file by completing the following steps:

1. Set the specification version by adding the following line to the beginning of the file: `product: 1.0.0`.  
This line specifies the template version, and is always `product: 1.0.0`.  
Note: The specification version is distinct from your Product version. The specification version refers to this YAML file, while the Product version is by your discretion.
2. Include an information section with details about the Product, as described in [Completing the information section of your Product description](#).
3. Include a visibility section that specifies who can view and subscribe to the Product, as described in [Specifying the visibility of your Product](#).
4. Include an APIs section that references the APIs to be included in the Product, as described in [Referencing the APIs for your Product](#).
5. Include a Plans section that described the Plans you want include in your Product, as described in [Describing Plans in your Product](#).

## Results

---

You have completed a YAML representation of your Product. A complete example with full indentation can be found in [An example YAML representation of a Product](#).

You can create multilingual API and Product documentation by using an `x-ibm-languages` extension directly in the OpenAPI definition. For more information, see [Using x-ibm-languages to create multilingual API and Product documentation](#).

- [Product definition schema](#)  
The product definition schema defines the properties (and their data types) that you can include in a product definition file.
- [Converting a Product YAML file to use DataPower API Gateway](#)  
IBM API Connect now supports DataPower® API Gateway. You can optionally specify this gateway type in your Product YAML file.

## Related information

---

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#), for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Product definition schema

The product definition schema defines the properties (and their data types) that you can include in a product definition file.

```
{
  "id": "https://api.ibm.com/product/schema.json#",
  "$schema": "http://json-schema.org/draft-06/schema#",
  "title": "A schema to represent the IBM specific API configuration",
  "type": "object",
  "additionalProperties": false,
  "required": [
    "product",
    "info"
  ],
  "patternProperties": {
    "^x-": {}
  },
  "properties": {
    "product": {
      "type": "string",
      "enum": [
        "1.0.0"
      ]
    },

## Completing the information section of your Product description

Provide users with information about your Product.

### About this task

---

The information section of a YAML representation of a Product contains the Product's name and version. It can also include contact and license details.

Note: All keys and enumeration values that are specified in this topic are case-sensitive.

An example information section for a YAML representation of a Product can be found at the end of this topic. An example of a complete YAML representation of a Product can be found in [An example YAML representation of a Product](#).

### Procedure

---

To complete the information section of your Product description, complete the following steps.

1. Begin the section and provide a name, title, description, and version number; use the following syntax:

```
info:
  version: Product_Version
  title: Product_Title
  name: Short_Name
  summary: Product_Description
```

where:

- *version* is the version number of the policy.  
Tip: The `version.release.modification` version numbering scheme is recommended, for example `1.0.0`.
- *Product\_Title* is the title of the Product. Any string can be used, but the title should be kept short so that it can be displayed in the API Manager user interface.
- *Short\_Name* is the short name for the policy. It must be a single word and contain only alphanumeric characters, and the - (dash) and \_ (underscore) characters. The name is case-sensitive, and should be 20 characters or fewer so that it can be displayed in the API Manager user interface of IBM API Connect.
- *Product\_Description* is a short description of the policy. Any string can be used.

2. Optional: Under info, supply contact information; use the following syntax:

```
contact:
  name: Contact_Name
  url: 'Contact_URL'
  email: Contact_email
```

where:

- *Contact\_Name* is the name of the contact for this Product.
- *Contact\_URL* is the URL for contact your organization.
- *Contact\_email* is an email for contacting your organization.

3. Optional: Under info, add license information for your Product; use the following syntax:

```
license:
  name: License_Name
  url: 'License_URL'
```

where:

- *License\_Name* is the name of the license that applied to your Product.
- *License\_URL* is the URL at which information about the license can be accessed.

4. Optional: Under info, add your terms of service; use the following syntax:

```
termsOfService: Terms
```

where *Terms* is a string that details the terms of service for using your Product.

### Results

---

You have completed the information section of your Product's YAML representation. It should have the following form:

```
info:
  version: Product_Version
  title: Product_Title
  name: Short_Name
  description: Product_Description
  contact:
    name: Contact_Name
    url: 'Contact_URL'
    email: Contact_email
  license:
    name: License_Name
    url: 'License_URL'
  termsOfService: Service_Terms
```

where all variables are as described in previously in this topic. The indentation must be as in the example.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Specifying a gateway type for your Product

Product definitions must specify which type of gateway the Product uses.

### Before you begin

---

IBM® API Connect supports two gateway types: DataPower® Gateway (v5 compatible) and DataPower API Gateway.

DataPower Gateway (v5 compatible) has been available with IBM API Connect for a number of years. The DataPower API Gateway is a new gateway that has been designed with APIs in mind, and with the same security focus as DataPower Gateway (v5 compatible).

For more information on how to choose which gateway type to use, see [API Connect gateway types](#).

### About this task

---

You can specify the gateway type for a Product.

Products can use only one type of gateway, and the APIs in the Product must use the same type of gateway. See [Specifying a gateway type for an API definition](#).

### Procedure

---

1. Determine the gateway type that is configured for the APIs in your Product. The Product gateway type must match the APIs gateway type.  
To review the APIs for your Product, see [Referencing the APIs for your Product](#).

2. Edit the Product definition file (YAML source) to add the gateway type you want to use:

- DataPower Gateway (v5 compatible):

```
gateways:  
  datapower-gateway
```

- DataPower API Gateway

```
gateways:  
  datapower-api-gateway
```

3. Ensure that the policies, including policy versions, in the APIs in your Product are supported by the gateway type. Review the list of policies on the [execute](#) page. If necessary, review the individual policy pages to determine the supported version number.

### Related information

- [DataPower API Gateway porting notes](#)

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Converting a Product YAML file to use DataPower API Gateway

IBM® API Connect now supports DataPower® API Gateway. You can optionally specify this gateway type in your Product YAML file.

### Before you begin

---

IBM API Connect provides two gateway types, DataPower Gateway (v5 compatible) and DataPower API Gateway.

DataPower Gateway (v5 compatible) has been available with IBM API Connect for a number of years. The DataPower API Gateway is a new gateway that has been designed with APIs in mind, and with the same security focus as DataPower Gateway (v5 compatible).

For more information on how to choose which gateway type to use, see [API Connect gateway types](#).

### About this task

---

Product definitions can specify only one type of gateway. The type of gateway must match the gateway type that is used by the APIs that are included in the product. If you want to take advantage of the capabilities of DataPower API Gateway, you can easily modify your existing Product definitions to specify it as the gateway type.

### Procedure

---

1. Verify that the APIs in the product specify DataPower API Gateway as the gateway type, and that the APIs have been converted for use with the DataPower API Gateway.
2. Open the Product YAML file for editing.  
For example:

```
product: '1.0.0'
info:
  name: testprod
  title: testprod
  version: 1.0.0
  .
  .
```

3. Add a `gateways` setting, and specify `datapower-api-gateway`.  
For example:

```
product: '1.0.0'
info:
  name: testprod
  title: testprod
  version: 1.0.0
gateways:
  - datapower-api-gateway
  .
  .
```

4. Save the modified YAML file.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Specifying the visibility of your Product

Detail who can view and subscribe to your Product.

### About this task

The visibility section of your Product's YAML representation determines who can view and subscribe to your Product in IBM® API Connect.

Note: All keys and enumeration values that are specified in this topic are case-sensitive.

An example visibility section of a YAML representation of a Product can be found at the end of this topic. An example of a complete YAML representation of a Product can be found in [An example YAML representation of a Product](#).

### Procedure

To complete the visibility section of your Product description, complete the following steps:

1. Title the section by adding `visibility`:
2. Under visibility, specify who can view the Product; use the following syntax:

```
view:
  enabled: View_Toggle
  type: View_Audience
  tags:
    - View_Tag_1
    - View_Tag_2
  orgs: View_Organizations
```

where

- `View_Toggle` determines whether the Product is visible to anybody or not. It must be `true` or `false`. If `false`, the Product will not be visible in the Developer Portal.
- `View_Audience` must be `public`, in which case the Product is visible to anybody who uses the Developer Portal, `authenticated`, in which case the Product is visible to anybody registered through the Developer Portal, or `custom`, in which case the Product is visible to a specified group of users.
- The `View_Tag` variables are strings that contains any tags that you want to attach to your Product's view status. Each tag must be on a new line and preceded with a dash. If you do not want to use any tags, do not include `tags:`.
- `View_Organizations` specifies the organizations that can view the Product if `View_Audience` is set to `custom`. If `View_Audience` is not set to `custom`, do not include `orgs:`. If `View_Audience` is `custom`, specify organizations in the following manner:

```
orgs:
  - Organization_1
  - Organization_2
```

where the `Organization` variables are the names of the organizations that are to be allowed to view the Product.

3. Under visibility, specify who can subscribe to your Product's Plans; use the following syntax:

```
subscribe:
  enabled: Subscribe_Toggle
  type: Subscribe_Audience
  tags:
    - Subscribe_Tag_1
    - Subscribe_Tag_2
  orgs: Subscribe_Organizations
```

where:

- *Subscribe\_Toggle* must be `true` or `false`. If `false`, no developers will be able to subscribe to the Product.
- *Subscribe\_Audience* must be `authenticated`, in which case the Product's Plans can be subscribed to by anybody who is registered through the Developer Portal, or `custom`, in which case the Product's Plans can be subscribed to by a specified group of users.
- The *Subscribe\_Tag* variables are strings that contains any tags you want to attach to your Product. Each tag must be on a new line and preceded by a dash.
- *Subscribe\_Organizations* specifies the organizations that can subscribe to the Product's Plans if *Subscribe\_Audience* is set to `custom`. If *Subscribe\_Audience* is not set to `custom`, omit it or set as `[]`. If *Subscribe\_Audience* is `custom`, specify organizations in the following manner:

```
orgs:
  - Organization 1
  - Organization 2
```

where the *Organization* variables are the names of the organizations that are to be allowed to subscribe to the Product.

Note: If a Product is to be available for subscription, it must already be visible. As a result, for the subscription audience to be `authenticated`, the view audience cannot be `custom`.

## Results

You have completed the visibility section of your Product's YAML representation. It should have the following form:

```
visibility:
  view:
    enabled: View_Toggle
    type: View_Audience
    tags:
      - View_Tag_1
      - View_Tag_2
    orgs:
      - Organization_1
      - Organization_2

  subscribe:
    enabled: Subscribe_Toggle
    type: Subscribe_Audience
    tags:
      - Subscribe_Tag_1
      - Subscribe_Tag_2
    orgs:
      - Organization_1
      - Organization_2
```

where all variables are as described in previously in this topic. The indentation must be as in the example.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Referencing the APIs for your Product

Detail the file paths for the APIs you want to include in your Product in IBM® API Connect.

### About this task

Before an API can be included in a Plan, it must first be referenced in the APIs section of your Product description.

### Procedure

Begin the APIs section and reference the APIs you want to include in your Product. The syntax that you use depends on which user interface you are using, as follows:

- API Designer:

```
apis:
  API_1_NameAPI_1_Version
  $ref: API_1_File_Path
  API_2_NameAPI_2_Version
  $ref: API_2_File_Path
```

- API Manager:

```
apis:
  API_1_NameAPI_1_Version
  name: 'API_1_Name:API_1_Version'
  API_2_NameAPI_2_Version
  name: 'API_2_Name:API_2_Version'
```

where

- the *API\_n\_Name* variables are the case-sensitive names of your APIs.
- the *API\_n\_Version* variables are the versions of your APIs.
- the *API\_n\_File\_Path* variables are the file paths for the YAML files containing OpenAPI representations of your APIs.

The following example shows a complete sample APIs section:

```
apis:
  api1.0.0:
    name: 'api1:1.0.0'
  api2.0.0:
    name: 'api2:1.0.0'
  api3.0.0:
    name: 'api3:1.0.0'
```

For more information about creating OpenAPI definitions, see [Creating an OpenAPI definition file](#).

The indentation must be as in the examples and the APIs must have been created before they can be referenced.

## Results

You have referenced the APIs that are to be included in your Product. An example of a complete YAML representation of a Product can be found in [An example YAML representation of a Product](#).

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Describing Plans in your Product

Describe the Plans that you want to include in your IBM® API Connect Product and which APIs they will contain, as well as any rate limits that apply.

### About this task

A Plan contains APIs and their operations. It can be used to implement rate limits and tailor visibility.

Note: If you are using more than one DataPower® server in a Gateway service, then to properly calculate API calls for rate limits the servers must be able to communicate with each other by using SLM peer groups, using either SLM unicast peering or SLM multicast peering depending on your network configuration. For more information, see [SLM peering](#).

In addition, you can apply burst limits to your Plans, to prevent usage spikes that might damage infrastructure. Multiple burst limits can be set per Plan, at second and minute time intervals. You can also set multiple rate limits per Plan and per operation, at second, minute, hour, day, and week time intervals.

Note: All keys and enumeration values that are specified in this topic are case-sensitive.

Two example Plan descriptions from a YAML representation of a Product can be found at the end of this topic. An example of a complete YAML representation of a Product can be found in [An example YAML representation of a Product](#).

## Procedure

To describe your Plans, include APIs in them, and set rate limits for Plans or specific operations, complete the following instructions:

1. Begin the Plans section with `plans`:
2. Under Plans, begin the description of your first Plan by providing a name, description, and specifying whether approval is required for subscription requests; use the following syntax:

```
plans:
  Plan_Name:
    title: Plan_Title
    description: Plan_Description
    approval: Approval_Toggle
```

where:

- *Plan\_Name* is the name of the Plan. It must be a single word and contain only alphanumeric characters, and the - (dash) and \_ (underscore) characters. The name is case-sensitive, and should be 20 characters or fewer so that it can be displayed in the API Manager user interface.
- *Plan\_Title* is the title of the Plan. Any string can be used, but the title should be kept short so that it can be displayed in the API Manager user interface.
- *Plan\_Description* is a description of your Plan.
- *Approval\_Toggle* must be either `true`, in which case approval is needed for subscription requests, or `false`, in which case subscriptions are automatically approved.

3. Optional: Under your Plan, add multiple burst and rate limits that will be shared across all the operations in the Plan; use the following syntax:

Note: For information about rate limits and burst limits in API Connect, see [Understanding rate limits for APIs and Plans](#).

```
rate-limits:
  Name:
    value: Rate_Limit
    hard-limit: Limit_Toggle
  Name:
    value: Rate_Limit
    hard-limit: Limit_Toggle
burst-limits:
  Name:
    value: Burst_Limit
```

where:

- *Name* is the name of the limit.
- *Rate\_Limit* is your rate limit. It can be for multiples of seconds, minutes, hours, days, or weeks, written as *second*, *minute*, *hour*, *day*, and *week* respectively; do not use the plural forms of the words. Use the syntax: **1/2minute**. If the time unit is singular, then it is not necessary to precede it with a number, for example, **1/minute**. If you do not want to apply a rate limit, set *Rate\_Limit* as *unlimited*.
- *Limit\_Toggle* must be *true* or *false*. If *true*, API calls by a developer will fail if the rate limit is exceeded. This step is not necessary if you have set *Rate\_Limit* to *unlimited*.
- *Burst\_Limit* is your burst limit. It can be for multiples of seconds or minutes, written as *second* or *minute*; do not use the plural forms of the words.

Note:

- Applying a rate limit at the Plan level creates a default rate limit that is shared across all the operations within the Plan. If you need to set specific rate limits for specific operations, you must set these within the operations themselves and these settings will override the setting at the Plan level.
- The test application that is used by the API Manager test tool is not subject to rate limits if you have enabled automatic subscriptions for the Catalog in which you are testing. For more information, see [Working with Catalogs](#)

4. Under your Plan, specify which APIs are to be included.

Reference APIs by name and version, as follows:

```
apis:
  API_1_nameAPI_1_version: {}
  API_2_nameAPI_2_version: {}
```

where

- the *API\_n\_name* variables are the case-sensitive names of your APIs.
- the *API\_n\_version* variables are the versions of your APIs.

5. Optional: If you want to include only a subset of an API's operations, list the operations that are to be included; use the following syntax:

```
apis:
  API_nameAPI_version:
    operations:
      - operation: Operation_1_Verb
        path: Operation_1_Path
      - operation: Operation_2_Verb
        path: Operation_2_Path
```

where

- the *Operation\_n\_Path* variables are the paths of operations that is to be included. The dash is required for each new operation.
- the *Operation\_n\_Verb* variables are the appropriate REST verbs for the operations.

6. Optional: If you want to specify multiple rate limits for a single operation; use the following syntax:

```
apis:
  API_nameAPI_version:
    operations:
      - operation: Operation_Verb
        path: Operation_Path
        rate-limits:
          Name:
            value: Operation_Limit
            hard-limit: Operation_Limit_Toggle
          Name:
            value: Operation_Limit
            hard-limit: Operation_Limit_Toggle
```

where:

- *Operation\_Limit* is the rate limit that you want to apply to your operation. It can be for multiples of seconds, minutes, hours, days, or weeks, written as *second*, *minute*, *hour*, *day*, and *week* respectively; do not use the plural forms of the words. Use the syntax: **1/2minute**. If the time unit is singular, then it is not necessary to precede it with a number, for example, **1/minute**. If you do not want to apply a rate limit, set *Operation\_Limit* as *unlimited*.
- *Operation\_Limit\_Toggle* must be *true* or *false*. If *true*, API calls by a developer will fail if the rate limit is exceeded. This step is not necessary if you have set *Operation\_Limit* to *unlimited*.

## Results

You have described the Plans that are to be included in your Product. Your Plans section should be similar to the following scenarios.

If you have enforced a rate limit for your Plan and not specified individual operations, your Plans section should have the following form:

```
plans:
  Plan_Name:
    title: Plan_Title
    description: Plan_Description
    approval: Approval_Toggle
    rate-limits:
      Name:
        value: Limit
        hard-limit: Limit_Toggle
  apis:
    API_1_nameAPI_1_version: {}
    API_2_nameAPI_2_version: {}
```

If you have enforced rate limits at the Plan level and want to include two operations, with a separate rate limit one for one of the operations, your Plans section should have the following form:

```
plans:
  Plan_Name:
    title: Plan_Title
    description: Plan_Description
    approval: Approval_Toggle
    rate-limits:
      Name:
        value: API_Limit
        hard-limit: API_Limit_Toggle
```

```

burst-limits:
  Name:
    value: Burst_Limit
apis:
  API_nameAPI_version:
    operations:
      - operation: Operation_1_Verb
        path: Operation_1_Path
        rate-limits:
          Name:
            value: Operation_Limit
            hard-limit: Operation_Limit_Toggle
      - operation: Operation_2_Verb
        path: Operation_2_Path

```

In both examples, variables are as in the previous steps and the indentation must be as presented.

The following example shows a complete sample Plans section:

```

plans:
  default:
    title: Default Plan
    description: Default Plan
    approval: false
    rate-limits:
      default:
        value: 100/hour
        hard-limit: false
  my-plan:
    title: my_plan
    rate-limits:
      Default rate-limit:
        value: 50/1hour
        hard-limit: false
    burst-limits:
      Default burst-limit:
        value: 10/1second
  apis:
    api21.0.0:
      operations:
        - operation: get
          path: /path2
    api31.0.0:
      operations:
        - operation: get
          path: /path3
      rate-limits:
        limit3:
          value: 10/1second
          hard-limit: true
        limit4:
          value: 100/1hour
          hard-limit: true
    api11.0.0: {}

```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## An example YAML representation of a Product

Products in IBM® API Connect can be represented by using a YAML file in a similar fashion to how APIs can be represented by using OpenAPI.

The following code describes a complete Product, with sample values.

```

info:
  version: 1.0.0
  title: SampleProduct
  name: SampleProduct
  summary: This is a sample product
gateways:
  - datapower-gateway
product: 1.0.0
visibility:
  view:
    enabled: true
    type: public
    tags: []
    orgs: []
  subscribe:
    enabled: true
    type: authenticated
    tags: []
    orgs: []
plans:
  default:
    title: Default Plan
    description: Default Plan
    approval: false

```

```

rate-limits:
  default:
    value: 100/hour
    hard-limit: false
newplan:
  title: NewPlan
  rate-limits:
    low:
      value: 10/1hour
      hard-limit: true
  burst-limits:
    Default burst-limit:
      value: 10/1second
apis:
  SampleAPI:
    name: 'Sampleapi:1.0.0'

```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Using `x-ibm-languages` to create multilingual API and Product documentation

Create multilingual API and Product documentation by using the `x-ibm-languages` extension in your API and Product OpenAPI definitions.

You can scale your API initiatives to a global user base, while still maintaining a single API definition. Translations are custom configured and controlled, so that they can be tailored to both your API documentation and the API consumer. The extensions that are used in API Connect are added directly to the YAML file as `x-ibm-languages`. These extensions are then used in the Developer Portal, so that whatever language the Developer Portal is set to reflects the translations that are contained in the API and Product definitions.

Add the following syntax into your API or Product YAML file at every point that you require some translated text:

```

x-ibm-languages:
  item_name:
    language_code: translated_text

```

Where:

- `item_name` is the name of the item that you want to translate, for example `summary`.
- `language_code` is the ISO code for the translation language. Supported languages with their ISO codes are listed in the following table.

Table 1. List of supported language codes

Language	Code
Chinese, simplified	zh_cn
Chinese, traditional	zh_tw
Dutch	nl
English	en
French	fr
German	de
Italian	it
Japanese	ja
Korean	ko
Portuguese	pt
Spanish	es
Turkish	tr

- `translated_text` is the translated text that you want to be displayed for the item in the Developer Portal.

Note: The Developer Portal automatically assumes that the default language in the OpenAPI definition is English. If you want to use a different default language in the definition, you must provide both the English translation and the default language text in the `x-ibm-languages` extension sections of your OpenAPI definition, by using the following syntax:

```

x-ibm-languages:
  item_name:
    en: English translated_text
    default_language_code: default_language_text

```

For an example of how to write an OpenAPI YAML file with French as the default language, see the [Examples](#) section.

## Examples

An example API OpenAPI YAML file that contains the `fr` language extension, where English is the default language:

```

swagger: '2.0'
info:
  x-ibm-name: climbing-weather-api
  title: Climbing Weather API
  version: 1.0.0
  x-ibm-languages:
    title:

```

```

    fr: Climat d'escalade
schemes:
  - https
host: ${catalog.host}
consumes:
  - application/json
produces:
  - application/json
x-ibm-configuration:
  assembly:
    execute:
      - invoke:
          target-url: 'https://1234.com'
          title: 3 day forecast invocation
          cache-response: time-to-live
          cache-key: ${request.search}
gateway: datapower-gateway
enforced: true
testable: true
phase: realized
cors:
  enabled: true
paths:
  /weather/forecast:
    get:
      summary: Retrieve the 3 day forecast for a location
      description: Retrieve the locations weather forecast descriptions for the next 3 days and nights
      operationId: getWeather
      x-ibm-languages:
        summary:
          fr: Récupérer la prévision de 3 jours pour un emplacement
        description:
          fr: Récupérer les descriptions des prévisions météo pour les 3 prochains jours et les nuits
      tags:
        - Weather
      parameters:
        - name: zip
          type: string
          in: query
          description: A 5 number zip code
          x-ibm-languages:
            description:
              fr: Un code postal à 5 numéros
        - name: country
          type: string
          in: query
          description: A 2 letter country code
          x-ibm-languages:
            description:

    25 calls per day:
      hard-limit: true
      value: 25/1day
100-calls-per-day:
  title: 100 Calls every day
  description: 'You get 100 calls each and every day!'
  x-ibm-languages:
    title:
      fr: "100 appels par jour"
    description:
      fr: "Vous recevez 100 appels chaque jour"
  apis: {}
  rate-limits:
    100 Calls per day:
      hard-limit: true
      value: 100/1day

```

An example of how to write an OpenAPI YAML file with French as the default language:

```

info:
  name: climat-d-escalade
  title: Climat d'escalade
  version: 1.0.0
  x-ibm-languages:
    title:
      en: Climbing Weather API
      fr: Climat d'escalade
...

```

This example shows that both the default French language, and the English language translation, must be provided in the `x-ibm-languages` section.

## Related information

- [Expand your API Initiatives Globally with Multi-Lingual Support of API and Product Definitions](#)

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Using `x-example` to control the examples displayed in the Developer Portal

OpenAPI does not support the use of `example` attributes on parameters, only on request and response objects and their properties. To allow API Developers to be able to control the examples displayed in the portal you can use `x-example` in OpenAPI parameters.

In this example, you cannot use `example` as it isn't supported by the OpenAPI spec, but you can use `x-example`.

```

- name: city
  in: query
  required: false
  type: string
  maxLength: 50
  description: "Location"
  x-example: "New York"

```

An `example` attribute is honored where set and allowed by the spec. If `example` is not found, `default` is honored where set and allowed by the spec. An `x-example` attribute is honored if found, if not found, a random example to match the schema is generated.

If the spec allows you to use `example`, then you should use it in preference to `x-example`.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Using `x-embedded-doc` to add additional documentation to products and APIs

You can use `x-embedded-doc` to add additional documentation to a product or an API as part of their definition.

You can embed additional documentation pages within the api swagger documentation. These pages can be base64 encoded strings or markdown strings of the html content of the page. These pages show up in the navigation, on the left side, underneath the overview for that product or API, and above the paths. Any styling that is

needed to theme the documentation can be included in the Developer Portal custom theme.

## Embedded docs for products and APIs

You can embed documentation for individual products and APIs by specifying an additional `x-embedded-doc` object in the product or API specification.

Field name	Type	Description
name	string	Required, the name of the embedded document
title	string	Required, The display title of the embedded document
format	string	Optional, the format of the embedded document content value. Values are <code>b64html</code> or <code>md</code> . Default value is <code>md</code> .
content	string	The base64 encoded html of page, or, the markdown string.
docs	x-embedded-doc	Additional embedded documentation. If no content is specified for parent, then the first child is the content that is shown.

Hierarchies of documents are supported by nesting of further doc properties. Language support is available by using `x-ibm-languages`.

## Examples

Documentation can be added to an api, by using the following JSON:

```
"x-embedded-doc": [
  {
    "name": "introduction",
    "title": "Introduction",
    "format": "md",
    "content": "# some markdown"
  },
  {
    "name": "concepts",
    "title": "Concepts",
    "format": "md",
    "content": "## more markdown"
  },
  {
    "name": "authentication",
    "title": "Authentication",
    "docs": [
      {
        "name": "auth_clientid_secret",
        "title": "Obtaining a Client ID and Secret",
        "format": "md",
        "content": "### even more markdown"
      },
      {
        "name": "auth_bearertoken",
        "title": "Getting and Using a Bearer Token",
        "format": "md",
        "content": "#### yet more markdown"
      }
    ]
  }
]
```

Alternatively, by using base 64 encoded HTML:

```
"x-embedded-doc": [
  {
    "name": "introduction",
    "title": "Introduction",
    "format": "b64html",
    "content": "PGFydG1jbGUgaWQ9ImIudHJvZHVjdGlvbiIqY2xhc3M...."
  },
  {
    "name": "concepts",
    "title": "Concepts",
    "format": "b64html",
    "content": "PGFydG1jbGUgaWQ9ImNvbmlcHRzIiBjbGFzc0icGFnZSI...."
  },
  {
    "name": "authentication",
    "title": "Authentication",
    "docs": [
      {
        "name": "auth_clientid_secret",
        "title": "Obtaining a Client ID and Secret",
        "format": "b64html",
        "content": "PGFydG1jbGUgaWQ9ImNsaWVudC1pZC1zZWNYZX...."
      },
      {
        "name": "auth_bearertoken",
        "title": "Getting and Using a Bearer Token",
        "format": "b64html",
        "content": "ICA8YXJ0aWNsZSBpZD0iYmVhcmVYLXRva2VuIiBjbGFz...."
      }
    ]
  }
]
```

Or mixed formats:

```
"x-embedded-doc": [
  {
    "name": "introduction",
    "title": "Introduction",
```

```

"format": "b64html",
"content": "PGFydGljbGUgaWQ9ImludHJvZHVjdGlubiIqY2xhc3M..."
},
{
"name": "concepts",
"title": "Concepts",
"format": "md",
"content": "# some markdown"
}
]

```

An example of some `x-embedded-doc` code and how it might render:

```

x-embedded-doc:
- name: document
  title: Interesting
  format: b64html
  content: >-
    PGFydGljbGUgaWQ9ImNsaWVudC1pZ...=
securityDefinitions:
  api_key:
    type: apiKey
    in: header
    name: api_key

```

[Products / My Doc APIs](#)

## Obtaining a Client ID and Secret

---

Each client app that accesses the API Connect REST API must be registered and configured to determine which operations the app may access.

To register a client app, use the `apic registrations:create` API Connect REST API.

**name**  
short name to identify the client

**title**  
display name of the client

**client\_id**  
a generated client ID value

**client\_secret**  
a generated client secret value

**client\_type**  
one of portal, gateway, toolkit, consumer\_toolkit, ui, consumer\_ui, ibm\_cloud

An example of some `x-embedded-doc` code into a product and how it might render:

```

x-embedded-doc:
- name: introduction
  title: Introduction
  format: md
  content: >-
    ## Overview

    ### Philosophy

    Markdown is intended to be as easy-to-read and easy-to-write as is
    feasible. Compellingly facilitate 2.0 intellectual capital for
    cross-platform networks. Dynamically incubate ethical sources after
    optimal technologies. Phosfluorescently restore global users via excellent
    niche markets. Credibly impact cross-media mindshare through strategic
    best practices. Synergistically impact interdependent web services rather
    than unique interfaces.

```

Continually reintermediate enabled sources rather than professional architectures. Appropriately embrace viral collaboration and idea-sharing whereas granular solutions. Energistically revolutionize competitive paradigms vis-a-vis highly efficient models. Objectively incentivize enterprise customer service through compelling e-markets. Competently grow multifunctional e-markets with business methods of empowerment.

Dramatically iterate equity invested scenarios and focused data. Compellingly reconceptualize next-generation deliverables rather than out-of-the-box architectures. Competently foster cross-unit web services with interactive innovation. Quickly revolutionize enabled communities and alternative content. Globally administrate resource maximizing deliverables whereas corporate e-business.

Progressively develop maintainable leadership.

## Using x-pathalias to give consistent URLs for products and APIs

You can use `x-pathalias` to assign a URL to a product or an API.

The information section of a YAML representation of a Product or API can include `x-pathalias`. This option can be useful as it allows the same URL to be used on different revisions of your product. It also allows the use of a vanity URL, which might better represent the branding of your site, or make the URL easier to pronounce.

In this example, you set an API called `Climbing weather API` in product `Weather watch` to have a URL of `portalURL/product/weather/api/climbing`.

Product information:

```
info:
  version: 1.0.0
  title: Weather watch
  name: weather-watch
  x-pathaliases: weather
```

API information:

```
info:
  title: Climbing Weather API
  x-ibm-name: climbing-weather-api
  version: 1.0.0
  x-pathaliases: climbing
```

# Validating the YAML or JSON definition of an API or Product

You can validate a YAML or JSON definition by using the IBM® API Connect developer toolkit.

## Before you begin

---

To complete the steps that are described in this topic, you must have installed the developer toolkit. For more information, see [Installing the toolkit](#).

## Procedure

---

To perform validation by using the developer toolkit, enter the following command:

```
apic validate filename
```

where *filename* is the file name of the API definition file you want to validate.

- Include `--product-only` to validate only a Product definition and not any APIs that it references.
- Include `--no-extensions` to validate only the default OpenAPI section of the API and none of its extensions.

Note:

- If the OpenAPI file that defines your API uses a `$ref` field to reference a fragment of OpenAPI code that is defined in a separate file, the `$ref` field is replaced with the contents of the target file before the draft API is created with the `apic drafts:validate` command. For more information, see [Using \\$ref to reuse code fragments in your OpenAPI files](#).
- Products that contain an API with a Swagger property using `regex` that include lookahead assertions, such as "(?)" cannot be validated or published. An error message is returned. For example:

```
Product has not been published!
The multipart 'openapi' field contains an OpenAPI definition with validation errors.
  definitions.properties.pattern Does not match format 'regex' (context: (root).definitions.properties.pattern, line: 0,
col: 0)
400
```

# Creating and using API and Product definitions templates

You can use template files when creating API and Product definitions. Template files are Handlebars templates containing variables of the form `{{variable-name}}` that are substituted with values when you create the API or Product definition.

## Before you begin

To complete the steps that are described in this topic, you must have installed the IBM® API Connect developer toolkit. For more information, see [Installing the toolkit](#).

## Procedure

1. Create a Product or API definition template, either from scratch, or by copying one of the examples provided in [API and Product definition template examples](#). The template file must have `.hbs` filename extension, and may contain any of the handlebars variables described in [Template variables for API and Product definitions](#).
2. To create a Product or API definition from a template, enter the following command:

```
apic create:[api | product ] --template template_file --title product_title options
```

where *template\_file* is the template `.hbs` file to use, *product\_title* is the title of the Product to create, and *options* is any additional command-line options. The path to the template file can be either an absolute path or relative to the location where the command is executed.

When the Product or API definition is created, the value of each command-line option is substituted for the corresponding handlebars template variable. For example, the value of the required `--title` option is substituted for the `info.title` field in the template file. The command creates a Product definition YAML file with the name specified in the `--name` option. If you don't supply the `--name` option, the command derives the name of the Product YAML file from the specified title by down-casing the title and replacing spaces with dashes.

## OpenAPI 3.0 support in IBM API Connect

From Version 2018.4.1.4, IBM® API Connect supports the OpenAPI 3.0 specification, with some limitations.

### Overview

A Product can contain any combination of OpenAPI 2.0 and OpenAPI 3.0 APIs. When you publish a Product that contains an OpenAPI 3.0 API, that API is validated to ensure that it is syntactically correct, and that references to configuration resources and policies resolve correctly, in the same way that OpenAPI 2.0 APIs are validated.

You can also validate OpenAPI 3.0 APIs in your local file system by using the `apic validate` command provided by the developer toolkit CLI; for details, see [Validating the YAML or JSON definition of an API or Product](#).

If you retrieve an API object by using the developer toolkit CLI or the API Connect REST APIs, there is an `oai_version` property that defines which OpenAPI version the API represents.

There is no OpenAPI 3.0 API support with the DataPower® Gateway (v5 compatible); OpenAPI 3.0 API support is provided by the DataPower API Gateway **only**.

### Limitations

The limitations to the OpenAPI 3.0 support in IBM API Connect are as follows:

- User interface limitations.
  - There is no support for working with draft OpenAPI 3.0 APIs in the API Manager or API Designer user interfaces. You must stage or publish OpenAPI 3.0 APIs directly by using the `apic products:publish` developer toolkit CLI command, or the API Connect REST APIs.
  - There is no support for editing OpenAPI 3.0 APIs in the API Manager user interface.
  - There might be some rendering errors in the Developer Portal test tool when OpenAPI 3.0 examples or schemas are displayed.
- Developer toolkit limitations.
  - You cannot create a draft API on a management server by uploading a local OpenAPI 3.0 API definition file with the `apic draft-apis:create` command. You can, however, stage or publish OpenAPI 3.0 APIs directly by using the `apic products:publish` developer toolkit CLI command, or the API Connect REST APIs.
- General limitations.
  - The `servers` array cannot contain more than one server.
  - The `url` entry in the `servers` array cannot contain `variables`.
  - `path` objects cannot contain server object overrides.
  - Wildcarding in response objects is not supported for error codes or success codes.
  - There is no support for converting a WSDL defined SOAP service into an OpenAPI 3.0 API.
- Security.
  - The following security schemes are not supported:
    - HTTP JWT Bearer (HTTP Basic scheme is supported).
    - OAuth2 with multiple flows (a single flow is supported).
    - OpenID Connect (OIDC).
  - The use of cookies in an API key is not supported.

- Assembly policies.
  - Only the following policies are supported:
    - `invoke`
    - `jwt-generate`
    - `jwt-validate`
    - `oauth`
    - `throw`
    - `user-security`
  - The `validate` and `map` policies are not supported.
  - Schema support is limited to Draft 4 and earlier. Therefore, the following policies are limited to those drafts:
    - `gatewayscript`
    - `set-variable`
    - `switch`
    - `json-to-xml`
    - `xml-to-json`
    - `parse`
    - `xslt`

For draft specification details, see <https://json-schema.org/specification-links.html>.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Working with global policies

Use global policies to configure policy assemblies that are called just before, or just after, each of your API assemblies is called. You can upload global policies into each of the gateway services in your Catalogs, and then designate, for each gateway service, which global policy is to be called before an API assembly is called, and which one is to be called after. The designated global policies are applied to all the APIs that are deployed to the associated gateway service.

## Prerequisites

IBM® DataPower® Gateway 7.7.1.3 or later.

To complete the global policy management tasks described in this topic, you must be the owner of the provider organization, or be assigned a role that has the **Settings:Manage** permission. The pre-supplied Administrator role has this permission by default; if you are assigned a custom role it must have this permission. For more information, see [Creating custom roles](#).

## Overview

A global policy is defined in a .yaml file. The global policy file specifies the policy assembly that you want to call. A global policy file has the following structure:

```
global-policy: 1.0.0

info:
  name: global_policy_name
  title: global_policy_title
  version: global_policy_version

gateways:
  - gateway_type

assembly:
  - policy_assembly_to_be_called
```

where *gateway\_type* has the value `datapower-gateway` if you want to use the global policy in a DataPower Gateway (v5 compatible), and `datapower-api-gateway` if you want to use the global policy in a DataPower API Gateway. For more information on the different types of gateway, see [API Connect gateway types](#). The `assembly` section can contain any valid API assembly flow. For more information, see the [execute](#) section.

For each of the gateway services in a Catalog, a global policy that you want to be called before any API assembly is called is designated as a *pre-request* global policy, and a global policy that you want to be called after any API assembly is called is designated as a *post-response* global policy. You can upload as many global policies into a gateway service as you want, but you can designate only one global policy to be pre-request, and one to be post-response, at any one time.

Note:

- If you are using the DataPower Gateway (v5 compatible), there can be only one **proxy** policy across the combined pre-request, API, and post-response assembly flows.
- Catalog properties, as described in [Creating and configuring Catalogs](#), and API properties, as described in [Setting API properties](#), are not supported with global policies. Therefore, if you use such properties in a global policy, they are **not** replaced with the values specified in the API or Catalog property definitions.

## Sample global policy .yaml file

```
global-policy: 1.0.0

info:
  name: sample-policy
  title: Sample Policy
  version: 2.0.0

gateways:
```

```

- datapower-gateway

assembly:
  execute:
    - invoke:
        target-url: http://myhost.com/mytarget
        version: 1.0.0

  catch:
    - errors:
        - ConnectionError
    execute:
      - activity-log:
          title: activity-log
          content: activity
          error-content: payload
          version: 1.0.0

```

## Logging in to the Management server

You work with global policies by using developer toolkit CLI commands. Before you can run the commands, you must log in to your management server from the CLI. Use the following command:

```
apic login --server mgmt_endpoint_url --username user_id --password password --realm provider/identity_provider
```

For full details of the `apic login` command, see [Logging in to a management server](#).

## Uploading a global policy to a gateway service

You upload a global policy to a gateway service by using the `apic global-policies:create` command. The command has the following format:

```
apic global-policies:create --catalog catalog_name --configured-gateway-service gateway_service_name --org organization_name --server mgmt_endpoint_url --scope scope [--space space] filename
```

where:

- `catalog_name` is the value of the `name` property of the Catalog that contains the gateway service to which you want to upload the global policy.
- `gateway_service_name` is the value of the `name` property of the gateway service.
- `organization_name` is the value of the `name` property of the provider organization that contains the Catalog.
- `mgmt_endpoint_url` is the platform API endpoint URL.
- `scope` has one of the following values:
  - `catalog` if the Catalog does not have Spaces enabled.
  - `space` if the Catalog has Spaces enabled. If you specify `space` for the `--scope` parameter you must also supply the `--space` parameter to specify the Space that contains the gateway service.
- (optional) `space` is the name of the Space that contains the gateway service. The `--space` parameter is required if the Catalog has Spaces enabled, in which case you must also include `--scope space` in the command.
- `filename` is the name of the global policy .yaml file that you want to upload.

Note: If Spaces are enabled in a Catalog, a global policy that you apply to one Space is applied to **all** Spaces; you cannot apply a global policy to an individual Space in the Catalog. Any subsequent updates are also applied to all Spaces.

You can confirm the global policies that have been uploaded by using the `apic global-policies:list-all` command, which has the following format:

```
apic global-policies:list-all --catalog catalog_name --configured-gateway-service gateway_service_name --org organization_name --server mgmt_endpoint_url --scope scope [--space space]
```

For reference details of the `apic global-policies` commands, see [apic global-policies](#).

## Designating the pre-request global policy

To designate the pre-request policy for a gateway service, complete the following steps:

1. Write the URL of the required global policy to a .yaml file by using the following command:

```
apic global-policies:get --catalog catalog_name --configured-gateway-service gateway_service_name --org organization_name --server mgmt_endpoint_url --scope scope [--space space] policy_name:policy_version --fields url
```

where `policy_name:policy_version` specifies the name and version number of the required global policy, as defined in the global policy .yaml file that was originally uploaded to the gateway service.

The value of the URL is written to a file called `GlobalPolicy.yaml`.

2. Edit the `GlobalPolicy.yaml` file and replace the string `url` with `global_policy_url`. The resulting file has the following format:

```
global_policy_url: >-
  https://server_host_name/api/catalogs/catalog_id/configured-gateway-services/gateway_service_id/global-policies/policy_id
```

3. Designate the global policy to be the pre-request policy by using the following command:

```
apic global-policy-prehooks:create --catalog catalog_name --configured-gateway-service gateway_service_name --org organization_name --server mgmt_endpoint_url --scope scope [--space space] GlobalPolicy.yaml
```

To replace the designated pre-request global policy with another policy, repeat steps [1](#) and [2](#), then use the `apic`

`global-policy-prehooks:update` command. To remove the pre-request global policy designation, use the `apic global-policy-prehooks:delete` command.

For reference details of the `apic global-policy-prehooks` commands, see [apic global-policy-prehooks](#).

## Designating the post-response global policy

---

To designate the post-response policy for a gateway service, complete the following steps:

1. Write the URL of the required global policy to a .yaml file by using the following command:

```
apic global-policies:get --catalog catalog_name --configured-gateway-service gateway_service_name --org organization_name --server mgmt_endpoint_url --scope scope [--space space] policy_name:policy_version --fields url
```

where `policy_name:policy_version` specifies the name and version number of the required global policy, as defined in the global policy .yaml file that was originally uploaded to the gateway service.

The value of the URL is written to a file called GlobalPolicy.yaml.

2. Edit the GlobalPolicy.yaml file and replace the string `url` with `global_policy_url`. The resulting file has the following format:

```
global_policy_url: >-
  https://server_host_name/api/catalogs/catalog_id/configured-gateway-services/gateway_service_id/global-policies/policy_id
```

3. Designate the global policy to be the post-response policy by using the following command:

```
apic global-policy-posthooks:create --catalog catalog_name --configured-gateway-service gateway_service_name --org organization_name --server mgmt_endpoint_url --scope scope [--space space] GlobalPolicy.yaml
```

To replace the designated post-response global policy with another policy, repeat steps 1 and 2, then use the `apic global-policy-posthooks:update` command. To remove the post-response global policy designation, use the `apic global-policy-posthooks:delete` command.

For reference details of the `apic global-policy-posthooks` commands, see [apic global-policy-posthooks](#).

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## API Connect context variables

List of IBM® API Connect context variables that you can reference when defining default parameter values in an assembly operation, or by using the `getContext()` function when defining a policy.

The following tables are presented:

- [General context variables](#).
- [OAuth context variables - DataPower Gateway \(v5 compatible\)](#).
- [Application certificate context variables](#).
- [API activity logging context variables](#).

For more information about implementing an assembly component, see [Including components in your assembly](#), and for information about how to reference context variables in API Connect see [Variable references in API Connect](#) and [Using context variables in GatewayScript and XSLT policies with the DataPower API Gateway](#).

For more information about creating a user-defined policy, see [Authoring policies](#).

## General context variables

Note:

- For plan variables (such as `plan.name` or `plan.version`), plan information is available only when the requested operation requires identification and the client passes the authentication check.
- If you deploy your API to the DataPower® Gateway (v5 compatible) then, with the exception of client ID and client secret, the passing of form input as a parameter into an API is not supported. This restriction does not apply if you deploy your API to the DataPower API Gateway.

Table 1. API Connect context variables

Name	Description
<code>api.catalog.id</code>	The ID of the Catalog in which the API is published.
<span style="border: 1px solid green; padding: 2px;">API Gateway only</span> <code>api.catalog.name</code>	The name of the Catalog in which the API is published.
<span style="border: 1px solid green; padding: 2px;">API Gateway only</span> <code>api.catalog.path</code>	The path segment that represents this Catalog.
<span style="border: 1px solid blue; padding: 2px;">DataPower Gateway (v5 compatible) only</span> <code>api.document</code>	The OpenAPI document.
<code>api.endpoint.address</code>	The address of the API Gateway endpoint.
<code>api.endpoint.hostname</code>	The host name of the API Gateway endpoint, as requested by the application.
<code>api.name</code>	The name of the API; this corresponds to the <code>x-ibm-name</code> field in the OpenAPI definition for the API.
<code>api.operation.id</code>	The ID of the operation.
<code>api.operation.path</code>	The path of the operation.
<code>api.org.id</code>	The organization ID of the API provider.
<code>api.org.name</code>	The organization short name of the API provider.
<code>api.properties.propertyname</code>	<p>The name of a custom API property. Property values are Catalog specific.</p> <p>Note:</p> <ul style="list-style-type: none"> <li>• You have write permission to a custom property <b>only</b> from the user interface, <b>not</b> from GatewayScript.</li> <li>• To access a Catalog specific property value from GatewayScript, you must refer to the property by using the following syntax:</li> </ul> <pre>apim-catalog-name</pre> <p>where <i>catalog</i> is the name of the Catalog, and <i>name</i> is the property name. For example:</p> <pre>var mypropertyvalue = \$(apim-mycatalog-mypropertyname)</pre>
<code>api.root</code>	The API basepath.
<code>api.type</code>	The API type; REST or SOAP.
<code>api.version</code>	The version string of the API.
<code>client.app.id</code>	The client ID or application key that is received on the request.
<code>client.app.lifecycle-state</code>	<p>The lifecycle status of the calling client application. The possible values are as follows:</p> <ul style="list-style-type: none"> <li>• <b>DEVELOPMENT</b></li> <li>• <b>PRODUCTION</b> (default)</li> </ul>
<code>client.app.metadata.key</code>	<p>The string value of an application metadata key, where <i>key</i> is the name of the key.</p> <p>You can add metadata keys to an application by using either the <code>apic apps:create</code> or the <code>apic apps:update</code> command; you include the metadata keys in the configuration file parameter that is passed to the command.</p> <p>For example:</p> <pre>apic apps:create myapp.yaml --server myserver.com --org myorg --catalog mycatalog --consumer-org mycorg</pre> <p>where myapp.yaml contains the following:</p> <pre>name: myapp title: My test application metadata:   key1: value1   key2: value2   key3: value3   key4: value4   key5: value5</pre> <p>You can then retrieve the value of a metadata key in an API assembly policy by using a context variable such as the following:</p> <pre>client.app.metadata.key3</pre> <p>Note that adding application metadata might impact gateway transaction performance.</p>
<code>client.app.name</code>	The name of the application that is identified as having issued the request.
<code>client.app.secret</code>	The client secret that is received in the request.
<code>client.org.id</code>	The unique identification key of the organization that owns this application.
<code>client.org.name</code>	The name of the organization that owns this application.

Name	Description
<b>API Gateway only</b> client.result	The result of the client security policy, which is <b>SUCCESS</b> or <b>FAILURE</b> .
<b>API Gateway only</b> client.third_party.type	The type of user registry used for third-party authentication of the extracted client credentials. The possible values are <b>LDAP</b> and <b>auth-url</b> .
<b>API Gateway only</b> client.third_party.headers	The array of headers added to the request that was sent to that API authentication URL during third-party authentication.
<b>API Gateway only</b> client.third_party.response.authenticating	The third-party authentication results. The possible values are as follows: <ul style="list-style-type: none"> <li><b>true</b>: the authentication was successful.</li> <li><b>false</b>: the authentication failed.</li> </ul>
<b>API Gateway only</b> client.third_party.response.user	The user for third-party authentication.
<b>API Gateway only</b> client.title	The title for the credentials that are received in the request.
<b>DataPower Gateway (v5 compatible) only</b> env.name	The name of the Catalog in which the API is published.
<b>DataPower Gateway (v5 compatible) only</b> env.path	The path segment that represents this Catalog.
message.body	The payload of the request or response message. Note: The <b>message.body</b> context variable is not supported with <b>getContext ()</b> function. Use the <b>getvariable ()</b> function instead.
message.headers.name	The value of the current named header of the message or of the current named header of the root part of a multipart message. The <b>name</b> segment is case-insensitive.
message.status.code	The HTTP status code of the response.
message.status.reason	The HTTP reason phrase of the response.
plan.name	The name of the plan.
plan.id	The unique identifier of the plan.
plan.version	The version number of the plan.
plan.rate-limit	The rate limit (the number of API calls per time interval) of the plan.
request.authorization	The parsed HTTP <b>authorization</b> header.
request.body	The payload from the incoming request.
request.content-type	Normalized content-type value.
request.date	A date object that represents approximately when the request was received by the Gateway.
request.headers.headername	The value of the original named header of the HTTP request, or the value of the current named header of the root part of a multipart request. The <b>headername</b> segment is case-insensitive.
request.parameters	You can obtain your incoming parameters from path and query parameters.
request.path	The path section of the <b>request.uri</b> that starts with the base path of the API, including the '/' character that begins the base path.
request.querystring	The request query string without the leading question mark.
request.search	The request query string with the leading question mark.
request.uri	The full HTTP request URI from the application.
request.verb	The HTTP verb of this request.
session.apiGateway	The gateway that receives the request.
session.apiGatewayName	The name of the API gateway as defined in the API Manager.
session.clientAddress	The address of the client that sent the request.
session.domainName	The name of the domain that the gateway belongs to.
session.globalTransactionID	The global transaction ID in the logs.
session.localAddress	The address of the gateway on the DataPower® Gateway.
session.timeStarted	The time that the gateway started to process the request.
session.transactionID	The transaction ID of the gateway request.
system.datetime	Returns a string that represents the current date and time in the system time zone of the gateway.
system.time	Returns a string that represents the current time in the system time zone of the gateway.
system.time.hour	Returns a number 0 - 23 inclusive, representing the hour of the current time in the system time zone of the gateway.
system.time.minute	Returns a number 0 - 59 inclusive representing the minute of the current time in the system time zone of the gateway.
system.time.seconds	Returns a number 0 - 59 inclusive representing the seconds of the current time in the system time zone of the gateway.
system.date	Returns a string that represents the current date in the system time zone of the gateway.
system.date.day-of-week	Returns a number 1 - 7 (Monday to Sunday) inclusive representing the day of the week in the system time zone of the gateway.
system.date.day-of-month	Returns a number 1 - 31 representing the day of the month in the system time zone of the gateway.
system.date.month	Returns a number 1 - 12 representing the month in the system time zone of the gateway.
system.date.year	Returns a four-digit number that represents the year in the system time zone of the gateway.
system.timezone	Returns a system time zone ISO 8601 identifier for the gateway, which might include a sign, a two-digit hour, and minutes. For example, <b>-04:00</b> .

## OAuth context variables - DataPower Gateway (v5 compatible)

The OAuth context variables described in this section apply only to the DataPower Gateway (v5 compatible). For details of the OAuth context variables that apply to the DataPower API Gateway, see [OAuth context variables](#).

Table 2. OAuth context variables (DataPower Gateway (v5 compatible)).

Note: Most OAuth context variables are available only when IBM API Connect is acting as the OAuth resource server. However, the `oauth.introspect` variables are also available when integrating with third party providers.

Name	Description
<code>oauth.access-token</code>	If the request is authenticated with OAuth, this variable contains the access token string.
<code>oauth.miscinfo</code>	This variable contains information explicitly included in the Authentication URL and Metadata URL headers. For more information, see <a href="#">Authenticate URL</a> .
<code>oauth.not-after</code>	If the request is authenticated with OAuth, this variable contains the date when the token expires.
<code>oauth.not-before</code>	If the request is authenticated with OAuth, this variable contains the date when the token was issued.
<code>oauth.resource-owner</code>	If the request is authenticated with OAuth, this variable contains the name of the resource owner.
<code>oauth.scope</code>	If the request is authenticated with OAuth, this variable contains the scope of this access token.
<code>oauth.introspect.active</code>	Always available to introspection. Boolean value.
<code>oauth.introspect.response</code>	Always available to introspection. Shows the complete current response payload. Example payload value: <code>{"active":true, "client_id", "xxx-xxx", "token_type", "bearer", "scope":"neon"}</code>
Other variables might be available from the third party, in the form of: <code>oauth.introspect.&lt;variable&gt;</code>	Decoding the previous example payload, the following variables are made available for further processing.  <code>oauth.introspect.client_id: xxx-xxx</code> <code>oauth.introspect.token_type: bearer</code> <code>oauth.introspect.scope: neon</code>

## Application certificate context variables

The following table describes context variables that are available when a certificate is used to verify access to an API, although these will vary depending on the signature mechanism that is being used; for more information, see the [Internet X.509 Public Key Infrastructure Certificate and CRL Profile specification](#).

Table 3. Application certificate context variables

Name	Description
<code>application.certificate.Base64</code>	Base64 format.
<code>application.certificate.fingerprint</code>	Fingerprint
<code>application.certificate.Version</code>	Version
<code>application.certificate.SerialNumber</code>	Serial number
<code>application.certificate.SignatureAlgorithm</code>	Signing algorithm
<code>application.certificate.Issuer</code>	The issuer of the certificate
<code>application.certificate.Subject</code>	Subject
<code>application.certificate.NotBefore</code>	Not valid before this date
<code>application.certificate.NotAfter</code>	Not valid after this date
<code>application.certificate.SubjectPublicKeyAlgorithm</code>	Algorithm for the subject public key
<code>application.certificate.SubjectPublicKeyBitLength</code>	Length for the subject public key
<code>application.certificate.KeyValue.type</code>	Various context variables that depend on the algorithm and key. The following are possible context variables: <ul style="list-style-type: none"> <li><code>application.certificate.KeyValue.RSAKeyValue.Modulus</code></li> <li><code>application.certificate.KeyValue.RSAKeyValue.Exponent</code></li> </ul>

## API activity logging context variables

If activity logging is enabled for an API, a `log` context variable is created; the `log` context variable contains the data relating to an API execution event. On completion of API execution, the `log` context variable is written to an API event record that is stored for subsequent access by API analytics. For details of the fields contained in the `log` context variable, see [API event record fields](#).

The way in which you enable and configure activity logging depends on the type of gateway you are using, as follows:

- If you are using the DataPower API Gateway, you configure activity logging in the API configuration settings; see [Activity logging with the DataPower API Gateway](#).
- If you are using the DataPower Gateway (v5 compatible), you configure activity logging by adding an [Activity Log](#) policy to the API assembly.

The activity logging configuration defines the default content of the `log` context variable, but you can modify it in an API assembly; for example:

- Add your own data values by using a [Set Variable](#) policy.
- Remove or redact data values by using a Redaction policy; see [Redaction - DataPower API Gateway](#) or [Redaction - DataPower Gateway \(v5 compatible\)](#).
-  Modify or replace the `log` context variable by using a [Log](#) policy.

## Related concepts

- [Variable references in API Connect](#)
- [The behavior of an assembly](#)

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details. For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## OAuth context variables

You can customize the OAuth security flow in a native OAuth provider by adding multiple OAuth policies to the assembly. Each OAuth policy takes input from context variables and writes output to context variables. By using these OAuth context variables you can manipulate the original request, and process the output from an OAuth policy.

Note: The OAuth context variables described here apply only to the DataPower® API Gateway. For details of the OAuth context variables that apply to the DataPower Gateway (v5 compatible), see [OAuth context variables - DataPower Gateway \(v5 compatible\)](#).

There are two main types of OAuth context variables:

- [Information variables](#), outputs of an OAuth policy.
- [Processing variables](#), processed during the execution of an OAuth policy.

## Information variables

These context variables are outputs of an OAuth policy. They are not used in the processing of the OAuth action.

### `oauth.result`

The result of the latest action; returns **SUCCESS** or **FAILURE**.

### `oauth.settings.variable_name`

Basic settings from the OAuth provider. The following context variables are available:

```
oauth.settings.allowed_scopes
oauth.settings.access_token_ttl
oauth.settings.authorization_code_ttl
oauth.settings.refresh_token_ttl
oauth.settings.refresh_token_limit
oauth.settings.maximum_consent_ttl
```

### `oauth.executed_components[0].variable_name`

The components that have executed in this transaction, with their result. If a failure occurs then the error and error description will be added. The following context variables are available:

```
oauth.executed_components[0].result
oauth.executed_components[0].type
oauth.executed_components[0].error_description
oauth.executed_components[0].error
```

The possible values for the `type` variable are as follows:

```
ValidateRequestComponent
GenerateAZCodeComponent
VerifyAZCodeComponent
VerifyRefreshTokenComponent
GenerateAccessTokenComponent
IntrospectTokenComponent
RevokeTokenComponent
CollectMetaDataComponent
```

The following example shows a corresponding JSON extract from the OAuth context:

```
"executed_components": [
  {
    "type": "ValidateRequestComponent",
    "result": "SUCCESS"
  },
  {
    "type": "GenerateAccessTokenComponent",
    "result": "SUCCESS"
  }
]
```

### `oauth.verified_access_token.variable_name`

The token that was verified in the security requirement for a native OAuth provider. The following context variables are available:

```
oauth.verified_access_token.access_token

oauth.verified_access_token.client_id
oauth.verified_access_token.consented_on
oauth.verified_access_token.consented_on_text
oauth.verified_access_token.grant_type
oauth.verified_access_token.misc_info
oauth.verified_access_token.not_after
oauth.verified_access_token.not_after_text
oauth.verified_access_token.not_before
oauth.verified_access_token.not_before_text
oauth.verified_access_token.one_time_use
oauth.verified_access_token.resource_owner
oauth.verified_access_token.scope
```

### `oauth.third_party.variable_name`

The token that was verified in the security requirement for a third party OAuth provider. The following context variables are available:

```
oauth.third_party.headers
oauth.third_party.response
```

#### `oauth.code.variable_name`

The code that was generated during the execution of a component of type `GenerateAZCodeComponent`. The following context variables are available:

```
oauth.code.client_id
oauth.code.code
oauth.code.redirect_uri
oauth.code.resource_owner
oauth.code.scope
```

#### `oauth.token.variable_name`

The token that was generated during the execution of a component of type `GenerateAccessTokenComponent`. The following context variables are available:

```
oauth.token.token_type
oauth.token.access_token
oauth.token.scope
oauth.token.expires_in
oauth.token.consented_on
oauth.token.redirect_uri
oauth.token.resource_owner
oauth.token.client_id
oauth.token.refresh_token
oauth.token.refresh_token_expires_in
oauth.token.refresh_token_count
```

#### `oauth.introspect.variable_name`

The token that was introspected during execution of a component of type `IntrospectTokenComponent`. The following context variables are available:

```
oauth.introspect.active
oauth.introspect.scope
oauth.introspect.client_id
oauth.introspect.resource_owner
oauth.introspect.token_type
oauth.introspect.grant_type
oauth.introspect.ttl
oauth.introspect.expires
oauth.introspect.expires_text
oauth.introspect.iat
oauth.introspect.not_before
oauth.introspect.not_before_text
oauth.introspect.consented_on
oauth.introspect.consented_on_text
oauth.introspect.one_time_use
```

## Processing variables

---

These context variables are processed during the execution of an OAuth policy in your API assembly. If they are set prior to any OAuth policy then the value overrides what was sent in the request. They can also be modified between OAuth policies to manipulate the next component that executes. The following context variables are available:

```
oauth.processing.assertion
oauth.processing.client_id
oauth.processing.client_secret
oauth.processing.grant_type
oauth.processing.redirect_uri
oauth.processing.scope
oauth.processing.response_type
oauth.processing.state
oauth.processing.resource_owner
oauth.processing.refresh_token
oauth.processing.code
oauth.processing.token
oauth.processing.token_type_hint
oauth.processing.nonce
oauth.processing.max_age
oauth.processing.oidc_values_requested
oauth.processing.id_token_requested
oauth.processing.oidc_signing_algorithm
oauth.processing.code_challenge
oauth.processing.code_challenge_method
oauth.processing.code_verifier

oauth.processing.metadata.access_token
oauth.processing.metadata.payload
oauth.processing.metadata.azcode_miscinfo

oauth.processing.verified_code.client_id
oauth.processing.verified_code.resource_owner
oauth.processing.verified_code.misc_info
oauth.processing.verified_code.scope
oauth.processing.verified_code.is_verified
oauth.processing.verified_code.nonce

oauth.processing.verified_refresh_token.client_id
oauth.processing.verified_refresh_token.resource_owner
oauth.processing.verified_refresh_token.misc_info
oauth.processing.verified_refresh_token.scope
oauth.processing.verified_refresh_token.refresh_token_count
oauth.processing.verified_refresh_token.is_verified
oauth.processing.verified_refresh_token.one_time_use
oauth.processing.verified_refresh_token.grant_type
```

The following example shows the OpenAPI source code for a `gateway-script` policy that executes before an OAuth policy in your API assembly and adds a custom scope to the request:

```
// Add another custom scope to the request
let scope = context.get("request.parameters.scope.values[0]");
if (scope)
  context.set("oauth.processing.scope", scope + " custom");
```

The following example shows the OpenAPI source code for a `gateway-script` policy that between OAuth policies in your assembly and modifies the scope depending on the resource owner:

```
// Check resource owner and modify the scope
let owner = context.get("oauth.processing.resource_owner");
let scope = context.get("oauth.processing.scope");

if (owner === 'admin') {
  context.set("oauth.processing.scope", scope + " admin");
} else {
  context.set("oauth.processing.scope", scope + " customer");
}
```

## Advanced scope context variables

The following context variables are used in OAuth advanced scope checking. They are populated by the values entered in the Endpoint and TLS Client Profile fields for the Application scope check and Owner scope check in the native OAuth provider configuration. Do not change these values as this might result in incorrect advanced scope operation.

For information on scope configuration, see [Configuring scopes for a native OAuth provider](#). For information on advanced scope checking, see [Scope](#).

```
oauth.advscope.app.url
oauth.advscope.app.tls-profile
oauth.advscope.own.url
oauth.advscope.own.tls-profile
```

## Custom error context variables

These context variables are used to stop OAuth processing and specify the respective error details. They can be used before OAuth processing takes place.

```
oauth.custom_error.status.code
oauth.custom_error.status.reason
oauth.custom_error.message
oauth.custom_error.description
```

## Related reference

- [Example - using multiple OAuth policies in an OAuth provider assembly](#)

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## API and Product definition template examples

You can use template files when creating API and Product definitions. Template files are Handlebars templates containing variables of the form `{{variable-name}}` that are substituted with values when you create the API or Product definition. This topic provides the default Handlebar templates used by `apic` to create Products and APIs as examples you can use to copy and customize for your own use.

## Default API definition template

The following example template is the default template that developer toolkit uses when you create an API definition. Copy this example template into your own template file (which must have the `.hbs` extension), then edit it for your purposes. Template variables are enclosed by double curly braces, for example `{{name}}`. For information on template variables, see [Template variables for API and Product definitions](#). For more information on Handlebars, see <https://handlebarsjs.com/>.

## OAuth 2.0 API definition template

The following example template is the default template that developer toolkit uses when you create an OAuth 2.0 API definition with the command `apic create:api -template oauth`. Copy this example template into your own template file (which must have the `.hbs` extension), then edit it for your purposes. Template variables are enclosed by double curly braces, for example `{{name}}`. For information on template variables, see [Template variables for API and Product definitions](https://handlebarsjs.com/). For more information on Handlebars, see <https://handlebarsjs.com/>.

```
swagger: "2.0"

post:
  consumes:
  - application/x-www-form-urlencoded
  produces:
  - application/json
  summary: Request Access Tokens
  description: |
    This endpoint allows requesting an access token following one of the flows below:
    - Authorization Code (exchange code for access token)
    - Client Credentials (2-legged, there isnt resource owner information)
    - Resource Owner Password Credentials (2-legged, client provides resource owner name and password)
    - Refresh Token (exchange refresh token for a new access code)

```

The table below indicates the required parameters for each specific grant\_type options. Empty cells indicate a parameter is ignored for that specific grant type.

Client authentication:

- Confidential clients should authenticate using HTTP Basic Authentication. Alternatively, they may post their client\_id and client\_secret information as a formData parameter.
- Public clients should send their client\_id as formData parameter.

grant_type	code	client_credentials	password	refresh_token
client_id	required*	required*	required*	required*
client_secret	required*	required*	required*	required*
code	required			
redirect_uri	required			
username			required	
password			required	
scope		optional	optional	
refresh_token				required

The implicit grant requests, see /oauth2/authorize.

## Template variables for API and Product definitions

You can use template files when creating API and Product definitions. Template files are Handlebars templates containing variables of the form `{{variable-name}}` that are substituted with values when you create the API or Product definition.

## Product definition variables

The following table describes the Handlebars template variables that can be used in a product definition file. For more information on Handlebars, see <https://handlebarsjs.com/>. Product definition template files must have a `.hbs` filename extension.

Table 1. Product definition Handlebars template variables

Variable	Type	Description
{{apis}}	Array of string	The APIs to which the product definition refers. After substitution, the array values become the values of <code>apis.routes[n].\$ref</code> fields, for example:  <pre>apis:   'routes':     \$ref: apidef.yaml     ...</pre>
{{name}}	String	Value of <code>info.x-ibm-name</code> field.
{{title}}	String	Value of <code>info.title</code> field.
{{version}}	String	Value of <code>info.version</code> field.

## API definition variables

The following table describes the Handlebars template variables that can be used in an API definition file. For more information on Handlebars, see <https://handlebarsjs.com/>. API definition template files must have a `.hbs` filename extension.

Table 2. API definition Handlebars template variables

Variable	Type	Description
{{basepath}}	String	Base path on which the API is served, which is relative to the <code>host</code> .
{{definitions}}	<a href="#">OpenAPI definitions object</a> converted to a YAML string ("stringified").	For a LoopBack API, contains data types that can be consumed and produced by operations. These data types can be primitives, arrays or models.
{{definitionsObj}}	<a href="#">OpenAPI definitions object</a> converted to a YAML string ("stringified").	For a LoopBack API, contains data types that can be consumed and produced by operations. These data types can be primitives, arrays or models.
{{hostname}}	String	Value of the <code>host</code> field.
{{name}}	String	Value of <code>info.x-ibm-name</code> field.
{{paths}}	<a href="#">OpenAPI paths object</a>	For a LoopBack API, contains the relative paths to the individual endpoints. The path is appended to <code>{basePath}</code> to construct the full URL.
{{pathsObj}}	<a href="#">OpenAPI paths object</a>	For a LoopBack API, contains the relative paths to the individual endpoints. The path is appended to <code>{basePath}</code> to construct the full URL.
{{schemes}}	Array of string	Transfer protocol of the API. Values must be one of: <code>"http"</code> , <code>"https"</code> , <code>"ws"</code> , or <code>"wss"</code> .
{{targeturl}}	String	Value of <code>x-ibm-configuration.assembly.execute[invoke]</code> . Default is <code>\$(runtime-url)\$(request.path)</code> .
{{title}}	String	Value of <code>info.title</code> field.
{{version}}	String	Value of <code>info.version</code> field.

## Managing your APIs

You manage your APIs by using the API Manager user interface of IBM® API Connect. You can also analyze your API usage by using the analytics that are provided and socialize your APIs in a developer portal.

## Why use APIs?

Whether you are a business user, an IT user, or an application developer, APIs are increasingly important to your business. You can use an API to publicize your company. The assets, data, or services of your company can be provided to external application developers to expand your enterprise and open new markets.

The API Manager UI provides a solution for companies to manage APIs for private internal APIs, and public external APIs. This on-premises offering provides the capabilities that are required so that you can externalize and manage your services as REST or SOAP APIs.

## What do you need to know?

Depending on your role, you can complete different tasks relating to managing your API Catalogs and these are outlined in the documentation. Each task is covered in the order that they are executed.

Each task introduces new features of the API Manager UI as they become relevant to the Catalog that you are building.

For security reasons, your session times out after a period of inactivity.

Before you start, check that the browser you are using is supported and meets the required minimum levels; for details, open the [Detailed system requirements for a specific product](#) page, search for the IBM API Connect product, then select the required offering and version.

The ways in which you can manage your APIs are described in the following subtopics:

- **[Activating your API Manager user account](#)**  
Before you can access the API Manager user interface of IBM API Connect, you must activate the user account that your Cloud Manager administrator invited you to join.
- **[Accessing the API Manager user interface](#)**  
The IBM API Connect API Manager user interface provides a range of options for working with your APIs and Products, and managing security.
- **[\[Technical Preview\] Searching for items in API Manager](#)**  
Use the search feature in IBM API Connect API Manager to easily locate items such as APIs, Catalogs, applications, and subscriptions.
- **[Working with Catalogs](#)**  
Products must be staged to a Catalog and then published; application developers are able to access the APIs in a Product by being members of Consumer organizations to which the Product is made available. In IBM API Connect, you can create multiple Catalogs. Catalogs are useful for separating Products and APIs for testing before you make them available to Consumer organizations. The syndication feature in API Connect means that you can also publish a Product to a Space in a Catalog.
- **[Using syndication in API Connect](#)**  
With the IBM API Connect syndication feature, you can partition your Catalogs into *Spaces*. Each Space is used by a different API provider development team and has its own set of management capabilities relating specifically to the APIs that the associated team publishes to that Space, enabling each team to manage their APIs independently.
- **[Administering Consumer organizations](#)**  
Manage the Consumer organizations that access your APIs and Plans when their users sign up to use the IBM API Connect Developer Portal.
- **[Security and authentication](#)**  
In API Manager, you can use TLS profiles to secure the transmission of data between the management server and other API Connect subsystems and external services, and also configure user registries to securely authenticate your Catalogs and APIs.
- **[Working with Products in the API Manager](#)**  
In IBM API Connect, Plans and APIs are grouped together in Products.
- **[API Analytics](#)**  
You can use IBM API Connect to filter, sort, and aggregate your API event data. You can present the results within correlated charts, tables, and maps to help you manage service levels, set quotas, establish controls, set up security policies, manage communities, and analyze trends.
- **[Administering user access](#)**  
If you have permission to administer users in IBM API Connect, you can add and delete users. After users are removed from an organization through deletion, the user account remains in API Manager.
- **[Changing your API Manager password](#)**  
You can change your API Manager password in IBM API Connect.
- **[Resolving login problems by increasing HTTP header size](#)**  
You can resolve login problems for the API Manager UI by increasing the maximum HTTP client header size.
- **[Reference](#)**  
Reference information for the API Manager component in IBM API Connect.
- **[API Manager tutorials](#)**  
Tutorials for using the API Manager user interface in IBM API Connect.

---

---

## Activating your API Manager user account

Before you can access the API Manager user interface of IBM® API Connect, you must activate the user account that your Cloud Manager administrator invited you to join.

---

### Before you begin

The Cloud Manager administrator invited you to join API Connect .

---

### Procedure

1. Complete the following steps to create your API Manager account:

If the Identity Provider uses LDAP

An invitation email with an activation link is sent. Click the activation link, or paste it in a browser, to log in directly with your user credentials. Upon authentication, the API Connect user record is updated from the backend identity provider.

If the Identity Provider uses a local registry

An invitation email with an activation link is sent. Click the activation link or paste it in a browser. The activation link takes you to a sign up page where you enter your first name, last name and password. Passwords must have a minimum of 8 characters and contain characters from at least three of the four following categories:

- Uppercase letters
- Lowercase letters

- Numbers
- Special characters (for example: ! # \$ %)

Note:

- The email address that you enter on the sign up page must match the email address to which the invitation email was sent, otherwise the account activation fails.
- If you previously had an account that the administrator removed, and they are inviting you again, you must re-activate your account by using the Sign In option on the page, **not** by completing the registration form and using the Sign Up option; attempting to re-register will fail.

If the Identity Provider uses an authentication URL

An invitation email with an activation link is sent. Click the activation link or paste it in a browser. The activation link takes you to a sign up page where you enter your credentials, which then become your user name and password. Upon authentication, the API Connect user record is updated from the backend identity provider.

If multiple user registries are available for selection on the sign up page, then make sure that the correct registry for your API Manager account is selected. You might need to ask your administrator which user registry is appropriate for your account.

For information on configuring user registries and making them available for API Manager login, see [User registries overview](#) and [Selecting user registries for Cloud Manager and API Manager](#).

2. Click Sign up to complete your registration, then click Sign in to open the API Manager login page.

---

## Results

You have created your API Connect account.

---

## What to do next

Log in to the API Manager user interface and, depending on your role, start to work with Catalogs, Consumer organizations, APIs and Products. To access the API Manager login page in the future, use the following URL:

**`https://host/manager`**

where *host* is the fully qualified host name or IP address of the Management server.

# Accessing the API Manager user interface

The IBM® API Connect API Manager user interface provides a range of options for working with your APIs and Products, and managing security.

To log in to the API Manager user interface, complete the following steps:

1. In a web browser, enter the following URL:

**`https://host/manager`**

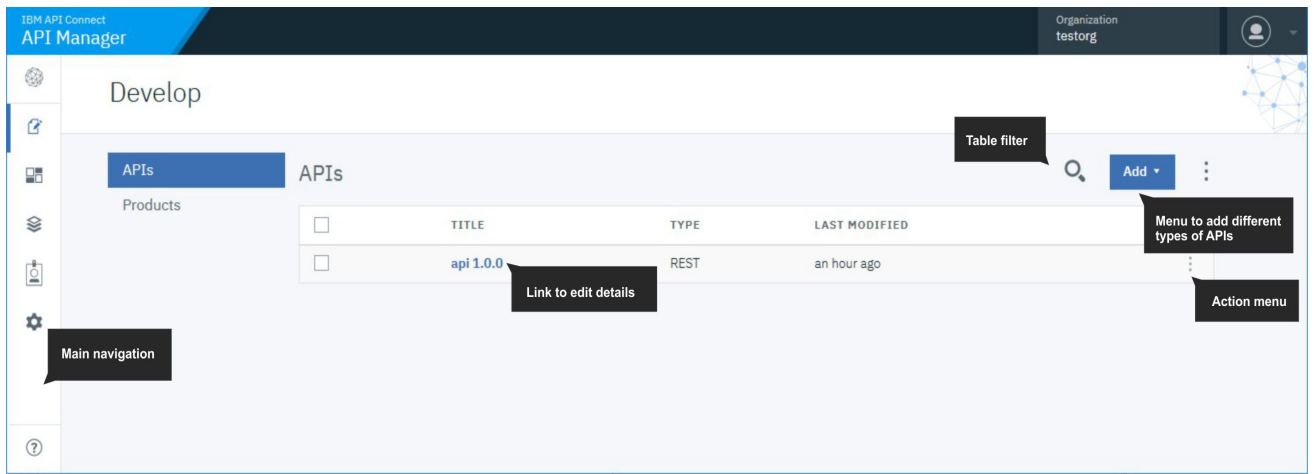

where *host* is the fully qualified host name or IP address of the Management server.

2. If your cloud contains multiple user registries, then select the user registry that contains the login credentials for your API Manager account. You might need to ask your administrator which user registry is appropriate for your account.

For information on configuring user registries and making them available for API Manager login, see [User registries overview](#) and [Selecting user registries for Cloud Manager and API Manager](#).

3. Enter your user name and password, then click Sign in. The API Manager user interface opens:

Depending on your role, you can now start to work with Catalogs, Consumer organizations, APIs and Products.

## [Technical Preview] Searching for items in API Manager

Use the search feature in IBM® API Connect API Manager to easily locate items such as APIs, Catalogs, applications, and subscriptions.

Search is available from any page in API Manager and can be accessed by typing in the search field in the page banner, or by clicking  Search in the navigation list.

## This feature is provided as a Technical Preview

As such, the feature might not be fully functional in your environment and support is limited. In addition, the feature's appearance and functionality are subject to change both in this release (V2018) and in later releases of API Connect. Review the following disclaimer before enabling the Search technical preview:

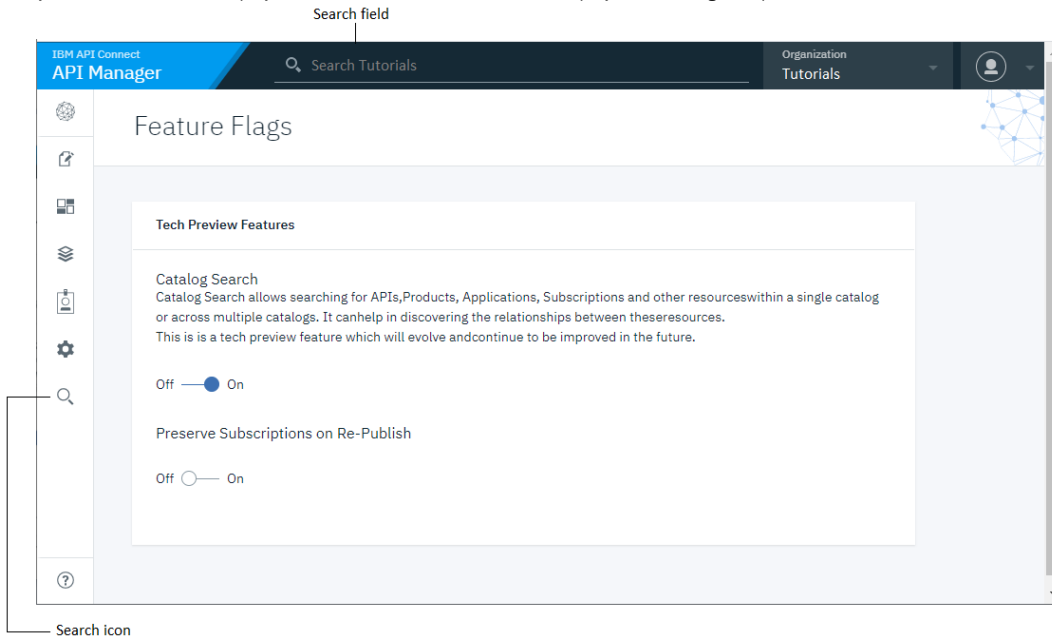

Notice: Technology Preview Code (TPC) may be included or distributed with the Program or updates to it but are not part of the Program. TPC is licensed under the same terms as the Program, except as provided below. TPC will be identified as such in the Notices File (or in an updated Notices File accompanying the updates). Some or all of the TPC may not be made generally available by IBM as or in a product. Licensee is permitted to use TPC only for internal use for evaluation purposes and not for use in a production environment. The Notices File may limit this evaluation use to an evaluation period. If so, at the end of such evaluation period Licensee must cease using and uninstall the TPC. IBM provides the TPC without obligation of support and "AS IS," WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESS OR IMPLIED, INCLUDING, WITHOUT LIMITATION, THE WARRANTY OF TITLE, NON-INFRINGEMENT OR NON-INTERFERENCE AND ANY IMPLIED WARRANTIES AND CONDITIONS OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE.

## Enabling Search

Enable Search for your API Connect user account by completing the following steps:

1. Log in to API Manager.
2. In the browser's address bar, append **/ff** to the URL and press Enter to display the Feature Flags page.  
For example: <https://example.com/my-org/ff>

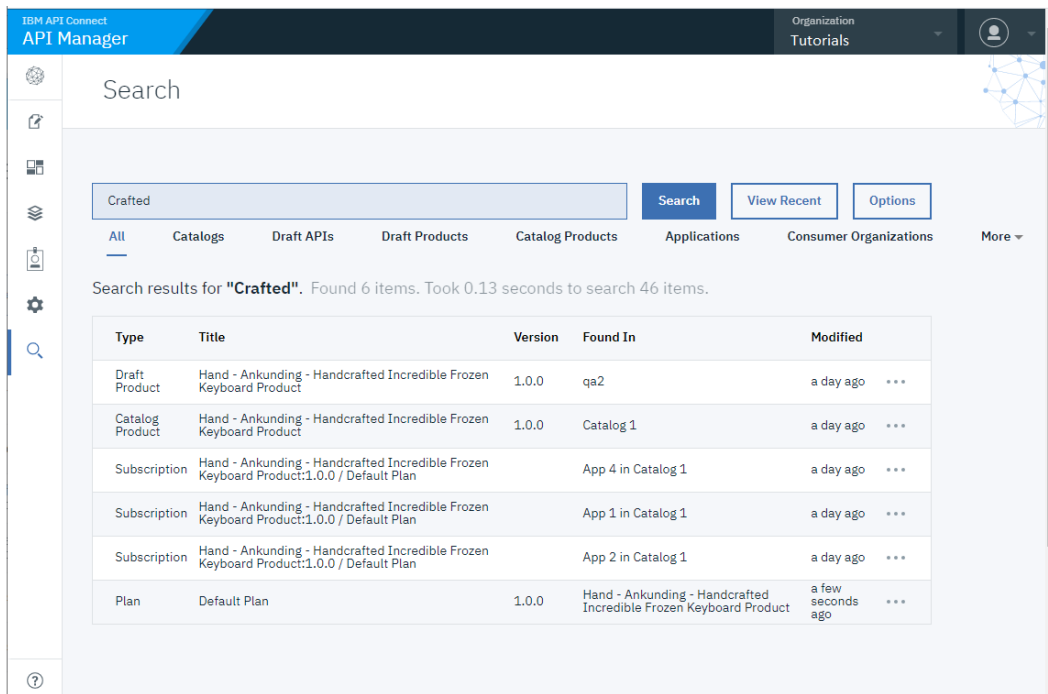

3. On the Feature Flags page, click the Off - On toggle for the "Catalog Search" option to set it to On.
4. When the "Enable Catalog Search" message displays, click Confirm.
5. Verify that the Search field displays in the banner and the Search icon displays in the navigation panel.

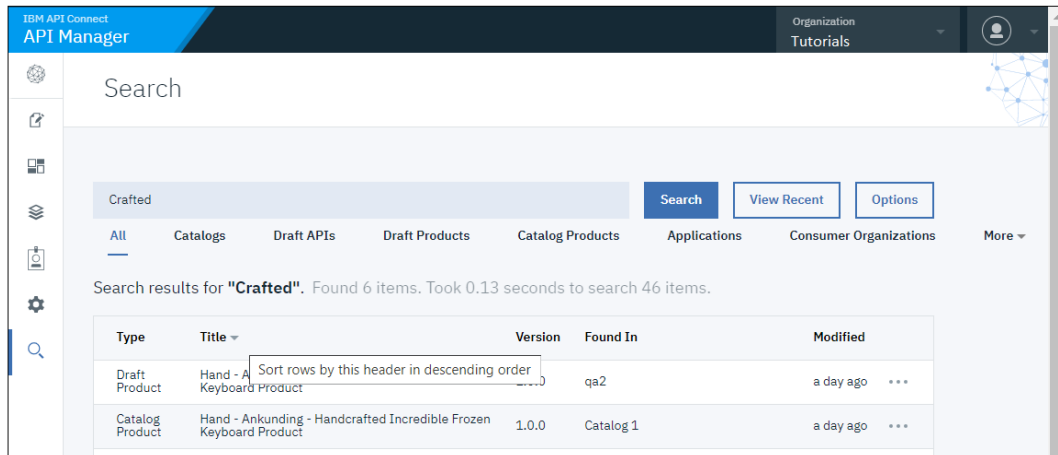

## Using Search

The Search feature is available on all pages of the API Manager. To start searching, just type a string into the Search field and press Enter. Whenever you press Enter in the Search field, the Search page displays with results and additional options. If you press Enter in an empty Search field, or click  Search in the navigation list, then the Search page displays a list all items. If you type a string before pressing Enter, the page displays the results from the corresponding search.

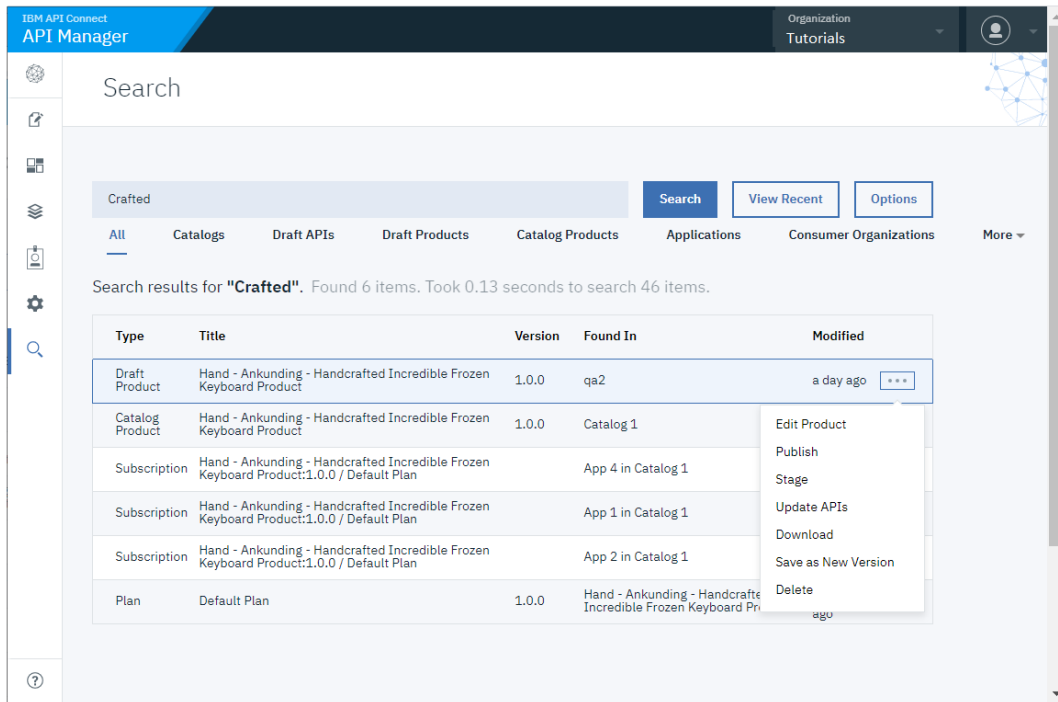

Search results include all items that contain the search string in a text field. For example, suppose you searched for "Crafted". The results might look like the following image, with items that don't match the search string exactly, but do include the string in a text field such as a title or a name:

By default, the search returns all types of items that contain the string. Sort results on a particular column by clicking the column header.

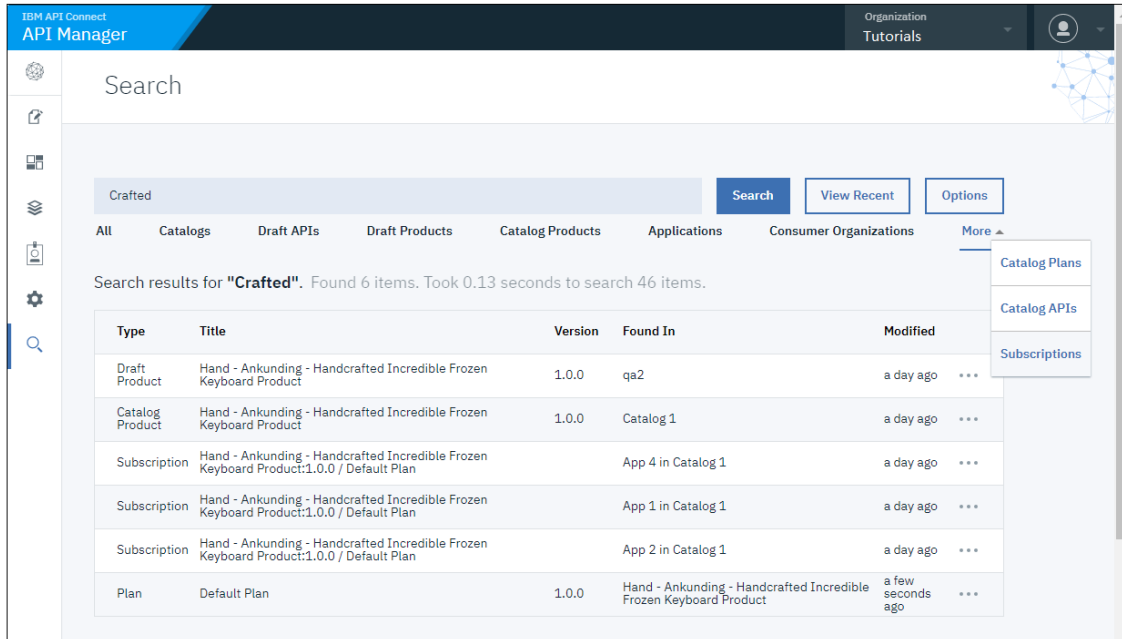

When you find an item you want to work with, click the ... actions menu next to the item's "Modified" date to see what you can do. The list of possible actions depends on the item's type.

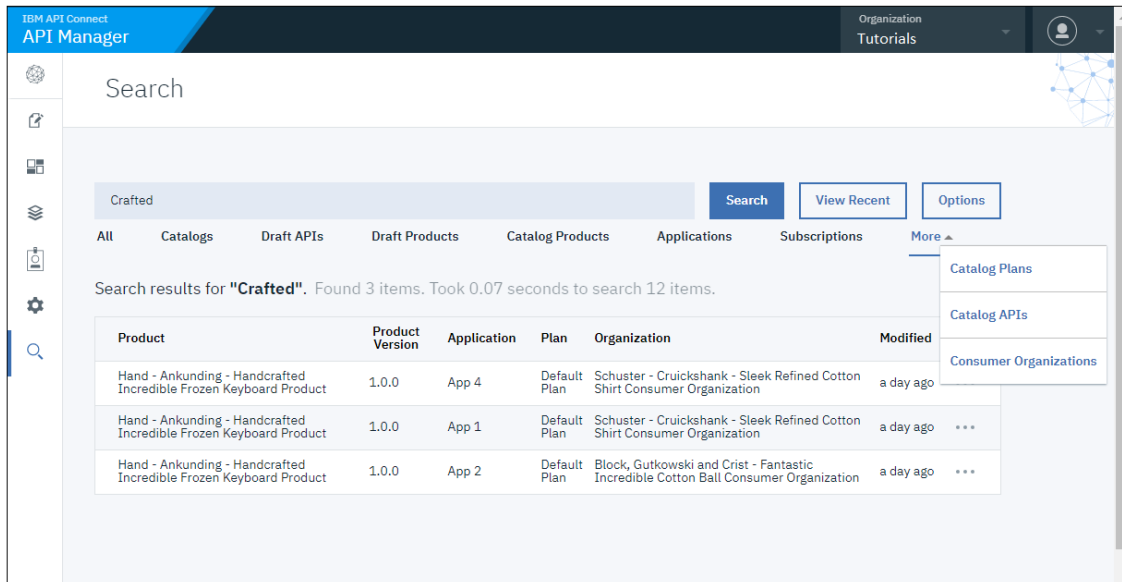

You can limit the search results by selecting an item type from the list that displays before the results. Click More to view additional types. If you select a type from the More menu, it replaces a type in the list.

In the following example, the results of the search for "Crafted" are filtered with the Subscriptions type.

Notice that "Subscriptions" now displays in the default list, and that "Consumer Organizations" moved to More menu.

If you want to refine the search further, click Options. On the Options panel, click Catalogs to Search and select which catalogs to search (the default is all catalogs). You can select up to 5 catalogs for a limited search.

You can also choose whether only exact matches (the complete string) are included in results, or items containing similar strings are also included.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Working with Catalogs

Products must be staged to a Catalog and then published; application developers are able to access the APIs in a Product by being members of Consumer organizations to which the Product is made available. In IBM API Connect, you can create multiple Catalogs. Catalogs are useful for separating Products and APIs for testing before you make them available to Consumer organizations. The syndication feature in API Connect means that you can also publish a Product to a Space in a Catalog.

A Catalog is a staging target, and behaves as a logical partition of the gateway and the Developer Portal. The URL for API calls and the Developer Portal are specific to a particular Catalog. In a typical configuration, an API provider organization uses a development Catalog for testing APIs under development and a production Catalog for hosting APIs that are ready for full use. A common approach is to have a development cloud with a development Catalog, a few test Catalogs and a production cloud that might have its own test Catalog.

You can use a *Space* to partition a Catalog so multiple teams can manage Products and APIs independently in a single Catalog. A Space is conceptually like a sub-catalog, except that Products and APIs in all Spaces in a given Catalog are published to the same developer portal. For more information about Spaces, see [Using syndication in API Connect](#).

Note:

Every account in the Developer Portal must have a unique email address, including the site Admin account. The default email address for the Admin account is the email address of the Catalog owner. It is not possible to create a Developer Portal user account (and associated Consumer organization) with the same email address as the Admin account (or that of the Catalog owner if their email address is different). Any attempts to create an account with the same email address results in the new account not functioning correctly, and returning the following error message when trying to log in to the Developer Portal: **A user already exists with this email address.**

For more information on using the Developer Portal, see [Developer Portal: Socialize your APIs](#).

- **Creating and configuring Catalogs**  
These instructions describe how to create and configure Catalogs in IBM API Connect.
- **Configuring sub paths for Developer Portal sites**  
You can increase the specificity of a IBM API Connect Developer Portal site URL by using sub paths.
- **Managing Catalog membership**  
You manage Catalog membership by adding new users to the Catalog and assigning roles to the users.
- **Importing a user-defined policy into a Catalog**  
You can make your user-defined policy available to API developers by importing it into an IBM API Connect Catalog, or a Space in a Catalog.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Creating and configuring Catalogs

These instructions describe how to create and configure Catalogs in IBM® API Connect.

### Before you begin

You must possess Catalog create permissions to complete this task. For more information about permissions, see [API Connect user roles](#).

Note:

As the user who creates the Catalog, you are automatically the Catalog owner and have all Catalog permissions.

Every account in the Developer Portal must have a unique email address, including the site Admin account. The default email address for the Admin account is the email address of the Catalog owner. It is not possible to create a Developer Portal user account (and associated Consumer organization) with the same email address as the Admin account (or that of the Catalog owner if their email address is different). Any attempts to create an account with the same email address results in the new account not functioning correctly, and returning the following error message when trying to log in to the Developer Portal: **A user already exists with this email address.**

### Procedure

To create and configure your Catalog, complete the following steps:

1. In the navigation pane of the API Manager UI, click  Manage.
2. Create the Catalog. You can create the Catalog in either of the following ways:
  - Specify the owner, then configure the Catalog yourself.
  - Send an invitation email, with an activation link, to the intended Catalog owner. The Catalog owner configures the Catalog after activating it.To specify the owner and configure the Catalog yourself, complete the following steps:
  - a. Click **Add > Create catalog**.
  - b. In the **Catalog Owner** field, select the owner of the Catalog; by default, you are the owner. You can specify any user who is a member of the provider organization.
  - c. Continue from step [3](#) to configure the Catalog.To invite the Catalog owner, complete the following steps:
  - a. Click **Add > Invite catalog owner**.
  - b. Enter the email address of the Catalog owner, then click **Invite**.On receipt of the invitation email, the Catalog owner should complete the following steps.
  - a. Open the activation link, complete the sign up form, and sign in to the API Manager UI.
  - b. Click **Manage Catalogs**, click the Catalog name that was provided on the sign up form, then click  **Settings**.
  - c. Continue from step [6](#) to configure the Catalog.
3. Enter the Catalog Title. A Name is entered automatically and cannot be changed.

Note: The value in the Name field is a single string that is used to identify the Catalog in developer toolkit CLI commands. The Title is used for display; you can change the title subsequently but the name does not change.

To view the CLI commands to manage Catalogs, see [apic catalogs](#).
4. Click **Create**.  
Your new Catalog is displayed on the **Manage** page.
5. To continue to configure your Catalog, select the Catalog on the **Manage** page, then click  **Settings**.
6. To configure the general settings for the Catalog, click **Overview**, then proceed with the following steps:
  - a. By default, the new Catalog is a development Catalog. To use the Catalog in production, set the **Production Mode** slider control to the **On** position, then click **Confirm**.  
In a development Catalog, all publish operations are forced, and any conflicts are resolved automatically. If you republish a previously published Product version it is overwritten without warning, allowing you, for example, to repeatedly republish the same Product version during testing. If Spaces are enabled in a development Catalog and you republish a previously published Product version to a different Space, it is removed from the previous Space.

A development Catalog behaves the same as any other Catalog with regard to requiring approval for staging and publishing actions, if the Catalog has been configured to require approval.

Note: In a production Catalog, the following conditions apply:

- You will be prevented from publishing a Product to the Catalog if there is already a Product in the Catalog with the same name and version, you must create a new version of the Product for publication; see [Creating a new version of your Product](#). If Spaces are enabled in a production Catalog, you cannot publish a Product with the same name and version to more than one Space in the Catalog.
- If this new Product contains one or more modified APIs, you **must** create new versions of these APIs for inclusion in the Product; see [Creating a new version of an API definition](#). If the Product contains a modified API and a published API of the same name and version already exists, the changes will **not** be published.

b. To enable the partition of this Catalog into Spaces, set the Spaces slider control to the On position, then click Confirm.

For more information, see [Using syndication in IBM API Connect](#).

7. To configure the gateway service settings for the Catalog, click Gateway Services, then proceed with the following steps:

Note: If Spaces are enabled in the Catalog then you configure the gateway settings for each Space separately, **not** for the Catalog as a whole. For more information about enabling and managing Spaces, see [Using syndication in API Connect](#).

a. Click Edit.

The Enable Gateway Services page opens.

b. Select the gateway services that you want to use with this Catalog.

Gateway services are configured by the using the Cloud Manager UI. For details, see [Registering a gateway service](#). If any Catalog default gateway services have been configured, they will already be selected when you create a new Catalog; see [Configuring default gateway services for Catalogs](#).

The TYPE column indicates the gateway type for each gateway service listed, DataPower® Gateway (v5 compatible) or DataPower API Gateway. For more information, see [API Connect gateway types](#).

c. Click Save to save your changes.

You publish APIs by adding them to a Product and then publishing the Product to a Catalog. To be able to publish Products to a Catalog, the Catalog must be assigned at least one gateway service so that the APIs in the Product are available to be called at a gateway service endpoint. You can assign more than one gateway service to a Catalog, and they can be of mixed types, DataPower API Gateway and DataPower Gateway (v5 compatible).

A Product is gateway type specific, either DataPower API Gateway or DataPower Gateway (v5 compatible). By default, when you publish a Product to a Catalog, it is published to all the assigned gateway services of the same gateway type as the Product, but you can choose to publish the Product only to selected gateway services, of that type, at publish time; see [Publishing a draft Product](#) for more information. The APIs in the Product will be available to be called at all the specified gateway service endpoints.

If you select two or more Gateway services then, for analytics data to be available in the Developer Portal for this Catalog, the Gateway services must all be associated with the **same** analytics service. If the set of associated analytics services for the selected gateway services includes two or more different analytics services then the Developer Portal does **not** display analytics data. An analytics service is associated with a gateway service in the Cloud Manager user interface; see [Associating an analytics service with a gateway service](#).

Note: You can also configure the gateway service settings for the Catalog by using the developer toolkit CLI; for details, see [apic configured-gateway-services](#).

8. To specify the Product lifecycle state changes for which you want to enforce approval, complete the following steps:

a. Click Lifecycle Approvals in the Catalog settings navigation pane, then click Edit.

b. Select the required state changes, then click Save when done.

For example, if you select Publish and leave the other check boxes cleared, approval is required when anyone attempts to publish a Product, but no approval is required for any of the other lifecycle state changes.

Note: Approval for Product lifecycle state changes in a Catalog is disabled by default. You must explicitly enable the Product lifecycle state changes that you want to enforce.

c. To allow the originator of a Product lifecycle change to approve it themselves, move the Task self approval slider control to the On position.

Note: In a development Catalog, the originator of a Product lifecycle change can **always** approve it themselves.

9. Click Save when done.

10. To configure the permissions that each role in API Manager has, complete the following steps:

a. Click Roles in the Catalog settings navigation pane.

To see the current permissions for a role, expand the role.

b. Click the options icon  alongside the role that you want to work with, then click Edit.

c. Select or clear the permissions check boxes as required.

To ensure a role can manage user-defined policies, select Manage for the Settings permission.

To grant a role the permission to approve a specific lifecycle state change, select the state change in the Product-Approval section.

Note: You cannot remove a permission that has been assigned to the role at the provider organization level. However, you can add permissions that haven't been assigned at the provider organization level.

d. Click Save when done.

11. To configure the default role permissions for consumer organizations that are created in this Catalog, complete the following steps:

a. Click Role Defaults in the Catalog settings navigation pane.

To see the current default permissions for a role, expand the role.

b. Click the options icon  alongside the role that you want to work with, then click Edit.

c. Select or clear the permissions check boxes as required.

d. Click Save when done.

e. To create a new role and assign default permissions to it, click Add, name the role and assign permissions, then click Save.

12. To manage the onboarding of application developers into this Catalog, complete the following steps:

a. Click Onboarding in the Catalog settings navigation pane.

b. To select the registries that are used to authenticate users of the Developer Portal associated with this Catalog, click Edit in the Catalog User Registries section, select the required registries, then click Save.

For details on how to configure a user registry, see [Authenticating by using your enterprise user registry](#).

c. To set a default registry, click the options icon  alongside the required registry, then select Set default.

When an application developer signs up to the Developer Portal, the specified registry is used by default, with the option to select another registry.

d. To allow application developers to complete their own sign-up process, move the Self service onboarding slider control to the On position.

If this option is disabled, an application developer cannot sign-up without an invitation from a consumer organization owner.

e. To configure the timeout for activation links that are sent in email invitations to application developers, click Edit in the Invitation Timeout section, specify the timeout length, then click Save.

13. To specify the user registries that are used to secure access to APIs in this Catalog, and to add the user registry to the Sandbox Catalog, complete the following steps:

- a. Select  Settings from the navigation panel, and then select API User Registries.
- b. Click Edit and select the user registries you want to use.  
For details on how to configure a user registry, see [Authenticating by using your enterprise user registry](#).
- c. Click Save when done.

Note:

- Only LDAP and Authentication URL registries can be used to secure access to APIs; therefore, only registries of these types are listed and available for selection.
- If Spaces are enabled in the Catalog then you specify the user registries for the Spaces, **not** for the Catalog as a whole. If you specify a user registry in one Space in a Catalog, it is deployed to the gateway services across all Spaces in that Catalog.  
For more information about enabling and managing Spaces, see [Using syndication in API Connect](#)

14. To specify the OAuth Providers that can be used to secure access to APIs in this Catalog, complete the following steps:

Note:

- If you want to specify an OAuth provider for a Catalog, ensure that the Sandbox Catalog is configured to use the same OAuth provider
- Any resources that the OAuth provider references, such as API user registries or TLS client profiles, must also be enabled in the Catalog
- If Spaces are enabled in the Catalog then you specify the OAuth providers for the Spaces, **not** for the Catalog as a whole. If you specify an OAuth provider in one Space in a Catalog, it is deployed to the gateway services across all Spaces in that Catalog.  
For more information about enabling and managing Spaces, see [Using syndication in API Connect](#).

- a. Click OAuth Providers in the Catalog settings navigation pane.
- b. Click Edit, then select the OAuth providers that you want to use.  
To configure an OAuth provider, see either [Configuring a native OAuth provider](#) using Cloud Manager or [Configuring a native OAuth provider](#) using API Manager.
- c. Click Save when done.

15. Optional: Configure vanity API endpoints for your Catalog.

For any API, there are two possible endpoints to consider:

- The gateway endpoint at which the API is invoked.
- The endpoint that is visible to the consumer in the Developer Portal.

If you do not configure vanity endpoints, these two endpoints are the same, and point to the gateway endpoint at which an API is invoked.

To have an endpoint visible to the consumer that is different to the gateway endpoint, you configure a vanity endpoint. A vanity endpoint represents the endpoint by which an API is known externally; that is, the endpoint that is published to the Developer Portal and is used by an application developer to invoke the API.

For any enforced API in API Connect, the gateway endpoints formats for the API are as follows:

- If the OpenAPI definition has no **host** field, the API endpoint has the following format:  

```
https://gateway_service_host/provider_organization/catalog/basepath
```
- If the OpenAPI definition has a **host** field (for example, **petstore.com**), the host is appended to the path after the *provider\_organization/catalog* segments, and the API endpoint has the following format:  

```
https://gateway_service_host/provider_organization/catalog/host_field_value/basepath
```

Note: This is a change in behavior from IBM API Connect Version 5.0, where the **host** field is not included in the API endpoint.

where:

- *gateway\_service\_host* is the host name of the gateway service on which the API is running.
- *provider\_organization* is the value of the **name** field of the provider organization that contains the Catalog in which the API is published.
- *catalog* is the value of the **name** field of the Catalog in which the API is published.
- *basepath* is the value of the **basepath** field in the OpenAPI definition for the API.
- *host\_field\_value* is the value of the host field in the OpenAPI definition for the API.

Note:

- IBM API Connect Version 5.0 provides a feature known as *host to catalog mapping*, whereby an API can be invoked without having to include the provider organization or Catalog name in the URL path; this feature is not supported in IBM API Connect Version 2018.
- IBM API Connect Version 5.0 provides a Default setting; calls to APIs that are published to the default Catalog do not need to include the Catalog name. This feature is not supported in IBM API Connect Version 2018.

To configure vanity API endpoints, so that you can publish endpoints that are different to these gateway endpoints, complete the following steps:

- a. Click API Endpoints in the Catalog settings navigation pane. The Vanity API Endpoint page opens.
- b. Click Edit.
- c. To display the current API base endpoint settings, select Display vanity endpoint.
- d. Select the required Preference setting. Choose one of the following settings:
  - Catalog priority: Any host field defined in the OpenAPI definition of the API is ignored and all API endpoints always point to the endpoints that you define here. For example, suppose you define a vanity API endpoint, with Catalog priority preference, to be `https://prod.acme.com/`. Then the API endpoint will be `https://prod.acme.com/basepath`
  - API priority: The host field defined in the OpenAPI definition for the API takes precedence. For example, suppose you define a vanity API endpoint, with API priority preference, to be `https://api.acme.com/`. Then the following rules determine the endpoint that is used when an API is called:
    - If the OpenAPI definition has a host field, `test.acme.com` for example, then that value is used to determine the API endpoint. For example: `https://test.acme.com/basepath`.
    - If the OpenAPI definition has no host field, the API endpoint will be `https://api.acme.com/basepath`, as determined by the vanity API endpoint setting.
    - If no vanity API endpoints are defined, then the default gateway endpoints are used to determine the API endpoint.
- e. Supply one or more endpoints, as follows:
  - If you selected Catalog priority, click Add to enter one or more endpoints URLs, and an optional summary for each. Any of the endpoint URLs can be used to invoke an API.
  - If you selected API priority, enter the endpoint URL, and an optional summary.

Note: After configuring your Catalog to support your vanity URL, you must configure your external network to map the vanity endpoints to the corresponding gateway endpoints. This typically includes the following:

- A DNS mapping to ensure that the vanity host resolves to the gateway.

- Additional URL routing for the API as required.

For example, if your gateway has a default domain name of `apigw.dc.zone.mycompany.com` and an IP address of `29.12.141.150`, then the generic DNS configuration might look like:

```
api.acme.com. CNAME apigw.dc.zone.mycompany.com.
```

or

```
api.acme.com. A 29.12.141.150
```

Consult your network administrator and the DNS provider's documentation to do this configuration.

- To configure the TLS client profiles that are used with this Catalog, complete the following steps:
 

Note: If Spaces are enabled in the Catalog then you configure the TLS client profiles for the Spaces, **not** for the Catalog as a whole. If you configure a TLS client profile in one Space in a Catalog, it is deployed to the gateway services across all Spaces in that Catalog.

For more information about enabling and managing Spaces, see [Using syndication in API Connect](#).

- Click TLS Client Profiles in the Catalog settings navigation pane.
- Click Edit, then select the TLS client profiles that you want to use with this Catalog.
 

For details on how to create a TLS client profile, see [Creating a TLS client profile](#).
- Click Save when done.

- To configure the Developer Portal, complete the following steps:
  - Click Portal in the Catalog settings navigation pane, then click Create.
  - Select the portal service that you want to use with this Catalog.
 

Portal services are configured by using the Cloud Manager UI. For details, see [Registering a portal service](#).
  - Optionally, override the default generated portal URL.
 

The URL must have the following format:

```
https://host_name.portal.com
```

where `host_name.portal.com` must resolve to the IP address of the Developer Portal machine.  
For example:

```
https://myhost.mydomain.com
```

Note:

- The URL must be unique across all Catalogs.
- To implement sub paths into your site URL, see [Sub paths for Developer Portal sites](#).

- Select the portal service that you want to use with this Catalog.
 

For more information on using the Developer Portal, see [Developer Portal: Socialize your APIs](#).
- Click Create to save your changes.

Note: The account profile for the owner of the Catalog must have an email address specified to receive the creation notification, otherwise the Developer Portal creation operation will fail. To check whether your account profile has an email address, and specify a value, complete the following steps:

- Click the User icon , and then select My Account.
- Check the contents of the Email field, and specify a value if necessary, then click Save.

- To define Catalog properties, complete the following steps:
  - Click Properties in the Catalog settings navigation pane, then click Create.
  - Enter the property Name and Value, then click Create.

The properties that you define can be referenced in any of the API definitions in this Catalog. It is also possible to define properties that are specific to an API definition; see [Setting API properties](#). For information on how to reference a property in an API definition, see [Variable references in API Connect](#).

Note:

- If you define a Catalog property of the same name as an API property, the API property takes precedence over the Catalog property.
- If you change the value of a Catalog property, any API that references that property must be republished for it use the new value.

## What to do next

---

Import your own policies into the Catalog. For details, see [Importing a user-defined policy into a Catalog](#).

Note: When you import a policy, its implementation is imported into all Gateway devices associated with the Gateway service that hosts the Catalog. Additionally, API Connect modifies some object names and file locations to mark them with the appropriate Catalog name and policy version.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Configuring sub paths for Developer Portal sites

You can increase the specificity of an IBM® API Connect Developer Portal site URL by using sub paths.

By adding additional text to the URL of a Developer Portal site, you can create more site permutations for an organization. Developer Portal site URLs must be unique across all Catalogs.

Important:

- Sub paths are case-sensitive.
- The Developer Portal host name must contain only **lowercase** characters.

You can create a Developer Portal in the following format:

```
https://host_name.portal.com/sub_path_1/sub_path_2/.../sub_path_n
```

Where *sub\_path* can be any text that you want to implement to specify your site URL. There is no limit to the number of sub paths that you can have for the first site that you want to create.

However, you must not create overlaps in the naming of your URLs. A URL of one site must not be able to be confused with pages belonging to another site. For example, if you create the following site URL:

```
https://host_name.portal.com/bank/safe/dollar
```

Then, you cannot have the following site URL permutations:

```
https://host_name.portal.com/bank/safe
```

or

```
https://host_name.portal.com/bank/safe/dollar/cent
```

However, you can lengthen or shorten a site URL if you change a single sub path value, or the *host\_name.portal.com* value. For example, if you created the following site URL:

```
https://host_name.portal.com/bank/safe/dollar
```

Then, you can create the following site URL permutations:

```
https://host_name.portal.com/bank/euro
```

and

```
https://host_name.portal.com/bank/euro/vault/cent
```

Important: If you already have a site URL that ends in *sub\_path* texts, you cannot create a new site URL with the sub path text at the start.

For example, if you create the following site URL:

```
https://host_name.portal.com/bank
```

then, you cannot create the following site URL:

```
https://bank.host_name.portal.com
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Managing Catalog membership

You manage Catalog membership by adding new users to the Catalog and assigning roles to the users.

### Before you begin

To manage Catalog members in the API Manager UI, a user must be assigned a role that has the Member\_>\_Manage permission for that Catalog. For more information on assigning Catalog permissions to a role, see [Creating and configuring Catalogs](#).

### Procedure

1. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with.
2. In the navigation pane of the API Manager UI, click  Members.
3. To add an existing user, click Add\_>\_Add member. To add a new user, click Add\_>\_Invite member.  
If you are using the Add member option, you can add any user who is already a member of another Catalog, or of a Space, in the provider organization, and is neither currently a member of this Catalog, nor the Catalog owner.
4. Enter the email address of a new user, or search for, and select, an existing user.
5. Select the roles that you want to assign to the user.  
For details of the roles and the default permissions assigned to them, see [API Connect user roles](#). For details on how to create your own roles, see [Creating custom roles](#).

If Spaces are enabled in the Catalog, any role that you assign to the user at the Catalog level is assigned automatically to the user in all Spaces in that Catalog. Furthermore, if a user had originally been assigned a role only in a specific Space in a Catalog and you subsequently assign the user that role at the Catalog level, the Space specific role assignment is lost and the user now has that role in all Spaces in the catalog.

Note: You can subsequently change the roles assigned to a user by selecting or clearing the appropriate check boxes alongside that user on the Members tab. If a user was originally added to the provider organization, rather than to the Catalog itself, the following conditions apply:

- Any role assigned to the user at the provider organization level is assigned automatically to the user in all Catalogs, and cannot be removed at the Catalog level.

For details on adding a user to a provider organization, see [Adding provider organization users and assigning roles](#).

- In the Catalog, the user has the permissions that are configured for the role at the Catalog level.
- Any role that hasn't been assigned to the user at the provider organization level can be assigned to the user at the Catalog level.

6. If you are adding an existing user, click Create. If you are adding a new user, click Invite.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

DataPower Gateway (v5 compatible) only

## Importing a user-defined policy into a Catalog

You can make your user-defined policy available to API developers by importing it into an IBM® API Connect Catalog, or a Space in a Catalog.

### Before you begin

You must possess Catalog edit permissions to complete this task.

Before you can import a user-defined policy into IBM API Connect, you must have completed the following tasks:

1. Described your policy in a YAML file.
2. Implemented your policy by using DataPower processing rules and actions.

Note: The tasks described on this page apply only to the DataPower® Gateway (v5 compatible), not to the DataPower API Gateway.

### Procedure

To import a policy into a Catalog or Space in API Manager, complete the following steps.

1. Create a .zip file for your policy that contains the following folder structure:

```
policy.yaml
implementation/mypolicy.zip
```

where

- *policy.yaml* is your policy definition file.
- *implementation/mypolicy.zip* is your policy implementation for a policy that is deployed to the DataPower Gateway. The policy implementation file contains the DataPower processing rules and actions that were exported from DataPower.

The name of the .zip file must start with the name of the user-defined policy (as defined in the policy YAML file). If the implementation requires certificate and key files, these files must be added to the implementation directory.

Note: Your package .zip file must contain a .zip policy implementation file.

2. Use the developer toolkit command-line tool to import your policy into a Catalog or Space. When successfully imported, the policy appears on the policy palette of the API Manager assembly editor.

- a. Log in to the command-line tool, for example:

```
apic login --username userid --password password --server mgmt_endpoint_url --realm mode/realm
```

where

- *userid* is your user name (you must have permissions to be able to update resources in the organization and Catalog where the policy is being imported).
- *password* is your password.
- *mgmt\_endpoint\_url* the platform API endpoint URL, for example `platform-api.myserver.com`.
- *mode/realm* is your authentication scope. *mode* is the context of your login, and can be one of two options:
  - **admin** - use this option when you want to log in as an administrator.
  - **provider** - use this option when you want to log in as a Provider organization.

*realm* is your identity provider, and this can be an external provider such as Google, or the identity provider that is configured in the Cloud Manager.

For example, if you are signing in as an administrator by using Google, then the realm option is `--realm`

`admin/google`. If you are signing in as a Provider organization by using an LDAP user registry called *ibm-ldap*, then the realm option is `--realm provider/ibm-ldap`.

For full details on how to log in to your management server from the CLI, see [Logging in to the management server](#).

For more information about user registries, see [Managing Authentication and Security](#).

- b. Run the following command:

```
apic policies:create --catalog catalog --configured-gateway-service gateway --org organization --server mgmthost.com --scope scope [--space space] mypolicy.zip
```

where

- *catalog* is the Catalog name or ID that you want to import your policy into.

- `gateway` is the Configured Gateway Service name or ID.
- `organization` is the Provider Organization name or ID.
- `mgmthost.com` is the address of the management server endpoint, for example `example.server.dev.ciondemand.com`.
- `scope` has one of the following values:
  - `catalog` if the Catalog does not have Spaces enabled.
  - `space` if the Catalog has Spaces enabled. If you specify `space` for the `--scope` parameter you must also supply the `--space` parameter.
- (optional) `space` is the name of the Space. The `--space` parameter is required if the Catalog has Spaces enabled, in which case you must also include `--scope space` in the command.
- `mypolicy` is the name of your policy .zip file.

Note:

- You must import your user-defined policy into every Catalog in API Manager that you require your policy to run in.
- For the policy to be displayed on the palette in the [API assembly editor](#), you must import the user-defined policy into the Sandbox Catalog.
- If you have more than one Gateway service enabled in your Catalog, you must repeat the import operation for each Gateway service.
- If Spaces are enabled in a Catalog, a user-defined policy that you import into one Space is imported into **all** Spaces; you cannot import a user-defined policy into an individual Space in the Catalog. Any subsequent updates are also applied to all Spaces.

## Results

---

The user-defined policy is now imported into a Catalog or Space, and is shown in the list of available policies in the Policy Assembly tab of the API Editor in the API Manager. Policies are listed by their name and version number, and multiple versions of the same policy are grouped under a single heading.

## Using syndication in API Connect

With the IBM® API Connect syndication feature, you can partition your Catalogs into *Spaces*. Each Space is used by a different API provider development team and has its own set of management capabilities relating specifically to the APIs that the associated team publishes to that Space, enabling each team to manage their APIs independently.

When you stage or publish an API to a Catalog that has Spaces enabled, you specify the Space within that Catalog that you want to stage or publish to. However, application developers that access the Developer Portal for the Catalog are unaware of the Space partitioning of the Catalog and see the APIs as a coordinated offering.

Each Space has its own Product lifecycle management, subscription approvals, and analytics data. You use Space specific access control to restrict user access to each Space; for example, a developer in the Flights team is able to stage APIs only to the Flights Space.

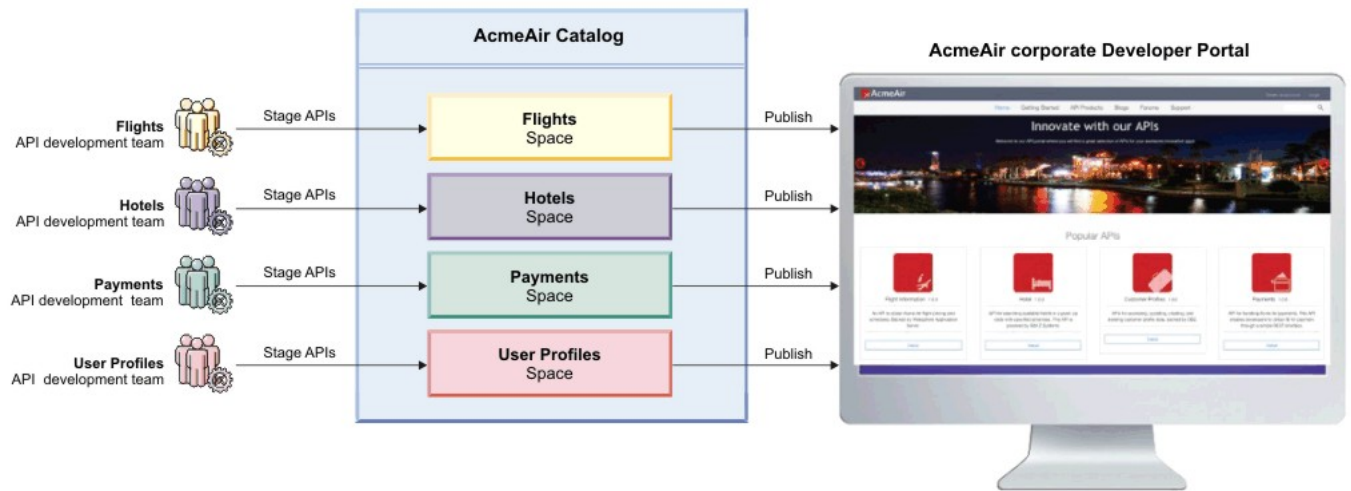

## Example

---

A travel company, AcmeAir, has separate API provider development teams for each of the following areas of their business:

- Flights
- Hotels
- Payments
- User Profiles

They have an AcmeAir corporate Catalog, with its associated corporate Developer Portal. They partition their Catalog into separate Spaces, one for each development team.

Spaces are described in detail in the following sections:

- [Enabling Spaces in a Catalog](#)  
To use the syndication feature in IBM API Connect, you must enable Spaces in any Catalog in which you require syndication capabilities.
- [Creating, modifying, and deleting Spaces](#)  
You use the API Manager user interface to create a new Space in a Catalog, modify the summary details, and delete a Space from a Catalog.
- [Working with Spaces](#)  
If Spaces are enabled in an IBM API Connect Catalog, you can select a specific Space to work with in the API Manager user interface. This enables you to manage the Products and APIs that are specific to that Space, and control user access to the Space.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Enabling Spaces in a Catalog

To use the syndication feature in IBM® API Connect, you must enable Spaces in any Catalog in which you require syndication capabilities.

### Before you begin

If Spaces are enabled for a Catalog, Products (and their associated APIs) can be published only to a Space within that Catalog. For information about publishing, see [Staging a Product](#) for publishing by using the API Manager, and see [Publishing APIs](#) for publishing by using the developer toolkit.

Note: You cannot enable Spaces in a Catalog to which one or more Products have already been staged or published. If the Catalog does contain staged or published Products, first complete the following steps for each Product in the Catalog:

1. Remove all staged Products.
2. Retire, then remove, all published Products.

After enabling Spaces, re-stage or re-publish Products, and re-create application subscriptions, as required.

### About this task

By default, Spaces are disabled in a Catalog. You enable Spaces by modifying the Catalog settings. After Spaces are enabled for a Catalog, a default Space is automatically created that inherits all of the configuration settings from the Catalog.

Note: You can also enable Spaces by using the developer toolkit CLI; for details, see [apic spaces](#).

### Procedure

To enable Spaces in a Catalog, complete the following steps:

1. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with.
2. In the navigation pane of the API Manager UI, click  Settings.
3. Set the Spaces slider control to the On position.
4. In the Enable Spaces window, click Enable.

### Results

Spaces are enabled for your Catalog, and a default Space is created that automatically inherits all of the configuration settings from the Catalog. The Catalog owner is also the owner of the default Space.

## What to do next

---

You can modify Space settings, and create more Spaces; see [Creating, modifying, and deleting Spaces](#) and [Working with Spaces](#) for more information.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Creating, modifying, and deleting Spaces

You use the API Manager user interface to create a new Space in a Catalog, modify the summary details, and delete a Space from a Catalog.

### Before you begin

---

Navigate to the Spaces page of the Catalog containing the Space you want to work with, by completing the following steps:

1. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with.
2. In the navigation pane of the API Manager UI, click  Spaces.  
The Spaces option is available only if Spaces are enabled in the Catalog; see [Enabling Spaces in a Catalog](#).

Note: You can also enable Spaces by using the developer toolkit CLI; for details, see [apic spaces](#).

### Procedure

---

- To create a new Space, complete the following steps:
  1. Click Add, Add a new Space.
  2. In the Space Details window, enter the Title of the Space and, optionally, a descriptive summary. A Name is entered automatically.  
Note: The value in the Name field is a single string that is used to identify the Space in developer toolkit CLI commands. The Title is used for display. To view the CLI commands to manage Spaces, see [apic spaces](#).

3. Click Create to create the Space.

Note:

- As the user who creates the Space, you are automatically the Space owner and have all Space permissions.
- When you create a new Space, it does not automatically inherit all of the configuration settings from the Catalog. So you should check and modify the settings as necessary.

- To modify the details of a Space, complete the following steps:
  1. On the Spaces page, select the Space whose details you want to modify.
  2. Use the options in the navigation pane to modify the details as required.

The following types of resource can be enabled in a Space:

- Gateway services
- API user registries
- OAuth providers
- TLS client profiles

Note:

- If you enable a resource of any of the following types in one Space in a Catalog, it is deployed to the gateway services across all Spaces in that Catalog:
  - API user registries
  - OAuth providers
  - TLS client profiles
- If you deploy any of the following types of resource to a gateway in a Space, it is actually deployed to the gateway at Catalog scope:
  - Custom policy
  - Global policy
  - Global policy pre-hook
  - Global policy post-hook
  - Gateway extension

- To delete a Space, complete the following steps:
  1. On the Spaces page, click the Manage icon  for the Space that you want to delete.
  2. Click Delete, then click Confirm to confirm deletion.

Note:

- You cannot delete a Space to which one or more Products have been staged or published.
- If there is only one Space in a Catalog, you cannot delete it, but you can disable Spaces for the Catalog. However, you cannot disable Spaces in a Catalog to which one or more Products have already been staged or published. If any of the Spaces in the Catalog do contain staged or published Products, first complete the following steps for the Products in each of the Spaces:

1. Remove all staged Products.
2. Retire, then remove, all published Products.

Then, to disable Spaces for the Catalog, complete the following steps:

1. Click  Settings in the Catalog.
2. Set the Spaces slider control to the Off position.

After disabling Spaces, re-stage or re-publish Products, and re-create application subscriptions, as required.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Working with Spaces

If Spaces are enabled in an IBM® API Connect Catalog, you can select a specific Space to work with in the API Manager user interface. This enables you to manage the Products and APIs that are specific to that Space, and control user access to the Space.

### Procedure

---

To work with a Space, complete the following steps:

1. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with.
2. In the navigation pane of the API Manager UI, click  Spaces.
3. Select the Space that you want to work with.

### What to do next

---

For details of the Space management tasks, see the following subtopics:

- [Managing Products in a Space](#)  
If Spaces are enabled in an IBM API Connect Catalog, you can use the API Manager user interface to separately manage the Products that are staged or published to each Space.
- [Managing subscription requests in a Space](#)  
If Spaces are enabled in an IBM API Connect Catalog, you can approve, or deny, individual requests to subscribe to Plans in Products that are published to the Space.
- [Managing application subscriptions in a Space](#)  
If Spaces are enabled in an IBM API Connect Catalog, you can use the API Manager user interface to separately manage the application subscriptions to Plans in the Products that are published to a Space.
- [Managing Space membership](#)  
If Spaces are enabled in an IBM API Connect Catalog, you can manage the members within the Space. You manage Space membership by adding new users to the Space and assigning roles to the users.
- [Managing user access in a Space](#)  
If Spaces are enabled in an IBM API Connect Catalog, you can manage the access that users have within the Space. You manage access by specifying the permissions that are assigned to user roles.
- [Managing Gateways in a Space](#)  
If Spaces are enabled in a Catalog, you can separately control which Gateway services are used by each of the Spaces in the IBM API Connect Catalog.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Managing Products in a Space

If Spaces are enabled in an IBM® API Connect Catalog, you can use the API Manager user interface to separately manage the Products that are staged or published to each Space.

### Before you begin

---

To manage Products in a Space in the API Manager UI, a user must be assigned a role that has the Products\_>\_Manage permission. For more information on assigning Space permissions to a role, see [Managing user access in a Space](#).

### Procedure

---

To manage the Products that are staged or published to a specific Space, complete the following steps:

1. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with.
2. In the navigation pane of the API Manager UI, click  Spaces.
3. Select the Space that you want to work with.

### What to do next

---

For details of the management tasks that you can perform on the Products in the Space, see [Working with Products in the API Manager](#).

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Managing subscription requests in a Space

If Spaces are enabled in an IBM® API Connect Catalog, you can approve, or deny, individual requests to subscribe to Plans in Products that are published to the Space.

## Before you begin

---

To manage Space subscription requests in the API Manager UI, a user must be assigned a role that has the Subscription Approvals, Manage permission. For more information on assigning Space permissions to a role, see [Managing user access in a Space](#).

## Procedure

---

To manage the subscription requests in a Space, complete the following steps:

1. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with.
2. In the navigation pane of the API Manager UI, click  Spaces.
3. Select the Space that you want to work with.
4. Click  Tasks in the API Manager UI navigation pane.  
The Tasks page lists only the subscription requests for the selected Space.

## What to do next

---

For details on how to manage approvals, see [Approving Product lifecycle and subscription requests](#).

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Managing application subscriptions in a Space

If Spaces are enabled in an IBM® API Connect Catalog, you can use the API Manager user interface to separately manage the application subscriptions to Plans in the Products that are published to a Space.

## Before you begin

---

To manage application subscriptions in the API Manager UI, a user must be assigned a role that has the Subscriptions, Manage permission. For more information on assigning Space permissions to a role, see [Managing user access in a Space](#).

## Procedure

---

1. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with.
2. In the navigation pane of the API Manager UI, click  Spaces.
3. Select the Space that you want to work with.
4. In the navigation pane of the API Manager UI, click  Applications.  
All applications that have been registered in the Developer Portal associated with this Space are listed.
5. Expand the application whose subscriptions you want to manage.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Managing Space membership

If Spaces are enabled in an IBM® API Connect Catalog, you can manage the members within the Space. You manage Space membership by adding new users to the Space and assigning roles to the users.

## Before you begin

---

To manage Space members in the API Manager UI, a user must be assigned a role that has the Child, Manage permission for the Catalog that contains the Space. For more information on assigning Space permissions to a role, see [Managing user access in a Space](#).

## About this task

---

Note: You can add the same user to two or more Spaces and assign different roles in each, allowing a user to have differing levels of access in different Spaces.

## Procedure

---

1. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with.
2. In the navigation pane of the API Manager UI, click  Spaces.
3. Select the Space that you want to work with.
4. In the navigation pane of the API Manager UI, click  Members.
5. To add an existing user, click Add\_>\_Add member. To add a new user, click Add\_>\_Invite member.  
If you are using the Add member option, you can add any user who is already a member of another Space, or of a Catalog, in the provider organization, and is neither currently a member of this Space, nor the Space owner.
6. Enter the email address of a new user, or search for, and select, an existing user.
7. Select the roles that you want to assign to the user.  
For details of the roles and the default permissions assigned to them, see [API Connect user roles](#). For details on how to create your own roles, see [Creating custom roles](#).

If a user was originally added either to the provider organization, or to the Catalog that contains the Space, rather than to the Space itself, the following conditions apply:

- Any role assigned to the user at the provider organization or Catalog level is assigned automatically to the user in all Spaces, and cannot be removed at the Space level.

For details on adding a user to a provider organization, see [Adding provider organization users and assigning roles](#).

For details on adding a user to a Catalog, see [Managing Catalog membership](#).

- In the Space, the user has the permissions that are configured for the role at the Space level.  
For details on configuring role permissions for a Space, see [Managing user access in a Space](#).

- Any role that hasn't been assigned to the user at the provider organization or Catalog level can be assigned at the Space level

Note: You can subsequently change the roles assigned to a user by selecting or clearing the appropriate check boxes alongside that user on the Members page.

8. If you are adding an existing user, click Create. If you are adding a new user, click Invite.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Managing user access in a Space

If Spaces are enabled in an IBM® API Connect Catalog, you can manage the access that users have within the Space. You manage access by specifying the permissions that are assigned to user roles.

### Before you begin

To manage Space permissions in the API Manager UI, a user must be assigned a role that has the Child\_>\_Manage permission for the Catalog that contains the Space. For information on adding users to a Space and assigning user roles, see [Managing Space membership](#).

### Procedure

1. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with.
2. In the navigation pane of the API Manager UI, click  Spaces.
3. Select the Space that you want to work with.
4. In the navigation pane of the API Manager UI, click  Settings.
5. Click Roles, click the options icon  alongside the role whose permissions you want to modify, then click Edit.
6. Select the required permissions, then click Save.

### Related tasks

- [Creating custom roles](#)

### Related information

- [API Connect user roles](#)

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Managing Gateways in a Space

If Spaces are enabled in a Catalog, you can separately control which Gateway services are used by each of the Spaces in the IBM® API Connect Catalog.

## Before you begin

---

To manage Space Gateway settings in the API Manager UI, a user must be assigned a role that has the Child\_>Manage permission for the Catalog that contains the Space. For information on adding users to a Space and assigning user roles, see [Managing Space membership](#).

## About this task

---

Note: If Spaces are enabled in a Catalog then you configure the Gateway settings for each Space separately, **not** for the Catalog as a whole.

## Procedure

---

To manage the Gateway settings for a Space, complete the following steps:

1. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with.
2. In the navigation pane of the API Manager UI, click  Spaces.
3. Select the Space that you want to work with.
4. In the navigation pane of the API Manager UI, click  Settings.
5. Click Gateway Services.  
The Gateway services that are currently enabled for the Space are listed.
6. To change the Gateway service configuration for the Space, click Edit, then select which Gateway services you want the Space to use.
7. Click Save to save your changes.

## Related information

---

- [Configuring the initial Gateway service](#)

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Administering Consumer organizations

---

Manage the Consumer organizations that access your APIs and Plans when their users sign up to use the IBM® API Connect Developer Portal.

## About this task

---

Application developers in Consumer organizations access the Developer Portal and sign up to use the Plans in the Products you create in the API Manager. You can create more than one Consumer organization and each organization has one owner. Application developers are added through the Developer Portal UI.

You can also create groups of Consumer organizations. A Consumer organization group is an efficient way of grouping application developers together to publish Products to, making it easier to control who has access to the Plans in the Products.

Use the following tasks to administer your Consumer organizations and Consumer organization groups:

- [Creating a Consumer organization](#)  
If you have permission to manage developers, you can create new Consumer organizations in a Catalog. Consumer organizations contain the application developers that subscribe to use the APIs that are published to the Catalog
- [Editing a Consumer organization](#)  
You can change the title of an IBM API Connect Consumer organization.
- [Deleting a Consumer organization](#)  
When you delete a Consumer organization, all of the resources in that organization are removed from the cloud. However, the account of the organization owner remains in IBM API Connect.
- [Working with Consumer organization groups](#)  
A *Consumer organization group* is a collection of Consumer organizations, and provides an efficient way of controlling who can see, and subscribe to, the APIs in your Products. By using a Consumer organization group, you can define this access for all the developers in the organizations in that group in a single operation, rather than having to define access for the organizations separately.
- [Managing developer applications](#)  
If an application is behaving suspiciously, exceeding rate limits, or has been compromised, you can disable it to block it from accessing your APIs.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Creating a Consumer organization

---

If you have permission to manage developers, you can create new Consumer organizations in a Catalog. Consumer organizations contain the application developers that subscribe to use the APIs that are published to the Catalog

## Before you begin

---

Your IBM® API Connect Developer Portal must be enabled to perform this task. For more information, see [Creating and configuring Catalogs](#). To complete this task, you must be defined as a member in a Catalog or Space (if Spaces are enabled), and you must be assigned a role that has the Consumer-Org\_ Manage permission. For more information, see [Adding provider organization users and assigning roles](#) and [Managing Catalog membership](#).

## About this task

---

You can create a consumer organization in either of the following ways:

- Invite a user to be a consumer organization owner, in which case they receive an invitation email with an activation link, and can complete the creation of the consumer organization and specify the title.
- Create the consumer organization yourself, specifying the owner and title. There are two ways you can specify the owner:
  - Specify the user ID of an existing user.
  - If you are using a Local User Registry, specify a new user ID; the user is added to the registry and becomes the owner of the consumer organization.

If Spaces are enabled in your Catalog, when you create a Consumer organization, it is added to the Catalog and its Spaces. For more information about enabling Spaces, see [Using syndication in API Connect](#).

## Procedure

---

1. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with.
2. Optional: If Spaces are enabled in the Catalog, select the Space that you want to work with by completing the following steps:
  - a. In the navigation pane of the API Manager UI, click  Spaces.
  - b. Select the Space that you want to work with.

For more information about enabling Spaces, see [Using syndication in API Connect](#).

3. In the navigation pane of the API Manager UI, click  Consumer Organizations.
4. To invite a user to be a consumer organization owner, complete the following steps:
  - a. Click Add\_ Invite organization owner.
  - b. Enter the email address of the organization owner.
  - c. Click Invite.

The new Consumer organization is added to the list, and an email invitation is sent to the owner; by using the activation link, the owner specifies the title of the organization. The status is shown as `Pending` until the recipient of the email clicks the link in the email to complete the creation of their Developer Portal account, after which the status changes to `Enabled`.

5. To create the consumer organization yourself, complete the following steps:
  - a. Click Add\_ Create organization.
  - b. Enter the organization Title. A Name is entered automatically.

The value in the Name field is a single string that is used to identify the consumer organization in developer toolkit CLI commands. The title is used for display.

To view the CLI commands to manage Consumer organizations, see [apic consumer-orgs](#).
  - c. Select the required user registry.
  - d. Specify the organization owner; complete one or other of the following steps, either to specify an existing user, or to create a new user:
    - To specify the user ID of an existing API Connect user who is in the selected user registry, complete the following steps:
      - For the Type of user, select Existing.
      - In the Username field, enter the user ID of the organization ownerAfter the consumer organization is created, the specified user can immediately log in to the Developer Portal associated with the Catalog.
    - If you selected a Local User Registry, then to specify a new user ID, complete the following steps:
      - For the Type of user, select New User.
      - In the Username field, enter the new user ID.
      - Enter the Email, First Name, Last Name, and Password.After the consumer organization is created, the new user will have been added to the selected registry and can immediately log in to the Developer Portal associated with the Catalog, by using the specified user ID and password.
  - e. Click Create to complete the creation of the consumer organization.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Editing a Consumer organization

You can change the title of an IBM® API Connect Consumer organization.

## Before you begin

---

To complete this task, you must be defined as a member in a Catalog or Space (if Spaces are enabled), and you must be assigned a role that has the Consumer-Org\_ Manage permission. For more information, see [Adding provider organization users and assigning roles](#) and [Managing Catalog membership](#).

## About this task

---

If Spaces are enabled in your Catalog, when you edit the details of a Consumer organization, the updates are applied to the Catalog and its Spaces. For more information about enabling Spaces, see [Using syndication in API Connect](#).

## Procedure

---

To change the title of a Consumer organization, complete the following steps:

1. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with.
2. Optional: If Spaces are enabled in the Catalog, select the Space that you want to work with by completing the following steps:
  - a. In the navigation pane of the API Manager UI, click  Spaces.
  - b. Select the Space that you want to work with.For more information about enabling Spaces, see [Using syndication in API Connect](#).
3. In the navigation pane of the API Manager UI, click  Consumer Organizations.
4. Click the options icon  for the Consumer organization that you want to work with, then click Edit.
5. Update the Title, then click Save.

## Results

---

The title of the Consumer organization is changed. All application developers that are members of that Consumer organization will see the title change reflected in the Developer Portal user interface.

## Related tasks

---

- [Publishing a Product](#)

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Deleting a Consumer organization

---

When you delete a Consumer organization, all of the resources in that organization are removed from the cloud. However, the account of the organization owner remains in IBM® API Connect.

## Before you begin

---

To complete this task, you must be defined as a member in a Catalog or Space (if Spaces are enabled), and you must be assigned a role that has the Consumer-Org\_> Manage permission. For more information, see [Adding provider organization users and assigning roles](#) and [Managing Catalog membership](#).

Important: If you delete a Consumer organization, client IDs and secrets associated with applications that were registered by users in the Consumer organization can no longer be used to call APIs. However, the account of the organization owner remains in API Connect.

## About this task

---

When you delete a Consumer organization, it is removed permanently and users can no longer access that organization.  
If Spaces are enabled in your Catalog, when you delete a Consumer organization, it is deleted from the Catalog and its Spaces. For more information about enabling Spaces, see [Using syndication in API Connect](#).

## Procedure

---

To delete a Consumer organization, complete the following steps:

1. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with.
2. Optional: If Spaces are enabled in the Catalog, select the Space that you want to work with by completing the following steps:
  - a. In the navigation pane of the API Manager UI, click  Spaces.
  - b. Select the Space that you want to work with.For more information about enabling Spaces, see [Using syndication in API Connect](#).
3. In the navigation pane of the API Manager UI, click  Consumer Organizations.
4. Click the options icon  alongside the Consumer organization you want to work with, then click Delete.
5. Click Confirm to delete the Consumer organization.

Note: If the consumer organization is the only one specified in the custom visibility settings for a published Product, the deletion operation will fail. For more information, see [Changing the availability of a Product](#).

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Working with Consumer organization groups

A *Consumer organization group* is a collection of Consumer organizations, and provides an efficient way of controlling who can see, and subscribe to, the APIs in your Products. By using a Consumer organization group, you can define this access for all the developers in the organizations in that group in a single operation, rather than having to define access for the organizations separately.

### About this task

---

A Consumer organization group might represent particular business partners, internal organizations, or other groups of application developers.

When you create a Product, you can define which application developers can access the APIs in that Product. You can configure the following types of access:

- Visibility, which specifies the application developers who can see the APIs in the Developer Portal.
- Subscribability, which specifies the application developers who can create subscribe to use the APIs.

You configure this access by selecting the required Consumer organizations, and Consumer organization groups. You can also change the visibility and subscribability settings for a Product after it has been published. For more information, see [Creating a draft Product](#) and [Changing the availability of a Product](#).

### Procedure

---

To work with Consumer organization groups, you first navigate to the Consumer organization groups page. You then create new groups, and edit or delete existing groups.

- Navigating to the required Consumer organization groups page.
  1. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with.
  2. If Spaces are enabled in the Catalog, select the Space that you want to work with by completing the following steps:
    - a. In the navigation pane of the API Manager UI, click  Spaces.
    - b. Select the Space that you want to work with.
  3. Click  Consumer Organizations, then click Manage Groups.
- Creating a Consumer organization group.
  1. Click Add.
  2. Enter a Title for the new group and, optionally, a Summary. A Name is entered automatically. The title is used for display.
  3. Use the Type to add organizations/groups field to search for, and select, the consumer organizations that you want to add to the group.

Note: To prevent excessive search results lists, only the first 10 matches are displayed when you begin typing in the field; lengthen your search string to shorten the list for locating the required consumer organization.
  4. Click Save to create the group.
- Editing a Consumer organization group.
  1. Click the options icon  for the Consumer organization group that you want to work with, then click Edit.
  2. Make the required updates, then click Save.
- Deleting a Consumer organization group.
  1. Click the options icon  for the Consumer organization group that you want to work with, then click Delete.
  2. Click Confirm to delete the group.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Managing developer applications

If an application is behaving suspiciously, exceeding rate limits, or has been compromised, you can disable it to block it from accessing your APIs.

### Before you begin

---

To complete this task, you must be assigned a role that has the Applications\_>\_Manage permission. For more information, see [Adding provider organization users and assigning roles](#) and [Managing Catalog membership](#).

### About this task

---

You might need to disable an application for any of the following reasons:

- The application is trying to maliciously hack your APIs.
- You have soft rate limits enabled on your Plan and the application is consistently exceeding the quota.
- You become aware that the client secret has been compromised and that the developer has not reset it.

Note: If a disabled application calls an API, the API gateway returns error code 403.

### Procedure

---

To disable an application, complete the following steps.

1. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with.
2. Optional: If Spaces are enabled in the Catalog, select the Space that you want to work with by completing the following steps:
  - a. In the navigation pane of the API Manager UI, click  Spaces.
  - b. Select the Space that you want to work with.For more information about enabling Spaces, see [Using syndication in API Connect](#).
3. In the navigation pane of the API Manager UI, click  Applications.  
All applications that have been registered in the Developer Portal associated with this Catalog are listed.
4. Click the options icon  for the application that you want to disable, then click Disable.  
The value in the STATE column for the application changes to Disabled. If Spaces are enabled in the Catalog, the application is disabled in the Catalog and its Spaces.
5. Optional: To enable an application, click the options icon  for the application that you want to enable, then click Enable.  
If Spaces are enabled in the Catalog, the application is reactivated in the Catalog and its Spaces.

## Results

---

When you disable or enable an application, the application developer is notified by email and in their Developer Portal activity feed.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Security and authentication

---

In API Manager, you can use TLS profiles to secure the transmission of data between the management server and other API Connect subsystems and external services, and also configure user registries to securely authenticate your Catalogs and APIs.

For details of authentication in IBM API Connect, see the following subtopics:

- [Creating a TLS client profile](#)  
In the IBM API Connect API Manager interface, TLS profiles are used to secure transmission of data between the management server and other API Connect subsystems and external services. TLS and SSL certificates guarantee that information you submit will not be stolen or tampered with. In this topic, you learn how to create a TLS profile in API Manager.
- [Authenticating by using your enterprise user registry](#)  
IBM API Connect supports a variety of user registry types for authenticating users and securing APIs.
- [Configuring a native OAuth provider](#)  
Native OAuth providers are configured and managed by you within your cloud.
- [Configuring a third-party OAuth provider](#)  
Enter the secure endpoints to provide OAuth authentication from a third party.
- [OAuth concepts for API Connect](#)  
OAuth is a token-based authorization protocol that allows third-party websites or applications to access user data without requiring the user to share personal information.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Creating a TLS client profile

---

In the IBM® API Connect API Manager interface, TLS profiles are used to secure transmission of data between the management server and other API Connect subsystems and external services. TLS and SSL certificates guarantee that information you submit will not be stolen or tampered with. In this topic, you learn how to create a TLS profile in API Manager.

### Before you begin

---

One of the following roles is required to configure TLS Profiles:

- Organization Administrator
- Owner
- Custom role with the `Settings: Manage permissions`

### About this task

---

API Connect supports the use of TLS and SSL certificates, but does not itself produce strong encryption keys or manage your encryption keys. Encryption keys should be created and managed according to your own procedures. For more information, see [Viewing certificate details and adding certificates to a keystore or truststore](#) and [Generating a PKCS#12 file for Certificate Authority](#).

Note: If you update a TLS profile that is associated with a Gateway service, the updates are not automatically propagated to Gateway servers.

For instructions on how to configure the toolkit command-line tool to use TLS certificates when connecting to API Manager, see [Configuring the command-line tool to use TLS certificates](#).

## Procedure

To create a TLS profile, complete the following steps:

1. In the API Manager, click  Resources.
2. Select TLS.
3. Click Create in the TLS Client Profile table.
4. Enter the fields to configure the TLS Client Profile:

Field	Description
Title (required)	Enter a Title for the profile. The title is displayed on the screen.
Name (required)	<p>The Name is auto-generated. The value in the Name field is a single string that can be used in developer toolkit CLI commands. To view the CLI commands to manage a TLS Client Profile, see <a href="#">apic tls-client-profiles</a>.</p> <p>Important: The name of the TLS Client Profile as saved on the DataPower® Gateway, depending on the gateway type, is as follows:</p> <ul style="list-style-type: none"> <li>• DataPower API Gateway: <code>provider-org-name_catalog-name_tlsp-tls-profile-nameV1.0.0</code></li> <li>• DataPower Gateway (v5 compatible): <code>provider-org-name-tls-profile-nameV1.0.0</code></li> </ul> <p>where</p> <ul style="list-style-type: none"> <li>• <code>tls-profile-name</code> is the value of the auto-generated Name field for the TLS client profile in API Connect.</li> <li>• <code>provider-org-name</code> is the name of the provider organization containing the TLS client profile.</li> <li>• <code>catalog-name</code> is the name of the Catalog, in that provider organization, containing the TLS client profile.</li> </ul>
Version (required)	Assign a version number for the profile. Using version numbers allows you to create multiple server profiles with the same name and different configurations, for example, <i>MyProfile 1.0</i> and <i>MyProfile 1.1</i> .
Summary (optional)	Enter a description of the profile.
Protocols (required)	Select one or more supported TLS protocol versions. The default is 1.2.
Server Connection (optional)	<p>Specify whether to support weak or insecure credentials.</p> <ul style="list-style-type: none"> <li>• Allow insecure server connections - Insecure server connections may result from self-signed certificates, expired or corrupted certificates, or certificates from an unknown or untrusted source. Check this box to allow the connection to proceed with an insecure connection. The default is to not allow insecure server connections.</li> <li>• Support Server Name Indication (SNI) - Check this box to enable SNI. SNI allows support for multiple certificates presented on the same IP address using different host names. The client profile sends the name of a virtual domain as part of the TLS negotiation. The default is to enable SNI.</li> </ul>
Keystore (optional)	A Keystore is a repository containing public and private key pairs. Select the keystore where you will store the certificates for the profile. Default keystores are provided, and you can also create your own.
Truststore (optional)	A Truststore is a repository containing verified public keys, which are usually obtained from a third-party certificate authority. Truststores provide secure identification for peer systems. A truststore is usually used when mutual authentication is enabled. Select a truststore for the profile. Default truststores are provided, and you can also create your own.
Ciphers (required)	Cipher suites are encryption/decryption algorithms used to secure HTTPs communication within the API Connect ecosystem. All ciphers are enabled by default. You can unselect one or more ciphers if they are not needed for the profile.

5. Click Save.

- [Creating a Keystore](#)  
Keystores contain matched pairs of public certificates and private keys used to confirm identity and encrypt/decrypt data transmission over HTTPS.
- [Creating a Truststore](#)  
Truststores are repositories containing trusted certificates with verified public keys. The certificates in the truststore are usually obtained from a third-party certificate authority (CA).
- [Generating a PKCS#12 file for Certificate Authority](#)  
PKCS#12 (P12) files define an archive file format for storing cryptographic objects as a single file. API Connect supports the P12 file format for uploading a keystore and truststore. The keystore should contain both a private and public key along with intermediate CA certificates.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Creating a Keystore

Keystores contain matched pairs of public certificates and private keys used to confirm identity and encrypt/decrypt data transmission over HTTPS.

### Before you begin

---

API Manager supports and uses TLS certificates, but does not produce strong encryption keys or manage your encryption keys. Encryption keys are generated and managed according to your own procedures. For more information, see [Generating a PKCS#12 file for Certificate Authority](#) and [Generating a self-signed certificate using OpenSSL](#).

One of the following roles is required to configure Keystores:

- Organization Administrator
- Owner
- Custom role with the `Settings: Manage permissions`

### About this task

---

API Connect includes pre-configured Keystores which may be used for testing purposes. For production environments, we suggest creating a new, secure Keystore.

### Procedure

---

Perform the following steps to create a TLS Client profile:

1. In the API Manager, click  Resources.
2. Select TLS.
3. Click Create in the Keystore table.

Field	Description
Title (required)	Enter a Title for the Keystore. The title is displayed on the screen.
Name (required)	The Name is auto-generated. The value in the Name field is a single string that can be used in developer toolkit CLI commands. To view the CLI commands to manage keystores, see <a href="#">apic keystores</a> .
Summary (optional)	Enter a brief description.
Private Key & Public Key: Step 1: Upload private key	Upload the file containing the private key certificate. If necessary, you can click Browse to locate the file. If the file contains both the private and public keys, upload it in Step 1. Private and public keys are always uploaded in pairs, either in a single file or separate files.
Private key password (optional)	Enter the password for the private key if it has a password.
Private Key & Public Key: Step 2: Upload public key	If the public key is contained in a separate file, upload it in Step 2. Private and Public keys are always uploaded in pairs, either in a single file or separate files.

4. Click Save.  
Note: After they have been uploaded, private keys cannot be downloaded from API Connect.

---

---

## Creating a Truststore

Truststores are repositories containing trusted certificates with verified public keys. The certificates in the truststore are usually obtained from a third-party certificate authority (CA).

### Before you begin

---

One of the following roles is required to configure truststores:

- Organization Administrator
- Owner
- Custom role with the `Settings: Manage permissions`

### About this task

---

API Manager supports and uses TLS certificates, but does not produce strong encryption keys or manage your encryption keys. Encryption keys are generated and managed according to your own procedures. For more information, see [Generating a PKCS#12 file for Certificate Authority](#) and [Generating a self-signed certificate using](#)

API Connect includes pre-configured Truststores which may be used for testing purposes. For production environments, we suggest creating a new, secure Truststore.

## Procedure

1. In the API Manager, click  Resources.
2. Select TLS.
3. Click Create in the Truststore table.

Field	
Title (required)	Enter a Title for the Truststore. The title is displayed on the screen.
Name (required)	The Name is auto-generated. The value in the Name field is a single string that can be used in developer toolkit CLI commands. To view the CLI commands to manage truststores, see <a href="#">apic truststores</a> .
Summary (optional)	Enter a brief description.
Public Keys	Upload the file containing the public key certificate. If necessary you can click Browse to locate the file.

4. Click Save.

## Related tasks

- [Creating a TLS client profile](#)
- [Creating a Keystore](#)

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Generating a PKCS#12 file for Certificate Authority

PKCS#12 (P12) files define an archive file format for storing cryptographic objects as a single file. API Connect supports the P12 file format for uploading a keystore and truststore. The keystore should contain both a private and public key along with intermediate CA certificates.

## Before you begin

One of the following roles is required to add a key to a keystore or truststore:

- Organization Administrator
- Owner
- Custom role with the `Settings: Manage permissions`

Before you can generate a P12 file, you must have a private key (for example: key.pem), a signed certificate by a Certificate Authority (for example certificate.pem) and one or more certificates from the CA authority (known as *intermediate CA certificates*).

Note: If your certificate file contains more than one certificate, you must manually split the file and create a single file for each entry. Each entry must be bound by the following markers:

```
-----BEGIN CERTIFICATE-----  
-----END CERTIFICATE-----
```

## Procedure

1. If you have intermediate certificates from your CA, concatenate them into a single .pem file to build your **caChain**. Be sure to enter a new line following each certificate's data.

```
cat ca1.pem ca2.pem ca3.pem > caChain.pem  
cat caChain.pem  
-----BEGIN CERTIFICATE-----  
MIIEPjCCA46gAwIBAgIQEod26KZabjd+BQMGlDwl6jANBgkqhkiG9w0BAQUFADCBA  
...  
lQX7CkTJn61AJUusyEa8H/gjVQnHp4VOLFR/dKgeVcCRvZF7Tt5AuiyHY  
-----END CERTIFICATE-----  
-----BEGIN CERTIFICATE-----  
MIIEPDCCAySgAwIBAgIQSEus8arH1xND0aJ0NUmXJTANBgkqhkiG9w0BAQUFADBVB  
...  
-----END CERTIFICATE-----  
-----BEGIN CERTIFICATE-----  
MIIEAjCCA66gAwIBAgIBATANBgkqhkiG9w0BAQUFADBvMQswCQYDVQGEwJTRTEU  
...  
-----END CERTIFICATE-----
```

2. Create the P12 file including the private key, the signed certificate and the CA file you created in step 1, if applicable. Omit the **-CAfile** option if you don't have CA certificates to include.

The following command uses OpenSSL, an open source implementation of the SSL and TLS protocols.

```
openssl pkcs12 -inkey key.pem -in certificate.pem -export -out certificate.p12 -CAfile caChain.pem -chain
```

Once the certificate file is created, it can be uploaded to a keystore.

3. Once the certificate file is created, it can be uploaded to a Truststore. In the API Manager, click .
4. Select TLS.
5. Click Create in the Keystore table.
6. Create a Keystore and upload the certificate file following the instructions at [Creating a Keystore](#).

Note:

- API Connect supports only the P12 (PKCS12) format file for the present certificate.
- Your P12 file must contain the private key, the public certificate from the Certificate Authority, and all intermediate certificates used for signing.
- Your P12 file can contain a maximum of 10 intermediate certificates.

7. Click Save.

## Results

---

Your P12 file is generated and ready to upload.

## What to do next

---

Upload your P12 file to IBM® API Connect. For more information, see [Creating a TLS client profile](#).

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Generating a self-signed certificate using OpenSSL

OpenSSL is an open source implementation of the SSL and TLS protocols. It provides the transport layer security over the normal communications layer, allowing it to be intertwined with many network applications and services.

## Before you begin

---

One of the following roles is required to complete this task:

- Organization Administrator
- Owner
- Custom role with the `Settings`: `Manage permissions`

## About this task

---

This topic tells you how to generate a self-signed SSL certificate request using the OpenSSL toolkit to enable HTTPS connections.

## Procedure

---

To generate a self-signed SSL certificate using the OpenSSL, complete the following steps:

1. Write down the Common Name (CN) for your SSL Certificate. The CN is the fully qualified name for the system that uses the certificate. For static DNS, use the hostname or IP address set in your Gateway Cluster (for example, `192.16.183.131` or `dp1.acme.com`).
2. Run the following OpenSSL command to generate your private key and public certificate. Answer the questions and enter the Common Name when prompted.

```
openssl req -newkey rsa:2048 -nodes -keyout key.pem -x509 -days 365 -out certificate.pem
```

3. Review the created certificate:

```
openssl x509 -text -noout -in certificate.pem
```

4. Combine your key and certificate in a PKCS#12 (P12) bundle:

```
openssl pkcs12 -inkey key.pem -in certificate.pem -export -out certificate.p12
```

5. Validate your P2 file.

```
openssl pkcs12 -in certificate.p12 -noout -info
```

Once the certificate file is created, it can be uploaded to a keystore.

6. In the API Manager, click  Resources.
7. Select TLS.
8. Click Create in the Keystore table.
9. Create a Keystore and upload the certificate file following the instructions at [Creating a Keystore](#).

Note:

- API Connect supports only the P12 (PKCS12) format file for the present certificate.
- Your P12 file must contain the private key, the public certificate from the Certificate Authority, and all intermediate certificates used for signing.
- Your P12 file can contain a maximum of 10 intermediate certificates.

10. Click Save.

## Viewing certificate details and adding certificates to a keystore or truststore

You can view details for the certificates in an existing keystore or truststore and add additional certificates. You might need add certificates when a certificate or PKCS #12 (P12) file expires.

### Before you begin

---

One of the following roles is required to edit Keystores and Truststores:

- Organization Administrator
- Owner
- Custom role with the `Settings: Manage permissions`

### About this task

---

API Connect includes pre-configured Keystores and Truststores which can be used for testing purposes. For production environments, we suggest creating a new, secure Keystore or Truststore. From an existing Keystore or Truststore, you can edit the title, view the details of the certificates, and add new certificates.

### Procedure

---

To work with existing Keystores and Truststores:

1. In the API Manager, click  Resources.
2. Select TLS.
3. Click the name of the keystore or truststore.
4. Edit the name and summary if needed.
5. The Subject, Finger Print, and Expiration date is shown for each certificate in the keystore or truststore. Click > to view the certificate details.
6. Add additional private and/or public keys if needed.
7. Click Save.

Note: After they have been uploaded, private keys cannot be downloaded from API Connect.

## Defining elliptic curve cryptographic schemes for a TLS client profile

You define the elliptic curve cryptographic schemes for a TLS client profile by using the developer toolkit CLI.

### About this task

---

To define elliptic curve cryptographic schemes for a TLS client profile, you include `elliptic_curve_auto_negotiation` and `elliptic_curve` properties in a YAML file definition for the TLS client profile. The `elliptic_curve` property lists the required elliptic curve cryptographic schemes. For example:

```
elliptic_curve_auto_negotiation: false
elliptic_curve:
- secp521r1
- secp384r1
- prime256v1
```

You then use the developer toolkit CLI to create the TLS client profile in API Connect.

When `elliptic_curve_auto_negotiation` is set to `true`, the system negotiates the Elliptic-curve Diffie-Hellman (ECDH) key agreement automatically with its peer, and any `elliptic_curve` property settings are ignored.

The following example shows a complete YAML file for a TLS client profile:

```
type: tls_client_profile
name: my-tls-client-profile
version: 1.0.0
title: My TLS client profile
protocols:
- tls_v1.2
ciphers:
- ECDHE_ECDSA_WITH_AES_256_GCM_SHA384
elliptic_curve_auto_negotiation: false
elliptic_curve:
- sect163k1
insecure_server_connections: false
server_name_indication: true
```

Note:

- The `elliptic_curve_auto_negotiation` option is not supported by any of the API Connect gateway types. If the TLS client profile is targeted for an API Connect gateway; this setting is ignored by the gateway.
- The elliptic curve cryptographic schemes shown in each row of the following table are equivalent. However, API Connect recognizes only one or the other depending on how the TLS profile is used, as indicated in the table.

Table 1.

API enforcement on the gateway	API Connect server access security
secp192r1	prime192v1
secp256r1	prime256v1

Therefore, if you want to use either of these schemes and are unsure whether you are targeting the TLS client profile to the API Connect gateway for API enforcement, whether you are using it to secure user access to the API Connect servers, or whether it will be used for both purposes, specify both equivalent schemes; API Connect will simply ignore the non-relevant scheme. For example:

```
elliptic_curve:
.
.
- secp256r1
- prime256v1
.
.
```

## Procedure

To create a TLS client profile with elliptic curve cryptographic schemes defined, complete the following steps:

1. Create a YAML file definition for your TLS client profile, with the required `elliptic_curve` property.
2. Log in to the management server from the developer toolkit CLI. Log in either as a member of the cloud administration organization or as a member of a provider organization, depending on where you want to create the TLS client profile. For details, see [Logging in to a management server](#).
3. Create the TLS client profile by using the following command:

```
apic tls-client-profiles:create --server mgmt_endpoint_url --org organization_name tls_client_profile_yaml_file
```

where:

- `mgmt_endpoint_url` is the platform API endpoint URL, and is the same as that which was used when you logged in at step 2.
- `organization_name` is either `admin`, for the cloud administration organization, or the name of your provider organization, and is the same as that which was used when you logged in at step 2.
- `tls_client_profile_yaml_file` is the name of the YAML file that contains the definition for your TLS client profile.

Note: When you install IBM® API Connect, the API Connect gateway has a pre-supplied default TLS client profile that is used for API enforcement if you do not configure a TLS client profile; you cannot configure this default TLS client profile on the gateway.

For reference details of all the `apic tls-client-profiles` commands, see [apic tls-client-profiles](#).

You can also complete the operations described in this topic by using the API Connect REST APIs; see the [API Connect REST API documentation](#).

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Authenticating by using your enterprise user registry

IBM® API Connect supports a variety of user registry types for authenticating users and securing APIs.

You can use your enterprise user registry for authentication in API Connect if it is of one of the following types:

LDAP directory

If your user registry uses Lightweight Directory Access Protocol (LDAP), you can use it in API Connect for both user authentication and API security.

Authentication URL User Registry

You can configure a non-LDAP user registry by using an authentication URL user registry. An authentication URL user registry enables integration with third-party authentication providers. You can use an authentication URL user registry in API Connect for both user authentication and API security.

Local User Registry

You can authenticate users with a local user registry. A local user registry is an internal registry stored within API Connect.

OpenID Connect

You can authenticate users through an identity provider that supports the OpenID Connect (OIDC) authentication protocol.

- [Working with user registries](#)  
To secure the APIs that are published to your IBM API Connect Catalogs, you authenticate with user registries.
- [Modifying the configuration details for a user registry](#)  
You modify the configuration details for a user registry by using the User Registries page in the API Manager user interface of IBM API Connect.
- [Password lockout criteria](#)  
You can be locked out of your account if you attempt to log in and fail consecutively.

## Related tasks

---

---

## Working with user registries

To secure the APIs that are published to your IBM® API Connect Catalogs, you authenticate with user registries.

### Procedure

---

To configure a user registry, complete the following steps:

1. In the API Manager user interface, select  Resources.
2. On the Resources page, select User Registries > Create.
3. Select the tile for the user registry type you want, and continue to the instructions for configuring user authentication for your selection:

Authentication URL User Registry

For more information, see [Creating an Authentication URL user registry](#).

LDAP User Registry

For more information, see [Creating an LDAP user registry in API Manager](#).

Local User Registry

For more information, see [Creating a Local User Registry](#).

### Results

---

The user registry information is added to API Manager.

### What to do next

---

You can now use API Manager to chart and manage your Catalogs.

- [Creating an LDAP user registry in API Manager](#)  
You can use the API Manager UI to configure an organization-specific LDAP user registry to provide user authentication and onboarding for the Developer Portal. APIs can also be secured with an LDAP user registry.
- [Creating an Authentication URL user registry](#)  
An Authentication URL user registry provides a simple mechanism for authenticating users by referencing a custom identity provider.
- [Creating a Local User Registry](#)  
A Local User Registry (LUR) can be created to provide user authentication for API Manager.
- [Creating an OIDC user registry](#)  
Create an organization-specific OIDC user registry when multi-factor authentication (MFA) is required.

## Creating an LDAP user registry in API Manager

You can use the API Manager UI to configure an organization-specific LDAP user registry to provide user authentication and onboarding for the Developer Portal. APIs can also be secured with an LDAP user registry.

## Before you begin

To configure an LDAP user registry as a resource in API Manager, the LDAP directory must be created and populated for use with your API Connect ecosystem.

LDAP registries can be used to secure APIs, or for securing a Catalog to authenticate Developer Portal users.

Important: If you are using an LDAP registry to secure APIs, note the following limitations:

- Authentication methods Compose DN and Compose UPN are not supported with the DataPower® API Gateway.
- The STARTTLS protocol, which upgrades an insecure protocol to a secure one by applying TLS security, is not supported with an LDAP user registry

One of the following roles is required to configure an LDAP user registry:

- Organization Administrator
- Owner
- Topology Administrator
- Custom role with the `Settings: Manage permissions`

## About this task

You can create an LDAP user registry that is specific to a provider organization, or one that can be shared and available to all of the provider organizations in your API Connect environment. An organization-specific LDAP user registry can be used for authenticating Developer Portal users in a specific provider organization. While a shared LDAP user registry can be used across the Cloud Manager, the API Manager, and the Developer Portal components in your environment.

This topic describes how to configure an organization-specific LDAP user registry. If you want to create a shared registry, see [Configuring an LDAP user registry in the Cloud Manager](#) for more information.

Note:

- You can also create and manage LDAP user registries by using the developer toolkit CLI. For more information, see [Using the CLI to create an organization-specific LDAP user registry](#).
- The API Connect REST APIs can also be used to create and manage LDAP user registries; see the [API Connect REST API documentation](#).

You create an LDAP user registry by configuring a set of properties in the API Manager UI. If you want to enable writable LDAP, you must complete the Attribute Mapping section by selecting the User Managed checkbox, and providing the mapping of your source LDAP attribute names to the target API Connect values. You can also change a registry to be read-only again by clearing the User Managed checkbox. To make the registry available to the Developer Portal, you must define the registry for consumer onboarding in the associated Catalog. To secure APIs with an LDAP registry, you must configure security definitions.

For general information about authenticating with LDAP, see [LDAP authentication](#).

## Procedure

Follow these steps to configure a new LDAP user registry as a Resource in the API Manager UI.

1. In the API Manager, click  Resources.
2. Click Create in the User Registries section.
3. Select LDAP User Registry for the user registry type, and enter the following information:

Field	Description
Title	Enter a descriptive name to display on the screen.
Name	The name that is used in CLI commands. The name is auto-generated. For details of the CLI commands for managing user registries, see <a href="#">apic user-registries</a> .
Display Name (required)	The name that is displayed for selection by the user when logging in to a user interface, or activating their API Manager account. For details of user interface log in, and account activation, see <a href="#">Accessing the Cloud Manager user interface</a> , <a href="#">Accessing the API Manager user interface</a> , and <a href="#">Activating your API Manager user account</a> .  Note: The Developer Portal uses the <b>Title</b> of the User Registries when rendering them at the login page, rather than the <b>Display Name</b> .
Summary (optional)	Enter a brief description.
Address	Enter the IP address or host name of the LDAP server.
Port	Enter the Port number that API Connect can use to communicate with the LDAP registry. For example, 389.
Select a TLS Client Profile (optional)	Select the TLS Client Profile the LDAP server requires.
Select a protocol version	Select the version number for the LDAP protocol that you are using.
Case-sensitivity	To ensure proper handling of user name capitalization, you <b>must</b> ensure that your case-sensitivity setting here matches the setting on your backend LDAP server: <ul style="list-style-type: none"> <li>• <b>Only</b> select Case sensitive if your backend LDAP server supports case-sensitivity.</li> <li>• <b>Do not</b> select Case sensitive if your backend LDAP server does not support case-sensitivity.</li> </ul> Note: The Developer Portal does not support case sensitive usernames.  Note: After at least one user has been onboarded into the registry, you cannot change this setting.

4. Click Next and enter the authentication information, which will vary depending on the selected Authentication Method. The choices are:
  - Compose DN - Select this format if you can compose the user LDAP Distinguished Name (DN) from the user name. For example, `uid=<username>,ou=People,dc=company,dc=com` is a DN format that can be composed from the user name. If you are unsure whether Compose (DN) is the

correct option, contact your LDAP administrator. If you are using an LDAP registry to secure APIs, Compose DN is not supported with the DataPower API Gateway.

- Compose UPN - Select this format if your LDAP directory supports binding with User Principal Names such as `john@acme.com`. The Microsoft Active Directory is an example of an LDAP directory that supports Compose UPN authentication. If you are unsure whether your LDAP directory supports binding with UPNs, contact your LDAP administrator. If you are using an LDAP registry to secure APIs, Compose UPN is not supported with the DataPower API Gateway.
- Search DN - Select this format if you cannot compose the user LDAP Distinguished Name from the user name; for example, if the base DN of the users are different. This format might require an administrator DN and password to search for users in the LDAP directory. If your LDAP directory permits anonymous binds, you can omit the admin DN and password. If you are unsure if your LDAP directory permits anonymous binds, contact your LDAP administrator.

For all of the authentication methods:

If you are creating an LDAP registry to authenticate users of an API, you can specify an LDAP authorization group to restrict API access. To be able to call an API that is secured by the LDAP registry, a user must successfully authenticate with their LDAP user ID and password **and** they must be a member of the specified authorization group. The authorization group can be a Static Group or Dynamic Group. A static group is one in which the individual members of the group are explicitly listed. A dynamic group is one which is defined according to the set of attributes that the group members share in common.

5. For authentication method Compose DN, enter the following:

Field	Description
Bind Method	Anonymous or Authenticated. If specific permissions are not needed to search the registry, select Anonymous Bind. Or, if specific permissions are necessary, select Authenticated Bind.
Admin DN	For Authenticated Bind, enter the Distinguished Name of a user authorized to perform searches in the LDAP directory. For example <code>cn=admin,dc=company,dc=com</code> .
Admin Password	For Authenticated Bind, enter the user password for the Admin DN.
Prefix	Specify the prefix to the DN. For example <code>(uid=</code> .
Suffix	Specify the suffix to the DN. For example <code>)</code> .
Base DN (optional)	Enter a base DN in the Base DN field, or click Get Base DN to populate the field with a retrieved base DN.
Use group authentication (optional)	Static or Dynamic. For Static Group, enter the Group Based DN, Prefix, and Suffix. For Dynamic Group, enter the Filter condition for the group.

6. For authentication method Compose UPN, enter the following:

Field	Description
Bind Method	Anonymous or Authenticated. If specific permissions are not needed to search the registry, select Anonymous Bind. Or, if specific permissions are necessary, select Authenticated Bind.
Admin DN	For Authenticated Bind, enter the Distinguished Name of a user authorized to perform searches in the LDAP directory. For example <code>cn=admin,dc=company,dc=com</code> .
Admin Password	For Authenticated Bind, enter the user password for the Admin DN.
Suffix	Enter the domain part of the user principal name. For example, <code>@acme.com</code> .
Use group authentication (optional)	Enter the Filter condition for the group.

7. For authentication method Search DN, enter the following:

Field	Description
Bind Method	Anonymous or Authenticated. If specific permissions are not needed to search the registry, select Anonymous Bind. Or, if specific permissions are necessary, select Authenticated Bind.
Admin DN	For Authenticated Bind, enter the Distinguished Name of a user authorized to perform searches in the LDAP directory. For example <code>cn=admin,dc=company,dc=com</code> .
Admin Password	For Authenticated Bind, enter the user password for the Admin DN.
Prefix	Specify the prefix to the DN. For example <code>(uid=</code> .
Suffix	Specify the suffix to the DN. For example <code>)</code> .
Base DN (optional)	Enter a base DN in the Base DN field, or click Get Base DN to populate the field with a retrieved base DN.
Use group authentication (optional)	Static or Dynamic. For Static Group, enter the Group Based DN, Prefix, and Suffix. For Dynamic Group, enter the Filter condition for the group.

8. Optional: Click Test configuration to test the settings for your LDAP user registry. Enter valid credentials to ensure that you can access the LDAP database.

9. Optional: If you want to make your LDAP user registry writable, select the User Managed checkbox in the Attribute Mapping section, and provide the mapping of your source LDAP attribute names to the target API Connect values. Click Add to add each name/value pair, specified as follows:

- LDAP ATTRIBUTE NAME - is the name of the source LDAP attribute.
- API CONNECT VALUE - is a string that represents the value that API Connect will populate the LDAP attribute with, by replacing the content contained in [ ] with the value that the user supplies when signing up.

The default user profile properties that API Connect requires during user registration are `username`, `first_name`, `last_name`, `email`, and `password`, as shown in the following example:

LDAP ATTRIBUTE NAME	API CONNECT VALUE
<code>dn</code>	<code>uid=[username],ou=users,dc=company,dc=com</code>
<code>cn</code>	<code>{first_name} {last_name}</code>
<code>sn</code>	<code>{last_name}</code>
<code>mail</code>	<code>{email}</code>
<code>userPassword</code>	<code>{password}</code>

You must ensure that you enter the correct attribute mapping values for your LDAP configuration, to enable API Connect to access the LDAP database. Note that a writable LDAP user registry cannot be used to authenticate Cloud Manager and API Manager users.

10. Click Create.

Your new LDAP registry is shown in the list of User Registries on the Resources page.

## What to do next

If you want to make the LDAP user registry available for authenticating Developer Portal users, you must enable it in the Catalog that is associated with that Developer Portal. Click the relevant Catalog, then click Settings > Onboarding. In the Catalog User Registries section, click Edit, select the user registry, and click Save. For more information, see [Creating and configuring Catalogs](#).

If you want to use the LDAP user registry to secure APIs, see the following information:

- To use for basic authentication in the security definition for an API, see [Creating a basic authentication security definition](#).
- To use for authentication in the User Security configuration for a native OAuth provider, see [Configuring user security for a native OAuth provider](#).
- [Using the CLI to create an organization-specific LDAP user registry](#)  
You can use the developer toolkit CLI to configure an organization-specific LDAP user registry to provide user authentication for the Developer Portal. APIs can also be secured with an LDAP user registry.

---

---

## Using the CLI to create an organization-specific LDAP user registry

You can use the developer toolkit CLI to configure an organization-specific LDAP user registry to provide user authentication for the Developer Portal. APIs can also be secured with an LDAP user registry.

### Before you begin

---

To configure an LDAP user registry as a resource in API Manager, the LDAP directory must be created and available to use with your API Connect ecosystem.

LDAP registries can be used to secure APIs, or for securing a Catalog to authenticate Developer Portal users.

Important: If you are using an LDAP registry to secure APIs, note the following limitations:

- Authentication methods `compose_dn` and `compose_upn` are not supported with the DataPower® API Gateway.
- The STARTTLS protocol, which upgrades an insecure protocol to a secure one by applying TLS security, is not supported with an LDAP user registry

One of the following roles is required to configure an LDAP user registry:

- Administrator
- Owner
- Topology Administrator
- Custom role with the `Settings: Manage permissions`

### About this task

---

You can create an LDAP user registry that is specific to a provider organization, or one that can be shared and available to all of the provider organizations in your API Connect environment. An organization-specific LDAP user registry can be used for onboarding and authenticating Developer Portal users in a specific provider organization. While a shared LDAP user registry can be used for authenticating Cloud Manager, API Manager, and Developer Portal users.

This topic describes how to configure an organization-specific LDAP user registry. If you want to create a shared registry, see [Using the CLI to configure a shared LDAP user registry](#) for more information.

Note:

- You can also create organization-specific LDAP user registries by using the API Manager UI; for more information see [Creating an LDAP user registry in API Manager](#).
- In addition, you can create and manage LDAP user registries by using the API Connect REST APIs; see the [API Connect REST API documentation](#).

You create an LDAP user registry by first defining the registry details in a configuration file. You then use a developer toolkit CLI command to create the registry, passing the configuration file as a parameter. To make the registry available to the Developer Portal, you must enable the registry in the associated Catalog. To secure APIs with an LDAP registry, you must configure security definitions. You can use the following instructions to create a writable or a read-only LDAP user registry.

For general information about authenticating with LDAP, see [LDAP authentication](#).

### Logging in to the management server CLI

---

Before you can define the LDAP user registry configuration, you must log in to your management server from the developer toolkit CLI as a member of a provider organization. Use the following command:

```
apic login --server mgmt_endpoint_url --username user_id --password password --realm provider/identity_provider
```

For full details of the login command, see [Logging in to a management server](#).

For more information about how to use the CLI, see [Installing the toolkit](#), and [Overview of the command-line tool](#).

### Defining your LDAP configuration

---

You define the configuration of your LDAP user registry in an `ldap_config_file.yaml` file, as shown in the following example. Note that the actual contents of your YAML file will vary depending on the authentication method of your LDAP server, and this is explained in the following tables.

```
name: registry_name
title: "display_title"
```

```

integration_url: LDAP_integration_url
user_managed: true_or_false
user_registry_managed: false
case_sensitive: true_or_false
identity_providers:
- name: provider_name
  title: provider_title
endpoint:
  endpoint: "ldap_server_url_and_port"
configuration:
  authentication_method: authentication_method
  authenticated_bind: "true_or_false"
  admin_dn: "admin_dn"
  admin_password: admin_password
  search_dn_base: "search_dn_base"
  search_dn_scope: search_dn_scope
  search_dn_filter_prefix: prefix
  search_dn_filter_suffix: suffix
  attribute_mapping:
    dn: "distinguished_name"
    cn: "common_name"
    sn: "last_name"
    mail: "email_address"
    userPassword: "password"

```

The registry properties that are common to each authentication method are described in the following table:

Property	Description
<b>name</b>	The name of the registry. This name is used in CLI commands.
<b>title</b>	A descriptive name to display in a graphical user interface.
<b>integration_url</b>	The LDAP integration URL in your API Connect configuration. You can determine the LDAP integration URL by using the following CLI command: <code>apic integrations:list --server mgmt_endpoint_url --subcollection user-registry</code>
<b>user_managed</b>	Determines whether your user registry is writable or not. Must be set to <b>true</b> for writable LDAP. You can change this setting to <b>false</b> if you don't want the registry to be writable; see the Switching your LDAP registry between writable and read-only section at the end of this topic for details. Note that a writable LDAP user registry cannot be used to authenticate Cloud Manager and API Manager users.
<b>user_registry_managed</b>	Must be set to <b>false</b> for LDAP. Determines whether API Connect manages your user registry. Only LUR registries are managed by API Connect.
<b>case_sensitive</b>	Determines whether your user registry is case-sensitive. Valid values are: <ul style="list-style-type: none"> <li><b>true</b></li> <li><b>false</b></li> </ul> <p>To ensure proper handling of user name capitalization, you <b>must</b> ensure that your case-sensitivity setting here matches the setting on your backend LDAP server:</p> <ul style="list-style-type: none"> <li><b>Only</b> set <b>case_sensitive</b> to <b>true</b> if your backend LDAP server supports case-sensitivity.</li> <li>Set <b>case_sensitive</b> to <b>false</b> if your backend LDAP server does not support case-sensitivity.</li> </ul> <p>Note: After at least one user has been onboarded into the registry, you cannot change this setting.</p>
<b>identity_providers</b>	An array containing the details of your LDAP server, where: <ul style="list-style-type: none"> <li><b>name</b> - is the name of the LDAP server and is the name that is used in CLI commands</li> <li><b>title</b> - is the display name of the LDAP server</li> </ul>
<b>endpoint</b>	The endpoint of your LDAP server, made up of the url and port, for example: <code>"ldap://server.com:389"</code>
<b>tls_profile</b>	Optionally set the TLS Client Profile that the LDAP server requires.
<b>protocol_version</b>	Optionally set the version number for the LDAP protocol that you are using. Valid values are: <ul style="list-style-type: none"> <li>2</li> <li>3</li> </ul> <p>Defaults to 3 if not explicitly set.</p>

The properties in the configuration section will vary depending on the selected authentication method. The three authentication methods are:

- compose\_dn** - Set this format if you can compose the user LDAP Distinguished Name (DN) from the user name. For example, `uid=<username>,ou=People,dc=company,dc=com` is a DN format that can be composed from the user name. If you are unsure whether Compose (DN) is the correct option, contact your LDAP administrator. If you are using an LDAP registry to secure APIs, **compose\_dn** is not supported with the DataPower API Gateway.
- compose\_upn** - Set this format if your LDAP directory supports binding with User Principal Names such as `john@acme.com`. The Microsoft Active Directory is an example of an LDAP directory that supports Compose UPN authentication. If you are unsure whether your LDAP directory supports binding with UPNs, contact your LDAP administrator. If you are using an LDAP registry to secure APIs, **compose\_upn** is not supported with the DataPower API Gateway.
- search\_dn** - Select this format if you cannot compose the user LDAP Distinguished Name from the user name; for example, if the base DN of the users are different. This format might require an administrator DN and password to search for users in the LDAP directory. If your LDAP directory permits anonymous binds, you can omit the admin DN and password. If you are unsure if your LDAP directory permits anonymous binds, contact your LDAP administrator.

For authentication method **compose\_dn**, set the following configuration properties:

Properties	Description
<b>authentication_method</b>	<b>compose_dn</b>
<b>authenticated_bind</b>	The bind method. Valid values are: <ul style="list-style-type: none"> <li><b>"true"</b> - authenticated bind</li> <li><b>"false"</b> - anonymous bind</li> </ul> <p>If specific permissions are not needed to search the registry, select <b>"false"</b>. If specific permissions are necessary, select <b>"true"</b>.</p>

Properties	Description
<b>admin_dn</b>	If <b>authenticated_bind</b> is set to <b>"true"</b> , enter the Distinguished Name (DN) of a user authorized to perform searches in the LDAP directory. For example:  "cn=admin,dc=company,dc=com"
<b>admin_password</b>	If <b>authenticated_bind</b> is set to <b>"true"</b> , enter the user password for the <b>admin_dn</b> .
<b>search_dn_base</b>	Optionally set a base DN, for example:  "dc=company,dc=com"
<b>bind_prefix</b>	Set the prefix to the DN, for example:  (uid=
<b>bind_suffix</b>	Set the suffix to the DN, for example:  )
<b>attribute_mapping</b>	If <b>user_managed</b> is set to <b>true</b> , provide the mapping of your source LDAP attribute names to the target API Connect values. This mapping is configured as a name/value pair, specified as follows:  <b>ldap_registry_attribute_name: "apic_ldap_attribute_value"</b>  Where: <ul style="list-style-type: none"> <li><b>ldap_registry_attribute_name</b> - is the name of the source LDAP attribute</li> <li><b>apic_ldap_attribute_value</b> - is a string that represents the value that API Connect will populate the LDAP attribute with, by replacing the content contained in [ ] with the value that the user supplies when signing up.</li> </ul> <p>The user profile properties that API Connect requires during user registration are <b>username</b>, <b>first_name</b>, <b>last_name</b>, <b>email</b>, and <b>password</b>. The following extract shows an example of an attribute mapping:</p> <pre>attribute_mapping: dn: "uid=[username],ou=users,dc=company,dc=com" cn: "[first_name] [last_name]" sn: "[last_name]" mail: "[email]" userPassword: "[password]"</pre>

For authentication method **compose\_upn**, set the following configuration properties:

Properties	Description
<b>authentication_method</b>	<b>compose_upn</b>
<b>authenticated_bind</b>	The bind method. Valid values are: <ul style="list-style-type: none"> <li><b>"true"</b> - authenticated bind</li> <li><b>"false"</b> - anonymous bind</li> </ul> <p>If specific permissions are not needed to search the registry, select <b>"false"</b>. If specific permissions are necessary, select <b>"true"</b>.</p>
<b>admin_dn</b>	If <b>authenticated_bind</b> is set to <b>"true"</b> , enter the Distinguished Name (DN) of a user authorized to perform searches in the LDAP directory. For example:  "cn=admin,dc=company,dc=com"
<b>admin_password</b>	If <b>authenticated_bind</b> is set to <b>"true"</b> , enter the user password for the <b>admin_dn</b> .
<b>bind_suffix</b>	Enter the domain part of the user principal name. For example:  @acme.com
<b>attribute_mapping</b>	If <b>user_managed</b> is set to <b>true</b> , provide the mapping of your source LDAP attribute names to the target API Connect values. This mapping is configured as a name/value pair, specified as follows:  <b>ldap_registry_attribute_name: "apic_ldap_attribute_value"</b>  Where: <ul style="list-style-type: none"> <li><b>ldap_registry_attribute_name</b> - is the name of the source LDAP attribute</li> <li><b>apic_ldap_attribute_value</b> - is a string that represents the value that API Connect will populate the LDAP attribute with, by replacing the content contained in [ ] with the value that the user supplies when signing up.</li> </ul> <p>The user profile properties that API Connect requires during user registration are <b>username</b>, <b>first_name</b>, <b>last_name</b>, <b>email</b>, and <b>password</b>. The following extract shows an example of an attribute mapping:</p> <pre>attribute_mapping: dn: "uid=[username],ou=users,dc=company,dc=com" cn: "[first_name] [last_name]" sn: "[last_name]" mail: "[email]" userPassword: "[password]"</pre>

For authentication method **search\_dn**, set the following configuration properties:

Property	Description
<b>authentication_method</b>	<b>search_dn</b>
<b>authenticated_bind</b>	The bind method. Valid values are: <ul style="list-style-type: none"> <li><b>"true"</b> - authenticated bind</li> <li><b>"false"</b> - anonymous bind</li> </ul> <p>If specific permissions are not needed to search the registry, select <b>"false"</b>. If specific permissions are necessary, select <b>"true"</b>.</p>

Property	Description
<code>admin_dn</code>	If <code>authenticated_bind</code> is set to <code>true</code> , enter the Distinguished Name (DN) of a user authorized to perform searches in the LDAP directory. For example: <code>"cn=admin,dc=company,dc=com"</code>
<code>admin_password</code>	If <code>authenticated_bind</code> is set to <code>true</code> , enter the user password for the <code>admin_dn</code> .
<code>search_dn_base</code>	Optionally set a base DN, for example: <code>"dc=company,dc=com"</code>
<code>search_dn_scope</code>	Optionally set the search DN scope. The scope determines which part of the directory information tree is examined. Possible values are: <ul style="list-style-type: none"> <li><code>base</code></li> <li><code>one</code></li> <li><code>sub</code></li> </ul>
<code>search_dn_filter_prefix</code>	Set the prefix to the DN, for example: <code>(uid=</code>
<code>search_dn_filter_suffix</code>	Set the suffix to the DN, for example: <code>)</code>
<code>attribute_mapping</code>	If <code>user_managed</code> is set to <code>true</code> , provide the mapping of your source LDAP attribute names to the target API Connect values. This mapping is configured as a name/value pair, specified as follows: <code>ldap_registry_attribute_name: "apic_ldap_attribute_value"</code> Where: <ul style="list-style-type: none"> <li><code>ldap_registry_attribute_name</code> - is the name of the source LDAP attribute</li> <li><code>apic_ldap_attribute_value</code> - is a string that represents the value that API Connect will populate the LDAP attribute with, by replacing the content contained in <code>[ ]</code> with the value that the user supplies when signing up.</li> </ul> The user profile properties that API Connect requires during user registration are <code>username</code> , <code>first_name</code> , <code>last_name</code> , <code>email</code> , and <code>password</code> . The following extract shows an example of an attribute mapping: <pre>attribute_mapping:   dn: "uid=[username],ou=users,dc=company,dc=com"   cn: "[first_name] [last_name]"   sn: "[last_name]"   mail: "[email]"   userPassword: "[password]"</pre>

Save your `ldap_config_file.yaml` so it can be accessed by the `user-registries:create` command in the following section. See the [Example](#) section for an example configuration file.

## Creating your LDAP user registry

To create your organization-specific LDAP user registry, run the following CLI command:

```
apic user-registries:create --server mgmt_endpoint_url --org organization_name ldap_config_file.yaml
```

where:

- `mgmt_endpoint_url` is the platform API endpoint URL.
- `organization_name` is the value of the `name` property of your provider organization.
- `ldap_config_file` is the name of the YAML file that defines the configuration of your LDAP user registry.

On completion of the registry creation, the command displays the following summary details:

```
registry_name registry_url
```

The `registry_name` is derived from the `name` property in the configuration YAML file. The `registry_url` is the URL with which the registry resource can be accessed. Your LDAP user registry is now created; see the following section for instructions on how to make the registry available in the Developer Portal.

## Configuring your LDAP registry in a Catalog

If you want to make your LDAP registry available for authenticating Developer Portal users, you must enable it in the Catalog that is associated with that Developer Portal. Complete the following steps:

- Determine the URL of your LDAP user registry by using the following command (or you can copy and paste from the summary of the registry creation):

```
apic user-registries:list --server mgmt_endpoint_url --org organization_name
```

- Log in to the management server as a member of a provider organization; enter the following command:

```
apic login --server mgmt_endpoint_url --username user_id --password password --realm provider/identity_provider
```

For full details of the `apic login` command, see [Logging in to a management server](#).

- Enter the following command (the terminating hyphen character means that the command takes input from the command line):

```
apic configured-catalog-user-registries:create --server mgmt_endpoint_url --org organization_name --catalog catalog_name -
```

where `catalog_name` is the value of the `name` property of the required Catalog. The command returns

```
Reading CONFIGURED_CATALOG_USER_REGISTRY_FILE arg from stdin
```

- Enter the following data, followed by a new line:

```
user_registry_url: ldap_registry_url
```

- where `ldap_registry_url` is the URL of your LDAP registry, obtained in step 1.
5. Press **CTRL D** to terminate the input.

## Switching your LDAP registry between writable and read-only

After an LDAP user registry has been created, it can be switched between writable and read-only by updating the `user_managed` property in the registry configuration. Complete the following steps.

1. Determine the name or ID of the LDAP user registry that you want to update, by running the following command (or you can use the summary from the registry creation):

```
apic user-registries:list --server mgmt_endpoint_url --org organization_name
```

The command returns a list of all the user registries for that organization, shown by name followed by their registry URL. The registry ID is located at the end of the URL, for example `https://company.com/api/user-registries/x-x-x-x-x/registry_id`.

2. Enter the following command (the terminating hyphen character means that the command takes input from the command line):

```
apic user-registries:update --server mgmt_endpoint_url --org organization_name registry_name_or_id -
```

where `registry_name_or_id` is the name or ID of the LDAP user registry that you want to update (as determined in the previous step). The command returns:

```
Reading USER_REGISTRY_FILE arg from stdin
```

3. Enter the following data, followed by a new line:

```
user_managed: true_or_false
```

where `true` makes the registry writable, and `false` makes the registry read-only.

4. Press **CTRL D** to terminate the input.

Note that if you are changing your registry from read-only to writable, you must also set the `attribute_mapping` configuration, as described in the previous registry property tables.

## Using an LDAP user registry to secure APIs

If you want to use the LDAP user registry to secure APIs, see the following information:

- To use for basic authentication in the security definition for an API, see [Creating a basic authentication security definition](#).
- To use for authentication in the User Security configuration for a native OAuth provider, see [Configuring user security for a native OAuth provider](#).

For details of all the `apic user-registries` and `apic configured-catalog-user-registries` commands, see [apic user-registries](#) and [apic configured-catalog-user-registries](#).

## Example

The following example shows a configuration file that uses the Search DN authentication method for setting up writable LDAP:

```
name: sdn-ldap
title: "SDN LDAP User Registry"
integration_url: https://mycompany.com/api/cloud/integrations/user-registry/xxx-xxx-xxx
user_managed: true
user_registry_managed: false
case_sensitive: false
identity_providers:
- name: ldap
  title: "SDN LDAP Identity Provider"
endpoint:
  endpoint: "ldap://mycompany.com:389"
configuration:
  authentication_method: search_dn
  authenticated_bind: "true"
  admin_dn: "cn=admin,dc=company,dc=com"
  admin_password: xxxx
  search_dn_base: "dc=company,dc=com"
  search_dn_scope: sub
  search_dn_filter_prefix: (uid=
  search_dn_filter_suffix: )
  attribute_mapping:
    dn: "uid=[username],ou=users,dc=company,dc=com"
    cn: "[first_name] [last_name]"
    sn: "[last_name]"
    mail: "[email]"
    userPassword: "[password]"
```

# Creating an Authentication URL user registry

An Authentication URL user registry provides a simple mechanism for authenticating users by referencing a custom identity provider.

## About this task

This topic describes how to create a new Authentication URL user registry as a Resource in your organization. After the user registry is created, the user registry must be added to the Sandbox catalog.

One of the following roles is required to configure user registries:

- Administrator
- Organization Owner
- Custom role with the `Settings: Manage permissions`

Note: When a user is presented with the form for completing their API Connect user registration, which fields are pre-populated depends on which fields are returned in the response from the Authentication URL identity provider. If any of the following fields are returned, they will be pre-populated in the registration form:

- `username`
- `email`
- `first_name`
- `last_name`

If the `username` field is not returned, the registration form displays the user name that was provided by the user. The pre-population capability requires that the response from the Authentication URL identity provider satisfies the following conditions:

- The `Content-Type` must be `application/json`.
- The response body format must be JSON.

A sample response is as follows:

```
HTTP/1.1 200 OK
Content-Type: application/json;charset=UTF-8
Cache-Control: no-store
Pragma: no-cache

{
  "username": "myuser",
  "email": "myuser@example.com",
  "first_name": "My",
  "last_name": "User"
}
```

## Procedure

1. In the API Manager, click  Resources.
2. Select User Registries to see the list of current user registries in your organization.
3. Click Create in the User Registries section.
4. Select Authentication URL User Registry and enter the following parameters:

Field	Description
Title (required)	Enter a descriptive name to use on the screen.
Name (required)	The name that is used in CLI commands. The name is auto-generated. For details of the CLI commands for managing user registries, see <a href="#">apic user-registries</a> .
Summary (optional)	Enter a brief description.
Display Name (required)	The name that is displayed for selection by the user when logging in to a user interface, or activating their API Manager account. For details of user interface log in, and account activation, see <a href="#">Accessing the Cloud Manager user interface</a> , <a href="#">Accessing the API Manager user interface</a> , and <a href="#">Activating your API Manager user account</a> . Note: The Developer Portal uses the <b>Title</b> of the User Registries when rendering them at the login page, rather than the <b>Display Name</b> .
URL (required)	Enter the URL for the authentication service. When establishing authentication, API Connect makes a GET call to the URL. The call includes the user name and password it has collected from the user in its authorization header. Either 200 OK or 401 Unauthorized will be returned.
TLS Client Profile (optional)	Select a TLS Client Profile to allow secure authentication with a specific web server.
Case sensitive	To ensure proper handling of user name capitalization, you <b>must</b> ensure that your case-sensitivity setting here matches the setting on your backend Authentication URL server: <ul style="list-style-type: none"><li>• <b>Only</b> select Case sensitive if your backend server supports case-sensitivity.</li><li>• Do <b>not</b> select Case sensitive if your backend server does not support case-sensitivity.</li></ul> Note: The Developer Portal does not support case sensitive usernames. Note: After at least one user has been onboarded into the registry, you cannot change this setting.

5. Click Save.
6. Add the user registry to the Sandbox catalog. See [Creating and configuring Catalogs](#).

## Results

The user registry can be used for Basic Authentication in the Security Definition for an API. For more information, see [Creating a basic authentication security definition](#).

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Creating a Local User Registry

A Local User Registry (LUR) can be created to provide user authentication for API Manager.

### About this task

---

Local User Registries (LURs) are the default user registries included in API Connect. LURs are local databases included with API Connect. Two default LURs are installed and configured during installation of API Connect. They cannot be deleted. The default Admin user account is stored in the Provider LUR.

You can use API Manager to create additional Local User Registries for use with your provider organization.

One of the following roles is required to configure user registries:

- Administrator
- Organization Owner
- Custom role with the `Settings: Manage permissions`

### Procedure

---

Follow these steps to configure a new LUR:

1. In the API Manager, click  Resources.
2. Select User Registries to see the list of current user registries in your organization.
3. Click Create in the User Registries section.
4. Select Local User Registry as the type for the user registry and enter the following information:

Field	Description
Title (required)	Enter a descriptive name for use on the screen.
Name (required)	The name that is used in CLI commands. The name is auto-generated. For details of the CLI commands for managing user registries, see <a href="#">apic user-registries</a> .
Display Name (required)	The name that is displayed for selection by the user when logging in to a user interface, or activating their API Manager account. For details of user interface log in, and account activation, see <a href="#">Accessing the Cloud Manager user interface</a> , <a href="#">Accessing the API Manager user interface</a> , and <a href="#">Activating your API Manager user account</a> . Note: The Developer Portal uses the <b>Title</b> of the User Registries when rendering them at the login page, rather than the <b>Display Name</b> .
Summary (optional)	Enter a brief description.
Case sensitive	Select this setting if user names are case-sensitive. Note: The Developer Portal does not support case sensitive usernames. Note: After at least one user has been onboarded into the registry, you cannot change this setting.

5. Click Save.
6. Add the user registry to the Sandbox Catalog. See [Creating and configuring Catalogs](#).

### Results

---

The user registry can be used for Basic Authentication in the Security Definition for an API. For more information, see [Creating a basic authentication security definition](#).

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Creating an OIDC user registry

Create an organization-specific OIDC user registry when multi-factor authentication (MFA) is required.

You can create an OIDC user registry that is specific to a provider organization, or that is shared and available to all the provider organizations in your API Connect environment. An organization-specific OIDC user registry is used for onboarding and authenticating Developer Portal users, while a shared OIDC user registry can be used for onboarding and authenticating Cloud Manager, API Manager, and Developer Portal users.

This topic describes how to create an organization-specific registry. For information on how to create a shared registry, see [Configuring an OIDC user registry](#).

API Connect provides two methods for creating an OIDC user registry in API Manager, as described in the following sections:

- [Using the UI to create an OIDC user registry](#)
- [Using the CLI to create an OIDC user registry](#)

Note: Refresh tokens are not supported for a user in an OIDC user registry when accessing the Cloud Manager or API Manager user interfaces.

## Using the UI to create an OIDC user registry

Use the API Manager user interface to create an organization-specific OIDC user registry when multi-factor authentication (MFA) is required.

1. In the API Manager navigation pane, click  Resources.
2. Click User Registries.
3. Click Create and select OIDC User Registry.
4. On the Create OIDC User Registry page, use the fields in each of the following sections to configure the registry settings, and then click Create. Many of the registry settings are preconfigured to simplify the configuration steps.

### Provider Type

Use the settings in Table 1 to define the provider type.

Table 1. Provider Type settings

Field	Description
Provider Type	OIDC provider. Select one of the following supported OIDC providers: <ul style="list-style-type: none"> <li>• Facebook</li> <li>• GitHub</li> <li>• Google</li> <li>• LinkedIn</li> <li>• Slack</li> <li>• Twitter</li> <li>• Windows Live</li> <li>• Standard OIDC (default value allows you to specify another provider)</li> </ul>
Title	Provide a descriptive name for display purposes.
Name	Automatically generated. This name is used in CLI commands to reference the registry. For details of the CLI commands for managing user registries, see the <a href="#">apic user-registries</a> topic in the Command Line tool reference section of this documentation.
Summary	Provide a brief description of the new registry.

### Provider Endpoint

Automatically generated for most supported providers. In the Authorization Endpoint field, type the URL of the provider's authorization endpoint.

### Token Endpoint

Fill in the settings as described in Table 2.

Table 2. Token Endpoint settings

Field	Description
URL	Preconfigured for most of the supported OIDC providers. Type the URL of the provider's token endpoint.
TLS	Select the TLS Client Profile for the token endpoint (OIDC must be configured to use TLS). Default is Default TLS Client Profile.

### UserInfo Endpoint

Fill in the settings as described in Table 3.

Table 3. UserInfo Endpoint settings

Field	Description
URL	Preconfigured for most of the supported OIDC providers. Type the URL of the provider's userinfo endpoint.
TLS	Select the TLS Client Profile for the userinfo endpoint (OIDC must be configured to use TLS). Default is Default TLS Client Profile.

### JWKS Endpoint

Fill in the settings as described in Table 4.

Table 4. JWKS Endpoint settings

Field	Description
URL	Type the URL of the read-only endpoint that contains the public keys' information in JWKS format.
TLS	Select the TLS Client Profile for the userinfo endpoint (OIDC must be configured to use TLS). Default is Default TLS Client Profile.

### Client Information

Fill in the settings as described in Table 5.

Table 5. Client Information settings

Field	Description
Client ID	Provide the client ID of the application that is registered with the selected OIDC provider.
Client Secret	Provide the client secret of the application that is registered with the selected OIDC provider.
Response Type	Preconfigured for most of the supported OIDC providers. Specify the data type of the response that will be received from the OIDC provider.
Scopes	Preconfigured for most of the supported OIDC providers. Specify the access scope for the OIDC provider.
Client Authentication Method	Preconfigured for most of the supported OIDC providers. Select the authentication method to be used with the OIDC provider. Options are: <ul style="list-style-type: none"> <li>• Http basic authentication schema</li> <li>• Data encoded form body</li> </ul>

### Additional Support

Optional. Select the additional security parameters described in Table 6.

Table 6. Additional security options

Security parameter	Description
NONCE	Enable the NONCE extension to prevent compromised requests from being used again (replayed).
Proof Key for Code Exchange (PKCE)	Enable the PKCE extension to allow public clients to mitigate the threat of having the authorization code intercepted.

### Advanced Features

Optional. Select the advanced features described in Table 7.

Table 7. Advanced features

Feature	Description
---------	-------------

Feature	Description
Auto onboard	Allow users to execute calls to APIs without logging in first, provided they present a valid token issued by the OIDC provider.
Always use the userinfo endpoint	Configures the OIDC user registry to always fetch user data from the userinfo endpoint, if populated.
Return third-party access token	Include the third-party OIDC access token in the response.
Return third-party id_token	Include the third-party OIDC id_token in the response.

#### User Mapping

Fill in the settings as described in Table 8.

Note:

The User Mapping fields are preconfigured for most of the supported OIDC providers to minimize potential errors; use care when changing the settings. For the Standard OIDC option, contact your OIDC provider to obtain the details of the fields.

Table 8. User mapping settings

Field	Description
Username	The name of the field in the response token that contains the user's user name. Note: The username field must be unique for this OIDC registry, because it identifies the user in the system and cannot be changed.
Email	The name of the field in the response token that contains the user's email address.
First name	The name of the field in the response token that contains the user's given name.
Last name	The name of the field in the response token that contains the user's surname.

### Enabling the OIDC user registry

Complete the following steps to enable the new user registry for a specific catalog in the Developer Portal. Repeat this procedure for each catalog that will use the new registry.

1. On the navigation pane, click  Manage.
2. Select the catalog for which you will enable the new OIDC user registry.
3. On the navigation pane, click  Settings.
4. On the Settings page, click Onboarding.
5. On the Onboarding page, click Edit in the Catalog User Registries section.
6. On the Edit User Registry page, select the new OIDC user registry to enable for your catalog.
7. Click Save.

## Using the CLI to create an OIDC user registry

Use the developer toolkit CLI to create an organization-specific OIDC user registry when multi-factor authentication (MFA) is required.

You configure an OIDC user registry by first defining the registry details in a configuration file. You then use a CLI command to create the registry, passing the configuration file as parameter. To make the registry available to the Developer Portal, you must enable the registry in the associated Catalog.

Note:

- An OIDC registry, in common with a Local User Registry, cannot be used to secure APIs on the gateway.
- Because the interaction with the third party OIDC provider is handled by the Management server, the Management server is the application from the point of view of the third party OIDC provider. Your OIDC redirection endpoint, which is used by authorization server to send the token to the Management server, must be accessible to the OIDC provider through your firewall. When you register your application with the third party OIDC provider, you are required to supply the associated OIDC redirect URI, `https://consumer.mycompany.com/consumer-api/oauth2/redirect` for example. However, this information is not available until you have created your OIDC user registry in API Connect. You must therefore first register your application without this information, then update it later, as detailed in the instructions on this page.

### Logging in to the Management server

Before you can create an OIDC user registry, you must log in to your management server from the CLI. Use the following command:

```
apic login --server mgmt_endpoint_url --username user_id --password password --realm provider/identity_provider
```

For full details of the `apic login` command, see [Logging in to a management server](#).

### Defining your OIDC registry configuration

You define the configuration of your OIDC user registry in a YAML file. As a minimum, the YAML file must have the following content:

```
title: registry_title
integration_url: oidc_integration_url
case_sensitive: case_sensitivity_setting
configuration:
  client_id: 'app_client_id'
  client_secret: 'my-client-secret'
  provider_type: oidc_provider_type
```

where:

- `registry_title` is your chosen descriptive title for the user registry.
- `oidc_integration_url` is the OIDC integration URL in your API Connect configuration. You can determine the OIDC integration URL by using the following CLI command:

```
apic integrations:list --server mgmt_endpoint_url --subcollection user-registry
```

- `case_sensitivity_setting` determines whether your user registry is case-sensitive. Valid values are:
  - `true`
  - `false`

To ensure proper handling of user name capitalization, you **must** ensure that your case-sensitivity setting here matches the setting on the backend OIDC provider:

- **Only** set `case_sensitive` to `true` if the backend OIDC provider supports case-sensitivity.
- Set `case_sensitive` to `false` if the backend OIDC provider does not support case-sensitivity.

Note: After at least one user has been onboarded into the registry, you cannot change this setting.

- `app_client_id` is the client ID of the application that is registered with the OIDC server, and must be in string format.
- `my-client-secret` is the client secret of the application that is registered with the OIDC server, and must be in string format.
- `oidc_provider_type` is the type of OIDC provider; specify one of the following values:
  - `facebook`
  - `github`
  - `google`
  - `linkedin`
  - `slack`
  - `twitter`
  - `windows_live`
  - `standard`

Use the `standard` provider type for any OIDC provider that is compliant with the OIDC standard.

Note: If the provider type is `standard`, you must include the following additional properties in the `configuration` section of your YAML file:

```
authorization_endpoint: 'oidc_auth_endpoint'
token_endpoint:
  endpoint: 'oidc_token_endpoint'
```

where:

- `oidc_auth_endpoint` is the authorization endpoint on the OIDC server, and must be in string format.
- `oidc_token_endpoint` is the token endpoint on the OIDC server, and must be in string format.

## Default OIDC configurations

For each OIDC provider type, API Connect assumes a default configuration, but you can override the default configuration properties in your YAML file. The default configurations are as follows:

- Facebook

```
authorization_endpoint: 'https://www.facebook.com/v3.1/dialog/oauth'
token_endpoint:
  endpoint: 'https://graph.facebook.com/v3.1/oauth/access_token'
userinfo_endpoint:
  endpoint: 'https://graph.facebook.com/me'
scope: email public_profile
field_mapping:
  username: email
  email: email
  last_name: last_name
  first_name: first_name
```

- Github

```
authorization_endpoint: 'https://github.com/login/oauth/authorize'
token_endpoint:
  endpoint: 'https://github.com/login/oauth/access_token'
userinfo_endpoint:
  endpoint: 'https://api.github.com/user'
scope: 'read:user user:email'
field_mapping:
  username: login
  email: email
  last_name: name
  first_name: name
```

- Google

```
authorization_endpoint: 'https://accounts.google.com/o/oauth2/v2/auth'
token_endpoint:
  endpoint: 'https://www.googleapis.com/oauth2/v4/token'
scope: openid profile email
field_mapping:
  username: email
  email: email
  last_name: family_name
  first_name: given_name
```

- LinkedIn

```
authorization_endpoint: 'https://www.linkedin.com/oauth/v2/authorization'
token_endpoint:
  endpoint: 'https://www.linkedin.com/oauth/v2/accessToken'
userinfo_endpoint:
  endpoint: 'https://api.linkedin.com/v1/people/~:(id,first-name,last-name,picture-url,public-profile-url,email-address)?
format=json'
scope: r_basicprofile r_emailaddress
field_mapping:
  username: emailAddress
  email: emailAddress
  last_name: lastName
  first_name: firstName
credential_location: form_body
```

- Slack

```
authorization_endpoint: 'https://slack.com/oauth/authorize'
token_endpoint:
```

```

endpoint: 'https://slack.com/api/oauth.access'
userinfo_endpoint:
  endpoint: 'https://slack.com/api/users.identity'
  scope: identity.basic identity.email
field_mapping:
  username: user.email
  email: user.email
  last_name: user.name
  first_name: user.name

```

- Twitter:

```

request_endpoint: https://api.twitter.com/oauth/request_token'
authorization_endpoint: https://api.twitter.com/oauth/authenticate'
token_endpoint:
  endpoint: 'https://api.twitter.com/oauth/access_token'
userinfo_endpoint:
  endpoint: 'https://api.twitter.com/1.1/account/verify_credentials.json'
oauth_signature_method: 'HMAC-SHA1'
field_mapping:
  email: email
  first_name: name
  last_name: name
  username: screen_name

```

- WindowsLive

```

authorization_endpoint: 'https://login.microsoftonline.com/common/oauth2/v2.0/authorize'
token_endpoint:
  endpoint: 'https://login.microsoftonline.com/common/oauth2/v2.0/token'
scope: openid offline_access profile email
field_mapping:
  username: preferred_username
  email: email
  last_name: last_name
  first_name: first_name

```

- Standard

```

response_type: code
scope: openid
field_mapping:
  username: sub
  email: email
  last_name: family_name
  first_name: given_name
credential_location: auth_header

```

Although this is the default configuration for the **standard** provider type, you should contact your OIDC provider to obtain the details of the fields that you need to define.

## Creating your OIDC user registry

To create your OIDC user registry, use the following CLI command:

```
apic user-registries:create --server mgmt_endpoint_url --org organization_name oidc_config_file
```

where:

- *mgmt\_endpoint\_url* is the platform API endpoint URL.
- *organization\_name* is the value of the **name** property of your provider organization.
- *oidc\_config\_file* is the name of the YAML file that defines the configuration of your OIDC user registry.

On completion of the registry creation, the command displays the following summary details:

```
registry_name registry_url
```

By default, the *registry\_name* is derived from the **title** property in the configuration YAML file but you can override this by including a **name** property in the file. The *registry\_url* is an internal URL that API Connect assigns to the registry.

After you have created your OIDC user registry, you must update your application registration with the third party OIDC provider to include the OIDC redirect URI; you can obtain this information by using the following command, which displays the details of the registry in the command window:

```
apic user-registries:get --server mgmt_endpoint_url --org organization_name registry_name --output -
```

The required **oidc\_redirect\_uri** value is in the **consumer:** section; for example:

```

consumer:
  oidc_redirect_uri: https://consumer.mycompany.com/consumer-api/oauth2/redirect

```

## Enabling your OIDC registry in a Catalog

To make your OIDC registry available for onboarding and authenticating Developer Portal users, you must enable it in the Catalog that is associated with that Developer Portal. Complete the following steps:

1. Determine the URL of your OIDC user registry by using the following command:

```
apic user-registries:list --server mgmt_endpoint_url --org organization_name
```

2. Enter the following command (the terminating hyphen character means that the command takes input from the command line):

```
apic configured-catalog-user-registries:create --server mgmt_endpoint_url --org organization_name --catalog catalog_name -
```

where *catalog\_name* is the value of the **name** property of the required Catalog. The command returns

Reading CONFIGURED\_CATALOG\_USER\_REGISTRY\_FILE arg from stdin

3. Enter the following data, followed by a new line:

```
user_registry_url: oidc_registry_url
```

where `oidc_registry_url` is the URL of your OIDC registry, obtained in step 1.

4. Press **CTRL D** to terminate the input.

For details of all the `apic user-registries` and `apic`

`configured-catalog-user-registries` commands, see [apic user-registries](#) and [apic configured-catalog-user-registries](#).

You can also complete the operations described in this topic by using the API Connect REST APIs; see the [API Connect REST API documentation](#).

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Modifying the configuration details for a user registry

You modify the configuration details for a user registry by using the User Registries page in the API Manager user interface of IBM® API Connect.

### About this task

If you want to authenticate an API Connect Catalog with a user registry that is not yet defined in API Connect, you define the registry when you configure the Catalog; for details, see [Working with user registries](#).

Note: User registries shared from the Cloud Manager cannot be edited.

To modify the configuration details for a user registry that is already defined, you use the User Registries page.

### Procedure

To modify the configuration details for a user registry, complete the following steps:

1. In the API Manager, click  Resources, and then select User Registries.
2. On the User Registries page, click the options icon  for the user registry that you want to edit, then click Edit.  
The details of the registry are displayed.
3. Modify the configuration details as required, then click Save to save your changes.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Password lockout criteria

You can be locked out of your account if you attempt to log in and fail consecutively.

Note: Account lock out applies only for local user registries.

The length of time that you are locked out of using the account is based on the number of consecutive attempts that you fail. The length of time increases as the number of consecutive failed attempts increases.

For example, you can be locked out for 15 seconds if you have five consecutive failed attempts, or 32 minutes for 12 consecutive failed attempts.

Note: External user registries, such as LDAP, might enforce their own lockout criteria.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Configuring a native OAuth provider

Native OAuth providers are configured and managed by you within your cloud.

### About this task

A native OAuth provider object provides settings for OAuth processing operations such as generating and validating OAuth tokens. An OAuth provider object is referenced by an OAuth security definition to protect an API. When a native OAuth provider is used, the OAuth operations are performed natively by API Connect.

Every OAuth provider object has a backing API. Your configuration here automatically updates the OpenAPI document of the API. You can edit the OpenAPI document directly by navigating to the  Resources > OAuth Providers page, selecting your OAuth provider, then clicking API Editor.

Note: Take care when modifying the code directly on the Source tab of the API Editor because validation is limited. For example:

- If you change the name of auto generated assembly actions in the source code, the assembly will be prevented from updating dynamically when the OAuth provider settings are modified.
- You must ensure that the OAuth provider name matches the value specified in the `oauth-provider-settings-ref` field in each OAuth assembly action.

When a published API references an OAuth provider object, the backing API is automatically made available in the gateway.

One of the following roles is required to configure a native OAuth provider:

- Organization Administrator
- Owner
- Custom role with the Settings > Manage permissions

Note:

- The OAuth provider logs Analytics data for failure cases, but does not log successful cases. Activity log policies that call for logging of Analytics data upon success do not apply for the OAuth provider.
- You must ensure the OAuth Provider is configured in the Sandbox Catalog before using the OAuth Provider in a non-Sandbox Catalog.

## Procedure

1. In the API Manager, click  Resources.

2. Click OAuth Providers > Add > Native OAuth provider.

a. Complete the following parameters for the first screen, then click Next.

Field	Description
Title	Enter a title for the native OAuth provider.
Name	This field is auto-populated by the system.
Description (optional)	Enter a brief description.
Base path (optional)	The base path is the URL segment of the API that is shared by all operations in the API. It does not include the host name or any additional segments for paths or operations. The base path must be unique for a given catalog. The base path cannot include special characters and must begin with a "/" character even if it is otherwise empty.
Gateway Type	Select the gateway type, either DataPower® Gateway (v5 compatible) or DataPower API Gateway. For information about types of gateways, see <a href="#">API Connect gateway types</a> .  OAuth Providers apply to one gateway type.

b. In the next screen, enter the following additional configuration parameters, then click Next.

Field	Description
Authorize Path	<code>/oauth2/authorize/</code> is the standard OAuth endpoint to login to account
Token Path	<code>/oauth2/token/</code> is the standard OAuth endpoint to exchange code for access token.
Supported grant types	<ul style="list-style-type: none"> <li>• Implicit - An access token is returned immediately without an extra authorization code exchange step.</li> <li>• Application - Application to application. Corresponds to the OAuth grant type "Client Credentials." Does not require User Security.</li> <li>• Access code - An authorization code is extracted from a URL and exchanged for an access code. Corresponds to the OAuth grant type "Authorization Code."</li> <li>• Resource owner - Password - The user's username and password are exchanged directly for an access token, so can only be used by first-party clients.</li> <li>• <span style="border: 1px solid green; padding: 2px;">API Gateway only</span> Resource owner - JWT - A verified signed JSON Web Token is exchanged directly for an access token.</li> </ul>
Supported client types	<ul style="list-style-type: none"> <li>• Confidential - Client can maintain secure credentials on a secure server</li> <li>• Public - Client credentials are not secure. (Public is not available for DataPower API Gateway at this time.)</li> </ul>

c. Enter the scopes in the next screen. A scope becomes an option in the request and response for an access token. Click Add to add additional fields for scopes. Click Next when done.

Field	Description
sample_scope_1	Scope for token
additional scopes	Scope for token

d. Enter the parameters for User Security in the next screen. Define the settings to use to extract the application users' credentials, authenticate their identities, and grant authorization. User Security is not required for the Application grant type. Click Next when done.

Field	Description
Identity Extraction	<p>Determines how the user credential is extracted:</p> <ul style="list-style-type: none"> <li>• Basic Authentication - HTTP basic authentication (requires no additional configuration)</li> <li>• Default HTML Form - Use default login form for user name and password</li> <li>• <span style="border: 1px solid green; padding: 2px;">API Gateway only</span> Context variable - Specify which variable contains the user name and password. API Connect OAuth context variables as listed here <a href="#">API Connect context variables</a> Note: DataPower API Gateway only. Not available for DataPower Gateway (v5 compatible).</li> <li>• Custom HTML Form - Enter the endpoint and select an optional TLS profile for a custom HTML form. For instructions on creating a custom form, see <a href="#">Creating a custom HTML login form for user security</a>.</li> <li>• Redirect - Enter an endpoint to redirect to a third-party identity provider. For more information, see <a href="#">Authenticating and authorizing through a redirect URL</a>.</li> <li>• <span style="border: 1px solid green; padding: 2px;">API Gateway only</span> Disabled - do not collect the user credential</li> </ul> <p>Note: If you use either the Default HTML Form or Redirect identity extraction methods, the response from the redirect endpoint <b>must</b> maintain the order of the query parameters before the <code>state_nonce</code> query parameter, otherwise the authorization fails.</p>

Field	Description
Authentication	Authenticate application users with a user registry. Select an LDAP or Authentication URL user registry or create the SampleAuthURL User Registry. For a DataPower API Gateway, you have the option to disable authentication with a user registry.
Authorization	The following methods for extracting the user credential are available: <ul style="list-style-type: none"> <li>Authenticated - Authorize authenticated users automatically.</li> <li>Default HTML Form - Use default HTML form to authorize.</li> <li>Custom HTML Form - Enter the endpoint and select an optional TLS profile for a custom HTML form. For instructions on creating a custom form, see <a href="#">Creating a custom HTML authorization form for user security</a>.</li> <li><span style="border: 1px solid green; padding: 2px;">API Gateway only</span> Disabled - Disable authorization.</li> </ul>

- Review the Summary for the native OAuth provider configuration.
- Click Back to make changes.
- Click Finish to save the basic configurations and to proceed to the Advanced Parameters for a native OAuth Provider.

## Results

You can use the OAuth Provider to secure the APIs in catalog.

- [Configuring basic settings for a native OAuth provider](#)  
You can update the identification details and basic configuration settings for a native OAuth provider.
- [Configuring scopes for a native OAuth provider](#)  
Access tokens contain authorization for specific scopes.
- [Configuring user security for a native OAuth provider](#)  
Define the settings to use to extract the application users' credentials, authenticate their identities, and grant authorization.
- [Configuring tokens for a native OAuth provider](#)  
Set time to live for access tokens and refresh tokens, and a time period for maximum consent for all tokens.
- [Configuring token management and revocation for a native OAuth provider](#)  
Select whether to use a native gateway (DataPower) or third party endpoint for token revocation.
- [Configuring introspection for a native OAuth provider](#)  
Define an introspection path to allow the metadata for an access token to be examined.
- [Configuring metadata for a native OAuth provider](#)  
Use Authentication URL or External URL parameters to request user-defined content from a remote server and include it in the access token or in the response payload that contains the access token.
- [Configuring the OIDC parameters for a native OAuth provider](#)  
Open ID Connect (OIDC) provides an additional authentication protocol based on OAuth 2.0. OIDC provides user information encoded in a JSON Web Token, or JWT.
- [Editing a native OAuth provider by using the API Editor](#)  
You can edit the source and assembly policies for the Native OAuth Provider using the API editor.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Configuring basic settings for a native OAuth provider

You can update the identification details and basic configuration settings for a native OAuth provider.

### About this task

One of the following roles is required to configure the basic settings for a native OAuth Provider:

- Organization Administrator
- Owner
- Custom role with the Settings\_>Manage permissions

You can select the basis settings pages for a native OAuth provider immediately on completion of the creation operation detailed in [Configuring a native OAuth provider](#), or you can update the basic settings for an existing native OAuth provider. If you want to update the basic settings for an existing native OAuth provider, complete the following steps before following the procedure described in this topic:

- Click  Resources > OAuth Providers.
- Select the required native OAuth provider.

### Procedure

- To modify the identification details, click Info in the sidebar menu, then update the following fields as required:

Field	Description
Title	Enter a title for the native OAuth provider.
Name	This field is auto-populated by the system.
Description (optional)	Enter a brief description.
Base path (optional)	The base path is the URL segment of the API that is shared by all operations in the API. It does not include the host name or any additional segments for paths or operations. The base path must be unique for a given catalog. The base path cannot include special characters and must begin with a "/" character even if it is otherwise empty.

2. To modify the basic configuration settings, click Configuration in the sidebar menu, then update the following fields as required:

Field	Description
Authorize Path	/oauth2/authorize/ is the standard OAuth endpoint to login to account
Token Path	/oauth2/token/ is the standard OAuth endpoint to exchange code for access token.
Supported grant types	<ul style="list-style-type: none"> <li>• Implicit - An access token is returned immediately without an extra authorization code exchange step.</li> <li>• Application - Application to application. Corresponds to the OAuth grant type "Client Credentials." Does not require User Security.</li> <li>• Access code - An authorization code is extracted from a URL and exchanged for an access code. Corresponds to the OAuth grant type "Authorization Code."</li> <li>• Resource owner - Password - The user's username and password are exchanged directly for an access token, so can only be used by first-party clients.</li> <li>• <span style="border: 1px solid green; padding: 2px;">API Gateway only</span> Resource owner - JWT - A verified signed JSON Web Token is exchanged directly for an access token.</li> </ul> <p>Note: If you plan to configure OpenID Connect (OIDC) for a native OAuth provider, you must include at least one of the following grant types: Implicit, Access code.</p>
Supported client types	<ul style="list-style-type: none"> <li>• Confidential - Client can maintain secure credentials on a secure server</li> <li>• Public - Client credentials are not secure. (Public is not available for DataPower® API Gateway at this time.)</li> </ul>

DataPower Gateway (v5 compatible) only Note: If the gateway type is DataPower Gateway (v5 compatible) and, when the native OAuth provider was created, only the Application grant type was selected, you cannot add further grant types until you configure the user security settings. In particular, you must specify the user registry for authenticating application users. To configure the user security settings, complete the following steps:

- a. Click User Security in the sidebar menu, then click Edit.
- b. Update the user security settings as required; for more details, see [Configuring user security for a native OAuth provider](#).
- c. Click Save when done.

3. Click Save when done.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details. For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Configuring scopes for a native OAuth provider

Access tokens contain authorization for specific scopes.

### About this task

The client applications can request only the scopes or a subset of the scopes that you define here. The scopes are included in the access tokens that are generated from the provider. When an OAuth protected API is invoked, the gateway checks the scopes carried in the access tokens against the list of allowed scopes in the security definition for the API to determine whether to grant access.

In addition, you can enforce advanced scope checks. The advanced scope check URLs are invoked after application authentication or after user authentication based on which URLs are configured. The final scope permission that is granted by the access token is the result of all scope checks.

Per IETF RFC 6749, the value of the scope parameter is a list of space-delimited, case-sensitive strings. For more information, see [The OAuth 2.0 Authorization Framework](#).

One of the following roles is required to configure scopes for a native OAuth Provider:

- Organization Administrator
- Owner
- Custom role with the Settings\_>Manage permissions

You can select the scope settings page for a native OAuth provider immediately on completion of the creation operation detailed in [Configuring a native OAuth provider](#), or you can update the scope settings for an existing native OAuth provider. If you want to update the scope settings for an existing native OAuth provider, complete the following steps before following the procedure described in this topic:

1. Click  Resources > OAuth Providers.
2. Select the required native OAuth provider.

### Procedure

1. Click Scopes in the sidebar menu. The currently configured scopes are listed. Review and update the scopes as required.

Field	Description
sample_scope_1	Scope for token
additional scopes	Scope for token

In the Default scopes section, select the default scopes to be used if the API request doesn't contain any scopes.

If the user authorization method is set to Default HTML Form in the User Security settings, all scopes specified here are added automatically to the authorization consent form.

2. Advanced scope check before token generation. This setting specifies the scope check endpoint where additional scope verification is performed in addition to the basic scopes. The advanced scope check URLs are invoked after application authentication or after owner authentication based on which URLs are configured. The scopes are included in the token and will overwrite any previous scopes.

Field	Description
Application scope check	Allow extra verification by running a scope check from an endpoint. Enter the endpoint and an optional TLS Profile to use for an application scope check.

Field	Description
Owner scope check	Further refine the scope with an additional check. Enter the endpoint and an optional TLS Profile to use for an owner scope check.

For more information about scope, see [Scope](#)

- Advanced scope check after token generation. This setting specifies an additional scope check at the API consumer level to verify compliance with the scope requirements of the API.

Field	Description
Enabled	Select the check box to enable the advanced scope check after token validation. Enter an optional default validator endpoint.
Use endpoint from API	Select the check box to use the endpoint from the API, or clear the check box to override the endpoint from the API.

For more information about scope, see [Scope](#)

- Click Save when done.

## Results

You can use the OAuth Provider with these scopes to secure the APIs in catalog.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Configuring user security for a native OAuth provider

Define the settings to use to extract the application users' credentials, authenticate their identities, and grant authorization.

### About this task

User security authenticates the user. It is required for the Implicit and Access Code (Authorization code) grant types.

One of the following roles is required to configure user security for a native OAuth Provider:

- Organization Administrator
- Owner
- Custom role with the Settings, Manage permissions

You can select the user security settings page for a native OAuth provider immediately on completion of the creation operation detailed in [Configuring a native OAuth provider](#), or you can update the user security settings for an existing native OAuth provider. If you want to update the user security settings for an existing native OAuth provider, complete the following steps before following the procedure described in this topic:

- Click  Resources, OAuth Providers.
- Select the required native OAuth provider.

### Procedure

- Click User Security in the sidebar menu.
- Specify the following parameters for User Security. Define the settings to use to extract the application users' credentials, authenticate their identities, and grant authorization. User Security is not required for the Client Credentials (Application) grant type. Click Next when done.

Field	Description
Identity Extraction	<p>Determines how the user credential is extracted:</p> <ul style="list-style-type: none"> <li>Basic Authentication - HTTP basic authentication (requires no additional configuration)</li> <li>Default HTML Form - Use default login form for user name and password</li> <li> Context variable - Specify which variable contains the user name and password. API Connect OAuth context variables as listed here <a href="#">API Connect context variables</a></li> <li>Custom HTML Form - Enter the endpoint and select an optional TLS profile for a custom HTML form. For instructions on creating a custom form, see <a href="#">Creating a custom HTML login form for user security</a>.</li> <li>Redirect - Enter an endpoint to redirect to a third-party identity provider. For more information, see <a href="#">Authenticating and authorizing through a redirect URL</a>.</li> <li> Disabled - do not collect the user credential</li> </ul> <p>Note: If you use either the Default HTML Form or Redirect identity extraction methods, the response from the redirect endpoint <b>must</b> maintain the order of the query parameters before the <b>state_nonce</b> query parameter, otherwise the authorization fails.</p>
Authentication	Authenticate application users with a user registry. Select an LDAP or Authentication URL user registry or create the SampleAuthURL User Registry.
Authorization	<p>Various methods may be used to authorize application users. For a DataPower® API Gateway, the following methods for extracting the user credential are available:</p> <ul style="list-style-type: none"> <li>Authenticated - Authorize authenticated users automatically.</li> <li>Default HTML Form - Use default HTML form to authorize. If you select the Default HTML Form method, all scopes that are specified in the Scopes settings are added automatically to the authorization consent form.</li> <li>Custom HTML Form - Enter the endpoint and select an optional TLS profile for a custom HTML form.</li> <li> Disabled - Disable authorization.</li> </ul>

- Click Save when done.

## Results

You can use the OAuth Provider to secure the APIs in catalog.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Configuring tokens for a native OAuth provider

Set time to live for access tokens and refresh tokens, and a time period for maximum consent for all tokens.

### About this task

Access tokens are granted to the client application to allow the application to access resources on behalf of the application user. Refresh tokens are issued to the client to obtain a new access token when the current access token becomes invalid or expires, or to obtain additional access tokens with identical or more narrow scope. You can also specify how long the consent given by the combination of any number of access and refresh token remains valid.

One of the following roles is required to configure tokens for a native OAuth Provider:

- Organization Administrator
- Owner
- Custom role with the Settings > Manage permissions

You can select the token settings page for a native OAuth provider immediately on completion of the creation operation detailed in [Configuring a native OAuth provider](#), or you can update the token settings for an existing native OAuth provider. If you want to update the token settings for an existing native OAuth provider, complete the following steps before following the procedure described in this topic:

1. Click  Resources > OAuth Providers.
2. Select the required native OAuth provider.

### Procedure

1. Click Tokens in the sidebar menu.
2. Define the settings to configure tokens.

Field	Description
Access tokens time to live	Enter the expiration time period in seconds for access tokens.
 One time use access token	Click the check box to enable one time use for the access token. Access tokens are multiple use by default which allows them to be used for multiple requests. When one time use is enabled, the access token will be consumed after one use. The OAuth flow will need to be repeated to obtain another access token. Note: If you select this option, you must also enable token management; see one of the following topics, depending on the user interface you are using: <ul style="list-style-type: none"><li>• <a href="#">Configuring token management and revocation for a native OAuth provider</a> (Cloud Manager)</li><li>• <a href="#">Configuring token management and revocation for a native OAuth provider</a> (API Manager)</li></ul>
Refresh tokens	Click the check box to enable Refresh tokens. Set the Count to limit the number of times a refresh token can be issued. Set the Refresh Token Time to Live value to determine the time to live, or expiration time period, for each refresh token in seconds.
One time use refresh token	Clear the check box to disable one time use for the refresh tokens. Refresh tokens are one time use by default which allows them to be used one time only to generate an access token and a new refresh token. When refresh token one time use is disabled then the refresh token count is limited to one and the refresh token can be used multiple times to generate new access tokens, however, another refresh token will not be generated unless the initial OAuth flow (Authorization Code or Password) is repeated. Note: If you select this option, you must also enable token management; see one of the following topics, depending on the user interface you are using: <ul style="list-style-type: none"><li>• <a href="#">Configuring token management and revocation for a native OAuth provider</a> (Cloud Manager)</li><li>• <a href="#">Configuring token management and revocation for a native OAuth provider</a> (API Manager)</li></ul>
Maximum consent	Click the check box to enable Maximum consent and enter the Maximum Consent Time to Live value in seconds. This is the time to live, or expiration time period, for all tokens, both access and refresh.
 Token secret	Click the check box to select the Shared Secret which was configured for the gateway. If no Shared Secret was entered in the Gateway Configuration, then enter an key name and key value to use as the token secret.
 Proof Key for Code Exchange	Proof Key for Code Exchange (PKCE) is a method to protect OAuth 2.0 public clients from an authorization code interception attack when they use Authorization Code grant requests. You can enable this extension when deploying with the DataPower® API Gateway. For more information, see <a href="#">RFC 7636</a> . Select the options for your OAuth Providers: <ul style="list-style-type: none"><li>• Enable proof key for code exchange If selected, enforces PKCE when submitted in Authorization Code grant requests.</li><li>• Always required If selected, requires PKCE in all Authorization Code grant requests.</li><li>• Allow plain Select this check box to allow the plain challenge method in Authorization Code grant requests.</li></ul>

3. Click Save when done.

## Results

---

You can use the OAuth Provider to secure the APIs in a catalog.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Configuring token management and revocation for a native OAuth provider

Select whether to use a native gateway (DataPower) or third party endpoint for token revocation.

### About this task

---

Token management enables you to prevent replay attacks by configuring token revocation. API Connect supports token revocation using a native gateway (DataPower) or a third party endpoint. For a native gateway, quota enforcement is used to manage tokens. For a third party endpoint, a URL to an external service is used to manage tokens.

For more information, see the IETF RFC 7009 [OAuth 2.0 Token Revocation](#).

One of the following roles is required to configure token management and revocation for a native OAuth Provider:

- Organization Administrator
- Owner
- Custom role with the Settings > Manage permissions

You can select the token management settings page for a native OAuth provider immediately on completion of the creation operation detailed in [Configuring a native OAuth provider](#), or you can update the token management settings for an existing native OAuth provider. If you want to update the token management settings for an existing native OAuth provider, complete the following steps before following the procedure described in this topic:

1. Click  Resources > OAuth Providers.
2. Select the required native OAuth provider.

### Procedure

---

1. Select Token Management in the sidebar menu.
2. Enable Token Management by selecting the check box.
3. From the Type dropdown menu, select either Native or Third party. Native points to DataPower as the token storage location; Third party points to a revocation URL for token storage. For DataPower® API Gateway, only Native is supported.
4. For Native, select one or both of the Resource owner revocation path and Client revocation path.
  - Resource owner revocation path - Uses the standard OAuth revocation path to allow the resource owner (end user) to revoke the application permission.
  - Client revocation path - Uses the standard OAuth revocation path to allow the client (application) to revoke a single token when the application closes.For more information about managing tokens with the Native DataPower Gateway, see [Token management with the native DataPower Gateway](#).
5. For Third party, specify the Endpoint and TLS Client Profile.
  - Endpoint - Enter the URL to an external web server that contains information about access or refresh tokens. API Connect calls the URL to determine if the associated token can be trusted. The token server then checks a token *blacklist* (a data store of inactive tokens) to ensure that the token is still valid. If the token is still valid, API Connect continues the processing. For more information see [Token revocation](#).
  - TLS Client Profile - Select a TLS profile to verify the external endpoint.
6. Click Save when done.

## Results

---

You can use the OAuth Provider to secure the APIs in a catalog.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Configuring introspection for a native OAuth provider

Define an introspection path to allow the metadata for an access token to be examined.

### About this task

---

Token introspection allows an authorized holder of an access token to examine the contents of tokens using an introspection path. The access token to introspect must be obtained through the native OAuth provider. Introspection provides context for the token by allowing an authorized protected resource to query the authorization server to determine the set of metadata for a given token. The metadata includes whether or not the token is currently active, the scopes assigned to the token, and the authorization context in which the token was granted (including who authorized the token and which client it was issued to). API Connect token introspection conforms to IETF RFC 7662. See [OAuth 2.0 Token Introspection](#).

One of the following roles is required to enable introspection for a native OAuth Provider:

- Organization Administrator
- Owner
- Custom role with the Settings > Manage permissions

You can select the introspection settings page for a native OAuth provider immediately on completion of the creation operation detailed in [Configuring a native OAuth provider](#), or you can update the introspection settings for an existing native OAuth provider. If you want to update the introspection settings for an existing native OAuth provider, complete the following steps before following the procedure described in this topic:

1. Click  Resources > OAuth Providers.
2. Select the required native OAuth provider.

## Procedure

1. Click Introspection in the sidebar menu.
2. Select the check box to enable Introspection. The OAuth standard path for introspection, /oauth2/introspect is automatically entered. This path will be used when another entity inspects the token contents.
3. Click Save when done.

## Results

Tokens will be queried using the /oauth2/introspect path. You can use the OAuth Provider to secure the APIs in a catalog.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Configuring metadata for a native OAuth provider

Use Authentication URL or External URL parameters to request user-defined content from a remote server and include it in the access token or in the response payload that contains the access token.

### About this task

Configure an Authentication URL or an External URL from which custom metadata is collected for inclusion in the token. The metadata is either stored inside the access token or it is sent along with the access token to the client application. For more information about how the metadata is collected, see [OAuth external URL and authentication URL](#).

Following are examples of metadata that can be included with the access token:

- Metadata about the authenticated resource owner
- Grant type that was used to obtain the token
- A confirmation code to be provided to the client application

One of the following roles is required to configure metadata collection for a native OAuth Provider:

- Organization Administrator
- Owner
- Custom role with the Settings > Manage permissions

You can select the metadata settings page for a native OAuth provider immediately on completion of the creation operation detailed in [Configuring a native OAuth provider](#), or you can update the metadata settings for an existing native OAuth provider. If you want to update the metadata settings for an existing native OAuth provider, complete the following steps before following the procedure described in this topic:

1. Click  Resources > OAuth Providers.
2. Select the required native OAuth provider.

## Procedure

1. Click Metadata in the sidebar menu.
2. Select Collect metadata to enable metadata collection.
3. The Authentication URL user registry is selected by default and is required. For more information about the Authentication URL, see [Authentication URL user registry](#).
4. Select the External URL to collect metadata from an external URL. Enter the endpoint and an option TLS Client Profile.
5.  If required, override the default Header name token value. The value of this header, if returned in the response from the OAuth endpoint, is placed in the response payload and indicated as **metadata**.
6.  If required, override the default Header name payload value. The value of this header, if returned in the response from the OAuth endpoint, is placed within the access token and indicated as **miscinfo**.
7. Save the OAuth Provider.
8. Click Save when done.

## Results

You can use the OAuth Provider to secure the APIs in a catalog.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Configuring the OIDC parameters for a native OAuth provider

Open ID Connect (OIDC) provides an additional authentication protocol based on OAuth 2.0. OIDC provides user information encoded in a JSON Web Token, or JWT.

### About this task

When you enable OpenID connect, a template is provided for generating ID tokens along with access tokens and the required assembly policies are automatically created. You can customize the policies to suit your needs in the API Editor. The sample key provided is for test purposes only and is used to sign the JWT token.

One of the following roles is required to configure an OIDC template for a native OAuth Provider:

- Organization Administrator
- Owner
- Custom role with the System\_>Manage permissions

Note: You can configure OIDC parameters only if the selected grant types for the native OAuth provider include at least one of the Implicit or Access code grant types; see [Configuring basic settings for a native OAuth provider](#).

You can select the OIDC settings page for a native OAuth provider immediately on completion of the creation operation detailed in [Configuring a native OAuth provider](#), or you can update the OIDC settings for an existing native OAuth provider. If you want to update the OIDC settings for an existing native OAuth provider, complete the following steps before following the procedure described in this topic:

1. Click  Resources > OAuth Providers.
2. Select the required native OAuth provider.

### Procedure

1. Click OpenID Connect in the sidebar menu.
2. Select the initial check box to configure an OIDC Template. Enter the following parameters:

Field	Description
 Support hybrid response types (optional)	Select the response types for the OpenID Connect hybrid flow to be supported by this OAuth provider.
 Auto Generate OIDC API Assembly	Select this option to generate the full OIDC assembly. Leave this option unselected to simply enable OIDC support in the OAuth provider and allow the developer to implement their own assembly.
 ID token issuer	Descriptive text to indicate the source of the key.
 ID token signing key	Specify the JSON Web Key (JWK) to be used to sign the ID token.
 ID token signing algorithm	Select the algorithm used to sign the token.

3. Click Save when done. You can edit the policies by using the API Editor.

### Results

You can use the OAuth Provider to secure the APIs in a catalog.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Editing a native OAuth provider by using the API Editor

You can edit the source and assembly policies for the Native OAuth Provider using the API editor.

### About this task

If you have configured an OIDC template, you can customize it in API Editor. In the API Editor, the Source tab allows you to edit the code for the configuration using a text editor. The API Assemble tab provides a graphical drag-and-drop editor (identical to the one in API Manager) that allows you to add additional elements to the assembly for the OAuth Provider.

Note: Take care when modifying the code directly on the Source tab of the API Editor because validation is limited. For example:

- If you change the name of auto generated assembly actions in the source code, the assembly will be prevented from updating dynamically when the OAuth provider settings are modified.
- You must ensure that the OAuth provider name matches the value specified in the `oauth-provider-settings-ref` field in each OAuth assembly action.

One of the following roles is required to configure tokens for a native OAuth Provider:

- Organization Administrator
- Owner
- Custom role with the Settings, Manage permissions

You can modify the native OAuth provider configuration by selecting the API Editor page immediately on completion of the creation operation detailed in [Configuring a native OAuth provider](#), or you can update the configuration for an existing native OAuth provider. If you want to update the configuration for an existing native OAuth provider, complete the following steps before following the procedure described in this topic:

1. Click  Resources, OAuth Providers.
2. Select the required native OAuth provider.

## Procedure

1. Click API Editor in the sidebar menu.
2. In the Source tab, view and edit the policies to customize the behavior for the OAuth provider.
3. In the API Assemble tab, use the drag and drop editor to add additional policies to the OIDC behavior.
 

Note: If you add a policy that references a TLS profile, an `invoke` policy for example, then when you publish an API that uses this OAuth provider, you must ensure that the TLS profile is enabled for the Catalog to which you publish the API. For details on how to enable a TLS profile in a Catalog, see [Creating and configuring Catalogs](#).
4. Save the edits.
5. Click Save when done.

## Results

You can use the OAuth Provider to secure the APIs in a catalog.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

# Configuring a third-party OAuth provider

Enter the secure endpoints to provide OAuth authentication from a third party.

## About this task

One of the following roles is required to configure OAuth Providers:

- Organization Administrator
- Owner
- Custom role with the Settings, Manage permissions

## Procedure

1. In the API Manager, click  Resources.
2. Select OAuth Providers, Add, Third party OAuth Provider.
  - a. Complete the following parameters for the first screen and click Next.

Field	Description
Title	Enter a descriptive title for the gateway service. This title will be displayed on the screen.
Name	This field is auto-populated by the system and used as the internal field name.
Supported grant types	<ul style="list-style-type: none"> <li>• Implicit - An access token is returned immediately without an extra authorization code exchange step.</li> <li>• Application - Application to application. Corresponds to the OAuth grant type Client Credentials. Does not require User Security.</li> <li>• Access code - An authorization code is extracted from a URL and exchanged for an access code. Corresponds to the OAuth grant type Authorization Code.</li> <li>• Resource owner password - The user's username and password are exchanged directly for an access token, so can only be used by first-party clients.</li> </ul>
Gateway type	Select the gateway type, either DataPower® Gateway (v5 compatible) or DataPower API Gateway. For information about types of gateways, see <a href="#">API Connect gateway types</a> .  OAuth Providers apply to one gateway type.

- b. Specify configuration settings for the endpoints.

Field	Description
Authorization URL	An authorization URL where the resource owner grants authorization to the client application to access a protected resource. Example:  <code>https://example.com/oauth2/authorize</code>

Field	Description
Token URL	A token request URL where the client application exchanges an authorization grant for an access token. Example: <code>https://example.com/oauth2/token</code>
Introspect URL	The introspection URL is where the API gateway validates the access tokens that are issued by the third party provider. Example: <code>https://example.com/oauth2/introspect</code>  For more information on integrating third party OAuth providers for introspection, see <a href="#">OAuth introspection for third-party OAuth providers</a> .
TLS Profile (optional)	Select an optional TLS profile for communicating with the third party provider.
Security	Default is Basic Authentication.
<span style="border: 1px solid green; border-radius: 5px; padding: 2px;">DataPower Gateway (v5 compatible) only</span> Basic authentication request header name	The <code>x-introspect-basic-authorization-header</code> is available to provide a user-configured HTTP Basic authorization header.
<span style="border: 1px solid green; border-radius: 5px; padding: 2px;">API Gateway only</span> Basic authentication request header name (optional)	The name of the header that will provide a user-configured HTTP Basic authorization. The default value is <code>x-introspect-basic-authorization-header</code> .
<span style="border: 1px solid green; border-radius: 5px; padding: 2px;">API Gateway only</span> Basic authentication username (optional)	The default user name for HTTP Basic authentication.
<span style="border: 1px solid green; border-radius: 5px; padding: 2px;">API Gateway only</span> Basic authentication password (optional)	The default password for HTTP Basic authentication.
<span style="border: 1px solid green; border-radius: 5px; padding: 2px;">API Gateway only</span> Custom header pattern (optional)	A regular expression for request headers that are to be passed to the third-party provider; for example, <code>x-Introspect-*</code> .

c. Enter the scopes in the third screen. A scope becomes an option in the request and response for an access token. Click Add to add additional fields for scopes. Click Next when done.

Field	Description
sample_scope_1	Scope for token
sample_scope_2	Scope for token
additional scopes	Scope for token

d. Review the settings on the Summary panel.

3. Click Save and Edit to complete the configuration.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details. For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## OAuth concepts for API Connect

OAuth is a token-based authorization protocol that allows third-party websites or applications to access user data without requiring the user to share personal information.

Note: In a multi-node cluster, OAuth operations will fail if quorum is lost. Quorum requires that the number of active nodes is greater than 50% of the total number of nodes in the cluster.

- [OAuth user scenario](#)  
Potential users of OAuth with IBM® API Connect have a number of methods to secure their API. The following scenario provides an overview of the available options.
- [OAuth introspection for third-party OAuth providers](#)  
OAuth token validation can be offloaded to the third-party Open Authorization (OAuth)/Open ID Connect (OIDC) provider by using the Introspection URL. Clients can use a third-party OAuth or OIDC provider to obtain a token that is protected by IBM API Connect. IBM API Connect can use this feature along with the mentioned provider to protect access to the API.
- [OAuth external URL and authentication URL](#)  
You can use the Authentication URL or External URL parameters to request user-defined content from a remote server and include it in the access token or in the response payload that contains the access token.
- [Scope](#)  
Per IETF RFC 6749, the value of the scope parameter is expressed as a list of space-delimited, case-sensitive strings.
- [Tokens](#)  
Tokens can be managed using refresh tokens and revocation URLs. You can extend the life of tokens using refresh tokens. You can end the life of a token by specifying a revocation URL.
- [Authentication URL user registry](#)  
You can use an Authentication URL user registry to specify a REST authentication service that manages user authentication, and optionally provides additional metadata to be embedded in the token.
- [Custom forms for user security](#)  
You can create custom forms for the authorization and identity extraction phase of OAuth.
- [Securing an API with a JSON Web Token](#)  
There are two methods to secure your API with a JSON Web Token. You can use the `jwt-generate` command, or you can use a token that has been generated external to IBM API Connect.
- [Troubleshooting OAuth](#)  
You can find the answers to some common questions in the Developer Portal, or in support communities and forums in DeveloperWorks, on GitHub, or on Youtube.

---

## OAuth user scenario

Potential users of OAuth with IBM® API Connect have a number of methods to secure their API. The following scenario provides an overview of the available options.

### Scenario overview

---

In this scenario, Alice is a user of an application. Alice can grant permission for an application to access specific information about Alice in a third-party system that is using OAuth. Depending on the type of OAuth that is supported by the target service, Alice does not enter her user name and password into the application. Instead, the application receives an access token that represents her credentials (user name and password). The application can now access the information about Alice in the target system.

For example, Alice maintains a list of books that she reads on a service that is provided by mybooks.com. Following the purchase of a smartphone, Alice installs an application on her new phone to display the book details. The phone application wants to call an API provided by mybooks.com, which can access the information. The mybooks.com API is secured by using the OAuth protocol.

To access the book details, the application must complete a two-step process:

1. The application must first obtain permission from Alice.
2. The application then uses that permission to call the target service and obtain the list of books.

In the first step, the application typically directs Alice to the provider of the target service, mybooks.com. Alice provides her user name and password, and gives permission for the application to access her information. It is important that Alice trusts that she is providing her credentials to the provider of the target service and not to an untrusted proxy application. For example, by checking that the security certificate of the website where Alice enters her credentials matches what Alice expects from the provider of the target service.

The result of this step is the access token that the application can use to call the API. The application then generates the appropriately formatted OAuth request. For example, the Authorization header, or HTTP query parameters, which includes the access token, consumer key, and signature method that are required by OAuth. This OAuth request is used to invoke the API proxy operation.

### Scenario within API Connect

---

No changes to the definition of your API operation are required to support this scenario.

1. Alice grants permission for the application to access her information *before* the invocation of the API.
2. When the application provides the Authorization header, or query parameters, containing the OAuth details about the call to the operation endpoint, the header is automatically passed through to the target service without any additional configuration.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

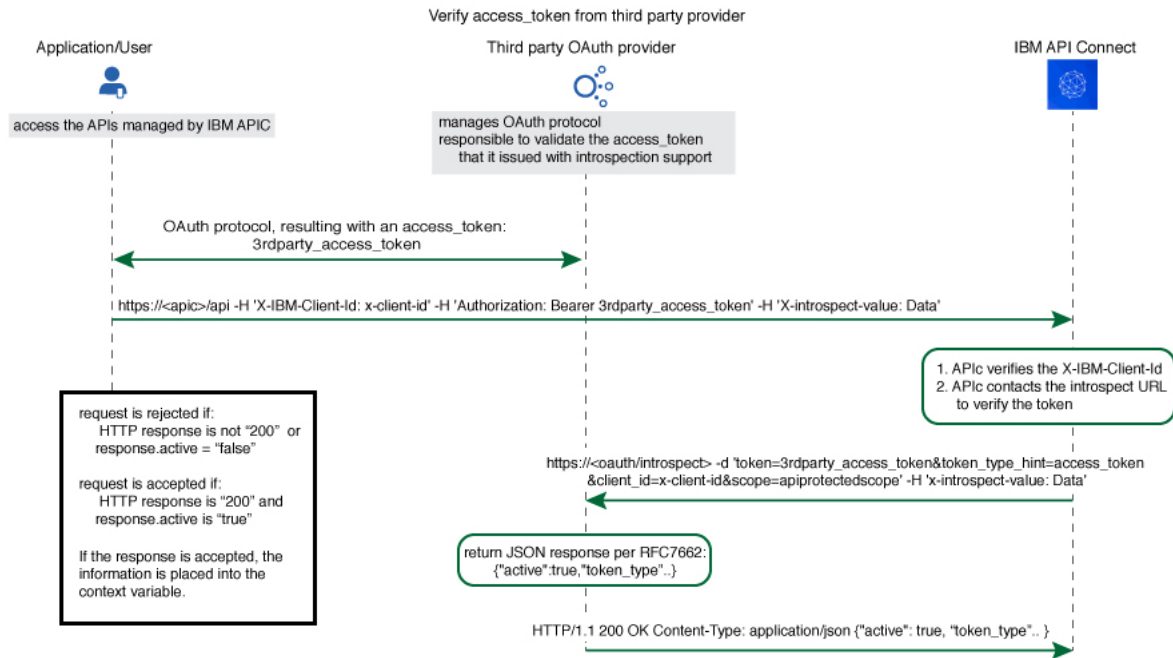

## OAuth introspection for third-party OAuth providers

OAuth token validation can be offloaded to the third-party Open Authorization (OAuth)/Open ID Connect (OIDC) provider by using the Introspection URL. Clients can use a third-party OAuth or OIDC provider to obtain a token that is protected by IBM API Connect. IBM® API Connect can use this feature along with the mentioned provider to protect access to the API.

You can use API Connect to protect an API that is secured by using the third-party OAuth access token in accordance with Introspection specification as defined in [RFC 7662](#). In addition to the specification, the `x-Introspect-` header is provided to pass other content to the third party as you require.

Authentication information can be carried in the request by configuring a basic authentication request header.

The following sequence diagram depicts the overall flow of request and response. The purpose of this diagram is only to provide a general visualization of the nature of the flow; for the precise details, refer to the explanatory information after the diagram.

The Introspect URL is configured in the Third Party OAuth provider configuration. See [Configuring a third-party OAuth provider](#).

When an API is protected by a third-party OAuth provider, API Connect will extract the bearer token and issue an HTTP POST request to the endpoint specified in the Introspect URL field.

The GET request is protected by API Connect with this feature.

You can use a header prefix to pass information to the third-party provider. The header prefix can include a regular expression and specifies the name pattern of the headers to use for sending additional information, such as `x-introspect-*`.

```
GET /petstore/pet/123 HTTP/1.1
Host: apiconnect.com
x-Introspect-type: dog
x-Introspect-name: simon
x-custom-apic: petstore123
Authorization: Bearer tGzv3JOkF0XG5Qx2TlKWIA
x-IBM-Client-Id: xxx-xxx
```

However, if you want to use a different header prefix, specify the required value in the Custom header pattern field in the third party OAuth provider configuration. For third-party OAuth provider configuration details, see [Configuring a third-party OAuth provider](#). The Custom header pattern feature is available only with the DataPower® API Gateway, if you are using the DataPower Gateway (v5 compatible) the header prefix must be `x-Introspect-`.

API Connect will issue this POST request to the introspection endpoint specified in `x-tokenIntrospect`, as illustrated in the code sample:

```
POST /oauth/introspectURL HTTP/1.1
Host: apiconnect.ibm.com
Content-Type: application/x-www-form-urlencoded
x-Introspect-type: dog
x-Introspect-name: simon
x-custom-apic: petstore123

token_type_hint=access_token&token=tGzv3JOkF0XG5Qx2TlKWIA
```

The third party OAuth/OIDC provider will respond with `HTTP 200` indicating the request was successful and that payload contains the token information. API Connect honors the active claim as defined in the RFC specification.

If the value of the active claim is `true`, the token is treated as valid.

```
HTTP/1.1 200 OK
Content-Type: application/json;charset=UTF-8
Cache-Control: no-store
Pragma: no-cache

{
  "active": true,
  "token type": "bearer",
  "client id": "xxx-xxx",
  "username": "John Smith",
  ...
}
```

If the value of the active claim is `false`, the token is treated as invalid.

```
HTTP/1.1 200 OK
Content-Type: application/json;charset=UTF-8
Cache-Control: no-store
Pragma: no-cache

{
```

```
"active":false
}
```

A response code other than **HTTP 200** indicates failure to process the request.

When the OAuth token is valid and active, context variables are populated with information from the introspect JSON response. For more information, see [API Connect context variables](#).

When contacting the introspection endpoint, API Connect uses `client_id/appId` and `client_secret/appSecret` to construct the HTTP Basic authorization header.

By default, if `x-introspect-basic-authorization-header` exists in the request, the value is used for the HTTP Basic authentication header when the introspection endpoint is contacted. API Connect verifies that the HTTP Basic authentication header value is Base64 encoded before it is sent, and encodes it if necessary as shown in the following example. If the header is already encoded, it is sent without modification.

```
GET /petstore/pet/123 HTTP/1.1
Host: apiconnect.com
x-introspect-basic-authorization-header: user:password
```

API Connect issues the following:

```
POST ..
Authorization: Basic M3JkLXBhcncR5LWNsaWVudF9pZDozcmQtcGFydHl1fy2xpZW50X3NlY3JldA==token_type_hint=access_token&token= ..
```

If you are using the DataPower API Gateway, you can specify your own value for the HTTP Basic authentication header by providing the required value in the Basic authentication request header name field in the third party OAuth provider configuration. The following rules determine what authentication data is passed to the introspection endpoint:

- If there is a basic authentication header in the request, the specified credentials are used. The value must be either a string in the format `user:password`, or the Base64 encoded equivalent; API Connect will Base64 encode the value if necessary before sending the request to the introspection endpoint.
- If there is no basic authentication header in the request but there are values specified in the Basic authentication username and Basic authentication password fields in the third party OAuth provider configuration, those values are used.
- If there is no basic authentication header in the request, and user name and password details are not supplied in the third party OAuth provider configuration, but `client_id` and `client_secret` values are supplied in the body of the request, these are used.
- Otherwise, an error is returned.

For third-party OAuth provider configuration details, see [Configuring a third-party OAuth provider](#).

If either, or both, of `scope` and `scope validate url` are configured, and if the response is an active token with a scope claim from the third-party OAuth Provider introspection endpoint, API Connect would further enforce the scope validation in the following order:

1. If `scope` is configured for the OAuth API protection, verify the third-party scope against the scope that is configured.
2. If `scope validation url` is configured, verify the third-party scope against the scope validation url.

For more information, see [Scope](#).

**DataPower Gateway (v5 compatible) only**

By default the API Connect client ID and scope are sent to the third party OAuth provider. You can suppress this behavior in either of the following ways:

- Supply a `suppress-parameters` header as follows:

```
suppress-parameters: client_id
```

```
suppress-parameters: scope
```

or

```
suppress-parameters: client_id scope
```

depending on which parameters you want to suppress.

- Define an API property called `suppress-parameters` in the API definition itself, with one of the following string values:

```
client_id
```

```
scope
```

or

```
client_id scope
```

depending on which parameters you want to suppress. For information on how to define API properties, see [Setting API properties](#).

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## OAuth external URL and authentication URL

You can use the Authentication URL or External URL parameters to request user-defined content from a remote server and include it in the access token or in the response payload that contains the access token.

### Including custom metadata in a token

In many scenarios, custom metadata needs to be included during the access token generation process. The metadata is either stored inside the access token or it is sent along with the access token to the client application. The client application can then send that access token, or the metadata in the payload, in a subsequent request to

IBM® API Connect where the metadata is retrieved, validated, or sent to the downstream systems as required.

Examples include, but are not limited to:

- When resource owners are authenticated, metadata about the authenticated resource owner needs to be stored within the access token.
- The grant type that was used to obtain the token is another example of metadata stored within the access token.
- A confirmation code that needs to be sent to the client application along with access token is stored as metadata within the access token.

## Configuring External URL or Authentication URL in API Connect to obtain metadata

Metadata can be set by using either or both of the following URLs:

- External URL - When you call the External URL, an HTTP GET request is sent and API Connect expects an HTTP 200 OK along with an optional set of the specified response headers.
- Authentication URL - When you call the Authentication URL, the API Connect gateway sends a GET request with HTTP headers and then processes any HTTP response from the URL. For authentication, a REST authentication service is expected at the Authentication URL.  
See: [Authentication URL](#).

The External URL endpoint is entered in the Metadata section when you configure an OAuth Provider in the Cloud Manager or API Manager UI.

Use the following HTTP headers in the response, depending on the type of gateway you are using:

- DataPower® API Gateway:

**X-API-OAUTH-METADATA-FOR-PAYLOAD**

**X-API-OAUTH-METADATA-FOR-ACCESSTOKEN**

Note: These are the default header names for the DataPower API Gateway but you can override them; see [Configuring metadata for a native OAuth provider](#).

- DataPower Gateway (v5 compatible):

**API-OAUTH-METADATA-FOR-PAYLOAD**

**API-OAUTH-METADATA-FOR-ACCESSTOKEN**

The response header value from **X-API-OAUTH-METADATA-FOR-PAYLOAD** or **API-OAUTH-METADATA-FOR-PAYLOAD** is placed in the response payload and indicated as `metadata`.

The response header value from **X-API-OAUTH-METADATA-FOR-ACCESSTOKEN** or **API-OAUTH-METADATA-FOR-ACCESSTOKEN** is placed within the access token and indicated as `miscinfo`.

The two metadata response headers are case insensitive and you must escape any special characters in the string value content.

An example response payload that contains metadata along with the access token:

```
{
  "token_type": "bearer",
  "access_token": "AAEkNzhjDHYyyYy...cL0Mv6ct137w7ZU",
  "metadata": "m:metadata-for-payload_content",
  "expires_in": 3600,
  "scope": "read",
  "refresh_token": "AAEnj5SynCMYbF...oEZ6JjxYax_HdNg",
}
```

This example output from the token introspection endpoint shows the contents of the access token with `miscinfo` containing the metadata information.

```
{
  "active": true,
  "token_type": "bearer",
  "client_id": "78c2f10f-799a-4e1f-8e0a-098634997a35",
  "username": "Fred Smith",
  "sub": "fred",
  "exp": 1479850049,
  "expstr": "2016-11-22T21:27:29Z",
  "iat": 1479846449,
  "nbf": 1479846449,
  "nbfstr": "2016-11-22T20:27:29Z",
  "scope": "read",
  "miscinfo": "m:metadata-for-accesstoken_content",
  "client_name": "MobileApp"
}
```

## Input to the External URL

The following request headers are sent to the External URL.

Note: Any existing metadata values that were previously sent from the Authentication URL are also sent in the two request headers **x-existing-metadata-for-payload** and **x-existing-metadata-for-access-token**. The Metadata URL can make use of this information to create a new set of metadata values. The two request headers that are sent to the Metadata URL are displayed in bold text.

```
X-existing-metadata-for-payload    payload-from-auth-url
X-existing-metadata-for-access-token    token-from-auth-url
X-URI-in      /org/env/miscinfo/oauth2/token (the URL that was sent to APICoconnect for this particular token request)
X-METHOD-in    POST
X-POST-Body-in  client_id=client_id&grant_type=password&scope=read&username=name&password=password
X-X-Client-IP    IP_address
X-X-Global-Transaction-ID    ID_number
...
```

Note: If you are using the DataPower API Gateway rather than the DataPower Gateway (v5 compatible), the **X-POST-Body-in** header is not supported.

## Retrieving Metadata in API Connect

As described in the previous example scenarios, the metadata can be retrieved from the access token in the Application API and sent to the downstream systems. Retrieval can be done in the API assembly, which is secured to accept tokens in the security definitions.

In the resource API that accepts an access token, the `miscinfo` field can be accessed in the Assembly with the `oauth.miscinfo` context variable, as in the example.

```
apim.setvariable('message.body', apim.getvariable('oauth.miscinfo'));
```

You can also use token introspection to look at the contents of the access token.

## Refresh tokens and metadata

The Authentication URL (if configured for authentication) is invoked first, during authentication of the resource owner. The External URL is invoked as the last step, just before the generation of the access token. The only exception is when access tokens are generated from a refresh token. In cases where refresh tokens are used to generate new access tokens, the External URL is not invoked. The metadata from the refresh token is retained and then copied into the newly generated access token.

## Identifying the source of the metadata

The metadata is prefixed with keywords to indicate whether it originated from the External URL or the Authentication URL.

- Metadata from the External URL is prefixed with `m`:
- Metadata from the Authentication URL is prefixed with `a`:

Note: When revocation is enabled, some internal details are also stored in the `miscinfo` field, in square-brackets within the access token as shown in the following example:

```
"miscinfo": "[tlsprofile@https://api-revoke-url:443/server/revocation-url]m:metadata-for-accesstoken_content"
```

## Maximum size of the metadata

Metadata for the access token cannot exceed 512 bytes.

Metadata for the payload does not have a specific size restriction, except for when you use the Authorization code grant type. These restrictions are described in following sections.

## Characters are not allowed in metadata in certain scenarios

When you use the Authorization code grant type, or when a consent form is used for implicit grant type, there is a temporary state or code where the metadata from the authentication URL is stored. API Connect internally uses two prefixes - `!ma` and `!mp` to differentiate between payload and token metadata received from the Authentication URL and store them internally in the temporary state/code. Hence these specific character sequences - `!ma` and `!mp` should not be used as the metadata itself.

## Grant types and metadata

The OAuth grant types described in the following sections include `authorization code` (`access code`), `implicit`, and `client credentials` (`application`).

Authorization code grant type

- When metadata is included from an Authentication URL for an Authorization code grant type, as it is a three legged flow, both the content and the payload are stored within the `dp-state` and carried on to the authorization code and to the access token. Note that around 10 characters are used internally to differentiate between the metadata for payload and metadata for the access token when stored in the `dp-state`. In addition, if revocation is enabled, that will also be part of the token metadata. Hence the combined size of the token metadata, the payload metadata (including the 10 characters of internal data), and internal revocation details, cannot exceed 512 bytes in total.

If the overall size of the metadata exceeds 512 bytes, then the access token generation succeeds, but the metadata fields contain an error message of "metadata too large" as shown in the example.

```
"metadata": "m:error: metadata too large for AZ code grant type[Authorization Code-metadata-url-payload]"
"miscinfo": "[r:gateway]m:error: metadata too large for AZ code grant type[Authorization Code-metadata-url-token]"
```

This size restriction can be overcome when the metadata is sent from the Metadata URL and not from the Authentication URL, because the metadata is not stored in `dp-state` or in the authorization code.

Example of the `authorization code` (`access code`) grant type:

```
$ curl -k -d
"grant_type=authorization_code&code=$mycode&client_id=$myid&scope=scope_introspect&redirect_uri="
https://9.70.153.90/fei/sb/introspectpl/oauth2/token
{ "token_type": "bearer",
  "access_token": "AAEkOThlZDhhNjYtYTQ1ZS00YTMzLWE0N2QtZmE2OGZkMzQ0NzQ2Z0Zn5Tl_TqYFeIfB7BFf6HFgibEoOjWXXEA84oFsWuE4NY-
RRZVdnGSaXAIYJz7s5vczfk5EV-BIb_6P_1YKm3ahrfrR5kI3sPO0uADEoseIP5-O9anUpEM5yhSayXvZbJ_6VDYz-hyXSJHTNqVj-
PHBialoRkBD5qca6k00fv2M", "metadata": "a:[Authorization Code-Test-auth-url-payload]", "expires_in": 3600,
  "scope": "scope_introspect", "refresh_token": "AAFAG1EVMbwicr_L0fTZ4q6HZ-
RcQygniXFC9zbSKO4wd3hcnlC4RQX21X0fL2c8cnmzCZgws8xxLzNyfjQhUJNG15C1GbTe3dwhXJdiWA0Go-
dduhVtCbG26sJRRXyYrMeRwWnJsy1BETPI8HQEN4a_D7fmxKcTVRZBvq86byg95qe1ZKYERi0Lhxdd_04Nvss" }
```

```
$ curl -k -H "X-IBM-Client-Id: $myid" -H "X-IBM-Client-Secret: $mysecret" -d
"token_type_hint=access_token&token=$mytoken" https://9.70.153.90/fei/sb/introspectp1/oauth2/introspect
{ "active":true, "token_type":"bearer", "client_id":"98ed8a66-a45e-4a33-a47d-fa68fd344746", "username":"anyuser",
"sub":"anyuser", "exp":1484766368, "expstr":"2017-01-18T19:06:08Z", "iat":1484762768, "nbf":1484762768,
"nbfstr":"2017-01-18T18:06:08Z", "scope":"scope_introspect", "miscinfo":{"r:gateway}a:[Authorization Code-Test-auth-
url-token]", "client_name":"oauth_app" }
```

Implicit grant type

- When implicit grant type is used, the access token and the metadata are returned in the `Location` header as a fragment, as you see in the example.

```
< Location:
https://localhost#access_token=AAEkOTh1ZDhhNjYtYTQ1ZS00YTMzLWE0N2QtZmE2OGZkMzQ0NzQ2buS2KfWdq-
nYBJSi4nmPxQBtLael7tKBPRMzwP5BC386nlxpoOTE1G748ZVH6Mq_TJL3GeV3PtXTVIkWOBJi_7t1jiQfnpVfrNkovvZkhUexYmFkcDsmLSdaWxZ6Pe
IMPAC4ojT8qV1sYV-
ChTk36yqOx_NiKimZaDikDk7WTg&expires_in=3600&scope=scope_introspect&token_type=bearer&metadata=a%3A[Implicit-Test-
auth-url-payload]
```

```
$ curl -k -H "X-IBM-Client-Id: $myid" -H "X-IBM-Client-Secret: $mysecret" -d
"token_type_hint=access_token&token=$mytoken" https://9.70.153.90/fei/sb/introspectp1/oauth2/introspect
{ "active":true, "token_type":"bearer", "client_id":"98ed8a66-a45e-4a33-a47d-fa68fd344746",
"username":"anyuser", "sub":"anyuser", "exp":1484768365, "expstr":"2017-01-18T19:39:25Z", "iat":1484764765,
"nbf":1484764765, "nbfstr":"2017-01-18T18:39:25Z", "scope":"scope_introspect", "miscinfo":{"r:gateway}a:[Implicit-
Test-auth-url-token]", "client_name":"oauth_app" }
```

Client credentials grant type

Authentication URL will not be invoked when using client credentials grant type, as there is no resource owner. The metadata from Authentication URL is not available for this grant type. However, content returned from Metadata URL will be included as metadata.

## Behavior when retrieving metadata with both an External URL and an Authentication URL

If an External URL is configured and a connection to the external server is successful, the response headers overwrite any existing metadata obtained from the Authentication URL to become the final value. Therefore, you must carefully examine the incoming request headers and create appropriate response headers from the External URL.

If an External URL is configured, but the connection to the External URL fails, then a failure message of "error on metadata url" is written for metadata in both the payload and the access token.

If an External URL is configured and the connection is successful, but the remote server does not send any of the specified HTTP response headers, a blank value is written for metadata in both the payload and the access token.

Attention: An External URL overwrites existing values from Authentication URL. This includes blank values.

If no External URL is configured, the metadata that is obtained from the Authorization URL is retained as the final value.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Scope

Per IETF RFC 6749, the value of the scope parameter is expressed as a list of space-delimited, case-sensitive strings.

In IBM® API Connect, scopes have no inherent meaning. Instead, scopes are defined in the OAuth Provider so that an application can request an access token that is valid for one or more of the scopes. In the secured API, scopes are listed as requirements for an access token to be considered valid. All scopes that are listed by the security definition for the API must be granted by the access token.

## OAuth provider

To provide more refined support for the OAuth scope handling, API Connect allows the [Authentication URL user registry](#) extension to modify the scope value.

When you define an [OAuth provider](#), the Advanced scope check extensions provide the flexibility to check and override allowed scopes. The optional extensions are Application scope check and Owner scope check.

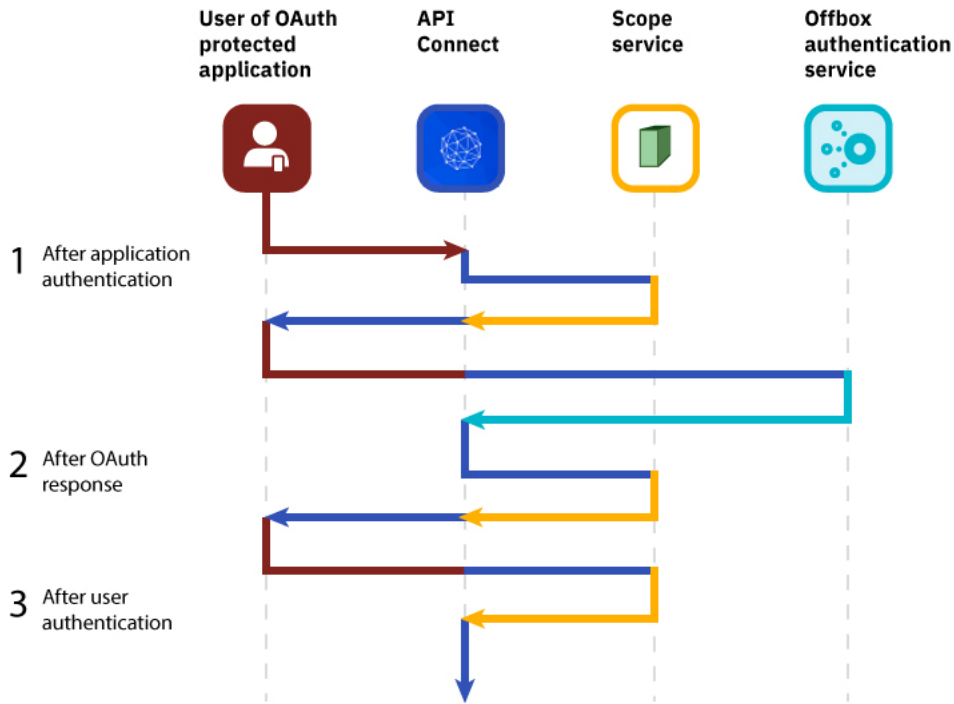

The scope that is eventually received by the application is determined by the interactions that are described in the three following paragraphs. Scope processing follows the sequence of paragraphs 1, 2, and 3 in order, offering three opportunities to override the scope value. Figure 1 provides an overview of the process.

1. After the application successfully authenticates, and if OAuth Native provider `>Advanced scope check>` Application scope check is configured, API Connect makes a call to allow extra verification and uses the contents of `x-selected-scope` to override the scope value that was initially requested by the application. When Application scope check is enabled, the HTTP response header `x-selected-scope` must be present, or the call fails.

2. If OAuth Native provider `>User Security>` Authentication is configured to authenticate application users using an Authentication URL, then API Connect makes a call, as documented in [Authentication URL user registry](#). When the response code is HTTP 200, and the response header `x-selected-scope` is present, the value that is configured in `x-selected-scope` is used as the new scope value, overriding both what the application already requested and what was provided in the Application scope check described in paragraph 1. In the response header, `x-selected-scope` is an optional element.

3. After the user successfully authenticates, and if OAuth Native provider `>Advanced scope check>` Owner scope check is enabled and configured with a valid URL, API Connect makes a call to allow the content of `x-selected-scope` to refine the scope value. When Owner scope check is enabled, the HTTP response header `x-selected-scope` must be present, or the call fails.

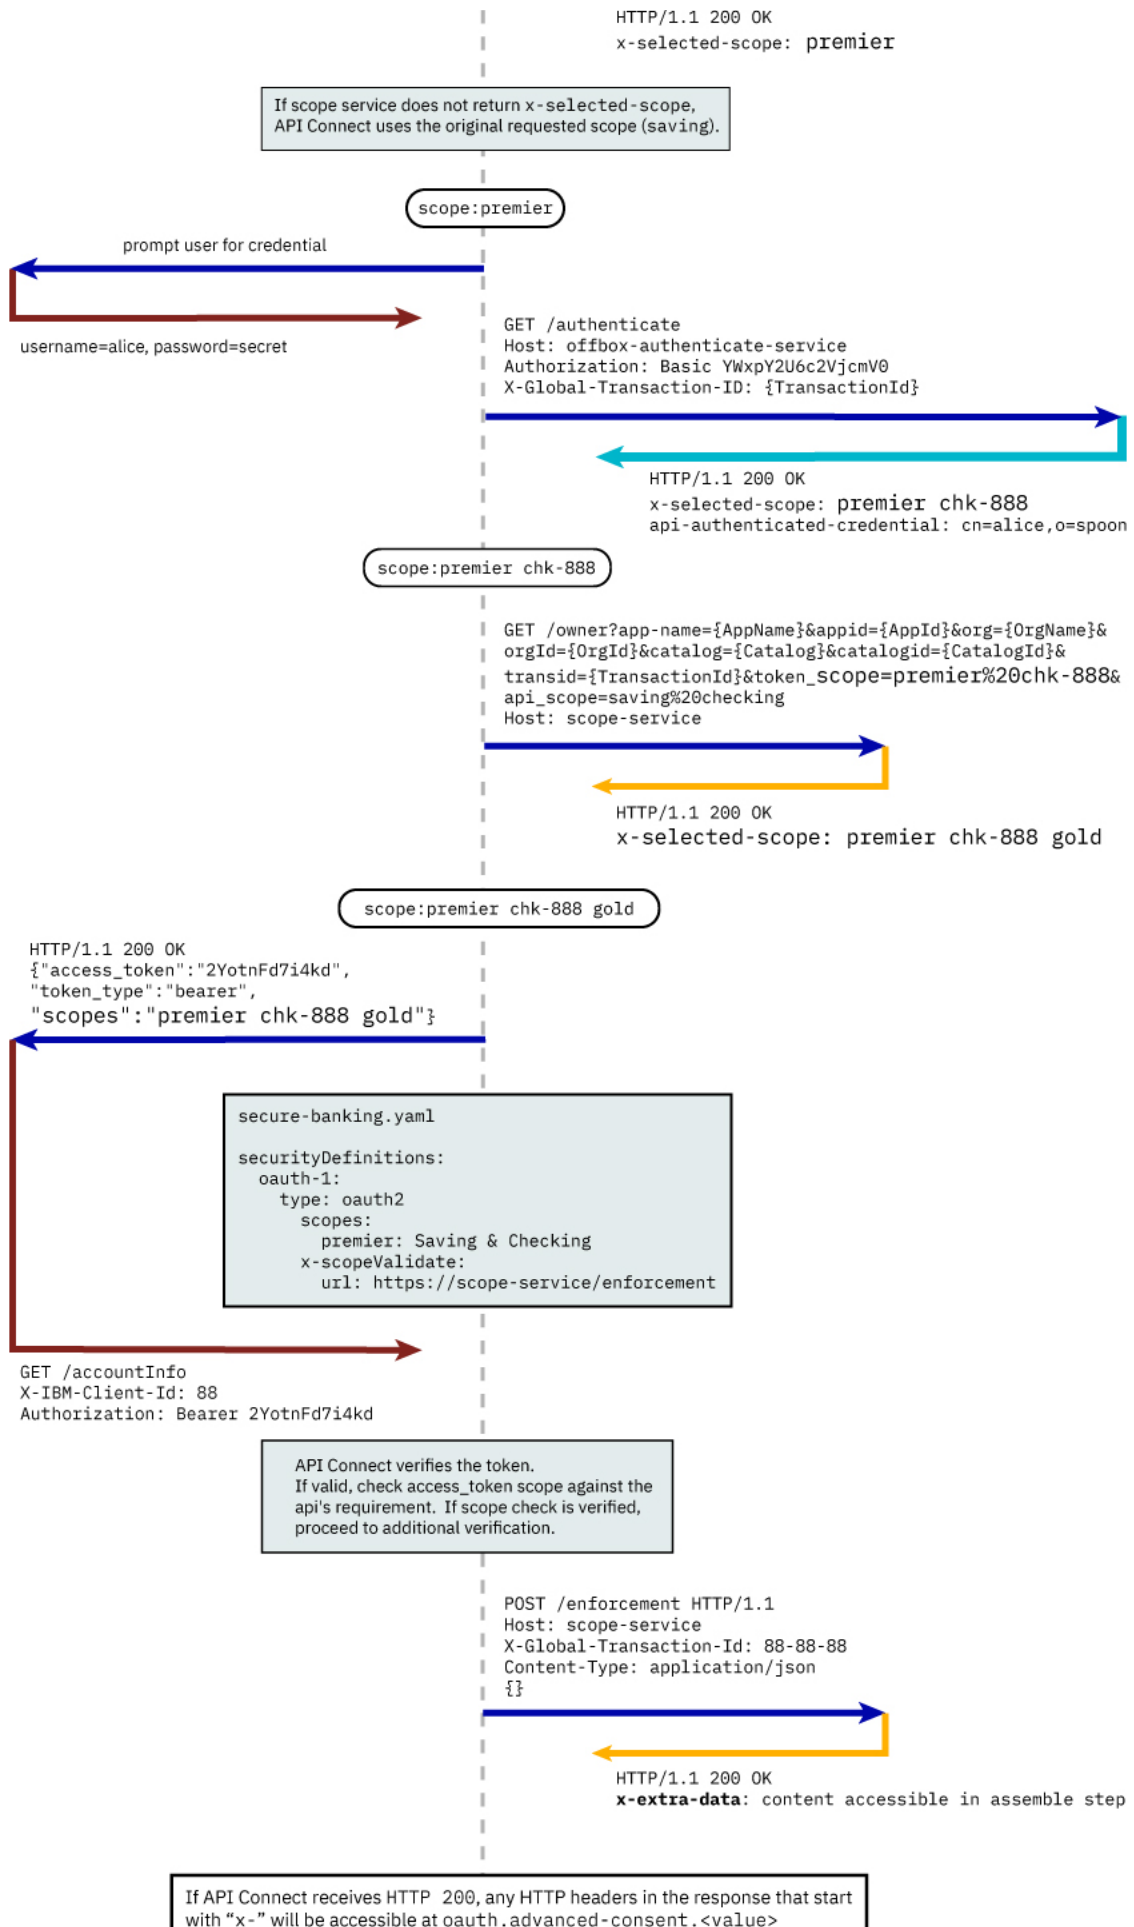

Figure 1. OAuth advanced scope overview

The final scope permission that is granted by the access token is the result of the flow described in paragraphs 1, 2, and 3. [Figure 2](#) shows a more detailed view of the transaction flow with examples that show when `x-selected-scope` provides a new scope value.

Figure 2. OAuth advanced scope detail

For the above example, `x-extra-data` is accessible at `oauth.advanced-consent.x-extra-data`.  
 If other than HTTP 200 is returned, it has the same effect as if the access token does not contain necessary permissions to access the resource.

## Consumer API enforcement

Standard scope validation

To access the API `/getaccount` the application must send a **GET** request with an access token that contains the scope, or scopes, defined in the OAuth provider.

```
GET /getaccount
HTTP/1.1
Host: server.example.com
X-IBM-Client-Id: 8888-8888-8888
Authorization: Bearer AAEkNjVkwOWIyYjgtOWY5ZS00YWQwLWlWYyZktZ
```

The following application OpenAPI file `secure-banking.yaml` defines the scope, or scopes, that must exist in the token to be granted access to the API `/getaccount`.

```
secure-banking.yaml

securityDefinitions:
  scope-only:
    type: oauth2
    description: ''
    flow: implicit
    authorizationUrl: ''
    scopes:
      checking: 'Checking Account'
      saving: 'Saving Account'
      mutual: 'Mutual Fund Account'
  security:
    - scope-only:
      - checking
    - scope-only:
      - saving
      - mutual
```

In the examples, the access token `AAEkNjVkwOWIyYjgtOWY5ZS00YWQwLWlWYyZktZ` is able to access the API because it contains one, or a combination of `scope-only` that is defined in `secure-banking.yaml` such as:

- `checking`
- `saving mutual`
- `checking saving mutual`

Advanced Scope Check

Administrators can enable an additional scope check by configuring the consumer API property Advanced Scope Check URL that becomes `x-scopeValidate` as shown in the following OpenAPI file example.

```
securityDefinitions:
  advanced-scope-only:
    type: oauth2
    description: ''
    flow: implicit
    authorizationUrl: ''
    scopes:
      checking: 'Checking Account'
      saving: 'Saving Account'
      mutual: 'Mutual Fund Account'
  x-scopeValidate:
    url: 'https://advanced-scope-check.bk.com/validate-scope'
    tls-profile: 'ssl-client'
```

After API Connect successfully verifies the access token against any scope requirement, API Connect will make an **HTTP POST** request to the `x-scopeValidate` endpoint similar to the following example. Response code `HTTP 200` from the endpoint indicates a success. Any other response code, or a connection error, is treated as a permission error for the token.

```
POST /validate-scope?app-name=..&appid=..&org=..&orgid=..&catalog=..&catalogid=..&transid=..
HTTP/1.1
Host: advanced-scope-check.bk.com
Content-Type: application/json
```

```
{
  "context-root" : checking,
  "resource" : accountinfo,
  "method" : GET,
  "api-scope-required" : [jointaccount],
  "access_token" : {
    "client_id" : "2cd71759-1003-4a1e-becb-0474d73455f3",
    "not_after" : 174364070,
    "not_after_text" : "2017-07-11T02:27:50Z",
    "not_before" : 174360470,
    "not_before_text" : "2017-07-11T01:27:50Z",
    "grant_type" : "code",
    "consented_on" : 1499736470,
    "consented_on_text" : "2015-07-11T01:27:50Z",
    "resource_owner" : "cn=spoon,email=spoon@poon.com",
    "scope" : "jointaccount mutual",
    "miscinfo" : "[r:gateway]"
  }
}
```

An example of successful response follows.

```
HTTP/1.1 200 OK
Cache-Control: no-store
Pragma: no-cache
X-Custom-For-Assemble-Process: audit
```

Any HTTP response header that begins with "x-" is kept as the context variable `oauth.advanced-consent`. Based on the example successful response, `X-Custom-For-Assemble-Process: audit` becomes `oauth.advanced-consent.x-custom-for-assemble-process`, and can be accessed in the assemble step.

Additional validation options

You can optionally use additional fields for validation:

Request Header

Defines the regular expression to match against **request** headers. Matching headers are included in the request to the advanced scope validation endpoint.

Response Context Variable

Defines the regular expression to match against **response** headers. Matching headers are saved as context variables in the format `oauth.advanced-consent.*`.

---

## Refresh tokens

If you are using OAuth authentication, you can enable refresh tokens. Refresh tokens are issued to the client to obtain a new access token when the current access token becomes invalid or expires, or to obtain additional access tokens with identical or narrower scope.

When you are using OAuth authentication, API requests must include a valid access token, by using the Authorization HTTP header. Access tokens that are issued by the IBM® API Connect Token Endpoint are valid for 3600 seconds (1 hour) by default, as indicated by the `expires_in` property that is returned on the token request. The following code block shows an example API request with an Authorization header:

```
GET /bankingApi/accountSummary?client_id=32427ce5-bb7c-48a7-9de3-4bb629091103
HTTP/1.1
Accept: application/json
Host: api.ibm.com
Authorization: Bearer AAEFYy1hbGx1hdS5nVX4x6iTL2sb3ymBivQb...
```

After an access token expires, if the option is enabled in the OAuth provider configuration Tokens > Refresh tokens screen, the application uses refresh tokens. Each refresh token is valid for approximately 31 days after it is issued (or for the Time to Live time period specified) and can be used only once to request a new access token. Along with the new access token, a new refresh token is also returned. For details on how to enable refresh tokens, see [Configuring a native OAuth provider](#).

If the access token is expired and the application does not have a refresh token, it must restart the OAuth exchange by using the choice of Grant Type(s) allowed by the OAuth provider.

Note: Refresh tokens are not supported for a user in an OIDC user registry when accessing the Cloud Manager or API Manager user interfaces.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Token revocation

In IBM® API Connect, you can revoke or refresh tokens. If necessary, you can also revoke all tokens that are issued to a specific client ID or a resource owner.

---

## Token revocation using an external third party service

This topic describes token revocation using a third party, external service. This option is configured in the Native OAuth provider, using the Token Management, Type = Third party screen. The revocation URL is an endpoint that links to an external service which contains information about access or refresh tokens. API Connect is involved in the initial creation and validation of tokens. When an OAuth revocation URL is present, API Connect calls the URL to determine if the associated token can be trusted. The token server then checks a token *blacklist* (a data store of inactive tokens) to ensure that the token is still valid. If the token is still valid, API Connect continues the processing.

---

## Examples

A number of revocation examples follow. The first shows a sample fetch request and the response from a remote revocation URL.

---

## GET request and response

In this example, an API Gateway server issues a GET request to the Revocation URL and receives a result. It shows that different resource owners (Laura and Emily) can revoke all tokens when using the same application (client ID).

Request:

```
<?xml version="1.0" encoding="UTF-8"?>
GET <revocationURL> HTTP/1.1
User-Agent: IBM-APIManagement/4.0
Accept: application/xml; text/xml
```

Response:

```
<?xml version="1.0" encoding="UTF-8"?>
<oauth-revocation>

<!--
Access Tokens and/or Refresh Tokens that are revoked can be individually listed.
To keep this list small, please only include access tokens and refresh tokens that are valid.
For access tokens, any token older than 20 minutes is no longer valid.
For refresh tokens, any token older than 44700 minutes is no longer valid.
-->

<token type="access">AAETb2F1dGgtcmV2b2t1LWN1c3RvbfZaRlVbnPScl...</token>
<token type="refresh">fZaRlVbnPSclUGTjCRdq4mPbOosD2+aZIKbJ6bTeW...</token>

<!--
If a resource owner has revoked all tokens issued to a given application, please
list them as shown here.
-->

<resource-owner client-id="760d75a2-44b1-4485-8c6f-0d264fcf7398">laura</resource-owner>
<resource-owner client-id="760d75a2-44b1-4485-8c6f-0d264fcf7398">emily</resource-owner>

</oauth-revocation>
```

---

## POST request and response

The next example shows a post request and response.

Request:

```
POST <revocationURL> HTTP/1.1
User-Agent: IBM-APIManagement/4.0
Content-Type: application/xml
```

```
<?xml version="1.0" encoding="UTF-8"?>
<token>
  <token_type>bearer</token_type>
  <access_token>AAENY1hbGwtcmVmcmVzaOfNeQKX8ZeojsBY9v0FI7/OerQvzKHq...</access_token>
  <expires_in>3600</expires_in>
  <scope>3600</scope>
  <resource-owner>alice</resource-owner>
  <client_id>83d9cdcd-ba72-4d00-abae-005da8da5fb1</client_id>
</token>
```

Response:

```
HTTP/1.1 200 OK
```

---

## Provide token information on revocation request

In this example, the application calls an API and passes a bearer token. In response, the Gateway fetches the revocation URL and provides information on the token being verified.

Gateway:

```
GET <revocationURL>HTTP/1.1
access-token: AAETb2F1dGgtcmV2b2t1LWN1c3RvbfZaRlVbnPSc1
client-id: 760d75a2-44b1-4485-8c6f-0d264fcf7398
resource-owner: alice
```

Alternatively, the same process occurs when using a refresh token to issue a new access token. The application sends a refresh request to the token service. The Gateway then fetches the revocation URL, providing information on the refresh token being verified.

Gateway:

```
GET <revocationURL>GET HTTP/1.1
refresh-token: AAETb2F1dGgtcmV2b2t1LWN1c3RvbfZaRlVbnPSc1
client-id: 760d75a2-44b1-4485-8c6f-0d264fcf7398
resource-owner: alice
```

Note: If you are using a third party OAuth provider then, for API Calls with bearer tokens, when Introspect URL is enabled on the API, the revocation URL is not applicable. Instead, the third party endpoint must validate the token and also check for revocation before returning a 200 OK response to the Gateway.

## Revoking tokens issued to Alice up to and including a specific date

On May 1st, Alice loses her phone and needs to reset her password. As a result, the token provider wants to revoke every token issued before Alice lost her phone. In this example, the Gateway sends a GET request to the revocation service. The revocation service replies confirming revocation of the specified tokens.

Gateway:

```
GET <revocationURL>HTTP/1.1
access-token: AAETb2F1dGgtcmV2b2t1LWN1c3RvbfZaRlVbnPSc1
client-id: 760d75a2-44b1-4485-8c6f-0d264fcf7398
resource-owner: alice
```

Revocation Service:

```
<?xml version="1.0" encoding="UTF-8"?>
<oauth-revocation>
  <resource-owner before="2015-05-01T09:30:10Z">alice</resource-owner>
</oauth-revocation>
```

## Revoking all tokens issued up to and including a specific date

Under certain catastrophic conditions, you may need to revoke all tokens issued up to and including a specific date, for example, May 1st. In this example, the Gateway sends a GET request to the revocation service. The revocation service replies confirming revocation of the specified tokens.

Gateway:

```
GET <revocationURL>HTTP/1.1
access-token: AAETb2F1dGgtcmV2b2t1LWN1c3RvbfZaRlVbnPSc1
client-id: 760d75a2-44b1-4485-8c6f-0d264fcf7398
resource-owner: alice
```

Revocation Service:

```
<?xml version="1.0" encoding="UTF-8"?>
<oauth-revocation>
  <everytoken before="2015-05-01T09:30:10Z" />
</oauth-revocation>
```

## Putting it all together

The following shows the examples contained in this topic executed in a single action:

Gateway:

```
GET <revocationURL>HTTP/1.1
access-token: AAETb2F1dGgtcmV2b2t1LWN1c3RvbfZaRlVbnPSc1
client-id: 760d75a2-44b1-4485-8c6f-0d264fcf7398
resource-owner: alice
```

Revocation Service:

```
HTTP/1.1 200 OK
Content-Type: application/xml
Cache-Control: public, max-age=120
Date: Fri, 08 May 2015 21:49:03 GMT
```

```
<?xml version="1.0" encoding="UTF-8"?>
<oauth-revocation>
  <resource-owner before="2015-04-08T09:30:10Z">mary</resource-owner>
  <resource-owner before="2015-04-12T09:30:10Z">john</resource-owner>
  <resource-owner before="2015-04-13T09:30:10Z">kevin</resource-owner>
  <resource-owner before="2015-04-01T09:30:10Z">alice</resource-owner>
</oauth-revocation>
```

Notes:

- In the previous example, there are no entries older than one month in the response (the maximum life of a refresh token).
- Each response is cached for up to two minutes according to response's directive.
- The **before** attribute uses the **xs:dateTime** syntax.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Authenticating and authorizing through a redirect URL

You can use a service that is hosted externally from IBM® API Connect to collect authentication and authorization details from your user when an application requests access on that user's behalf.

### Before you begin

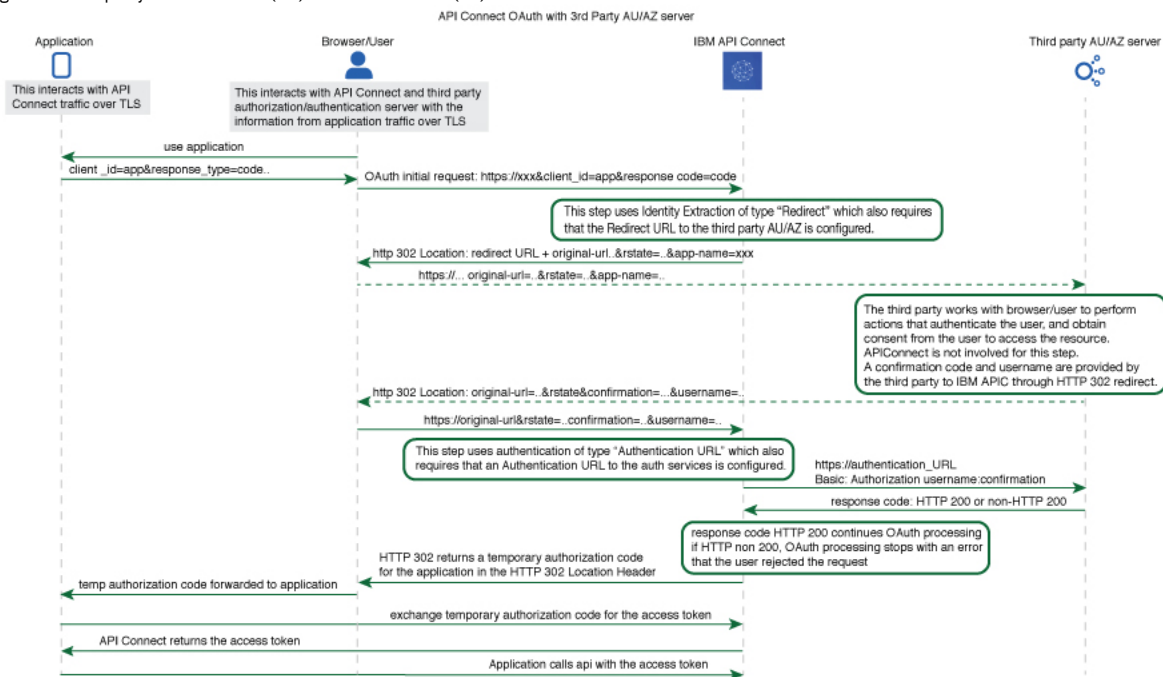

To complete this task, you will need to either create or have created an OAuth security definition that uses Implicit grant type or Access Code (Authorization Code) grant type. For more information, see [Creating an OAuth security definition](#).

### About this task

If you use methods for authentication that are not supported by API Connect, you can redirect users to a suitable URL at which they can authenticate. The user is then returned to the OAuth process after authentication and authorization have been confirmed.

The following illustration indicates the transaction flow for third party authentication.

Figure 1. Third party authentication (AU) and authorization (AZ) transaction flow

1. The application initiates a request to access an API protected with a third-party entity. API Connect redirects the application with an **HTTP 302** redirect based on **identity extraction** -> **redirect** -> **redirect-url**, for user authentication (and optional authorization).
2. The application communicates directly with the third-party entity to gather user identity. API Connect is not involved in this communication. After the third-party entity finishes processing authentication (and optional authorization), it returns an **HTTP 302** redirect that uses the **original-uri** from the request, with the username and confirmation code appended.
3. API Connect receives the request that includes the username and confirmation code, and communicates with the authentication URL, based on **authentication** -> **x-ibm-authentication-url**, to confirm user identity before the request is completed.
4. An **HTTP 200** response from the third-party entity allows API Connect to continue the OAuth 2.0 request process as if the owner is authenticated. The request is then processed according to the **grants** type.
  - - **accessCode** returns a temporary code to the application.
  - - **implicit** returns the access token to the application.

For any response other than HTTP 200, the request fails with a statement added to the error log.

## Procedure

To create an external form, and to indicate the URL to which API Connect will redirect users, complete the following instructions:

1. Create your service for authentication and authorization. You will use the URL of the landing page of this service as your redirect URL.
  - a. To include elements in your form that are provided by API Connect, use the query parameters from the URL that your user is redirected to. When the user is redirected to your page, the URL they are sent to contains the following query parameters:

**app-name**  
The name of the application requesting access, as provided through the Developer Portal.

**appid**  
The id of the application requesting access.

**catalog**  
The name of the catalog where the product is being used by the application.

**catalogid**  
The id of the catalog where the product is being used by the application.

**catalogtitle**  
User-friendly display name for the catalog.

**org**  
The name of the consumer organization that hosts the application.

**orgid**  
The id of the consumer organization that hosts the application.

**orgtitle**  
User-friendly display name for the organization.

**original-url**  
The original URL that the user was directed to by the application, including query parameters from the original URL that are necessary for standard OAuth 2.0 requests. You can include these parameters in your service to provide information to the user. Additionally the `state_nonce` is appended. The `state_nonce` is a hash code generated by API Connect for verification purposes. The URL is URL-encoded and should be decoded before further use, the `state_nonce` should remain unchanged.

**provider**  
The name of the API provider organization.

**providerid**  
The id of the API provider organization.

**providertitle**  
User-friendly display name for the provider organization.

**requested-scope**  
[optional] If [Application Scope check](#) is enabled and replaces the `scope` from the initial application request, this field holds the `scope` value from the initial application request, and the new replacement scope value is put into `original-url`.

**transid**  
transaction id used in the GW for the transaction which trigger this call

The URL to which the user is sent to when they are redirected to your page has the following form:

**`Redirect_URL?original-url=Original_URL&state_nonce=R_State&app-name=Application_Name`**

where all variables are as described previously. The Redirect URL does not have a size limit enforced by API Connect.

- b. Create the stages of authentication, authorization, and any intermediate stages that you require to take place before you allow access to the application. Upon completion of these stages, redirect the user to the `Original_URL` and append a user name, their confirmation code, and the application name to be evaluated for access grant or denial by API Connect. The confirmation code does not have a size limit enforced by API Connect. Original URL requires the following form:

**`Original_URL&username=User_Name&confirmation=Confirmation_Code`**

where all variables are as described previously.

For example:

**`https://your_gateway.com/your_org/your_catalog/your_api/oauth/authorize?response_type=code&redirect_uri=https://example.com/redirect&scope=/your_api&client_id=5af57a4a-6db9-4141-ad08-5709432af66e&state_nonce=HoIbRG+6bZtq1B7LDkq4gj1D3SHKq1CbnYdHs/bMz2Y=&username=spoon&confirmation=12345678`**

- c. To send your own error responses after the authentication and authorization service, redirect the user to the `Original_URL` and append an error code. You can also append a user name. Use the following form:

**`Original_URL&username=User_Name&error=Error_Response`**

where `Error_Response` is the message you wish to send and all other variables are described as previously.

For example:

**`https://your_gateway.com/your_org/your_catalog/your_api/oauth/authorize?response_type=code&redirect_uri=https://example.com/redirect&scope=/your_api&client_id=5af57a4a-6db9-4141-ad08-5709432af66e&state_nonce=HoIbRG+6bZtq1B7LDkq4gj1D3SHKq1CbnYdHs/bMz2Y=&username=User&error=access_denied`**

2. Create a service to validate the confirmation code and user name. API Connect makes a GET call to your authentication URL after the user is redirected back to the authorization URL. When the call is made, it includes in its authorization header the user name and confirmation code you supplied previously. Confirm that these are correct and respond with an HTTP success code such as 200 OK if you want to allow access, or non-200 HTTP response code, such as 401 Unauthorized to deny access.
3. In your OAuth provider configuration, supply the redirect URL that is used in Step 1 and the authentication URL that is used in Step 2. For more information on configuring an OAuth Provider, see [Configuring a native OAuth provider](#) when using API Manager or [Configuring a native OAuth provider](#) when using Cloud Manager.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Token management with the DataPower Gateway (v5 compatible)

API Connect can use the DataPower distributed cache to manage the token lifecycle that includes when to revoke access rights.

In order to manage tokens with the DataPower® Gateway (v5 compatible), you must set the Token Management Type to Native in your Native OAuth provider configuration. See [Configuring token management and revocation for a native OAuth provider](#) when using Cloud Manager or [Configuring token management and revocation for a native OAuth provider](#) when using API Manager.

Also, the DataPower quota enforcement server must be enabled on the DataPower Gateway to use the distributed cache to manage tokens. See [Quota enforcement](#).

When distributed cache support is enabled, replay protection is provided across the gateway cluster through the quota enforcement server. This support ensures that the same token cannot be reused across the members of the quota enforcement peer group.

Important:

If you have a cluster of DataPower Gateway servers, the OAuth data synchronization behavior across the servers depends on whether or not you enable revocation:

- If you enable revocation, API Connect uses the DataPower quota enforcement server, and OAuth data is synchronized across the servers. If an access token is obtained from one server, the OAuth data synchronization ensures that the same authorization code cannot be used to obtain an access code from another server. You must ensure that the DataPower quota enforcement server is configured.
- If you disable revocation, API Connect does **not** use the DataPower quota enforcement server and OAuth data does not synchronize across the cluster of DataPower Gateway servers. Therefore, to prevent the same authorization code being used to obtain an access code from more than one server you must configure DataPower to synchronize OAuth data across the servers, by using the DataPower Gateway console.

To configure DataPower to synchronize OAuth data, ensure that the DataPower quota enforcement server is configured. For more information, see [Configuring the quota enforcement server](#).

## Resource owner revocation

When Resource owner revocation path is selected in the Token Management screen, the configuration inserts two REST API calls to /oauth2/issued.

- An HTTP GET operation that retrieves a list of all granted permissions for a specific user.
- An HTTP DELETE operation that revokes an application for a specific user.

The setting inserts header-based security definitions of client ID and client secret as shown in the **View permissions example**. The API call to revoke a given application for a given user is shown in the **Revoke permissions example**.

View permissions example

To list all the applications granted by user `cn=spoon,o=ibm` with username `spoon` and password `spoon` using a registered administration application of `5287fe53-8747-438a-8262-681ec75b79c5`.

- Request:

```
GET /oauth2/issued
HTTP/1.1
Host: apic.ibm.com
x-ibm-client-id: 5287fe53-8747-438a-8262-681ec75b79c5
x-ibm-client-secret: E2qM6mG2bX2uClxT2iN1uU6bT5cV4dN7nW5kM5uP8vL3uF3cT7
Authorization: Basic c3Bvb246c3Bvb24=
```

- Response:

```
HTTP/1.1 200 OK
Content-Type: application/json;charset=UTF-8
Cache-Control: no-store
Pragma: no-cache
[
  {
    "clientId": "7369ad66-5674-b7d3-4567-de35283421aca",

    "owner": "cn=spoon,o=ibm",
    ...
  }
]
```

Revoke permissions example

To revoke application `a8746323-9825-a842-8736-abd8202356ac8` by owner `cn=spoon,o=ibm`.

- Request

```
DELETE /oauth2/issued?client-id=a8746323-9825-a842-8736-abd8202356ac8
HTTP/1.1
Host: apic.ibm.com
x-ibm-client-id: 5287fe53-8747-438a-8262-681ec75b79c5
x-ibm-client-secret: E2qM6mG2bX2uClxT2iN1uU6bT5cV4dN7nW5kM5uP8vL3uF3cT7
Authorization: Basic c3Bvb246c3Bvb24=
```

- Response

```
HTTP/1.1 200 OK
Content-Type: application/json;charset=UTF-8
Cache-Control: private, no-store, no-cache, must-revalidate
Pragma: no-cache

{ "status": "success" }
```

## Client revocation

---

When Client revocation path is selected in the Token Management screen, the result is the following:

This option inserts one REST API call to /oauth2/revoke, which supports OAuth 2.0 [IETF RFC 7009](#). An HTTP POST operation that an application can send to this API to revoke either an `access_token`, or `refresh_token` with `token_type_hint` as shown in the following examples:

Revoke `access_token`

- Request:

```
POST /oauth2/revoke
HTTP/1.1

Host: apic.ibm.com

x-ibm-client-id: 5287fe53-8747-438a-8262-681ec75b79c5
x-ibm-client-secret: E2qM6mG2bX2uClxT2iN1uU6bT5cV4dN7nW5kM5uP8vL3uF3cT7
Content-Type: application/x-www-form-urlencoded

token_type_hint=access_token&token=AAIHZGVmYXVsdD1-KqwD0Yc3EDn941SWX14xuR....
```

- Response:

```
HTTP/1.1 200 OK
Content-Type: application/json;charset=UTF-8
Cache-Control: private, no-store, no-cache, must-revalidate
Pragma: no-cache

{ "status": "success" }
```

Revoke `refresh_token`

- Request:

```
POST /oauth2/revoke
HTTP/1.1

Host: apic.ibm.com

x-ibm-client-id: 5287fe53-8747-438a-8262-681ec75b79c5
x-ibm-client-secret: E2qM6mG2bX2uClxT2iN1uU6bT5cV4dN7nW5kM5uP8vL3uF3cT7
Content-Type: application/x-www-form-urlencoded

token_type_hint=refresh_token&token=.....
```

- Response:

```
HTTP/1.1 200 OK
Content-Type: application/json;charset=UTF-8
Cache-Control: private, no-store, no-cache, must-revalidate
Pragma: no-cache

{ "status": "success" }
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Token management with the DataPower API Gateway

API Connect can use the DataPower distributed cache to manage the token lifecycle that includes when to revoke access rights.

In order to manage tokens with the DataPower® API Gateway, you must set the Token Management Type to Native in your Native OAuth provider configuration. See [Configuring token management and revocation for a native OAuth provider](#) when using Cloud Manager or [Configuring token management and revocation for a native OAuth provider](#) when using API Manager.

For token management with the DataPower API Gateway, you must configure the API Security Token Manager on the gateway. Complete the following steps:

1. Log in to the DataPower administration console, selecting apiconnect for the domain, and WebGUI for the Graphical Interface.

2. In the search box, enter API Security Token Manager, then click on the API Security Token Manager link that displays in the search results.
3. For the Administrative state, select enabled.
4. Click the + icon alongside the Gateway Peering field to create a new gateway peering object.
5. Provide a Name and a Local address.
6. In the Local port and Monitor port fields, provide values that aren't already in use by services for the Local address.
7. Ensure that Peer group mode is selected.
8. Alongside the Peers field, use the add button and accompanying field to add at least two peers, to ensure that quorum is achieved.
9. If the Enable SSL option is selected, select a value for the Identification credentials.
10. For Persistence location, select a setting other than memory.
11. When done, click Apply.
12. Repeat steps 1 to 11 for each DataPower API Gateway in the peer group.
13. When done, click Apply, then click Save Configuration to save your changes.

For more information, see [Defining the API security token manager](#) and [Creating a gateway peering instance](#).

## Resource owner revocation

When Resource owner revocation path is selected in the Token Management screen, the configuration inserts two REST API calls to /oauth2/issued.

- An HTTP GET operation that retrieves a list of all granted permissions for a specific user.
- An HTTP DELETE operation that revokes an application for a specific user.

The setting inserts header-based security definitions of client ID and client secret as shown in the **View permissions example**. The API call to revoke a given application for a given user is shown in the **Revoke permissions example**.

View permissions example

To list all the applications granted by user `cn=spoon,o=ibm` with username `spoon` and password `spoon` using a registered administration application of `5287fe53-8747-438a-8262-681ec75b79c5`.

- Request:

```
GET /oauth2/issued
HTTP/1.1
Host: apic.ibm.com
x-ibm-client-id: 5287fe53-8747-438a-8262-681ec75b79c5
x-ibm-client-secret: E2qM6mG2bX2uClxT2iNluU6bT5cV4dN7nW5kM5uP8vL3uF3cT7
Authorization: Basic c3Bvb246c3Bvb24=
```

- Response:

```
HTTP/1.1 200 OK
Content-Type: application/json;charset=UTF-8
Cache-Control: no-store
Pragma: no-cache
[
  {
    "clientId": "7369ad66-5674-b7d3-4567-de35283421aca",
    "owner": "cn=spoon,o=ibm",
    "clientName": "PetStore Application",
    "scope": "listpet",
    "issuedAt": 1503327054,
    "consentedOn": 1503327054,
    "expiredAt": 1503330654,
    "refreshTokenIssued": false,
    "appId": "d2031f0f27339315333734ab9",
    "org": "PetStoreOrg",
    "orgTitle": "Katie Pet Grooming Inc",
    "orgId": "5887803de4b06e6998c4b2c7",
    "provider": "SuperStore",
    "providerTitle": "Simon SuperStore",
    "providerId": "5887803de4b06e6998c4b2c7",
    "catalog": "publicapi",
    "catalogTitle": "For public",
    "catalogId": "5887803de4b06e6998c4b2d3"
  },
  {
    "clientId": "a8746323-9825-a842-8736-abd8202356ac8",
    "owner": "cn=spoon,o=ibm",
    ...
  }
]
```

Revoke permissions example

To revoke application `a8746323-9825-a842-8736-abd8202356ac8` by owner `cn=spoon,o=ibm`.

- Request

```
DELETE /oauth2/issued?client-id=a8746323-9825-a842-8736-abd8202356ac8
HTTP/1.1
Host: apic.ibm.com
x-ibm-client-id: 5287fe53-8747-438a-8262-681ec75b79c5
x-ibm-client-secret: E2qM6mG2bX2uClxT2iNluU6bT5cV4dN7nW5kM5uP8vL3uF3cT7
Authorization: Basic c3Bvb246c3Bvb24=
```

- Response

```
HTTP/1.1 200 OK
Content-Type: application/json;charset=UTF-8
Cache-Control: private, no-store, no-cache, must-revalidate
Pragma: no-cache
```

```
{ "status": "success" }
```

## Client revocation

When Client revocation path is selected in the Token Management screen, the result is the following:

This option inserts one REST API call to `/oauth2/revoke`, which supports OAuth 2.0 [IETF RFC 7009](#). An HTTP POST operation that an application can send to this API to revoke either an `access_token`, or `refresh_token` with `token_type_hint` as shown in the following examples:

Revoke `access_token`

- Request:

```
POST /oauth2/revoked
HTTP/1.1
```

```
Host: apic.ibm.com
```

```
x-ibm-client-id: 5287fe53-8747-438a-8262-681ec75b79c5
x-ibm-client-secret: E2qM6mG2bX2uClxT2iN1uU6bt5cV4dN7nW5kM5uP8vL3uF3cT7
Content-Type: application/x-www-form-urlencoded
```

```
token_type_hint=access_token&token=AAIHZGVmYXVsdD1-KqwD0Yc3EDn94lSWX14xuR....
```

- Response:

```
HTTP/1.1 200 OK
Content-Type: application/json;charset=UTF-8
Cache-Control: private, no-store, no-cache, must-revalidate
Pragma: no-cache
```

```
{ "status": "success" }
```

Revoke `refresh_token`

- Request:

```
POST /oauth2/revoked
HTTP/1.1
```

```
Host: apic.ibm.com
```

```
x-ibm-client-id: 5287fe53-8747-438a-8262-681ec75b79c5
x-ibm-client-secret: E2qM6mG2bX2uClxT2iN1uU6bt5cV4dN7nW5kM5uP8vL3uF3cT7
Content-Type: application/x-www-form-urlencoded
```

```
token_type_hint=refresh_token&token=.....
```

- Response:

```
HTTP/1.1 200 OK
Content-Type: application/json;charset=UTF-8
Cache-Control: private, no-store, no-cache, must-revalidate
Pragma: no-cache
```

```
{ "status": "success" }
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Authentication URL user registry

You can use an Authentication URL user registry to specify a REST authentication service that manages user authentication, and optionally provides additional metadata to be embedded in the token.

This support can optionally enable any of the following:

- Providing the authenticated credential to IBM® API Connect. For example, the user logs-in with user name: `spoon`, and password: `fork`. When the user is authenticated, the credential becomes `cn=spoon,o=eatery`. The credential is kept in the OAuth `access_token` to represent the user.
- Providing metadata support. Allow extra metadata to be stored in the `access_token`.
- Overriding the `scope` that the application receives after a successful OAuth protocol processing. By responding with a specific header, the Authentication URL endpoint can replace the `scope` value that the application receives. For example, you can provide a specific resource owner an account number within the `scope` header response for use in future processing steps.

When you call the Authentication URL user registry, the API Connect gateway sends a GET request with HTTP headers and then processes any HTTP response from the URL. For authentication, a REST authentication service is expected at the Authentication URL.

The following response from the REST authentication service indicates that user authentication is successful and that API Connect will use `cn=spoon,o=eatery` as the user identity.

```
HTTP/1.1 200 OK
Server: example.org
X-API-Authenticated-Credential: cn=spoon,o=eatery
```

For information on how to configure a User Security policy in an API assembly for use with an Authentication URL user registry, see [User Security policy](#).

For an example of an OAuth provider configuration that uses an Authentication URL user registry, see [Example - using multiple OAuth policies in an OAuth provider assembly](#).

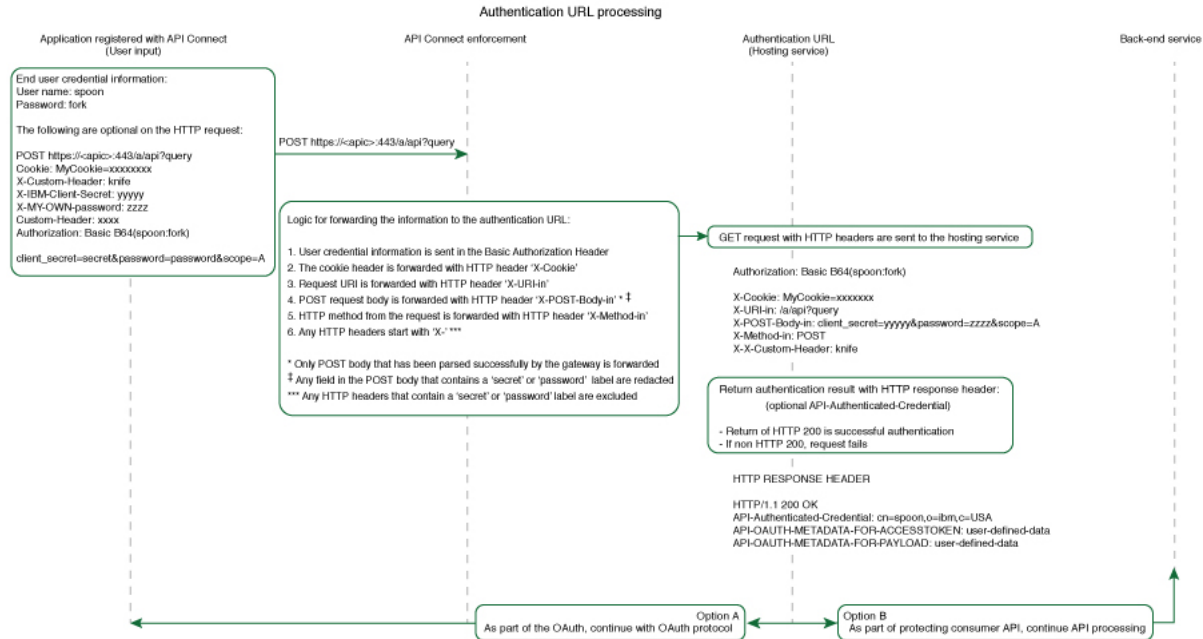

API Connect considers any non-200 HTTP response code a failed user authentication attempt.

When an Authentication URL user registry is invoked, two HTTP response headers are available that include metadata in the access token or the response payload that contains the access token. For more information, see [OAuth external URL and authentication URL](#). The two metadata response headers are:

**API-OAUTH-METADATA-FOR-ACCESSTOKEN**  
**API-OAUTH-METADATA-FOR-PAYLOAD**

When an Authentication URL is invoked, an HTTP response header is available to override the requested **scope** from the application. For more information, see [Scope](#). The response header is:

**x-selected-scope**

If you are using the DataPower® API Gateway rather than the DataPower Gateway (v5 compatible), this diagram is provided for guidance only and is not fully accurate for this release.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Custom forms for user security

You can create custom forms for the authorization and identity extraction phase of OAuth.

### About this task

The Native OAuth provider configuration provides the capability for requiring additional authentication and authorization steps for user security. Custom HTML forms may be created to extract the identity of the user and to authorize the user. This capability applies to Implicit, Resource owner password, and Access code grant types.

- [Creating a custom HTML login form for user security](#)  
Custom HTML forms can be created for user security during the identity extraction stage in OAuth.
- [Creating a custom HTML authorization form for user security](#)  
Custom HTML forms can be created for user security during the authorization stage in OAuth.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Creating a custom HTML login form for user security

Custom HTML forms can be created for user security during the identity extraction stage in OAuth.

## Before you begin

The Native OAuth provider configuration includes Identity Extraction when using the Implicit, Access code, or Resource owner password grant types. You have the option to select how to extract the user credential and one of the choices is Custom HTML Form. For more information, see [Configuring a native OAuth provider](#) when using API Manager or [Configuring a native OAuth provider](#) when using Cloud Manager. For more information, see [Configuring a native OAuth provider](#). This topic describes how to create the Custom HTML form for identity extraction.

## About this task

During three-legged OAuth definitions (Implicit flow, Resource owner password flow, and Access (Authorization) code flow, the user is presented with a form for signing in to the service provided by the API. You can present a custom form or a default form. Your custom form must fulfill certain requirements.

Important: The fields used by IBM® API Connect to inject information into your form have case-sensitive field names.

## Procedure

To create a custom sign-in form for your Native OAuth provider, complete the following steps:

1. Create a well formed XHTML document that will be parsed and transformed by API Connect to inject hidden fields.
2. For your XHTML form, set the method as `POST`, the encoding type as `application/x-www-form-urlencoded`, and the action as `authorize`. Add any other parameters that you require.  
For example:

```
<form method="POST" enctype="application/x-www-form-urlencoded" action="authorize">
```

3. Create a text input field that is named `username` and create a password input field named `password`.
4. Add the line `<EI-INJECT-HIDDEN-INPUT-FIELDS>`. This third element is a placeholder that API Connect replaces with input fields to complement the user-submitted data.
5. Create a button to initiate the sign-in process.  
For example:

```
<button  
id=" home_markdown_jenkins_workspace_Transform_in_SSMNED_2018_com.ibm.apic.apionprem.doc_oauth_custom_login_form_2_login_b  
utton" type="submit" name="login" value="true">Log in</button>
```

6. Optional: Add text that is displayed the first time that the user visits the sign-in page. Use the tag `<EI-LOGINFIRSTTIME>` for the text that you want to display.
7. Optional: Add text that appears when the user is returned to the sign-in page if they fail to authenticate. Use the tag `<EI-LOGINFAILED>` for the text that you want to display.
8. Optional: Have an error message displayed when an error in the custom form prevents it from being displayed to the user correctly. Use the tag `<EI-INTERNAL-CUSTOM-FORM-ERROR/>`; the message text is generated automatically. You should detect such errors during testing to prevent this error message being displayed to the end user.
9. Optional: You can add elements that are loaded from external sources, such as images or JavaScript.
10. Insert spacing and other features as you require. Completing Steps [1](#) through to [8](#) results in a form similar to the following example:

```
<html lang="en" xml:lang="en">  
<head><meta http-equiv="Content-Type" content="text/html; charset=UTF-8" /></head>  
<body>  
<form method="POST" enctype="application/x-www-form-urlencoded" action="authorize">  
<h1>Please sign in</h1>  
<p>Username </p>  
<p ><input type="text" name="username" required="required" /> </p>  
<p>Password </p>  
<p ><input type="password" name="password" required="required" /> </p>  
<EI-INJECT-HIDDEN-INPUT-FIELDS/>  
<p > <button  
id=" home_markdown_jenkins_workspace_Transform_in_SSMNED_2018_com.ibm.apic.apionprem.doc_oauth_custom_login_form_2_login_b  
utton" type="submit" name="login" value="true">Log in</button> </p>
```

```
<EI-LOGINFIRSTTIME>  
<p>If you have forgotten your user name or password, contact your system administrator.</p>  
</EI-LOGINFIRSTTIME>
```

```
<EI-LOGINFAILED>  
<p >At least one of your entries does not match our records.  
If you have forgotten your user name or password, contact your system administrator.</p>  
</EI-LOGINFAILED>
```

```
<EI-INTERNAL-CUSTOM-FORM-ERROR/>
```

```
</form>  
</body>  
</html>
```

11. Make your form available at a URL of your choice.
12. If you have not already done so, configure your Native OAuth provider to use a Custom HTML form for identity extraction and provide the URL at which your form is available. For more information, see [Configuring a native OAuth provider](#) when using API Manager or [Configuring a native OAuth provider](#) when using Cloud Manager.

---

## Creating a custom HTML authorization form for user security

Custom HTML forms can be created for user security during the authorization stage in OAuth.

### Before you begin

The Native OAuth provider configuration includes user authorization when using the Implicit, Access code, or Resource owner password grant types. You have the option to select how to authorize application users and one of the choices is Custom HTML Form. For more information, see [Configuring a native OAuth provider](#) when using API Manager or [Configuring a native OAuth provider](#) when using Cloud Manager. This topic describes how to create the Custom HTML form for authorization.

### About this task

During three-legged OAuth definitions (Implicit flow, Resource owner password flow, and Access (Authorization) code flow, the user is presented with a form through which they grant permission to an application to access their data through the API on their behalf. You can present a custom form or a default form. Your custom form must fulfill certain requirements.

Important: The fields used by IBM® API Connect to inject information into your form have case-sensitive field names.

### Procedure

To create a custom authorization form for your Native OAuth provider, complete the following steps:

1. Create a well-formed XHTML document. This will be parsed and transformed by API Connect to inject hidden fields.
2. For your XHTML form, set the method as POST, the encoding type as `application/x-www-form-urlencoded`, and the action as `authorize`. Add any other parameters that you require.  
For example:

```
<form method="POST" enctype="application/x-www-form-urlencoded" action="authorize">
```

3. Add the line `<AZ-INJECT-HIDDEN-INPUT-FIELDS/>`. This line is a placeholder that API Connect will replace with input fields necessary for the completion of the OAuth process.
4. Create two buttons with the following code so that the user can grant or deny permission. Edit the text to suit your preferences.

```
<button class="cancel" type="submit" name="approve" value="false">No Thanks</button>  
<button class="submit" type="submit" name="approve" value="true">Allow Access</button>
```

5. Optional: Display an error message when an error in the custom form prevents it from being displayed to the user correctly. Use the tag `<AZ-INTERNAL-CUSTOM-FORM-ERROR/>`; the message text is generated automatically. You should detect such errors during testing to prevent this error message being displayed to the end user.
6. Optional: You can add to the form HTML elements that will load features from external sources, such as images or JavaScript.  
For example, `<script src="http://www.example.com/example.js" />`
7. Insert spacing and additional elements as you require. Completing Steps [1](#) through to [6](#) results in a form similar to the following example:

```
<html lang="en" xml:lang="en">  
<head><title>Request for permission</title></head>  
<body class="customconsent">  
  <div>  
    <div>  
      <form method="post" enctype="application/x-www-form-urlencoded" action="authorize">  
        <AZ-INJECT-HIDDEN-INPUT-FIELDS/>  
        <p>Greeting..</p><DISPLAY-RESOURCE-OWNER/>  
        <p>This app </p><OAUTH-APPLICATION-NAME/><p> would like to access your data.</p>  
        <div>  
          <button class="cancel" type="submit" name="approve" value="false">No Thanks</button>  
          <button class="submit" type="submit" name="approve" value="true">Allow Access</button>  
        </div>  
      </form>  
    </div>  
    <AZ-INTERNAL-CUSTOM-FORM-ERROR/>  
  </div>  
</body>  
</html>
```

8. Make your form available at a URL of your choice.
9. If you have not already done so, configure your Native OAuth provider to use a Custom HTML Form for authorization for User Security. Provide the URL as the endpoint at which your form is available. For more information, see [Configuring a native OAuth provider](#) when using API Manager or [Configuring a native OAuth provider](#) when using Cloud Manager.

## Securing an API with a JSON Web Token

There are two methods to secure your API with a JSON Web Token. You can use the **jwt-generate** command, or you can use a token that has been generated external to IBM® API Connect.

### About this task

---

JSON Web Token (JWT) is an OAuth 2.0 compliant method of authentication that can be useful to secure your API in API Connect.

You can secure your API with a JSON Web Token by using either of the following methods:

- Generate a token through the **jwt-generate** command, and then augment the response payload with your generated token replacing the `id` token.
- Use a token that was generated outside of API Connect and include it into the response payload, by using the metadata URL.

### Procedure

---

Create a **jwt-generate** policy in the assembly.

- In API Manager, open the Assembly tab.
- Add a **jwt-generate** policy to the assembly for the API.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Troubleshooting OAuth

You can find the answers to some common questions in the Developer Portal, or in support communities and forums in DeveloperWorks, on GitHub, or on Youtube.

You can use the following links to go to the topics:

- [Enable an extended error description](#)
- [OAuth 2.0 support in the developer portal test tool](#)
- [OAuth requires quorum in a multi-node cluster](#)

### Enable an extended error description

---

The [OAuth 2.0 Authorization Framework](#) governs how IBM® API Connect is defined. According to the specification, OAuth 2.0 error conditions trigger a payload with `error`, and an optional field `error_description`. To prevent information leakage, the IBM DataPower® Gateway default setting returns the error only. However, during the development and testing phase of an application, it is useful to find out why an OAuth 2.0 request is being rejected. To enable this behavior, the caller can pass an HTTP request header in the OAuth request:

```
APIm-Debug: true
```

The presence of the header enables the 'just-in-time' debugging for that OAuth transaction, and `error_description` is returned as part of the error condition. The output helps the caller to determine why an OAuth request is rejected by API Connect as shown in the examples.

Example error output without 'just-in-time' debugging:

```
{ "error": "invalid_request" }
```

Example error output with 'just-in-time' debugging:

```
{ "error": "invalid_request", "error_description": "Multiple OAuth client credentials are provided" }
```

### OAuth 2.0 support in the developer portal test tool

---

OAuth 2.0 support is exposed as an API through the provider OpenAPI definition. You can use the test tool that is included with API Connect to test the OAuth 2.0 configuration. For more information, see [Testing an API using the Developer Portal test tool](#).

### OAuth requires quorum in a multi-node cluster

---

In a multi-node cluster, OAuth operations will fail if quorum is lost. Quorum requires that the number of active nodes is greater than 50% of the total number of nodes in the cluster.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Working with Products in the API Manager

In IBM API Connect, Plans and APIs are grouped together in Products.

Information about managing Products in the API Manager UI can be found in the following topics.

- [The Product lifecycle](#)  
When you manage your Product versions, you move them through a series of lifecycle states. From initially staging a Product version to a Catalog, through to publishing to make the Product version available to your application developers, and to eventual retiring and archiving. The syndication feature in IBM API Connect means that Product lifecycle states can also be managed within Spaces in the associated Catalog.
- [Managing your Products](#)  
You can manage your Products in API Manager by using the Products page of the associated Catalog. In this view, you can move the Products through their lifecycle, display analytics information, and control who can see or subscribe to the Products. The syndication feature in IBM API Connect means that Products can also be managed by using the Products tab of the associated Space.
- [Managing the APIs in a Product](#)  
For a specific Product, you can take an individual API offline. If an API is taken offline then it becomes unavailable and calls to the API will fail.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

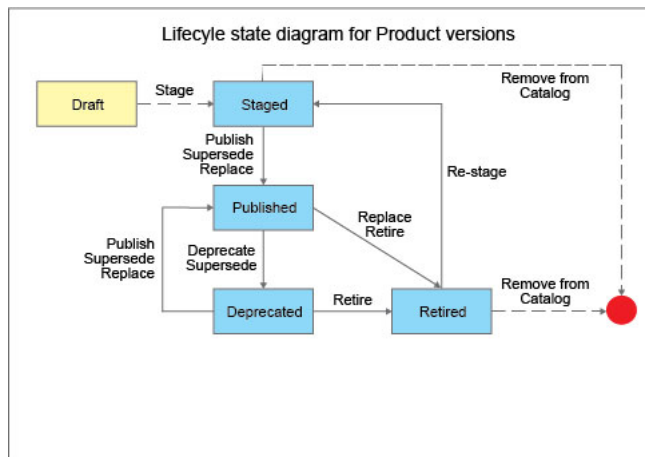

## The Product lifecycle

When you manage your Product versions, you move them through a series of lifecycle states. From initially staging a Product version to a Catalog, through to publishing to make the Product version available to your application developers, and to eventual retiring and archiving. The syndication feature in IBM® API Connect means that Product lifecycle states can also be managed within Spaces in the associated Catalog.

---

## Product lifecycle state diagram

The following diagram shows the possible lifecycle states for a Product version, and the Product management operations that move a Product version from one lifecycle state to another. For example, the Retire operation moves a Product version from the Published to the Retired state.

Note: The same Product lifecycle states apply irrespective of whether your Product is managed within a Catalog, or within a Space in a Catalog. For more information about the syndication feature, see [Using syndication in API Connect](#).

If approval is required for a Product management operation, an approval request is sent and the Product version moves to the pending state. When the request is approved, the operation is completed and the Product version moves to the next lifecycle state. If approval is not required, the operation is completed immediately.

Note: Approval is not required for the following lifecycle state transitions:

- Retired to Staged.
- Deprecated to Published.

For information on configuring Product lifecycle approvals for a Catalog, see [Creating and configuring Catalogs](#). For information on approving requests, see [Approving Product lifecycle and subscription requests](#).

Note:

- Approval for Product lifecycle state changes in a Catalog is disabled by default. You must explicitly enable the Product lifecycle state changes that you want to enforce.
- Product lifecycle approvals can be configured only at the Catalog level. This feature is not available at the Space level.

The following sections describe the various lifecycle states for a Product version.

Note: All references in this topic to a Catalog, can also be applied to a Space in a Catalog, unless specified otherwise.

---

## Draft

The draft state for a Product or API is when a Product or API definition is not deployed and is not associated with any Catalog.

---

## Staged

When you stage a Product, a copy of the Product version is deployed to the target Catalog. Staged is the initial state when you publish a Product. When a Product is in the staged state, it is not yet visible to, or subscribable by, any developers. For more information about staging a Product, see [Staging a Product](#).

You stage a Product so that the appropriate approvals, internally within the organization, can be given for it to then be published. For information on configuring Product lifecycle approvals for a Catalog, see [Creating and configuring Catalogs](#). For information on approving requests, see [Approving Product lifecycle and subscription requests](#). For information on publishing a Product, see [Publishing a Product](#).

---

## Published

When you publish a Product, a fixed copy of the Product version is deployed to the target Catalog. The Product version is visible to, and subscribable by, the targeted developers or communities. When a Product is published in a Catalog, the visibility and subscription settings can be changed for the published version of that Product. Any further changes require a new version of the Product to be staged and published before they take effect.

If you replace a Published Product with a Staged or Deprecated Product, the replacement Product is published, and the replaced Product is retired.

If you supersede a Published Product with a Staged or Deprecated Product, the superseding Product is published, and the superseded Product is deprecated.

For more information about publishing a Product, see [Publishing a Product](#).

---

## Deprecated

When you deprecate a Product, the Product version is visible only to developers whose applications are currently subscribed. No new subscriptions to the Plans in the Product are possible. For more information about deprecating Products, see [Deprecating a Product](#).

A Product is also deprecated if you supersede it with another Product. For more information, see [Superseding a Product with another Product](#).

---

## Retired

When you retire a Product, the Product version can neither be viewed nor can its Plans be subscribed to, and all of the associated APIs are taken offline. For more information about retiring Products, see [Retiring a Product](#).

A Product is also retired if you replace it with another Product. For more information, see [Replacing a Product with another Product](#).

---

---

## Managing your Products

You can manage your Products in API Manager by using the Products page of the associated Catalog. In this view, you can move the Products through their lifecycle, display analytics information, and control who can see or subscribe to the Products. The syndication feature in IBM® API Connect means that Products can also be managed by using the Products tab of the associated Space.

---

## Before you begin

To complete the Product management tasks that are described in this topic, you must either be the owner of the API provider organization, or be assigned Manage permission for Products in the Catalog that contains the Product. If you have View permission for Products, you have read-only access to the Product management page. For information on configuring Product management permissions for a Catalog, see [Creating and configuring Catalogs](#).

The syndication feature in IBM API Connect means that Products can be contained within a Space in a Catalog. In this case, to complete the Product management tasks that are described in this topic, you must either be the owner of the API provider organization, or be assigned Manage permission for Products in the Space that contains the Product. For information on configuring Product management permissions for a Space, see [Managing user access in a Space](#).

## About this task

---

For more information about the Product lifecycle, see [The Product lifecycle](#).

For more information about the syndication feature, see [Using syndication in API Connect](#).

For information on viewing Analytics that can provide insight into Product and API usage and performance, see [API Analytics](#).

## Procedure

---

To manage your Product, complete the following steps.

1. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with.  
The Products page of the Catalog opens, and all of the Products available in that Catalog are displayed.
2. If the Product that you want to work with is contained within a Space, select the required Space by completing the following steps
  - a. In the navigation pane of the API Manager UI, click  Spaces.
  - b. Select the Space that you want to work with.  
The Products page of the Space opens, and all of the Products available in that Space are displayed.
3. Expand a Product to see details of the APIs and Plans in that Product.  
Manage options are also available, depending on the state of the Product. To view the manage options, click the options icon  and select the options that you require.
4. To manage the lifecycle of a version of a Product, click the options icon  alongside the Product version, and select the required lifecycle action.
5. To set the migration target of a version of a Product, click the options icon  alongside the Product version, and select Set migration target. In the Set migration target window, select the Product that you want to set as the migration target, and select Next. Then map the migration source Plans to the migration target Plans, and click OK.  
Restriction: If the Plan is part of a Product that is contained within a Space in the Catalog, and the migration action is being made at the Space level, the Plan that you are migrating subscriptions from must be located in the same Space as the Plan you are migrating to. If the migration action is being made at the Catalog level, subscriptions can be migrated across Spaces. For more information about the Space feature, see [Using syndication in API Connect](#).

## What to do next

---

For details of the ways in which you can manage your Products, see the following subtopics:

- [Publishing a Product](#)  
APIs become accessible when a Product is published and made visible on the IBM API Connect Developer Portal for use by application developers. A Product can be published to selected communities of application developer organizations, and the Plans within the Product can be used to tailor access and visibility further.
- [Changing the availability of a Product](#)  
You can change the availability of a Product and the associated Plans by using the Products view within a Catalog in API Manager. The syndication feature in IBM API Connect means that you can also use the Products view within a Space in a Catalog to change the availability of a Product.
- [Deprecating a Product](#)  
You can deprecate a published Product by using the Manage Products page within a Catalog in API Manager. When you deprecate a Product, application developers that are already subscribed to the Product can continue to use it, but no new developers can subscribe to the Product. The syndication feature in IBM API Connect means that you can also use the Manage Products page within a Space in a Catalog to deprecate a published Product.
- [Retiring a Product](#)  
You can retire a published or deprecated Product by using the Manage Products page within a Catalog in API Manager. When a Product is retired, all associated APIs are taken offline, and any subscriptions are deleted. The syndication feature in IBM API Connect means that you can also use the Manage Products page within a Space in a Catalog to retire a Product.
- [Re-staging a Product](#)  
If a Product in a Catalog has been retired, you can re-stage the Product so that it can re-enter the Product lifecycle. A re-staged Product moves to the Staged state, from where it can be published. The syndication feature in IBM API Connect means that you can also re-stage a Product within a Space in a Catalog.
- [Updating the gateway services for a Product](#)  
When you stage or publish a draft Product to a Catalog, you specify the gateway services at which the APIs in the Product are to be made available. However, you can later update the selected gateway services after a Product has been stage or published.
- [Removing a Product from a Catalog](#)  
You can remove a Product from a specific Catalog by using the Products view within a Catalog in API Manager. The syndication feature in IBM API Connect means that you can also use the Products view within a Space to remove a Product from a Catalog.
- [Approving Product lifecycle and subscription requests](#)  
To approve or decline requests to change the lifecycle state of a Product, and requests by application developers to subscribe to a Plan, use the Tasks page in the Catalog that contains the associated Product in API Manager. The syndication feature in IBM API Connect means that you can also use the Tasks page within a Space in a Catalog to approve or decline requests.

---

## Publishing a Product

APIs become accessible when a Product is published and made visible on the IBM® API Connect Developer Portal for use by application developers. A Product can be published to selected communities of application developer organizations, and the Plans within the Product can be used to tailor access and visibility further.

### Before you begin

---

You must stage a Product before it can be published. For more information about staging Products, see [Staging a Product](#).  
Note: If you want to publish a LoopBack project, you must publish both the APIs (by publishing the Products that contain the APIs) and the associated applications so the project can be run. For more information about publishing LoopBack applications, see [Publishing APIs and applications](#).  
To complete the Product management tasks that are described in this topic, you must either be the owner of the API provider organization, or be assigned Manage permission for Products in the Catalog that contains the Product. If you have View permission for Products, you have read-only access to the Product management page. For information on configuring Product management permissions for a Catalog, see [Creating and configuring Catalogs](#).

The syndication feature in IBM API Connect means that Products can be contained within a Space in a Catalog. In this case, to complete the Product management tasks that are described in this topic, you must either be the owner of the API provider organization, or be assigned Manage permission for Products in the Space that contains the Product. For information on configuring Product management permissions for a Space, see [Managing user access in a Space](#).

### About this task

---

A community is a collection of consumer organizations, used to control which organizations have access to Products and Plans without having to assign access on an individual basis. A Product can be published to selected communities, which means that only application developers within those organizations contained within the community can see the Product on the Developer Portal and obtain application keys to access it. A Product can alternatively be published to all communities. Communities are used to restrict the visibility and accessibility of APIs, for example to particular business partners, internal organizations, or other groups of application developers.

### Procedure

---

You can publish a product in any of the following ways:

- Publish a new Product.
- Replace a Product with another Product.
- Supersede a Product with another Product  
For details of the ways in which you can publish a Product, see the following subtopics:
- [Publishing a new Product](#)  
Publish a Product from within its containing Catalog in API Manager. The syndication feature in IBM API Connect means that you can also publish a Product from within its containing Space in a Catalog.
- [Replacing a Product with another Product](#)  
You can replace a published Product in IBM API Connect with another Product, and automatically migrate subscribers to the new Product, by using the API Manager.
- [Superseding a Product with another Product](#)  
You can supersede a published Product with another Product by using the API Manager.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Publishing a new Product

Publish a Product from within its containing Catalog in API Manager. The syndication feature in IBM® API Connect means that you can also publish a Product from within its containing Space in a Catalog.

### Before you begin

---

The Product that you are publishing must be in the Staged or Deprecated state.

To complete the Product management tasks that are described in this topic, you must either be the owner of the API provider organization, or be assigned Manage permission for Products in the Catalog that contains the Product. If you have View permission for Products, you have read-only access to the Product management page. For information on configuring Product management permissions for a Catalog, see [Creating and configuring Catalogs](#).

The syndication feature in IBM API Connect means that Products can be contained within a Space in a Catalog. In this case, to complete the Product management tasks that are described in this topic, you must either be the owner of the API provider organization, or be assigned Manage permission for Products in the Space that contains the Product. For information on configuring Product management permissions for a Space, see [Managing user access in a Space](#).

### About this task

---

You can complete this task either by using either the API Designer UI application, or by using the browser based API Manager UI.

If you publish a Product to a non-development Catalog, the Product that is published is an independent and fixed copy of the version of the Product that you chose to stage. Editing the Product through the Products page will not affect the published Product. For this reason, it is recommended that when you stage a Product, you then create a new version of the Product to edit in future, so as to avoid confusion regarding the properties of the published Product. For more information on creating new versions of your Product, see [Creating a new version of your Product](#).

An exception is that if you publish a Product to a development Catalog, editing it through the Products page will enable you to re-stage and publish the same version of the Product. For information on how to create a development Catalog, see [Creating and configuring Catalogs](#).

Although you can publish to a development Catalog, the development Catalog should be used only for testing purposes. Similarly, a Developer Portal created from a development Catalog must be used for testing purposes only, and not for production use. For more information on Catalogs, see [Working with Catalogs](#).

Note: All references in this topic to a Catalog can also be applied to a Space in a Catalog, unless specified otherwise. For more information about Spaces, see [Using syndication in API Connect](#).

## Procedure

---

To publish a Product, complete the following steps:

1. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with.  
The Products page of the Catalog opens, and all of the Products available in that Catalog are displayed.
  2. If the Product that you want to work with is contained within a Space, select the required Space by completing the following steps
    - a. In the navigation pane of the API Manager UI, click  Spaces.
    - b. Select the Space that you want to work with.  
The Products page of the Space opens, and all of the Products available in that Space are displayed.
  3. Alongside the Product version that you want to work with, click the options icon  and then click Publish.  
The Confirm Visibility Settings page opens.
  4. Specify the following options:
    - The users that the Product is visible to  
You can choose Public users, Authenticated users, or Custom.
    - Custom - You can use the Type to add... field to search for organizations or communities that you want your Product to be visible to.
    - Who can subscribe to the Product  
You can add or remove one or more consumer organizations or communities.
    - Custom - You can use the Type to add... field to search for organizations or communities that you want to allow to subscribe to your Product.
  5. Click Publish, then click Confirm to proceed with the publish operation.  
If approval is required to publish Products in this Catalog, an approval request is sent, and the Product moves to the Pending state; the Product is published when the request is approved. If approval is not required, the Product version is published immediately, and moves to the Published state. For information on configuring Product lifecycle approvals for a Catalog, see [Creating and configuring Catalogs](#). For information on approving requests, see [Approving Product lifecycle and subscription requests](#).
- Note:
- Approval for Product lifecycle state changes in a Catalog is disabled by default. You must explicitly enable the Product lifecycle state changes that you want to enforce.
  - Product lifecycle approvals can be configured only at the Catalog level. This feature is not available at the Space level.

## Results

---

Your Product is in the Published state.

Your Product is published to your Catalog and available to your specified organizations or communities. Application developers within the groups you selected can see and use the APIs within the Product.

Any application developer requests to use your Product are displayed on the Approvals tab in the containing Catalog, where you can decline or accept the request.

## Related tasks

---

## Replacing a Product with another Product

You can replace a published Product in IBM® API Connect with another Product, and automatically migrate subscribers to the new Product, by using the API Manager.

## Before you begin

---

The Product to be replaced must be in the Published state, and the replacement Product must be in the Staged, Published, or Deprecated state.

To complete the Product management tasks that are described in this topic, you must either be the owner of the API provider organization, or be assigned Manage permission for Products in the Catalog that contains the Product. If you have View permission for Products, you have read-only access to the Product management page. For information on configuring Product management permissions for a Catalog, see [Creating and configuring Catalogs](#).

The syndication feature in IBM API Connect means that Products can be contained within a Space in a Catalog. In this case, to complete the Product management tasks that are described in this topic, you must either be the owner of the API provider organization, or be assigned Manage permission for Products in the Space that contains the Product. For information on configuring Product management permissions for a Space, see [Managing user access in a Space](#).

Restriction: If Spaces are enabled in the Catalog, both the Product you are replacing and the replacement Product must be located in the same Space. For more information about the Space feature, see [Using syndication in API Connect](#).

## About this task

---

When you replace a Product with another Product, the following actions are taken:

- The replacement Product is published.
- If the visibility and subscribability settings in the replacement Product are such that access is the same as, or less restrictive than, the original Product, the settings in the replacement Product are used. If the settings in the replacement Product are more restrictive, meaning that fewer consumer organizations can see or subscribe to the Product, the replace operation fails. For more information on visibility and subscribability settings, see [Changing the availability of a Product](#).
- The subscribers to the original Product are migrated to the replacement Product.
- The original Product is moved to the Retired state. Products in the Retired state are removed from the Developer Portal; they are no longer visible to the application developers, and any subscriptions to them are canceled. However, the Product can be staged again later if required.

Although you can publish to a development Catalog, the development Catalog should be used only for testing purposes. Similarly, a Developer Portal created from a development Catalog must be used for testing purposes only, and not for production use. For more information on Catalogs, see [Working with Catalogs](#).

Note: All references in this topic to a Catalog, can also be applied to a Space in a Catalog, unless specified otherwise.

## Procedure

---

To replace a Product, complete the following steps:

1. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with. The Products page of the Catalog opens, and all of the Products available in that Catalog are displayed.
2. If the Product that you want to work with is contained within a Space, select the required Space by completing the following steps
  - a. In the navigation pane of the API Manager UI, click  Spaces.
  - b. Select the Space that you want to work with. The Products page of the Space opens, and all of the Products available in that Space are displayed.
3. Alongside the Product version that you want to replace, click the options icon , then click Replace. The Replace window opens.
4. Select the replacement Product, then click Next.
5. From the drop-down list, select which Plans from your new Product correspond to Plans in your old Product.
6. Click Replace.

If approval is required to replace Products in this Catalog, an approval request is sent, and the Product moves to the Pending state; the Product is replaced when the request is approved. If approval is not required, the Product is replaced immediately. For information on configuring Product lifecycle approvals for a Catalog, see [Creating and configuring Catalogs](#). For information on approving requests, see [Approving Product lifecycle and subscription requests](#).

Note:

- Approval for Product lifecycle state changes in a Catalog is disabled by default. You must explicitly enable the Product lifecycle state changes that you want to enforce.
- Product lifecycle approvals can be configured only at the Catalog level. This feature is not available at the Space level.

## Results

---

Your new Product is in the Published state, and the original Product is in the Retired state.

Your new Product is published to your preferred organizations or communities. Application developers within the groups you selected can see and use the APIs within the Product.

Any application developer requests to use your Product are displayed on the Approvals tab in the containing Catalog, where you can decline or accept the request.

# Superseding a Product with another Product

You can supersede a published Product with another Product by using the API Manager.

## Before you begin

---

The Product to be superseded must be in the Published state. The superseding Product must be in the Staged, Published, or Deprecated state.

To complete the Product management tasks that are described in this topic, you must either be the owner of the API provider organization, or be assigned Manage permission for Products in the Catalog that contains the Product. If you have View permission for Products, you have read-only access to the Product management page. For information on configuring Product management permissions for a Catalog, see [Creating and configuring Catalogs](#).

The syndication feature in IBM® API Connect means that Products can be contained within a Space in a Catalog. In this case, to complete the Product management tasks that are described in this topic, you must either be the owner of the API provider organization, or be assigned Manage permission for Products in the Space that contains the Product. For information on configuring Product management permissions for a Space, see [Managing user access in a Space](#).

Restriction: If Spaces are enabled in the Catalog, both the Product you are superseding and the superseding Product must be located in the same Space. For more information about the Space feature, see [Using syndication in API Connect](#).

## About this task

---

When you supersede a Product with another Product, the following actions are taken:

- The superseding Product is published.
- If the visibility and subscribability settings in the superseding Product are such that access is the same as, or less restrictive than, the original Product, the settings in the superseding Product are used. If the settings in the superseding Product are such that access is more restrictive, meaning that fewer consumer organizations can see or subscribe to the Product, the supersede operation fails. For more information on visibility and subscribability settings, see [Changing the availability of a Product](#).
- The original Product is moved to the Deprecated state.
- The application developers that are already subscribed to the now deprecated Product can continue to use it, but no new developers can subscribe to the Product. In the Developer Portal the application developers will see a Migrate this subscription message, which they can click to upgrade their subscription to the migration target.
- The deprecated product can be published again if required.

Although you can publish to a development Catalog, the development Catalog should be used only for testing purposes. Similarly, a Developer Portal created from a development Catalog must be used for testing purposes only, and not for production use. For more information on Catalogs, see [Working with Catalogs](#).

Note: All references in this topic to a Catalog, can also be applied to a Space in a Catalog, unless specified otherwise.

## Procedure

---

To supersede a Product, complete the following steps:

1. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with.  
The Products page of the Catalog opens, and all of the Products available in that Catalog are displayed.
2. If the Product that you want to work with is contained within a Space, select the required Space by completing the following steps
  - a. In the navigation pane of the API Manager UI, click  Spaces.
  - b. Select the Space that you want to work with.  
The Products page of the Space opens, and all of the Products available in that Space are displayed.
3. Alongside the Product version that you want to supersede, click the options icon  and then click Supersede.
4. Select the superseding Product and then click Next.
5. From the drop-down list, select which Plans from your new Product correspond to Plans in your old Product.
6. Click Supersede.

If approval is required to supersede Products in this Catalog, an approval request is sent, and the Product moves to the Pending state; the Product is superseded when the request is approved. If approval is not required, the Product is superseded immediately. For information on configuring Product lifecycle approvals for a Catalog, see [Creating and configuring Catalogs](#). For information on approving requests, see [Approving Product lifecycle and subscription requests](#).

Note:

- Approval for Product lifecycle state changes in a Catalog is disabled by default. You must explicitly enable the Product lifecycle state changes that you want to enforce.
- Product lifecycle approvals can be configured only at the Catalog level. This feature is not available at the Space level.

## Results

---

Your superseding Product is in the Published state.

The Product that was superseded is in the Deprecated state.

Your superseding Product is published to your preferred organizations or communities. Application developers within the groups you selected can see and use the APIs within the Product. The original Product is deprecated.

Any application developer requests to use your Product are displayed on the Approvals tab in the containing Catalog, where you can decline or accept the request.

## Changing the availability of a Product

You can change the availability of a Product and the associated Plans by using the Products view within a Catalog in API Manager. The syndication feature in IBM® API Connect means that you can also use the Products view within a Space in a Catalog to change the availability of a Product.

### Before you begin

---

To complete the Product management tasks that are described in this topic, you must either be the owner of the API provider organization, or be assigned Manage permission for Products in the Catalog that contains the Product. If you have View permission for Products, you have read-only access to the Product management page. For information on configuring Product management permissions for a Catalog, see [Creating and configuring Catalogs](#).

The syndication feature in IBM API Connect means that Products can be contained within a Space in a Catalog. In this case, to complete the Product management tasks that are described in this topic, you must either be the owner of the API provider organization, or be assigned Manage permission for Products in the Space that contains the Product. For information on configuring Product management permissions for a Space, see [Managing user access in a Space](#).

**Note:** All references in this topic to a Catalog can also be applied to a Space in a Catalog, unless specified otherwise. For more information about Spaces, see [Using syndication in API Connect](#).

### Procedure

---

To change the availability of a Product, complete the following steps:

1. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with.  
The Products page of the Catalog opens, and all of the Products available in that Catalog are displayed.
2. If the Product that you want to work with is contained within a Space, select the required Space by completing the following steps
  - a. In the navigation pane of the API Manager UI, click  Spaces.
  - b. Select the Space that you want to work with.  
The Products page of the Space opens, and all of the Products available in that Space are displayed.
3. Alongside the Product version that you want to work with, click the options icon , then click Edit visibility.  
The Visibility page opens.
4. In the Visibility section, specify the users that you want the Product to be visible to. You can choose Public to make the Product visible to all users, Authenticated to make the Product available to users who have successfully authenticated, or Custom to specify the consumer organizations and consumer organization groups that you want the Product to be visible to.
  - If you select Custom, use the Type to add organizations field to search for the consumer organizations and consumer organization groups that you want the Product to be visible to. For information about how to create and manage consumer organizations and consumer organization groups, see [Administering Consumer organizations](#).
5. In the Subscribability section, specify the users that can subscribe to the Plans in the Product. You can choose Authenticated to make the Plans in the Product subscribable by users who have successfully authenticated, or Custom to specify the consumer organizations and consumer organization groups that can subscribe to the Plans in the Product.
  - If you select Custom, use the Type to add organizations field to search for the consumer organizations and consumer organization groups that can subscribe to the Plans in the Product. If you selected custom visibility, only the consumer organizations and consumer organization groups selected there are available for adding to the custom subscribability list. For information about how to create and manage consumer organizations and consumer organization groups, see [Administering Consumer organizations](#).
6. Click Save when done.  
The Product version is configured with the modified availability settings.  
**Note:**
  - Changing who can view or subscribe to a Product does not affect the settings of the draft Product. The change applies only in the Catalog that was selected in Step 1.
  - Changing who can view or subscribe to a Product does not affect existing subscriptions.

### Results

---

Your Product remains in the same lifecycle state, now with new availability settings.

### Related tasks

## Deprecating a Product

You can deprecate a published Product by using the Manage Products page within a Catalog in API Manager. When you deprecate a Product, application developers that are already subscribed to the Product can continue to use it, but no new developers can subscribe to the Product. The syndication feature in IBM® API Connect means that you can also use the Manage Products page within a Space in a Catalog to deprecate a published Product.

## Before you begin

---

The Product that you are deprecating must be in the Published state.

To complete the Product management tasks that are described in this topic, you must either be the owner of the API provider organization, or be assigned Manage permission for Products in the Catalog that contains the Product. If you have View permission for Products, you have read-only access to the Product management page. For information on configuring Product management permissions for a Catalog, see [Creating and configuring Catalogs](#).

The syndication feature in IBM API Connect means that Products can be contained within a Space in a Catalog. In this case, to complete the Product management tasks that are described in this topic, you must either be the owner of the API provider organization, or be assigned Manage permission for Products in the Space that contains the Product. For information on configuring Product management permissions for a Space, see [Managing user access in a Space](#).

## Procedure

---

To deprecate a Product, complete the following steps:

1. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with. The Products page of the Catalog opens, and all of the Products available in that Catalog are displayed.
2. If the Product that you want to work with is contained within a Space, select the required Space by completing the following steps
  - a. In the navigation pane of the API Manager UI, click  Spaces.
  - b. Select the Space that you want to work with. The Products page of the Space opens, and all of the Products available in that Space are displayed.
3. Alongside the Product version that you want to work with, click the options icon , then click Deprecate. The Deprecate Product window opens.
4. Click Confirm to deprecate the Product.

If approval is required to deprecate Products in this Catalog, an approval request is sent, and the Product moves to the Pending state; the Product is deprecated when the request is approved. If approval is not required, the Product is deprecated immediately. For information on configuring Product lifecycle approvals for a Catalog, see [Creating and configuring Catalogs](#). For information on approving requests, see [Approving Product lifecycle and subscription requests](#).

Note:

- Approval for Product lifecycle state changes in a Catalog is disabled by default. You must explicitly enable the Product lifecycle state changes that you want to enforce.
- Product lifecycle approvals can be configured only at the Catalog level. This feature is not available at the Space level.

## Results

---

Your Product is in the Deprecated state.

## Related concepts

---

## Retiring a Product

You can retire a published or deprecated Product by using the Manage Products page within a Catalog in API Manager. When a Product is retired, all associated APIs are taken offline, and any subscriptions are deleted. The syndication feature in IBM® API Connect means that you can also use the Manage Products page within a Space in a Catalog to retire a Product.

## Before you begin

---

The Product that you are retiring must be in the Published or Deprecated state.

To complete the Product management tasks that are described in this topic, you must either be the owner of the API provider organization, or be assigned Manage permission for Products in the Catalog that contains the Product. If you have View permission for Products, you have read-only access to the Product management page. For information on configuring Product management permissions for a Catalog, see [Creating and configuring Catalogs](#).

The syndication feature in IBM API Connect means that Products can be contained within a Space in a Catalog. In this case, to complete the Product management tasks that are described in this topic, you must either be the owner of the API provider organization, or be assigned Manage permission for Products in the Space that contains the Product. For information on configuring Product management permissions for a Space, see [Managing user access in a Space](#).

## Procedure

---

To retire a Product, complete the following steps.

1. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with.  
The Products page of the Catalog opens, and all of the Products available in that Catalog are displayed.
2. If the Product that you want to work with is contained within a Space, select the required Space by completing the following steps
  - a. In the navigation pane of the API Manager UI, click  Spaces.
  - b. Select the Space that you want to work with.The Products page of the Space opens, and all of the Products available in that Space are displayed.
3. Alongside the Product version that you want to work with, click the options icon  and then click Retire. The Retire Product window opens.
4. Click Confirm.

If approval is required to retire Products in this Catalog, an approval request is sent, and the Product moves to the Pending state; the Product is retired when the request is approved. If approval is not required, the Product is retired immediately. For information on configuring Product lifecycle approvals for a Catalog, see [Creating and configuring Catalogs](#). For information on approving requests, see [Approving Product lifecycle and subscription requests](#).

Note:

- Approval for Product lifecycle state changes in a Catalog is disabled by default. You must explicitly enable the Product lifecycle state changes that you want to enforce.
- Product lifecycle approvals can be configured only at the Catalog level. This feature is not available at the Space level.

## Results

---

Your Product is in the Retired state. It is also removed from the Developer Portal, is no longer visible to the application developers, and any subscriptions to it are deleted. You can stage the Product again later if required; for details, see [Staging a Product](#).

## Related concepts

## Re-staging a Product

If a Product in a Catalog has been retired, you can re-stage the Product so that it can re-enter the Product lifecycle. A re-staged Product moves to the Staged state, from where it can be published. The syndication feature in IBM® API Connect means that you can also re-stage a Product within a Space in a Catalog.

## Before you begin

---

The Product that you are re-staging must be in the Retired state.

To complete the Product management tasks that are described in this topic, you must either be the owner of the API provider organization, or be assigned Manage permission for Products in the Catalog that contains the Product. If you have View permission for Products, you have read-only access to the Product management page. For information on configuring Product management permissions for a Catalog, see [Creating and configuring Catalogs](#).

The syndication feature in IBM API Connect means that Products can be contained within a Space in a Catalog. In this case, to complete the Product management tasks that are described in this topic, you must either be the owner of the API provider organization, or be assigned Manage permission for Products in the Space that contains the Product. For information on configuring Product management permissions for a Space, see [Managing user access in a Space](#).

## About this task

---

You stage a Product so that the appropriate approvals, internally within the organization, can be given for it to then be published. For information on configuring Product lifecycle approvals for a Catalog, see [Creating and configuring Catalogs](#). For information on approving requests, see [Approving Product lifecycle and subscription requests](#). For information on publishing a Product, see [Publishing a Product](#).

## Procedure

---

To re-stage a Product, complete the following steps.

1. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with.  
The Products page of the Catalog opens, and all of the Products available in that Catalog are displayed.
2. If the Product that you want to work with is contained within a Space, select the required Space by completing the following steps
  - a. In the navigation pane of the API Manager UI, click  Spaces.
  - b. Select the Space that you want to work with.The Products page of the Space opens, and all of the Products available in that Space are displayed.

3. Alongside the Product version that you want to work with, click the options icon  and then click Re-stage. The Re-stage Product window opens.
4. Click Confirm.

If approval is required to stage Products in this Catalog, an approval request is sent, and the Product moves to the Pending state; the Product is re-staged when the request is approved. If approval is not required, the Product is re-staged immediately. For information on configuring Product lifecycle approvals for a Catalog, see [Creating and configuring Catalogs](#). For information on approving requests, see [Approving Product lifecycle and subscription requests](#).

Note:

- Approval for Product lifecycle state changes in a Catalog is disabled by default. You must explicitly enable the Product lifecycle state changes that you want to enforce.
- Product lifecycle approvals can be configured only at the Catalog level. This feature is not available at the Space level.

## Results

---

Your Product is in the Staged state, from where it can be published; see [Publishing a new Product](#).

# Updating the gateway services for a Product

When you stage or publish a draft Product to a Catalog, you specify the gateway services at which the APIs in the Product are to be made available. However, you can later update the selected gateway services after a Product has been stage or published.

## Before you begin

---

To complete the Product management tasks that are described in this topic, you must either be the owner of the API provider organization, or be assigned Manage permission for Products in the Catalog that contains the Product. If you have View permission for Products, you have read-only access to the Product management page. For information on configuring Product management permissions for a Catalog, see [Creating and configuring Catalogs](#).

The syndication feature in IBM® API Connect means that Products can be contained within a Space in a Catalog. In this case, to complete the Product management tasks that are described in this topic, you must either be the owner of the API provider organization, or be assigned Manage permission for Products in the Space that contains the Product. For information on configuring Product management permissions for a Space, see [Managing user access in a Space](#).

## About this task

---

When you stage or publish a draft Product to a Catalog, you can either choose to make the APIs in the Product available at all the gateway services that match the gateway service type of the Product, either DataPower® API Gateway or DataPower Gateway (v5 compatible), or can you select specific gateway services of that type. The APIs in the Product can then be called at those gateway service endpoints.

However, after a Product has been staged or published you can later update the gateway services to change the selections.

For more information on staging and publishing a Product, see [Staging a draft Product](#) and [Publishing a draft Product](#).

For more information on the gateway service types, see [API Connect gateway types](#).

## Procedure

---

To update the gateway services for a Product, complete the following steps:

1. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with.  
The Products page of the Catalog opens, and all of the Products available in that Catalog are displayed.
2. If the Product that you want to work with is contained within a Space, select the required Space by completing the following steps
  - a. In the navigation pane of the API Manager UI, click  Spaces.
  - b. Select the Space that you want to work with.  
The Products page of the Space opens, and all of the Products available in that Space are displayed.
3. Alongside the Product version that you want to work with, click the options icon , then click Update gateway services.  
The Select Gateway Services window opens.
4. Select the required gateway services, then click Save.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Removing a Product from a Catalog

You can remove a Product from a specific Catalog by using the Products view within a Catalog in API Manager. The syndication feature in IBM® API Connect means that you can also use the Products view within a Space to remove a Product from a Catalog.

### Before you begin

---

The Product that you are removing from the Catalog must be in the Staged or Retired state. For more information, see [Staging a Product](#) or [Retiring a Product](#).

To complete the Product management tasks that are described in this topic, you must either be the owner of the API provider organization, or be assigned Manage permission for Products in the Catalog that contains the Product. If you have View permission for Products, you have read-only access to the Product management page. For information on configuring Product management permissions for a Catalog, see [Creating and configuring Catalogs](#).

The syndication feature in IBM API Connect means that Products can be contained within a Space in a Catalog. In this case, to complete the Product management tasks that are described in this topic, you must either be the owner of the API provider organization, or be assigned Manage permission for Products in the Space that contains the Product. For information on configuring Product management permissions for a Space, see [Managing user access in a Space](#).

### Procedure

---

To remove a Product from a Catalog, complete the following steps.

1. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with.  
The Products page of the Catalog opens, and all of the Products available in that Catalog are displayed.
2. If the Product that you want to work with is contained within a Space, select the required Space by completing the following steps
  - a. In the navigation pane of the API Manager UI, click  Spaces.
  - b. Select the Space that you want to work with.  
The Products page of the Space opens, and all of the Products available in that Space are displayed.
3. Alongside the Product version that you want to work with, click the options icon , then click Delete.  
The Delete Product window opens.
4. Click Confirm to delete the Product.

### Results

---

Your Product is removed from the Catalog. You can stage the Product again if required; for details, see [Staging a Product](#).  
If your Product was contained within a Space in a Catalog, your Product is removed from both the Space and the Catalog.

### Related concepts

## Approving Product lifecycle and subscription requests

To approve or decline requests to change the lifecycle state of a Product, and requests by application developers to subscribe to a Plan, use the Tasks page in the Catalog that contains the associated Product in API Manager. The syndication feature in IBM® API Connect means that you can also use the Tasks page within a Space in a Catalog to approve or decline requests.

### Before you begin

---

To see lifecycle change requests for a Product, you must either be the owner of the API provider organization, or you must be assigned a user role that has permission to view or manage Products in the Catalog that contains the Product. For information on configuring Product management permissions for a Catalog, see [Creating and configuring Catalogs](#).

The syndication feature in API Connect means that Products can be contained within a Space in a Catalog. In this case, to see lifecycle change requests for a Product, you must either be the owner of the API provider organization, or you must be assigned a user role that has permission to view or manage Products in the Space that contains the Product. For information on configuring Product management permissions for a Space, see [Managing user access in a Space](#).

### About this task

---

If approvals for Product lifecycle changes are enabled for a Catalog, then an attempt to change the lifecycle state of a Product results in an approval request being sent. This request is displayed in the Tasks page in the Catalog, from where the request can be approved or declined. The authority to approve Product lifecycle state changes is restricted to users in specified roles. For information on configuring Product lifecycle approvals for a Catalog, see [Creating and configuring Catalogs](#).

Note:

- Approval for Product lifecycle state changes in a Catalog is disabled by default. You must explicitly enable the Product lifecycle state changes that you want to enforce.
- Product lifecycle approvals can be configured only at the Catalog level. This feature is not available at the Space level.

If a Product is set to require approval for subscription by application developers, then an attempt by an application developer to subscribe to the Product results in an approval request being sent. This request is displayed in the Approvals tab in the Catalog that contains the associated Product in API Manager, from where the request can be approved or declined.

## Procedure

---

To work with a Product lifecycle change request, complete the following steps.

1. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with.  
The Products page of the Catalog opens, and all of the Products available in that Catalog are displayed.
2. If the Product that you want to work with is contained within a Space, select the required Space by completing the following steps
  - a. In the navigation pane of the API Manager UI, click  Spaces.
  - b. Select the Space that you want to work with.  
The Products page of the Space opens, and all of the Products available in that Space are displayed.
3. Click  Tasks in the API Manager UI navigation pane, then locate the Product lifecycle change request that you want to deal with.
4. Click the Approve or Decline as required.  
Note: You can approve or decline lifecycle change requests only if you have a user role that has permission to approve Product publish requests in the Catalog in which the changes will take place.  
For information on configuring Product management permissions for a Catalog, see [Creating and configuring Catalogs](#).

To work with a subscription request, complete the following steps.

5. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with.  
The Products page of the Catalog opens, and all of the Products available in that Catalog are displayed.
6. If the Product that you want to work with is contained within a Space, select the required Space by completing the following steps
  - a. In the navigation pane of the API Manager UI, click  Spaces.
  - b. Select the Space that you want to work with.  
The Products page of the Space opens, and all of the Products available in that Space are displayed.
7. Click  Tasks, then locate the subscription requests that you want to deal with.  
Note: To see subscription approvals, you must either be the owner of the API provider organization, or you must be assigned a user role that has permission to view or approve subscription requests. For information on creating and assigning user roles, see [Administering user access](#).
8. Click the Approve or Decline as required.  
Note: The options to approve or decline a subscription request are available only if you are assigned a user role that has permission to approve subscription requests. For information on configuring permissions for a Catalog, see [Creating and configuring Catalogs](#) For information on assigning user roles, see [Managing Catalog membership](#).

## Results

---

For a subscription request, an email is sent confirming whether you approved or declined the request. For a request to change the lifecycle state of a Product, no email is sent.

## Related concepts

## Managing the APIs in a Product

For a specific Product, you can take an individual API offline. If an API is taken offline then it becomes unavailable and calls to the API will fail.

## Before you begin

---

The Product must be in the Published or Deprecated state.

To complete the Product management tasks that are described in this topic, you must either be the owner of the API provider organization, or be assigned Manage permission for Products in the Catalog that contains the Product. If you have View permission for Products, you have read-only access to the Product management page.

For information on configuring Product management permissions for a Catalog, see [Creating and configuring Catalogs](#).

The syndication feature in IBM® API Connect means that Products can be contained within a Space in a Catalog. In this case, to complete the Product management tasks that are described in this topic, you must either be the owner of the API provider organization, or be assigned Manage permission for Products in the Space that contains the Product. For information on configuring Product management permissions for a Space, see [Managing user access in a Space](#).

## About this task

---

After a Product has been published to a Catalog, you can individually take any of its APIs offline so that the API is no longer available to be called. When required, you can make the API available again by putting it back online.

## Procedure

---

To manage the APIs in a Product, complete the following steps:

1. Locate the API that you want to work with:

- a. In the navigation pane of the API Manager UI, click  Manage, then select the Catalog that you want to work with.
- b. If Spaces are enabled in the Catalog, select the Space that you want to work with by completing the following steps:
  - i. In the navigation pane of the API Manager UI, click  Spaces.
  - ii. Select the Space that you want to work with.
- c. If the Products page is not already displayed, click  Products in the API Manager UI navigation pane.
- d. Alongside the Product version that you want to work with, click the options icon , then click Manage APIs. The Product APIs window opens, listing all the APIs in the Product.
- e. Locate the required API in the list.

2. To take an API offline, click the options icon  alongside the required API, then click Take Offline.

3. To make an API available that is currently offline, click the options icon  alongside the required API, then click Online.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## API Analytics

You can use IBM API Connect to filter, sort, and aggregate your API event data. You can present the results within correlated charts, tables, and maps to help you manage service levels, set quotas, establish controls, set up security policies, manage communities, and analyze trends.

API analytics is built on the Kibana open source analytics and visualization platform, which is designed to work with the Elasticsearch real-time distributed search and analytics engine.

Use the following tasks to configure and manage analytics:

- [Catalogs, Spaces, and Analytics](#)  
Understand how syndication and the use of Catalogs and Spaces affects the use of the features in IBM API Connect Analytics.
- [Accessing analytics](#)  
You can view predefined or customized analytics information for your IBM API Connect Catalogs within dashboards. If Spaces are enabled in your Catalogs, you can also view predefined or customized analytics information for your API Connect Spaces within dashboards.
- [The applications landing page](#)  
In IBM API Connect, each Catalog or Space has an applications landing page, which is a launching point for accessing the saved searches, dashboards, and visualizations that are available for that Catalog or Space. For more information about Catalogs and Spaces, see [Working with Catalogs](#) and [Using syndication in API Connect](#).
- [Dashboard application page](#)  
In IBM API Connect, each Catalog has its own default landing page, which lists the dashboards that are available for that Catalog.
- [Visualization application page](#)  
In IBM API Connect, you can use existing visualizations or create your own visualizations to organize the data on your dashboards.
- [Working with searches \(Discover\)](#)  
Use the IBM API Connect Analytics Discover tab to create and run searches against your analytics data.
- [Exporting API event data](#)  
You can obtain analytics and API event data from the API Manager user interface of IBM API Connect or by using REST API calls.
- [Troubleshooting Analytics start-up](#)  
If you receive an error starting the Analytics service after installing, upgrading, or recovering from a catastrophic failure of IBM API Connect, you might be able to resolve it by completing this task.

---

## Catalogs, Spaces, and Analytics

Understand how syndication and the use of Catalogs and Spaces affects the use of the features in IBM® API Connect Analytics.

The data for Analytics is collated from API events that are logged when API operations are invoked. Analytics data for an API is scoped to the Catalog or Space where that API resides, and is only included in search results (and thus, visualizations and dashboards) for the owning Catalog or Space. For example, you cannot create a single dashboard that includes data from multiple Catalogs.

Access to the analytics data, and to the analytics functions in the API Manager user interface, can be managed through the use of Catalogs and Spaces, and the roles and permissions that are assigned to the users (or *members*) of the provider organization.

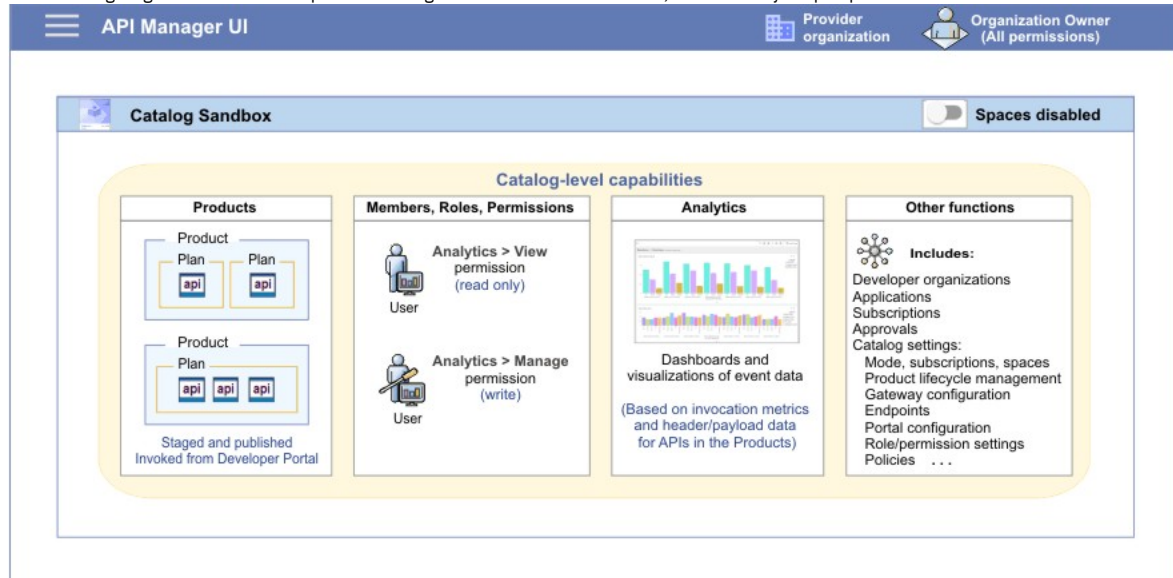

## Catalogs, Spaces, and permissions

Catalogs act as deployment targets through which APIs (in their containing Plans and Products) are staged and published to consumer organizations. API Manager users in the provider organization can be assigned the following access to the Analytics component for a Catalog:

- A role that has the `Analytics.>.View` permission for a Catalog: These users can view the analytics data generated for the APIs in the Catalog within *dashboards*, export dashboard data in its raw format or as event records, and apply filters to the data shown within the dashboards.
- A role that has the `Analytics.>.Manage` permission for a Catalog: These users have an implicit View permission. They can additionally complete the following actions:
  - Create, edit, and delete dashboards.
  - Create, edit, delete, export, and import the charts, tables, and maps.

For more information about creating and configuring Catalogs, and assigning roles and permissions to a Catalog, see [Working with Catalogs](#).

The following diagram shows an example of a Catalog with its associated functions, from an analytics perspective.

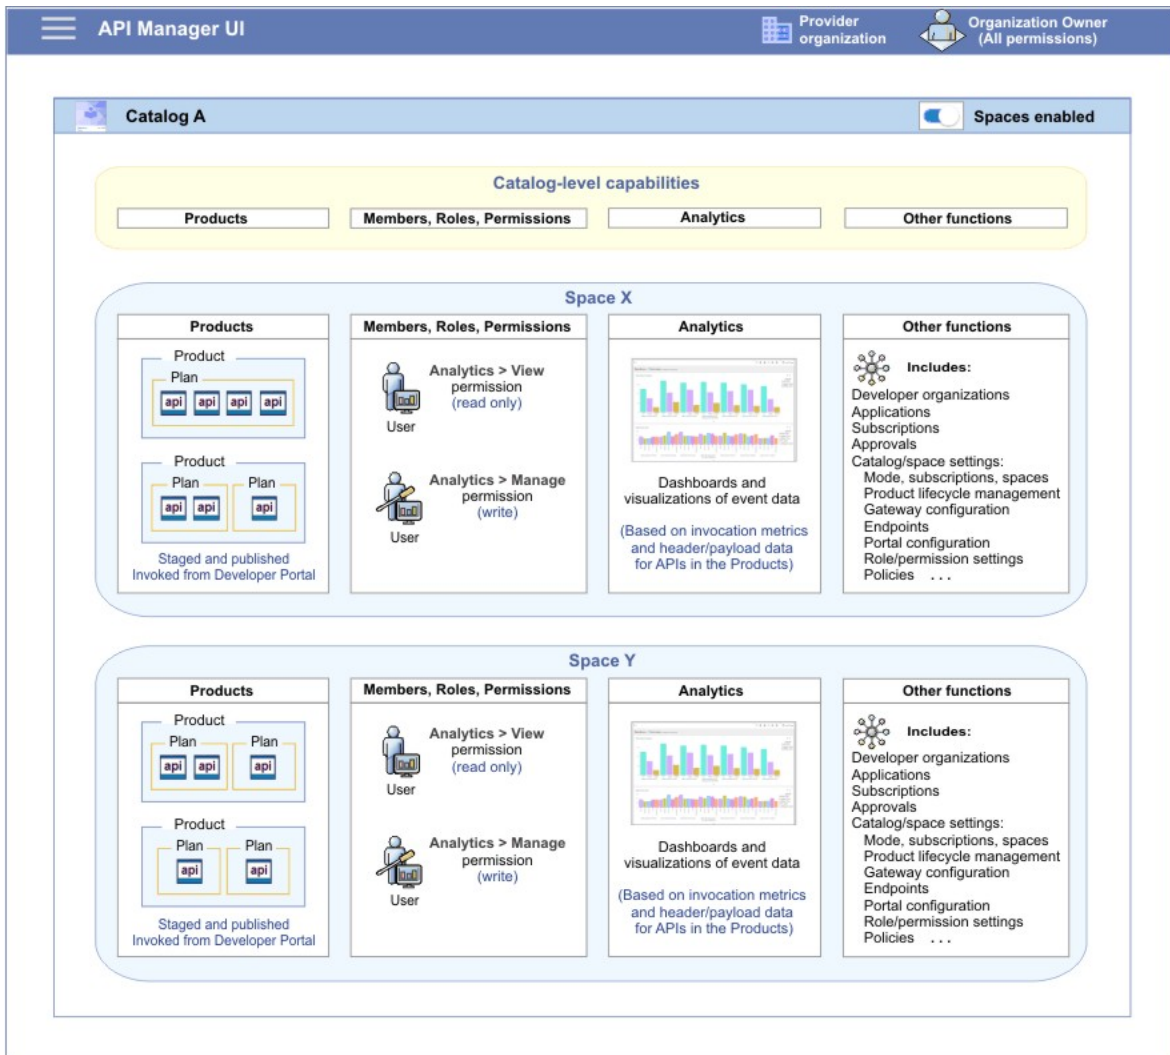

The IBM API Connect syndication feature provides a way for you to partition a Catalog into multiple deployment targets (or *Spaces*) through which separate groupings of APIs (in their containing Plans and Products) can be staged and published. Each Space can be allocated to a separate group of users who need to manage their Products independently, and the analytics data in each Space is scoped to those Products only. API Manager users in the provider organization can be assigned the following access to the Analytics component for a Space:

- A role that has the `Analytics.>.View` permission for a Space: These users can view the analytics data generated for the APIs in the Space within dashboards, export dashboard data in its raw format, and apply filters to the data shown within the dashboards.
- A role that has the `Analytics.>.Manage` permission for a Space: These users have an implicit View permission. They can additionally complete the following actions:
  - Create, edit, and delete dashboards.
  - Create, edit, delete, export, and import the charts, tables, and maps.

For information about enabling Spaces in a Catalog, setting up Spaces, and assigning roles and permissions to a Space, see [Using syndication in API Connect](#).

Note: Users can also be assigned a role with Catalog permissions, which provides a view of all Spaces (including analytics) in a Catalog.

The following diagram shows an example of a Catalog with its associated functions and Space partitions, from an analytics perspective.

For more information about assigning Catalog or Space permissions to a role, see [Managing Catalog membership](#) and [Managing Space membership](#).

For more information about the default API Manager roles and permissions, see [API Connect user roles](#).

## Dashboards and visualizations: Understanding the inheritance flow across Catalogs and Spaces

When you create a Catalog, a set of default API Manager dashboards, visualizations, and searches are added to the Catalog. If you enable Spaces in the Catalog, a similar set of default dashboards, visualizations, and searches are added to each Space. You can also create custom dashboards, visualizations, and searches in the Catalog and its Spaces, if you have the required permission.

A layered implementation is used to define an "inheritance" flow for dashboards, visualizations, and searches in a Catalog and its Spaces. This structure determines whether updates made to the dashboards, visualizations, and searches in a Catalog are reflected in a Space, and affects what you see when you attempt to edit, delete, or restore default dashboards, visualizations, or searches, or when you attempt to create, edit, or delete custom dashboards, visualizations, or searches.

To help you identify the state of a dashboard, visualization, or search as default, custom, or inherited, tags are applied to dashboards and visualizations within the API Manager user interface. These tags are visible on the main Discover, Visualize, and Dashboard pages, which list your saved searches, dashboards, and visualizations.

Searches, dashboards, and visualizations

For the searches, dashboards, and visualizations, the following principles apply for create, edit, or delete operations:

Create

- When you create a search, dashboard, or visualization in a Catalog, it is automatically added to the Spaces in that Catalog.
- When you create a search, dashboard, or visualization in a Space, the search, dashboard, or visualization is added to that Space only.

Edit

- You cannot edit a default search, dashboard, or visualization. You must clone it, and then edit the clone.
- Searches, dashboards, and visualizations that are created in the Catalog are propagated down to the Spaces in that Catalog.
- You cannot modify a Catalog search, dashboard, or visualization in the Space of the Catalog. You must clone it to modify it.
- Searches, dashboards, and visualizations that are created or cloned in a Space are not propagated up to the Catalog.

Delete

- You cannot delete a default search, dashboard, or visualization.

- When you delete a search, dashboard, or visualization from a Catalog, it is also deleted from the Spaces within that Catalog.
- When you delete a search, dashboard, or visualization from a Space, it is not deleted from the Catalog.
- If a search, dashboard, or visualization in a Space was inherited from a Catalog, and has not been edited in the Space, you cannot delete that search, dashboard, or visualization from the Space. You must delete it from the Catalog.

How tags are applied to searches, dashboards, and visualizations in the Discover, Dashboard, and Visualize pages

The Discover, Dashboard, and Visualize pages, display tags to highlight the state of a search, dashboard or visualization as admin, catalog, or space. At the Catalog level, the following tags are applied to searches, dashboards or visualizations in the list to indicate their state:

- Each default search, dashboard or visualization, which has not been customized, is tagged with a **admin** label.
- Each search, dashboard or visualization that was created or cloned in the Catalog is tagged with a **catalog** label.
- Each custom dashboard or visualization that was created in the Space is tagged with a **space** label.

For information about accessing the Manage Saved Objects page from the API Manager UI, see:

- [Editing visualizations](#)
- [Exporting visualizations](#)
- [Importing visualizations](#)
- [Deleting custom visualizations](#)
- [Editing dashboards](#)
- [Exporting dashboards](#)
- [Importing dashboards](#)
- [Deleting custom dashboards](#)

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Accessing analytics

You can view predefined or customized analytics information for your IBM® API Connect Catalogs within dashboards. If Spaces are enabled in your Catalogs, you can also view predefined or customized analytics information for your API Connect Spaces within dashboards.

### About this task

The analytics capabilities and functions are identical across Catalogs and Spaces. However, the analytics data is scoped to a Catalog when dashboards are accessed at the Catalog level, and the data is scoped to a Space when dashboards are accessed at the Space level. The ability to access analytics data at a Catalog or Space level depends on your assigned roles and permissions. For more information about Catalogs and Spaces, see [Working with Catalogs](#) and [Using syndication in API Connect](#).

Restriction: If the visualizations in your dashboards display no data or show data only for a time period in the past, a possible reason might be that access to analytics data within API Connect is switched off. Contact your cloud administrator for confirmation. (For more information, see [Configuring analytics offload for API Connect](#).)

### Procedure

- To open the analytics dashboard for any Catalog, complete the following steps:
  1. Log on to the API Manager that contains the Catalog for which you want to view the analytics.
  2. Select Manage  in the navigation.
  3. From the list of available Catalogs in the API Manager Dashboard, select the required Catalog.
  4. Select Analytics  in the navigation.  
The default analytics dashboard for the Catalog is displayed.
- To open the analytics dashboard for any Space, complete the following steps:
  1. Log on to the API Manager that contains the Catalog for which you want to view the analytics.
  2. Select Manage  in the navigation.
  3. From the list of available Catalogs in the API Manager Dashboard, select the required Catalog.
  4. Select Spaces  in the navigation.
  5. Select the Space that you want to view.
  6. Select Analytics  in the navigation.  
The default analytics dashboard for the Space is displayed.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## The applications landing page

In IBM® API Connect, each Catalog or Space has an applications landing page, which is a launching point for accessing the saved searches, dashboards, and visualizations that are available for that Catalog or Space. For more information about Catalogs and Spaces, see [Working with Catalogs](#) and [Using syndication in API Connect](#).

You can navigate to the different applications pages by using the Discover, Visualize, and Dashboard applications icons on the Applications landing page. You can return to this page when you are anywhere within the Analytics navigation by selecting Apps in the breadcrumb trail.

The applications landing page for Catalogs or Spaces displays a table with the following information:

**Name**

The names of the items in the last application that you viewed. For example, if you last viewed dashboards, then it lists the dashboard titles.

**Tags**

Tags that identify at what level the item was created, and the required access level that is required to change them. The following tags are supported:

**admin**

This items is provided with IBM API Connect. You cannot modify items with the **admin** tag. You must clone them if you want to customize them.

**catalog**

This item was created by someone with Catalog management permissions. You can only modify dashboards with the **catalog** tag if you have Catalog management permissions, or higher. If you only have space permissions, then you must clone it to modify it.

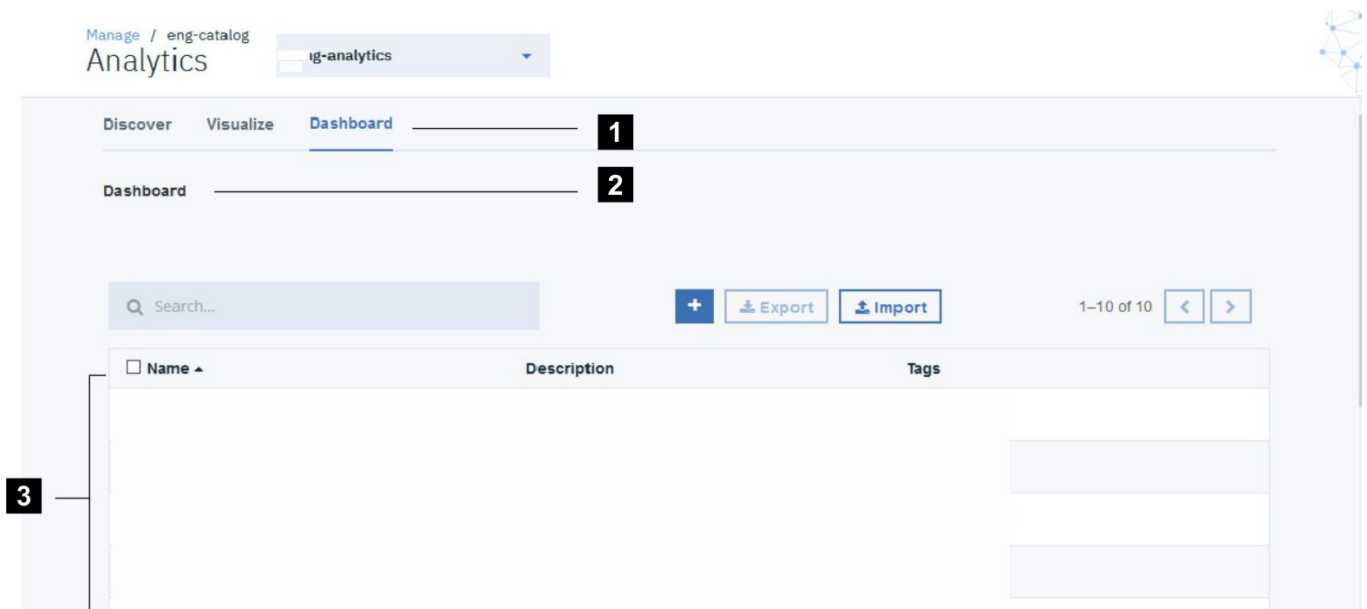

**space**

This dashboard was created by someone with space management permissions. You can only modify dashboards with the **space** tag if you have space management permissions, or higher.

## The screen elements of the applications landing page

The following image shows an example of the applications page of a Sandbox Catalog. While the screen elements of all of the application pages are similar, see the individual application page topics for specific information for each page:

- [Working with searches \(Discover\)](#)
- [Visualization application page](#)
- [Dashboard application page](#)

The screen elements are summarized in the following table.

Screen element	Description
1 Application selector	Indicates your selected application inside the analytics tab navigation. You can select a different application name to view the information for that application.
2 Breadcrumb trail	Indicates your location inside the analytics tab.
3 Instance information	Lists the instances of the last items that you viewed.

## Related tasks

- [Accessing analytics](#)

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details. For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Dashboard application page

In IBM® API Connect, each Catalog has its own default landing page, which lists the dashboards that are available for that Catalog.

If Spaces are enabled in your Catalogs, each Space also has its own default landing page with the list of dashboards that are available for the space. For more information about Catalogs and Spaces, see [Working with Catalogs](#) and [Using syndication in API Connect](#).

Note: Either an incognito tab, a separate browser instance, or a full page refresh is required for viewing dashboards in multiple Analytics services simultaneously.

The dashboard landing page for Catalogs or Spaces displays a table with the following information:

**Name**

The name of the dashboard. The names of the default dashboards are based on the information that is contained within the dashboard.

**Description**

A brief description of the dashboard and its purpose.

**Tags**

Tags that identify at what level the dashboard was created, and the required access level that is required to change them. The following tags are supported:

**admin**

This dashboard is provided with IBM API Connect. You cannot modify dashboards with the **admin** tag. You must clone them if you want to customize them.

**catalog**

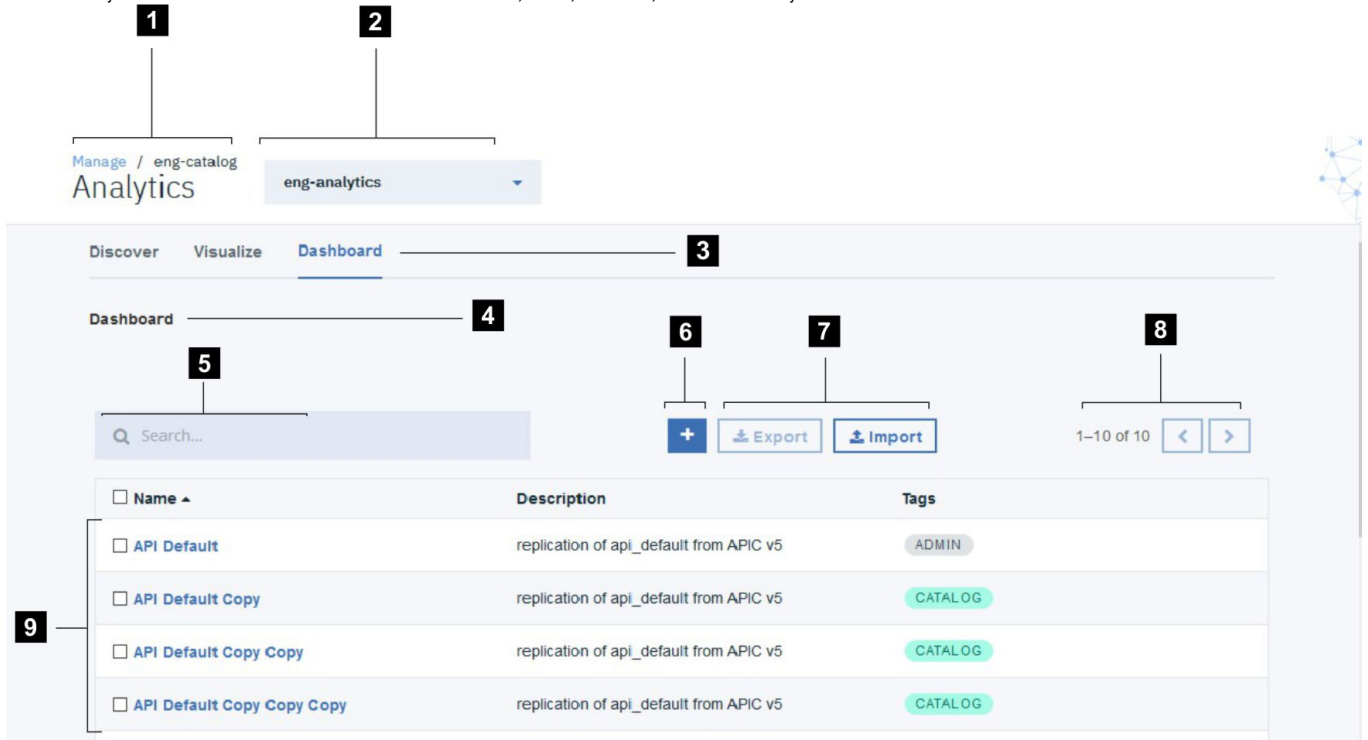

This dashboard was created by someone with catalog management permissions. You can only modify dashboards with the **catalog** tag if you have catalog management permissions. If you only have space permissions, then you must clone it to modify it.

**space**

This dashboard was created by someone with space management permissions. You can only modify dashboards with the **space** tag if you have space management permissions.

## The screen elements of the dashboard application page

The following image shows an example of the Overview dashboard for the Sandbox Catalog with sample data. Custom dashboards that you create for Catalogs or Spaces, and the Analytics dashboards for other entities such as Products, Plans, and APIs, have a similar layout.

The screen elements are summarized in the following table.

Screen element	Description
1 Catalog or Space name	Identifies the selected Catalog or Space.
2 Service identifier	Identifies the analytics service that you are viewing. If you only have one analytics service configured, there is only one possible value.
3 Application selector	Lists the applications that are available for this Catalog or Space. These are only displayed when Apps is selected in the breadcrumb trail.
4 Breadcrumb trail	Indicates your location inside the analytics tab navigation.
5 Search bar	Use this bar to filter the list of dashboards for the Catalog or Space.
6 Create a dashboard	Use this icon to create a customized dashboard. See <a href="#">Creating custom dashboards</a> .
7 Dashboard configuration icons	Use these icons to export dashboards that you want to reuse or back up, import previously exported dashboards to your available dashboards, or create dashboards.
8 Navigation icons	Use this icon to navigate through a large number of dashboards that require multiple screens. Each screen displays a maximum of 20 dashboards.
9 Dashboard information	Names and information about the dashboards for this Catalog or Space.

- **Default dashboards**  
IBM API Connect analytics provides some preconfigured dashboards for you to use to view common analytics data.
- **Cloning a dashboard**  
You can clone an existing dashboard to use it as a base for a customized dashboard.
- **Creating custom dashboards**  
You can use API Connect to create custom dashboards that group together a set of related visualizations.
- **Importing dashboards**  
You can import dashboards from other IBM API Connect users for use, or you can import dashboards from another Catalog on your system. If Spaces are enabled in a Catalog, you can also import dashboards from a Space.

- [Editing dashboards](#)  
You cannot edit the IBM API Connect preconfigured dashboards, but you can clone it to create a custom dashboard to add, edit, or remove visualizations, and to resize or rearrange visualizations. You can also use the Time Picker to change the time range of the data shown in the visualizations.
- [Exporting dashboards](#)  
You can export dashboards for backing up the configuration, or so they can be imported into other Catalogs on your IBM API Connect system. If Spaces are enabled in a Catalog, exported dashboards can also be imported into a Space.
- [Backing up and restoring dashboards](#)  
To ensure you can recreate your IBM API Connect analytics dashboards in the event of data loss, you should export them and save the files as a back-up. Then you can import the files later if needed.
- [Deleting custom dashboards](#)  
If a custom dashboard is no longer required, you can permanently delete it from IBM API Connect.

## Related tasks

---

- [Accessing analytics](#)

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Default dashboards

IBM® API Connect analytics provides some preconfigured dashboards for you to use to view common analytics data.

A list of dashboards is displayed when you open the default dashboards page for the first time. These dashboards provide examples of the data that you can view by using the analytics dashboards. You can use these dashboards as they are, or clone them to customize them to your needs. You cannot modify the existing dashboards. After you have cloned or created some of your own dashboards, your dashboards also appear in this list. The following dashboards are provided with API Connect:

### API Default

Includes general information about your APIs. This is the equivalent dashboard that was provided as api\_default in API Connect Version 5. It includes the following visualizations:

- Status Codes (detailed)  
Lists the detailed status codes of the API requests.
- Errors  
Displays the number of errors in a vertical bar graph.
- Minimum Response Time (ms)  
Lists the fastest response time of the APIs in milliseconds.
- Average response time (ms)  
Lists the average response time across all of the APIs in milliseconds.
- Maximum Response Time (ms)  
Lists the maximum response time of the APIs in milliseconds.
- Response Times (ms)  
Provides a complete list of the response times of the API calls in milliseconds.
- API calls  
Provides a list of the API calls.
- API Calls per day  
Provides a graphical representation of the number of API calls that occurred each day.

### Catalog Default

Includes general information about the most used Products in your Catalog. This is the equivalent dashboard for catalog\_default in API Connect Version 5. It includes the following visualizations:

- Top 5 Products Overall (Daily Usage)  
Displays a graph of your 5 Products that receive the most calls on a daily basis.
- Top 5 APIs Overall (Daily Usage)  
Displays a graph of your 5 APIs that receive the most calls on a daily basis.

### Monitoring Latency

Provides information about the amount of time that elapses after the API request is submitted and the transfer of data begins. It contains the following visualizations:

- Response Times (ms)  
Provides a complete list of the response times of the API calls in milliseconds.
- Response times (>1 sec)  
Displays the calls where the response times are greater than 1 second.  
Note: This visualization runs a search that limits the results to the last 500 calls.
- Average response time (ms)  
Lists the average response time across all of the APIs in milliseconds.
- Data Usage (bytes received)  
Lists the bytes of data that are received to complete your calls.
- Data Usage (bytes sent)  
Lists the bytes of data that are sent to complete your calls.
- Maximum Response Time (ms)  
Lists the maximum response time of the APIs in milliseconds.

## Monitoring Status

Provides information about monitoring the status of your API. This dashboard includes the following visualizations:

### Success Rate

Displays how many of your API calls were successful, compared to how many were submitted.

### Status Codes (simple)

Provides overview status codes for the API calls.

### API calls

Provides a list of the API calls.

### Errors

Displays the number of errors in a vertical bar graph.

### Successes

Lists the successful API calls.

Note: This visualization runs a search that limits the results to the last 500 calls.

## Portal Default

Provides information about the API requests to APIs in the Developer Portal. This is a replication of the portal\_default dashboard in API Connect Version 5. This dashboard includes the following visualizations:

### Success Rate

Displays how many of your API calls were successful, compared to how many were submitted.

### Data Usage (bytes sent)

Lists the bytes of data that are sent to complete your calls.

### Response Times (ms)

Provides a complete list of the response times of the API calls in milliseconds.

## Product Default

Provides information about the Products. This is a replication of the product\_default dashboard in API Connect Version 5. This dashboard includes the following visualizations:

### Developer Organizations

Lists the numerical value of the number of existing developer organizations.

### Apps per Plan

Displays a pie chart with the number of subscriptions to each Plan.

### API Calls per day

Provides a graphical representation of the number of API calls that occurred each day.

### API calls

Provides a list of the API calls.

### API Calls per day

Provides a graphical representation of the number of API calls that occurred each day.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Cloning a dashboard

You can clone an existing dashboard to use it as a base for a customized dashboard.

### About this task

---

You might want to customize a dashboard that is already created. Because the default dashboards that are provided with IBM® API Connect are read-only, you must clone a default dashboard to change it. You can clone any dashboard that you want to make additional changes to it without changing the original dashboard. To clone a dashboard, complete the following steps:

### Procedure

---

1. If you are not already in the Dashboard application, select Dashboard to view the list of available dashboards.
2. Select the dashboard that you would like to clone to open it.  
The dashboard opens, and the visualizations for that dashboard are displayed.
3. Select Clone in the menu bar to make a copy of the dashboard.
4. Enter a unique name for the new dashboard.
5. Select Confirm Clone to create the clone.  
The clone is created, and your new dashboard is opened.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Creating custom dashboards

You can use API Connect to create custom dashboards that group together a set of related visualizations.

## Before you begin

---

To create dashboards, you must either be the owner of the API provider organization, or be assigned a role that has the Analytics, Manage permission for the selected Catalog or Space. For information about enabling Spaces in a new or existing Catalog, see [Creating and configuring Catalogs](#) and [Enabling Spaces in a Catalog](#). For more information about assigning Catalog or Space permissions to a role, see [Managing Catalog membership](#) and [Managing Space membership](#).

## About this task

---

If Spaces are enabled in the selected Catalog, dashboards created at the Catalog level are added to all Spaces in the Catalog. However, if you create a dashboard within a Space, the dashboard is added to that Space only. For more information, see the *Dashboards and visualizations: Understanding the inheritance flow across Catalogs and Spaces* section in [Catalogs, Spaces, and Analytics](#).

When you create a dashboard, you can add previously saved visualizations, and then arrange and resize them as required in the dashboard. If you want to add a new visualization that does not yet exist to the new dashboard, you must first create the visualization to make it available for selection from the list of saved visualizations. For more information, see [Creating visualizations](#).

## Procedure

---

To create a custom dashboard, complete the following steps:

1. If you are not already in the Dashboard application, select Dashboard to view the list of available dashboards.
2. Select the New Dashboard icon  to open an empty dashboard.
3. To add visualizations to this dashboard, complete the following steps:
  - a. Click Add on the dashboard to add a new visualization.  
The list of saved visualizations is displayed.
  - b. Add one or more saved visualizations to the dashboard as follows:
    - i. From the list of saved and default visualizations, select a visualization.  
Tip: If you have a large set of saved visualizations, you can either browse through the saved list or use the visualization filter.  
The visualization is displayed at the end of the dashboard. Depending on the number of visualizations that are already on the dashboard, you might not see the newly added visualization until you close the saved list as described in step 4.
    - ii. Select any other visualizations that you want to add.
4. Close the list of saved and default visualizations by clicking Add new Visualization.
5. Arrange the visualizations in the required order by using the move icon  to drag and drop the visualizations in the preferred location in the dashboard. You can see this icon in the upper right-hand corner when you hover over a visualization on the dashboard.
6. Resize the visualization containers by dragging outwards or downwards from the lower right-hand corner to increase the size, or dragging inwards or upwards to decrease the size.
7. Optional: Change the time period against which the data in the visualizations is scoped. By default, a Last 15 minutes filter is applied. You can specify a different filter by using the Time Picker icon .
8. To save the new dashboard, complete the following steps:
  - a. Click Save in the menu bar.
  - b. Specify a name for the dashboard in the Title text field.
  - c. Add a description of the dashboard in the Description field that helps you identify it.
  - d. If you want to save the dashboard with the time period that you specified in step 7, select the Store time with dashboard check box.
  - e. Click the Save button to exit edit mode and view the dashboard.

## Results

---

The dashboard is added to a list of saved dashboards and can be opened at any time if you want view, edit, or share it.

## Related tasks

---

- [Editing dashboards](#)

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Importing dashboards

---

You can import dashboards from other IBM® API Connect users for use, or you can import dashboards from another Catalog on your system. If Spaces are enabled in a Catalog, you can also import dashboards from a Space.

Dashboards can be imported from .json files that contain one or more exported dashboard definitions.

Note: JSON files that contain a combination of exported visualizations and dashboards can also be imported as described in the following steps.

## Before you begin

---

To import dashboards, you must either be the owner of the API provider organization, or be assigned a role that has the Analytics\_>Manage permission for the selected Catalog or Space. If you import a dashboard into a Catalog, the analytics data is scoped at the Catalog level, and if imported into a Space, the data is scoped to that Space. For information about enabling Spaces in a new or existing Catalog, see [Creating and configuring Catalogs](#) and [Enabling Spaces in a Catalog](#). For more information about assigning Catalog or Space permissions to a role, see [Managing Catalog membership](#) and [Managing Space membership](#).

## Procedure

---

To import one or more dashboards, complete the following steps:

1. If you are not already in the Dashboard application, select Dashboard to view the list of available dashboards.  
The list of saved dashboards is displayed.
2. Select Import.
3. Navigate to the location where the .json file is stored and select the file to import it. If the file contains any dashboards that will overwrite existing ones on your system, new dashboards will be created even if they are duplicates.  
Remember that you cannot overwrite a default dashboard. If an imported dashboard has the same name as a default dashboard, it is saved with the same name but identified with a tag based on the whether it is a Catalog or Space dashboard.  
All dashboards in the .json file are added as individual objects to the Dashboards tab.

## Related tasks

---

- [Exporting dashboards](#)

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Editing dashboards

You cannot edit the IBM® API Connect preconfigured dashboards, but you can clone it to create a custom dashboard to add, edit, or remove visualizations, and to resize or rearrange visualizations. You can also use the Time Picker to change the time range of the data shown in the visualizations.

## Before you begin

---

To edit dashboards, you must either be the owner of the API provider organization, or be assigned a role that has the Analytics\_>Manage permission for the selected Catalog or Space. For information about enabling Spaces in a new or existing Catalog, see [Creating and configuring Catalogs](#) and [Enabling Spaces in a Catalog](#). For more information about assigning Catalog or Space permissions to a role, see [Managing Catalog membership](#) and [Managing Space membership](#).

## About this task

---

If Spaces are enabled in the selected Catalog, when you edit the dashboard at the Catalog level, your changes are reflected in the Catalog, and are also propagated to the corresponding inherited dashboard in each Space provided the dashboard has not been edited in the Space. However, changes that you make to a dashboard in a Space will apply only within that Space. For more information, see the *Dashboards and visualizations: Understanding the inheritance flow across Catalogs and Spaces* section in [Catalogs, Spaces, and Analytics](#).

Any visualizations that you want to add to the dashboard must already be in the list of saved visualizations. If you want to add a new visualization that does not yet exist, you must first create the visualization to make it available for selection from the list of saved visualizations. For more information, see [Creating visualizations](#).

## Procedure

---

To edit a dashboard, complete the following steps:

Remember: You cannot directly edit a default dashboard that is provided with IBM API Connect. See [Cloning a dashboard](#) for information about how to clone the dashboard and modify it.

1. Access the dashboard that you want to edit:
  - a. If you are not already in the Dashboard application, select Dashboard to view the list of available dashboards. The list of saved dashboards is displayed.
  - b. Select the dashboard that you want to edit to open it.  
If you have a large set of saved dashboards, you can either browse through the list or use the filter to locate the dashboard.
  - c. Select Edit in the menu bar of the dashboard. The dashboard opens in edit mode.
2. Modify the contents as required:
  - Add an existing visualization to the dashboard:
    - Select Add to add a visualization. The list of saved visualizations is displayed.
    - Select the visualization you want to add.  
Tip: If you have a large set of saved visualizations, you can either browse through the list or use the visualization filter to locate the visualization. The visualization is added to the dashboard, within a container (but might be obscured by the saved list). You can resize or reposition the visualization as described later.
    - Close the list of saved visualizations by clicking Save.
  - Edit a visualization in the dashboard.  
Important: When you edit a visualization in this way, you must overwrite the original visualization in the saved list when prompted, in order to have the changes reflected in the dashboard you are editing. Be aware however, that your changes will also be reflected in any other dashboards that contain this visualization. (This might be undesired.)

- Hover over the visualization and then click the Edit icon  that is displayed in the upper right-hand corner of the visualization container. The visualization builder page opens.
  - Update and save the visualization configuration as described in [Configuring visualizations](#). When you close the visualization builder page, you return to the dashboard being edited.
  - Remove a visualization from the dashboard by hovering over the visualization and then clicking the Delete icon  that is displayed in the upper right-hand corner of the visualization container. The action only removes the visualization container from the dashboard; it does not delete the visualization itself from the saved list.
  - Resize a visualization container from its lower right-hand corner by dragging inwards or upwards to decrease the size, or dragging outwards or downwards to increase the size.
  - Rearrange the visualizations by using the move icon  to drag and drop the visualizations in the required location in the dashboard. You can see this icon in the upper right-hand corner when you hover over a container.
  - Change the time period against which the data in the visualizations is scoped. You can specify a different filter by using the Time Picker icon .
3. When your changes are complete, save the dashboard as follows:
- a. Click Save in the menu bar.
  - b. If you specified a time period as described in step 2, and you want to save the dashboard with that time filter, select the Store time with dashboard check box.
  - c. Click the Save button and then confirm that you want to overwrite the current dashboard. Your changes are reflected in the saved dashboard.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details. For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Exporting dashboards

You can export dashboards for backing up the configuration, or so they can be imported into other Catalogs on your IBM® API Connect system. If Spaces are enabled in a Catalog, exported dashboards can also be imported into a Space.

Dashboards are exported as .json files, which can then be imported. When you export, the filters that are currently applied are preserved in the exported file.

### Before you begin

To export dashboards, you must either be the owner of the API provider organization, or be assigned a role that has the Analytics\_>\_Manage permission for the selected Catalog or Space. For information about enabling Spaces in a new or existing Catalog, see [Creating and configuring Catalogs](#) and [Enabling Spaces in a Catalog](#). For more information about assigning Catalog or Space permissions to a role, see [Managing Catalog membership](#) and [Managing Space membership](#).

### Procedure

To export one or more dashboards, complete the following steps:

1. If you are not already in the Dashboard application, select Dashboard to view the list of available dashboards. The list of saved dashboards is displayed.
2. From the Dashboards tab, export one, several, or all dashboards as follows:
  - To export a single dashboard, locate the dashboard, select its check box, and then select Export.
  - To export several dashboards, locate each dashboard and select its check box. Then select Export.
  - To export all dashboards, select the Select All check box at the beginning of the Name column. Then select Export.

Tip: If you have a large set of saved dashboards, you can either browse through the list or use the filter to locate the dashboards.
3. Choose to save the file, which is named export.json by default. The file is saved to the download location that is configured for your browser. If you intend to export more than once, and you are exporting to the same location each time, you might want to rename each file with a meaningful name to help you differentiate between them.

### Related tasks

- [Importing dashboards](#)

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details. For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Backing up and restoring dashboards

To ensure you can recreate your IBM® API Connect analytics dashboards in the event of data loss, you should export them and save the files as a back-up. Then you can import the files later if needed.

### About this task

API Connect does not back up dashboards, so it is good practice to create your own backups by exporting all of your dashboards.

This task only operates on the dashboard metadata, not on the analytics data.

## Procedure

---

1. Export your dashboards as explained in the topic, [Exporting dashboards](#).
2. If you need to restore the dashboards, import them as explained in the topic, [Importing dashboards](#).

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Deleting custom dashboards

If a custom dashboard is no longer required, you can permanently delete it from IBM® API Connect.

Note: You cannot delete the default dashboards.

## Before you begin

---

To delete custom dashboards, you must either be the owner of the API provider organization, or be assigned a role that has the Analytics\_>Manage permission for the selected Catalog or Space. For information about enabling Spaces in a new or existing Catalog, see [Creating and configuring Catalogs](#) and [Enabling Spaces in a Catalog](#). For more information about assigning Catalog or Space permissions to a role, see [Managing Catalog membership](#) and [Managing Space membership](#).

## About this task

---

If Spaces are enabled in the selected Catalog, when you delete the dashboard at the Catalog level, the corresponding inherited dashboard is also deleted from each Space if it has not been edited in the Space. If you delete a dashboard that was created in a Space and is unique to that Space, the dashboard is removed from that Space.

If a custom dashboard is inherited from a Catalog and has not been edited in a Space, you cannot delete that dashboard from the Space, and must delete it from the Catalog if necessary. Similarly, an inherited dashboard that has been updated in a Space also cannot be deleted from that Space, and must be deleted from the Catalog.

For more information, see the *Dashboards and visualizations: Understanding the inheritance flow across Catalogs and Spaces* section in [Catalogs, Spaces, and Analytics](#).

## Procedure

---

To delete one or more dashboards, complete the following steps:

1. If you are not already in the Dashboard application, select Dashboard to view the list of available dashboards.  
The list of saved dashboards is displayed.  
Tip: After the deletion, you are returned to the currently loaded dashboard, so it might be best to start this task from a dashboard that you do not intend to delete at the current time. If you delete the currently loaded dashboard, you are returned to the Overview dashboard by default, with the following error message displayed in the notification banner: `Could not locate that dashboard (id: dashboard_ID)`. You can click OK to close the message.
2. From the Dashboards tab, delete one or several dashboards as follows:

- To delete a single dashboard, locate the dashboard, select its check box, and then click the Delete icon .
- To delete several dashboards, locate each dashboard and select its check box. Then click the Delete icon .

Tips:

- If you have a large set of saved dashboards, you can either browse through the list or use the filter to locate the dashboards.
- Each default dashboard is tagged with a **Admin** label. Default dashboards that have been customized are additionally tagged with either a **Catalog** or a **Space** label. Any dashboard that is tagged with a **Admin** label cannot be deleted.
- Any dashboard that is inherited from a **Catalog** must be deleted from the Catalog.

3. Confirm the deletion.

Note: If a default dashboard was selected for deletion, a message is displayed in the notification banner to indicate that default dashboards cannot be deleted.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Visualization application page

In IBM® API Connect, you can use existing visualizations or create your own visualizations to organize the data on your dashboards.

You can access the visualizations application page by selecting Analytics in the navigation for a Catalog. Select Apps\_>Visualize to open the Visualization page.

The visualization landing page displays a table with the following information:

Name

The name of the visualization. The names of the default visualizations are based on the information that is contained within the visualization. This list contains both preconfigured visualizations and customized visualizations.

Type

The format of the data in the visualization.

Tags

Tags that identify at what level the visualization was created, and the required access level that is required to change them. The following tags are supported:

admin

This visualization is provided with IBM API Connect. You cannot modify visualizations with the `admin` tag. You must clone them if you want to customize them.

catalog

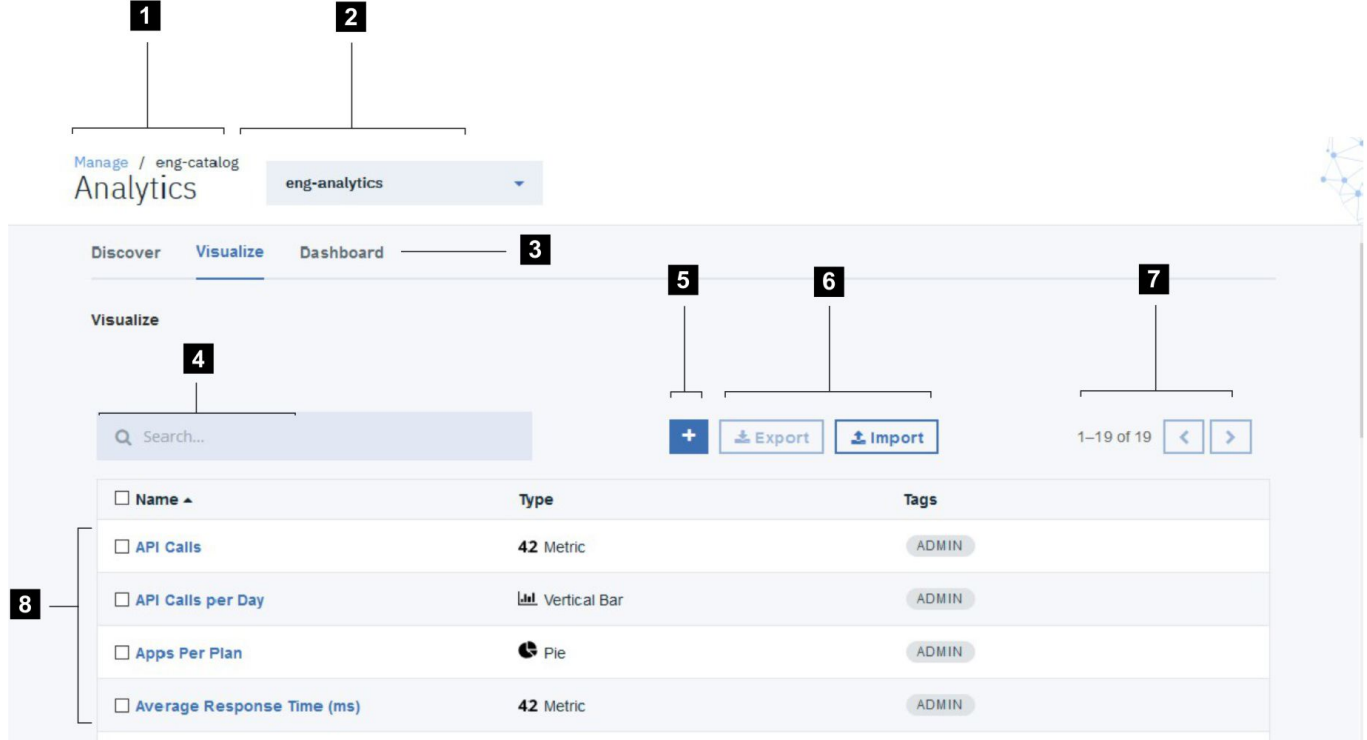

This visualization was created by someone with catalog management permissions. You can only modify visualizations with the `catalog` tag if you have catalog management permissions. If you only have space permissions, then you must clone it to modify it.

space

This visualization was created by someone with space management permissions. You can only modify visualizations with the `space` tag if you have space management permissions.

## The screen elements of the visualize application page

The following image shows an example of the visualizations for the Sandbox Catalog with sample data. Custom visualizations that you create for Catalogs or Spaces, and the Analytics visualizations for other entities such as Products, Plans, and APIs, have a similar layout.

The screen elements are summarized in the following table.

Screen element	Description
1 Catalog or Space name	Identifies the selected Catalog or Space.
2 Service identifier	Identifies the analytics service that you are viewing. If you only have one analytics service configured, there is only one possible value.
3 Application selector	Indicates your selected application inside the analytics tab navigation. You can select a different application name to view the information for that application.
4 Search bar	Use this bar to filter your visualizations for the Catalog or Space.
5 Create a visualization	Use this icon to create a customized visualization. See <a href="#">Creating visualizations</a> .
6 Visualization configuration icons	Import or export your visualization to integrate a visualization or share one.
7 Navigation icons	Use these icons to navigate through a large number of visualizations that require multiple screens. Each screen displays a maximum of 20 visualizations.
8 Visualization information	Names and information about the saved visualizations for this Catalog or Space.

- [Visualizations](#)  
Visualizations provide a way for you to apply a series of search criteria to your indexed data, compute metrics, and then graphically present the results in a convenient format for analysis or review. IBM API Connect analytics provides some preconfigured visualizations for you to use to view common analytics data on your dashboards. You can also create your own visualizations.
- [Applying filters to change the sampling of data displayed in visualizations](#)  
You can apply different types of filters to change your view of the data in your IBM API Connect visualizations.
- [Creating visualizations](#)  
You can create visualizations from the Visualize application page or when modifying a custom dashboard in IBM API Connect. All visualizations that you create are added to a list of saved visualizations, and can be used in any dashboard.
- [Importing visualizations](#)  
You can import visualizations from other IBM API Connect users for use in your dashboards, or you can import visualizations from another Catalog on your system. If Spaces are enabled in a Catalog, you can also import visualizations from a Space.

- [Exporting visualizations](#)  
You can export visualizations so they can be imported by other IBM API Connect users, or into other Catalogs on your system. If Spaces are enabled in a Catalog, exported visualizations can also be imported into a Space.
- [Backing up and restoring visualizations](#)  
To ensure you can recreate your IBM API Connect analytics visualizations in the event of data loss, you should export them and save the files as a back-up. Then you can import the files later if needed.
- [Deleting custom visualizations](#)  
If no longer required for use in your IBM API Connect dashboards, you can permanently delete your custom visualizations.

## Related tasks

---

- [Accessing analytics](#)

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Visualizations

Visualizations provide a way for you to apply a series of search criteria to your indexed data, compute metrics, and then graphically present the results in a convenient format for analysis or review. IBM® API Connect analytics provides some preconfigured visualizations for you to use to view common analytics data on your dashboards. You can also create your own visualizations.

## Default visualizations

---

A list of visualizations is displayed when you select Visualize in the application selector and open the visualization application page for the first time. These are preconfigured visualizations of some common ways to parse and view analytics data. You can use these visualizations as they are, or clone them to customize them to your needs. You cannot modify the existing visualizations. After you have cloned or created some of your own visualizations, your visualizations also appear in this list. The following default visualizations are provided with API Connect:

### API calls

Provides a list of the API calls.

### API Calls per day

Provides a graphical representation of the number of API calls that occurred each day.

### Apps per Plan

Displays a pie chart with the number of subscriptions to each Plan.

### Average response time (ms)

Lists the average response time across all of the APIs in milliseconds.

### Data Usage (bytes received)

Lists the bytes of data that are received to complete your calls.

### Data Usage (bytes sent)

Lists the bytes of data that are sent to complete your calls.

### Developer Organizations

Lists the numerical value of the number of existing developer organizations.

### Errors

Displays the number of errors in a vertical bar graph.

### Maximum Response Time (ms)

Lists the maximum response time of the APIs in milliseconds.

### Minimum Response Time (ms)

Lists the fastest response time of the APIs in milliseconds.

### Response Times (ms)

Provides a complete list of the response times of the API calls in milliseconds.

### Response times (>1 sec)

Displays the calls where the response times are greater than 1 second.

Note: This visualization runs a search that limits the results to the last 500 calls.

### Status Codes (detailed)

Lists the detailed status codes of the API requests.

### Status Codes (simple)

Provides overview status codes for the API calls.

### Subscribed Apps

Lists the number of subscribed apps.

### Success Rate

Displays how many of your API calls were successful, compared to how many were submitted.

### Successes

Lists the successful API calls.

Note: This visualization runs a search that limits the results to the last 500 calls.

### Top 5 APIs Overall (Daily Usage)

Displays a graph of your 5 APIs that receive the most calls on a daily basis.

### Top 5 APIs Overall (Overall Usage)

Displays a graph of your 5 APIs that receive the most calls..

### Top 5 Products Overall (Daily Usage)

Displays a graph of your 5 Products that receive the most calls on a daily basis.

### Top 5 Products Overall (Overall Usage)

Displays a graph of your 5 Products that receive the most calls.

## Created visualizations

You cannot directly modify the default visualizations. You can clone and modify them, or create your own from scratch. The visualizations that you clone or create are added to the list of default visualizations. The created visualizations are designated with a **Catalog** or a **Space** tag.

API Connect supports the following types of visualizations:

- Area chart
- Bar chart
- Coordinate map
- Data table
- Gauge
- Goal
- Heat map
- Line chart
- Markdown widget
- Metric
- Pie chart
- Region map
- Tag cloud
- Tile map
- Vertical bar chart

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Applying filters to change the sampling of data displayed in visualizations

You can apply different types of filters to change your view of the data in your IBM® API Connect visualizations.

- [Filtering API events in your visualizations](#)
- [Specifying a time period and auto-refresh rate for the data in your visualizations](#)
- [Drilling down into data in your time-based visualizations](#)
- [Applying a filter by using the legend in a visualization](#)

## Filtering API events in your visualizations

In a dashboard, the visualizations depict information that relates to all the API events that occur for the selected Catalog in the IBM API Connect organization, and which are scoped to a specified time range. You can further filter the API events by using a free text search or a Lucene search query.

### Procedure

To filter the API events, complete the following steps:

1. To perform a free text search, delete the asterisk character (\*) if shown, and then enter a text string in the search bar. For example, to filter for an API called **accounts**, enter `accounts` in the search bar.

Then, press Enter or click the Search icon .

The visualizations are refreshed to show the results of your search query.

2. To use the Lucene query syntax, complete the following steps:

- a. In the search bar, delete the asterisk character (\*) if shown, and then enter a search string.

For basic search queries, use the following guidelines:

Guideline	Example
Construct searches on field names and their actual values by using this syntax: <code>field_name:value</code> . Field names and their values are case-sensitive.	<code>app_name:legacyquote</code>
Where required for numeric fields, use comparison operators such as greater than (>), less than (<), or equal to (=).	<code>rateLimit.count:&gt;10</code>
Use the logic operators AND, OR, and NOT to combine search terms.	<code>app_name:livequote OR app_name:legacyquote</code>

For detailed information about the Lucene query syntax, see [Apache Lucene - Query Parser Syntax](#). For information about the API event fields that you can specify in search queries, see [API event record fields](#).

Tip: Two quick ways to check for the field names on certain visualizations are to check the tooltip, or to click the caret icon  (which is displayed in the lower left-hand corner when you hover over the container) to display the raw data behind the visualization.

- b. Press Enter or click the Search icon .

The visualizations are refreshed to show the results of your search query.

3. To revert to your previous view of the dashboard, delete the search query in the search bar and press Enter.

## Specifying a time period and auto-refresh rate for the data in your visualizations

You can change the time period to which your visualization data relates by using the Time Picker. The defined time filter will be applied to all relevant visualizations in the IBM API Connect dashboard.

### Procedure

To apply a time filter and auto-refresh rate, complete the following steps:

1. From the dashboard, click the Time Picker icon .
2. From the Time Picker, use one of these options to set a time filter:

#### Quick

Select this option to choose a predefined value such as Today, Yesterday, This week, or Last *n* minutes.

#### Relative

Select this option to specify a start time that is relative to now; for example, 20 seconds, minutes, hours, days, weeks, or months ago, optionally rounded to the specified unit of time. The date and time that corresponds to your "relative" selection is displayed before the fields. Click Go.

#### Absolute

Select this option to specify a precise time range. Either use the calendars to select a From and To date, or enter the values directly into the fields by using the date and time format specified underneath the fields. Click Go.

Notice that Auto-refresh is also shown to the left-hand of the Time Picker icon when you open the Time Picker.

3. If you want to additionally specify a frequency at which the data should automatically be refreshed in your visualizations, click Auto-refresh and then select a predefined refresh interval.
4. If you set an auto-refresh interval as described in the previous step, click the auto-refresh value, which is displayed next to the Time Picker icon , to confirm your settings and close the time selection panels. If you did not set an auto-refresh interval, close the Time Picker panel by clicking within the box where the Time Picker icon  is located. The search query is resubmitted as you make your selections and the visualizations in the dashboard are automatically refreshed to show the matching data. The specified quick, relative, or absolute filter setting is shown to the right-hand side of the Time Picker icon . If set, the auto-refresh interval is shown to the left-hand side of the Time Picker icon, together with a Pause icon that can be used to pause auto-refresh if required.  
Tip: To switch off the auto-refresh capability, click the auto-refresh value next to the Time Picker icon, and click Off. Then, close the Refresh Interval panel by clicking within the Auto-refresh box next to the Time Picker icon.

## Drilling down into data in your time-based visualizations

On time-based visualizations that display histograms, you can zoom in on a specific time range on the chart. This is equivalent to applying a filter for an "absolute" time period.

### Procedure

To zoom in on your data, complete one of the following steps:

- In the chart, move your cursor to the area that depicts the start time, and hover over the x-axis so that the cursor changes to a plus (+). Click and then drag the mouse to select a boxed area that depicts the time range you want to examine. Release the mouse button to zoom in on the area and view the data in greater detail.

The filter is applied to all time-based visualizations in the current dashboard, and the start and end time range is shown to the right-hand side of the Time Picker icon .

Tip: To remove the filter, click the browser Back button. Alternatively, use the Time Picker icon to select the previous, or a different time range.

- Bar charts only: To zoom in on a particular bar, click that bar in the chart, and then in the filter banner that is displayed underneath the search bar, click Apply Now.

## Applying a filter by using the legend in a visualization

For any chart that includes a legend, you can use the legend labels to apply inclusion (or *positive*) filters to that chart and other relevant charts on the dashboard. When you use the legend in this way to specify inclusion, data is displayed only for the selected item. You can alternatively apply exclusion (or *negative*) filters to exclude the data for a selected item. You can also apply other filter conditions in addition to inclusion and exclusion filters.

### Procedure

To apply a filter from the legend of a chart such as an area chart, line chart, pie chart, or vertical bar chart, complete the following steps:

1. In the chart, click a legend label to apply a filter for that item.  
The color picker opens as displayed in the following example, which shows the label and color picker for a Product named **Clothing**. Notice that two icons are also shown above the colored dots.

Tip: You can change the color of the lines, slices, or bars on a chart by clicking the colored dots in the color picker to select a preferred color. To retain these colors, you will have to save the dashboard.

2. Apply an inclusion or exclusion filter as follows:
  - To apply an inclusion filter that shows data associated with that item only (for example, the **Clothing** Product), click the Positive Filter icon . A blue inclusion filter oval and an Actions twistie are displayed beneath the search bar of the dashboard, as shown in the following example. The filter condition (which in this case is `product_name: "Clothing"`) is also shown in the filter oval.

product\_name: "Clothing" Actions ▶

- To apply an exclusion filter that excludes data about that item from the chart, click the Negative Filter icon . A red exclusion filter oval and an Actions twistie are displayed beneath the search bar of the dashboard, as shown in the following example. The filter condition (for example, `product_name: "Clothing"`) is also shown in the filter oval.

product\_name: "Clothing" Actions ▶

3. Hover over the filter oval to view the filter icons and use these icons to apply other filter conditions.

The following image shows an example of the filter icons for an inclusion filter, and also shows the Actions twistie in an expanded state. The Actions twistie provides equivalent options for the icons. For an exclusion filter, similar icons are shown in a red oval.

All filters: Enable Disable Pin Unpin Invert Toggle Remove

Icon	Description	Equivalent Actions option
	Click this icon to temporarily disable the inclusion or exclusion filter that was set in step 2. When you disable an inclusion filter, the filter oval is shown in a blue striped color, and the chart displays all the data again. (For a disabled exclusion filter, the filter oval is shown in a red striped color.) To enable the filter again, click the icon again.	Disable Enable  Toggle is an alternative for Enable/Disable.
	Click this icon to pin the filter. A pin icon is shown to the left-hand side of the filter condition in the blue (or red) oval as an indication. Pinning a filter causes it to be applied to other dashboards that you open. To unpin the filter, hover over the oval and click the pin icon again.	Pin Unpin
	Click this icon to toggle the filter to instead show excluded items (that is, those items that do <i>not</i> match the filter condition). The toggle action switches between applying an inclusion filter and an exclusion filter to the data in the visualization. When the exclusion filter is applied, the filter oval switches from blue to red  .	Invert
	Click this icon to remove the filter and restore the chart to its original state.	Remove
	Click this icon to display the JSON representation of the filter. If required, you can directly modify the JSON code to change your filter query and then specify an alias that can be used as the filter name. To see an example of how to use this option, see the <a href="#">Edit Filter</a> section within the <i>Filtering by Field</i> topic in the Kibana documentation.	

Example of how an inclusion filter works when enabled: Suppose the filter condition `product_name: "Clothing"` is applied to the first visualization, which shows the five most active Products. A second visualization in the same dashboard, which shows the five most active APIs, would automatically be refreshed to display data only for those APIs in the Product named `Clothing`.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Creating visualizations

You can create visualizations from the Visualize application page or when modifying a custom dashboard in IBM® API Connect. All visualizations that you create are added to a list of saved visualizations, and can be used in any dashboard.

### Before you begin

To create visualizations, you must either be the owner of the API provider organization, or be assigned a role that has the `Analytics:manage` permission for the selected Catalog or Space. For information about enabling Spaces in a new or existing Catalog, see [Creating and configuring Catalogs](#) and [Enabling Spaces in a Catalog](#). For more information about assigning Catalog or Space permissions to a role, see [Managing Catalog membership](#) and [Managing Space membership](#).

### About this task

If Spaces are enabled in the selected Catalog, visualizations created at the Catalog level are added to all Spaces in the Catalog. However, if you create a visualization within a Space, the visualization is added to that Space only. For more information, see the *Dashboards and visualizations: Understanding the inheritance flow across Catalogs and Spaces* section in [Catalogs, Spaces, and Analytics](#).

To create a visualization from a new dashboard page, complete the following steps:

### Procedure

- Click the New Dashboard icon  to create a new dashboard.
- Select Add to prepare to add visualizations.
- Select Add new Visualization.
- From the Select visualization type page, choose a visualization type, and then configure and save it as described in [Configuring visualizations](#). You return to the new dashboard page.

### Results

The new visualization is added to the list of saved visualizations and can be selected for use.

- [Configuring visualizations](#)  
Use this information either when creating a visualization or when editing an existing visualization.
- [Editing visualizations](#)  
You can edit a visualization either from a dashboard that contains that visualization or by managing your saved objects.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Configuring visualizations

Use this information either when creating a visualization or when editing an existing visualization.

### Before you begin

---

As a starting point for this task, you must have completed one of the following actions:

- Clicked Add, and then Create new Visualization in a new dashboard page to open the Select visualization type page. (In this case, start from step [1](#) in the procedure that follows.)
- Clicked Edit from an existing dashboard, and then clicked Add to open the Create new Visualization page. (In this case, start from step [1](#) in the procedure that follows.)
- Clicked the Edit icon  on a visualization container on an existing dashboard, to open the visualization builder page. (In this case, start from step [2](#) in the procedure that follows.)
- Clicked the Edit icon  for a visualization to open the visualization builder page. (In this case, start from step [2](#) in the procedure that follows.)

To configure visualizations, you must either be the owner of the API provider organization, or be assigned a role that has the Analytics > Manage permission for the selected Catalog or Space. For information about enabling Spaces in a new or existing Catalog, see [Creating and configuring Catalogs](#) and [Enabling Spaces in a Catalog](#). For more information about assigning Catalog or Space permissions to a role, see [Managing Catalog membership](#) and [Managing Space membership](#).

### About this task

---

When you configure visualizations, you use the following Elasticsearch aggregations to define the type and level of information to be retrieved and displayed:

- metrics: You can configure one or more metric aggregations that will calculate metrics based on values extracted from the indexed data fields. (Indexed fields are searchable and are available for use in visualizations.)
- buckets: Buckets operate in a similar way to SQL GROUP BY statements and enable aggregate functions to be performed on a filtered data set. You can configure one or more bucket aggregations that will sort your data according to the criteria specified.

For detailed information about aggregations, see the [Elasticsearch aggregations reference](#). For information about the indexed data fields that can be specified while configuring visualizations, see [API event record fields](#).

You can also specify view options for each visualization type; for example, the capability to show or hide the tooltip and legend.

**Note:** The API Manager analytics component loads with a preselected default index pattern, which identifies the index against which search and analytics are run, and which scopes the Kibana queries to the default Catalog. To ensure tenant and Catalog isolation, this default index pattern cannot be customized by users.

### Procedure

---

To configure a visualization, complete the following steps:

1. From the Create New Visualization page, choose the type of visualization that you want to create:
  - Area chart
  - Bar chart
  - Coordinate map
  - Data table
  - Gauge
  - Goal
  - Heat map
  - Line chart
  - Markdown widget
  - Metric
  - Pie chart
  - Region map
  - Tag cloud
  - Tile map
  - Vertical bar chart

Tip: If necessary, review the guidance on the page to help you decide which type you need.

2. From the visualization builder page, define the content and layout for the visualization you are creating or editing.  
You can configure your settings by using the visualization builder controls in the left-hand pane, and then view the results of your actions in the preview canvas on the right.
  - a. From the Data tab in the visualization builder, configure the metric and bucket aggregations for the visualization.
  - b. From the Options tab in the visualization builder, specify view options for the visualization.

For full details about completing the visualization builder for your selected visualization, see the following information in the Kibana documentation:

- [Area Charts](#)
- [Bar Charts](#)
- [Coordinate Maps](#)
- [Data Table](#)
- [Gauge Chart](#)
- [Goal Charts](#)
- [Heat Map Chart](#)
- [Line Charts](#)
- [Markdown Widget](#)
- [Metric](#)
- [Pie Charts](#)
- [Region Maps](#)
- [Timelion](#)
- [Tag Clouds](#)
- [Vertical Bar Charts](#)

For additional information about visualizations and aggregations, see the [Creating a Visualization](#) section in the Kibana documentation.

As you configure each setting in the visualization builder, you can click Apply changes  to view the results of your action within the preview canvas, or click

Discard changes  to undo a change. You can also click the Refresh icon  to refresh the visualization preview. If you are creating a complex visualization, you might find it useful to save and name the visualization (as described in step 3) after the initial metric or bucket aggregations are configured, and then save in stages as you configure more aggregations for the visualization.

3. When the configuration is complete, save the visualization:
  - a. Click Save.
  - b. Specify a name for the visualization in the text field (if not already specified).
  - c. Click the Save button. (If you have previously saved, confirm that you want to overwrite.)
4. Select Analytics in the navigation to exit the visualization builder page.

You return to the previous dashboard.

  - If you created a visualization, it is added to the saved list.
  - If you edited an existing visualization, your changes are reflected in any dashboards that contain that visualization.

## Related tasks

---

- [Creating custom dashboards](#)
- [Creating visualizations](#)
- [Editing dashboards](#)
- [Editing visualizations](#)

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Editing visualizations

You can edit a visualization either from a dashboard that contains that visualization or by managing your saved objects.

### Before you begin

---

To edit visualizations, you must either be the owner of the API provider organization, or be assigned a role that has the Analytics\_>Manage permission for the selected Catalog or Space. For information about enabling Spaces in a new or existing Catalog, see [Creating and configuring Catalogs](#) and [Enabling Spaces in a Catalog](#). For more information about assigning Catalog or Space permissions to a role, see [Managing Catalog membership](#) and [Managing Space membership](#).

### About this task

---

If Spaces are not enabled in the selected Catalog, all dashboards that contain the modified visualization will be updated to reflect the changes made for that visualization. If Spaces are enabled in the selected Catalog, when you edit a visualization at the Catalog level, your changes are reflected in all dashboards (which contain that visualization) in the Catalog. Your changes are also reflected in the corresponding visualization in each Space if the visualization was inherited from the Catalog and has not been edited in the Space. However, changes that you make to a visualization in a Space will apply only within that Space. For more information, see the *Dashboards and visualizations: Understanding the inheritance flow across Catalogs and Spaces* section in [Catalogs, Spaces, and Analytics](#).

### Procedure

---

To edit a visualization, complete either of the following steps:

- Edit a visualization in a dashboard.

Important: When you edit a visualization in this way, you must overwrite the original visualization in the saved list when prompted, in order to have the changes reflected in the dashboard you are editing. Be aware however, that your changes will also be reflected in any other dashboards that contain this visualization. (This might be undesired.)

  1. From a dashboard that contains the visualization you want to edit, locate the visualization, hover over it, and then click the Edit icon  that is displayed in the upper right-hand corner of the container. The visualization builder page opens.
  2. Update and save the visualization configuration as described in [Configuring visualizations](#).

When you close the visualization builder page, you return to the dashboard and can see the updated visualization.

- Edit a visualization by managing your saved objects.
  1. From a dashboard, click Edit, then Add.  
The list of saved visualizations is displayed.
  2. Click Manage Visualizations to open the Manage Saved Objects page.  
This page contains separate tabs that show a listing of all your saved dashboards and visualizations, and the total counts.
  3. From the Visualizations tab, locate the visualization you want to edit.  
Tip: If you have a large set of saved visualizations, you can either browse through the list or use the filter to locate the visualization.
  4. Click the Edit button  for the visualization. The visualization builder page opens.
  5. Update and save the visualization configuration as described in [Configuring visualizations](#).  
When you close the visualization builder page, you return to the previous dashboard. If you now open any dashboard that contains the edited visualization, your changes will be reflected in that dashboard.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Importing visualizations

You can import visualizations from other IBM® API Connect users for use in your dashboards, or you can import visualizations from another Catalog on your system. If Spaces are enabled in a Catalog, you can also import visualizations from a Space.

Visualizations can be imported from .json files that contain one or more exported visualization definitions.

Note: JSON files that contain a combination of exported visualizations and dashboards can also be imported as described in the following steps.

### Before you begin

To import visualizations, you must either be the owner of the API provider organization, or be assigned a role that has the Analytics\_...\_Manage permission for the selected Catalog or Space. If you import a visualization into a Catalog, the analytics data is scoped at the Catalog level, and if imported into a Space, the data is scoped to that Space. For information about enabling Spaces in a new or existing Catalog, see [Creating and configuring Catalogs](#) and [Enabling Spaces in a Catalog](#). For more information about assigning Catalog or Space permissions to a role, see [Managing Catalog membership](#) and [Managing Space membership](#).

### Procedure

To import one or more visualizations, complete the following steps:

1. From a dashboard, click Edit, then Add.  
The list of saved visualizations is displayed.
2. Click Manage Visualizations to open the Manage Saved Objects page.  
This page contains separate tabs that show a listing of all your saved dashboards and visualizations, and the total counts. The Visualizations tab is displayed by default.
3. Click the Import button.
4. Navigate to the location where the .json file is stored and select the file to import it. If the file contains any visualizations that will overwrite existing ones on your system, new visualizations will be created even if they are duplicates.  
All visualizations in the .json file are added as individual objects to the Visualizations tab.
5. Click the Close button to close the page and return to the dashboard.

### Related tasks

- [Exporting visualizations](#)

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Exporting visualizations

You can export visualizations so they can be imported by other IBM® API Connect users, or into other Catalogs on your system. If Spaces are enabled in a Catalog, exported visualizations can also be imported into a Space.

Visualizations are exported as .json files, which can then be imported.

### Before you begin

To export visualizations, you must either be the owner of the API provider organization, or be assigned a role that has the Analytics\_>\_Manage permission for the selected Catalog or Space. For information about enabling Spaces in a new or existing Catalog, see [Creating and configuring Catalogs](#) and [Enabling Spaces in a Catalog](#). For more information about assigning Catalog or Space permissions to a role, see [Managing Catalog membership](#) and [Managing Space membership](#).

---

## Procedure

To export one or more visualizations, complete the following steps:

1. From a dashboard, click Edit, then Add.  
Tip: You can also start from the Visualize application page by selecting Visualize.  
The list of saved visualizations is displayed.
2. From the Visualizations tab, export one, several, or all visualizations as follows:
  - To export a single visualization, locate the visualization, select its check box, and then click Export.
  - To export several visualizations, locate each visualization and select its check box. Then click Export.
  - To export all visualizations, select the Select All check box and then click Export.Tip: If you have a large set of saved visualizations, you can either browse through the list or use the filter to locate the visualizations.
3. Choose to save the file, which is named export.json by default. The file is saved to the download location that is configured for your browser. If you intend to export more than once, and you are exporting to the same location each time, you might want to rename each file with a meaningful name to help you differentiate between them.

---

## Related tasks

- [Importing visualizations](#)

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Backing up and restoring visualizations

To ensure you can recreate your IBM® API Connect analytics visualizations in the event of data loss, you should export them and save the files as a back-up. Then you can import the files later if needed.

---

## About this task

API Connect does not back up visualizations, so it is good practice to create your own backups by exporting all of your visualizations.

This task only operates on the visualization metadata, not on the analytics data.

---

## Procedure

1. Export your visualizations as explained in the topic, [Exporting visualizations](#).
2. If you need to restore the visualizations, import them as explained in the topic, [Importing visualizations](#).

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Deleting custom visualizations

If no longer required for use in your IBM® API Connect dashboards, you can permanently delete your custom visualizations.

Note: You cannot delete the default visualizations.

---

## Before you begin

To delete custom visualizations, you must either be the owner of the API provider organization, or be assigned a role that has the Analytics\_>\_Manage permission for the selected Catalog or Space. For information about enabling Spaces in a new or existing Catalog, see [Creating and configuring Catalogs](#) and [Enabling Spaces in a Catalog](#). For more information about assigning Catalog or Space permissions to a role, see [Managing Catalog membership](#) and [Managing Space membership](#).

---

## About this task

If Spaces are enabled in the selected Catalog, when you delete a visualization at the Catalog level, the corresponding inherited visualization is also deleted from each Space if it has not been edited in the Space. If you delete a visualization that was created in a Space and is unique to that Space, the visualization is removed from that Space.

If a custom visualization is inherited from a Catalog and has not been edited in a Space, you cannot delete that visualization from the Space, and must delete it from the Catalog if necessary. Similarly, an inherited visualization that has been updated in a Space also cannot be deleted from that Space, and must be deleted from the Catalog.

## Procedure

To delete one or more visualizations, complete the following steps:

1. From a dashboard, click Edit, then Add.  
Tip: You can also start from the Visualize application page by selecting Visualize. The list of saved visualizations is displayed.
2. From the Visualizations tab, delete one or several visualizations as follows:

- To delete a single visualization, locate the visualization, select its check box, and then click the Delete icon .
- To delete several visualizations, locate each visualization and select its check box. Then click the Delete icon .

Tips:

- If you have a large set of saved visualizations, you can either browse through the list or use the filter to locate the visualizations.
- Each default visualization is tagged with a **Admin** label. Default visualizations that have been customized are tagged with a **Catalog** or **Space** tag. Any visualization that is tagged with an **Admin** tag cannot be deleted.
- Each custom visualization is tagged with a **Catalog** or **Space** tag. Any visualization that is at the Space level but inherited from the Catalog level cannot be deleted at the Space level. It must be deleted at the Catalog level.

3. Confirm the deletion.

Note:

- If a default visualization was selected for deletion, a message is displayed in the notification banner to indicate that default visualizations cannot be deleted.
- If you delete a visualization that is currently inserted in one or more dashboards, the visualization container is retained in those dashboards and displays the following message: `Could not locate that visualization (id: visualization_ID)`. You will have to remove the visualization container from these dashboards.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

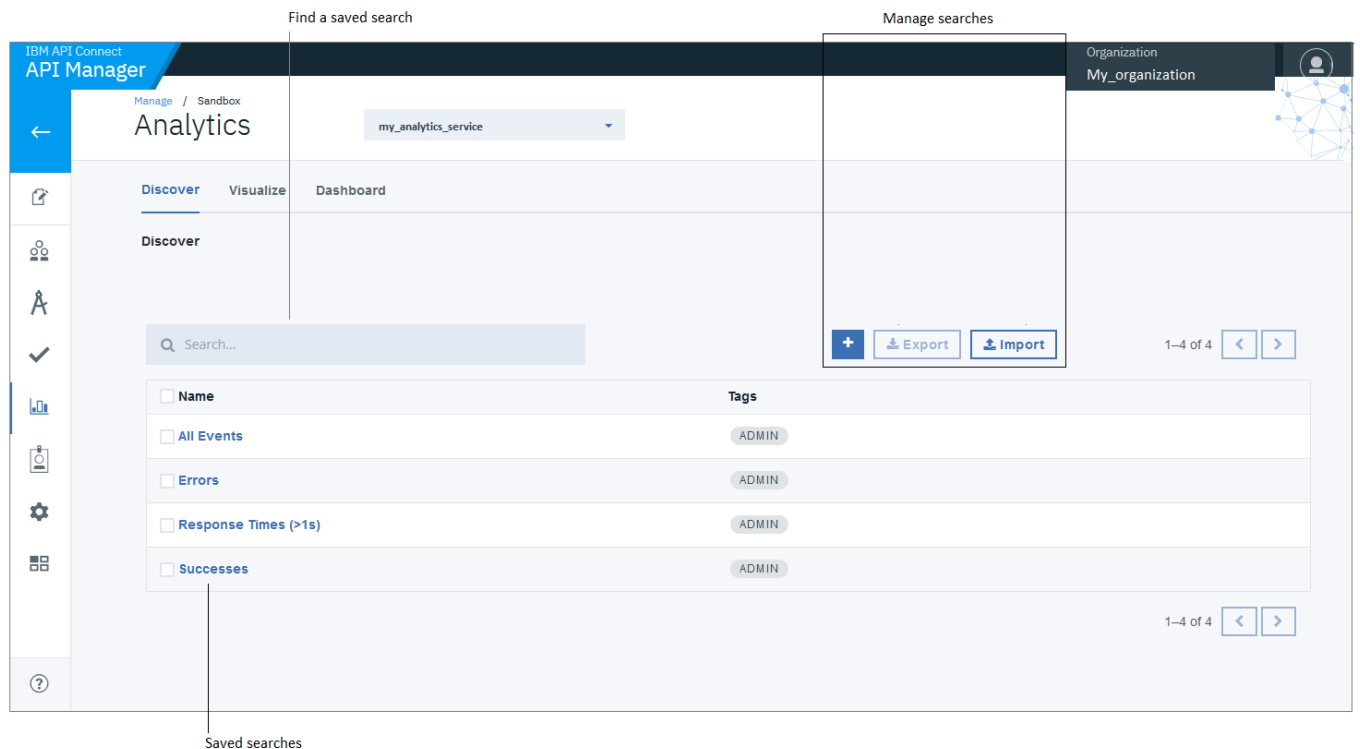

## Working with searches (Discover)

Use the IBM® API Connect Analytics Discover tab to create and run searches against your analytics data.

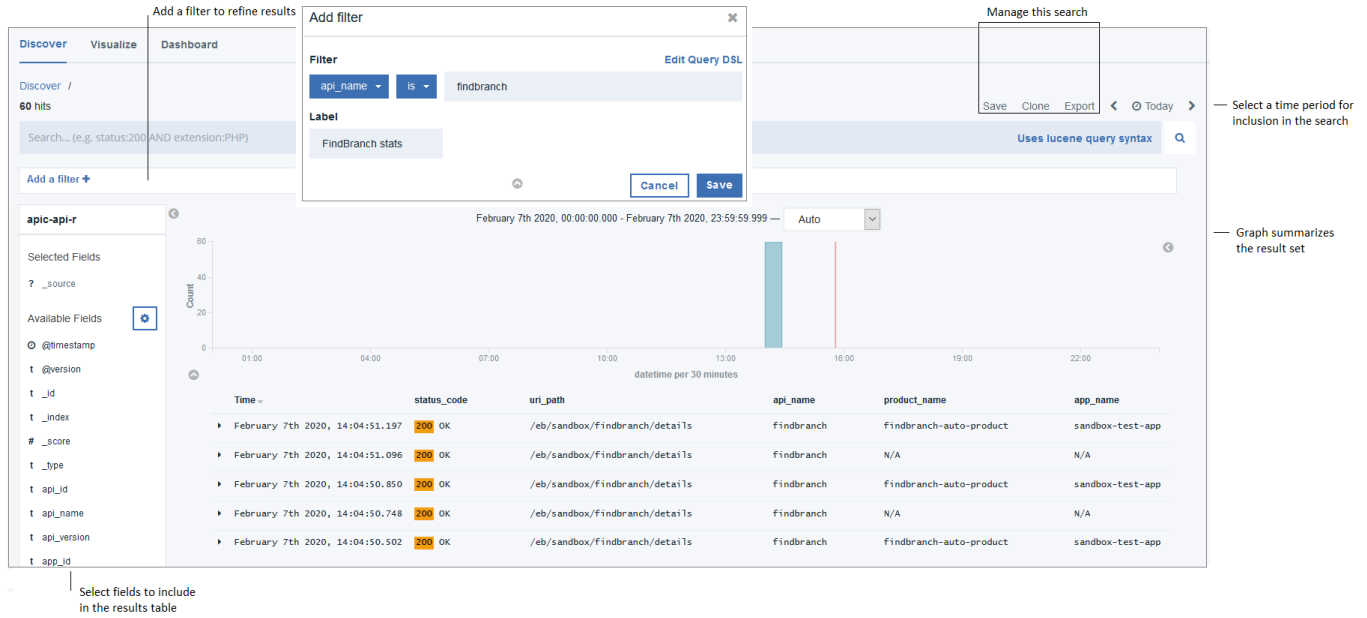

Each search is based on a query that is written using Lucene query syntax, which is described in the [Elasticsearch documentation](#).

Saved searches display a title and a tag that indicates the level of permissions needed to modify the query. For example, if a saved search is tagged with **catalog** then you must have Analytics Manage permissions at the Catalog scope to modify it; otherwise you must clone it and customize your own copy. Searches tagged with **admin** are predefined and cannot be modified but they can be cloned and then customized.

The following image shows the Discover page with the predefined searches.

Any user with Analytics View permissions can run a saved search and view the results, as well as export a saved search to JSON format by selecting the search and clicking Export. Users with Analytics Manage permissions can additionally create new searches by clicking  and defining a query, or by clicking Import and importing a JSON file that contains a query definition. The following image shows the results of the predefined "Successes" search.

The screenshot displays the 'Discover' tab in the IBM API Connect Analytics interface. It shows a search for 'findbranch' with 60 hits. An 'Add filter' dialog is open, showing a filter for 'api\_name' with the value 'findbranch'. Below the dialog, a bar chart shows a single bar at 16:00. A table below the chart lists search results with columns for Time, status\_code, uri\_path, api\_name, product\_name, and app\_name. The table contains five rows of data, all with a status\_code of '200 OK' and a uri\_path of '/eb/sandbox/Findbranch/details'. On the left, a sidebar shows 'Selected Fields' and 'Available Fields'. On the right, a 'Manage this search' dialog is open, showing 'Save', 'Clone', and 'Export' options. Annotations with arrows point to the 'Add filter' dialog, the 'Manage this search' dialog, the bar chart, and the table.

- **[Creating searches](#)**  
Use the IBM API Connect Analytics Discover tab to create new searches by defining a search query, or to import a search query that is stored in a JSON format file. You can then use saved searches to create visualizations.
- **[Editing searches](#)**  
Use the IBM API Connect Analytics Discover tab to modify searches.
- **[Exporting searches](#)**  
You can export searches for backing up the definitions, or so they can be imported into other Catalogs on your IBM API Connect system. If Spaces are enabled in a Catalog, exported searches can also be imported into a Space.
- **[Importing searches](#)**  
You can import searches from other IBM API Connect users for use, or you can import searches from another Catalog on your system. If Spaces are enabled in a Catalog, you can also import searches from a Space.
- **[Backing up and restoring searches](#)**  
To ensure you can recreate your IBM API Connect searches in the event of data loss, you should export them and save the files as a back-up. Then you can import the search definitions later if needed.
- **[Deleting searches](#)**  
Use the IBM API Connect Analytics Discover tab to delete searches.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details. For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Creating searches

Use the IBM® API Connect Analytics Discover tab to create new searches by defining a search query, or to import a search query that is stored in a JSON format file. You can then use saved searches to create visualizations.

## Before you begin

To create searches, you must either be the owner of the API provider organization, or be assigned a role that has the Analytics - Manage permission for the selected Catalog or Space.

## About this task

When you create a search at the Catalog level, the search is automatically added to all of the Spaces in that Catalog. When you create a search in a Space, the search is added only to the current Space.

## Procedure

1. [Navigate to the Analytics feature for the Catalog or Space where you want to create a search.](#)
2. Click Discover to open the Discover tab, where you can create and manage searches.
3. Click .

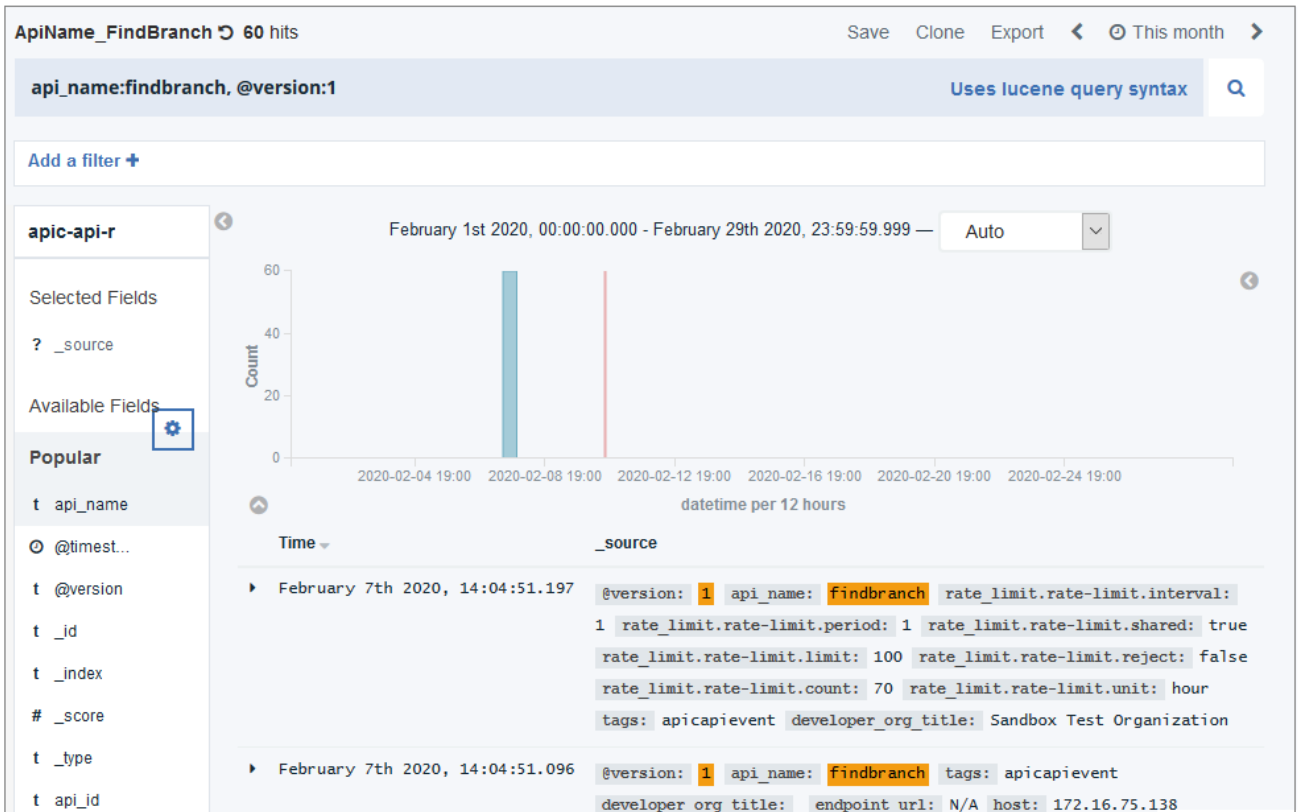

4. Use the Search field to define a query using [Lucene query syntax](#) as explained in the Elasticsearch documentation.

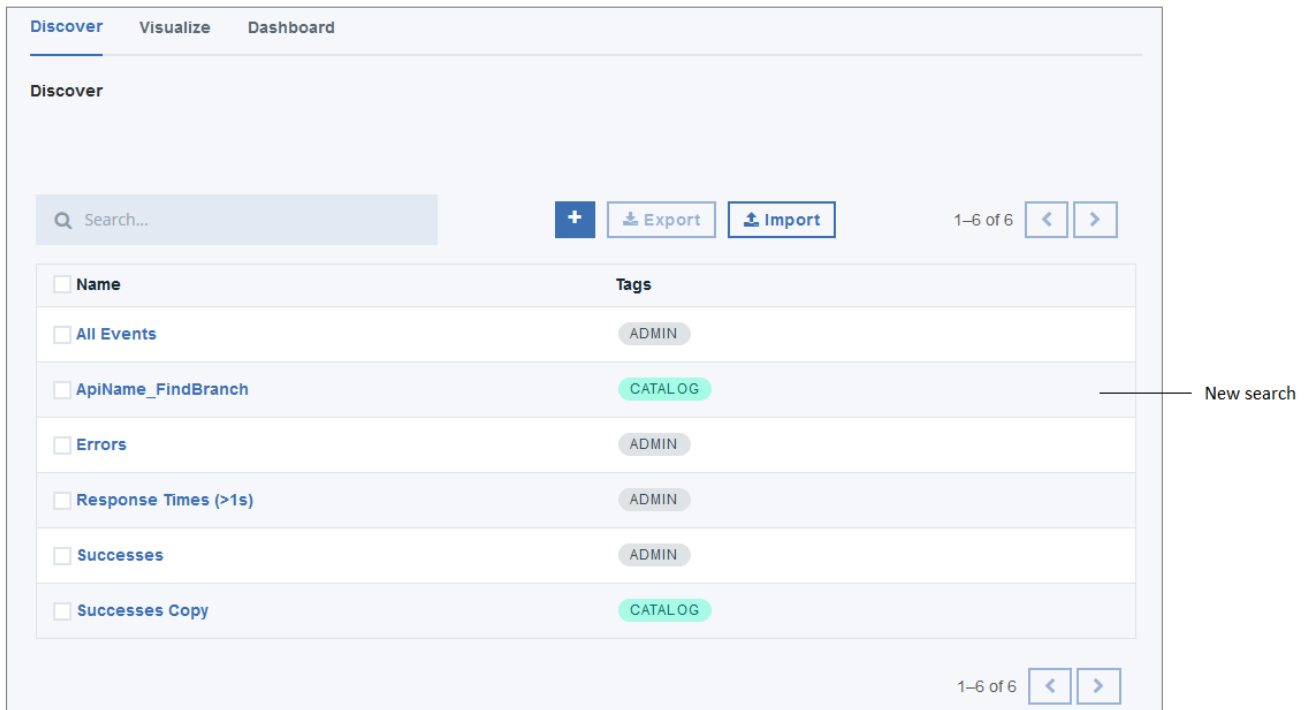

5. Click  and select a time range for the API events to be included in the search results.

6. Click  to run the search.

7. Save the search by clicking Save, providing a name for the search (the name defaults to "New Saved Search"), and clicking **Save**. The saved search is added to the displayed list of saved searches.

## Results

When your searches are saved, you can use them on the Visualize tab to display search results in graphical formats such as charts and maps.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details. For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Editing searches

Use the IBM® API Connect Analytics Discover tab to modify searches.

### Before you begin

---

To edit searches, you must either be the owner of the API provider organization, or be assigned a role that has the Analytics - Manage permission for the selected Catalog or Space.

### About this task

---

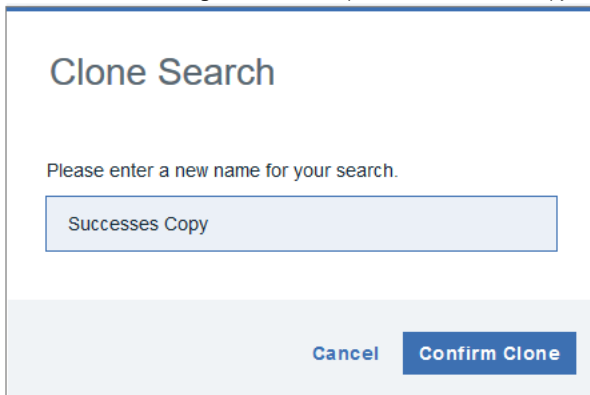

When you modify a search, you can run it immediately and see the new result set on the Discover tab. The new results might also appear in the visualizations and dashboards that use the search. Whether the visualizations and dashboards based on that search are updated to reflect the new result set depends on their scope and inheritance.

For example, if you select a Space and modify the search there, then the change only applies to the version of the search that runs within that Space. Versions of the search stored in other Spaces are not updated. If you modify the search at the Catalog scope, then the changes are applied across the entire Catalog and all Spaces within in it.

### Procedure

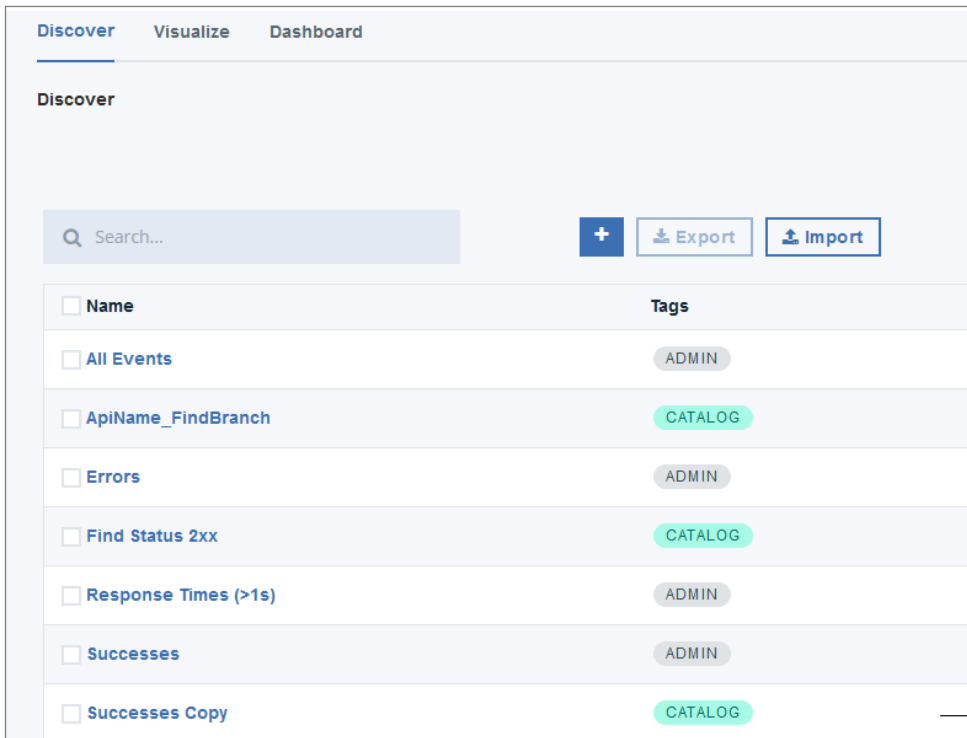

---

1. [Navigate to the Analytics feature for the Catalog or Space where you want to modify a search.](#)
2. Click Discover to open the Discover tab, where you can create and manage searches.
3. If you want to modify a search that you don't have permission to edit, clone it first by completing the following steps:  
In addition to belonging to a role with Analytics - Manage permission, you must have access to the scope in which the search was created if you want to edit that search directly. If you do not have the correct permissions to edit the search, you can clone it and then edit the copy to customize it. The tag that displays next to the search name indicates the scope of permissions required to edit the search. A predefined search (displays the **Admin** tag) cannot be modified and must always be cloned. A search tagged with **Space** can only be modified by users who have access to the Space in which the search was created. A search tagged with **Catalog** can be modified by all users of the current Catalog.
  - a. Click the name of the search that you want to clone.
  - b. Click Clone.
  - c. In the Clone Search dialog box, click Clone, provide a name for the copy (the name defaults to "Search-name Copy"), and then click Confirm Clone.

The image shows a 'Clone Search' dialog box. At the top, it says 'Clone Search'. Below that, it asks 'Please enter a new name for your search.' There is a text input field containing 'Successes Copy'. At the bottom of the dialog, there are two buttons: 'Cancel' and 'Confirm Clone'.

The new, editable copy of the search immediately appears in the list of saved searches.

4. In the list of searches, click the name of the search that you want to modify.
5. Edit the search query and the time frame for the search as needed.
6. Click Save to update the saved search or optionally store a new copy of the search.

A dialog box displays where you can optionally rename the search or save it as a new search. Complete the fields and click **Save**.

Name of search being edited                      Name of new copy of search

Save copy as a new search

Note: If you provide a new name for the search, it is saved with that name and the search that you originally selected to modify is left unchanged. If you select Save as a new search then a new search is created with the specified name. If you save a new search but do not change the name, a message displays to confirm that you want to create a different search using the same name. Click Save search to confirm that you want to save it as a new search.

If you save the search with an duplicate name, the search list displays both versions of the search with the older search appearing first.

Newest copy of search

You can edit searches and save them with new names to remove duplication.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details. For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Exporting searches

You can export searches for backing up the definitions, or so they can be imported into other Catalogs on your IBM® API Connect system. If Spaces are enabled in a Catalog, exported searches can also be imported into a Space.

## Before you begin

To export searches, you must either be the owner of the API provider organization, or be assigned a role that has the Analytics - Manager permission for the selected Catalog or Space.

## About this task

Searches are exported as .json files, which can then be [imported](#).

## Procedure

1. [Navigate to the Analytics feature for the Catalog or Space where you want to create a search.](#)
2. Click Discover to open the Discover tab, where you can create and manage searches.
3. Select the searches that you want to export into a single JSON file.

Discover Visualize Dashboard

Discover

Search...

Export Import

Name	Tags
<input checked="" type="checkbox"/> All Events	ADMIN
<input checked="" type="checkbox"/> ApiName_FindBranch	CATALOG
<input type="checkbox"/> ApiName_FindBranch	CATALOG
<input type="checkbox"/> Errors	ADMIN
<input checked="" type="checkbox"/> Find Status 2xx	CATALOG
<input type="checkbox"/> Response Times (>1s)	ADMIN

Select all

Export

- Click
- Choose whether to open the file now or save it as export.json to your local "downloads" location.

## Results

The selected searches are exported to a single file called export.json.

Tip: If you plan to export multiple files, rename them after each download to avoid confusion.

```

1  [
2  {
3    "_type": "search",
4    "_source": {
5      "title": "All Events",
6      "description": "",
7      "hits": 0,
8      "columns": [],
9      "sort": [
10     "datetime",
11     "desc"
12   ],
13   "version": 1,
14   "kibanaSavedObjectMeta": {
15     "searchSourceJSON":
16     "{\"index\":\"apic-api-r\",\"highlightAll\":true,\"version\":true,\"filter\":[]}"
17   },
18   "default": true
19 }
20 ]

```

You can import the searches in this file to another Space or Catalog.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Importing searches

You can import searches from other IBM® API Connect users for use, or you can import searches from another Catalog on your system. If Spaces are enabled in a Catalog, you can also import searches from a Space.

### Before you begin

To import searches, you must either be the owner of the API provider organization, or be assigned a role that has the Analytics - Manage permission for the selected Catalog or Space.

### About this task

Searches can be imported from .json files that contain one or more exported search definitions. When you import a search at the Catalog level, the search is automatically added to all of the Spaces in that Catalog. When you import a search into a Space, the search is added only to the current Space.

Your search query must be contained in a JSON format file. If the file contains multiple search definitions, they will all be imported. For each search definition, the value in the `title` field is used as the new search's name.

```
1 [
2   {
3     "_type": "search",
4     "_source": {
5       "title": "Find Status 2xx",
6       "description": "",
7       "hits": 0,
8       "columns": [
9         "status_code",
10        "uri_path",
11        "api_name",
12        "product_name",
13        "app_name"
14      ],
15      "sort": [
16        "datetime",
17        "desc"
18      ],
19      "version": 1,
20      "kibanaSavedObjectMeta": {
21        "searchSourceJSON":
22        "{\"index\":\"apic-api-r\",\"highlightAll\":true,\"version\":true,\"filter\":[],\"query\":{\"query_string\":{\"query\":\"status_code:2*\",\"analyze_wildcard\":true}}}"
23      },
24      "catalog_id": "dd010c40-8bd6-460d-a12ff-fbcd3635f13f",
25      "org_id": "3f535b9b-baef-39ab-8ffd-495839b32408"
26    }
27  ]
```

### Procedure

1. [Navigate to the Analytics feature for the Catalog or Space where you want to create a search.](#)
2. Click Discover to open the Discover tab, where you can create and manage searches.
3. Click  Import.
4. Select the JSON file containing the search query and click Open.

### Results

The imported search is saved automatically and added to the displayed list of saved searches.

The screenshot shows the 'Discover' tab in IBM API Connect. At the top, there are navigation tabs for 'Discover', 'Visualize', and 'Dashboard'. Below the navigation, there is a search bar with the text 'Search...'. To the right of the search bar are buttons for '+', 'Export', and 'Import'. Further right, it shows '1-7 of 7' with left and right arrow buttons. Below this is a table of searches:

Name	Tags
<input type="checkbox"/> All Events	ADMIN
<input type="checkbox"/> ApiName_FindBranch	CATALOG
<input type="checkbox"/> Errors	ADMIN
<input type="checkbox"/> Find Status 2xx	CATALOG
<input type="checkbox"/> Response Times (>1s)	ADMIN
<input type="checkbox"/> Successes	ADMIN

An arrow points from the text 'Imported search' to the 'Find Status 2xx' search entry in the table.

If the JSON file contains multiple search definitions, all of the searches in the file are imported added to the search list. If an imported search's title duplicates an existing search title, all of the searches are retained and display in the search list with duplicate names. You can edit searches and save them with new names to remove duplication.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details. For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Backing up and restoring searches

To ensure you can recreate your IBM® API Connect searches in the event of data loss, you should export them and save the files as a back-up. Then you can import the search definitions later if needed.

### About this task

API Connect does not back up searches, so it is good practice to create your own backups by exporting all of your saved searches.

This task only operates on the search definition, not on the analytics data that is returned in the results.

### Procedure

1. Export your search definitions to JSON format as explained in the topic, [Exporting searches](#).
2. If you need to restore the searches, import the definitions from the JSON files as explained in the topic, [Importing searches](#).

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details. For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Deleting searches

Use the IBM® API Connect Analytics Discover tab to delete searches.

### Before you begin

To delete searches, you must either be the owner of the API provider organization, or be assigned a role that has the Analytics - Manage permission for the selected Catalog or Space.

Searches are used in visualizations. When you delete a search, it is removed from all visualizations where it was previously used. A user who views a visualization based on a search that was deleted sees the following error message: `Could not locate that search (id: search_ID)`. Before deleting a search, you should remove it from visualizations to ensure that users don't encounter the error.

## About this task

In addition to belonging to a role with Analytics - Manage permission, you must have access to the scope in which the search was created if you want to delete that search. The tag that displays next to the search name indicates the scope of permissions required to edit the search. A predefined search (displays the **Admin** tag) cannot be deleted. A search tagged with **Catalog** can be deleted by all users of the current Catalog. A search tagged with **Space** can only be deleted by users who have access to the Space in which the search was created. Deleting a search from a Space removes it only from the current space. Other versions of the search stored in different Spaces are not deleted.

## Procedure

1. [Navigate to the Analytics feature for the Catalog or Space where you want to modify a search.](#)
2. Click Discover to open the Discover tab, where you can create and manage searches.
3. Select the searches that you want to delete.

Tip: If you have a large set of saved searches, you can either browse through the list or use the filter to locate the searches.

4. Click .

5. If you really want to delete the selected searches, click  to confirm.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Exporting API event data

You can obtain analytics and API event data from the API Manager user interface of IBM® API Connect or by using REST API calls.

## About this task

From the API Manager UI, you can view and export the raw analytics data that is returned in your configured visualizations. You can also view the individual API event records that are generated for the aggregated data sets in your visualizations, and you can collectively export all the API event records that relate to all visualizations in a dashboard. Any analytics or API event data that you export is saved to a comma-separated values (CSV) file.

You can alternatively obtain analytics data for a specific Catalog and API provider organization by using REST API calls to return JSON objects that contain the analytics data.

- [Using the UI to export API event data](#)  
Use the IBM API Connect Analytics interface to export API events data to CSV or JSON Lines format.
- [Using REST APIs to export events data to JSON or YAML](#)  
Use the IBM API Connect REST APIs to export API events data to JSON or YAML format.
- [API event record fields](#)

An API event is logged each time an API operation is invoked, and an event record is generated for each API event in the Gateway server. The API event record contains information about the API call and the content of the record depends on the logging policy that is set for the operation.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Using the UI to export API event data

Use the IBM® API Connect Analytics interface to export API events data to CSV or JSON Lines format.

### About this task

---

Use the Analytics Discover tab to search for event data and then export the *hits* (the records in the search results) to a file. Each hit represents one API invocation in the Gateway server. When you view the hits in the UI, the display is limited to 500 records. To view the entire set of hits, export the data to a CSV or JSON Lines file.

### Procedure

---

1. Navigate to the Analytics page and click Discover.
2. Run a search.

Select a predefined search to run, or click  to define your own search, and then run it. Optionally apply filters to refine the results. The export option is only available when a search returns at least one hit.

3. Click Export (this option displays before the search results).
4. In the "Export Hits" panel, select the Filetype for the exported data.  
There are two options for the file's type:

- a. JSON Lines (.txt): Exports data to a .txt file that contains a complete JSON record for each hit.
- b. Comma-separated Values (.csv): Exports to a .csv file that can be viewed either in a text editor, a spreadsheet, or some other CSV viewer.  
If you intend to view the .csv file in a viewer that does not support special characters, select the following options as needed to ensure compatibility with your viewer:
  - i. Escape double quotes: Insert an additional quotation mark (") as an escape character before each " that is already included in the file.
  - ii. Escape special characters: Insert a quotation mark (") as an escape character before each of the following characters: = \_ + % @The content of the API event records in the CSV file depends on the logging policy that is set for the operation. If the logging policy includes the HTTP headers and the payload, then these details are included in the API event record. Where the payload is large, it might take longer to complete the export of the analytics data. For more information, see [activity-log.policy](#). For information about the fields that are included in the CSV file, see [API event records](#).

5. In the panel, click Export to start the export operation.
6. When the "The export has completed successfully." message displays, click Download to save the file, or click Another one? to run a new export operation. (Remember to save the current export results before running a new export).

Attention:

- If your browser is configured to block pop-ups, the download might be blocked. The precise behavior varies across browsers, but if you see a notification about "blocked pop-ups", reconfigure the browser to always allow pop-ups for the API Manager host address. Then check the "Export Hits" panel for the Download option, which completes the operation. If you do not see a Download option, repeat the export operation.
  - If you navigate away from the Analytics interface before the exported file is downloaded, the download operation is suspended. If you return to Analytics before any other export operation begins and before the file expires, you might see a Download option that allows you to finish downloading the file. Otherwise, you must repeat the entire export operation.
  - Each downloaded file is saved to the download location that is configured for your browser, using a randomly generated file name. If you intend to export more than once, and you are exporting to the same location each time, you might want to rename each file with a meaningful name.
- [Exporting aggregated analytics data from a visualization](#)  
From a visualization, you can view the raw aggregated data from which the graphical representation is constructed, and then export that data to a CSV file.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Exporting aggregated analytics data from a visualization

From a visualization, you can view the raw aggregated data from which the graphical representation is constructed, and then export that data to a CSV file.

### Procedure

---

To export analytics data from a visualization, complete the following steps.

1. Navigate to the Analytics page and click Visualize.
2. Select a visualization by clicking it.  
For example, you might select the visualization called "Status Codes (Detailed)" as shown in the following image:

3. Display the data in grid format by clicking the  that displays after the visualization. In the resulting grid, a row is displayed for each aggregated data set that matches the search criteria configured in the visualization's aggregation builder. The raw data shown in the columns and rows depends on the type of visualization accessed and the aggregations configured for that visualization.

Visualize / Status Codes (Detailed) Refresh Clone < This week >

\* Uses lucene query syntax

Add a filter +

Table

filters	Count	status_code.keyword: Descending	Count
1xx	0		
2xx	20	200 OK	20
3xx	0		
4xx	2	401 Unauthorized	2
5xx	0		

Export: Raw Formatted

Page Size 10

Display in graph format Export options

4. Export a tabular format of the raw data that is displayed in the grid:
- To export the data as stored in Elasticsearch, click the Raw link.
  - To export Kibana formatted data that is similar to what you see in the grid, click the Formatted link.
5. When prompted, choose to save the file, which is named *visualization\_name.csv* by default. The file is saved to the download location that is configured for your browser. If you intend to export more than once from the same or another visualization, and you are exporting to the same location each time, you might want to rename each file with a meaningful name.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Using REST APIs to export events data to JSON or YAML

Use the IBM® API Connect REST APIs to export API events data to JSON or YAML format.

The Analytics REST APIs let you create analytics objects and retrieve data. When you reference an API, use the API's own endpoint on your management server.

For details on the APIs, browse to the **API Connect Analytics APIs 1.0.0** section of the [API Connect REST API documentation](#).

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## API event record fields

An API event is logged each time an API operation is invoked, and an event record is generated for each API event in the Gateway server. The API event record contains information about the API call and the content of the record depends on the logging policy that is set for the operation.

You can use the activity-log policy to configure your logging preferences for the API event details that are stored in the Analytics component. By default, invocation details are logged if an API call is successful, and invocation, header, and payload (message body) details are logged if an API call results in an error code. To override these default settings and change the level of detail that is included in the API event record, you can add the activity-log policy to your API assembly and then configure the policy's properties. For example:

- To include details about the request body or response body in the API event record for a successful API call, you can add an activity-log policy to the associated API operation and set the content type to **payload**.  
Restriction: The payload logging feature is disabled for IBM® Cloud instances that are hosted in the Frankfurt region. The requirements for storing Sensitive Personal Information (SPI) are more restrictive in that region, so the payload information cannot be saved.
- To include details about the HTTP request headers or HTTP response headers in the API event record for a successful API call, you can add an activity-log policy to the associated API operation and set the content type to either **header** or **payload**.

For more information about how to configure your logging preferences, see [activity-log policy](#) and [Including components in your assembly](#).

Tip: A log policy field is included in the event record to identify the logging setting. To see examples of the invocation, header, and payload details that can be included in an API event record, see:

- [Example: Event record with invocation details \(activity logging setting\)](#)
- [Example: Event record with invocation and header details \(header logging setting\)](#)
- [Example: Event record with invocation, header, and payload details \(payload logging setting\)](#)

The following table lists the static set of fields that are displayed in an API event record. When creating visualizations, you can use these fields to configure aggregations that define the type and level of information to be retrieved and displayed. For more information, see [Configuring visualizations](#). If you have configured your logging preferences to include header and payload details, your header and payload fields will additionally be available for selection while configuring aggregations, enabling you to create visualizations based on header and payload data if required.

Note: If you want to include the `client_geoup` and `gateway_geoup` fields in your Analytics data, ask your administrator to configure it as explained in [Configuring output plugins for analytics offload](#).

Table 1. API event record fields

Field name	Type	Description
<code>datetime</code>	Date	A time stamp that records when the record was written by the <a href="#">Logstash</a> data collection engine that feeds data into Elasticsearch.
<code>api_id</code>	String	The API identifier.
<code>api_name</code>	String	The name of the API.
<code>api_version</code>	String	The version number of the API.
<code>app_id</code>	String	The identifier for the registered application.
<code>app_name</code>	String	The name of the registered application.
<code>app_type</code>	String	The application type, with a value of <b>Production</b> or <b>Development</b> .
<code>bytes_received</code>	Number	The number of bytes received on the inbound request.
<code>bytes_sent</code>	Number	The number of bytes sent on the outbound request.
<code>client_geoup.area_code</code>	Number	The public switched telephone network (PSTN) area code of the client, as identified from its IP address.
<code>client_geoup.city_name</code>	String	The city name of the client, as identified from its IP address.
<code>client_geoup.continent_code</code>	String	The two-letter continent code of the client, as identified from its IP address.
<code>client_geoup.country_code2</code>	String	The two-letter country code of the client, as identified from its IP address.
<code>client_geoup.country_code3</code>	String	The three-letter country code of the client, as identified from its IP address.

Field name	Type	Description
client_geop.country_name	String	The country name of the client, as identified from its IP address.
client_geop.dma_code	Number	The Designated Market Area (DMA) code of the client, as identified from its IP address.
client_geop.ip	String	The IP address of the client.
client_geop.latitude	Number	The latitude of the client location, as identified from its IP address.
client_geop.location	String	The longitude and latitude of the client location (separated by a comma), as identified from its IP address.
client_geop.longitude	Number	The longitude of the client location, as identified from its IP address.
client_geop.postal_code	String	The postal code of the client, as identified from its IP address.
client_geop.real_region_name	String	The full name of the region that corresponds to the IP address of the client.
client_geop.region_name	String	The abbreviated form of the region that corresponds to the IP address of the client.
client_geop.timezone	String	The time zone of the client, as identified from its IP address.
client_id	String	The unique ID of the client that is attached to the API request.
client_ip	String	The original client IP address, as obtained from the <b>X-Forwarded-For</b> header.
datetime	Date	A time stamp that records when the API was executed. The time stamp is always shown in coordinated universal time UTC.
developer_org_id	String	The identifier for the consumer organization that owns the application.
endpoint_url	String	When the request failed, identifies the proxy or invoke target URL on which the request failed. It is not included with a successful request.
developer_org_name	String	The name of the consumer organization that owns the application.
env_id	String	The Catalog identifier.
env_name	String	The name of the Catalog.
gateway_geop.area_code	Number	The public switched telephone network (PSTN) area code of the gateway, as identified from its IP address.
gateway_geop.city_name	String	The city name of the gateway, as identified from its IP address.
gateway_geop.continent_code	String	The two-letter continent code of the gateway, as identified from its IP address.
gateway_geop.country_code2	String	The two-letter country code of the gateway, as identified from its IP address.
gateway_geop.country_code3	String	The three-letter country code of the gateway, as identified from its IP address.
gateway_geop.country_name	String	The country name of the gateway, as identified from its IP address.
gateway_geop.dma_code	Number	The Designated Market Area (DMA) code of the gateway, as identified from its IP address.
gateway_geop.ip	String	The IP address of the gateway.
gateway_geop.latitude	Number	The latitude of the gateway location, as identified from its IP address.
gateway_geop.location	String	The longitude and latitude of the gateway location (separated by a comma), as identified from its IP address.
gateway_geop.longitude	Number	The longitude of the gateway location, as identified from its IP address.
gateway_geop.postal_code	String	The postal code of the gateway, as identified from its IP address.
gateway_geop.real_region_name	String	The full name of the region that corresponds to the IP address of the gateway.
gateway_geop.region_name	String	The abbreviated form of the region that corresponds to the IP address of the gateway.
gateway_geop.timezone	String	The time zone of the gateway, as identified from its IP address.
gateway_ip	String	The IP address of the gateway.
headers.field_name	String	A component of the header section of a message. Note: The following types of headers are considered sensitive and will not show in analytics data for security reasons: <ul style="list-style-type: none"> <li>Any secret key configured in the API security</li> <li>Any header that contains <b>secret</b></li> <li>Any header that contains <b>Authorization</b></li> </ul>
host	String	The host name or IP address.
http_user_agent	String	The value of the User Agent header on the inbound request.
immediate_client_ip	String	The client IP address that is directly in front of the gateway. In most cases this is a load balancer.

Field name	Type	Description
latency_info.started	Number	The time delay (in milliseconds) between when the request was received and when the corresponding task was started by the gateway. Starting a task comprises multiple steps to prepare for executing an API; for example, completing the TCP/TLS handshake, verifying an app's client ID and secret, and matching the request URI to a Catalog, API, and Plan. When the gateway receives a request, the "Start" duration is set to 0. The duration of each step within the Start task is then added up, and the total represents the duration of the Start task.
latency_info.task	String	The API transaction that was processed.
log_policy	String	The defined logging policy. Values include none, event, headers, and payload.
org_id	String	The identifier for the provider organization that owns the API and associated Products.
org_name	String	The name of the provider organization that owns the API and associated Products.
plan_id	String	The Plan identifier.
plan_name	String	The name of the Plan.
plan_version	String	The version number of the Plan.
product_name	String	The Product name.
product_title	String	The title of the Product.
product_version	String	The version number of the Product.
query_string	String	The URL query string value on the inbound request.
rate_limit.count	Number	The number of API calls made in the defined rate limit time window.
rate_limit.limit	Number	The maximum number of requests an application is allowed to make to the API during a specified time window.
rate_limit.period	Number	The time window that is used to set a rate limit for API calls.
rate_limit.reject	String	An indication of whether calls that exceed the specified rate limit will be rejected. If true, the API call will be rejected with a 429 status code. If false, a record is created in the Activity log.
rate_limit.shared	String	An indication of whether the rate limit is shared at a Plan level by all operations, or whether a rate limit is specified on individual operations.
request_body	String	The body of the inbound request.
request_http_headers.field_name	String	A component of the HTTP header section of the inbound request; for example, the acceptable encodings, the identification string for the user agent, or the proxies through which the request was sent.
request_method	String	The method of the inbound request.
request_protocol	String	The protocol of the inbound request.
resource	String	The name of the operation.
resource_id	String	The operation identifier.
resource_path	String	The operation path.
response_body	String	The body of the outbound response.
response_http_headers.field_name	String	A component of the HTTP header section of the outbound response; for example, the MIME type of the content or the data and time when the message was sent.
status_code	String	The status code set on the outbound response.
time_to_serve_request	Number	The time elapsed (in milliseconds) from when the request was received by the backend application to when it sent a response.
transaction_id	String	The identifier for the API transaction.
uri_path	String	The URI path on the inbound request.

## Example: Event record with invocation details (activity logging setting)

```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#), for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x](#) and [later product documentation](#).

## Troubleshooting Analytics start-up

If you receive an error starting the Analytics service after installing, upgrading, or recovering from a catastrophic failure of IBM® API Connect, you might be able to resolve it by completing this task.

### Uh oh! An error has occurred

In rare cases, the Kibana index can fail and the following message displays:

This error typically indicates that the index was corrupted. Complete the following steps to verify the problem and delete the corrupted index.

Before you begin, determine the names of one of the deployment's storage-coordinating pods (called *analytics-storage-coordinating-pod* in the steps that follow) and one of the client pods (called *analytics-client-pod* in the steps). To see the pod names, run the following command:

```
kubectl get pods
```

In the following sample output, a storage-coordination pod is named `r70eaa1a0f2-analytics-storage-coordinating-5d87d4c76-btpfq` and a client pod is named `r70eaa1a0f2-analytics-client-68c499d5f9-7g7vm`:

r70eaa1a0f2-analytics-storage-data-1	1/1	Running	0	76m
r70eaa1a0f2-analytics-storage-data-2	1/1	Running	0	80m
r70eaa1a0f2-analytics-storage-master-0	1/1	Running	0	72m
r70eaa1a0f2-analytics-storage-master-1	1/1	Running	0	75m
r70eaa1a0f2-analytics-storage-master-2	1/1	Running	0	80m

1. Verify that you have both the `.kibana` and `.kibana-6` indexes by running the following command:

```
kubectl exec -it analytics-storage-coordinating-pod -- curl_es /_cat/indices?v
```

In the `index` column of the response, look for `.kibana` and `.kibana-6`:

```
health status index      uid      pri rep docs.count docs.deleted store.size pri.store.size  
green open   .kibana-6      9AC2HDC3TLuKTRlvm0Bt0A  1  2      1      0      9.3kb      3.1kb  
green open   .kibana        WLMq7241ST6YRjI8p3Vp1Q  1  2      1      0      14.6kb     4.8kb  
green open   .apic-config   Zlh3BNn-T4GFWMHnBDG3w  1  2      0      0      573b      191b  
green open   .export-status 4uvi5QRVRlWQ-1sum1-Krg  5  2      148889  0      350.2mb   116.8mb  
green open   apic-api-2019.06.04-1 0WC8pIuqKqR6USJgRdGQ  5  2      8000    0      24.7mb    8.2mb
```

If the response includes both indexes, it indicates a problem with the index creation. Proceed to the next step.

Note: If you received the "Uh oh! An error has occurred" page and the response to this command only includes the `.kibana-6` index, then something else is wrong with the cluster and you should contact IBM Support for assistance.

2. Set the `.kibana` index to be read-and-write enabled by running the following command, replacing `analytics-storage-coordinating-pod` with the name of the storage-coordinating pod that you determined at the beginning of this task:

```
kubectl exec -it analytics-storage-coordinating-pod -- curl_es -XPUT .kibana/_settings -d '{"index.blocks.write":false}'
```

When you see the following response: `{"acknowledged":true}`, continue to the next step.

Note: If you see a different response, make sure the request was correct and try again. If the command still does not work, then something else is wrong with the cluster and you should contact IBM Support for assistance.

3. Delete the `.kibana-6` index by running the following command:

```
kubectl exec -it analytics-storage-coordinating-pod -- curl_es -XDELETE .kibana-6
```

When you see the following response: {"acknowledged":true} to indicate that the deletion was successful, continue to the next step.

Note: If you see a different response, then the index was not deleted. Make sure the request was correct and try again. If the delete operation still fails, then something else is wrong with the cluster and you should contact IBM Support for assistance.

- Restart a single analytics client pod by running the following command and replacing `analytics-client-pod` with the name of the pod (which you determined at the beginning of this task):

```
kubectl delete pod analytics-client-pod
```

Sample response: pod "analytics-client-pod" deleted

Wait for the response to ensure that the pod was successfully deleted. Then wait a few minutes for a new pod to start automatically. To check the status of the pods, run the following command:

```
kubectl get pods
```

- Navigate to the Analytics page and refresh to verify that the dashboard now displays correctly.
- (Optional) If you have a backup of `ui` or `.kibana-6`, you restore it now as explained in [Backing up and restoring the analytics database](#) and [Backing up and restoring the analytics database](#)

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Administering user access

If you have permission to administer users in IBM® API Connect, you can add and delete users. After users are removed from an organization through deletion, the user account remains in API Manager.

### About this task

You can also authorize users to perform different roles within your organization. To make any changes to the users that can access your organizations, use the following tasks:

- [Viewing your user information](#)  
You can view the users that can access your IBM API Connect organization.
- [Adding provider organization users and assigning roles](#)  
If you have the permissions that are required to edit users in IBM API Connect, you can add users to your provider organization, remove users, assign roles and perform other user administration tasks.
- [Creating custom roles](#)  
If you have permission to edit roles in IBM API Connect, you can create custom roles, and assign permissions, in a provider organization. You can create as many custom roles as you want.
- [Removing a user from a provider organization](#)  
If you have permission to edit users, you can remove a user from a provider organization.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Viewing your user information

You can view the users that can access your IBM® API Connect organization.

### Procedure

To view your organization user information, complete the following steps:

In the navigation pane of the API Manager UI, click  Members.

### Results

All of your user accounts are listed.

### What to do next

You can modify your user accounts; see [Adding provider organization users and assigning roles](#).

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Adding provider organization users and assigning roles

If you have the permissions that are required to edit users in IBM® API Connect, you can add users to your provider organization, remove users, assign roles and perform other user administration tasks.

### About this task

---

You can add a user to your provider organization by inviting them to be an organization member; the user receives an invitation email with an activation link that enables them to complete the addition operation.

### Procedure

---

To add users and assign user roles for your provider organization, complete the following steps:

1. In the navigation pane of the API Manager UI, click  Members.
2. Click Invite member.
3. Enter the email address of the user.
4. Select the roles that you want to assign to the user.
5. Click Invite.

### Results

---

The user is added to the list of provider organization members, and an email invitation is sent. The status is shown as `Pending` until the recipient of the email clicks the link in the email to complete the creation of their account, after which the status changes to `Enabled`.

### What to do next

---

The new user can access the API Manager user interface. The user's authorization within API Manager is defined by the roles that are assigned to them.

### Related tasks

---

- [Creating custom roles](#)

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Creating custom roles

If you have permission to edit roles in IBM® API Connect, you can create custom roles, and assign permissions, in a provider organization. You can create as many custom roles as you want.

### About this task

---

Permissions can be applied on an organizational or Catalog level.

For a description of the permissions, and details of the default user roles and default permissions assigned to those roles, see [API Connect user roles](#).

Note: In API Manager, the Organization Owner role has full access and cannot be edited or deleted. All other roles, including custom roles, can be deleted. If you delete a role, users lose that role. If a user loses that role, their account remains in API Manager, enabling you to add a role to the user at a future date.

### Procedure

---

To create a custom role, complete the following steps:

1. In the navigation pane of the API Manager UI, click  Settings.
2. Click Roles, then click Add.  
The Create a New Role page opens.
3. Enter a role Title and an optional Summary. A Name is entered automatically.  
Note: The value in the Name field is a single string that is used to identify the role in developer toolkit CLI commands. The Title is used for display.  
To view the CLI commands to manage roles, see [apic roles](#).
4. Use the check boxes to assign permissions to the new role.
5. When you are finished, click Save.
6. To delete a role, click the options icon  alongside the role that you want to delete, click Delete this role, then click Confirm to complete the role deletion.

Note: You can delete a role only at the provider organization level. You cannot delete a role at the Catalog level. Nor can you delete a role at the Space level. You can, however, assign Catalog-specific permissions to the role; for details, see [Creating and configuring Catalogs](#). You can also assign Space-specific permissions; for details, see [Managing user access in a Space](#); for more information on Spaces, see [Using syndication in API Connect](#).

## Results

---

The custom role is created and assigned the permissions that you selected.

## What to do next

---

Assign the custom role to a user.

## Related tasks

---

- [Adding provider organization users and assigning roles](#)
- [Creating and configuring Catalogs](#)

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details. For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Removing a user from a provider organization

---

If you have permission to edit users, you can remove a user from a provider organization.

## About this task

---

After you have removed the user from your IBM® API Connect provider organization, their resources are deleted and the user cannot access any of the organization's artifacts.

Note: The user account of the deleted user remains in the associated API Connect user registry. The user can still log in to the API Manager user interface but only information links are available; there is no access to view or manage any resources.

If you later invite the same user again, they can re-activate their account. If you are using a Local User Registry, the user must re-activate their account by using the Sign In option, **not** by completing the registration form and using the Sign Up option; attempting to re-register will fail. For details on how to invite a user to join your organization, see [Adding provider organization users and assigning roles](#).

## Procedure

---

To remove a user from a provider organization complete the following steps:

1. In the navigation pane of the API Manager UI, click  Members.
2. Alongside the user that you want to delete, click the options icon , click Delete, then click Confirm to complete the user deletion.  
Note: You cannot delete the owner of a provider organization.

## Results

---

The user is removed from the provider organization, and the user account remains in API Manager.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details. For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Changing your API Manager password

---

You can change your API Manager password in IBM® API Connect.

## Procedure

---

To change your password, complete the following steps:

1. Log in to the API Manager user interface.
2. Click the User icon  then click Account.
3. In the Change password section, enter your current password and your new password, and confirm the new password.  
Passwords must satisfy the following requirements:
  - Cannot be re-used for at least 8 password cycles
  - Cannot contain more than 2 consecutive repeating characters

- Must include at least 8 characters
- Must include 1 or more characters from at least 2 of the following categories:
  - Lowercase letters
  - Uppercase letters
  - Numbers
  - Special characters – only the following special characters are allowed:

```
!
\"
#
$
%
&
\
(
)
*
+
,
-
.
/
:
;
<
=
>
?
@
[
\\
]
^
_
{
|
}
~
```

4. Click Change Password.

## Results

Your password is changed.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details. For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Resolving login problems by increasing HTTP header size

You can resolve login problems for the API Manager UI by increasing the maximum HTTP client header size.

### About this task

Login attempts to the user interface might fail with error **502 (Bad Gateway)**. This error can occur when logging in from a browser that has a large number of cookies. The error occurs because size of the login request exceeds the maximum HTTP client header size.

The maximum HTTP client header size is limited for security reasons. To workaround this issue, you can clear the browser cache and cookies, or open an incognito window from the browser, and then retry the login.

Alternatively, you can increase the maximum HTTP client header size. Use caution when increasing the maximum size because larger headers can raise a security risk to your system.

### Procedure

1. **SSH** to your management system or appliance.
2. Enter the following commands:

```
kubectl get deployment -n namespace | grep apim-v2
kubectl edit deployment -n namespace apiconnect-apim-v2-deployment
```

3. In the **env** section of the deployment configuration, change **--max-http-header-size=12000** to a larger value that works for your environment. For example:

```
- name: NODE_OPTIONS
  value: --max-old-space-size=8094 --max-http-header-size=16000
```

4. Save the updated configuration.
5. Run `kubectl get pod -n namespace` a few times until the new `apiconnect-apim-v2` pod is up and running.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Reference

Reference information for the API Manager component in IBM® API Connect.

---

## API gateway response codes

When an API is called, different HTTP status codes are returned by the gateway to indicate whether the request was successfully completed.

The response codes used in IBM® API Connect correspond to the registered HTTP status codes that are typically generated to provide informational (1xx), successful (2xx), redirection (3xx), client error (4xx), or server error (5xx) responses, as described at <https://tools.ietf.org/html/rfc7231#section-6> and [Hypertext Transfer Protocol \(HTTP\) Status Code Registry](#).

In API Connect, successful responses vary depending on the API being called. Other response codes can also be generated, depending on the implementation of the assembly and the response from the external systems. The standard reasons listed for the registered HTTP status codes are considered adequate for most responses that are returned; these response codes and their causes are therefore not listed here.

In certain cases, a client or server error response code can be caused by a condition that is specific to API Connect. The following table contains a list of these error response codes and identifies possible causes for these codes being returned. For some error codes, multiple causes are possible.

Table 1. Error codes and their causes

Error Code	Cause
401 Unauthorized	<ul style="list-style-type: none"><li>• The required client identification has not been successfully provided.</li><li>• User authentication failed or did not take place.</li><li>• The application is not registered with the plan that is used.</li><li>• The application is not active.</li></ul>
404 Not Found	<ul style="list-style-type: none"><li>• Information for the provider organization or environment was not found.</li><li>• The API URL was not found in the organization or environment.</li></ul>
405 Method Not Allowed	The API URL was found, but no operation was found that supports the requested HTTP verb.
406 Not Acceptable	The API cannot produce any responses that are supported by the application.
429 Too Many Requests	The rate limit has been exceeded for the plan or operation being used.
500 Internal Server Error	An error occurred while executing this request.
503 Service Unavailable	The status of an API was switched from online to offline, making the API unavailable across all Products in which it is contained. For more information, see <a href="#">Managing your Products in the API Manager UI</a> and <a href="#">Managing API Products using the developer toolkit</a> .

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## API Manager tutorials

Tutorials for using the API Manager user interface in IBM® API Connect.

---

## Prerequisites

Because you are working online, using API Manager, to complete the following tutorials you must be the Organization Manager of an API Connect account. Or, you received an invite to join API Connect as an Administrator. See [Administering Consumer organizations](#) for more information.

If you have received an email inviting you to create an API Connect user account, follow the instructions in your email to create your API Connect account.

## Overview

---

In the following tutorials, you will use API Manager to create simple SOAP API definitions that can be accessed through the Developer Portal and called through the gateway in the same manner as other API Connect API definitions.

- **[Tutorial: Creating a proxy REST API definition](#)**  
This tutorial shows you how to define and implement a REST API definition that proxies an existing service.
- **[Tutorial: Creating a SOAP API](#)**  
This tutorial shows you how to create an API definition by using a SOAP service Web Service Definition Language (WSDL). This API definition simplifies creating and managing access to the SOAP service.
- **[Tutorial: Creating a REST API definition that invokes an existing SOAP service](#)**  
This tutorial shows you how to expose an existing SOAP service and transform the XML data that is returned by it into specified JSON data.
- **[Tutorial: Mapping JSON Content](#)**  
This tutorial shows you how to map message content from one format or schema to another format or schema.
- **[Tutorial: Importing an API](#)**  
This tutorial shows you how to import an existing OpenAPI 2.0 definition.
- **[Tutorial: Supersede a Product](#)**  
This tutorial shows you how to supersede a published product with another product.
- **[Tutorial: Implementing OAuth Security](#)**  
This tutorial shows you how to create a native OAuth provider using API Manager.
- **[Tutorial: Implementing OpenID Connect Security](#)**  
This tutorial shows you how to add OpenID Connect capability to an existing native OAuth provider using API Manager.
- **[Tutorial: Generate a JSON Web Token \(JWT\)](#)**  
This tutorial shows you how to define and implement a REST API definition that generates a JSON Web Token (JWT).
- **[Tutorial: Validate a JSON Web Token \(JWT\)](#)**  
This tutorial shows you how to define and implement a REST API definition that validates a JSON Web Token (JWT).
- **[Tutorial: Creating a Client Application](#)**  
This tutorial shows you how to create a client application using the API Manager. The ability to create a new application using the API Manager allows members of a provider organization, such as API developers or testers, to create the environment needed to complete an API.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Tutorial: Creating a proxy REST API definition

This tutorial shows you how to define and implement a REST API definition that proxies an existing service.

### About this tutorial

---

In this tutorial you will complete the following lessons:

1. [Creating a REST API definition](#)
2. [Testing the REST API](#)

Note: The Sandbox catalog must be configured to use either a DataPower® API Gateway, or a DataPower Gateway (v5 compatible), or both. See [Creating and configuring Catalogs](#).

### Creating a REST API definition

---

Add and define a REST API to return the branch details of an example BankA.

To add and define a REST API, complete the following steps:

1. Log in to API Manager.
2. In the Welcome page, click the Develop APIs and Products tile.

Welcome to the API Manager  
Choose an option to get started

- Develop APIs and Products**  
Edit, assemble, secure and test APIs.  
Package APIs using products for publishing to consumers.
- Manage Catalogs**  
Manage active APIs and consumers
- Manage Resources**  
Configure user registries, OAuth providers and TLS
- Manage Settings**  
Edit settings for roles, notifications and more.
- Learn more**  
Documentation and tutorials with step-by-step instructions
- Connect**  
Find expert answers in the API Connect community forum

3. Click Add > API.

Develop

APIs and Products

Add ▾

- API
- Product

You haven't added any APIs or Products

4. Select From target service. Click Next.

Create

- From target service**  
Create a REST proxy that routes all traffic to a target API or service endpoint
- From existing OpenAPI service**  
Create a REST proxy based upon an OpenAPI described target service
- From existing WSDL service (SOAP proxy)**  
Create a SOAP proxy based upon a WSDL described target service
- From existing WSDL service (REST proxy)**  
Create a REST proxy based upon a WSDL described target service
- New OpenAPI**  
Compose a new REST proxy by defining paths and operations

Import

- Existing OpenAPI**  
Use an existing definition of a REST proxy

Cancel Next

- Enter the appropriate information to create a REST API definition.
  - In the Title field, enter `Branches`.
  - The Name and Base Path fields autopopulate with the terms `branches` and `/branches` respectively.
  - Leave the Version field at `1.0.0`.
  - In the Target Service URL field, enter `https://apictutorials.mybluemix.net/branches`.

### Info

Enter details of this API

**Title**  
Branches

**Name**  
branches

**Version**  
1.0.0

**Base path (optional)**  
/branches

**Description (optional)**

---

**Target Service URL**  
Enter the URL for the target service you would like to proxy

**Target service URL**  
https://apictutorials.mybluemix.net/branches

6. Click Next.
7. In the Security dialog, take the following steps.
  - a. Select Limit API calls on a per key basis.
  - b. Click Next.

8. You see the progress as the new API gets created. When it is done, you see a Summary. Click Edit API.

9. On the Design page, click Definitions in the side bar.
10. Click Add.

11. In the Name field, enter address, and a Description of The format of the address object.
12. Using the same Definitions panel, configure the Properties definition according to the following table. Create new properties by clicking Add.

Table 1. Properties

Property Name	Description	Type	Example
street1	The first line of the address	string	4660 La Jolla Village Drive
street2	The second line of the address	string	Suite 300
city	The city of the address	string	San Diego
state	The state of the address	string	CA
zip_code	The zip code of the address	string	92122

**Name**

## Testing the REST API

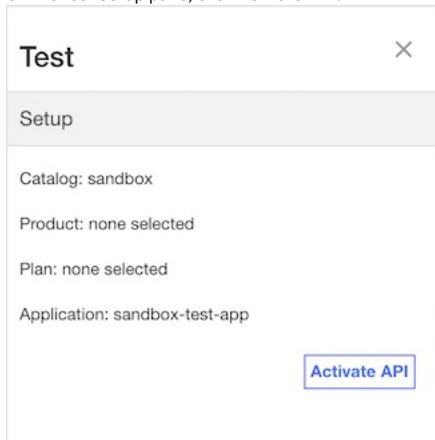

Note: Due to Cross-Origin Resource Sharing (CORS) restrictions, the assembly test tool cannot be used with the Chrome or Safari browsers on the macOS Catalina platform.

To test the REST API, complete the following steps:

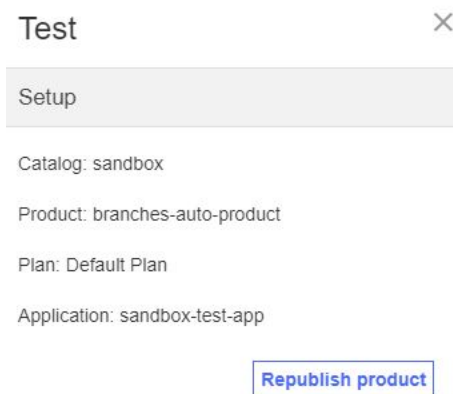

1. Click Assemble.
2. Click the Test icon

3. On the test Setup pane, click Activate API.

4. The Test pane refreshes. A Product and Plan are automatically selected.

5. Scroll down. Select the get /details Operation.

**Operation**

Choose an operation to invoke:

**Operation**

get /details

---

**Identification**

clientId

06b824f9c78a2bc07e81fb635a6a2b03

---

Repeat

Repeat the API invocation a set number of times, or until the stop button is clicked

Stop after:  Stop on error

**Invoke**

6. Click Invoke. You may encounter a yellow error box with a URL embedded in it. Click this URL to override a browser certificate error.

**Response**

Status code:

-1

No response received. Causes include a lack of CORS support on the target server, the server being unavailable, or an untrusted certificate being encountered.

Clicking the link below will open the server in a new tab. If the browser displays a certificate issue, you may choose to accept it and return here to test again.

[https://apimdev.ibm.com:9443/gorg/sandbox/branches/details?client\\_id=uv0cflw0](https://apimdev.ibm.com:9443/gorg/sandbox/branches/details?client_id=uv0cflw0)

7. Click Invoke again. The response contains branch data.

## What you did in this tutorial

---

In this tutorial, you completed the following activities:

- Created a REST API definition.
- Tested a REST API.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Tutorial: Creating a SOAP API

This tutorial shows you how to create an API definition by using a SOAP service Web Service Definition Language (WSDL). This API definition simplifies creating and managing access to the SOAP service.

### About this tutorial

---

In API Manager, you create an API by importing the WSDL for an existing SOAP service. Both SOAP 1.1 and SOAP 1.2 standards are supported by API Connect. When called, the API takes a SOAP request from the API caller and uses it to make its own request to the SOAP service. The API then returns the response of the SOAP service. In this tutorial, the SOAP service returns the balance of an account corresponding to a user identifier.

Note: The Sandbox catalog must be configured to use either a DataPower® Gateway (v5 compatible) or a DataPower API Gateway or both. See [Creating and configuring Catalogs](#).

### Creating a SOAP API

---

To create an API for an existing SOAP service, complete the following steps:

1. Download the SOAP WSDL file [AccountService.txt](#). Rename this file `AccountService.wsdl`.
2. Log into the API Manager.
3. Click the Develop APIs and Products tile.

Welcome to the API Manager  
Choose an option to get started

- Develop APIs and Products**  
Edit, assemble, secure and test APIs. Package APIs using products for publishing to consumers.
- Manage Catalogs**  
Manage active APIs and consumers
- Manage Resources**  
Configure user registries, OAuth providers and TLS
- Manage Settings**  
Edit settings for roles, notifications and more.
- Learn more**  
Documentation and tutorials with step-by-step instructions
- Connect**  
Find expert answers in the API Connect community forum

4. Click Add > API.

Develop

Edit API

11. Click Edit API.

You have created a SOAP API and included it in a Product. The WSDL file has provided the information needed to configure the API's inputs and response.

## Testing your SOAP API

Note: Due to Cross-Origin Resource Sharing (CORS) restrictions, the assembly test tool cannot be used with the Chrome or Safari browsers on the macOS Catalina platform.

To add your SOAP API to a Product and Plan, and then test it, complete the following steps:

1. Click Assemble.

Develop AccountService 1.0.0

Design Source Assemble

API Setup

Security Definitions

Info

Enter the API summary details

2. On the Assemble page, click the Test icon. The test tool opens.

Develop AccountService 1.0.0

Design Source Assemble

Filter Search Show catches

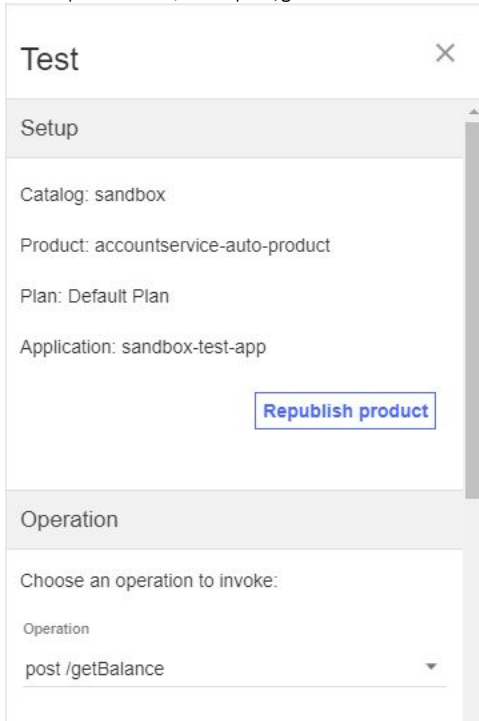

Logic

Switch

Throw

invoke

3. In the Operation field, select post /getBalance.

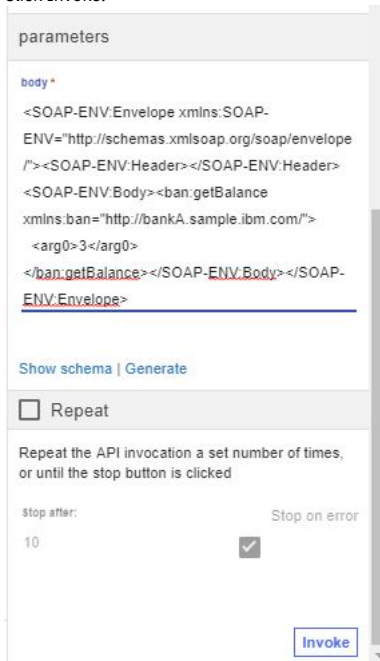

4. In the Body field, of the Parameters section, enter the following request body:

```
<SOAP-ENV:Envelope xmlns:SOAP-ENV="http://schemas.xmlsoap.org/soap/envelope/"><SOAP-ENV:Header></SOAP-ENV:Header><SOAP-ENV:Body><ban:getBalance xmlns:ban="http://bankA.sample.ibm.com/"><arg0>3</arg0></ban:getBalance></SOAP-ENV:Body></SOAP-ENV:Envelope>
```

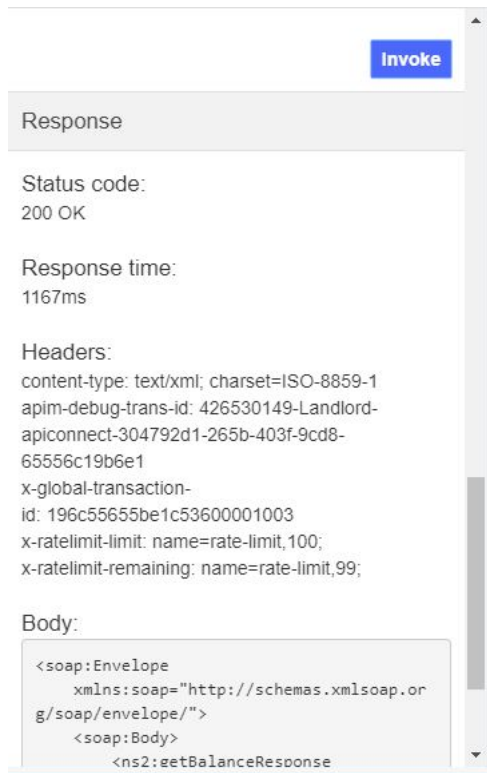

This request body is the same as would ordinarily be passed to the SOAP endpoint, and requests the balance of the account identified by the "arg0" node. However, unlike the SOAP service, the API requires identification using a Client ID, which is enforced by the gateway server.

5. Click Invoke.

The response is displayed.

Note: If you are using a self-signed certificate, you might be prompted to visit a provided URL. Click the link and then accept the certificate before returning to API Manager and clicking Invoke again.

## What you did in this tutorial

---

In this tutorial, you completed the following activities:

- Created a SOAP API
- Tested your SOAP API

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

A default value which will be used if the inputs to the map are not defined.

- Click the handle alongside the *city* field in Input and click the handle alongside the *citystatezip* field in Output.

33. Click the handle alongside the *state* field in Input and click the handle alongside the *citystatezip* field in Output.  
 34. Click the handle alongside the *code* field in Input and click the handle alongside the *citystatezip* field in Output.

35. Click the handle alongside the *citystatezip* field in Output. A dialog box opens.  
 36. Enter the following code in the box. Note that the variable references are positional; \$(1) refers to the first mapped value (input.order.customer.city), and so on. Click ok.

`$(1) + " " + $(2) + " " + $(3)`

**Configure mapping**

Mapped from:

- input.order.customer.address.city
- input.order.customer.address.state
- input.order.customer.address.code

Value

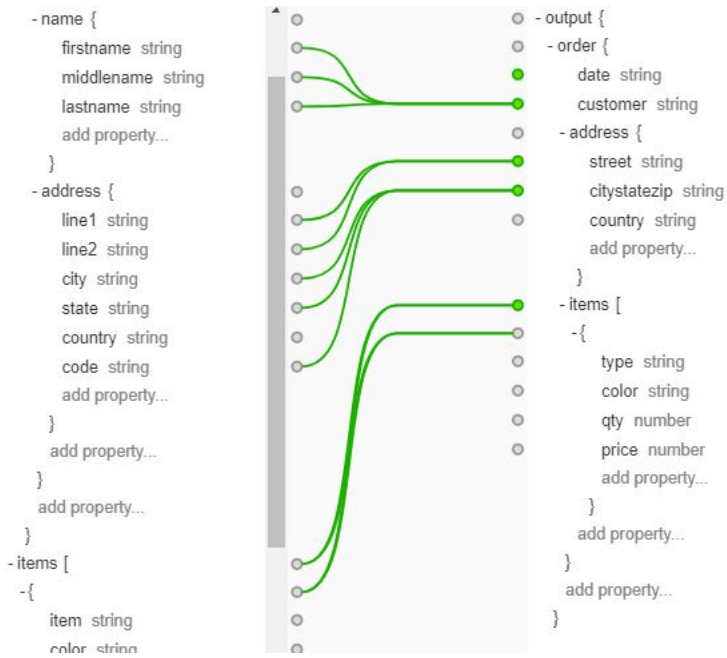

```
1 $(1) + " " + $(2) + " " + $(3)
```

Default

---

A default value which will be used if the inputs to the map are not defined.

37. Click the handle alongside the *items* field in Input and click the handle alongside the *items* field in Output. An additional wire is drawn automatically.

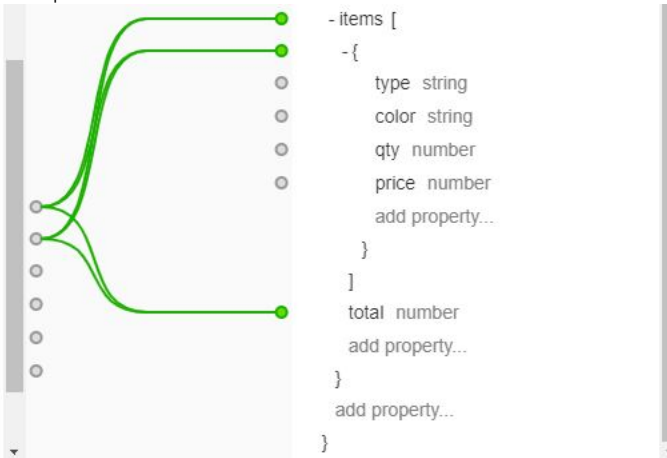

38. Click add property after the closing array bracket - ] - of the Output items array.

39. Enter total in the field that is labeled property. Set the type to float. Click the + icon.

40. Click the handle alongside the items field in Input and click the handle alongside the total field in Output. Note that the system automatically adds a connector to the map.

41. Click the handle alongside total in Output. This opens a dialog box.

42. Enter the following code in the box. This code sums the items for each order. Click ok.

```
$(0) + ($(input.items.price) * $(input.items.qty))
```

## Configure mapping

Mapped from:

 input.items

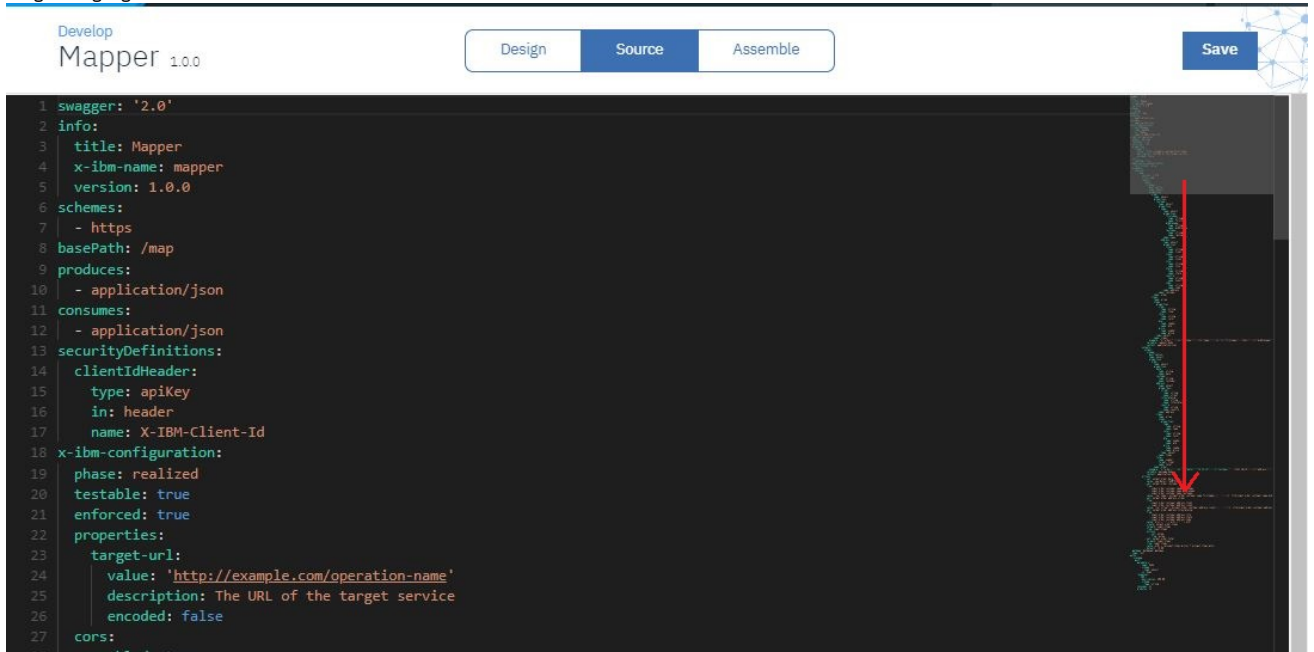

Value

```
1 ${0} + ((${input.items.price} * ${input.items.qty})
```

Default

A default value which will be used if the inputs to the map are not defined.

43. Click the Save icon to save these changes.
44. Click Source.
45. Drag the highlighter to the end of the Source.

```
1 swagger: '2.0'
2 info:
3   title: Mapper
4   x-ibm-name: mapper
5   version: 1.0.0
6 schemes:
7   - https
8 basePath: /map
9 produces:
10  - application/json
11 consumes:
12  - application/json
13 securityDefinitions:

25      description: The URL of the target service
26      encoded: false
27  cors:
28    enabled: true
```

46. Locate the code where total is calculated.

```
- create: output.order.items
  foreach: input.items
  from: input.items
  actions:
    - set: $item
      from: $item
    - set: output.order.total
      from: input.items
      value: '${0} + (${Input.items.price} * ${Input.items.qty})'
      version: 1.0.0
catch: []
phase: realized
```

47. Insert a new line with the code `foreach: input.items`.

```
- set: output.order.total
  foreach: input.items
  from: input.items
  value: '${0} + (${Input.items.price} * ${Input.items.qty})'
  version: 1.0.0
```

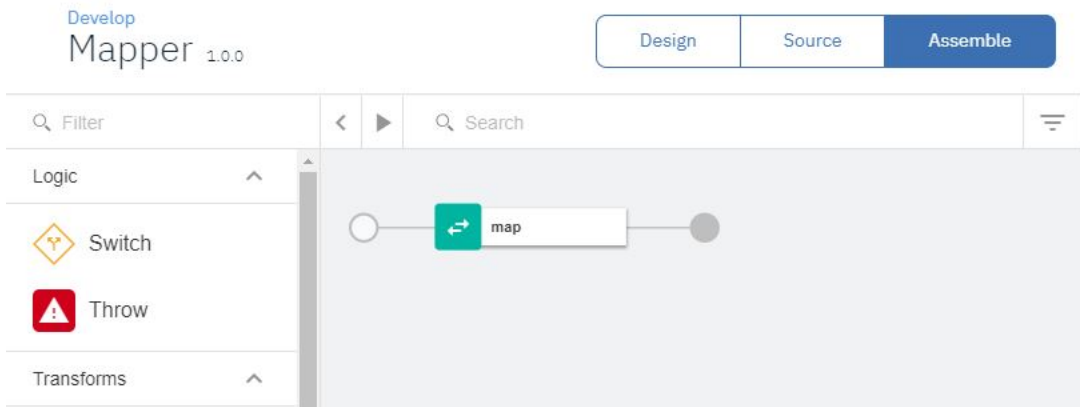

48. Click the Save icon to save these changes.

## Testing your API definition

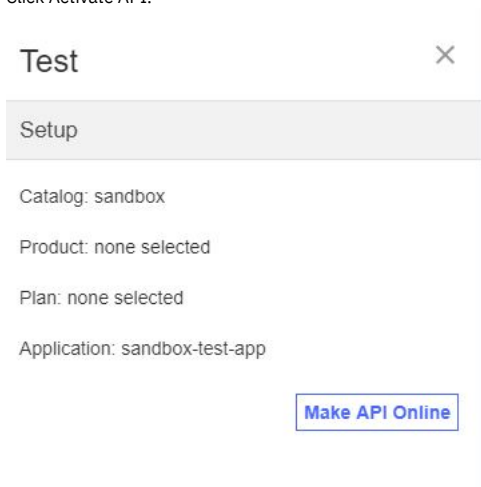

Note: Due to Cross-Origin Resource Sharing (CORS) restrictions, the assembly test tool cannot be used with the Chrome or Safari browsers on the macOS Catalina platform.

To test your API definition by using the API Manager test tool, complete the following steps:

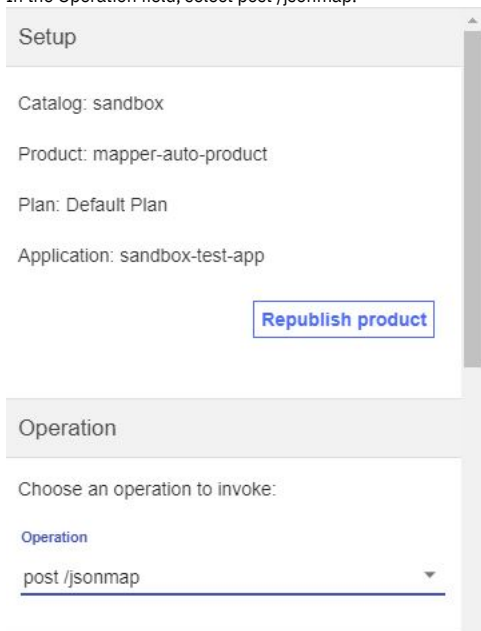

1. Click the Assemble.

2. Click the Test icon . The test tool opens.  
3. Click Activate API.

4. In the Operation field, select post /jsonmap.

5. In the body field, enter the following JSON text.

```
{ "order":  
  { "customer":  
    { "name":  
      {  
        "firstname": "John",  
        "middlename": "Q",  
        "lastname": "Smith"  
      }  
    }  
  }  
}
```

```
"address":
{
"line1": "550 King St",
"line2": "Dept 5",
"city": "Littleton",
"state": "MA",
"country": "USA",
"code": "01460"
}
},
"items":
[{"item": "shoes", "color": "black", "qty": 2, "price": 23.50},
{"item": "socks", "color": "argyle", "qty": 2, "price": 3.95},
{"item": "pants", "color": "grey", "qty": 1, "price": 48.00}]
}
```

6. Click Invoke. The response is displayed.

Note: If you are using a self-signed certificate, you might be prompted to visit a provided URL. Click the link and then accept the certificate before returning to API Manager and clicking Invoke again.

}

```

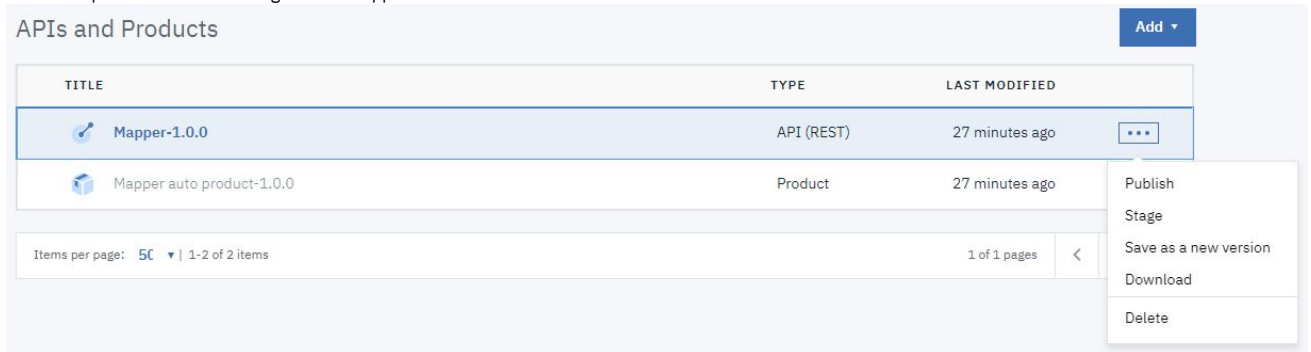

## Manage your API definition

Now that your new API works correctly, you can manage this API. To see your immediate options, take the following steps.

1. Click the Develop icon  on the navigation bar.

2. Click the Options icon  alongside the Mapper API.

3. Select Download.

## What you did in this tutorial

- Created a new API
- Mapped content from one JSON schema to another schema.

## Related information

- [Tutorials home](#)

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Tutorial: Importing an API

This tutorial shows you how to import an existing OpenAPI 2.0 definition.

### About this tutorial

In this tutorial you will complete the following lessons:

1. [Importing an API](#)
2. [Testing the imported API](#)

### Before you begin

Note: The Sandbox catalog must be configured to use either a DataPower® Gateway (v5 compatible) or a DataPower API Gateway or both. See [Creating and configuring Catalogs](#).

If your Sandbox catalog uses a DataPower Gateway (v5 compatible) (as one of the gateways, or as the only gateway), download the [findbranch.txt](#) file to your local filesystem. Rename this file `findbranch.yaml`.

If your Sandbox catalog uses a DataPower API Gateway, download the [findbranch\\_v6.txt](#) file to your local filesystem. Rename this file `findbranch.yaml`.

### Importing an API

To import an API, complete the following steps:

1. Log in to API Manager.
2. In the Welcome page, click the Develop APIs and Products tile.

The screenshot shows the IBM API Manager interface. At the top, there is a dark blue header with the text "IBM API Connect API Manager" on the left and "Organization Tutorial" on the right. Below the header, the main content area is titled "Welcome to the API Manager" with the subtitle "Choose an option to get started". A vertical sidebar on the left contains several icons: a globe, a document, a grid, a stack of layers, a clipboard, and a gear. The main area features six white tiles with blue icons and text:

- Develop APIs and Products**: Edit, assemble, secure and test APIs. Package APIs using products for publishing to consumers.
- Manage Catalogs**: Manage active APIs and consumers.
- Manage Resources**: Configure user registries, OAuth providers and TLS.
- Manage Settings**: Edit settings for roles, notifications and more.
- Learn more**: Documentation and tutorials with step-by-step instructions.
- Connect**: Find expert answers in the API Connect community forum.

3. Click Add > API.

The screenshot shows the "Develop" section of the IBM API Manager. The page title is "Develop" and the sub-section is "APIs and Products". A vertical sidebar on the left contains the same icons as the previous screenshot. The main content area features a large white box with a blue icon of an open cardboard box and the text "You haven't added any APIs or Products". In the top right corner of this box, there is a blue "Add" button with a dropdown arrow. The dropdown menu is open, showing two options: "API" (highlighted in blue) and "Product".

4. In the Import section, select Existing OpenAPI. Click Next.

## Add API

### Create

- From target service**  
Create a REST proxy that routes all traffic to a target API or service endpoint
- From existing OpenAPI service**  
Create a REST proxy based upon an OpenAPI described target service
- From existing WSDL service (SOAP proxy)**  
Create a SOAP proxy based upon a WSDL described target service
- From existing WSDL service (REST proxy)**  
Create a REST proxy based upon a WSDL described target service
- New OpenAPI**  
Compose a new REST proxy by defining paths and operations

### Import

- Existing OpenAPI**  
Use an existing definition of a REST proxy

## What you did in this tutorial

In this tutorial, you completed the following activities:

- Imported an API definition.
- Tested an API.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details. For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Tutorial: Supersede a Product

This tutorial shows you how to supersede a published product with another product.

### Before You Begin

This task can be completed by users who are assigned one of the following roles:

- Catalog Owner
- Catalog Administrator
- Portal User

You must also do the following steps.

- Complete the [Tutorial: Importing an API](#) tutorial.
- You must have a Developer Portal activated for the Sandbox catalog. If you do not, complete the [Tutorial: Creating the Developer Portal](#) tutorial.
- You must have created an application in the Developer Portal and subscribed it to a product. If you do not, complete the [Tutorial: Creating Accounts and Applications on the Developer Portal](#) tutorial.

## About this tutorial

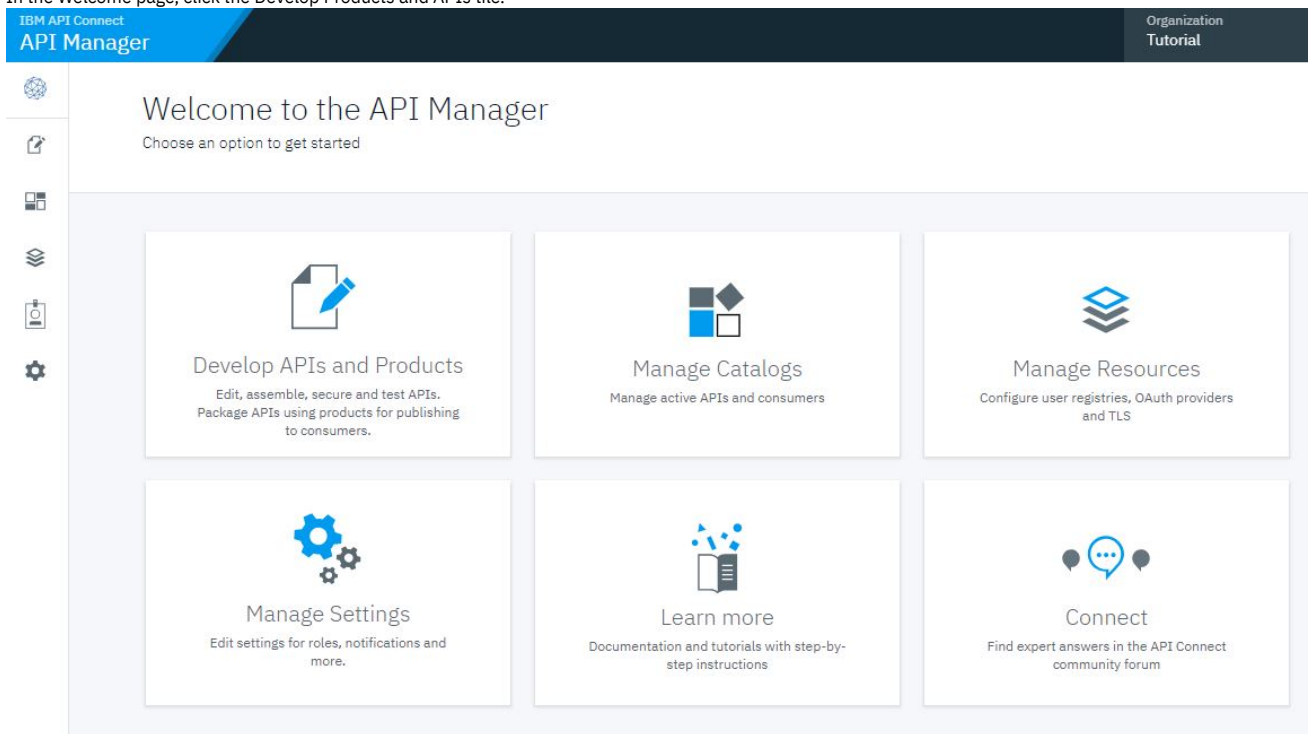

In this tutorial you are going to complete the following lessons:

- [Modify an Existing API](#)
- [Duplicate and Change a Product](#)
- [Supersede a Product](#)
- [Migrate a Product](#)

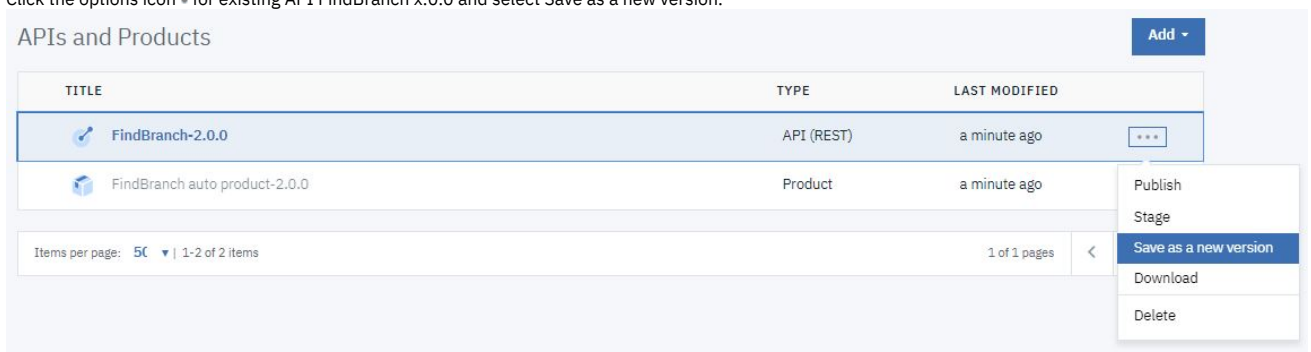

## Modify an Existing API

Take the following steps to modify an existing API.

1. Log in to API Manager.
2. In the Welcome page, click the Develop Products and APIs tile.

3. Click the options icon  for existing API FindBranch x.0.0 and select Save as a new version.

4. In the Version field, enter 3.0.0.
5. Click Save field. The dialog box closes.

## Save API as a new Version

### Version

3.0.0

Cancel

Save

6. Click the arrow to expand the findbranch API listing. Click FindBranch 3.0.0 to edit the new API.

## Tutorial: Implementing OAuth Security

This tutorial shows you how to create a native OAuth provider using API Manager.

## About this tutorial

In this tutorial you will complete the following lessons:

1. [Create a Native OAuth Provider](#)
2. [Adding OAuth Security to an API](#)
3. [Test OAuth Security](#)

## Before you begin

In this tutorial you will implement and test OAuth security. To complete this tutorial, you must have the following available:

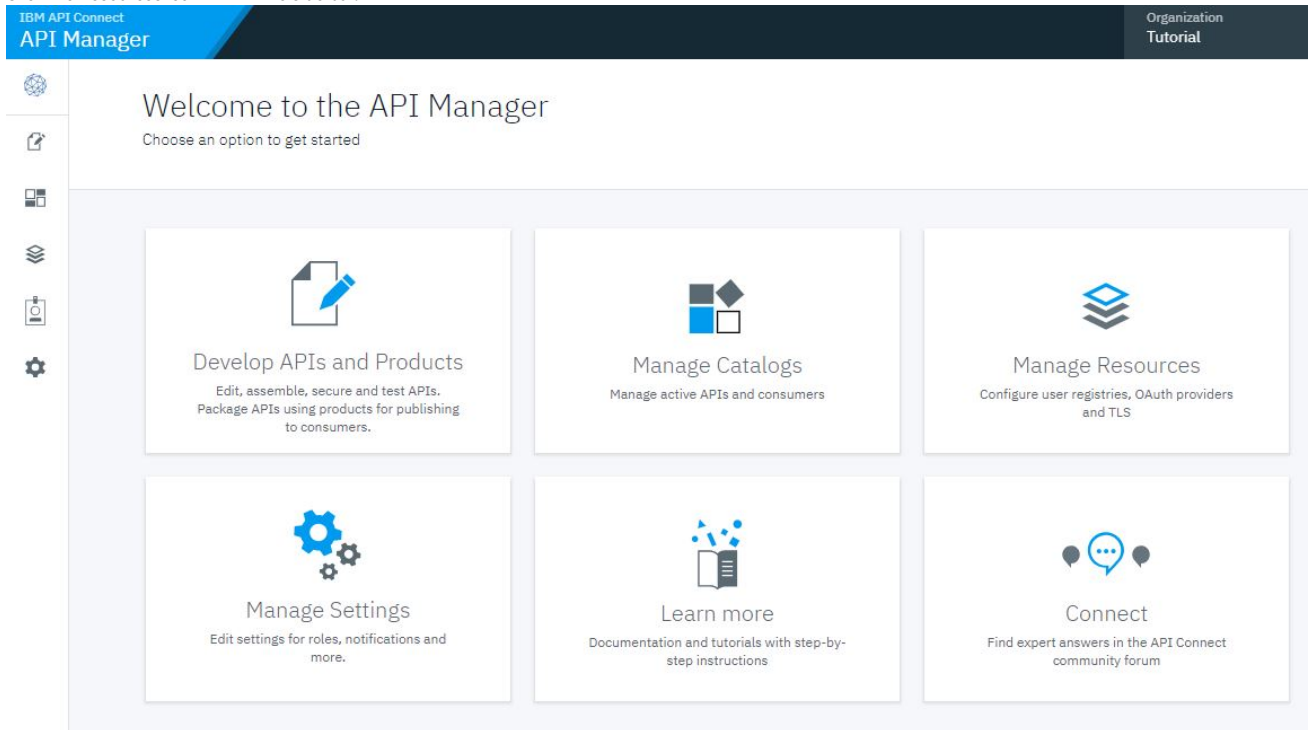

1. An existing published API. If you do not have an API available, complete the [Tutorial: Importing an API](#) tutorial.
2. An existing client application. If you do not have a client application available, complete [Tutorial: Creating a Client Application](#).
3. An external application, such as cURL, used to send requests to the OAuth token provider endpoint.

Note: The Sandbox catalog must be configured to use either a DataPower® Gateway (v5 compatible) or a DataPower API Gateway or both. See [Creating and configuring Catalogs](#).

## Create a Native OAuth Provider

To create a native OAuth provider by using API Manager, complete the following steps:

1. Log in to API Manager.
2. Click the Resources icon  in the side bar.

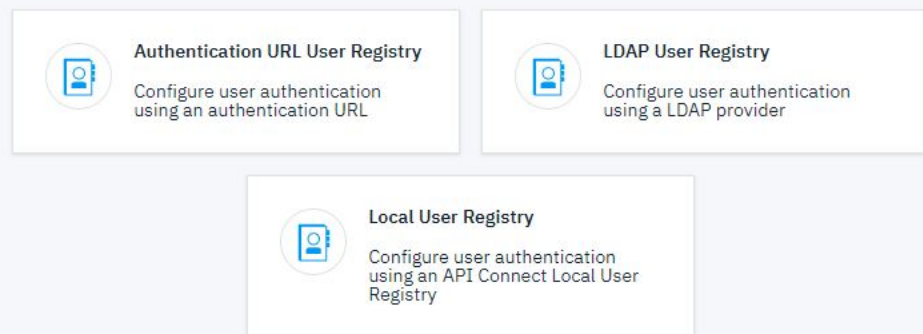

3. On the User Registries page, click Create.

4. Click Authentication URL User Registry.

### Select the user registry type

5. Take the following steps:
  - a. Enter AuthURL in the Title and Display Name fields.
  - b. Enter `https://httpbin.org/basic-auth/user/pass` in the URL field.

- c. Select `No TLS client profile` in the `TLS Client Profile` field.
6. Click `Save`.

### Authentication URL User Registry

18. A Summary page appears. Scroll down and click Finish.

## Create Native OAuth Provider

The screenshot shows a 'Summary' page for creating a Native OAuth Provider. The page has a light blue header with the word 'Summary'. Below the header, the title 'Native OAuth Provider Summary' is displayed. There are two input fields: 'Title' with the value 'MainProviderOA' and 'Base path' which is currently empty.

19. The Info page appears. Scroll down and select Enable debug response headers. Click Save.

The screenshot shows an 'Info' page for creating a Native OAuth Provider. The page contains several fields: 'Title' (MainProviderOA), 'Name' (mainprovideroa), 'Description (optional)' (empty), 'Gateway version' (6000), and 'Base path' (/mainprovideroa). At the bottom, there is a checkbox labeled 'Enable debug response headers' which is checked. At the bottom right, there are two buttons: 'Cancel' and 'Save'.

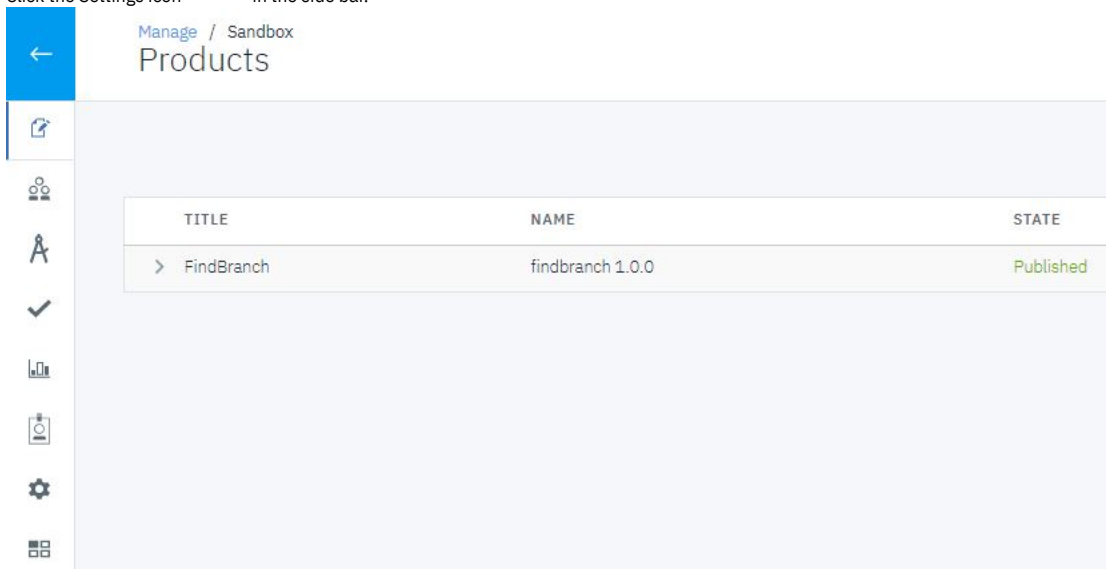

20. Click the Manage icon  in the side bar.

21. Click the Sandbox catalog icon.

22. Click the Settings icon  in the side bar.

23. Click API User Registries.

24. Click Edit.

- TLS Client Profiles

### Vanity API Endpoint

Configure how vanity endpoints are displayed in the developer portal

- Use gateway URLs  
https://apimdev.ibm.com:9443/tutorial/sandbox

## Verify or create test application credentials

You will need the client ID and client secret for an application to test the OAuth functionality. You obtained this information during the completion of the [Tutorial: Creating a Client Application](#) tutorial listed in the Prerequisites.

Note: These steps are necessary only if you did not make note of the credentials for the client application you previously created.

1. Click the Applications icon  in the side bar.
2. Click the Down arrow icon alongside the AppOne application. The findbranch product should be listed.

TITLE	APPLICATION TYPE	CONSUMER ORGANIZATION	STATE						
AppOne	Production	sandbox-test-org	Enabled						
<table border="1"> <thead> <tr> <th>TITLE</th> <th>NAME</th> <th>PLAN</th> </tr> </thead> <tbody> <tr> <td>FindBranch auto product</td> <td>findbranch-auto-product:2.0.0</td> <td>Default Plan</td> </tr> </tbody> </table>				TITLE	NAME	PLAN	FindBranch auto product	findbranch-auto-product:2.0.0	Default Plan
TITLE	NAME	PLAN							
FindBranch auto product	findbranch-auto-product:2.0.0	Default Plan							
Test App Title	Production	sandbox-test-org	Enabled						

3. Click the Options icon  alongside AppOne. Select Credentials.

TITLE	APPLICATION TYPE	CONSUMER ORGANIZATION	STATE						
AppOne	Production	sandbox-test-org	Enabled						
<table border="1"> <thead> <tr> <th>TITLE</th> <th>NAME</th> <th>PLAN</th> </tr> </thead> <tbody> <tr> <td>FindBranch auto product</td> <td>findbranch-auto-product:2.0.0</td> <td>Default</td> </tr> </tbody> </table>				TITLE	NAME	PLAN	FindBranch auto product	findbranch-auto-product:2.0.0	Default

## Adding OAuth Security to an API

You add OAuth security enforcement to an existing API by creating a security definition for OAuth and then including that definition in the security applied to the API. Follow these steps.

1. Click the existing API to which you want to add OAuth security. This tutorial uses the FindBranch API.

Note: The gateway type used by this API must match the gateway type used by the OAuth Provider you just created. The gateway type for the API is shown at the foot of the API Setup page.

## Develop

APIs and Products Add ▾

TITLE	TYPE	LAST MODIFIED
 FindBranch-2.0.0	API (REST)	an hour ago
 FindBranch auto product-2.0.0	Product	2 hours ago

2. Click Security Definitions.
3. Click Add.

## Test OAuth Security

Note: Due to Cross-Origin Resource Sharing (CORS) restrictions, the assembly test tool cannot be used with the Chrome or Safari browsers on the macOS Catalina platform.

To test the new OAuth security added to the API, complete the following steps:

1. Click Assemble.

2. Click the Test icon .

Develop  
FindBranch 2.0.0

Design Source Assemble

Filter Search Show catches

Logic

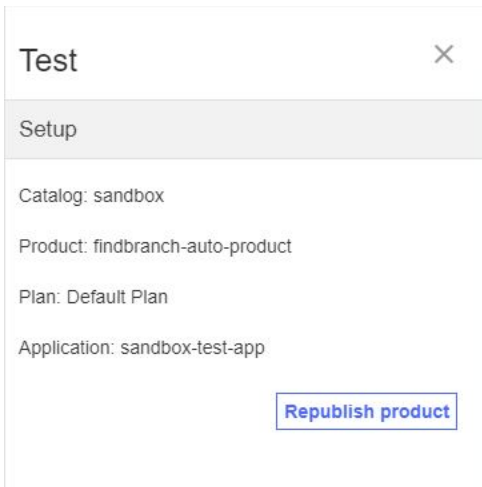

Switch

Throw

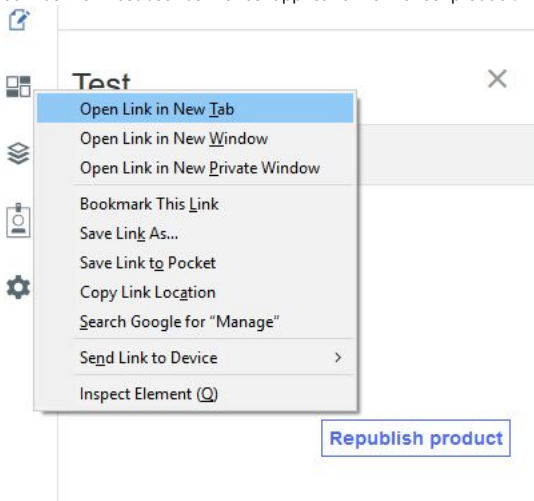

invoke

3. On the test Setup pane, click Republish product.

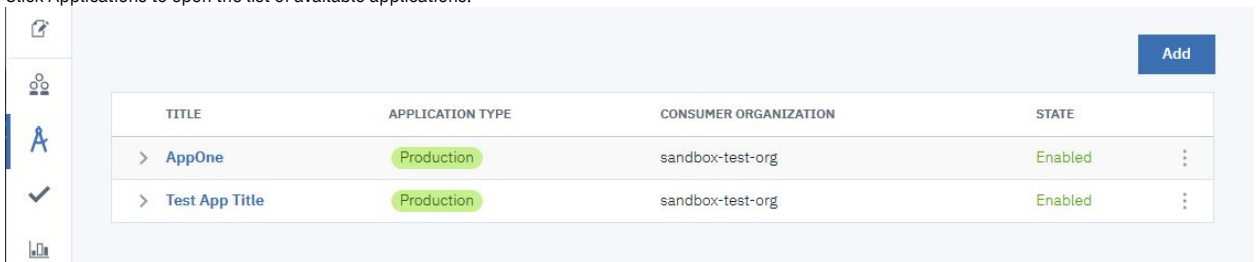

4. You must now resubscribe the test application to the test product. Right-click the Manage icon , and select Open Link in New Tab.

Take the following steps to navigate to the catalog applications page.

- a. Log in to the Manager page again.
- b. On the home page, click Manage.
- c. Click Sandbox to open the catalog.
- d. Click Applications to open the list of available applications.

e. Click the Options icon  alongside the AppOne application. Select Create Subscription .

f. Select FindBranch. Click Create .

### Product/Plan

Select the product and plan for the application subscription

- AccountService auto product:1.0.0/Default Plan
- Branches auto product:1.0.0/Default Plan
- FindBranch auto product:2.0.0/Default Plan

You must now return to testing the republished API. Close the currently open browser tab to return to testing the API you just republished.

5. Select `get /details` in the Operation field.

### Test

Operation

Choose an operation to invoke:

Operation

`get /details`

Identification

6. Enter the client ID you created previously in the `clientId` field.

7. Enter the client secret you created previously in the `clientSecret` field.

### Test

Choose an operation to invoke:

Operation

`get /details`

Identification

`clientId`

`a79c4a3b6602f9acdac59ca487a61e60`

`clientSecret`

.....

8. Enter `user` in the Username field. Enter `pass` in the Password field.

## Test ✕

Authorization

Repeat the API invocation a set number of times, or until the stop button is clicked

Stop after:

10

Stop on error

11. Click Invoke. You may encounter a yellow error box with a URL embedded in it. Click this URL to override a browser certificate error.

### Response

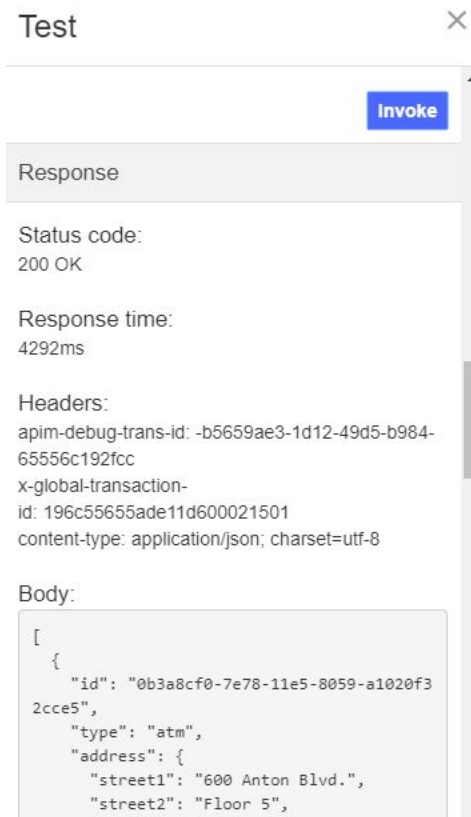

Status code:  
-1

No response received. Causes include a lack of CORS support on the target server, the server being unavailable, or an untrusted certificate being encountered.

Clicking the link below will open the server in a new tab. If the browser displays a certificate issue, you may choose to accept it and return here to test again.

[https://apimdev.ibm.com:9443/gorg/sandbox/branches/details?client\\_id=untrusted](https://apimdev.ibm.com:9443/gorg/sandbox/branches/details?client_id=untrusted)

12. Click Invoke again. The response contains branch data.

---

## What you did in this tutorial

In this tutorial, you completed the following activities:

- Created an OAuth Provider.
- Made the OAuth provider available within the catalog.
- Added OAuth security to an existing API.
- Tested the OAuth security.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details. For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Tutorial: Implementing OpenID Connect Security

This tutorial shows you how to add OpenID Connect capability to an existing native OAuth provider using API Manager.

---

### About this tutorial

In this tutorial you will complete the following lessons:

1. [Add OIDC capability to an OAuth native provider](#)
2. [Test OIDC Security](#)

---

### Before you begin

In this tutorial you will implement and test OpenID Connect security. To complete this tutorial, you must have the following available:

1. An existing published native OAuth provider. If you do not have an API available, complete the [Tutorial: Implementing OAuth Security](#) tutorial.
2. An external application, such as cURL, used to send requests to the OAuth token provider endpoint.

Note: The Sandbox catalog must be configured to use either a DataPower® Gateway (v5 compatible) or a DataPower API Gateway or both. See [Creating and configuring Catalogs](#).

---

### Add OIDC capability to an OAuth native provider

To add OIDC security to a native OAuth provider by using API Manager, complete the following steps:

1. Log in to API Manager.

2. Click the Resources icon  in the side bar.

IBM API Connect

## Test OIDC Security

Note: Due to Cross-Origin Resource Sharing (CORS) restrictions, the assembly test tool cannot be used with the Chrome or Safari browsers on the macOS Catalina platform.

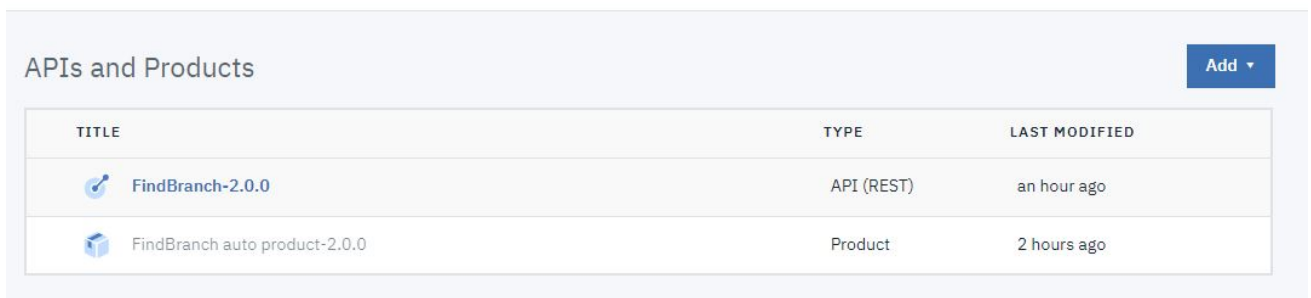

To test the new OIDC security added to the API, complete the following steps:

1. Click Develop  in the side bar.

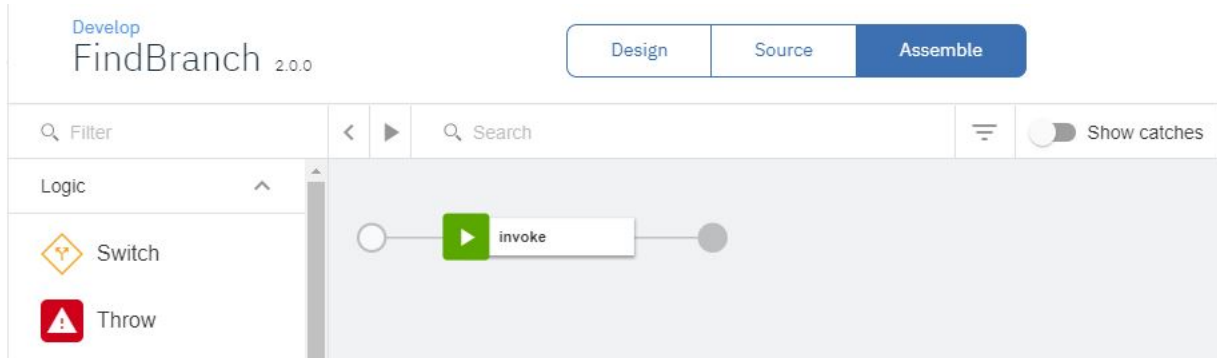

2. On the Develop page, click the name of the API that uses the OAuth provider to which you added OIDC. This tutorial uses the FindBranch API.

## Develop

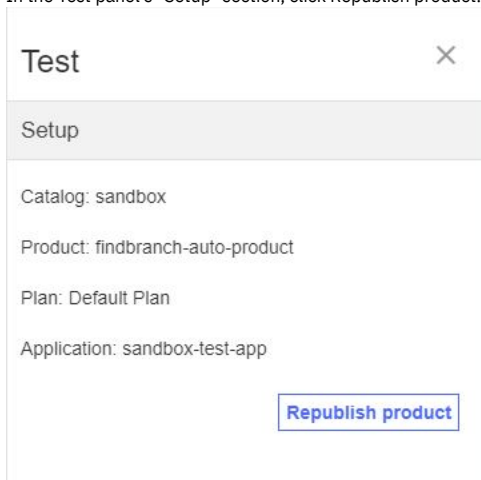

3. Click Assemble in the page header to open the Test panel.

4. Click the Test icon .

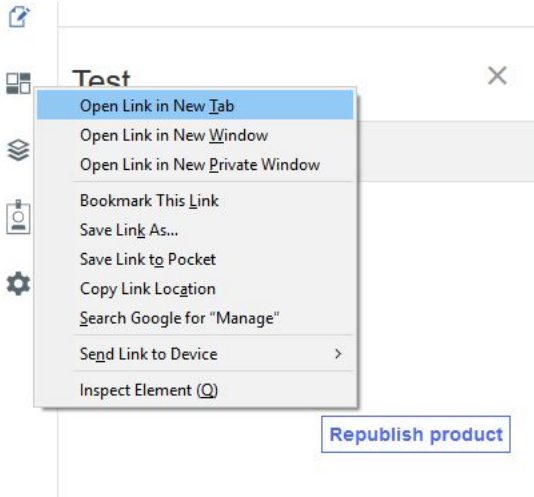

5. In the Test panel's "Setup" section, click Republish product.

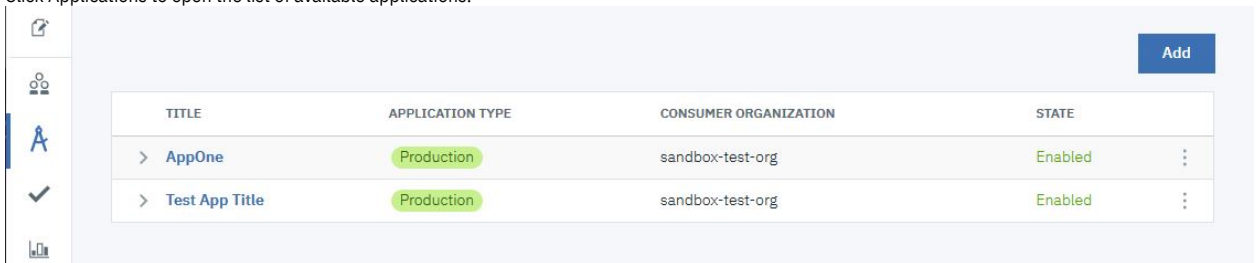

You must now resubscribe the test application to the updated product.

6. Open a copy of the API Manager in a new browser tab.  
For example, in Windows, right-click API Manager in the page header, and select Open Link in New Tab.

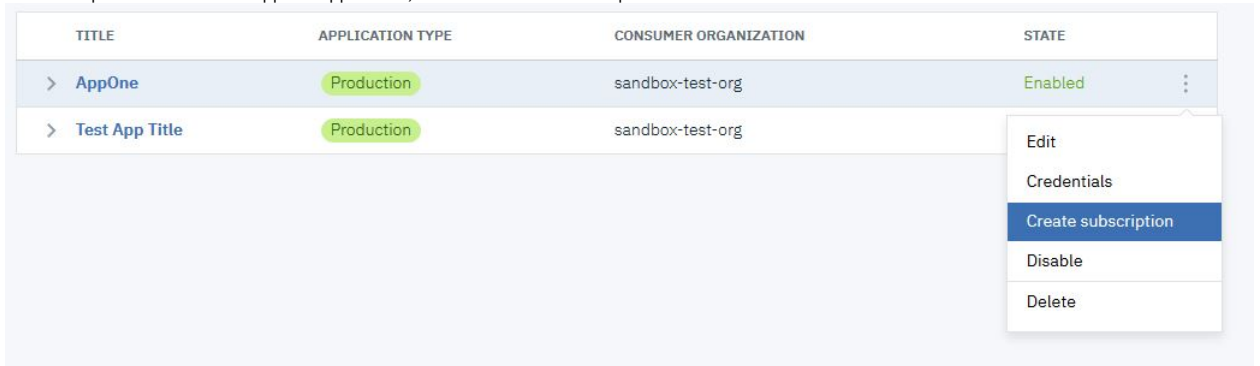

Complete the following steps to subscribe the client app to the updated API:

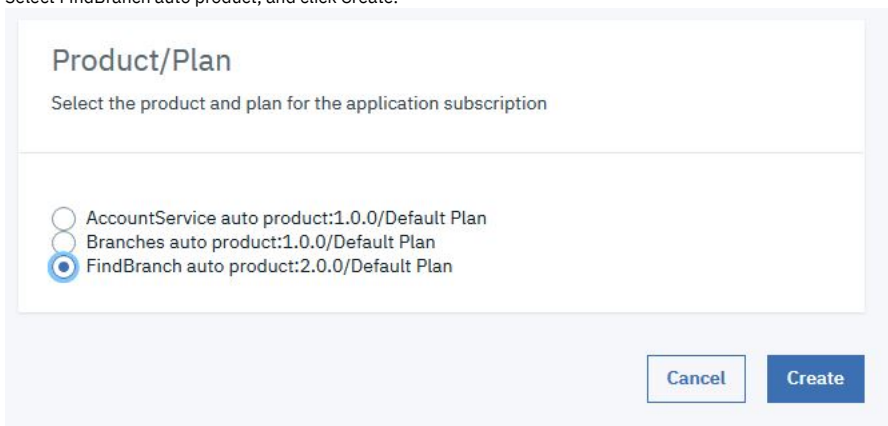

- a. In the newly opened browser tab, log in to API Manager.
- b. On the Home page, click Manage in the navigation list.
- c. Click the Sandbox catalog.
- d. Click Applications to open the list of available applications.

- e. Click the Options icon (three dots) for the AppOne application, and select Create subscription.

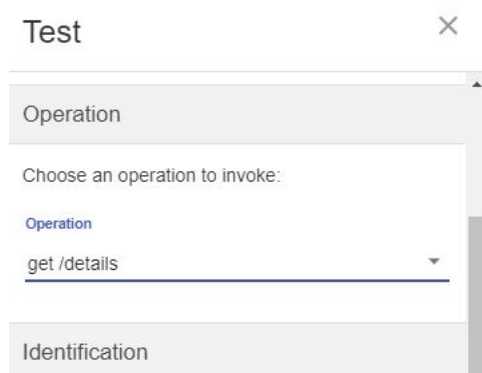

- f. Select FindBranch auto product, and click Create.

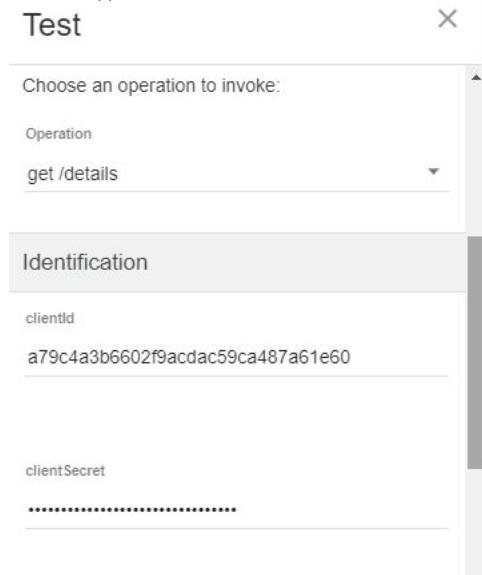

Return to the browser tab where you opened the Test panel.

7. Select `get /details` in the Operation field.

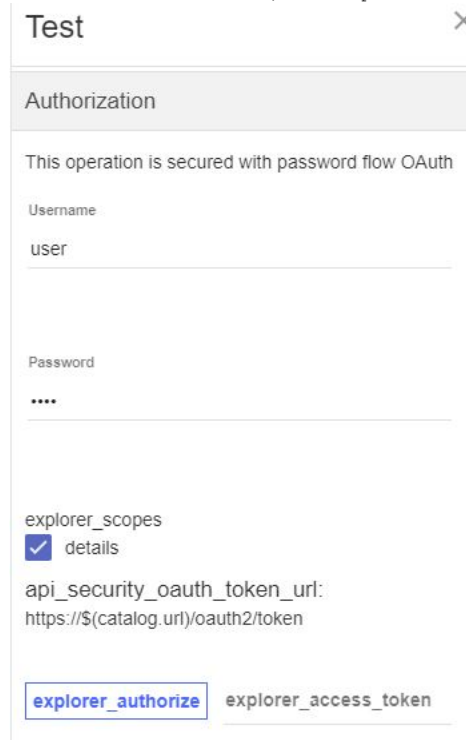

The screenshot shows a 'Test' panel with a close button (X) in the top right. Below the title bar, there is a section titled 'Operation'. Underneath, it says 'Choose an operation to invoke:'. There is a dropdown menu labeled 'Operation' with 'get /details' selected and highlighted. Below the dropdown is a section titled 'Identification'.

8. Paste the application's client ID in the `clientId` field.
9. Paste the application's client secret in the `clientSecret` field.

The screenshot shows the 'Test' panel with the 'Operation' dropdown still set to 'get /details'. The 'Identification' section is expanded, showing two input fields. The 'clientId' field contains the value 'a79c4a3b6602f9acdac59ca487a61e60'. The 'clientSecret' field contains a series of dots representing a masked password.

10. Enter `user` in the Username field, and enter `pass` in the Password field.

The screenshot shows the 'Test' panel with the 'Authorization' section expanded. It contains the text 'This operation is secured with password flow OAuth'. Below this, there are two input fields: 'Username' with the value 'user' and 'Password' with a series of dots. At the bottom, there is a section for 'explorer\_scopes' with a checked checkbox for 'details'. Below that, the 'api\_security\_oauth\_token\_url' is shown as 'https://\$(catalog.url)/oauth2/token'. At the very bottom, there is a button labeled 'explorer\_authorize' and an input field labeled 'explorer\_access\_token'.

- Obtain an OAuth token. For example, run the following cURL command in a command window to obtain the token:

```
curl -k https://gateway_url/org_name/sandbox/mainprovider/oa/oauth2/token -d
"grant_type=password&scope=details
openid&username=user&password=pass&client_id=app_client_id&client_secret=app_client_secret"
```

```
C:\Users\David >curl -k https://apimdev.ibm.com:9443/tutorial/sandbox/mainprovider/oa/oauth2/token -d
"grant_type=password&scope=details&username=user&password=pass&client_id=35824f2646f799ef4c3f79e5d40df0ac&client_secret=57b2d3882aa6062b546a15ae704981f8"
{"token_type":"Bearer", "access_token":"AAIgMzU4MjRmMjY0NmY3OT1lZjRjM2Y3OWU1ZDQwZGYwYW0xkwNYTnIxWwHu8Htf10UAQUEG13TLJVHayXjPJE5Rxd7c1NdBEYRAEKuHIWx8r2KF4AA9_Su0CnxJsETDaij", "expires_in":3600, "consented_on":1524503117, "scope":"details" }
C:\Users\David >
```

- Introspect the token. In this case, cURL is used to obtain the data returned from the introspection endpoint. Use a command similar to the following command.

```
curl -k
https://gateway_url/org_name/sandbox/mainprovider/oa/oauth2/introspect -d
"username=user&password=pass&client_id=app_client_id&client_secret=app_client_secret&token=Atokenstring"
```

```
C:\Users\David >curl -k https://apimdev.ibm.com:9443/tutorial/sandbox/mainprovider/oa/oauth2/introspect -d
"client_id=13ab76a200d62678567970070d829a9e&client_secret=59f7587cf05778f0c1229b5c45fd70c5&token=AAIgMTNhYjc2YTlWmgQ2MjY3ODU2Nzk3MDA3MGQ4Mj1hOWVb6S-C-uB9MEh0fTFeBHneCvKiDtIpFjggqIbQ2jx64CVhWbgaOQdCS16IpskLfIjFqOn8CGheVM9vFWVDI fHLv4u0HhVhGdCNu7xFWgkQ13w"
{"active":true,"scope":"details openid","client_id":"13ab76a200d62678567970070d829a9e","username":"user","token_type":"Bearer", "grant_type":"password", "ttl":1139, "exp":1550606219, "expstr":"2019-02-19T19:56:59Z", "iat":1550602619, "nbf":1550602619, "nbfstr":"2019-02-19T18:56:59Z", "consented_on":1550602619, "consented_on_str":"2019-02-19T18:56:59Z", "one_time_use":false}
C:\Users\DavidShute>
```

- Enter or paste the access token in the explorer\_access\_token field, and then click explorer\_authorize.

Here is an example token: **AAIgMTNhYjc2YTlWmgQ2MjY3ODU2Nzk3MDA3MGQ4Mj1hOWVb6S-C-uB9MEh0fTFeBHneCvKiDtIpFjggqIbQ2jx64CVhWbgaOQdCS16IpskLfIjFqOn8CGheVM9vFWVDI fHLv4u0HhVhGdCNu7xFWgkQ13w**

## What you did in this tutorial

In this tutorial, you completed the following activities:

- Added OpenID Connect security to an existing API.
- Tested the security.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details. For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Tutorial: Generate a JSON Web Token (JWT)

This tutorial shows you how to define and implement a REST API definition that generates a JSON Web Token (JWT).

### About this tutorial

In this tutorial you will complete the following lessons:

1. [Generate a JWT](#)
2. [Testing the REST API](#)

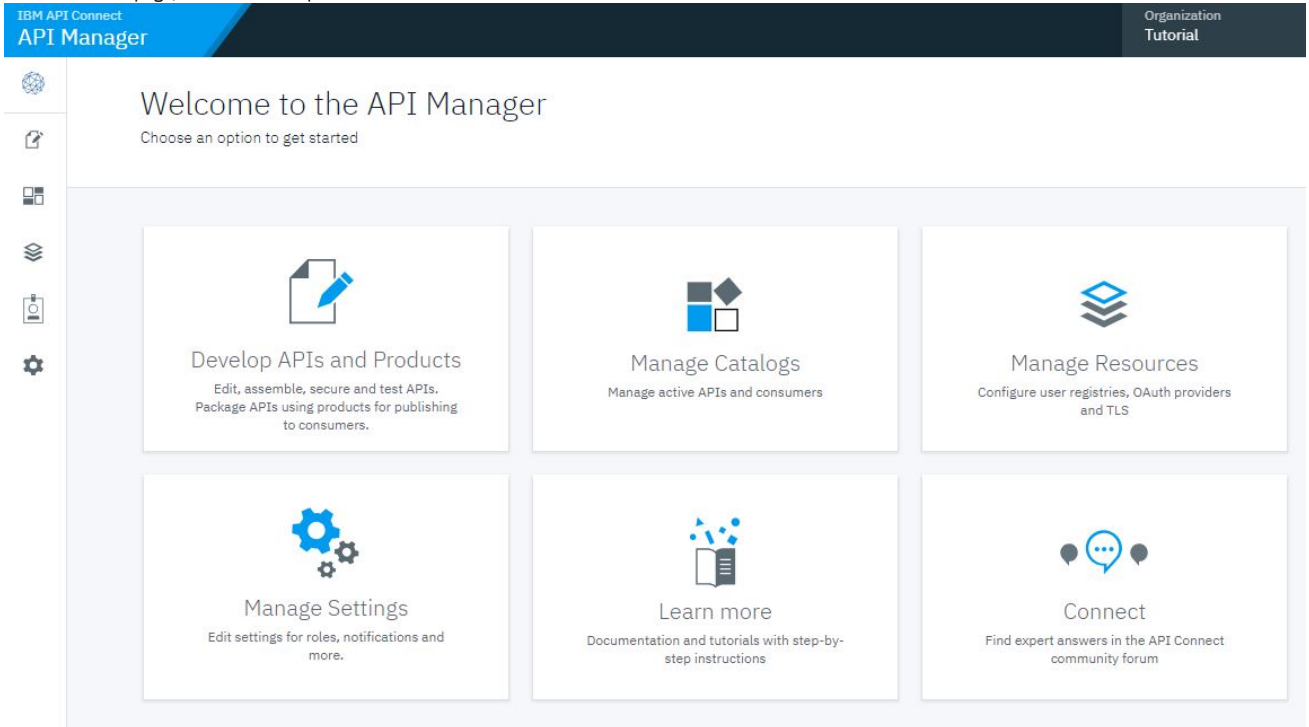

Note: The Sandbox catalog must be configured to use either a DataPower® Gateway (v5 compatible) or a DataPower API Gateway or both. See [Creating and configuring Catalogs](#).

## Generate a JWT

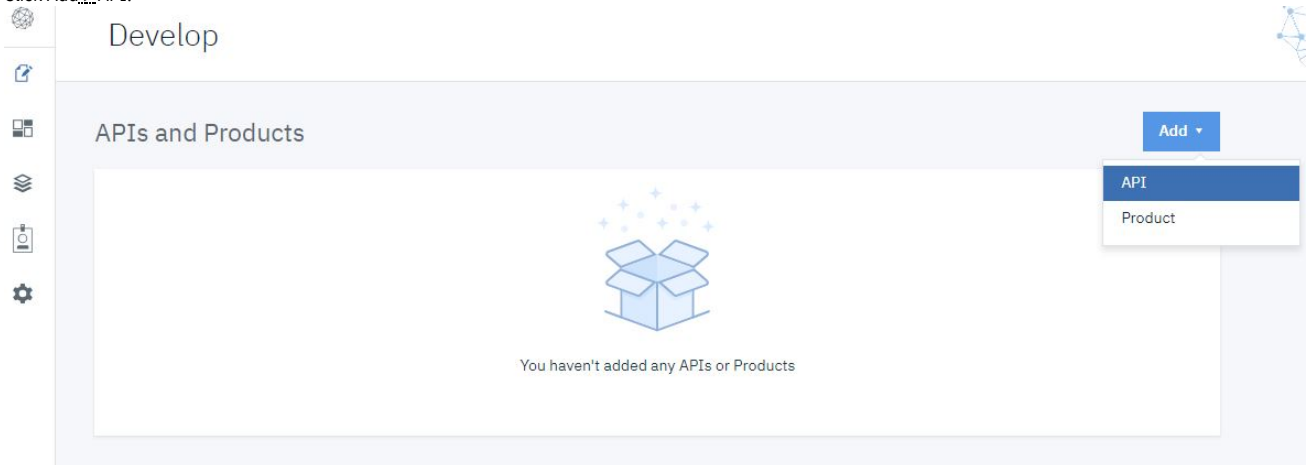

Create a REST API to generate and return a JSON Web Token (JWT).

To add and define this REST API, complete the following steps:

1. Log in to API Manager.
2. In the Welcome page, click the Develop APIs and Products tile.

3. Click Add > API.

4. Select New OpenAPI. Click Next.

**Create**

- From target service**  
Create a REST proxy that routes all traffic to a target API or service endpoint
- From existing OpenAPI service**  
Create a REST proxy based upon an OpenAPI described target service
- From existing WSDL service (SOAP proxy)**  
Create a SOAP proxy based upon a WSDL described target service
- From existing WSDL service (REST proxy)**  
Create a REST proxy based upon a WSDL described target service
- New OpenAPI**  
Compose a new REST proxy by defining paths and operations

**Import**

- Existing OpenAPI**  
Use an existing definition of a REST proxy

5. Enter the appropriate information to create a REST API definition.
  - a. In the Title field, enter `JWT`.
  - b. The Name and Base Path fields autopopulate with the terms `jwt` and `/jwt` respectively.
  - c. Enter `1.0.0` in the Version field.

**Info**  
Enter details of this API

**Title**  
JWT

**Name**  
jwt

**Version**  
1.0.0

**Base path (optional)**  
/jwt

**Description (optional)**

6. Click Next.
7. Make no changes on the Secure screen. Click Next.

## Secure

Configure the security of this API

- Secure using Client ID
- CORS

8. You see the progress as the new API gets created. When it is done, you see a Summary. Click Edit API.

## Summary

- Generated OpenAPI 2.0 definition
- Applied security

9. In the side bar of the Design page, select Paths to display the Paths panel.

Develop  
JWT 1.0.0

14. Click Save.
15. Click /gen in the list of available paths.

**Paths**

| NAME |
|------|
| /gen |

16. Click GET in the list of Operations.
17. Scroll down. In the Parameters section, click Add.
  - a. Select REQUIRED.
  - b. Enter `iss-claim` in the NAME field.
  - c. Select `header` in the LOCATED IN field.
  - d. Select `string` in the TYPE field.
  - e. Enter `Enter https://myidp.ibm.com to match` in the DESCRIPTION field.

**Parameters** Add

| REQUIRED                            | NAME      | LOCATED_IN | TYPE   | DESCRIPTION                          | DELETE |
|-------------------------------------|-----------|------------|--------|--------------------------------------|--------|
| <input checked="" type="checkbox"/> | iss-claim | header     | string | Enter https://myidp.ibm.com to match |        |

18. Click Add to add a second parameter.
  - a. Select REQUIRED.
  - b. Enter `aud-claim` in the NAME field.
  - c. Select `header` in the LOCATED IN field.
  - d. Select `string` in the TYPE field.
  - e. Enter `Enter ClientID1 to match` in the DESCRIPTION field.

**Parameters** Add

| REQUIRED                            | NAME      | LOCATED_IN | TYPE   | DESCRIPTION                          | DELETE |
|-------------------------------------|-----------|------------|--------|--------------------------------------|--------|
| <input checked="" type="checkbox"/> | iss-claim | header     | string | Enter https://myidp.ibm.com to match |        |
| <input checked="" type="checkbox"/> | aud-claim | header     | string | Enter ClientID1 to match             |        |

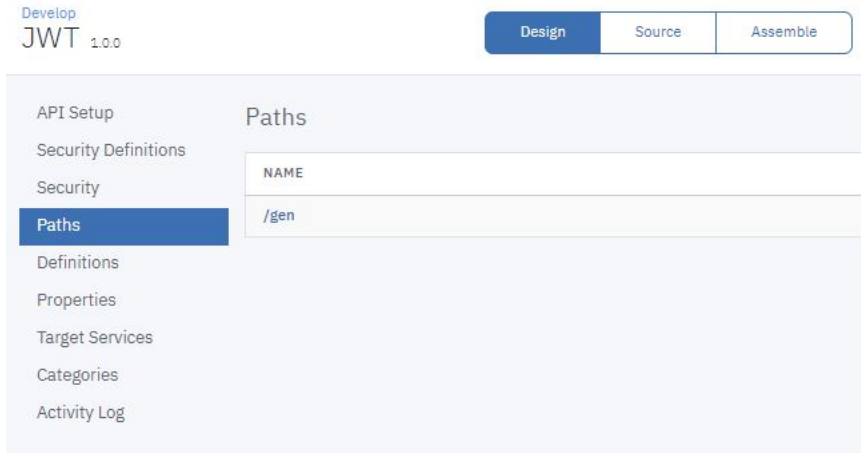

19. In the Response section, change the description of the pre-supplied 200 status code to 200 OK.

**Response** Add

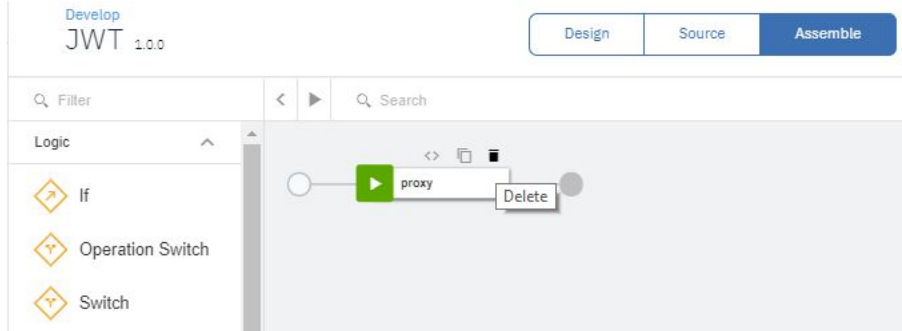

| STATUS CODE | SCHEMA | DESCRIPTION | DELETE |
|-------------|--------|-------------|--------|
| 200         | string | 200 OK      |        |

Cancel Save

20. Click Save.
21. Click Assemble.

22. Hover the mouse over the existing Proxy or Invoke action and click the trash can icon to delete it.

23. Drag the Set Variable action onto the processing flow line. A configuration panel automatically opens.

24. Click + Action field.
25. Enter `hs256-key` in the Set field.
26. Select `string` in the Type field.
27. Enter a JWK in the Value field. Here is an example. 

```
{ "alg": "HS256", "kty": "oct", "use": "sig", "k": "o5yErLaE-dbgVpSw65Rq570A9dHyaF66Q_Et5azPa-XUjbyP0w9iRWhR4kru09aFfQLXeIODIN4uhjE1YKXt8n76jt0Pjkd2pqk4t9abRF6tnL19GV4pflfL6uvVKkP4weOh39tqHt4TmkBgF2P-gFhgssZpjwq6182fz3dUhQ2nkzoLA_CnyDGLZLd7SZ1yv73uzfE20t813zmig8KTMEMWvcWSDvy61F06vs_6LURcq_IEEEvUiubBxG5S2akNnWigfphWYjMI5M22FOCpdcDBt4L7K1-yHt95Siz0Qub0MN1T_X8F76wh7_A37GpKKJGqaiNWmHkgWdE8QWDQ", "kid": "hs256-key" }
```

Action \*

Set

Set, Add, or Clear a runtime variable.

Set

hs256-key

The name of the variable to be set.

Type \*

string

The type of the value to set. This can be string, number or boolean.

Value

```
{ "alg": "HS256", "kty": "oct", "use": "sig", "k": "o5yErLa
```

The value that the variable will be set to.

28. Close the property panel. Click Save.

29. Drag the Generate JWT action onto the processing flow line after the set-variable icon. A configuration panel automatically opens.

The screenshot shows a processing flow line with two actions: 'set-variable' (checked) and 'jwt-generate'. To the right, a configuration panel for 'jwt-generate' is open, showing fields for Title and Description.

30. Enter `request.headers.iss-claim` in the Issuer Claim field.

31. Enter `request.headers.aud-claim` in the Audience Claim field.

Title

jwt-generate

Description

JSON Web Token (JWT)

generated.jwt

Runtime variable in which to place the generated JWT. If not set, the JWT is placed in the Authorization Header as a Bearer token.

JWT ID Claim

Indicates whether a JWT ID (jti) claim should be added to the JWT. If selected, the jti claim value will be a UUID.

Issuer Claim

request.headers.iss-claim

Runtime variable from which the Issuer (iss) claim string can be retrieved. This claim represents the Principal that issued the JWT.

Subject Claim

Runtime variable from which the Subject (sub) claim string can be retrieved.

Audience Claim

request.headers.aud-claim

32. Enter `hs256-key` in the Sign JWK variable name field.

33. Select HS256 in the Cryptographic Algorithm field.

**request.headers.aud-claim**

Runtime variable from which the Audience (aud) claim string can be retrieved. Multiple variables are set via a comma-separated string.

Validity Period

3600

The length of time (in seconds), that is added to the current date and time, in which the JWT is considered valid.

Private Claims

Runtime variable from which a valid set of JSON claims can be retrieved.

Sign JWK variable name

hs256-key

Runtime variable containing the JWK to use to sign the JWT.

Cryptographic Algorithm\*

HS256

Select a cryptographic algorithm.

Sign Crypto Object

34. Close the property panel. Click Save.
35. Drag the GatewayScript action onto the processing flow line after the Generate JWT icon. A configuration panel automatically opens.
36. Enter the following code:

```
var apim = require('apim');
apim.setvariable('message.body', apim.getvariable('generated.jwt'));
```

The screenshot shows the API Gateway configuration interface. The main flow consists of three actions: 'set-variable', 'jwt-generate', and 'gatewayscript'. A configuration panel for the 'gatewayscript' action is open on the right, displaying the code:

```
1 var apim = require('apim');
2 apim.setvariable('message.body', apim
  .getvariable('generated.jwt'));
```

37. Close the property panel. Click Save.

## Testing the REST API

Note: Due to Cross-Origin Resource Sharing (CORS) restrictions, the assembly test tool cannot be used with the Chrome or Safari browsers on the macOS Catalina platform.

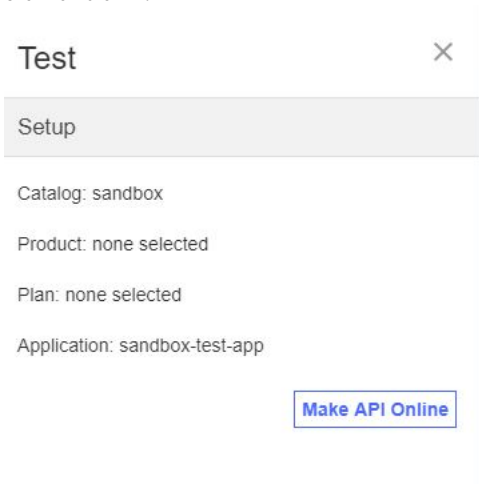

To test the REST API, complete the following steps:

1. Click the Test icon .

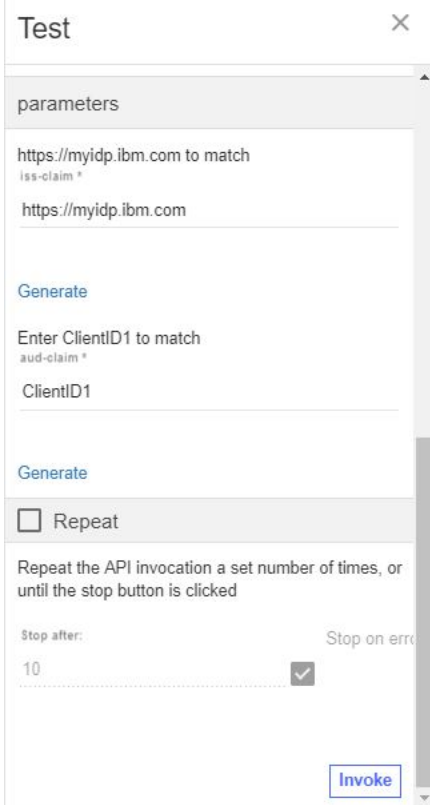

2. Click Activate API.

3. Select the get /gen Operation.

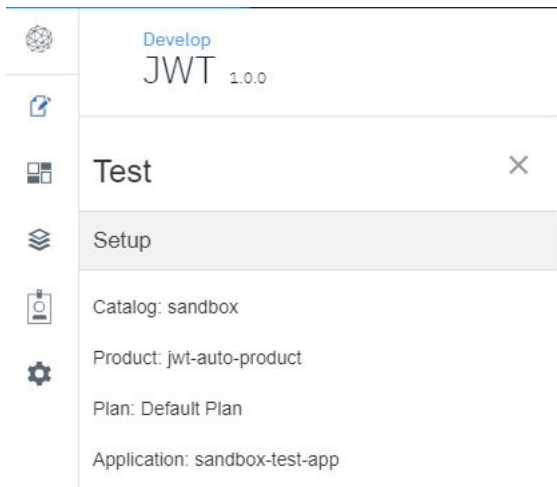

4. Enter `https://myidp.ibm.com` in the iss-claim field.

5. Enter `ClientID1` in the aud-claim field.

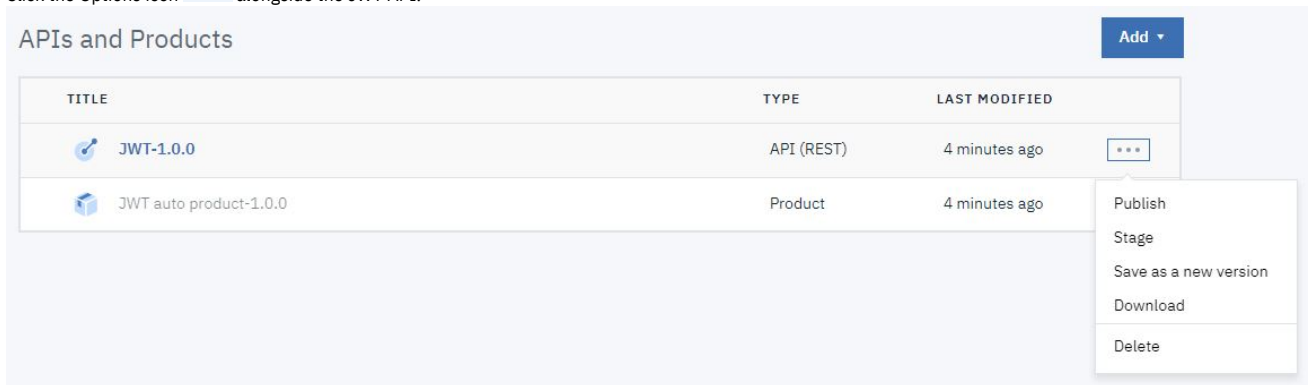

6. Click Invoke. You may encounter a yellow error box with a URL embedded in it. Click this URL to override a browser certificate error.

2. Click the Options icon  alongside the JWT API.

3. Select Download.

## What you did in this tutorial

In this tutorial, you completed the following activities:

- Created a new API definition that generates a JSON Web Token (JWT).
- Tested the new API.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details. For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Tutorial: Validate a JSON Web Token (JWT)

This tutorial shows you how to define and implement a REST API definition that validates a JSON Web Token (JWT).

### About this tutorial

In this tutorial you will complete the following lessons:

1. [Validate a JWT](#)
2. [Testing the REST API](#)

Note: The Sandbox catalog must be configured to use either a DataPower® Gateway (v5 compatible) or a DataPower API Gateway or both. See [Creating and configuring Catalogs](#).

### Before You Begin

You must also do the following steps.

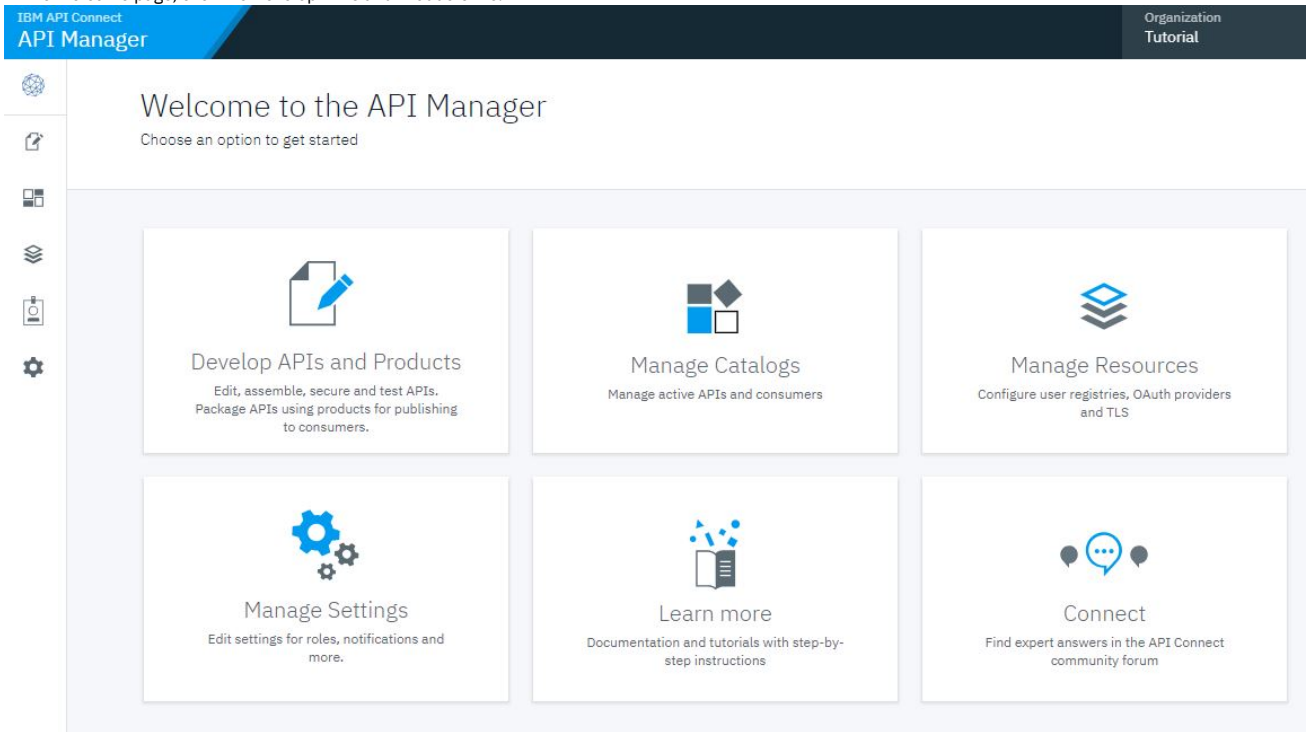

- Complete the [Tutorial: Generate a JSON Web Token \(JWT\)](#) tutorial. This tutorial generates a JSON Web Token that can be validated by this tutorial. You will need this JWT to test this validation API.

## Validate a JWT

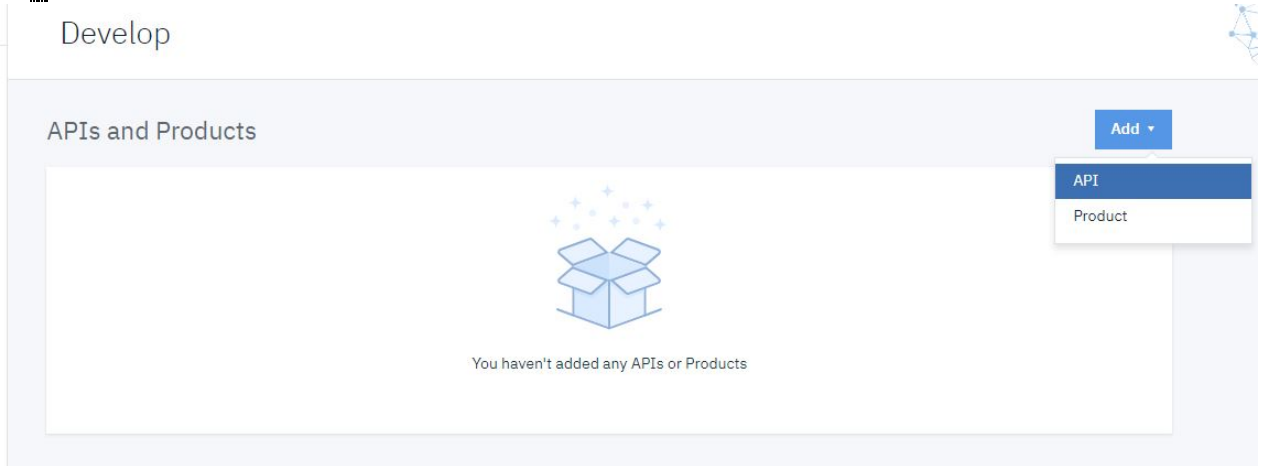

Create a REST API to validate a JSON Web Token (JWT).

To add and define this REST API, complete the following steps:

1. Log in to API Manager.
2. In the Welcome page, click the Develop APIs and Products tile.

3. Click Add > API.

4. Select New OpenAPI. Click Next.

**Create**

- From target service**  
Create a REST proxy that routes all traffic to a target API or service endpoint
- From existing OpenAPI service**  
Create a REST proxy based upon an OpenAPI described target service
- From existing WSDL service (SOAP proxy)**  
Create a SOAP proxy based upon a WSDL described target service
- From existing WSDL service (REST proxy)**  
Create a REST proxy based upon a WSDL described target service
- New OpenAPI**  
Compose a new REST proxy by defining paths and operations

**Import**

- Existing OpenAPI**  
Use an existing definition of a REST proxy

5. Enter the appropriate information to create a REST API definition.
  - a. In the Title field, enter `JWTVAL`.
  - b. The Name and Base Path fields autopopulate with the terms `jwtval` and `/jwtval` respectively.
  - c. Enter `1.0.0` in the Version field.

**Info**  
Enter details of this API

**Title**  
JWTVAL

**Name**  
jwtval

**Version**  
1.0.0

**Base path (optional)**  
/jwtval

**Description (optional)**

6. Click Next.
7. Make no changes on the Secure screen. Click Next.

## Secure

Configure the security of this API

- Secure using Client ID
- CORS

8. You see the progress as the new API gets created. When it is done, you see a Summary. Click Edit API.

## Summary

- Generated OpenAPI 2.0 definition
- Applied security

9. In the side bar of the Design page, select Paths to display the Paths panel.

Runtime variable containing the JWK t

30. Close the property panel. Click Save.

31. Drag the GatewayScript action onto the processing flow line after the Validate JWT icon. A configuration panel automatically opens.

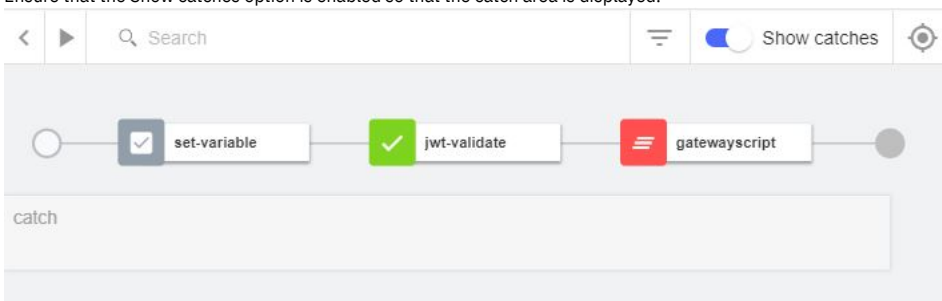

32. Enter the following code:

```
var apim = require('apim');
apim.setvariable('message.body', apim.getvariable('decoded.claims'));
```

33. Close the property panel. Click Save.

34. Ensure that the Show catches option is enabled so that the catch area is displayed.

35. Click Catch. A property panel opens.

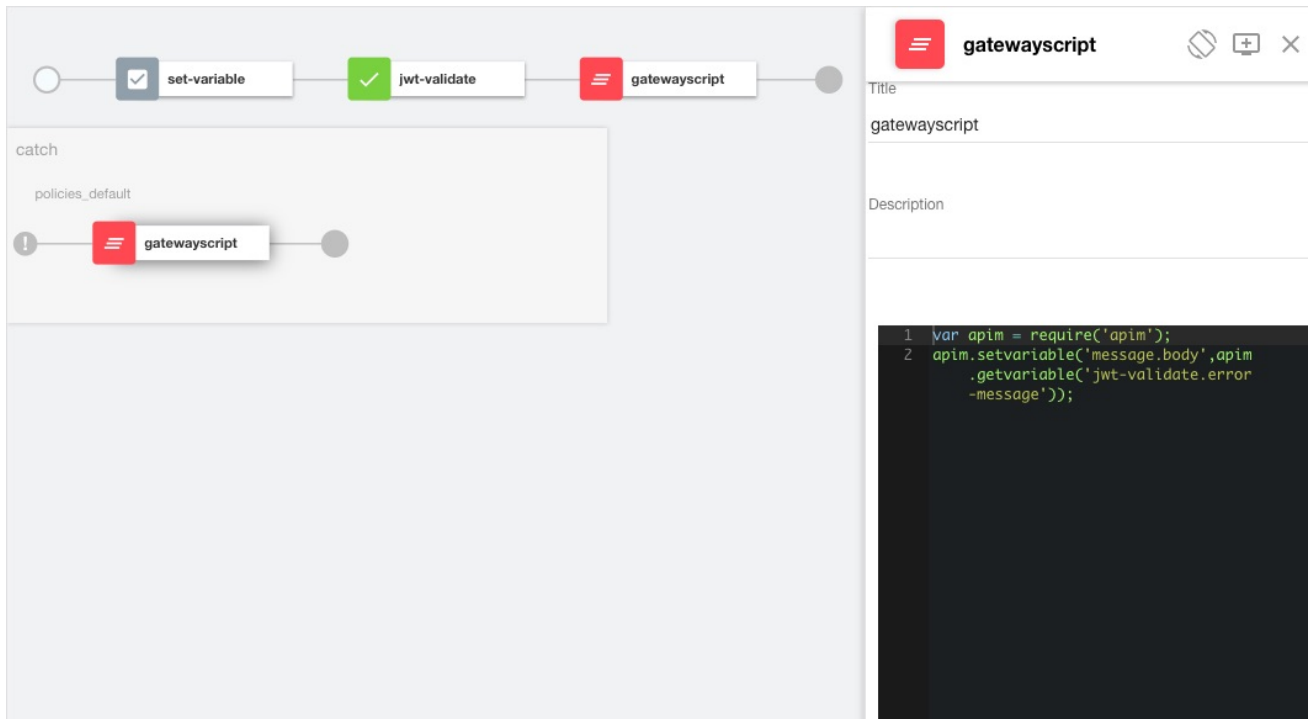

36. Click + Default.

37. Drag the GatewayScript policy action onto the catch flow line.

38. Enter the following code:

```
var apim = require('apim');
apim.setvariable('message.body', apim.getvariable('jwt-validate.error-message'));
```

39. Close the property panel. Click Save.

## Testing the REST API

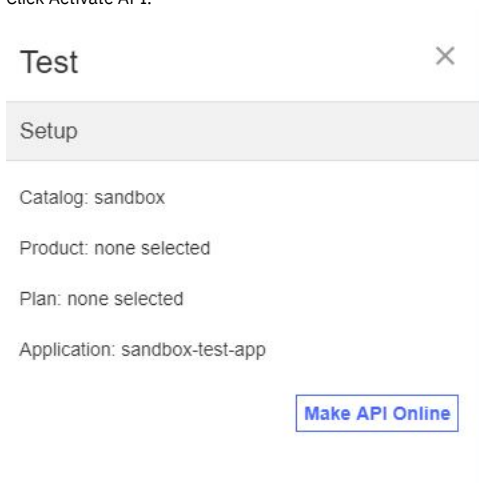

Note: Due to Cross-Origin Resource Sharing (CORS) restrictions, the assembly test tool cannot be used with the Chrome or Safari browsers on the macOS Catalina platform.

To test the REST API, you will need a valid JWT. You can obtain such a JWT by invoking the API created in the [Tutorial: Generate a JSON Web Token \(JWT\)](#). To complete testing, take the following steps:

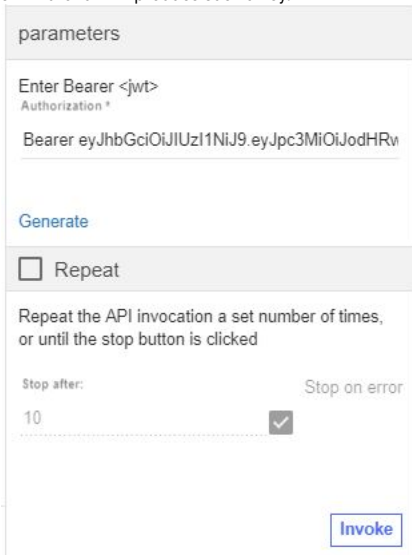

1. Click the Test icon .

2. Click Activate API.

3. Select the `get /val` Operation.
4. Enter `Bearer` followed by a space followed by a valid JWT generated with the same sign key in the Authorization field. Invoking the API created by the Generate JWT tutorial will produce such a key.

parameters

Enter Bearer <jwt>  
Authorization \*

Bearer eyJhbGciOiJIUzI1NiJ9.eyJpc3MiOiJodHRv

Generate

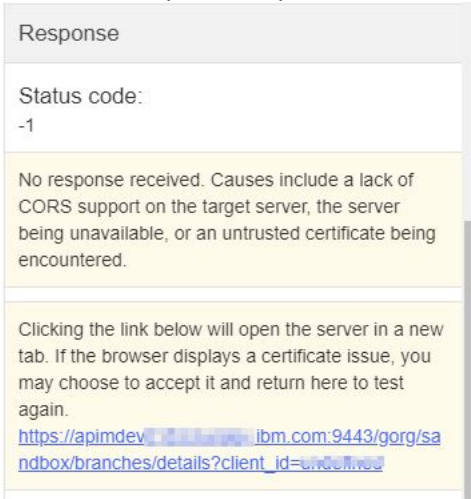

Repeat

Repeat the API invocation a set number of times, or until the stop button is clicked

Stop after: 10 Stop on error

Invoke

5. Click Invoke. You may encounter a yellow error box with a URL embedded in it. Click this URL to override a browser certificate error.

Response

Status code:  
-1

No response received. Causes include a lack of CORS support on the target server, the server being unavailable, or an untrusted certificate being encountered.

Clicking the link below will open the server in a new tab. If the browser displays a certificate issue, you may choose to accept it and return here to test again.

## What you did in this tutorial

In this tutorial, you completed the following activities:

- Created a new API definition that validates a JSON Web Token (JWT).
- Tested the new API.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details. For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Tutorial: Creating a Client Application

This tutorial shows you how to create a client application using the API Manager. The ability to create a new application using the API Manager allows members of a provider organization, such as API developers or testers, to create the environment needed to complete an API.

### About this tutorial

In this tutorial you will complete the following lessons:

1. [Create a Client Application](#)
2. [Subscribing to Products and APIs](#)

### Before you begin

In this tutorial you will create a new client application. You can then subscribe this new application to a product if one exists in your catalog. If you do not have an existing product, complete [Tutorial: Importing an API](#) first before beginning this tutorial.

### Create a Client Application

To create a client application using the API Manager, complete the following steps:

1. Log in to API Manager.
2. In the Welcome page, click the Manage Catalogs tile.

Welcome to the API Manager  
Choose an option to get started

- Develop APIs and Products**  
Edit, assemble, secure and test APIs. Package APIs using products for publishing to consumers.
- Manage Catalogs**  
Manage active APIs and consumers
- Manage Resources**  
Configure user registries, OAuth providers and TLS
- Manage Settings**  
Edit settings for roles, notifications and more.
- Learn more**  
Documentation and tutorials with step-by-step instructions
- Connect**  
Find expert answers in the API Connect community forum

3. Click the Sandbox catalog icon.

Sandbox  
Sandbox Catalog

4. Click the Application icon <sup>A</sup> in the side bar.  
5. Click Add > Create.

Manage / Sandbox  
Applications

## Subscribing to Products and APIs

You can subscribe the new client application to an existing published product if you have already published at least one product. Complete the following steps to subscribe the client application to a product.

1. Click the options icon , then Create subscription.

| TITLE              | APPLICATION TYPE | CONSUMER ORGANIZATION | STATE   |
|--------------------|------------------|-----------------------|---|
| > AppOne           | Production       | sandbox-test-org      | Enabled   |
| > Sandbox Test App | Production       | sandbox-test-org      | <div style="border: 1px solid #ccc; padding: 5px;">           Edit<br/>           Credentials<br/> <b>Create subscription</b><br/>           Disable<br/>           Delete         </div> |

2. Select the Product/Plan for your API.

**Product/Plan**  
Select the product and plan for the application subscription

---

FindBranch auto product:2.0.0/Default Plan

3. Click Create.

## What you did in this tutorial

In this tutorial, you completed the following activities:

- Created a client application.
- Subscribed the client to a product.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details. For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Authoring policies

With the on-premise offering, you can control specific processing features in the Gateway server of IBM® API Connect by creating user-defined policies.

IBM API Connect enables organizations to easily promote business services as APIs to internal and external developer communities. API developers can rapidly create, proxy, assemble, and secure APIs through the API Manager user interface (UI). The API Manager assembly feature allows API developers to create complex REST or SOAP API operations that transform data, perform multiple service calls, aggregate data, and apply policies.

A policy is a piece of configuration that controls a specific aspect of processing in the IBM DataPower® Gateway server during the handling of an API invocation at run time. IBM API Connect provides a number of different types of policies, but you can also create user-defined policies to provide more processing control.

## When would you need a user-defined policy?

A user-defined policy enables you to control extra processing features in the Gateway server, such as security, or routing of requests. The user-defined policies feature is available only with the on-premise offering of IBM API Connect.

Create a user-defined policy in IBM API Connect when you need to augment the actions or activities that are performed by the API gateway. For example, you might want to perform the following operations:

- Implement your own proprietary logic for dynamic routing of requests.
- Enforce extra security constraints to your API.
- Make accessible an extra capability that is provided in DataPower that is not yet accessible in the IBM API Connect policy catalog.

**Note:** For best results, do not try to update your existing user-defined policies, because those are already in use by your APIs. Instead, create a new version of the policy that you want to update, and then modify the API assembly to use the newer version of the policy.

See the following topics for more information about user-defined policies, and how to create and import them into IBM API Connect:

- [Authoring policies for the DataPower Gateway \(v5 compatible\)](#)

A user-defined policy for the DataPower Gateway (v5 compatible) consists of a package that contains a YAML definition file that describes the policy, together with the policy implementation files. You import the package into one or more Catalogs in your IBM API Connect environment to make the policy available to APIs that are published to those Catalogs.

- [Authoring policies for the DataPower API Gateway](#)

A user-defined policy for the DataPower API Gateway consists of a package that contains a configuration file of DataPower API Gateway CLI commands that define the actions of the policy, together with the policy implementation files. You publish the package to the DataPower API Gateway to make it available to APIs that are deployed there.

DataPower Gateway (v5 compatible) only

## Authoring policies for the DataPower Gateway (v5 compatible)

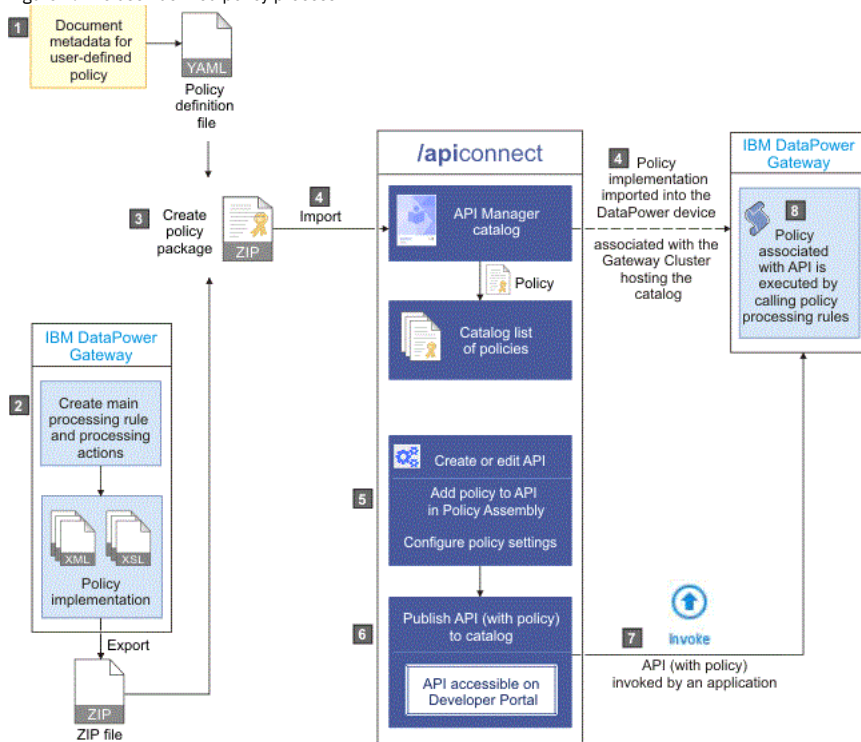

A user-defined policy for the DataPower® Gateway (v5 compatible) consists of a package that contains a YAML definition file that describes the policy, together with the policy implementation files. You import the package into one or more Catalogs in your IBM® API Connect environment to make the policy available to APIs that are published to those Catalogs.

## How do user-defined policies work?

A user-defined policy is implemented as a DataPower processing rule. After a policy is imported into an IBM API Connect Catalog, the policy is available to be placed into an assembly flow of an enforced API. When the API is published, and invoked by an application, the API Gateway executes all policies that are associated with this API. An API Gateway that is running in DataPower calls the IBM DataPower Gateway processing rules that those policies implement.

The following diagram provides an overview of how to create and execute a user-defined policy in IBM API Connect.

Figure 1. The user-defined policy process

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Describing your policy

Describe your user-defined policy by creating a definition file in YAML format to document metadata about the policy.

### About this task

A policy YAML file contains the following sections:

- A specification version.
- An information section.
- An attach section.
- A properties section.
- A gateways section.

You can create a policy YAML file by using any editor of your choice. Both .yaml and .yml file extensions are supported, but the use of the .yaml file extension is recommended by [yaml.org](http://yaml.org).

Note: All keys and enumeration values that are specified in this topic are case-sensitive.

### Procedure

The following steps describe how to construct a policy YAML file.

1. Set the specification version by adding the following line to the beginning of the file: `policy: 1.0.0`.
2. Complete the information section with details about the policy by using the following syntax:

```
info:
  title: Title of policy
  name: <policy-name>
  version: 1.0.0
  description: An example policy
  contact:
    name: name1
    url: url1
    email: email1
```

where:

- **title** is the title of the policy. Any string can be used, but the title should be kept short so that it can be displayed in the API Manager user interface.
- **name** is the short name for the policy and must contain only alphanumeric characters, the - (dash) character, and the \_ (underscore) character (blank spaces are not supported). The name is case-sensitive, and should be 20 characters or less so that it can be displayed in the API Manager user interface. In the example, the name is shown as `<policy-name>`.  
Important: The policy short name must be different from the OpenAPI names of the built-in policies, otherwise it will cause a policy conflict in the API assembly definition. For a list of the OpenAPI built-in policy names, see [execute](#). Also, consider including an appropriate unique prefix or suffix string in the short names of your user-defined policies to prevent possible name conflicts with future built-in policies.  
Note: The **name** property must be identical to the Node.js module name.
- **version** is the version number of the policy. This is a reserved property.  
Tip: The `version.release.modification` version numbering scheme is recommended, for example `1.0.0`.  
Note: The **info.version** in `policy.yaml` must match the **version** indicated in `package.json`.
- **description** (optional) is a short description of the policy.
- **contact** (optional) is the contact information for the policy, where:
  - **name** (string) is the identifying name of the contact person or organization.
  - **url** (string) is the URL that points to the contact information.
  - **email** (string) is the email address of the contact person or organization.

3. Complete the attach section by specifying which type of API flow the policy can be attached to.

```
attach:
- rest
- soap
```

where:

- **rest** indicates that this policy can be attached to a REST API flow.
- **soap** indicates that this policy can be attached to a SOAP API flow.

The attach section must contain at least one API flow type. If a policy can be attached to both API flow types, they must both be indicated in the attach section.

4. Complete the properties section by defining a JSON schema (based on JSON Schema Specification Draft 4, but rendered in YAML format) that contains the list of properties the policy will declare as required input. These properties are presented to the API author at development time, when the properties can be configured or mapped to values as required.

The JSON schema defines a root object that contains the following JSON properties:

- **type**
- **properties**
- **required**

The syntax and definition of these properties matches the JSON schema definition. The following code block shows an example of a simple schema that defines one required property (`a_property`):

```
properties:
  $schema: "http://json-schema.org/draft-04/schema#"
```

```

type: object
properties:
  a_property:
    label: a label
    description: a description
    type: a type
required:
  - a_property

```

The root *type* of the schema must be an **object**, as shown in the example schema. You can define zero or more properties in the schema. Required properties are declared by using the **required** parameter, as shown in the example schema. The policy will not be accessible in the API Manager assembly editor, unless all the required properties have values. Each property is an object with the following items:

- **label** is a short name for the property and is displayed in the Name column of the API Manager assembly editor.
  - **description** is a short description for the property and is displayed in the Description column of the API Manager assembly editor.
  - **type** must be one of the following primitives that are supported:
    - *integer*
    - *number*
    - *string*
    - *boolean* (this primitive is shown as a check box in the assembly editor)
    - *array*
  - **default** (optional) specifies a default value for the property.
  - **enum** (for properties with a **type** of *string*) is an array of valid values.
5. In your gateways section, specify that the policy is for the DataPower® Gateway. Enter the following code:

```

gateways:
  - datapower-gateway

```

6. Save the new policy as a YAML file using the value of the **name** property (in the **info** section) as the file's name. Required: To ensure a successful import, the YAML file must use the name specified in the policy's **name** property.

## Results

You have created a user-defined policy definition YAML file that documents metadata about your policy.

## Example

The following code block shows an example of a policy definition file that contains all the supported primitives. This policy must be saved as `sampleimpl.yaml` to ensure that it can be imported into API Connect.

```

policy: 1.0.0

info:
  title: Sample Policy
  name: sampleimpl
  version: 1.0.1
  description: This is a sample policy.
  contact:
    name: Steve Product Manager
    url: http://developer.acme.com/contacturl
    email: steve-product-manager@someemailservice.com

attach:
  - rest
  - soap

properties:
  $schema: "http://json-schema.org/draft-04/schema#"
  type: object
  properties:
    samplestring:
      label: String Property
      description: Sample string property
      type: string
    sampleboolean:
      label: Boolean Property
      description: Sample boolean property
      type: boolean
    sampleinteger:
      label: Integer Property
      description: Sample integer property
      type: integer
    samplenumber:
      label: Number Property
      description: Sample number property
      type: number
    samplestringwithenum:
      label: Enum Property
      description: Sample string enum property
      enum:
        - one
        - two
        - three
      default: one
      type: string
    samplearray:
      label: Array of properties
      description: Sample array of properties
      type: array

```

```

    items:
      type: object
      properties:
        string:
          label: String Property
          description: Sample string property in array
          type: string
        boolean:
          label: Boolean Property
          description: Sample boolean property in array
          type: boolean
      required:
        - string
  required:
    - samplestring
    - sampleboolean
    - sampleinteger
    - samplenumber
    - samplearray

```

```

gateways:
  - datapower-gateway

```

In the following code block, an example of a policy definition file for modifying message payload is shown.

```

policy: 1.0.0

info:
  title: Run GatewayScript
  name: gatewayscript-policy
  version: 1.0.0
  description: Execute GatewayScript
  contact:
    name: IBM DataPower Samples
    url: https://github.com/ibm-datapower/
    email: steve-product-manager@ibm.com

attach:
  - rest
  - soap

gateways:
  - datapower-gateway

properties:
  $schema: "http://json-schema.org/draft-04/schema#"
  type: object
  properties:
    source:
      label: "GatewayScript Source"
      description: "The location of the GatewayScript file to execute"
      type: string
      default: store:///identity.js
    value:
      label: "New Value"
      description: "The value to be added to the payload"
      type: string
      default: "Hello Policy"
  required:
    - source
    - value

```

## What to do next

Create an implementation for your user-defined policy by using DataPower processing rules and actions. For more information, see [Implementing your policy](#).

## Related concepts

- [Authoring policies](#)

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details. For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

DataPower Gateway (v5 compatible) only

## Creating a new user-defined policy

Create a user-defined policy by configuring a policy definition file and its implementation, and then packaging the policy and importing it into IBM® API Connect.

Review the following topics to learn how to create a user-defined policy.

Tip: Some sample policies are available on GitHub, and these policies can be downloaded and adapted for use with IBM API Connect. For more information, see [API Connect Policies on GitHub](#).

- [Implementing your policy](#)  
Create an implementation for your user-defined policy by using DataPower processing rules and actions.

---

DataPower Gateway (v5 compatible) only

## Implementing your policy

Create an implementation for your user-defined policy by using DataPower® processing rules and actions.

### Before you begin

---

You must create a policy YAML file before you create an implementation. For more information, see [Describing your policy](#).

You can create an implementation for your policy by using the usual tools available to IBM® DataPower Gateway developers. However, the DataPower user interface is typically the tool that is used to create processing rules and actions.

**Note:** You must be skilled in DataPower tooling and concepts, before you can create a policy implementation.

In order for your processing actions to work well under the API Gateway configuration, and also to enable the use of contextual information that is relevant to the processing actions, a library of functions and templates is available that you can use to assist you in writing the XSLT or GatewayScript transformations. This library provides the following mechanisms:

- Access to input property values (input from the assembly editor).
- Access to context values (the API Gateway runtime context).
- Access to the runtime payload message and media-type.
- Ability to modify the payload message.
- Ability to end the policy execution with an error.

### About this task

---

You create an implementation for your user-defined policy in the IBM DataPower Gateway. The implementation must adhere to the following conventions:

1. You must create a main processing rule, and this rule will be the starting point for the policy. The rule name must start with the name of the policy (the value of the **name** property in the "info" section of the policy YAML file), followed by -main; for example *checkmembership-main*.
2. There are no restrictions on what actions the processing rule can execute, on condition that the rule adheres to the naming convention in point 1. and the instructions that are detailed in this topic.
3. The names of the processing actions and all other objects also must start with the name of the user-defined policy (the value of the **name** property in the "info" section of the policy YAML file).
4. If your processing rule runs transformation actions that use XSLT or GatewayScript files, these files must be stored in the following location: `local://policy/<policy-name>`.
5. If you have certificate and key files that must be stored in the `cert:` folder, the names of these files also must start with the name of the user-defined policy (as defined in the policy YAML file).
6. If your policy is using GatewayScript transformations, your policy code must require `apim.custom.js`, for example:

```
var apic = require('local://isp/policy/apim.custom.js');
```

The following steps describe how to create an implementation for your user-defined policy:

- [Create a main processing rule.](#)
- [Create one or more processing actions:](#)
  - [Configure access to input properties.](#)
  - [Configure access to the runtime context.](#)
  - [Configure access to the input payload.](#)
  - [Configure access to the HTTP headers.](#)
  - [Modify the payload in XSLT or gatewayscript.](#)
  - [Configure the implementation to produce error information.](#)
  - [Set variables.](#)
- [Export your policy implementation.](#)

## Procedure

---

1. Create a main processing rule that is called `<policy-name>-main` where `<policy-name>` is the name of your user-defined policy (the value of the **name** property in the "info" section of the policy YAML file).  
**Note:** You must specify the following processing rule settings:
  - Rule direction: Both Directions
  - Non-XML Processing: on
2. Create one or more processing actions.

Each processing action should have a unique name and must start with the name of the user-defined policy (as defined in the policy YAML file).

Note: Different processing actions in DataPower might require different releases of the DataPower firmware. When using the GatewayScript actions, the minimum DataPower firmware that should be used is version 7.2.0.

The following processing actions are available:

- Configure access to the input properties in XSLT (`policyProperties`), or in GatewayScript (`apic.getPolicyProperty`).  
If required by the properties that are defined in the policy YAML file, when the policy is attached to an API the API developer must enter the input settings or variables for a particular property. This function provides the mechanism to retrieve these input settings or variables at run time. For an example code snippet, see [Access to input properties code snippet](#).
- Configure access to the runtime context in XSLT (`getContext`), or in GatewayScript (`apic.getContext`).  
When an API is invoked, runtime information about the request can be accessed by using a user-defined policy, and this information is known as the runtime context. The function `getContext` provides the mechanism to access this runtime context. For an example code snippet, see [Access to runtime context code snippet](#). For a complete list of context variables, see [API Gateway context variables](#).
- Configure access to the input payload in XSLT (`payloadRead`), or in GatewayScript (`apic.readInput(callback)`).  
Some policies require access to the input message or payload that is provided by the application. Accessing the input message or payload during an assembly flow can be difficult, as this information might change as the policies and the assembly steps run. This function provides a mechanism to get the correct input message or payload at the time of policy execution. For an example code snippet, see [Access to input payload code snippet](#).

This function returns an XML node-set that contains the payload of the request. If the payload is in JSON format, a JSONx node-set is returned that can then be manipulated within an XSLT or GatewayScript stylesheet. If the payload is not in JSON or XML format, the node-set that is returned is empty.

Note: The `payloadType()` function can be called to determine what type of payload (XML or JSONx) will be returned by the `payloadRead()` or the `apic.readInput(callback)` function.

- Configure access to the HTTP headers in XSLT (`getContext`), or in GatewayScript (`apic.getContext`).  
The HTTP header information of a request can be retrieved from the request context. The HTTP header names are normalized to lowercase. The function `getContext()` provides the mechanism to access the HTTP header information. For an example code snippet, see [Access to HTTP headers code snippet](#).

Note: Access or modification of HTTP headers by using DataPower extensions, such as `dp:set-request-header`, is not advisable, as such actions might yield unexpected results when the policy is combined with other policies and assembly steps.

- Modify the payload in XSLT or GatewayScript.  
When a policy implementation is required to change a payload message, you must configure the DataPower Transform Processing Action to set the Output context field to `OUTPUT` (referred to as the `OUTPUT` named context).

The output must be an XML node-set, which represents an XML or SOAP message, or a JSON message by using JSONx. To assist the API Gateway policy framework to accept the new or transformed message, call the `apim-output` template. For an example code snippet, see [Modify the payload code snippet](#).

Note: The modify the payload processing action works only with a proxy task. An HTTP or web service task always overwrites the output of a policy implementation.

- Configure the implementation to produce error information.  
If you require your policy implementation to produce error information when there is a failure, you must configure the implementation by calling the error template. For an example code snippet, see [Configure error information code snippet](#).
- Set variables.  
Use the `setVariable` template to set a runtime variable to a specified string value. This value can then be retrieved by using the function `getVariable()`, or by mapping the value into a step. For an example code snippet, see [Set variables code snippet](#).

### 3. Export your policy implementation from DataPower.

From the DataPower user interface, export the objects and files that are referenced by your main processing rule as a compressed file. No other objects or files should be exported. The following file list is an example configuration of an export from DataPower:

```
Archive: checkmembership.zip
11819  11-19-2014 22:53 dp-aux/basetypes.xml
3028207 11-19-2014 22:53 dp-aux/drMgmt.xml
6456  11-19-2014 22:53 dp-aux/map-dmz.xsl
7299  11-19-2014 22:53 dp-aux/management.xsl
23130 11-19-2014 22:53 dp-aux/SchemaUtil.xsl
216003 11-19-2014 22:53 dp-aux/clixform.xsl
5284  11-19-2014 22:53 local/policy/checkmembership/check.xsl
5061  11-19-2014 22:53 export.xml
```

The example shows the exported configuration file (export.xml) that contains all the processing actions and DataPower objects, the referenced files, and the DataPower configuration schemas that are created by using the configuration export in the DataPower user interface.

## Results

---

You have created an implementation for your user-defined policy and exported this implementation from the DataPower user interface.

## What to do next

---

Create a user-defined policy package that can then be imported into IBM API Connect. For details, see [Packaging and importing your policies into IBM API Connect](#).

## Related concepts

---

- [Authoring policies](#)

## Related information

---

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#), for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

DataPower Gateway (v5 compatible) only

## Packaging and importing your policies into IBM API Connect

Make your user-defined policy available to API developers by packaging it and importing it into an IBM® API Connect Catalog.

### Before you begin

Before you can package a user-defined policy and import it into IBM API Connect, you must complete the following tasks:

1. [Describe your policy](#), in a YAML file.
2. [Implement your policy](#), by using DataPower processing rules and actions.

### Procedure

To package and import your user-defined policy, complete the following steps:

1. Create a .zip file that contains the following folder structure:

```
<policy-name>.yaml
implementation/
  policy-name.zip
```

where

- `<policy-name>.yaml` is your policy definition file. The YAML file must use the name that is specified in its `name` property.
- `implementation/policy-name.zip` is your policy implementation for a policy that is deployed to the DataPower Gateway. The policy implementation file contains the DataPower processing rules and actions that were exported from DataPower in step 2.

The name of the .zip file must start with the name of the user-defined policy (as defined in the policy YAML file). If the implementation requires certificate and key files, these files must be added to the implementation directory.

Note: Your package .zip file must contain a .zip policy implementation file.

2. Use the API Manager user interface to import your policy into a Catalog. For more information, see [Importing a user-defined policy into a Catalog](#).

Note:

- You must import your user-defined policy into every Catalog in API Manager that you require your policy to run in.
- For the policy to be displayed on the palette in the [API assembly editor](#), you must import the user-defined policy into the Sandbox Catalog.

### What to do next

Make your user-defined policy package accessible to the API Designer UI. To display user-defined policies in the API Designer UI, edit the .apiconnect/config file to point to the directory containing the policy.yaml file. You can edit the global config file (~/.apiconnect/config) or a project-specific config file (~/ProjectA/.apiconnect/config). Follow these steps:

1. Create one or more directories to hold your policy.yaml files that are accessible to Node.js, and copy the user-defined policy package into this directory. For example, create directories named /ProjectA/Policies and /ProjectB/Policies.
2. Extract the policy package so that the folder structure is visible, for example `policy.yaml` and `implementation/policy-name.zip`. The file containing the custom policies must be named `policy.yaml`.
3. Add the `userPolicies`: [ ] array object to the config file in `~/ProjectA/.apiconnect/` or `~/.apiconnect/`, and edit the array object so it contains the absolute path to the director(ies) containing the policy.yaml file.

Following is an example of an `~/.apiconnect/config` file showing the `userPolicies` entry pointing to the directory containing the policy.yaml file:

```
apim_server: us.apiconnect.ibmcloud.com
us.apiconnect.ibmcloud.com.meta:
  formFactor: BLUEMIX_PUBLIC
  serverCapabilities:
    authTypes:
      - basic
      - token
  toolkit:
    version_recommended: 2.1.30
    version_minimum: 2.1.30
catalog: >-
  apic-catalog://us.apiconnect.ibmcloud.com/orgs/sampleorg-myspace2/catalogs/sb
app: >-
  apic-app://us.apiconnect.ibmcloud.com/orgs/sampleorg-myspace2/apps/acme-bank
userPolicies:
  - /ProjectA/Policies
```

Note:

- The `userPolicies`: [ ] array object contains a list of absolute paths to the policy director(ies). The values can point to a parent location, for example `userPolicies`: ["/~/mypolicies"]. Alternatively, each policy location can be specified in the array, for example `userPolicies`: ["/~/mypolicies/policya", "/~/mypolicies/policyb"]. However, do not use both of these approaches in the same directory. For example, do not create policies in a directory structure like this `~/foo`, `~/foo/policya`, and `~/foo/policyb`.

4. Open the API Designer UI. The user-defined policy is available on the policy assembly palette, and you can add the policy to your API definition.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

DataPower Gateway (v5 compatible) only

## Implementation code examples

Example code snippets to help the creation of a user-defined policy implementation.

Note: If you are using GatewayScript, you must include the following command:

```
var apic = require('./apim.custom.js');
```

where *apic* is the common name used for the GatewayScript examples in this topic. However, *apic* could be any given name of your choice, for example you could use:

```
var apim = require('./apim.custom.js');
```

and then you would start your calls with **apim**.

- [Access to input properties code snippet](#)
- [Access to runtime context code snippet](#)
- [Access to input payload code snippet](#)
- [Access to HTTP headers code snippet](#)
- [Modify the payload code snippet](#)
- [Configure error information code snippet](#)
- [Set variables code snippet](#)

## Access to input properties code snippet

The following code block shows an example of how to access the input properties by using the XSLT `policyProperties()` function. The example defines a property that is named `a_property`, which is declared as an integer value, but is retrieved in XSLT as text.

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet version="1.0"
  xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:dp="http://www.datapower.com/extensions"
  xmlns:func="http://exslt.org/functions"
  xmlns:apim="http://www.ibm.com/apimmanagement" extension-element-prefixes="dp func apim">

  <!-- Contains the APIM functions -->
  <xsl:import
href="#_home_markdown_jenkins_workspace_Transform_in_SSMNED_2018_com.ibm.apic.policy.doc_local:_isp_policy_apim.custom.xsl" />

  <xsl:template match="/">
    <xsl:variable name="p" select="apim:policyProperties()" />
    <xsl:message>
      The value of my input property is
      <xsl:value-of select="$p/a_property" />
    </xsl:message>
  </xsl:template>
</xsl:stylesheet>
```

If you are using GatewayScript, you must call the function:

```
apic.getPolicyProperty(propertyName)
```

where *propertyName* is the name of the input property that you want to access. If the input property name is blank, the action will return all input properties.

## Access to runtime context code snippet

The following code block shows an example of how to access the runtime context by using the XSLT `getContext()` function.

```

<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet version="1.0"
  xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:dp="http://www.datapower.com/extensions"
  xmlns:func="http://exslt.org/functions"
  xmlns:apim="http://www.ibm.com/apimanagement" extension-element-prefixes="dp func apim">

  <!-- Contains the APIM functions -->
  <xsl:import
href="#_home_markdown_jenkins_workspace_Transform_in_SSMNED_2018_com.ibm.apic.policy.doc_local:_isp_policy_apim.custom.xsl" />

  <xsl:template match="/">
    <xsl:variable name="client-id" select="apim:getContext('client.app.id') " />
    <xsl:message>
      The calling application is
    <xsl:value-of select="$client-id" />
    </xsl:message>
  </xsl:template>

</xsl:stylesheet>

```

If you are using GatewayScript, you must call the function:

```
apic.getContext(varName)
```

where `varName` is the name of the context variable that you want to access.

For a complete list of context variables, see [API Gateway context variables](#).

## Access to input payload code snippet

The following code block shows an example of how to access the input payload by using the XSLT `payloadRead()` function.

```

<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet version="1.0"
  xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:dp="http://www.datapower.com/extensions"
  xmlns:func="http://exslt.org/functions"
  xmlns:apim="http://www.ibm.com/apimanagement" extension-element-prefixes="dp func apim">

  <!-- Contains the APIM functions -->
  <xsl:import
href="#_home_markdown_jenkins_workspace_Transform_in_SSMNED_2018_com.ibm.apic.policy.doc_local:_isp_policy_apim.custom.xsl" />

  <xsl:template match="/">
    <xsl:variable name="input" select="apim:payloadRead() " />
    <xsl:message>
      The input payload is
    <xsl:copy-of select="$input" />
    </xsl:message>
  </xsl:template>

</xsl:stylesheet>

```

If you are using GatewayScript, you must call the function:

```
apic.readInput(callback)
```

A callback is required because the actual payload read is asynchronous. The callback method is called when the payload is ready.

This function returns an XML node-set that contains the payload of the request. If the payload is in JSON format, a JSONx node-set is returned that can then be manipulated within an XSLT or GatewayScript stylesheet. If the payload is not in JSON or XML format, the node-set that is returned is empty.

The following example shows how to use the `payloadType()` function to determine what type of payload (XML or JSONx) will be returned by the XSLT `payloadRead()` function.

```

<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet version="1.0"
  xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:dp="http://www.datapower.com/extensions"
  xmlns:func="http://exslt.org/functions"
  xmlns:apim="http://www.ibm.com/apimanagement" extension-element-prefixes="dp func apim">

  <!-- Contains the APIM functions -->
  <xsl:import
href="#_home_markdown_jenkins_workspace_Transform_in_SSMNED_2018_com.ibm.apic.policy.doc_local:_isp_policy_apim.custom.xsl" />

  <xsl:template match="/">
    <xsl:variable name="payloadType" select="apim:payloadType() " />
    <xsl:message>
      <xsl:text>Payload type is [</xsl:text>
    <xsl:value-of select="$payloadType" />
    <xsl:text>]</xsl:text>
    </xsl:message>
  </xsl:template>

</xsl:stylesheet>

```

## Access to HTTP headers code snippet

The following code block shows an example of how to access the HTTP headers in XSLT by using the `getContext()` function.

```

<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet version="1.0"
  xmlns:xsl="http://www.w3.org/1999/XSL/Transform"

```

```

xmlns:dp="http://www.datapower.com/extensions"
xmlns:func="http://exslt.org/functions"
xmlns:apim="http://www.ibm.com/apimanagement" extension-element-prefixes="dp func apim">

<!-- Contains the APIM functions -->
<xsl:import
href="#_home_markdown_jenkins_workspace_Transform_in_SSMNED_2018_com.ibm.apic.policy.doc_local:_isp_policy_apim.custom.xsl" />

<xsl:template match="/">
  <xsl:variable name="content-type" select="apim:getContext('request.headers.content-type')"/>
  <xsl:message>
    The request content type is
    <xsl:value-of select="$content-type" />
  </xsl:message>
</xsl:template>

</xsl:stylesheet>

```

If you are using GatewayScript, you must call the function:

```
apic.getContext(request.headers.headerName)
```

where `headerName` maps to the name of the header you want to access.

Note: Access or modification of HTTP headers by using DataPower® extensions, such as `dp:set-request-header`, is not advisable, as such actions might yield unexpected results when the policy is combined with other policies and assembly steps.

## Modify the payload code snippet

The output from a user-defined policy must be an XML node-set, which represents an XML or SOAP message, or a JSON message by using JSONx. The following code block shows an example of how to modify the payload in XSLT. To assist the API Gateway policy framework to accept the new or transformed message, call the `apim-output` template, as shown in the following example.

```

<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet version="1.0"
  xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:apim="http://www.ibm.com/apimanagement"
  xmlns:jsonx="http://www.ibm.com/xmlns/prod/2009/jsonx">

  <!-- Contains the APIM functions -->
  <xsl:include
href="#_home_markdown_jenkins_workspace_Transform_in_SSMNED_2018_com.ibm.apic.policy.doc_local:_isp_policy_apim.custom.xsl" />

  <xsl:template match="/">
    <!-- Creates a JSON document (empty object is for simplicity) -->
    <jsonx:object>
    </jsonx:object>

    <!-- Indicates the media type of the output being produced -->

    <xsl:call-template name="apim:output">
      <xsl:with-param name="mediaType" select="'application/json'"/>
    </xsl:call-template>
  </xsl:template>

</xsl:stylesheet>

```

where `mediaType`:

- `'application/json'` is when the output is written in JSONx format.
- `'application/xml'` is when the output is written in XML format.

If you are using GatewayScript, you must call the function:

```
apic.output(mediaType)
```

where `mediaType` is:

- `application/json` is when the output is written in JSONx format.
- `application/xml` is when the output is written in XML format.

Specifying the media type allows the next steps in the assembly flow to understand how to process the new payload.

Tip: The output from a user-defined policy must be XML or JSONx. JSONx is an IBM standard format to represent JSON as XML. One way to convert output GatewayScript JSON data into JSONx, is to add a **Convert Query Params to XML** action to follow the GatewayScript action within the same policy rule. The **Convert Query Params to XML** action must have an **Input Conversion** with the **Default Encoding** set to **JSON**. The output from the GatewayScript action must be the input for the **Convert Query Params to XML** action for JSONx to be produced.

## Configure error information code snippet

The following XSLT code block shows an example of how to configure the policy implementation to produce error information by calling the `apim-error` template.

```

<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet version="1.0"
  xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:apim="http://www.ibm.com/apimanagement">

  <!-- Contains the APIM functions -->
  <xsl:include
href="#_home_markdown_jenkins_workspace_Transform_in_SSMNED_2018_com.ibm.apic.policy.doc_local:_isp_policy_apim.custom.xsl" />

```

```

<!-- Indicates this policy has a failure and provides
      additional information for the client application -->
<xsl:template match="/">
  <xsl:call-template name="apim:error">
    <xsl:with-param name="httpCode" select="'401'" />
    <xsl:with-param name="httpReasonPhrase" select="'Unauthorized'" />
    <xsl:with-param name="errorMessage" select="'Please select a Plan'" />
  </xsl:call-template>
</xsl:template>

```

```
</xsl:stylesheet>
```

where:

- `httpCode` is the code of the required error message.
- `httpReasonPhrase` is the reason for the error.
- `errorMessage` is the suggested action for the user.

If you are using GatewayScript, you must call the template:

```
apim.error(name, httpCode, httpReasonPhrase, message)
```

where:

- `name` is the name of the error.
- `httpCode` is the code of the required error message.
- `httpReasonPhrase` is the reason for the error.
- `message` is the suggested action for the user.

## Set variables code snippet

The following XSLT code block shows an example of how to set a runtime variable to a specified string value by calling the `setVariable` template.

```

<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet version="1.0"
  xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:dp="http://www.datapower.com/extensions"
  xmlns:func="http://exslt.org/functions"
  xmlns:apim="http://www.ibm.com/apimmanagement" extension-element-prefixes="dp func apim">

  <!-- Contains the APIM functions -->
  <xsl:import
    href="#_home_markdown_jenkins_workspace_Transform_in_SSMNED_2018_com.ibm.apic.policy.doc_local:_isp_policy_apim.custom.xsl" />

  <xsl:template match="/">
    <xsl:call-template name="apim:setVariable">
      <xsl:with-param name="varName" select="'serviceEndpoint'" />
      <xsl:with-param name="value" select="'https://endpoint.host.com/data'" />
    </xsl:call-template>
    <xsl:message>
      <xsl:text>Variable [ </xsl:text>
      <xsl:value-of select="'serviceEndpoint'" />
      <xsl:text>] set to [ </xsl:text>
      <xsl:value-of select="'https://endpoint.host.com/data'" />
      <xsl:text>] </xsl:text>
    </xsl:message>
  </xsl:template>

```

```
</xsl:stylesheet>
```

where:

- `varName` is the name of the runtime variable that you want to set a value to.
- `value` is the string value that you want to set the variable to. This can be a literal value, or another variable. For example, to set your named variable to the value of the Content-Type header in a request, you would specify the `value` as `$(request.headers.content-type)`.

If you are using GatewayScript, you must call the template:

```
apim.setvariable(varName, varValue, action)
```

where:

- `varName` is the name of the runtime variable that you want to set a value to, or that you want to add or clear.
- `varValue` is the string value that you want to set the variable to. This can be a literal value, or another variable. For example, to set your named variable to the value of the Content-Type header in a request, you would specify the `varValue` as `request.headers.content-type`. This property is only required when `set` or `add` is specified as the action.
- `action` is the action that you want to apply to the variable. Valid options are:
  - `set`
  - `add`
  - `clear`

If no option is set, the default option of `set` is applied.

The following XSLT example shows how to retrieve the value of a runtime variable by using the `getVariable()` function.

```

<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet version="1.0"
  xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:dp="http://www.datapower.com/extensions"
  xmlns:func="http://exslt.org/functions"

```

```

xmlns:apim="http://www.ibm.com/apimanagement" extension-element-prefixes="dp func apim">

<!-- Contains the APIM functions -->
<xsl:import
href="#_home_markdown_jenkins_workspace_Transform_in_SSMNED_2018_com.ibm.apic.policy.doc_local:_isp_policy_apim.custom.xsl" />

<xsl:template match="/">
  <xsl:variable name="varValue" select="apim:getVariable('serviceEndpoint')" />
  <xsl:message>
    <xsl:text>Variable [</xsl:text>
    <xsl:value-of select="'serviceEndpoint'" />
    <xsl:text>] = [</xsl:text>
    <xsl:value-of select="$varValue" />
    <xsl:text>]</xsl:text>
  </xsl:message>
</xsl:template>

</xsl:stylesheet>

```

where

- **varValue** is the name of the runtime variable that you want to retrieve a value for.

If you are using GatewayScript, you must call the function:

```
apic.getvariable(varName)
```

where **varName** is the name of the runtime variable that you want to retrieve a value for.

- [Implementing your policy](#)

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

API Gateway only

## Authoring policies for the DataPower API Gateway

A user-defined policy for the DataPower® API Gateway consists of a package that contains a configuration file of DataPower API Gateway CLI commands that define the actions of the policy, together with the policy implementation files. You publish the package to the DataPower API Gateway to make it available to APIs that are deployed there.

For details on how to define and publish user-defined policies for the DataPower API Gateway, see the following subtopics:

- [Defining and packaging your user-defined policy for the DataPower API Gateway](#)  
You define your policy by creating a .cfg configuration file. This configuration file consists of DataPower API Gateway CLI commands that specify the actions of your policy. You then package this file with any dependent files that are referenced from the CLI commands.
- [Publishing your user-defined policy to the DataPower API Gateway](#)  
You publish a user-defined policy by uploading the policy package .zip file, as a gateway extension, to the DataPower API Gateway.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

API Gateway only

## Defining and packaging your user-defined policy for the DataPower API Gateway

You define your policy by creating a .cfg configuration file. This configuration file consists of DataPower® API Gateway CLI commands that specify the actions of your policy. You then package this file with any dependent files that are referenced from the CLI commands.

### Configuration file example

The following code extracts describe the sections in a sample policy configuration file. You can obtain the complete sample by downloading the file [udp-basic.policy.txt](#); to re-use this file, rename the extension to .cfg.

Define a **set-variable** assembly policy

```

assembly-setvar udp-basic_1.0.0_set-variable_0
reset
title "set-variable"
correlation-path "$.x-ibm-configuration.assembly.execute[0]"
variable
  action set
  name "param1"
  type string
  value "$(local.parameter.credential)"
exit
exit

```

These commands define a `set-variable` assembly policy that sets a variable called `param1` to the value supplied by the API developer in the API assembly editor. The variable `$(local.parameter.credential)` refers to an input field labeled `credential` that is displayed in the properties window for the policy when it is added to an API assembly, and the value of the variable will be set to the value entered in that field.

Define a `gatewayscript` assembly policy

```

assembly-gatewayscript udp-basic_1.0.0_gatewayscript_1
reset
title "gatewayscript"
correlation-path "$.x-ibm-configuration.assembly.execute[1]"
gatewayscript-location temporary:///filestores/extensions/gateway-extension/udp-basic/udp-basic-gws.js
exit

```

This command defines a `gatewayscript` assembly policy that executes the GatewayScript in the file `udp-basic-gws.js` (see [The code for the GatewayScript policy](#)); this file must be packaged with the configuration file when the policy is deployed to the DataPower API Gateway. The `gatewayscript-location` command must specify the location of the file in the gateway extension folder on the gateway after the policy is deployed, the root of which will be `temporary:///filestores/extensions/gateway-extension`.

Build the DataPower API Gateway configuration for the policy

```

api-rule udp-basic_1.0.0_main
reset
action udp-basic_1.0.0_set-variable_0
action udp-basic_1.0.0_gatewayscript_1
exit

assembly udp-basic_1.0.0
reset
rule udp-basic_1.0.0_main
exit

```

These commands specify the policies, in the required sequence, that will be invoked by the user-defined policy.

Create the policy

```

assembly-function "udp-basic_1.0.0"
reset
summary "udp-basic-policy_1.0.0"
title "UDP Basic"
parameter
  name "credential"
  description "Parameter name"
  value-type string
exit
assembly udp-basic_1.0.0
exit

```

These commands create the user-defined policy and define the information that will be displayed in the properties window for the policy when it is added to an API assembly. The `parameter` section causes an input field labeled `credential` to be displayed; it is the value entered in this field, by the API developer, that is referenced by the `set-variable` policy definition described in [Define a set-variable assembly policy](#).

Important: The policy short name, `udp-basic` in this example, must be different from the OpenAPI names of the built-in policies, otherwise it will cause a policy conflict in the API assembly definition. For a list of the OpenAPI built-in policy names, see [execute](#). Also, consider including an appropriate unique prefix or suffix string in the short names of your user-defined policies to prevent possible name conflicts with future built-in policies.

Deploy the policy to the DataPower API Gateway

```

apic-gw-service
admin-state disabled
exit

apic-gw-service
admin-state enabled
exit

apic-gw-service
user-defined-policies udp-basic_1.0.0
exit

```

These commands restart the API Connect Gateway Service to trigger the API Connect management service to push the user-defined policy to the DataPower API Gateway, then add the user-defined policy to the API Connect Gateway Service. After the user-defined policy is published to the DataPower API Gateway, the policy will, as a result of these commands, be displayed in the palette on the assembly page in the API editor, from where it can be added to an API assembly flow.

The code for the GatewayScript policy

The code for the GatewayScript policy that is referenced by the `gatewayscript` policy definition described in [Define a gatewayscript assembly policy](#) is as follows:

```

var apim = require('apim');

var param1 = context.get('param1');
console.info ("param1 %s", param1);

```

```

if (param1 == null || param1 == '') {
    context.reject('Invalid Parameter', 'The parameter param1 you provided is invalid');
    context.message.statusCode = '401 Unauthorized';
}

var jsonBody = {
    "param1" : param1,
    "body" : apim.getvariable('message.body')
}

session.output.write(jsonBody);

```

The variable `param1` contains the value that is entered by the API developer in the credential field for the user-defined policy. If the policy is placed after an `invoke` policy in an API assembly, the `param1` value is prepended to the response body returned by the `invoke` policy.

## Packaging your user-defined policy

To package your user-defined policy, create a .zip file that contains the .cfg file together with all policy implementation files.

Note: When you publish the policy to the DataPower API Gateway, the files in the .zip file are uploaded to the temporary:///filestores/extensions/gateway-extension/ folder in the gateway file system, so any file references in your policy configuration must be defined accordingly.

## What to do next

Publish your user-defined policy; see [Publishing your user-defined policy to the DataPower API Gateway](#).

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Publishing your user-defined policy to the DataPower API Gateway

You publish a user-defined policy by uploading the policy package .zip file, as a gateway extension, to the DataPower® API Gateway.

## Before you begin

Define and package your policy; see [Defining and packaging your user-defined policy for the DataPower API Gateway](#).

Note: This page includes instructions for restarting the gateway, which is essential for the user-defined policy to be published successfully.

## Procedure

To publish your user-defined policy, complete the following steps:

1. Log in to your API Connect Management server as an administrator, by using the following command:

```
apic login --server mgmt_endpoint_url --username admin_user_ID --password admin_password --realm admin/identity_provider
```

where:

- `mgmt_endpoint_url` is the platform API endpoint URL.
- `admin_user_ID` is the user ID of your administrator account, and is the same as the user ID that you use to log in to the Cloud Manager user interface.
- `admin_password` is the password for your administrator account.
- `identity_provider` is the identity provider that is used to authenticate administrative users.

For example:

```
apic login --server platform-api.myserver.com --username admin --password password --realm admin/myldap
```

For full details on how to log in to your management server from the CLI, see [Logging in to the management server](#).

2. Upload the user-defined policy .zip file, as a Gateway extension, by using the following command:

```
apic gateway-extensions:create udp_zip_file --scope org --org admin --gateway-service gateway_service --availability-zone availability-zone --server mgmt_endpoint_url
```

where:

- `udp_zip_file` is the user-defined policy .zip file that you want to upload.
- `gateway_service` is the name of the Gateway service that you want add the extension to.
- `availability-zone` is the name of the availability zone that contains the Gateway service.
- `mgmt_endpoint_url` is the platform API endpoint URL.

For example:

```
apic gateway-extensions:create myudp.zip --scope org --org admin --gateway-service mygateway-service --availability-zone myavailabilityzone --server platform-api.myserver.com
```

You can confirm that the user-defined policy has been added to the Gateway service by using the `gateway-extensions:get` command; for example:

```
apic gateway-extensions:get --scope org --org admin --gateway-service mygateway-service --availability-zone myavailabilityzone --server platform-api.myserver.com --output -
```

(the parameter setting `--output` - writes the details of the Gateway extension object to the command window. You can specify the name of an existing folder to have the details written to a `.yaml` file in that folder.)

For reference details of the `apic gateway-extensions` commands, see [apic gateway-extensions](#).

Note: You cannot upload more than one Gateway extension .zip file to the same Gateway service. If the Gateway service already has a Gateway extension, you must use the `apic gateway-extensions:delete` command to remove the extension from the Gateway service, add your user-defined policy files to the original .zip file, then upload it again.

## Results

---

The user-defined policy is deployed to the DataPower API Gateway, and is displayed in the palette on the assembly page in the API editor, from where it can be added to an API assembly flow.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Developer Portal: socialize your APIs

The Developer Portal is your one-stop-shop for sharing your APIs with application developers.

In addition to allowing application developers to find and subscribe to APIs, the Developer Portal provides additional features including forums, blogs, comments, and ratings, together with an administrative interface for customizing the Developer Portal to your brand and theme. See the following topics for more information.

### [Using the Developer Portal](#)

As well as enabling application developers to find and use your APIs, the Developer Portal also provides features such as API analytics, forums, blogs, and rating facilities.

### [Configuring the Developer Portal site](#)

Customize the look and feel of the Developer Portal site, and brand it for your organization.

### [Concepts in the Developer Portal](#)

Understand the various concepts and terminology that are referenced throughout the Developer Portal.

### [Getting started configuring the Developer Portal site](#)

A quick start guide to configuring your Developer Portal site.

### [Developer Portal tutorials](#)

Guided examples that take you through some of the most common user scenarios, as well as some of the more complex areas.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Using the Developer Portal

As well as enabling application developers to find and use your APIs, the Developer Portal also provides features such as API analytics, forums, blogs, and rating facilities.

The Developer Portal is the one-stop-shop for sharing APIs with application developers. After a Developer Portal has been enabled through the API Manager, and one or more API Products have been published, application developers can browse and use the APIs. Typically, a Developer Portal is customized to fit the corporate branding and design requirements of a particular organization. For more information about configuring a Developer Portal site, see [Configuring the Developer Portal site](#). However, when the Developer Portal is first enabled it can be used as is, for example for test and development purposes, or for internal use only.

The following topics provide information about the main API consumer concepts in the Developer Portal, and how an application developer can navigate the default site. However, bear in mind that the actual consumer experience might be very different depending on how the site is configured. For tutorials guiding you through enabling a Developer Portal site, and navigating and using APIs as an application developer, see [Tutorial: Creating the Developer Portal](#) and [Tutorial: Creating Accounts and Applications on the Developer Portal](#).

- [Exploring APIs and Products in the Developer Portal](#)

As an application developer, you can browse, test, and subscribe to APIs in the Developer Portal by exploring the available API Products.

- [Applications in the Developer Portal](#)

You can view, edit, configure, and create applications in the Developer Portal.

- [Analytics in the Developer Portal](#)

You can view analytics for APIs in the Developer Portal at the application and organization levels. This information is displayed in dashboard views that show the analytics metrics in the form of *visualizations* (represented as charts).

- [Consumer organizations in the Developer Portal](#)

Consumer organizations provide a way of grouping application developers together. You can add, remove, and configure Consumer organizations in the Developer Portal.

- [User accounts, passwords, and support in the Developer Portal](#)

You can change general elements such as user accounts and passwords in the Developer Portal.

---

## Exploring APIs and Products in the Developer Portal

As an application developer, you can browse, test, and subscribe to APIs in the Developer Portal by exploring the available API Products.

### Browsing available APIs

In API Connect API providers package their APIs into Products to offer one or more APIs to application developers. The providers then use Plans to control access to APIs and to manage API usage. Products are packages that contain both the APIs and the accompanying Plans.

From the Developer Portal home screen, click API Products to browse the available products. You can then select a Product to explore the available Plans and APIs further, including viewing API code snippets, and request and response examples.

Note: If you have an account on the Developer Portal, you can specify a default programming language for the code snippets to display in by editing the Code Snippet Language in your account settings.

### Subscribing to a Plan

A Plan is a collection of API operations or subsets of operations from one or more APIs. In order to subscribe to a Plan, you must have an account on the Developer Portal and have created an App. For more information, see [User accounts, passwords, and support in the Developer Portal](#) and [Applications in the Developer Portal](#). Rate limits specify how many requests an App is allowed to make during a specified time interval. A Plan can have a shared rate limit for all the operations, or each operation can have a different rate limit. In addition, Plans can have multiple rate limits set per Plan and per operation, at second, minute, hour, day, and week time intervals. Plans can also have burst limits to prevent usage spikes that might damage infrastructure. Multiple burst limits can be set per Plan, at second and minute time intervals.

After you have identified the Plan that you want to use, click Subscribe and then select the App that you want to use with this Plan. If the Plan is not restricted, you can use it immediately. If the Plan is restricted, the subscription is shown as Pending Approval, and you cannot use the requested Plan until the administrator approves your request.

### Testing an API

You can test an API in the Developer Portal by using the interactive API document test tool. If the API operation that you want to test doesn't require a client ID, then you can use the test tool without the need to log in. For more information, see [Testing an API by using the Developer Portal test tool](#).

### Calling an API in your application

When you have subscribed to a Plan and you begin coding your application, you must retrieve the operation URL in order to call the API. You can retrieve the operation URL from the API overview page. For more information, see [Calling an API](#).

- **Testing an API by using the Developer Portal test tool**

You can test the behavior of an API without the need to write any code by using the Developer Portal test tool. You provide the necessary API parameters within the test tool and click Invoke to see the response.

- **Calling an API**

When you have a selected a Plan and you begin coding your application, you must retrieve the operation URL to call the API.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Testing an API by using the Developer Portal test tool

You can test the behavior of an API without the need to write any code by using the Developer Portal test tool. You provide the necessary API parameters within the test tool and click Invoke to see the response.

### Before you begin

To use the Developer Portal test tool with an API that requires an App client ID, you must first complete the following tasks:

- Create an App. For more information, see [Registering an application](#).
- Subscribe to a Plan that contains the API that you want to test. For more information, see [Exploring APIs and Products in the Developer Portal](#).

### About this task

The Developer Portal test tool is an interactive API document test tool. If the operation that you want to test does not require a client ID, then you can use Developer Portal test tool without the need to sign in. However, if the operation that you want to interact with requires a client ID, then you must sign in to the Developer Portal first.

Using the Developer Portal test tool is subject to the rate limit that is applied to an operation or Plan. For example, if an operation has a rate limit of 10 requests per minute and you invoke the operation, the number of requests that can be made is reduced to nine. The limitations are triggered every time that you click invoke within the minute interval. This caveat affects the quota of the App that is selected to use with the Developer Portal test tool, but it does not affect the quota of the other Apps that are using the same operation or Plan.

To test an API in the Developer Portal, the Allow this API to be tested check box must be selected in the API Manager. For more information, see [Creating API definitions](#).

#### Restriction:

- There are security mechanisms that prevent you using the Developer Portal test tool to test an Implicit or Authorization Code grant type in an OAuth provider API. Other grant types in the same OAuth provider API **can** be tested. If your OAuth provider allows those actions to function correctly from the test tool, you can disable

- this option. For more information, see [Disabling test tool restrictions](#).
- You cannot use the Developer Portal test tool with suspended applications.
  - You can only test an unenforced API if `testable=true`, and if the existing API implements CORS and is using HTTPS.

## Procedure

1. To use the Developer Portal test tool with an API that does not require the client ID of an App, complete the following steps:

- Click API Products.  
All of the APIs that can be used by application developers are displayed.
- Click the name of the API that you want to test.
- Select an operation and then select Try It.
- Click Try this operation.
- Supply the values for required headers or parameters.
- If the operation is secured with Basic Authentication, supply the credentials.
- Click Send Request.

The result is displayed in the Response Body field. You can continue to test different parameter values as necessary.

Note:

The first time that you click Try It, you might be presented with a security error. Copy the URL from the Request URL field, open it in a browser window, and accept the security certificate. You are not presented with the security error again.

Also, for performance reasons, if the payload is large, above 1500 DOM highlighted elements, you get the response, but it is not pretty printed.

2. To use the Developer Portal test tool with an API that does require the client ID of an App, complete the following steps:

- Sign in to the Developer Portal.
- If you have not already done so, you must create an App so that you can test an API that requires a client ID. For more information, see [Registering an application](#).
- Ensure that your App is subscribed to the Plan that contains the API that you want to test. For more information, see [Exploring APIs and Products in the Developer Portal](#).
- Click API Products.  
All of the APIs that can be used by application developers are displayed.
- Click the API that you want to test.
- Select the **Provide credentials for Client ID (API Key)** operation and then select Try It.  
The API Key Identification window displays.
- Use the Register an application in order to select a client ID drop-down list to select an App to test the API with.
- Click Save credentials.
- If a client secret is required, enter the value in the Client Secret field.
- Find the operation that you want to test, then click Try It.
- Supply the required parameters and values.
- If the operation is secured with Basic Authentication, supply the credentials.
- Click Send.

The result is displayed in the Response section. You can continue to test different field values as necessary.

Note: The first time that you click Invoke, you might be presented with a security error. Click the link that is provided to accept the security certificate. You are not presented with the security error again.

## Related tasks

- [Calling an API by using CORS](#)

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Calling an API

When you have a selected a Plan and you begin coding your application, you must retrieve the operation URL to call the API.

## About this task

Be aware of the following points when you call APIs in IBM® API Connect:

- In the HTTP response message for status code 200 the reason phrase is replaced with OK.
- API error messages are displayed in English only.

## Procedure

To retrieve the operation URL, complete the following steps:

- Click API Products, then select a product.
- Click the API that you want to work with.  
The API overview page opens.
- Select the operation you need and then copy the endpoint.  
This is the URL that the application calls, and its structure is defined:

| Type of API | URL |
|-------------|-----|
|-------------|-----|

| Type of API | URL   |
|-------------|---|
| REST APIs   | <code>https://host/org/catalog/api/operation</code>                       |
| SOAP APIs   | <code>https://host/org/catalog/api</code> for all operations in the WSDL. |

where:

- *host* is the fully qualified host name of your gateway cluster.
- *org* is the URL path of your organization.
- *catalog* is the name of your Catalog.
- *api* is the name of your API.
- *operation* is the URL path of your operation.

4. Take note of any parameters, the request body, and the response body. Code your application to create the expected requests and handle the expected responses.

Depending on the Identify your application using setting for the API, you might have to provide a client ID, or client ID and client secret. To do this, complete the following steps:

- To find the client ID, complete the following steps:
  - Click Apps, then click the application name that you want to work with.
  - Select the Show check box for Client ID.  
The client ID is displayed.
  - Provide the client ID with the header parameter `&client_id=`  
For example, the URL used in the API might be:

```
https://host/org/catalog/api/quote?loanAmount=20000
```

but when you call it with a client ID of 1234, change the URL to:

```
https://host/org/catalog/api/quote?loanAmount=20000&client_id=1234
```

Note: API Gateway only A client ID is generated automatically by API Connect when you register an application. However, if you specify a customized client ID, by using the CLI or REST API, then the length must not exceed 512 bytes, otherwise the gateway will reject the API request and return a **401** error.

- The client secret is produced when you register an application. Provide the client secret with the query parameter `&client_secret=`. If you did not note the client secret when you registered the application, you must reset it; for information, see [Managing applications](#).

The client ID, or client ID and secret can be logged along with the URL. Web servers usually log the URL in their access logs, which would give away the client secret. If you do not want to expose your client ID or secret in the URL, complete the following steps.

- For the client ID, set the header, **X-IBM-Client-Id**, as part of the HTTP message that the application sends when it calls the API.  
An example URL statement might be:

```
curl --header "X-IBM-Client-Id: 1234" https://host/org/catalog/api/quote?loanAmount=20000
```

Note: API Gateway only A client ID is generated automatically by API Connect when you register an application. However, if you specify a customized client ID, by using the CLI or REST API, then the length must not exceed 512 bytes, otherwise the gateway will reject the API request and return a **401** error.

- For the client secret, set the header, **X-IBM-Client-Secret**, as part of the HTTP message that the application sends when it calls the API.  
For example, the URL would be:

```
https://host/org/catalog/api/quote?loanAmount=20000
```

and set the following HTTP headers:

```
X-IBM-Client-Id=1234
X-IBM-Client-Secret=ABCD
```

## What to do next

Monitor the API and application usage. For more information, see [Managing applications](#).

- [Calling an API by using CORS](#)  
CORS (cross origin resource sharing) is a technique that allows calls to be made from code that is running in a browser to a third-party server (such as APIs running on an API Connect Gateway). These calls are, by default, not allowed as per the same origin security policy that is applied to the browser sandbox. Without CORS support, web developers are required to use more complex techniques such as server-side proxies.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Calling an API by using CORS

CORS (cross origin resource sharing) is a technique that allows calls to be made from code that is running in a browser to a third-party server (such as APIs running on an API Connect Gateway). These calls are, by default, not allowed as per the same origin security policy that is applied to the browser sandbox. Without CORS support, web developers are required to use more complex techniques such as server-side proxies.

## About this task

API Connect Gateway servers support CORS to make it as easy as possible for web developers to use APIs within their web applications.  
CORS is supported in the following browsers:

- Chrome 3+

- Firefox 3.5+
- Internet Explorer V11, or later
- Opera 12+
- Safari 4+

A CORS enabled browser automatically sends either a simple CORS request, consisting of the original request with the addition of the **Origin** header, or a preflight request followed by a simple CORS request.

An example CORS preflight request is as follows:

```
OPTIONS /org/env/api/resource HTTP/1.1
User-Agent: useragent details
Access-Control-Request-Method: GET
Access-Control-Request-Headers: header names
Host: x.xx.xxx.xx
Origin: https://example.com
Accept: */*
```

You do not need to create CORS requests yourself, other than for testing or troubleshooting purposes.

A CORS response is received from the gateway; for example:

```
HTTP/1.1 200 OK
X-Backside-Transport: FAIL FAIL
Connection: Keep-Alive
Transfer-Encoding: chunked
Access-Control-Allow-Origin: https://example.com
Access-Control-Allow-Credentials: true
Access-Control-Allow-Headers: accept, accept-language, content-type, x-ibm-client-id
Access-Control-Allow-Methods: methods allowed on the resource
Vary: Origin
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Applications in the Developer Portal

You can view, edit, configure, and create applications in the Developer Portal.

Before you can subscribe to a Plan that contains the API or APIs that you want to use, you must first register an application by creating an App. You can create more than one App, and these Apps can be edited and deleted as required.

To learn about applications in the Developer Portal, use the following topic links.

- [Registering an application](#)  
Before you can use an API, you must register your application to the Developer Portal.
- [Managing applications](#)  
You can show or reset a client ID for an application, verify or reset a client secret, and view the details of the APIs in the application. You can also unsubscribe from a Plan that the application is subscribed to.
- [Editing an application](#)  
You can edit applications in the Developer Portal. If a user has the correct permissions, they can edit the content of any application in their organization.
- [Deleting an application](#)  
You can delete applications in the Developer Portal.
- [Changing an application image](#)  
You can change the image for an application in the Developer Portal.
- [Verifying an application client secret](#)  
You can verify an application client secret in the Developer Portal

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Registering an application

Before you can use an API, you must register your application to the Developer Portal.

### About this task

---

When you register an application, you are provided with a client ID and client secret for the application. You must supply the client ID when you call an API that requires you to identify your application by using a client ID, or a client ID and client secret.

You can, optionally, add further client ID/client secret pairs to an application, any of which can be used to identify the application when calling an API.

---

## Procedure

To register an application, complete the following steps:

1. Click Apps.  
The Apps page opens.
2. Click Create new App.
3. Optional: Specify a URL in the Application OAuth Redirect URL(s) field.  
You can specify multiple OAuth redirect URLs by clicking Add another item. If only one redirect URL is specified, and the application does not provide the `redirect_uri` in the OAuth request, then API Connect automatically uses the one redirect URL specified. However, if more than one redirect URL is specified, then the application must provide the `redirect_uri` in the OAuth request, or the OAuth request is rejected.
4. Click Submit.  
Your application is displayed.
5. The client secret is hidden; click the Show check boxes, make a note of your client secret because it is displayed only once.  
You must supply the client secret when you call an API that requires you to identify your application by using a client ID and client secret.  
Note: The client secret cannot be retrieved. If you forget it, you must reset it.
6. Optional: In the Certificate field, paste the public X509 certificate for your application, in PEM format.  
The Certificate field is available only if the APIs that have been published to the Developer Portal include at least one API that has been secured with TLS mutual authentication. You must complete this field if you want to call an API that has been secured with TLS mutual authentication. For more information, see [Composing a REST API definition](#).  
  
These certificates are sent to the management server and to the gateway, and are used for certificate verification when the application calls an API that has been secured with TLS mutual authentication.  
  
Important: When you paste the certificate, ensure that it contains no line breaks, and that the (-----BEGIN CERTIFICATE-----) prefix and (-----END CERTIFICATE-----) suffix are removed.
7. Optional: The client ID is hidden, to display the client ID for your application, click Subscriptions, then select the Show check box for Client ID.  
The client ID is displayed and can be hidden again by clearing the check box.
8. Optional: To verify your client secret, click Subscriptions, then click Verify, enter your client secret in the Secret field, then click Submit.  
You have confirmed whether your client secret is correct or incorrect.
9. To add an additional client ID and client secret to the application, complete the following steps:
  - a. Click Subscriptions.
  - b. Click Add alongside Credentials.  
The "Add new application credentials" window opens.
  - c. Enter a name and an optional summary, and click Submit.
  - d. Select the Show Client ID or Show Client Secret check box to display the client ID or client secret for the new credentials.
  - e. To add a description to a set of client credentials, or to change the current description, click Update alongside the required credentials.
  - f. To remove a set of client credentials from the application, click Delete alongside the required credentials.If you add additional credentials to an application, any of the associated client ID/client secret pairs can be used to identify the application when calling an API.  
Note: If you add two or more sets of client credentials to an application, OAuth tokens are not shared between them; each client credential set uses a different OAuth token.
10. To add an image, click Upload image from the application overflow menu.  
A new window opens; click Browse, select an image from your directory, and click Submit.
11. Optional: To change the URL that authenticated OAuth flows for this application should be redirected to, click Edit from the application overflow menu, then enter a URL in the Application OAuth Redirect URL(s) field.
12. Optional: To change the application name or description, click the Edit from the application overflow menu.

---

## Results

Your application is registered.

---

## What to do next

Select a Plan to use with your application, see [Exploring APIs and Products in the Developer Portal](#).

---

## Related information

---

## Managing applications

You can show or reset a client ID for an application, verify or reset a client secret, and view the details of the APIs in the application. You can also unsubscribe from a Plan that the application is subscribed to.

---

## About this task

On the application details page, you can display and reset a client ID and client secret. You might want to reset a client secret if it is compromised or you forget it. A client secret is only displayed once, so after you reveal it for the first time at a time of your choosing, you can use this window to verify that what you have is correct or reset it if necessary.

You can, optionally, add further client ID/client secret pairs to an application, any of which can be used to identify the application when calling an API.

## Procedure

---

To manage an application, complete the following steps:

1. Click Apps.  
The Apps page opens.
2. Select the application that you want to work with from the displayed list.
3. Click Subscriptions.
4. The client ID is hidden; to display the client ID, select the Show check box. The client ID is displayed, and can be hidden again by clearing the Show check box.
5. To reset your client ID, click Reset.  
Warning: API calls made by the application with the existing client ID will fail.
6. If the client secret is compromised or you forget it, click Reset to generate a new value for the client secret.
7. If you are unsure whether the value that you have for the client secret is correct, you can click Verify, enter the value, and click Submit to confirm whether or not it is correct.
8. To add an additional client ID and client secret to the application, complete the following steps:
  - a. Click Subscriptions.
  - b. Click Add alongside Credentials.  
The "Add new application credentials" window opens.
  - c. Enter a name and an optional summary, and click Submit.
  - d. Select the Show Client ID or Show Client Secret check box to display the client ID or client secret for the new credentials.
  - e. To add a description to a set of client credentials, or to change the current description, click Update alongside the required credentials.
  - f. To remove a set of client credentials from the application, click Delete alongside the required credentials.If you add additional credentials to an application, any of the associated client ID/client secret pairs can be used to identify the application when calling an API.  
Note: If you add two or more sets of client credentials to an application, OAuth tokens are not shared between them; each client credential set uses a different OAuth token.
9. To view more details about an individual API, click the API name.  
The operations are listed.
10. To unsubscribe from a Plan, click Unsubscribe alongside the Plan name.

---

## Analytics in the Developer Portal

You can view analytics for APIs in the Developer Portal at the application and organization levels. This information is displayed in dashboard views that show the analytics metrics in the form of *visualizations* (represented as charts).

Restriction:

- If the Catalog that is associated with this Developer Portal has two or more gateway services enabled then, for analytics data to be available, the gateway services must all be associated with the **same** analytics service. If the set of associated analytics services for the gateway services includes two or more different analytics services then the Developer Portal does **not** display analytics data. An analytics service is associated with a gateway service in the Cloud Manager user interface; see [Associating an analytics service with a gateway service](#).
- If the visualizations in your dashboard views display no data or show data only for a time period in the past, a possible reason might be that access to analytics data within API Connect has been switched off. Contact your API provider for confirmation.

Use the following topic links to learn how to access the various analytics available to you in the Developer Portal:

- [Application analytics in the Developer Portal](#)  
From the Developer Portal, you can view interactive analytic information about all of the APIs used by an application.
- [Organization analytics in the Developer Portal](#)  
From the Developer Portal, you can view interactive analytic information about all of the APIs within an organization.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Application analytics in the Developer Portal

From the Developer Portal, you can view interactive analytic information about all of the APIs used by an application.

### About this task

---

All members of the consumer organization can view analytics information relating to APIs used by an application.

## Procedure

---

1. Click Apps from the Developer Portal dashboard.
2. Click the name of the application for which you want to view analytic information.  
From the Dashboard tab, you can see your application analytics including, API Stats, Total Calls, and Total Errors.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Organization analytics in the Developer Portal

From the Developer Portal, you can view interactive analytic information about all of the APIs within an organization.

### About this task

---

All members of the consumer organization can view analytics information relating to the APIs that are used within an organization.

## Procedure

---

1. Click your userName from the Developer Portal dashboard.
2. From the drop-down menu, select My organization.
3. Click the Analytics tab.  
From the Analytics tab, you can see your organization analytics including, API Stats, Total Calls, and Total Errors.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Consumer organizations in the Developer Portal

Consumer organizations provide a way of grouping application developers together. You can add, remove, and configure Consumer organizations in the Developer Portal.

Developer Portal users must be a member of at least one Consumer organization. A Consumer organization can have multiple members and multiple applications. Members must register an application before they can subscribe to an API. A Consumer organization owns all the applications that are created within it. The members do not own any applications. As long as there is one member of a Consumer organization, all applications continue unchanged.

Note: Every account in the Developer Portal must have a unique email address, including the site Admin account. The default email address for the Admin account is the email address of the Catalog owner. It is not possible to create a user account (and associated Consumer organization) with the same email address as the Admin account (or that of the Catalog owner if their email address is different). Any attempts to create an account with the same email address results in the new account not functioning correctly, and returning the following error message when trying to log in: **A user already exists with this email address.**

To learn more about Consumer organizations in the Developer Portal, see the following topics.

- [Adding a Consumer organization from within the Developer Portal](#)  
You can create a new Consumer organization from within your user account in the Developer Portal. The new Consumer organization appears also in the API Manager UI after it is created.
- [Editing the name of a Consumer organization](#)  
You can edit the name of your Consumer organization from within the Developer Portal.
- [Switching Consumer organizations](#)  
You can switch from one Consumer organization to another in the Developer Portal.
- [Adding users to a Consumer organization](#)  
If the API Provider organization administrator has granted you permission to collaborate, you can invite users to join your Consumer organization. Those organization members can then access the Developer Portal and use the APIs that have been made available to the Consumer organization.
- [Removing a user from a Consumer organization](#)  
You can remove a developer from a Consumer organization in the Developer Portal.
- [Changing the ownership of a Consumer organization](#)  
You can change the ownership of a Consumer organization in the Developer Portal.
- [Deleting a Consumer organization](#)  
You can delete a Consumer organization in the Developer Portal.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Adding a Consumer organization from within the Developer Portal

You can create a new Consumer organization from within your user account in the Developer Portal. The new Consumer organization appears also in the API Manager UI after it is created.

### Procedure

---

1. Sign in to your user account in the Developer Portal.
2. Click the arrow next to your Consumer organization name on the upper-right corner of the Developer Portal home page.
3. Select Create organization from the drop-down menu.
4. In the Organization Title field, type the name of the new Consumer organization, then click Submit.

### Results

---

Your new Consumer organization is created, and you can switch to it by clicking on its name in the Organization drop-down menu on the upper right of the home page.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Editing the name of a Consumer organization

You can edit the name of your Consumer organization from within the Developer Portal.

### Procedure

---

1. Sign in to your user account in the Developer Portal.
2. Click the arrow next to your Consumer organization name on the upper-right corner of the Developer Portal home page, and click My organization.
3. In the Manage tab, click the vertical ellipsis Manage organization icon, and click Edit organization.
4. Enter the new name for your Consumer organization in the Organization Title field, and then click Submit.  
You changed the name of your Consumer organization.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Switching Consumer organizations

You can switch from one Consumer organization to another in the Developer Portal.

### Procedure

---

1. If you are a member of more than one Consumer organization, click the menu of Consumer organizations in the upper-right corner of the Developer Portal home page.
2. Select the Consumer organization that you want to switch to, and ensure that any applications you register are registered to the correct catalog.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Adding users to a Consumer organization

If the API Provider organization administrator has granted you permission to collaborate, you can invite users to join your Consumer organization. Those organization members can then access the Developer Portal and use the APIs that have been made available to the Consumer organization.

### About this task

---

Depending on the permissions enabled by the Provider organization administrator, members can view applications and application activity, create and edit applications, manage client keys and subscribe to API Plans, or perform all activities.

Note: Every account in the Developer Portal must have a unique email address, including the site Admin account. The default email address for the Admin account is the email address of the Catalog owner. It is not possible to create a user account (and associated Consumer organization) with the same email address as the Admin account (or that of the Catalog owner if their email address is different). Any attempts to create an account with the same email address results in the new account not functioning

correctly, and returning the following error message when trying to log in: **A user already exists with this email address.**

## Procedure

---

To invite users to join your Consumer organization, complete the following steps.

Note: The ability to invite users is only visible if the API Provider organization administrator has granted you permission to collaborate.

1. Sign in to your user account in the Developer Portal.
2. Click the arrow next to your Consumer organization name on the upper-right corner of the Developer Portal home page, and click My organization. The organization page is displayed.
3. On the Manage tab, select Invite.
4. Enter the email address of the new user in the Email field.
5. Under the Assign Roles heading, use the radio buttons to select a role for the new user, the roles are:
  - **Administrator**-- Can administer the Consumer organization, including invite new members, and can create, and edit applications, manage client keys, and subscribe to API Plans.
  - **Developer**-- Can create and edit applications, manage client keys, and subscribe to API Plans.
  - **Viewer**-- Can only view applications and application activity.

For full details of the permissions that are assigned to the Developer Portal roles, see [API Connect user roles](#).

6. Click Submit.  
An invitation is sent to the new user.

## Results

---

The user is added to the Consumer organization list of members, and they are sent an email inviting them to join the organization. The user must click the link that is provided in the email to activate their account, and complete the setup.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Removing a user from a Consumer organization

You can remove a developer from a Consumer organization in the Developer Portal.

### Before you begin

---

You must be the owner of your Consumer organization and have previously added the developer you wish to remove from the organization. Note that removing a user from a Consumer organization does not delete their user account, it only removes them from that organization.

## Procedure

---

1. Click your user name in the Developer Portal home page.
2. Click My organization in the menu.
3. Click Remove user for the user you want to remove.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Changing the ownership of a Consumer organization

You can change the ownership of a Consumer organization in the Developer Portal.

### Before you begin

---

You can change the ownership of a Consumer organization if you are the owner of that organization, or if you have the administrator role in that organization. The user that you transfer ownership to must already be a member of the organization. To have an account on a Developer Portal, you must be a member of at least one Consumer organization.

### About this task

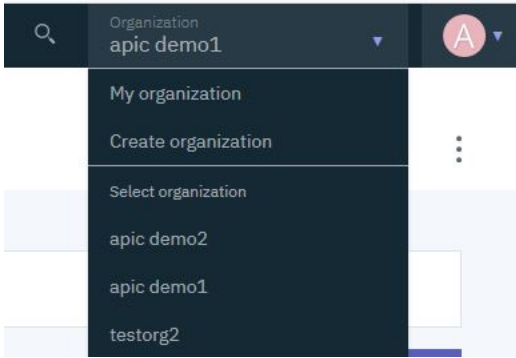

---

Transferring the ownership of a Consumer organization to another organization member, changes your role in that organization to App Developer.

## Procedure

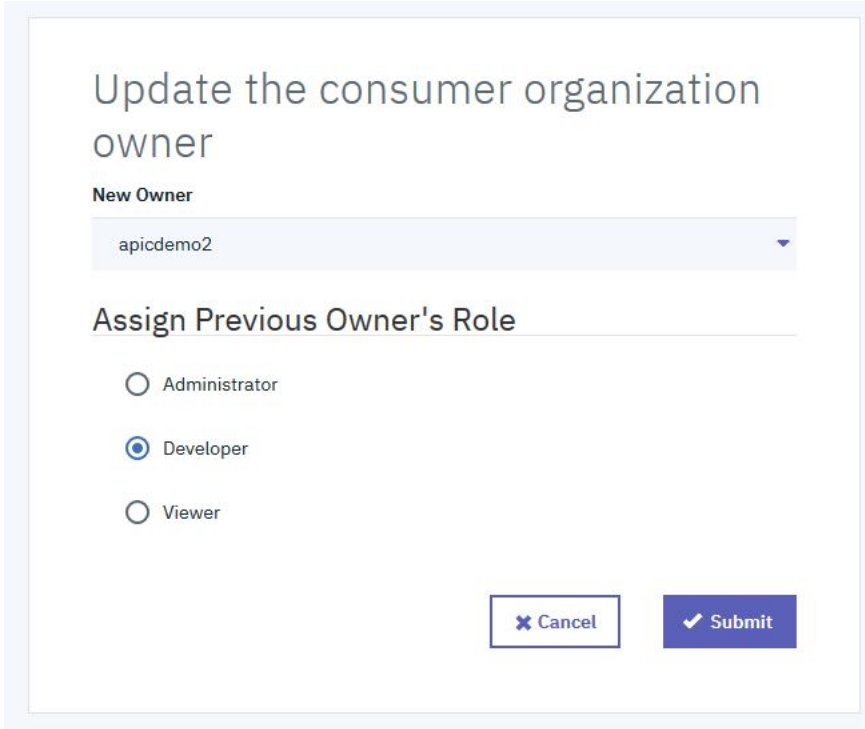

---

1. Click your Organization name in the Developer Portal home page, and select the organization whose owner you want to change by using the drop-down arrow.

2. Click your Organization name in the Developer Portal home page, and select My organization.

3. Click the options icon, , and select Change ownership.

4. Select the **New Owner** by using the drop-down arrow.

5. Use the radio buttons to **Assign Previous Owner's Role**, then click Submit.

## Results

You successfully transferred ownership of a Consumer organization in the Developer Portal.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Deleting a Consumer organization

You can delete a Consumer organization in the Developer Portal.

### Before you begin

You can delete a Consumer organization only if you are the owner of that organization. To have an account on a Developer Portal, you must be a member of at least one Consumer organization. Therefore, if you are a member of only one Consumer organization, to delete that organization you must first either join or create another Consumer organization, or you can delete your whole developer account. For more information, see [Deleting your developer account](#).

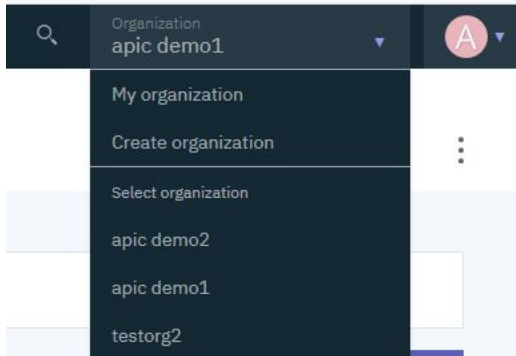

### About this task

Deleting a Consumer organization in the Developer Portal permanently removes access to the organization, and all of its applications and subscriptions, for all members of the organization. Consider carefully the impact on any members of your Consumer organizations before you delete the organization. Any users that were members of only the deleted organization, must create a new Consumer organization when they next logon to the Developer Portal.

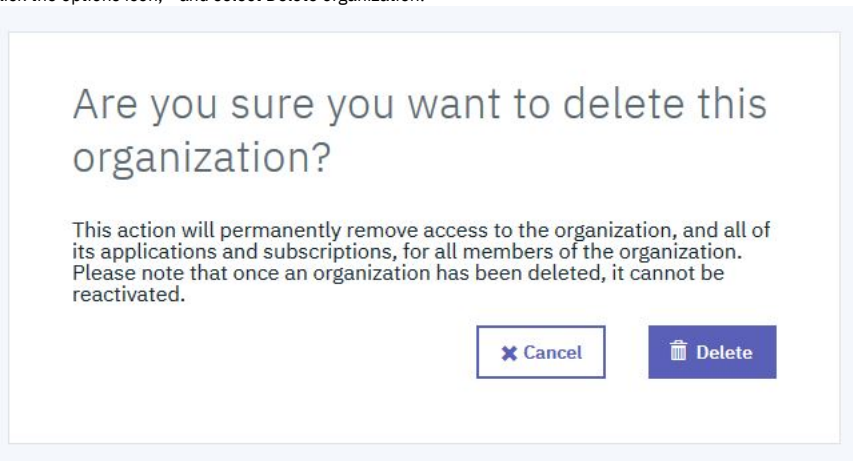

Important: When an organization is deleted, it cannot be reactivated. You might want to consider changing the ownership of a Consumer organization, rather than deleting it. For more information, see [Changing the ownership of a Consumer organization](#).

## Procedure

1. Click your Organization name in the Developer Portal home page, and select the organization that you want to delete by using the drop-down arrow. You must be in more than one Consumer organization.

2. Click your Organization name in the Developer Portal home page, and select My organization.
3. Click the options icon, , and select Delete organization.

4. Click Delete.

## Results

You permanently deleted a Consumer organization in the Developer Portal.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## User accounts, passwords, and support in the Developer Portal

You can change general elements such as user accounts and passwords in the Developer Portal.

Note: Every account in the Developer Portal must have a unique email address, including the site Admin account. The default email address for the Admin account is the email address of the Catalog owner. It is not possible to create a user account (and associated Consumer organization) with the same email address as the Admin account (or that of the Catalog owner if their email address is different). Any attempts to create an account with the same email address results in the new account not functioning correctly, and returning the following error message when trying to log in: **A user already exists with this email address.**

To learn about general user features of the Developer Portal, see the following topics:

- [Creating a new developer account](#)  
You can create new developer accounts, and their associated Consumer organizations, in the Developer Portal.
- [Changing your account settings](#)  
You can edit your user account settings in the Developer Portal, such as changing your name, password, time zone, and language settings.
- [Deleting your developer account](#)  
You can delete your account in the Developer Portal.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Creating a new developer account

You can create new developer accounts, and their associated Consumer organizations, in the Developer Portal.

### Before you begin

---

You need to provide an email address to create a new account. That email address must be a valid email address, and the domain that is used is required to have a valid MX record that is determined by DNS. You can disable the security module that checks that the email domain has a DNS record.

1. Log in to your Developer Portal as an administrator.
2. If the administrator dashboard isn't displayed, click **Manage** to display it.
3. Navigate to **Extend > Disable** module.
4. In the search bar enter **check\_dns**, then select the **check\_dns** module and click **Disable**.
5. Click **Disable** to confirm that you want to disable the module.

### About this task

---

In order to use the Developer Portal, you must have a developer account, and be a member of at least one Consumer organization. When you create a developer account, a Consumer organization is created at the same time. You can be an owner, and a member of, multiple Consumer organizations. For more information about Consumer organizations, see [Consumer organizations in the Developer Portal](#).

**Note:** Every account in the Developer Portal must have a unique email address, including the site Admin account. The default email address for the Admin account is the email address of the Catalog owner. It is not possible to create a user account (and associated Consumer organization) with the same email address as the Admin account (or that of the Catalog owner if their email address is different). Any attempts to create an account with the same email address results in the new account not functioning correctly, and returning the following error message when trying to log in: **A user already exists with this email address**.

### Procedure

---

1. From the Developer Portal home page, click **Create account**.
2. Populate the available fields with the details of the developer account and Consumer organization that you want to create.
3. Click **Sign up**.

The email address that you provided for the new developer account is sent an email that contains an activation link for the new developer account. Use this link to activate your new account.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Changing your account settings

You can edit your user account settings in the Developer Portal, such as changing your name, password, time zone, and language settings.

### About this task

---

You can edit various details about your user account, for example, change your password, update your code snippet language, change your time zone, select your preferred site language, and select an avatar.

### Procedure

---

1. Click your user name in the Developer Portal home page, and click **My account**.
2. To update your password, click **Change Password**, and update the fields as required.
3. To update other elements of your account, such as your name, time zone, and language, click **Edit** and update the fields as required.
4. Click **Save** to save your changes.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Deleting your developer account

You can delete your account in the Developer Portal.

## Before you begin

---

You must be the owner of the developer account that you want to delete, and you must not own more than one Consumer organization. If you do own more than one Consumer organization, you must either change the ownership of those organizations, or delete them, before you can delete your account. If you own only one Consumer organization, when you delete your account the Consumer organization is deleted at the same time as your account.

## About this task

---

When you delete your account, any Consumer organizations that you own must also be deleted or transferred to new owners. If there are other members in a Consumer organization that you delete, these members will no longer have access to that organization, or any of its applications and subscriptions. Consider carefully the impact on any members of your Consumer organizations before you delete your account. For more information, see [Deleting a Consumer organization](#).

Important: When an organization has been deleted, it cannot be reactivated. You might want to consider changing the ownership of your Consumer organizations before you delete your account. For more information, see [Changing the ownership of a Consumer organization](#).

## Procedure

---

1. Click your user name in the Developer Portal home page, and select My account.
2. Click the Edit tab.
3. Click Delete account at the bottom of the page.
4. Click Delete to confirm deletion of the account.

This action deletes your developer account and, if you own a Consumer organization, this organization is also deleted.

## Results

---

You successfully deleted your developer account in the Developer Portal.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Configuring the Developer Portal site

Customize the look and feel of your Developer Portal site, and brand it for your organization.

The Developer Portal is based on the open source Drupal content management system, and consequently it is almost infinitely customizable. What an individual user is able to configure, depends on the role the user has been assigned, and the associated permissions of that role. A user can be assigned one of four Developer Portal roles:

### Authenticated user

An authenticated user is, typically, an application developer, and can perform all of the actions that are described in the [Using the Developer Portal](#) section.

### Forum Moderator, Content Author, or Administrator

In addition to performing all of the tasks that an Authenticated user role can, a Forum Moderator, Content Author, or Administrator role have additional permissions related to configuring the Developer Portal site. For more information, see [Working with roles in the Developer Portal](#).

Note: By default, the Developer Portal administration operations are available only if you have Administrator access.

Before you start to configure your Developer Portal site, you should familiarize yourself with the various concepts and terminology that is referenced throughout the Developer Portal. See [Concepts in the Developer Portal](#).

When you are ready to start configuring your Developer Portal site, see [Getting started configuring the Developer Portal site](#) for a quick start guide on customization. There is also a tutorial that you can follow that takes you through an example customization scenario; see [Tutorial: Creating a custom theme for the Developer Portal](#).

In addition to the aforementioned options, Developer Portal configuration operations are described in the following sections:

### [Appearance](#)

Control and configure the general appearance of your Developer Portal site by setting and configuring a default theme.

Important: Editing API Connect themes, modules, or Drupal core on the filesystem is not permitted or supported. For more information, see [Creating a sub-theme](#) and [Extend](#).

### [Content](#)

Control multiple content entities in the Developer Portal, including the customization and restriction of specific content.

### [Structure](#)

Control the layout of the Developer Portal, such as configuring the front page, adding and changing blocks, and displaying Products and APIs in categories.

### [Configuration](#)

As an administrator, you can control multiple aspects of the Developer Portal configuration, including managing security and general configuration tasks.

### [People](#)

You can manage and customize the user experience in the Developer Portal, by altering permissions and assigning roles to specific users.

### [Forums](#)

Create and control forums in the Developer Portal.

### [Reports](#)

You can view reports about the general configuration and status of your Developer Portal site.

### [Extend](#)

You can extend the Developer Portal by creating and installing custom modules, or installing additional Drupal 9 contributed modules.

---

---

## Concepts in the Developer Portal

The Developer Portal is built on Drupal 9, an open source content management technology. A good understanding of Drupal 8 concepts and terminology enhances your ability to work with the Developer Portal.

In Drupal, most content on the website is treated as variations on the concept of a **node**. Node types, such as static pages, blog posts, and news items, are all stored in the same way. The navigation structure of the site is designed separately by editing **menus**, **views**, and **blocks**. Finally, the **theme** of the system controls the overall appearance of the site to visitors. Access to these depends on the permissions that your role possesses. These are explained more fully in the following sections.

## Nodes

A node is a set of individual related content such as a page, a poll, an article, a forum topic, or a blog post. For example, when you create a blog post, and define the body text, you also define its title, content, author link, creation date, and taxonomy. Some of these elements are shown by the theme layer when the node is displayed, and some elements are metadata that control where and when the node is displayed at all. Each set of content in a Developer Portal site is a node. You can apply new features or changes to all content of a single node type.

## Fields

A field is somewhere that you can add extra metadata to a node. The following types of data are examples of fields:

- Title
- Body
- Comment body
- Tags
- Image

You can create different types of fields, and they can be defined at the content-type level for content items and comments, at the vocabulary level for taxonomy terms, and at the site level for user accounts. Field types are defined by modules, and managed by the Field module. In addition, other modules might enable fields to be defined for their data.

## Content types

A content type is a predefined collection of fields. Content types define the default fields that content editors use to add content in a Developer Portal site, and help structure the authoring and developing of content. Content types can be displayed in the Developer Portal. You can control which content types, and the order and format that they are displayed, in the Developer Portal.

## Themes

You can use themes to control the overall appearance of your Developer Portal site. You can modify the appearance of the theme in following ways:

1. Extend the code of an existing theme.
2. Identify and use a theme that is provided by the Drupal community or a third-party website, and modify the theme settings.
3. Create a complete custom theme from scratch.

However, you cannot directly edit the API Connect theme as editing is not supported. Any edited versions of these files are overwritten when a fix pack or iFix is installed. So, the way to create a custom theme is to create a custom subtheme of the standard API Connect theme that the Developer Portal uses by default. A subtheme inherits all of the settings of its parent theme, apart from the settings that are overridden. For more information, see [Creating a sub-theme](#).

Most themes use the Twig template engine for PHP.

## Regions

The specific areas of a Developer Portal site in which content can be placed. Regions are customized and styled in the theme.

## Blocks

Blocks are boxes of content that can be displayed in regions on your Developer Portal page. Blocks can be made available to your Developer Portal site by enabling specific modules. After a block is created, its appearance, shape, size, and position can be modified. You can also define which Developer Portal page or pages blocks appear on. Some modules can provide multiple blocks when they are enabled, while other modules might not define new blocks. For more information, see [Adding and changing the blocks displayed on Developer Portal pages](#).

## Modules

Modules are similar to the concept of plug-ins, in that they extend the core functions of the Developer Portal site. A set of modules is implemented by default with the Drupal core, and there are extra modules that can be enabled to extend the default functions. You can find and add more modules to your Developer Portal site from the internet. For more information, see [Extend](#).

## Views

---

You can use views to manipulate the content that is displayed on a page, block, and other visual elements in the Developer Portal site. Views can be used along with content types to format the appearance of your site to your specification. For more information, see [Using the Views module in the Developer Portal](#).

## Pages

---

Pages are used by the features that can modify the appearance of the Developer Portal to customize the appearance of your Developer Portal site. Pages can be customized to be as specific as you require, and can be configured to satisfy the context of the situation that they are used in.

## Users

---

After you log in to the Developer Portal site, you have a user record in the Developer Portal database. User ID 1 is always reserved for the administrator account. Regardless of whether other user accounts are using remote authentication such as LDAP, the administrator account is always a local account to enable administration of the Developer Portal site. For more information, see [People](#).

## Roles

---

A role is a collection of permissions that define the actions that a user can do in the Developer Portal site. Users can be given one or more roles. By default, a user that is logged in to the Developer Portal is in the Authenticated role. Other roles that can be assigned to a user include:

- Administrator
- Forum Moderator
- Content Author

You can also create new custom roles. For more information, see [Working with roles in the Developer Portal](#).

## Permissions

---

Permissions define the actions that a user can or cannot do in a Developer Portal site. Permissions are additive. If a permission that enables a user to do an action is not assigned, the user cannot do the action. If a user has multiple roles, and any of them contain a specific permission, the user is able to do that action. There are also permissions that have security implications, and you are recommended to assign those permissions to trusted roles. For more information, see [Controlling access to Developer Portal content](#).

## Templates

---

Template files define how the output of a particular component can look. They are formatted as Twig template files. The following are examples of where you can use templates:

- `html.html.twig` - the template for Developer Portal HTML pages
- `page.html.twig` - the body of Developer Portal HTML page
- `node.html.twig` - the template for all of the content nodes
- `comment.html.twig` - the template for all of the comment nodes
- `search-result.html.twig` - the template for search results
- `node--product.html.twig` - the template for nodes that use the Product content type
- `node--product--teaser.html.twig` - the template for the previews for the Product content type

For more information about overriding templates in the Developer Portal, see [Applying a modified content type template](#).

---

## Getting started configuring the Developer Portal site

A quick start guide to the main tasks involved in configuring the Developer Portal to your brand or theme.

The Developer Portal is based on the open source Drupal 9 content management software, and consequently is almost completely customizable. The following sections take you through the most common tasks to get your Developer Portal branded to your organizational requirements.

Important:

All of the customizations that are detailed in this topic are preserved when you update to new versions of API Connect. Drupal updates, as well as new functionality, defect fixes, and security updates, are made available through API Connect update packages as determined by IBM. These update packages can be applied by upgrading your deployment; see the upgrade instructions for your platform in [Installing and maintaining your IBM API Connect cloud](#). To find out what update packages are available, select your product on [IBM Fix Central](#).

Directly editing any API Connect themes, modules, or Drupal core on the file system is not permitted or supported, as edited versions of these files are overwritten when an update package is installed. Customizations must be done by using the proper mechanisms as described in this topic, such as custom modules and themes, and not by

directly editing the source.

For more information about the API Connect support policy, see [IBM® API Connect Support Lifecycle Policy](#).

- [Create a custom theme](#)
- [Changing the page layout](#)
- [Changing the front page](#)
- [Advanced theme development](#)
- [Custom modules](#)
- [What to do next](#)

---

## Create a custom theme

If you want your Developer Portal to have your corporate branding and style, you need to create a custom theme. Themes are composed primarily of Cascading Style Sheets (CSS) files, although they can include much more; see [Advanced theme development](#).

Directly editing the API Connect theme is not permitted or supported, as edited versions of these files are overwritten when a fix pack or iFix is installed. The way to create a custom theme is to create a custom sub-theme of the standard API Connect theme that the Developer Portal uses by default. A sub-theme inherits the parent theme's resources, and this means that your custom sub-theme CSS file needs to contain only the changes or overrides that you want to make from the default theme. The CSS file can contain as little or as many updates as you like.

For more information, see [Creating a sub-theme](#). You can also follow a tutorial that takes you through how to use the theme generator, customize a theme, and install a custom theme; see [Tutorial: Creating a custom theme for the Developer Portal](#).

While experience with Drupal is beneficial, the only skill you really need to create a sub-theme is CSS.

---

## Changing the page layout

While the theme defines *regions* of the page, such as a footer, or sidebar first, the page layout is defined by configuring which blocks appear in which regions. Blocks are controlled by using the Structure > Block layout options on the Developer Portal administrator dashboard. You can then further limit those blocks to show only on specific pages, or show on all pages except certain ones, to show only for certain roles, or for certain languages, and more.

For information about how to configure the page layout, see [Adding and changing the blocks displayed on Developer Portal pages](#).

Changing the page layout is done entirely in the Developer Portal UI as an Administrator.

---

## Changing the front page

The front page is a special case and does not use the blocks system that is mentioned previously. Instead, you configure it from the Structure > Pages options on the Developer Portal administrator dashboard.

For information about how to configure the front page, see [Configuring the front page](#).

Further options that you might want to consider when designing your front page include:

- Change the banner block content or image: [Changing the front page banner block](#).
- Display featured API Products by creating a featured content block: [Changing the front page Featured Content block](#).
- Create custom blocks with your own HTML content: [Adding and changing the blocks displayed on Developer Portal pages](#).
- Set up the social block to include your organization Twitter feed: [Integrating Twitter data into the social block](#).
- Add a carousel to the front page to display a series of images: [Implementing an image carousel](#).

Again, changing the front page is done entirely in the Developer Portal UI as an Administrator.

---

## Advanced theme development

The DOM structure for specific blocks and parts of the page is controlled by templates. These templates are Twig files that define the actual HTML output for a particular piece of content. You can override a Twig template by copying the original template into the templates folder of your custom sub-theme, and then editing the template to your specification. The Developer Portal then uses your template in preference to the original one. For more information, see [Applying a modified content type template](#).

Modifying Twig templates allows very fine-grained control over the structure of pages. However, it also means you might miss new features and defect fixes that are made to the original templates, as your Developer Portal is using your overrides instead of the originals. So, if you override a template, it is your responsibility to check the templates in the latest API Connect releases, and to ensure that any equivalent changes that are needed to your overrides to maintain functional equivalence are made.

If you're developing custom templates, knowledge of Twig templating language, Drupal, HTML, and CSS is recommended.

---

## Custom modules

If you need to modify the functional behavior of the Developer Portal, then you can create a custom module to do so. Drupal has an extensible programmatic API that is built around a system of *hooks*. By using these hooks in your custom modules you can change what happens when, for example, forms are displayed, forms are submitted, or make extra variables available to custom templates, and other options.

For more information on writing custom modules, see [Extend](#). You can also follow a tutorial that includes using a custom module, see [Tutorial: Adding validation to a field on the sign-up form](#).

Custom modules are written in PHP, and so Drupal experience and PHP knowledge are very beneficial.

---

## What to do next

There are an almost infinite number of configuration options available to you on the Developer Portal. Explore the following sections to find out more:

- [Appearance](#)
- [Content](#)
- [Structure](#)
- [Configuration](#)
- [People](#)
- [Forums](#)

## Controlling general appearance elements in the Developer Portal

You can control general appearance aspects of the Developer Portal.

To learn how to control general aspects of the Developer Portal appearance, use the following topic links:

- [Changing the shortcut icon](#)  
You can change the shortcut icon, or favicon, in the Developer Portal.
- [Changing the site email address](#)  
You can change the site email address in the Developer Portal.
- [Changing the site logo](#)  
You can change the site logo for your Developer Portal.
- [Changing the site name or site slogan](#)  
You can change the site name, or the site slogan, for your Developer Portal.
- [Changing the visibility of site branding](#)  
You can toggle the visibility of your site branding elements for your Developer Portal.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Changing the shortcut icon

You can change the shortcut icon, or favicon, in the Developer Portal.

---

### Before you begin

You must have administrator access to complete this task.

## About this task

---

The shortcut icon, or favicon, is displayed in the address bar or bookmarks of most browsers. Drupal provides a default favicon, the water drop logo, but if you want to make your Developer Portal stand out, you should provide your own. The default Drupal favicon is 32 pixels high by 32 pixels wide. As a favicon is displayed only in the address bar and favorites (bookmarks) list, any favicon that you create should be similarly small.

## Procedure

---

To change the shortcut icon, complete the following steps:

1. If the administrator dashboard is not displayed, click Manage to display it.
  2. Click Appearance in the administrator dashboard.
  3. Click Settings for the default theme.
  4. Click Favicon in the Override Global Settings section.
  5. Deselect the Use the favicon supplied by the theme check box.
  6. Provide a path to a custom icon on the server by entering it in the Path to custom icon field. Alternatively, you can browse for, and upload, a favicon image under the Upload favicon image subheading.
  7. Click Save configuration.
- Note: If the changes don't appear immediately in your browser, clear your browser's cache and reload the page. If you've bookmarked the site, you may need to delete the bookmark and then create it again, so the new favicon is used.

## Results

---

You have changed the favicon for the site.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details. For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Changing the site email address

You can change the site email address in the Developer Portal.

## Before you begin

---

You must have administrator access to complete this task.

## Procedure

---

To change the site email address, complete the following steps:

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Configuration in the administrator dashboard.
3. Under the System heading, click Basic site settings.
4. In the SITE DETAILS section, enter the new site email address in the Email address field.
5. Click Save configuration.

## Results

---

You changed the email address for the site.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details. For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Changing the site logo

You can change the site logo for your Developer Portal.

## Before you begin

---

You must have administrator access to complete this task.

## Procedure

---

To change the site logo, complete the following steps:

1. If the administrator dashboard is not displayed, click Manage to display it.
  2. Click Appearance in the administrator dashboard.
  3. Click Settings for the default theme.
  4. Click Logo image in the Override Global Settings section.
  5. Deselect the Use the logo supplied by the theme check box.
  6. Provide a path to your custom logo by completing the Path to custom logo field. Alternatively, you can browse and upload a logo image under the Upload logo image subheading.
  7. Click Save configuration.
- Note: If the changes don't appear immediately in your browser, clear your browser's cache and reload the page.

---

## Results

You changed the site logo for your Developer Portal. How the site logo is used depends on the settings for your theme.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Changing the site name or site slogan

You can change the site name, or the site slogan, for your Developer Portal.

---

### Before you begin

You must have administrator access to complete this task.

---

### About this task

The site name is used to identify the site and can be displayed in browsers. You can also set a site slogan for your theme.

---

### Procedure

To change the site name or site slogan, complete the following steps:

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Configuration > System > Basic site settings in the administrator dashboard.
3. In the SITE DETAILS section, enter the new site name in the Site name field, or enter a new slogan in the Slogan field.
4. Click Save configuration.

---

## Results

The site name or site slogan is updated. How the site name and the site slogan are used depends on the settings for your site theme. For more information, see [Changing the visibility of site branding](#).

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Changing the visibility of site branding

You can toggle the visibility of your site branding elements for your Developer Portal.

---

### Before you begin

You must have administrator access to complete this task.

---

### About this task

The site branding block includes the site logo, name, and slogan. You can choose which of these branding elements you want to be displayed in this block.

---

### Procedure

To change the visibility of your site branding elements, complete the following steps:

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Structure > Block layout in the administrator dashboard.
3. Find the Site branding block in the Navigation section, and click Configure.
4. In the TOGGLE BRANDING ELEMENTS section, use the check boxes to select which branding elements you want to be visible.

5. Click Save block to save your changes.

## Results

---

You changed the visibility of your site branding elements. How these elements are used depends on the settings for your theme.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Adding custom JavaScript to a custom theme

To increase customization of the Developer Portal, you can add custom JavaScript to custom themes that you install.

### Procedure

---

1. Add your JavaScript file to your theme. For example, in a sub-directory named `js` and the file `myfilename.js`.
2. Add the JavaScript file to your theme, by editing your `{custom_theme}.libraries.yml` file and adding in the JavaScript file.

An example of the JavaScript file:

```
myfile:
  js:
    js/myfilename.js: {}
```

3. Add the following code to your theme's `.info.yml` file:

```
libraries:
- {custom_theme}/myfile
```

Note: You must replace `{custom_theme}` with your theme name. Also, both files must reference `myfile`.

4. Zip up the directory and upload it to your portal site. For more information, see [Installing additional themes](#).

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Applying a modified content type template

You can apply a modified content type template to override a default content type template in the Developer Portal. For example, you can override the product content type template to change its layout.

### Before you begin

---

You must have administrator access to complete this task.

You must also have a custom sub-theme, and a copy of an existing template that you want to update. For information about how to create a sub-theme, see [Creating a sub-theme](#).

To obtain a copy of an existing template, you can download a copy from the following locations on GitHub:

- [https://github.com/ibm-apiconnect/devportal/tree/APIC\\_v2018/ibm\\_apim/templates](https://github.com/ibm-apiconnect/devportal/tree/APIC_v2018/ibm_apim/templates)
- [https://github.com/ibm-apiconnect/devportal/tree/APIC\\_v2018/apic\\_api/templates](https://github.com/ibm-apiconnect/devportal/tree/APIC_v2018/apic_api/templates)
- [https://github.com/ibm-apiconnect/devportal/tree/APIC\\_v2018/apic\\_app/templates](https://github.com/ibm-apiconnect/devportal/tree/APIC_v2018/apic_app/templates)
- [https://github.com/ibm-apiconnect/devportal/tree/APIC\\_v2018/product/templates](https://github.com/ibm-apiconnect/devportal/tree/APIC_v2018/product/templates)
- [https://github.com/ibm-apiconnect/devportal/tree/APIC\\_v2018/consumerorg/templates](https://github.com/ibm-apiconnect/devportal/tree/APIC_v2018/consumerorg/templates)

Note that you must copy the template to your sub-theme, and then modify the content. Do not modify the content that is stored on GitHub.

### About this task

---

You can override the Developer Portal core templates by creating a custom sub-theme, and then adding your modified templates to the sub-theme folder. A sub-theme inherits all of the settings of its parent theme, apart from the settings that are overridden, such as by applying modified templates. After you have applied a modified content types template, these changes take precedence over the default content types template. The Developer Portal templates are formatted as Twig template files. The following levels are examples of where you can use templates:

- `html.html.twig` - the template for Developer Portal HTML pages
- `page.html.twig` - the body of Developer Portal HTML page
- `node.html.twig` - the template for all of the content nodes
- `comment.html.twig` - the template for all of the comment nodes
- `search-result.html.twig` - the template for search results
- `node--product.html.twig` - the template for nodes that use the Product content type
- `node--product--teaser.html.twig` - the template for the previews for the Product content type

For more information about Twig templates, see [Working with Twig templates](#) and [Debugging Twig templates](#) on the Drupal documentation website. Modifying Twig templates allows very fine-grained control over the structure of pages. However, it also means you might miss new features and defect fixes that are made to the original templates, as your Developer Portal is using your overrides instead of the originals. So, if you override a template, it is your responsibility to check the templates in the latest API Connect releases, and to ensure that any equivalent changes that are needed to your overrides to maintain functional equivalence are made.

Important:

Directly editing any API Connect theme files is not permitted or supported, as edited versions of these files are overwritten when a fix pack or iFix is installed.

## Procedure

To override a default content type template:

1. Apply the modifications that you require to the default template that you obtained.

Warning: Although the ability to override templates is supported, if you override a template they are your responsibility. Templates can be from multiple sources and compatibility with an earlier version is not ensured. You must check the templates in the latest API Connect release to check whether you need to make equivalent changes to your overrides to maintain functional equivalence.

2. Create a directory in your custom sub-theme, and name it templates.

3. Add your modified template to the templates directory.

Note: The modified template file name must be identical to the original name of the template file that it is overriding.

4. Log in to the Developer Portal UI as an administrator.

5. If the administrator dashboard is not displayed, click Manage to display it.

6. Install your custom sub-theme onto the Developer Portal by clicking Appearance > Install new theme on the administrator dashboard.

7. Click Choose file, select your sub-theme, and then click Install.

8. Click Install newly added theme, find your new theme in the list of Uninstalled themes, and click Install and set as default to set your new custom sub-theme as the default theme for your site.

Your new theme, which contains the modified template file, is now set as the default theme, and is listed in the Installed themes section.

## Results

You successfully modified and applied a template to override a default content type template in the Developer Portal.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Creating a sub-theme

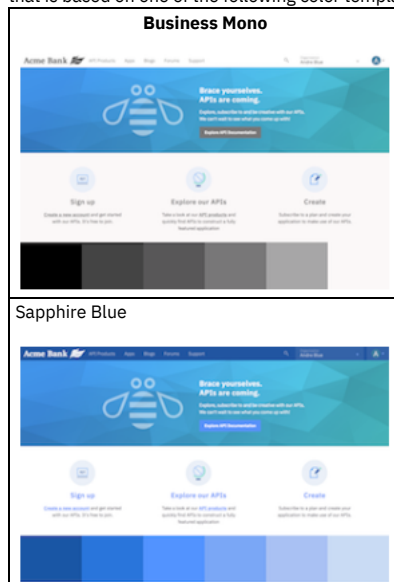

Create a custom theme for your Developer Portal site by generating and configuring a sub-theme. A sub-theme is a theme that inherits all the resources of a specified parent theme. You can then override specific resources to configure your required customizations.

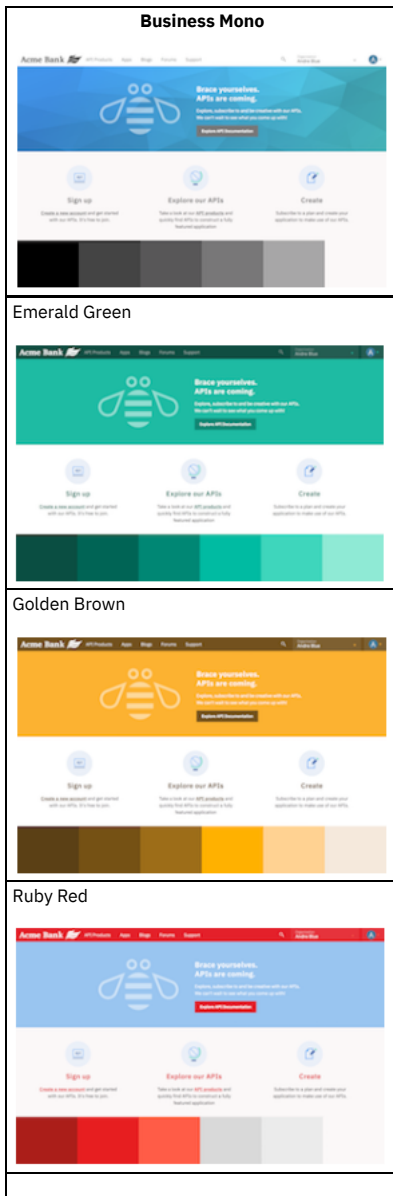

## Before you begin

You must have administrator access to complete this task.

## About this task

Directly editing the API Connect theme isn't permitted or supported, as edited versions of these files are overwritten when a fix pack or iFix is installed. So, the way to create a custom theme is to create a custom sub-theme of the standard API Connect theme that the Developer Portal uses by default. You can also create a sub-theme that is based on one of the following color templates:

Selecting a color template provides you with a base theme that you can build on more easily to produce your required site branding and styling. Create a sub-theme by using the theme generator in the Developer Portal UI, customize the appearance as required, and then upload the compressed file back onto the site.

**Important:**

- You're not permitted to include any IBM® API Connect code within any custom themes that you create. Also, directly editing any API Connect themes on the file system is not permitted or supported, as edited versions of these files are overwritten when a fix pack or iFix is installed.
- All custom development is your responsibility. Although the use of custom themes is supported, IBM API Connect do not provide support in their development or modification.

For a guided example on creating a sub-theme, see [Tutorial: Creating a custom theme for the Developer Portal](#). In this example, you create a sub-theme, and then customize the styling by editing the overrides.css file.

## Procedure

1. If the administrator dashboard is not displayed, click **Manage** to display it.
2. On the administrator dashboard, click **Appearance**, **Generate sub-theme**.  
The **Generate sub-theme** page is displayed.
3. Enter a Sub-theme name, and select the Sub-theme type that you would like to use. The name can contain only lowercase characters a - z, and numerals 1 - 9.
  - CSS - Cascading Style Sheets; the language that is used to describe how to display the HTML elements in the theme.
  - SCSS - Sass CSS; a superset of CSS. SCSS contains all the features of CSS, but is extended to include the features of Sass as well. However, SCSS must be compiled into CSS before it can be installed and used in the Developer Portal.
4. Select the template to base your sub-theme on:
  - Default - the standard connect\_theme that the Developer Portal is based on.
  - Business Mono - a black and white color theme.
  - Sapphire Blue - a blue color theme.
  - Emerald Green - a green color theme.
  - Golden Brown - a brown color theme.
  - Ruby Red - a red color theme.

5. Click Generate.  
Your sub-theme is available to download from the Generate sub-theme page.
6. Click your new sub-theme and save it to your preferred location.
7. Extract the resources from the sub-theme file, and then edit the specific resources to configure the customizations that you require.  
Define your theme by creating metadata in the *your\_theme\_name*.info.yml file. You can then customize the appearance of your theme by configuring the overrides.css file. For detailed information about how to customize themes, see [Theming Drupal](#).
8. After you have completed your customizations, compress the sub-theme resources back into the .zip file.  
Note that the following file extensions are also supported: tar, tgz, gz, and bz2.
9. Install your new sub-theme onto the Developer Portal by clicking Appearance > Install new theme.
10. Click Choose file, select your sub-theme, and then click Install.
11. Click Install newly added theme, find your new theme in the list of Uninstalled themes, and click Install and set as default to set your new custom sub-theme as the default theme for your site.  
Your new theme is now set as the default theme, and is listed in the Installed themes section.

---

## Results

You created and installed a new sub-theme for your Developer Portal site.

---

## What to do next

You can edit the display settings for your new theme, by clicking Settings next to your theme.

---

## Related information

---

---

## Installing additional themes

You can install additional themes in the Developer Portal.

---

## Before you begin

You must have administrator access to complete this task.

---

## Procedure

To install additional themes, complete the following steps:

1. Click Appearance in the administrator dashboard.
2. Click + Install new theme.
3. You can enter a path to the theme in the Install from a URL field. Alternatively, you can upload a theme under the Upload a module or theme archive to install heading.
4. Click Install.
5. Click Enable newly added themes.
6. Click Enable and set default for the theme that you want to be displayed in the Developer Portal.  
Your theme is displayed in the Developer Portal when you navigate to the home page.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Deleting themes

You can delete a theme from your Developer Portal site.

---

## Before you begin

You must have administrator access to complete this task.

---

## About this task

If you have a custom theme which is disabled, you can remove it from the Developer Portal. Deleting a theme is useful if you have identified a theme that you do not want to use again.

## Procedure

---

1. Click Appearance from the administrator dashboard.
2. Identify the custom theme that you want to delete, and ensure that it is disabled.
3. Click Delete against the theme.

The theme is now deleted from your Developer Portal site.

## Results

---

You deleted a disabled theme in the Developer Portal.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Content

---

Control multiple content entities in the Developer Portal, including the customization and restriction of specific content.

A *content entity* is an item of content data, which can consist of text, HTML markup, images, attached files, and other data that is intended to be displayed to site visitors. Content entities can be defined by the core software or by modules. Content entities are grouped into *entity types*, which have different purposes and are displayed in different ways on the site. Most entity types are also divided into *entity sub-types*, which are divisions within an entity type to allow for smaller variations in how the entities are used and displayed.

The Developer Portal site contains the following content entity types:

- API
- Application
- Article
- Basic page
- Blog post
- Book page
- Consumer Organization
- FAQ
- Forum Topic
- Product

Within content entity items the data is stored in individual *fields*, each of which holds one type of data, such as formatted or plain text, images or other files, or dates. Field types can be defined by the core software or by modules.

Fields can be added by an administrator on content entity sub-types, so that all the entity items of a given entity sub-type have the same collection of fields available. When you create or edit entity items, you are specifying the values for the fields on the entity item.

To learn how to configure the content entities of your Developer Portal site, use the following topic links.

- [Adding content elements in the Developer Portal](#)  
You can add content elements in the Developer Portal.
- [Configuring and restricting content in the Developer Portal](#)

You can turn certain content elements on or off in the Developer Portal

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Adding content elements in the Developer Portal

You can add content elements in the Developer Portal.

To learn how to add various content elements in the Developer Portal, use the following topic links:

- [Adding and configuring meta tags](#)  
You can customize the Developer Portal by adding and configuring meta tags.
- [Adding custom pages](#)  
You can create custom pages within the Developer Portal. You can add a basic page for static content, or an article for news content.
- [Integrating Twitter data into the social block](#)  
You can retrieve and integrate data from a Twitter account of interest and display it into a social block in a Developer Portal site.
- [Adding content in multiple languages](#)  
You can create content in multiple languages in the Developer Portal.
- [Adding custom pages to APIs and Products](#)  
After you create a custom page in the Developer Portal, you can add a link to the new page to any APIs and Products that exist in the Developer Portal.

- [Adding new frequently asked questions](#)  
You can add new FAQs to the Developer Portal.
- [Applying an image to an API or Product](#)  
You can apply an image to an API or a Product in the Developer Portal.
- [Attaching a documentation file to APIs](#)  
You can attach a file to APIs in the Developer Portal, and display them as documentation attachments. You can attach multiple files to APIs.
- [Configuring blogs](#)  
You can post new blog entries in the Developer Portal, and configure them to suit your requirements. You can also turn blogs off.
- [Configuring the taxonomy menu block](#)  
To display your tag hierarchy in the Developer Portal, you must configure the taxonomy menu block.
- [Customizing the URL alias for a specific API or Product page](#)  
You can customize the URL of an API or Product page from the default alias that they are assigned.
- [Embedding multimedia in site content](#)  
You can embed multimedia elements in site content in the Developer Portal.
- [Linking from one piece of site content to another](#)  
You can link from one piece of site content to another in the Developer Portal.
- [Linking to social media sites](#)  
You can link to social media sites from the Developer Portal. You can configure where and how these links are displayed and which sites you want to link to.
- [Managing tags in the Developer Portal](#)  
These instructions show you how to add new tags to your taxonomy, and how to manage the tag hierarchy in the Developer Portal. You can use tags to classify your Developer Portal content.
- [Posting a poll](#)  
You can post a poll in the Developer Portal.
- [Adding images to site content](#)  
You can add .jpg, .png and .gif images to your site content in the Developer Portal.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Adding and configuring meta tags

You can customize the Developer Portal by adding and configuring meta tags.

### Before you begin

You must have administrator access to complete this task.

### About this task

Meta tags provide preview information that is displayed for a link to a website. The preview information can include images, descriptions, tags, and links. Meta tags are used when you link to external website, for example Facebook, Twitter, and Slack.

You can see which entities have the meta tag form available on their respective edit pages by default, and can be configured, Configuration > Search and metadata > Metatags > Settings:

- CONTENT
  - API
  - APPLICATION
  - ARTICLE
  - BLOG POST
  - BOOK PAGE
  - CONSUMER ORGANIZATION
  - FAQ
  - FORUM TOPIC
  - BASIC PAGE
  - PRODUCT
- TAXONOMY TERM
  - FORUMS
  - TAGS
- USER
  - USER

### Procedure

1. In the administrator dashboard, click Extend > Update, then click List.
2. Enter `meta tag` in the Filter list field.
3. Select the check boxes for the Meta tags you want to enable, click Enable.

- [Disabling external search engine indexing](#)  
If you do not want your Developer Portal site content to be indexed by external search engines, then you can disable the indexing.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Disabling external search engine indexing

If you do not want your Developer Portal site content to be indexed by external search engines, then you can disable the indexing.

### Before you begin

---

You must have administrator or content author access to complete this task.

### About this task

---

By disabling the external search indexing, you can increase the confidentiality of your content and restrict its exposure.

### Procedure

---

1. If the administrator dashboard is not displayed, click **Manage** to display it.
2. On the administrator dashboard, click **Configuration**.
3. In the **SEARCH AND METADATA** section, click **Metatag**.
4. Click **Edit** for the **GLOBAL** type.
5. Expand the **ADVANCED** section and, in the **Robots** section, select **Prevents search engines from indexing this page**.
6. Click **Save**.

### Results

---

You have disabled external search engine indexing.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Adding custom pages

You can create custom pages within the Developer Portal. You can add a basic page for static content, or an article for news content.

### Before you begin

---

You must have administrator or content author access to complete this task.

### About this task

---

Use basic pages for your static content, such as an "About us" page. Typically, a basic page is used for static content that can be linked into the main navigation bar, although this is not a requirement. Use articles for time-sensitive content, like news, press releases, or blog posts.

### Procedure

---

To add custom pages, complete the following steps.

1. Log in to the Developer Portal as an administrator or content author.
2. If the administrator dashboard is not displayed, click **Manage** to display it.
3. In the administrator dashboard, click **Content**.
4. Click **+Add content**, then click either **Basic page** or **Article**, depending on the type of content you want to display.
5. Enter a page title, select the language, and enter the content.
6. Specify the remaining page options as required.
  - If you want your new page to be linked to from a menu, you must complete the **Menu settings** section.
7. Optional: Click **Edit summary** and specify a summary page description.
8. Click **Save** to publish the new page immediately. If you don't want to publish the new page immediately, ensure that you **deselect Published** before saving.

### Results

---

You added a new custom page to the Developer Portal. You can edit the page after it is created by clicking **Edit** for the custom page.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Integrating Twitter data into the social block

You can retrieve and integrate data from a Twitter account of interest and display it into a social block in a Developer Portal site.

### Before you begin

---

You must have administrator access to complete this task.

You must have a Twitter App for the Twitter account of interest. The Twitter App contains information that is used to configure the social block. For information on creating Twitter Apps, see <https://apps.twitter.com/>.

### Procedure

---

1. If the administrator dashboard is not displayed, click Manage to display it.
2. On the administrator dashboard, click Configuration.
3. In the WEB SERVICES section, click IBM Social Block settings.
4. Using the information from your Twitter App, enter the Consumer Key, Consumer Secret, Access Token, and Token Secret in the corresponding fields.
5. Click Save configuration.

Twitter data from a Twitter account of interest has been integrated with the Developer Portal, and is displayed on the social block of the site.

- **Editing the social block**

After you have integrated Twitter data into the Developer Portal social block, you can edit the content, appearance, and functionality of the social block.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Editing the social block

After you have integrated Twitter data into the Developer Portal social block, you can edit the content, appearance, and functionality of the social block.

### Before you begin

---

You must have administrator access to complete this task.

You must have Twitter data integrated into the Developer Portal social block. For more information, see [Integrating Twitter data into the social block](#).

### Procedure

---

1. On your social block, click the Settings icon , then click Edit Block.  
The Edit Social Block window is displayed, with the Edit Block tab open.
2. Configure your social block by configuring any of the following options:

Number of tiles to display

Configure the number of tiles that you want to display on the social block by entering a number in the Number of tiles to display field. The default number of tiles that are displayed on the social block is 8, and there is a limit of 100 tiles.

Display topics from all forums

If you want to display the topics from all forums, ensure that the Display topics from all forums check box is selected. If you want to specify which forum topics are displayed, clear the check box and select the appropriate forums.

Get tweets from

From the Get tweets from drop-down list, select whether you want to display Twitter data from users or a search term. If you select User, enter the account name for the user, in the adjacent field. If you select Search term, enter the specific term that will return the corresponding Twitter data, in the adjacent field.

Twitter cache duration

Enter the length of time, in minutes, that you want the Twitter data to remain in the cache of the Developer Portal. The default length of time is 60 minutes.

Types of tweets to display

Select the types of tweets that you want to display from the drop-down list. You can select to display tweets, or tweets and replies.

3. After you have configured the social block, click Save.  
Your social block is configured, and the configurations are implemented when you return to the home page.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Adding content in multiple languages

You can create content in multiple languages in the Developer Portal.

## Before you begin

---

You must have administrator or content author access to complete this task.

## About this task

---

You can provide custom pages in multiple languages to your APIs and Products to improve your customer experience and understanding. By default, multiple languages are enabled in the Developer Portal.

Note: In API Manager, translations for APIs and products must be done within a document. For more information, see [Using x-ibm-languages to create multilingual API and Product documentation](#).

## Procedure

---

1. Log in to the Developer Portal as an administrator or content author.
2. If the administrator dashboard is not displayed, click Manage to display it.
3. On the administrator dashboard, click Content.
4. If you are creating a new page to be translated, click +Add content.
  - a. Click Basic page, then select type, for example **Basic page**.
  - b. Enter a title for your custom page in the Title field.
  - c. Enter your information in the Body field.
  - d. Click Save.
  - e. Click Translate.
  - f. Click Add for the language you want to translate.
  - g. Provide the language content.
  - h. Click Save (this translation).
5. If you are translating an existing page, find the page that you want to update in the list.
  - a. Click Translate from the drop-down list for the page.
  - b. Click Add for the language you want to translate.
  - c. Provide the language content.
  - d. Click Save (this translation).

## Results

---

You successfully created a translated version of your content.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Adding custom pages to APIs and Products

After you create a custom page in the Developer Portal, you can add a link to the new page to any APIs and Products that exist in the Developer Portal.

## Before you begin

---

You must have administrator or content author access to complete this task.

You must have an API or Product to add the custom page to.

## About this task

---

You can add custom pages to your APIs and Products to provide further information on their use and value.

For example, you can create a custom documentation page on the implementation of an API in a specific circumstance, and add this custom documentation page to the API.

## Procedure

---

1. Log in to the Developer Portal as an administrator or content author.
2. If the administrator dashboard is not displayed, click Manage to display it.
3. On the administrator dashboard, click Content, then click +Add content.
4. Click Basic page.

The Create Basic page window is displayed.
5. Enter a title for your custom page in the Title field.
6. Enter your information of interest in the Body field.
7. If you want to add the custom page to a specific Product, enter the Product name in the Link to one or more specific Products field. As you type into this field, a list of available Products is displayed for you to select. You can add more Products by clicking Add another item. If you want to add the custom page to all Products, select the Link to all Products check box.
8. If you want to add the custom page to a specific API, select the APIs tab, and then enter the API name in the Link to one or more specific APIs field. As you type into this field, a list of available APIs is displayed for you to select. You can add more APIs by clicking Add another item. If you want to add the custom page to all APIs,

- select the Link to all APIs check box.
- 9. Optional: Configure the additional settings of the custom page to your specification.
- 10. Click Save.

---

## Results

Your custom page is created and linked to the APIs or Products that you have specified. You can edit the page after it is created, and update the APIs and Products that it is linked to, by clicking Edit for the custom page.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Adding new frequently asked questions

You can add new FAQs to the Developer Portal.

---

### Before you begin

You must have administrator or content author access to complete this task.

---

### About this task

To add new FAQs, you create a new FAQ node and add questions and answers to that node. Each FAQ node represents an FAQ topic, and each topic can contain multiple questions and answers.

---

### Procedure

To add new FAQs, complete the following steps:

1. Log in to the Developer Portal as an administrator.
2. If the administrator dashboard is not displayed, click Manage to display it.
3. Click Content in the administrator dashboard.
4. Click +Add content.
5. Click FAQ.
  - The Create FAQ page displays.
6. Provide a Title for the new FAQ topic.
7. Enter the question in the Question field, and enter the answer in the Answer field.
8. Optional: If you have more content for this FAQ topic, click Add another item and complete the Question and Answer fields. Repeat this step as required.
9. Click Save to save your new FAQ topic.
  - Your new FAQ topic is displayed in the Support section of the Developer Portal.

---

## Results

You successfully added new FAQs to the Developer Portal.

---

### What to do next

You can edit the current content of FAQs by clicking Content in the administrator dashboard, finding the FAQ content that you want to edit, and clicking Edit against that FAQ.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Applying an image to an API or Product

You can apply an image to an API or a Product in the Developer Portal.

---

### Before you begin

You must have administrator or content author access to complete this task.

---

### Procedure

To add an image to an API or Product, complete the following steps:

1. If the administrator dashboard is not displayed, click Manage to display it.

2. Click Content in the administrator dashboard.
3. Click Edit next to the API or Product that you want to edit.
4. Under the Image heading, click Choose File to select an image.
5. Click Save and keep published, to publish the updated content, or select Save and unpublish if you want to publish the updated content later.  
You have added a new picture to the selected API or Product.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Attaching a documentation file to APIs

You can attach a file to APIs in the Developer Portal, and display them as documentation attachments. You can attach multiple files to APIs.

### Before you begin

---

You must have administrator or content author access to complete this task.

### About this task

---

You can attach only one file at a time. The default file upload size limit applies to the files that you want to attach, and you can attach up to 10 files to an API by default.

**Note:** You can change the default limit for the number of files that you want to attach.

An administrator can configure the types of file that are uploaded, and the number of files that a user can upload.

The following file types can be uploaded:

- txt doc pdf
- xls ppt pptx
- docx xlsx rtf
- odt ods odp md json
- yaml tgz tar zip

### Procedure

---

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Content in the administrator dashboard.
3. Click Edit next to the API you want to attach the file to.
4. In the Documentation section, click Browse and identify the file that you want to upload, then click Open.
5. Click Upload, then click Save.
6. Optional: Clear the Display checkbox for the file if you want to upload and attach the file to the API, but not show it in the Developer Portal.
7. Optional: Enter a description for your file in the Description field. This description can be used as the label of the link to the file.
8. Optional: If you uploaded multiple files, you can use the drag handle next to the file name to rearrange them.

### Results

---

You successfully attached a documentation file to your API.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Configuring blogs

You can post new blog entries in the Developer Portal, and configure them to suit your requirements. You can also turn blogs off.

### Before you begin

---

You must have administrator or content author access to complete this task.

### Procedure

---

To post a new blog entry, complete the following steps:

- If the administrator dashboard is not displayed, click Manage to display it.
- Click Content in the administrator dashboard.
- Click Add content.
- Click Blog post.
- Fill in the Title and Body fields.
- Click Save and keep published, to publish the updated content, or select Save and unpublish if you want to publish the updated content later.

You have posted a new blog entry.

To configure a blog post, complete the following steps:

- If the administrator dashboard is not displayed, click Manage to display it.
- Click Content in the administrator dashboard.
- Click Edit next to the blog post that you want to configure.
- You can configure the selected blog from this view.
- Click Save and keep published, to publish the updated content, or select Save and unpublish if you want to publish the updated content later. You have configured the selected blog post.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Configuring the taxonomy menu block

To display your tag hierarchy in the Developer Portal, you must configure the taxonomy menu block.

### Before you begin

---

You must have administrator or content author access to complete this task.

### About this task

---

Along with controlling how your tag hierarchy is displayed through configuring your taxonomy menu block, you can configure options for the taxonomy tree. The following options can be configured for your taxonomy menu block:

- Vocabulary
- Parent option
- Depth
- Node options and content
- Region settings
- Visibility settings

Important: The taxonomy block will appear after configuration only if there are tags for it to display.

### Procedure

---

1. In the Administrator dashboard, click Structure > Blocks.
2. Click configure for the Taxonomy Menu Block (Tags) block.
3. Configure the options that are available for your taxonomy menu block.
4. When you have configured your taxonomy menu block, click Save block.  
You have configured your taxonomy menu block, and your tag hierarchy is displayed based on your configurations.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Customizing the URL alias for a specific API or Product page

You can customize the URL of an API or Product page from the default alias that they are assigned.

### Before you begin

---

You must have administrator or content author access to complete this task.

### About this task

---

Creating a custom URL alias is useful if you want to make the URL relevant to the API or Product page.

### Procedure

---

1. If the administrator dashboard is not displayed, click Manage to display it.
2. On the administrator dashboard, click Content.
3. Identify the API or Product page that you want to customize the URL alias for, and click Edit.
4. Expand URL path settings.
5. In the URL alias text field, enter the custom URL alias that you want to assign your API or Product page.

- Note: URL aliases must all be unique.
6. Click Save and keep published, to publish the updated content, or select Save and unpublish if you want to publish the updated content later.

---

## Results

You have applied a custom URL alias for your specified API or Product page, and it is displayed in the URL of your browser when the API or Product page is selected.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Embedding multimedia in site content

You can embed multimedia elements in site content in the Developer Portal.

---

### Before you begin

You must have administrator or content author access to complete this task.

---

### Procedure

To embed multimedia in site content, complete the following steps:

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Content in the administrator dashboard.
3. Under the TITLE heading, click the title of the required content.
4. Click the Edit tab.
5. Use the Insert Media Embed icon  in the WYSIWYG editor to embed multimedia in the content.  
Note: The Insert Media Embed icon is available only if you have selected Full HTML mode.
6. Click Save and keep published to publish the new page immediately, or select Save and unpublish if you want to publish the page later.  
You have embedded multimedia in the selected site content.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Linking from one piece of site content to another

You can link from one piece of site content to another in the Developer Portal.

---

### Before you begin

You must have administrator or content author access to complete this task.

---

### Procedure

To link from one piece of site content to another, complete the following steps:

1. Click Content in the administrator dashboard.
2. Under the TITLE heading, click the title of the required content.
3. Select the Edit tab.
4. Use the Link to content icon  in the WYSIWYG editor.
5. Click Save.  
You have linked the selected site content to another site content element.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Linking to social media sites

You can link to social media sites from the Developer Portal. You can configure where and how these links are displayed and which sites you want to link to.

## Before you begin

---

You must have administrator access to complete this task.

## Procedure

---

1. Click Structure in the administrator dashboard.
2. Click Blocks.
3. Under the Disabled heading, locate the Follow site block.
4. Select the location for your social media block from the drop-down list for Follow Site in the REGION column.  
The Follow Site block will appear under the heading that corresponds to the region you selected in the REGION drop-down list.
5. Required: Click Save blocks before you begin configuring your new block.
6. Click configure for the Follow Site block.
7. In the Block title field, type the name of your block.
8. Under the Default block title heading, select one of the following leading text options for your block using the radio buttons for each option:
  - "Follow *your.portal.site* on"
  - "Follow me on"
  - "Follow us on"
9. Use the User pages check box to decide whether you want your block to display on your user's profile pages.
10. Use the Alignment and Icon Style drop-down lists to adjust the appearance of your block.
11. Click Save block.
12. Click Configuration in the administrator dashboard.
13. Under the WEB SERVICES heading, click Follow.
14. Type the URL under the URL heading for each of the social media sites you want your users to access. The following is an example of a link to the @ibmapiconnect twitter handle:  

```
https://twitter.com/ibmapiconnect
```
15. Click Submit.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Managing tags in the Developer Portal

These instructions show you how to add new tags to your taxonomy, and how to manage the tag hierarchy in the Developer Portal. You can use tags to classify your Developer Portal content.

## Before you begin

---

You must have administrator or content author access to complete this task.

## Procedure

---

To manage your tags, complete the following steps

1. If the administrator dashboard is not displayed, click Manage to display it.
  2. Click Structure > Taxonomy > Tags in the administrator dashboard.  
The List window for Tags is displayed.
  3. You can add new terms, delete, and reorganize terms from this view.
    - a. To add a new term, click Add term, define the new term, then click Save.
    - b. To delete a term, select Delete from the OPERATIONS menu next to the term that you want to delete. Then click Delete to confirm.
    - c. To reorganize terms, ensure that the row weights are hidden by clicking Hide row weights if necessary, then use the drag-and-drop handles to manage the tag hierarchy. Terms can be dragged up and down in the list, and they can also be dragged to the right or left to organize a parent grouping hierarchy. Then click Save.
- [Tagging APIs based on their lifecycle phase](#)  
In the Developer Portal, you can have APIs automatically tagged with their lifecycle phase; realized, identified, or specified.

## Related tasks

---

- [Editing tags for a specific item](#)

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Tagging APIs based on their lifecycle phase

In the Developer Portal, you can have APIs automatically tagged with their lifecycle phase; realized, identified, or specified.

---

## Before you begin

You must have administrator or content author access to complete this task.

---

## About this task

APIs are tagged in the API Manager with a lifecycle phase as follows:

- Realized (default) - The API is in the implementation phase.
- Identified - The API is in the early conceptual phase and is neither fully designed nor implemented.
- Specified - The API has been fully designed and passed an internal milestone, but has not yet been implemented.

You can configure the Developer Portal to tag APIs with their lifecycle phase automatically.

---

## Procedure

Tagging APIs with their phase is disabled by default. To enable the function:

1. If the administrator dashboard is not displayed, click Manage to display it.
2. On the administrator dashboard, click Configuration.
3. In the SYSTEM section, click IBM API Connect.
4. Select Automatically tag APIs with their phase, and then click Save configuration.

---

## What to do next

You can manage the tag hierarchy of your APIs. For more information, see [Managing tags in the Developer Portal](#).

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Posting a poll

You can post a poll in the Developer Portal.

---

## Before you begin

You must have administrator or content author access to complete this task.

---

## Procedure

To post a poll, complete the following steps:

1. Click Content in the administrator dashboard.
2. Click Add content.
3. Click Poll.
4. Enter the poll question in the Poll question field.
5. Under the Choice heading, add answers to the available fields as choices.
6. From the Poll duration drop-down menu, select a time limit for the poll.
7. Click Save.

You have posted a poll.

---

## What to do next

See [Editing sample content](#) to learn how to add a links to your poll to sample content.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Adding images to site content

You can add .jpg, .png and .gif images to your site content in the Developer Portal.

---

## Before you begin

You must have administrator or content author access to complete this task.

## Procedure

---

To upload images for use in site content, complete the following steps:

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Content in the administrator dashboard.
3. Under the TITLE heading, click the title of the required content.
4. Click the EDIT tab.
5. Use the Image icon  in the WYSIWYG editor to add an image.
6. Click Save and keep published to publish the new page immediately, or select Save and unpublish if you want to publish the page later.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Configuring and restricting content in the Developer Portal

You can configure and restrict certain content elements in the Developer Portal.

To learn how to configure and restrict content in the Developer Portal, use the following topic links:

- [Creating content types](#)  
Content types define default fields for editors to add content on your Developer Portal site and are the building blocks for authoring content. You can control which content types are available
- [Configuring documentation upload limitations](#)  
You can attach documentation to an API by uploading it in the Developer Portal. You can configure the API content type to place limitations on the uploaded documentation.
- [Configuring image upload limitations](#)  
You can attach an image file to an API by uploading it in the Developer Portal. You can configure the API content type to place limitations on the uploaded image files.
- [Configuring the appearance of ratings in the Developer Portal](#)  
You can configure the appearance of ratings in the Developer Portal.
- [Customizing the privacy policy statement](#)  
You can define and customize a privacy policy statement that sets out the privacy conditions of your Developer Portal site. The privacy policy can be linked to from the cookie compliance banner.
- [Customizing the terms of use statement](#)  
You can define and customize a terms of use statement that sets out the terms and conditions that your users must accept to use your Developer Portal site.
- [Editing a site comment](#)  
You can edit site comments in the Developer Portal.
- [Editing sample content](#)  
You can edit sample content, such as basic pages, in the Developer Portal.
- [Editing tags for a specific item](#)  
You can edit tags for a specific item in the Developer Portal.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Creating content types

Content types define default fields for editors to add content on your Developer Portal site and are the building blocks for authoring content. You can control which content types are available

## Before you begin

---

You must have administrator access to complete this task.

## About this task

---

After you create your content type, it is added to the following list of default content types that are present in the Developer Portal:

- API
- Application
- Article
- Basic page
- Blog post
- Book page
- Consumer organization
- Forum topic
- Product

The content type that you create, and the default content types, can be edited and configured further to your specifications.

## Procedure

---

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Structure in the administrator dashboard.
3. Click Content types.
4. Click +Add content type.
5. Enter a name for your content type in the Name field.
6. Optional: Enter the text that you want to appear on the Add new content page, in the Description field.
7. Enter a title field label for your content type in the Title field label field.
8. Optional: Configure any of the following options for your content type:
  - Submission form settings
  - Publishing options
  - Language settings
  - Display settings
  - Menu settings
9. After you have configured your content type to your specifications, click Save and manage fields.  
You have created a new content type.

## What to do next

---

You can add fields to your new content type; see [Adding fields to content types](#).

- [Adding fields to content types](#)  
Fields can be added to content types in the Developer Portal for customization, and to add functionality.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Adding fields to content types

Fields can be added to content types in the Developer Portal for customization, and to add functionality.

## Before you begin

---

You must have administrator access to complete this task.

## About this task

---

You can specify the type of data that a field can store, and the form element to edit the data with. The type of form element that is available is dependent on the type of data that your field stores.

**Note:** You can specify the number of values that a field can store, including an unlimited amount. You can configure the value after the field is created. Reducing the number of values that can be stored after the field is created might lead to data loss.

## Procedure

---

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Structure in the administrator dashboard.
3. Click Content types, and identify the content type that you want to add a field to.
4. Click Manage fields for the content type, then click Add field.
5. Select a field type or select an existing field to reuse, then enter a label for your field in the Label field.  
The label that you specify for your field is displayed in the UI.
6. Optional: If you want to edit the machine name that is automatically created based on your label, click Edit and enter the new name.  
You cannot change the machine name after the field is created.
7. Click Save and continue.
8. Modify the field type specific settings as required, then click Save field settings.  
You have added a field to your content type.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Configuring documentation upload limitations

You can attach documentation to an API by uploading it in the Developer Portal. You can configure the API content type to place limitations on the uploaded documentation.

## Before you begin

---

You must have administrator access to complete this task.

## About this task

---

The set of configurable limitations that you can place on uploading documentation is different to the set of limitations that you can place on uploading images.

The file size limit that is applied when you upload documentation is also different to the limit that is applied when you upload images.

## Procedure

---

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Structure in the administrator dashboard.
3. Click Content types.
4. For the API content type, click Manage fields.
5. For the Documentation field, click Edit.
6. Configure the type of files that are allowed to be uploaded in the Allowed file extensions field.
7. Enter the file size upload limit in the Maximum upload size field.  
The default size is 10MB, while the maximum upload size possible is 64MB.
8. Click Save settings.  
You have configured the documentation upload limitations.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Configuring image upload limitations

You can attach an image file to an API by uploading it in the Developer Portal. You can configure the API content type to place limitations on the uploaded image files.

## Before you begin

---

You must have administrator access to complete this task.

## Procedure

---

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Structure in the administrator dashboard.
3. Click Content types.
4. For the API content type, click Manage fields.
5. For the Image field, click Edit.
6. Configure the type of image files that are allowed to be uploaded in the Allowed file extensions field.
7. Specify the maximum and minimum allowed image sizes in the Maximum image resolution and Minimum image resolution fields.
8. Enter the file size upload limit in the Maximum upload size field.  
The default size is 2MB, while the maximum upload size possible is 64MB.
9. Click Save settings.  
You have configured the image upload limitations.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Configuring the appearance of ratings in the Developer Portal

You can configure the appearance of ratings in the Developer Portal.

## Before you begin

---

You must have administrator access to complete this task.

## About this task

---

You can configure the appearance of ratings for only the following content types in the Developer Portal:

- APIs
- Applications
- Products

Note: The Applications and Products content types rating functionality is set to hidden by default.

## Procedure

---

These following steps describe how to customize the rating on a selected API, Application, or Product. To ensure that the configured rating is also displayed in the list view of APIs, Applications, or Products, then you must repeat these steps on the Teaser tab in the Manage Display window:

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Structure in the administrator dashboard.
3. Click Content types.
4. Select Manage display from the list in OPERATIONS column, next to the required content type.
5. Select the style of the Rating field from the list in the FORMAT column.
6. Optional: Click the Settings icon  this icon to refine the display configuration further, then click Update.
7. Click Save. You have configured the appearance of the ratings feature for the required content type.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Customizing the privacy policy statement

You can define and customize a privacy policy statement that sets out the privacy conditions of your Developer Portal site. The privacy policy can be linked to from the cookie compliance banner.

### Before you begin

---

You must have administrator access to complete this task.

## Procedure

---

To define or customize a privacy policy, complete the following steps:

1. Log in to the Developer Portal as an administrator.
2. If the administrator dashboard is not displayed, click Manage to display it.
3. Click Content, then enter `privacy` into the title search filter, and click Filter.  
The Privacy Policy content item is displayed in the list of content.
4. Click Edit next to the Privacy Policy content item.
5. Update the content as required. For example, you can complete the following tasks:
  - a. Edit the text of the privacy policy statement.
  - b. Set the display settings.
  - c. Link the content to Products and APIs.
  - d. Enter an explanation of the changes that have been made to the privacy policy since the last version.
6. Click Save to save your changes.

## Results

---

The privacy policy statement is successfully updated.

### What to do next

---

You can set your cookie compliance banner to link to your updated privacy policy. For more information, see [Enabling a cookie compliance banner](#).

### Related tasks

---

---

---

## Customizing the terms of use statement

You can define and customize a terms of use statement that sets out the terms and conditions that your users must accept to use your Developer Portal site.

## Before you begin

---

You must have administrator access to complete this task.

## Procedure

---

To define or customize a terms of use statement, complete the following steps:

1. Log in to the Developer Portal as an administrator.
2. If the administrator dashboard is not displayed, click Manage to display it.
3. Click Content, then enter `terms` into the title search filter, and click Filter.  
The Terms of use content item is displayed in the list of content.
4. Click Edit next to the Terms of use content item.
5. Update the content as required. For example, you can complete the following tasks:
  - a. Edit the text of the terms of use statement.
  - b. Set the display settings.
  - c. Link the content to Products and APIs.
  - d. Enter an explanation of the changes that have been made to the terms of use since the last version.
6. Click Save to save your changes.

## Results

---

The terms of use statement is successfully updated.

## What to do next

---

You can force new users to accept the terms and conditions on the Developer Portal. For more information, see [Forcing new users to accept terms and conditions](#).

## Related tasks

---

---

## Editing a site comment

You can edit site comments in the Developer Portal.

## Before you begin

---

You must have administrator or content author access to complete this task.

## Procedure

---

To edit a site comment, complete the following steps:

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Content in the administrator dashboard.
3. Click the Comments tab.
4. In the OPERATIONS column, click Edit alongside the comment that you want to edit.
5. Edit the content of the comment as required.
6. Click Save.  
You have edited the selected comment.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Editing sample content

You can edit sample content, such as basic pages, in the Developer Portal.

## Before you begin

---

You must have administrator or content author access to complete this task.

## Procedure

---

To edit sample content, complete the following steps:

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Content in the administrator dashboard.
3. In the OPERATIONS column, click Edit alongside the content item that you want to edit.
4. Edit the sample content of the selected element as required.
5. Click Save and keep published, to publish the updated content, or select Save and unpublish if you want to publish the updated content later.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Editing tags for a specific item

You can edit tags for a specific item in the Developer Portal.

## Before you begin

---

You must have administrator or content author access to complete this task.

You must have some tags that are available to apply to your content; see [Managing tags in the Developer Portal](#).

## Procedure

---

To edit tags for a specific item, complete the following steps:

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Content in the administrator dashboard.
3. In the list of content items, click Edit alongside the content item that you want to update.
4. In the Tags section, select the required tag.
5. To add another tag, click Add another item, then select the required tag.
6. If you want to publish the updated content, ensure the Published check box is selected. Deselect the check box if you want to publish the updated content later.
7. Click Save.

## Deleting a site comment

You can delete site comments in the Developer Portal.

### Before you begin

---

You must have administrator or content author access to complete this task.

### Procedure

---

To delete a site comment, complete the following steps

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Content in the administrator dashboard.
3. Click the Comments tab.
4. From the UPDATE OPTIONS list, select Delete the selected comments.
5. Select the comments that you want to delete, then click Update.  
The confirmation screen displays.
6. Click Delete comments.  
You have deleted the selected comments.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Deleting blocks

You can delete blocks in the Developer Portal.

### Before you begin

---

You must have administrator access to complete this task.

### Procedure

---

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Structure in the administrator dashboard.
3. Click Pages.
4. In the OPERATIONS column, find the welcome page row and select Edit from the drop-down list.
5. Expand Panels, then click Content.
6. In the OPERATIONS column, find the block that you want to delete and select Delete for the drop-down list.
7. Click Delete to confirm, then click Update and save.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Disabling blogs

You can disable blogs on your Developer Portal.

### Before you begin

---

You must have administrator access to complete this task.

Before any changes are made, **Blogs** show as an option on the front page like this:

## Procedure

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Structure > Menus from the administrator dashboard.
3. In the OPERATIONS column, click Edit menu for **Main navigation**.
4. Clear Enabled for the **Blogs Menu link**, then click Save.

**Title \***

Main navigation Machine name: main

**Administrative summary**

Site section links

**Menu language**

English ▼

| MENU LINK      | ENABLED                             | OPERATIONS |
|----------------|-------------------------------------|------------|
| ⊕ Home         | <input checked="" type="checkbox"/> | Edit ▼     |
| ⊕ API Products | <input checked="" type="checkbox"/> | Edit ▼     |
| ⊕ Apps         | <input checked="" type="checkbox"/> | Edit ▼     |
| ⊕ Blogs        | <input type="checkbox"/>            | Edit       |
| ⊕ Forums       | <input checked="" type="checkbox"/> | Edit ▼     |
| ⊕ Support      | <input checked="" type="checkbox"/> | Edit       |

Save

## Results

You removed the **Blogs** option from the front page. The options on the front page of your Developer Portal now look like this:

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details. For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Deleting forums from the front page

You can delete the help information on forums from the front page of your Developer Portal.

## Before you begin

You must have administrator access to complete this task.

Before any changes are made, the front page help bar looks like this:

## Procedure

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Structure in the administrator dashboard.
3. Click Block layout > Custom block library.
4. In Block description, enter `Get help`, then click Apply.

|                                       |                                      |
|---------------------------------------|--------------------------------------|
| Block description                     | Block type                           |
| <input type="text" value="Get help"/> | <input type="text" value="- Any -"/> |

Apply

| BLOCK DESCRIPTION | BLOCK TYPE  | UPDATED            | OPERATIONS |
|-------------------|-------------|--------------------|------------|
| Get Help [en]     | Basic block | 05/07/2020 - 19:52 | Edit       |

5. In the OPERATIONS column, click Edit for `Get Help`.
6. In the **Body** section, delete the forum information, then click Save.

## Results

You removed the forum information from the front page of your Developer Portal and the front page now looks like this:

The screenshot shows a dark-themed navigation bar with three main sections:

- Getting Help:** "Be sure to check out these extra help resources." Below it is a link "Create an Account" with a right-pointing arrow.
- Get Started:** "Get started with our APIs by creating an account and exploring the documentation to find what's right for you." Below it is a link "Email us" with a right-pointing arrow.
- Contact Us:** "Can't find the answer to your question? Need more help? Have some feedback? Let us know!" Below it is a link "Email us" with a right-pointing arrow.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details. For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Turning comments for specific content types on or off in the Developer Portal

You can turn the comments for specific content types on or off in the Developer Portal.

### Before you begin

You must have administrator access to complete this task.

## Procedure

To turn comments for specific content types on or off in the Developer Portal, complete the following steps:

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Structure in the administrator dashboard.
3. Click Content types.
4. In the OPERATIONS column, click Manage fields for the required content type.
5. In the OPERATIONS column, click Edit for the Comments field.

Note:

- If there is no Comments field, you can enable commenting for the selected content type by adding one as follows:
    - Click Add field.
    - From the Add a new field list, select Comments.
    - Enter a field label, then click Save and continue.
    - Select the required comment type, then click Save field settings.
  - You can completely disable commenting for the selected content type, and permanently remove all current comments, by selecting Delete.
6. Select the required option in the DEFAULT VALUE section.
    - a. To allow commenting, select Open.
    - b. To keep existing comments but disallow further commenting, select Closed.
    - c. To hide all comments, select Hidden.
  7. When done, click Save settings.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details. For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Turning comments off for an individual item

You can turn off comments for individual items within a content type.

## Before you begin

---

Users with edit permission for the selected content type can perform this task.

## Procedure

---

To turn off comments for a single item, complete the following steps:

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Content in the administrator dashboard.
3. In the OPERATIONS column, click Edit for the required content item.
4. Click Comment settings in the side pane.
5. Select Closed to turn comments off for the selected item.
6. Click Save.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Turning off ratings for specific content types in the Developer Portal

You can turn off ratings for specific content types in the Developer Portal by hiding the ratings field.

## Before you begin

---

You must have administrator access to complete this task.

## Procedure

---

To turn off ratings for specific content types in the Developer Portal, complete the following steps:

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Structure in the administrator dashboard.
3. Click Content types.
4. In the OPERATIONS column for the required content type, select Manage fields from the drop-down list.
5. Click on the Manage form display tab. In the FIELD list, click on Rating and drag and drop it into the Disabled, then click Save.
6. Click on the Manage display tab. In the FIELD list, click on Rating and drag and drop it into the Disabled, then click Save.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Turning the ability to tag specific content types off in the Developer Portal

You can turn the ability to tag specific content types on or off in the Developer Portal.

## Before you begin

---

You must have administrator access to complete this task.

## Procedure

---

To turn the ability to tag specific content types on or off in the Developer Portal, complete the following steps:

1. Click Structure in the administrator dashboard.
2. Click Content types.
3. Click Manage fields next to the required content type.
4. From the Tags field, click Edit.
5. Click Delete, then confirm the Delete as the action cannot be undone.  
You have turned the ability to tag specific content types off.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Structure

Control the layout of the Developer Portal, such as configuring the front page, adding and changing blocks, and displaying Products and APIs in categories.

To learn how to control the layout of the content on your Developer Portal site, use the following topic links.

- [Configuring the front page](#)  
You can configure the Developer Portal front page.
- [Adding a menu](#)  
You can add a menu to the Developer Portal, and define the items that are included in the menu.
- [Adding and changing the blocks displayed on Developer Portal pages](#)  
You can add new blocks, and modify the existing blocks that are displayed on Developer Portal pages.
- [Changing the front page banner block](#)  
You can change the front page banner content and image that is displayed on the home page when a user first logs in to the Developer Portal.
- [Changing the front page Featured Content block](#)  
You can display featured Products or APIs on the front page of your Developer Portal by configuring the Featured Content block.
- [Changing the items in the main menu](#)  
You can change the items in the main menu that is displayed on all pages in the Developer Portal.
- [Changing the ratings display](#)  
You can change the appearance of the content ratings in the Developer Portal.
- [Displaying APIs and Products in categories](#)  
You can create taxonomies in the Developer Portal, which dictate the categorization of APIs and Products, and how they are displayed. The taxonomies that you define can be used by API developers to categorize APIs and Products in YAML files.
- [Implementing an image carousel](#)  
You can customize your Developer Portal home page to display images in a carousel. The image carousel provides your Developer Portal home page with a continuous slide show that is customized to your specifications.
- [Making your application's image public](#)  
You might want to display your application's image in an oauth authentication page to reassure customers that they are authenticating the correct application in the Developer Portal. That authentication uses a URL to the image that is stored on the Developer Portal. However, by default, those images are private unless you are logged in, which doesn't work if you want to display it in an oauth page. The solution is for the admin to change the `application_image` field to use public instead of private.
- [Providing navigation by tag hierarchy](#)  
You can provide the ability for users in the Developer Portal to navigate by using tag hierarchy.
- [Using the Views module in the Developer Portal](#)  
By using the Views module, you can fetch content from your Developer Portal site, and present it to users in different formats such as lists, graphs, and tables.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Configuring the front page

You can configure the Developer Portal front page.

---

## Before you begin

You must have administrator access to complete this task.

---

## About this task

Create a customized welcome page for your users. Note that blocks that are placed on the front page of the Developer Portal are visible to all users, regardless of whether the blocks have access restrictions placed on them. The visibility of blocks to all users also extends to the Featured Content block.

---

## Procedure

To configure the front page, complete the following steps:

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Structure, then click Pages.
3. Alongside the welcome entry, click Edit.
4. Use the options provided to configure the front page.  
Here you can edit the page information, access, and configuration of the welcome page.
5. Click Update and save to save your changes.

---

## What to do next

You can create a custom page. For more information, see [Creating custom pages](#).

- [Disabling blogs](#)  
You can disable blogs on your Developer Portal.
- [Deleting forums from the front page](#)  
You can delete the help information on forums from the front page of your Developer Portal.

## Related tasks

- [Changing the front page banner block](#)
- [Changing the front page Featured Content block](#)

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

## Disabling blogs

You can disable blogs on your Developer Portal.

## Before you begin

You must have administrator access to complete this task.

Before any changes are made, **Blogs** show as an option on the front page like this:

## Procedure

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Structure > Menus from the administrator dashboard.
3. In the OPERATIONS column, click Edit menu for **Main navigation**.
4. Clear Enabled for the **Blogs Menu link**, then click Save.

**Title \***

Machine name: main

### Administrative summary

### Menu language

| MENU LINK    | ENABLED                             | OPERATIONS                          |
|--------------|-------------------------------------|-------------------------------------|
| Home         | <input checked="" type="checkbox"/> | <input type="button" value="Edit"/> |
| API Products | <input checked="" type="checkbox"/> | <input type="button" value="Edit"/> |
| Apps         | <input checked="" type="checkbox"/> | <input type="button" value="Edit"/> |
| Blogs        | <input type="checkbox"/>            | <input type="button" value="Edit"/> |
| Forums       | <input checked="" type="checkbox"/> | <input type="button" value="Edit"/> |
| Support      | <input checked="" type="checkbox"/> | <input type="button" value="Edit"/> |

## Results

You removed the **Blogs** option from the front page. The options on the front page of your Developer Portal now look like this:

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Deleting forums from the front page

You can delete the help information on forums from the front page of your Developer Portal.

### Before you begin

You must have administrator access to complete this task.

Before any changes are made, the front page help bar looks like this:

### Procedure

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Structure in the administrator dashboard.
3. Click Block layout, Custom block library.
4. In Block description, enter Get help, then click Apply.

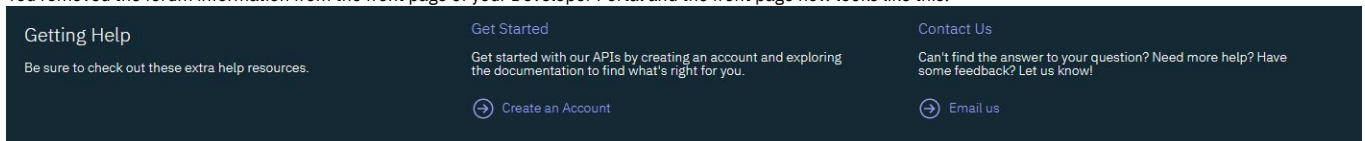

Block description:  Block type:

| BLOCK DESCRIPTION             | BLOCK TYPE  | UPDATED            | OPERATIONS                          |
|-------------------------------|-------------|--------------------|-------------------------------------|
| <a href="#">Get Help [en]</a> | Basic block | 05/07/2020 – 19:52 | <input type="button" value="Edit"/> |

5. In the OPERATIONS column, click Edit for **Get Help**.
6. In the **Body** section, delete the forum information, then click Save.

### Results

You removed the forum information from the front page of your Developer Portal and the front page now looks like this:

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Adding a menu

You can add a menu to the Developer Portal, and define the items that are included in the menu.

### Before you begin

You must have administrator access to complete this task.

### Procedure

To add a menu, complete the following steps:

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Structure, Menus.
3. Click Add menu, provide a title, and an optional summary and menu language, and click Save.
4. To add items to your menu, click Add link, and configure the menu link details that you require.
5. Click Save to save your changes.  
A new block for your menu is created automatically, and your menu is now in the **Menus** list.

## What to do next

You can use block configuration options to control which pages your menu is displayed on, and where it is positioned. You can use your menu with, or instead of, other menus available within the site. For more information, see [Changing the blocks displayed on Developer Portal pages](#).

You can also update an existing menu, or change your menu. For more information, see [Changing the items in the main menu](#).

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Adding and changing the blocks displayed on Developer Portal pages

You can add new blocks, and modify the existing blocks that are displayed on Developer Portal pages.

### Before you begin

You must have administrator access to complete this task.

### About this task

Blocks are boxes of content that are rendered into an area, or region, of a page. The content can be custom HTML, Github Markdown, or plain text, and you can specify the appearance, shape, size, position, and also configure which pages a block appears on by editing its visibility settings. You can also modify an existing block to change its appearance, shape, size, position, and visibility.

- [Add a new block](#)
- [Edit the content of an existing block](#)
- [Modify the layout or visibility of an existing block](#)

### Procedure

To add a new basic block, complete the following steps.

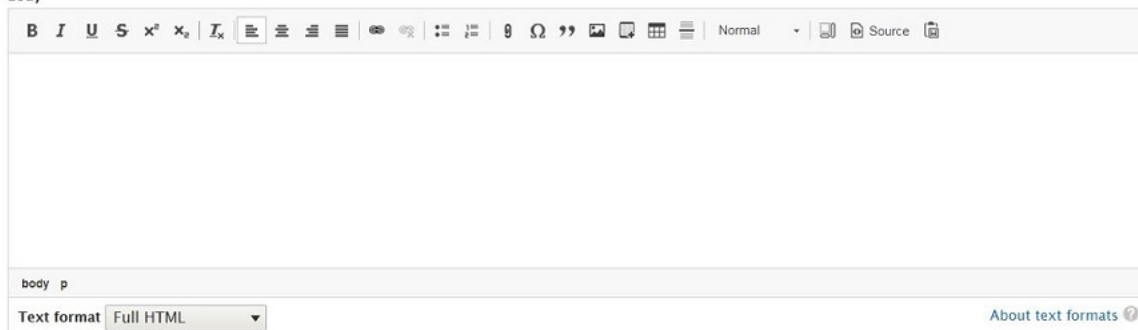

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Structure, then click Block layout.  
All of the blocks that are in the system are displayed by theme. From the Block layout page you can assign blocks to a region, and control the order of the blocks within the region. Blocks are positioned on a per-theme basis, so if you enable more than one theme on your site, you can place blocks differently for each theme.
3. Click Place block, Add custom block.  
The Add custom block page is displayed.
4. Complete the Block description field.
5. Enter the content that you require for your block into the Body section.

You can set the text format to Full HTML, Basic HTML, Restricted HTML, or Github Markdown. You can use the edit icons at the top of the Body section to configure your content. Click the Source icon  to enter code source, such as HTML.

Block description \*

A brief description of your block.

Body

The screenshot shows the 'Body' section of a block configuration page. It features a rich text editor toolbar with various icons for bold, italic, underline, strikethrough, bulleted list, numbered list, link, unlink, and other text formatting options. The toolbar also includes a 'Normal' dropdown menu and a 'Source' icon. Below the toolbar is a large text area for entering content. At the bottom of the section, there is a 'Text format' dropdown menu currently set to 'Full HTML' and a link for 'About text formats'.

6. Click Save.  
The new custom block is saved and the Configure block page is displayed.
7. Complete the block Title field.
8. In the Visibility section, specify how you want the block to be displayed.  
You can specify the content types, configure the language settings, restrict the block to show only on pages that display specific content types, set which pages the block is displayed on, and restrict which user roles the block is visible to.

#### Visibility

|  |   |
|--|---|
| <b>Content type</b>                    | <b>When the user has the following roles</b><br><input type="checkbox"/> Anonymous user<br><input type="checkbox"/> Superuser<br><input type="checkbox"/> Authenticated user<br><input type="checkbox"/> Forum Moderator<br><input type="checkbox"/> Content Author<br><input type="checkbox"/> Administrator |
| <b>Language</b><br>Not restricted      |   |
| <b>Content types</b><br>Not restricted |   |
| <b>Pages</b><br>Not restricted         |   |
| <b>Roles</b><br>Not restricted         |   |

9. In the Region section, select the region where the block should be displayed.
10. Click Save block.

The new custom block is added to your Developer Portal site.

To edit the content of an existing block, from the Block layout page complete the following steps.

11. Click the Custom block library tab (or select Structure > Block layout > Custom block library from the administrator dashboard).
12. Click Edit alongside the required block.
13. Change the block description and body content as required.
14. Click Save to save your changes.

To modify the layout or visibility settings of an existing block, from the Block layout page complete the following steps.

15. To change the region in which a block is positioned, select the required Region from the drop-down list next to the required block.
16. To change the vertical sort-order of a block within a region, drag the block to the required position.
17. To edit the visibility settings of an existing block, click Configure from the Operations drop-down menu next to the required block.
18. To enable or disable an existing block, select Enable or Disable from the Operations drop-down menu next to the required block.
19. Click Save blocks to save your changes.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Changing the front page banner block

You can change the front page banner content and image that is displayed on the home page when a user first logs in to the Developer Portal.

### Before you begin

You must have administrator or content author access to complete this task.

### About this task

You can change the front page banner by editing the Welcome Banner block in the custom block library.

### Procedure

To change the front page banner block, complete the following steps.

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Structure > Block layout.
3. Select the Custom block library tab.
4. Click edit against the Welcome Banner block entry.  
The Edit Basic block Welcome Banner page is displayed.
5. Edit the Body section with the content and image that you require.  
You can set the text format to Full HTML, Basic HTML, Restricted HTML, or Github Markdown. You can use the edit icons at the top of the Body section to configure your content. Click the Source icon  to view and edit the code source, such as HTML.
6. Configure the language and translation settings as required.
7. Click Save to save your changes.

### Results

You successfully updated the front page banner block.

### Related tasks

- [Configuring the front page](#)

- [Adding and changing the blocks displayed on Developer Portal pages](#)

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

---

## Changing the front page Featured Content block

You can display featured Products or APIs on the front page of your Developer Portal by configuring the Featured Content block.

### Before you begin

You must have administrator access to complete this task.

### About this task

You can configure the Featured Content block on the front page of your Developer Portal. By default this block displays a list of the most recently created Products, but you can configure the block to display Products or APIs, and select how the featured content is chosen.

### Procedure

1. Log in to the Developer Portal as an administrator.
2. If the administrator dashboard is not displayed, click Manage to display it.
3. Click Structure > Pages.
4. Click Edit against the welcome page.  
The edit menu for the Welcome page is displayed.
5. Select Panels > Content from the left navigation column, and then click Edit against the Featured Content block.  
The Edit block page for the Featured Content block is displayed.

The screenshot shows the 'Edit block' configuration page for the Featured Content block. The page has a dark header with the title 'Edit block' and a close button. Below the header, there is a paragraph of instructions: 'Configure the node selection settings for this Featured Content block. For each node the block will display its image, title and summary. If no summary is present then a truncated form of the description field will be used instead. To modify the content shown for a node either Edit that node in the portal or edit the YAML document for that node in the API Manager. Note that the node selection is per user, and so depending on the visibility settings, different users may see different nodes.'

The configuration form includes the following sections:

- Block description:** 'Featured Content block'
- Title \*:** A text input field containing 'Featured Content'. Below it is a checkbox labeled 'Display title' which is unchecked.
- Node type \*:** A dropdown menu set to 'Product'. Below it is the text 'Feature APIs or Products?'.
- Number of tiles to display \*:** A spinner control set to '3'. Below it is the text 'How many tiles should be shown?'.
- Node selection algorithm \*:** A dropdown menu set to 'Most recently created'. Below it is the text 'Select how the featured content should be chosen. For example, based on creation or modification time, name, or random.'
- Custom nodes:** An empty text input field. Below it is the text 'Manually specify the nodes to feature. ',' separated. (This field is only used if using 'Custom' node selection.)'
- Region \*:** A dropdown menu set to 'Content'.
- Update block:** A blue button at the bottom of the form.

6. Configure the Feature Content block as required.  
You can choose to display the title or not, select whether to use Products or APIs, for your node type. You can choose how many tiles to display, and select which algorithm is used to select the node. If you start typing in the **Custom nodes** field, you can choose from the options you are given.
7. Click Update block, then Update and save, to save your changes.

### Results

You successfully configured the Featured Content block on the front page of your Developer Portal.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Changing the items in the main menu

You can change the items in the main menu that is displayed on all pages in the Developer Portal.

## Before you begin

You must have administrator access to complete this task.

## About this task

The following screen capture shows an example of a main menu:

However, you can add new menu items, remove items, and change the item order.

## Procedure

To change the items in the main menu, complete the following steps:

1. Log in to the Developer Portal as an administrator.
2. If the administrator dashboard is not displayed, click Manage to display it.
3. Click Structure > Menus > Main navigation.

[Home](#) > [Administration](#) > [Structure](#) > [Menus](#)

[+ Add link](#)

**Title \***  
 Machine name: main

**Administrative summary**

**Menu language**

| MENU LINK                      | ENABLED                             | OPERATIONS             |
|--------------------------------|-------------------------------------|------------------------|
| <a href="#">+ Home</a>         | <input checked="" type="checkbox"/> | <a href="#">Edit</a> ▾ |
| <a href="#">+ API Products</a> | <input checked="" type="checkbox"/> | <a href="#">Edit</a> ▾ |
| <a href="#">+ Apps</a>         | <input checked="" type="checkbox"/> | <a href="#">Edit</a> ▾ |
| <a href="#">+ Blogs</a>        | <input checked="" type="checkbox"/> | <a href="#">Edit</a>   |
| <a href="#">+ Forums</a>       | <input checked="" type="checkbox"/> | <a href="#">Edit</a> ▾ |
| <a href="#">+ Support</a>      | <input checked="" type="checkbox"/> | <a href="#">Edit</a>   |

[Save](#)

4. Use the options provided to change the menu items.
5. Click Save to save your changes.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Changing the ratings display

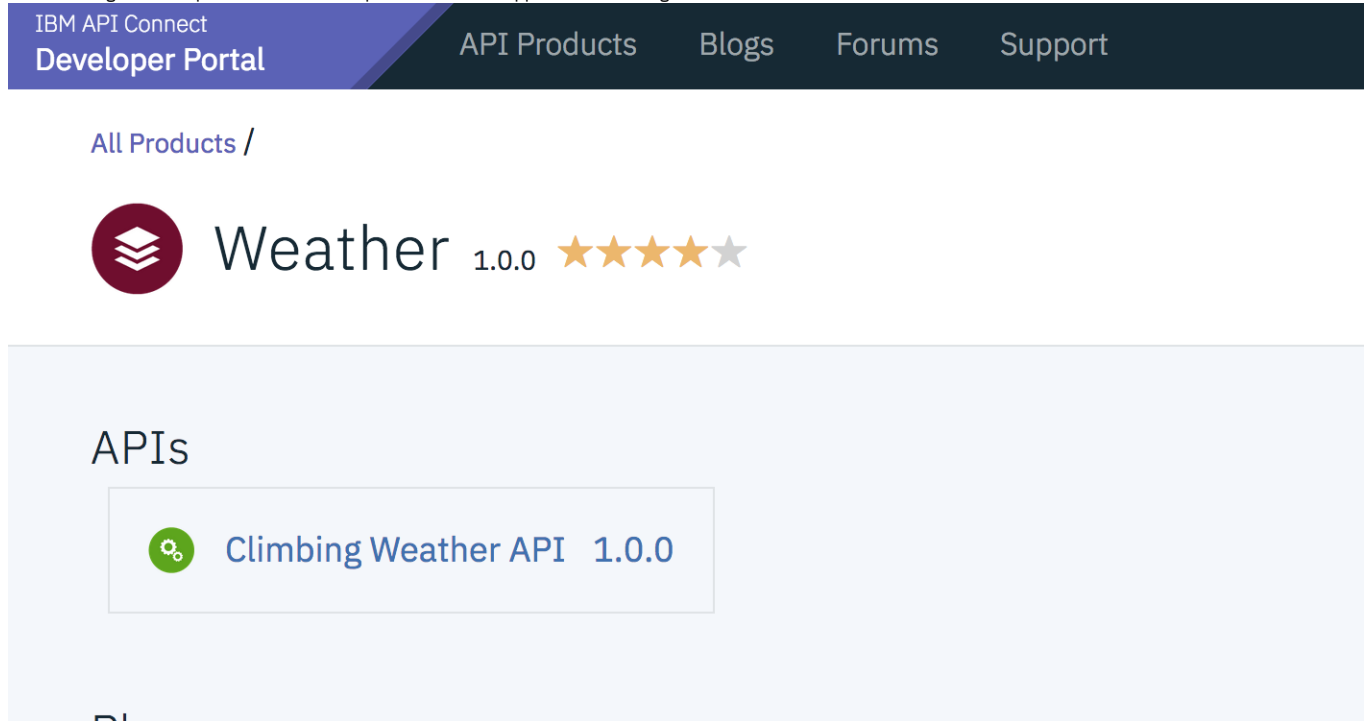

You can change the appearance of the content ratings in the Developer Portal.

## Before you begin

You must have administrator access to complete this task.

## About this task

The following screen capture shows an example of the default appearance of ratings:

You can change this display if you want to.

## Procedure

1. Log in to the Developer Portal as an administrator.
2. If the administrator dashboard is not displayed, click Manage to display it.
3. Click Structure > Content types.
4. Click the Manage fields drop-down against the content type you want to change, for example **Product**.
5. Click Edit on the **Rating** row. Then, select the Field settings tab.

These settings apply to the *Rating* field everywhere it is used.

**Vote type \***

Normal vote ▾

**Vote plugin \***

Fivestar rating ▾

**Allowed number of values**

Limited ▾ 5

**Save field settings**

6. Change the style settings as required and click Save field settings.  
Here is an example of an alternative Ratings style:

[All Products /](#)

Weather 1.0.0

good

## APIs

Climbing Weather API 1.0.0

## Results

You successfully changed the ratings display for a content type in your Developer Portal.

Note: There are different view modes, and the settings would need to be changed for each view mode for each content type.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Displaying APIs and Products in categories

You can create taxonomies in the Developer Portal, which dictate the categorization of APIs and Products, and how they are displayed. The taxonomies that you define can be used by API developers to categorize APIs and Products in YAML files.

You might want to create taxonomies to control which set of APIs and products can and cannot be used in the Developer Portal.

By default, all taxonomies must be created in the Developer Portal. For more information, see [Managing tags in the Developer Portal](#).

After you create your taxonomies for your APIs and Products, API developers can assign content to those taxonomies manually in the Developer Portal, or by using categories in YAML files.

However, if you create categories for your APIs and Products in the API Manager or API Manager UI, you can have your APIs and Products that are displayed in those categories in the Developer Portal. For more information on how to create categories for your APIs and Products in the API Manager or API Manager UI, see [Organizing your APIs and Products into categories](#). For information on how to have your APIs and Products that are displayed in those categories in the Developer Portal, see [Enabling dynamic category creation](#).

You can add more Developer Portal taxonomies to the categories that are defined in the API Manager or API Manager UI.

- [Enabling dynamic category creation](#)

You can display APIs and Products in pre-defined categories in the Developer Portal. You can define the categories that the APIs and Products are displayed in, in the API Manager or API Manager UI.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Enabling dynamic category creation

You can display APIs and Products in pre-defined categories in the Developer Portal. You can define the categories that the APIs and Products are displayed in, in the API Manager or API Manager UI.

## Before you begin

You must have administrator access to complete this task.

Your APIs and Products must be categorized in the API Manager or API Manager UI, and they must be published. For more information, see [Organizing your APIs and Products into categories](#).

## About this task

---

By organizing your APIs and Products into categories, you can provide a hierarchical display for your APIs and Products in the Developer Portal.

Note: Organizing APIs and Products into a hierarchical view in the API Manager UI is different from tagging in the Developer Portal.

The categories that are defined in the API Manager or API Manager UI can be overridden by creating taxonomies in the Developer Portal. For more information, see [Displaying APIs and Products in categories](#).

## Procedure

---

1. To enable the Developer Portal to display the categories for your APIs and Products:
  - a. On the administrator dashboard, click Configuration > System > IBM API Connect.
  - b. In the Categories section, select the Create taxonomies for categories if they do not already exist check box.
  - c. Click Save configuration.
2. To enable the Developer Portal to display the change to the categories you made in step 1, you must republish your APIs and products.

## Results

---

You enabled the Developer Portal to display the categories that you defined for your APIs and Products. You can see the categories that you defined, including the number of APIs and Products that are in each category, by selecting your APIs and Products in the Developer Portal.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Implementing an image carousel

You can customize your Developer Portal home page to display images in a carousel. The image carousel provides your Developer Portal home page with a continuous slide show that is customized to your specifications.

## Before you begin

---

You must have administrator access to complete this task.

## About this task

---

By implementing an image carousel, you can replace the default welcome banner or any previously set images.

## Procedure

---

1. Create a content type of Image for your carousel.
  - a. Click Structure > Content types > Add content type.
  - b. Enter the name of your content type in the Name field.  
For example, *Slide show picture*.
  - c. Optional: Specify the description of your content type in the Description field.  
For example, *A picture to display in the slideshow*.
  - d. Click Save and manage fields for your newly created content type.
  - e. Click Add field.
  - f. Select Image for Add a new field, and enter a label for your field.  
For example, *slide image*.
  - g. Click Save and continue.  
The Field settings page for your new field is displayed.
  - h. In the DEFAULT IMAGE section, click Choose file to assign the image that you want as your default image for your slide show if no other images are found.
  - i. Optional: Complete the Alternative text and Title fields.
  - j. Click Save field settings.
  - k. In the Manage fields tab for your newly created content type of *Slide show picture*, delete the `Body` field by clicking Delete on the OPERATIONS drop-down menu. Click Delete again to confirm.
2. Upload the images that you want to appear in your carousel.
  - a. Click Content > Add content, then click the content type that you added in step 1.
  - b. Enter a title for your image in the Title field.  
For example, if you had an image of a lighthouse, you can label the content as *Lighthouse*.
  - c. Click Choose file under Slide image and select an image for your slide show. Complete the Alternative text field with some text to use when the image cannot be loaded.
  - d. Click Save.
  - e. Repeat sub-steps 2.a to 2.d until you are satisfied with the content of the slides for your carousel.
3. Create a view for your carousel.
  - a. Click Structure > Views > Add new view.
  - b. Complete View name.

- For example, Slide show.
- c. Select the Create a block check box in the BLOCK SETTINGS section.
  - d. Select Slick Carousel for the display format.
  - e. Enter the number of slides you have for your carousel in the Items per block field, then click Save and edit.  
The Edit page for your slide show view is displayed.
  - f. Click the title of the view and enter <none> into the text field. Click Apply.
  - g. In the FIELDS section click Add, select the check box for slide image, and click Add and configure fields.
  - h. Ensure the check box for Create a label is not selected, and click Apply.
  - i. In the FIELDS section, click Content: Title, Remove.
  - j. In the FORMAT section, click Settings for Slick Carousel, and then set Skin Main to Default.
  - k. Scroll down to the CAPTION FIELDS section, and select the Content: slide image and Override main optionset check boxes.
  - l. In the OVERRIDABLE OPTIONS section, select the Autoplay, Dots, and Draggable check boxes.
  - m. Click Apply.
  - n. In the FILTER CRITERIA section, click Content: Published, Remove.
  - o. Click Save to save the Slide show view.
4. Configure your home page to host the carousel.
    - a. Click Structure, then click Pages.
    - b. Click edit for the welcome page, then click content in the Panels section.
    - c. To remove the current welcome banner, click the down-arrow under the OPERATIONS column for the Welcome Banner, and select Delete. Click Delete again to confirm.
    - d. To add your carousel, click Add new block and select the slide show view you created in step 3. Deselect Display title and click Add block.
    - e. Click Update and save.

---

## Results

Your Developer Portal front page now has a slide show carousel.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Making your application's image public

You might want to display your application's image in an oauth authentication page to reassure customers that they are authenticating the correct application in the Developer Portal. That authentication uses a URL to the image that is stored on the Developer Portal. However, by default, those images are private unless you are logged in, which doesn't work if you want to display it in an oauth page. The solution is for the admin to change the `application_image` field to use public instead of private.

---

## Before you begin

You must have administrator access to complete this task.

---

## About this task

1. Log in to your Developer Portal as an administrator.
2. If the administrator dashboard isn't displayed, click Manage to display it.
3. Navigate to Structure, Content types, Application, Manage fields
4. Navigate to the Image label, then in the Edit drop down, select **storage settings**.
5. Click **Public files** for **Upload destination**.
6. Click **Save field settings**.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Providing navigation by tag hierarchy

You can provide the ability for users in the Developer Portal to navigate by using tag hierarchy.

---

## Before you begin

You must have administrator access to complete this task.

---

## About this task

The Categories block provides the ability to navigate by tag hierarchy. The Categories block is disabled by default, so you need to enable the block and then configure it to your requirements.

---

## Procedure

To provide navigation by tag hierarchy, complete the following steps:

1. Click Extend, in the filter box enter `Hierarchical Taxonomy Menu`.
2. Select **Hierarchical Taxonomy Menu**, then click Enable.
3. Click Structure\_>Block layout.

All of the blocks in the connect\_theme are displayed.

4. Scroll to the region that you want to add the block to, for example Collapse left, click Place block.
5. Find the **Hierarchical Taxonomy Menu** block in the list and click Place block.
6. Complete any configuration tasks that you require for the **Collapse left** block, including selecting the correct taxonomy to use.
7. Click Save block to save your changes.

You can add new blocks, and modify the existing blocks that are displayed on Developer Portal pages. For more information, see [Adding and changing the blocks displayed on Developer Portal pages](#).

---

## Using the Views module in the Developer Portal

By using the Views module, you can fetch content from your Developer Portal site, and present it to users in different formats such as lists, graphs, and tables.

The Views module is a powerful SQL query builder that can access almost all the information in your Developer Portal site database and display it in any format.

There are many uses cases for views, but the following list shows some of the common ones:

- You want to display some of the content differently, such as Products, APIs, and applications.
- You want to display a block with the five most recent posts of some kind.
- You want to change the way that articles are displayed.
- You want to provide an unread forum posts list.
- You want to provide a monthly archive of posts.

For information about how to create a view in the Developer Portal, see the following topic.

- [Creating views in the Developer Portal](#)  
You can create new views in the Developer Portal, such as content lists of Products, APIs, and applications, by using the Views module.
- [Configuring the search results view in the Developer Portal](#)  
You can configure the way that the search results are displayed in the Developer Portal.
- [Configuring the default number of items in a view list in the Developer Portal](#)  
You can configure the default number of items that are displayed in a view list in the Developer Portal.

---

## Related information

- [Views module in Drupal](#)

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Creating views in the Developer Portal

You can create new views in the Developer Portal, such as content lists of Products, APIs, and applications, by using the Views module.

---

## Before you begin

You must have administrator access to complete this task.

---

## About this task

Creating views in the Developer Portal enables you to control the presentation of specific content for users. For more information about views, see [Using the Views module in the Developer Portal](#).

---

## Procedure

To create a view, complete the following steps.

1. Log in to the Developer Portal as an administrator.
2. If the administrator dashboard is not displayed, click **Manage** to display it.
3. On the administrator dashboard, click **Structure > Views > Add new view**.  
The **Add view** page is displayed.
4. Complete the **View name** and, optionally, the **Description**.
5. Complete the **VIEW SETTINGS** section with details of what you want your view to show, and how you want it to be sorted.  
For example, to create a view of APIs that are sorted by title, select **Show Content**, of type **API**, and sorted by **Title**.
6. Select whether to **Create a page**, **Create a block**, or both, for your view.  
A page is a full-screen page in the Developer Portal. Whereas a block would be a site block that you can then place on whatever pages you want to show a smaller view of the content, for example the 10 newest APIs.
7. Complete the options that you require for your view. For example, the display format, the number of items per page or block, whether to include a pager, whether to create a menu link, and whether to include an RSS feed.
8. Click **Save and edit**.  
Your new view opens in the **Edit** tab.
9. Refine your view further.  
Here you can further modify the display of your view or add new displays. More options include formatting of the view, what fields to include in a table or grid format, filtering and sorting criteria, add header or footer details, as well as advanced options around contextual filters, relationships, and behavior when there are no results to display. The **Edit** tab also includes a preview area, so you can check your view before publishing.
10. Click **Save** to make your changes permanent.  
When saved, your new view is visible in the **Structure > Views** pane.

---

## Results

You created a new view in the Developer Portal.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Configuring the search results view in the Developer Portal

You can configure the way that the search results are displayed in the Developer Portal.

---

### Before you begin

You must have administrator access to complete this task.

---

### About this task

In the Developer Portal, the search results are displayed as a view, and so you can control the presentation of this search content. For more information about views, see [Using the Views module in the Developer Portal](#).

---

### Procedure

To configure the search results view, complete the following steps.

1. Log in to the Developer Portal as an administrator.
2. If the administrator dashboard is not displayed, click **Manage** to display it.
3. On the administrator dashboard, click **Structure > Views**.  
The list of views is displayed.
4. Find the **Search content** view in the list, and click **Edit**.
5. Edit the **Search content** view settings as required.  
Here you can modify the display of the view or add new displays. For example, you can configure the formatting of the view, the filtering and sorting criteria, add header or footer details, as well as more advanced options around contextual filters, relationships, and behavior when there are no results to display. There is also a preview area so you can check the view before publishing.
6. Click **Save** to make your changes permanent.

---

## Results

You updated the view of the search results in the Developer Portal.

---

### What to do next

You can configure the search index and server that are used to generate the search results. For more information, see [Configuring search indexes and servers](#).

---

### Related information

- [Drupal Views module](#)

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Configuring the default number of items in a view list in the Developer Portal

You can configure the default number of items that are displayed in a view list in the Developer Portal.

### Before you begin

---

You must have administrator access to complete this task.

### About this task

---

In the Developer Portal, you can manage how many items in a list are shown for each page on a view. For more information about views, see [Using the Views module in the Developer Portal](#).

### Procedure

---

To configure the search results view, complete the following steps.

1. Log in to the Developer Portal as an administrator.
2. If the administrator dashboard is not displayed, click Manage to display it.
3. On the administrator dashboard, click Structure > Views.  
The list of views is displayed.
4. In the list, find the view name that you want to update, for example, Products, then click Edit.
5. Click Pager.
6. Select Display a specified number of items, click Apply.
7. Set the Items per page as required, click Apply.
8. Click Save to make your changes permanent.

### Results

---

You updated the default number of items in a view of the search results in the Developer Portal.

### What to do next

---

The Views module is a powerful SQL query builder that can access almost all the information in your Developer Portal site database and display it in any format. For more information, see [Using the Views module in the Developer Portal](#).

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Configuration

As an administrator, you can control multiple aspects of the Developer Portal configuration, including managing security and general configuration tasks.

To learn how to configure specific aspects of your Developer Portal site, use the following section links.

- [Configuring content moderation](#)  
By configuring content moderation, you can configure a review and approval process for content types in the Developer Portal. You can specify which roles can perform which actions by assigning them the appropriate permissions.
- [General configuration tasks](#)

---

## Configuring content moderation

By configuring content moderation, you can configure a review and approval process for content types in the Developer Portal. You can specify which roles can perform which actions by assigning them the appropriate permissions.

## Before you begin

An example use case for configuring content moderation would be for a professional documentation writer to review an APIs documentation before it is published on the Developer Portal. They might, for example, notify the API Developer of typographical errors, suggest improvements to operation descriptions, or attach an image file. Edits might then be made before the documentation was republished to the API and then published to the Developer Portal.

You must have a Developer Portal enabled, and you must have administrator access to complete this task.

## About this task

By using content moderation, you can configure the workflow of your Developer Portal site so that you can moderate content types, such as APIs and Products. However, you cannot moderate Consumer organizations or applications.

## Procedure

1. Log in to your Developer Portal as an administrator.
2. If the administrator dashboard isn't displayed, click Manage to display it.
3. Enable the required modules:
  - a. On the administrator dashboard, click Extend.
  - b. In the search bar enter **workflows**, then select the Workflows module and click Enable.
  - c. In the search bar enter **content moderation**, then select the Content Moderation module and click Enable.
4. Navigate to Configuration > Workflow > Workflows
5. Check that **Editorial** is listed as a workflow. If it isn't listed:
  - a. Click + **Add workflow**.

**Label \***

Machine name: editorial [\[Edit\]](#)

**Workflow type \***

Content moderation ▼

Save

- b. Enter **Editorial** as the label.
  - c. Select the workflow type **Content moderation**.
  - d. Click **Save**.
6. Set up the workflow:
    - a. Click **Edit** on the **Editorial** workflow.
    - b. Click the **Add a new state** link.

**Label \***

Machine name: editorial

▼ STATES

| STATE                              | OPERATIONS                            |
|------------------------------------|---------------------------------------|
| <input type="checkbox"/> Draft     | <input type="button" value="Edit"/>   |
| <input type="checkbox"/> Published | <input type="button" value="Edit"/>   |
| <input type="checkbox"/> Review    | <input type="button" value="Edit"/> ▼ |

[Add a new state](#)

- c. Enter the value **Review** in the **State label** field, leave the **Published** and **Default revision** check boxes cleared then click Save.

**State label \***

Review

Machine name: review [Edit]

 Published

When content reaches this state it should be published.

 Default revision

When content reaches this state it should be made the default revision; this is implied for published states.

**Save**

- d. Drag the **review** state to between the **Draft** and **Published** states then click 'Save'. If the drag handles are not visible, then click the **Hide row weights** link in the **STATES** section to make them appear.

**Label \***

Editorial

Machine name: editorial

▼ STATES

⚠ You have unsaved changes.

| STATE                              | OPERATIONS                          |
|------------------------------------|-------------------------------------|
| <input type="checkbox"/> Draft     | <input type="button" value="Edit"/> |
| <input type="checkbox"/> Review*   | <input type="button" value="Edit"/> |
| <input type="checkbox"/> Published | <input type="button" value="Edit"/> |

[Add a new state](#)

- e. Click the **Add a new transition** link.
- f. Enter the value **Review** in the **Transition Label** field, tick the **Draft** check box in the **From** section and click **Review** in the **To** section then click Save.
- g. Drag the **Review** transition to between the **Create New Draft** and **Publish** transitions, then click Save.
- h. Click the **Edit** operation on the **Create New Draft** transition.
- i. In the **From** check box list, untick **Published** and tick **Review** then click Save.
- j. Click the **Edit** operation on the **Publish** transition.
- k. In the **From** check box list, untick **Draft** and tick **Review** then click Save.
- l. Click **Select** for the **Content types** item in the **THIS WORKFLOW APPLIES TO** section.
- m. Select the **Product** content type then click Save.
7. Set up the permission schema for the workflow:
- Click **People**, **Roles**, **Add a new role**.
  - In the **Role Name** field, enter the value **Editor** then click Save.
  - Drag the **Editor** role to between the **Content Author** and **Administrator** roles then click Save.
  - Click the **Permissions** tab and scroll down to the **Content Moderation** permission section.
  - For the **EDITOR** role, select all the permissions in the **Content Moderation** section.
  - For the **CONTENT AUTHOR** role, select the permissions **Editorial workflow: Use Create New Draft transition**, **View any unpublished content**, and **View the latest version** then click Save permissions.
  - Ensure that the **EDITOR** and **CONTENT AUTHOR** roles have the permission **Use the administration toolbar**.
8. Assign the permissions to users in the portal. If you do not already have some registered users in your portal, create a new consumer organization and invite two new users to it.
- Click **People**.
  - Tick the check box next to one of the users in the list, but not the admin user, then from the **Action** drop-down select **Add the Content Author role to the selected user(s)** then click **Apply to selected items**.
  - Tick the check box next to another one of the users in the list, but not the admin user, then from the **Action** drop-down select **Add the Editor role to the selected user(s)** then click **Apply to selected items**.

## Results

You successfully configured content moderation on your Developer Portal. You can now use the API manager user interface to publish a product to the portal, and transition the product from draft to review state.

- [Editing, reviewing, and publishing moderated content](#)

If you have published content from API Manager UI to your Developer Portal or created content within the Developer Portal, you can edit and review the content through the Moderated content page before you publish it in the Developer Portal.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Editing, reviewing, and publishing moderated content

If you have published content from API Manager UI to your Developer Portal or created content within the Developer Portal, you can edit and review the content through the Moderated content page before you publish it in the Developer Portal.

### Before you begin

---

You must have administrator access to complete this task.

You must have content that is published to the Developer Portal from the API Manager UI.

Your role must have the necessary permissions that enable you to perform the tasks. For more information on assigning the necessary tasks, see [Configuring content moderation](#).

### About this task

---

In addition to editing content through the content moderation page, you can specify whether the content needs further review, or even publish the content if you have the permission.

### Procedure

---

1. Log in to your Developer Portal as an administrator.
2. If the administrator dashboard isn't displayed, click Manage to display it.
3. On the administrator dashboard, click Content.
4. Click the Moderated content tab.
5. If you have the necessary permissions to edit your content type, for example, you are a **Content author**:
  - a. Click the Title of the content type that you want to edit, then click the Edit.
  - b. Edit your content to your specification, then click Save.  
You are redirected to the **View** tab.
  - c. When you have finished editing your content type on the **edit** tab, ensure that the **Review** state is selected from the **Change to** drop down, then click Save.
6. If you have the necessary permissions to review and publish your content type, for example, you are a **Reviewer**:
  - a. On the administrator dashboard, click Content.  
The content page is displayed listing all content.
  - b. Click the Moderated content tab.
  - c. Click the Title of the content type that you want to review.
  - d. Optional: If the content that you are reviewing requires editing, click Edit, apply the changes to your content type, then click Save.  
You are redirected to the View tab.

### Results

---

You edited, reviewed, and published your draft content type.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## General configuration tasks

You can perform general configuration tasks in the Developer Portal as an administrator.

To learn how to configure specific aspects of your Developer Portal site, use the following topic links.

- [Adding a page load progress indicator](#)  
You can extend your Developer Portal site by adding a page load progress indicator. This option might be useful on servers that have a slow connection to the API Manager, or for customers that are using OIDC and have slow response times from their OIDC provider.
- [Adding custom fields to user records](#)  
You can add custom fields to user records in the Developer Portal.
- [Checking the site status report](#)  
You can check the site status report in the Developer Portal.

- [Clearing the server caches](#)  
You can clear the server caches from within the Developer Portal.
- [Configuring a proxy](#)  
You can configure the proxy settings in your Developer Portal.
- [Configuring cron to run scheduled tasks](#)  
You can configure cron to run scheduled tasks in the Developer Portal.
- [Configuring search indexes and servers](#)  
You can configure search indexes and servers in the Developer Portal by using the Search API module.
- [Configuring the date and time](#)  
You can configure the date and time in the Developer Portal.
- [Configuring the settings of a Consumer organization](#)  
You can configure the settings of your Consumer organization from within your Developer Portal.
- [Configuring the site default timezone](#)  
You can configure the site default timezone in the Developer Portal.
- [Configuring the site error handling](#)  
You can configure the site error handling in the Developer Portal.
- [Configuring which buttons are displayed in the WYSIWYG rich text editor](#)  
You can configure which buttons are displayed in the WYSIWYG rich text editor in the Developer Portal.
- [Configuring which languages are available](#)  
You can configure which languages are available in the Developer Portal.
- [Customizing user account settings](#)  
You can customize the user account options that are displayed to users when they register and use the Developer Portal.
- [Disabling languages](#)  
You can extend your Developer Portal site by managing which languages are available for use on the site.
- [Disabling test tool restrictions](#)  
The default OAuth provider contains security mechanisms that prevent the ability to obtain authorization tokens in the Developer Portal test tool when you use Implicit or Authorization Code grant types. If your OAuth provider allows those actions to function correctly from the test tool, you can disable this option.
- [Enabling a cookie compliance banner](#)  
You can add a cookie compliance banner to your Developer Portal site by configuring the EU Cookie Compliance module.
- [Enabling code languages for code snippets](#)  
You can specify the languages that code snippets for APIs can be displayed in.
- [Enabling code snippets for SOAP APIs](#)  
By default, code snippets are only shown for REST APIs. You can enable code snippets for SOAP APIs.
- [Forcing new users to accept terms and conditions](#)  
You can extend your Developer Portal site by forcing new users to accept the terms and conditions before they are able to create accounts.
- [Hiding the admin registry on the login form](#)  
You can hide the admin registry as an option on the login form. The use case for this option might be a public facing Developer Portal where admin access shouldn't be shown to the customer.
- [Hiding the certificate in the header for APIs secured with mutual TLS](#)  
You can hide the certificate in the header for APIs secured with mutual TLS. By default, the `x-client-certificate` header is shown in an API when mutual TLS is configured. You can choose to turn off this option in your Developer Portal.
- [Importing and exporting taxonomies](#)  
You can import and export taxonomies in the Developer Portal.
- [Restricting access by IP address](#)  
You can restrict access to a role or a user by IP address in the Developer Portal.
- [Restricting or preventing access from search engines](#)  
You can restrict or prevent access to your Developer Portal from search engines. You might want to control the access if you have a development or test site.
- [Toggling the site in and out of maintenance mode](#)  
You can put the Developer Portal site into maintenance mode for short periods of time. During maintenance mode, only the administrator can access the site; all other users who enter the site URL get a maintenance message set by the administrator.
- [Viewing available updates](#)  
You can view available updates in the Developer Portal.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Adding a page load progress indicator

You can extend your Developer Portal site by adding a page load progress indicator. This option might be useful on servers that have a slow connection to the API Manager, or for customers that are using OIDC and have slow response times from their OIDC provider.

### Before you begin

You must have administrator access to complete this task.

### Procedure

1. If the administrator dashboard is not displayed, click Manage to display it.
2. In the administrator dashboard, click Extend.  
The List tab for the Extend page opens, and the list of installed modules is displayed. The list shows all the modules that are installed. The enabled modules are displayed with a selected check box. The disabled modules are displayed without a selected check box.
3. Enter `page_load_progress` into the search filter.  
The **Page Load Progress** content item is displayed in the list of content.

- By default, the **Page Load Progress** module is enabled. However, if not, select the check box and click Enable. You have now enabled the default settings for the **Page Load Progress** module.
- To change the default settings for the module, navigate to Configuration > User interface > Page Load Progress.
- Decide which settings you want to change, for example, **Time to wait before locking the screen**, and click Save.
 

Note: Changing the settings does not apply to the OIDC buttons. If it is enabled, the OIDC buttons use the page load process indicator, but do not allow any configuration.
- To enable the permissions, navigate to People > Permissions.
- Scroll down to **Page Load Progress**, check the boxes for anonymous and authenticated for **Use Page Load Progress**.

| Page Load Progress            |                                     |                                     |                                     |                                     |                                     |                                     |
|-------------------------------|-------------------------------------|-------------------------------------|-------------------------------------|-------------------------------------|-------------------------------------|-------------------------------------|
| Administer Page Load Progress | <input type="checkbox"/>            | <input type="checkbox"/>            | <input type="checkbox"/>            | <input type="checkbox"/>            | <input type="checkbox"/>            | <input checked="" type="checkbox"/> |
| Use Page Load Progress        | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> |

- Click Save permissions.

## Results

You successfully enabled the **Page Load Progress**. Now, the page loading spinner is automatically added to the login and register forms for OIDC buttons.

## What to do next

You can customize the appearance of the modal page and spinner in CSS in a custom theme.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details. For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Adding custom fields to user records

You can add custom fields to user records in the Developer Portal.

## Before you begin

You must have administrator access to complete this task.

## About this task

Any data that is added to a custom field for user records will remain in the Developer Portal database.

## Procedure

- In the administrator dashboard, click Configuration > People > Account settings.
- Click the MANAGE FIELDS tab.
- Click Add field.
- Specify the type of data that your field can store by selecting the type from the Add a new field list.
- Enter a label for your field in the Label field.
- Optional: If you want to edit the machine name that is automatically created based on your label, click Edit and enter the new name.
- Click Save and continue.
- Configure any additional values for the new field then click Save field settings.
 

You have added a custom field to your user record.

## What to do next

You can configure the contents of your custom field depending on what type of data you specified it could store.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details. For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Checking the site status report

You can check the site status report in the Developer Portal.

## Before you begin

You must have administrator access to complete this task.

## Procedure

---

To check the site status report, complete the following steps:

1. Click Reports in the administrator dashboard.
2. Click Status report.
3. You can review information relating to the site status report from this view.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Clearing the server caches

You can clear the server caches from within the Developer Portal.

### Before you begin

---

You must have administrator access to complete this task.

## Procedure

---

1. In the administrator dashboard, click Configuration, then in the Development section, click Performance.
2. Click Clear all caches.

You have cleared the server caches, and a message will be displayed stating: Caches cleared.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Configuring a proxy

You can configure the proxy settings in your Developer Portal.

### Before you begin

---

You must have administrator access to complete this task.

### About this task

---

The Developer Portal communicates with the management server by way of the consumer and product APIs. For a Developer Portal that is deployed externally to the management server zone, and does not have access to the consumer and product APIs, a proxy can be used.

## Procedure

---

To configure a proxy to use for communicating with management server APIs, complete the following steps:

1. Log in to the Developer Portal as an administrator.
2. If the administrator dashboard is not displayed, click Manage to display it.
3. Click Configuration, > System > IBM API Connect in the administrator dashboard.
4. To configure a proxy, select **Enable Proxy Support**, and make the required changes.

**PROXY CONFIGURATION (EXPERIMENTAL)**

If a proxy is required to allow communication from the portal server to the consumer API.

Enable Proxy Support

**Proxy type**

CURLPROXY\_HTTP

Select what type of proxy to use, CURLPROXY\_HTTP is the default.

**Proxy URL**

Provide the URL of the proxy e.g. <http://proxyserver.domain.com:8080>.

**Proxy Authentication**

If the proxy requires authentication then provide the 'username:password'.

Save configuration

5. When your changes are complete, click Save configuration.

## Results

---

You successfully configured a proxy on your Developer Portal.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Configuring cron to run scheduled tasks

You can configure cron to run scheduled tasks in the Developer Portal.

### Before you begin

---

You must have administrator access to complete this task.

### Procedure

---

To configure cron to run scheduled tasks, complete the following steps:

1. Click Configuration in the administrator dashboard.
2. Under the SYSTEM heading, click Cron.
3. Use the drop-down list for the module you want to configure and select Edit.
4. From the Run cron every drop-down menu, select the frequency of cron runs for this module.
5. Click Save.

You have configured cron to run scheduled tasks.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Configuring search indexes and servers

You can configure search indexes and servers in the Developer Portal by using the Search API module.

### Before you begin

---

You must have administrator access to complete this task.

## About this task

---

The Search API module provides a generic framework for search capabilities within the Developer Portal, and you can customize the default database server and content index setup that is provided. By default, the search in the Developer Portal runs over the entire OpenAPI and WSDL documentation. It is not possible to restrict the search to specific sections of an Open API or WSDL document. The search can be configured to include any custom fields that were added to the Developer Portal, but it does not include any attached files.

The search results page is a view in the Developer Portal, and so it can also be configured. For more information, see [Configuring the search results view in the Developer Portal](#).

## Procedure

---

To configure the default database server and content index settings, complete the following steps.

1. Log in to the Developer Portal as an administrator.
2. If the administrator dashboard is not displayed, click **Manage** to display it.
3. Click **Configuration**, **Search** and **metadata**, **Search API** in the administrator dashboard.
4. To configure the server settings, click **Edit** against the Database Server and make the required changes. For example:
  - Server name; the displayed name for the server.
  - Description; a description of the server.
  - CONFIGURE DATABASE BACKEND; the minimum number of characters a word must consist of to be indexed, and whether to search on parts of a word. However, wildcard searching can make searches on large sites very slow.
  - AUTOCOMPLETE SETTINGS; how suggestions are computed when autocompletion is used.
5. To configure the index settings, click **Edit** against the Default content index and make the required changes. For example:
  - Index name; the displayed name for the index.
  - Data sources; the data sources of the items to be stored in the index.
  - CONFIGURE THE DATASOURCE; for each data source, set which bundles of content should be indexed, and in which languages.
  - Server; the server that the index should use.
  - Description; a description for the index.
  - INDEX OPTIONS; whether the index is read only, whether to index new or updated items immediately, and setting how many items to index when indexing items during a cron run.
6. When your changes are complete, click **Save**.  
The View page of the updated default database server or default content index is displayed.

## Results

---

You successfully configured the search indexes and servers in the Developer Portal.

## What to do next

---

You can configure how searches are displayed by editing the Search content view. For more information, see [Configuring the search results view in the Developer Portal](#).

## Related information

---

- [Search API module](#)

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Configuring the date and time

---

You can configure the date and time in the Developer Portal.

## Before you begin

---

You must have administrator access to complete this task.

## Procedure

---

To configure the date and time, complete the following steps:

1. If the administrator dashboard is not displayed, click **Manage** to display it.
2. Click **Configuration** in the administrator dashboard.
3. Under the **Regional** and language heading, click **Date and time formats**.
4. Click **Edit** for the format you want to change.
5. Change the settings of the format then click **Save format**.  
You have configured the date and time.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Configuring the settings of a Consumer organization

You can configure the settings of your Consumer organization from within your Developer Portal.

### About this task

---

The default settings allow users to delete their accounts and organizations, create more consumer organizations, rename their organization, and change the owner of their organization.

### Procedure

---

1. Log in to your Developer Portal as an administrator.
2. If the administrator dashboard isn't displayed, click Manage to display it.
3. Navigate to Configuration > System > IBM API Connect.
4. Look in the "CONSUMER ORGANIZATIONS" section.

**CONSUMER ORGANIZATIONS**

Allow users to delete their accounts  
If checked then users will be allowed to delete their accounts.

Allow users to create additional consumer organizations  
If checked then users will be allowed to create additional consumer organizations. Note that self service onboarding must also be enabled in API Manager catalog settings.

Allow users to rename their organization  
If checked then consumer organization Owner and Administrators will be able to rename their consumer organizations.

Allow users to change the owner of their organization  
If checked then consumer organization Owner and Administrators will be able to change the owner of their consumer organizations.

Allow users to delete their organizations  
If checked then Owner or Administrators users will be allowed to delete their consumer organizations.

5. Clear or set the options as needed, and then click Save configuration.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Configuring the site default timezone

You can configure the site default timezone in the Developer Portal.

### Before you begin

---

You must have administrator access to complete this task.

### Procedure

---

To configure which languages are available, complete the following steps:

1. Click Configuration in the administrator dashboard.
2. Under the REGIONAL AND LANGUAGE heading, click Regional settings.
3. From the Default Time Zone drop-down menu, select the default time zone.
4. Click Save configuration.  
You have configured the default time zone.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Configuring the site error handling

You can configure the site error handling in the Developer Portal.

## Before you begin

---

You must have administrator access to complete this task.

## Procedure

---

To configure the site error handling, complete the following steps:

1. Click Configuration in the administrator dashboard.
2. Under the DEVELOPMENT heading, click Logging and errors.
3. You can review and configure all information relating to site error handling from this view.  
Note: On a production system, set Logging and errors to **none**, to avoid any security issues.
4. Click Save configuration.  
You have configured the site error handling.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Configuring which buttons are displayed in the WYSIWYG rich text editor

You can configure which buttons are displayed in the WYSIWYG rich text editor in the Developer Portal.

## Before you begin

---

You must have administrator access to complete this task.

## Procedure

---

To configure which buttons are displayed in the WYSIWYG rich text editor, complete the following steps:

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Configuration, Content authoring, Text formats and editors.
3. Click Configure for the Full HTML profile.
4. In the **TOOLBAR CONFIGURATION** section, edit the buttons that you want to expose.
5. Click Save configuration.  
You have configured the editor buttons that are displayed in the WYSIWYG rich text editor.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Configuring which languages are available

You can configure which languages are available in the Developer Portal.

## Before you begin

---

You must have administrator access to complete this task.

## Procedure

---

To configure which languages are available, complete the following steps:

1. Click Configuration in the administrator dashboard.
2. Under the REGIONAL AND LANGUAGE heading, click Languages.
3. Under the DEFAULT heading, select the radio button for the language you want to set as default.
4. To add a new language, click +Add language. Use the drop-down menu to select the language you want to add.
5. Click Save configuration.  
You have configured the languages that are available.
6. You can also provide your own translations, for strings of the website that are not translated, from the User interface translation view, under Configuration, Regional and Language in the administrator dashboard.

## Results

---

You have configured the available languages for the Developer Portal.

Note: Multilingual API and Product documentation can be created by using an `x-ibm-languages` extension directly in the OpenAPI definition. For more information, see [Using x-ibm-languages to create multilingual API and Product documentation](#).

Note: IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Customizing user account settings

You can customize the user account options that are displayed to users when they register and use the Developer Portal.

### Before you begin

You must have administrator access to complete this task.

### About this task

You can change what fields users of the Developer Portal see when they register to use the site, when they log in, and when they view their user account profile. For instance, you can change the field order display, hide fields, and add custom fields.

As an example, the Consumer organization field is a required entry field when a user creates an account on the Developer Portal. However, you can configure this field to be hidden, in which case the field is automatically completed with a default entry of `firstname lastname` of the new user instead.

### Procedure

To customize the user account settings, complete the following steps.

1. Log in to the Developer Portal as an administrator.
2. If the administrator dashboard is not displayed, click Manage to display it.
3. Click Configuration > People > Account settings in the administrator dashboard.  
The Account settings page is displayed.
4. From the Settings tab you can edit the following options:
  - a. CONTACT SETTINGS; enable or disable the personal contact form for new users.
  - b. PASSWORD RESET TIMEOUT; set the timeout in seconds for one-time login links. This setting applies only to the admin user of the Developer Portal.
  - c. ANONYMOUS USERS; set the name to be used to indicate anonymous users.
  - d. ADMININISTRATOR ROLE; assign the administrator role that is automatically given new permissions whenever a new module is enabled. The default is Superuser.  
Note: The Superuser role has the highest level of permissions in the Developer Portal. This role bypasses all content access control, which means that users that have a Superuser role can see all of the site content. For more information, see [Working with roles in the Developer Portal](#).
  - e. LANGUAGE SETTINGS; enable or disable translation.
  - f. REGISTRATION AND CANCELLATION; enable or disable the password strength indicator, and set the action to take when a user account is canceled.
  - g. Notification email address; set the email address to use as the from address for all account notifications.
  - h. Emails; edit the emails that are sent when an account is blocked or canceled, or when a new password is requested.
  - i. Click Save configuration to save your updates.
5. Click the Manage fields tab to customize the fields that are available for storing user data.  
Here you can edit the settings for current fields, delete fields, and add new fields. Remember to save any updates that you make.
6. Click the Manage form display tab to configure how the user forms are displayed.
  - a. Click the Default form mode to configure how the form fields display when a user profile is being edited.
  - b. Click the Register form mode to configure how the form fields display when a new user creates an account.  
For each user form mode you can edit the field settings, enable and disable fields, and drag the fields to change their display order. You can also manage the form modes.  
For example, to hide the Consumer organization field when a new user creates an account, click the Register form mode, and drag the Consumer organization into the Disabled section.
  - c. Click Save to save your updates.
7. Click the Manage display tab to configure how fields are displayed on a user profile page.  
You can edit the field settings, enable and disable fields, and drag the fields to change their display order. You can also manage the display view modes. Remember to save any updates that you make.
8. Click the Translate account settings tab to configure the language options for the user account settings. Remember to save any updates that you make.

### Results

You successfully customized the user account settings in the Developer Portal.

# Disabling languages

You can extend your Developer Portal site by managing which languages are available for use on the site.

## Before you begin

You must have administrator access to complete this task.

## Procedure

1. If the administrator dashboard is not displayed, click Manage to display it.

To disable all languages apart from English.

2. Navigate to Configuration > Regional and language > Languages > Detection and selection.
3. Select the checkbox for the **Selected language** detection method, and deselect all other methods, then click Save settings.

### Interface text language detection

Order of language detection methods for interface text. If a translation of interface text is available in the detected language, it will be displayed.

| DETECTION METHOD               | DESCRIPTION                                    | ENABLED                             | OPERATIONS                |
|--------------------------------|--|-------------------------------------|---------------------------|
| + Account administration pages | Account administration pages language setting. | <input type="checkbox"/>            |                           |
| + URL                          | Language from the URL (Path prefix or domain). | <input type="checkbox"/>            | <a href="#">Configure</a> |
| + Session                      | Language from a request/session parameter.     | <input type="checkbox"/>            | <a href="#">Configure</a> |
| + User                         | Follow the user's language preference.         | <input type="checkbox"/>            |                           |
| + Browser                      | Language from the browser's language settings. | <input type="checkbox"/>            | <a href="#">Configure</a> |
| + Selected language            | Language based on a selected language.         | <input checked="" type="checkbox"/> | <a href="#">Configure</a> |

### Content language detection

Order of language detection methods for content. If a version of content is available in the detected language, it will be displayed.

Customize Content language detection to differ from Interface text language detection settings

[Save settings](#)

To disable one or more languages.

4. In the administrator dashboard, click Extend.  
The List tab for the Extend page opens, and the list of installed modules is displayed. The list shows all the modules that are installed. The enabled modules are displayed with a selected checkbox. The disabled modules are displayed without a selected checkbox.
5. Enter `disable language` into the search filter.  
The Disable Language content item is displayed in the list of content.
6. Select the checkbox for the **Disable Language** module, and click Enable.
7. Navigate to Configuration > Regional and language > Languages > Detection and selection.
8. Select the checkbox to enable URL, and click Save settings.

### Interface text language detection

Order of language detection methods for interface text. If a translation of interface text is available in the detected language, it will be displayed.

| DETECTION METHOD               | DESCRIPTION                                    | ENABLED                             | OPERATIONS                |
|--------------------------------|--|-------------------------------------|---------------------------|
| + Account administration pages | Account administration pages language setting. | <input type="checkbox"/>            |                           |
| + URL                          | Language from the URL (Path prefix or domain). | <input checked="" type="checkbox"/> | <a href="#">Configure</a> |

9. Navigate to Configuration > Regional and language > Languages.
10. Click Edit on the language that you want to disable.
11. Select the checkbox to **Disable language**, then click Save language.

**Edit language** ☆

Edit

Home » Administration » Configuration » Regional and language » Languages

**Language code**  
de

**Language name** \*

**Direction** \*

Left to right

Right to left

Direction that text in this language is presented.

**Disable language**  
This will remove the language from the language switcher and filter out the Simple XML sitemap

**Select language to which we redirect**

This option will redirect to the selected language when a user calls the disabled language

**Save language**

## Results

You successfully disabled your chosen language.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Disabling test tool restrictions

The default OAuth provider contains security mechanisms that prevent the ability to obtain authorization tokens in the Developer Portal test tool when you use Implicit or Authorization Code grant types. If your OAuth provider allows those actions to function correctly from the test tool, you can disable this option.

## Before you begin

You must have administrator access to complete this task.

## Procedure

1. If the administrator dashboard is not displayed, click Manage to display it.
2. In the administrator dashboard, click Configuration » System » IBM API Connect.
3. In the **CONFIGURATION** section, deselect the **Optimise OAuth experience in test tool** option

Optimise OAuth experience in test tool

If checked then certain OAuth flows (such as implicit or access code) which cannot be completed from the test tool for technical reasons are optimised to improve usability.

4. Click Save configuration.

## Results

You successfully disabled the **Optimise OAuth experience in test tool** option. You can now use the Developer Portal test tool to test an Implicit or Authorization Code grant type in an OAuth provider API, if your OAuth provider allows those actions to function correctly from the test tool.

## What to do next

You can enable the **Optimise OAuth experience in test tool** option by repeating the task but selecting the option and then clicking Save configuration.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Enabling a cookie compliance banner

You can add a cookie compliance banner to your Developer Portal site by configuring the EU Cookie Compliance module.

## Before you begin

---

You must have administrator access to complete this task.

## About this task

---

The EU Cookie Compliance module provides a customizable pop-up notification that informs visitors to your site that cookies are being used. The notification enables your site visitors to find out more about cookies, and to decide not to browse the site if they disagree with using cookies. You can also provide a link from your cookie compliance banner to an internal or external privacy policy. For more information about configuring an internal privacy policy, see [Customizing the privacy policy statement](#).

The EU Cookie Compliance module is enabled by default. The following instructions show you how to configure the notification.

## Procedure

---

1. Log in to the Developer Portal as an administrator.
2. If the administrator dashboard is not displayed, click Manage to display it.
3. Click Configuration > System > EU Cookie Compliance.  
The Settings tab of the EU Cookie Compliance page is displayed.
4. In the SETTINGS section select Enable banner, otherwise the notification does not display.
5. In the PRIVACY POLICY section, edit the Privacy policy link field to provide a link to your privacy policy or other page that explains cookies to your site visitors. The default link is `/privacy`, which links to the Privacy Policy content that is configured within the Developer Portal. For more information, see [Customizing the privacy policy statement](#).

External links should start with `http://` or `https://`. For example:

```
https://example.com/privacy
```

6. Configure the remaining options as required. For example, you can change the wording, and edit the display size and color.
7. Click Save configuration to save your updates.

## Results

---

You successfully enabled a cookie compliance banner on your Developer Portal site. New visitors to your site are now prompted to accept cookies.

## Related tasks

---

## Enabling code languages for code snippets

You can specify the languages that code snippets for APIs can be displayed in.

## Before you begin

---

You must have administrator access to complete this task.

## Procedure

---

1. On the administrator dashboard, click Configuration > System > IBM API Connect.
2. In the API Code Snippets section, select the check boxes for the languages that you want to make available for the code snippets to be displayed in.
3. Click Save configuration.  
The languages that you have enabled are displayed as options for your code snippets.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Enabling code snippets for SOAP APIs

By default, code snippets are only shown for REST APIs. You can enable code snippets for SOAP APIs.

## Before you begin

---

You must have administrator access to complete this task.

## About this task

---

Code snippets for SOAP APIs use raw HTTP, and do not use any SOAP libraries.

## Procedure

---

1. On the administrator dashboard, click Configuration, System, IBM API Connect.
2. In the API Code Snippets section, select the Display code snippets for SOAP APIs as well as REST APIs check box.
3. Click Save configuration.

The languages that you have enabled are displayed as options for your code snippets.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Forcing new users to accept terms and conditions

You can extend your Developer Portal site by forcing new users to accept the terms and conditions before they are able to create accounts.

## Before you begin

---

You must have administrator access to complete this task.

## Procedure

---

1. If the administrator dashboard is not displayed, click Manage to display it.
2. In the administrator dashboard, click Extend.  
The List tab for the Extend page opens, and the list of installed modules is displayed. The list shows all the modules that are installed. The enabled modules are displayed with a selected check box. The disabled modules are displayed without a selected check box.
3. Enter `terms of use` into the search filter.  
The Terms of use content item is displayed in the list of content.
4. Select the check box for the **Terms of use** module, and click Enable.
5. Navigate to Configuration, People, Terms of use.
6. Enter the name of the page that contains your site terms and conditions. If you type `terms`, the system automatically suggests the default **Terms of use (1)** page that is created by default.
7. Select the page that you require, and click Save.

## Results

---

You successfully enabled the **Terms of use** module. Now, when a user tries to create an account on your Developer Portal site, they must agree to the **Terms of use** as a part of the registration.

The image shows a registration form with the following elements:

- Consumer organization \***: A text input field containing "AppDev".
- Password \***: A password input field with a strength indicator below it. The indicator shows a yellow bar (Fair) and a grey bar (Weak).
- Password strength: Fair**: Text indicating the password strength.
- Confirm password \***: A text input field for confirming the password.
- Message box**: A green-bordered box containing the text "Your password meets the password policies required for this site".
- Terms of Use**: A section with a title and a paragraph of text. Below the text is a checkbox labeled "I agree with these terms \*".

## What to do next

You can edit the terms and conditions page. For more information, see [Customizing the terms of use statement](#). The terms are displayed when you create an account and also from the link in the site footer.

You can disable the use of terms and conditions during site registration by disabling the module.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details. For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Hiding the admin registry on the login form

You can hide the admin registry as an option on the login form. The use case for this option might be a public facing Developer Portal where admin access shouldn't be shown to the customer.

## Before you begin

You must have administrator access to complete this task.

## Procedure

1. If the administrator dashboard is not displayed, click Manage to display it.
2. On the administrator dashboard, click Configuration > System > IBM API Connect.
3. In the Configuration section, select the check box for **Hide the admin registry on the login form**.
4. Click Save configuration.  
The **Hide the admin registry on the login form**. configuration is saved.

## What to do next

The admin registry is no longer shown on the login form. However, it is still accessible directly. The user can navigate to `<site_url>/user/login?registry_url=/admin`.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Hiding the certificate in the header for APIs secured with mutual TLS

You can hide the certificate in the header for APIs secured with mutual TLS. By default, the `x-client-certificate` header is shown in an API when mutual TLS is configured. You can choose to turn off this option in your Developer Portal.

### Before you begin

The parameters for the example API showing the certificate.

Parameters

Header

|                      |   |
|----------------------|---|
| Accept               | application/json                        |
| optional             |   |
| Content-Type         | application/json                        |
| optional             |   |
| X-Client-Certificate | The TLS certificate of your application |
| Required             | string                                  |

Example

```
-----BEGIN CERTIFICATE-----xxxEXAMPLExxxxxxxxxEXAMPLExxxxxxxxxEXAMPLExxxxxxxxxEXAMPLExxx  
xxxxEXAMPLExxxxxxxxxEXAMPLExxxxxxxxxEXAMPLExxxxxxxxxEXAMPLExxxxxxxxxEXAMPLExxxxxxxxxEXAMPL  
ExxxxxxxxxEXAMPLExxxxxxxxxEXAMPLExxxxxxxxxEXAMPLExxxxxxxxxEXAMPLExxxxxxxxxEXAMPLExxxxxxxx  
xxEXAMPLExxxx-----END CERTIFICATE-----
```

You must have administrator access to complete this task.

### Procedure

1. If the administrator dashboard is not displayed, click Manage to display it.
2. On the administrator dashboard, click Configuration > System > IBM API Connect.
3. In the Configuration section, deselect the checkbox for **Show certificate in header for APIs secured with mutual TLS**.
4. Click Save configuration.  
The **Show certificate in header for APIs secured with mutual TLS** configuration is saved.  
The parameters for the example API now not showing the certificate:

Parameters

Header

|          |                  |
|----------|------------------|
| Accept   | Permitted values |
| optional |                  |
|          | application/json |

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Importing and exporting taxonomies

You can import and export taxonomies in the Developer Portal.

## Before you begin

You must have administrator access to complete this task.

## Procedure

1. Log in to the Developer Portal as an administrator.
2. If the administrator dashboard is not displayed, click **Manage** to display it.
3. In the administrator dashboard, click **Configuration** » **Content authoring** » **Term CSV Export/Import**.
4. Select **Term CSV Import**, or **Term CSV Export**.

For Term CSV Import

5. Enter your CSV input in the format given in the examples, and select the **Taxonomy** from the drop-down list.

The screenshot shows the 'CSV Term Import' configuration page. At the top, there are two tabs: 'Term CSV Import' (selected) and 'Term CSV Export'. Below the tabs is a breadcrumb trail: 'Home » Administration » Configuration » Content authoring'. The main section is titled 'Input' and contains a large empty text area for entering CSV data. Below the text area, there is a note: 'See CSV Export for an example.' followed by the instruction 'Enter in the form of:'. Two examples of CSV headers are provided: one with fields 'name, description, format, weight, parent\_name, [any\_additional\_fields]' and another with 'tid, uuid, name, description, format, weight, parent\_name[:parent\_name1;parent\_name2;...], [any\_additional\_fields]'. A note states that '[any\_additional\_fields]' are optional and stringified using 'http\_build\_query'. There is a checkbox labeled 'Preserve Vocabularies on existing terms.' which is unchecked. Below this is a 'Taxonomy' dropdown menu with 'forums' selected. At the bottom of the form is a 'Next' button.

6. Click **Next**.
7. Click **Import**.

For Term CSV Export

8. Select the **Taxonomy** from the drop-down list, and check any other options that you want.

The screenshot shows the 'CSV Term Export' configuration page. At the top, there are two tabs: 'Term CSV Import' and 'Term CSV Export' (selected). Below the tabs is a breadcrumb trail: 'Home » Administration » Configuration » Content authoring'. The main section is titled 'Taxonomy' and contains a dropdown menu with 'forums' selected. Below the dropdown are three checkboxes: 'Include Term Ids in export.', 'Include Term Headers in export.', and 'Include extra fields in export.', all of which are unchecked. A note states that fields are stringified using 'http\_build\_query'. At the bottom of the form is an 'Export' button.

9. Click **Export**.

## Results

You successfully imported or exported a taxonomy.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Restricting access by IP address

You can restrict access to a role or a user by IP address in the Developer Portal.

### Before you begin

---

You must have administrator access to complete this task.

### About this task

---

By restricting access to a role by IP address, that role is unavailable to users outside of the IP address ranges that you define. If a role restriction is triggered, the user's session is unaffected, but the restricted role is no longer available to the user. Role restriction affects only the availability of the restricted role to users. Role restrictions are available for all roles, except `anonymous user` and `authenticated user`.

By restricting login access of a user by IP address, the user is unable to log in outside of the IP address ranges that you define. You can also specify global IP address ranges, which apply to all users. IP restrictions are checked on every page load. If a user restriction is triggered by an attempt at logging in being denied, then the user is logged out and sent to the 'error page' that is specified by the site administrator.

Note: IP address ranges must be entered in CIDR notation that is separated with semi-colons and no trailing semi-colon. For more information on CIDR notation, see [CIDR format](#).

### Procedure

---

1. In the Developer Portal, click Configuration, > People, > Restrict by IP, then click **Restrict log in by IP**.
2. On the **Global restrictions** tab, enter the address of the page to which the user is redirected to if they are not allowed to log in, in the Login denied error page.
3. Select one of the following options:
  - To restrict access to a role by IP address, complete the following steps:
    - Click Restrict role by IP.
    - Decide which role you want to restrict, the roles that you can restrict include Administrator, Content Author, and Forum Moderator.
    - Enter the IP address range (in CIDR notation) that you do not want to restrict log in for in the field for that role, for example, Forum Moderator role IP range.
    - Click Save configuration.

## Restrict role by IP ☆

Save configuration

- To restrict login for all users, complete the following steps:
  - Click Restrict login by IP, then click **Global restrictions** tab.
  - Enter the global IP address ranges (in CIDR notation) in the Restrict global login to allowed IP range field.
  - Click Save configuration.
- 4. To remove an IP restriction, delete the value that is associated with the restriction, then click Save configuration.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Restricting or preventing access from search engines

You can restrict or prevent access to your Developer Portal from search engines. You might want to control the access if you have a development or test site.

### Before you begin

You must have administrator access to complete this task.

### About this task

You might have a development or test Developer Portal site on the internet, but do not want them to be indexed by Google, or other search engines, making them visible to your customers. Google explicitly advises not to use `robots.txt` as a blocking mechanism. A correct solution is to control access by using Metatag.

### Procedure

1. In the Developer Portal, click Configuration, Search and metadata, Metatag.
2. On the **Global restrictions** tab, click Edit.
3. In the Advanced section, select the meta tags that you want to use to restrict or prevent the access:

## Robots

- index – Allow search engines to index this page (assumed).
- follow – Allow search engines to follow links on this page (assumed).
- noindex – Prevents search engines from indexing this page.
- nofollow – Prevents search engines from following links on this page.
- noarchive – Prevents cached copies of this page from appearing in search results.
- nosnippet – Prevents descriptions from appearing in search results, and prevents page caching.
- noodp – Blocks the [Open Directory Project](#) description from appearing in search results.
- noydir – Prevents Yahoo! from listing this page in the [Yahoo! Directory](#).
- noimageindex – Prevent search engines from indexing images on this page.
- notranslate – Prevent search engines from offering to translate this page in search results.

Provides search engines with specific directions for what to do when this page is indexed.

4. Click Save.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## toggling the site in and out of maintenance mode

You can put the Developer Portal site into maintenance mode for short periods of time. During maintenance mode, only the administrator can access the site; all other users who enter the site URL get a maintenance message set by the administrator.

### Before you begin

You must have administrator access to complete this task.

**Important:** Maintenance mode is designed for short-term site maintenance; it is not meant for long-term usage. While a site is in maintenance mode, the database is not updated with new content from API Manager. As soon as the maintenance tasks are finished, you must take the site out of maintenance mode. Do not log out of the Developer Portal while the site is in maintenance mode, as you will not be able to log back in to the UI. In this case, maintenance mode can be turned off only by using the CLI; see the following instructions for details.

### Procedure

To put the site into maintenance mode, complete the following steps in the Developer Portal UI:

1. Log in to your site as the admin user.
2. Click Configuration > Development > Maintenance mode in the administrator dashboard.
3. Select the Put site into maintenance mode checkbox.
4. Enter a site message, or leave the default site maintenance text.  
This message is what will be seen by users who go to the site while it is in maintenance mode.
5. Click Save configuration.  
Your site is now in maintenance mode.

After you finish your maintenance tasks, take the site out of maintenance mode by completing the following steps:

6. Click Configuration > Development > Maintenance mode in the administrator dashboard.
7. Clear the Put site into maintenance mode checkbox.  
Your site is now available to users and out of maintenance mode.

If your site is in maintenance mode and you are locked out of the UI, you must use the command line interface (CLI) to turn off maintenance mode.

8. Use the CLI to log in to your Developer Portal appliance, and move to the directory of the site that you want to update.
9. Run the following command:

```
drush sset system.maintenance_mode 0 --input -format=integer
```

Maintenance mode is now turned off.

Note: If you are using IBM® API Connect V2018 Reserved Instance, and you are locked out of the Developer Portal UI, you must raise a support request on the IBM Cloud support page to get your site updated. For more information, see [Getting help from IBM support](#).

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Viewing available updates

You can view available updates in the Developer Portal.

### Before you begin

---

You must have administrator access to complete this task.

### Procedure

---

To view available updates, complete the following steps:

1. Click Reports in the administrator dashboard.
2. Click Available updates.
3. You can see what updates are available from this view. However, updates can be applied only by applying the latest available API Connect release; see [Upgrading in a Kubernetes environment](#), or [Upgrading in a VMware environment](#), for more information.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Managing Developer Portal security

You can manage multiple security elements in the Developer Portal.

- [Configuring CAPTCHA](#)  
You can add a CAPTCHA challenge to any of your Developer Portal pages to protect your site from spam.
- [Configuring reCAPTCHA](#)  
You can configure reCAPTCHA on your Developer Portal site to provide more protection from spam and abuse.
- [Configuring session timeout and limit](#)  
You can specify session timeout settings to control when a user is automatically logged out of the Developer Portal. You can also restrict the number of sessions a single user has available to them.
- [Configuring the timeout length for the password reset link](#)  
You can configure the timeout length for the one-time password reset link that is sent from the Developer Portal to the admin user account.
- [Configuring your site password policy](#)  
You can configure your site password policy to define the constraints that are applied to the passwords of your Developer Portal users.
- [Disabling CORS warnings](#)  
You can disable cross-origin resource sharing (CORS) warnings for unenforced APIs in the Developer Portal.
- [Disabling live testing of APIs](#)  
You can disable live testing of APIs in the Developer Portal to restrict exposure of an API.
- [How to enable penetration testing, and information about Developer Portal cookies](#)  
Many security features are available in the Developer Portal, but if you need to do a penetration test of your Developer Portal site, some of these features might block the scan that is required as part of the testing. This topic provides guidance on the security features that you might need to disable to allow penetration testing of your site, as well as information about Developer Portal cookies.
- [How to manage IP security in the Developer Portal](#)  
The Developer Portal offers the ability to perform various IP address security measures, such as adding and removing specific IP addresses from the banned IP address list, automatically banning client IP addresses by using the Drupal Perimeter Defence module, or managing login security by using flood control.
- [Managing banned IP addresses](#)  
You can ban specific IP addresses from accessing your Developer Portal site.
- [Using flood control for login security](#)  
You can configure login security for your Developer Portal by using flood control.
- [Login security](#)  
You can configure the login security for your Developer Portal at an IP and user level. You can also configure login security for Developer Portal contact forms.
- [Using the Security kit](#)  
You can improve the security of your website by configuring various options that are available in the Security Kit module, in the Developer Portal.
- [Using Honeypot for spam protection](#)  
Honeypot protection provides security mechanisms to protect your Developer Portal site from form submission by spam bots. If spam bot activity is detected, form submission is blocked.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Configuring CAPTCHA

You can add a CAPTCHA challenge to any of your Developer Portal pages to protect your site from spam.

## Before you begin

---

You must have administrator access to complete this task.

## About this task

---

The types of CAPTCHA challenges that are available include Image and Math based CAPTCHAs. Both types of CAPTCHA challenges are configurable in the CAPTCHA dialog box. By default, your Developer Portal site is configured with the Image based CAPTCHA challenge enabled. You can also configure reCAPTCHA on your site. For more information, see [Configuring reCAPTCHA](#).

## Procedure

---

To configure CAPTCHAS, complete the following steps:

1. If the administrator dashboard is not displayed, click [Manage](#) to display it.
2. Click [Configuration](#) in the administrator dashboard.
3. In the PEOPLE section, click CAPTCHA module settings.  
The CAPTCHA settings window opens.
4. Use the CAPTCHA configuration options provided as required. For example, you can complete the following tasks:
  - a. Specify the CAPTCHA challenge type.
  - b. Specify which forms must include a CAPTCHA challenge.
  - c. Add a description to the CAPTCHA.
  - d. Enable CAPTCHA statistics.
5. Click [Save configuration](#) to save your changes.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details. For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Configuring reCAPTCHA

You can configure reCAPTCHA on your Developer Portal site to provide more protection from spam and abuse.

## Before you begin

---

You must have administrator access to complete this task.

## About this task

---

reCAPTCHA is a CAPTCHA-like system that is designed to establish that a computer user is human. The types of reCAPTCHA that are available include Checkbox, Invisible, and Android.

Note: To use reCAPTCHA the administrator of your Developer Portal is required to sign up to Google's reCAPTCHA API, and your portal server must have internet access.

## Procedure

---

To configure reCAPTCHA, complete the following steps:

1. If the administrator dashboard is not displayed, click [Manage](#) to display it.
2. Click [Configuration](#), [People](#), [CAPTCHA module settings](#), [reCAPTCHA](#) in the administrator dashboard.  
The reCAPTCHA settings window opens.
3. In the GENERAL SETTINGS section, click [register for reCAPTCHA](#).  
The Google registration site for reCAPTCHA is displayed.
4. Follow the instructions on Google to register your Developer Portal site, and obtain the Site key and Secret key.
5. Return to the reCAPTCHA settings window in the Developer Portal, and enter the Site key and Secret key that you obtained from Google into the GENERAL SETTINGS section.
6. Optional: Update the WIDGET SETTINGS section as required.
7. Click [Save configuration](#) to save your changes.
8. Click the CAPTCHA Settings tab, and in the FORM PROTECTION section change the Default challenge type to reCAPTCHA (from module reCAPTCHA).
9. Click [Save configuration](#).

## Results

---

The reCAPTCHA module is now enabled on your Developer Portal site.

## Related tasks

---

- [Configuring CAPTCHA](#)

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Configuring session timeout and limit

You can specify session timeout settings to control when a user is automatically logged out of the Developer Portal. You can also restrict the number of sessions a single user has available to them.

### Before you begin

---

You must have administrator access to complete this task.

### Procedure

---

1. If the administrator dashboard is not displayed, click Manage to display it.
2. To manage the automated logout settings, complete the following steps:
  - a. Click Configuration in the administrator dashboard.
  - b. In the PEOPLE section, click Automated logout settings.

Note: You must check **Enforce auto logout on admin pages** for **autoLogout** to apply when navigating the admin areas of the site.

Enforce auto logout on admin pages

If checked, then users will be automatically logged out when administering the site.

**Save configuration**

- c. Use the session timeout configuration options provided as required. For example, you can complete the following tasks:
    - Specify the length of inactivity time, in seconds, before a user is automatically logged out.
    - Specify session timeout values for individual user roles.  
Note: The default session timeout is 30 minutes.
    - Provide a redirection URL at logout.
    - Provide session expiry message texts.
  - d. Click Save configuration to save your changes.
3. To restrict the number of sessions available to a user, complete the following steps:
    - a. Click Configuration in the administrator dashboard.
    - b. In the PEOPLE section, click Session limit.
    - c. Specify the default maximum number of sessions for a user by entering the number into the Default maximum number of active sessions field.
    - d. Select the required action from the When the session limit is exceeded options.
    - e. From the Logged out message severity list, select the severity of the message that the user receives when they are logged out.
    - f. Optionally, in the ROLE LIMITS section, specify separate session limits for each role.
    - g. Click Save configuration to save your changes.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Configuring the timeout length for the password reset link

You can configure the timeout length for the one-time password reset link that is sent from the Developer Portal to the admin user account.

### Before you begin

---

You must have administrator access to complete this task.

### About this task

---

By completing the steps in this task, you are configuring the timeout length for the one-time password reset link that is sent to the admin user account by the Developer Portal.

Note:

- Setting the password reset timeout length in the Developer Portal affects only the admin user account.
- You are not affecting the user activation or password reset links that are used by any other identification provider type in API Manager.

### Procedure

---

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Configuration in the administrator dashboard.

3. In the PEOPLE section, click Account settings.  
The Account settings window opens.
4. In the Account settings window, navigate to the PASSWORD RESET TIMEOUT section.
5. Enter your required value for the timeout in the Password Reset Timeout field.  
Note: The timeout value is specified in seconds, and is 86400 seconds by default.
6. Click Save configuration.  
You have configured the timeout length for the one-time link that is sent from the Developer Portal for the admin user account.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Configuring your site password policy

You can configure your site password policy to define the constraints that are applied to the passwords of your Developer Portal users.

---

### Before you begin

You must have administrator access to complete this task.

---

### About this task

Any passwords that are stored in the API Manager must comply with the API Manager password policy. You can configure your password policy to be the same as or stricter than the API Manager password policy.

---

### Procedure

To configure your site password policy, complete the following steps:

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Configuration in the administrator dashboard.
3. In the SECURITY section, click Password Policy.  
The Password Policies page opens.
4. In the OPERATIONS column for the default password policy, click Edit.  
Note: You can create a new password policy by clicking Add Policy; this allows you to apply different password policy settings to different roles. If you need only a single password policy, just configure the pre-supplied default policy.
5. Click Next.  
The Configure Constraints page opens.
6. Configure the password constraints as required.
  - a. To configure a constraint, click Edit in the OPERATIONS column for the required constraint.
  - b. To delete a constraint, select Delete in the OPERATIONS column.
  - c. To add a constraint, select the required constraint type from the drop-down list, then click Configure Constraint Settings.
  - d. When you are done, click Next.  
The Apply to Roles page opens.
7. Select the roles to which the password policy settings are to be applied. then click Finish.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Disabling CORS warnings

You can disable cross-origin resource sharing (CORS) warnings for unenforced APIs in the Developer Portal.

---

### Before you begin

You must have administrator access to complete this task.

---

### About this task

By disabling the CORS warnings, users will not receive further warnings regarding the usage of unenforced APIs.

---

### Procedure

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Configuration in the administrator dashboard.
3. In the SYSTEM section, click IBM API Connect.
4. Ensure that the Display CORS warnings for unenforced APIs check box is cleared.

5. Click Save Configuration.

You have disabled CORS warnings in the Developer Portal. To enable CORS warnings, repeat the steps and ensure that the Display CORS warnings for unenforced APIs check box is selected.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details. For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Disabling live testing of APIs

You can disable live testing of APIs in the Developer Portal to restrict exposure of an API.

### Before you begin

You must have administrator access to complete this task.

### Procedure

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Configuration in the administrator dashboard.
3. In the SYSTEM section, click IBM API Connect.
4. Ensure that the Allow live testing of APIs check box is cleared.
5. Click Save configuration.

You have disabled live testing of APIs. To enable live testing of APIs, repeat the steps and ensure that the Allow live testing of APIs check box is selected.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details. For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## How to enable penetration testing, and information about Developer Portal cookies

Many security features are available in the Developer Portal, but if you need to do a penetration test of your Developer Portal site, some of these features might block the scan that is required as part of the testing. This topic provides guidance on the security features that you might need to disable to allow penetration testing of your site, as well as information about Developer Portal cookies.

Penetration testing, or pen testing, is the practice of testing a computer system, network, or web application for potential security vulnerabilities that an attacker might exploit. For certain elements of your pen testing, you might want to disable some of the security features that block scanning of the Developer Portal. The following sections describe the security features in the Developer Portal that you might need to disable. The actual requirements depend on your Developer Portal configuration, and on the type of pen testing that you are running. Note also the final section, which discusses testing for Distributed Denial of Service attacks.

Important:

- If you run a pen test, and you give the automated test tool the admin credentials, the tool submits all of the administration configuration forms as well, and this action is likely to break the Portal site configuration. Best practice is to use different credentials for the testing.
- If you disable security modules, and then run security scans, your Portal site configuration might be broken by the scanning process. Before running any security testing, ensure that you have a valid backup of your Portal site.
- If your Portal site configuration is broken by the security testing, then you must delete the Portal site from the API Manager Catalog settings and re-create it, or restore it from a backup (for information about restoring your site, see [How to restore a Developer Portal service](#)).
- Note that disabling of security modules makes it highly likely that you will find issues that are not actually vulnerabilities, because you have disabled the modules that are designed to protect against these vulnerabilities. Therefore, any issue that is found in these circumstances must be replicated in an environment without the security modules disabled, before contacting IBM Support.
- Do not use the **Enforced** mode of the **Content Security Policy**, this mode is not supported and can break core Developer Portal functionality such as API rendering and the content editor. The **Content Security Policy** must be in **Report only** mode.

Note: You might need to disable the **Honeypot** module to allow your penetration test to run. For more information, see [Using Honeypot for spam protection](#). This topic contains the following sections:

- [CAPTCHA and reCAPTCHA verifications](#)
- [Drupal Perimeter Defense module](#)
- [Login Security module](#)
- [Developer Portal cookies](#)
- [Should I test the Developer Portal for vulnerability to Distributed Denial of Service attacks?](#)

---

### CAPTCHA and reCAPTCHA verifications

CAPTCHA and reCAPTCHA verifications are a type of challenge-response test that are used in web applications to check whether the user is human. By default, your Developer Portal site is configured with an Image based CAPTURE challenge enabled, but you can also configure a Math based CAPTCHA challenge, and Checkbox, Invisible, and Android reCAPTCHA challenges. If you need to disable these verifications before pen testing, see the following instructions.

To disable the CAPTCHA and reCAPTCHA verifications, you must disable the modules as follows:

1. Log in to the Developer Portal as an administrator.
2. If the administrator dashboard is not displayed, click Manage to display it.
3. On the administrator dashboard, click Extend > Disable module.
4. Search through the list of modules, and select the check boxes next to the Image CAPTCHA and reCAPTCHA modules.
5. Click Disable, and click Disable again to confirm.
6. On the Disable tab, select the check box next to the CAPTCHA module, and click Disable. The display shows the forms that the CAPTCHA configuration is removed from.
7. Click Disable again to confirm. Note that the modules must be disabled in this order.

The CAPTCHA and reCAPTCHA modules are now disabled, and you can complete your pen testing. After pen testing, you can enable the modules again by clicking Extend on the administrator dashboard, selecting the check box for each module in the List tab, and clicking Enable.

## Drupal Perimeter Defense module

---

The Drupal Perimeter Defense module (machine name: perimeter) immediately bans the IP addresses of those users that send suspicious requests to your site, so any pen testing scans would be blocked. This module is enabled by default on the Developer Portal. For more information about the module, see the Drupal documentation [Drupal Perimeter Defense module](#).

If you need to disable the Drupal Perimeter Defense module before pen testing, see the following instructions:

1. Log in to the Developer Portal as an administrator.
2. If the administrator dashboard is not displayed, click Manage to display it.
3. On the administrator dashboard, click Extend > Disable module.
4. Search through the list of modules, and select the check box next to the Drupal Perimeter Defense module.
5. Click Disable, and click Disable again to confirm.

The Drupal Perimeter Defense module is now disabled, and you can complete your pen testing. After pen testing, you can enable the module again by clicking Extend on the administrator dashboard, selecting the check box next to the Drupal Perimeter Defense module in the List tab, and clicking Enable.

## Login Security module

---

The Login Security module (machine name: login\_security) enables the site administrator to improve the security options in the login operation of your Developer Portal site. For example, controlling the number of invalid login attempts before blocking users, and denying access by IP address. This module is enabled by default on the Developer Portal. For more information about the module, see the Drupal documentation [Login Security module](#).

If you need to disable these security options before pen testing, you need to manually modify the configuration of your security options according to your requirements. For example, you might need to change the number of login attempts that are allowed before a user or IP address is blocked. To configure the security options, see the following instructions:

1. Log in to the Developer Portal as an administrator.
2. If the administrator dashboard is not displayed, click Manage to display it.
3. On the administrator dashboard, click Configuration > People > Login Security.
4. In the Login Security window, update the security options according to your requirements.
5. Click Save configuration to save your updates.

The Login Security options are now updated, and you can complete your pen testing. After pen testing, you can reconfigure your security options in the Login Security window.

## Developer Portal cookies

---

Cookies are small text files that are placed on a computer by websites when they are visited. The Developer Portal uses cookies that remain on the computer for varying times. Some cookies expire at the end of each session, and some remain longer to enhance the user experience in the future. The list here explains the cookies that are used by the Developer Portal, and why they are used.

Note: Any load balancer that sits in front of the Developer Portal must be a transparent proxy that enables all cookies returned by the Developer Portal to pass through to the browser.

### Drupal session identifier cookie

This is the main cookie that all of the Developer Portal sites have, and it stores the session identification. The session cookie is named in the format `SSESSUUID`, where `UUID` is a randomly generated unique string of characters for that session, and this is the session token itself. The session cookie is always marked with the following flags as instructions to the browser client:

- **Secure** - means that the cookie is sent only over a secure connection (that is, over TLS).
- **HttpOnly** - means that the browser adds this cookie on outbound requests only, and not provide the value to client side javascript.

### session\_store.id cookie

This cookie is used to store information on where a user is in the subscription flow, and any options that they selected, if they haven't yet signed in, so the Developer Portal can redirect them back there later. The `session_store.id` cookie is also marked with the **Secure** and **HttpOnly** flags, and it does not contain any confidential information.

### Drupal.visitor.startSubscriptionWizard cookie

This cookie is used to store information on where a user started in the subscription flow if they haven't yet signed in, so the Developer Portal can redirect them back there later. The `Drupal.visitor.startSubscriptionWizard` cookie is also marked with the **Secure** and **HttpOnly** flags, and it does not contain any confidential information.

### portal\_session\_route cookie

This cookie is used to achieve session persistence, which it does by ensuring that web traffic between the user and the Developer Portal is correctly routed to the server. The `portal_session_route` cookie is used for both HTTP and HTTPS communications, so that routing is meaningful irrespective of the transfer protocol, and ensuring consistent behavior if the switching of protocols is required. The cookie contains only a hash of the pod that served the traffic to maintain session persistence, and does not contain any confidential information. The cookie is provided by the Portal ingress. This cookie is not marked as **Secure** or **HttpOnly**, as the Kubernetes ingress does not yet support these attributes.

### Other cookies

In addition to the cookies listed previously, there are other (usually temporary) cookies that might be created depending on the configuration options of your Developer Portal site. For example, if the site uses OAuth for authentication, then during the OAuth token activation flow a JSON Web Token is sent to the browser. This token is stored in a cookie for a limited lifetime. This action is part of the normal function of an OAuth flow. As the creation of these other cookies depends on your particular Developer Portal configuration, we cannot provide a complete list of cookies here.

## Should I test the Developer Portal for vulnerability to Distributed Denial of Service attacks?

When you run penetration testing, it's important to understand that individual systems are not responsible for (nor capable of dealing with) Distributed Denial of Service (DDoS) attacks. DDoS attacks are launched by huge numbers of external computers simultaneously, with a goal of using up all of the resources of a system, and thereby denying service to legitimate users. These kinds of attacks are usually defended against at the level of the network and edge gateways, and information about how to protect against them is out of the scope of this topic. Although the Developer Portal does have some capabilities, including the modules mentioned previously, for potentially mitigating some of the effects of a DDoS attack, do not rely on these capabilities as the first line of defense; rather they are designed to assist in dealing only with any elements of an attack that might have gotten through the outer network layers of protection.

## Related tasks

- [Configuring CAPTCHA](#)
- [Configuring reCAPTCHA](#)
- [Disabling modules](#)
- [Login security](#)
- [Blocking and unblocking specific users](#)
- [Managing banned IP addresses](#)

## Related information

- [Understanding Drupal](#)

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## How to manage IP security in the Developer Portal

The Developer Portal offers the ability to perform various IP address security measures, such as adding and removing specific IP addresses from the banned IP address list, automatically banning client IP addresses by using the Drupal Perimeter Defence module, or managing login security by using flood control.

See the following links for information about how to manage IP security in the Developer Portal:

- [Enable and disable IP security](#)
- [Correctly passing through client IP addresses](#)
- [Managing banned IP addresses](#)

## Enable and disable IP security

The ability to enable or disable IP security related actions can be controlled at the Portal service level by using an internal Developer Portal command. When IP security is enabled, modules such as the Drupal Perimeter Defence module, or flood control, will block client IP addresses suspected of malicious behavior, as expected. When IP security is disabled, all IP related security is switched off. For example, the perimeter module won't block client IP addresses when IP security is disabled. You might want to turn off IP security if you are performing penetration tests, or if you cannot pass through the client IP address from your external load balancer. Note that IP security is enabled by default.

Complete the following instructions to toggle the IP security setting between enabled and disabled.

Note: These instructions assume you have a working Kubernetes environment with the kubectl command-line tool installed, and that you understand how to manage Kubernetes. For more information, see <https://kubernetes.io>.

1. Run the following command to get a list of the pods that are running on the virtual machine where the Developer Portal service is deployed:

```
kubectl get pods -n namespace
```

Identify the `portal-www` pod from the resulting list.

2. Run the following command to set the Developer Portal IP security to enabled:

```
kubectl exec portal-www-pod -c admin -- /opt/ibm/bin/set_ip_security_enabled -e
```

For example:

```
kubectl exec r1234b98d02-apic-portal-www-0 -c admin -- /opt/ibm/bin/set_ip_security_enabled -e
Toggling IP security = 1 on the Developer Portal
Running: drush8 -y @test.com state-set ibm_apim.ip_ban_enabled --input-format=integer 1
IP security successfully set to 1
```

3. Run the following command to set the Developer Portal IP security to disabled:

```
kubectl exec portal-www-pod -c admin -- /opt/ibm/bin/set_ip_security_enabled -d
```

For example:

```
kubectl exec r1234b98d02-apic-portal-www-0 -c admin -- /opt/ibm/bin/set_ip_security_enabled -d
Toggling IP security = 0 on the Developer Portal
Running: drush8 -y @test.com state-set ibm_apim.ip_ban_enabled --input-format=integer 0
IP security successfully set to 0
```

---

## Correctly passing through client IP addresses

---

In order to correctly use modules that make use of client IP banning, such as the Drupal Perimeter Defence module, you must ensure that any external load balancer that fronts the Portal cluster passes through the client IP address. This can be achieved by passing the client IP address through in an '**x-forwarded-for**' header, or by making use of the proxy protocol (provided both the load balancer and the ingress controller are compatible with the proxy protocol, and have the protocol enabled). Failure to correctly pass through the client IP address, results in the load balancer IP address being blocked when a client attempts to send a suspicious request to the portal.

If you are fronting the Portal cluster with an HAProxy setup acting as the load balancer, then you can make use of the proxy protocol by adding the **send-proxy** directive to the end of the Portal server declarations in the HAProxy configuration file, for example:

```
server portal0 portal_host:port check send-proxy
```

You must restart the HAProxy for the change to take effect. Note that if your load balancer IP address has already been blocked, you will need to remove the blocked IP address from the banned list. For more information, see [Managing banned IP addresses](#).

For more information about the Drupal Perimeter Defence module, see [Drupal Perimeter Defense module](#).

---

## Managing banned IP addresses

---

You can manage banned IP addresses for a particular site by using the administrator dashboard for a particular Developer Portal site. For more information, see [Managing banned IP addresses](#).

- [Managing banned IP addresses](#)

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Managing banned IP addresses

---

You can ban specific IP addresses from accessing your Developer Portal site.

---

## Before you begin

---

You must have administrator access to complete this task.

---

## Procedure

---

To manage banned IP addresses, complete the following steps:

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Configuration in the administrator dashboard.
3. In the PEOPLE section, click IP address bans.  
The IP address bans window opens.
4. You can complete the following tasks:
  - a. To ban an IP address, enter the address in the IP address field, then click Add.  
The address is added to the BANNED IP ADDRESSES list.
  - b. To remove an IP address from the banned list, click Delete alongside the required address.

Note: There is automatic login "flood" protection built into the Developer Portal. This feature means that an excess of login attempts from the same IP address in one hour will cause that IP to be temporarily banned. For more information, see [Using flood control for login security](#).

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Using flood control for login security

You can configure login security for your Developer Portal by using flood control.

### Before you begin

---

You must have administrator access to complete this task.

### Procedure

---

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Navigate to Configuration > System > Flood Control.
3. Enter values in the following fields in the LOGIN SETTINGS section according to your requirements:
  - Failed IP login limit (min 1) - the number of failed login attempts from the same client IP.
  - Failed IP login window in seconds (0 = Off) - the time window, in seconds, for the number of failed login attempts from the same client IP.
  - Failed User login limit (min 1) - the number of failed login attempts from a user.
  - Failed User login window in seconds (0 = Off) - the time window, in seconds, for the number of failed login attempts from a user.
4. Enter values in the following fields in the CONTACT FORM section according to your requirements:
  - Emails sent limit - the number of emails that can be sent.
  - Emails sent window in seconds - the time window, in seconds, for the number of emails that can be sent.
5. Click Save configuration.

### What to do next

---

To unblock a user, see [Blocking and unblocking specific users](#). To unblock an IP address, see [Managing banned IP addresses](#).

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Login security

You can configure the login security for your Developer Portal at an IP and user level. You can also configure login security for Developer Portal contact forms.

### Before you begin

---

Important: The Login Security module is being removed from future releases. It has been replaced by Flood Control. Existing users of the Login security module should configure Flood Control with the same limits and time windows as specified here. For more information, see [Using flood control for login security](#).

You must have administrator access to complete this task.

### Procedure

---

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Configuration in the administrator dashboard.
3. In the PEOPLE section, click Login Security.
4. Enter values in the following fields in the GENERAL SETTINGS section according to your requirements:
  - Track time - the time window to check for security violations.
  - User - the number of login failures before blocking a user.
  - Soft host - the number of login failures before soft blocking a host. The host can still browse the site as an anonymous user.
  - Host - the number of login failures before hard blocking a host. The host cannot access the site at all.
  - Attack detection - the number of login failures before warning about an ongoing attack.
5. Select the check boxes that satisfy your notification requirements in the NOTIFICATION section:
  - Disable login failure error message
  - Notify the user about the number of remaining login attempts
  - Display last login timestamp
  - Display last access timestamp
6. Optional: Edit the EMAIL FOR ONGOING ATTACK DETECTION section.
7. Optional: Edit the EMAIL FOR BLOCKED ACCOUNT section.
8. Optional: You can edit the notification texts that are displayed by configuring the following options:
  - Failed login attempt
  - Banned host (soft IP ban)
  - Banned host (hard IP ban)
  - Blocked user by uid
9. After you have configured your login security options, click Save configuration.

### What to do next

---

To unblock a user, see [Blocking and unblocking specific users](#). To unblock an IP address, see [Managing banned IP addresses](#).

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Using the Security kit

You can improve the security of your website by configuring various options that are available in the Security Kit module, in the Developer Portal.

### Before you begin

---

You must have administrator access to complete this task.

### About this task

---

The Security Kit module provides your website with various options to mitigate risks of common web application vulnerabilities like Cross-site Scripting, Cross-site Request Forgery and Clickjacking. It also has some options to improve your SSL/TLS security.

### Procedure

---

1. If the administrator dashboard is not displayed, click [Manage](#) to display it.
2. Click [Configuration](#) in the administrator dashboard.
3. In the **SYSTEM** section, click [Security Kit settings](#).
4. In the Security Kit module, configure the security settings for your website as required.
5. When you are done, click [Save configuration](#).

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details. For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Using Honeypot for spam protection

Honeypot protection provides security mechanisms to protect your Developer Portal site from form submission by spam bots. If spam bot activity is detected, form submission is blocked.

### Before you begin

---

You must have administrator access to complete this task.

### About this task

---

Honeypot protection provides the following security mechanisms:

- A hidden field, unseen by users, is added to the form. If a value has been entered in the field when the form is submitted then this indicates that the form was completed by a spam bot, and the submission is blocked. You can specify the name of the hidden field.
- If the form is submitted before a specified time has elapsed (five seconds by default), it is assumed that this is too short a time for a human to have completed the form, and the submission is blocked. You can specify the time length.

Honeypot protection is provided by the Honeypot module, which is enabled by default.

**Note:** If you want to carry out automated testing of your Developer Portal, you might need to disable the Honeypot module, because Honeypot spam protection is designed specifically to block automated Developer Portal usage. For details on how to disable a module, see [Disabling modules](#).

### Procedure

---

To configure Honeypot for spam protection in the Developer Portal, complete the following steps:

1. If the administrator dashboard is not displayed, click [Manage](#) to display it.
2. Click [Configuration](#) in the administrator dashboard.
3. In the **CONTENT AUTHORING** section, click [Honeypot configuration](#).
4. Specify the forms that you want to protect with Honeypot.
  - a. To enable Honeypot protection for all the forms on your Developer Portal site, select [Protect all forms with Honeypot](#).
  - b. To choose which forms you want to protect with Honeypot, clear the [Protect all forms with Honeypot](#) check box, then select the required forms in the **HONEYPOT ENABLED FORMS** section.

By default, Honeypot protection is enabled for all user management forms and all comment forms.
5. To have details of all blocked form submissions written to the log file, select [Log blocked form submissions](#).
6. In the Honeypot element name field, specify the name of the hidden form field.

The default field name is `url`. You need to change the value if your form already has a field of the same name. For the most effective protection, use a generic field name; for example, `email`, `homepage`, or `link`.
7. In the Honeypot time limit field, specify the number of seconds that must elapse before it is assumed that a form is being submitted by a human rather than a spam bot. If the form is submitted before this time has elapsed then the submission is blocked.

The default value is five seconds.  
8. When done, click Save configuration.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## People

You can manage and customize the user experience in the Developer Portal, by altering permissions and assigning roles to specific users.

To learn how to configure the user experience for your Developer Portal site, use the following section links.

- [Working with roles in the Developer Portal](#)  
As a site administrator, you can create and customize site configuration roles in the Developer Portal.
- [Blocking and unblocking specific users](#)  
You can block and unblock specific users in the Developer Portal.
- [Controlling access to Developer Portal content](#)  
In IBM® API Connect, you can restrict access to content for Consumer organizations through an access content list. However, you can also assign permissions in the Developer Portal that override the access content list, and allow users to access and edit all of the content for Products, APIs, and Applications.
- [Creating a developer account to customize API properties](#)  
You can allow specific users in the Developer Portal to customize the properties for certain APIs, including APIs that are not viewable by the administrator, or other customizable features, by creating an internal Consumer organization.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Working with roles in the Developer Portal

As a site administrator, you can create and customize site configuration roles in the Developer Portal.

Rather than assigning individual permissions to each user, permissions are assigned to roles, and then roles are assigned to users. Using roles gives administrators greater control over permissions, and makes it easy to assign and remove roles when necessary.

Administrators can assign the following site configuration roles to users in the Developer Portal:

### Superuser

The Superuser role has the highest level of permissions in the Developer Portal, and is the role that is assigned by default to the admin user, in addition to the Administrator role, when they enable a Developer Portal site in the API Manager. This role bypasses all content access control, which means that users that have a Superuser role can see all of the site content. This level of access can lead to some unexpected behavior when they access content such as their Consumer organizations and their applications. Careful consideration should be given before you assign users to a Superuser role.

### Administrator

An Administrator can use the administrator dashboard to customize and configure the Developer Portal. An Administrator is able to perform any task within the Developer Portal that does not involve the creation of APIs, Products, and Apps.

### Content Author

A Content Author is a curator of content for the Developer Portal. A Content Author can perform the following actions:

- Set taxonomies on the content.
- Provide custom icons for content.
- Upload additional documentation files.
- Create documentation pages in the Developer Portal.

### Forum Moderator

A Forum Moderator can moderate the content of a forum in the Developer Portal.

**Note:** Every account in the Developer Portal must have a unique email address, including the site Admin account. The default email address for the Admin account is the email address of the Catalog owner. It is not possible to create a user account (and associated Consumer organization) with the same email address as the Admin account (or that of the Catalog owner if their email address is different). Any attempts to create an account with the same email address results in the new account not functioning correctly, and returning the following error message when trying to log in: **A user already exists with this email address.**

To learn how to create and customize roles in the Developer Portal, use the following topic links:

- [Creating administrator users for the Developer Portal](#)  
You can create additional administrator users for an Developer Portal.
- [Assigning users to a role](#)  
Assign users to one or more roles in the Developer Portal to enable role specific permissions.
- [Assigning permissions to a role](#)  
You can assign permissions to a new role in the Developer Portal, and update the permissions for current roles.
- [Creating a new role](#)  
You can create a new role within the Developer Portal.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Creating administrator users for the Developer Portal

You can create additional administrator users for an Developer Portal.

### Before you begin

You must have administrator access to complete this task.

### About this task

After you enable a Developer Portal site in the API Manager, you are sent an email that contains a one-time log in link for the Developer Portal site Admin user. The Admin user can administer the Content Management System (CMS) capabilities of the Developer Portal. For more information about enabling a site, see [Creating and configuring Catalogs](#).

However, you can also create additional administrative roles for users from within the Developer Portal by assigning the role to users that have access to the Developer Portal. A user with an Administrator role can use the administrator dashboard to customize and configure the Developer Portal. An Administrator is able to perform any task within the Developer Portal that does not involve the creation of APIs, Products, and Apps. You should be careful to ensure that only trusted users are given this access and level of control of your site.

### Procedure

To create additional administrative users, complete the following steps:

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click People in the administrator dashboard.
3. Select the List tab.
4. Select the check boxes for the target users.
5. From the drop-down list under the Action heading, select Add the Administrator role to the selected user(s).
6. Click Apply to selected items.

### Results

You have assigned the selected users to the Administrator role.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Assigning users to a role

Assign users to one or more roles in the Developer Portal to enable role specific permissions.

### Before you begin

You must have administrator access to complete this task.

### Procedure

To assign users to a role, complete the following steps:

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click People in the administrator dashboard.
3. Select the List tab.
4. Select the check boxes for the target users.
5. From the drop-down list under the Action heading, select the role that you want to assign.
6. Click Apply to selected items.

### Results

You have assigned the selected users to the required role.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Assigning permissions to a role

You can assign permissions to a new role in the Developer Portal, and update the permissions for current roles.

### Before you begin

---

You must have administrator access to complete this task.

### Procedure

---

To assign or update permissions for a role, complete the following steps:

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click People in the administrator dashboard.
3. Select the Permissions tab.
4. Assign a permission to a role, by selecting the check box in the relevant column for the permission that you want to assign.
5. Click Save permissions.

### Results

---

You have assigned permissions to the target role.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Creating a new role

You can create a new role within the Developer Portal.

### Before you begin

---

You must have administrator access to complete this task.

### Procedure

---

To create a new role, complete the following steps:

1. Click People in the administrator dashboard.
2. Select the Roles tab.
3. Click Add role.
4. Enter a name for the new role in Role name, and click Save.
5. Your new role is displayed in the list of roles. You can drag any of the roles to re-order them. It's recommended to order roles from least permissive (for example, Anonymous user) to most permissive (for example, Administrator user). Users who aren't logged in have the Anonymous user role. Users who are logged in have the Authenticated user role, plus any other roles granted to their user account.

### Results

---

You have created a new role in the Developer Portal.

### What to do next

---

The new role is created with the same permissions as an Authenticated user role. You can click the Permissions tab and edit the permissions as required.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Blocking and unblocking specific users

You can block and unblock specific users in the Developer Portal.

### Before you begin

---

You must have administrator access to complete this task.

## Procedure

---

To block or unblock a specific user, complete the following steps:

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click People in the administrator dashboard.  
A list of users is displayed.
3. Select the check box next to the target user.
4. From the drop-down list under Action, select Block the selected user(s) or Unblock the selected user(s).
5. Click Apply to selected items.

You have blocked or unblocked specific users from the Developer Portal.

Note: If a user reports that they are unable to login, but they do not appear as blocked, then it might be that they have been blocked by Flood Control. To unblock such users, select Configuration > System > Flood unblock. You can configure your Flood Control settings; see [Using flood control for login security](#) for more information.

## Related tasks

---

- [Using flood control for login security](#)

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Controlling access to Developer Portal content

In IBM® API Connect, you can restrict access to content for Consumer organizations through an access content list. However, you can also assign permissions in the Developer Portal that override the access content list, and allow users to access and edit all of the content for Products, APIs, and Applications.

## Before you begin

---

You must have administrator access to complete this task.

## About this task

---

A user with a Content Author role is a curator of content for the Developer Portal. A Content Author user can perform the following actions:

- Set taxonomies on the content
- Provide custom icons for content
- Upload additional documentation files
- Create documentation pages in the Developer Portal.

By default, Content Author users are assigned the following user permissions:

Edit any Product content

The user can access and edit all of the Products available in the Catalog that the Developer Portal is associated with. The user can also access APIs that belong to those Products.

Edit any API content

The user can access and edit all of the APIs that are available in the Catalog, but not the Products with which they are associated. (Note that this permission is a subset of Edit any Product content; as Content Author users are assigned both permissions they can access and edit all of the Products and the associated APIs that are available.)

The Edit any Application permission grants the user access to all of the Applications that are in the Developer Portal, but is not assigned to any user or role by default.

Note: There are security implications if you grant the Edit any Application permission, and it should be assigned only to trusted roles.

A user can configure, attach, and upload content if they are assigned the appropriate permissions.

## Procedure

---

To check and assign permissions that grant users access to all content, proceed with one of the following options:

- Assign a user to the Content Author role. For more information, see [Assigning users to a role](#).
- Create a custom role, to which you can add the relevant permissions and add users to your new custom role. For more information, see [Creating a new role](#), [Assigning permissions to a role](#), and [Assigning users to a role](#).

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Creating a developer account to customize API properties

You can allow specific users in the Developer Portal to customize the properties for certain APIs, including APIs that are not viewable by the administrator, or other customizable features, by creating an internal Consumer organization.

## Before you begin

---

You must have administrator access to complete this task.

## About this task

---

Every user in the Developer Portal must be a member of a Consumer organization. To enable additional users to be editors of particular content in the Developer Portal, you can create an internal Consumer organization. You can then invite these additional editors to this organization, and assign them a specific role that grants certain editing permissions. For example, the following API properties can be customized by any member of the new Consumer organization that have been assigned the Administrator or Content Author role:

- Image uploading
- Tag assignment
- File attachment
- Custom field editing

## Procedure

---

To create a new Consumer organization within the Developer Portal, complete the following steps:

1. Log in to the Developer Portal as an administrator or Content Author.
2. Click the arrow next to `your_organization_name` from the Developer Portal home page, and select Create organization.
3. In the Organization Title field, type the name of the organization that you want, then click Submit.

To invite the editor users to your new organization, complete the following steps:

4. Switch to your newly created organization by clicking the arrow next to `your_current_organization_name`, and select your new organization name from the list.
5. Click the arrow next to `your_new_organization_name` and select My organization.  
Your new organization page is displayed.
6. For each new user, click Invite, complete their Email details, and click Submit. Note that you can leave the default role of Developer selected and then change the role later, or you can select the Administrator role now. However, be aware that an administrator is able to perform any task within the Developer Portal that does not involve the creation of APIs, Products, and Apps. You should be careful to ensure that only trusted users are given this access and level of control of your site. Each new user will receive an invitation email, and they need to click on the link in the email to activate their Developer Portal account.

To assign the required permissions to the users of your organization, you must log in as an administrator and complete the following steps:

7. Log in to the Developer Portal as an administrator.
8. If the administrator dashboard is not displayed, click Manage to display it.
9. Click People on the administrator dashboard.
10. Select the check box for the user, or users, to whom you want to give new permissions.
11. Under the Action heading, select the relevant role from the drop-down list.  
For example, selecting Add the Content Author role to the selected user(s) means they can edit images and content within the Developer Portal.
12. Click Apply to selected items to update the roles.

## What to do next

---

If you want specific Products or APIs to be customized by the editor users, you must ensure that the relevant Products are visible to the internal Consumer organization that you have created. For more information on how to make a plan visible in API Manager, see [Changing the availability of a Product](#). Note that you can also create new roles and assign specific permissions to those roles. For more information, see [Creating a new role](#) and [Assigning permissions to a role](#).

---

## Creating a new forum

You can create a new forum in the Developer Portal.

### Before you begin

---

You must have administrator or Forum moderator access to complete this task.

### Procedure

---

To create a new forum, complete the following tasks:

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Structure in the administrator dashboard.
3. Click Forums.
4. Click Add forum.
5. Fill in the Name and Description fields for the new forum.
6. From the Parent drop-down list, select the hierarchical position of the new forum.
7. Click Save. You have created a new forum.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Creating new forum containers

You can create new forum containers in the Developer Portal.

### Before you begin

---

You must have administrator or Forum moderator access to complete this task.

### Procedure

---

To create a new forum containers, complete the following tasks:

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Structure in the administrator dashboard.
3. Click Forums.
4. Click Add container.
5. Fill in the Name and Description fields for the new forum container.
6. From the Parent drop-down list, select the hierarchical position of the new forum container.
7. Click Save. You have created a new forum container.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Configuring the creation of new forums for each API

You can choose whether or not to automatically create a new forum when an API is created in the Developer Portal.

## Before you begin

---

You must have administrator access to complete this task.

## Procedure

---

To configure the creation of new forums for each API, complete the following tasks:

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Configuration in the administrator dashboard.
3. Under the SYSTEM heading, click IBM API Connect.
4. Select or clear the Automatically create a forum per API check box to turn the feature on or off.
5. Click Save configuration.

You have configured the creation of new forums for each API.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Locking forum topics

You can lock forum topics in the Developer Portal.

## Before you begin

---

You must have administrator or Forum moderator access to complete this task.

## Procedure

---

To lock forum topics, complete the following tasks:

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Content in the administrator dashboard.
3. Click Edit for the forum topic that you want to lock.
4. Click Comment settings. The view expands.
5. Select Closed .
6. Keeping the Published selected, click Save.

You have disallowed any further replies and marked the topic as locked.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Marking content in a forum as sticky

You can mark content in a forum as sticky in the Developer Portal.

## Before you begin

---

You must have administrator or Forum moderator access to complete this task.

## Procedure

---

To mark content in a forum as sticky, complete the following tasks:

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Content in the administrator dashboard.
3. From the Action drop-down menu, select Make content sticky.
4. Select the check boxes next to the forum topics that you want to make sticky.
5. Click Apply to selected items.

You made the selected forum content sticky.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Removing forum posts

You can remove forum posts in the Developer Portal.

### Before you begin

---

You must have administrator or Forum moderator access to complete this task.

### Procedure

---

To remove forum posts, complete the following tasks:

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Click Content in the administrator dashboard.
3. From the Action drop-down menu, select Delete content.
4. Select the check boxes next to the forum posts that you want to remove.
5. Click Apply to selected items.

You removed the selected forum posts.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Turning off forums in the Developer Portal

You can turn off forums in the Developer Portal by disabling the Forum module. This action prevents users from viewing, and contributing to, forums.

### Before you begin

---

You must have administrator access to complete this task.

### About this task

---

To turn off forums, you must first remove all Forums terms, and then you can disable the Forum module.

### Procedure

---

To turn off forums, complete the following steps.

1. If the administrator dashboard is not displayed, click Manage to display it.
2. Delete all Forums terms by completing the following steps:
  - a. Click Structure > Taxonomy > Forums in the administrator dashboard.  
The list of Forums terms is displayed.
  - b. For each item in the list of terms, select Delete from the drop-down list in the OPERATIONS column, and then click Delete again to confirm.  
All of the Forums terms are deleted.
3. Disable the Forum module by completing the following steps:
  - a. Click Extend > Disable module in the administrator dashboard.
  - b. Select the Forum module, then click Disable.
  - c. The display then shows a list of forum configuration that will also be removed if the Forum module is disabled. Click Disable again to confirm that you agree to this removal.

### Results

---

You successfully turned off forums in the Developer Portal.  
If you want, you can enable the Forum module again by clicking Extend, selecting the Forum module on the List tab, and clicking Enable.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Reports

You can view reports about the general configuration and status of your Developer Portal site.

Use the Reports section in the Developer Portal to view information about the following areas:

#### Available updates

Status report about available updates for your installed modules and themes.

#### Node Type Count

Status report about how much of each content type there is in your portal site, and whether it is published or not. It can also provide totals of how many users there are of each role.

#### Available translation updates

Status report about available interface translations for your installed modules and themes.

#### Field list

Overview of fields on all entity types.

#### Status report

Short overview of your site's parameters, as well as any problems detected with your installation.

#### Views plugins

Overview of the plugins that are used in all views.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Extend

You can extend the Developer Portal by creating and installing custom modules, or installing additional Drupal 9 contributed modules.

Modules provide functionality to your site, and the *core modules* that are included in the standard Developer Portal installation, provide all of the basic functions that most sites need. However, some of the core modules are not enabled by default, so you might want to examine the module list under the Extend menu of your site, to see whether the functionality you require is available from a core module before starting to investigate custom and contributed modules. If you still require additional custom or contributed modules, consider the following topics to help you create and implement modules consistently.

Note: The Developer Portal contains a Rules framework for event based actions. Some of those actions and triggers might exhibit unexpected behavior. A workaround is to create a custom module instead, because the same events and actions are possible there.

- [Custom module development: an introduction to Drupal tools for PHP development](#)

Some guidance about the Drupal tools and environment considerations when developing in PHP, to help when writing custom modules to extend your Developer Portal functionality.

- [Custom module development: background and prerequisites](#)

You can create custom modules in the Developer Portal to extend functionality. The following information provides a getting started developer guide to custom module development.

- [Custom module development: creating a module skeleton](#)

You can extend your Developer Portal site by creating custom modules. The starting point for a new module is to create a module skeleton.

- [Custom module development: using hooks](#)

You can use hooks in custom modules to alter the behavior of Drupal core or other modules in your Developer Portal.

- [Installing custom modules](#)

You can extend your Developer Portal site by installing custom modules that you created, and also installing contributed modules from the Drupal community.

- [Deleting custom modules](#)

You can delete custom modules from your Developer Portal if you want to remove them entirely from your site.

- [Disabling modules](#)

You can disable an entire module in the Developer Portal if you want to improve performance, or remove functionality.

## Related information

## Custom module development: an introduction to Drupal tools for PHP development

Some guidance about the Drupal tools and environment considerations when developing in PHP, to help when writing custom modules to extend your Developer Portal functionality.

The following sections provide an overview of the key automation tools and environment considerations for PHP development in the Developer Portal. For a complete list of Drupal tools, see [Development tools overview](#) on Drupal.org, however, note that you are not permitted to access the Developer Portal command line interface (CLI).

Important:

- You are not permitted to include any IBM® API Connect modules within any custom modules that you create. Also, directly editing any API Connect themes, modules, included modules, or Drupal core on the file system is not permitted or supported, as edited versions of these files are overwritten when a fix pack or iFix is installed.
- All custom development is your responsibility. Although the use of custom modules and themes is supported, IBM API Connect do not provide support in their development or modification.

## Devel, Devel Generate Kint, and Webprofiler development modules

---

The Devel, Devel Generate Kint, and Webprofiler modules are all packaged within the Devel module. These modules provide the following development support:

- *Devel* - Helper functions for Drupal developers.
- *Devel Generate Kint* - Accelerate development of your site or module by quickly generating nodes, comments, terms, users, and more.
- *Kint* - Pretty print of variables with `kint($my_var)`.
- *Webprofiler* - Port of the Symfony WebProfiler Bundle as a Drupal module.

For more information, see [Devel module](#) on drupal.org, and [Devel](#) on drupalship.org.

---

## Admin Toolbar module

The Admin Toolbar module improves the default Drupal Toolbar by transforming it into a drop-down menu, providing fast access to the administration pages. It also adds extra links to the Drupal icon on the left of the admin toolbar to development tools such as flush all caches, run cron, and run updates.

For more information, see [Admin toolbar module](#) on drupal.org.

---

## Examples for developers project

The Examples for Developers project aims to provide high-quality, well-documented API examples for a broad range of Drupal core functionality.

The project contains many modules that illustrate best practices for implementing Drupal core APIs. For example there are examples for Block, Cache, Config and Content Entity, Cron, Database API, Email, Events, Form API, Field, Field Permission, File, Hooks, Javascript, Node Type, Page, Pager, PHPUnit, Plugin Type, Queue, Simple Test, Stream Wrapper, Table Sort, Testing, and Tour.

For more information, see [Examples for developers project](#) on drupal.org.

---

## Coding standards

The Drupal Coding Standards apply to code within Drupal and its contributed modules. For more information, see [Coding standards](#) on drupal.org.

---

---

---

# Custom module development: background and prerequisites

You can create custom modules in the Developer Portal to extend functionality. The following information provides a getting started developer guide to custom module development.

Custom modules are written in PHP, which is an open source server-side scripting language that is used for creating dynamic web pages. For general information on the Drupal tools for PHP development, see [Custom module development: an introduction to Drupal tools for PHP development](#).

The following sections provide an overview of custom module development, with links to learn more about the required development languages and concepts. Creating custom modules affects the source of your Developer Portal site, so it is recommended that you gain Drupal experience and PHP knowledge before you start creating modules.

Important:

- You are not permitted to include any IBM® API Connect modules within any custom modules that you create. Also, directly editing any API Connect themes, modules, included modules, or Drupal core on the file system is not permitted or supported, as edited versions of these files are overwritten when a fix pack or iFix is installed.
- All custom development is your responsibility. Although the use of custom modules and themes is supported, IBM API Connect do not provide support in their development or modification.

---

## Object-Oriented Programming (OOP)

OOP is established as best practice for development, so ensure your knowledge of OOP is good. The PHP documentation on [Classes and Objects](#) is a good place to start. For a general overview of PHP best practices, see [PHP The Right Way](#). The following resources are also helpful:

- [Object-oriented programming](#) (on Wikipedia)
- [Object Oriented Programming with PHP](#) (on phpro.org)
- [Object-Oriented PHP for Beginners](#) (on tutstplus.com)
- [Object Oriented Programming in PHP](#) (on tutorialspoint.com)

Drupal also uses some common design patterns, so you need to ensure you have a basic understanding of these. See the following pattern resources:

- [The Factory Pattern](#) (on [phptherightway.com](#)), and [Late Static Bindings](#) (on [php.net](#))
- [Software design pattern](#) (on Wikipedia)
- [Programming Foundations: Design Patterns](#) (on [lynda.com](#))

---

## PHP namespaces

You must be familiar with the concept of namespaces in PHP. In most cases, the Drupal code is namespaced based on the module that code belongs to.

For example, the namespace for `block.module` is:

```
namespace Drupal\block;
```

When you create Drupal modules, it is important to consider that PHP has a global namespace, and that function names must be unique. You are recommended to prefix the name of any methods with the module name.

For example, if you have a module that is named `custom_module`, a `create` method within it is called `custom_module_create()`.

For more information about namespaces, see the following resources:

- [Drupal namespace standards](#) (on [drupal.org](#))
- [How to use PHP namespaces](#) (on [sitepoint.com](#))
- [PHP Namespaces](#) (on [php.net](#))

---

## Dependency injection

It is important that you have a baseline understanding of dependency injection. Drupal makes heavy use of this concept, so you will need this understanding to be able to access and make use of many of the core APIs.

To find out more about dependency injection, see [Dependency Injection](#) (on [phptherightway.com](#)), as well as the additional articles that are linked to on that page. See also [Services and dependency injection in Drupal](#) (on [drupal.org](#)).

---

## Symfony

Symfony is a set of reusable PHP components and a PHP framework for web projects. Drupal borrows from this framework in order to reduce code duplication across various PHP projects. Much of the code that Drupal uses to handle routing, sessions, and the services container, amongst other things, is borrowed from Symfony.

To understand how Symfony works, see the [Symfony Documentation](#) on [symfony.com](#).

---

## Other useful resources

- <https://api.drupal.org/api/drupal/core%21core.api.php/group/annotation/9.1.x> - list of the different annotation types that Drupal uses for plugin discovery, and to provide additional context/meta-data for the code that's being executed.
- [Plugin API overview](#) - overview about how plugins are used in Drupal.

---

---

# Custom module development: creating a module skeleton

You can extend your Developer Portal site by creating custom modules. The starting point for a new module is to create a module skeleton.

---

## Before you begin

You must have administrator access to complete this task.

You must also have experience in Drupal and PHP development. For more information, see [Custom module development: an introduction to Drupal tools for PHP development](#) and [Custom module development: background and prerequisites](#).

Important:

- You are not permitted to include any IBM® API Connect modules within any custom modules that you create. Also, directly editing any API Connect themes, modules, included modules, or Drupal core on the file system is not permitted or supported, as edited versions of these files are overwritten when a fix pack or iFix is installed.
- All custom development is your responsibility. Although the use of custom modules and themes is supported, IBM API Connect do not provide support in their development or modification.

## About this task

Every custom module creation starts with creating an `.info.yml` file. This file, or module skeleton, is used to store the metadata about the custom theme. After the module skeleton is created, the module can be installed onto your site by using the Extend menu on the administrator dashboard of the Developer Portal UI. However, without any module specific code, your site won't be affected.

The following instructions guide you through creating a custom module skeleton. What to do next in your custom module creation depends on what you want your module to do. Options are shown at the end of this task.

## Procedure

1. Choose a short name, also known as a machine name, for your custom module.

The machine name is used in several files and functions in your module, as well as by Drupal core to programmatically refer to your module. The name must conform to the following rules:

- It must start with a letter.
- It must contain only lower-case letters and underscores. (Note that if upper-case letters are used in the name, Drupal won't recognize any hook implementations in your module.)
- It must not contain any spaces.
- It must be unique within your Developer Portal site.
- It should not be any of the following reserved terms: `src`, `lib`, `vendor`, `assets`, `css`, `files`, `images`, `js`, `misc`, `templates`, `includes`, `fixtures`, `Drupal`.

2. Create a module folder in a location of your choice, for example, `/modules/module_name`.

You don't have to name the folder the same name as your module machine name, however, you must remember to use the machine name programmatically within your module's code and filenames.

3. Create a `module_name.info.yml` file in your module folder.

Where `module_name` is the short name, or machine name, that you chose in Step 1.

4. Insert the metadata for your custom module into the `module_name.info.yml` file as follows:

```
name: Example module name
description: Description of the module.
package: Custom

type: module
core: 8.x
core_version_requirement: '^8 || ^9'
version: 1.0

dependencies:
  - module_name

test_dependencies:
  - module_name

configure: example.settings

php: 7.1

hidden: true
```

where

- **name** (required) is the name of your module, and is the text that is shown on the module administration page in the Developer Portal UI.
- **description** (optional) is a description of your module, and is the text that is shown on the module administration page in the Developer Portal UI.
- **package** (optional) is a key that enables you to group similar modules together.
- **type** (required) is the type of extension that you are creating, for example, a module, theme or profile. In this instance you are creating a module.
- **core** (optional) specifies with which Drupal core version your module is compatible.
- **core\_version\_requirement** (required) specifies which versions of Drupal your module is compatible with. This example specifies that the module is compatible with all versions of Drupal 8 and 9.
- **version** (required) is the version number of your module. Note that **version** is not required if you are publishing your module on Drupal.org.
- **dependencies** (optional) is a YAML list of any modules that your module depends on. They must be namespaced in the format `module_name`, where `module_name` is the module's machine name.
- **test\_dependencies** (optional) is list of any modules (in the same format as **dependencies**) that are needed to run certain automated tests for your module on Drupal's automated test runner (DrupalCI), but are not needed as module dependencies in general.
- **configure** (optional), if your module offers a configuration form, specify the route to this form here.
- **php** (optional) is the minimum PHP version that is required for your module. For the Developer Portal the minimum PHP version is 7.1.
- **hidden** (optional) is an option that, if set, will hide your module from the Extend section of the administrator dashboard on the Developer Portal UI. This option might be useful if your module only contains tests, or if the module is meant as an example to other developers.

5. Save your `module_name.info.yml`.

## Results

You successfully created your module skeleton.

## Example

An example `.info.yml` file:

```
name: User field example
type: module
description: Developer Portal tutorial about a user field example
package: IBM API Connect Tutorials
core: 8.x
core_version_requirement: '^8 || ^9'
version: 8.x-0.0.1
dependencies:
```

```
- ibm_apim
- auth_apic
```

## What to do next

---

You now need to create the appropriate content for your custom module, depending on what you want the module to do. For information about the various options, see [Creating custom modules](#) on Drupal.org. There is also a walkthrough example of creating a basic custom module that is available on Drupal.org, see: [A "Hello World" custom page module](#).

Note: If you are defining URL paths in the routing file of your module, you must consider any potential implications of those paths, and avoid conflicts with other parts of the Developer Portal. For example, you are recommended not to prefix any paths with `ibm_apic`.

After you have created your custom module content, you need to package your custom module files up into a zip, tar, tgz, gz, or bz2 file. This file can then be installed onto your Developer Portal site by using the Extend menu on the administrator dashboard. For more information, see [Installing custom modules](#).

## Related information

---

---

## Custom module development: using hooks

You can use hooks in custom modules to alter the behavior of Drupal core or other modules in your Developer Portal.

Custom modules enable you to extend the functionality of your Developer Portal site. For more information about how to create custom modules, see [Custom module development: an introduction to Drupal tools for PHP development](#), and [Custom module development: background and prerequisites](#).

Hooks are one of the ways that custom modules can use to interact with other modules and with Drupal core subsystems. The following sections provide an overview of hooks, and a list of the IBM® API Connect specific hooks.

Important:

- You are not permitted to include any IBM API Connect modules within any custom modules that you create. Also, directly editing any API Connect themes, modules, included modules, or Drupal core on the file system is not permitted or supported, as edited versions of these files are overwritten when a fix pack or iFix is installed.
- All custom development is your responsibility. Although the use of custom modules and themes is supported, IBM API Connect do not provide support in their development or modification.

## About hooks

---

Hooks define functions that alter the behavior of Drupal core. So one way for custom modules to alter these functions, is to use hooks. Hooks are specially-named functions that a module defines (this is known as *implementing the hook*), these hooks are then discovered and called at specific times to alter or add to the base behavior or data (this is known as *invoking the hook*). Each hook has a name (for example: `hook_batch_alter()`), a defined set of parameters, and a defined return value. Your custom modules can implement hooks that are defined by Drupal core, by API Connect, or by other modules that they interact with. Your custom modules can also define their own hooks, in order to let other modules interact with them. For more information, see [Understanding Hooks](#) on Drupal.org.

Note: If you write a hook implementation function, the function must not throw errors or exceptions, or use `alert` level log messages. Errors, exceptions, and `alert` level log messages can break all the processing in the parent code. For example, if you write a hook that calls an external server when an application is updated, the code needs to have error handling in place to handle the server not being found, or not returning the expected result. Otherwise, Drupal stops parsing the function and the application might not get updated correctly. It can cause webhook and snapshot parsing to abort leaving the portal in an inconsistent state.

For a list of all the hooks that are available on Drupal core, and how to implement them in your custom module, see [Drupal API Hooks](#).

For a list of all the API Connect specific hooks, see the following section.

## Using hooks in custom modules

---

To invoke a hook you need to add a function to your `.module` file in your custom module, and prefix the hook with your custom module name. For example, when using an API Connect hook in a custom module, you must replace the word `hook` in the hook name with the name of your custom module. For example:

`hook_apic_app_create`

should be referenced in your custom module as:

`moduleName_apic_app_create`

See also the following example `.module` file that shows a custom module called `user_field_example`:

```
/**
 * Implementation of hook_form_alter() to alter the Sign up form
 */
function user_field_example_form_alter(&$form, FormStateInterface $form_state, $form_id) {
  if ($form_id === 'user_register_form') {
    // add our validator to the #validate array for the user_register_form
    $form['#validate'][] = 'user_field_example_validate_department_code';
  }
}
```

```

/**
 * Validate the Department code field on the Sign up form.
 *
 * Valid entry = DEPnnn
 * where n = single figure digit.
 */
function user_field_example_validate_department_code($form, &$form_state) {
  if (isset($form_state->getValue('field_department_code')[0]['value'])) {
    $dept_code = $form_state->getValue('field_department_code')[0]['value'];
    $valid = preg_match('/^DEP\d{3}$/i', $dept_code);
    if (!$valid) {
      // if the value is not valid then set an inline error on the relevant field
      $form_state->setErrorByName('field_department_code', t('Invalid department code.'));
    }
  }
}

```

## API Connect specific hooks

The following tables list the hooks that are specific to the API Connect Developer Portal. Each section contains a link to the .php file on the API Connect Developer Portal repository on GitHub for those hooks. This file contains examples of how you can use the hooks in your modules.

Note: From IBM API Connect Version 2018.4.1.10, hooks `hook_apic_app_delete` and `hook_consumerorg_delete` are deprecated, and are replaced by the following hooks:

- `hook_apic_app_pre_delete`
- `hook_apic_app_post_delete`
- `hook_consumerorg_pre_delete`
- `hook_consumerorg_post_delete`

### Hooks about Applications

The following table lists the hooks relating to Applications in the Developer Portal. For examples of how to use Application hooks, see [apic\\_app/apic\\_app.api.php](#) on GitHub.

Table 1. Hooks about Applications

| Hook name   | Description   |
|---|---|
| <code>hook_apic_app_create</code>                           | Triggered when an Application is created.   |
| <code>hook_apic_app_update</code>                           | Triggered when an Application is updated.   |
| <code>hook_apic_app_delete</code>                           | Triggered when an Application is deleted. Note: This hook is deprecated from IBM API Connect Version 2018.4.1.10.   |
| <code>hook_apic_app_pre_delete</code>                       | Triggered when an Application is deleted, before the node deletion or cascade has happened.   |
| <code>hook_apic_app_post_delete</code>                      | Triggered when an Application is deleted, after the node deletion or cascade has happened.  |
| <code>hook_apic_app_promote</code>                          | Triggered when an Application is promoted.  |
| <code>hook_apic_app_creds_create</code>                     | Triggered when a new set of credentials is created for an Application.  |
| <code>hook_apic_app_creds_update</code>                     | Triggered when a set of credentials is updated for an Application.  |
| <code>hook_apic_app_creds_delete</code>                     | Triggered when a set of credentials is deleted for an Application.  |
| <code>hook_apic_app_subscribe</code>                        | Triggered when a subscription is created.   |
| <code>hook_apic_app_migrate</code>                          | Triggered when a subscription is migrated to a new Plan.  |
| <code>hook_apic_app_unsubscribe</code>                      | Triggered when an Application is unsubscribed from a Plan.  |
| <code>hook_apic_app_image_create</code>                     | Triggered when a custom Application image is created.   |
| <code>hook_apic_app_image_delete</code>                     | Triggered when a custom Application image is deleted.   |
| <code>hook_apic_app_clientid_reset</code>                   | Triggered when a credential client ID is reset.   |
| <code>hook_apic_app_clientsecret_reset</code>               | Triggered when a credential client secret is reset.   |
| <code>hook_apic_app_modify_getplaceholderimage_alter</code> | Alter the Application placeholder image provided in <code>\Drupal\apic_app\Application::getPlaceholderImage()</code> . Can be used to define a specific placeholder image to use when the consumer has not uploaded their own custom image for their Application. |
| <code>hook_apic_app_modify_getimageforapp_alter</code>      | Alter the Application placeholder image provided in <code>\Drupal\apic_app\Application::getImageForApp()</code> . Can be used to provide a full path to a specific image to use for an Application that overrides any custom image that might have been uploaded. |
| <code>hook_apic_app_modify_clientid_reset_alter</code>      | Alter the client ID provided by API Manager when the ID is reset.   |
| <code>hook_apic_app_modify_clientsecret_reset_alter</code>  | Alter the client secret provided by API Manager when the secret is reset.   |
| <code>hook_apic_app_modify_credentials_create_alter</code>  | Alter the credentials provided by API Manager when a new Application is created.  |
| <code>hook_apic_app_modify_credentials_create_alter</code>  | Alter the credentials provided by API Manager when new credentials are created.   |

### Hooks about Consumer organizations

The following table lists the hooks relating to Consumer organizations in the Developer Portal. For examples of how to use Consumer organization hooks, see [consumerorg/consumerorg.api.php](#) on GitHub.

Table 2. Hooks about Consumer organizations

| Hook name                            | Description  |
|--------------------------------------|--|
| <code>hook_consumerorg_create</code> | Triggered when a Consumer organization is created.   |
| <code>hook_consumerorg_update</code> | Triggered when a Consumer organization is updated.   |
| <code>hook_consumerorg_delete</code> | Triggered when a Consumer organization is deleted. Note: This hook is deprecated from IBM API Connect Version 2018.4.1.10. |

| Hook name                    | Description  |
|------------------------------|--|
| hook_consumerorg_pre_delete  | Triggered when a Consumer organization is deleted, before the node deletion or cascade has happened. |
| hook_consumerorg_post_delete | Triggered when a Consumer organization is deleted, after the node deletion or cascade has happened.  |

Hooks about APIs

The following table lists the hooks relating to APIs in the Developer Portal. For examples of how to use API hooks, see [apic\\_api/apic\\_api.api.php](#) on GitHub.

Table 3. Hooks about APIs

| Hook name            | Description                       |
|----------------------|-----------------------------------|
| hook_apic_api_create | Triggered when an API is created. |
| hook_apic_api_update | Triggered when an API is updated. |
| hook_apic_api_delete | Triggered when an API is deleted. |

Hooks about Products

The following table lists the hooks relating to Products in the Developer Portal. For examples of how to use Product hooks, see [product/product.api.php](#) on GitHub.

Table 4. Hooks about Products

| Hook name           | Description                          |
|---------------------|--------------------------------------|
| hook_product_create | Triggered when a Product is created. |
| hook_product_update | Triggered when a Product is updated. |
| hook_product_delete | Triggered when a Product is deleted. |

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

# Installing custom modules

You can extend your Developer Portal site by installing custom modules that you created, and also installing contributed modules from the Drupal community.

## Before you begin

You must have administrator access to complete this task.

## About this task

You can add extra functions to your site by installing new custom or contributed modules. For more information on creating custom modules, see [Custom module development: background and prerequisites](#). Contributed modules are modules that are contributed by Drupal community members. To search for contributed modules, go to [Drupal Download & Extend](#). You can install both types of modules into your Developer Portal site by using the following instructions.

## Procedure

1. If the administrator dashboard is not displayed, click Manage to display it.
2. In the administrator dashboard, click Extend.  
The List tab for the Extend page opens, and the list of installed modules is displayed. The list shows all the modules that are installed. The modules that are displayed with a selected checkbox are enabled, the modules that are displayed without a selected checkbox are not enabled.
3. Click + Install new module, and either complete the Install from a URL field, or click Choose file to upload a *filename.tar.gz* module file from your local computer.
4. Click Install.  
The Update manager confirms that the module was installed successfully.
5. Click Enable newly added modules to return to the List tab for the Extend page.
6. Find your newly added module in the list of modules, select its checkbox, and click Enable.  
Your newly added module is now enabled and available for you to use in the Developer Portal.

Note: The following modules are unsupported and their installation is blocked in the Developer Portal:

- `backup_migrate`
- `content_sync`
- `delete_all`
- `devel_themer`
- `domain`
- `php`
- `theme_editor`

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Deleting custom modules

You can delete custom modules from your Developer Portal if you want to remove them entirely from your site.

### Before you begin

---

You must have administrator access to complete this task.

Note that any custom modules that you want to delete must be disabled first, including disabling any associated sub-modules. For more information, see [Disabling modules](#). Any modules that are shipped with IBM® API Connect cannot be deleted.

### Procedure

---

1. Log in to the Developer Portal as an administrator.
2. If the administrator dashboard is not displayed, click Manage to display it.
3. In the administrator dashboard, click Extend.
4. Click the Delete tab.  
The list of disabled custom modules that can be deleted is displayed. Note that any disabled modules that have sub-modules that are still enabled, are prevented from being disabled.
5. After you have found the module that you want to disable, select the check box next to the module, then click Delete.
6. At the confirmation dialogue, select Delete to delete the module completely from your site, or select Cancel to cancel the operation.

### Results

---

You successfully deleted the module.

### What to do next

---

To install a module, see [Installing custom modules](#).

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Disabling modules

You can disable an entire module in the Developer Portal if you want to improve performance, or remove functionality.

### Before you begin

---

You must have administrator access to complete this task.

Note that the disable process removes all data related to a module.

### Procedure

---

1. Log in to the Developer Portal as an administrator.
2. If the administrator dashboard is not displayed, click Manage to display it.
3. In the administrator dashboard, click Extend.  
The List tab for the Extend page opens, and the list of installed modules is displayed. The list shows all the modules that are installed, some of which are enabled (displayed with a selected check box), and some of which are not enabled (where the check box is not selected).
4. Click the Disable tab.  
The list of modules that can be disabled is displayed. Note that any modules that are required by other enabled modules, are prevented from being disabled.
5. Either enter the name of the module that you want to disable in the Filter by name or description field, or scroll through the list of modules.
6. After you have identified the module that you want to disable, select the check box next to the module, then click Disable.
7. At the confirmation dialogue, select Disable to disable the module and remove any data that relates to it, or select Cancel to cancel the operation.

### Results

---

You successfully disabled the module.

### What to do next

---

To enable a module, return to the List tab, select the check box next to the module that you want to enable, and click Enable.

You can also delete custom modules completely from your Developer Portal site; see [Deleting custom modules](#).

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Troubleshooting guide for the Developer Portal

Use this guide to help you diagnose and resolve some of the more common Developer Portal issues in IBM® API Connect Version 2018. For example, why is the Developer Portal not connecting to the Management server, why is my site not created, and why can't I log in?

### About

---

The following sections provide advice about how to diagnose and resolve some common problems. This information can help you to identify whether a specific IBM API Connect Version 2018 component is failing, whether it's an environmental problem, and whether you should raise a support request. Some advice includes reviewing specific log files so you can narrow down the source of the problem. If you need to raise an IBM Support Service Request (formerly known as PMRs) these logs, along with all of the logs that are described on the [IBM API Connect Mustgather - Portal 2018](#), must be supplied to the IBM Support team. If any of the issues relate to interactions with the Management server, then logs from the Management server also need to be supplied, see [Mustgather for Management server 2018](#).

1. [Why is the Developer Portal not connecting to the Management server?](#)
2. [Why is my Developer Portal site not being created?](#)
3. [Why can't I register a user?](#)
4. [Why can't I login?](#)
5. [Why are changes to Products not appearing in the Developer Portal?](#)
6. [Why am I having problems with my Developer Portal user interface?](#)
7. [Why am I have problems with my Kubernetes system?](#)
8. [Why am I having problems with my Developer Portal backup?](#)
9. [Why am I having problems installing Drupal 8 based custom modules or sub-themes into the Drupal 9 based Developer Portal?](#)

### Why is the Developer Portal not connecting to the Management server?

---

Problems with connecting to the Management server can be due to connectivity or TLS issues. You should check the following areas:

- Can the Management server actually reach the Developer Portal?
- Is SSL pass-through enabled or required on any load balancer that sits between the Management server and the Developer Portal? For more information, see [Setting the security mode of the Portal Director](#).

If you need to open a Service Request, include the following information:

- The [IBM API Connect Mustgather - Portal 2018](#) logs
- Details of the date and time that the connection attempts were made.

### Why is my Developer Portal site not being created?

---

If you are having problems creating a site, you should take the following actions to help diagnose the issue:

1. Tail the nginx container log to confirm that the site create request reached the portal, for example:

```
kubectl logs rb93d4fb118-apic-portal-nginx-7c7b464fb6-vvx5m
```

2. Look in the container log for a site create request, for example:

```
POST /portal-service-configuration-create HTTP/1.1" 200
```

- a. If you don't find a site create request in the log, then the create request is not reaching the Developer Portal from the Management. Follow the instructions in [Why is the Developer Portal not connecting to the Management server?](#) to diagnose the connectivity issues.
- b. If a site create request is in the log, then further diagnostics can be found in the admin pod log, for example:

```
kubectl logs -f rb93d4fb118-apic-portal-www-p4bhj -c admin
```

Look in the admin pod log for messages that refer to `create_site`, as well as the name of the site.

### Why can't I register a user?

---

If you are having problems registering a user, take the following actions to help diagnose the issue:

- The user registration links in the emails are only valid for 24 hours, so check that the system time is correctly configured across all of the pods.
- If emails aren't being received, check that the email server is correctly configured; see [Configuring an email server for notifications](#). Also, if possible, check whether other emails such as publish approval alerts or password reset emails are being received.

If you need to open a Service Request, please take the following steps:

1. Note which user registry type is being used, such as Local User Registry (LUR), or LDAP user registry.
2. Enable the debug REST server and method trace in the Developer Portal UI. Click Configuration > Development > IBM Development on the administrator dashboard. Then select the Enable method entry / exit trace and Enable API Manager REST interface debug check boxes. Click Save configuration.
3. Re-create the issue, making a note of the time, the username, and any messages displayed on the screen.
4. Gather the web container log for the www pod, for example:

```
kubectl logs portal-apic-portal-www-zhqxf web > web.log
```

For more information, see [IBM API Connect Mustgather - Portal 2018](#).

## Why can't I login?

If users are having problems with logging in to the Developer Portal, please take the following steps before opening a Service Request:

1. Note which user registry type is being used, such as Local User Registry (LUR), or LDAP user registry.
2. Enable the debug REST server and method trace in the Developer Portal UI. Click Configuration > Development > IBM Development on the administrator dashboard. Then select the Enable method entry / exit trace and Enable API Manager REST interface debug check boxes. Click Save configuration.
3. Recreate the issue, making a note of the time, the username, and any messages printed to the screen.
4. Gather the web container log for the www pod, for example:

```
kubectl logs portal-apic-portal-www-zhqxf web > web.log
```

For more information, see [IBM API Connect Mustgather - Portal 2018](#).

## Why are changes to Products not appearing in the Developer Portal?

To determine whether the problem is with the Portal server (either the nginx or the www pod), the Management server, or the network, please make the following diagnostic checks.

Portal nginx pod

1. Tail the nginx pod log on the Portal, for example:

```
kubectl logs -f portal-apic-portal-nginx-866c977c4c-n9gbf
```

2. Make a publish request to the Catalog (note that the request must be a Publish or Retire operation, not a Stage operation).
3. In the log being tailed, see if the following message appears:

```
...POST /event-create...
```

If the POST message appears in the nginx log, then the publish webhook that was sent from the Management server did arrive at the Portal. If there is an error message in place of a POST message, then the problem is likely to be with the nginx pod. If there is no message at all, then it's likely that the webhook from the Management server is not reaching the Portal and there is a network problem.

Portal www pod

1. Tail the www pod admin container log on the Portal, for example:

```
kubectl logs -f portal-apic-portal-www-dtbzw -c admin
```

2. Make a publish request to the Catalog (note that the request must be a Publish or Retire operation, not a Stage operation).
3. In the log being tailed, see if the following message appears:

```
Received webhook event 'product_lifecycle' for catalog
```

If no such message appears, it suggests that the webhook is either not arriving at the Portal, or not getting beyond the nginx pod (see the previous section [Portal nginx pod](#)). Any errors that the admin container has in processing the webhook will be logged in the www pod admin container log.

Management server apim pod

1. Tail the apim pod log on the Management server, for example:

```
kubectl logs -f apiconnect-apim-v2-86b464c4f5-4cx6r
```

2. Make a publish request to the Catalog (note that the request must be a Publish or Retire operation, not a Stage operation).
3. In the log being tailed, see if there any error messages.

Search for the word 'sending', you should see the message **webhook: sending successful** if the webhook is sent, or error messages indicating why if the webhook is not sent.

## Why am I having problems with my Developer Portal user interface?

If you are having user interface (UI) problems, make the following checks:

- Try clearing the cache from your browser, try using private browsing, and try using different browsers - see whether there are any differences in behavior.
- Check your browser window size and screen resolution, and try increasing and decreasing the settings.
- Investigate the browser developer tools console and network tabs, as they might provide some diagnostic clues.
- Try clearing the Drupal caches from within the Developer Portal; see [Clearing the server caches](#) for details.

If you need to open a Service Request, along with the [IBM API Connect Mustgather - Portal 2018](#) logs, also include details of the time and date when the problem was reproduced. In addition, an export of the browser developer tools console and network output would be helpful.

## Why am I have problems with my Kubernetes system?

Kubernetes provides a DNS server as one of the pods in the kube-system namespace (unless you have configured your Kubernetes setup differently), and sometimes this DNS server can silently fail. When the Portal www or db pods restart, they check that their own hostname and IP address is in the service that is defined for the pod. If the DNS server is down, this check fails. An indication that the DNS server is down is seeing the following log lines printed endlessly in the admin or db containers:

```
[ admin stdout] 2cd141dc:2cd141dc:2cd141dc 2018-10-08 07:27:54: service-ready:
[ admin stdout] 2cd141dc:2cd141dc:2cd141dc 2018-10-08 07:27:54: service-all:
[ admin stdout] 2cd141dc:2cd141dc:2cd141dc 2018-10-08 07:27:54: Waiting for sleep in service all check. Pid(s) 352 Seconds
24
[ admin stdout] 2cd141dc:2cd141dc:2cd141dc 2018-10-08 07:27:59: Finished waiting for sleep in service all check. Pid(s)
352 Seconds 29
```

```
[ admin stdout] 2cd141dc:2cd141dc:2cd141dc 2018-10-08 07:28:01: WARNING 5: r4c09b98d02-apic-portal-admin-all doesn't include this pod or r4c09b98d02-apic-portal-director does. Checking again in 5 seconds.
```

To fix this problem, delete the DNS pod in the kube-system namespace to force it to restart, for example:

```
kubect1 -n kube-system delete pod kube-dns-b76db4f7f-n41vt
```

Where `kube-dns-b76db4f7f-n41vt` is the full name of the DNS pod.

Note: To find out the full name of the DNS pod in your Kubernetes system, run the following command:

```
kubect1 -n kube-system get pods
```

This command will return data like the following example:

```
$ kubect1 -n kube-system get pods
NAME READY STATUS RESTARTS AGE
default-http-backend-5bccfbd8c-mjnnb 1/1 Running 0 4d
etcd-minikube 1/1 Running 0 4d
kube-addon-manager-minikube 1/1 Running 0 4d
kube-apiserver-minikube 1/1 Running 0 4d
kube-controller-manager-minikube 1/1 Running 0 4d
kube-dns-6f4fd4bdf-7zslq 3/3 Running 0 4d
kube-proxy-mcdmj 1/1 Running 0 4d
kube-registry-proxy-99qml 1/1 Running 0 4d
kube-registry-v0-zt8pv 1/1 Running 0 4d
kube-scheduler-minikube 1/1 Running 0 4d
kubernetes-dashboard-77d8b98585-dczcs 1/1 Running 0 4d
nginx-ingress-controller-57bcfc76d6-z775d 1/1 Running 0 4d
storage-provisioner 1/1 Running 0 4d
tiller-deploy-587df449fb-bpwhq 1/1 Running 0 4d
```

## Why am I having problems with my Developer Portal backup?

If you attempt to back up your portal system or site:

```
apicup subsys exec <portal_subsystem> backup-system|backup-site|backup-all
```

You might encounter the following message:

```
curl: (6) Could not resolve host: apic-portal-apic-portal-director
```

This error is the result of a failure of the SFTP backup file transfer to the backup system, caused by missing authentication with the portal node. To correct this error, `ssh` from the backup system to the portal node, and accept the authentication key when prompted:

1. Enter the portal-www admin container, for example:

```
kubect1 exec -it WWW_POD_NAME -c admin bash
```

2. `ssh` to your backup server and accept any authentication prompts, for example:

```
ssh BACKUP_SERVER_HOSTNAME
```

When you have successfully authenticated with your backup server, you can close the session. This action needs to be done only once. Portal back ups can then run without any issues.

## Why am I having problems installing Drupal 8 based custom modules or sub-themes into the Drupal 9 based Developer Portal?

From IBM API Connect 2018.4.1.17, the Developer Portal is based on the Drupal 9 content management system. If you want to install Drupal 8 custom modules or sub-themes into the Drupal 9 based Developer Portal, you must ensure that they are compatible with Drupal 9, including any custom code that they contain, and not using any deprecated APIs, for example. There are tools available for checking your custom code, such as [Drupal check](#) on GitHub, which checks Drupal code for deprecations.

For example, any Developer Portal sites that contain modules or sub-themes that don't contain a Drupal 9 version declaration will fail to upgrade, and errors like the following output will be seen in the `admin` logs:

```
[ queue stdout] 14834 729319:355ec8:a7d29c 2021-09-04 20:34:49: check_d9_compat: Checking theme: emeraldgreen
[ queue stdout] 14834 729319:355ec8:a7d29c 2021-09-04 20:34:49: check_d9_compat: ERROR: Incompatible
core_version_requirement '' found for emeraldgreen
[ queue stdout] 14834 729319:355ec8:a7d29c 2021-09-04 20:34:49: check_d9_compat: Checking theme: rubyred
[ queue stdout] 14834 729319:355ec8:a7d29c 2021-09-04 20:34:49: check_d9_compat: ERROR: Incompatible
core_version_requirement '8.x' found for rubyred
[ queue stdout] 14834 729319:355ec8:a7d29c 2021-09-04 20:34:49: check_d9_compat: ERROR: Found themes incompatible with
Drupal 9: emeraldgreen rubyred
[ queue stdout] 14834 729319:355ec8:a7d29c 2021-09-04 20:34:49: check_d9_compat: ERROR: /tmp/restore_site.355ec8 is NOT
Drupal 9 compatible
...
[ queue stdout] 14834 729319:355ec8:a7d29c 2021-09-04 20:44:49: check_d9_compat: Checking module: custom_mod_1
[ queue stdout] 14834 729319:355ec8:a7d29c 2021-09-04 20:44:49: check_d9_compat: ERROR: Incompatible
core_version_requirement '' found for custom_mod_1
[ queue stdout] 14834 729319:355ec8:a7d29c 2021-09-04 20:44:49: check_d9_compat: Checking module: custom_mod_2
[ queue stdout] 14834 729319:355ec8:a7d29c 2021-09-04 20:44:49: check_d9_compat: ERROR: Incompatible
core_version_requirement '8.x' found for custom_mod_2
[ queue stdout] 14834 729319:355ec8:a7d29c 2021-09-04 20:44:49: check_d9_compat: ERROR: Found modules incompatible with
Drupal 9: emeraldgreen rubyred
[ queue stdout] 14834 729319:355ec8:a7d29c 2021-09-04 20:44:49: check_d9_compat: ERROR: site1.com is NOT Drupal 9
compatible
```

To fix version compatibility errors, all custom modules and sub-themes should declare a `core_version_requirement` key in their `*.info.yml` file that indicates Drupal 9 compatibility. For example:

```
name: Example module
type: module
description: Purely an example
core: 8.x
core_version_requirement: '^8 || ^9'
package: Example module
```

```
# Information added by Drupal.org packaging script on 2020-05-31
version: '8.x-1.3'
project: 'example_module'
datestamp: 1590905415
```

This example specifies that the module is compatible with all versions of Drupal 8 and 9. For more information, see [Let Drupal know about your module with an .info.yml file](#) on the drupal.org website.

If you have a backup of a site that you need to restore, and are getting the version compatibility error, but the module or theme \*.info.yml file cannot be changed easily, then you have two options. Either:

- Add an environment variable for the `www` pod of the `admin` container stating `SKIP_D9_COMPAT_CHECK: "true"`. However, if you choose this method, you must be positive that all of the custom modules and themes for your sites are Drupal 9 compatible, as otherwise the sites may end up inaccessible after the upgrade or restore. Add the environment variable by using the following instructions:
  - Create an extra values file to contain the environment variable, as follows:

```
apic-portal-www:
  admin:
    env:
      SKIP_D9_COMPAT_CHECK: "true"
```

Save the file as `d9compat.yaml`, and run the following command:

```
apicup subsys set <portal_subsystem_name> extra-values-file d9compat.yaml
```

Then, update the portal with the updated setting by running the following command:

```
apicup subsys install <portal_subsystem_name>
```

Or:

- Extract the site backup, edit the relevant files inside it, and then tar the backup file again. Note that this procedure will overwrite the original backup file, so ensure that you keep a separate copy of the original file before you start the extraction. For example:

```
1. mkdir /tmp/backup
2. cd /tmp/backup
3. tar xfz path_to_backup.tar.gz
4. Edit the custom module and theme files to make them Drupal 9 compatible, and add the correct core_version_requirement setting.
5. rm -f path_to_backup.tar.gz
6. tar cfz path_to_backup.tar.gz
7. cd /
8. rm -rf /tmp/backup
```

## Related information

---

- [IBM Support](#)

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Setting the security mode of the Portal Director

You can set the security mode of the Portal Director for a Developer Portal service in your API Connect on-premise cloud.

### About this task

---

By default, the Portal Director rest server is started in **secure** mode, meaning that requests to it are carried out using mutual TLS (mTLS). In order for this process to work, any load balancer on the Portal Director must allow SSL pass-through so that client certificates that are sent on incoming requests reach the Director and can be checked. In certain scenarios, it might not be possible for a load balancer to provide SSL pass-through. In that case, the Portal Director must be set to **Insecure** mode so that client certificates on incoming requests are not checked.

**Warning:** It is not recommended to run Portal Directors in production Developer Portal services in **Insecure** mode.

To configure the security mode of the Portal Director belonging to a Developer Portal service in your cloud, complete these steps:

### Procedure

---

1. Get a list of the pods that are running on the virtual machine where the Developer Portal service is deployed.

```
kubectl get pods -n <namespace>
```

2. Identify the `portal-www` pod from the resulting list then set the Portal Director's security mode to **Insecure** with the following command:

```
kubectl exec <portal-www-pod> -c admin -- /opt/ibm/services/node_modules/portal/client/client
director_security_mode --secure false
```

## Results

---

The Portal Director is now set to **Insecure** mode. Any new incoming requests are not checked for a valid client certificate.

## What to do next

---

To set the Portal Director back to **Secure** mode, use the following command:

```
kubect1 exec <portal-www-pod> -c admin -- /opt/ibm/services/node_modules/portal/client/client
director_security_mode --secure true
```

For more information on security settings, including cookies, see [How to enable penetration testing, and information about Developer Portal cookies](#).

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Migrating your Developer Portal from Version 5 to Version 2018

Guidance on how to migrate a Developer Portal site from IBM® API Connect Version 5, to IBM API Connect Version 2018.

In IBM API Connect Version 2018 the Developer Portal is based on the open source Drupal 9 content management software, which enables more advanced, flexible, and powerful customization capabilities. However, in IBM API Connect Version 5 the Developer Portal is based on Drupal 7. The migration tooling in Version 2018 will create a new Developer Portal site, and migrate all of the associated APIs and Products, user information, and subscriptions over. However, customizations such as modules and themes cannot be automatically migrated, as the Drupal 9 baseline is very different to Drupal 7. For more information about upgrading from a Drupal 7 baseline to a Drupal 9 baseline, see [Upgrading Drupal](#) in the Drupal documentation.

The following sections take you through the migration process for the Developer Portal, and provide guidance on how to manually migrate any specific customizations to Drupal 9.

- [Migration process for the Developer Portal](#)
- [Portal Delegated User Registries](#)
- [Custom themes](#)
- [Custom modules](#)
- [Custom Rules](#)
- [Custom content types and fields](#)
- [Advanced theme development](#)
- [Changing the page layout](#)
- [Changing the front page](#)
- [Features no longer available in the Developer Portal](#)

Note: The ability to migrate is available only from IBM API Connect Version 5.0.8.7 onwards. If your deployment is at an earlier version, you must upgrade before migrating. See [Upgrading your API Connect cloud](#) for information about upgrading in Version 5. For more information about the supported versions for migration, see [Migrating a Version 5 deployment to Version 2018](#).

---

## Migration process for the Developer Portal

The migration process for the Developer Portal migrates all of the following information to Version 2018 for each site in your cluster:

- User information (if Portal Delegated User Registry is enabled, the process is slightly different; see [Portal Delegated User Registries](#)).
- Products and APIs.
- Consumer organizations.
- Applications.
- Subscriptions.

For information about the main migration process, see [Migrating a Version 5 deployment to Version 2018](#).

---

## Portal Delegated User Registries

If your IBM API Connect Version 5 Developer Portal uses Portal Delegated User Registry (PDUR), you must first export the user information that is stored in the Version 5 Developer Portal local database. This user information can then be fed into the migration tooling so that the correct user registries can be created in Version 2018.

For more information, see [Exporting Portal Delegated User Registry user information](#).

---

## Custom themes

If your Version 5 Developer Portal is using a custom theme, you'll need to create the custom theme again for the Drupal 9 baseline. Start by creating a sub-theme of the new Version 2018 Developer Portal site by using the theme generator, and then manually customize the sub-theme to your specifications for Drupal 9 by using Cascading Style Sheets (CSS), or Sass CSS (SCSS). Note that using SCSS in your theme makes it far simpler to change colors. We've also added a color template theme generator, which means you can quickly generate a base color theme on which to build your customized site branding. For more information, see [Creating a sub-theme](#).

Note, directly editing the API Connect theme is not permitted or supported, as edited versions of these files are overwritten when a fix pack or iFix is installed.

Other useful resources:

- [Tutorial: Creating a custom theme for the Developer Portal](#) - takes you through how to use the theme generator, customize a theme, and install a custom theme.

- [Changing the site logo](#) - how to change your site logo.
- [Changing the shortcut icon](#) - how to change the shortcut icon (favicon).
- [Creating sub-themes](#) - Drupal documentation about creating sub-themes.
- [Theming differences between Drupal 6, 7 & 8](#) - Drupal documentation about theming differences.

## Custom modules

---

If your Version 5 Developer Portal is using any custom modules, you will need to create these custom modules again for the Drupal 9 baseline. For more information on writing custom modules, see [Extend](#).

Other useful resources:

- [Creating custom modules](#) - Drupal documentation about creating custom modules.
- [Getting started creating custom modules](#) - Drupal documentation giving background information and prerequisites needed for custom module development.
- [Understanding hooks](#) - Drupal documentations about hooks.
- [Drupal API hooks](#) - Drupal documentation about the hooks that are available.

## Custom Rules

---

If your Version 5 Developer Portal is using any custom Rules, you will need to create them as custom modules for the Drupal 9 baseline. You cannot export the Drupal 7 Rules, and then import them into the Drupal 9 baseline, as the events and actions are implemented in a different way. For more information about custom modules, see the section about [Custom modules](#).

## Custom content types and fields

---

If you've created custom content in your Version 5 Developer Portal, you can export the following custom content types:

- Any custom fields added to APIs, Applications, Products, Consumer Organizations, or users.
- Any custom image files for Applications, APIs, or Products.
- Any attachment files added to APIs or Products.

When the migration tooling is available, you can then import this content into your Version 2018 Developer Portal. For information about exporting custom content from Version 5, see [How to export custom Developer Portal content](#).

Any other custom types or fields content that you've created in Version 5, will need to be created again for the Drupal 9 baseline. For information about creating custom content types, see the following topics:

- [Creating content types](#)
- [Adding fields to content types](#)
- [Adding custom fields to user records](#)

## Advanced theme development

---

If your Version 5 Developer Portal is using modified content type templates, you must create these templates again for the Drupal 9 baseline. In Drupal 9 the templates are Twig files that define the actual HTML output for a particular piece of content. You can override a Twig template by copying the original template into the templates folder of your custom sub-theme, and then editing the template to your specification. The Developer Portal then uses your template in preference to the original one. For more information, see [Applying a modified content type template](#), and [Creating a sub-theme](#). You can also follow a guided example of how to create a new theme, see [Tutorial: Creating a custom theme for the Developer Portal](#).

Note:

Modifying Twig templates allows very fine-grained control over the structure of pages. However, it also means you might miss new features and defect fixes that are made to the original templates, as your Developer Portal is using your overrides instead of the originals. So, if you override a template, it is your responsibility to check the templates in the latest API Connect Version 2018 releases, and to ensure that any equivalent changes that are needed to your overrides to maintain functional equivalence are made.

## Changing the page layout

---

If your Version 5 Developer Portal is using a different page layout, you will need to create this layout again for the Drupal 9 baseline. The page layout is defined by configuring which blocks appear in which regions. Blocks are controlled by using the Structure\_>Block layout options on the Developer Portal administrator dashboard.

For information about how to configure the page layout, see [Adding and changing the blocks displayed on Developer Portal pages](#).

## Changing the front page

---

If your Version 5 Developer Portal is using a different front page, you will need to create this front page again for the Drupal 9 baseline. The front page is configured from the Structure\_>Pages options on the Developer Portal administrator dashboard.

For information about how to configure the front page, see [Configuring the front page](#), and [Adding custom pages](#).

Further options that you might want to consider when designing your front page include:

- Change the banner block content or image: [Changing the front page banner block](#).
- Display featured API Products by creating a featured content block: [Changing the front page Featured Content block](#).
- Create custom blocks with your own HTML content: [Adding and changing the blocks displayed on Developer Portal pages](#).
- Set up the social block to include your organization Twitter feed: [Integrating Twitter data into the social block](#).

## Features no longer available in the Developer Portal

---

The following features that are available in IBM API Connect Version 5, are not available in IBM API Connect Version 2018:

- Security questions - these can now be created inside an OpenID Connect provider.
- Two-factor authentication - this can now be performed inside an OpenID Connect provider.
- Support tickets - no Drupal 9 equivalent module is currently available.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Developer Portal tutorials

Tutorials for using the Developer Portal.

The following guided examples help you through some of the most common user scenarios in the Developer Portal, as well as some of the more complex areas.

## Tutorial: Creating the Developer Portal

### About this task

In this tutorial, you are going to complete the following lessons:

### Enabling the Developer Portal through the API Manager

By proceeding with the following steps, you create an administrator account:

1. Log in to the API Manager
2. Click Manage, then click Add, and select Create a catalog.
3. From the drop-down **Select user**, then enter a **Title** for your catalog, for example `Production`.

← Create Catalog

### Create Catalog

Enter the catalog summary details; you can fully configure the catalog after you create it

**Select user**

apic demo (apicdemo1), apicdemo1@outlook.com

**Title**

Production

**Name**

production

Cancel Create

4. Click Create.

IBM API Connect  
API Manager

## Manage

A catalog hosts a collection of API products that are visible in the associated developer portal when published

Production

Sandbox  
Sandbox Catalog

5. Click your new catalog, for example **Production**.

6. In Production, click  Settings.
7. Click Gateway Services. If it says **No items found**, click Edit, select **gateway\_service\_1**, and click Save.

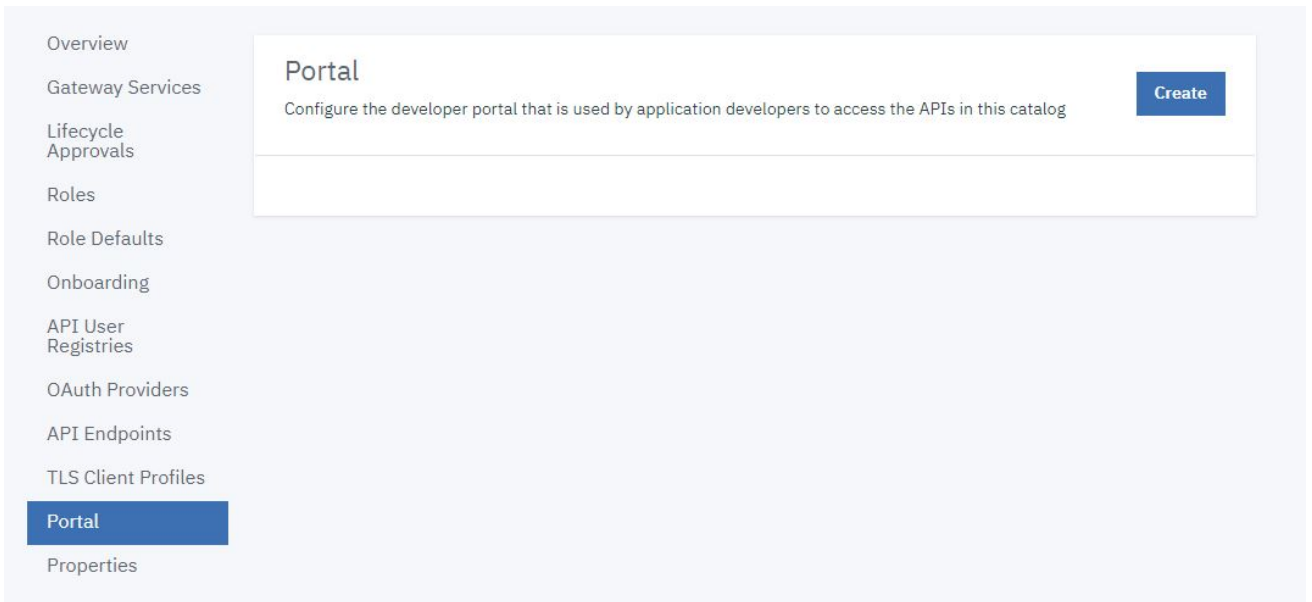

← Manage / Production

### Enable Gateway Services

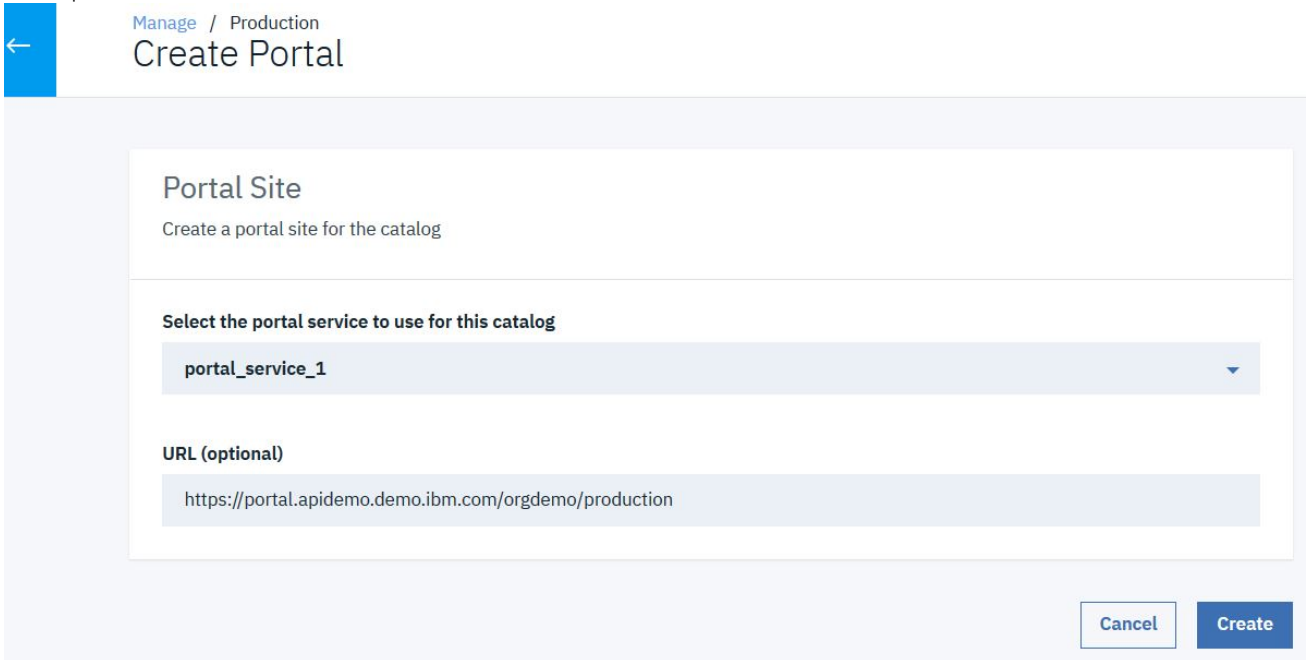

| <input checked="" type="checkbox"/> | TITLE             | TYPE                  |
|-------------------------------------|-------------------|-----------------------|
| <input checked="" type="checkbox"/> | gateway_service_1 | DataPower API Gateway |

Cancel Save

8. Click Portal.
9. Click Create.

10. Select a portal service to use. Click Create.

After a few minutes, you receive an email with a link to your Developer Portal site for that catalog. The link is a single use only link for the administrator account.

Administrator ([admin](#)).

Your Developer Portal site has been created. You can log in as the '[admin](#)' user by using the following one-time log in link. After you have logged in with the following link, you must change the password for the '[admin](#)' user account immediately.

[https://portal.apidemo.demo.ibm.com/production/production/user/reset/1/1566308312/5QdHaGExu2\\_M5cAx1FcchbpvDhf9xHLiyX\\_I9ZMYIQ/new](https://portal.apidemo.demo.ibm.com/production/production/user/reset/1/1566308312/5QdHaGExu2_M5cAx1FcchbpvDhf9xHLiyX_I9ZMYIQ/new)

11. Click the email link. Click Sign in.

This is a one-time login for *admin*.  
 Click on this button to log in to the site and change your password.  
 This login can be used only once.

[Sign in](#)

12. Change the password. Click Submit.

### Change your password

Change your password.

# Tutorial: Creating a private Developer Portal site

You can create a private version of the Developer Portal, so that authenticated users only can access content on the site. You might want to do this if you want to restrict public access to your content unless they are logged in.

---

## Before you begin

You must have a Developer Portal enabled, and you must have administrator access to complete this tutorial. The tutorial [Creating the Portal](#) explains how to enable the portal if you have not already done so.

---

## About this tutorial

In this tutorial, you are going to restrict access for all the content to authenticated users only. This gives access to all users from **Content Author** to **Superuser**, as they are all required to authenticate to access their roles. You will then add the login form to the home page, so that public users will be able to view the public home page that contains the login form only.

This tutorial takes you through the following steps:

1. [Export your configuration settings](#).
2. [Restrict all permissions to authenticated users](#).
3. [Restrict blocks to authenticated users](#).
4. [Add login form to the home page](#).

---

## Export your configuration settings

In case you make an error, or want to revert all of the changes made during this tutorial, you can back up your configuration settings to your machine before you make any changes.

1. Log in to your Developer Portal as an administrator.
2. If the administrator dashboard isn't displayed, click Manage to display it.
3. Navigate to Configuration > Development > Configuration synchronization > Export.
4. Click **Export**.

---

## Restrict all permissions to authenticated users

1. If the administrator dashboard isn't displayed, click Manage to display it.
2. Navigate to People > Permissions.
3. Clear all check boxes that are associated with **ANONYMOUS USER**.
4. Click **Save permissions** at the end of the page.

---

## Restrict blocks to authenticated users

1. If the administrator dashboard isn't displayed, click Manage to display it.
2. Navigate to Structure > Block layout.
3. Find the row that is labeled **Main menu** and click **Configure**.
4. Find the setting **Roles** under the category **Visibility**.
5. Check the box **Authenticated user**.
6. Click **Save block**.
7. Repeat from step 3 for the **Footer menu**.
8. Click **Save blocks**.

---

## Add login form to the home page

1. If the administrator dashboard isn't displayed, click Manage to display it.
2. Navigate to Structure > Pages.

3. Click **Edit** beside the **Welcome** page.
4. Navigate to **Panels**, **Content**.
5. Click + **Add new block**.
6. Find and click **User login**, under the **FORMS** section.
7. Clear the **Display title** check box.
8. Click **Add block**.
9. Rearrange the new login block so that it is underneath the **Welcome Banner**.
10. Click **Update and save**.

## What you did in this tutorial

---

On your Developer Portal, you restricted access for all the content to authenticated users only. Now when you access your home page as an unauthenticated user, you see that the login form appears underneath the welcome banner. Navigating to other URLs on the site presents an **unauthorized** page to appear.

When you log in, the login form disappears from the home page and you are able to access all of the pages that are visible to your role.

## What to do next

---

If you exported your configuration and now want to revert to your configuration as it was before this tutorial, then complete these steps:

1. Navigate to **Configuration**, **Development**, **Configuration synchronization**, **Import**.
2. Click **Chose file** and select your exported backup.
3. Click **Upload**.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

# Tutorial: Creating Accounts and Applications on the Developer Portal

---

This tutorial shows you how to create a developer account and register an application on the Developer Portal.

## Before you begin

---

You must have a Developer Portal installed, and created and published at least one API product.

If you do not have a Developer Portal available, complete the tutorial [Creating a Developer Portal](#).

If you do not have an API product available, complete the tutorial [Importing an API](#).

## About this task

---

In this tutorial you are going to complete the following lessons:

- [Creating a developer account in the Developer Portal](#)
- [Creating a developer application in the Developer Portal](#)
- [Testing the Branches API in the Developer Portal](#)

Note: The administrator account cannot create an App, or register to an App. To create or register to an App, you must have a developer account. A developer account that has been assigned administrator privileges can create and register Apps.

## Creating a developer account in the Developer Portal

---

Take the following steps to create a developer account:

1. Open a Developer Portal at the previously specified URL, then click **Create an account** and complete the fields. If the **Create an account** link is not visible, log out as **Admin** from the Developer Portal first.  
Note: Your email is used as your user name for the Developer Portal. The email address must be different from the address used for creating the administrator account.
2. Go to the home page of the Developer Portal
3. Click **Create an account**.
4. Complete the sign up form. The email address you provide must be functional. Click **Sign up**. A confirmation message is sent to the email address provided in the form.

Consumer organization \*

Password \*

Password strength: Fair

Confirm password \*

Your password meets the password policies required for this site

What code is in the image? \*

[Sign up](#)

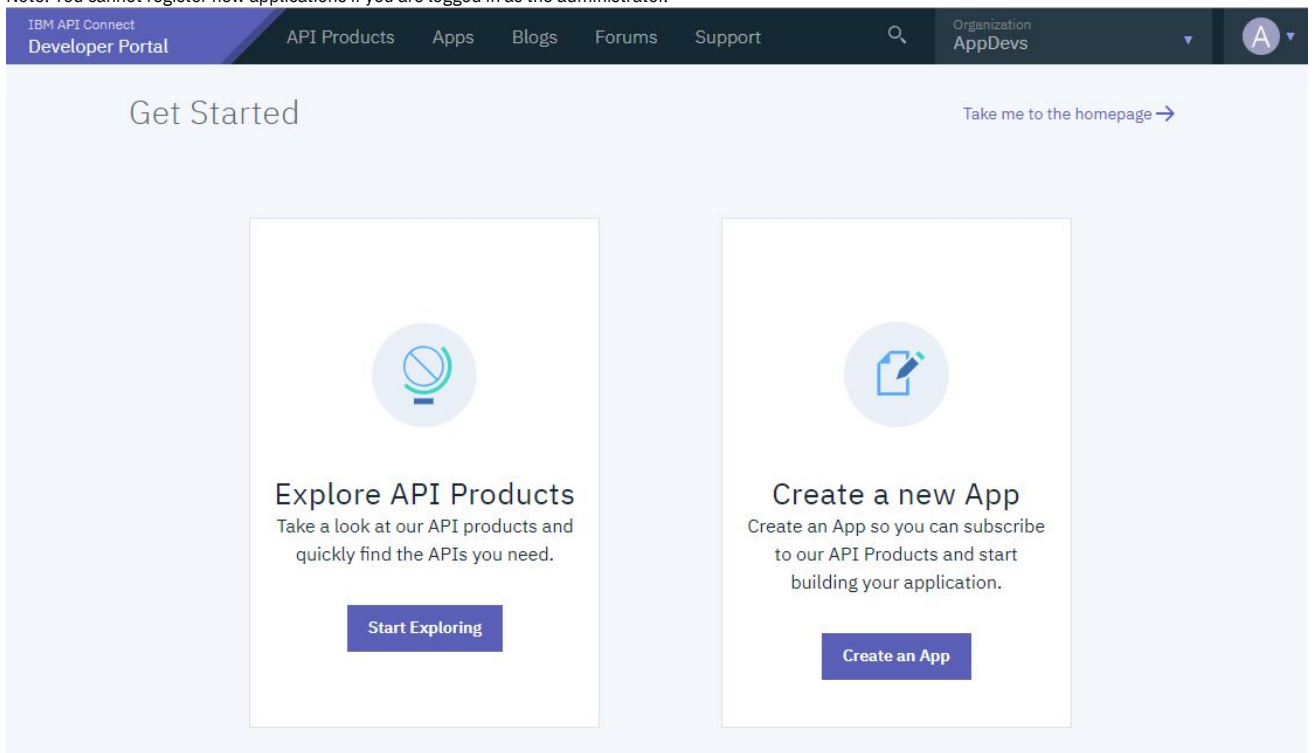

Already have an account? [Sign in](#)

5. Click the account activation link in the confirmation email to activate your account.
6. To use the Developer Portal, click Login and sign in with the user credentials you specified.

## Creating a Developer Portal Application

To create and register a new App:

1. In the Developer Portal, click Create an App.  
Note: You cannot register new applications if you are logged in as the administrator.

The screenshot shows the IBM API Connect Developer Portal interface. The top navigation bar includes 'IBM API Connect Developer Portal', 'API Products', 'Apps', 'Blogs', 'Forums', 'Support', a search icon, and a user profile icon for 'Organization AppDevs'. The main content area is titled 'Get Started' and features two prominent cards. The first card, 'Explore API Products', includes a magnifying glass icon and a 'Start Exploring' button. The second card, 'Create a new App', includes a document icon and a 'Create an App' button. A link 'Take me to the homepage' is located in the top right corner of the main content area.

2. Enter the following values for the application that is being registered.

Table 1. Values for registering the application

| Field Name                        | Value              |
|-----------------------------------|--------------------|
| Title                             | AppOne             |
| Application OAuth Redirect URL(s) | http://example.com |

Create a new application

Title \*

AppOne

Description

Application OAuth Redirect URL(s)

http://example.com

Add another item

Cancel Submit

3. Click Submit.

4. The opportunity to discover the key and secret for the new app is presented. Click Show to see and take note off these values.

Application created successfully.

## What you did in this tutorial

In this tutorial, you completed the following activities:

- Created a developer account in the Developer Portal.
- Created and registered a new App, and subscribed it to a Plan.
- Tested an API in the Developer Portal.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Tutorial: Creating a custom theme for the Developer Portal

Customize the appearance of your Developer Portal home page, by generating a sub-theme, configuring the overrides.css file, and installing the newly customized theme.

---

### Before you begin

You must have a Developer Portal enabled, and you must have administrator access to complete this tutorial. The tutorial [Creating the Portal](#) explains how to enable the portal if you have not already done so.

Important: You're not permitted to include any IBM® API Connect code within any custom themes that you create.

---

### About this tutorial

The way to create a custom theme is to create a custom sub-theme of the standard API Connect theme that the Developer Portal uses by default. The sub-theme inherits all of the resources of the parent theme, and you can then override specific resources to configure the required customizations.

This tutorial takes you through the following lessons:

1. [Creating a sub-theme](#) by using the theme generator.
2. [Customizing the overrides.css file](#).
3. [Installing and enabling your customized theme](#).

---

### Creating a sub-theme

1. Log in to your Developer Portal as an administrator.
2. If the administrator dashboard isn't displayed, click Manage to display it.
3. Click Appearance > Generate sub-theme. The Generate sub-theme window is displayed.
4. Enter a Sub-theme name, and select CSS for the Sub-theme type. (If you prefer, you can select SCSS, but this extension to CSS is for advanced theme developers, and isn't covered by this tutorial.)

## Generate sub-theme ☆

List Generate Update Settings

Home » Administration

The first step in customizing the branding of your Developer Portal is to create a custom sub-theme.

The sub-theme inherits all of the resources of the parent theme, and you can then override specific resources in the overrides.css file to configure your customizations. For more information, see: [Knowledge Center](#)

Complete the form below and you will be presented with a custom sub-theme to download.

**Sub-theme name \***

banka\_theme

A custom theme name, for example: 'mycustom\_theme' or 'banka\_theme'. The name does not need to end in '\_theme' but it is a common convention.

**Sub-theme type**

CSS

SCSS

Your sub-theme can be setup to use either CSS or SCSS. SCSS is an extension to CSS and is for more advanced theme developers.

**Template**

Your sub-themes can use one of several different base templates, either the default connect\_theme, or one of several different color variants.

Generate

5. Select the Default template to base your sub-theme on. You can create a sub-theme based on a color template, however, for this tutorial we'll use the default connect\_theme template.
6. Click Generate.
7. Download the generated sub-theme to a location of your choice, and extract all the files from the .zip file.

## Customizing the overrides.css file

1. Open the overrides.css file in your chosen editor (the file is located in the css folder of the sub-theme that you downloaded).
2. Customize your sub-theme by entering the following elements into the overrides.css file:

```
/* Body of the home page */
body.path-frontpage.contexthome {
  color: #152935;
  background-color: #d1f0f7;
}

/* Header of the home page */
.navbar {
  background-color: #a0a0a0;
}

/* Footer of the home page */
footer.footer {
  background-color: #dee0e2;
}

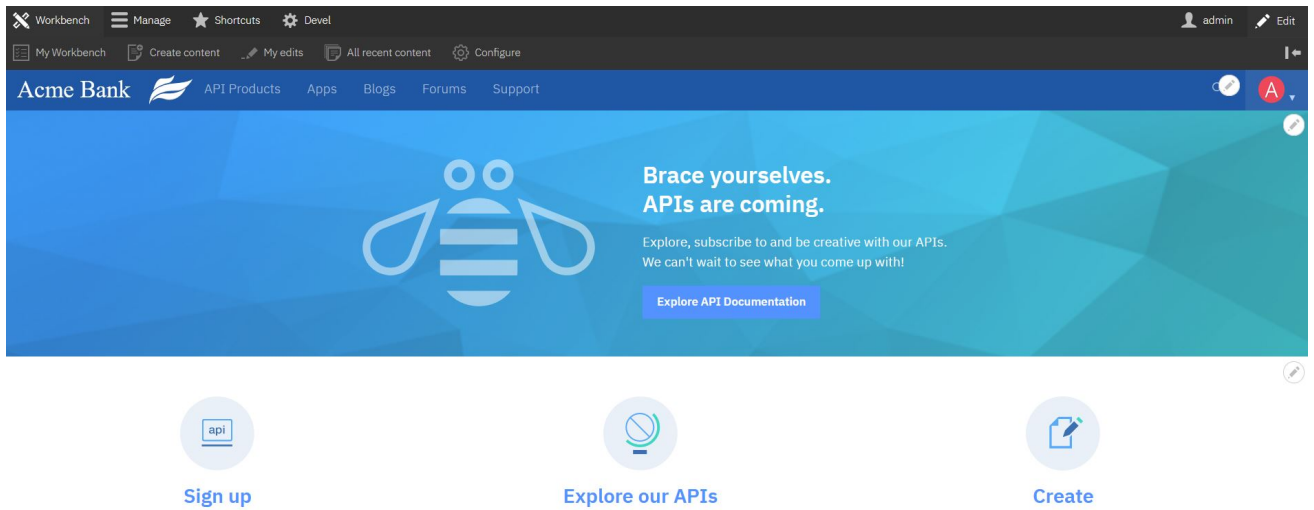

footer.footer ul.nav > li > a {
  color: #454A4C;
}
```

3. Save the overrides.css file.

## Installing and enabling your customized theme

1. After you have finished updating the overrides.css file, compress all the theme files back into the .zip sub-theme file that you downloaded originally. Note that you can also include your own custom logo and favicon in your theme files, and these are then included as part of your theme when it is installed. These files must use the naming convention logo.svg, and favicon.ico, respectively. You can also change your logo and favicon at a later time, see [Changing the site logo](#) and [Changing the shortcut icon](#).
2. In the Developer Portal, click Appearance > Install new theme. The Install new theme window is displayed.
3. In Upload a module or theme archive to install click Choose file, and select your newly updated compressed theme file.
4. Click Install to install the theme onto your site.
5. Click Enable newly added themes, and find your new theme in the list of Disabled themes. Click Enable and set as default to set your new custom sub-theme as the default theme for your site.
6. Return to the Developer Portal home page by clicking Back to site in the upper left of the screen. You can now see your custom theme.

## What you did in this tutorial

In this tutorial, you completed the following tasks:

- Created a sub-theme of your Developer Portal site by using the theme generator.
- Configured some customized home page elements in the `overrides.css` file of your sub-theme.
- Uploaded and installed your customized theme in your Developer Portal site.
- Successfully customized the appearance of your Developer Portal home page.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details. For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Tutorial: Using avatars

You can use an avatar generator to better represent the branding of your site, and add a sense of community for your users, than the default name initial that is provided in the Developer Portal.

### Before you begin

You must have a Developer Portal enabled, and you must have administrator access to complete this tutorial. The tutorial [Creating the Portal](#) explains how to enable the portal if you have not already done so.

### About this tutorial

In this task, you add the **Robohash** avatar generator to your Developer Portal site, and assign it as the primary avatar generator for all users.

This tutorial takes you through the following steps:

1. [Install the Robohash avatar generator.](#)
2. [Set Robohash as the preferred avatar generator for your site.](#)
3. [Configure the permissions for the Robohash avatar generator.](#)

The avatar of the admin user displays like this before the block is added.

### Enable the Robohash avatar generator

1. Log in to your Developer Portal as an administrator.
2. If the administrator dashboard isn't displayed, click **Manage** to display it.
3. Click **Extend**.

- In the text box, enter `avatar` in the **Block description**.
- Check the **Robohash** box, click Enable.

[+ Install new module](#)

avatar

Enter a part of the module name or description

Below is a list of installed modules. Modules that are installed and enabled are shown with a selected check box. To enable a module,

▼ AVATARS

|                                     |                      |   |
|-------------------------------------|----------------------|---|
| <input type="checkbox"/>            | <b>Adorable</b>      | ▶ Adds an Adorable.io avatar generator for Avatar Kit.        |
| <input checked="" type="checkbox"/> | <b>Avatar Kit</b>    | ▶ Provides a selection of generated avatars for users.        |
| <input type="checkbox"/>            | <b>Gravatar</b>      | ▶ Adds Gravatar.com avatar generators for Avatar Kit.         |
| <input checked="" type="checkbox"/> | <b>Letter Avatar</b> | ▶ Adds a letter avatar generator based on the name of a user. |
| <input checked="" type="checkbox"/> | <b>Robohash</b>      | ▶ Adds Robohash avatar generators for Avatar Kit.             |

[Enable](#)

When the module is enabled, you receive a **Module Robohash has been enabled** message.

## Set Robohash as the preferred avatar generator for your site

- If the administrator dashboard isn't displayed, click Manage to display it.
- Navigate to Configuration > People > Avatar settings.
- Click **+ Add avatar generator**.
- Enter `Robohash` as the label.
- Check **Robohash** for the avatar generator.
- Click Save

**Label \***

Robohash

**Avatar generator \***

**Letter Avatar**

Letter generated by the LetterAvatar library.

**Robohash**

Robots and monsters from Robohash.org

**User preference**

Avatar generator calculated based on user preference.

**User upload**

Image uploaded by the user to the site.

[Save](#)

- You are then taken to the **Edit avatar generator Robohash** page. Select **Type: Robot Heads** and **Background: Transparent**. Click Save.

**Label \***

Robohash

**Type**

- Robots
- Robot Heads
- Monsters

**Background**

- Transparent
- Places
- Patterns

Save

[Delete](#)

8. You are now on the avatar generator page. Drag **Robohash** to be first in the list, and check **Enabled**, then click Save configuration.

You have now set **Robohash** as the preferred avatar generator for your site.

## Configure the permissions for the Robohash avatar generator

The default setting for the **Robohash** avatar generator is to generate avatars for users with **superuser** access only. In this example, the permissions are changed so that all **authenticated users** can access **Robohash**.

1. If the administrator dashboard isn't displayed, click Manage to display it.
2. Navigate to People > Permissions.
3. Find **Use Robohash** under the permission type **Avatar Kit**.
4. Check **AUTHENTICATED USER** for **Use Robohash** to enable the generator for all authenticated users.

Notice that all the boxes to the right of this user type are then automatically checked because all of those users have the same permissions as an authenticated user, or higher.

| PERMISSION  | ANONYMOUS USER           | AUTHENTICATED USER                  | FORUM MODERATOR                     | CONTENT AUTHOR                      | ADMINISTRATOR                       | SUPERUSER                           |
|---|--------------------------|-------------------------------------|-------------------------------------|-------------------------------------|-------------------------------------|-------------------------------------|
| Change own logout threshold   | <input type="checkbox"/> | <input type="checkbox"/>            | <input type="checkbox"/>            | <input type="checkbox"/>            | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> |
| <b>Avatar Kit</b>   |                          |                                     |                                     |                                     |                                     |                                     |
| Administer Avatar Kit<br><i>Warning: Give to trusted roles only; this permission has security implications. Manage settings for Avatar Kit.</i> | <input type="checkbox"/> | <input type="checkbox"/>            | <input type="checkbox"/>            | <input type="checkbox"/>            | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> |
| Use Letter Generator<br>User can select Letter Generator avatar generator.  | <input type="checkbox"/> | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> |
| Use Robohash<br>User can select Robohash avatar generator.  | <input type="checkbox"/> | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> |

5. Click Save permissions.

## What you did in this tutorial

The avatars of all users now have the **robohash** avatar.

You can check that the avatar of the admin user has changed by looking at your site page.

You can check that the avatars of other users have changed by finding their published content and looking for their avatar. Or, you can navigate to Manage > People, click a user, and see their avatar on their profile page.

**First Name**  
firstnametest

**Last Name**  
lastnametest

**Member for** 2 weeks 1 day

**Picture**

---

## What to do next

You can disable the **robohash** avatar generator.

1. Navigating to Extend > Disable module.
2. Search for **avatar** in the filter text box.
3. Check **Robohash**, click Disable
4. Click Disable.

You can also disable the **robohash** avatar generator by clearing it within Configuration > People > Avatar settings, or, lowering its preference by dragging it lower in the list order. Click Save configuration.

## Tutorial: Using image optimization

You can use image optimization on your Developer Portal site to enhance the use of images.

Optimized images do not overload your website and significantly increase its performance compared to using the original images. Your customer satisfaction and brand reputation improve with fast-loading and trimmed visual assets. Automatic optimization can save time and effort on editing and content moderation.

---

## Before you begin

You must have a Developer Portal enabled, and you must have administrator access to complete this tutorial. The tutorial [Creating the Portal](#) explains how to enable the portal if you have not already done so.

---

## About this tutorial

In this task, you create an image style that is called `User picture`, and give it a scale and crop effect. Then, use the `User picture` as the **Picture** field in the user account.

This tutorial takes you through the following steps:

1. [Create the image style `User picture`](#).
2. [Edit the image style `User picture`](#).
3. [Assign `User picture` to the `picture` option in `Account settings`](#).

## Create the image style `User picture`

1. Log in to your Developer Portal as an administrator.
2. If the administrator dashboard isn't displayed, click **Manage** to display it.
3. Navigate to **Configuration > Media > Image styles**.
4. Click **+ Add image style**.
5. Enter `User picture` in the **Image style name** block. Click **Create new style**

### Add image style ☆

[Home](#) » [Administration](#) » [Configuration](#) » [Media](#) » [Image styles](#)

**Image style name \***

Machine name: `user_picture` [\[Edit\]](#)

**Create new style**

You created the image style `User picture`.

## Edit the image style `User picture`

When you edit this style, you choose the width and height settings. Also, the part of the picture to retain during the crop, for example, the center.

1. If the administrator dashboard isn't displayed, click **Manage** to display it.
2. Navigate to **Configuration > Media > Image styles**.
3. Click **Edit** on the `User picture` style name.

### Edit style `User picture` ☆

**Edit**

[Translate image style](#)

[Home](#) » [Administration](#) » [Configuration](#) » [Media](#) » [Image styles](#)

**Preview**

original (view actual size)

600px

800px

**Image style name \***

Machine name: `user_picture` [\[Edit\]](#)

**EFFECT**

Select a new effect ▼

**Add**

**Save**

[Delete](#)

4. Select **Scale and crop** from **Select a new effect**, then click **Add**.
5. Enter **300** in the **Width** and **Height** boxes. Leave the **Anchor** as the middle setting. Click **Add effect**.

Scale and crop will maintain the aspect-ratio of the original image, then crop the larger dimension.

**Width \***  
300 pixels

**Height \***  
300 pixels

**Anchor**

|                       |                                  |                       |
|-----------------------|----------------------------------|-----------------------|
| <input type="radio"/> | <input type="radio"/>            | <input type="radio"/> |

| <input type="radio"/> | <input type="radio"/>            | <input type="radio"/> |

The part of the image that will be retained during the crop.

**Add effect** **Cancel**

6. Click Save.

You edited the image style **User picture**.

## Assign User picture to the picture option in Account settings

1. If the administrator dashboard isn't displayed, click Manage to display it.
2. Navigate to Configuration > People > Account settings > Manage display, then click Compact tab.

**Manage display** ☆

Settings Manage fields Manage form display **Manage display** Translate account settings

Default **Compact**

Home > Administration > Configuration > People > Account settings > Manage display

+ Add group

| FIELD   | LABEL      | FORMAT |   | Show row weights |
|---------|------------|--------|---|------------------|
| Picture | - Hidden - | Image  | Image style: Thumbnail (100x100)<br>Linked to content | ⚙️               |

3. On the **Picture** row, click ⚙️.
4. Select **User picture** from the **Image style** drop-down.
5. Click Update and Save.

You set the **User picture** image style for all accounts.

## What you did in this tutorial

You changed your account settings so that if the user displays a picture it is within the limits of the image style **User picture**.

To check the picture used by a user, navigate to Manage > People, click a user, and see their picture on their profile page. Right-click the image, then click **View image info**, you can see that the dimensions are scaled.

|                  |   |
|------------------|---|
| Type:            | JPEG Image                              |
| Size:            | 29.95 KB (30,667 bytes)                 |
| Dimensions:      | 620px × 413px (scaled to 240px × 160px) |
| Associated Text: | Profile picture for user apicdemo1      |

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details. For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Tutorial: Adding a Back to top button

You might want to add a Back to top button, as a navigation enhancement to help your Developer Portal users get back to the top of the page that they are viewing, instead of scrolling.

### Before you begin

---

You must have a Developer Portal enabled, and you must have administrator access to complete this tutorial.

### About this tutorial

---

In this tutorial, you add a Back to top button to your Developer Portal.

Before you begin, ensure that the **Back to top** module is installed and enabled:

1. Log in to your Developer Portal as an administrator.
2. If the administrator dashboard isn't displayed, click **Manage** to display it.
3. Click **Extend**.
4. In the text box, enter `back to top` in the **Block description**.
5. Check the **Back To Top** box, click **Enable**.

### Configure the Back to top module

---

1. If the administrator dashboard isn't displayed, click **Manage** to display it.
2. Navigate to **Configuration > User interface > Back to Top**.

**Back To Top** ☆

Home > Administration > Configuration > User interface

Prevent on mobile and touch devices  
Do you want to prevent Back To Top on touch devices?

Prevent on administration pages and node edit  
Do you want to prevent Back To Top on admin pages?

Prevent on front page  
Do you want to prevent Back To Top on front page?

**Trigger**  
  
Set the number of pixel which trigger the Back To Top button default: 100

**Placement**  
  
Where should the Back To Top button appear?

**Button text**  
  
Set the text of the Back To Top button

3. Change any settings as required, or keep the defaults.
4. Click **Save configuration**

You now have a Back to Top button.

## Tutorial: Adding a zoom effect

You can configure an **Image to Intense** option on your Developer Portal to give a zoom effect to your images.

Adding a zoom effect to the images on your Developer Portal can enhance the user experience.

### Before you begin

You must have a Developer Portal enabled, and you must have administrator access to complete this tutorial. The tutorial [Creating the Portal](#) explains how to enable the portal if you have not already done so.

### About this tutorial

In this task, you configure the image field of Article content types to use the zoom effect. Then, create an Article that uses an image, and test the zoom effect.

Before you begin, ensure that the **Intense images** module is installed and enabled:

1. Log in to your Developer Portal as an administrator.
2. If the administrator dashboard isn't displayed, click **Manage** to display it.
3. Click **Extend**.
4. In the text box, enter `Intense images` in the **Block description**.  
Note: If the **Intense images** module does not appear in the list see, [Installing custom modules](#).
5. Check the **Intense images** box, click **Enable**.

This tutorial takes you through the following steps:

1. [Configure the image field of Article content types to use the zoom effect.](#)
2. [Create an Article with an image.](#)
3. [Test the zoom effect.](#)

### Configure the image field of Article content types to use the zoom effect

1. Log in to your Developer Portal as an administrator.
2. If the administrator dashboard isn't displayed, click **Manage** to display it.
3. Navigate to **Structure > Content types > Article > Manage** display.
4. In **Image field Format**, select **Blazy** from the drop-down.
5. Click the edit icon .
6. In **Media Switcher** select **Image to Intense**, then click **Update**.

[+ Add group](#)

| FIELD | LABEL      | FORMAT |
|-------|------------|--------|
| Image | - Hidden - |        |

Format settings: **Blazy**

|                       |                         |                    |                          |
|-----------------------|-------------------------|--------------------|--------------------------|
| Image style           | Large (480x480)         | Responsive image   | - None -                 |
| <b>MEDIA SWITCHER</b> |                         |                    |                          |
| Media switcher        | <b>Image to Intense</b> | Use CSS background | <input type="checkbox"/> |
| Lightbox image style  | - None -                | Thumbnail style    | - None -                 |
| Aspect ratio          | - None -                | Lightbox caption   | - None -                 |

7. Click **Save**.

You changed the **Image field Format** for Article content types to use the zoom effect.

### Create an Article with an image

1. If the administrator dashboard isn't displayed, click **Manage** to display it.
2. Navigate to **Content > Add content > Article**.
3. Enter a title for your article, upload an image, and provide **Alternative text** for the image. Click **Save**.

You created an article and added an image.

### Test the zoom effect

1. If the administrator dashboard isn't displayed, click **Manage** to display it.
2. Click **Content**.
3. Click the Article that you created.
4. Hover your cursor over the article's image, the cursor turns into a cross, and if you click the image it enlarges.

You tested the zoom effect on the article that you created.

## What you did in this tutorial

You successfully configured the image field of Article content types to use the zoom effect. Then, created an Article that uses an image, and tested the zoom effect.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Tutorial: Creating a drop-down menu link

You can create and use drop-down menus, or nested menus, to enhance the use of your Developer Portal .

### Before you begin

You must have a Developer Portal enabled, and you must have administrator access to complete this tutorial. The tutorial [Creating the Portal](#) explains how to enable the portal if you have not already done so.

### About this tutorial

In this tutorial, you create a drop-down menu link on the **Main navigation** menu.

Note:

Although drop-down menu links can be created in the Developer portal, the drop-down menu doesn't expand by default. To make the drop-down menu expand, you need to use the **Superfish** module.

This tutorial takes you through the following steps:

1. [Add menu links to the main navigation menu.](#)
2. [Make the drop-down menu expand by using the Superfish module.](#)

The front page **Main navigation** displays like this before the changes are made.

### Add menu links to the main navigation menu

1. Log in to your Developer Portal as an administrator.
2. If the administrator dashboard isn't displayed, click **Manage** to display it.
3. Navigate to **Structure > Menus > Main navigation > Add link**
4. Enter **API's** in the **Menu link title**. Enter **/api** in the **Link**. Check **Show as expanded**, then click **Save**.  
Note: Ensure **Show as expanded** is checked as this is the parent link for the submenu links.
5. Add another menu link to the main navigation menu. Enter **API One** in the **Menu link title**. Enter **/product/10/api/5** in the **Link**. Select -- **API's** in the **Parent link**, then click **Save**.

## Add menu link ☆

[Home](#) » [Administration](#) » [Structure](#) » [Menus](#) » [Main navigation](#)

### Menu link title \*

The text to be used for this link in the menu.

### Link \*

- The location this menu link points to.
- Start typing the title of a piece of content to select it. You can also enter an internal path such as `/node/add` or an external URL such as `http://example.com`. Enter `<from`

 Enabled

A flag for whether the link should be enabled in menus or hidden.

### Description

Shown when hovering over the menu link.

 Show as expanded

If selected and this menu link has children, the menu will always appear expanded. This option may be overridden for the entire menu tree when placing a menu block.

### Parent link

The maximum depth for a link and all its children is fixed. Some menu links may not be available as parents if selecting them would exceed this limit.

### Weight

Link weight among links in the same menu at the same depth. In the menu, the links with high weight will sink and links with a low weight will be positioned nearer the top.

6. Add another menu link to the main navigation menu. Enter `API Two` in the **Menu link title**. Enter `/product/10/api/9` in the **Link**. Select `-- API's` in the **Parent link**. Select `1` in **Weight**, then click **Save**.

## Add menu link ☆

[Home](#) » [Administration](#) » [Structure](#) » [Menus](#) » [Main navigation](#)

### Menu link title \*

The text to be used for this link in the menu.

### Link \*

- The location this menu link points to.
- Start typing the title of a piece of content to select it. You can also enter an internal path such as `/node/add` or an external URL such as `http://example.com`. Enter `<from`

 Enabled

A flag for whether the link should be enabled in menus or hidden.

### Description

Shown when hovering over the menu link.

 Show as expanded

If selected and this menu link has children, the menu will always appear expanded. This option may be overridden for the entire menu tree when placing a menu block.

### Parent link

The maximum depth for a link and all its children is fixed. Some menu links may not be available as parents if selecting them would exceed this limit.

### Weight

Link weight among links in the same menu at the same depth. In the menu, the links with high weight will sink and links with a low weight will be positioned nearer the top.

7. Navigate to Structure > Menus > Main navigation. The hierarchy of the menu links now looks like this:

**+ Add link**

**Title \***  
Main navigation Machine name: main

**Administrative summary**  
Site section links

**Menu language**  
English

| MENU LINK    | ENABLED                             | OPERATIONS |
|--------------|-------------------------------------|------------|
| Home         | <input checked="" type="checkbox"/> | Edit       |
| API's        | <input checked="" type="checkbox"/> | Edit       |
| API One      | <input checked="" type="checkbox"/> | Edit       |
| API Two      | <input checked="" type="checkbox"/> | Edit       |
| API Products | <input checked="" type="checkbox"/> | Edit       |
| Apps         | <input checked="" type="checkbox"/> | Edit       |

8. Navigate to the home page. The **APIs** menu link that you added into the main navigation menu does appear but the submenus links don't expand when you hover over it.

## Make the drop-down menu expand by using the Superfish module

To make the drop-down menu expand when you hover over it, you need to use the **Superfish** module and configure the **Block Layout**.

1. If the administrator dashboard isn't displayed, click Manage to display it.
2. Navigate to Extend. Search for **superfish**, check the **Superfish** box, click Enable.

**+ Install new module**

superfish

Enter a part of the module name or description

Below is a list of installed modules. Modules that are i

**USER INTERFACE**

**Superfish**

**Enable**

3. Navigate to Structure > Block layout.

4. Click Configure, and select Disable for the **Main menu** block.

| BLOCK                                     | CATEGORY | REGION           | OPERATIONS   |
|---|----------|------------------|--|
| Navigation <span>Place block</span>       |          |                  |  |
| Site branding                             | System   | Navigation       | Configure  |
| Main menu                                 | Menus    | Navigation       | Configure<br>Disable<br>Translate<br>Remove<br>Configure |
| Navigation Right <span>Place block</span> |          |                  |  |
| User menu                                 | Menus    | Navigation Right |  |

5. Click Place block for Navigation, Then search for `main navigation` in the box. The filtered results might show two or more options. Click Place block for the **Main navigation** with the Category **Superfish**.

**Place block**

[Save block](#)

7. Drag **Main navigation** to be under **Site branding**.

| BLOCK                               | CATEGORY  | REGION       | OPERATIONS  |
|-------------------------------------|-----------|--------------|-------------|
| Navigation <span>Place block</span> |           |              |             |
| + Site branding                     | System    | Navigation ▾ | Configure ▾ |
| + Main navigation                   | Superfish | Navigation ▾ | Configure ▾ |
| + Main menu (disabled)              | Menus     | Navigation ▾ | Enable ▾    |

8. Click Save blocks.

9. Navigate to the home page. The **APIs** menu link that you added into the main navigation menu does now expand when you hover over it.

## What you did in this tutorial

You created a drop-down menu link on the **Main navigation** menu.

## What to do next

You can consider any other uses of the drop-down menu to enhance your users experience on your Developer Portal.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details. For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Tutorial: Displaying blog posts on the front page

You can customize the appearance of the front page of your Developer Portal to display recent blog posts. You might use the blog posts to provide your users with information, such as service availability or marketing campaigns.

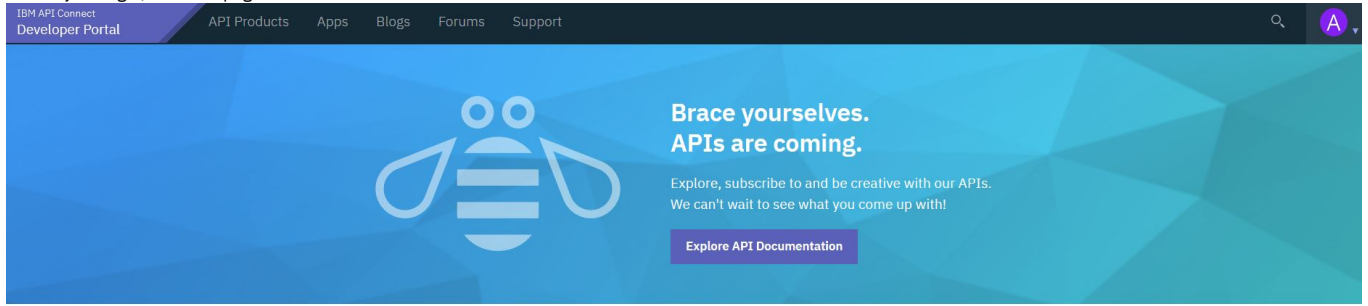

## Before you begin

You must have a Developer Portal enabled, and you must have administrator access to complete this tutorial. The tutorial [Creating the Portal](#) explains how to enable the portal if you have not already done so.

## About this tutorial

In this task, you create a view, customize that view to show blog posts, then embed that view on the front page of your Developer Portal site.

Before you begin, the front page looks like this:

### Sign up

[Create a new account](#) and get started with our APIs. It's free to join.

### Explore our APIs

Take a look at our [API products](#) and quickly find APIs to construct a fully featured application

### Create

Subscribe to a plan and create your application to make use of our APIs.

This tutorial takes you through the following steps:

1. [Create a view.](#)
2. [Customize the view.](#)
3. [Embed the view on the front page of your Developer Portal.](#)

## Create a view

1. Log in to your Developer Portal as an administrator.
2. If the administrator dashboard isn't displayed, click Manage to display it.
3. Navigate to Structure > Views > Add view.
4. In the **View name** block, enter a name for your view, for example Recent Blog posts.
5. Under **VIEW SETTINGS**, show **Content** of type **Blog Post** sorted by **Newest first**.
6. Check **Create a block** in **BLOCK SETTINGS**, and choose the number of blog posts that you want to be displayed.

**VIEW BASIC INFORMATION**

[Save and edit](#) [Cancel](#)

7. Click Save and edit.

## Customize the view

You are now on the page where you can edit your view.

1. If you are not on the edit view page, navigate to Structure > Views, find the name of the view that you created, and click Edit.
2. Click Unformatted list in the **Format** section.
3. Select **Bootstrap List Group**, then click Apply.
4. Select Content: Title in the **Title field** drop-down, then click Apply.
5. Click Save.

## Embed the view on the front page of your Developer Portal

1. If the administrator dashboard isn't displayed, click Manage to display it.
2. Navigate to Structure > Pages.
3. Click **Edit** on the welcome page.
4. Click **Panels**, then **Content**.
5. Click +Add new block.
6. Select your new block, which is under **LISTS (VIEWS)**.

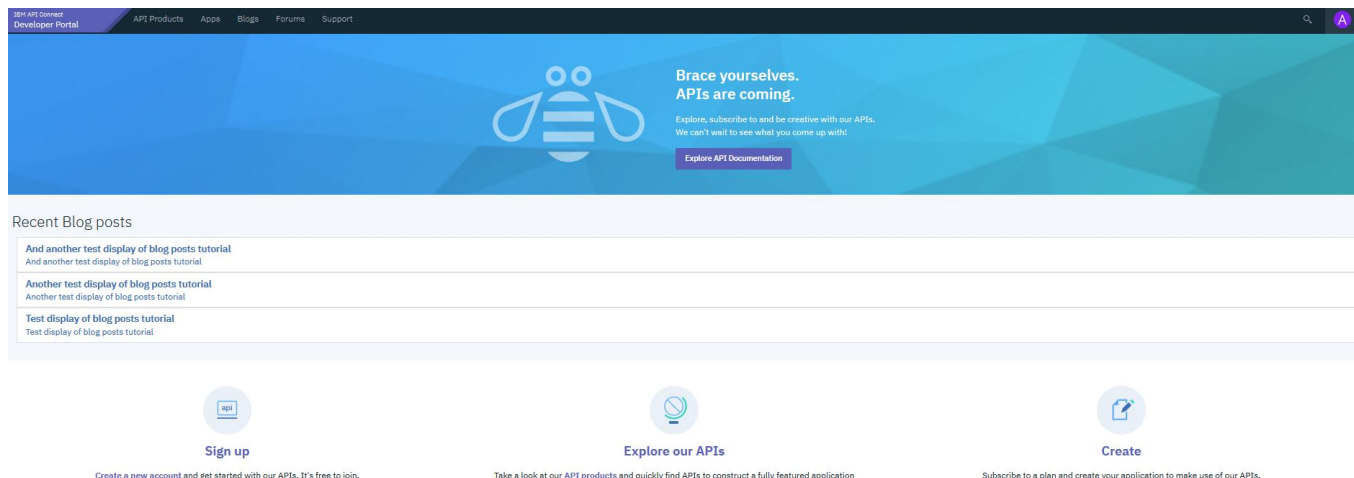

7. Select the number of **Items per block**, then click Add block.
8. You can now rearrange your view to be where you would like it on the front page.

| LABEL          | PLUGIN ID         |  |
|----------------|-------------------|--|
| <b>Content</b> |                   |  |
| +              | Welcome Banner    | block_content:2fcd632-d4b9-44d9-b195-359e751966a1  |
| +              | Featured Content  | featuredcontent                                    |
| +              | Recent Blog posts | views_block:recent_blog_posts-block_1              |
| +              | Getting Started   | block_content:f2b7762b-97f4-4d51-b7dc-d6de5be6d0ce |

9. Click Update and save.

## What you did in this tutorial

You can check that the view you created appears on the front page of your site page.

## What to do next

You can edit your view at any time by navigating to Structure > Views and selecting your view by its name. You can also modify or delete the view's layout on the front page by navigating back to the layout section of your page under Structure > Pages.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#), for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Tutorial: Displaying tweets on the front page

You can customize the appearance of the front page of your Developer Portal to display recent tweets. You might use the tweets to provide your users with information, such as service availability or marketing campaigns.

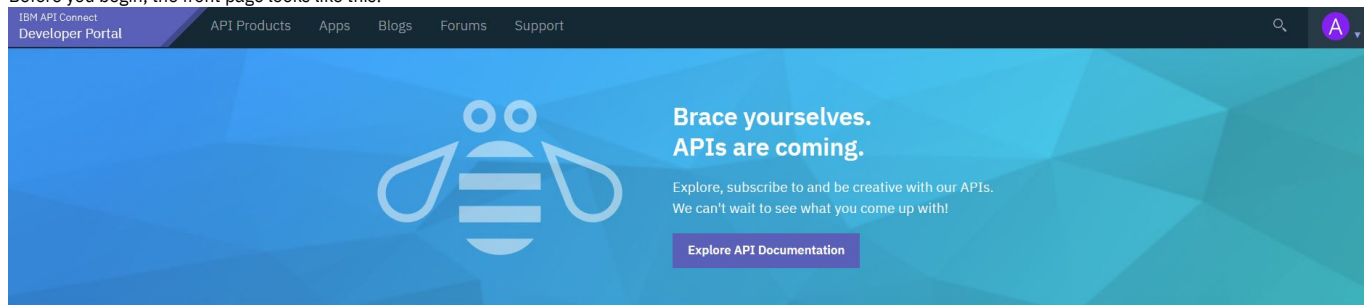

### Before you begin

You must have a Developer Portal enabled, and you must have administrator access to complete this tutorial. The tutorial [Creating the Portal](#) explains how to enable the portal if you have not already done so.

### About this tutorial

In this task, you create a view, customize that view to show tweets, then embed that view on the front page of your Developer Portal site.

Before you begin, the front page looks like this:

#### Sign up

[Create a new account](#) and get started with our APIs.  
It's free to join.

#### Explore our APIs

Take a look at our [API products](#) and quickly find APIs to construct a fully featured application

#### Create

Subscribe to a plan and create your application to make use of our APIs.

This tutorial takes you through the following steps:

1. [Enable the Media entity twitter module.](#)
2. [Create an entity called Twitter to store the tweets.](#)
3. [Add media items.](#)
4. [Create a carousel view.](#)
5. [Customize the carousel view.](#)
6. [Embed the carousel view on the front page of your Developer Portal.](#)

## Enable the Media entity twitter module

1. Log in to your Developer Portal as an administrator.
2. If the administrator dashboard isn't displayed, click Manage to display it.
3. Click Extend, enter `media` in the search bar.
4. Check Media Entity Twitter, under **MEDIA**.

#### ▼ MEDIA

|                                     |                                |  |
|-------------------------------------|--------------------------------|--|
| <input checked="" type="checkbox"/> | <b>Enhanced Entity Browser</b> | ► Provides some behavior and style enhancements to Entity Browsers, specifically for multiselect and image/media browsers. |
| <input checked="" type="checkbox"/> | <b>Media Entity Twitter</b>    | ► Media Entity Twitter provider.   |

5. Click Enable.

## Create an entity called Twitter to store the tweets

1. Navigate to Structure > Media types > Add media type.
2. In the **Name** field, enter `Twitter`.

### Media source \*

Twitter

Media source that is responsible for additional logic related to this media type.

3. In the **Media source** dropdown, select **Twitter**.
4. Ensure that **Whether to use Twitter api to fetch tweets or not** value is set to No.
5. Ensure the values in the **FIELD MAPPING** section are set to - Skip field -.

**Name \***  
Twitter Machine name: twitter  
The human-readable name of this media type.

**Description**

Describe this media type. The text will be displayed on the *Add new media* page.

**Media source \***  
Twitter  
*The media source cannot be changed after the media type is created.*

**MEDIA SOURCE CONFIGURATION**  
*Tweet URL* field is used to store the essential information about the media item.

**Whether to use Twitter api to fetch tweets or not.**  
No  
In order to use Twitter's api you have to create a developer account and an application. For more information consult the readme file.

Generate thumbnails  
If checked, Drupal will automatically generate thumbnails for tweets that do not reference any external media. In certain circumstances

**FIELD MAPPING**  
Media sources can provide metadata fields such as title, caption, size information, credits, etc. Media can automatically save this information

**Tweet ID**  
- Skip field -

**Twitter user information**  
- Skip field -

6. Click Save.
7. Click Manage display from the Edit dropdown for the new `Twitter` media type.
8. Drag the **Author**, **Author**, and **Thumbnail** fields to the **Disabled** section, and set the **FORMAT** of the **Tweet URL** field to **Twitter embed**.

| FIELD                   | LABEL      | FORMAT        |
|-------------------------|------------|---------------|
| ✚ Tweet URL             | Above      | Twitter embed |
| <b>Disabled</b>         |            |               |
| ✚ Language              | Above      | Language      |
| ✚ Name                  | Above      | Smart trimmed |
| ✚ Search result excerpt |            |               |
| ✚ Authored on           | - Hidden - | Default       |
| ✚ Authored by           | - Hidden - | Author        |
| ✚ Thumbnail             | - Hidden - | Image         |

▶ CUSTOM DISPLAY SETTINGS

Save

9. Click Save.

## Add media items

1. Navigate to Content > Media > Add media > Twitter.
2. In the **Name** field, enter a name for the media, for example `Drupal Tweet`.

3. In the **Tweet URL** field, enter a URL, for example, <https://twitter.com/drupal/status/966443708160839684>.

**Name \***

**Tweet URL \***

|  |   |
|--|---|
| <b>Revision information</b><br>No revision                 | <b>Revision log message</b><br><br>Briefly describe the changes you |
| <b>URL alias</b><br>No alias                               |   |
| <b>Authoring information</b><br>By admin (1) on 2020-01-08 |   |

Published

**Save**

4. Click Save.
5. Repeat these steps to add more tweets, you need at least 2 to make a carousel view.

## Create a carousel view

1. Navigate to Structure > Views > Add view.
2. In the **view name** block, enter a name for your view, for example `Tweet view`.
3. Under **VIEW SETTINGS**, show **Media** of type **Twitter** sorted by **Unsorted**.
4. In the **BLOCK SETTINGS**, section check **Create a block** and ensure it is **Display format Slick Carousel** of **fields**.

**VIEW BASIC INFORMATION**

**View name \***

 Machine name: tweet\_view [Edit]

Description

**VIEW SETTINGS**

Show:  of type:  sorted by:

**PAGE SETTINGS**

Create a page

**BLOCK SETTINGS**

Create a block

Block title

**BLOCK DISPLAY SETTINGS**

Display format:  of:

5. Click Save and edit.

## Customize the carousel view

You are now on the page where you can edit your view.

1. If you are not the edit view page, navigate to Structure > Views, find the name of the view that you created, and click Edit.
2. Click **Tweet view** and change it to the value **<none>**. Then, click Apply.

**Block: The title of this view**

**Title**

This title will be displayed with the view, wherever titles are normally displayed; i.e., as the page title, block title, etc.

**Apply** **Cancel**

3. Click Add in the **FIELDS** section, then search for **tweet**, select the checkbox for **Tweet URL**. Then, click Add and configure fields.

|                                     |                  |       |                      |

[Apply](#) [Cancel](#) [Remove](#)

**True**), then click Remove.

7. In the **FORMAT** section, click **Settings** next to **Slick Carousel**.

8. Set **Skin Main** to **Default**.

9. In the **CAPTION FIELDS** section, check **Media: Tweet URL**, and **Override main optionset**.

10. In the **OVERRIDEABLE OPTIONS** section, select **Autoplay** and **Dots** then, click Apply.

| CAPTION FIELDS  |  |   |   |
|---|--|---|---|
| Media: Tweet URL <input checked="" type="checkbox"/>        |  |   |   |
| slick ID # <input type="text"/>                             |  | Cache <input type="text" value="&lt;No caching&gt;"/> |   |
| Override main optionset <input checked="" type="checkbox"/> |  |   |   |
| OVERRIDABLE OPTIONS   |  |   |   |
| Arrows <input type="checkbox"/>                             | Autoplay <input checked="" type="checkbox"/> | Dots <input checked="" type="checkbox"/>              | Draggable <input type="checkbox"/>      |
| Infinite <input type="checkbox"/>                           | Mousewheel <input type="checkbox"/>          | Randomize <input type="checkbox"/>                    | Variable width <input type="checkbox"/> |

**Block: Pager options**

**Items to display**  
  
 Enter 0 for no limit.

**Offset (number of items to skip)**  
  
 For example, set this to 3 and the first 3 items will not be displayed.

11. In the **PAGER** section, click **Items**, set the field to 0 then, click Apply.  
 12. Click Save.

## Embed the view on the front page of your Developer Portal

1. Navigate to Structure > Pages.
2. Click **Edit** on the welcome page.
3. Click **Panel**s, then **Content**.
4. Click +Add new block.

### LISTS (VIEWS)

- Active forum topics
- APIs
- Applications
- Blog
- New forum topics
- Product List
- Recent comments
- Recent content
- Tweet view
- Who's online
- Workbench: Current user: Overview block
- Workbench: Edits by user: Overview block
- Workbench: Recent content: Overview block

5. Select your new block, which is under **LISTS (VIEWS)**.
6. Deselect **Display title** then, click Add block.

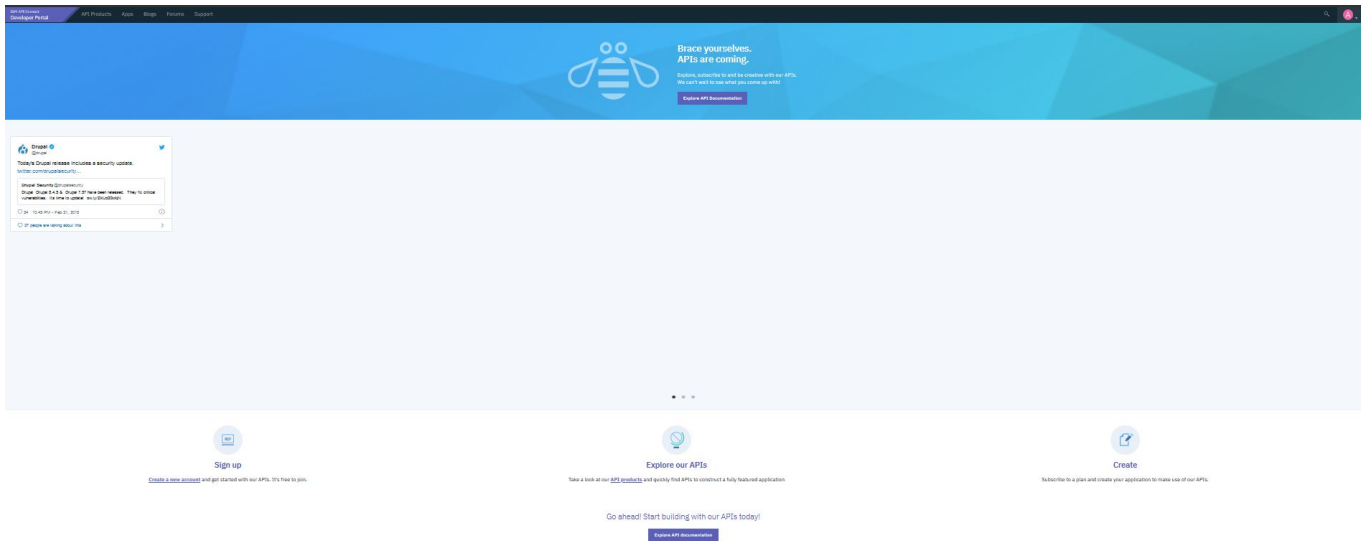

7. You can now rearrange your view to be where you would like it on the front page.

| LABEL            | PLUGIN ID  |
|------------------|--|
| <b>Content</b>   |  |
| Welcome Banner   | block_content:d0f69e7a-e8c3-4f56-8537-13cea477f68a |
| Featured Content | featuredcontent                                    |

8. Click Update and save.

## What you did in this tutorial

You can check that the view you created appears on the front page of your site page.

## What to do next

You can edit your view at any time by navigating to Structure > Views and selecting your view by its name. You can also modify or delete the view's layout on the front page by navigating back to the layout section of your page under Structure > Pages.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details. For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Tutorial: Changing the front page of your Developer Portal

You can create and arrange content in your Developer Portal to provide a front page that aligns with your brand, and helps your users discover your APIs.

### Before you begin

You must have a Developer Portal enabled, and you must have administrator access to complete this tutorial. The tutorial [Creating the Portal](#) explains how to enable the portal if you have not already done so.

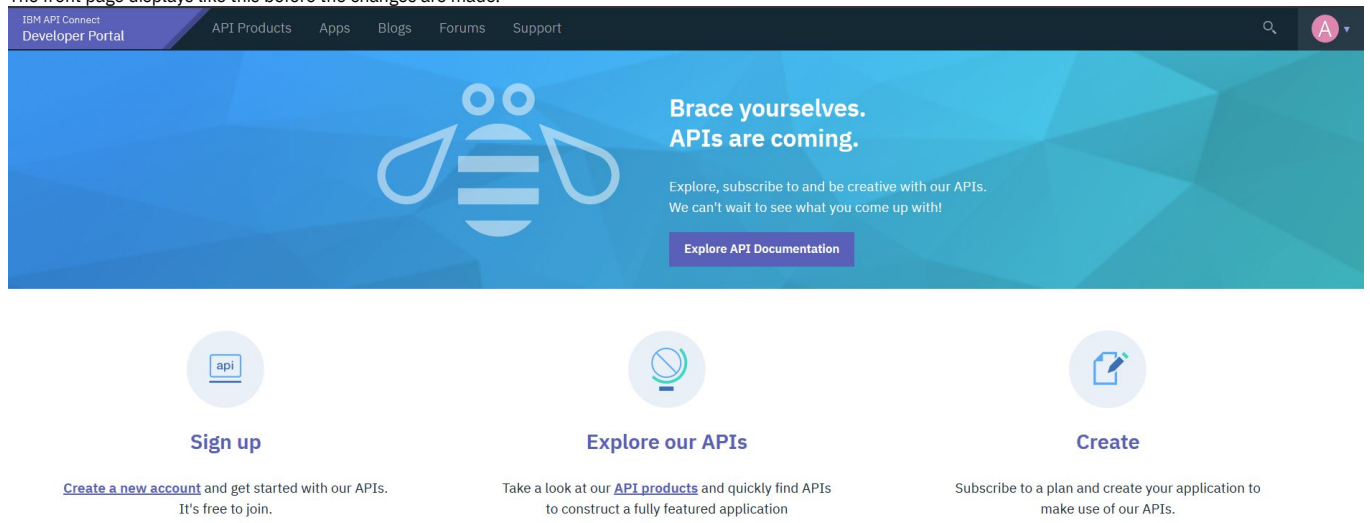

### About this tutorial

In this tutorial, you create some content for a page, and then change the front page to be your new page.

This tutorial takes you through the following steps:

1. [Creating some custom blocks.](#)
2. [Create and configure a page.](#)
3. [Adding the custom blocks to the page.](#)
4. [Changing the front page to be your new page.](#)

The front page displays like this before the changes are made.

## Creating some custom blocks

1. Log in to your Developer Portal as an administrator.
2. If the administrator dashboard isn't displayed, click Manage to display it.
3. Navigate to Structure > Block layout > Add custom block
4. Enter `Block 1` in the **Block description**.
5. In the body area, click **Source**, then enter this HTML:

```
<div class="tutorial_block_1 tutorial_block_frontpage">
<h1><span>Create with our APIs</span></h1>

<p><span>Welcome to our Developer Portal where you will find APIs to create your awesome app.</span></p>
</div>
```

### Add custom block ☆

[Home](#)

#### Block description \*

Block 1

A brief description of your block.

#### Body

Rich text editor toolbar with options: Bold, Italic, Underline, Strikethrough, Bulleted list, Numbered list, Indent, Outdent, Link, Unlink, Image, Video, Table, Undo, Redo, Format, Source, and Refresh.

```
<div class="tutorial_block_1 tutorial_block_frontpage">
<h1><span>Create with our APIs</span></h1>

<p><span>Welcome to our Developer Portal where you will find APIs to create your awesome app.</span></p>
</div>
```

6. Check what the block looks like by clicking **Source** again.

## Add custom block ☆

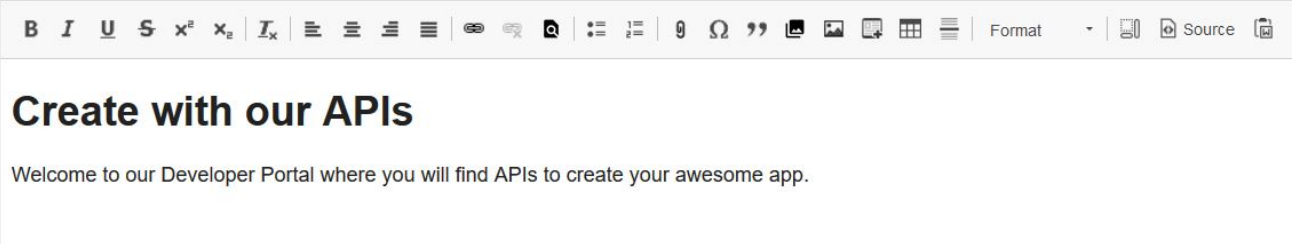

Home

### Block description \*

Block 1

A brief description of your block.

### Body

The screenshot shows a rich text editor interface. At the top, there is a toolbar with various icons for text formatting (bold, italic, underline, strikethrough, text color, background color), list creation, link, unlink, and other functions. Below the toolbar, the main content area contains the following text:

## Create with our APIs

Welcome to our Developer Portal where you will find APIs to create your awesome app.

Note: This block uses almost no inline-styling, instead it allows your theme to decide how it is rendered. The advantage of this set up is that you can easily change the rendering without modifying existing content in the database. Any styling that is required can be added to a custom theme. For more information, see [Tutorial: Creating a custom theme for the Developer Portal](#).

7. Click **Save**.

You have created **Block 1**, repeat steps 3 to 7 to create **Block 2**, **Block 3**, and **Block 4**.

8. Enter **Block 2** in the **Block description**. In the body area, click **Source**, then enter this HTML:

```
<div class="tutorial_block 2 tutorial_block frontpage">
<p class="text-align-center">Explore and subscribe to our APIs.<br />
See what you come up with!</p>

<p class="text-align-center">&nbsp;</p>

<div class="bannerButtonRow text-align-center"><a class="button cta-btns--white_btn"
href="#_home_markdown_jenkins_workspace_Transform_in_SSMNED_2018_com.ibm.apic.devportal.doc_product">Explore API
Documentation</a></div>
</div>
```

9. Enter **Block 3** in the **Block description**. In the body area, click **Source**, then enter this HTML:

```
<div class="tutorial_block 3">
<p class="text-align-center"><a
href="#_home_markdown_jenkins_workspace_Transform_in_SSMNED_2018_com.ibm.apic.devportal.doc_user_register">Create a new
account</a> and get started with our APIs. It's free to join.</p>
</div>
```

10. Enter **Block 4** in the **Block description**. In the body area, click **Source**, then enter this HTML:

```
<div class="block-get-help">
<div class="get_help">
<div class="column col1">
<h3>Getting Help</h3>

<div>Be sure to check out these extra help resources.</div>
</div>

<div class="column col2">
<h4>Get Started</h4>

<div>Get started with our APIs by creating an account and exploring the documentation to find what's right for you.</div>

You added **Block 1**, repeat steps 1 to 3 to add **Block 2**, **Block 3**, and **Block 4**.

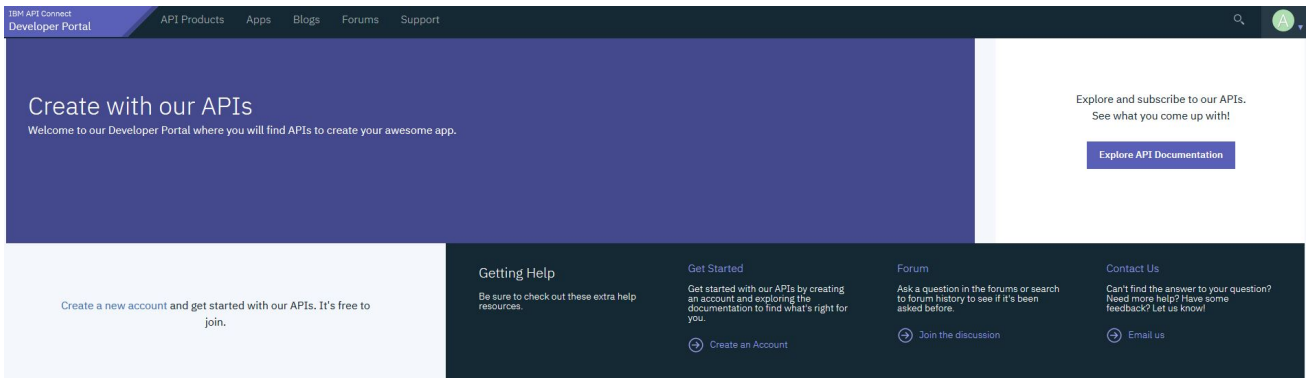

4. For **Block 2** select region **Top Right**.
5. For **Block 3** select region **Bottom left**.
6. For **Block 4** select region **Bottom Right**.
7. Click **Finish**.
8. Click Update and save.

## Changing the front page to be your new page

---

Note: In this tutorial, you create a new page and swap it with the default. If errors are made, the default page is still available as a backup.

1. Navigate to **Structure > Pages**.
2. Click the **newhome** URL link for your new **Portal home** page, check that your page looks as designed.

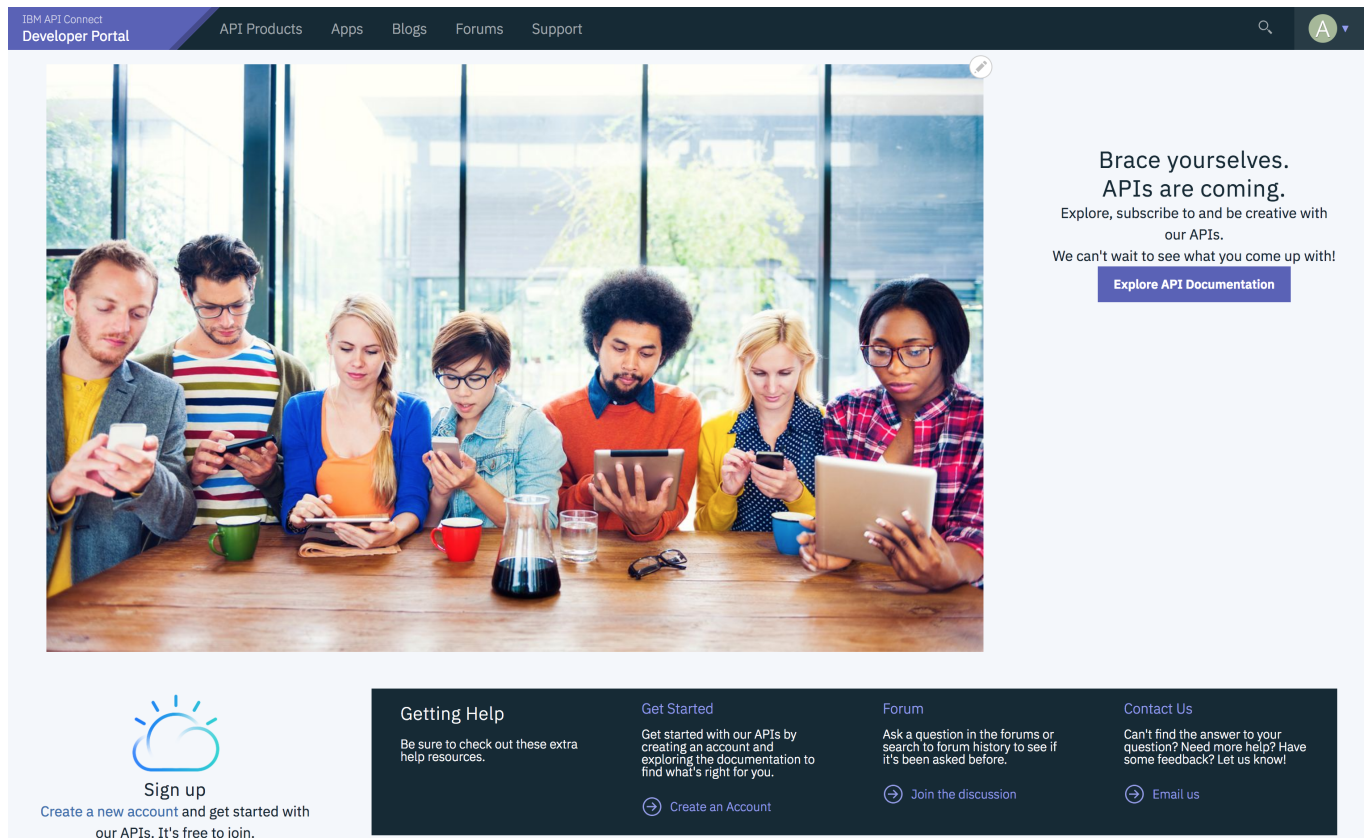

3. Navigate to Configuration > System > Basic site settings
4. In **Front Page** region set Default front page field to **newhome**.
5. Click Save configuration.

## What you did in this tutorial

The front page of your Developer Portal is now changed and laid out with the blocks of content that you specified.

## What to do next

You can add further branding by adding content to your custom blocks such as images, or try to use one of the provided custom blocks such as the Featured Content Block. By default this block is English, you might want to consider adding versions in other languages.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details. For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Tutorial: Grouping products by category

You can configure the Developer Portal so that products are displayed in groups according to the category that they are tagged with.

You can use the **Views** module to fetch content from your Developer Portal site, such as lists of products, and present the content to users in different formats. You can combine multiple views on a new page to display whatever content you want.

## Before you begin

You must have a Developer Portal enabled, and you must have administrator access to complete this tutorial. The tutorial [Creating the Portal](#) explains how to enable the portal if you have not already done so.

## About this tutorial

In this tutorial you create three views in the Developer Portal, each one is configured to display a list of products according to their category. You then create a new page to show the views, where you see products that are grouped by category.

1. Log in to your Developer Portal as an administrator.
2. If the administrator dashboard isn't displayed, click **Manage** to display it.
3. Create three new taxonomy tags.
  - a. Navigate to **Structure > Taxonomy > Tags**.
  - b. Click **Add term**.
  - c. Enter **Accounts** in the **Name** field and click **Save**.
  - d. Enter **Logistics** in the **Name** field and click **Save**.
  - e. Enter **Marketing** in the **Name** field and click **Save**.
  - f. Navigate to **Structure > Taxonomy > Tags** to show the list of the new tags.

**Tags** ☆

List Edit Manage fields Manage form display Manage display

Home » Administration » Structure » Taxonomy » Edit Tags

You can reorganize the terms in *Tags* using their drag-and-drop handles, and group terms under a parent term by sliding them under and to the right of the parent.

+ Add term

NAME	OPERATIONS
+ Accounts	Edit ▾
+ Logistics	Edit ▾
+ Marketing	Edit ▾

Save Reset to alphabetical

4. Create a view to display products with the **Accounts** category.
  - a. Navigate to **Structure > Views > Add new view**.
  - b. Enter **Accounts products** in the **View name** field.
  - c. In **View Settings**, select **Show: Content, of type: Product, sorted by: Newest first**, from the drop-down lists.
  - d. In **Page settings** leave the **Create a page** cleared.
  - e. In **Block settings** select **Create a block** and enter **Accounts products** in the **Block title**.
  - f. Ensure **Block Display Settings** has **Display format: Masonry, of: tiles (linked)**, and select **Use a pager**.

**PAGE SETTINGS**

Use a pager

**Save and edit** **Cancel**

- g. Click **Save and edit**.
- 5. Configure the view block settings.
  - a. Under the **Format** section click the **Fields** link next to the **Show** label.
  - b. In the dialog box, select the **Content** radio button then click **Apply**.
  - c. Select **Card** from the **View mode** drop-down list, then click **Apply**.
  - d. Click **Add** next to the **Filter Criteria** section.
  - e. In the dialog box, search for **tag** then select the option **Tags (apic\_tags)** from the list then click **Add and configure filter criteria**.
  - f. In the next dialog box, select the **Tags** radio button and the **Client-side hierarchical** then click **Apply and continue**.
  - g. Next set the **Operator** to **Is all of**, and from the **Select terms from vocabulary Tags** drop-down select **Accounts** and click **Apply**.
  - h. Under the **Advanced** options, click the **None** link next to the **CSS class** label.
  - i. If you are using the default API connect theme, then enter the CSS class name **product-view** and click **Apply**. If you have your own css class that you want to use, then enter its name in here instead.
  - j. Click **Save** to save all the changes.

Displays

Block\* + Add Edit view name/description

Display name: **Block** Duplicate Block

---	---	--

**Save** **Cancel**

- 6. Create a view for the Logistics products.
  - a. Select **Structure > Views**.
  - b. Navigate to the **Accounts products** view and select the **Duplicate** option.
  - c. Give the duplicated view the name **Logistics products** and click **Duplicate**.

- d. Click the Title **Accounts products** and change it to **Logistics products** and click **Apply**.
  - e. Under the **Filter Criteria** section click the **Content: Tags: (=Accounts)** link.
  - f. Change the value in the **Select terms from vocabulary Tags** drop-down to **Logistics** and click **Apply**.
  - g. Click **Save** to save all the changes.
7. Repeat step 6 for Marketing products.
  8. Next, create a page to display the views.
    - a. Select Structure, > Pages.
    - b. Click **Add page**.
    - c. Enter **Products by category** in the **Administrative title**, and **products-by-category** in the **Path**. Select the **Panels** option from the **Variant type** drop-down list then click **Next**.

Page information > Configure variant

**PAGE MANAGER**

**Administrative title \***

Panels

---

**Optional features**

Page access

Variant contexts

Variant selection criteria

Check any optional features you need to be presented with forms for configuring them. If you do not check them here you will still be able to utilize these features once the new page is created. If you are not sure, leave these unchecked.

**Next**

- d. Change the **Label** value to **Products grouped by category** and set the **Builder** to **Standard** then click **Next**.
- e. From the **Layout** drop-down list select the value **Three column** then click **Next**.
- f. Leave all the defaults on the next page and click **Next**.
- g. Click **+Add new block**.
- h. Select **Accounts products** from the **Lists (views)** section.
- i. Ensure that **Display tile** is selected and **Region** is set to **Left**, click **Add block**.

**Add block** ×

---

**Block description**

Accounts products

Display title

**Items per block**

Override title

**Region \***

Left

**Add block**

- j. Click **Add new block**. Select **Logistics products** view from the list and set the **Region** to **Middle**, click **Add block**.
- k. Click **Add new block**. Select **Marketing products** view from the list and set the **Region** to **Right**, click **Add block**.
- l. Enter **Products grouped by category** in the **Page title** field, and click **Finish**.

**Page title**  
  
 Configure the page title that will be used for this display.

[+ Add new block](#)

LABEL	PLUGIN ID	REGION
<b>Left</b>		
Accounts products	views_block:accounts_products-block_1	Left
<b>Middle</b>		
Logistics products	views_block:logistics_products-block_1	Middle
<b>Right</b>		
Marketing products	views_block:marketing_products-block_1	Right

[Previous](#) [Finish](#)

- From your API Manager, create three new products, or update existing ones, to give each one a category value of either Accounts, Logistics, or Marketing. Publish each of the products to the catalog with the configured Developer Portal.
- Check that the **Products grouped by category** page shows your published products by category.
  - Select **Structure > Pages**.
  - Click the **/products-by-category** path link.
  - You are redirected to the **/products-by-category** page and can see the products that you assigned to these categories.

## What you did in this tutorial

You created three new views in the Developer Portal, and configured each one to display a list of products according to their category. You then created a new page to show the views.

### Accounts products

### Logistics products

### Marketing products

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details. For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Tutorial: Adding a field to the sign up form

You might want to collect and store additional information about your Developer Portal users. For example, you might want to collect a department name, employee ID, or similar data when a user registers for an account on the portal.

### Before you begin

You must have a Developer Portal enabled, and you must have administrator access to complete this tutorial. The tutorial [Creating the Portal](#) explains how to enable the portal if you have not already done so.

### About this tutorial

In this tutorial, you will add a Department code field to the Sign up form. This field is required for all portal users.

This tutorial takes you through the following steps:

- [Adding a field to a user entity.](#)
- [Adding the new field to the Sign up form.](#)
- [Testing the new field.](#)

### Adding a field to a user entity

- Log in to your Developer Portal as an administrator.

2. If the administrator dashboard isn't displayed, click **Manage** to display it.
3. Navigate to **Configuration** » **People** » **Account settings** » **Manage fields**

You are on the **Manage fields** tab.

1. Click **+ Add field**.
2. In the **Select a field type** dropdown, select **Text (plain)**.
3. In the **Label** field enter, **Department code**.
4. Click **Save and continue**.

You are on the **Field settings** tab.

1. Accept the defaults of **Maximum length** (255) and **Allowed number of values** (Limited:1).
2. Click **Save field settings**.

You are on the **Edit** tab.

1. Add some help text. This is information that is displayed to the user to assist them completing the field on a form. Examples or links to further information are useful here. We are going to add an example in this tutorial.
2. Add **Example department code: DEP123** into the **Help text** field.
3. Check the **Required field**.
4. Click **Save settings**.

The field has now been created. You are back on the **Manage fields** tab.

1. Check that **Department code** is a listed field.

## Adding the new field to the Sign up form

1. If the administrator dashboard isn't displayed, click **Manage** to display it.
2. Navigate to **Configuration** » **People** » **Account settings** » **Manage form display**

You are on the **Manage form display** tab. These tabs, one per form, show the fields that are displayed from the user entity, and in which order.

1. Switch to the **Register** tab. Notice that initially the new **Department code** field is below the **Disabled row** in the page. This means that it isn't shown on the form.
2. Click the **Department code** icon and drag it so that it is between **Last name** and **Consumer organization** in the list.

The screenshot shows the 'Manage form display' interface for the 'Register' form. At the top, there are tabs for 'Settings', 'Manage fields', 'Manage form display', 'Manage display', and 'Translate account settings'. The 'Manage form display' tab is active. Below the tabs, there are two sub-tabs: 'Default' and 'Register'. The 'Register' sub-tab is selected. The breadcrumb path is 'Home » Administration » Configuration » People » Account settings » Manage form display'. There is a '+ Add group' button. A 'Show row weights' link is visible on the right. The main area contains a table with two columns: 'FIELD' and 'WIDGET'. The table lists several fields, including 'Status', 'Username', 'Roles', 'Notify user about new account', 'Current password', 'E-mail address', 'First Name', 'Last Name', 'Department code', 'Consumer organization', 'Password', and 'Language code'. The 'Department code' field is currently in the 'Disabled' row. The 'Consumer organization' field is highlighted in blue. Each field has a widget dropdown menu and a 'Textfield size: 60' label. There are gear icons for settings next to the 'First Name', 'Last Name', 'Department code', and 'Consumer organization' fields.

FIELD	WIDGET	Textfield size: 60	⚙️
+	Status		
+	Username		
+	Roles		
+	Notify user about new account		
+	Current password		
+	E-mail address		
+	First Name	Textfield	⚙️
+	Last Name	Textfield	⚙️
+	Department code	Textfield	⚙️
+	Consumer organization	Textfield	⚙️
+	Password		
<b>Disabled</b>			
+	Language code	Language select	

3. Click **Save**.

## Testing the new field

1. Sign out as the Admin user.
2. Click **Create account**.
3. Observe that the **Department code** field is now part of the sign up form.

## What you did in this tutorial

You added a Department code field to the Sign up form, then tested the form to ensure that the `Department code` field is now part of the sign up form.

In reality, you would need to add this configuration in such a way that it is available for all sites. To achieve this you would include the configuration in your custom module. For more information, see [this Drupal documentation](#).

You might want to add extra validation to the Department code field on the Sign up form. For more information, see [Tutorial: Adding validation to a field on the sign-up form](#).

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details. For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Tutorial: Adding validation to a field on the sign-up form

You might want to add extra validation to a field to help your Developer Portal users. For example, you might want to validate a department name, employee ID, or similar data when a user registers for an account on the portal.

### Before you begin

You must have a Developer Portal enabled, and you must have administrator access to complete this tutorial. You must have completed the tutorial about [Adding a field to the sign up form](#), where you added a Department code field to the Sign-up form.

### About this tutorial

In this tutorial, you add some validation to the Department code field on the Sign-up form. This is a required field for all portal users and is a string of the format `DEPnnn`, where `DEP` is the string prefix and `nnn` is a three-digit number, for example, `DEP123`. The validation is done by using a custom module that is already available in [IBM APIC Portal - addons](#). However, for more information, see [Custom module development: creating a module skeleton](#).

This tutorial takes you through the following steps:

1. [Cloning and packaging the validation module](#).
2. [Installing and enabling the validation module](#).
3. [Testing the validation in the sign up form](#).

Look at the files we will use in this link [IBM APIC Portal - addons](#).

- `user_field_example.info.yml` - this is the metadata for the module, defining things like the name and version, and containing other important information that is required by Drupal to import and enable the module.

```
name: 'IBM APIC Portal - user field example'
type: module
description: 'IBM API Connect Developer Portal tutorial - Example of validating a custom user field'
package: 'Custom'
core_version_requirement: ^8 || ^9
version: 1.0.0
project: 'user_field_example'
dependencies:
  - ibm_apim
  - auth_apic
```

- `user_field_example.module` - this contains a validation function and adds this to the Sign-up form by using the `hook_form_alter` function.

```
<?php
use Drupal\Core\Form\FormStateInterface;

/**
 * Implementation of hook_form_alter() to alter the Sign up form
 */
function user_field_example_form_alter(&$form, FormStateInterface $form_state, $form_id) {
  if ($form_id === 'user_register_form') {
    $form['#validate'][] = 'user_field_example_validate_department_code';
  }
}

/**
 * Validate the Department code field on the Sign up form.
 *
 * Valid entry = DEPnnn
 * where n = single figure digit.
 */
function user_field_example_validate_department_code($form, &$form_state) {
  $dept_code = $form_state->getValue('field_department_code')[0]['value'];
  $valid = preg_match('/^DEP\d{3}$/', $dept_code);
  if (!$valid) {
    $form_state->setErrorByName('field_department_code', t('Invalid department code.'));
  }
}
```

### Cloning and packaging the validation module

Validation is added to the **Department code** field on the Sign-up form by using a custom module.

1. Clone the custom module. Here is an example command if you are using Mac and Linux:

```
git clone https://github.com/ibm-apiconnect/devportal-addons
```

2. Package up the custom module.

```
cd devportal-addons/apic_v10/modules
tar -czf user_field_example.tgz user_field_example/
```

## Installing and enabling the validation module

1. Log in to your Developer Portal as an administrator.
2. If the administrator dashboard isn't displayed, click **Manage** to display it.
3. Click **Extend**, **Install new module**.
4. Click **Choose file** from the **Upload a module or theme archive to install** section.
5. Browse to and select **user\_field\_example.tgz**, the packaged custom module that you created earlier. Click **Open**.
6. Click **Install**.
7. Click the **Enable newly added modules** link.
8. Enter **IBM APIC Portal - user field example** in the filter box.
9. Check the checkbox next to **IBM APIC Portal - user field example**.
10. Click **Enable**.

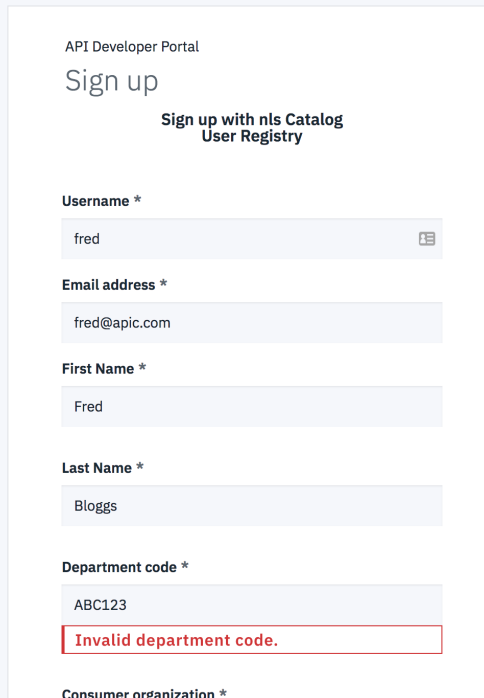

The module is now installed and enabled.

## Testing the validation in the sign-up form

1. Sign out as the Admin user.
2. Click **Create account**.
3. Complete all fields, set **Department code** to **ABC123**.
4. Click **Sign up**.
5. Observe the failure message and highlighting on the **Department code** field.

1 error has been found: **Department code**

API Developer Portal

### Sign up

Sign up with nls Catalog  
User Registry

**Username \***  
fred

**Email address \***  
fred@apic.com

**First Name \***  
Fred

**Last Name \***  
Bloggs

**Department code \***  
ABC123  
**Invalid department code.**

**Consumer organization \***

6. Change the **Department code** field to **DEP245**, reenter the password and click **Sign up** to see that a valid code is accepted.

## What you did in this tutorial

You added some validation to the Department code field on the Sign-up form, then tested the form to ensure that the **Department code** field accepts only codes in the format of **DEPnnn**.

In reality, you would need to add this configuration in such a way that it is available for all sites. To achieve this availability, you would include the configuration in your custom module. For more information, see [Drupal custom modules](#).

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Tutorial: Adding a field group to group fields in a content type

You might want to change how your user account pages are displayed when you have lots of fields.

If you have many fields for one of your content types, for example, a user, then you might want to group some of these fields together when you display them to other users, or when these fields are being edited inside a user form.

Field groups allow you to create a parent field that contains other fields, set up as children, within that group. The **Fieldgroup** forms come with default HTML wrappers such as vertical tabs, horizontal tabs, accordions, fieldsets, or div wrappers.

---

### Before you begin

You must have a Developer Portal enabled, and you must have administrator access to complete this tutorial.

---

### About this tutorial

You will create field groups for various groups of user information. These groups can then be seen under the users own section on the account view and edit pages.

This tutorial takes you through the following steps:

1. [Adding a field group called Consumer Organization to the user account display.](#)
2. [Adding a field group called Personal Details to the user form display.](#)

---

## Adding a field group called Consumer Organization to the user account display

1. Log in to your Developer Portal as an administrator.
2. If the administrator dashboard isn't displayed, click Manage to display it.
3. Navigate to Configuration » People » Account settings » Manage display.
4. Click + **Add group**.
5. Select the group type **tab**.
6. Enter **Consumer Organization** as the label.
7. Click **Save and continue**.
8. Set the default state to **open**. This sets the tab to be expanded by default.
9. Click **Create group**.

[Home](#) » [Administration](#) » [Configuration](#) » [People](#) » [Account settings](#) » [Manage display](#)

Field group label

Default state

Description

ID

Extra CSS classes

Create group

When the group is created, you can assign fields to that group and rearrange the group on the page. After you create the group, you are on the **Manage Display** page.

1. Drag your new group from the disable section up into the upper section, just underneath **Picture**.
2. Drag **URL, Consumer Organization**, and **Consumer Organization URL** underneath the **Consumer Organization** group row, and slightly to the right. It fixates itself underneath and to the right of the parent, and this is now set as the child of that group.

3. Click **Save**.

FIELD	LABEL	FORMAT	
⊕ First Name	Above	Plain text	⚙
⊕ Last Name	Above	Plain text	⚙
⊕ Member for			
⊕ Picture	Above	Image	Original image ⚙
⊕ Consumer Organization		Tab	Tab: open <a href="#">delete</a> ⚙
⊕ URL	Above	Plain text	⚙
⊕ Consumer organization	Above	Plain text	⚙
⊕ Consumer organization URL	Above	Plain text	⚙
⊕ State	Above	Default	
⊕ Language code	Above	Language	⚙

You are now able to see the new group of fields on the account page of a user.

### Consumer Organization

**URL**  
 /consumer-api/user-registries/574dbbea-e045-4457-91f3-2e8581a72d6c/users/e29beb15-2fd6-4583-854c-fe2854389ee7

**Consumer organization**  
 Joe Smith

**Consumer organization URL**  
 /consumer-api/orgs/7d9808be-eae5-44dc-a45c-551e17c2b7d1

## Adding a field group called Personal Details to the user form display

1. Navigate to Configuration > People > Account settings > Manage form display.
2. Click **Add group**.
3. Select the group type **tab**.
4. Enter **Personal Details** as the label.

[Home](#) » [Administration](#) » [Configuration](#) » [People](#) » [Account settings](#) » [Manage form display](#)

Add a new group \*

Tab

Label \*

Personal Details Machine name: group\_personal\_details [Edit]

Save and continue

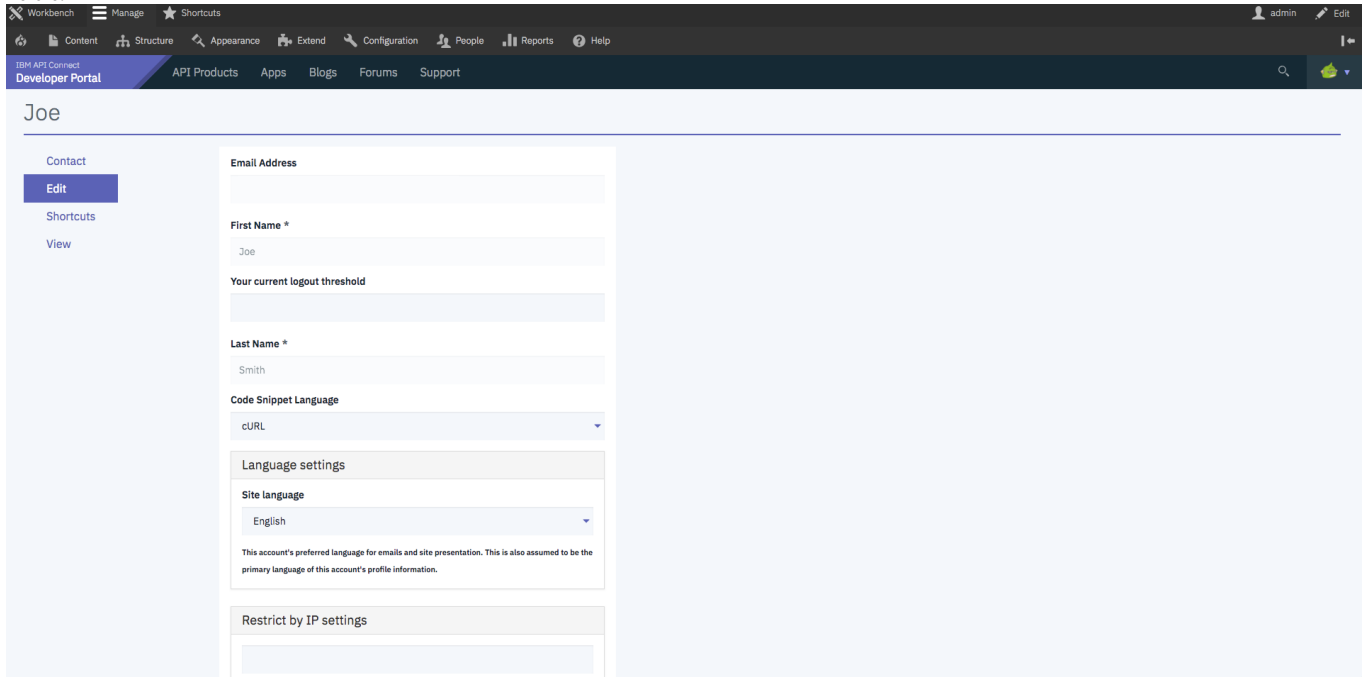

5. Click **Save and continue**.
6. Set the default state to **open**. This sets the tab to be expanded by default.
7. Click **Create group**.

Again, when the group is created, you can assign fields to that group and then rearrange the group on the page as you require. After you create the group, you are returned to the **Manage Display** page.

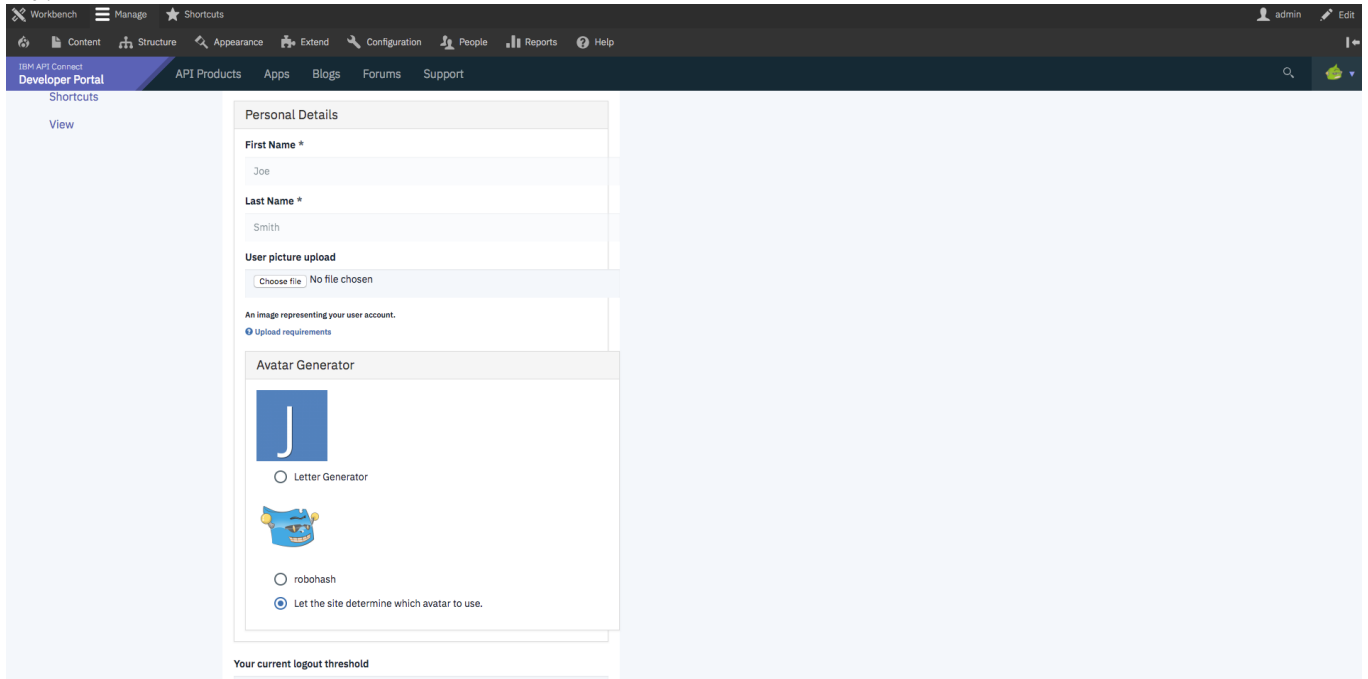

1. Drag your new group from the disabled section up into the upper section, onto the highest row.
2. Drag **First Name**, **Last Name**, **User picture upload**, and **Avatar Generator** to underneath the **Personal Details** group row, and slightly to the right. It fixates itself underneath and to the right of the parent, and this is now set as the child of that group.
3. Click **Save**.

You and your user can now see the new grouped section when you edit their account.

Before:

After:

## What you did in this tutorial

You have successfully created field groups for various groups of user information, and presented them to the user under its own section on the account view and edit pages.

You can check whether your field groups are applied, by viewing the profile of another user. Do this check by finding any other users published content and clicking the associated avatar. Or, from the administrator dashboard you can click **People** and then click a user. You can see the new Consumer Organization field group on their profile page. If you then click **Edit** for the user, you can see the Personal Details field group.

## What to do next

You can edit the user displays anytime by navigating back to **Configuration** > **People** > **Account settings** > **Manage display** or **Manage form display**.

You can delete the field group by clicking the **delete** button in the field group row on either of these pages. You can also modify the type of group it is, for example, vertical tabs, horizontal tabs, accordions, and field sets.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details. For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Tutorial: Adding a custom block to the front page

You can customize the appearance of the front page of your Developer Portal by adding a custom block. Blocks are boxes of content that are rendered into an area, or region, of a web page such as the Products page or Apps page that can be displayed in regions, such as footer or sidebar, on your page.

### Before you begin

You must have a Developer Portal enabled, and you must have administrator access to complete this tutorial. The tutorial [Creating the Portal](#) explains how to enable the portal if you have not already done so. The tutorial [Adding a custom block to a page other than the front page](#) explains how to add a custom block to any other page.

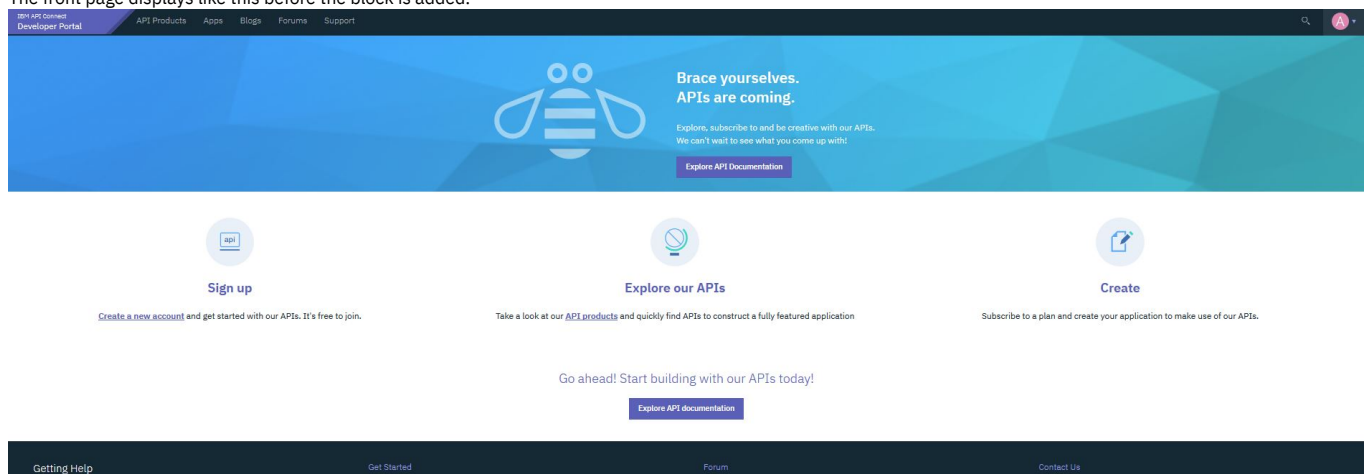

### About this tutorial

In this tutorial, you create a block that contains a marketing announcement and add it to the front page of your Developer Portal.

This tutorial takes you through the following steps:

1. [Creating a custom block.](#)
2. [Adding the custom block to the front page.](#)

The front page displays like this before the block is added.

### Creating a custom block

1. Log in to your Developer Portal as an administrator.
2. If the administrator dashboard isn't displayed, click **Manage** to display it.
3. Navigate to **Structure**, **Block layout**, **Add custom block**.
4. Enter **Marketing Info** in the **Block description**.
5. In the body area, click **Source**, then enter this HTML:

```
<div class="tutorial_block_1 tutorial_block_frontpage">
<h1><span>Create with our APIs</span></h1>
<p><span>Welcome to our Developer Portal where you will find APIs to create your awesome app.</span></p>
</div>
```

## Add custom block ☆

[Home](#)

### Block description \*

Marketing Info

A brief description of your block.

### Body

**B I U S** x<sup>2</sup> x<sub>2</sub> | *I*<sub>x</sub> | ≡ ≡ ≡ ≡ | 🔗 🔗 🔗 🔗 | ⋮ ⋮ ⋮ ⋮ | ☰ Ω ” ” | 🖼️ 🖼️ 🗨️ 🗨️ 🗨️ | Format ▾ | 📄 Source 📄

```
<div class="tutorial_block_1 tutorial_block_frontpage">

A brief description of your block.

### Body

**B I U S** x<sup>2</sup> x<sub>2</sub> | *I*<sub>x</sub> | ≡ ≡ ≡ ≡ | 🔗 🔗 🔗 🔗 | ⋮ ⋮ ⋮ ⋮ | ☰ Ω ” ” | 🖼️ 🖼️ 🗨️ 🗨️ 🗨️ | Format ▾ | 📄 Source 📄

# Create with our APIs

Welcome to our Developer Portal where you will find APIs to create your awesome app.

Text format

Note: This block uses almost no inline-styling, instead it allows your theme to decide how it is rendered. The advantage of this set up is that you can easily change the rendering without modifying existing content in the database. Any styling that is required can be added to a custom theme. For more information, see [Tutorial: Creating a custom theme for the Developer Portal](#).

7. Click **Save**.

You have now created the custom block.

## Adding the custom block to the front page

1. If the administrator dashboard isn't displayed, click **Manage** to display it.
2. Navigate to **Structure > Pages**.
3. Click **Edit** on the **Welcome** page label.
4. Click **Panels** in the **Variants** section.
5. Click **Content** on the expanded menu.
6. Click + **Add new block**.
7. Click **Marketing Info** in the Custom list.
8. Clear **Display title**, keep **Content** in the drop-down list, and click **Add block**.

Add block
✕

**Block description**  
Marketing Info

**Title \***

Display title

**Region \***

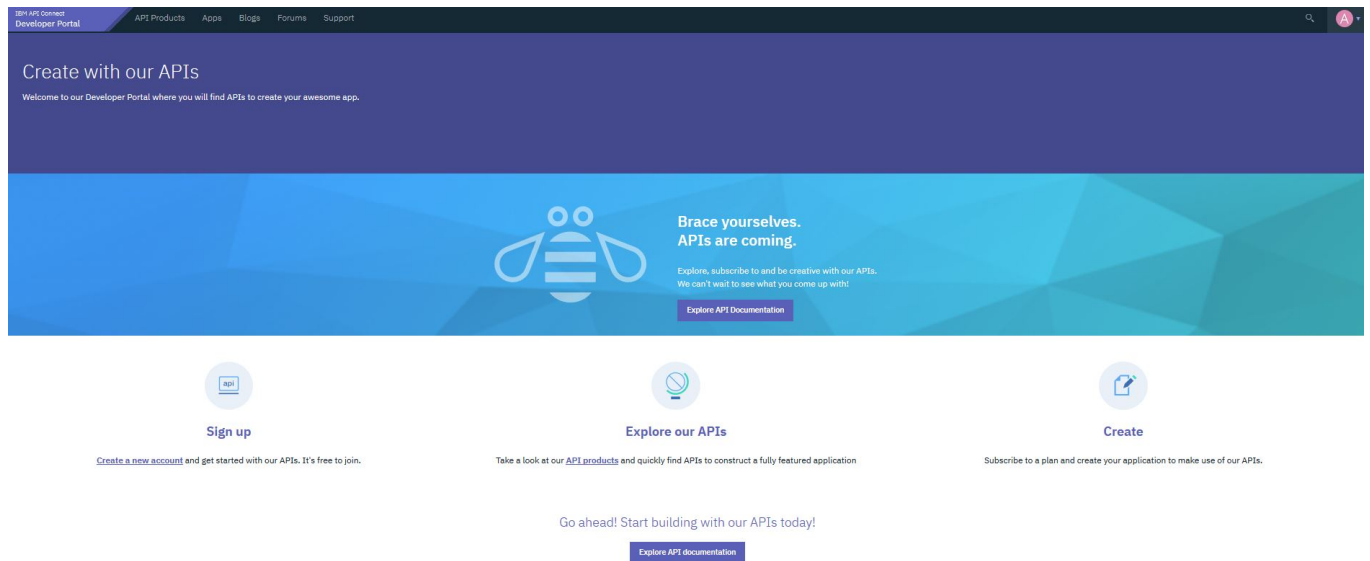

Content ▾

Add block

9. Drag **Marketing Info** to the order you want, in this example before the **Welcome banner** content.
10. Click **Update and save**.

## What you did in this tutorial

The front page now has the new block with a marketing message.

## What to do next

You can add further branding by adding content to your custom blocks such as images, or try using one of the provided custom blocks such as the Featured Content Block. Instead of using inline styling like that provided in the html, adopt best practice by adding class selectors and developing a custom theme. By default this block is English, you might want to consider adding translated versions.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details. For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Tutorial: Adding a custom block to a page other than the front page

You can customize the appearance of a page on your Developer Portal by adding a custom block. Blocks are boxes of content that are rendered into an area or region of a web page, such as the Products page or Apps page. Blocks can be displayed in regions, such as footer or sidebar, on your page.

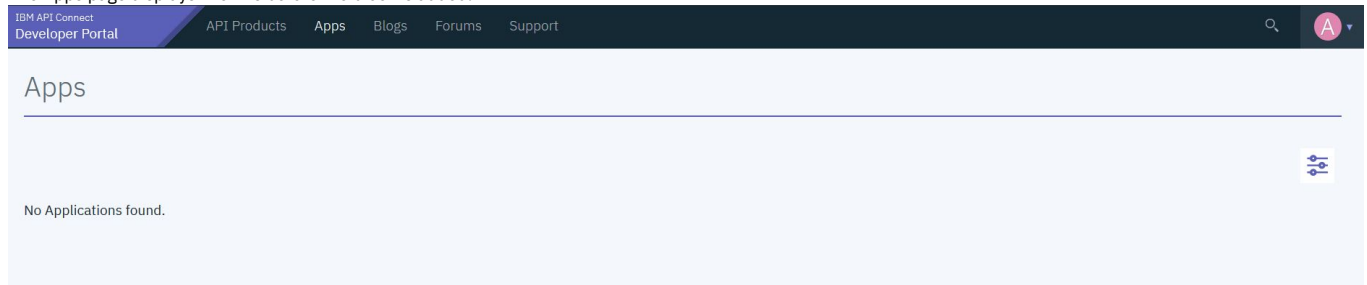

## Before you begin

You must have a Developer Portal enabled, and you must have administrator access to complete this tutorial. The tutorial [Creating the Portal](#) explains how to enable the portal if you have not already done so. The tutorial [Adding a custom block to the front page](#) explains how to add a custom block to the front page.

## About this tutorial

In this tutorial, you create a custom block that contains extra guidance on application creation and registration, and add that custom block to the Apps page of your Developer Portal.

The Apps page displays like this before the block is added.

This tutorial takes you through creating a custom block, and configuring it to show on the Apps page.

1. Log in to your Developer Portal as an administrator.
2. If the administrator dashboard isn't displayed, click **Manage** to display it.
3. Navigate to **Structure > Block layout > Add custom block**.
4. Enter **App Info** in the **Block description**.
5. In the body area, click **Source**, then enter this HTML:

```
<div class="tutorial_block_2">
<p>Before you can use an API, you must create an application. When you create an application you are provided with a client ID and client secret for the application. You must supply the client ID when you call an API that requires you to identify your application by using a client ID, or a client ID and client Secret.</p>
</div>
```

**Block description \***

  
A brief description of your block.

**Body**

**Source**

```
<div class="tutorial_block_2">
<p>Before you can use an API, you must create an application. When you create an application you are provided with a client ID and client secret for the application. You must supply the client ID when you call an API that requires you to identify your application by using a client ID, or a client ID and client Secret.</p>
</div>
```

Text format: Full HTML

[About text formats](#)

6. To see a preview of the block click **Source** again.

**Block description \***

  
A brief description of your block.

**Body**

**Source**

Before you can use an API, you must create an application. When you create an application you are provided with a client ID and client secret for the application. You must supply the client ID when you call an API that requires you to identify your application by using a client ID, or a client ID and client Secret.

Text format: Full HTML

[About text formats](#)

Note: This block uses almost no inline-styling, instead it allows your theme to decide how it is rendered. The advantage of this set up is that you can easily change the rendering without modifying existing content in the database. Any styling that is required can be added to a custom theme. For more information, see [Tutorial: Creating a custom theme for the Developer Portal](#).

7. Click **Save**.

8. Enter `Creating an App` in the **Title** box, keep the **Display title** selected.

✓ Basic block *App Info* has been created.

**Block description:** App Info

**Title \***

Creating an App

Machine name: appinfo [Edit]

This field supports tokens. [Browse available tokens.](#)

Display title

9. Click **Pages** in the **Visibility** list.

10. Enter `/application` in the **Pages** text area, keep the **Show for the listed pages** selected.

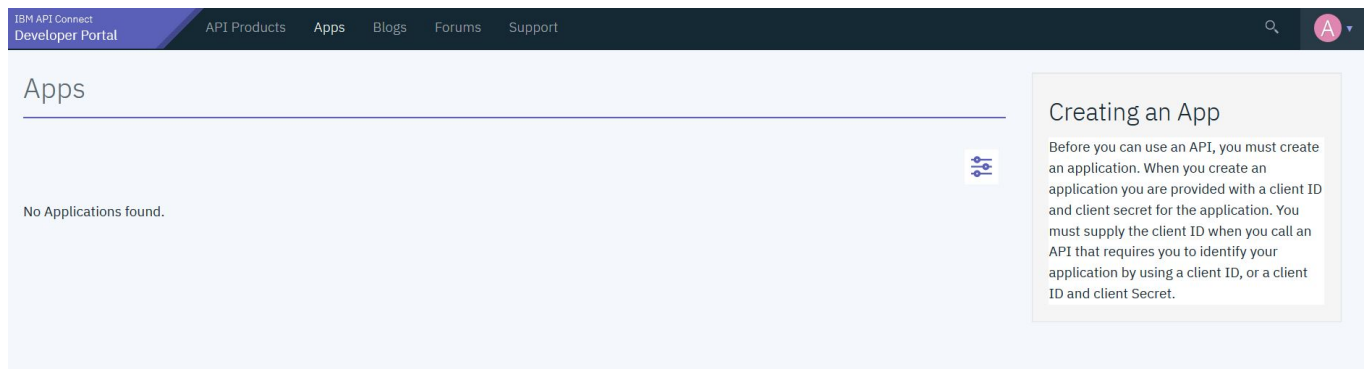

11. Select **Secondary** from the **Region** drop-down menu.

12. Click **Save block**.

13. Click **Save blocks**.

## What you did in this tutorial

The **Apps** page now has an additional block with a guidance message.

The screenshot shows the IBM API Connect Developer Portal interface. The top navigation bar includes 'API Products', 'Apps', 'Blogs', 'Forums', and 'Support'. The main content area is titled 'Apps' and displays 'No Applications found.' A sidebar block titled 'Creating an App' provides guidance: 'Before you can use an API, you must create an application. When you create an application you are provided with a client ID and client secret for the application. You must supply the client ID when you call an API that requires you to identify your application by using a client ID, or a client ID and client Secret.'

## What to do next

Instead of using inline styling like that provided in the html, adopt best practice by adding class selectors and developing a custom theme. By default this block is English, so you might want to consider adding translated versions.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Tutorial: Configuring the RobotsTxt file

You can control the access of a visiting Web robot. You can configure the `robots.txt` file that exists on your web server, usually at the root level, to control access. Web robots are programs that crawl through the web to obtain web content for all the sites that are visited, and provide indexing for better performance of search engines. You can also specify separate rules for different robots.

## Why would I want to edit Drupal's pre-existing robots.txt file?

Malicious robots might choose not to honor the `robots.txt` file, and by editing this file you are broadcasting which sites you do not want others to see. Therefore, you should not use this file to hide sensitive data. Instead, you might want to edit your `robots.txt` file to:

- Prevent duplicate information from being identified on your site
- Prevent internal pages from appearing in search engines
- Prevent private pages from appearing in search engines
- Prevent particular images, files, and so on, from being crawled
- Specify a `crawl-delay` attribute to prevent robots from overloading your server at load time
- Exclude a particular robot

## Before you begin

You must have a Developer Portal enabled, and you must have administrator access to complete this tutorial.

## About this tutorial

---

You will edit the pre-existing `robots.txt` file and exclude access to a visiting robot called BadBot.

1. Log in to your Developer Portal as an administrator.
2. If the administrator dashboard isn't displayed, click **Manage** to display it.
3. Navigate to **Configuration** » **Search and Metadata** » **RobotsTxt**.

### RobotsTxt

[Home](#) » [Administration](#) » [Configuration](#) » [Search and metadata](#)

See <http://www.robotstxt.org/> for more information concerning how to write your `robots.txt` file.

#### Contents of robots.txt

```
#
# robots.txt
#
# This file is to prevent the crawling and indexing of certain parts
# of your site by web crawlers and spiders run by sites like Yahoo!
# and Google. By telling these "robots" where not to go on your site,
# you save bandwidth and server resources.
#
# This file will be ignored unless it is at the root of your host:
# Used: http://example.com/robots.txt
# Ignored: http://example.com/site/robots.txt
#
# For more information about the robots.txt standard, see:
# http://www.robotstxt.org/robotstxt.html

User-agent: *
# CSS, JS, Images
Allow: /core/*.css$
Allow: /core/*.css?
Allow: /core/*.js$
Allow: /core/*.js?
```

**Save configuration**

4. Enter the policy to exclude access to a robot called BadBot.

```
User-agent: BadBot
Disallow: /
```

5. Click **Save Configuration** to save your changes.

## What you did in this tutorial

---

You have now successfully customized the `robots.txt` file. Robots now use this updated file to decide where they can crawl on your site. The BadBot robot is excluded access.

You can check whether your `robots.txt` file is successfully changed by navigating to your site and appending `/robots.txt`. You should see the content you entered into that file.

```
#
# robots.txt
#
# This file is to prevent the crawling and indexing of certain parts
# of your site by web crawlers and spiders run by sites like Yahoo!
# and Google. By telling these "robots" where not to go on your site,
# you save bandwidth and server resources.
#
# This file will be ignored unless it is at the root of your host:
# Used: http://example.com/robots.txt
# Ignored: http://example.com/site/robots.txt
#
# For more information about the robots.txt standard, see:
# http://www.robotstxt.org/robotstxt.html

User-agent: BadBot
Disallow: /

User-agent: *
# CSS, JS, Images
Allow: /core/*.css$
Allow: /core/*.css?
Allow: /core/*.js$
Allow: /core/*.js?
```

For more information on how to edit your `robots.txt` file, see <https://www.robotstxt.org/>.

---

## What to do next

You can edit the `robots.txt` at any time by navigating back to the page within the configuration settings. You might choose to duplicate this file across all of your sites, or choose different policies for different sites.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Tutorials for using custom modules in the Developer Portal

You can configure custom modules to complete specific actions in the Developer Portal.

Note: You must have administrator access to complete the tutorials.

You can configure rules for the following events that occur in the Developer Portal:

- Change the profile page to display **firstname last name**, instead of **username**.
- Add validation to a field on the sign up form.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## Tutorial: Changing the profile page to display firstname lastname, instead of username

You might want to change the profile page of your users on your Developer Portal to display their **firstname** and **lastname** rather than their **username**.

---

### Before you begin

You must have a Developer Portal enabled, and you must have administrator access to complete this tutorial.

---

### About this tutorial

In this tutorial, you change the profile page of your users to display their **firstname** and **lastname** rather than their **username**. The change to the profile page is done by using the custom module `change_account_display` that is already available in [IBM APIC Portal - addons](#). However, for more information, see [Custom module development: creating a module skeleton](#).

This tutorial takes you through the following steps:

1. [Cloning and packaging the change\\_account\\_display module](#).
2. [Installing and enabling the change\\_account\\_display module](#).

## Cloning and packaging the `change_account_display` module

---

1. Clone the custom module. Here is an example command if you are using Mac and Linux:

```
git clone https://github.com/ibm-apiconnect/devportal-addons
```

2. Package up the custom module.

```
cd devportal-addons/Drupal8/modules
tar -czf change_account_display.tgz change_account_display/
```

## Installing and enabling the `change_account_display` module

---

1. Log in to your Developer Portal as an administrator.
2. If the administrator dashboard isn't displayed, click **Manage** to display it.
3. Click **Extend** > **Install new module**.
4. Click **Browse** from the **Upload a module or theme archive to install** section.
5. Navigate to and select the packaged custom module that you created earlier. For example, `change_account_display.tgz`, then click **Open**.

# API Developer Portal

## Update manager

✓ Installation was completed successfully.

### change\_account\_display

- Installed *change\_account\_display* successfully

### Next steps

- [Install another module](#)
- [Enable newly added modules](#)
- [Administration pages](#)

6. Click **Install**.
7. Click the **Enable newly added modules** link.
8. Enter **Change Account Display** in the filter box.
9. Check the check box next to **Change Account Display**.
10. Click **Enable**.

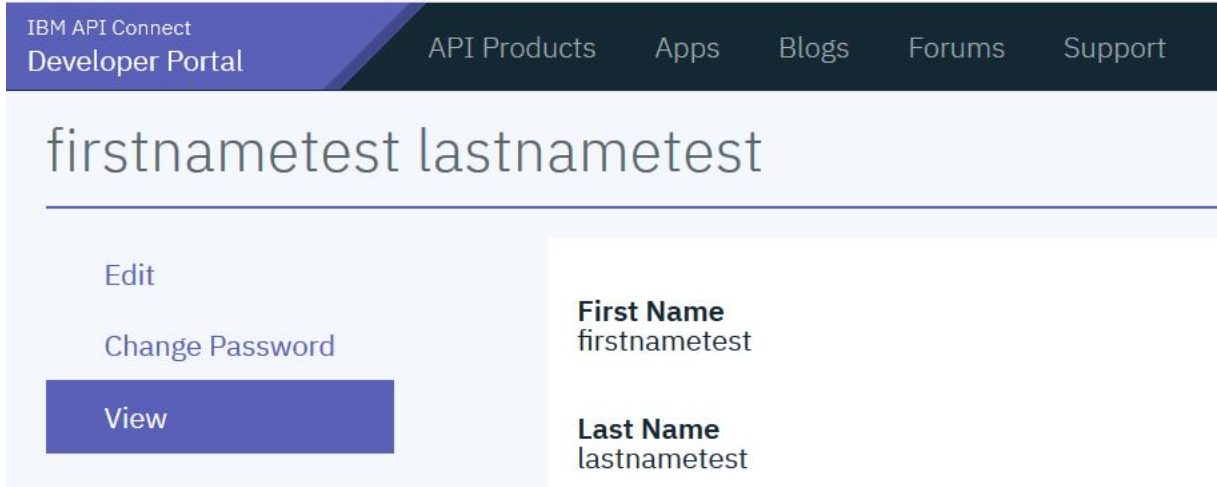

The module is now installed and enabled.

## Test the profile page change

---

1. Sign out as the Admin user.
2. Sign in as a user of your Developer Portal.
3. Click **My account** from the drop down next to your **username**.

4. Notice that your **firstname** and **lastname** are now displayed.

IBM API Connect  
Developer Portal

API Products Apps Blogs Forums Support

firstnametest lastnametest

Edit

Change Password

View

**First Name**  
firstnametest

**Last Name**  
lastnametest

## What you did in this tutorial

You used a custom module to change the profile page display for the users of your Developer Portal.

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Tutorial: Adding validation to a field on the sign-up form

You might want to add extra validation to a field to help your Developer Portal users. For example, you might want to validate a department name, employee ID, or similar data when a user registers for an account on the portal.

### Before you begin

You must have a Developer Portal enabled, and you must have administrator access to complete this tutorial. You must have completed the tutorial about [Adding a field to the sign up form](#), where you added a Department code field to the Sign-up form.

### About this tutorial

In this tutorial, you add some validation to the Department code field on the Sign-up form. This is a required field for all portal users and is a string of the format **DEPnnn**, where **DEP** is the string prefix and **nnn** is a three-digit number, for example, **DEP123**. The validation is done by using a custom module that is already available in [IBM APIC Portal - addons](#). However, for more information, see [Custom module development: creating a module skeleton](#).

This tutorial takes you through the following steps:

1. [Cloning and packaging the validation module](#).
2. [Installing and enabling the validation module](#).
3. [Testing the validation in the sign up form](#).

Look at the files we will use in this link [IBM APIC Portal - addons](#).

- `user_field_example.info.yml` - this is the metadata for the module, defining things like the name and version, and containing other important information that is required by Drupal to import and enable the module.

```
name: 'IBM APIC Portal - user field example'
type: module
description: 'IBM API Connect Developer Portal tutorial - Example of validating a custom user field'
package: 'Custom'
core_version_requirement: ^8 || ^9
version: 1.0.0
project: 'user_field_example'
dependencies:
  - ibm_apim
  - auth_apic
```

- `user_field_example.module` - this contains a validation function and adds this to the Sign-up form by using the `hook_form_alter` function.

```
<?php
use Drupal\Core\Form\FormStateInterface;

/**
 * Implementation of hook_form_alter() to alter the Sign up form
 */
function user_field_example_form_alter(&$form, FormStateInterface $form_state, $form_id) {
  if ($form_id === 'user_register_form') {
```

```

        $form['#validate'][] = 'user_field_example_validate_department_code';
    }
}

/**
 * Validate the Department code field on the Sign up form.
 *
 * Valid entry = DEPnnn
 * where n = single figure digit.
 */
function user_field_example_validate_department_code($form, &$form_state) {
    $dept_code = $form_state->getValue('field_department_code')[0]['value'];
    $valid = preg_match('/^DEP\d{3}$/', $dept_code);
    if (!$valid) {
        $form_state->setErrorByName('field_department_code', t('Invalid department code.'));
    }
}
}

```

## Cloning and packaging the validation module

---

Validation is added to the `Department code` field on the Sign-up form by using a custom module.

1. Clone the custom module. Here is an example command if you are using Mac and Linux:

```
git clone https://github.com/ibm-apiconnect/devportal-addons
```

2. Package up the custom module.

```
cd devportal-addons/apic_v10/modules
tar -czf user_field_example.tgz user_field_example/
```

## Installing and enabling the validation module

---

1. Log in to your Developer Portal as an administrator.
2. If the administrator dashboard isn't displayed, click **Manage** to display it.
3. Click **Extend > Install new module**.
4. Click **Choose file** from the **Upload a module or theme archive to install** section.
5. Browse to and select `user_field_example.tgz`, the packaged custom module that you created earlier. Click **Open**.
6. Click **Install**.
7. Click the **Enable newly added modules** link.
8. Enter **IBM APIC Portal - user field example** in the filter box.
9. Check the checkbox next to **IBM APIC Portal - user field example**.
10. Click **Enable**.

The module is now installed and enabled.

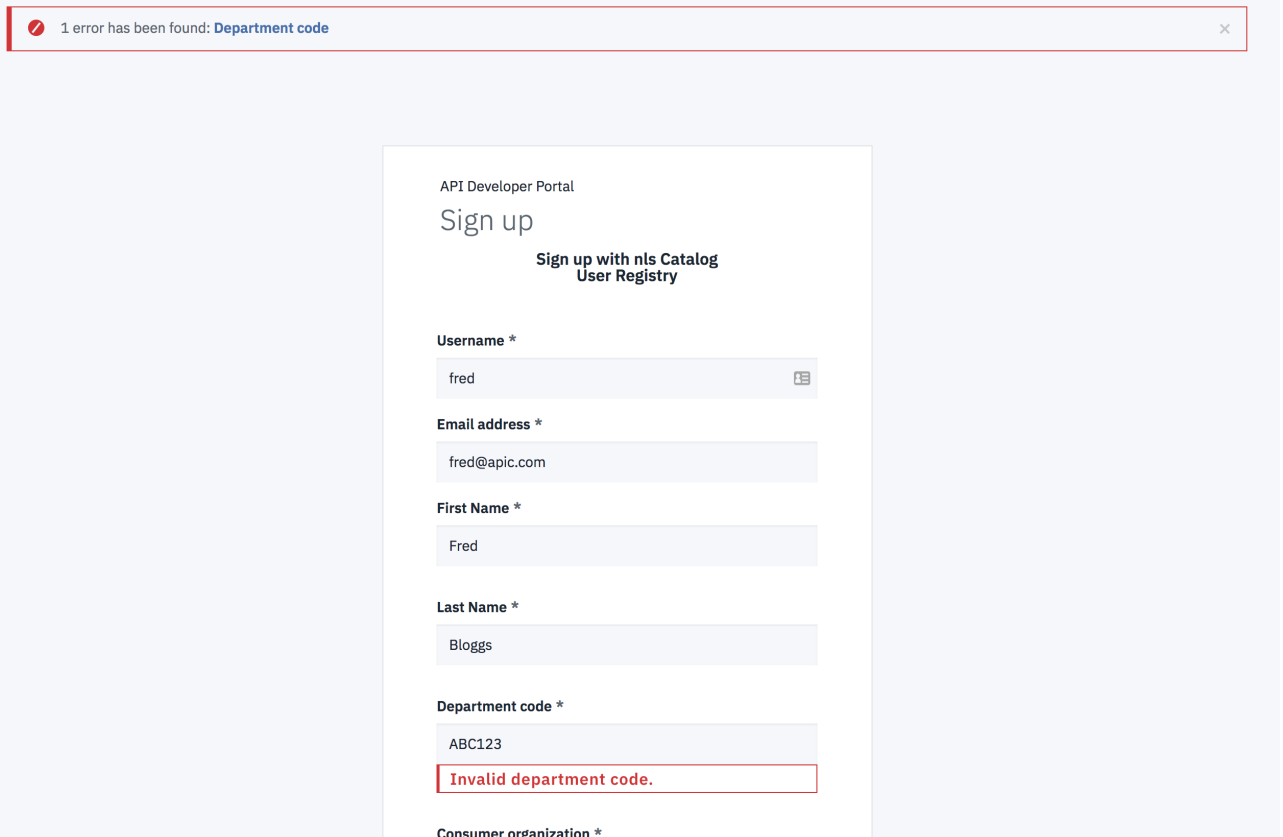

## Testing the validation in the sign-up form

---

1. Sign out as the Admin user.
2. Click **Create account**.
3. Complete all fields, set **Department code** to **ABC123**.
4. Click **Sign up**.

5. Observe the failure message and highlighting on the **Department code** field.

The screenshot shows a sign-up form titled "API Developer Portal Sign up with nls Catalog User Registry". The form includes fields for Username, Email address, First Name, Last Name, Department code, and Consumer organization. The Department code field contains "ABC123" and has a red border with the message "Invalid department code." below it. At the top of the page, a red error message states "1 error has been found: Department code".

6. Change the **Department code** field to **DEP245**, reenter the password and click **Sign up** to see that a valid code is accepted.

## What you did in this tutorial

You added some validation to the Department code field on the Sign-up form, then tested the form to ensure that the **Department code** field accepts only codes in the format of **DEPnnn**.

In reality, you would need to add this configuration in such a way that it is available for all sites. To achieve this availability, you would include the configuration in your custom module. For more information, see [Drupal custom modules](#).

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details. For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Tutorial: Using a custom weighting sort order on the product list page

You can use a custom weighting to sort your products on the API products list page of your Developer Portal.

### Before you begin

You must have a Developer Portal enabled, and you must have administrator access to complete this tutorial. The tutorial [Creating the Portal](#) explains how to enable the portal if you have not already done so.

### About this tutorial

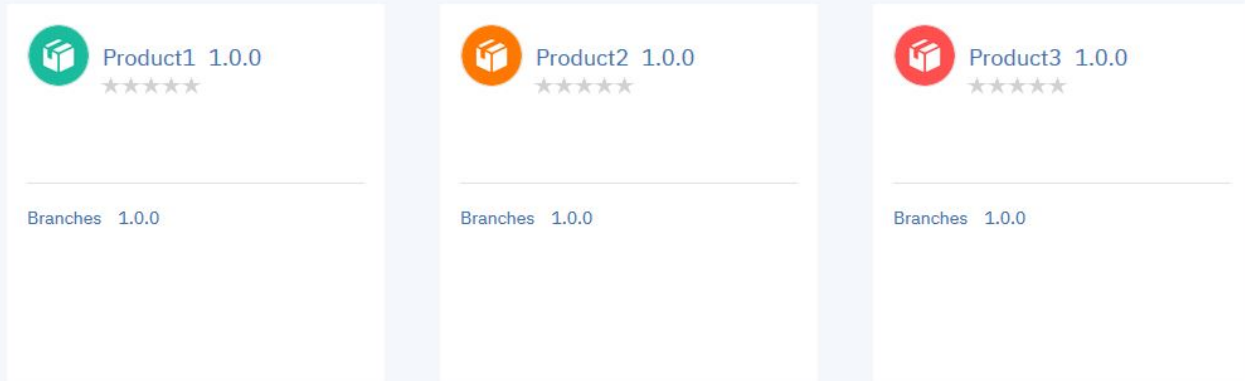

In this task, you set up a weighting sort criteria and use it to list your products, on the API Products page, in a particular order. You set up the weightings so the order reads, Product3, Product1, and Product2.

This tutorial takes you through the following steps:

1. [Add a custom integer field to the API content type.](#)
2. [Modify the Products view to change the sort order.](#)
3. [Add a weighting to each Product.](#)

The API Products page displays Product1, Product2, and Product3 in this order before the weightings are added.

## API Products

### Add a custom integer field to the API content type

1. Log in to your Developer Portal as an administrator.
2. If the administrator dashboard isn't displayed, click **Manage** to display it.
3. Click **Structure** > **Content types** > **Product** > **Manage fields**.
4. Click **+ Add field**.
5. In **Add a new field**, select **Number (Integer)**. Enter **Weighting** as the label title.

#### Add field ☆

[Home](#) > [Administration](#) > [Structure](#) > [Content types](#) > [Product](#) > [Manage fields](#)

#### Add a new field

Number (integer) ▼

or

#### Re-use an existing field

- Select an existing field - ▼

#### Label \*

Weighting

Machine name: field\_weighting [Edit]

**Save and continue**

6. Click **Save and continue**.
7. Leave the **Allowed number of values** set to 1 and click **Save field settings**.
8. Enter 0 as the default value, click **Save settings**.
9. Click **Save**.

The **Weighting** field now shows in the **Manage fields** list.

### Modify the Products view to change the sort order

1. If the administrator dashboard isn't displayed, click **Manage** to display it.
2. Navigate to **Structure** > **Views**, scroll down to the **Products** view and click **Edit**.
3. In the **SORT CRITERIA** section click **Add**.
4. Enter **weight** in the search box. Then, select **Weighting (field\_weighting)**, and click **Apply** (all displays).
5. Leave the **Order** as **Sort ascending**, click **Apply** (all displays).
6. In the **SORTCRITERIA** section, select **Rearrange** from the drop-down menu next to the **Add**.

Rearrange sort criteria ✕

**For**  
All displays (except overridden) ▾

[Show row weights](#)

	REMOVE
✚ Content: Title Exposed	<a href="#">Remove</a>
✚ Content: Version (apic_version) Exposed	<a href="#">Remove</a>
✚ Content: Changed Exposed	<a href="#">Remove</a>
✚ Content: Authored on Exposed	<a href="#">Remove</a>
✚ Content: Rating (apic_rating) Exposed	<a href="#">Remove</a>
✚ Content: Weighting (field_weighting) asc	<a href="#">Remove</a>

Apply (all displays)
Cancel

7. For all rows except **Weighting (field\_weighting)**, click **Remove**.
8. Click **Apply (all displays)**.

You modified the **Products** view to sort based on **Weighting (field\_weighting)**.

## Add a weighting to each Product

1. If the administrator dashboard isn't displayed, click **Manage** to display it.
2. Click **Content**, and select **Product** from the **Content type**, click **Filter**. A list of available Products on your site is displayed.

+ Add content

Title Content type Published status Language  
 Product ▾ - Any - ▾ - Any - ▾

Filter

**Action**  
Delete content ▾

Apply to selected items

<input type="checkbox"/>	TITLE	CONTENT TYPE	AUTHOR	STATUS	UPDATED	OPERATIONS
<input type="checkbox"/>	Product3	Product	admin	Published	06/18/2019 - 15:34	<span style="border: 1px solid #ccc; border-radius: 3px; padding: 2px 5px;">Edit</span> ▾
<input type="checkbox"/>	Product2	Product	admin	Published	06/18/2019 - 15:32	<span style="border: 1px solid #ccc; border-radius: 3px; padding: 2px 5px;">Edit</span> ▾
<input type="checkbox"/>	Product1	Product	admin	Published	06/18/2019 - 15:31	<span style="border: 1px solid #ccc; border-radius: 3px; padding: 2px 5px;">Edit</span> ▾

3. For Product1 click edit, in the **Weighting field**, select 2 as the value, click **Save**.
4. For Product2 click edit, in the **Weighting field**, select 3 as the value, click **Save**.
5. For Product3 click edit, in the **Weighting field**, select 1 as the value, click **Save**.

The API Products page displays Product3, Product1, and Product2 in this order after the weightings are added.

## What you did in this tutorial

You changed the order that the API Products appear on the products page.

--offset int32       Offset item number from list to begin return
-o, --org string      Organization name or id (required)
--output string      Write file(s) to directory, instead of STDOUT (default "-")
--scope string       scope
-s, --server string  management server endpoint (required)
```

### Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#), for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic activations:clear

Activations clear operations

### Synopsis

Activations clear operations

```
apic activations:clear [flags]
```

### Options

```
-c, --catalog string  Catalog name or id (required)
--confirm string      Confirmation for critical updates (required)
--format string      Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for activations:clear
-o, --org string      Organization name or id (required)
--output string      Write file(s) to directory, instead of STDOUT (default "-")
--scope string       scope
-s, --server string  management server endpoint (required)
```

### Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#), for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic activations:delete

Activations delete operations

### Synopsis

---

Activations delete operations

```
apic activations:delete [flags]
```

### Options

---

```
-c, --catalog string  Catalog name or id (required)
--format string      Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for activations:delete
-o, --org string     Organization name or id (required)
--output string      Write file(s) to directory, instead of STDOUT (default "-")
--scope string       scope
-s, --server string  management server endpoint (required)
```

### Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic activations:get

Activations get operations

### Synopsis

---

Activations get operations

```
apic activations:get [flags]
```

### Options

---

```
-c, --catalog string  Catalog name or id (required)
--fields string      List of field names to return
--format string      Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for activations:get
-o, --org string     Organization name or id (required)
--output string      Write file(s) to directory, use - for STDOUT. (default: cwd)
--scope string       scope
-s, --server string  management server endpoint (required)
```

### Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic activations:list

## Synopsis

---

Activations list operations

```
apic activations:list [flags]
```

## Options

---

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--fields string</code>	List of field names to return
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for activations:list
<code>--limit int32</code>	Maximum number of items to return
<code>--offset int32</code>	Offset item number from list to begin return
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>--scope string</code>	scope
<code>-s, --server string</code>	management server endpoint (required)

## Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic analytics

Analytics operations

## Synopsis

---

Analytics operations

```
apic analytics [flags]
```

## Options

---

<code>-h, --help</code>	Help for analytics
-------------------------	--------------------

## Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic analytics:create

Analytics create operations

## Synopsis

---

Analytics create operations

```
apic analytics:create [flags]
```

## Options

---

```

--analytics-service string  Analytics Service name or id (required)
-c, --catalog string       Catalog name or id (required)
--format string            Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help                 Help for analytics:create
-o, --org string           Organization name or id (required)
--output string            Write file(s) to directory, instead of STDOUT (default "-")
--query string             Add query to request
--scope string             scope
-s, --server string        management server endpoint (required)
--space string            Space name or id (required)

```

## Options inherited from parent commands

```

--accept-license          Accept the license for API Connect
--debug                  Enable debug output
--debug-output string    Write debug output to file
--live-help              Enable or disable tracking of limited usage information
-m, --mode string        Toolkit operation mode (default "apim")

```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## apic analytics-services

Analytics Services operations

### Synopsis

Analytics Services operations

```
apic analytics-services [flags]
```

### Options

```

--availability-zone string  Availability Zone name or id (required)
-c, --catalog string       Catalog name or id (required)
--fields string            List of field names to return
--format string            Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help                 Help for analytics-services
--limit int32              Maximum number of items to return
--offset int32             Offset item number from list to begin return
-o, --org string           Organization name or id (required)
--output string            Write file(s) to directory, instead of STDOUT (default "-")
--scope string             scope
-s, --server string        management server endpoint (required)
--space string            Space name or id (required)

```

## Options inherited from parent commands

```

--accept-license          Accept the license for API Connect
--debug                  Enable debug output
--debug-output string    Write debug output to file
--live-help              Enable or disable tracking of limited usage information
-m, --mode string        Toolkit operation mode (default "apim")

```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## apic analytics-services:clear

Clear the Analytics Service objects

### Synopsis

Clear the Analytics Service objects

```
apic analytics-services:clear [flags]
```

### Options

```

--availability-zone string  Availability Zone name or id (required)
--confirm string           Confirmation for critical updates (required)

```

```
--format string      Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help          Help for analytics-services:clear
-o, --org string     Organization name or id (required)
--output string      Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string  management server endpoint (required)
```

## Options inherited from parent commands

---

```
--accept-license    Accept the license for API Connect
--debug             Enable debug output
--debug-output string Write debug output to file
--live-help         Enable or disable tracking of limited usage information
-m, --mode string    Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic analytics-services:create

Create a Analytics Service object

### Synopsis

---

Create a Analytics Service object

```
apic analytics-services:create [flags]
```

### Options

---

```
--availability-zone string Availability Zone name or id (required)
--format string           Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help               Help for analytics-services:create
-o, --org string         Organization name or id (required)
--output string          Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string      management server endpoint (required)
```

## Options inherited from parent commands

---

```
--accept-license    Accept the license for API Connect
--debug             Enable debug output
--debug-output string Write debug output to file
--live-help         Enable or disable tracking of limited usage information
-m, --mode string    Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic analytics-services:delete

Delete the Analytics Service object by name or id

### Synopsis

---

Delete the Analytics Service object by name or id

```
apic analytics-services:delete [flags]
```

### Options

---

```
--availability-zone string Availability Zone name or id (required)
--format string           Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help               Help for analytics-services:delete
-o, --org string         Organization name or id (required)
--output string          Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string      management server endpoint (required)
```

## Options inherited from parent commands

---

```
--accept-license    Accept the license for API Connect
--debug             Enable debug output
```

```
--debug-output string  Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic analytics-services:get

Get the Analytics Service object by name or id

---

### Synopsis

Get the Analytics Service object by name or id

```
apic analytics-services:get [flags]
```

---

### Options

```
--availability-zone string  Availability Zone name or id (required)
-c, --catalog string       Catalog name or id (required)
--fields string           List of field names to return
--format string           Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help                Help for analytics-services:get
-o, --org string           Organization name or id (required)
--output string           Write file(s) to directory, use - for STDOUT. (default: cwd)
--query string            Add query to request
--scope string            scope
-s, --server string       management server endpoint (required)
--space string            Space name or id (required)
```

---

### Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string  Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic analytics-services:list

List the Analytics Service objects

---

### Synopsis

List the Analytics Service objects

```
apic analytics-services:list [flags]
```

---

### Options

```
--availability-zone string  Availability Zone name or id (required)
-c, --catalog string       Catalog name or id (required)
--fields string           List of field names to return
--format string           Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help                Help for analytics-services:list
--limit int32             Maximum number of items to return
--offset int32            Offset item number from list to begin return
-o, --org string           Organization name or id (required)
--output string           Write file(s) to directory, instead of STDOUT (default "-")
--scope string            scope
-s, --server string       management server endpoint (required)
--space string            Space name or id (required)
```

---

### Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string  Write debug output to file
```

```
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic analytics-services:update

Update the Analytics Service object by name or id

### Synopsis

Update the Analytics Service object by name or id

```
apic analytics-services:update [flags]
```

### Options

```
--availability-zone string  Availability Zone name or id (required)
--format string             Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help                 Help for analytics-services:update
-o, --org string           Organization name or id (required)
--output string            Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string        management server endpoint (required)
```

### Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic api-keys

Api Keys operations

### Synopsis

Api Keys operations

```
apic api-keys [flags]
```

### Options

```
--fields string  List of field names to return
--format string  Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for api-keys
--limit int32   Maximum number of items to return
--offset int32  Offset item number from list to begin return
--output string Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

### Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic api-keys:create

Create a API Key object

### Synopsis

---

Create a API Key object

```
apic api-keys:create [flags]
```

### Options

---

```
--format string  Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.  
-h, --help      Help for api-keys:create  
--output string  Write file(s) to directory, instead of STDOUT (default "-")  
-s, --server string  management server endpoint (required)
```

### Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect  
--debug          Enable debug output  
--debug-output string  Write debug output to file  
--live-help      Enable or disable tracking of limited usage information  
-m, --mode string  Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic api-keys:delete

Delete the API Key object by name or id

### Synopsis

---

Delete the API Key object by name or id

```
apic api-keys:delete [flags]
```

### Options

---

```
--format string  Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.  
-h, --help      Help for api-keys:delete  
--output string  Write file(s) to directory, instead of STDOUT (default "-")  
-s, --server string  management server endpoint (required)
```

### Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect  
--debug          Enable debug output  
--debug-output string  Write debug output to file  
--live-help      Enable or disable tracking of limited usage information  
-m, --mode string  Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic api-keys:get

Get the API Key object by name or id

### Synopsis

---

Get the API Key object by name or id

```
apic api-keys:get [flags]
```

## Options

---

```
--fields string  List of field names to return
--format string  Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for api-keys:get
--output string  Write file(s) to directory, use - for STDOUT. (default: cwd)
-s, --server string  management server endpoint (required)
```

## Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string  Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic api-keys:list

List the API Key objects

## Synopsis

---

List the API Key objects

```
apic api-keys:list [flags]
```

## Options

---

```
--fields string  List of field names to return
--format string  Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for api-keys:list
--limit int32    Maximum number of items to return
--offset int32   Offset item number from list to begin return
--output string  Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string  management server endpoint (required)
```

## Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string  Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic apis

Apis operations

## Synopsis

---

Apis operations

```
apic apis [flags]
```

## Options

---

```
-c, --catalog string  Catalog name or id (required)
--fields string      List of field names to return
--format string      Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help          Help for apis
--limit int32       Maximum number of items to return
--offset int32      Offset item number from list to begin return
-o, --org string     Organization name or id (required)
--output string      Write file(s) to directory, instead of STDOUT (default "-")
```

```
--scope string      scope
-s, --server string  management server endpoint (required)
--space string      Space name or id (required)
```

## Options inherited from parent commands

---

```
--accept-license    Accept the license for API Connect
--debug             Enable debug output
--debug-output string Write debug output to file
--live-help         Enable or disable tracking of limited usage information
-m, --mode string   Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic apis:clone

Apis clone operations

## Synopsis

---

Apis clone operations

```
apic apis:clone [flags]
```

## Options

---

```
-c, --catalog string  Catalog name or id (required)
--fields string       List of field names to return
--format string       Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for apis:clone
--limit int32        Maximum number of items to return
--offset int32       Offset item number from list to begin return
-o, --org string      Organization name or id (required)
--output string       Write file(s) to directory, use - for STDOUT. (default: cwd)
--scope string        scope
-s, --server string   management server endpoint (required)
--space string        Space name or id (required)
```

## Options inherited from parent commands

---

```
--accept-license    Accept the license for API Connect
--debug             Enable debug output
--debug-output string Write debug output to file
--live-help         Enable or disable tracking of limited usage information
-m, --mode string   Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic apis:document

Apis document operations

## Synopsis

---

Apis document operations

```
apic apis:document [flags]
```

## Options

---

```
-c, --catalog string  Catalog name or id (required)
--format string       Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for apis:document
--id                 id
-o, --org string      Organization name or id (required)
--output string       Write file(s) to directory, instead of STDOUT (default "-")
--scope string        scope
-s, --server string   management server endpoint (required)
--space string        Space name or id (required)
```

## Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic apis:get

Apis get operations

### Synopsis

---

Apis get operations

```
apic apis:get [flags]
```

### Options

---

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--fields string</code>	List of field names to return (default "add(wsd1,api)")
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for apis:get
<code>--id</code>	id
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, use - for STDOUT. (default: cwd)
<code>--scope string</code>	scope
<code>-s, --server string</code>	management server endpoint (required)
<code>--space string</code>	Space name or id (required)

## Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic apis:list

Apis list operations

### Synopsis

---

Apis list operations

```
apic apis:list [flags]
```

### Options

---

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--fields string</code>	List of field names to return
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for apis:list
<code>--limit int32</code>	Maximum number of items to return
<code>--offset int32</code>	Offset item number from list to begin return
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>--scope string</code>	scope
<code>-s, --server string</code>	management server endpoint (required)
<code>--space string</code>	Space name or id (required)

## Options inherited from parent commands

---

```
--accept-license      Accept the license for API Connect
--debug              Enable debug output
--debug-output string Write debug output to file
--live-help          Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic apis:list-all

Apis list-all operations

### Synopsis

Apis list-all operations

```
apic apis:list-all [flags]
```

### Options

```
-c, --catalog string  Catalog name or id (required)
--fields string      List of field names to return
--format string      Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for apis:list-all
--limit int32        Maximum number of items to return
--offset int32       Offset item number from list to begin return
-o, --org string      Organization name or id (required)
--output string      Write file(s) to directory, instead of STDOUT (default "-")
--scope string       scope
-s, --server string  management server endpoint (required)
--space string       Space name or id (required)
```

### Options inherited from parent commands

```
--accept-license      Accept the license for API Connect
--debug              Enable debug output
--debug-output string Write debug output to file
--live-help          Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic apis:update

Apis update operations

### Synopsis

Apis update operations

```
apic apis:update [flags]
```

### Options

```
-c, --catalog string  Catalog name or id (required)
--format string      Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for apis:update
--id string          id
-o, --org string      Organization name or id (required)
--output string      Write file(s) to directory, instead of STDOUT (default "-")
--scope string       scope
-s, --server string  management server endpoint (required)
--space string       Space name or id (required)
```

### Options inherited from parent commands

```
--accept-license      Accept the license for API Connect
--debug              Enable debug output
--debug-output string Write debug output to file
```

```
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic apis:wsdl

Apis wsdl operations

### Synopsis

Apis wsdl operations

```
apic apis:wsdl [flags]
```

### Options

```
-c, --catalog string  Catalog name or id (required)
--format string      Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for apis:wsdl
--id                id
-o, --org string     Organization name or id (required)
--output string     Write file(s) to directory, use - for STDOUT. (default: cwd)
--scope string      scope
-s, --server string  management server endpoint (required)
--space string      Space name or id (required)
```

### Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic apps

Apps operations

### Synopsis

Apps operations

```
apic apps [flags]
```

### Options

```
-c, --catalog string      Catalog name or id (required)
--consumer-org string    Consumer Organization name or id (required)
--expand string          List of transient field to expand
--fields string          List of field names to return
--format string          Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help              Help for apps
--limit int32           Maximum number of items to return
--offset int32          Offset item number from list to begin return
-o, --org string        Organization name or id (required)
--output string         Write file(s) to directory, instead of STDOUT (default "-")
--scope string          scope
-s, --server string     management server endpoint (required)
--space string          Space name or id (required)
--space-initiated       space-initiated
```

### Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
```

```
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic apps:clear

Clear the Application objects

### Synopsis

Clear the Application objects

```
apic apps:clear [flags]
```

### Options

```
-c, --catalog string      Catalog name or id (required)
--confirm string          Confirmation for critical updates (required)
--consumer-org string     Consumer Organization name or id (required)
--format string           Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help                Help for apps:clear
-o, --org string           Organization name or id (required)
--output string           Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string       management server endpoint (required)
--space string            Space name or id (required)
--space-initiated        space-initiated
```

### Options inherited from parent commands

```
--accept-license      Accept the license for API Connect
--debug               Enable debug output
--debug-output string Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic apps:create

Create a Application object

### Synopsis

Create a Application object

```
apic apps:create [flags]
```

### Options

```
-c, --catalog string      Catalog name or id (required)
--consumer-org string     Consumer Organization name or id (required)
--format string           Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help                Help for apps:create
-o, --org string           Organization name or id (required)
--output string           Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string       management server endpoint (required)
--space string            Space name or id (required)
--space-initiated        space-initiated
```

### Options inherited from parent commands

```
--accept-license      Accept the license for API Connect
--debug               Enable debug output
--debug-output string Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic apps:delete

Delete the Application object by name or id

### Synopsis

---

Delete the Application object by name or id

```
apic apps:delete [flags]
```

### Options

---

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--consumer-org string</code>	Consumer Organization name or id (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for apps:delete
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)
<code>--space string</code>	Space name or id (required)
<code>--space-initiated</code>	space-initiated

### Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic apps:get

Get the Application object by name or id

### Synopsis

---

Get the Application object by name or id

```
apic apps:get [flags]
```

### Options

---

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--consumer-org string</code>	Consumer Organization name or id (required)
<code>--fields string</code>	List of field names to return
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for apps:get
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, use - for STDOUT. (default: cwd)
<code>-s, --server string</code>	management server endpoint (required)
<code>--space string</code>	Space name or id (required)
<code>--space-initiated</code>	space-initiated

### Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic apps:list

List the Application objects

### Synopsis

---

List the Application objects

```
apic apps:list [flags]
```

### Options

---

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--consumer-org string</code>	Consumer Organization name or id (required)
<code>--expand string</code>	List of transient field to expand
<code>--fields string</code>	List of field names to return
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for apps:list
<code>--limit int32</code>	Maximum number of items to return
<code>--offset int32</code>	Offset item number from list to begin return
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>--scope string</code>	scope
<code>-s, --server string</code>	management server endpoint (required)
<code>--space string</code>	Space name or id (required)
<code>--space-initiated</code>	space-initiated

### Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic apps:update

Update the Application object by name or id

### Synopsis

---

Update the Application object by name or id

```
apic apps:update [flags]
```

### Options

---

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--consumer-org string</code>	Consumer Organization name or id (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for apps:update
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)
<code>--space string</code>	Space name or id (required)
<code>--space-initiated</code>	space-initiated

### Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic associates

Associates operations

### Synopsis

---

Associates operations

```
apic associates [flags]
```

### Options

---

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--consumer-org string</code>	Consumer Organization name or id (required)
<code>--fields string</code>	List of field names to return
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for associates
<code>--limit int32</code>	Maximum number of items to return
<code>--offset int32</code>	Offset item number from list to begin return
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>--scope string</code>	scope
<code>-s, --server string</code>	management server endpoint (required)
<code>--space string</code>	Space name or id (required)
<code>--space-initiated</code>	space-initiated

### Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic associates:get

Associates get operations

### Synopsis

---

Associates get operations

```
apic associates:get [flags]
```

### Options

---

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--consumer-org string</code>	Consumer Organization name or id (required)
<code>--fields string</code>	List of field names to return
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for associates:get
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, use - for STDOUT. (default: cwd)
<code>--scope string</code>	scope
<code>-s, --server string</code>	management server endpoint (required)
<code>--space string</code>	Space name or id (required)
<code>--space-initiated</code>	space-initiated

### Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic associates:list

Associates list operations

### Synopsis

---

Associates list operations

```
apic associates:list [flags]
```

### Options

---

```
-c, --catalog string      Catalog name or id (required)
--consumer-org string    Consumer Organization name or id (required)
--fields string          List of field names to return
--format string          Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help               Help for associates:list
--limit int32            Maximum number of items to return
--offset int32           Offset item number from list to begin return
-o, --org string         Organization name or id (required)
--output string          Write file(s) to directory, instead of STDOUT (default "-")
--scope string           scope
-s, --server string      management server endpoint (required)
--space string           Space name or id (required)
--space-initiated       space-initiated
```

### Options inherited from parent commands

---

```
--accept-license        Accept the license for API Connect
--debug                 Enable debug output
--debug-output string   Write debug output to file
--live-help             Enable or disable tracking of limited usage information
-m, --mode string       Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic availability-zones

Availability Zones operations

### Synopsis

---

Availability Zones operations

```
apic availability-zones [flags]
```

### Options

---

```
--fields string        List of field names to return
--format string        Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help             Help for availability-zones
--limit int32          Maximum number of items to return
--offset int32         Offset item number from list to begin return
-o, --org string       Organization name or id (required)
--output string        Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string    management server endpoint (required)
```

### Options inherited from parent commands

---

```
--accept-license        Accept the license for API Connect
--debug                 Enable debug output
--debug-output string   Write debug output to file
--live-help             Enable or disable tracking of limited usage information
-m, --mode string       Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic availability-zones:clear

Clear the Availability Zone objects

### Synopsis

---

Clear the Availability Zone objects

```
apic availability-zones:clear [flags]
```

### Options

---

```
--confirm string  Confirmation for critical updates (required)
--format string   Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help        Help for availability-zones:clear
-o, --org string  Organization name or id (required)
--output string   Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

### Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic availability-zones:create

Create a Availability Zone object

### Synopsis

---

Create a Availability Zone object

```
apic availability-zones:create [flags]
```

### Options

---

```
--format string  Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help        Help for availability-zones:create
-o, --org string  Organization name or id (required)
--output string   Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

### Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic availability-zones:delete

Delete the Availability Zone object by name or id

### Synopsis

---

Delete the Availability Zone object by name or id

```
apic availability-zones:delete [flags]
```

## Options

---

```
--format string  Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for availability-zones:delete
-o, --org string Organization name or id (required)
--output string Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

## Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic availability-zones:get

Get the Availability Zone object by name or id

## Synopsis

---

Get the Availability Zone object by name or id

```
apic availability-zones:get [flags]
```

## Options

---

```
--fields string  List of field names to return
--format string  Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for availability-zones:get
-o, --org string Organization name or id (required)
--output string  Write file(s) to directory, use - for STDOUT. (default: cwd)
-s, --server string management server endpoint (required)
```

## Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic availability-zones:list

List the Availability Zone objects

## Synopsis

---

List the Availability Zone objects

```
apic availability-zones:list [flags]
```

## Options

---

```
--fields string  List of field names to return
--format string  Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for availability-zones:list
--limit int32    Maximum number of items to return
--offset int32   Offset item number from list to begin return
-o, --org string Organization name or id (required)
```

```
--output string Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

## Options inherited from parent commands

---

```
--accept-license Accept the license for API Connect
--debug Enable debug output
--debug-output string Write debug output to file
--live-help Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic availability-zones:update

Update the Availability Zone object by name or id

### Synopsis

---

Update the Availability Zone object by name or id

```
apic availability-zones:update [flags]
```

### Options

---

```
--format string Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help Help for availability-zones:update
-o, --org string Organization name or id (required)
--output string Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

## Options inherited from parent commands

---

```
--accept-license Accept the license for API Connect
--debug Enable debug output
--debug-output string Write debug output to file
--live-help Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic billings

Billings operations

### Synopsis

---

Billings operations

```
apic billings [flags]
```

### Options

---

```
--fields string List of field names to return
--format string Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help Help for billings
--limit int32 Maximum number of items to return
--offset int32 Offset item number from list to begin return
-o, --org string Organization name or id (required)
--output string Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

## Options inherited from parent commands

---

```
--accept-license Accept the license for API Connect
--debug Enable debug output
--debug-output string Write debug output to file
```

```
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic billings:clear

Clear the Billing objects

### Synopsis

Clear the Billing objects

```
apic billings:clear [flags]
```

### Options

```
--confirm string Confirmation for critical updates (required)
--format string  Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for billings:clear
-o, --org string Organization name or id (required)
--output string Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

### Options inherited from parent commands

```
--accept-license Accept the license for API Connect
--debug          Enable debug output
--debug-output string Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic billings:create

Create a Billing object

### Synopsis

Create a Billing object

```
apic billings:create [flags]
```

### Options

```
--format string Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for billings:create
-o, --org string Organization name or id (required)
--output string Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

### Options inherited from parent commands

```
--accept-license Accept the license for API Connect
--debug          Enable debug output
--debug-output string Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic billings:delete

Delete the Billing object by name or id

### Synopsis

---

Delete the Billing object by name or id

```
apic billings:delete [flags]
```

### Options

---

```
--format string  Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for billings:delete
-o, --org string Organization name or id (required)
--output string  Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

### Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic billings:get

Get the Billing object by name or id

### Synopsis

---

Get the Billing object by name or id

```
apic billings:get [flags]
```

### Options

---

```
--fields string  List of field names to return
--format string  Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for billings:get
-o, --org string Organization name or id (required)
--output string  Write file(s) to directory, use - for STDOUT. (default: cwd)
-s, --server string management server endpoint (required)
```

### Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic billings:list

List the Billing objects

### Synopsis

---

List the Billing objects

```
apic billings:list [flags]
```

## Options

---

```
--fields string  List of field names to return
--format string  Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for billings:list
--limit int32    Maximum number of items to return
--offset int32   Offset item number from list to begin return
-o, --org string Organization name or id (required)
--output string  Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

## Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic billings:update

Update the Billing object by name or id

## Synopsis

---

Update the Billing object by name or id

```
apic billings:update [flags]
```

## Options

---

```
--format string  Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for billings:update
-o, --org string Organization name or id (required)
--output string  Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

## Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic catalog-settings

Catalog Settings operations

## Synopsis

---

Catalog Settings operations

```
apic catalog-settings [flags]
```

## Options

---

```
-h, --help  Help for catalog-settings
```

## Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## apic catalog-settings:get

Get the Catalog Setting object

### Synopsis

Get the Catalog Setting object

```
apic catalog-settings:get [flags]
```

### Options

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--fields string</code>	List of field names to return
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for catalog-settings:get
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, use - for STDOUT. (default: cwd)
<code>-s, --server string</code>	management server endpoint (required)

### Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## apic catalog-settings:update

Update the Catalog Setting object

### Synopsis

Update the Catalog Setting object

```
apic catalog-settings:update [flags]
```

### Options

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for catalog-settings:update
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)

### Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic catalogs

Catalogs operations

### Synopsis

---

Catalogs operations

```
apic catalogs [flags]
```

### Options

---

```
--fields string    List of field names to return
--format string    Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help         Help for catalogs
--limit int32      Maximum number of items to return
--my              my
--offset int32     Offset item number from list to begin return
-o, --org string   Organization name or id (required)
--output string    Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

### Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic catalogs:clear

Clear the Catalog objects

### Synopsis

---

Clear the Catalog objects

```
apic catalogs:clear [flags]
```

### Options

---

```
--confirm string    Confirmation for critical updates (required)
--format string     Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help         Help for catalogs:clear
-o, --org string    Organization name or id (required)
--output string     Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

### Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic catalogs:create

Create a Catalog object

## Synopsis

---

Create a Catalog object

```
apic catalogs:create [flags]
```

## Options

---

```
--format string  Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.  
-h, --help      Help for catalogs:create  
-o, --org string Organization name or id (required)  
--output string Write file(s) to directory, instead of STDOUT (default "-")  
-s, --server string management server endpoint (required)
```

## Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect  
--debug          Enable debug output  
--debug-output string Write debug output to file  
--live-help      Enable or disable tracking of limited usage information  
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic catalogs:delete

Delete the Catalog object by name or id

## Synopsis

---

Delete the Catalog object by name or id

```
apic catalogs:delete [flags]
```

## Options

---

```
--format string  Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.  
-h, --help      Help for catalogs:delete  
-o, --org string Organization name or id (required)  
--output string Write file(s) to directory, instead of STDOUT (default "-")  
-s, --server string management server endpoint (required)
```

## Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect  
--debug          Enable debug output  
--debug-output string Write debug output to file  
--live-help      Enable or disable tracking of limited usage information  
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic catalogs:get

Get the Catalog object by name or id

## Synopsis

---

Get the Catalog object by name or id

```
apic catalogs:get [flags]
```

## Options

---

```
--fields string    List of field names to return
--format string   Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help        Help for catalogs:get
-o, --org string  Organization name or id (required)
--output string  Write file(s) to directory, use - for STDOUT. (default: cwd)
-s, --server string management server endpoint (required)
```

## Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic catalogs:list

List the Catalog objects

## Synopsis

---

List the Catalog objects

```
apic catalogs:list [flags]
```

## Options

---

```
--fields string    List of field names to return
--format string   Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help        Help for catalogs:list
--limit int32     Maximum number of items to return
--my              my
--offset int32    Offset item number from list to begin return
-o, --org string  Organization name or id (required)
--output string  Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

## Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic catalogs:transfer-owner

Transfer owner to an associate

## Synopsis

---

Transfer owner to an associate

```
apic catalogs:transfer-owner [flags]
```

## Options

---

```
--format string  Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help       Help for catalogs:transfer-owner
-o, --org string Organization name or id (required)
--output string  Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

## Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic catalogs:update

Update the Catalog object by name or id

### Synopsis

---

Update the Catalog object by name or id

```
apic catalogs:update [flags]
```

### Options

---

```
--format string  Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help       Help for catalogs:update
-o, --org string  Organization name or id (required)
--output string  Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

### Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic client-creds

Manage the client configuration parameters. Client ID and Client Secret.

### Synopsis

---

Manage the client configuration parameters. Client ID and Client Secret.

```
apic client-creds [flags]
```

### Options

---

```
-g, --global  list the global configuration variables
-h, --help    Help for client-creds
-l, --local   list the local application configuration variables
```

### Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic client-creds:clear

clear the set client credentials.

### Synopsis

---

clear the set client credentials.

```
apic client-creds:clear [flags]
```

### Examples

---

```
$ apic client-creds:clear  
Deleted client credentials.
```

### Options

---

```
-g, --global    list the global configuration variables  
-h, --help      Help for client-creds:clear  
-l, --local     list the local application configuration variables
```

### Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect  
--debug           Enable debug output  
--debug-output string Write debug output to file  
--live-help       Enable or disable tracking of limited usage information  
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic client-creds:list

List the set clientID/secret parameters.

### Synopsis

---

List the set clientID/secret parameters.

```
apic client-creds:list [flags]
```

### Examples

---

```
$ apic client-creds:list
```

### Options

---

```
-g, --global    list the global configuration variables  
-h, --help      Help for client-creds:list  
-l, --local     list the local application configuration variables
```

### Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect  
--debug           Enable debug output  
--debug-output string Write debug output to file  
--live-help       Enable or disable tracking of limited usage information  
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic client-creds:set

Set the client configuration parameters. ClientID and Client Secret.

## Synopsis

---

Set the client configuration parameters. ClientID and Client Secret.

```
apic client-creds:set /path/to/creds/json ... [flags]
```

## Examples

---

```
$ apic client-creds:set /Users/local_user/credential.json
```

## Options

---

```
-g, --global list the global configuration variables
-h, --help   Help for client-creds:set
-l, --local  list the local application configuration variables
```

## Options inherited from parent commands

---

```
--accept-license Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic cloud-settings

Cloud Settings operations

## Synopsis

---

Cloud Settings operations

```
apic cloud-settings [flags]
```

## Options

---

```
-h, --help Help for cloud-settings
```

## Options inherited from parent commands

---

```
--accept-license Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic cloud-settings:about

Return information about the cloud

## Synopsis

---

Return public information about the cloud

```
apic cloud-settings:about [flags]
```

## Options

---

```
--format string  Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for cloud-settings:about
--output string  Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

## Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic cloud-settings:audit-endpoint-test-connection

Test an audit endpoint connection

### Synopsis

---

Test an audit endpoint connection

```
apic cloud-settings:audit-endpoint-test-connection [flags]
```

### Options

---

```
--format string  Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for cloud-settings:audit-endpoint-test-connection
--output string  Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

## Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic cloud-settings:designer-credentials-list

List credential for designer

### Synopsis

---

List credential for designer

```
apic cloud-settings:designer-credentials-list [flags]
```

### Options

---

```
--format string  Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for cloud-settings:designer-credentials-list
--output string  Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

## Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic cloud-settings:get

Get the Cloud Setting object

### Synopsis

---

Get the Cloud Setting object

```
apic cloud-settings:get [flags]
```

### Options

---

<code>--fields string</code>	List of field names to return
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for cloud-settings:get
<code>--output string</code>	Write file(s) to directory, use - for STDOUT. (default: cwd)
<code>-s, --server string</code>	management server endpoint (required)

### Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic cloud-settings:info

Return public information about the cloud deployment

### Synopsis

---

Return public information about the cloud deployment

```
apic cloud-settings:info [flags]
```

### Options

---

<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for cloud-settings:info
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)

### Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic cloud-settings:mail-server-configured

Return true or false based on if mail server is configured or not

## Synopsis

---

Return true or false based on if mail server is configured or not

```
apic cloud-settings:mail-server-configured [flags]
```

## Options

---

```
--format string  Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.  
-h, --help      Help for cloud-settings:mail-server-configured  
--output string Write file(s) to directory, instead of STDOUT (default "-")  
-s, --server string management server endpoint (required)
```

## Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect  
--debug           Enable debug output  
--debug-output string Write debug output to file  
--live-help       Enable or disable tracking of limited usage information  
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic cloud-settings:oauth2-certs

Support JWKS\_URI endpoint, conform to OIDC specification

## Synopsis

---

Return JWKS that is used to issue token. You MUST supply the --format option when using this command from the API Connect toolkit.

```
apic cloud-settings:oauth2-certs [flags]
```

## Options

---

```
--format string  Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.  
-h, --help      Help for cloud-settings:oauth2-certs  
--output string Write file(s) to directory, instead of STDOUT (default "-")  
-s, --server string management server endpoint (required)
```

## Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect  
--debug           Enable debug output  
--debug-output string Write debug output to file  
--live-help       Enable or disable tracking of limited usage information  
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic cloud-settings:toolkit-credentials-list

List credential for toolkit and consumer toolkit

## Synopsis

---

List credential for toolkit and consumer toolkit

```
apic cloud-settings:toolkit-credentials-list [flags]
```

## Options

---

```
--format string  Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.  
-h, --help      Help for cloud-settings:toolkit-credentials-list  
--output string Write file(s) to directory, instead of STDOUT (default "-")  
-s, --server string management server endpoint (required)
```

## Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic cloud-settings:topology

Return the topology of the cloud for governance

### Synopsis

---

Return the topology of the cloud for governance

`apic cloud-settings:topology [flags]`

### Options

---

<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for cloud-settings:topology
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)

## Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic cloud-settings:update

Update the Cloud Setting object

### Synopsis

---

Update the Cloud Setting object

`apic cloud-settings:update [flags]`

### Options

---

<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for cloud-settings:update
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)

## Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic config

Manage configuration variables

### Synopsis

---

Manage configuration variables

```
apic config [flags]
```

### Options

---

```
-g, --global  list the global configuration variables
-h, --help    Help for config
-l, --local   list the local application configuration variables
```

### Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic config:clear

Delete all configuration variables

### Synopsis

---

Delete all configuration variables

```
apic config:clear [flags]
```

### Examples

---

```
$ apic config:clear
Deleted config catalog
Deleted config org
Deleted config space

$ apic config:clear --global
Deleted config catalog
```

### Options

---

```
-g, --global  list the global configuration variables
-h, --help    Help for config:clear
-l, --local   list the local application configuration variables
```

### Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic config:delete

Delete a configuration variable

## Synopsis

---

Configuration variables:

**catalog** The catalog configuration variable should be set to the URI of an API Connect catalog. The value of the catalog provides the default identity of a catalog for all the commands that are used to manage aspects of a catalog. The default values defined by the catalog's URI can be overridden using the `--server`, `--organization`, and `--catalog` command line options. The catalog URI has the form: `https://MANAGEMENT_SERVER/api/catalogs/ORGANIZATION_NAME/CATALOG_NAME`

**org** The default value of `org` defined by the app's or catalog's URI can be set using the `org` URI. The `org` URI has the form: `https://MANAGEMENT_SERVER/api/orgs/ORGANIZATION_NAME`

**space** The space configuration variable should be set to the URI of an API Connect space. The value of the space provides the default identity of a space for all the commands that are used to manage aspects of a space. The default values defined by the spaces's URI can be overridden using the `--server`, `--organization`, `--catalog`, and `--space` command line options. The space URI has the form: `https://MANAGEMENT_SERVER/api/spaces/ORGANIZATION_NAME/CATALOG_NAME/SPACE_NAME`

**consumer** The consumer configuration variable should be set to the URI of an API Connect consumer. The value of the `consumer-org` provides the default identity of a consumer. The default values defined by the consumer URI can be overridden using the `--server`, `--organization`, `--catalog`, and `--consumer` command line options. The consumer URI has the form: `https://MANAGEMENT_SERVER/api/consumer-orgs/ORGANIZATION_NAME/CATALOG_NAME/CONSUMER_ORG_NAME`

**cloud** The cloud configuration variable should be set to the management server URI. The value of the cloud variable provides default server URI for cloud admin commands. It can be overridden using the `--server` and `--mode` command line options. The cloud URI has the form: `https://MANAGEMENT_SERVER/api/`

**mode** The value of mode configuration variable defines the toolkit operation mode. It can be overridden using the `--mode` command line option. The value can be set to `apim` or `consumer`

**template-path** List of places to look for handlebar templates

**template-default-api** Defines the default api template

**template-default-product** Defines the default product template

**apic config:delete** `NAME...` [`flags`]

## Examples

---

```
$ apic config:delete catalog
Deleted config catalog
```

```
$ apic config:delete org
Deleted config org
```

```
$ apic config:delete template-path
Deleted config template-path
```

## Options

---

```
-g, --global list the global configuration variables
-h, --help   Help for config:delete
-l, --local  list the local application configuration variables
```

## Options inherited from parent commands

---

```
--accept-license Accept the license for API Connect
--debug          Enable debug output
--debug-output string Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic config:get

Get a configuration variable

## Synopsis

---

Configuration variables:

**catalog** The catalog configuration variable should be set to the URI of an API Connect catalog. The value of the catalog provides the default identity of a catalog for all the commands that are used to manage aspects of a catalog. The default values defined by the catalog's URI can be overridden using the `--server`, `--organization`, and `--catalog` command line options. The catalog URI has the form: `https://MANAGEMENT_SERVER/api/catalogs/ORGANIZATION_NAME/CATALOG_NAME`

**org** The default value of `org` defined by the app's or catalog's URI can be set using the `org` URI. The `org` URI has the form: `https://MANAGEMENT_SERVER/api/orgs/ORGANIZATION_NAME`

space The space configuration variable should be set to the URI of an API Connect space. The value of the space provides the default identity of a space for all the commands that are used to manage aspects of a space. The default values defined by the spaces's URI can be overridden using the `--server`, `--organization`, `--catalog`, and `--space` command line options. The space URI has the form: `https://MANAGEMENT_SERVER/api/spaces/ORGANIZATION_NAME/CATALOG_NAME/SPACE_NAME`

consumer The consumer configuration variable should be set to the URI of an API Connect consumer. The value of the consumer-org provides the default identity of a consumer. The default values defined by the consumer URI can be overridden using the `--server`, `--organization`, `--catalog`, and `--consumer` command line options. The consumer URI has the form: `https://MANAGEMENT_SERVER/api/consumer-orgs/ORGANIZATION_NAME/CATALOG_NAME/CONSUMER_ORG_NAME`

cloud The cloud configuration variable should be set to the management server URI. The value of the cloud variable provides default server URI for cloud admin commands. It can be overridden using the `--server` and `--mode` command line options. The cloud URI has the form: `https://MANAGEMENT_SERVER/api/`

mode The value of mode configuration variable defines the toolkit operation mode. It can be overridden using the `--mode` command line option. The value can be set to `apim` or `consumer`

template-path List of places to look for handlebar templates

template-default-api Defines the default api template

template-default-product Defines the default product template

```
apic config:get NAME [flags]
```

## Examples

```
$ apic config:get catalog
catalog: https://mgmthost.com/api/catalogs/climbon/sb
```

```
$ apic config:get org
org: https://mgmthost.com/api/orgs/climbon
```

```
$ apic config:get template-path
template-path: /etc/templates
```

## Options

```
-g, --global list the global configuration variables
-h, --help   Help for config:get
-l, --local  list the local application configuration variables
```

## Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## apic config:list

List the application and global configuration variables

## Synopsis

Configuration variables:

catalog The catalog configuration variable should be set to the URI of an API Connect catalog. The value of the catalog provides the default identity of a catalog for all the commands that are used to manage aspects of a catalog. The default values defined by the catalog's URI can be overridden using the `--server`, `--organization`, `--catalog`, and `--catalog` command line options. The catalog URI has the form: `https://MANAGEMENT_SERVER/api/catalogs/ORGANIZATION_NAME/CATALOG_NAME`

org The default value of org defined by the app's or catalog's URI can be set using the org URI. The org URI has the form: `https://MANAGEMENT_SERVER/api/orgs/ORGANIZATION_NAME`

space The space configuration variable should be set to the URI of an API Connect space. The value of the space provides the default identity of a space for all the commands that are used to manage aspects of a space. The default values defined by the spaces's URI can be overridden using the `--server`, `--organization`, `--catalog`, and `--space` command line options. The space URI has the form: `https://MANAGEMENT_SERVER/api/spaces/ORGANIZATION_NAME/CATALOG_NAME/SPACE_NAME`

consumer The consumer configuration variable should be set to the URI of an API Connect consumer. The value of the consumer-org provides the default identity of a consumer. The default values defined by the consumer URI can be overridden using the `--server`, `--organization`, `--catalog`, and `--consumer` command line options. The consumer URI has the form: `https://MANAGEMENT_SERVER/api/consumer-orgs/ORGANIZATION_NAME/CATALOG_NAME/CONSUMER_ORG_NAME`

cloud The cloud configuration variable should be set to the management server URI. The value of the cloud variable provides default server URI for cloud admin commands. It can be overridden using the `--server` and `--mode` command line options. The cloud URI has the form: `https://MANAGEMENT_SERVER/api/`

mode The value of mode configuration variable defines the toolkit operation mode. It can be overridden using the `--mode` command line option. The value can be set to `apim` or `consumer`

template-path List of places to look for handlebar templates

template-default-api Defines the default api template

template-default-product Defines the default product template

```
apic config:list [flags]
```

## Examples

---

```
$ apic config
catalog: https://mgmthost.com/api/catalogs/climbon/sb
org: https://mgmthost.com/api/orgs/climbon

$ apic config --global
catalog: https://mgmthost.com/api/catlogs/climbon/sb
```

## Options

---

```
-g, --global list the global configuration variables
-h, --help Help for config:list
-l, --local list the local application configuration variables
```

## Options inherited from parent commands

---

```
--accept-license Accept the license for API Connect
--debug Enable debug output
--debug-output string Write debug output to file
--live-help Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic config:set

Set or update configuration variables

## Synopsis

---

Configuration variables:

catalog The catalog configuration variable should be set to the URI of an API Connect catalog. The value of the catalog provides the default identity of a catalog for all the commands that are used to manage aspects of a catalog. The default values defined by the catalog's URI can be overridden using the --server, --organization, and --catalog command line options. The catalog URI has the form: https://MANAGEMENT\_SERVER/api/catalogs/ORGANIZATION\_NAME/CATALOG\_NAME

org The default value of org defined by the app's or catalog's URI can be set using the org URI. The org URI has the form: https://MANAGEMENT\_SERVER/api/orgs/ORGANIZATION\_NAME

space The space configuration variable should be set to the URI of an API Connect space. The value of the space provides the default identity of a space for all the commands that are used to manage aspects of a space. The default values defined by the spaces's URI can be overridden using the --server, --organization, --catalog, and --space command line options. The space URI has the form: https://MANAGEMENT\_SERVER/api/spaces/ORGANIZATION\_NAME/CATALOG\_NAME/SPACE\_NAME

consumer The consumer configuration variable should be set to the URI of an API Connect consumer. The value of the consumer-org provides the default identity of a consumer. The default values defined by the consumer URI can be overridden using the --server, --organization, --catalog, and --consumer command line options. The consumer URI has the form: https://MANAGEMENT\_SERVER/api/consumer-orgs/ORGANIZATION\_NAME/CATALOG\_NAME/CONSUMER\_ORG\_NAME

cloud The cloud configuration variable should be set to the management server URI. The value of the cloud variable provides default server URI for cloud admin commands. It can be overridden using the --server and --mode command line options. The cloud URI has the form: https://MANAGEMENT\_SERVER/api/

mode The value of mode configuration variable defines the toolkit operation mode. It can be overridden using the --mode command line option. The value can be set to apim or consumer

template-path List of places to look for handlebar templates

template-default-api Defines the default api template

template-default-product Defines the default product template

```
apic config:set NAME=VALUE ... [flags]
```

## Examples

---

```
$ apic config:set catalog=https://mgmthost.com/api/catalogs/climbon/sb
catalog: https://mgmthost.com/api/catalogs/climbon/sb

$ apic config:set org=https://mgmthost2.com/api/orgs/hikeon
org: https://mgmthost2.com/api/orgs/hikeon
```

```
$ apic config:set --global template-path="/etc/templates"
template-path: /etc/templates
```

## Options

---

```
-g, --global    list the global configuration variables
-h, --help      Help for config:set
-l, --local     list the local application configuration variables
```

## Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## apic configured-api-user-registries

Configured Api User Registries operations

## Synopsis

---

Configured Api User Registries operations

```
apic configured-api-user-registries [flags]
```

## Options

---

```
-c, --catalog string  Catalog name or id (required)
--fields string       List of field names to return
--format string        Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help            Help for configured-api-user-registries
--limit int32         Maximum number of items to return
--offset int32        Offset item number from list to begin return
-o, --org string       Organization name or id (required)
--output string        Write file(s) to directory, instead of STDOUT (default "-")
--scope string         scope
-s, --server string    management server endpoint (required)
--space string         Space name or id (required)
```

## Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic configured-api-user-registries:clear

Configured Api User Registries clear operations

## Synopsis

---

Configured Api User Registries clear operations

```
apic configured-api-user-registries:clear [flags]
```

## Options

---

```
-c, --catalog string  Catalog name or id (required)
--confirm string      Confirmation for critical updates (required)
```

<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for configured-api-user-registries:clear
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>--scope string</code>	scope
<code>-s, --server string</code>	management server endpoint (required)
<code>--space string</code>	Space name or id (required)

## Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## apic configured-api-user-registries:create

Configured Api User Registries create operations

### Synopsis

Configured Api User Registries create operations

```
apic configured-api-user-registries:create [flags]
```

### Options

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for configured-api-user-registries:create
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>--scope string</code>	scope
<code>-s, --server string</code>	management server endpoint (required)
<code>--space string</code>	Space name or id (required)

## Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## apic configured-api-user-registries:delete

Configured Api User Registries delete operations

### Synopsis

Configured Api User Registries delete operations

```
apic configured-api-user-registries:delete [flags]
```

### Options

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for configured-api-user-registries:delete
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>--scope string</code>	scope
<code>-s, --server string</code>	management server endpoint (required)
<code>--space string</code>	Space name or id (required)

## Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic configured-api-user-registries:get

Configured Api User Registries get operations

### Synopsis

---

Configured Api User Registries get operations

```
apic configured-api-user-registries:get [flags]
```

### Options

---

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--fields string</code>	List of field names to return
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for configured-api-user-registries:get
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, use - for STDOUT. (default: cwd)
<code>--scope string</code>	scope
<code>-s, --server string</code>	management server endpoint (required)
<code>--space string</code>	Space name or id (required)

## Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic configured-api-user-registries:list

Configured Api User Registries list operations

### Synopsis

---

Configured Api User Registries list operations

```
apic configured-api-user-registries:list [flags]
```

### Options

---

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--fields string</code>	List of field names to return
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for configured-api-user-registries:list
<code>--limit int32</code>	Maximum number of items to return
<code>--offset int32</code>	Offset item number from list to begin return
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>--scope string</code>	scope
<code>-s, --server string</code>	management server endpoint (required)
<code>--space string</code>	Space name or id (required)

## Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug          Enable debug output
--debug-output string Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic configured-billings

Configured Billings operations

### Synopsis

Configured Billings operations

```
apic configured-billings [flags]
```

### Options

```
-c, --catalog string  Catalog name or id (required)
--fields string      List of field names to return
--format string      Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for configured-billings
--limit int32        Maximum number of items to return
--offset int32       Offset item number from list to begin return
-o, --org string      Organization name or id (required)
--output string      Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string  management server endpoint (required)
```

### Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug          Enable debug output
--debug-output string Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic configured-billings:clear

Clear the Configured Billing objects

### Synopsis

Clear the Configured Billing objects

```
apic configured-billings:clear [flags]
```

### Options

```
-c, --catalog string  Catalog name or id (required)
--confirm string      Confirmation for critical updates (required)
--format string      Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for configured-billings:clear
-o, --org string      Organization name or id (required)
--output string      Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string  management server endpoint (required)
```

### Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug          Enable debug output
--debug-output string Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic configured-billings:create

Create a Configured Billing object

### Synopsis

---

Create a Configured Billing object

```
apic configured-billings:create [flags]
```

### Options

---

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for configured-billings:create
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)

### Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic configured-billings:delete

Delete the Configured Billing object by name or id

### Synopsis

---

Delete the Configured Billing object by name or id

```
apic configured-billings:delete [flags]
```

### Options

---

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for configured-billings:delete
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)

### Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic configured-billings:get

Get the Configured Billing object by name or id

## Synopsis

---

Get the Configured Billing object by name or id

```
apic configured-billings:get [flags]
```

## Options

---

```
-c, --catalog string  Catalog name or id (required)
--fields string      List of field names to return
--format string       Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for configured-billings:get
-o, --org string      Organization name or id (required)
--output string       Write file(s) to directory, use - for STDOUT. (default: cwd)
-s, --server string   management server endpoint (required)
```

## Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## apic configured-catalog-user-registries:list

List the Configured Catalog User Registry objects

### Synopsis

---

List the Configured Catalog User Registry objects

```
apic configured-catalog-user-registries:list [flags]
```

### Options

---

```
-c, --catalog string  Catalog name or id (required)
--fields string       List of field names to return
--format string       Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help            Help for configured-catalog-user-registries:list
--limit int32         Maximum number of items to return
--offset int32        Offset item number from list to begin return
-o, --org string      Organization name or id (required)
--output string       Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string   management server endpoint (required)
```

## Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## apic configured-catalog-user-registries:search

Search for users in the catalog user registry

### Synopsis

Search for users in the catalog user registry

```
apic configured-catalog-user-registries:search [flags]
```

### Options

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for configured-catalog-user-registries:search
<code>--limit int32</code>	Maximum number of items to return
<code>--offset int32</code>	Offset item number from list to begin return
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)

### Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## apic configured-gateway-services

Configured Gateway Services operations

### Synopsis

Configured Gateway Services operations

```
apic configured-gateway-services [flags]
```

### Options

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--fields string</code>	List of field names to return
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for configured-gateway-services
<code>--limit int32</code>	Maximum number of items to return
<code>--offset int32</code>	Offset item number from list to begin return
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>--scope string</code>	scope
<code>-s, --server string</code>	management server endpoint (required)
<code>--space string</code>	Space name or id (required)

### Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic configured-gateway-services:clear

Configured Gateway Services clear operations

### Synopsis

Configured Gateway Services clear operations

```
apic configured-gateway-services:clear [flags]
```

### Options

-c, --catalog string	Catalog name or id (required)
--confirm string	Confirmation for critical updates (required)
--format string	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help	Help for configured-gateway-services:clear
-o, --org string	Organization name or id (required)
--output string	Write file(s) to directory, instead of STDOUT (default "-")
--scope string	scope
-s, --server string	management server endpoint (required)
--space string	Space name or id (required)

### Options inherited from parent commands

--accept-license	Accept the license for API Connect
--debug	Enable debug output
--debug-output string	Write debug output to file
--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic configured-gateway-services:create

Configured Gateway Services create operations

### Synopsis

Configured Gateway Services create operations

```
apic configured-gateway-services:create [flags]
```

### Options

-c, --catalog string	Catalog name or id (required)
--format string	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help	Help for configured-gateway-services:create
-o, --org string	Organization name or id (required)
--output string	Write file(s) to directory, instead of STDOUT (default "-")
--scope string	scope
-s, --server string	management server endpoint (required)
--space string	Space name or id (required)

### Options inherited from parent commands

--accept-license	Accept the license for API Connect
--debug	Enable debug output
--debug-output string	Write debug output to file
--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic configured-gateway-services:delete

Configured Gateway Services delete operations

### Synopsis

---

Configured Gateway Services delete operations

```
apic configured-gateway-services:delete [flags]
```

### Options

---

```
-c, --catalog string    Catalog name or id (required)
--format string        Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help             Help for configured-gateway-services:delete
-o, --org string        Organization name or id (required)
--output string        Write file(s) to directory, instead of STDOUT (default "-")
--scope string         scope
-s, --server string    management server endpoint (required)
--space string         Space name or id (required)
```

### Options inherited from parent commands

---

```
--accept-license      Accept the license for API Connect
--debug              Enable debug output
--debug-output string Write debug output to file
--live-help          Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic configured-gateway-services:get

Configured Gateway Services get operations

### Synopsis

---

Configured Gateway Services get operations

```
apic configured-gateway-services:get [flags]
```

### Options

---

```
-c, --catalog string    Catalog name or id (required)
--fields string        List of field names to return
--format string        Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help             Help for configured-gateway-services:get
-o, --org string        Organization name or id (required)
--output string        Write file(s) to directory, use - for STDOUT. (default: cwd)
--scope string         scope
-s, --server string    management server endpoint (required)
--space string         Space name or id (required)
```

### Options inherited from parent commands

---

```
--accept-license      Accept the license for API Connect
--debug              Enable debug output
--debug-output string Write debug output to file
--live-help          Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic configured-gateway-services:list

Configured Gateway Services list operations

## Synopsis

---

Configured Gateway Services list operations

```
apic configured-gateway-services:list [flags]
```

## Options

---

```
-c, --catalog string    Catalog name or id (required)
--fields string        List of field names to return
--format string        Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help             Help for configured-gateway-services:list
--limit int32         Maximum number of items to return
--offset int32        Offset item number from list to begin return
-o, --org string       Organization name or id (required)
--output string        Write file(s) to directory, instead of STDOUT (default "-")
--scope string         scope
-s, --server string    management server endpoint (required)
--space string         Space name or id (required)
```

## Options inherited from parent commands

---

```
--accept-license      Accept the license for API Connect
--debug               Enable debug output
--debug-output string Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic configured-oauth-providers

Configured OAuth Providers operations

## Synopsis

---

Configured OAuth Providers operations

```
apic configured-oauth-providers [flags]
```

## Options

---

```
-c, --catalog string    Catalog name or id (required)
--fields string        List of field names to return
--format string        Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help             Help for configured-oauth-providers
--limit int32         Maximum number of items to return
--offset int32        Offset item number from list to begin return
-o, --org string       Organization name or id (required)
--output string        Write file(s) to directory, instead of STDOUT (default "-")
--scope string         scope
-s, --server string    management server endpoint (required)
--space string         Space name or id (required)
```

## Options inherited from parent commands

---

```
--accept-license      Accept the license for API Connect
--debug               Enable debug output
--debug-output string Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic configured-oauth-providers:clear

Configured OAuth Providers clear operations

## Synopsis

---

Configured OAuth Providers clear operations

```
apic configured-oauth-providers:clear [flags]
```

## Options

---

```
-c, --catalog string    Catalog name or id (required)
--confirm string       Confirmation for critical updates (required)
--format string        Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help             Help for configured-oauth-providers:clear
-o, --org string        Organization name or id (required)
--output string        Write file(s) to directory, instead of STDOUT (default "-")
--scope string         scope
-s, --server string    management server endpoint (required)
--space string         Space name or id (required)
```

## Options inherited from parent commands

---

```
--accept-license      Accept the license for API Connect
--debug              Enable debug output
--debug-output string Write debug output to file
--live-help          Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic configured-oauth-providers:create

Configured OAuth Providers create operations

## Synopsis

---

Configured OAuth Providers create operations

```
apic configured-oauth-providers:create [flags]
```

## Options

---

```
-c, --catalog string    Catalog name or id (required)
--format string        Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help             Help for configured-oauth-providers:create
-o, --org string        Organization name or id (required)
--output string        Write file(s) to directory, instead of STDOUT (default "-")
--scope string         scope
-s, --server string    management server endpoint (required)
--space string         Space name or id (required)
```

## Options inherited from parent commands

---

```
--accept-license      Accept the license for API Connect
--debug              Enable debug output
--debug-output string Write debug output to file
--live-help          Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic configured-oauth-providers:delete

Configured OAuth Providers delete operations

## Synopsis

---

Configured OAuth Providers delete operations

```
apic configured-oauth-providers:delete [flags]
```

## Options

---

```
-c, --catalog string    Catalog name or id (required)
--format string        Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help             Help for configured-oauth-providers:delete
-o, --org string       Organization name or id (required)
--output string        Write file(s) to directory, instead of STDOUT (default "-")
--scope string         scope
-s, --server string    management server endpoint (required)
--space string         Space name or id (required)
```

## Options inherited from parent commands

---

```
--accept-license      Accept the license for API Connect
--debug              Enable debug output
--debug-output string Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

## apic configured-oauth-providers:list

Configured OAuth Providers list operations

## Synopsis

---

Configured OAuth Providers list operations

```
apic configured-oauth-providers:list [flags]
```

## Options

---

```
-c, --catalog string    Catalog name or id (required)
--fields string        List of field names to return
--format string        Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
```

-h, --help	Help for configured-oauth-providers:list
--limit int32	Maximum number of items to return
--offset int32	Offset item number from list to begin return
-o, --org string	Organization name or id (required)
--output string	Write file(s) to directory, instead of STDOUT (default "-")
--scope string	scope
-s, --server string	management server endpoint (required)
--space string	Space name or id (required)

## Options inherited from parent commands

--accept-license	Accept the license for API Connect
--debug	Enable debug output
--debug-output string	Write debug output to file
--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## apic configured-tls-client-profiles

Configured Tls Client Profiles operations

### Synopsis

Configured Tls Client Profiles operations

```
apic configured-tls-client-profiles [flags]
```

### Options

-c, --catalog string	Catalog name or id (required)
--fields string	List of field names to return
--format string	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help	Help for configured-tls-client-profiles
--limit int32	Maximum number of items to return
--offset int32	Offset item number from list to begin return
-o, --org string	Organization name or id (required)
--output string	Write file(s) to directory, instead of STDOUT (default "-")
--scope string	scope
-s, --server string	management server endpoint (required)
--space string	Space name or id (required)

## Options inherited from parent commands

--accept-license	Accept the license for API Connect
--debug	Enable debug output
--debug-output string	Write debug output to file
--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## apic configured-tls-client-profiles:clear

Configured Tls Client Profiles clear operations

### Synopsis

Configured Tls Client Profiles clear operations

```
apic configured-tls-client-profiles:clear [flags]
```

### Options

-c, --catalog string	Catalog name or id (required)
--confirm string	Confirmation for critical updates (required)
--format string	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help	Help for configured-tls-client-profiles:clear
-o, --org string	Organization name or id (required)

```
--output string      Write file(s) to directory, instead of STDOUT (default "-")
--scope string       scope
-s, --server string  management server endpoint (required)
--space string       Space name or id (required)
```

## Options inherited from parent commands

---

```
--accept-license    Accept the license for API Connect
--debug             Enable debug output
--debug-output string Write debug output to file
--live-help         Enable or disable tracking of limited usage information
-m, --mode string   Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic configured-tls-client-profiles:clear-all

Configured Tls Client Profiles clear-all operations

### Synopsis

---

Configured Tls Client Profiles clear-all operations

```
apic configured-tls-client-profiles:clear-all [flags]
```

### Options

---

```
-c, --catalog string  Catalog name or id (required)
--confirm string      Confirmation for critical updates (required)
--format string       Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help            Help for configured-tls-client-profiles:clear-all
-o, --org string       Organization name or id (required)
--output string       Write file(s) to directory, instead of STDOUT (default "-")
--scope string        scope
-s, --server string   management server endpoint (required)
--space string        Space name or id (required)
```

## Options inherited from parent commands

---

```
--accept-license    Accept the license for API Connect
--debug             Enable debug output
--debug-output string Write debug output to file
--live-help         Enable or disable tracking of limited usage information
-m, --mode string   Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic configured-tls-client-profiles:create

Configured Tls Client Profiles create operations

### Synopsis

---

Configured Tls Client Profiles create operations

```
apic configured-tls-client-profiles:create [flags]
```

### Options

---

```
-c, --catalog string  Catalog name or id (required)
--format string       Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help            Help for configured-tls-client-profiles:create
-o, --org string       Organization name or id (required)
--output string       Write file(s) to directory, instead of STDOUT (default "-")
--scope string        scope
-s, --server string   management server endpoint (required)
--space string        Space name or id (required)
```

## Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic configured-tls-client-profiles:delete

Configured Tls Client Profiles delete operations

### Synopsis

---

Configured Tls Client Profiles delete operations

```
apic configured-tls-client-profiles:delete [flags]
```

### Options

---

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for configured-tls-client-profiles:delete
<code>--id</code>	id
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>--scope string</code>	scope
<code>-s, --server string</code>	management server endpoint (required)
<code>--space string</code>	Space name or id (required)

## Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic configured-tls-client-profiles:get

Configured Tls Client Profiles get operations

### Synopsis

---

Configured Tls Client Profiles get operations

```
apic configured-tls-client-profiles:get [flags]
```

### Options

---

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--fields string</code>	List of field names to return
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for configured-tls-client-profiles:get
<code>--id</code>	id
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, use - for STDOUT. (default: cwd)
<code>--scope string</code>	scope
<code>-s, --server string</code>	management server endpoint (required)
<code>--space string</code>	Space name or id (required)

## Options inherited from parent commands

---

```
--accept-license      Accept the license for API Connect
--debug              Enable debug output
--debug-output string Write debug output to file
--live-help          Enable or disable tracking of limited usage information
-m, --mode string    Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic configured-tls-client-profiles:list

Configured Tls Client Profiles list operations

### Synopsis

Configured Tls Client Profiles list operations

```
apic configured-tls-client-profiles:list [flags]
```

### Options

```
-c, --catalog string  Catalog name or id (required)
--fields string       List of field names to return
--format string        Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help            Help for configured-tls-client-profiles:list
--limit int32         Maximum number of items to return
--offset int32        Offset item number from list to begin return
-o, --org string       Organization name or id (required)
--output string        Write file(s) to directory, instead of STDOUT (default "-")
--scope string         scope

---

## apic consumer-org-settings:delete

Delete the Consumer Organization Setting object

### Synopsis

---

Delete the Consumer Organization Setting object

```
apic consumer-org-settings:delete [flags]
```

### Options

---

```
-c, --catalog string  Catalog name or id (required)
--consumer-org string Consumer Organization name or id (required)
--format string       Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for consumer-org-settings:delete
-o, --org string      Organization name or id (required)
--output string       Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string   management server endpoint (required)
--space string        Space name or id (required)
--space-initiated    space-initiated
```

### Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic consumer-org-settings:get

Get the Consumer Organization Setting object

### Synopsis

---

Get the Consumer Organization Setting object

```
apic consumer-org-settings:get [flags]
```

### Options

---

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--consumer-org string</code>	Consumer Organization name or id (required)
<code>--fields string</code>	List of field names to return
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for consumer-org-settings:get
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, use - for STDOUT. (default: cwd)
<code>-s, --server string</code>	management server endpoint (required)
<code>--space string</code>	Space name or id (required)
<code>--space-initiated</code>	space-initiated

### Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic consumer-org-settings:update

Update the Consumer Organization Setting object

### Synopsis

---

Update the Consumer Organization Setting object

```
apic consumer-org-settings:update [flags]
```

### Options

---

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--consumer-org string</code>	Consumer Organization name or id (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for consumer-org-settings:update
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)
<code>--space string</code>	Space name or id (required)
<code>--space-initiated</code>	space-initiated

### Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic consumer-orgs

## Synopsis

---

Consumer Orgs operations

```
apic consumer-orgs [flags]
```

## Options

---

```
-c, --catalog string    Catalog name or id (required)
--fields string        List of field names to return
--format string        Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help              Help for consumer-orgs
--limit int32          Maximum number of items to return
--offset int32         Offset item number from list to begin return
-o, --org string        Organization name or id (required)
--output string        Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string    management server endpoint (required)
--space string         Space name or id (required)
--space-initiated     space-initiated
```

## Options inherited from parent commands

---

```
--accept-license      Accept the license for API Connect
--debug               Enable debug output
--debug-output string Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic consumer-orgs:clear

Clear the Consumer Organization objects

## Synopsis

---

Clear the Consumer Organization objects

```
apic consumer-orgs:clear [flags]
```

## Options

---

```
-c, --catalog string    Catalog name or id (required)
--confirm string        Confirmation for critical updates (required)
--format string        Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help              Help for consumer-orgs:clear
-o, --org string        Organization name or id (required)
--output string        Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string    management server endpoint (required)
--space string         Space name or id (required)
--space-initiated     space-initiated
```

## Options inherited from parent commands

---

```
--accept-license      Accept the license for API Connect
--debug               Enable debug output
--debug-output string Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic consumer-orgs:create

Create a Consumer Organization object

## Synopsis

---

Create a Consumer Organization object

```
apic consumer-orgs:create [flags]
```

## Options

---

```
-c, --catalog string    Catalog name or id (required)
--format string        Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help             Help for consumer-orgs:create
-o, --org string       Organization name or id (required)
--output string        Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string    management server endpoint (required)
--space string         Space name or id (required)
--space-initiated     space-initiated
```

## Options inherited from parent commands

---

```
--accept-license      Accept the license for API Connect
--debug               Enable debug output
--debug-output string Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic consumer-orgs:delete

Delete the Consumer Organization object by name or id

## Synopsis

---

Delete the Consumer Organization object by name or id

```
apic consumer-orgs:delete [flags]
```

## Options

---

```
-c, --catalog string    Catalog name or id (required)
--format string        Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help             Help for consumer-orgs:delete
-o, --org string       Organization name or id (required)
--output string        Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string    management server endpoint (required)
--space string         Space name or id (required)
--space-initiated     space-initiated
```

## Options inherited from parent commands

---

```
--accept-license      Accept the license for API Connect
--debug               Enable debug output
--debug-output string Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic consumer-orgs:get

Get the Consumer Organization object by name or id

## Synopsis

---

Get the Consumer Organization object by name or id

```
apic consumer-orgs:get [flags]
```

## Options

---

```
-c, --catalog string      Catalog name or id (required)
--fields string          List of field names to return
--format string          Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help                Help for consumer-orgs:get
-o, --org string          Organization name or id (required)
--output string           Write file(s) to directory, use - for STDOUT. (default: cwd)
-s, --server string       management server endpoint (required)
--space string            Space name or id (required)
--space-initiated         space-initiated
```

## Options inherited from parent commands

---

```
--accept-license         Accept the license for API Connect
--debug                  Enable debug output
--debug-output string     Write debug output to file
--live-help              Enable or disable tracking of limited usage information
-m, --mode string         Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic consumer-orgs:list

List the Consumer Organization objects

## Synopsis

---

List the Consumer Organization objects

```
apic consumer-orgs:list [flags]
```

## Options

---

```
-c, --catalog string      Catalog name or id (required)
--fields string          List of field names to return
--format string          Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help                Help for consumer-orgs:list
--limit int32            Maximum number of items to return
--offset int32           Offset item number from list to begin return
-o, --org string          Organization name or id (required)
--output string           Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string       management server endpoint (required)
--space string            Space name or id (required)
--space-initiated         space-initiated
```

## Options inherited from parent commands

---

```
--accept-license         Accept the license for API Connect
--debug                  Enable debug output
--debug-output string     Write debug output to file
--live-help              Enable or disable tracking of limited usage information
-m, --mode string         Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic consumer-orgs:transfer-owner

Transfer owner to an associate

## Synopsis

---

Transfer owner to an associate

```
apic consumer-orgs:transfer-owner [flags]
```

## Options

---

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for consumer-orgs:transfer-owner
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)
<code>--space string</code>	Space name or id (required)
<code>--space-initiated</code>	space-initiated

## Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## apic consumer-orgs:update

Update the Consumer Organization object by name or id

### Synopsis

Update the Consumer Organization object by name or id

```
apic consumer-orgs:update [flags]
```

### Options

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for consumer-orgs:update
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)
<code>--space string</code>	Space name or id (required)
<code>--space-initiated</code>	space-initiated

## Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## apic create

Create an API or product definition

### Synopsis

Create an API or product definition

```
apic create [flags]
```

### Options

<code>-h, --help</code>	Help for create
<code>-i, --interactive</code>	use interactive mode

## Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## apic create:api

Create an OpenAPI (Swagger) definition

### Synopsis

Create an OpenAPI (Swagger) definition

```
apic create:api [flags]
```

### Examples

Create an API

```
$ apic create:api --title Routes
Created routes.yaml API definition [routes:1.0.0]
```

Create an API and generate a product referencing the API

```
$ apic create:api --title Routes --product "Climb On"
Created routes.yaml API definition [routes:1.0.0]
Created climb-on.yaml product definition [climb-on:1.0.0]
```

Create an API interactively

```
$ apic create:api
Title: Routes
Name (routes): routes
File (routes.yaml): routes.yaml
Template: ()
Basepath (/routes): /routes
Hostname ($(catalog.host)): $(catalog.host)
Schemes:
Target url: ()
Create product [true]: true
Product title (Routes Product): Climb On
Product name (climb-on): climb-on
Product file (climb-on.yaml): climb-on.yaml
Created routes.yaml API definition [routes:1.0.0]
Created climb-on.yaml product definition [climb-on:1.0.0]
```

Create an API from a WSDL document

```
$ apic create:api --wsdl globalweather.wsdl
Created globalweather.yaml API definition [globalweather.yaml:1.0.0]
```

Create an API using APIC's default OAuth 2 provider template

```
$ apic create:api --title "OAuth2 Provider" --template oauth2
Created oauth2-provider.yaml API definition [oauth2-provider:1.0.0]
```

Create an API using one of your templates

```
$ apic config:set --global template-path="/etc/templates"
$ ls /etc/templates
proxy.hbs staging.hbs
$ apic create:api --title "Proxy Provider" --template proxy
Created proxy-provider.yaml API definition [proxy-provider:1.0.0]
```

Create an API using your default template

```
$ apic config:set --global template-path="/etc/templates"
$ ls /etc/templates
proxy.hbs staging.hbs
$ apic config:set --global template-default-api=staging
$ apic create:api --title "Staging Provider"
Created staging-provider.yaml API definition [staging-provider:1.0.0]
```

### Options

<code>--api_type string</code>	The type of api (rest, wsdl-to-rest, or wsdl) (default "wsdl")
<code>--basepath string</code>	basepath value (default derived from name)
<code>--disable_ws_security</code>	Disable generation of WS-Security definitions in api
<code>--filename string</code>	filename (default derived from name)
<code>--gateway-type string</code>	The type of the gateway (datapower-gateway, datapower-api-gateway) (default "datapower-gateway")
<code>-h, --help</code>	Help for create:api
<code>--hostname string</code>	host value (default \$(catalog.host))
<code>-i, --interactive</code>	use interactive mode
<code>--name string</code>	x-ibm-name value (default derived from title)
<code>--product string</code>	generate a product definition referencing the API
<code>--schemes string</code>	list of schemes (valid options are http, https, ws and wss)
<code>--services string</code>	service names separated by space

<code>--target-url string</code>	target url
<code>--template string</code>	use a provider template (if empty defaults to apic template)
<code>--title string</code>	title value (required)
<code>-v, --version string</code>	version value (default "1.0.0")
<code>--wsdl string</code>	wsdl file to use as the source (required authentication via apic login)

## Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## apic create:product

Create a product definition

### Synopsis

Create a product definition

```
apic create:product [flags]
```

### Examples

```
Create a product
$ apic create:product --title "Climb On"
Created climb-on.yaml product definition [climb-on:1.0.0]
Create a product interactively
$ apic create:product
? Title: Climb On
? Name: climb-on
? File: climb-on.yaml
? Template:
? API Files:
Created climb-on.yaml product definition [climb-on:1.0.0]
Create a product referencing existing APIs
$ apic create:product --title "Climb On" --apis "routes.yaml ascents.yaml"
Created climb-on.yaml product definition [climb-on:1.0.0]
Create an product using one of your templates
$ apic config:set --global template-path="/etc/templates"
$ ls /etc/templates
proxy-product.hbs staging-product.hbs
$ apic create:product --title "Proxy Product" --template proxy
Created proxy-product.yaml product definition [proxy-product:1.0.0]
Create a product using your default template
$ apic config:set --global template-path="/etc/templates"
$ ls /etc/templates
proxy-product.hbs staging-product.hbs
$ apic config:set --global template-default-product=staging
$ apic create:product --title "Staging Product"
Created staging-product.yaml product definition [staging-product:1.0.0]
```

### Options

<code>--apis string</code>	api file names separated by a space
<code>--filename string</code>	filename (default derived from name)
<code>--gateway-type string</code>	The type of the gateway (datapower-gateway, datapower-api-gateway) (default "datapower-gateway")
<code>-h, --help</code>	Help for create:product
<code>-i, --interactive</code>	use interactive mode
<code>--name string</code>	x-ibm-name value (default derived from title)
<code>--template string</code>	use a provider template (if empty defaults to apic template)
<code>--title string</code>	title value (required)
<code>-v, --version string</code>	version value (default "1.0.0")

## Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic credentials

Credentials operations

### Synopsis

---

Credentials operations

```
apic credentials [flags]
```

### Options

---

<code>-a, --app string</code>	Application name or id (required)
<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--consumer-org string</code>	Consumer Organization name or id (required)
<code>--fields string</code>	List of field names to return
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for credentials
<code>--limit int32</code>	Maximum number of items to return
<code>--offset int32</code>	Offset item number from list to begin return
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)
<code>--space string</code>	Space name or id (required)
<code>--space-initiated</code>	space-initiated

### Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic credentials:clear

Clear the Application Credential objects

### Synopsis

---

Clear the Application Credential objects

```
apic credentials:clear [flags]
```

### Options

---

<code>-a, --app string</code>	Application name or id (required)
<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--confirm string</code>	Confirmation for critical updates (required)
<code>--consumer-org string</code>	Consumer Organization name or id (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for credentials:clear
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)
<code>--space string</code>	Space name or id (required)
<code>--space-initiated</code>	space-initiated

### Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic credentials:create

Create a Application Credential object

### Synopsis

---

Create a Application Credential object

```
apic credentials:create [flags]
```

### Options

---

-a, --app string	Application name or id (required)
-c, --catalog string	Catalog name or id (required)
--consumer-org string	Consumer Organization name or id (required)
--format string	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help	Help for credentials:create
-o, --org string	Organization name or id (required)
--output string	Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string	management server endpoint (required)
--space string	Space name or id (required)
--space-initiated	space-initiated

### Options inherited from parent commands

---

--accept-license	Accept the license for API Connect
--debug	Enable debug output
--debug-output string	Write debug output to file
--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic credentials:delete

Delete the Application Credential object by name or id

### Synopsis

---

Delete the Application Credential object by name or id

```
apic credentials:delete [flags]
```

### Options

---

-a, --app string	Application name or id (required)
-c, --catalog string	Catalog name or id (required)
--consumer-org string	Consumer Organization name or id (required)
--format string	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help	Help for credentials:delete
-o, --org string	Organization name or id (required)
--output string	Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string	management server endpoint (required)
--space string	Space name or id (required)
--space-initiated	space-initiated

### Options inherited from parent commands

---

--accept-license	Accept the license for API Connect
--debug	Enable debug output
--debug-output string	Write debug output to file
--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic credentials:get

Get the Application Credential object by name or id

### Synopsis

---

Get the Application Credential object by name or id

```
apic credentials:get [flags]
```

### Options

---

-a, --app string	Application name or id (required)
-c, --catalog string	Catalog name or id (required)
--consumer-org string	Consumer Organization name or id (required)
--fields string	List of field names to return
--format string	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help	Help for credentials:get
-o, --org string	Organization name or id (required)
--output string	Write file(s) to directory, use - for STDOUT. (default: cwd)
-s, --server string	management server endpoint (required)
--space string	Space name or id (required)
--space-initiated	space-initiated

### Options inherited from parent commands

---

--accept-license	Accept the license for API Connect
--debug	Enable debug output
--debug-output string	Write debug output to file
--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic credentials:list

List the Application Credential objects

### Synopsis

---

List the Application Credential objects

```
apic credentials:list [flags]
```

### Options

---

-a, --app string	Application name or id (required)
-c, --catalog string	Catalog name or id (required)
--consumer-org string	Consumer Organization name or id (required)
--fields string	List of field names to return
--format string	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help	Help for credentials:list
--limit int32	Maximum number of items to return
--offset int32	Offset item number from list to begin return
-o, --org string	Organization name or id (required)
--output string	Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string	management server endpoint (required)
--space string	Space name or id (required)
--space-initiated	space-initiated

### Options inherited from parent commands

---

--accept-license	Accept the license for API Connect
--debug	Enable debug output
--debug-output string	Write debug output to file
--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic credentials:reset-client-secret

Reset the client secret

### Synopsis

---

Reset the client secret

```
apic credentials:reset-client-secret [flags]
```

### Options

---

-a, --app string	Application name or id (required)
-c, --catalog string	Catalog name or id (required)
--consumer-org string	Consumer Organization name or id (required)
--format string	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help	Help for credentials:reset-client-secret
-o, --org string	Organization name or id (required)
--output string	Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string	management server endpoint (required)
--space string	Space name or id (required)
--space-initiated	space-initiated

### Options inherited from parent commands

---

--accept-license	Accept the license for API Connect
--debug	Enable debug output
--debug-output string	Write debug output to file
--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic credentials:reset

Reset the client id and client secret

### Synopsis

---

Reset the client id and client secret

```
apic credentials:reset [flags]
```

### Options

---

-a, --app string	Application name or id (required)
-c, --catalog string	Catalog name or id (required)
--consumer-org string	Consumer Organization name or id (required)
--format string	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help	Help for credentials:reset
-o, --org string	Organization name or id (required)
--output string	Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string	management server endpoint (required)
--space string	Space name or id (required)
--space-initiated	space-initiated

### Options inherited from parent commands

---

--accept-license	Accept the license for API Connect
--debug	Enable debug output
--debug-output string	Write debug output to file
--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic credentials:update

Update the Application Credential object by name or id

## Synopsis

---

Update the Application Credential object by name or id

```
apic credentials:update [flags]
```

## Options

---

-a, --app string	Application name or id (required)
-c, --catalog string	Catalog name or id (required)
--consumer-org string	Consumer Organization name or id (required)
--format string	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help	Help for credentials:update
-o, --org string	Organization name or id (required)
--output string	Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string	management server endpoint (required)
--space string	Space name or id (required)
--space-initiated	space-initiated

## Options inherited from parent commands

---

--accept-license	Accept the license for API Connect
--debug	Enable debug output
--debug-output string	Write debug output to file
--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic credentials:verify-client-secret

Verify the client secret

## Synopsis

---

Verify the client secret

```
apic credentials:verify-client-secret [flags]
```

## Options

---

-a, --app string	Application name or id (required)
-c, --catalog string	Catalog name or id (required)
--consumer-org string	Consumer Organization name or id (required)
--format string	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help	Help for credentials:verify-client-secret
-o, --org string	Organization name or id (required)
--output string	Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string	management server endpoint (required)
--space string	Space name or id (required)
--space-initiated	space-initiated

## Options inherited from parent commands

---

--accept-license	Accept the license for API Connect
--debug	Enable debug output
--debug-output string	Write debug output to file
--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic draft-apis

Draft Apis operations

## Synopsis

---

Draft Apis operations

```
apic draft-apis [flags]
```

## Options

---

```
--fields string  List of field names to return
--format string  Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for draft-apis
--limit int32   Maximum number of items to return
--offset int32  Offset item number from list to begin return
-o, --org string Organization name or id (required)
--output string Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

## Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic draft-apis:clear-all

Clear all Draft API objects in all collections

## Synopsis

---

Clear all Draft API objects in all collections

```
apic draft-apis:clear-all [flags]
```

## Options

---

```
--confirm string  Confirmation for critical updates (required)
--format string   Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help       Help for draft-apis:clear-all
-o, --org string  Organization name or id (required)
--output string   Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

## Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic draft-apis:clear

Clear the Draft API objects

## Synopsis

---

Clear the Draft API objects

```
apic draft-apis:clear [flags]
```

## Options

---

```

--confirm string      Confirmation for critical updates (required)
--format string      Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for draft-apis:clear
-o, --org string      Organization name or id (required)
--output string       Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string   management server endpoint (required)

```

## Options inherited from parent commands

```

--accept-license      Accept the license for API Connect
--debug              Enable debug output
--debug-output string Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")

```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## apic draft-apis:clone

Clone the draft-api objects

### Synopsis

Clone the draft-api objects

```
apic draft-apis:clone [flags]
```

### Options

```

--fields string      List of field names to return
--format string      Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for draft-apis:clone
--limit int32        Maximum number of items to return
--offset int32       Offset item number from list to begin return
-o, --org string      Organization name or id (required)
--output string       Write file(s) to directory, use - for STDOUT. (default: cwd)
-s, --server string   management server endpoint (required)

```

## Options inherited from parent commands

```

--accept-license      Accept the license for API Connect
--debug              Enable debug output
--debug-output string Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")

```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## apic draft-apis:create

Create a Draft API object

### Synopsis

Create a Draft API object

```
apic draft-apis:create [flags]
```

### Options

```

--api_type string     The type of api (rest, wsdl_to_rest, or wsdl)
--assembly_type string The type of the assembly to generate (rest_to_proxy)
--disable_ws_security Disable generation of WS-Security definitions in api
--format string       Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
--gateway_type string The type of the gateway (datapower-gateway, datapower-api-gateway)
-h, --help           Help for draft-apis:create
-o, --org string      Organization name or id (required)
--output string       Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string   management server endpoint (required)
--wsdl_service string Name of WSDL service to create the OpenAPI definition from

```

## Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic draft-apis:delete

Delete a Draft API

### Synopsis

---

Delete a Draft API

```
apic draft-apis:delete [flags]
```

### Options

---

<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for draft-apis:delete
<code>--id</code>	id
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)

## Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic draft-apis:document

Get the Draft API document by name and version

### Synopsis

---

Get the Draft API document by name and version

```
apic draft-apis:document [flags]
```

### Options

---

<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for draft-apis:document
<code>--id</code>	id
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)

## Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic draft-apis:get

Get the Draft API object by name and version

### Synopsis

Get the Draft API object by name and version

```
apic draft-apis:get [flags]
```

### Options

```
--fields string  List of field names to return (default "add(wsd1,draft_api)")
--format string  Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for draft-apis:get
--id            id
-o, --org string Organization name or id (required)
--output string Write file(s) to directory, use - for STDOUT. (default: cwd)
-s, --server string management server endpoint (required)
```

### Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic draft-apis:list

List the Draft API objects

### Synopsis

List the Draft API objects

```
apic draft-apis:list [flags]
```

### Options

```
--fields string  List of field names to return
--format string  Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for draft-apis:list
--limit int32    Maximum number of items to return
--offset int32   Offset item number from list to begin return
-o, --org string Organization name or id (required)
--output string  Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

### Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic draft-apis:list-all

List all Draft API objects in all collections

## Synopsis

---

List all Draft API objects in all collections

```
apic draft-apis:list-all [flags]
```

## Options

---

```
--fields string  List of field names to return
--format string  Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for draft-apis:list-all
--limit int32   Maximum number of items to return
--offset int32  Offset item number from list to begin return
-o, --org string Organization name or id (required)
--output string Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

## Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug          Enable debug output
--debug-output string Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic draft-apis:update

Update the Draft API object by name and version

## Synopsis

---

Update the Draft API object by name and version

```
apic draft-apis:update [flags]
```

## Options

---

```
--api_type string  The type of api (rest, wsdl_to_rest, or wsdl)
--disable_ws_security Disable generation of WS-Security definitions in api
--format string    Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help        Help for draft-apis:update
--id              id
-o, --org string  Organization name or id (required)
--output string   Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
--wsdl_service string Name of WSDL service to create the OpenAPI definition from
```

## Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug          Enable debug output
--debug-output string Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic draft-apis:validate

Validate the draft api

## Synopsis

---

Validate the draft api

```
apic draft-apis:validate [flags]
```

## Options

---

```
--format string  Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for draft-apis:validate
--id            id
-o, --org string Organization name or id (required)
--output string Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

## Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic draft-apis:wsdl

Get the Draft API wsdl document by name and version

## Synopsis

---

Get the Draft API wsdl document by name and version

```
apic draft-apis:wsdl [flags]
```

## Options

---

```
--format string  Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for draft-apis:wsdl
--id            id
-o, --org string Organization name or id (required)
--output string Write file(s) to directory, use - for STDOUT. (default: cwd)
-s, --server string management server endpoint (required)
```

## Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic draft-products

Draft Products operations

## Synopsis

---

Draft Products operations

```
apic draft-products [flags]
```

## Options

---

```
--fields string  List of field names to return
--format string  Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for draft-products
--limit int32    Maximum number of items to return
--offset int32   Offset item number from list to begin return
-o, --org string Organization name or id (required)
```

```
--output string  Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string  management server endpoint (required)
```

## Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string  Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic draft-products:clear-all

Clear all Draft Product objects in all collections

## Synopsis

---

Clear all Draft Product objects in all collections

```
apic draft-products:clear-all [flags]
```

## Options

---

```
--confirm string  Confirmation for critical updates (required)
--format string   Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help        Help for draft-products:clear-all
-o, --org string  Organization name or id (required)
--output string  Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string  management server endpoint (required)
```

## Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string  Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic draft-products:clear

Clear the Draft Product objects

## Synopsis

---

Clear the Draft Product objects

```
apic draft-products:clear [flags]
```

## Options

---

```
--confirm string  Confirmation for critical updates (required)
--format string   Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help        Help for draft-products:clear
-o, --org string  Organization name or id (required)
--output string  Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string  management server endpoint (required)
```

## Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string  Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic draft-products:clone

Clone the draft-product objects

### Synopsis

---

Clone the draft-product objects

```
apic draft-products:clone [flags]
```

### Options

---

<code>--fields string</code>	List of field names to return
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for draft-products:clone
<code>--limit int32</code>	Maximum number of items to return
<code>--offset int32</code>	Offset item number from list to begin return
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, use - for STDOUT. (default: cwd)
<code>-s, --server string</code>	management server endpoint (required)

### Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic draft-products:create

Create a Draft Product object

### Synopsis

---

Create a Draft Product object

```
apic draft-products:create [flags]
```

### Options

---

<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for draft-products:create
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>--product-only</code>	Upload only the product document
<code>-s, --server string</code>	management server endpoint (required)

### Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic draft-products:delete

Delete a Draft Product

### Synopsis

---

Delete a Draft Product

```
apic draft-products:delete [flags]
```

### Options

---

<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for draft-products:delete
<code>--id</code>	id
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)

### Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic draft-products:document

Get the Draft Product document by name and version

### Synopsis

---

Get the Draft Product document by name and version

```
apic draft-products:document [flags]
```

### Options

---

<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for draft-products:document
<code>--id</code>	id
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)

### Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic draft-products:get

Get the Draft Product object by name and version

### Synopsis

---

Get the Draft Product object by name and version

```
apic draft-products:get [flags]
```

## Options

---

```
--fields string  List of field names to return (default "add(draft_product,url)")
--format string  Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for draft-products:get
--id            id
-o, --org string Organization name or id (required)
--output string Write file(s) to directory, use - for STDOUT. (default: cwd)
-s, --server string management server endpoint (required)
```

## Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic draft-products:list-all

List all Draft Product objects in all collections

## Synopsis

---

List all Draft Product objects in all collections

```
apic draft-products:list-all [flags]
```

## Options

---

```
--fields string  List of field names to return
--format string  Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for draft-products:list-all
--limit int32    Maximum number of items to return
--offset int32   Offset item number from list to begin return
-o, --org string Organization name or id (required)
--output string  Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

## Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic draft-products:list

List the Draft Product objects

## Synopsis

---

List the Draft Product objects

```
apic draft-products:list [flags]
```

## Options

---

```
--fields string  List of field names to return
--format string  Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for draft-products:list
```

```

--limit int32      Maximum number of items to return
--offset int32     Offset item number from list to begin return
-o, --org string   Organization name or id (required)
--output string    Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)

```

## Options inherited from parent commands

---

```

--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")

```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic draft-products:publish

Publish a draft product

### Synopsis

---

Publish a draft product

```
apic draft-products:publish [flags]
```

### Options

---

```

-c, --catalog string  Catalog name or id (required)
--format string       Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
--gateway_services string The list of gateway service names to support partial publishing
-h, --help            Help for draft-products:publish
-o, --org string       Organization name or id (required)
--output string       Write file(s) to directory, instead of STDOUT (default "-")
--scope string        scope
-s, --server string    management server endpoint (required)
--space string        Space name or id (required)
--stage              stage

```

## Options inherited from parent commands

---

```

--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")

```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic draft-products:update

Update the Draft Product object by name and version

### Synopsis

---

Update the Draft Product object by name and version

```
apic draft-products:update [flags]
```

### Options

---

```

--format string  Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for draft-products:update
--id            id
-o, --org string Organization name or id (required)
--output string Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)

```

## Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic draft-products:validate

Validate the draft product

### Synopsis

---

Validate the draft product

```
apic draft-products:validate [flags]
```

### Options

---

<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for draft-products:validate
<code>--id</code>	id
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)

## Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic drafts

Drafts operations

### Synopsis

---

Drafts operations

```
apic drafts [flags]
```

### Options

---

<code>--fields string</code>	List of field names to return
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for drafts
<code>--limit int32</code>	Maximum number of items to return
<code>--offset int32</code>	Offset item number from list to begin return
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)

## Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic drafts:clear

Clear the Draft objects

### Synopsis

---

Clear the Draft objects

```
apic drafts:clear [flags]
```

### Options

---

```
--confirm string  Confirmation for critical updates (required)
--format string   Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help        Help for drafts:clear
-o, --org string  Organization name or id (required)
--output string   Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

### Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic drafts:list

List the Draft objects

### Synopsis

---

List the Draft objects

```
apic drafts:list [flags]
```

### Options

---

```
--fields string  List of field names to return
--format string   Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help        Help for drafts:list
--limit int32     Maximum number of items to return
--offset int32    Offset item number from list to begin return
-o, --org string  Organization name or id (required)
--output string   Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

### Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic entries

Entries operations

### Synopsis

---

Entries operations

```
apic entries [flags]
```

### Options

---

```
--fields string      List of field names to return
--format string      Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for entries
--limit int32        Maximum number of items to return
--offset int32       Offset item number from list to begin return
-o, --org string      Organization name or id (required)
--output string       Write file(s) to directory, instead of STDOUT (default "-")
--scope string        scope
-s, --server string   management server endpoint (required)
--truststore string  Truststore name or id (required)
```

### Options inherited from parent commands

---

```
--accept-license     Accept the license for API Connect
--debug              Enable debug output
--debug-output string Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic entries:clear

Entries clear operations

### Synopsis

---

Entries clear operations

```
apic entries:clear [flags]
```

### Options

---

```
--confirm string     Confirmation for critical updates (required)
--format string      Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for entries:clear
-o, --org string      Organization name or id (required)
--output string       Write file(s) to directory, instead of STDOUT (default "-")
--scope string        scope
-s, --server string   management server endpoint (required)
--truststore string  Truststore name or id (required)
```

### Options inherited from parent commands

---

```
--accept-license     Accept the license for API Connect
--debug              Enable debug output
--debug-output string Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic entries:create

Entries create operations

## Synopsis

---

Entries create operations

```
apic entries:create [flags]
```

## Options

---

<code>--format</code> string	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for entries:create
<code>-o, --org</code> string	Organization name or id (required)
<code>--output</code> string	Write file(s) to directory, instead of STDOUT (default "-")
<code>--scope</code> string	scope
<code>-s, --server</code> string	management server endpoint (required)
<code>--truststore</code> string	Truststore name or id (required)

## Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output</code> string	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode</code> string	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic entries:delete

Entries delete operations

## Synopsis

---

Entries delete operations

```
apic entries:delete [flags]
```

## Options

---

<code>--format</code> string	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for entries:delete
<code>-o, --org</code> string	Organization name or id (required)
<code>--output</code> string	Write file(s) to directory, instead of STDOUT (default "-")
<code>--scope</code> string	scope
<code>-s, --server</code> string	management server endpoint (required)
<code>--truststore</code> string	Truststore name or id (required)

## Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output</code> string	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode</code> string	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic entries:get

Entries get operations

## Synopsis

---

Entries get operations

```
apic entries:get [flags]
```

## Options

---

```
--fields string      List of field names to return
--format string     Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help          Help for entries:get
-o, --org string    Organization name or id (required)
--output string     Write file(s) to directory, use - for STDOUT. (default: cwd)
--scope string      scope
-s, --server string management server endpoint (required)
--truststore string Truststore name or id (required)
```

## Options inherited from parent commands

---

```
--accept-license    Accept the license for API Connect
--debug             Enable debug output
--debug-output string Write debug output to file
--live-help         Enable or disable tracking of limited usage information
-m, --mode string   Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic entries:list

Entries list operations

## Synopsis

---

Entries list operations

```
apic entries:list [flags]
```

## Options

---

```
--fields string      List of field names to return
--format string     Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help          Help for entries:list
--limit int32       Maximum number of items to return
--offset int32      Offset item number from list to begin return
-o, --org string    Organization name or id (required)
--output string     Write file(s) to directory, instead of STDOUT (default "-")
--scope string      scope
-s, --server string management server endpoint (required)
--truststore string Truststore name or id (required)
```

## Options inherited from parent commands

---

```
--accept-license    Accept the license for API Connect
--debug             Enable debug output
--debug-output string Write debug output to file
--live-help         Enable or disable tracking of limited usage information
-m, --mode string   Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic entries:update

Entries update operations

## Synopsis

---

Entries update operations

```
apic entries:update [flags]
```

## Options

---

```
--format string     Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help          Help for entries:update
```

-o, --org string	Organization name or id (required)
--output string	Write file(s) to directory, instead of STDOUT (default "-")
--scope string	scope
-s, --server string	management server endpoint (required)
--truststore string	Truststore name or id (required)

## Options inherited from parent commands

--accept-license	Accept the license for API Connect
--debug	Enable debug output
--debug-output string	Write debug output to file
--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## apic extensions

Extensions operations

### Synopsis

Extensions operations

**apic extensions** [flags]

### Options

--availability-zone string	Availability Zone name or id (required)
-c, --catalog string	Catalog name or id (required)
--configured-gateway-service string	Configured Gateway Service name or id (required)
--fields string	List of field names to return
--format string	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
--gateway-service string	Gateway Service name or id (required)
-h, --help	Help for extensions
--limit int32	Maximum number of items to return
--offset int32	Offset item number from list to begin return
-o, --org string	Organization name or id (required)
--output string	Write file(s) to directory, instead of STDOUT (default "-")
--scope string	scope
-s, --server string	management server endpoint (required)
--space string	Space name or id (required)

## Options inherited from parent commands

--accept-license	Accept the license for API Connect
--debug	Enable debug output
--debug-output string	Write debug output to file
--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## apic extensions:clear-all

Extensions clear-all operations

### Synopsis

Extensions clear-all operations

**apic extensions:clear-all** [flags]

### Options

-c, --catalog string	Catalog name or id (required)
--configured-gateway-service string	Configured Gateway Service name or id (required)
--confirm string	Confirmation for critical updates (required)
--format string	Output format. One of [json yaml go-template=... go-template-file=...], defaults to

```

yaml.
-h, --help                Help for extensions:clear-all
-o, --org string          Organization name or id (required)
--output string          Write file(s) to directory, instead of STDOUT (default "-")
--scope string           scope
-s, --server string       management server endpoint (required)
--space string           Space name or id (required)

```

## Options inherited from parent commands

```

--accept-license        Accept the license for API Connect
--debug                Enable debug output
--debug-output string   Write debug output to file
--live-help            Enable or disable tracking of limited usage information
-m, --mode string       Toolkit operation mode (default "apim")

```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## apic extensions:clear

Extensions clear operations

### Synopsis

Extensions clear operations

```
apic extensions:clear [flags]
```

### Options

```

-c, --catalog string      Catalog name or id (required)
--configured-gateway-service string  Configured Gateway Service name or id (required)
--confirm string          Confirmation for critical updates (required)
--format string           Output format. One of [json yaml go-template=... go-template-file=...], defaults to
yaml.
-h, --help                Help for extensions:clear
-o, --org string          Organization name or id (required)
--output string          Write file(s) to directory, instead of STDOUT (default "-")
--scope string           scope
-s, --server string       management server endpoint (required)
--space string           Space name or id (required)

```

## Options inherited from parent commands

```

--accept-license        Accept the license for API Connect
--debug                Enable debug output
--debug-output string   Write debug output to file
--live-help            Enable or disable tracking of limited usage information
-m, --mode string       Toolkit operation mode (default "apim")

```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## apic extensions:clone

Extensions clone operations

### Synopsis

Extensions clone operations

```
apic extensions:clone [flags]
```

### Options

```

--availability-zone string  Availability Zone name or id (required)
-c, --catalog string        Catalog name or id (required)
--configured-gateway-service string  Configured Gateway Service name or id (required)
--fields string            List of field names to return
--format string           Output format. One of [json yaml go-template=... go-template-file=...], defaults to
yaml.

```

```

--gateway-service string      Gateway Service name or id (required)
-h, --help                   Help for extensions:clone
--limit int32                Maximum number of items to return
--offset int32               Offset item number from list to begin return
-o, --org string              Organization name or id (required)
--output string               Write file(s) to directory, use - for STDOUT. (default: cwd)
--scope string                scope
-s, --server string           management server endpoint (required)
--space string                Space name or id (required)

```

## Options inherited from parent commands

---

```

--accept-license             Accept the license for API Connect
--debug                      Enable debug output
--debug-output string        Write debug output to file
--live-help                  Enable or disable tracking of limited usage information
-m, --mode string            Toolkit operation mode (default "apim")

```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic extensions:create

Extensions create operations

### Synopsis

---

Extensions create operations

```
apic extensions:create [flags]
```

### Options

---

```

-c, --catalog string          Catalog name or id (required)
--configured-gateway-service string  Configured Gateway Service name or id (required)
--format string               Output format. One of [json yaml go-template=... go-template-file=...], defaults to
yaml.
-h, --help                    Help for extensions:create
-o, --org string               Organization name or id (required)
--output string                Write file(s) to directory, instead of STDOUT (default "-")
--scope string                  scope
-s, --server string            management server endpoint (required)
--space string                  Space name or id (required)

```

## Options inherited from parent commands

---

```

--accept-license             Accept the license for API Connect
--debug                      Enable debug output
--debug-output string        Write debug output to file
--live-help                  Enable or disable tracking of limited usage information
-m, --mode string            Toolkit operation mode (default "apim")

```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic extensions:delete

Extensions delete operations

### Synopsis

---

Extensions delete operations

```
apic extensions:delete [flags]
```

### Options

---

```

-c, --catalog string          Catalog name or id (required)
--configured-gateway-service string  Configured Gateway Service name or id (required)
--format string               Output format. One of [json yaml go-template=... go-template-file=...], defaults to
yaml.
-h, --help                    Help for extensions:delete

```

--id	id
-o, --org string	Organization name or id (required)
--output string	Write file(s) to directory, instead of STDOUT (default "-")
--scope string	scope
-s, --server string	management server endpoint (required)
--space string	Space name or id (required)

## Options inherited from parent commands

--accept-license	Accept the license for API Connect
--debug	Enable debug output
--debug-output string	Write debug output to file
--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## apic extensions:document

Extensions document operations

### Synopsis

Extensions document operations

```
apic extensions:document [flags]
```

### Options

--availability-zone string	Availability Zone name or id (required)
-c, --catalog string	Catalog name or id (required)
--configured-gateway-service string	Configured Gateway Service name or id (required)
--format string	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
--gateway-service string	Gateway Service name or id (required)
-h, --help	Help for extensions:document
--id	id
-o, --org string	Organization name or id (required)
--output string	Write file(s) to directory, instead of STDOUT (default "-")
--scope string	scope
-s, --server string	management server endpoint (required)
--space string	Space name or id (required)

## Options inherited from parent commands

--accept-license	Accept the license for API Connect
--debug	Enable debug output
--debug-output string	Write debug output to file
--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## apic extensions:get

Extensions get operations

### Synopsis

Extensions get operations

```
apic extensions:get [flags]
```

### Options

--availability-zone string	Availability Zone name or id (required)
-c, --catalog string	Catalog name or id (required)
--configured-gateway-service string	Configured Gateway Service name or id (required)
--fields string	List of field names to return
--format string	Output format. One of [json yaml go-template=... go-template-file=...], defaults to

```

yaml.
--gateway-service string      Gateway Service name or id (required)
-h, --help                    Help for extensions:get
--id                           id
-o, --org string               Organization name or id (required)
--output string                Write file(s) to directory, use - for STDOUT. (default: cwd)
--scope string                 scope
-s, --server string            management server endpoint (required)
--space string                 Space name or id (required)

```

## Options inherited from parent commands

```

--accept-license              Accept the license for API Connect
--debug                       Enable debug output
--debug-output string         Write debug output to file
--live-help                   Enable or disable tracking of limited usage information
-m, --mode string             Toolkit operation mode (default "apim")

```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## apic extensions:list

Extensions list operations

### Synopsis

Extensions list operations

```
apic extensions:list [flags]
```

### Options

```

--availability-zone string    Availability Zone name or id (required)
-c, --catalog string          Catalog name or id (required)
--configured-gateway-service string  Configured Gateway Service name or id (required)
--fields string               List of field names to return
--format string                Output format. One of [json yaml go-template=... go-template-file=...], defaults to
yaml.
--gateway-service string      Gateway Service name or id (required)
-h, --help                    Help for extensions:list
--limit int32                 Maximum number of items to return
--offset int32                Offset item number from list to begin return
-o, --org string               Organization name or id (required)
--output string                Write file(s) to directory, instead of STDOUT (default "-")
--scope string                 scope
-s, --server string            management server endpoint (required)
--space string                 Space name or id (required)

```

## Options inherited from parent commands

```

--accept-license              Accept the license for API Connect
--debug                       Enable debug output
--debug-output string         Write debug output to file
--live-help                   Enable or disable tracking of limited usage information
-m, --mode string             Toolkit operation mode (default "apim")

```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## apic extensions:list-all

Extensions list-all operations

### Synopsis

Extensions list-all operations

```
apic extensions:list-all [flags]
```

### Options

<code>--availability-zone string</code>	Availability Zone name or id (required)
<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--configured-gateway-service string</code>	Configured Gateway Service name or id (required)
<code>--fields string</code>	List of field names to return
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>--gateway-service string</code>	Gateway Service name or id (required)
<code>-h, --help</code>	Help for extensions:list-all
<code>--limit int32</code>	Maximum number of items to return
<code>--offset int32</code>	Offset item number from list to begin return
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>--scope string</code>	scope
<code>-s, --server string</code>	management server endpoint (required)
<code>--space string</code>	Space name or id (required)

## Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## apic extensions:update

Extensions update operations

### Synopsis

Extensions update operations

```
apic extensions:update [flags]
```

### Options

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--configured-gateway-service string</code>	Configured Gateway Service name or id (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for extensions:update
<code>--id</code>	id
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>--scope string</code>	scope
<code>-s, --server string</code>	management server endpoint (required)
<code>--space string</code>	Space name or id (required)

## Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## apic gateway-extensions

Gateway Extensions operations

### Synopsis

Gateway Extensions operations

```
apic gateway-extensions [flags]
```

## Options

---

```
-h, --help    Help for gateway-extensions
```

## Options inherited from parent commands

---

```
--accept-license    Accept the license for API Connect
--debug            Enable debug output
--debug-output string Write debug output to file
--live-help        Enable or disable tracking of limited usage information
-m, --mode string   Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

---

## apic gateway-extensions:update

Gateway Extensions update operations

### Synopsis

Gateway Extensions update operations

```
apic gateway-extensions:update [flags]
```

### Options

<code>--availability-zone</code> string	Availability Zone name or id (required)
<code>--format</code> string	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>--gateway-service</code> string	Gateway Service name or id (required)
<code>-h, --help</code>	Help for gateway-extensions:update
<code>-o, --org</code> string	Organization name or id (required)
<code>--output</code> string	Write file(s) to directory, instead of STDOUT (default "-")
<code>--scope</code> string	scope
<code>-s, --server</code> string	management server endpoint (required)

### Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output</code> string	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode</code> string	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic gateway-services

Gateway Services operations

### Synopsis

Gateway Services operations

```
apic gateway-services [flags]
```

### Options

<code>--availability-zone</code> string	Availability Zone name or id (required)
<code>--fields</code> string	List of field names to return
<code>--format</code> string	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for gateway-services
<code>--limit</code> int32	Maximum number of items to return
<code>--offset</code> int32	Offset item number from list to begin return
<code>-o, --org</code> string	Organization name or id (required)
<code>--output</code> string	Write file(s) to directory, instead of STDOUT (default "-")
<code>--scope</code> string	scope
<code>-s, --server</code> string	management server endpoint (required)

### Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output</code> string	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode</code> string	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic gateway-services:clear

Clear the Gateway Service objects

### Synopsis

---

Clear the Gateway Service objects

```
apic gateway-services:clear [flags]
```

### Options

---

```
--availability-zone string  Availability Zone name or id (required)
--confirm string           Confirmation for critical updates (required)
--format string            Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help                 Help for gateway-services:clear
-o, --org string           Organization name or id (required)
--output string            Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string        management server endpoint (required)
```

### Options inherited from parent commands

---

```
--accept-license          Accept the license for API Connect
--debug                   Enable debug output
--debug-output string     Write debug output to file
--live-help               Enable or disable tracking of limited usage information
-m, --mode string         Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic gateway-services:create

Create a Gateway Service object

### Synopsis

---

Create a Gateway Service object

```
apic gateway-services:create [flags]
```

### Options

---

```
--availability-zone string  Availability Zone name or id (required)
--format string            Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help                 Help for gateway-services:create
-o, --org string           Organization name or id (required)
--output string            Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string        management server endpoint (required)
```

### Options inherited from parent commands

---

```
--accept-license          Accept the license for API Connect
--debug                   Enable debug output
--debug-output string     Write debug output to file
--live-help               Enable or disable tracking of limited usage information
-m, --mode string         Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic gateway-services:delete

Delete the Gateway Service object by name or id

### Synopsis

---

Delete the Gateway Service object by name or id

```
apic gateway-services:delete [flags]
```

## Options

<code>--availability-zone string</code>	Availability Zone name or id (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for gateway-services:delete
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)

## Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## apic gateway-services:get

Get the Gateway Service object by name or id

## Synopsis

Get the Gateway Service object by name or id

```
apic gateway-services:get [flags]
```

## Options

<code>--availability-zone string</code>	Availability Zone name or id (required)
<code>--fields string</code>	List of field names to return
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for gateway-services:get
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, use - for STDOUT. (default: cwd)
<code>--scope string</code>	scope
<code>-s, --server string</code>	management server endpoint (required)

## Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## apic gateway-services:list

List the Gateway Service objects

## Synopsis

List the Gateway Service objects

```
apic gateway-services:list [flags]
```

## Options

<code>--availability-zone string</code>	Availability Zone name or id (required)
<code>--fields string</code>	List of field names to return

<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for gateway-services:list
<code>--limit int32</code>	Maximum number of items to return
<code>--offset int32</code>	Offset item number from list to begin return
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>--scope string</code>	scope
<code>-s, --server string</code>	management server endpoint (required)

## Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## apic gateway-services:reset-oauth-secret

Reset the oauth shared crypto material

### Synopsis

Reset the oauth shared crypto material

```
apic gateway-services:reset-oauth-secret [flags]
```

### Options

<code>--availability-zone string</code>	Availability Zone name or id (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for gateway-services:reset-oauth-secret
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)

## Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## apic gateway-services:update

Update the Gateway Service object by name or id

### Synopsis

Update the Gateway Service object by name or id

```
apic gateway-services:update [flags]
```

### Options

<code>--availability-zone string</code>	Availability Zone name or id (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for gateway-services:update
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)

## Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## apic global-policies

Global Policies operations

### Synopsis

Global Policies operations

```
apic global-policies [flags]
```

### Options

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--configured-gateway-service string</code>	Configured Gateway Service name or id (required)
<code>--fields string</code>	List of field names to return
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for global-policies
<code>--limit int32</code>	Maximum number of items to return
<code>--offset int32</code>	Offset item number from list to begin return
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>--scope string</code>	scope
<code>-s, --server string</code>	management server endpoint (required)
<code>--space string</code>	Space name or id (required)

### Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## apic global-policies:clear

Global Policies clear operations

### Synopsis

Global Policies clear operations

```
apic global-policies:clear [flags]
```

### Options

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--configured-gateway-service string</code>	Configured Gateway Service name or id (required)
<code>--confirm string</code>	Confirmation for critical updates (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for global-policies:clear
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>--scope string</code>	scope
<code>-s, --server string</code>	management server endpoint (required)
<code>--space string</code>	Space name or id (required)

### Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic global-policies:clear-all

Global Policies clear-all operations

### Synopsis

Global Policies clear-all operations

```
apic global-policies:clear-all [flags]
```

### Options

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--configured-gateway-service string</code>	Configured Gateway Service name or id (required)
<code>--confirm string</code>	Confirmation for critical updates (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for global-policies:clear-all
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>--scope string</code>	scope
<code>-s, --server string</code>	management server endpoint (required)
<code>--space string</code>	Space name or id (required)

### Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic global-policies:create

Global Policies create operations

### Synopsis

Global Policies create operations

```
apic global-policies:create [flags]
```

### Options

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--configured-gateway-service string</code>	Configured Gateway Service name or id (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for global-policies:create
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>--scope string</code>	scope
<code>-s, --server string</code>	management server endpoint (required)
<code>--space string</code>	Space name or id (required)

### Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file

--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## apic global-policies:delete

Global Policies delete operations

### Synopsis

Global Policies delete operations

```
apic global-policies:delete [flags]
```

### Options

-c, --catalog string	Catalog name or id (required)
--configured-gateway-service string	Configured Gateway Service name or id (required)
--format string	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help	Help for global-policies:delete
--id	id
-o, --org string	Organization name or id (required)
--output string	Write file(s) to directory, instead of STDOUT (default "-")
--scope string	scope
-s, --server string	management server endpoint (required)
--space string	Space name or id (required)

### Options inherited from parent commands

--accept-license	Accept the license for API Connect
--debug	Enable debug output
--debug-output string	Write debug output to file
--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## apic global-policies:document

Global Policies document operations

### Synopsis

Global Policies document operations

```
apic global-policies:document [flags]
```

### Options

-c, --catalog string	Catalog name or id (required)
--configured-gateway-service string	Configured Gateway Service name or id (required)
--format string	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help	Help for global-policies:document
--id	id
-o, --org string	Organization name or id (required)
--output string	Write file(s) to directory, instead of STDOUT (default "-")
--scope string	scope
-s, --server string	management server endpoint (required)
--space string	Space name or id (required)

### Options inherited from parent commands

--accept-license	Accept the license for API Connect
--debug	Enable debug output
--debug-output string	Write debug output to file
--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic global-policies:get

Global Policies get operations

### Synopsis

Global Policies get operations

```
apic global-policies:get [flags]
```

### Options

```
-c, --catalog string      Catalog name or id (required)
--configured-gateway-service string  Configured Gateway Service name or id (required)
--fields string          List of field names to return
--format string          Output format. One of [json yaml go-template=... go-template-file=...], defaults to
yaml.
-h, --help               Help for global-policies:get
--id string              id
-o, --org string         Organization name or id (required)
--output string          Write file(s) to directory, use - for STDOUT. (default: cwd)
--scope string           scope
-s, --server string      management server endpoint (required)
--space string           Space name or id (required)
```

### Options inherited from parent commands

```
--accept-license      Accept the license for API Connect
--debug               Enable debug output
--debug-output string Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic global-policies:list

Global Policies list operations

### Synopsis

Global Policies list operations

```
apic global-policies:list [flags]
```

### Options

```
-c, --catalog string      Catalog name or id (required)
--configured-gateway-service string  Configured Gateway Service name or id (required)
--fields string          List of field names to return
--format string          Output format. One of [json yaml go-template=... go-template-file=...], defaults to
yaml.
-h, --help               Help for global-policies:list
--limit int32            Maximum number of items to return
--offset int32           Offset item number from list to begin return
-o, --org string         Organization name or id (required)
--output string          Write file(s) to directory, instead of STDOUT (default "-")
--scope string           scope
-s, --server string      management server endpoint (required)
--space string           Space name or id (required)
```

### Options inherited from parent commands

```
--accept-license      Accept the license for API Connect
--debug               Enable debug output
--debug-output string Write debug output to file
```

```
--live-help          Enable or disable tracking of limited usage information
-m, --mode string    Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic global-policies:list-all

Global Policies list-all operations

### Synopsis

Global Policies list-all operations

```
apic global-policies:list-all [flags]
```

### Options

```
-c, --catalog string          Catalog name or id (required)
--configured-gateway-service string  Configured Gateway Service name or id (required)
--fields string              List of field names to return
--format string              Output format. One of [json yaml go-template=... go-template-file=...], defaults to
yaml.
-h, --help                  Help for global-policies:list-all
--limit int32               Maximum number of items to return
--offset int32              Offset item number from list to begin return
-o, --org string            Organization name or id (required)
--output string             Write file(s) to directory, instead of STDOUT (default "-")
--scope string              scope
-s, --server string         management server endpoint (required)
--space string              Space name or id (required)
```

### Options inherited from parent commands

```
--accept-license    Accept the license for API Connect
--debug             Enable debug output
--debug-output string Write debug output to file
--live-help         Enable or disable tracking of limited usage information
-m, --mode string    Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic global-policies:update

Global Policies update operations

### Synopsis

Global Policies update operations

```
apic global-policies:update [flags]
```

### Options

```
-c, --catalog string          Catalog name or id (required)
--configured-gateway-service string  Configured Gateway Service name or id (required)
--format string              Output format. One of [json yaml go-template=... go-template-file=...], defaults to
yaml.
-h, --help                  Help for global-policies:update
--id string                  id
-o, --org string            Organization name or id (required)
--output string             Write file(s) to directory, instead of STDOUT (default "-")
--scope string              scope
-s, --server string         management server endpoint (required)
--space string              Space name or id (required)
```

### Options inherited from parent commands

```
--accept-license    Accept the license for API Connect
--debug             Enable debug output
--debug-output string Write debug output to file
```

```
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic global-policy-posthooks

Global Policy Posthooks operations

### Synopsis

Global Policy Posthooks operations

```
apic global-policy-posthooks [flags]
```

### Options

```
-h, --help  Help for global-policy-posthooks
```

### Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## apic global-policy-posthooks:get

Global Policy Posthooks get operations

### Synopsis

---

Global Policy Posthooks get operations

```
apic global-policy-posthooks:get [flags]
```

### Options

---

```
-c, --catalog string          Catalog name or id (required)
--configured-gateway-service string  Configured Gateway Service name or id (required)
--fields string              List of field names to return
--format string              Output format. One of [json yaml go-template=... go-template-file=...], defaults to
yaml.
-h, --help                  Help for global-policy-posthooks:get
-o, --org string            Organization name or id (required)
--output string             Write file(s) to directory, use - for STDOUT. (default: cwd)
--scope string              scope
-s, --server string         management server endpoint (required)
--space string              Space name or id (required)
```

### Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string  Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## apic global-policy-prehooks:update

Global Policy Prehooks update operations

### Synopsis

Global Policy Prehooks update operations

```
apic global-policy-prehooks:update [flags]
```

### Options

```

-c, --catalog string      Catalog name or id (required)
--configured-gateway-service string  Configured Gateway Service name or id (required)
--format string          Output format. One of [json yaml go-template=... go-template-file=...], defaults to
yaml.
-h, --help                Help for global-policy-prehooks:update
-o, --org string          Organization name or id (required)
--output string          Write file(s) to directory, instead of STDOUT (default "-")
--scope string           scope
-s, --server string       management server endpoint (required)
--space string           Space name or id (required)

```

## Options inherited from parent commands

```

--accept-license        Accept the license for API Connect
--debug                Enable debug output
--debug-output string   Write debug output to file
--live-help            Enable or disable tracking of limited usage information
-m, --mode string       Toolkit operation mode (default "apim")

```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## apic groups

Groups operations

### Synopsis

Groups operations

```
apic groups [flags]
```

### Options

```

-c, --catalog string      Catalog name or id (required)
--fields string          List of field names to return
--format string          Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help                Help for groups
--limit int32           Maximum number of items to return
--offset int32          Offset item number from list to begin return
-o, --org string          Organization name or id (required)

```

```
--output string Write file(s) to directory, instead of STDOUT (default "-")
--scope string scope
-s, --server string management server endpoint (required)
```

## Options inherited from parent commands

---

```
--accept-license Accept the license for API Connect
--debug Enable debug output
--debug-output string Write debug output to file
--live-help Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic groups:clear

Groups clear operations

## Synopsis

---

Groups clear operations

```
apic groups:clear [flags]
```

## Options

---

```
-c, --catalog string Catalog name or id (required)
--confirm string Confirmation for critical updates (required)
--format string Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help Help for groups:clear
-o, --org string Organization name or id (required)
--output string Write file(s) to directory, instead of STDOUT (default "-")
--scope string scope
-s, --server string management server endpoint (required)
```

## Options inherited from parent commands

---

```
--accept-license Accept the license for API Connect
--debug Enable debug output
--debug-output string Write debug output to file
--live-help Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic groups:create

Groups create operations

## Synopsis

---

Groups create operations

```
apic groups:create [flags]
```

## Options

---

```
-c, --catalog string Catalog name or id (required)
--format string Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help Help for groups:create
-o, --org string Organization name or id (required)
--output string Write file(s) to directory, instead of STDOUT (default "-")
--scope string scope
-s, --server string management server endpoint (required)
```

## Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## apic groups:delete

Groups delete operations

### Synopsis

Groups delete operations

```
apic groups:delete [flags]
```

### Options

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for groups:delete
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>--scope string</code>	scope
<code>-s, --server string</code>	management server endpoint (required)

### Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## apic groups:get

Groups get operations

### Synopsis

Groups get operations

```
apic groups:get [flags]
```

### Options

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--fields string</code>	List of field names to return
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for groups:get
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, use - for STDOUT. (default: cwd)
<code>--scope string</code>	scope
<code>-s, --server string</code>	management server endpoint (required)

### Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic groups:list

Groups list operations

### Synopsis

---

Groups list operations

```
apic groups:list [flags]
```

### Options

---

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--fields string</code>	List of field names to return
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for groups:list
<code>--limit int32</code>	Maximum number of items to return
<code>--offset int32</code>	Offset item number from list to begin return
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>--scope string</code>	scope
<code>-s, --server string</code>	management server endpoint (required)

### Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic groups:update

Groups update operations

### Synopsis

---

Groups update operations

```
apic groups:update [flags]
```

### Options

---

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for groups:update
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>--scope string</code>	scope
<code>-s, --server string</code>	management server endpoint (required)

### Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic identity-providers

Identity Providers operations

### Synopsis

---

Identity Providers operations

```
apic identity-providers [flags]
```

### Options

---

```
--fields string  List of field names to return
--format string  Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help       Help for identity-providers
--limit int32    Maximum number of items to return
--offset int32   Offset item number from list to begin return
--output string  Write file(s) to directory, instead of STDOUT (default "-")
--scope string   scope
-s, --server string management server endpoint (required)
```

### Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic identity-providers:list

Identity Providers list operations

### Synopsis

---

Identity Providers list operations

```
apic identity-providers:list [flags]
```

### Options

---

```
--fields string  List of field names to return
--format string  Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help       Help for identity-providers:list
--limit int32    Maximum number of items to return
--offset int32   Offset item number from list to begin return
--output string  Write file(s) to directory, instead of STDOUT (default "-")
--scope string   scope
-s, --server string management server endpoint (required)
```

### Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic integrations

Integrations operations

## Synopsis

---

Integrations operations

```
apic integrations [flags]
```

## Options

---

```
--fields string  List of field names to return
--format string  Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for integrations
--limit int32    Maximum number of items to return
--offset int32   Offset item number from list to begin return
--output string  Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

## Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic integrations:clear

Integrations clear operations

## Synopsis

---

Integrations clear operations

```
apic integrations:clear [flags]
```

## Options

---

```
--confirm string  Confirmation for critical updates (required)
--format string    Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help        Help for integrations:clear
--output string    Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
--subcollection string subcollection
```

## Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic integrations:create

Integrations create operations

## Synopsis

---

Integrations create operations

```
apic integrations:create [flags]
```

## Options

---

```
--format string      Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for integrations:create
--output string      Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string   management server endpoint (required)
--subcollection string subcollection
```

## Options inherited from parent commands

---

```
--accept-license     Accept the license for API Connect
--debug              Enable debug output
--debug-output string Write debug output to file
--live-help          Enable or disable tracking of limited usage information

## apic integrations:list

Integrations list operations

### Synopsis

Integrations list operations

```
apic integrations:list [flags]
```

### Options

```
--fields string      List of field names to return
--format string      Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for integrations:list
--limit int32        Maximum number of items to return
--offset int32       Offset item number from list to begin return
--output string      Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string  management server endpoint (required)
--subcollection string subcollection
```

### Options inherited from parent commands

```
--accept-license    Accept the license for API Connect
--debug             Enable debug output
--debug-output string Write debug output to file
--live-help         Enable or disable tracking of limited usage information
-m, --mode string   Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic integrations:list-all

List all Integration objects in all collections

### Synopsis

List all Integration objects in all collections

```
apic integrations:list-all [flags]
```

### Options

```
--fields string      List of field names to return
--format string      Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for integrations:list-all
--limit int32        Maximum number of items to return
--offset int32       Offset item number from list to begin return
--output string      Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string  management server endpoint (required)
```

### Options inherited from parent commands

```
--accept-license    Accept the license for API Connect
--debug             Enable debug output
--debug-output string Write debug output to file
--live-help         Enable or disable tracking of limited usage information
-m, --mode string   Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic integrations:update

Integrations update operations

### Synopsis

---

Integrations update operations

```
apic integrations:update [flags]
```

### Options

---

<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for integrations:update
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)
<code>--subcollection string</code>	subcollection

### Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic invitations

Invitations operations

### Synopsis

---

Invitations operations

```
apic invitations [flags]
```

### Options

---

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--fields string</code>	List of field names to return
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for invitations
<code>--limit int32</code>	Maximum number of items to return
<code>--offset int32</code>	Offset item number from list to begin return
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>--scope string</code>	scope
<code>-s, --server string</code>	management server endpoint (required)
<code>--space string</code>	Space name or id (required)
<code>--space-initiated</code>	space-initiated

### Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic invitations:clear

Invitations clear operations

## Synopsis

---

Invitations clear operations

```
apic invitations:clear [flags]
```

## Options

---

-c, --catalog string	Catalog name or id (required)
--confirm string	Confirmation for critical updates (required)
--format string	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help	Help for invitations:clear
-o, --org string	Organization name or id (required)
--output string	Write file(s) to directory, instead of STDOUT (default "-")
--scope string	scope
-s, --server string	management server endpoint (required)
--space string	Space name or id (required)
--space-initiated	space-initiated

## Options inherited from parent commands

---

--accept-license	Accept the license for API Connect
--debug	Enable debug output
--debug-output string	Write debug output to file
--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic invitations:create

Invitations create operations

## Synopsis

---

Invitations create operations

```
apic invitations:create [flags]
```

## Options

---

-c, --catalog string	Catalog name or id (required)
--format string	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help	Help for invitations:create
-o, --org string	Organization name or id (required)
--output string	Write file(s) to directory, instead of STDOUT (default "-")
--scope string	scope
-s, --server string	management server endpoint (required)
--space string	Space name or id (required)
--space-initiated	space-initiated

## Options inherited from parent commands

---

--accept-license	Accept the license for API Connect
--debug	Enable debug output
--debug-output string	Write debug output to file
--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic invitations:delete

Invitations delete operations

## Synopsis

---

Invitations delete operations

```
apic invitations:delete [flags]
```

## Options

---

```
-c, --catalog string    Catalog name or id (required)
--format string        Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help             Help for invitations:delete
-o, --org string        Organization name or id (required)
--output string        Write file(s) to directory, instead of STDOUT (default "-")
--scope string         scope
-s, --server string    management server endpoint (required)
--space string         Space name or id (required)
--space-initiated     space-initiated
```

## Options inherited from parent commands

---

```
--accept-license      Accept the license for API Connect
--debug              Enable debug output
--debug-output string Write debug output to file
--live-help          Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic invitations:get

Invitations get operations

## Synopsis

---

Invitations get operations

```
apic invitations:get [flags]
```

## Options

---

```
-c, --catalog string    Catalog name or id (required)
--fields string        List of field names to return
--format string        Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help             Help for invitations:get
-o, --org string        Organization name or id (required)
--output string        Write file(s) to directory, use - for STDOUT. (default: cwd)
--scope string         scope
-s, --server string    management server endpoint (required)
--space string         Space name or id (required)
--space-initiated     space-initiated
```

## Options inherited from parent commands

---

```
--accept-license      Accept the license for API Connect
--debug              Enable debug output
--debug-output string Write debug output to file
--live-help          Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic invitations:list

Invitations list operations

## Synopsis

---

Invitations list operations

```
apic invitations:list [flags]
```

## Options

---

```

-c, --catalog string      Catalog name or id (required)
--fields string          List of field names to return
--format string          Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help               Help for invitations:list
--limit int32            Maximum number of items to return
--offset int32           Offset item number from list to begin return
-o, --org string         Organization name or id (required)
--output string          Write file(s) to directory, instead of STDOUT (default "-")
--scope string           scope
-s, --server string      management server endpoint (required)
--space string           Space name or id (required)
--space-initiated       space-initiated

```

## Options inherited from parent commands

---

```

--accept-license        Accept the license for API Connect
--debug                Enable debug output
--debug-output string   Write debug output to file
--live-help             Enable or disable tracking of limited usage information
-m, --mode string       Toolkit operation mode (default "apim")

```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic invitations:update

Invitations update operations

### Synopsis

---

Invitations update operations

```
apic invitations:update [flags]
```

### Options

---

```

-c, --catalog string      Catalog name or id (required)
--format string          Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help               Help for invitations:update
-o, --org string         Organization name or id (required)
--output string          Write file(s) to directory, instead of STDOUT (default "-")
--scope string           scope
-s, --server string      management server endpoint (required)
--space string           Space name or id (required)
--space-initiated       space-initiated

```

## Options inherited from parent commands

---

```

--accept-license        Accept the license for API Connect
--debug                Enable debug output
--debug-output string   Write debug output to file
--live-help             Enable or disable tracking of limited usage information
-m, --mode string       Toolkit operation mode (default "apim")

```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic jobs

Jobs operations

### Synopsis

---

Jobs operations

```
apic jobs [flags]
```

### Options

---

```
-h, --help Help for jobs
```

## Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic configured-billings:clear

Clear the Configured Billing objects

### Synopsis

---

Clear the Configured Billing objects

```
apic configured-billings:clear [flags]
```

### Options

---

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--confirm string</code>	Confirmation for critical updates (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for configured-billings:clear
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)

## Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic jobs:delete

Delete the Job object by name or id

### Synopsis

---

Delete the Job object by name or id

```
apic jobs:delete [flags]
```

### Options

---

<code>--billing string</code>	Billing name or id (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for jobs:delete
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)

## Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic jobs:get

Get the Job object by name or id

### Synopsis

---

Get the Job object by name or id

```
apic jobs:get [flags]
```

### Options

---

```
--billing string  Billing name or id (required)
--fields string   List of field names to return
--format string   Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help        Help for jobs:get
-o, --org string   Organization name or id (required)
--output string   Write file(s) to directory, use - for STDOUT. (default: cwd)
-s, --server string management server endpoint (required)
```

### Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic jobs:list

List the Job objects

### Synopsis

---

List the Job objects

```
apic jobs:list [flags]
```

### Options

---

```
--billing string  Billing name or id (required)
--fields string   List of field names to return
--format string   Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help        Help for jobs:list
--limit int32     Maximum number of items to return
--offset int32    Offset item number from list to begin return
-o, --org string   Organization name or id (required)
--output string   Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

### Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic jobs:retry

Re-attempt blocked or failed job

### Synopsis

---

Re-attempt blocked or failed job

```
apic jobs:retry [flags]
```

### Options

---

```
--billing string      Billing name or id (required)
--format string       Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help            Help for jobs:retry
--operation string    Operation to perform on the user registry (get_base_dn_list, validate_password) (required)
-o, --org string      Organization name or id (required)
--output string       Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string   management server endpoint (required)
```

### Options inherited from parent commands

---

```
--accept-license      Accept the license for API Connect
--debug              Enable debug output
--debug-output string Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic keystores

Keystores operations

### Synopsis

---

Keystores operations

```
apic keystores [flags]
```

### Options

---

```
--fields string      List of field names to return
--format string       Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help            Help for keystores
--limit int32         Maximum number of items to return
--offset int32        Offset item number from list to begin return
-o, --org string      Organization name or id (required)
--output string       Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string   management server endpoint (required)
```

### Options inherited from parent commands

---

```
--accept-license      Accept the license for API Connect
--debug              Enable debug output
--debug-output string Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic keystores:clear

Clear the Keystore objects

## Synopsis

---

Clear the Keystore objects

```
apic keystores:clear [flags]
```

## Options

---

<code>--confirm</code>	string	Confirmation for critical updates (required)
<code>--format</code>	string	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>		Help for keystores:clear
<code>-o, --org</code>	string	Organization name or id (required)
<code>--output</code>	string	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server</code>	string	management server endpoint (required)

## Options inherited from parent commands

---

<code>--accept-license</code>		Accept the license for API Connect
<code>--debug</code>		Enable debug output
<code>--debug-output</code>	string	Write debug output to file
<code>--live-help</code>		Enable or disable tracking of limited usage information
<code>-m, --mode</code>	string	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic keystores:create

Create a Keystore object

## Synopsis

---

Create a Keystore object

```
apic keystores:create [flags]
```

## Options

---

<code>--format</code>	string	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>		Help for keystores:create
<code>-o, --org</code>	string	Organization name or id (required)
<code>--output</code>	string	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server</code>	string	management server endpoint (required)

## Options inherited from parent commands

---

<code>--accept-license</code>		Accept the license for API Connect
<code>--debug</code>		Enable debug output
<code>--debug-output</code>	string	Write debug output to file
<code>--live-help</code>		Enable or disable tracking of limited usage information
<code>-m, --mode</code>	string	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic keystores:delete

Delete the Keystore object by name or id

## Synopsis

---

Delete the Keystore object by name or id

```
apic keystores:delete [flags]
```

## Options

---

<code>--format</code>	string	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>		Help for keystores:delete

```
-o, --org string      Organization name or id (required)
--output string      Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string   management server endpoint (required)
```

## Options inherited from parent commands

---

```
--accept-license      Accept the license for API Connect
--debug               Enable debug output
--debug-output string Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic keystores:get

Get the Keystore object by name or id

### Synopsis

---

Get the Keystore object by name or id

```
apic keystores:get [flags]
```

### Options

---

```
--fields string      List of field names to return
--format string       Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for keystores:get
-o, --org string      Organization name or id (required)
--output string       Write file(s) to directory, use - for STDOUT. (default: cwd)
-s, --server string   management server endpoint (required)
```

## Options inherited from parent commands

---

```
--accept-license      Accept the license for API Connect
--debug               Enable debug output
--debug-output string Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic keystores:list

List the Keystore objects

### Synopsis

---

List the Keystore objects

```
apic keystores:list [flags]
```

### Options

---

```
--fields string      List of field names to return
--format string       Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for keystores:list
--limit int32         Maximum number of items to return
--offset int32        Offset item number from list to begin return
-o, --org string      Organization name or id (required)
--output string       Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string   management server endpoint (required)
```

## Options inherited from parent commands

---

```
--accept-license      Accept the license for API Connect
--debug               Enable debug output
```

```
--debug-output string  Write debug output to file
--live-help            Enable or disable tracking of limited usage information
-m, --mode string      Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic keystores:update

Update the Keystore object by name or id

### Synopsis

---

Update the Keystore object by name or id

```
apic keystores:update [flags]
```

### Options

---

```
--format string      Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for keystores:update
-o, --org string      Organization name or id (required)
--output string       Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string   management server endpoint (required)
```

### Options inherited from parent commands

---

```
--accept-license     Accept the license for API Connect
--debug              Enable debug output
--debug-output string Write debug output to file
--live-help          Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic lb4

create and manage LoopBack applications

### Synopsis

---

create and manage LoopBack applications

```
apic lb4 [flags]
```

### Options

---

```
-h, --help  Help for lb4
```

### Options inherited from parent commands

---

```
--accept-license     Accept the license for API Connect
--debug              Enable debug output
--debug-output string Write debug output to file
--live-help          Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic licenses

Review the license for API Connect

## Synopsis

---

Review the license for API Connect

```
apic licenses [flags]
```

## Options

---

```
-h, --help           Help for licenses
--non-ibm-license    Display the non IBM license files.
--notices            Display the notices file
```

## Options inherited from parent commands

---

```
--accept-license    Accept the license for API Connect
--debug             Enable debug output
--debug-output string Write debug output to file
--live-help         Enable or disable tracking of limited usage information
-m, --mode string   Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic log-spec

Log Spec operations

## Synopsis

---

Log Spec operations

```
apic log-spec [flags]
```

## Options

---

```
-h, --help   Help for log-spec
```

## Options inherited from parent commands

---

```
--accept-license    Accept the license for API Connect
--debug             Enable debug output
--debug-output string Write debug output to file
--live-help         Enable or disable tracking of limited usage information
-m, --mode string   Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic log-spec:get

Get the Log Spec object

## Synopsis

---

Get the Log Spec object

```
apic log-spec:get [flags]
```

## Options

---

```
--fields string  List of field names to return
--format string  Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help       Help for log-spec:get
--output string  Write file(s) to directory, use - for STDOUT. (default: cwd)
-s, --server string management server endpoint (required)
```

## Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug          Enable debug output
--debug-output string Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic log-spec:update

Update the Log Spec object

### Synopsis

---

Update the Log Spec object

```
apic log-spec:update [flags]
```

### Options

---

```
--format string  Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for log-spec:update
--output string  Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

### Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug          Enable debug output
--debug-output string Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic login

Log in to an IBM API Connect cloud

### Synopsis

---

Log in to an IBM API Connect cloud

```
apic login [flags]
```

### Examples

---

```
Interactive login
$ apic login
Enter your API Connect credentials
? Server: mgmthost.com
? Realm: company/realm
? Username: tommy
? Password: password
Logged into mgmthost.com successfully
```

```
Non-interactive login
$ apic login --username tommy --password password --server mgmthost.com --realm company/realm
Logged into mgmthost.com successfully
```

### Options

---

```
-h, --help      Help for login
-p, --password string password
-r, --realm string realm
-s, --server string management server endpoint
-u, --username string user name
```

## Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic logout

Log out of an IBM API Connect cloud

## Synopsis

---

Log out of an IBM API Connect cloud

```
apic logout [flags]
```

## Examples

---

```
Clear the local authentication credentials for mgmthost.com
$ apic logout --server mgmthost.com
Logged out of server mgmthost.com
```

## Options

---

<code>-h, --help</code>	Help for logout
<code>-s, --server string</code>	management server endpoint

## Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic mail-servers

Mail Servers operations

## Synopsis

---

Mail Servers operations

```
apic mail-servers [flags]
```

## Options

---

<code>--fields string</code>	List of field names to return
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for mail-servers
<code>--limit int32</code>	Maximum number of items to return
<code>--offset int32</code>	Offset item number from list to begin return
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)

## Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file

```
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic mail-servers:clear

Clear the Mail Server objects

### Synopsis

Clear the Mail Server objects

```
apic mail-servers:clear [flags]
```

### Options

```
--confirm string Confirmation for critical updates (required)
--format string  Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for mail-servers:clear
-o, --org string Organization name or id (required)
--output string Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

### Options inherited from parent commands

```
--accept-license Accept the license for API Connect
--debug          Enable debug output
--debug-output string Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic mail-servers:create

Create a Mail Server object

### Synopsis

Create a Mail Server object

```
apic mail-servers:create [flags]
```

### Options

```
--format string Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for mail-servers:create
-o, --org string Organization name or id (required)
--output string Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

### Options inherited from parent commands

```
--accept-license Accept the license for API Connect
--debug          Enable debug output
--debug-output string Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic mail-servers:delete

Delete the Mail Server object by name or id

### Synopsis

---

Delete the Mail Server object by name or id

```
apic mail-servers:delete [flags]
```

### Options

---

```
--format string  Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.  
-h, --help      Help for mail-servers:delete  
-o, --org string Organization name or id (required)  
--output string Write file(s) to directory, instead of STDOUT (default "-")  
-s, --server string management server endpoint (required)
```

### Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect  
--debug           Enable debug output  
--debug-output string Write debug output to file  
--live-help       Enable or disable tracking of limited usage information  
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic mail-servers:get

Get the Mail Server object by name or id

### Synopsis

---

Get the Mail Server object by name or id

```
apic mail-servers:get [flags]
```

### Options

---

```
--fields string  List of field names to return  
--format string  Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.  
-h, --help      Help for mail-servers:get  
-o, --org string Organization name or id (required)  
--output string  Write file(s) to directory, use - for STDOUT. (default: cwd)  
-s, --server string management server endpoint (required)
```

### Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect  
--debug           Enable debug output  
--debug-output string Write debug output to file  
--live-help       Enable or disable tracking of limited usage information  
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic mail-servers:list

List the Mail Server objects

### Synopsis

---

List the Mail Server objects

```
apic mail-servers:list [flags]
```

## Options

---

```
--fields string  List of field names to return
--format string  Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for mail-servers:list
--limit int32    Maximum number of items to return
--offset int32   Offset item number from list to begin return
-o, --org string Organization name or id (required)
--output string  Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

## Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic mail-servers:test-connection

Test a Mail Server connection

## Synopsis

---

Test a Mail Server connection

```
apic mail-servers:test-connection [flags]
```

## Options

---

```
--format string  Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for mail-servers:test-connection
-o, --org string Organization name or id (required)
--output string  Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
--test-config-only test-config-only
```

## Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic mail-servers:update

Update the Mail Server object by name or id

## Synopsis

---

Update the Mail Server object by name or id

```
apic mail-servers:update [flags]
```

## Options

---

```
--format string  Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for mail-servers:update
-o, --org string Organization name or id (required)
```

```
--output string Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

## Options inherited from parent commands

---

```
--accept-license Accept the license for API Connect
--debug Enable debug output
--debug-output string Write debug output to file
--live-help Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic me

Me operations

## Synopsis

---

Me operations

```
apic me [flags]
```

## Options

---

```
-h, --help Help for me
```

## Options inherited from parent commands

---

```
--accept-license Accept the license for API Connect
--debug Enable debug output
--debug-output string Write debug output to file
--live-help Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic me:change-password

Change my password

## Synopsis

---

Change my password

```
apic me:change-password [flags]
```

## Options

---

```
--format string Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help Help for me:change-password
--output string Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

## Options inherited from parent commands

---

```
--accept-license Accept the license for API Connect
--debug Enable debug output
--debug-output string Write debug output to file
--live-help Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic me:delete

Delete the Me object

### Synopsis

---

Delete the Me object

```
apic me:delete [flags]
```

### Options

---

```
--format string  Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for me:delete
--output string  Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

### Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic me:get

Get the Me object

### Synopsis

---

Get the Me object

```
apic me:get [flags]
```

### Options

---

```
--context string  user's login context admin/manager
--fields string   List of field names to return
--format string   Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for me:get
--output string   Write file(s) to directory, use - for STDOUT. (default: cwd)
-s, --server string management server endpoint (required)
```

### Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic me:update

Update the Me object

### Synopsis

---

Update the Me object

```
apic me:update [flags]
```

## Options

---

```
--format string  Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for me:update
--output string  Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

## Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic member-invitations

Member Invitations operations

## Synopsis

---

Member Invitations operations

```
apic member-invitations [flags]
```

## Options

---

```
-c, --catalog string  Catalog name or id (required)
--consumer-org string Consumer Organization name or id (required)
--fields string       List of field names to return
--format string       Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help            Help for member-invitations
--limit int32         Maximum number of items to return
--offset int32        Offset item number from list to begin return
-o, --org string      Organization name or id (required)
--output string       Write file(s) to directory, instead of STDOUT (default "-")
--scope string        scope
-s, --server string   management server endpoint (required)
--space string        Space name or id (required)
--space-initiated     space-initiated
```

## Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic member-invitations:clear

Member Invitations clear operations

## Synopsis

---

Member Invitations clear operations

```
apic member-invitations:clear [flags]
```

## Options

---

```
-c, --catalog string  Catalog name or id (required)
--confirm string     Confirmation for critical updates (required)
--consumer-org string Consumer Organization name or id (required)
```

--format string	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help	Help for member-invitations:clear
-o, --org string	Organization name or id (required)
--output string	Write file(s) to directory, instead of STDOUT (default "-")
--scope string	scope
-s, --server string	management server endpoint (required)
--space string	Space name or id (required)
--space-initiated	space-initiated

## Options inherited from parent commands

--accept-license	Accept the license for API Connect
--debug	Enable debug output
--debug-output string	Write debug output to file
--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## apic member-invitations:create

Member Invitations create operations

### Synopsis

Member Invitations create operations

```
apic member-invitations:create [flags]
```

### Options

-c, --catalog string	Catalog name or id (required)
--consumer-org string	Consumer Organization name or id (required)
--format string	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help	Help for member-invitations:create
-o, --org string	Organization name or id (required)
--output string	Write file(s) to directory, instead of STDOUT (default "-")
--scope string	scope
-s, --server string	management server endpoint (required)
--space string	Space name or id (required)
--space-initiated	space-initiated

## Options inherited from parent commands

--accept-license	Accept the license for API Connect
--debug	Enable debug output
--debug-output string	Write debug output to file
--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## apic member-invitations:delete

Member Invitations delete operations

### Synopsis

Member Invitations delete operations

```
apic member-invitations:delete [flags]
```

### Options

-c, --catalog string	Catalog name or id (required)
--consumer-org string	Consumer Organization name or id (required)
--format string	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help	Help for member-invitations:delete
-o, --org string	Organization name or id (required)
--output string	Write file(s) to directory, instead of STDOUT (default "-")

--scope string	scope
-s, --server string	management server endpoint (required)
--space string	Space name or id (required)
--space-initiated	space-initiated

## Options inherited from parent commands

--accept-license	Accept the license for API Connect
--debug	Enable debug output
--debug-output string	Write debug output to file
--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## apic member-invitations:get

Member Invitations get operations

### Synopsis

Member Invitations get operations

```
apic member-invitations:get [flags]
```

### Options

-c, --catalog string	Catalog name or id (required)
--consumer-org string	Consumer Organization name or id (required)
--fields string	List of field names to return
--format string	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help	Help for member-invitations:get
-o, --org string	Organization name or id (required)
--output string	Write file(s) to directory, use - for STDOUT. (default: cwd)
--scope string	scope
-s, --server string	management server endpoint (required)
--space string	Space name or id (required)
--space-initiated	space-initiated

## Options inherited from parent commands

--accept-license	Accept the license for API Connect
--debug	Enable debug output
--debug-output string	Write debug output to file
--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## apic member-invitations:list

Member Invitations list operations

### Synopsis

Member Invitations list operations

```
apic member-invitations:list [flags]
```

### Options

-c, --catalog string	Catalog name or id (required)
--consumer-org string	Consumer Organization name or id (required)
--fields string	List of field names to return
--format string	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help	Help for member-invitations:list
--limit int32	Maximum number of items to return
--offset int32	Offset item number from list to begin return
-o, --org string	Organization name or id (required)
--output string	Write file(s) to directory, instead of STDOUT (default "-")

```
--scope string      scope
-s, --server string management server endpoint (required)
--space string      Space name or id (required)
--space-initiated   space-initiated
```

## Options inherited from parent commands

---

```
--accept-license   Accept the license for API Connect
--debug            Enable debug output
--debug-output string Write debug output to file
--live-help        Enable or disable tracking of limited usage information
-m, --mode string   Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic member-invitations:update

Member Invitations update operations

### Synopsis

---

Member Invitations update operations

```
apic member-invitations:update [flags]
```

### Options

---

```
-c, --catalog string      Catalog name or id (required)
--consumer-org string     Consumer Organization name or id (required)
--format string           Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help                Help for member-invitations:update
-o, --org string           Organization name or id (required)
--output string           Write file(s) to directory, instead of STDOUT (default "-")
--scope string            scope
-s, --server string       management server endpoint (required)
--space string            Space name or id (required)
--space-initiated         space-initiated
```

## Options inherited from parent commands

---

```
--accept-license   Accept the license for API Connect
--debug            Enable debug output
--debug-output string Write debug output to file
--live-help        Enable or disable tracking of limited usage information
-m, --mode string   Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic members

Members operations

### Synopsis

---

Members operations

```
apic members [flags]
```

### Options

---

```
-c, --catalog string      Catalog name or id (required)
--consumer-org string     Consumer Organization name or id (required)
--fields string           List of field names to return
--format string           Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help                Help for members
--limit int32             Maximum number of items to return
--offset int32            Offset item number from list to begin return
-o, --org string           Organization name or id (required)
--output string           Write file(s) to directory, instead of STDOUT (default "-")
--scope string            scope
```

```
-s, --server string      management server endpoint (required)
--space string          Space name or id (required)
--space-initiated      space-initiated
```

## Options inherited from parent commands

---

```
--accept-license      Accept the license for API Connect
--debug               Enable debug output
--debug-output string Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic members:clear

Members clear operations

## Synopsis

---

Members clear operations

```
apic members:clear [flags]
```

## Options

---

```
-c, --catalog string      Catalog name or id (required)
--confirm string          Confirmation for critical updates (required)
--consumer-org string     Consumer Organization name or id (required)
--format string           Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help                Help for members:clear
-o, --org string           Organization name or id (required)
--output string           Write file(s) to directory, instead of STDOUT (default "-")
--scope string            scope
-s, --server string       management server endpoint (required)
--space string            Space name or id (required)
--space-initiated        space-initiated
```

## Options inherited from parent commands

---

```
--accept-license      Accept the license for API Connect
--debug               Enable debug output
--debug-output string Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic members:create

Members create operations

## Synopsis

---

Members create operations

```
apic members:create [flags]
```

## Options

---

```
-c, --catalog string      Catalog name or id (required)
--consumer-org string     Consumer Organization name or id (required)
--format string           Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help                Help for members:create
-o, --org string           Organization name or id (required)
--output string           Write file(s) to directory, instead of STDOUT (default "-")
--scope string            scope
-s, --server string       management server endpoint (required)
--space string            Space name or id (required)
--space-initiated        space-initiated
```

## Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic members:delete

Members delete operations

### Synopsis

---

Members delete operations

```
apic members:delete [flags]
```

### Options

---

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--consumer-org string</code>	Consumer Organization name or id (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for members:delete
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>--scope string</code>	scope
<code>-s, --server string</code>	management server endpoint (required)
<code>--space string</code>	Space name or id (required)
<code>--space-initiated</code>	space-initiated

## Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic members:get

Members get operations

### Synopsis

---

Members get operations

```
apic members:get [flags]
```

### Options

---

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--consumer-org string</code>	Consumer Organization name or id (required)
<code>--fields string</code>	List of field names to return
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for members:get
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, use - for STDOUT. (default: cwd)
<code>--scope string</code>	scope
<code>-s, --server string</code>	management server endpoint (required)
<code>--space string</code>	Space name or id (required)
<code>--space-initiated</code>	space-initiated

## Options inherited from parent commands

---

```
--accept-license    Accept the license for API Connect
--debug            Enable debug output
--debug-output string Write debug output to file
--live-help        Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic members:list

Members list operations

### Synopsis

Members list operations

```
apic members:list [flags]
```

### Options

```
-c, --catalog string  Catalog name or id (required)
--consumer-org string Consumer Organization name or id (required)
--fields string       List of field names to return
--format string       Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help            Help for members:list
--limit int32         Maximum number of items to return
--offset int32        Offset item number from list to begin return
-o, --org string      Organization name or id (required)
--output string       Write file(s) to directory, instead of STDOUT (default "-")
--scope string        scope
-s, --server string   management server endpoint (required)
--space string        Space name or id (required)
--space-initiated     space-initiated
```

### Options inherited from parent commands

```
--accept-license    Accept the license for API Connect
--debug            Enable debug output
--debug-output string Write debug output to file
--live-help        Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic members:update

Members update operations

### Synopsis

Members update operations

```
apic members:update [flags]
```

### Options

```
-c, --catalog string  Catalog name or id (required)
--consumer-org string Consumer Organization name or id (required)
--format string       Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help            Help for members:update
-o, --org string      Organization name or id (required)
--output string       Write file(s) to directory, instead of STDOUT (default "-")
--scope string        scope
-s, --server string   management server endpoint (required)
--space string        Space name or id (required)
--space-initiated     space-initiated
```

### Options inherited from parent commands

```
--accept-license    Accept the license for API Connect
--debug            Enable debug output
--debug-output string Write debug output to file
--live-help        Enable or disable tracking of limited usage information
-m, --mode string   Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic notification-templates

Notification Templates operations

### Synopsis

Notification Templates operations

```
apic notification-templates [flags]
```

### Options

```
-c, --catalog string   Catalog name or id (required)
--fields string        List of field names to return
--format string        Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help            Help for notification-templates
--limit int32          Maximum number of items to return
--offset int32         Offset item number from list to begin return
-o, --org string       Organization name or id (required)
--output string        Write file(s) to directory, instead of STDOUT (default "-")
--scope string         scope
-s, --server string    management server endpoint (required)
--space string         Space name or id (required)
```

### Options inherited from parent commands

```
--accept-license    Accept the license for API Connect
--debug            Enable debug output
--debug-output string Write debug output to file
--live-help        Enable or disable tracking of limited usage information
-m, --mode string   Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic notification-templates:get

Notification Templates get operations

### Synopsis

Notification Templates get operations

```
apic notification-templates:get [flags]
```

### Options

```
-c, --catalog string   Catalog name or id (required)
--fields string        List of field names to return
--format string        Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help            Help for notification-templates:get
-o, --org string       Organization name or id (required)
--output string        Write file(s) to directory, use - for STDOUT. (default: cwd)
--scope string         scope
-s, --server string    management server endpoint (required)
--space string         Space name or id (required)
--subcollection string subcollection
```

### Options inherited from parent commands

```
--accept-license    Accept the license for API Connect
--debug            Enable debug output
--debug-output string Write debug output to file
```

<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## apic notification-templates:list

Notification Templates list operations

### Synopsis

Notification Templates list operations

```
apic notification-templates:list [flags]
```

### Options

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--fields string</code>	List of field names to return
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for notification-templates:list
<code>--limit int32</code>	Maximum number of items to return
<code>--offset int32</code>	Offset item number from list to begin return
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>--scope string</code>	scope
<code>-s, --server string</code>	management server endpoint (required)
<code>--space string</code>	Space name or id (required)
<code>--subcollection string</code>	subcollection

### Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## apic notification-templates:list-all

Notification Templates list-all operations

### Synopsis

Notification Templates list-all operations

```
apic notification-templates:list-all [flags]
```

### Options

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--fields string</code>	List of field names to return
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for notification-templates:list-all
<code>--limit int32</code>	Maximum number of items to return
<code>--offset int32</code>	Offset item number from list to begin return
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>--scope string</code>	scope
<code>-s, --server string</code>	management server endpoint (required)
<code>--space string</code>	Space name or id (required)

### Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file

```
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic notification-templates:update

Notification Templates update operations

### Synopsis

Notification Templates update operations

```
apic notification-templates:update [flags]
```

### Options

```
-c, --catalog string      Catalog name or id (required)
--format string          Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help               Help for notification-templates:update
-o, --org string          Organization name or id (required)
--output string          Write file(s) to directory, instead of STDOUT (default "-")
--scope string           scope
-s, --server string       management server endpoint (required)
--space string           Space name or id (required)
--subcollection string   subcollection
```

### Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic oauth-providers

Oauth Providers operations

### Synopsis

Oauth Providers operations

```
apic oauth-providers [flags]
```

### Options

```
--fields string      List of field names to return
--format string       Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for oauth-providers
--limit int32        Maximum number of items to return
--offset int32       Offset item number from list to begin return
-o, --org string      Organization name or id (required)
--output string       Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string   management server endpoint (required)
```

### Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic oauth-providers:clear

Clear the OAuth Provider objects

### Synopsis

---

Clear the OAuth Provider objects

```
apic oauth-providers:clear [flags]
```

### Options

---

<code>--confirm string</code>	Confirmation for critical updates (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for oauth-providers:clear
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)

### Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic oauth-providers:create

Create a OAuth Provider object

### Synopsis

---

Create a OAuth Provider object

```
apic oauth-providers:create [flags]
```

### Options

---

<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for oauth-providers:create
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)

### Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic oauth-providers:delete

Delete the OAuth Provider object by name or id

## Synopsis

---

Delete the Oauth Provider object by name or id

```
apic oauth-providers:delete [flags]
```

## Options

---

```
--format string  Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.  
-h, --help      Help for oauth-providers:delete  
-o, --org string Organization name or id (required)  
--output string Write file(s) to directory, instead of STDOUT (default "-")  
-s, --server string management server endpoint (required)
```

## Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect  
--debug           Enable debug output  
--debug-output string Write debug output to file  
--live-help       Enable or disable tracking of limited usage information  
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic oauth-providers:get

Get the Oauth Provider object by name or id

## Synopsis

---

Get the Oauth Provider object by name or id

```
apic oauth-providers:get [flags]
```

## Options

---

```
--fields string  List of field names to return  
--format string  Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.  
-h, --help      Help for oauth-providers:get  
-o, --org string Organization name or id (required)  
--output string Write file(s) to directory, use - for STDOUT. (default: cwd)  
-s, --server string management server endpoint (required)
```

## Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect  
--debug           Enable debug output  
--debug-output string Write debug output to file  
--live-help       Enable or disable tracking of limited usage information  
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic oauth-providers:list

List the Oauth Provider objects

## Synopsis

---

List the Oauth Provider objects

```
apic oauth-providers:list [flags]
```

## Options

---

```
--fields string  List of field names to return  
--format string  Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
```

```
-h, --help           Help for oauth-providers:list
--limit int32       Maximum number of items to return
--offset int32      Offset item number from list to begin return
-o, --org string     Organization name or id (required)
--output string     Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string  management server endpoint (required)
```

## Options inherited from parent commands

---

```
--accept-license    Accept the license for API Connect
--debug             Enable debug output
--debug-output string Write debug output to file
--live-help         Enable or disable tracking of limited usage information
-m, --mode string   Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic oauth-providers:update

Update the OAuth Provider object by name or id

### Synopsis

---

Update the OAuth Provider object by name or id

```
apic oauth-providers:update [flags]
```

### Options

---

```
--format string  Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help       Help for oauth-providers:update
-o, --org string  Organization name or id (required)
--output string  Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

## Options inherited from parent commands

---

```
--accept-license    Accept the license for API Connect
--debug             Enable debug output
--debug-output string Write debug output to file
--live-help         Enable or disable tracking of limited usage information
-m, --mode string   Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic org-settings

Org Settings operations

### Synopsis

---

Org Settings operations

```
apic org-settings [flags]
```

### Options

---

```
-h, --help  Help for org-settings
```

## Options inherited from parent commands

---

```
--accept-license    Accept the license for API Connect
--debug             Enable debug output
--debug-output string Write debug output to file
--live-help         Enable or disable tracking of limited usage information
-m, --mode string   Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic org-settings:get

Get the Organization Setting object

### Synopsis

---

Get the Organization Setting object

```
apic org-settings:get [flags]
```

### Options

---

```
--fields string  List of field names to return
--format string  Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for org-settings:get
-o, --org string Organization name or id (required)
--output string Write file(s) to directory, use - for STDOUT. (default: cwd)
-s, --server string management server endpoint (required)
```

### Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic org-settings:update

Update the Organization Setting object

### Synopsis

---

Update the Organization Setting object

```
apic org-settings:update [flags]
```

### Options

---

```
--format string  Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for org-settings:update
-o, --org string Organization name or id (required)
--output string  Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

### Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic orgs

## Synopsis

---

Orgs operations

```
apic orgs [flags]
```

## Options

---

```
--fields string      List of field names to return
--format string      Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for orgs
--limit int32        Maximum number of items to return
--my                 my
--offset int32       Offset item number from list to begin return
--org_type string    Type of orgs to return
--output string      Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string  management server endpoint (required)
```

## Options inherited from parent commands

---

```
--accept-license     Accept the license for API Connect
--debug              Enable debug output
--debug-output string Write debug output to file
--live-help          Enable or disable tracking of limited usage information
-m, --mode string    Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic orgs:clear

Clear the Organization objects

## Synopsis

---

Clear the Organization objects

```
apic orgs:clear [flags]
```

## Options

---

```
--confirm string      Confirmation for critical updates (required)
--format string        Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help            Help for orgs:clear
--output string        Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string    management server endpoint (required)
```

## Options inherited from parent commands

---

```
--accept-license     Accept the license for API Connect
--debug              Enable debug output
--debug-output string Write debug output to file
--live-help          Enable or disable tracking of limited usage information
-m, --mode string    Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic orgs:create

Create an Organization object

## Synopsis

---

Create an Organization object

```
apic orgs:create [flags]
```

## Options

---

```
--format string  Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for orgs:create
--output string  Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

## Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug          Enable debug output
--debug-output string Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic orgs:delete

Delete the Organization object by name or id

## Synopsis

---

Delete the Organization object by name or id

```
apic orgs:delete [flags]
```

## Options

---

```
--format string  Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for orgs:delete
--output string  Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

## Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug          Enable debug output
--debug-output string Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic orgs:get

Get the Organization object by name or id

## Synopsis

---

Get the Organization object by name or id

```
apic orgs:get [flags]
```

## Options

---

```
--fields string  List of field names to return
--format string  Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for orgs:get
--output string  Write file(s) to directory, use - for STDOUT. (default: cwd)
-s, --server string management server endpoint (required)
```

## Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug          Enable debug output
--debug-output string Write debug output to file
```

```
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic orgs:list

List the Organization objects

### Synopsis

List the Organization objects

```
apic orgs:list [flags]
```

### Options

```
--fields string  List of field names to return
--format string  Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for orgs:list
--limit int32    Maximum number of items to return
--my            my
--offset int32   Offset item number from list to begin return
--org_type string Type of orgs to return
--output string  Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

### Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic orgs:transfer-owner

Transfer owner to an associate

### Synopsis

Transfer owner to an associate

```
apic orgs:transfer-owner [flags]
```

### Options

```
--format string  Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for orgs:transfer-owner
--output string  Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

### Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic orgs:update

Update the Organization object by name or id

### Synopsis

---

Update the Organization object by name or id

```
apic orgs:update [flags]
```

### Options

---

```
--format string  Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.  
-h, --help      Help for orgs:update  
--output string  Write file(s) to directory, instead of STDOUT (default "-")  
-s, --server string management server endpoint (required)
```

### Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect  
--debug          Enable debug output  
--debug-output string Write debug output to file  
--live-help      Enable or disable tracking of limited usage information  
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic payment-methods

Payment Methods operations

### Synopsis

---

Payment Methods operations

```
apic payment-methods [flags]
```

### Options

---

```
-c, --catalog string  Catalog name or id (required)  
--consumer-org string Consumer Organization name or id (required)  
--fields string      List of field names to return  
--format string      Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.  
-h, --help          Help for payment-methods  
--limit int32        Maximum number of items to return  
--offset int32       Offset item number from list to begin return  
-o, --org string     Organization name or id (required)  
--output string      Write file(s) to directory, instead of STDOUT (default "-")  
-s, --server string  management server endpoint (required)  
--space string       Space name or id (required)  
--space-initiated    space-initiated
```

### Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect  
--debug          Enable debug output  
--debug-output string Write debug output to file  
--live-help      Enable or disable tracking of limited usage information  
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic payment-methods:create

Create a Payment Method object

## Synopsis

---

Create a Payment Method object

```
apic payment-methods:create [flags]
```

## Options

---

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--consumer-org string</code>	Consumer Organization name or id (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for payment-methods:create
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)
<code>--space string</code>	Space name or id (required)
<code>--space-initiated</code>	space-initiated

## Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic payment-methods:delete

Delete the Payment Method object by name or id

## Synopsis

---

Delete the Payment Method object by name or id

```
apic payment-methods:delete [flags]
```

## Options

---

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--consumer-org string</code>	Consumer Organization name or id (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for payment-methods:delete
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)
<code>--space string</code>	Space name or id (required)
<code>--space-initiated</code>	space-initiated

## Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic payment-methods:get

Get the Payment Method object by name or id

## Synopsis

---

Get the Payment Method object by name or id

```
apic payment-methods:get [flags]
```

## Options

---

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--consumer-org string</code>	Consumer Organization name or id (required)
<code>--fields string</code>	List of field names to return
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for payment-methods:get
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, use - for STDOUT. (default: cwd)
<code>-s, --server string</code>	management server endpoint (required)
<code>--space string</code>	Space name or id (required)
<code>--space-initiated</code>	space-initiated

## Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic payment-methods:list

List the Payment Method objects

## Synopsis

---

List the Payment Method objects

```
apic payment-methods:list [flags]
```

## Options

---

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--consumer-org string</code>	Consumer Organization name or id (required)
<code>--fields string</code>	List of field names to return
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for payment-methods:list
<code>--limit int32</code>	Maximum number of items to return
<code>--offset int32</code>	Offset item number from list to begin return
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)
<code>--space string</code>	Space name or id (required)
<code>--space-initiated</code>	space-initiated

## Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic payment-methods:update

Update the Payment Method object by name or id

## Synopsis

---

Update the Payment Method object by name or id

```
apic payment-methods:update [flags]
```

## Options

---

```
-c, --catalog string      Catalog name or id (required)
--consumer-org string    Consumer Organization name or id (required)
--format string          Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help               Help for payment-methods:update
-o, --org string         Organization name or id (required)
--output string          Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string      management server endpoint (required)
--space string           Space name or id (required)
--space-initiated        space-initiated
```

## Options inherited from parent commands

---

```
--accept-license        Accept the license for API Connect
--debug                 Enable debug output
--debug-output string   Write debug output to file
--live-help             Enable or disable tracking of limited usage information
-m, --mode string       Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic permissions

Permissions operations

## Synopsis

---

Permissions operations

```
apic permissions [flags]
```

## Options

---

```
--fields string         List of field names to return
--format string         Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help              Help for permissions
--limit int32           Maximum number of items to return
--offset int32          Offset item number from list to begin return
--output string         Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string     management server endpoint (required)
```

## Options inherited from parent commands

---

```
--accept-license        Accept the license for API Connect
--debug                 Enable debug output
--debug-output string   Write debug output to file
--live-help             Enable or disable tracking of limited usage information
-m, --mode string       Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## apic permissions:get

Permissions get operations

## Synopsis

---

Permissions get operations

```
apic permissions:get [flags]
```

## Options

---

```
--fields string         List of field names to return
--format string         Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help              Help for permissions:get
--output string         Write file(s) to directory, use - for STDOUT. (default: cwd)
```

```
-s, --server string      management server endpoint (required)
--subcollection string  subcollection
```

## Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic permissions:list

Permissions list operations

### Synopsis

---

Permissions list operations

```
apic permissions:list [flags]
```

### Options

---

```
--fields string      List of field names to return
--format string      Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for permissions:list
--limit int32        Maximum number of items to return
--my                 my
--offset int32       Offset item number from list to begin return
--output string      Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string  management server endpoint (required)
--subcollection string subcollection
```

## Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic permissions:list-all

List all Permission objects in all collections

### Synopsis

---

List all Permission objects in all collections

```
apic permissions:list-all [flags]
```

### Options

---

```
--fields string      List of field names to return
--format string      Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for permissions:list-all
--limit int32        Maximum number of items to return
--offset int32       Offset item number from list to begin return
--output string      Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string  management server endpoint (required)
```

## Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## apic policies

Policies operations

### Synopsis

Policies operations

`apic policies` [flags]

### Options

<code>--availability-zone string</code>	Availability Zone name or id (required)
<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--configured-gateway-service string</code>	Configured Gateway Service name or id (required)
<code>--fields string</code>	List of field names to return
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>--gateway-service string</code>	Gateway Service name or id (required)
<code>-h, --help</code>	Help for policies
<code>--limit int32</code>	Maximum number of items to return
<code>--offset int32</code>	Offset item number from list to begin return
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>--scope string</code>	scope
<code>-s, --server string</code>	management server endpoint (required)
<code>--space string</code>	Space name or id (required)

### Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## apic policies:clear

Policies clear operations

### Synopsis

Policies clear operations

`apic policies:clear` [flags]

### Options

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--configured-gateway-service string</code>	Configured Gateway Service name or id (required)
<code>--confirm string</code>	Confirmation for critical updates (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for policies:clear
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>--scope string</code>	scope
<code>-s, --server string</code>	management server endpoint (required)
<code>--space string</code>	Space name or id (required)

## Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic policies:clear-all

Policies clear-all operations

### Synopsis

---

Policies clear-all operations

```
apic policies:clear-all [flags]
```

### Options

---

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--configured-gateway-service string</code>	Configured Gateway Service name or id (required)
<code>--confirm string</code>	Confirmation for critical updates (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for policies:clear-all
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>--scope string</code>	scope
<code>-s, --server string</code>	management server endpoint (required)
<code>--space string</code>	Space name or id (required)

## Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic policies:clone

Policies clone operations

### Synopsis

---

Policies clone operations

```
apic policies:clone [flags]
```

### Options

---

<code>--availability-zone string</code>	Availability Zone name or id (required)
<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--configured-gateway-service string</code>	Configured Gateway Service name or id (required)
<code>--fields string</code>	List of field names to return
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>--gateway-service string</code>	Gateway Service name or id (required)
<code>-h, --help</code>	Help for policies:clone
<code>--limit int32</code>	Maximum number of items to return
<code>--offset int32</code>	Offset item number from list to begin return
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, use - for STDOUT. (default: cwd)
<code>--scope string</code>	scope

```
-s, --server string      management server endpoint (required)
--space string          Space name or id (required)
```

## Options inherited from parent commands

---

```
--accept-license      Accept the license for API Connect
--debug               Enable debug output
--debug-output string Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic policies:create

Policies create operations

## Synopsis

---

Policies create operations

```
apic policies:create [flags]
```

## Options

---

```
-c, --catalog string      Catalog name or id (required)
--configured-gateway-service string Configured Gateway Service name or id (required)
--format string          Output format. One of [json yaml go-template=... go-template-file=...], defaults to
yaml.
-h, --help               Help for policies:create
-o, --org string         Organization name or id (required)
--output string          Write file(s) to directory, instead of STDOUT (default "-")
--policy-file string     Policy document override
--scope string           scope
-s, --server string      management server endpoint (required)
--space string           Space name or id (required)
```

## Options inherited from parent commands

---

```
--accept-license      Accept the license for API Connect
--debug               Enable debug output
--debug-output string Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic policies:delete

Policies delete operations

## Synopsis

---

Policies delete operations

```
apic policies:delete [flags]
```

## Options

---

```
-c, --catalog string      Catalog name or id (required)
--configured-gateway-service string Configured Gateway Service name or id (required)
--format string          Output format. One of [json yaml go-template=... go-template-file=...], defaults to
yaml.
-h, --help               Help for policies:delete
--id string              id
-o, --org string         Organization name or id (required)
--output string          Write file(s) to directory, instead of STDOUT (default "-")
--scope string           scope
-s, --server string      management server endpoint (required)
--space string           Space name or id (required)
```

## Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic policies:document

Policies document operations

### Synopsis

---

Policies document operations

```
apic policies:document [flags]
```

### Options

---

<code>--availability-zone string</code>	Availability Zone name or id (required)
<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--configured-gateway-service string</code>	Configured Gateway Service name or id (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>--gateway-service string</code>	Gateway Service name or id (required)
<code>-h, --help</code>	Help for policies:document
<code>--id</code>	id
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>--scope string</code>	scope
<code>-s, --server string</code>	management server endpoint (required)
<code>--space string</code>	Space name or id (required)

## Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic policies:get

Policies get operations

### Synopsis

---

Policies get operations

```
apic policies:get [flags]
```

### Options

---

<code>--availability-zone string</code>	Availability Zone name or id (required)
<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--configured-gateway-service string</code>	Configured Gateway Service name or id (required)
<code>--fields string</code>	List of field names to return (default "add(policy,implementation)")
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>--gateway-service string</code>	Gateway Service name or id (required)
<code>-h, --help</code>	Help for policies:get
<code>--id</code>	id
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, use - for STDOUT. (default: cwd)
<code>--scope string</code>	scope

```
-s, --server string      management server endpoint (required)
--space string          Space name or id (required)
```

## Options inherited from parent commands

---

```
--accept-license      Accept the license for API Connect
--debug               Enable debug output
--debug-output string Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic policies:implementation

Policies implementation operations

### Synopsis

---

Policies implementation operations

```
apic policies:implementation [flags]
```

### Options

---

```
-c, --catalog string      Catalog name or id (required)
--configured-gateway-service string Configured Gateway Service name or id (required)
--format string          Output format. One of [json yaml go-template=... go-template-file=...], defaults to
yaml.
-h, --help               Help for policies:implementation
--id                     id
-o, --org string         Organization name or id (required)
--output string          Write file(s) to directory, use - for STDOUT. (default: cwd)
--scope string           scope
-s, --server string      management server endpoint (required)
--space string           Space name or id (required)
```

## Options inherited from parent commands

---

```
--accept-license      Accept the license for API Connect
--debug               Enable debug output
--debug-output string Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic policies:list

Policies list operations

### Synopsis

---

Policies list operations

```
apic policies:list [flags]
```

### Options

---

```
--availability-zone string Availability Zone name or id (required)
-c, --catalog string      Catalog name or id (required)
--configured-gateway-service string Configured Gateway Service name or id (required)
--fields string           List of field names to return
--format string          Output format. One of [json yaml go-template=... go-template-file=...], defaults to
yaml.
--gateway-service string Gateway Service name or id (required)
-h, --help               Help for policies:list
--limit int32            Maximum number of items to return
--offset int32           Offset item number from list to begin return
-o, --org string         Organization name or id (required)
```

--output string	Write file(s) to directory, instead of STDOUT (default "-")
--scope string	scope
-s, --server string	management server endpoint (required)
--space string	Space name or id (required)

## Options inherited from parent commands

--accept-license	Accept the license for API Connect
--debug	Enable debug output
--debug-output string	Write debug output to file
--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## apic policies:list-all

Policies list-all operations

### Synopsis

Policies list-all operations

```
apic policies:list-all [flags]
```

### Options

--availability-zone string	Availability Zone name or id (required)
-c, --catalog string	Catalog name or id (required)
--configured-gateway-service string	Configured Gateway Service name or id (required)
--fields string	List of field names to return
--format string	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
--gateway-service string	Gateway Service name or id (required)
-h, --help	Help for policies:list-all
--limit int32	Maximum number of items to return
--offset int32	Offset item number from list to begin return
-o, --org string	Organization name or id (required)
--output string	Write file(s) to directory, instead of STDOUT (default "-")
--scope string	scope
-s, --server string	management server endpoint (required)
--space string	Space name or id (required)

## Options inherited from parent commands

--accept-license	Accept the license for API Connect
--debug	Enable debug output
--debug-output string	Write debug output to file
--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## apic policies:update

Policies update operations

### Synopsis

Policies update operations

```
apic policies:update [flags]
```

### Options

-c, --catalog string	Catalog name or id (required)
--configured-gateway-service string	Configured Gateway Service name or id (required)
--format string	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help	Help for policies:update

--id	id
-o, --org string	Organization name or id (required)
--output string	Write file(s) to directory, instead of STDOUT (default "-")
--scope string	scope
-s, --server string	management server endpoint (required)
--space string	Space name or id (required)

## Options inherited from parent commands

--accept-license	Accept the license for API Connect
--debug	Enable debug output
--debug-output string	Write debug output to file
--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## apic portal-services

Portal Services operations

### Synopsis

Portal Services operations

```
apic portal-services [flags]
```

### Options

--availability-zone string	Availability Zone name or id (required)
--fields string	List of field names to return
--format string	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help	Help for portal-services
--limit int32	Maximum number of items to return
--offset int32	Offset item number from list to begin return
-o, --org string	Organization name or id (required)
--output string	Write file(s) to directory, instead of STDOUT (default "-")
--scope string	scope
-s, --server string	management server endpoint (required)

## Options inherited from parent commands

--accept-license	Accept the license for API Connect
--debug	Enable debug output
--debug-output string	Write debug output to file
--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## apic portal-services:clear

Clear the Portal Service objects

### Synopsis

Clear the Portal Service objects

```
apic portal-services:clear [flags]
```

### Options

--availability-zone string	Availability Zone name or id (required)
--confirm string	Confirmation for critical updates (required)
--format string	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help	Help for portal-services:clear
-o, --org string	Organization name or id (required)
--output string	Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string	management server endpoint (required)

## Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic portal-services:create

Create a Portal Service object

### Synopsis

---

Create a Portal Service object

```
apic portal-services:create [flags]
```

### Options

---

<code>--availability-zone string</code>	Availability Zone name or id (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for portal-services:create
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)

## Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic portal-services:delete

Delete the Portal Service object by name or id

### Synopsis

---

Delete the Portal Service object by name or id

```
apic portal-services:delete [flags]
```

### Options

---

<code>--availability-zone string</code>	Availability Zone name or id (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for portal-services:delete
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)

## Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic portal-services:get

Get the Portal Service object by name or id

### Synopsis

Get the Portal Service object by name or id

```
apic portal-services:get [flags]
```

### Options

```
--availability-zone string  Availability Zone name or id (required)
--fields string             List of field names to return
--format string             Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help                  Help for portal-services:get
-o, --org string            Organization name or id (required)
--output string             Write file(s) to directory, use - for STDOUT. (default: cwd)
--scope string              scope
-s, --server string         management server endpoint (required)
```

### Options inherited from parent commands

```
--accept-license           Accept the license for API Connect
--debug                    Enable debug output
--debug-output string      Write debug output to file
--live-help                Enable or disable tracking of limited usage information
-m, --mode string          Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

## apic portal-services:list

List the Portal Service objects

### Synopsis

List the Portal Service objects

```
apic portal-services:list [flags]
```

### Options

```
--availability-zone string  Availability Zone name or id (required)
--fields string             List of field names to return
--format string             Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help                  Help for portal-services:list
--limit int32               Maximum number of items to return
--offset int32              Offset item number from list to begin return
-o, --org string            Organization name or id (required)
--output string             Write file(s) to directory, instead of STDOUT (default "-")
--scope string              scope
-s, --server string         management server endpoint (required)
```

### Options inherited from parent commands

```
--accept-license           Accept the license for API Connect
--debug                    Enable debug output
--debug-output string      Write debug output to file
--live-help                Enable or disable tracking of limited usage information
-m, --mode string          Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic portal-services:update

Update the Portal Service object by name or id

### Synopsis

---

Update the Portal Service object by name or id

```
apic portal-services:update [flags]
```

### Options

---

<code>--availability-zone</code> string	Availability Zone name or id (required)
<code>--format</code> string	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for portal-services:update
<code>-o, --org</code> string	Organization name or id (required)
<code>--output</code> string	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server</code> string	management server endpoint (required)

### Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output</code> string	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode</code> string	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic portal-services:update-credentials

Update the Portal Service configuration

### Synopsis

---

Update the Portal Service configuration

```
apic portal-services:update-credentials [flags]
```

### Options

---

<code>--availability-zone</code> string	Availability Zone name or id (required)
<code>--format</code> string	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for portal-services:update-credentials
<code>-o, --org</code> string	Organization name or id (required)
<code>--output</code> string	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server</code> string	management server endpoint (required)

### Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output</code> string	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode</code> string	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## apic primary-events

Primary Events operations

### Synopsis

---

Primary Events operations

apic primary-events [flags]

## Options

```
--availability-zone string      Availability Zone name or id (required)
-c, --catalog string           Catalog name or id (required)
--configured-gateway-service string  Configured Gateway Service name or id (required)
--fields string                List of field names to return
--format string                 Output format. One of [json yaml go-template=... go-template-file=...], defaults to
yaml.
--gateway-service string       Gateway Service name or id (required)
-h, --help                     Help for primary-events
--limit int32                  Maximum number of items to return
--offset int32                 Offset item number from list to begin return
-o, --org string                Organization name or id (required)
--output string                 Write file(s) to directory, instead of STDOUT (default "-")
--portal-service string         Portal Service name or id (required)
--scope string                  scope
-s, --server string             management server endpoint (required)
--state string                  State for a webhook event in subscriber queue
```

## Options inherited from parent commands

```
--accept-license      Accept the license for API Connect
--debug                Enable debug output
--debug-output string  Write debug output to file
--live-help            Enable or disable tracking of limited usage information
-m, --mode string      Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## apic primary-events:get

Primary Events get operations

## Synopsis

Primary Events get operations

apic primary-events:get [flags]

## Options

```
--availability-zone string      Availability Zone name or id (required)
-c, --catalog string           Catalog name or id (required)
--configured-gateway-service string  Configured Gateway Service name or id (required)
--fields string                List of field names to return
--format string                 Output format. One of [json yaml go-template=... go-template-file=...], defaults to
yaml.
--gateway-service string       Gateway Service name or id (required)
-h, --help                     Help for primary-events:get
-o, --org string                Organization name or id (required)
--output string                 Write file(s) to directory, use - for STDOUT. (default: cwd)
--portal-service string         Portal Service name or id (required)
--scope string                  scope
-s, --server string             management server endpoint (required)
```

## Options inherited from parent commands

```
--accept-license      Accept the license for API Connect
--debug                Enable debug output
--debug-output string  Write debug output to file
--live-help            Enable or disable tracking of limited usage information
-m, --mode string      Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic products:document

Products document operations

## Synopsis

---

Products document operations

```
apic products:document [flags]
```

## Options

---

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for products:document
<code>--id</code>	id
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>--scope string</code>	scope
<code>-s, --server string</code>	management server endpoint (required)
<code>--space string</code>	Space name or id (required)

## Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic products:execute-migration-target

Products execute-migration-target operations

### Synopsis

---

Products execute-migration-target operations

```
apic products:execute-migration-target [flags]
```

### Options

---

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for products:execute-migration-target
<code>--id</code>	id
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>--scope string</code>	scope
<code>-s, --server string</code>	management server endpoint (required)
<code>--space string</code>	Space name or id (required)

### Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic products:get

Products get operations

### Synopsis

---

Products get operations

```
apic products:get [flags]
```

### Options

---

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--fields string</code>	List of field names to return (default "add(product)")

--format string	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help	Help for products:get
--id	id
-o, --org string	Organization name or id (required)
--output string	Write file(s) to directory, use - for STDOUT. (default: cwd)
--scope string	scope
-s, --server string	management server endpoint (required)
--space string	Space name or id (required)

## Options inherited from parent commands

--accept-license	Accept the license for API Connect
--debug	Enable debug output
--debug-output string	Write debug output to file
--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## apic products:list

Products list operations

### Synopsis

Products list operations

```
apic products:list [flags]
```

### Options

-c, --catalog string	Catalog name or id (required)
--fields string	List of field names to return
--format string	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help	Help for products:list
--limit int32	Maximum number of items to return
--offset int32	Offset item number from list to begin return
-o, --org string	Organization name or id (required)
--output string	Write file(s) to directory, instead of STDOUT (default "-")
--scope string	scope
-s, --server string	management server endpoint (required)
--space string	Space name or id (required)

## Options inherited from parent commands

--accept-license	Accept the license for API Connect
--debug	Enable debug output
--debug-output string	Write debug output to file
--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## apic products:list-all

Products list-all operations

### Synopsis

Products list-all operations

```
apic products:list-all [flags]
```

### Options

-c, --catalog string	Catalog name or id (required)
--fields string	List of field names to return
--format string	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help	Help for products:list-all
--limit int32	Maximum number of items to return

```

--offset int32      Offset item number from list to begin return
-o, --org string    Organization name or id (required)
--output string     Write file(s) to directory, instead of STDOUT (default "-")
--scope string      scope
-s, --server string management server endpoint (required)
--space string      Space name or id (required)

```

## Options inherited from parent commands

```

--accept-license    Accept the license for API Connect
--debug            Enable debug output
--debug-output string Write debug output to file
--live-help        Enable or disable tracking of limited usage information
-m, --mode string   Toolkit operation mode (default "apim")

```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## apic products:migrate-subscriptions

Products migrate-subscriptions operations

### Synopsis

Products migrate-subscriptions operations

```
apic products:migrate-subscriptions [flags]
```

### Options

```

-c, --catalog string  Catalog name or id (required)
--format string       Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help            Help for products:migrate-subscriptions
--id                  id
-o, --org string      Organization name or id (required)
--output string       Write file(s) to directory, instead of STDOUT (default "-")
--scope string        scope
-s, --server string   management server endpoint (required)
--space string        Space name or id (required)

```

## Options inherited from parent commands

```

--accept-license    Accept the license for API Connect
--debug            Enable debug output
--debug-output string Write debug output to file
--live-help        Enable or disable tracking of limited usage information
-m, --mode string   Toolkit operation mode (default "apim")

```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## apic products:publish

Publish the product

### Synopsis

Publish the product

```
apic products:publish [flags]
```

### Options

```

-c, --catalog string  Catalog name or id (required)
--format string       Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
--gateway_services string The list of gateway service names to support partial publishing
-h, --help            Help for products:publish
-o, --org string      Organization name or id (required)
--output string       Write file(s) to directory, instead of STDOUT (default "-")
--scope string        scope
-s, --server string   management server endpoint (required)

```

```
--space string      Space name or id (required)
--stage             stage
```

## Options inherited from parent commands

---

```
--accept-license    Accept the license for API Connect
--debug             Enable debug output
--debug-output string Write debug output to file
--live-help         Enable or disable tracking of limited usage information
-m, --mode string   Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic products:replace

Products replace operations

### Synopsis

---

Products replace operations

```
apic products:replace [flags]
```

### Options

---

```
-c, --catalog string  Catalog name or id (required)
--format string       Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help            Help for products:replace
--id                  id
-o, --org string      Organization name or id (required)
--output string       Write file(s) to directory, instead of STDOUT (default "-")
--scope string        scope
-s, --server string   management server endpoint (required)
--space string        Space name or id (required)
```

## Options inherited from parent commands

---

```
--accept-license    Accept the license for API Connect
--debug             Enable debug output
--debug-output string Write debug output to file
--live-help         Enable or disable tracking of limited usage information
-m, --mode string   Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic products:set-migration-target

Products set-migration-target operations

### Synopsis

---

Products set-migration-target operations

```
apic products:set-migration-target [flags]
```

### Options

---

```
-c, --catalog string  Catalog name or id (required)
--format string       Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help            Help for products:set-migration-target
--id                  id
-o, --org string      Organization name or id (required)
--output string       Write file(s) to directory, instead of STDOUT (default "-")
--scope string        scope
-s, --server string   management server endpoint (required)
--space string        Space name or id (required)
```

## Options inherited from parent commands

---

```
--accept-license    Accept the license for API Connect
--debug            Enable debug output
--debug-output string Write debug output to file
--live-help        Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic products:supersede

Products supersede operations

### Synopsis

Products supersede operations

```
apic products:supersede [flags]
```

### Options

```
-c, --catalog string  Catalog name or id (required)
--format string      Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for products:supersede
--id                id
-o, --org string     Organization name or id (required)
--output string     Write file(s) to directory, instead of STDOUT (default "-")
--scope string      scope
-s, --server string  management server endpoint (required)
--space string      Space name or id (required)
```

### Options inherited from parent commands

```
--accept-license    Accept the license for API Connect
--debug            Enable debug output
--debug-output string Write debug output to file
--live-help        Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic products:update

Products update operations

### Synopsis

Products update operations

```
apic products:update [flags]
```

### Options

```
-c, --catalog string  Catalog name or id (required)
--format string      Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for products:update
--id                id
-o, --org string     Organization name or id (required)
--output string     Write file(s) to directory, instead of STDOUT (default "-")
--scope string      scope
-s, --server string  management server endpoint (required)
--space string      Space name or id (required)
```

### Options inherited from parent commands

```
--accept-license    Accept the license for API Connect
--debug            Enable debug output
--debug-output string Write debug output to file
--live-help        Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic properties

Properties operations

### Synopsis

---

Properties operations

```
apic properties [flags]
```

### Options

---

```
-c, --catalog string  Catalog name or id (required)
--fields string      List of field names to return
--format string       Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for properties
--limit int32        Maximum number of items to return
--offset int32       Offset item number from list to begin return
-o, --org string      Organization name or id (required)
--output string       Write file(s) to directory, instead of STDOUT (default "-")
--scope string        scope
-s, --server string   management server endpoint (required)
```

### Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic properties:clear

Properties clear operations

### Synopsis

---

Properties clear operations

```
apic properties:clear [flags]
```

### Options

---

```
-c, --catalog string  Catalog name or id (required)
--confirm string      Confirmation for critical updates (required)
--format string       Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for properties:clear
-o, --org string      Organization name or id (required)
--output string       Write file(s) to directory, instead of STDOUT (default "-")
--scope string        scope
-s, --server string   management server endpoint (required)
```

### Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic properties:create

Properties create operations

### Synopsis

---

Properties create operations

```
apic properties:create [flags]
```

### Options

---

```
-c, --catalog string    Catalog name or id (required)
--format string        Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help             Help for properties:create
-o, --org string       Organization name or id (required)
--output string        Write file(s) to directory, instead of STDOUT (default "-")
--scope string         scope
-s, --server string    management server endpoint (required)
```

### Options inherited from parent commands

---

```
--accept-license      Accept the license for API Connect
--debug              Enable debug output
--debug-output string Write debug output to file
--live-help          Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic properties:delete

Properties delete operations

### Synopsis

---

Properties delete operations

```
apic properties:delete [flags]
```

### Options

---

```
-c, --catalog string    Catalog name or id (required)
--format string        Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help             Help for properties:delete
-o, --org string       Organization name or id (required)
--output string        Write file(s) to directory, instead of STDOUT (default "-")
--scope string         scope
-s, --server string    management server endpoint (required)
```

### Options inherited from parent commands

---

```
--accept-license      Accept the license for API Connect
--debug              Enable debug output
--debug-output string Write debug output to file
--live-help          Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic properties:get

Properties get operations

### Synopsis

---

Properties get operations

```
apic properties:get [flags]
```

## Options

---

```
-c, --catalog string  Catalog name or id (required)
--fields string      List of field names to return
--format string      Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for properties:get
-o, --org string      Organization name or id (required)
--output string      Write file(s) to directory, use - for STDOUT. (default: cwd)
--scope string       scope
-s, --server string  management server endpoint (required)
```

## Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic properties:list

Properties list operations

## Synopsis

---

Properties list operations

```
apic properties:list [flags]
```

## Options

---

```
-c, --catalog string  Catalog name or id (required)
--fields string      List of field names to return
--format string      Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for properties:list
--limit int32        Maximum number of items to return
--offset int32       Offset item number from list to begin return
-o, --org string      Organization name or id (required)
--output string      Write file(s) to directory, instead of STDOUT (default "-")
--scope string       scope
-s, --server string  management server endpoint (required)
```

## Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic properties:update

Properties update operations

## Synopsis

---

Properties update operations

```
apic properties:update [flags]
```

## Options

---

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for properties:update
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>--scope string</code>	scope
<code>-s, --server string</code>	management server endpoint (required)

## Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic registrations

Registrations operations

## Synopsis

---

Registrations operations

```
apic registrations [flags]
```

## Options

---

<code>--fields string</code>	List of field names to return
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for registrations
<code>--limit int32</code>	Maximum number of items to return
<code>--offset int32</code>	Offset item number from list to begin return
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)

## Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic registrations:clear

Clear the Registration objects

## Synopsis

---

Clear the Registration objects

```
apic registrations:clear [flags]
```

## Options

---

<code>--confirm string</code>	Confirmation for critical updates (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for registrations:clear
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)

## Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic registrations:create

Create a Registration object

### Synopsis

---

Create a Registration object

```
apic registrations:create [flags]
```

### Options

---

<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for registrations:create
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)

## Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic registrations:delete

Delete the Registration object by name or id

### Synopsis

---

Delete the Registration object by name or id

```
apic registrations:delete [flags]
```

### Options

---

<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for registrations:delete
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)

## Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic registrations:get

Get the Registration object by name or id

### Synopsis

---

Get the Registration object by name or id

```
apic registrations:get [flags]
```

### Options

---

```
--fields string  List of field names to return
--format string  Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for registrations:get
--output string  Write file(s) to directory, use - for STDOUT. (default: cwd)
-s, --server string  management server endpoint (required)
```

### Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string  Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic registrations:list

List the Registration objects

### Synopsis

---

List the Registration objects

```
apic registrations:list [flags]
```

### Options

---

```
--fields string  List of field names to return
--format string  Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for registrations:list
--limit int32    Maximum number of items to return
--offset int32   Offset item number from list to begin return
--output string  Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string  management server endpoint (required)
```

### Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string  Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic registrations:update

Update the Registration object by name or id

### Synopsis

---

Update the Registration object by name or id

```
apic registrations:update [flags]
```

## Options

---

```
--format string  Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.  
-h, --help      Help for registrations:update  
--output string Write file(s) to directory, instead of STDOUT (default "-")  
-s, --server string management server endpoint (required)
```

## Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect  
--debug          Enable debug output  
--debug-output string Write debug output to file  
--live-help      Enable or disable tracking of limited usage information  
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic role-defaults

Role Defaults operations

## Synopsis

---

Role Defaults operations

```
apic role-defaults [flags]
```

## Options

---

```
-c, --catalog string  Catalog name or id (required)  
--fields string      List of field names to return  
--format string      Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.  
-h, --help          Help for role-defaults  
--limit int32       Maximum number of items to return  
--offset int32      Offset item number from list to begin return  
-o, --org string     Organization name or id (required)  
--output string     Write file(s) to directory, instead of STDOUT (default "-")  
--scope string      scope  
-s, --server string  management server endpoint (required)  
--space string      Space name or id (required)
```

## Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect  
--debug          Enable debug output  
--debug-output string Write debug output to file  
--live-help      Enable or disable tracking of limited usage information  
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic role-defaults:clear

Role Defaults clear operations

## Synopsis

---

Role Defaults clear operations

```
apic role-defaults:clear [flags]
```

## Options

---

```
-c, --catalog string  Catalog name or id (required)  
--confirm string     Confirmation for critical updates (required)  
--format string      Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
```

-h, --help	Help for role-defaults:clear
-o, --org string	Organization name or id (required)
--output string	Write file(s) to directory, instead of STDOUT (default "-")
--scope string	scope
-s, --server string	management server endpoint (required)
--space string	Space name or id (required)
--subcollection string	subcollection

## Options inherited from parent commands

---

--accept-license	Accept the license for API Connect
--debug	Enable debug output
--debug-output string	Write debug output to file
--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic role-defaults:create

Role Defaults create operations

### Synopsis

---

Role Defaults create operations

```
apic role-defaults:create [flags]
```

### Options

---

-c, --catalog string	Catalog name or id (required)
--format string	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help	Help for role-defaults:create
-o, --org string	Organization name or id (required)
--output string	Write file(s) to directory, instead of STDOUT (default "-")
--scope string	scope
-s, --server string	management server endpoint (required)
--space string	Space name or id (required)
--subcollection string	subcollection

## Options inherited from parent commands

---

--accept-license	Accept the license for API Connect
--debug	Enable debug output
--debug-output string	Write debug output to file
--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic role-defaults:delete

Role Defaults delete operations

### Synopsis

---

Role Defaults delete operations

```
apic role-defaults:delete [flags]
```

### Options

---

-c, --catalog string	Catalog name or id (required)
--format string	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help	Help for role-defaults:delete
-o, --org string	Organization name or id (required)
--output string	Write file(s) to directory, instead of STDOUT (default "-")
--scope string	scope
-s, --server string	management server endpoint (required)

```
--space string      Space name or id (required)
--subcollection string subcollection
```

## Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic role-defaults:get

Role Defaults get operations

### Synopsis

---

Role Defaults get operations

```
apic role-defaults:get [flags]
```

### Options

---

```
-c, --catalog string  Catalog name or id (required)
--fields string      List of field names to return
--format string      Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for role-defaults:get
-o, --org string      Organization name or id (required)
--output string      Write file(s) to directory, use - for STDOUT. (default: cwd)
--scope string       scope
-s, --server string  management server endpoint (required)
--space string       Space name or id (required)
--subcollection string subcollection
```

## Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic role-defaults:list

Role Defaults list operations

### Synopsis

---

Role Defaults list operations

```
apic role-defaults:list [flags]
```

### Options

---

```
-c, --catalog string  Catalog name or id (required)
--fields string      List of field names to return
--format string      Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for role-defaults:list
--limit int32       Maximum number of items to return
--offset int32      Offset item number from list to begin return
-o, --org string      Organization name or id (required)
--output string      Write file(s) to directory, instead of STDOUT (default "-")
--scope string       scope
-s, --server string  management server endpoint (required)
--space string       Space name or id (required)
--subcollection string subcollection
```

## Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic role-defaults:list-all

Role Defaults list-all operations

### Synopsis

---

Role Defaults list-all operations

```
apic role-defaults:list-all [flags]
```

### Options

---

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--fields string</code>	List of field names to return
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for role-defaults:list-all
<code>--limit int32</code>	Maximum number of items to return
<code>--offset int32</code>	Offset item number from list to begin return
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>--scope string</code>	scope
<code>-s, --server string</code>	management server endpoint (required)
<code>--space string</code>	Space name or id (required)

## Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic role-defaults:update

Role Defaults update operations

### Synopsis

---

Role Defaults update operations

```
apic role-defaults:update [flags]
```

### Options

---

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for role-defaults:update
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>--scope string</code>	scope
<code>-s, --server string</code>	management server endpoint (required)
<code>--space string</code>	Space name or id (required)
<code>--subcollection string</code>	subcollection

## Options inherited from parent commands

---

```
--accept-license    Accept the license for API Connect
--debug            Enable debug output
--debug-output string Write debug output to file
--live-help        Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic roles

Roles operations

---

### Synopsis

Roles operations

```
apic roles [flags]
```

---

### Options

```
-c, --catalog string  Catalog name or id (required)
--consumer-org string Consumer Organization name or id (required)
--fields string       List of field names to return
--format string       Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help            Help for roles
--limit int32         Maximum number of items to return
--offset int32        Offset item number from list to begin return
-o, --org string       Organization name or id (required)
--output string       Write file(s) to directory, instead of STDOUT (default "-")
--scope string        scope
-s, --server string   management server endpoint (required)
--space string        Space name or id (required)
--space-initiated    space-initiated
```

---

### Options inherited from parent commands

```
--accept-license    Accept the license for API Connect
--debug            Enable debug output
--debug-output string Write debug output to file
--live-help        Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic roles:clear

Roles clear operations

---

### Synopsis

Roles clear operations

```
apic roles:clear [flags]
```

---

### Options

```
-c, --catalog string  Catalog name or id (required)
--confirm string     Confirmation for critical updates (required)
--consumer-org string Consumer Organization name or id (required)
--format string       Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help            Help for roles:clear
-o, --org string       Organization name or id (required)
--output string       Write file(s) to directory, instead of STDOUT (default "-")
--scope string        scope
-s, --server string   management server endpoint (required)
--space string        Space name or id (required)
--space-initiated    space-initiated
```

---

### Options inherited from parent commands

```
--accept-license    Accept the license for API Connect
--debug            Enable debug output
--debug-output string Write debug output to file
--live-help        Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic roles:create

Roles create operations

### Synopsis

---

Roles create operations

```
apic roles:create [flags]
```

### Options

---

```
-c, --catalog string  Catalog name or id (required)
--consumer-org string Consumer Organization name or id (required)
--format string       Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help            Help for roles:create
-o, --org string       Organization name or id (required)
--output string       Write file(s) to directory, instead of STDOUT (default "-")
--scope string        scope
-s, --server string    management server endpoint (required)
--space string        Space name or id (required)
--space-initiated     space-initiated
```

### Options inherited from parent commands

---

```
--accept-license    Accept the license for API Connect
--debug            Enable debug output
--debug-output string Write debug output to file
--live-help        Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic roles:delete

Roles delete operations

### Synopsis

---

Roles delete operations

```
apic roles:delete [flags]
```

### Options

---

```
-c, --catalog string  Catalog name or id (required)
--consumer-org string Consumer Organization name or id (required)
--format string       Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help            Help for roles:delete
-o, --org string       Organization name or id (required)
--output string       Write file(s) to directory, instead of STDOUT (default "-")
--scope string        scope
-s, --server string    management server endpoint (required)
--space string        Space name or id (required)
--space-initiated     space-initiated
```

### Options inherited from parent commands

---

```
--accept-license    Accept the license for API Connect
--debug            Enable debug output
--debug-output string Write debug output to file
```

<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## apic roles:get

Roles get operations

### Synopsis

Roles get operations

```
apic roles:get [flags]
```

### Options

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--consumer-org string</code>	Consumer Organization name or id (required)
<code>--fields string</code>	List of field names to return
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for roles:get
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, use - for STDOUT. (default: cwd)
<code>--scope string</code>	scope
<code>-s, --server string</code>	management server endpoint (required)
<code>--space string</code>	Space name or id (required)
<code>--space-initiated</code>	space-initiated

### Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## apic roles:list

Roles list operations

### Synopsis

Roles list operations

```
apic roles:list [flags]
```

### Options

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--consumer-org string</code>	Consumer Organization name or id (required)
<code>--fields string</code>	List of field names to return
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for roles:list
<code>--limit int32</code>	Maximum number of items to return
<code>--offset int32</code>	Offset item number from list to begin return
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>--scope string</code>	scope
<code>-s, --server string</code>	management server endpoint (required)
<code>--space string</code>	Space name or id (required)
<code>--space-initiated</code>	space-initiated

### Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file

```
--live-help          Enable or disable tracking of limited usage information
-m, --mode string    Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic roles:update

Roles update operations

### Synopsis

Roles update operations

```
apic roles:update [flags]
```

### Options

```
-c, --catalog string    Catalog name or id (required)
--consumer-org string  Consumer Organization name or id (required)
--format string        Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help             Help for roles:update
-o, --org string       Organization name or id (required)
--output string        Write file(s) to directory, instead of STDOUT (default "-")
--scope string         scope
-s, --server string    management server endpoint (required)
--space string         Space name or id (required)
--space-initiated      space-initiated
```

### Options inherited from parent commands

```
--accept-license      Accept the license for API Connect
--debug               Enable debug output
--debug-output string Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic services

Services operations

### Synopsis

Services operations

```
apic services [flags]
```

### Options

```
-c, --catalog string    Catalog name or id (required)
--configured-gateway-service string Configured Gateway Service name or id (required)
--fields string        List of field names to return
--format string        Output format. One of [json yaml go-template=... go-template-file=...], defaults to
yaml.
-h, --help             Help for services
--limit int32          Maximum number of items to return
--offset int32         Offset item number from list to begin return
-o, --org string       Organization name or id (required)
--output string        Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string    management server endpoint (required)
--space string         Space name or id (required)
--space-initiated      space-initiated
```

### Options inherited from parent commands

```
--accept-license      Accept the license for API Connect
--debug               Enable debug output
--debug-output string Write debug output to file
```

--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic services:clear

Services clear operations

### Synopsis

Services clear operations

```
apic services:clear [flags]
```

### Options

-c, --catalog string	Catalog name or id (required)
--configured-gateway-service string	Configured Gateway Service name or id (required)
--confirm string	Confirmation for critical updates (required)
--format string	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help	Help for services:clear
-o, --org string	Organization name or id (required)
--output string	Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string	management server endpoint (required)
--space string	Space name or id (required)
--space-initiated	space-initiated

### Options inherited from parent commands

--accept-license	Accept the license for API Connect
--debug	Enable debug output
--debug-output string	Write debug output to file
--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic services:clear-all

Services clear-all operations

### Synopsis

Services clear-all operations

```
apic services:clear-all [flags]
```

### Options

-c, --catalog string	Catalog name or id (required)
--configured-gateway-service string	Configured Gateway Service name or id (required)
--confirm string	Confirmation for critical updates (required)
--format string	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help	Help for services:clear-all
-o, --org string	Organization name or id (required)
--output string	Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string	management server endpoint (required)
--space string	Space name or id (required)
--space-initiated	space-initiated

### Options inherited from parent commands

--accept-license	Accept the license for API Connect
--debug	Enable debug output
--debug-output string	Write debug output to file
--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic services:create

Services create operations

### Synopsis

Services create operations

```
apic services:create [flags]
```

### Options

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--configured-gateway-service string</code>	Configured Gateway Service name or id (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for services:create
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)
<code>--space string</code>	Space name or id (required)
<code>--space-initiated</code>	space-initiated

### Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic services:delete

Services delete operations

### Synopsis

Services delete operations

```
apic services:delete [flags]
```

### Options

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--configured-gateway-service string</code>	Configured Gateway Service name or id (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for services:delete
<code>--id</code>	id
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)
<code>--space string</code>	Space name or id (required)
<code>--space-initiated</code>	space-initiated

### Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic services:get

Services get operations

### Synopsis

---

Services get operations

```
apic services:get [flags]
```

### Options

---

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--configured-gateway-service string</code>	Configured Gateway Service name or id (required)
<code>--fields string</code>	List of field names to return
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to

yaml.

<code>-h, --help</code>	Help for services:get
<code>--id</code>	id
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, use - for STDOUT. (default: cwd)
<code>-s, --server string</code>	management server endpoint (required)
<code>--space string</code>	Space name or id (required)
<code>--space-initiated</code>	space-initiated

### Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic services:list

Services list operations

### Synopsis

---

Services list operations

```
apic services:list [flags]
```

### Options

---

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--configured-gateway-service string</code>	Configured Gateway Service name or id (required)
<code>--fields string</code>	List of field names to return
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to

yaml.

<code>-h, --help</code>	Help for services:list
<code>--limit int32</code>	Maximum number of items to return
<code>--offset int32</code>	Offset item number from list to begin return
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)
<code>--space string</code>	Space name or id (required)
<code>--space-initiated</code>	space-initiated

### Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic services:list-all

Services list-all operations

### Synopsis

Services list-all operations

```
apic services:list-all [flags]
```

### Options

```
-c, --catalog string          Catalog name or id (required)
--configured-gateway-service string  Configured Gateway Service name or id (required)
--fields string              List of field names to return
--format string              Output format. One of [json yaml go-template=... go-template-file=...], defaults to
yaml.
-h, --help                   Help for services:list-all
--limit int32                Maximum number of items to return
--offset int32               Offset item number from list to begin return
-o, --org string             Organization name or id (required)
--output string              Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string          management server endpoint (required)
--space string               Space name or id (required)
--space-initiated            space-initiated
```

### Options inherited from parent commands

```
--accept-license            Accept the license for API Connect
--debug                     Enable debug output
--debug-output string       Write debug output to file
--live-help                  Enable or disable tracking of limited usage information
-m, --mode string           Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## apic services:update

Services update operations

### Synopsis

Services update operations

```
apic services:update [flags]
```

### Options

```
-c, --catalog string          Catalog name or id (required)
--configured-gateway-service string  Configured Gateway Service name or id (required)
--format string              Output format. One of [json yaml go-template=... go-template-file=...], defaults to
yaml.
-h, --help                   Help for services:update
--id                          id
-o, --org string             Organization name or id (required)
--output string              Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string          management server endpoint (required)
--space string               Space name or id (required)
--space-initiated            space-initiated
```

### Options inherited from parent commands

```
--accept-license            Accept the license for API Connect
--debug                     Enable debug output
--debug-output string       Write debug output to file
--live-help                  Enable or disable tracking of limited usage information
-m, --mode string           Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic space-settings

Space Settings operations

### Synopsis

---

Space Settings operations

```
apic space-settings [flags]
```

### Options

---

```
-h, --help Help for space-settings
```

### Options inherited from parent commands

---

```
--accept-license Accept the license for API Connect
--debug Enable debug output
--debug-output string Write debug output to file
--live-help Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#), for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic space-settings:get

Get the Space Setting object

### Synopsis

---

Get the Space Setting object

```
apic space-settings:get [flags]
```

### Options

---

```
-c, --catalog string Catalog name or id (required)
--fields string List of field names to return
--format string Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help Help for space-settings:get
-o, --org string Organization name or id (required)
--output string Write file(s) to directory, use - for STDOUT. (default: cwd)
-s, --server string management server endpoint (required)
--space string Space name or id (required)
```

### Options inherited from parent commands

---

```
--accept-license Accept the license for API Connect
--debug Enable debug output
--debug-output string Write debug output to file
--live-help Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#), for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic space-settings:update

Update the Space Setting object

### Synopsis

---

Update the Space Setting object

```
apic space-settings:update [flags]
```

## Options

---

-c, --catalog string	Catalog name or id (required)
--format string	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help	Help for space-settings:update
-o, --org string	Organization name or id (required)
--output string	Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string	management server endpoint (required)
--space string	Space name or id (required)

## Options inherited from parent commands

---

--accept-license	Accept the license for API Connect
--debug	Enable debug output
--debug-output string	Write debug output to file
--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic spaces

Spaces operations

## Synopsis

---

Spaces operations

```
apic spaces [flags]
```

## Options

---

-c, --catalog string	Catalog name or id (required)
--fields string	List of field names to return
--format string	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help	Help for spaces
--limit int32	Maximum number of items to return
--my	my
--offset int32	Offset item number from list to begin return
-o, --org string	Organization name or id (required)
--output string	Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string	management server endpoint (required)

## Options inherited from parent commands

---

--accept-license	Accept the license for API Connect
--debug	Enable debug output
--debug-output string	Write debug output to file
--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic spaces:clear

Clear the Space objects

## Synopsis

---

Clear the Space objects

```
apic spaces:clear [flags]
```

## Options

---

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--confirm string</code>	Confirmation for critical updates (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for spaces:clear
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)

## Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic spaces:create

Create a Space object

### Synopsis

---

Create a Space object

```
apic spaces:create [flags]
```

### Options

---

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for spaces:create
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)

## Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic spaces:delete

Delete the Space object by name or id

### Synopsis

---

Delete the Space object by name or id

```
apic spaces:delete [flags]
```

### Options

---

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for spaces:delete
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)

## Options inherited from parent commands

---

```
--accept-license    Accept the license for API Connect
--debug            Enable debug output
--debug-output string Write debug output to file
--live-help        Enable or disable tracking of limited usage information
-m, --mode string   Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic spaces:get

Get the Space object by name or id

### Synopsis

---

Get the Space object by name or id

```
apic spaces:get [flags]
```

### Options

---

```
-c, --catalog string  Catalog name or id (required)
--fields string       List of field names to return
--format string        Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help            Help for spaces:get
-o, --org string       Organization name or id (required)
--output string        Write file(s) to directory, use - for STDOUT. (default: cwd)
-s, --server string    management server endpoint (required)
```

### Options inherited from parent commands

---

```
--accept-license    Accept the license for API Connect
--debug            Enable debug output
--debug-output string Write debug output to file
--live-help        Enable or disable tracking of limited usage information
-m, --mode string   Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic spaces:list

List the Space objects

### Synopsis

---

List the Space objects

```
apic spaces:list [flags]
```

### Options

---

```
-c, --catalog string  Catalog name or id (required)
--fields string       List of field names to return
--format string        Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help            Help for spaces:list
--limit int32         Maximum number of items to return
--my                  my
--offset int32        Offset item number from list to begin return
-o, --org string       Organization name or id (required)
--output string        Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string    management server endpoint (required)
```

### Options inherited from parent commands

---

```
--accept-license    Accept the license for API Connect
--debug            Enable debug output
--debug-output string Write debug output to file
--live-help        Enable or disable tracking of limited usage information
-m, --mode string   Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic spaces:transfer-owner

Transfer owner to an associate

### Synopsis

---

Transfer owner to an associate

```
apic spaces:transfer-owner [flags]
```

### Options

---

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for spaces:transfer-owner
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)

### Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic spaces:update

Update the Space object by name or id

### Synopsis

---

Update the Space object by name or id

```
apic spaces:update [flags]
```

### Options

---

<code>-c, --catalog string</code>	Catalog name or id (required)
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for spaces:update
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)

### Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic subscriber-events

## Synopsis

---

Subscriber Events operations

```
apic subscriber-events [flags]
```

## Options

---

```
-c, --catalog string  Catalog name or id (required)
--fields string      List of field names to return
--format string      Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for subscriber-events
--limit int32        Maximum number of items to return
--offset int32       Offset item number from list to begin return
-o, --org string     Organization name or id (required)
--output string      Write file(s) to directory, instead of STDOUT (default "-")
--scope string       scope
-s, --server string  management server endpoint (required)
--state string       State for a webhook event in subscriber queue
--webhook string     Webhook name or id (required)
```

## Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic subscriber-events:get

Subscriber Events get operations

## Synopsis

---

Subscriber Events get operations

```
apic subscriber-events:get [flags]
```

## Options

---

```
-c, --catalog string  Catalog name or id (required)
--fields string      List of field names to return
--format string      Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for subscriber-events:get
-o, --org string     Organization name or id (required)
--output string      Write file(s) to directory, use - for STDOUT. (default: cwd)
--scope string       scope
-s, --server string  management server endpoint (required)
--webhook string     Webhook name or id (required)
```

## Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic subscriber-events:list

Subscriber Events list operations

## Synopsis

---

Subscriber Events list operations

```
apic subscriber-events:list [flags]
```

## Options

---

```
-c, --catalog string    Catalog name or id (required)
--fields string        List of field names to return
--format string        Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help             Help for subscriber-events:list
--limit int32         Maximum number of items to return
--offset int32        Offset item number from list to begin return
-o, --org string       Organization name or id (required)
--output string       Write file(s) to directory, instead of STDOUT (default "-")
--scope string        scope
-s, --server string    management server endpoint (required)
--state string        State for a webhook event in subscriber queue
--webhook string      Webhook name or id (required)
```

## Options inherited from parent commands

---

```
--accept-license      Accept the license for API Connect
--debug              Enable debug output
--debug-output string Write debug output to file
--live-help          Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic subscriptions

Subscriptions operations

## Synopsis

---

Subscriptions operations

```
apic subscriptions [flags]
```

## Options

---

```
-a, --app string        Application name or id (required)
-c, --catalog string    Catalog name or id (required)
--consumer-org string   Consumer Organization name or id (required)
--fields string         List of field names to return
--format string         Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help             Help for subscriptions
--limit int32          Maximum number of items to return
--offset int32         Offset item number from list to begin return
-o, --org string        Organization name or id (required)
--output string         Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string     management server endpoint (required)
--space string          Space name or id (required)
--space-initiated       space-initiated
```

## Options inherited from parent commands

---

```
--accept-license      Accept the license for API Connect
--debug              Enable debug output
--debug-output string Write debug output to file
--live-help          Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic subscriptions:clear

Clear the Subscription objects

## Synopsis

---

Clear the Subscription objects

```
apic subscriptions:clear [flags]
```

## Options

---

-a, --app string	Application name or id (required)
-c, --catalog string	Catalog name or id (required)
--confirm string	Confirmation for critical updates (required)
--consumer-org string	Consumer Organization name or id (required)
--format string	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help	Help for subscriptions:clear
-o, --org string	Organization name or id (required)
--output string	Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string	management server endpoint (required)
--space string	Space name or id (required)
--space-initiated	space-initiated

## Options inherited from parent commands

---

--accept-license	Accept the license for API Connect
--debug	Enable debug output
--debug-output string	Write debug output to file
--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic subscriptions:create

Create a Subscription object

## Synopsis

---

Create a Subscription object

```
apic subscriptions:create [flags]
```

## Options

---

-a, --app string	Application name or id (required)
-c, --catalog string	Catalog name or id (required)
--consumer-org string	Consumer Organization name or id (required)
--format string	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help	Help for subscriptions:create
-o, --org string	Organization name or id (required)
--output string	Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string	management server endpoint (required)
--space string	Space name or id (required)
--space-initiated	space-initiated

## Options inherited from parent commands

---

--accept-license	Accept the license for API Connect
--debug	Enable debug output
--debug-output string	Write debug output to file
--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic subscriptions:delete

Delete the Subscription object by name or id

## Synopsis

---

Delete the Subscription object by name or id

```
apic subscriptions:delete [flags]
```

## Options

-a, --app string	Application name or id (required)
-c, --catalog string	Catalog name or id (required)
--consumer-org string	Consumer Organization name or id (required)
--format string	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help	Help for subscriptions:delete
-o, --org string	Organization name or id (required)
--output string	Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string	management server endpoint (required)
--space string	Space name or id (required)
--space-initiated	space-initiated

## Options inherited from parent commands

--accept-license	Accept the license for API Connect
--debug	Enable debug output
--debug-output string	Write debug output to file
--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## apic subscriptions:get

Get the Subscription object by name or id

## Synopsis

Get the Subscription object by name or id

```
apic subscriptions:get [flags]
```

## Options

-a, --app string	Application name or id (required)
-c, --catalog string	Catalog name or id (required)
--consumer-org string	Consumer Organization name or id (required)
--fields string	List of field names to return
--format string	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help	Help for subscriptions:get
-o, --org string	Organization name or id (required)
--output string	Write file(s) to directory, use - for STDOUT. (default: cwd)
-s, --server string	management server endpoint (required)
--space string	Space name or id (required)
--space-initiated	space-initiated

## Options inherited from parent commands

--accept-license	Accept the license for API Connect
--debug	Enable debug output
--debug-output string	Write debug output to file
--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## apic subscriptions:list

List the Subscription objects

## Synopsis

List the Subscription objects

```
apic subscriptions:list [flags]
```

## Options

---

-a, --app string	Application name or id (required)
-c, --catalog string	Catalog name or id (required)
--consumer-org string	Consumer Organization name or id (required)
--fields string	List of field names to return
--format string	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help	Help for subscriptions:list
--limit int32	Maximum number of items to return
--offset int32	Offset item number from list to begin return
-o, --org string	Organization name or id (required)
--output string	Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string	management server endpoint (required)
--space string	Space name or id (required)
--space-initiated	space-initiated

## Options inherited from parent commands

---

--accept-license	Accept the license for API Connect
--debug	Enable debug output
--debug-output string	Write debug output to file
--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic subscriptions:update

Update the Subscription object by name or id

## Synopsis

---

Update the Subscription object by name or id

```
apic subscriptions:update [flags]
```

## Options

---

-a, --app string	Application name or id (required)
-c, --catalog string	Catalog name or id (required)
--consumer-org string	Consumer Organization name or id (required)
--format string	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help	Help for subscriptions:update
-o, --org string	Organization name or id (required)
--output string	Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string	management server endpoint (required)
--space string	Space name or id (required)
--space-initiated	space-initiated

## Options inherited from parent commands

---

--accept-license	Accept the license for API Connect
--debug	Enable debug output
--debug-output string	Write debug output to file
--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic task-queues

Task Queues operations

## Synopsis

---

Task Queues operations

```
apic task-queues [flags]
```

## Options

---

```
--apply-filter      Filter tasks
--cascade           Cascade the behavior
--fields string     List of field names to return
--format string     Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help         Help for task-queues
--iteration string  iteration of task
--kind string       kind of item
--limit int32       Maximum number of items to return
--offset int32      Offset item number from list to begin return
--output string     Write file(s) to directory, instead of STDOUT (default "-")
--query string      Add query to request
--scope string      scope
-s, --server string management server endpoint (required)
--state string      State for a webhook event in subscriber queue
```

## Options inherited from parent commands

---

```
--accept-license    Accept the license for API Connect
--debug             Enable debug output
--debug-output string Write debug output to file
--live-help         Enable or disable tracking of limited usage information
-m, --mode string   Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic task-queues:get

Task Queues get operations

## Synopsis

---

Task Queues get operations

```
apic task-queues:get [flags]
```

## Options

---

```
--cascade           Cascade the behavior
--fields string     List of field names to return
--format string     Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help         Help for task-queues:get
--kind string       kind of item
--output string     Write file(s) to directory, use - for STDOUT. (default: cwd)
--query string      Add query to request
--scope string      scope
-s, --server string management server endpoint (required)
--state string      State for a webhook event in subscriber queue
```

## Options inherited from parent commands

---

```
--accept-license    Accept the license for API Connect
--debug             Enable debug output
--debug-output string Write debug output to file
--live-help         Enable or disable tracking of limited usage information
-m, --mode string   Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic task-queues:list

Task Queues list operations

## Synopsis

---

Task Queues list operations

```
apic task-queues:list [flags]
```

## Options

---

```
--apply_filter      Filter tasks
--cascade           Cascade the behavior
--fields string     List of field names to return
--format string     Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help         Help for task-queues:list
--iteration string  iteration of task
--kind string       kind of item
--limit int32       Maximum number of items to return
--offset int32      Offset item number from list to begin return
--output string     Write file(s) to directory, instead of STDOUT (default "-")
--query string      Add query to request

---

## apic tls-client-profiles

Tls Client Profiles operations

## Synopsis

---

Tls Client Profiles operations

```
apic tls-client-profiles [flags]
```

## Options

---

```
--fields string    List of field names to return
--format string    Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help         Help for tls-client-profiles
--limit int32      Maximum number of items to return
--offset int32     Offset item number from list to begin return
-o, --org string   Organization name or id (required)
--output string    Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

## Options inherited from parent commands

---

```
--accept-license      Accept the license for API Connect
--debug              Enable debug output
--debug-output string Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic tls-client-profiles:clear

Clear the TLS Client Profile objects

## Synopsis

---

Clear the TLS Client Profile objects

```
apic tls-client-profiles:clear [flags]
```

## Options

---

```
--confirm string    Confirmation for critical updates (required)
--format string     Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help         Help for tls-client-profiles:clear
-o, --org string    Organization name or id (required)
```

```
--output string  Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string  management server endpoint (required)
```

## Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string  Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic tls-client-profiles:clear-all

Clear all TLS Client Profile objects in all collections

## Synopsis

---

Clear all TLS Client Profile objects in all collections

```
apic tls-client-profiles:clear-all [flags]
```

## Options

---

```
--cascade           Cascade the behavior
--confirm string    Confirmation for critical updates (required)
--format string     Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help          Help for tls-client-profiles:clear-all
-o, --org string    Organization name or id (required)
--output string     Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string  management server endpoint (required)
```

## Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string  Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic tls-client-profiles:create

Create a TLS Client Profile object

## Synopsis

---

Create a TLS Client Profile object

```
apic tls-client-profiles:create [flags]
```

## Options

---

```
--format string  Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help       Help for tls-client-profiles:create
-o, --org string  Organization name or id (required)
--output string  Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string  management server endpoint (required)
```

## Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string  Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic tls-client-profiles:delete

Delete a TLS Client Profile

### Synopsis

---

Delete a TLS Client Profile

```
apic tls-client-profiles:delete [flags]
```

### Options

---

<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for <code>tls-client-profiles:delete</code>
<code>--id</code>	id
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)

### Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic tls-client-profiles:get

Get the TLS Client Profile object by name and version

### Synopsis

---

Get the TLS Client Profile object by name and version

```
apic tls-client-profiles:get [flags]
```

### Options

---

<code>--fields string</code>	List of field names to return
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for <code>tls-client-profiles:get</code>
<code>--id</code>	id
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, use - for STDOUT. (default: cwd)
<code>-s, --server string</code>	management server endpoint (required)

### Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic tls-client-profiles:list

List the TLS Client Profile objects

## Synopsis

---

List the TLS Client Profile objects

```
apic tls-client-profiles:list [flags]
```

## Options

---

```
--fields string  List of field names to return
--format string  Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for tls-client-profiles:list
--limit int32   Maximum number of items to return
--offset int32  Offset item number from list to begin return
-o, --org string Organization name or id (required)
--output string Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

## Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic tls-client-profiles:list-all

List all TLS Client Profile objects in all collections

## Synopsis

---

List all TLS Client Profile objects in all collections

```
apic tls-client-profiles:list-all [flags]
```

## Options

---

```
--fields string  List of field names to return
--format string  Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for tls-client-profiles:list-all
--limit int32   Maximum number of items to return
--offset int32  Offset item number from list to begin return
-o, --org string Organization name or id (required)
--output string Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

## Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic tls-client-profiles:update

Update the TLS Client Profile object by name and version

## Synopsis

---

Update the TLS Client Profile object by name and version

```
apic tls-client-profiles:update [flags]
```

## Options

---

```
--format string  Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for tls-client-profiles:update
--id            id
-o, --org string Organization name or id (required)
--output string Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

## Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic tls-server-profiles

Tls Server Profiles operations

## Synopsis

---

Tls Server Profiles operations

```
apic tls-server-profiles [flags]
```

## Options

---

```
--fields string  List of field names to return
--format string  Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for tls-server-profiles
--limit int32    Maximum number of items to return
--offset int32   Offset item number from list to begin return
-o, --org string Organization name or id (required)
--output string  Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

## Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic tls-server-profiles:clear

Clear the TLS Server Profile objects

## Synopsis

---

Clear the TLS Server Profile objects

```
apic tls-server-profiles:clear [flags]
```

## Options

---

```
--cascade      Cascade the behavior
--confirm string Confirmation for critical updates (required)
--format string Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help     Help for tls-server-profiles:clear
```

```
-o, --org string      Organization name or id (required)
--output string      Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string   management server endpoint (required)
```

## Options inherited from parent commands

---

```
--accept-license      Accept the license for API Connect
--debug               Enable debug output
--debug-output string Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic tls-server-profiles:clear-all

Clear all TLS Server Profile objects in all collections

### Synopsis

---

Clear all TLS Server Profile objects in all collections

```
apic tls-server-profiles:clear-all [flags]
```

### Options

---

```
--cascade           Cascade the behavior
--confirm string    Confirmation for critical updates (required)
--format string      Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help          Help for tls-server-profiles:clear-all
-o, --org string     Organization name or id (required)
--output string      Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string  management server endpoint (required)
```

## Options inherited from parent commands

---

```
--accept-license      Accept the license for API Connect
--debug               Enable debug output
--debug-output string Write debug output to file
--live-help           Enable or disable tracking of limited usage information
-m, --mode string     Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic tls-server-profiles:create

Create a TLS Server Profile object

### Synopsis

---

Create a TLS Server Profile object

```
apic tls-server-profiles:create [flags]
```

### Options

---

```
--format string      Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help          Help for tls-server-profiles:create
-o, --org string     Organization name or id (required)
--output string      Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string  management server endpoint (required)
```

## Options inherited from parent commands

---

```
--accept-license      Accept the license for API Connect
--debug               Enable debug output
--debug-output string Write debug output to file
```

<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic tls-server-profiles:delete

Delete a TLS Server Profile

### Synopsis

Delete a TLS Server Profile

```
apic tls-server-profiles:delete [flags]
```

### Options

<code>--cascade</code>	Cascade the behavior
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for tls-server-profiles:delete
<code>--id</code>	id
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)

### Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic tls-server-profiles:get

Get the TLS Server Profile object by name and version

### Synopsis

Get the TLS Server Profile object by name and version

```
apic tls-server-profiles:get [flags]
```

### Options

<code>--fields string</code>	List of field names to return
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for tls-server-profiles:get
<code>--id</code>	id
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, use - for STDOUT. (default: cwd)
<code>-s, --server string</code>	management server endpoint (required)

### Options inherited from parent commands

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic tls-server-profiles:list

List the TLS Server Profile objects

### Synopsis

---

List the TLS Server Profile objects

```
apic tls-server-profiles:list [flags]
```

### Options

---

```
--fields string  List of field names to return
--format string  Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help       Help for tls-server-profiles:list
--limit int32    Maximum number of items to return
--offset int32   Offset item number from list to begin return
-o, --org string Organization name or id (required)
--output string  Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

### Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic tls-server-profiles:list-all

List all TLS Server Profile objects in all collections

### Synopsis

---

List all TLS Server Profile objects in all collections

```
apic tls-server-profiles:list-all [flags]
```

### Options

---

```
--fields string  List of field names to return
--format string  Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help       Help for tls-server-profiles:list-all
--limit int32    Maximum number of items to return
--offset int32   Offset item number from list to begin return
-o, --org string Organization name or id (required)
--output string  Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

### Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic tls-server-profiles:update

Update the TLS Server Profile object by name and version

## Synopsis

---

Update the TLS Server Profile object by name and version

```
apic tls-server-profiles:update [flags]
```

## Options

---

<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for tls-server-profiles:update
<code>--id</code>	id
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)

## Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic truststores

Truststores operations

## Synopsis

---

Truststores operations

```
apic truststores [flags]
```

## Options

---

<code>--fields string</code>	List of field names to return
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for truststores
<code>--limit int32</code>	Maximum number of items to return
<code>--offset int32</code>	Offset item number from list to begin return
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)

## Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic truststores:clear

Clear the Truststore objects

## Synopsis

---

Clear the Truststore objects

```
apic truststores:clear [flags]
```

## Options

---

```
--confirm string  Confirmation for critical updates (required)
--format string  Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for truststores:clear
-o, --org string Organization name or id (required)
--output string Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

## Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug          Enable debug output
--debug-output string Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic truststores:create

Create a Truststore object

## Synopsis

---

Create a Truststore object

```
apic truststores:create [flags]
```

## Options

---

```
--format string  Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for truststores:create
-o, --org string Organization name or id (required)
--output string Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

## Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug          Enable debug output
--debug-output string Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic truststores:delete

Delete the Truststore object by name or id

## Synopsis

---

Delete the Truststore object by name or id

```
apic truststores:delete [flags]
```

## Options

---

```
--format string  Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for truststores:delete
-o, --org string Organization name or id (required)
--output string Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

## Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug          Enable debug output
--debug-output string Write debug output to file
```

```
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#), for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic truststores:get

Get the Truststore object by name or id

### Synopsis

Get the Truststore object by name or id

```
apic truststores:get [flags]
```

### Options

```
--fields string  List of field names to return
--format string  Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for truststores:get
-o, --org string Organization name or id (required)
--output string Write file(s) to directory, use - for STDOUT. (default: cwd)
-s, --server string management server endpoint (required)
```

### Options inherited from parent commands

```
--accept-license Accept the license for API Connect
--debug          Enable debug output
--debug-output string Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#), for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic truststores:list

List the Truststore objects

### Synopsis

List the Truststore objects

```
apic truststores:list [flags]
```

### Options

```
--fields string  List of field names to return
--format string  Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for truststores:list
--limit int32   Maximum number of items to return
--offset int32  Offset item number from list to begin return
-o, --org string Organization name or id (required)
--output string Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

### Options inherited from parent commands

```
--accept-license Accept the license for API Connect
--debug          Enable debug output
--debug-output string Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#), for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic truststores:update

Update the Truststore object by name or id

### Synopsis

---

Update the Truststore object by name or id

```
apic truststores:update [flags]
```

### Options

---

```
--format string  Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for truststores:update
-o, --org string Organization name or id (required)
--output string Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

### Options inherited from parent commands

---

```
--accept-license Accept the license for API Connect
--debug          Enable debug output
--debug-output string Write debug output to file
--live-help     Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic user-registries

User Registries operations

### Synopsis

---

User Registries operations

```
apic user-registries [flags]
```

### Options

---

```
--fields string List of field names to return
--format string Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for user-registries
--limit int32   Maximum number of items to return
--offset int32  Offset item number from list to begin return
-o, --org string Organization name or id (required)
--output string Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

### Options inherited from parent commands

---

```
--accept-license Accept the license for API Connect
--debug          Enable debug output
--debug-output string Write debug output to file
--live-help     Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic user-registries:clear

Clear the User Registry objects

### Synopsis

---

Clear the User Registry objects

```
apic user-registries:clear [flags]
```

## Options

---

<code>--confirm</code>	string	Confirmation for critical updates (required)
<code>--format</code>	string	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>		Help for user-registries:clear
<code>-o, --org</code>	string	Organization name or id (required)
<code>--output</code>	string	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server</code>	string	management server endpoint (required)

## Options inherited from parent commands

---

<code>--accept-license</code>		Accept the license for API Connect
<code>--debug</code>		Enable debug output
<code>--debug-output</code>	string	Write debug output to file
<code>--live-help</code>		Enable or disable tracking of limited usage information
<code>-m, --mode</code>	string	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic user-registries:create

Create a User Registry object

## Synopsis

---

Create a User Registry object

```
apic user-registries:create [flags]
```

## Options

---

<code>--format</code>	string	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>		Help for user-registries:create
<code>-o, --org</code>	string	Organization name or id (required)
<code>--output</code>	string	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server</code>	string	management server endpoint (required)

## Options inherited from parent commands

---

<code>--accept-license</code>		Accept the license for API Connect
<code>--debug</code>		Enable debug output
<code>--debug-output</code>	string	Write debug output to file
<code>--live-help</code>		Enable or disable tracking of limited usage information
<code>-m, --mode</code>	string	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic user-registries:delete

Delete the User Registry object by name or id

## Synopsis

---

Delete the User Registry object by name or id

```
apic user-registries:delete [flags]
```

## Options

---

<code>--format</code>	string	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>		Help for user-registries:delete
<code>-o, --org</code>	string	Organization name or id (required)
<code>--output</code>	string	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server</code>	string	management server endpoint (required)

## Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic user-registries:execute

Execute a User Registry operation

### Synopsis

---

Execute a User Registry operation

```
apic user-registries:execute [flags]
```

### Options

---

<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for user-registries:execute
<code>--operation string</code>	Operation to perform on the user registry (get_base_dn_list, validate_password) (required)
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)
<code>--test-config-only</code>	test-config-only

## Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic user-registries:get

Get the User Registry object by name or id

### Synopsis

---

Get the User Registry object by name or id

```
apic user-registries:get [flags]
```

### Options

---

<code>--fields string</code>	List of field names to return
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for user-registries:get
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, use - for STDOUT. (default: cwd)
<code>-s, --server string</code>	management server endpoint (required)

## Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic user-registries:list

List the User Registry objects

### Synopsis

---

List the User Registry objects

```
apic user-registries:list [flags]
```

### Options

---

<code>--fields string</code>	List of field names to return
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for user-registries:list
<code>--limit int32</code>	Maximum number of items to return
<code>--offset int32</code>	Offset item number from list to begin return
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)

### Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic user-registries:search

Search for users in the user registry

### Synopsis

---

Search for users in the user registry

```
apic user-registries:search [flags]
```

### Options

---

<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for user-registries:search
<code>--limit int32</code>	Maximum number of items to return
<code>--offset int32</code>	Offset item number from list to begin return
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)

### Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic user-registries:test-connection

Test a User Registry connection

### Synopsis

---

Test a User Registry connection

```
apic user-registries:test-connection [flags]
```

### Options

---

<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for user-registries:test-connection
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)
<code>--test-config-only</code>	test-config-only

### Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic user-registries:update

Update the User Registry object by name or id

### Synopsis

---

Update the User Registry object by name or id

```
apic user-registries:update [flags]
```

### Options

---

<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for user-registries:update
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)

### Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic user-registry-settings

User Registry Settings operations

### Synopsis

---

User Registry Settings operations

```
apic user-registry-settings [flags]
```

## Options

---

```
-h, --help Help for user-registry-settings
```

## Options inherited from parent commands

---

```
--accept-license Accept the license for API Connect
--debug Enable debug output
--debug-output string Write debug output to file
--live-help Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic user-registry-settings:get

Get the User Registry Setting object

## Synopsis

---

Get the User Registry Setting object

```
apic user-registry-settings:get [flags]
```

## Options

---

```
--fields string List of field names to return
--format string Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help Help for user-registry-settings:get
--output string Write file(s) to directory, use - for STDOUT. (default: cwd)
-s, --server string management server endpoint (required)
```

## Options inherited from parent commands

---

```
--accept-license Accept the license for API Connect
--debug Enable debug output
--debug-output string Write debug output to file
--live-help Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic user-registry-settings:update

Update the User Registry Setting object

## Synopsis

---

Update the User Registry Setting object

```
apic user-registry-settings:update [flags]
```

## Options

---

```
--format string Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help Help for user-registry-settings:update
--output string Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

## Options inherited from parent commands

---

```
--accept-license Accept the license for API Connect
--debug Enable debug output
--debug-output string Write debug output to file
```

```
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic users

Users operations

### Synopsis

Users operations

```
apic users [flags]
```

### Options

```
--fields string      List of field names to return
--format string      Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for users
--limit int32        Maximum number of items to return
--offset int32       Offset item number from list to begin return
-o, --org string      Organization name or id (required)
--output string      Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string  management server endpoint (required)
--user-registry string User Registry name or id (required)
```

### Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic users:clear

Clear the User objects

### Synopsis

Clear the User objects

```
apic users:clear [flags]
```

### Options

```
--confirm string      Confirmation for critical updates (required)
--format string      Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for users:clear
-o, --org string      Organization name or id (required)
--output string      Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string  management server endpoint (required)
--user-registry string User Registry name or id (required)
```

### Options inherited from parent commands

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help      Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic users:create

Create a User object

### Synopsis

---

Create a User object

```
apic users:create [flags]
```

### Options

---

<code>--format</code> string	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for users:create
<code>-o, --org</code> string	Organization name or id (required)
<code>--output</code> string	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server</code> string	management server endpoint (required)
<code>--user-registry</code> string	User Registry name or id (required)

### Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output</code> string	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode</code> string	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic users:delete

Delete the User object by name or id

### Synopsis

---

Delete the User object by name or id

```
apic users:delete [flags]
```

### Options

---

<code>--format</code> string	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for users:delete
<code>-o, --org</code> string	Organization name or id (required)
<code>--output</code> string	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server</code> string	management server endpoint (required)
<code>--user-registry</code> string	User Registry name or id (required)

### Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output</code> string	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode</code> string	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic users:get

Get the User object by name or id

## Synopsis

---

Get the User object by name or id

```
apic users:get [flags]
```

## Options

---

<code>--fields string</code>	List of field names to return
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for users:get
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, use - for STDOUT. (default: cwd)
<code>-s, --server string</code>	management server endpoint (required)
<code>--user-registry string</code>	User Registry name or id (required)

## Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic users:list

List the User objects

## Synopsis

---

List the User objects

```
apic users:list [flags]
```

## Options

---

<code>--fields string</code>	List of field names to return
<code>--format string</code>	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
<code>-h, --help</code>	Help for users:list
<code>--limit int32</code>	Maximum number of items to return
<code>--offset int32</code>	Offset item number from list to begin return
<code>-o, --org string</code>	Organization name or id (required)
<code>--output string</code>	Write file(s) to directory, instead of STDOUT (default "-")
<code>-s, --server string</code>	management server endpoint (required)
<code>--user-registry string</code>	User Registry name or id (required)

## Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic users:request-password-reset

Send reset password link

## Synopsis

---

Send reset password link

```
apic users:request-password-reset [flags]
```

## Options

---

```
--format string  Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for users:request-password-reset
--output string  Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
```

## Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic users:search-provider

Users search-provider operations

## Synopsis

---

Users search-provider operations

```
apic users:search-provider [flags]
```

## Options

---

```
--format string  Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for users:search-provider
--limit int32    Maximum number of items to return
--offset int32   Offset item number from list to begin return
-o, --org string  Organization name or id (required)
--output string  Write file(s) to directory, instead of STDOUT (default "-")
--scope string   scope
-s, --server string management server endpoint (required)
```

## Options inherited from parent commands

---

```
--accept-license  Accept the license for API Connect
--debug           Enable debug output
--debug-output string Write debug output to file
--live-help       Enable or disable tracking of limited usage information
-m, --mode string  Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic users:update

Update the User object by name or id

## Synopsis

---

Update the User object by name or id

```
apic users:update [flags]
```

## Options

---

```
--format string  Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help      Help for users:update
-o, --org string  Organization name or id (required)
--output string  Write file(s) to directory, instead of STDOUT (default "-")
-s, --server string management server endpoint (required)
--user-registry string User Registry name or id (required)
```

## Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic validate

Validate an API or product definition

### Synopsis

---

Validate an API or product definition

```
apic validate [FILE] [flags]
```

### Examples

---

```
Validate an API definition
$ apic validate routes.yaml
Validated routes.yaml API definition [routes:1.0]
Validate an API definition without IBM extensions
$ apic validate --no-extensions routes.yaml
Validated routes.yaml API definition [routes:1.0]
Validate a product definition and its referenced APIs
$ apic validate climb-on.yaml
Validated climb-on.yaml product definition [climb-on:1.0.0]
Validated routes.yaml API definition [valid:1.0]
Validate a product definition without validating its referenced APIs
$ apic validate --product-only climb-on.yaml
Validated climb-on.yaml product definition [climb-on:1.0.0]
```

### Options

---

<code>-h, --help</code>	Help for validate
<code>--no-extensions</code>	for API definitions, do not validate against IBM Swagger extensions
<code>-p, --product-only</code>	for products definitions, do not validate referenced APIs

## Options inherited from parent commands

---

<code>--accept-license</code>	Accept the license for API Connect
<code>--debug</code>	Enable debug output
<code>--debug-output string</code>	Write debug output to file
<code>--live-help</code>	Enable or disable tracking of limited usage information
<code>-m, --mode string</code>	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic version

Get the APIConnect toolkit version

### Synopsis

---

Get the APIConnect toolkit version

```
apic version [flags]
```

### Options

---

<code>-h, --help</code>	Help for version
-------------------------	------------------

## Options inherited from parent commands

---

```
--accept-license      Accept the license for API Connect
--debug              Enable debug output
--debug-output string Write debug output to file
--live-help          Enable or disable tracking of limited usage information
-m, --mode string    Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic webhooks

Webhooks operations

### Synopsis

Webhooks operations

```
apic webhooks [flags]
```

### Options

```
-c, --catalog string  Catalog name or id (required)
--fields string      List of field names to return
--format string      Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for webhooks
--limit int32       Maximum number of items to return
--offset int32      Offset item number from list to begin return
-o, --org string     Organization name or id (required)
--output string     Write file(s) to directory, instead of STDOUT (default "-")
--scope string      scope
-s, --server string  management server endpoint (required)
```

### Options inherited from parent commands

```
--accept-license      Accept the license for API Connect
--debug              Enable debug output
--debug-output string Write debug output to file
--live-help          Enable or disable tracking of limited usage information
-m, --mode string    Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic webhooks:get

Webhooks get operations

### Synopsis

Webhooks get operations

```
apic webhooks:get [flags]
```

### Options

```
-c, --catalog string  Catalog name or id (required)
--fields string      List of field names to return
--format string      Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help           Help for webhooks:get
-o, --org string     Organization name or id (required)
--output string     Write file(s) to directory, use - for STDOUT. (default: cwd)
--scope string      scope
-s, --server string  management server endpoint (required)
```

### Options inherited from parent commands

```
--accept-license      Accept the license for API Connect
--debug              Enable debug output
--debug-output string Write debug output to file
--live-help          Enable or disable tracking of limited usage information
-m, --mode string    Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic webhooks:list

Webhooks list operations

### Synopsis

---

Webhooks list operations

```
apic webhooks:list [flags]
```

### Options

---

-c, --catalog string	Catalog name or id (required)
--fields string	List of field names to return
--format string	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help	Help for webhooks:list
--limit int32	Maximum number of items to return
--offset int32	Offset item number from list to begin return
-o, --org string	Organization name or id (required)
--output string	Write file(s) to directory, instead of STDOUT (default "-")
--scope string	scope
-s, --server string	management server endpoint (required)

### Options inherited from parent commands

---

--accept-license	Accept the license for API Connect
--debug	Enable debug output
--debug-output string	Write debug output to file
--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## apic webhooks:update

Webhooks update operations

### Synopsis

---

Webhooks update operations

```
apic webhooks:update [flags]
```

### Options

---

-c, --catalog string	Catalog name or id (required)
--format string	Output format. One of [json yaml go-template=... go-template-file=...], defaults to yaml.
-h, --help	Help for webhooks:update
-o, --org string	Organization name or id (required)
--output string	Write file(s) to directory, instead of STDOUT (default "-")
--scope string	scope
-s, --server string	management server endpoint (required)

### Options inherited from parent commands

---

--accept-license	Accept the license for API Connect
--debug	Enable debug output
--debug-output string	Write debug output to file
--live-help	Enable or disable tracking of limited usage information
-m, --mode string	Toolkit operation mode (default "apim")

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic wsdl

Manage WSDL files

### Synopsis

---

Manage WSDL files

```
apic wsdl WSDL_FILE [flags]
```

### Options

---

```
-h, --help Help for wsdl
```

### Options inherited from parent commands

---

```
--accept-license Accept the license for API Connect
--debug Enable debug output
--debug-output string Write debug output to file
--live-help Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## apic wsdl:introspect

Introspect a WSDL file displaying all its services

### Synopsis

---

Introspect a WSDL file displaying all its services

```
apic wsdl:introspect WSDL_FILE [flags]
```

### Options

---

```
-h, --help Help for wsdl:introspect
```

### Options inherited from parent commands

---

```
--accept-license Accept the license for API Connect
--debug Enable debug output
--debug-output string Write debug output to file
--live-help Enable or disable tracking of limited usage information
-m, --mode string Toolkit operation mode (default "apim")
```

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

---

## API Connect REST APIs

The API Connect platform REST APIs provide complete access to the capability of the platform.

The API Connect platform REST APIs can be used for the following actions:

- Automate the administration of the platform.
- Implement scripts and tools to support a continuous integration environment for API development and publishing.
- Manage catalogs of APIs, and their subscribers.

The operations provided in the REST APIs also correspond directly with the commands in the [developer toolkit command-line tool \(CLI\)](#).

**Note:** You can now use the URL to navigate directly to specific APIs and operations in the OpenAPI Explorer Documentation for the API Connect REST APIs. You can also select the APIs for a specific version by using the drop-down menu in the header bar.

For full details, see the [API Connect REST API documentation](#).

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.  
For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

---

## Example: Using the platform REST APIs to publish a product containing a SOAP API

Review this sample scenario to see how you can use the API Connect platform REST APIs to publish a product that contains a SOAP API.

This example demonstrates how to format a request to publish the product, and includes sample files that illustrate the product definition, the API definition, and the SOAP API's WSDL description.

---

### Using the Catalogs API

Publish the product using the API Connect platform **Catalogs** API:

- To publish a product to a catalog, use the following syntax:

```
POST catalogs/{org}/{catalog}/publish
```

- To publish a product to a space within a catalog, additionally specify the space with the following syntax:

```
POST catalogs/{org}/{catalog}/{space}/publish
```

The payload in both cases is a multipart, form-encoded body containing three required parts and one optional part:

- (Required) A part named **product** with media type **application/yaml** or **application/json**, containing the yaml or JSON source for the product to be published.
- (Required) One or more occurrences of a part named **openapi** with media type **application/yaml** or **application/json**, containing the YAML or JSON source for each API in the product.
- (Required for SOAP APIs) One or more occurrences of a part named **wSDL** with media type **application/wSDL**, **application/wSDL+xml**, **text/xml**, or **application/zip** containing the WSDL definitions (and referenced XSD files if applicable) associated with the API content.
- (Optional) A part named **gateway\_service\_urls** with media type **application/yaml** or **application/json** which is a YAML or JSON array of URLs to specify a subset of the configured gateway services within the catalog or space as publish targets. These URLs can be obtained using the following calls:

- o For a catalog:

```
GET /api/catalogs/{org}/{catalog}/configured-gateway-services
```

- o For a space:

```
GET /spaces/{org}/{catalog}/{space}/configured-gateway-services
```

Within the **product** content, the form of the references to APIs in the **apis** section is significant. Each API reference must use the **name** property instead of the **\$ref** form that may appear in other situations. Here is an example showing a product that refers to the API **globalweather** version **1.0.0** in the correct form:

```
info:
  version: 1.0.0
  title: GlobalWeatherProduct
  name: globalweatherproduct

### Example publish operation using cURL

This example publishes a product containing a SOAP API to the *Sandbox* catalog of the *onlinebanking* provider organization, using the **curl -F** option to create a set of form-encoded payload parts and the **@** prefix to read the content for each part from a file. Note the part name (**product**, **openapi**, **wSDL**) and the content type of each part given by the **type=** value.

In this example, the access token has been retrieved earlier and placed in an environment variable named **TOKEN**. The command is split onto multiple lines for ease of reading but must be entered as a single line.

Request:

```
curl -v -k
-F "product=@globalweatherproduct_1.0.0.yaml;type=application/yaml"
-F "openapi=@globalweather_1.0.0.yaml;type=application/yaml"
-F "wSDL=@globalweather.wSDL;type=application/wSDL"
-H "Authorization: Bearer $TOKEN"
-H 'Content-Type: multipart/form-data'
-H 'Accept: */*' https://dev.apic.example.com/api/catalogs/onlinebanking/sandbox/publish
```

Response:

201 Created

```

The request specifies three files, which are included with this example for reference:

- [Product definition](#) -F "product=@globalweatherproduct\_1.0.0.yaml;type=application/yaml"
- [API definition](#) -F "openapi=@globalweather\_1.0.0.yaml;type=application/yaml"
- [WSDL description](#) -F "wsdl=@globalweather.wsdl;type=application/wsdl"

**Note:** IBM API Connect 2018.x was EOS after 30 April 2023. See [support policy](#) for details.

For a more recent version, see the [IBM API Connect 10.0.5.x and later product documentation](#).

## Example Product file: globalweatherproduct\_1.0.0.yaml

The following code sample contains a Product definition.

The Product definition file globalweatherproduct\_1.0.0.yaml is referenced by the example scenario in [Example: Using the platform REST APIs to publish a product containing a SOAP API](#).

```
