Chapter 1. Overview

An adapter is an interface between a managed resource and the Identity server.

Adapters can be installed on the managed resource. The Identity server manages access to the resource by using the security system. Adapters function as trusted virtual administrators on the target operating system. The adapter creates, suspends, restores user accounts, and other functions that administrators run manually. The adapter runs as a service, independently of whether you are logged on to the Identity server.

You can use the SQL Server Adapter to automate the following administrative tasks:

- Creating an account to authorize access to SQL server.
- Modifying an existing account to access SQL server.
- Removing access to a user account. This deletes the account from the SQL server.
- Suspending a user account by temporarily denying access to SQL server.
- Changing a user account password on SQL server.
- Reconciling user account information of all current accounts on SQL server.
- Reconciling the account information of a particular user account on SQL server by performing a lookup.

Chapter 2. Planning

Installing and configuring the adapter involves several steps that you must complete in a specific sequence. Follow the roadmap for the main tasks.

Roadmap for Adapter Development Kit based adapters, using Setup.exe

Follow this section when using the guide to install, configure, troubleshoot, or uninstall the adapter.

Pre-installation

Complete these tasks.

1. Verify that your environment meets the software and hardware requirements for the adapter. See *Prerequisites*.
2. Obtain the installation software. See *Software downloads*.
3. Obtain the necessary information for the installation and configuration. See *Installation worksheet*.

Installation

Complete these tasks.

1. Install the adapter binary.
2. Install 3rd party client libraries.
3. Set up the adapter environment.
4. Import the adapter profile.
5. Restart the adapter service.
6. Create an adapter service/target.
7. Install the adapter language package.
8. Verify that the adapter is working correctly.

Upgrade

You can do an upgrade or do a full installation. Review the *Release Notes*[®] for the specific adapter before you proceed.

Configuration

Complete these tasks.

1. Configure secure communication between the Identity server and the adapter.
 - a. Configure 1-way authentication.
 - b. Configure 2-way authentication.
2. Configure secure communication between the adapter and the managed target.
 - a. Configure 1-way authentication.
 - b. Configure 2-way authentication.
3. Configure the adapter.
4. Modify the adapter profiles.
5. Customize the adapter.

Troubleshooting

See the following topics.

- Techniques for troubleshooting problems
- Configure debugging
- Logs
- Error messages and problem solving

Uninstallation

Complete these tasks.

1. Stop the adapter service.
2. Uninstall the adapter binary
3. Remove 3rd party client libraries.
4. Delete the adapter service/target.
5. Delete the adapter profile.

Reference

See the following topics.

- Adapter attributes and object classes
- Adapter attributes by operations
- Special attributes

Prerequisites

Verify that your environment meets the software and hardware requirements for the adapter.

Prerequisite	Description
Operating System	<ul style="list-style-type: none">• Microsoft Windows 10• Microsoft Windows 2016• Microsoft Windows 2019
Microsoft SQL Server	<ul style="list-style-type: none">• Microsoft SQL Server 2016• Microsoft SQL Server 2019 <p>The system where the adapter is installed must have SQL connectivity to the system where the SQL Server is installed.</p>
Multiple Sites and Servers	A single SQL Server Adapter installation can be used by an organization with multiple MS SQL sites or multiple servers at an SQL site.
Network Connectivity	TCP/IP network.
System Administrator authority	To complete the adapter installation procedure, you must have system administrator authority.

Table 1. Prerequisites to install the adapter (continued)

Prerequisite	Description
Identity server	<p>The following servers are supported:</p> <ul style="list-style-type: none"> • IBM Security Verify Governance Identity Manager v10.0 • IBM Security Verify Governance v10.0 • IBM Security Identity Manager v7.0.x • IBM Security Identity Manager v6.0.x • IBM Security Privileged Identity Manager v2.x • IBM Security Identity Governance and Intelligence v5.2.x

Software downloads

Download the software through your account at the IBM® Passport Advantage® website.

Go to [IBM Passport Advantage](#).

See the corresponding *IBM Security Verify Governance Download Document* for instructions.

Note:

You can also obtain additional adapter information from IBM Support.

Installation worksheet

The installation worksheet lists the information that is required to install and configure the adapter. Complete this worksheet before you start the installation procedure for ease of reference. Make a copy of the worksheet for each adapter instance you install.

Table 2. Required information to install the adapter

Required information	Description
SQL Server client must be installed.	Before you install the SQL Server Adapter on its installation platform, install the SQL Server client software version 2016 and 2019 on that system. For example, if you want to manage the SQL Server version 2019, the SQL Server client version 2019 must be installed on the system as the adapter.

Chapter 3. Installing

Installing the adapter mainly involves importing the adapter profile and creating an adapter service. Depending on the adapter, several other tasks can be involved to completely install it.

Installing the adapter

You can use these steps to install the adapter.

If you are updating a previous installation, the adapter you want to update must already exist. If it does not exist, the software generates the following message:

```
Adapter is not found at specified location.  
Can not perform Update Installation. Please correct  
the path of installed adapter or select Full Installation.
```

This task provides all the necessary steps for installing the SQL Server Adapter software.

1. If you downloaded the installation software from Passport Advantage, perform the following steps:
 - a. Create a temporary directory on the computer on which you want to install the software.
 - b. Extract the contents of the compressed file into the temporary directory.
2. Start the installation program with the `setupwin32.exe` file in the temporary directory.
3. Click **Next** on the Welcome window.
4. Select either Full installation or Update installation and click Next to display the Select Destination Directory window. Remember that the adapter must already exist if you want to perform an updated installation.
5. Specify where you want to install the adapter in the Directory Name field. Do one of the following steps.
 - Click **Next** to accept the default location.
 - Click **Browse** and navigate to a different directory and click **Next**.
6. Review the installation settings in the Install Summary window and do one of the following steps:
 - Click **Back** and return to a previous window to change any of these settings.
 - Click **Next** when you are ready to begin the installation.
7. Click **Finish** when the software displays the Install Completed window.

Related concepts

[Verifying the adapter installation](#)

If the adapter is installed correctly, the following directories exist in the adapter installation directory.

[Service/Target form details](#)

Complete the service/target form fields.

Related tasks

[Restarting the adapter service](#)

Perform the following steps to start and stop the SQL Server Adapter service.

[Importing the adapter profile](#)

You can import a profile definition file, which creates a profile in Identity server. Use this option for importing adapter profiles.

[Importing attribute mapping file](#)

After importing the adapter profile, you must import an attribute map from a profile mapping definition file.

[Adding a connector](#)

After you import the adapter profile on the Verify Governance server, add a connector so that Verify Governance server can communicate with the managed resource.

Enabling connectors

After you create a connector, by default it is in a disabled state. You must enable a connector to use it.

Reviewing and setting channel modes for each new connector

Use this procedure to set up the read-from and write-to channels and to set the synchronization schedule for each new connector.

Attribute Mapping

Attribute mapping is required to define which target attributes correspond to the Verify Governance account attributes.

Verifying that the adapter is working correctly

After you install and configure the adapter, verify that the installation and configuration are correct.

Verifying the adapter installation

If the adapter is installed correctly, the following directories exist in the adapter installation directory.

bin

The bin directory contains the following files:

- `SqlServerAdapter.exe`
- `agentCfg.exe`
- `CertTool.exe`
- `fipsEnable.exe`
- `regis.exe`
- `IsamTool.exe`

data

Initially the data directory is empty.

log

The log directory contains the adapter log file. After the adapter installation is complete and if the adapter service is *Started*, the adapter creates `SqlServerAdapter.log` file.

jre

The jre directory contains the Java™ Standard Edition Runtime Environment. It provides complete runtime support for the Java applications.

_unist

The _unist directory contains the `uninstaller.exe` and the `DelRegKey.exe` files. You can uninstall the SQL Server Adapter from the agent server workstation by using the `uninstaller.exe` file.

After the adapter installation completes, ensure that windows service for SQL Server Adapter is created and its status is *Started*. To view the windows service status:

1. Click **Start > Programs > Administrative Tools > Services** to display the Services page.
2. Search for the SQL Server Adapter service.

The adapter copies the following files to the `system32` directory:

- `AdkApi.dll`
- `ErmApi.dll`
- `ErmApiDam1.dll`
- `icudt36.dll`
- `icuuc36.dll`
- `libeay32.dll`

- ssleay32.dll

Review the IBM_Security_Identity_Manager Sql_Server_Adapter_setInstallLog.log file in the adapter installation directory for any errors.

Related concepts

[Service/Target form details](#)

Complete the service/target form fields.

Related tasks

[Installing the adapter](#)

You can use these steps to install the adapter.

[Restarting the adapter service](#)

Perform the following steps to start and stop the SQL Server Adapter service.

[Importing the adapter profile](#)

You can import a profile definition file, which creates a profile in Identity server. Use this option for importing adapter profiles.

[Importing attribute mapping file](#)

After importing the adapter profile, you must import an attribute map from a profile mapping definition file.

[Adding a connector](#)

After you import the adapter profile on the Verify Governance server, add a connector so that Verify Governance server can communicate with the managed resource.

[Enabling connectors](#)

After you create a connector, by default it is in a disabled state. You must enable a connector to use it.

[Reviewing and setting channel modes for each new connector](#)

Use this procedure to set up the read-from and write-to channels and to set the synchronization schedule for each new connector.

[Attribute Mapping](#)

Attribute mapping is required to define which target attributes correspond to the Verify Governance account attributes.

[Verifying that the adapter is working correctly](#)

After you install and configure the adapter, verify that the installation and configuration are correct.

Restarting the adapter service

Perform the following steps to start and stop the SQL Server Adapter service.

1. Click **Start > Programs > Administrative Tools > Services** to display the Services page.
2. Search for the SQL Server Adapter service
3. To start the service, right-click SQL Server Adapter and select **Start** from the pop-up menu.
4. To stop the service, right-click SQL Server Adapter and select **Stop** from the pop-up menu.

Note: Do not stop the adapter service if the adapter is processing any requests.

Related concepts

Complete the service/target form fields.

Related tasks

[Installing the adapter](#)

You can use these steps to install the adapter.

[Importing the adapter profile](#)

You can import a profile definition file, which creates a profile in Identity server. Use this option for importing adapter profiles.

Importing attribute mapping file

After importing the adapter profile, you must import an attribute map from a profile mapping definition file.

Adding a connector

After you import the adapter profile on the Verify Governance server, add a connector so that Verify Governance server can communicate with the managed resource.

Enabling connectors

After you create a connector, by default it is in a disabled state. You must enable a connector to use it.

Reviewing and setting channel modes for each new connector

Use this procedure to set up the read-from and write-to channels and to set the synchronization schedule for each new connector.

Attribute Mapping

Attribute mapping is required to define which target attributes correspond to the Verify Governance account attributes.

Verifying that the adapter is working correctly

After you install and configure the adapter, verify that the installation and configuration are correct.

Importing the adapter profile

You can import a profile definition file, which creates a profile in Identity server. Use this option for importing adapter profiles.

- The Identity server is installed and running.
- You have administrator authority on the Identity server.
- The file to be imported must be a Java archive (JAR) file. The `<Adapter>Profile.jar` file includes all the files that are required to define the adapter schema, account form, service/target form, and profile properties. If necessary, you can extract the files from the JAR file, modify the files, and repackage the JAR file with the updated files.

Target definition files are also called adapter profile files. The profile definition files are provided with the various IBM Security Verify Adapter. The adapter profile must be imported because it defines the types of resources that the Verify Governance server can manage.

The adapter profile definition file is used to create a target profile on the Verify Governance server and to establish communication with the adapter. If the adapter profile is not imported, you cannot create a connector for that adapter type.

An upload error might occur when no file is selected, or when the file is empty, or due to any upload operation error, such as a timeout or connection error. If the adapter profile is not installed correctly, the adapter cannot function correctly. You cannot create a connector with the adapter profile or open and account on the service. You must import the adapter profile again.

This task can be completed from the Enterprise Connectors module in the Administration Console. To import an adapter target profile, complete these steps:

1. Log in to the Verify Governance Administration Console.
2. From the Administration Console, select **Enterprise Connectors**.
3. Select **Manage > Profiles**.
4. Optional: Click **Filter** to toggle the filter on to refine your search results, or click **Hide Filter** to toggle the filter off. When the filter is visible, you can specify search criteria for your requests, and then click **Search**.
5. Click **Actions > Import**.
6. On the **Import** page, complete these steps:
 - a) Select **Profile**.

b) Click **Browse** to locate the JAR file that you want to import.

c) Click **Upload file**.

A message indicates that you successfully imported a profile.

7. Click **Close**.

The new profile is displayed in the list of profiles.

The upload is synchronous but has a timeout. The progress bar on the **Import** page accurately indicates the upload status. However, when a timeout is reached, the following message occurs: "The import is still in progress and will complete shortly. Close this window to proceed." If you see that message, allow a few minutes for the upload to complete and for the profile to be available.

After the target profile is imported successfully, complete these tasks.

- Import the attribute mapping file. See [“Importing attribute mapping file” on page 11](#).
- Create a connector that uses the target profile. See [“Adding a connector” on page 12](#).

Related concepts

[Verifying that the adapter is working correctly](#)

After you install and configure the adapter, verify that the installation and configuration are correct.

Importing attribute mapping file

After importing the adapter profile, you must import an attribute map from a profile mapping definition file.

This task involves importing an account attribute mapping definition file, which is included in the adapter package. The imported file must be a DEF file.

1. Log in to the Verify Governance Administration Console.
2. From the Administration Console, select **Enterprise Connectors**.
3. Select **Manage > Profiles**.

4. Optional: Click **Filter** to toggle the filter on to refine your search results, or click **Hide Filter** to toggle the filter off. When the filter is visible, you can specify search criteria for your requests, and then click **Search**.
5. Click **Actions > Import**.
6. On the **Import** page, complete these steps:
 - a) Select **Attribute Mapping**.
 - b) Click **Browse** to locate the attribute mapping file that you want to import.
 - c) Click **Upload file**.

A message indicates that you successfully imported the file.
7. Click **Close**.

After you install and configure the adapter, verify that the installation and configuration are correct.

Adding a connector

After you import the adapter profile on the Verify Governance server, add a connector so that Verify Governance server can communicate with the managed resource.

Complete [Importing the adapter profile](#).

Note: If you migrated from Verify Governance V5.2.2 or V5.2.2.1 and want to add or configure a connector, see *Adding and configuring a connector for each target* in the IBM Security Verify Governance product documentation.

The connectors consolidate, extract, and reconcile user identities, organization units, permissions, and user entitlements with the most common enterprise applications. Configure a connector to keep the Access Governance Core repository synchronized with the target system.

This task can be completed from the Enterprise Connectors module in the Administration Console.

To add a connector, complete these steps.

1. Log in to the Verify Governance Administration Console.
2. From the Administration Console, select **Enterprise Connectors**.
3. Select **Manage > Connectors**.

A list of connectors is displayed on the **Connectors** tab.

4. Click **Filter** to toggle the filter on to refine your search results, or click **Hide Filter** to toggle the filter off. When the filter is visible, you can specify search criteria for your requests, and then click **Search**.
5. To view all of the columns in the list of connectors, expand the **Connectors** pane.
6. Click **Actions > Add**.

The **Connector Details** pane is enabled for your input.

7. On the **Connector Details** tab, complete these steps:
 - a) Assign a name and description for the connector.
 - b) Select the target profile type as Identity Brokerage and its corresponding target profile.
 - c) Select the entity, such as **Account** or **User**.

Depending on the connector type, this field might be preselected.
 - d) Optional: Select **Trace ON** and the corresponding **Trace Level** to enable trace logs.

The available trace levels are DEBUG, INFO, and ERROR.
 - e) Optional: Select **History ON** to save and track the connector usage.
 - f) Click **Save**.

The fields for enabling the channels for sending and receiving data are now visible.
 - g) Select and set the connector properties in the **Global Config** accordion pane.

For information about the global configuration properties, see [Global Config accordion pane](#).
 - h) Click **Save**. The fields for enabling the channels for sending and receiving data are now visible.

The connector is saved and added to the list of connectors in the **Connectors** pane.

If you cannot create a connector with the target profile or open an account on an existing connector, the target profile was not installed correctly during the import. You must import the target profile again.

Enable the channel modes to synchronize the data between the target systems and Verify Governance. For more information, see [“Enabling connectors” on page 14](#).

Related concepts

Verifying that the adapter is working correctly

After you install and configure the adapter, verify that the installation and configuration are correct.

Enabling connectors

After you create a connector, by default it is in a disabled state. You must enable a connector to use it.

Prerequisite	Find more information
A connector must exist in Verify Governance.	“Adding a connector” on page 12.
Ensure that you enabled the appropriate channel modes for the connector.	“Reviewing and setting channel modes for each new connector” on page 15.

To enable a connector, complete these steps:

1. Log in to the Verify Governance Administration Console.
2. From the Administration Console, select **Enterprise Connectors**.
3. Select **Manage > Connectors**.
A list of connectors is displayed on the **Connectors** tab.
4. Optional: Click **Filter** to toggle the filter on to refine your search results, or click **Hide Filter** to toggle the filter off. When the filter is visible, you can specify search criteria for your requests, and then click **Search**.
5. Optional: To view all of the columns in the list of connectors, expand the **Connectors** pane.
6. Select the connector that you want to enable.
7. On the **Connector Details** tab, complete these steps:
 - a) Select the channel modes that you want to enable, and then click **Save**. Depending on the channels that you enable, the corresponding **Channel** tabs are displayed.

Enable write-to channel

Propagates every change in the Access Governance Core repository into the target system.

For connectors that are not HR feed, the check boxes for enabling the read-from channel and the write-to channel are available.

Enable read-from channel

Reads the INPUT EVENTS and USER DATA from the target system. Imports data from the target system to the Access Governance Core repository.

For HR feed connectors, only the check box for enabling the read-from channel is available.

Enable reconciliation

Synchronizes the modified data between the Access Governance Core repository and the target system.

The connector is enabled

Enable the channel modes to synchronize the data between the target systems and Verify Governance.

Related concepts

[Verifying the adapter installation](#)

If the adapter is installed correctly, the following directories exist in the adapter installation directory.

Service/Target form details

Complete the service/target form fields.

Related tasks

Installing the adapter

You can use these steps to install the adapter.

Restarting the adapter service

Perform the following steps to start and stop the SQL Server Adapter service.

Importing the adapter profile

You can import a profile definition file, which creates a profile in Identity server. Use this option for importing adapter profiles.

Importing attribute mapping file

After importing the adapter profile, you must import an attribute map from a profile mapping definition file.

Adding a connector

After you import the adapter profile on the Verify Governance server, add a connector so that Verify Governance server can communicate with the managed resource.

Reviewing and setting channel modes for each new connector

Use this procedure to set up the read-from and write-to channels and to set the synchronization schedule for each new connector.

Attribute Mapping

Attribute mapping is required to define which target attributes correspond to the Verify Governance account attributes.

Verifying that the adapter is working correctly

After you install and configure the adapter, verify that the installation and configuration are correct.

Reviewing and setting channel modes for each new connector

Use this procedure to set up the read-from and write-to channels and to set the synchronization schedule for each new connector.

Note: Legacy Verify Governance Enterprise connectors use Reconciliation channel, whereas Identity Brokerage Enterprise connectors use Read From Channel and Change Log Sync.

For more information about any of tasks in the following steps, see the IBM® Security Identity Governance and Intelligence product documentation.

To enable the read-from and write-to channels, and to set the change log synchronization schedule for each new connector, complete these steps in Verify Governance V5.2.3:

1. Log in to the Verify Governance Administration Console.
2. From the Administration Console, select **Enterprise Connectors**.
3. Select **Manage > Connectors**.
A list of connectors is displayed on the **Connectors** tab.
4. Optional: Click **Filter** to toggle the filter on to refine your search results, or click **Hide Filter** to toggle the filter off. When the filter is visible, you can specify search criteria for your requests, and then click **Search**.
5. Optional: To view all of the columns in the list of connectors, expand the **Connectors** pane.
6. Select the connector that you want to enable.
7. On the **Connector Details** tab, complete these steps:
 - a) Select the channel modes that you want to enable, and then click **Save**. Depending on the channels that you enable, the corresponding **Channel** tabs are displayed, in which you can do more configuration, such as mapping attributes and setting up rules.

Enable write-to channel

Propagates every change in the Access Governance Core repository into the target system.

Enable read-from channel

Reads the INPUT EVENTS and USER DATA from the target system. Imports data from the target system to the Access Governance Core repository.

Enable reconciliation

Synchronizes the modified data between the Access Governance Core repository and the target system.

8. Select **Monitor > Change Log Sync Status**.

A list of connectors is displayed.

9. On the **Change Log Sync Status** tab, complete these steps:

- a) Optional: Click **Filter** to toggle the filter on to refine your search results, or click **Hide Filter** to toggle the filter off. When the filter is visible, you can specify search criteria for your requests, and then click **Search**.
- b) Select a connector, and click **Actions > Sync Now**.
The synchronization process begins.
- c) Optional: To view the status of the synchronization request, select **Sync History** in the right pane. Information about the synchronization is displayed in the **Sync History** tab.

10. Set the change log synchronization schedule for each new connector that you migrated.

11. When the connector configuration is complete, enable the connector by completing these steps:

- a) Select **Manage > Connectors**.
- b) Select the connector that you want to enable, and then select the **Enable** check box in the **Connector Details** tab.
- c) Click **Save**.

For more information, see [“Enabling connectors” on page 14](#).

For Identity Brokerage connectors that are not HR feed, the check boxes for enabling the read-from channel and the write-to channel are available.

For Identity Brokerage HR feed connectors, only the check box for enabling the read-from channel is available.

12. Start the connector by selecting **Monitor > Connector Status**. Select the connector that you want to start, and then select **Actions > Start**.

Related concepts

[Verifying the adapter installation](#)

If the adapter is installed correctly, the following directories exist in the adapter installation directory.

[Service/Target form details](#)

Complete the service/target form fields.

Related tasks

[Installing the adapter](#)

You can use these steps to install the adapter.

[Restarting the adapter service](#)

Perform the following steps to start and stop the SQL Server Adapter service.

[Importing the adapter profile](#)

You can import a profile definition file, which creates a profile in Identity server. Use this option for importing adapter profiles.

[Importing attribute mapping file](#)

After importing the adapter profile, you must import an attribute map from a profile mapping definition file.

[Adding a connector](#)

After you import the adapter profile on the Verify Governance server, add a connector so that Verify Governance server can communicate with the managed resource.

Enabling connectors

After you create a connector, by default it is in a disabled state. You must enable a connector to use it.

Attribute Mapping

Attribute mapping is required to define which target attributes correspond to the Verify Governance account attributes.

Verifying that the adapter is working correctly

After you install and configure the adapter, verify that the installation and configuration are correct.

Attribute Mapping

Attribute mapping is required to define which target attributes correspond to the Verify Governance account attributes.

This task involves an account attribute mapping definition file, which is included in the adapter package.

The file consists of Verify Governance account attributes and their equivalent attributes in the managed target. The file is structured as `<IGI_attribute> = <target_attribute>`.

The `<IGI_attribute>` is fixed and must not be modified. Edit only the `<target_attribute>`. Some `<IGI_attribute>` already has a fixed equivalent `<target_attribute>` of `eraccount`.

Some `<IGI_attribute>` do not have a defined `<target_attribute>` and you can assign the mapping. For example:

```
USER_TYPE=USER_TYPE
ATTR1=ATTR1
```

Note:

- The default mapping is already included out-of-the box. If there are no changes to the attribute mapping, there is no need to import the attribute mapping files.
 - It might take up to 10 minutes for the attribute mapping changes to take effect once the file is imported.
1. Open the mapping definition file by using any text editor.
 2. Edit the mapping.
 3. If the target attribute has a list of predefined values, use the following syntax to convert its values to the corresponding Verify Governance attribute values.

```
[conversion].<target_attribute>.<IGI_attribute> =
[<target_attribute_value1>=<IGI_attribute_value1>;...;
<target_attribute_valuen>=<IGI_attribute_valuen>]
```

4. For attributes that contains date and time, use the following syntax to convert its values.
For example:

```
[conversion.date].erbirthDate.BIRTHDAY=[yyyyMMdd=dd/MM/yyyy HH:mm:ss]
[conversion.date].ACCOUNT_EXPIRY_DATE.ACCOUNT_EXPIRY_DATE=
[dd/MM/yyyy HH:mm:ss=dd/MM/yyyy HH:mm:ss]
```

5. Import the updated mapping definition file through the Enterprise Connectors module. For more information, see *Attribute-to-permission mapping service* in the IBM Security Verify Governance product documentation.
6. Map the following attributes for **Chanel-Write To** and **Chanel-Read From**

Attribute	Mapped Attribute
eruid	CODE
erpassword	PASSWORD

For more information, see *Mapping attributes for a connector* in the IBM Security Verify Governance product documentation.

[Enabling connectors](#)

After you create a connector, by default it is in a disabled state. You must enable a connector to use it.

[Reviewing and setting channel modes for each new connector](#)

Use this procedure to set up the read-from and write-to channels and to set the synchronization schedule for each new connector.

[Verifying that the adapter is working correctly](#)

After you install and configure the adapter, verify that the installation and configuration are correct.

Service/Target form details

Complete the service/target form fields.

On the General Information tab:

Service Name

Specify a name that defines the adapter service on the Identity server.

Description

Optional. Specify a description that identifies the service for your environment.

URL

Specify the location and port number of the SQL Server Adapter. The port number is defined in the protocol configuration by using the `agentCfg` program.

User ID

Specify a Directory Access Markup Language (DAML) protocol user name. The user name is defined in the protocol configuration by using the `agentCfg` program.

Password

Specify the password for the DAML protocol user name. This password is defined in the protocol configuration by using the `agentCfg` program. For more information about the protocol configuration settings, see [“Modifying protocol configuration settings” on page 27](#).

Owner

Optional: Specify the service owner, if any.

Service Prerequisite

Optional: Specify an existing service that is a prerequisite for the SQL server service.

SQL Server Name

Specify the instance name of SQL Server to be managed by this SQL Server Service. The instance name value is an IP address or host name.

Note: If Always On feature is enabled on your setup, then provide the Listener's VNN (Virtual Network Name) or Listener's IP address. Listener IP enables a client to connect to the current primary SQL instance.

SQL Admin Account

Specify the SQL Server instance administrator account name.

SQL Admin Password

Specify the SQL Server instance administrator account password.

Authentication

Specify an authentication mode by which the adapter connects to the SQL Server. From the dropdown menu, accept the default selection, **SQL Server Authentication**, or select **Windows Authentication**. With SQL Server authentication, the adapter uses the values from the **SQL Admin Account** and **SQL Admin Password** attributes for authentication.

With Windows authentication, the adapter uses the Windows account of the SQL Server Adapter windows service. The adapter uses the value from the **Log On As** attribute of the SQL Server Adapter Windows service. With Windows authentication, the adapter does not use the values from **SQL Admin Account** and **SQL Admin Password** attributes for authentication.

LocalSystem is the default Windows account of a SQL Server Adapter Windows service after the adapter installation. Change the Log On account to a domain Windows account that is also a member of the sysadmin Server role in the SQL Server instance to which the adapter is connecting. For example, DOMAIN\user.

Use SSL for Adapter to SQL Server Connection

Click this check box to use SSL communication between the adapter and the SQL Server. See your SQL Server product documentation to set up secure communication (SSL) between SQL Client and SQL Server. Only Windows authentication can be used with SSL. SSL Communication with SQL authentication is not supported.

Note: SSL is not supported by all versions of SQL Server. See your SQL Server product documentation before you configure the adapter to use SSL with the SQL Server.

On the Status and information tab

This page contains read only information about the adapter and managed resource. These fields are examples. The actual fields vary depending on the type of adapter and how the service form is configured. The adapter must be running to obtain the information. Click **Test Connection** to populate the fields.

Last status update: Date

Specifies the most recent date when the Status and information tab was updated.

Last status update: Time

Specifies the most recent time of the date when the Status and information tab was updated.

Managed resource status

Specifies the status of the managed resource that the adapter is connected to.

Adapter version

Specifies the version of the adapter that the service uses to provision request to the managed resource.

Profile version

Specifies the version of the profile that is installed in the Identity server.

ADK version

Specifies the version of the ADK that the adapter uses.

Installation platform

Specifies summary information about the operating system where the adapter is installed.

Adapter account

Specifies the account that running the adapter binary file.

Adapter up time: Date

Specifies the date when the adapter started.

Adapter up time: Time

Specifies the time of the date when the adapter started.

Adapter memory usage

Specifies the memory usage for running the adapter.

If the connection fails, follow the instructions in the error message. Also,

- Verify the adapter log to ensure that the test request was sent successfully to the adapter.
- Verify the adapter configuration information.
- Verify service parameters for the adapter profile. For example, verify the work station name or the IP address of the managed resource and the port.

Attribute mapping is required to define which target attributes correspond to the Verify Governance account attributes.

Chapter 4. Upgrading

You can upgrade either the SQL Server Adapter or the Adapter Development Kit (ADK).

Upgrading the adapter, as opposed to reinstalling it, allows you to keep your configuration settings. Additionally, you do not have to uninstall the current adapter and install the newer version.

Note: If your existing adapter version is earlier than 5.0, you must uninstall the older version of the adapter before you can install the 5.0 adapter. You cannot migrate from an earlier version to 5.0 because the encryption used in the 5.0 release is not compatible with previous ADK versions. Any previously encrypted values cannot be read by the 5.0 adapter.

The ADK is the base component of the adapter. While all adapters have the same ADK, the remaining adapter functionality is specific to the managed resource. You can perform an adapter upgrade to migrate your current adapter installation to a newer version, for example version 5.0 to version 5.x.

If only a code fix has been made to the ADK, instead of upgrading the entire adapter, you can upgrade just the ADK to the newer version. See [“Upgrading the ADK”](#) on page 23.

Upgrading the SQL Server Adapter

For adapter versions 5 and higher, use the adapter upgrade option:

- If you want to keep the adapter configuration (registry keys and certificates) unchanged.
- If the installed adapter is FIPS enabled. The Update Installation option keeps FIPS configurations such as the CA certificates, `fipsdata.txt` (the key generated by running `fipsenable.exe`) and the registry keys encrypted with `fipsdata.txt` unchanged.

If update installation option is selected, the path of the existing installed adapter is required. The installer replaces the binaries and the DLLs of the adapter and the ADK. The installer does not prompt for any configuration information during an update installation.

Note: Adapter related registry keys are not modified. The update installation does not create a new service for the adapter.

During an upgrade, in order to maintain all of your current configuration settings, as well as the certificate and private key, do not uninstall the old version of the adapter before installing the new version. During the install, specify the same installation directory where the previous adapter was installed.

In order to upgrade an existing adapter, complete the following steps:

1. Stop the SQL Server Adapter service.
2. Install the new version of the adapter.

When the upgraded adapter starts for the first time, new log files will be created, replacing the old files.

The adapter installer allows an update installation of the adapter, for adapters versions 5.0 or later.

Upgrading the ADK

You can use the ADK upgrade program to update the ADK portion of the adapters that are currently installed on a workstation.

This allows you to install just the ADK, and not the entire adapter. As part of the ADK upgrade, the ADK library and the DAML protocol library are updated. In addition, the **agentCfg** and `certTool` binaries are updated.

Note: Upgrading the ADK from versions 4.5 or 4.6 to 5.0 or a higher version is not supported.

The ADK consists of the runtime library, filtering and event notification functionality, protocol settings, and logging information. The remainder of the adapter is comprised of the Add, Modify, Delete, and Search

functions. While all adapters have the same ADK, the remaining functionality is specific to the managed resource.

Before upgrading the ADK files, the upgrade program checks the current version of the ADK. A warning message occurs if the current level is higher than what you are attempting to install.

To upgrade the SQL Server Adapter ADK, complete the following steps:

1. Download the ADK upgrade program compressed file from the IBM Web site.
2. Extract the contents of the compressed file into a temporary directory.
3. Stop the SQL Server Adapter service.
4. Start the upgrade program using the `adkinst_win32.exe` file in the temporary directory. For example, select **Run** from the **Start** menu, and type `C:\TEMP\adkinst_win32.exe` in the **Open** field.

If no adapter is installed, you will receive the following error message, and the program exits:

```
No Agent Installed - Cannot Install ADK.
```

5. In the Welcome window, click **Next**.
6. In the Software License Agreement window, review the license agreement and decide if you accept the terms of the license. If you do, click **Accept**.
7. On the Installation Information window, click **Next** to begin the installation.
8. On the Install Completed window, click **Finish** to exit the program.

Location of the ADK log files

Logging entries are stored in the `ADKVersionInstaller.log` and `ADKVersionInstalleropt.log` files, where *ADKVersion* is the version of the ADK. For example, `ADK50Installer.log` and `ADK50Installeropt.log`.

These files are created in the folder where you run the installation program.

Chapter 5. Configuring

After you install the adapter, configure it to function correctly. Configuration is based on your requirements or preference.

Configuring the adapter

After you install the adapter, configure the adapter to function correctly.

Note: The screens in these tasks are examples. The actual screens might differ.

To configure the adapter, take the following steps:

1. Start the adapter service. Use the Windows Services tool.
2. Configure the Directory Access Markup Language (DAML) protocol for the adapter to establish communication with the Identity server.
3. Configure the adapter for event notification.
4. Install a certificate on the workstation where the adapter is installed and also on the Identity server to establish secure communication between them.
5. Install the adapter profile on the Identity server.
6. Configure the adapter service form.
7. Use the adapter configuration program, **agentCfg**, to view or modify the adapter parameters.
8. Configure the adapter account form.
9. Restart the adapter service after you modify the adapter configuration settings.

Starting the adapter configuration tool

Start the **agentCfg** tool to access the configuration menu, where you can modify the different adapter parameters.

Note: The screens displayed in the tasks topics are examples. Information in the actual screens might be different.

1. Browse to the Windows Command Prompt.
2. In the command prompt, change to the read/write /bin subdirectory of the adapter. If the adapter is installed in the default location for the read/write directory, run the following command.

```
cd C:\Program Files\IBM\ISIM\Agents\adapter_name\bin\
```

3. Run the following command

```
agentCfg -agent adapterAGNT
```

4. At the **Enter configuration key for Agent 'adapterAGNT'**, type the configuration key for the adapter.

The default configuration key is agent.

Note: To prevent unauthorized access to the configuration of the adapter, you must modify the configuration key after the adapter installation completes..

The **Agent Main Configuration Menu** is displayed.

Agent Main Configuration Menu

- A. Configuration Settings.
- B. Protocol Configuration.
- C. Event Notification.
- D. Change Configuration Key.
- E. Activity Logging.
- F. Registry Settings.
- G. Advanced Settings.
- H. Statistics.
- I. Codepage Support.

X. Done.

Select menu option:

The following table lists the different options available in the **Agent Main Configuration Menu**.

Option	Configuration task
A	Viewing configuration settings
B	Changing protocol configuration settings
C	Configuring event notification
D	Changing the configuration key
E	Changing activity logging settings
F	Changing registry settings
G	Changing advanced settings
H	Viewing statistics
I	Changing code page settings

Viewing configuration settings

View the adapter configuration settings for information about the adapter, including version, ADK version, and adapter log file name.

1. Access the **Agent Main Configuration** menu.
2. Type A to display the configuration settings for the adapter.

Configuration Settings

```
-----  
Name           : adapter_nameAgent  
Version        : 6.0.4.1200  
ADK Version    : 6.0.1017  
ERM Version    : 6.0.4.1200  
Adapter Events :  
License       : NONE  
Asynchronous ADD Requests : (Max.Threads:3)  
Asynchronous MOD Requests : (Max.Threads:3)  
Asynchronous DEL Requests : (Max.Threads:3)  
Asynchronous SEA Requests : (Max.Threads:3)  
Available Protocols : DAML  
Configured Protocols : DAML  
Logging Enabled : TRUE  
Logging Directory : C:\Program Files\IBM\ISIM\Agents\adapter_name\log  
Log File Name : adapter_name.log  
Max. log files : 3  
Max.log file size (Mbytes) : 1  
Debug Logging Enabled : TRUE  
Detail Logging Enabled : FALSE  
Thread Logging Enabled : FALSE
```

Press any key to continue

3. Press any key to return to the **Main** menu.

Modifying protocol configuration settings

The adapter uses the DAML protocol to communicate with the Identity server.

By default, when the adapter is installed, the DAML protocol is configured for a nonsecure environment. To configure a secure environment, use Secure Socket Layer (SSL) and install a certificate.

The DAML protocol is the only supported protocol that you can use. Do not add or remove a protocol.

1. Access the Agent Main Configuration menu.
2. Type B. The DAML protocol is configured and available by default for the adapter.

```
Agent Protocol Configuration Menu
-----
Available Protocols: DAML
Configured Protocols: DAML
A. Add Protocol.
B. Remove Protocol.
C. Configure Protocol.

X. Done

Select menu option
```

3. At the Agent Protocol Configuration menu, type C to display the Configure Protocol Menu.

```
Configure Protocol Menu
-----
A. DAML

X. Done

Select menu option:
```

4. Type a letter to display the Protocol Properties menu for the configured protocol with protocol properties.

The following screen is an example of the DAML protocol properties.

```
DAML Protocol Properties
-----
A. USERNAME          ***** ;Authorized user name.
B. PASSWORD          ***** ;Authorized user password.
C. MAX_CONNECTIONS  100      ;Max Connections.
D. PORTNUMBER        45580    ;Protocol Server port number.
E. USE_SSL           FALSE    ;Use SSL secure connection.
F. SRV_NODENAME      ----- ;Event Notif. Server name.
G. SRV_PORTNUMBER    9443     ;Event Notif. Server port number.
H. HOSTADDR          ANY      ;Listen on address < or "ANY" >
I. VALIDATE_CLIENT_CE FALSE   ;Require client certificate.
J. REQUIRE_CERT_REG  FALSE   ;Require registered certificate.
K. READ_TIMEOUT      0        ;Socket read timeout (seconds)
L. MIN_TLS_LEVEL     1.0      ;Minimum TLS level (0 for none)
X. Done

Select menu option:
```

5. Follow these steps to change a protocol value:

- Type the letter of the menu option for the protocol property to configure. The following table describes each property.
- Take one of the following actions:
 - Change the property value and press **Enter** to display the Protocol Properties menu with the new value.
 - If you do not want to change the value, press **Enter**.

<i>Table 5. Options for the DAML protocol menu</i>	
Option	Configuration task
A	<p>Displays the following prompt:</p> <p>Modify Property 'USERNAME' :</p> <p>Type a user ID, for example, agent. The Identity server uses this value to connect to the adapter. The default user ID is agent.</p>
B	<p>Displays the following prompt:</p> <p>Modify Property 'PASSWORD' :</p> <p>Type a password, for example, agent. The Identity server uses this value to connect to the adapter. The default password is agent.</p>
C	<p>Displays the following prompt:</p> <p>Modify Property 'MAX_CONNECTIONS' :</p> <p>Enter the maximum number of concurrent open connections that the adapter supports. The default number is 100.</p>
D	<p>Displays the following prompt:</p> <p>Modify Property 'PORTNUMBER' :</p> <p>Type a different port number.</p> <p>This value is the port number that the Identity server uses to connect to the adapter. The default port number is 45580.</p>
E	<p>Displays the following prompt:</p> <p>Modify Property 'USE_SSL' :</p> <p>TRUE specifies to use a secure SSL connection to connect the adapter. If you set USE_SSL to TRUE, you must install a certificate. FALSE, the default value, specifies not to use a secure SSL connection.</p> <p>Note: By default event notification requires USE_SSL set to TRUE. To use event notification, you must set USE_SSL to TRUE and add a certificate and key from the PKCS12 file in the adapter.</p>
F	<p>Displays the following prompt:</p> <p>Modify Property 'SRV_NODENAME' :</p> <p>Type a server name or an IP address of the workstation where you installed the Identity server.</p> <p>This value is the DNS name or the IP address of the Identity server that is used for event notification and asynchronous request processing.</p> <p>Note: If your operating system supports Internet Protocol version 6 (IPv6) connections, you can specify an IPv6 server.</p>
G	<p>Displays the following prompt:</p> <p>Modify Property 'SRV_PORTNUMBER' :</p> <p>Type a different port number to access the Identity server.</p> <p>The adapter uses this port number to connect to the Identity server. The default port number is 9443.</p>

<i>Table 5. Options for the DAML protocol menu (continued)</i>	
Option	Configuration task
H	<p>The HOSTADDR option is useful when the system where the adapter is running has more than one network adapter. You can select which IP address the adapter must listen to.</p> <p>The default value is ANY.</p>
I	<p>Displays the following prompt:</p> <p>Modify Property 'VALIDATE_CLIENT_CE':</p> <p>Specify TRUE for the Identity server to send a certificate when it communicates with the adapter. When you set this option to TRUE, you must configure options D through I.</p> <p>Specify FALSE, the default value to enable the Identity server to communicate with the adapter without a certificate.</p> <p>Note:</p> <ul style="list-style-type: none"> – The property name is VALIDATE_CLIENT_CERT; however, it is truncated by the agentCfg to fit in the screen. – You must use certTool to install the appropriate CA certificates and optionally register the Identity server certificate.
J	<p>Displays the following prompt:</p> <p>Modify Property 'REQUIRE_CERT_REG':</p> <p>This value applies when option I is set to TRUE.</p> <p>Type TRUE to register the adapter with the client certificate from the Identity server before it accepts an SSL connection.</p> <p>Type FALSE to verify the client certificate against the list of CA certificates. The default value is FALSE.</p>
K	<p>Displays the following prompt:</p> <p>Modify Property 'READ_TIMEOUT':</p> <p>Type the timeout value in seconds for IBM Security Verify Governance and the adapter connection.</p> <p>This option applies to setups that have a firewall between IBM Security Verify Governance and the adapter. This firewall has a timeout value that is less than the maximum connection age DAML property on IBM Security Verify Governance. When your transactions run longer than the firewall timeout, the firewall terminates the connection. The sudden termination of connections might leave the adapter with incorrect connection threads causing the adapter to crash.</p> <p>When the adapter halts randomly because of the specified setup, change the value for the READ_TIMEOUT. The value must be in seconds and less than the timeout value of the firewall.</p>

<i>Table 5. Options for the DAML protocol menu (continued)</i>	
Option	Configuration task
L	<p>This option controls the minimum TLS level that is used when SSL is enabled. The setting supersedes the values <code>DISABLE_SSLV3</code> and <code>DISABLE_TLS10</code>. The valid settings for this value are:</p> <ul style="list-style-type: none"> – 0: No restrictions. This setting allows SSLV3 connections which are known to have vulnerabilities. – 1.0: TLS 1.0 and higher are supported. – 1.1: TLS 1.1 and higher are supported. – 1.2: TLS 1.2 and higher are supported. – 1.3: TLS 1.3 and higher are supported. <p>For backward compatibility, if <code>MIN_TLS_LEVEL</code> is not set, it will be set at startup based on the settings of <code>DISABLE_SSLV3</code> and <code>DISABLE_TLS10</code>.</p>

6. Follow these steps at the prompt:

- Change the property value and press **Enter** to display the Protocol Properties menu with the new value.
- If you do not want to change the value, press **Enter**.

7. Repeat step 5 to configure the other protocol properties.

8. At the Protocol Properties menu, type X to exit.

Related concepts

[“SSL certificate management with certTool” on page 42](#)

Use the certTool utility to manage private keys and certificates.

[“Configuring SSL authentication” on page 37](#)

You can provide SSL authentication, certificates, and enable SSL authentication with the certTool utility.

Related tasks

[“Starting the adapter configuration tool” on page 25](#)

Start the **agentCfig** tool to access the configuration menu, where you can modify the different adapter parameters.

[“Installing the certificate” on page 45](#)

After you receive your certificate from your trusted CA, install it in the registry of the adapter.

Changing the configuration key

Use the configuration key as a password to access the configuration tool for the adapter.

1. Access the **Agent Main Configuration Menu**.
2. At the **Main Menu** prompt, type D.
3. Do one of the following actions:
 - Change the value of the configuration key and press Enter. The default configuration key is **agent**. Ensure that your password is complex.
 - Press **Enter** to return to the **Main Configuration Menu** without changing the configuration key.

The following message is displayed:

```
Configuration key is successfully changed.
```

The configuration program returns to the **Main Menu** prompt.

Related tasks

[“Starting the adapter configuration tool” on page 25](#)

Start the **agentCfg** tool to access the configuration menu, where you can modify the different adapter parameters.

Changing activity log settings

When you enable logging, the adapter maintains a log file of all transactions, *adapter_nameAgent.log*. By default, the log file is in the `\log` directory.

To change the adapter **activity logging** settings, take the following steps:

1. Access the Agent Main Configuration menu.
2. At the **Main Menu** prompt, type E to display the Agent Activity Logging menu. The following screen displays the default **activity logging** settings.

```
Agent Activity Logging Menu
-----
A. Activity Logging (Enabled).
B. Logging Directory (current: C:\Program Files\IBM\ISIM\Agents\adapter_nameAgent\log).
C. Activity Log File Name (current: adapter_nameAgent.log).
D. Activity Logging Max. File Size ( 1 mbytes)
E. Activity Logging Max. Files ( 3 )
F. Debug Logging (Enabled).
G. Detail Logging (Disabled).
H. Base Logging (Disabled).
I. Thread Logging (Disabled).
X. Done
Select menu option:
```

3. Perform one of the following steps:
 - Type the value for menu option B, C, D, or E and press **Enter**. The other options are changed automatically when you type the corresponding letter of the menu option. The following table describes each option.
 - Press **Enter** to return to the Agent Activity Logging menu without changing the value.

Note: Ensure that Option A is enabled for the values of other options to take effect.

Table 6. Options for the activity logging menu	
Option	Configuration task
A	<p>Set this option to enabled to have the adapter maintain a dated log file of all transactions.</p> <p>When the option is set to:</p> <ul style="list-style-type: none"> • Disabled, pressing the A to key changes to enabled. • Enabled, pressing the A to key changes to disabled. <p>Type A to toggle between the options.</p>
B	<p>Displays the following prompt:</p> <pre>Enter log file directory:</pre> <p>Type a different value for the logging directory, for example, C:\Log. When the logging option is enabled, details about each access request are stored in the logging file that is in this directory.</p>
C	<p>Displays the following prompt:</p> <pre>Enter log file name:</pre> <p>Type a different value for the log file name. When the logging option is enabled, details about each access request are stored in the logging file.</p>

Option	Configuration task
D	<p>Displays the following prompt:</p> <pre data-bbox="511 283 1039 325">Enter maximum size of log files (mbytes):</pre> <p>Type a new value such as 10. The oldest data is archived when the log file reaches the maximum file size. File size is measured in megabytes. It is possible for the activity log file size to exceed disk capacity.</p>
E	<p>Displays the following prompt:</p> <pre data-bbox="511 525 1071 556">Enter maximum number of log files to retain:</pre> <p>Type a new value up to 99 such as 5. The adapter automatically deletes the oldest activity logs beyond the specified limit.</p>
F	<p>If this option is set to enabled, the adapter includes the debug statements in the log file of all transactions.</p> <p>When the option is set to:</p> <ul data-bbox="503 808 1218 871" style="list-style-type: none"> • Disabled, pressing the F key changes the value to enabled. • Enabled, pressing the F key changes the value to disabled. <p>Type F to toggle between the options.</p>
G	<p>If this option is set to enabled, the adapter maintains a detailed log file of all transactions. The detail logging option must be used for diagnostic purposes only. Detailed logging enables more messages from the adapter and might increase the size of the logs.</p> <p>When the option is set to:</p> <ul data-bbox="503 1144 1218 1207" style="list-style-type: none"> • Disabled, pressing the G key changes the value to enabled. • Enabled, pressing the G key changes the value to disabled. <p>Type G to toggle between the options.</p>
H	<p>If this option is set to enabled, the adapter maintains a log file of all transactions in the Adapter Development Kit (ADK) and library files. Base logging substantially increases the size of the logs.</p> <p>When the option is set to:</p> <ul data-bbox="503 1449 1218 1512" style="list-style-type: none"> • Disabled, pressing the H key changes the value to enabled. • Enabled, pressing the H key changes the value to disabled. <p>Type H to toggle between the options.</p>
I	<p>If this option is enabled, the log file contains thread IDs, in addition to a date and timestamp on every line of the file.</p> <p>When the option is set to:</p> <ul data-bbox="503 1722 1218 1785" style="list-style-type: none"> • Disabled, pressing the I key changes the value to enabled. • Enabled, pressing the I key changes the value to disabled. <p>Type I to toggle between the options.</p>

Modifying registry settings

Use the **Agent Registry Menu** to change the adapter registry settings.

1. Type F (Registry Settings) at the main menu prompt to display the Registry menu:

```
adapter_name and version Agent Registry Menu
-----
A. Modify Non-encrypted registry settings.
B. Modify encrypted registry settings.
C. Multi-instance settings.
X. Done
Select menu option:
```

2. See the following procedures for modifying registry settings.

Modifying advanced settings

You can change the adapter thread count settings.

You can change the thread count settings for the following types of requests:

- System Login Add
- System Login Change
- System Login Delete
- Reconciliation

These settings determine the maximum number of requests that the adapter processes concurrently. To change these settings, take the following steps:

1. Access the Agent Main Configuration menu.
2. At the **Main Menu** prompt, type G to display the Advanced Settings menu.

The following screen displays the default thread count settings.

```
adapter_name and version number Advanced settings menu
-----
A. Single Thread Agent (current:FALSE)
B. ADD max. thread count. (current:3)
C. MODIFY max. thread count. (current:3)
D. DELETE max. thread count. (current:3)
E. SEARCH max. thread count. (current:3)
F. Allow User EXEC procedures (current:FALSE)
G. Archive Request Packets (current:FALSE)
H. UTF8 Conversion support (current:TRUE)
I. Pass search filter to agent (current:FALSE)
J. Thread Priority Level (1-10) (current:4)
X. Done
Select menu option:
```

Option	Description
A	Forces the adapter to allow only 1 request at a time. The default value is FALSE.
B	Limits the number of ADD requests that can run simultaneously. The default value is 3.
C	Limits the number of MODIFY requests that can run simultaneously. The default value is 3.

<i>Table 7. Options for advanced settings menu (continued)</i>	
Option	Description
D	Limits the number of DELETE requests that can run simultaneously. The default value is 3.
E	Limits the number of SEARCH requests that can run simultaneously. The default value is 3.
F	Determines whether the adapter can do the pre-exec and post-exec functions. The default value is FALSE. Note: Enabling this option is a potential security risk.
G	This option is no longer supported.
H	This option is no longer supported.
I	Currently, this adapter does not support processing filters directly. This option must always be FALSE.
J	Sets the thread priority level for the adapter. The default value is 4.

3. Type the letter of the menu option that you want to change.
4. Change the value and press Enter to display the Advanced Settings menu with new settings.

Related tasks

“Starting the adapter configuration tool” on [page 25](#)

Start the **agentCfg** tool to access the configuration menu, where you can modify the different adapter parameters.

Viewing statistics

You can view an event log for the adapter.

1. Access the **Agent Main Configuration Menu**.
2. At the **Main Menu** prompt, type H to display the activity history for the adapter.

```

Agent Request Statistics
-----
Date      Add      Mod      Del      Ssp      Res      Rec
-----
02/15/06 000001  000000  000000  000000  000000  000001
-----
X. Done

```

3. Type X to return to the **Main Configuration Menu**.

“Starting the adapter configuration tool” on [page 25](#)

Start the **agentCfg** tool to access the configuration menu, where you can modify the different adapter parameters.

Modifying code page settings

You can change the code page settings for the adapter.

To list the supported code page information for the adapter, the adapter must be running. Run the following command to view the code page information:

```
agentCfg -agent [adapter_name] -codepages
```

1. Access the Agent Main Configuration menu.
2. At the **Main Menu** prompt, type I to display the Code Page Support menu.

```
adapter_name and version number Codepage Support Menu
-----
* Configured codepage: US-ASCII
-----
*
*****
* Restart Agent After Configuring Codepages
*****
A. Codepage Configure.
X. Done
Select menu option:
```

3. Type A to configure a code page.
Note: The code page uses Unicode, therefore this option is not applicable.
4. Type X to return to the Main Configuration menu.

Related tasks

[“Starting the adapter configuration tool” on page 25](#)

Start the **agentCfg** tool to access the configuration menu, where you can modify the different adapter parameters.

Accessing help and other options

Access the **agentCfg** help menu to view the list of available argument that you can use.

Note: The screens displayed in the tasks topics are examples. Information in the actual screens might be different.

1. Access the **Agent Main Configuration Menu**.
2. Type X to display the command prompt.
3. Type **agentCfg -help** at the prompt to display the help menu and list of arguments.

```
Usage:
-version                ;Show version
-hostname <value>      ;Target nodename to connect to (Default:Local host IP address)
-findall                ;Find all agents on target node
-list                  ;List available agents on target node
-agent <value>         ;Name of agent
-tail                  ;Display agent's activity log
-portnumber <value>    ;Specified agent's TCP/IP port number
-netsearch <value>     ;Lookup agents hosted on specified subnet.
-codepages              ;Display list of available codepages.
-help                  ;Display this help screen
```

The following table describes each argument.

<i>Table 8. Arguments and descriptions for the agentCfg help menu</i>	
Argument	Description
-version	Use this argument to display the version of the agentCfg tool.
-hostname <i>value</i>	Use the -hostname argument with one of the following arguments to specify a different host: <ul style="list-style-type: none"> • -findall • -list • -tail • -agent Enter a host name or IP address as the value.
-findall	Use this argument to search and display all port addresses 44970 - 44994 and their assigned adapter names. This option times out the unused port numbers, therefore, it might take several minutes to complete. Add the -hostname argument to search a remote host.
-list	Use this argument to display the adapters that are installed on the local host of the adapter. By default, the first time you install an adapter, it is either assigned to port address 44970 or to the next available port number. You can then assign all the later installed adapters to the next available port address. After the software finds an unused port, the listing stops. Use the -hostname argument to search a remote host.
-agent <i>value</i>	Use this argument to specify the adapter that you want to configure. Enter the adapter name as the value. Use this argument with the -hostname argument to modify the configuration setting from a remote host. You can also use this argument with the -tail argument.
-tail	Use this argument with the -agent argument to display the activity log for an adapter. Add the -hostname argument to display the log file for an adapter on a different host.
-portnumber <i>value</i>	Use this argument with the -agent argument to specify the port number that is used for connections for the agentCfg tool.
-netsearch <i>value</i>	Use this argument with the -findall argument to display all active adapters on the managed resource. You must specify a subnet address as the value.
-codepages	Use this argument to display a list of available code pages.
-help	Use this argument to display the Help information for the agentCfg command.

4. Type **agentCfg** before each argument that you want to run, as shown in the following examples.

agentCfg -list

Displays:

- A list of all the adapters on the local host.
- The IP address of the host.
- The IP address of the local host.
- The node on which the adapter is installed.

The default node for the Identity server must be 44970. The output is similar to the following example:

```
Agent(s) installed on node '127.0.0.1'
-----
adapterAGNT   (44970)
```

agentCfg -agent adapterAGNT

Displays the main menu of the **agentCfg** tool, which you can use to view or modify the adapter parameters.

agentCfg -list -hostname 192.9.200.7

Displays a list of the adapters on a host with the IP address 192.9.200.7. Ensure that the default node for the adapter is 44970. The output is similar to the following example:

```
Agent(s) installed on node '192.9.200.7'
-----
agentname     (44970)
```

agentCfg -agent adapterAGNT -hostname 192.9.200.7

Displays the **agentCfg** tool **Main menu** for a host with the IP address 192.9.200.7. Use the menu options to view or modify the adapter parameters.

Configuring SSL authentication

You can provide SSL authentication, certificates, and enable SSL authentication with the certTool utility.

For secure connection between the adapter and the server, configure the adapter and the server to use the Secure Sockets Layer (SSL) authentication with the DAML default communication protocol. Typically, SSL is used to establish a secure connection that encrypts the data that is being exchanged. While it can assist in authentication, you must enable registered certificates in DAML to use SSL for authentication. By configuring the adapter for SSL, the server can verify the identity of the adapter before the server makes a secure connection.

You can configure SSL authentication for connections that originate from the Identity server or from the adapter. The Identity server initiates a connection to the adapter to set or retrieve the value of a managed attribute on the adapter. Depending on the security requirements of your environment, you might configure SSL authentication for connections that originate from the adapter. For example, adapter events can notify the Identity server of changes to attributes on the adapter. In this case, configure SSL authentication for web connections that originate from the adapter to the web server used by the Identity server.

In a production environment, you must enable SSL security. If an external application communicates with the adapter (for example, the Identity server) and uses server authentication, enable SSL on the adapter. Enabling SSL verifies the certificate that the application presents.

Running in SSL mode with Windows 2008

You can use Windows 2008 and run the adapter in Secure Socket Layer (SSL) mode.

Note: If you do not do these steps, the certificate is not installed completely and the SSL is not enabled. See http://en.wikipedia.org/wiki/User_Account_Control.

1. Disable the User Account Control (UAC) security.
2. Install the required certificate.
3. (Optional) If required, enable the UAC security.

Related concepts

“SSL certificate management with certTool” on page 42

Use the certTool utility to manage private keys and certificates.

Overview of SSL and digital certificates

In an enterprise network deployment, you must provide secure communication between the Identity server and the software products and components with which the server communicates.

SSL protocol uses signed digital certificates from a certificate authority (CA) for authentication. SSL secures communication in a configuration. SSL provides encryption of the data that is exchanged between the applications. Encryption makes data that is transmitted over the network intelligible only to the intended recipient.

Signed digital certificates enable two applications that connect in a network to authenticate their identity. An application that acts as an SSL server presents its credentials to verify to an SSL client. The SSL client then verifies that the application is the entity it claims to be. You can configure an application that acts as an SSL server so that it requires the application that acts as an SSL client to present its credentials in a certificate. In this way, the two-way exchange of certificates is completed. A third-party certificate authority issues signed certificates for a fee. Some utilities, such as those provided by OpenSSL, can also provide signed certificates.

You must install a certificate authority certificate (CA certificate) to verify the origin of a signed digital certificate. When an application receives a signed certificate from another application, it uses a CA certificate to verify the certificate originator. A certificate authority can be:

- Well-known and widely used by other organizations.
- Local to a specific region or a company.

Many applications, such as web browsers, use the CA certificates of well-known certificate authorities. Using a well-known CA eliminates or reduces the task of distributing CA certificates throughout the security zones in a network.

Private keys, public keys, and digital certificates

Keys, digital certificates, and trusted certificate authorities establish and verify the identities of applications.

SSL uses public key encryption technology for authentication. In public key encryption, a public key and a private key are generated for an application. The data encrypted with the public key can be decrypted only with corresponding private key. Similarly, the data encrypted with the private key can be decrypted only by using the corresponding public key. The private key is password-protected in a key database file. Only the owner can access the private key to decrypt messages that are encrypted with the corresponding public key.

A signed digital certificate is an industry-standard method of verifying the authenticity of an entity, such as a server, a client, or an application. To ensure maximum security, a third-party certificate authority provides a certificate. A certificate contains the following information to verify the identity of an entity:

Organizational information

This certificate section contains information that uniquely identifies the owner of the certificate, such as organizational name and address. You supply this information when you generate a certificate with a certificate management utility.

Public key

The receiver of the certificate uses the public key to decipher encrypted text that is sent by the certificate owner to verify its identity. A public key has a corresponding private key that encrypts the text.

Certificate authority's distinguished name

The issuer of the certificate identifies itself with this information.

Digital signature

The issuer of the certificate signs it with a digital signature to verify its authenticity. The corresponding CA certificate compares the signature to verify that the certificate is originated from a trusted certificate authority.

Web browsers, servers, and other SSL-enabled applications accept as genuine any digital certificate that is signed by a trusted certificate authority and is otherwise valid. For example, a digital certificate can be invalidated for the following reasons:

- The digital certificate expired.
- The CA certificate that is used to verify that it is expired.
- The distinguished name in the digital certificate of the server does not match with the distinguished name specified by the client.

Self-signed certificates

You can use self-signed certificates to test an SSL configuration before you create and install a signed certificate that is provided by a certificate authority.

A self-signed certificate contains a public key, information about the certificate owner, and the owner signature. It has an associated private key; however, it does not verify the origin of the certificate through a third-party certificate authority. After you generate a self-signed certificate on an SSL server application, you must:

1. Extract it.
2. Add it to the certificate registry of the SSL client application.

This procedure is equivalent to installing a CA certificate that corresponds to a server certificate. However, you do not include the private key in the file when you extract a self-signed certificate to use as the equivalent of a CA certificate.

Use a key management utility to:

- Generate a self-signed certificate.
- Generate a private key.
- Extract a self-signed certificate.
- Add a self-signed certificate.

Usage of self-signed certificates depends on your security requirements. To obtain the highest level of authentication between critical software components, do not use self-signed certificates or use them selectively. You can authenticate applications that protect server data with signed digital certificates. You can use self-signed certificates to authenticate web browsers or adapters.

If you are using self-signed certificates, you can substitute a self-signed certificate for a certificate and CA certificate pair.

Certificate and key formats

Certificates and keys are stored in the files with various formats.

.pem format

A privacy-enhanced mail (.pem) format file begins and ends with the following lines:

```
-----BEGIN CERTIFICATE-----  
-----END CERTIFICATE-----
```

A .pem file format supports multiple digital certificates, including a certificate chain. If your organization uses certificate chaining, use this format to create CA certificates.

.arm format

An `.arm` file contains a base-64 encoded ASCII representation of a certificate, including its public key, not a private key. The `.arm` file format is generated and used by the IBM Key Management utility.

.der format

A `.der` file contains binary data. You can use a `.der` file for a single certificate, unlike a `.pem` file, which can contain multiple certificates.

.pfx format (PKCS12)

A PKCS12 file is a portable file that contains a certificate and a corresponding private key. Use this format to convert from one type of SSL implementation to another. For example, you can create and export a PKCS12 file with the IBM Key Management utility. You can then import the file to another workstation with the certTool utility.

The use of SSL authentication

When you start the adapter, it loads the available connection protocols.

The DAML protocol is the only available protocol that supports SSL authentication. You can specify DAML SSL implementation.

The DAML SSL implementation uses a certificate registry to store private keys and certificates. The certTool key and certificate management tool manages the location of the certificate registry. You do not have to specify the location of the registry when you do certificate management tasks.

Configuring certificates for SSL authentication

You can configure the adapter for one-way or two-way SSL authentication with signed certificates.

Use the certTool utility for these tasks:

- [“Configuring certificates for one-way SSL authentication” on page 40](#)
- [“Configuring certificates for two-way SSL authentication” on page 41](#)
- [“Configuring certificates when the adapter operates as an SSL client” on page 42](#)

Configuring certificates for one-way SSL authentication

In this configuration, the Identity server and the adapter use SSL.

Client authentication is not set on either application. The Identity server operates as the SSL client and initiates the connection. The adapter operates as the SSL server and responds by sending its signed certificate to the Identity server. The Identity server uses the installed CA certificate to validate the certificate that is sent by the adapter.

In Figure 1 on page 40, Application A operates as the Identity server, and Application B operates as the adapter.

Figure 1. One-way SSL authentication (server authentication)

To configure one-way SSL, do the following tasks for each application:

1. On the adapter, complete these steps:

- a. Start the certTool utility.
 - b. To configure the SSL-server application with a signed certificate issued by a certificate authority:
 - i) Create a certificate signing request (CSR) and private key. This step creates the certificate with an embedded public key and a separate private key and places the private key in the PENDING_KEY registry value.
 - ii) Submit the CSR to the certificate authority by using the instructions that are supplied by the CA. When you submit the CSR, specify that you want the root CA certificate to be returned with the server certificate.
2. On the Identity server, do one of these steps:
- If you used a signed certificate that is issued by a well-known CA:
 - a. Ensure that the Identity server stored the root certificate of the CA (CA certificate) in its truststore.
 - b. If the truststore does not contain the CA certificate, extract the CA certificate from the adapter and add it to the truststore of the server.
 - If you generated the self-signed certificate on the Identity server, the certificate is installed and requires no additional steps.
 - If you generated the self-signed certificate with the key management utility of another application:
 - a. Extract the certificate from the keystore of that application.
 - b. Add it to the truststore of the Identity server.

Configuring certificates for two-way SSL authentication

In this configuration, the Identity server and adapter use SSL.

The adapter uses client authentication. After the adapter sends its certificate to the server, the adapter requests identity verification from the Identity server. The server sends its signed certificate to the adapter. Both applications are configured with signed certificates and corresponding CA certificates.

In the following figure, the Identity server operates as Application A and the adapter operates as Application B.

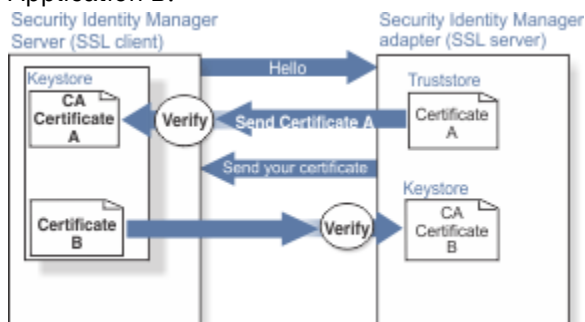

Figure 2. Two-way SSL authentication (client authentication)

Before you do the following procedure, configure the adapter and Identity server for one-way SSL authentication. If you use signed certificates from a CA:

- The CA provides a configured adapter with a private key and a signed certificate.
- The signed certificate of the adapter provides the CA certification for the Identity server.

To complete the certificate configuration for two-way SSL, do the following tasks:

1. On the Identity server, create a CSR and private key. Next, obtain a certificate from a CA, install the CA certificate, install the newly signed certificate, and extract the CA certificate to a temporary file.
2. On the adapter, add the CA certificate that was extracted from the keystore of the Identity server to the adapter.

After you configure the two-way certificate, each application has its own certificate and private key. Each application also has the certificate of the CA that issued the certificates.

[“Configuring certificates for one-way SSL authentication” on page 40](#)

In this configuration, the Identity server and the adapter use SSL.

Configuring certificates when the adapter operates as an SSL client

In this configuration, the adapter operates as both an SSL client and as an SSL server.

This configuration applies if the adapter initiates a connection to the web server (used by the Identity server) to send an event notification. For example, the adapter initiates the connection and the web server responds by presenting its certificate to the adapter.

Figure 3 on page 42 describes how the adapter operates as an SSL server and an SSL client.

To communicate with the Identity server, the adapter sends its certificate for authentication. To

communicate with the web server, the adapter receives the certificate of the web server.

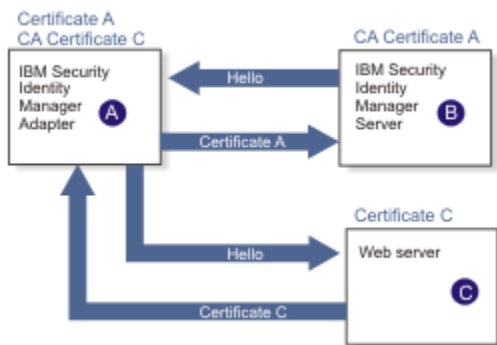

Figure 3. Adapter operating as an SSL server and an SSL client

If the web server is configured for two-way SSL authentication, it verifies the identity of the adapter. The adapter sends its signed certificate to the web server (not shown in the illustration). To enable two-way SSL authentication between the adapter and web server, take these steps:

1. Configure the web server to use client authentication.
2. Follow the procedure for creating and installing a signed certificate on the web server.
3. Install the CA certificate on the adapter with the certTool utility.
4. Add the CA certificate corresponding to the signed certificate of the adapter to the web server.

You can have the software send an event notification when the adapter initiates a connection to the web server (used by the Identity server).

SSL certificate management with certTool

Use the certTool utility to manage private keys and certificates.

Starting certTool

To start the certificate configuration tool named certTool for the adapter, complete these steps:

1. Click **Start > Programs > Accessories > Command Prompt**.
2. At a DOS command prompt, change to the bin directory for the adapter.
If the directory is in the default location, type the following command:

```
cd C:\Program Files\IBM\ISIM\Agents\adapter_name\bin\
```

3. Type `CertTool -agent agent_name` at the prompt.

For example, to display the main menu, type: `CertTool -agent NotesAgent`

```

Main menu - Configuring agent: agentnameAgent
-----
A. Generate private key and certificate request
B. Install certificate from file
C. Install certificate and key from PKCS12 file
D. View current installed certificate

E. List CA certificates
F. Install a CA certificate
G. Delete a CA certificate

H. List registered certificates
I. Register certificate
J. Unregister a certificate

K. Export certificate and key to PKCS12 file

X. Quit

Choice:

```

From the **Main** menu, you can generate a private key and certificate request, install and delete certificates, register and unregister certificates, and list certificates. The following sections summarize the purpose of each group of options.

By using the first set of options (A through D), you can generate a CSR and install the returned signed certificate on the adapter.

A. Generate private key and certificate request

Generate a CSR and the associated private key that is sent to the certificate authority.

B. Install certificate from file

Install a certificate from a file. This file must be the signed certificate that is returned by the CA in response to the CSR that is generated by option A.

C. Install certificate and key from a PKCS12 file

Install a certificate from a PKCS12 format file that includes both the public certificate and a private key. If options A and B are not used to obtain a certificate, the certificate that you use must be in PKCS12 format.

D. View current installed certificate

View the certificate that is installed on the workstation where the adapter is installed.

With the second set of options, you can install root CA certificates on the adapter. A CA certificate validates the corresponding certificate that is presented by a client, such as the Identity server.

E. List CA certificates

Show the installed CA certificates. The adapter communicates only with Identity server whose certificates are validated by one of the installed CA certificates.

F. Install a CA certificate

Install a new CA certificate so that certificates generated by this CA can be validated. The CA certificate file can either be in X.509 or PEM encoded formats.

G. Delete a CA certificate

Remove one of the installed CA certificates.

Options H through K apply to adapters that must authenticate the application to which the adapter is sending information. An example of an application is the Identity server or the web server. Use these options to register certificates on the adapter.

If you configure the adapter for event notification or enable client authentication in DAML, you must install the CA certificate. The CA certificate must correspond to the signed certificate of the Identity server. Use option F, **Install a CA certificate**.

H. List registered certificates

List all registered certificates that are accepted for communication.

I. Register a certificate

Register a new certificate. The certificate for registration must be in Base 64 encoded X.509 format or PEM.

J. Unregister a certificate

Unregister (remove) a certificate from the registered list.

K. Export certificate and key to PKCS12 file

Export a previously installed certificate and private key. You are prompted for the file name and a password for encryption.

Generating a private key and certificate request

A certificate signing request (CSR) is an unsigned certificate that is a text file.

When you submit an unsigned certificate to a certificate authority, the CA signs the certificate with the private digital signature. The signature is included in their corresponding CA certificate. When the CSR is signed, it becomes a valid certificate. A CSR contains information about your organization, such as the organization name, country, and the public key for your web server.

1. At the **Main Menu** of the certTool, type A. The following message and prompt are displayed:

```
Enter values for certificate request (press enter to skip value)
-----
```

2. At **Organization**, type your organization name and press **Enter**.
3. At **Organizational Unit**, type the organizational unit and press **Enter**.
4. At **Agent Name**, type the name of the adapter for which you are requesting a certificate and press **Enter**.
5. At **email**, type the email address of the contact person for this request and press **Enter**.
6. At **State**, type the state that the adapter is in and press **Enter**.
For example, type TX if the adapter is in Texas. Some certificate authorities do not accept two letter abbreviations for states; type the full name of the state.
7. At **Country**, type the country that the adapter is in and press **Enter**.
8. At **Locality**, type the name of the city that the adapter is in and press **Enter**.
9. At **Accept these values**, take one of the following actions and press **Enter**:
 - Type Y to accept the displayed values.
 - Type N and specify different values.

The private key and certificate request are generated after the values are accepted.

10. At **Enter name of file to store PEM cert request**, type the name of the file and press **Enter**. Specify the file that you want to use to store the values you specified in the previous steps.
11. Press **Enter** to continue. The certificate request and input values are written to the file that you specified. The file is copied to the adapter bin directory and the **Main** menu is displayed again.

You can now request a certificate from a trusted CA by sending the .pem file that you generated to a certificate authority vendor.

Example of certificate signing request

Here is an example certificate signing request (CSR) file.

```
-----BEGIN CERTIFICATE REQUEST-----

-----END CERTIFICATE REQUEST-----
```

Installing the certificate

After you receive your certificate from your trusted CA, install it in the registry of the adapter.

1. If you received the certificate as part of an email message, do the following actions.
 - a. Copy the text of the certificate to a text file.
 - b. Copy that file to the bin directory of the adapter.

For Windows operating systems:

```
C:\Program Files\IBM\ISIM\Agents\adapter_nameAgent\bin
```

2. At the **Main Menu** prompt of the certTool, type B. The following prompt is displayed:

```
Enter name of certificate file:
-----
```

3. At **Enter name of certificate file**, type the full path to the certificate file and press **Enter**.

The certificate is installed in the registry for the adapter, and **Main Menu** is displayed again.

Installing the certificate and key from a PKCS12 file

If the certTool utility did not generate a CSR to obtain a certificate, you must install both the certificate and private key.

Store the certificate and private key in a PKCS12 file. The CA sends a PKCS12 file that has a .pfx extension. The file might be a password-protected file and it includes both the certificate and private key.

1. Copy the PKCS12 file to the bin directory of the adapter.

For Windows operating systems:

```
C:\Program Files\IBM\ISIM\Agents\adapter_nameAgent\bin
```

2. At the **Main Menu** prompt for the certTool, type C to display the following prompt:

```
Enter name of PKCS12 file:
-----
```

3. At **Enter name of PKCS12 file**, type the name of the PKCS12 file that has the certificate and private key information and press **Enter**. For example, Dam1Srvr.pfx.
4. At **Enter password**, type the password to access the file and press **Enter**.

After you install the certificate and private key in the adapter registry, the certTool displays **Main Menu**.

View installed certificate

To list the certificate on your workstation, type D at the Main menu of certTool.

The utility displays the installed certificate and the Main menu. The following example shows an installed certificate:

```
The following certificate is currently installed.
Subject: c=US,st=California,l=Irvine,o=DAML,cn=DAML Server
```

Installing a CA certificate

If you use client authentication, you must install a CA certificate that is provided by a certificate authority vendor. You can install a CA certificate that was extracted in a temporary file.

1. At the **Main Menu** prompt, type F (Install a CA certificate).

The following prompt is displayed:

```
Enter name of certificate file:
```

2. At **Enter name of certificate file**, type the name of the certificate file, such as `Dam1CACerts.pem` and press **Enter**.

The certificate file opens and the following prompt is displayed:

```
e=admin@ibm.com,c=US,st=California,l=Irvine,o=IBM,ou=Engineering,cn=Eng
Install the CA? (Y/N)
```

3. At **Install the CA**, type Y to install the certificate and press **Enter**.

The certificate file is installed in the `CACerts.pem` file.

Viewing CA certificates

Use the `certTool` utility to view a private key and certificate that are installed the adapter.

The `certTool` utility installs only one certificate and one private key.

Type E at the **Main Menu** prompt.

The `certTool` utility displays the installed CA certificates and the **Main** menu. The following example shows an installed CA certificate:

```
Subject: o=IBM,ou=SampleCACert,cn=TestCA
Valid To: Wed Jul 26 23:59:59 2006
```

Deleting a CA certificate

You can delete a CA certificate from the adapter directories.

1. At the **Main Menu** prompt, type G to display a list of all CA certificates that are installed on the adapter.

```
0 - e=admin@ibm.com,c=US,st=California,l=Irvine,o=IBM,ou=Engineering,cn=Eng
1 - e=support@ibm.com,c=US,st=California,l=Irvine,o=IBM,ou=Support,cn=Support
Enter number of CA certificate to remove:
```

2. At **Enter number of CA certificate to remove**, type the number of the CA certificate that you want to remove and press **Enter**.

After the CA certificate is deleted from the `CACerts.pem` file, the `certTool` displays the Main menu.

Viewing registered certificates

The adapter accepts only the requests that present a registered certificate when client validation is enabled.

To view a list of all registered certificates, type H on the **Main Menu** prompt.

The utility displays the registered certificates and the **Main** menu. The following example shows a list of the registered certificates:

```
0 - e=admin@ibm.com,c=US,st=California,l=Irvine,o=IBM,ou=Engineering,cn=Eng
1 - e=support@ibm.com,c=US,st=California,l=Irvine,o=IBM,ou=Support,cn=Support
```

Registering a certificate

You can register a certificate for the adapter.

1. At the **Main Menu** prompt, type I to display the following prompt:

```
Enter name of certificate file:
```

2. At **Enter name of certificate file**, type the name of the certificate file that you want to register and press **Enter**.

The subject of the certificate is displayed, and a prompt is displayed, for example:

```
e=admin@ibm.com,c=US,st=California,l=Irvine,o=IBM,ou=Engineering,cn=Eng
Register this CA? (Y/N)
```

3. At **Register this CA**, type Y to register the certificate, and press **Enter**.

After you register the certificate to the adapter, the certTool displays the **Main** menu.

Unregistering a certificate

You can unregister a certificate for the adapter.

1. At the **Main Menu** prompt, type J to display the registered certificates. The following example shows a list of lists registered certificates:

```
0 - e=admin@ibm.com,c=US,st=California,l=Irvine,o=IBM,ou=Engineering,cn=Eng
1 - e=support@ibm.com,c=US,st=California,l=Irvine,o=IBM,ou=Support,cn=Support
```

2. Type the number of the certificate file that you want to unregister and press **Enter**.
For example:

```
e=admin@ibm.com,c=US,st=California,l=Irvine,o=IBM,ou=Engineering,cn=Eng
Unregister this CA? (Y/N)
```

3. At **Unregister this CA**, type Y to unregister the certificate and press **Enter**.

After you remove the certificate from the list of registered certificate for the adapter, the certTool displays the **Main Menu**.

Exporting a certificate and key to a PKCS12 file

You can export a certificate and key to a PKCS12 file.

1. At the **Main Menu** prompt, type K to display the following prompt:

```
Enter name of PKCS12 file:
```

2. At the **Enter name of PKCS12 file** prompt, type the name of the PKCS12 file for the installed certificate or private key and press **Enter**.
3. At the **Enter Password** prompt, type the password for the PKCS12 file and press **Enter**.
4. At the **Confirm Password** prompt, type the password again and press **Enter**.

After the certificate or private key is exported to the PKCS12 file, the certTool displays the Main menu.

Customizing the adapter

You can update the SQL Server Adapter JAR file, `SQL2000Profile.jar`, to change the adapter schema, account form, service form, and profile properties.

To make updates, extract the files from the JAR file, make changes to the necessary files, and repackage the JAR file with the updated files. Follow these steps in order to customize the SQL Server Adapter profile:

1. Copy the JAR file to a temporary directory and extract the files.
For more information on extracting the files, see [“Copying the SQL2000Profile.jar file and extracting the files”](#) on page 48.
2. Make the appropriate file changes.
3. Install the new attributes on the IBM Security Verify Governance.
For more information on updating this file, see [“Creating a JAR file and installing new attributes on the IBM Security Verify Governance Identity Manager”](#) on page 48.

Copying the SQL2000Profile.jar file and extracting the files

You can modify the profile JAR file to customize your environment.

The profile JAR file, SQL2000Profile.jar, is included in the SQL Server Adapter compressed file that you downloaded from the IBM Web site. The SQL2000Profile.jar file contains the following files:

- CustomLabels.properties
- erSQL2000Account.xml
- erSQL2000DAMLSERVICE.xml
- resource.def
- schema.dsm1

When you finish updating the profile JAR file, install it on the IBM Security Verify Governance.

To modify the SQL2000Profile.jar file, complete the following steps:

1. Log in to the system where the SQL Server Adapter is installed.
2. On the **Start** menu, click **Programs > Accessories > Command Prompt**.
3. Copy the SQL2000Profile.jar file into a temporary directory.
4. Extract the contents of the SQL2000Profile.jar file into the temporary directory by running the following command:

```
cd c:\temp
jar -xvf SQL2000Profile.jar
```

The jar command will create the c:\temp\SQL2000Profile directory.

5. Edit the appropriate file.

Editing adapter profiles on the UNIX or Linux® operating system

The adapter profile .JAR file might contain ASCII files that are created by using the MS-DOS ASCII format (For example, schema.dsm1, CustomLabels.properties, and service.def).

If you edit an MS-DOS ASCII file on the UNIX operating system, you see character ^M at the end of each line. This is the extra character 0x0d that is used to indicate a new line of text in MS-DOS. Tools, such as, dos2unix are used to remove the ^M character.

You might also want to use the text editors, such as, vi editor that ignore the ^M character. In the mentioned command, the ^M (or Ctrl-M) must be entered by pressing ^v^M (or Ctrl V Ctrl M) in sequence.

For example, if you are using the vi editor, you can remove the ^M character by performing the following steps:

1. From the vi editor command mode, run the following command:

```
:%s/^M//g
```

and press **Enter**.

Enter the ^M (or Ctrl-M) by pressing ^v^M (or Ctrl V Ctrl M) in sequence. The ^v (or Ctrl V) preface indicates to the vi editor to use the next keystroke instead of considering the entry as a command.

Creating a JAR file and installing new attributes on the IBM Security Verify Governance Identity Manager

After you modify the schema.dsm1 and CustomLabels.properties files, you must import these files, and any other files that were modified for the adapter, into the IBM Security Verify Governance Identity Manager for the changes to take effect.

To install the new attributes, complete the following steps:

1. Create a new JAR file using the files in the \temp directory by running the following commands:

```
cd c:\temp
jar -cvf SQL2000Profile.jar SQL2000Profile
```

2. Import the SQL2000Profile.jar file into the IBM Security Verify Governance Identity Manager Application Server.
3. Stop and start the IBM Security Verify Governance Identity Manager server.

Note: If you are upgrading an existing adapter profile, the new adapter profile schema is not reflected immediately. Stop and start the IBM Security Verify Governance Identity Manager server to refresh the cache and the adapter schema.

Managing passwords during account restoration

When a person's accounts are restored from being previously suspended, you are prompted to supply a new password for the reinstated accounts. However, there are circumstances when you might want to circumvent this behavior.

The password requirement to restore an account on MS SQL falls into two categories: allowed and required. How each restore action interacts with its corresponding managed resource depends on either the managed resource, or the business processes that you implement. Certain resources will reject a password when a request is made to restore an account.

In this case, you can configure IBM Security Verify Governance to forego the new password requirement. If your company has a business process in place that dictates that the account restoration process must be accompanied by resetting the password, you can set the SQL Server Adapter to require a new password when the account is restored.

In the resource.def file, you can define whether a password is required as a new protocol option. When you import the adapter profile, if an option is not specified, the adapter profile importer determines the correct restoration password behavior.

Adapter profile components also enable remote services to find out if you discard a password that is entered by the user in a situation where multiple accounts on disparate resources are being restored. In this scenario, only some of the accounts being restored might require a password. Remote services will discard the password from the restore action for those managed resources that do not require them.

To configure the SQL Server Adapter to *not* prompt for a new password when restoring accounts:

Note: If you are upgrading an existing adapter profile, the new adapter profile schema will not be reflected immediately. You need to stop and start the Identity server in order to refresh the cache and therefore the adapter schema.

1. Stop the Identity server.
2. Extract the files from the SQL2000Profile.jar file.
For more information on customizing the adapter profile file, see [“Customizing the adapter” on page 47](#).
3. Change to the \SQL2000Profile directory, where the resource.def file has been created.
4. Edit the resource.def file to add the new protocol options, for example:

```
<Property Name = "com.ibm.itim.remoteservices.ResourceProperties.  
PASSWORD_NOT_REQUIRED_ON_RESTORE" Value = "TRUE"/>  
<Property Name = "com.ibm.itim.remoteservices.ResourceProperties.  
PASSWORD_NOT_ALLOWED_ON_RESTORE" Value = "FALSE"/>
```

Adding the two options in the example above ensures that you will *not* be prompted for a password when an account is restored.

5. Create a new SQL2000Profile.jar file using the resource.def file and import the adapter profile file into the Identity server.
6. Start the Identity server again.

Verifying that the adapter is working correctly

After you install and configure the adapter, take steps to verify the installation.

1. Test the connection for the service that you created on IBM Security Verify Governance.
2. Perform a full reconciliation from the Identity server.
3. Perform all supported operations (add, change and delete) on one account and verify the `SqlServerAdapter.log` file after each operation to ensure that no errors were reported.

For more information about the `SqlServerAdapter.log` file, see [“Changing activity log settings”](#) on [page 31](#).

Chapter 6. Troubleshooting

Troubleshooting is a systematic approach to solving a problem. The goal of troubleshooting is to determine why something does not work as expected and how to resolve the problem. This topic provides information and techniques for identifying and resolving problems that are related to the adapter, including troubleshooting errors that might occur during the adapter installation.

Techniques for troubleshooting problems

Certain common techniques can help with the task of troubleshooting. The first step in the troubleshooting process is to describe the problem completely.

Problem descriptions help you and the IBM technical-support representative find the cause of the problem. This step includes asking yourself basic questions:

- What are the symptoms of the problem?
- Where does the problem occur?
- When does the problem occur?
- Under which conditions does the problem occur?
- Can the problem be reproduced?

The answers to these questions typically lead to a good description of the problem, which can then lead you to a problem resolution.

What are the symptoms of the problem?

When you start to describe a problem, the most obvious question is "What is the problem?" This question might seem straightforward; however, you can break it down into several more-focused questions that create a more descriptive picture of the problem. These questions can include:

- Who, or what, is reporting the problem?
- What are the error codes and messages?
- How does the system fail? For example, is it a loop, hang, crash, performance degradation, or incorrect result?

Where does the problem occur?

Determining where the problem originates is not always easy, but it is one of the most important steps in resolving a problem. Many layers of technology can exist between the reporting and failing components. Networks, disks, and drivers are only a few of the components to consider when you are investigating problems.

The following questions help you to focus on where the problem occurs to isolate the problem layer:

- Is the problem specific to one operating system, or is it common across multiple operating systems?
- Is the current environment and configuration supported?
- Do all users have the problem?
- (For multi-site installations.) Do all sites have the problem?

If one layer reports the problem, the problem does not necessarily originate in that layer. Part of identifying where a problem originates is understanding the environment in which it exists. Take some time to completely describe the problem environment, including the operating system and version, all corresponding software and versions, and hardware information. Confirm that you are running within an environment that is a supported configuration. Many problems can be traced back to incompatible levels of software that are not intended to run together or are not fully tested together.

When does the problem occur?

Develop a detailed timeline of events that lead up to a failure, especially for those cases that are one-time occurrences. You can most easily develop a timeline by working backward: Start at the time an error was reported (as precisely as possible, even down to the millisecond), and work backward through the available logs and information. Typically, you use the first suspicious event that you find in a diagnostic log.

To develop a detailed timeline of events, answer these questions:

- Does the problem happen only at a certain time of day or night?
- How often does the problem happen?
- What sequence of events leads up to the time that the problem is reported?
- Does the problem happen after an environment change, such as upgrading or installing software or hardware?

Responding to these types of questions can give you a frame of reference in which to investigate the problem.

Under which conditions does the problem occur?

Knowing which systems and applications are running at the time that a problem occurs is an important part of troubleshooting. These questions about your environment can help you to identify the root cause of the problem:

- Does the problem always occur when the same task is being done?
- Is a certain sequence of events required for the problem to occur?
- Do any other applications fail at the same time?

Answering these types of questions can help you explain the environment in which the problem occurs and correlate any dependencies. Remember that just because multiple problems might occur around the same time, the problems are not necessarily related.

Can the problem be reproduced?

From a troubleshooting standpoint, the ideal problem is one that can be reproduced. Typically, when a problem can be reproduced you have a larger set of tools or procedures at your disposal to help you investigate. Problems that you can reproduce are often easier to debug and solve.

However, problems that you can reproduce can have a disadvantage: If the problem is of significant business impact, you do not want it to recur. If possible, re-create the problem in a test or development environment, which typically offers you more flexibility and control during your investigation.

- Can the problem be re-created on a test system?
- Do multiple users or applications have the same type of problem?
- Can the problem be re-created by running a single command, a set of commands, or a particular application?

Techniques for troubleshooting problems

Certain common techniques can help with the task of troubleshooting. The first step in the troubleshooting process is to describe the problem completely.

Chapter 7. Uninstalling

To remove an adapter from the Identity server for any reason, you must remove all the components that were added during installation. Uninstalling the adapter involves running the uninstaller and removing the adapter profile from the Identity server.

Before you remove the adapter, inform your users that the SQL Server Adapter is unavailable.

If the server is taken offline, adapter requests that were completed might not be recovered when the server is back online. To completely uninstall the SQL Server Adapter, perform these procedures:

1. Uninstall the adapter from the target server.
2. Remove the adapter profile from the .

Uninstalling the adapter from the target server

You can remove the SQL Server Adapter.

1. Stop the adapter service.
2. Run the uninstaller. To run the uninstaller:
 - a. Navigate to the adapter home directory. For example, navigate to the `Tivoli/agents/adaptername/_uninst` directory.
 - b. Double click the `uninstaller.exe` file.
 - c. In the Welcome window, click **Next**.
 - d. In the uninstallation summary window, click **Next**.
 - e. Click **Finish**.
 - f. Inspect the directory tree for the adapter directories, subdirectories, and files to verify that uninstall is complete.

Removing the adapter profile

Before you remove the adapter profile, ensure that no objects exist on your Identity server that reference the adapter profile.

Examples of objects on the Identity server that can reference the adapter profile are:

- Adapter service instances
- Policies referencing an adapter instance or the profile
- Accounts

For specific information on how to remove the adapter profile, see the IBM Security Verify Governance product documentation.

Chapter 8. Reference

Reference information is organized to help you locate particular facts quickly, such as adapter attributes, registry settings, and environment variables.

Adapter attributes and object classes

Adapter attributes and object classes are required for customization, creating provisioning rules, and understanding what service/target attributes are supported by the adapter. The Identity server communicates with the adapter by using attributes, which are included in transmission packets that are sent over a network.

Table 10. Attributes, descriptions, and data types

Attribute	Directory server attribute	Description	Data type
AccountPassword	erPassword	Specifies the password used to create a SQL Server account.	Binary
DatabaseRole	ersqldbrole	Specifies roles to be granted for the user mapped to the login ID in the database. If the user does not exist in the specified database then the adapter creates a user for the LoginId and grants specified database roles to that user. Specify the format on one line: <pre>database_name: database_role_name</pre> This role can be selected from the support data search box.	String
DatabaseUser	ersqldbuser	Specifies the user to which the LoginId is mapped in a database. Specify the format on one line: <pre>database_name: user_name</pre> A user with a login ID is created automatically in the login ID default database.	String
DefaultDatabase	erSQL2000DefDatabase	Specifies the default database for the user. If not provided, the default database is <i>master</i> with public as default permissions.	String
DefaultLanguage	erSQL2000DefLanguage	Specifies the default language of the user. If not provided, the form default is English.	String
LoginId	erUid	Specifies the login ID of the SQL Server or the Windows Mapped login in the SQL Server.	String

Attribute	Directory server attribute	Description	Data type
ServerRole	erSQL2000ServerRole	Specifies the fixed server roles. Each roles has certain predefined permissions on the SQL Server. The roles can be granted and revoked from the SQL LoginId.	String

Adapter attributes by operations

Adapter attributes by operations refer to adapter actions by their functional transaction group. They are required for customization, creating provisioning rules, and understanding what service/target attributes are supported by the adapter.

System Login Add

A System Login Add is a request to create a user account with the specified attributes.

Required attribute	Optional attribute
erUid erSQL2000ServerName erSQL2000AdminAccount erServicePwd1	All other supported attributes

System Login Change

A System Login Change is a request to change one or more attributes for the specified users.

Required attribute	Optional attribute
erUid erSQL2000ServerName erSQL2000AdminAccount erServicePwd1	All other supported attributes

System Login Delete

A System Login Delete is a request to remove the specified user from the directory.

Required attribute	Optional attribute
erUid erSQL2000ServerName erSQL2000AdminAccount erServicePwd1	None

System Login Suspend

A System Login Suspend is a request to disable a user account. The user is not removed and their attributes are not modified.

<i>Table 14. Suspend request attributes</i>	
Required attribute	Optional attribute
erUid erAccountStatus erSQL2000ServerName erSQL2000AdminAccount erServicePwd1	None

System Login Restore

A System Login Restore is a request to activate a user account that was previously suspended. After an account is restored, the user can access the system with the same attributes as the ones before the Suspend function was called.

<i>Table 15. Restore request attributes</i>	
Required attribute	Optional attribute
erUid erAccountStatus erSQL2000ServerName erSQL2000AdminAccount erServicePwd1	None

Reconciliation

The Reconciliation request synchronizes user account information between IBM Security Verify Governance and the adapter.

<i>Table 16. Reconciliation request attributes</i>	
Required attribute	Optional attribute
erSQL2000ServerName erSQL2000AdminAccount erServicePwd1	None

Note:

- The adapter returns the BUILTIN\ADMINISTRATORS and sa accounts in a reconciliation operation, however, you cannot delete these accounts. Do not manage these accounts from SQL Server Adapter.
- The Database Access tab has the following attributes:
 - Database Role
 - Database User

The following table describes the syntax for specifying access and roles for the user on the Database Access tab on SQL Server Adapter:

Table 17. Syntax for specifying access and roles for the user on the Database Access tab

Attribute	Syntax	Syntax
Database Role	dbname:dbroleName	master:db_owner
Database User	dbname:dbuser	pubs:user

Special attributes

This topic is not applicable for this adapter.
